Charles, Robert Henry, Irish theologian and scholar: b. County Tyrone, 6 Aug. 1855. He was educated at Queen’s College, Belfast, and Trinity College, Dublin, and was admitted to the Anglican ministry in 1883. He was curate of Saint Mark’s, Whitechapel, 1883–85; of Saint Philip’s, Kensington, 1885–86; and of Saint Mark’s, Kennington, 1886–89. From 1898–1906 he was professor of biblical Greek at Trinity College, Dublin; Grinfield lecturer in the Sepulchre, Oxford, 1905–11; speaker’s lecturer in biblical studies, Oxford, 1910–14; and has been canon of Westminster since 1913. He has published ‘Forgiveness, and Other Sermons’ (1886); ‘Book of Enoch Translated from the Ethiopic’ (1889); ‘Ethiopic Text of Book of Jubilees’ (1894); ‘Book of the Secrets of Enoch’ (1895); ‘The Assumption of Moses’ (1897); ‘The Doctrine of a Future Life’ (2d ed., 1913); ‘Studies in the Apocalypse’ (1913); ‘The Development between the Old and the New Testament’ (1914); and made numerous contributions to encyclopedias and educational works.

CHARLES ALBERT, King of Sardinia: b. 2 Oct. 1798; d. Oporto, Portugal, 28 July 1849. He was the son of Charles Emmanuel, Prince of Savoy-Carignan. He was educated in France, and in 1831 succeeded to the throne as the nearest heir on the death of Charles Felix. In the first years of his reign he showed himself favorable to the cause of progress by promoting several measures of beneficial reforms. Subsequently, indeed, he became more absolute in his views, but after the French Revolution of February 1848, he granted a constitution, and took the field against Austria on behalf of the revolted peoples of the Lombardo-Venetian kingdom and the duchies of central Italy. His armies were at first very successful, the Austrians were defeated in various encounters: but he was at last repulsed by Marshal Radetzky and obliged to sue for an armistice. On its expiration he renewed the hostilities, but the battle of Novara, fought on 23 March 1849, proved fatal to the aspirations of Charles Albert and Sardinia. That very day he abdicated in favor of his son, Victor Emmanuel II, afterward King of Italy, and retired to a monastery at Oporto in Portugal. Consult Capellani, L., ‘Storia di Carlo Alberto’ (Rome 1899); Masi, E., ‘Il Segreto del Re Carlo Alberto’ (Bologna 1891).

CHARLES OF ANJOU, King of Naples and Sicily, the son of Louis VIII of France: b. about 1220; d. Foggia, 7 Jan. 1262. He waged war on King Manfred of Sicily, who was defeated and slain. He then seized on the Neapolitan crown (1266). His cruelty and exacting rule induced such a detestation of the French name, that the Sicilians, headed by John de Procida, rose in arms on the eve before Easter Day, 1282, and slaughtered all the French in the town and neighborhood of Palermo, the signal for the rising being the tolling of the vespers-bell: this tragedy is hence recorded in history as the "Sicilian Vespers" (q.v.), as the French were entirely expelled from the island. Charles was unsuccessful in subsequent projects against the island.

CHARLES AUGUSTUS, Grand Duke of Saxe-Weimar: b. 3 Sept. 1757; d. Graditz, Prussia, 14 June 1828. His mother, Amalia, reigned as regent for him until he succeeded to power in 1775. He was a general in the army of Prussia 1772–93, and with the allies opposed Napoleon 1813–15. By the Congress of Vienna his principedom in 1815 was restored, and he was soon liberally patronized in science and art, and under him his capital of Weimar became the literary centre of Germany. He was a close friend of Goethe.

CHARLES THE BALD. See Charles I of France.

CHARLES THE BOLD, Duke of Burgundy: b. Dijon, 10 Nov. 1433; d. Nancy, 5 Jan. 1477. He succeeded to the dukedom in 1467, and immediately engaged in a war with the citizens of Liége, whom he conquered and treated with extreme severity. Before this undertaking he had been obliged to restore to the citizens of Ghent the privileges which had been taken from them by the deposed John. He now revoked his forced concessions, caused the leaders of the insurrection to be executed and imposed a large fine on the city. In 1468 he married Margaret of York, sister of the king of England. Learning that Liége, instigated by King Louis XI, had rebelled anew, and made themselves masters of Tongres, he compelled the King to sign a treaty the most disgraceful condition of which was that he should march with Charles against the city of Liége, which he had himself excited against the Duke. Charles encamped before Liége in company with the King; the city was taken by storm, and abandoned to the fury of the soldiers. Such success rendered the mind of the Duke utterly obdurate, and added the last traits of that inflexible, sanguinary character which made him the scourge of his neighborhood, and led to his own destruction. Edward IV conferred on him in 1470 the Order of the Garter. Shortly after he received in Flanders Edward himself, who came to seek an asylum with the Duke. Charles gave him money and ships to return to England. About the end of the same year the war between the King of France and the Duke of Burgundy was renewed, and nevermore he show himself more deserving of the name of the "Bold" or "Rash," than in this war.

Having completed the conquest of Lorraine by the taking of Nancy in 1475, he turned his arms against the Swiss; and notwithstanding the representations of these neutrals, who told him that all that he could find among them would not be worth so much as the spurs of his horsemen, he took the city of Granson, and put to the sword 800 men, by whom it was defended. These were soon avenged by the signal victory which the Swiss obtained near the same city 3 March 1476.

With a new army he returned to Switzerland, and lost the battle of Murten (Morat) 22 June. The Duke of Lorraine, who had fought in the army of the Swiss, led the victors to the walls of Nancy, which surrendered 6 October. At the first information of this siege Charles marched to Lorraine, to retake the city of Nancy from the Duke. On 5 or 6 June 1477 the two armies met: the wings of the Burgundian army were broken through and dispersed, and the centre, commanded by the Duke in person, was attacked in front and
flank. As Charles was putting on his helmet, the gilded lion which formed its crest fell to the ground, and he exclaimed with surprise, Ecce magnum signum Dei! Defeated, and carried along with the current of fugitives, he fell, with his horse, into a ditch, where he was killed by the thrust of a lance. His body, covered with blood and mire, and with the head embedded in the ice, was not found till two days after the battle, when it was so disfigured that for some time his own brothers did not recognize it. See Kirk, 'History of Charles the Bold' (1863-68). In 'Quentin Durward,' Sir Walter Scott has portrayed the character of Charles, and some of the quarrels between him and Louis of France.

CHARLES CITY, Iowa, city and county-seat of Floyd County, on Cedar River, 40 miles northwest of Cedar Falls, and on the Illinois Central and the Chicago, Milwaukee and St. Paul railroads. It is supplied with good water power by the river and has a number of manufacturing interests, including stove fixtures, furniture, sashes and doors, harrows and gasoline traction and stationary engines. Live stock, poultry, dairy, and nursery stock are the chief items of trade. It is the seat of Charles City College, a coeducational institution, organized in 1891, under the auspices of the German Methodist Church, which had 246 students at the end of 1910. It contains an opera-house, public library, a home for the aged and several parks. It was settled in 1856, incorporated in 1859 and is governed by a mayor and council. The waterworks are the property of the municipality. Pop. (1910) 6,892.

CHARLES CITY CROSS-ROADS, Battle of. See Glendale, BATTLE OF.

CHARLES EDWARD STUART. See STUART, CHARLES EDWARD LOUIS.

CHARLES EMMANUEL I, Duke of Savoy, surnamed 'the Great': b. Rivoli, 12 Jan. 1562; d. Savignano, 26 July 1630. He formed a plan of uniting Provence to his dominions. Philip II of Spain, his father-in-law, obliged the Parliament of Aix to acknowledge him as the protector of this province, in order by this example to induce France to acknowledge the king of Spain as protector of the whole realm. The Duke of Savoy, not less ambitious, likewise aimed at this crown, and after the death of Matthias desired also to be chosen emperor of Germany. He likewise intended to conquer the kingdom of Cyprus, and to take possession of Macedonia, the inhabitants of which, oppressed by the Turks, offered him the sovereignty over their country. The citizens of Geneva were obliged to defend their city in 1602 against this ambitious prince, who fell upon them by night in time of peace. Henry IV, who had reason to complain of the Duke, and whose general, the Duke of Lesdiguières, had beaten Charles Emmanuel several times, entered at last into a treaty of peace with him, not disadvantageous to the Duke of Savoy. In 1628 he joined Spain in the war against France and his territory was left to him to support unaided by his allies. He died when this struggle had all but exhausted his army's strength.

CHARLES THE FAIR. See CHARLES IV of France.

CHARLES THE FAT. See CHARLES II of France.

CHARLES FRIEDRICH AUGUST WILHELM, Duke of Brunswick: b. 30 Oct. 1804; d. 1873. He succeeded to the dukedom in 1823, but his rule was so arbitrary and oppressive that the German Diet deposed him. He subsequently lived in Paris and London, and at his death bequeathed his vast fortune to the city of Geneva.

CHARLES MARTEL, King of the Franks: b. about 688; d. 22 Oct. 741. He was a natural son of Pepin Héristal, mayor of the palace under the last kings of the Merovingian dynasty. On the death of his father in 714, Charles was thrown into prison, but managed to escape, and gradually made himself master of a greater part of the country of the Franks. By establishing unity in Gaul he saved it from the danger of conquest by the Arabs who had already taken possession of most of Spain. In 732 Charles gained a decided victory over Abd-ur-Rahman, the Arab leader, who had undertaken to conquer France. He extended his influence over Frisia, the Germanic tribes, Saxony, Bavaria and neighboring races. He organized the nobility and the knights into great bodies, under effective discipline of a military character; and the favors he extended to them to gain his ends had a strong effect on the creation and future growth of the feudal system. Charles Martel was a man of activity, courage and far-sightedness and, though his political schemes failed in the end, yet his work had a vast influence upon the future of southern and western Europe.

CHARLES D'ORLÉANS, shär'lôr-lā·ən', French nobleman and poet, son of Louis d'Orléans: b. 26 May 1391; d. 4 Jan. 1465. He was the grandson of Charles V of France, and the father of Louis XI. He was taken prisoner at Agincourt, and kept a captive in England from 1415 to 1440, when he was ransomed. He wrote a number of lyrics while in prison and after his return to France. At Blois, where he held his court, he gathered together the chief French writers of his time, and took part with them in poetical tournaments, in one of which François Villon competed successfully. He has been termed the father of French lyric poetry, but has no claim to the title. His light and graceful lyrics are the last flowering of the courtly poetry of the Middle Ages; they show no trace of the modern spirit which appears so strongly in the works of his contemporary, Villon. His favorite themes are love and the springtime; his favorite form is the rondeau, with two rhymes, of which he is considered the chief master, as Villon is of the ballade and Voiture of the rondeau. His works were edited by D'Héricault (1874), with memoir. Consult Beaufils, 'Études sur la vie et les poésies de Charles d'Orléans' (2 vols., Paris 1875); and Stevenson, R. L., 'Familiar Studies of Men and Books' (1882).

CHARLES RIVER, a river in Massachusetts, which flows into Boston harbor, dividing Boston from Charlestown. The source of the principal branch is a pond bordering on Hopkinton. It is navigable, for
lighters and large boats to Watertown, seven miles west of Boston. The chief towns on its banks are the Newtons, Waltham, Watertown, Cambridge, Brookline and Boston.

CHARLES THE SIMPLE. See CHARLES III of France.

CHARLES TOWN, W. Va., town and county-seat of Jefferson County, situated on a branch of the Baltimore and Ohio Railroad, 10 miles southwest of Harper's Ferry. It is the centre of an agricultural region, has deposits of limestone and iron ore in the vicinity, and manufactures brass fittings, harness, collars, fly nets, various wooden products and fertilizers. It was settled about 1750 and was first incorporated in 1873. It was here that John Brown, after his raid at Harper's Ferry, was tried, condemned and hanged on 2 Dec. 1859. On 18 Oct. 1862, a Confederate cavalry division, under General Imboden, captured the place and secured 424 prisoners and large quantities of military stores, but, on the approach of a superior Union force, almost immediately withdrew. Pop. 2,662.

CHARLES'S WAIN, a common name for the constellation of the Great Bear or Ursa Major. Originally instead of Charles's Wain, the name was "carl's" or "churl's wain," meaning the farmer's wagon. Since the time of Homer this constellation has been called a wagon; but since the 17th century the name has been associated with Charles I and Charles II. Shakespeare calls it Charles's Wain.

CHARLES THE WISE. See CHARLES V of France.

CHARLESTON, Ill., county-seat of Cola County, situated at the junction of the Cleveland, Cincinnati, Chicago and Saint Louis and the Toledo, Saint Louis and Western railroads. It is the centre of a large oil, gas and coal region, and 49 miles southeast of Decatur. It has manufactories of woolen goods, carriages, stoves, plows, brooms and also flour mills, banks, good schools and several churches. It is the seat of the Eastern Illinois Normal School, and contains a Carnegie library. Charleston was settled in 1830, and incorporated in 1855. The government is vested in a mayor, chosen for two years, and a council. The waterworks are municipally owned. Pop. 5,684.

CHARLESTON, Mo., city and county-seat of Mississippi, 15 miles southwest of Cairo, III., on the Saint Louis, Iron Mountain and Southern Railroad. It has a large trade in grain, flour, fruits, live stock and potatoes. It contains flour mills, saw mills, axe handle factories and stave and barrel heading works. Indian mounds are numerous in the vicinity. The city owns the waterworks. Pop. 3,144.

CHARLESTON, S. C., the chief city of the State, and most important on the Atlantic seaboard south of Chesapeake Bay, seat of Charleston County; 130 miles southeast of Columbia, the capital, and 32 miles south of Savannah. Railroad service includes Atlantic Coast Line and connections (Charleston & W. Carolina; Georgia Railroad; Cola, N. & L.; Winston-Salem Southbound; N. C. & St. L.; L. & N. Southern Railway and connections (Q. C. and Georgia Railroad)—and Seaboard Air Line and connections. Charleston lies on a peninsula, 10 or 12 miles long and 8 or 10 feet above high water, between the navigable Ashley and Cooper rivers, 2,100 yards and 1,400 yards wide respectively at the mouth; the latter reinforced by the Wando at the city, and the estuary of the three forming a magnificent landlocked harbor, six miles long by the wide mouth 40 feet of water at the city—one of the finest, safest and most spacious on the Atlantic Coast.

The harbor's channel, lying for some distance between jetties, is 700 feet wide and has a mean depth at low water of 28 feet and at high water of 33 feet. There are about 17 miles of available waterfront, with development constantly in progress on both the Ashley and the Cooper rivers. During the years 1910 to January 1916, for example, wharfage and terminal improvements costing nearly $5,500,000 were made. Ocean traffic has been quick to take advantage of the several large inducements held out by Charleston and now its steamship service includes American Hawaiian SS. Company (Boston, New York, Jacksonville); Baltimore & Carolina SS. Company (Baltimore, Georgetown); Philadelphia & New Orleans SS. Company (Philadelphia, New Orleans); Southern Transportation Company (barge line, Philadelphia, Baltimore, Norfolk, Wilmington, Georgetown); American-Hawaiian SS. Company (West Coast, S.); Luckenbach SS. Company (contract service, West Coast, South America); Grace Line (contract service, West Coast, South America); Carolina Line (contract European service); United Fruit Company (port of call); Sea Island Steamboat Company (Charleston, Beaufort).

The resemblance of Charleston's position to that of New York in its rivers and harbors is striking. Freight here is moved directly from vessel to freight cars, or vice-versa, without lightering or trucking. Distances from the Central West to Charleston are not great and the city has just entered upon a period of rapid growth. The city is the leading railway and manufacturing point of the Southeast. In 1,728 miles of coast line, from Cape Hatteras to the mouth of the Rio Grande, it has the only United States navy yard. Also, it is the only place on the South Atlantic and Gulf coasts with a dry dock large enough to repair a battleship. The city is seven and one-half miles from the ocean and the channel is easily mined and is protected by forts Sumter and Moultrie. It is located directly north of the Panama Canal, from which its sailing distance is only 12 per cent greater than that from New Orleans. It has the only large coaling terminals on the coast and is the distributing point for the Carolinas of two of the greatest oil companies. Admirals of the navy have repeatedly pointed out its wonderful strategic advantages and its practical impregnability. The Charleston navy yard is to-day in a high state of efficiency, employing more than 4,500 people and paying civilian wages of more than $5,000,000 annually. Charleston is America's entrance into the World War, became the headquarters of the Southeastern
1 Post Office, with St. Michael's, Charleston's Oldest Church, in the Distance
2 United States Customs House
3 Fort Sumter
Military Department and of the Sixth Naval District.

Trade and Commerce.—At the outbreak of the Civil War, Charleston's export trade in cotton, rice and naval stores made up the largest part of a total of about $17,000,000 annually and in the shipping business of the harbor. The work of repairs to docks, wharves and railroads was slow and it is only in recent years that Charleston has recovered from her tremendous losses and has begun to forge ahead rapidly. Recent years, however, have witnessed the strides that are record-breaking, as seen in the statistics for 1903 and 1913: Foreign imports, (1903) $1,768,000, (1913) $5,361,000; coastwise imports, (1903) $10,315,000, (1913) $22,040,000; foreign exports, (1903) $5,468,000, (1913) $20,783,000; coastwise exports, (1903) $32,107,000, (1913) $31,040,000; total exports and imports, (1903) $47,659,000, (1913) $79,225,000. The rate of increase since then has been even greater, the total commerce for 1913 being $222,881,814, and that for 1914 $230,000,000. The principal exports are cotton, cotton goods, lumber, fertilizers, cigars and tobacco, fruits and vegetables. Charleston is the centre of the second most important trucking district of the country and the city's wholesale and retail business is also increasing. The principal wholesale dealers in the city are the Williams and Rutledge and Ashley avenues, run the entire length of the city, north and south. King street ends in White Point Garden, a handsome wooded park containing monuments to Sergeant Jasper and his comrade and to William Gilmore Simms; the old gun from the Keokuk, the Phosphate Monument and a drinking fountain to the heroes of the Hunley who lost their lives in Charleston Harbor on the first submarine boat ever built in America. White Point Gardens, with its adjacent esplanade, the Battery, 1,500 feet long, is Charleston's greatest pride and beauty. The Battery gives a magnificent view of the harbor and the forts. In the middle distance stands Fort Sumter; to the right the shores of Morris, James and John's islands, on which are located the lighthouse and United States quarantine station, and where formerly stood Fort Johnson, Battery Wagner and Cummings Point; in the distance to the left, the houses of Mount Pleasant, Sullivan's Island and the Isle of Palms, suburbs and beach resorts; nearer still, Castle Pinckney, on its little marsh island in the Cooper, and Fort Riley. Adjoining the Battery is a development of recent years called the Island and a section of land filled in from the river at a cost of about $400,000 and fronted by a beautiful walk and drive 4,000 feet long. This, with the Battery, gives a continuous waterfront esplanade of 5,500 feet or more than a mile.

Manufactures.—Charleston's principal enterprises embrace: fertilizers, lumber and timber, mineral waters and soda, bakers, textiles, foundries and machinery, printing and publishing, tobacco and cigars and flour and grist. There are also important manufactories of carriages and wagons, ice, medicine and rugs, baskets, boxes and furniture. The most important manufacturers are: fertilizers, with lumber second and textiles third. Manufacturing statistics for 1917 are as follows: Plants, 190; capital, $20,268,513; annual products, $36,663,945; salaried persons, 801; wage earners, 14,437; paid in salaries and wages, $10,883,087.

As a distributing and wholesale center, Charleston is pre-eminent in its section. Wholesale establishments number 89, employing 1,528 wage earners. They pay wages and salaries of $1,135,602 and do an annual business of $30,801,884. Principal lines are groceries, cement, lime and plaster, drugs, dry goods and notions, flour, fruit and produce, machinery and mill supplies, provisions, rice and shoes.

Buildings, Streets, Suburbs, etc.—Charleston's long existence for an American city (founded 1670) and its position of leadership in all political movements as well as vital importance in war time give it rich historical interest; and this, with its fine climate and its old garden-set mansions and outlying garden spots of rare beauty, make it one of the choicest and most popular Southern tourist resorts. In summer it attracts large numbers of visitors by reason of its beach resort, the Isle of Palms, where the scenes of Poe's 'Gold Bug' are said to have been laid.

Charleston is unique among American cities in that while keeping up with the most modern in commercial and industrial progress, it has preserved all its historic places and features. Within its gates the student of history is presented opportunities to study every period in American life from 1700 to the present time. The city is laid out generally at right angles, but with some picturesque irregularities in the streets; four of these, King street, the principal retail thoroughfare, Meeting street, the principal wholesale and distributing thoroughfare, East Bay street, and Rutledge and Ashley avenues, run the entire length of the city, north and south. King street ends in White Point Garden, a handsome wooded park containing monuments to Sergeant Jasper and his comrade and to William Gilmore Simms; the old gun from the Keokuk, the Phosphate Monument and a drinking fountain to the heroes of the Hunley who lost their lives in Charleston Harbor on the first submarine boat ever built in America. White Point Gardens, with its adjacent esplanade, the Battery, 1,500 feet long, is Charleston's greatest pride and beauty. The Battery gives a magnificent view of the harbor and the forts. In the middle distance stands Fort Sumter; to the right the shores of Morris, James and John's islands, on which are located the lighthouse and United States quarantine station, and where formerly stood Fort Johnson, Battery Wagner and Cummings Point; in the distance to the left, the houses of Mount Pleasant, Sullivan's Island and the Isle of Palms, suburbs and beach resorts; nearer still, Castle Pinckney, on its little marsh island in the Cooper, and Fort Riley. Adjoining the Battery is a development of recent years called the Island and a section of land filled in from the river at a cost of about $400,000 and fronted by a beautiful walk and drive 4,000 feet long. This, with the Battery, gives a continuous waterfront esplanade of 5,500 feet or more than a mile.

Going north from the Battery, one finds at the juncture of Meeting and Broad streets several large public buildings. They are the county courthouse, a solid brick building; the city hall, an imposing structure entered by a double flight of steps and containing valuable paintings and relics; the United States post-office, a four-story, $500,000, modern office building of Carolina granite, reputed to be the "cleanest Federal building in the country," and Saint Michael's Church, the central point of all Charleston's historical associations. The United States custom house, near Market wharf on the Cooper River, is a superb structure of white marble costing some $3,400,000. In front of the city hall is Washington Park or City Hall Park, containing a statue of William Pitt, erected before the British shot off one of the arms in 1780 — and monuments to the Confederate dead, to General
Beauregard, and a bust of Henry Timrod, the Charleston poet. Nearby is the old post-office building, where Washington and LaFayette were entertained, where Steve Bonnet and other privateers were housed where the forbidden tea imports were stored and whence the patriot Isaac Hayne was led to his execution by the British. The Charleston Chamber of Commerce, which is nearby, was founded in 1773 and is the second oldest civic and commercial body in America and the oldest city Chamber of Commerce.

Going northward from the city hall one comes upon the Gibbes Memorial Art Gallery and, on the street west of it, the Charleston Library, both handsome buildings. Other interesting public buildings are South Carolina hall (1804), Charleston orphan house (1794), Hibernian hall (1799), the old Powder magazine (1705), the Slave market, the old Charleston market (1841); and such residences as the Heyward house, built in 1675; the old Heyward house, in which Washington was entertained for a week in 1791; the Huger residence, in which Lord William Campbell, last colonial governor of South Carolina, resided; the William Heyward house; and the Harry bowman house. In addition to the Battery and Washington Park, Charleston’s parks include Marion Square, or "Citadel Green," containing a statue of John C. Calhoun and other interesting objects; Hampton Park, with sunken gardens and a wealth of Southern foliage; Colonial Lake and Common; Hampstead Mall and Cannon Park.

Charleston has one of the best electric street railways in the country, covering the city completely and running to the navy yard, seven miles distant, and to North Charleston, a suburban development which is being built into a model city along scientific lines. A ferry line gives transportation across the river to Mount Pleasant, a suburb, and thence an electric railway runs through Sullivan’s Island, where is to be found Fort Moultrie, and finally to the Isle of Palms, Charleston’s beach resort, that boasts a beautiful white sand beach nine miles long, cottages, a large pavilion and other resort features. Magnolia Gardens, 12 miles west of Charleston, in the Ashley valley, is another beautiful resort. Magnolia Cemetery is Charleston’s largest and most beautiful burial place. A new cemetery of large proportions has been opened, however—the RiverAND View—Charleston has a new and thorough system of drainage which further improves the fine sanitary condition for which the city has been noted.

Education.—The public-school system, established in 1810, had, in 1914, eight school districts. The statistics are: 20 institutions, 241 teachers, 7,818 pupils, buildings valued at $463,500, annual expenditures of $291,324. For higher education the principal institutions are: 1749, College of Charleston; in 1785, the Military College of South Carolina, a State institution, established in 1845, one of the foremost military schools in the country and famed for the active part its students took in the Civil War; the Medical College of South Carolina, a State institution ranking in Class A of the American Medical Association; Porter Military Academy, the oldest school in South Carolina, Memminger High and Normal School, Academy of Our Lady of Mercy, Confederate College, Ashley Hall, Avernl Normal Institute, Wallingford Academy for Colored Youth and many private academies and schools. The Charleston Museum, the oldest museum in the American continent, having been founded in 1773, is also one of the most complete and well-rounded collections outside the largest cities. In addition to its collecting and exhibition work, it works with the public and private schools of the city.

Churches and Charitable Institutions.—Charleston is truly a city of churches, there being 81 (42 white and 39 colored), divided among the Adventist, Baptist, Christian, Christian Science, Congregational, Episcopalian, French Protestant, Greek Orthodox, Hebrew, Lutheran, Methodist, Presbyterian, Roman Catholic and Unitarian denominations among the white churches and Baptist, Congregationalist and Roman Catholic among the colored. The leading denominations are Episcopalian, Lutheran and Roman Catholic. It is the home of the Episcopal bishop of South Carolina and also of the Roman Catholic bishop. It has a Roman Catholic cathedral, that of Saint John the Baptist. The oldest church building is Saint Michael’s (Protestant Episcopal), dating from 1761, with a fine chime, of interesting history, and numerous associations that make it the most famous church in South Carolina; the oldest organisation is that of Saint Philip’s (Protestant Episcopal), whose building was burned in the great fire of 1835, after having been saved from two earlier fires, and whose present one is a classic structure of great beauty and originality, with a steeple nearly 200 feet high, bearing at night a beacon, visible far out at sea; and with a churchyard full of distinguished names, including Calhoun, Gadsden, Rutledge and Pinckney. Saint Michael’s Church (Congregational) is noted, while the Old Huguenot Church is the only congregation of its kind in the United States. Other churches of interest are Grace (Protestant Episcopal), the Scotch, the Second and Westminster Presbyterian; Citadel Square (Baptist) and First (Baptist); Unitarian; Bethel and Trinity (Methodist); the Hasell Street Synagogue (Hebrew); Saint Matthew’s (Lutheran); Saint Mary’s (Catholic).

Of the charitable organizations and institutions, the most important are the Orphan House, founded 1792, the oldest of its kind in the United States; the Euston Home for the Aged; Home for Mothers, Widows and Daughters of Confederate Soldiers; the Roper Hospital; the almshouse; the Old Folks’ Home for Aged Colored People; the Shirras Dispensary. Among charitable societies are Associated Charities; Ladies’ Benevolent Society, organized 1813; Ladies’ Fuel Society; Saint Andrew’s Society, founded by Scotchmen in 1696; the oldest society in the city; Hebrew Benevolent Society, and the South Carolina Society, founded by Huguenots in 1736, renamed
from the Two-Bit Club, so called from the sum contributed by each member at each meeting for the relief of their own indigent.

Charleston's Young Men's Christian Association will probably under construction.

Banks.—In Charleston there are 19 national savings and State banks, with aggregate capital and surplus of $5,077,899, resources of nearly $46,367,069, and deposits of $31,002,632. The city's annual bank clearings are more than $175,000,000. Charleston also has in active operation building and loan associations with aggregate capital amounting to between $2,000,000 and $3,000,000.

Government and Finances.—The government is, by the charter of 1836; a four-years' mayor and a council elected half by wards and half at large. The administrative boards and officials are partly appointive by the mayor and partly elective by the council. The city expended $600,000 in repairs and improvements in 1873, of which $240,000 were for schools and charities, $250,000 for police and $50,000 for the fire department. The net debt in 1910 was $4,086,500; the assessed valuation of all taxable property, $18,624,978, of which $12,400,000 is real estate; the city tax rate is 27c. per $100, besides a school tax of 1c. and a State and county tax of 10c. 67c.

Population.—In 1790, the first census, 16,359; 1800, 18,924; 1810, 24,711; 1820, 24,780; 1830, 30,280; 1840, 39,261; 1850, 42,985; 1860, 40,522; 1870, 48,956; 1880, 40,984; 1890, 54,955; 1900, 55,807; 1910, 58,833; 1916, 72,000; 1918, 81,807.

History.—The first settlement in South Carolina was made at Port Royal by the French in 1652; it was not successful, but they never forgot the experiment or their favor for the region. In 1670 an English colony under Gov. William Sayle made for Port Royal also; but on the advice of the cacique of Kiawah, (1673), Fenwick Island, at Albemarle Point, on the west bank of the Kiawah, three miles from the present site,—fortunately, as the colony Lord Cardross planted at Port Royal was exterminated by the Spaniards in 1690. The settlement was named Charles Town after Charles II. Within two years the settlers had discovered that Oyster Point, the end of the Charleston peninsula, was a better site, and within 10 years later had become the main settlement and the offices were removed there. The first village was on the Cooper entirely, as the main business still is. The commerce even at this early date was lively, 16 vessels sometimes discharging at once. In 1685-86 a colony of Huguenot refugees settled there and built a church; this strain has deeply molded Charleston and South Carolina, and its fiery zeal in heading every political movement is perhaps due to a quick French blood. In 1704 there were five churches: Saint Paul's, 1704, the first Baptist, a Presbyterian and Congregational meeting house and a Quaker one. In August 1706 an allied French and Spanish fleet attacked it, but were driven off by a small improvised fleet under Lieutenant-Governor Rhett; shortly afterward another French vessel, unaware of the others' defeat, came up and landed a party, which was routed with heavy loss, and the survivors, with the ship and the rest of the marines, captured. The city was this time desolated with yellow fever, but this militia action counts among the brilliant feats of the War of the Succession. In 1753 a colony of 1,200 deported Acadians settled there, but further reinforcing the British element. In 1773, Josiah Quincy of Boston writes in his diary that the town was "beautiful and in many respects magnificent"; and "far surpassed everything he ever saw or expected to see in America." It was at this time the third seaport in size in America, and in 1774 established a chamber of commerce. It was not only the first Southern city to join the Revolutionary movement, but was the prime agent in bringing about the first provincial congress 10 years before; it held the first convention in any colony in March 1776, and promulgated an independent constitution. On 28 June, the British fleet, under Sir Peter Parker, besieged the city, and was beaten off with terrible loss by the garrison behind an improvised palmetto fortification. In 1779 a second attack under Gen. Augustine Prevost was defeated. But on 12 May 1780 Sir Henry Clinton captured it and its garrison under General Lincoln, after a six weeks' siege; it was not recaptured by the Americans till 14 Dec. 1782. In 1783 it was incorporated as a city, and remained the capital of South Carolina till 1790. In 1784 it exported the first bale of cotton sent from the United States to Europe. In 1793 some 500 French refugees from the massacres of San Domingo settled there. It was the heart of the Nullification movement in 1832, as of all movements to oppose Federal authority first and last; and the Breckenridge convention of 1860 met here before adjourning to Baltimore. The convention which proclaimed the State's secession from the Union was held here 20 Dec. 1860. The Civil War was begun by its bombardment and capture of Fort Sumter on 12-13 April 1861; and from 7 April to 18 April 1863, the fort was incessantly besieged and steadily bombarded by the Union fleet, for the last 18 months it being only a heap of ruins, but impregnable. On 17 Feb. 1865, on the surrender of Columbia, Hardee evacuated the city and burned all public buildings, stores and shipping, and the next day Foster and the Union forces took possession. Despite its devastation and wreckages, it grew 21 per cent from 1860 to 1870, while it had fallen off in the previous decade—a curious phenomenon. In 1880, 31 August, the heaviest earthquake ever recorded in the United States destroyed several hundred buildings, and made three-fourths of the whole uninhabitable; killed scores of people and caused a property damage estimated at $8,000,000. On 2 Dec. 1901 the South Carolina Interstate and West Indian Exposition was inaugurated in the city. The year 1906 saw Charleston beginning the era of modern business and prosperity upon which she is now fully launched. After 10 years that have passed since then, the city has grown faster than in 25 or 30 years before. It has now assumed its position as the leading seaport city of the South.
CHARLESTON, S. C.—CHARLEVILLE

Atlantic and the most important military point between the Chesapeake and the mouth of the Rio Grande. Her people have been filled with a great faith in her future and are leaving no stone unturned to make their city as great in the America of the future as she was in that of the past.

For a compact sketch of its history, consult Yates Snowden in Powell's 'Historic Towns of the Southern States' and Mrs. Ravenel's, 'Charleston, the Place and the People'; in connection with State history, McCready's three volumes of South Carolina history, 1897-1901.

SYDNEY RITTENBERG,
Charleston Chamber of Commerce.

CHARLESTON, S. C., Attacks on. In May 1776 a British squadron under Peter Parker with troops under Sir Henry Clinton (q.v.) sailed to reduce South Carolina, on 1 June anchoring off Sullivan's Island (q.v.), near Charleston. The city had been put in a state of defense by Gens. John Armstrong, Charles Lee and Robert Howe (q.v.) and Fort Moultrie (q.v.) on Sullivan's Island had been built and manned. On 28 June the fleet opened fire and troops were sent to flank the fort but its defenders replied so vigorously that the fleet was compelled to retire and the troops were unable to reach the fort. A few days later the squadron set sail for New York. Consult Gordon, William, 'American Revolution' (Vol. II); Drayton, W. H., 'Memoirs of the Revolution' (Vol. II); Moultrie, William, 'Memoirs of the Revolution' (Vol. I); McCready, Edward, 'South Carolina in the Revolution' (p. 137 et seq.); Ramsay, David, 'History of the Revolution' (Vol. I); Sparks, Jared, 'Correspondence of the Revolution' (Vol. II, pp. 494-505); Wiley and Rines, 'The United States' (Vol. II, pp. 404-07). In December 1779 Sir Henry Clinton sailed from New York and on 11 Feb. 1780 landed about 30 miles south of Charleston. With reinforcements from New York and Savannah, he had about 13,000 troops, to oppose which Gen. Benjamin Lincoln (q.v.) had about 2,000 regulars and 1,000 militia, besides residents. On 9 April the fleet passed Fort Moultrie and Clinton established his batteries before the city, dispatching small expeditions to cut off communication with the interior. On 21 April Lincoln offered to capitulate, but Clinton rejected his terms, on 7 May captured Fort Moultrie, then threatened to assault the city and finally compelled Lincoln to capitulate, 12 May. More than 5,000 persons were captured besides 400 pieces of artillery, large quantities of stores, a number of small American frigates and two French vessels. This paved the way for Cornwallis' operations against Gates, culminating in the battle of Camden (q.v.). Consult McCready, 'South Carolina in the Revolution' (p. 427 et seq.); Sparks, 'Correspondence of the Revolution' (Vol. II, p. 401 et seq.); Ramsay, 'History of the Revolution' (Vol. II); Gordon, 'Narrative of the Revolution' (Vol. III); McCready, 'Field-Book of the Revolution' (Vol. II); Tarleton, Banastre, 'History of the Campaigns of 1780-81 in the Southern Provinces of North America'; Stedman, Charles, 'American War' (Vol. II); Moultrie, 'Memoirs' (Vol. II); Wiley and Rines, 'The United States' (Vol. III, pp. 187-92).

CHARLESTON, W. Va., city, capital of the State and county-seat of Kanawha County, at the junction of the Kanawha and Elk rivers, on the Chesapeake and Ohio, the Ohio Central, the Kanawha and Michigan and the Charleston, C. and Sutton railroads, 130 miles south by west of Wheeling. It is an important commercial, lumber and coal-mining centre, with steamier communications with all Ohio and Mississippi River ports. In 1910 it contained 63 manufacturing establishments, valued at $2,824,882. It has extensive salt springs, State house, custom house, hospital and opera-house, three national banks and several daily and weekly newspapers. Pop. 22,990.

CHARLESTOWN, Mass., since 1874 a part of the municipality of Boston, previously a separate city and seaport. One of the chief navy yards in the United States, occupying an area of about 100 acres, is in the southeast part of Charlestown. It was settled as early as 1629, and in 1634 became a town, its original territory being considerably larger than at present, having been divided up to form the towns of Woburn, Malden, Stoneham, Burlington and Somerville, and parts of Medford, Cambridge, Arlington and Reading. It was the scene of stirring events in the Revolutionary War. The battle of Bunker Hill was fought here 17 June 1775, when the British set fire to the town, destroying 320 buildings, valued at $255,000. The battle is commemorated by a monument. Charlestown was the home of John Harvard, the earliest benefactor of Harvard University, and the birthplace of Samuel F. B. Morse, the inventor of the electric telegraph. It had a population of 23,373 at the time of its annexation to Boston. Consult Sawyer, 'Old Charlestown' (1902).

CHARLESTOWN, South Africa, a town of the extreme north of Natal, on the railway from Durban to Johannesburg. It stands at a height of over 5,300 feet. Majuba Hill is four miles distant.

CHARLET, shär-lâ, Nicolas Toussaint, French painter and engraver: b. Paris, 20 Dec. 1792; d. Paris, 29 Oct. 1845. He held a clerkship under the Empire, but lost it at the Restoration (1815), and afterward devoted himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. He was especially successful in his sketches of children and military incidents. His drawings numbered about 2,000. His pictures in oil include 'Episode in the Retreat from Russia' (Lyons) and 'Wounded Soldiers Halting in a Rain' (Valenciennes). Of special importance are his illustrations of 'Napoleon's Diary at Saint Helena.' Consult his biography by Lacombe (Paris 1856); Dayot (Paris 1893); Dayot, 'Les peintres militaires Charlet et Raffet' (ib.).

CHARLEVILLE, shâr-le-vêl, France, town in the department of Ardennes, on the left bank of the Meuse, opposite Rezin, with which it communicates by a suspension bridge. It is regularly built, has straight, wide and clean streets, and a public square and fountain, surrounded by arcades, from which the four principal streets diverge. It manufactures hard-
ware, leather, sugar, brushes and beer; and the Meuse affords facilities for considerable trade in metals, coal, iron, slate, wine and nails. It was the medieval Arca Remorum and Carolopolis, and an important military station until the destruction of its fortifications in 1687.

CHARLEVOIX, shahr-le-vee, Pierre Francois Xavier de, French Jesuit traveler: b. Saint Quentin, 29 Oct. 1682; d. La Fleche, 1 Feb. 1761. He became a member of the Society of Jesus in 1657 and taught in Quebec from 1705 to 1709. After a brief return to France he was again sent to America by the Duke of Orleans. The object of this journey was the discovery of the "Western Sea" then supposed to be west of the Mississippi. He voyaged down the Mississippi to New Orleans. His chief title to fame rests on his "Histoire et description generale de la Nouvelle France avec le journal historique d'un voyage fait dans l'Amérique septentrionale" (1744; Eng. trans. by Trunk (1856-72). His other works include "Histoire et description generale du Japon" (1715); "Vie de la mere Marie de l'Incarnation" (1734); "Histoire de l'ile espagnole, ou de Saint Domingue" (1730); and "Histoire du Paraguay," (1756; Eng. trans. 1769).

CHARLEVOIX, shahr-le-vock, Mich., city, and county-seat of Charlevoix County, 210 miles northeast of Grand Rapids, on the Pine River and the Pere Marquette Railroad. It has manufactures of cement, lime, lumber and stone, and a Carnegie library. It has extensive fishing and lumbering interests and is the seat of a branch station of the United States Fish Hatchery. The city is a favorite summer resort and owns the electric-lighting and water plants. It was chartered as a city in 1905. Pop. 2,420.

CHARLOCK. See MUSTARD.

CHARLOTTE, Mich., city and county-seat of Eaton County, 15 miles southwest of Lansing, on the Michigan Central and the Grand Trunk railroads. It was incorporated in 1835, was first incorporated in 1863 as a village, and as a city in 1871. It has a Carnegie library and manufactory of furniture, automobiles, bridges and athletic equipment. It contains also grain elevators and grain warehouses. The city is a municipal, county and state office and courthouse, the assay office, city hall, county courthouse, the M. C. A. and the Y. W. C. A. buildings, the Auditorium, several fine business blocks and numerous hotels. Nearly all the leading religions are represented, and there are many handsome church edifices. The charitable institutions include Saint Peter's Home and Hospital, a hospital for colored people, Thompson Orphanage, Presbyterian Home for Aged and Helpless Women, the Presbyterian Hospital, Alexander Rescue Home for Children, Negro Orphanage, Crittenton Home, Mercy Hospital (Catholic), and the Country Home. Beside several public and private schools there are Elizabeth College and Conservatory of Music, Presbyterian College, Saint Mary's Seminary conducted by the Sisters of Mercy, North Carolina Medical College and Biddle University for colored students. There is also a Carnegie library. Charlotte is in a fertile agricultural and an extensive cotton growing region, the trade center for Mecklenburg and surrounding counties, and is also the center of the southern cotton mill industry, having 23 mills, operating 191,206 spindles and 4,326 looms. Within a radius of 100 miles are over 400 mills operating 5,000,000 spindles, 125,000 looms and 3,000 knitting machines. The electric plants in the vicinity supply light and power for many surrounding cities and towns. There are several gold mines nearby. Manufactures include cotton-milling machinery, cotton-seed oil and by-products, various kinds of machinery, agricultural implements, fertilizers, pipe, hardware, brick, saddlery and harness, belting, clothing, boots and shoes, drugs, flour, cement, building materials, scales, caskets and cases, etc.

The United States census of manufactures for 1914 recorded 106 industrial establishments of factory grade, employing 4,279 persons, of whom 3,800 were wage earners, receiving annually $1,477,000 in wages. The capital invested aggregated $11,808,000, and the year's output was valued at $10,893,000 of this, $3,367,000 was the value added by manufacture.

There are several daily, weekly and monthly publications. There are four national and savings banks, two trust companies and three building and loan associations with combined capitalization of $4,632,590 and deposits of $5,263,279. The taxable valuation is about $12,000,000. The city is divided into 11 wards. The government under the 1907 charter is vested in a mayor and a board of aldermen of 21 members (elected for two years) and minor city officials. The waterworks is owned and operated by the municipality and there is a paid fire department. Charlotte was settled about 1750, was incorporated in 1768 and became the county-seat in 1774. It received its city charter in 1856 and its present charter in 1907. The Mecklenburg Declaration of Independence was signed in the city in May 1775. The signers are commemorated by a monument. During the Revolution several bloody battles were fought in and around Charlotte. In September 1780, Lord Cornwallis entered Charlotte, and occupied it for several days. He referred to it as a "hornet's nest," and this has since been adopted as the city's emblem. Later in the year General Gates made his headquarters here. The city was the last meeting place of the full Confederate Cabinet. (See MECKLENBURG County). Pop. 38,000.

CHARLOTTE, shahr-leht-en-boorg, Prussia, residential suburb adjoining Berlin on the west, and now practically forming part of it, on the banks of the river Spree. It is connected with Berlin by street railway, by the Stadtbahn and the Voltastrasse (main road). It contains a palace built for Sophia Charlotte, the first queen of Prussia, which was begun at the end of the 17th century. In the garden is the handsome Doric mausoleum, erected in 1810 by Gente, containing the tombs
CHARLOTTESVILLE—CHARMES

of Frederick William III and Queen Louisa, and Emperor William I and Empress Augusta. The town was founded soon after. The town contains various important educational and other institutions, including a school of art, music, and engineering, and a technical high school, royal academy of music, royal academy of art, physical-technical institute and a military preparatory school. The technical academy is a spacious and noteworthy building, and contains a valuable architectural museum. A splendid municipal opera-house was opened in 1912. The manufacturing interests are important; chief among them is a porcelain factory, founded in 1761. There are also iron foundries and manufactures of machinery, glass, pottery, electrical apparatus, dyes, wagons, asphalt, woodworking machinery, beer, paper, leather and chemicals. Pop. 305,181.

CHARLOTTESVILLE, Va., county-seat of Albemarle County, on the Rivanna River, and on the Chesapeake and Ohio and the Southern railroads, 96 miles southwest of Washington. It is the seat of the University of Virginia, founded by Thomas Jefferson, and of Saint Anne’s School for Girls, Jefferson School, Miller’s Manual Training School and the University Summer School. It contains also two hospitals and two sanatoriums. Monticello, Jefferson’s home, is but three miles distant, to the southeast. The city has woolen, flour, silk and planing mills, tan-bark, locust-pin and cigar factories, wine presses, etc., and is in a rich agricultural and fruit-growing region. It is a popular summer resort; has electric lights and street railways, a national bank and several daily and weekly newspapers. Settled as early as 1744, Charlottesville was chartered as a city in 1885. The government is administered by a city manager elected by the city council. The waterworks and gas plant are owned and operated by the municipality. Pop. 6,765.

CHARLOTTETOWN, Prince Edward Island, Canada, capital city of the province; in Queen’s County at the head of Hillsborough Bay and at the influence of three large tidal rivers, on the Prince E. I. Railway. Its fine harbor accommodates vessels of the greatest draught, and it has a large export trade. The country in the neighborhood is very fertile and the horses of the district have a wide reputation. The fisheries are extensive and important; oysters and lobsters are plentiful, and are canned and shipped in large quantities. Charlottetown has iron foundries, woolen mills, railway workshops, packing houses, sash factory, starch factory, etc. The streets are wide and the town well built and lighted by gas and electricity. It has good water and sewerage systems. It has fine public buildings. It has excellent public and normal schools, a business college, and is the seat of Prince of Wales College, Saint Dunstan’s College (Roman Catholic) and a Methodist college. It is the seat of a United States consulate and the see of a Roman Catholic bishopric. Charlottetown was founded about 1750, by the French, and was called Port la Joie. It came under English rule in 1763 by the cession of Canada. In 1775 it was raided by American privateers, but the prisoners were returned and the property of the people restored by order of General Washington. The first conference toward a federation of the Canadian provinces was held in Charlo
tetown in 1864. Pop. 11,198.

CHARLTON, John, Canadian statesman: b. near Caledonia, N. Y., 1827; d. 1910. He was educated at the Springfield Academy, went to Ontario in 1849. He was first a farmer and merchant and acquired a fortune in the lumber business. In 1872 he was elected to the House of Commons as a Liberal. He attracted attention through his knowledge of trade and tariff questions and advocated government intervention in private industry. He supported the Conservative premier during the crisis of the Riel rebellion in 1885. He secured the passage of various laws for the protection of women and girls and was an advocate of reciprocity with the United States.

CHARM, anything believed to possess some occult or supernatural power, such as an amulet, spell, etc., but properly applied to spells couched in formulas of words or verse.

Among celebrated charms the Danish Danebrog, or national banner, is the most prominent. This banner was said to have been woven in a day and a night by three daughters of a celebrated Norse chief, of the race of Ynglings said to be descended from the god Odin. These girls were ordered by their father to work in the temple of the gods, giants, dwarfs and norns, and in the center of the banner they placed a raven, the bird of Odin, wonderfully lifelike and realistic. The superstition was that the result of a battle was foretold by this raven, which if victory was to fall to the possessors of the banner, held his head and bill in an upright position. By observing this banner the Danes in three years’ time had won 27 important battles, going into action only when the raven looked skyward. If the bird looked droopy and held its head low, they remained in camp, or, if in action, and the attitude of the raven suddenly changed, they withdrew from the field. Alfred, the king of the English Saxons, noting the enthusiasm which this banner inspired in the Danes, determined to capture it, and succeeded after a savage battle in which the Danes fought desperately for three hours. When, however, it fell into the hands of the Saxons, and the head and wings of the raven drooped, there was a general rout. The Danes were moved by courage and bravery so long as superstition fanned the fire of faith in their hearts, but they were arrant cowards the minute they realized that their idol was powerless to protect them. Another curious charm is to be seen in the National Museum at Washington. This is a necklace of human fingers which was captured from the Sioux Indians in 1876, the loss of which brought about the subjection of the Indians. Consult Grendon, The Anglo-Saxon Charms? (in Journal of American Folk-Lore, Vol. XXII, Boston 1909).

CHARMES, shäm, Francis, French editor: b. Aurillac 1848. He was educated at the College of Aurillac and at the lycées of Clermont-Ferrand and Poitiers. In 1872-80 and 1889-1907 he was editor of the L’Instruction publique. In 1879-83 he was editor of the Revue des Deux Mondes. He also held various public offices, principally in the Department of Foreign Affairs, was deputy for Contal in 1881-85 and 1889-98 and senator in 1900. He was
elected to the Academy in 1908. He published "Études historiques et diplomatiques" (1892) and numerous literary and political articles in his editorial capacity.

CHARMIAIN, kär-ml-an, or CHARMIAN, an attendant on Cleopatra in Shakespeare's "Antony and Cleopatra." After Cleopatra's suicide, Charmian also made away with herself.

CHARNAY, shär-nä, Claude Joseph Désiré, French traveler: b. Fleurieux, 2 May 1828. In 1857-61 he traveled in Mexico in behalf of the French Ministry of Education; from 1863 to 1870 he went on a number of expeditions to North and South America, Australia and other countries. In 1880 he conducted an expedition to the ruined cities of Mexico, the expense of which was borne by Pierre Lorillard; and in 1880 again visited Yucatan. He has written "Le Mexique, souvenirs et impressions de voyage"; "Les anciennes villes du nouveau monde" (trans. into English 1888); "Cités et ruines américaines" (1863); "A travers les forêts vierges" (1890); and "Histoire de l'origine des Indiens qui habitaient la nouvelle Espagne selon leurs traditions" (1903).

CHARNEL-HOUSE, a chamber or building under or near churches, where the bones of the dead are deposited. In England the crypts of some churches were formerly used as charnel-houses.

CHARNWOOD FOREST, a forest in Leicestershire, England. It is situated on a gradual rise, the highest point of which is Bardon Hill, 900 feet high.

CHARON, kär-rön, in mythology, the son of Erebus and Night. It was his office to ferry the dead in his crazy boat over the dark waters of the Acheron, over Cocytus resounding with the doleful lamentations of the dead, and finally over the Styx, dreaded even by the immortals. The shades were each obliged to pay him an obolus, which was put at time of burial, into the mouth of the deceased. Those who could not pay the fare had been so unfortunate as to find no grave in the upper world, were compelled to wander on the desolate banks of the Acheron for 100 years, after which Charon would carry them to their final resting-place. The traditions relative to Charon are posterior to the Homeric age, and it is thought that the myth was imported into Greece from Egypt. Charon is a familiar figure in literature after the 5th century B.C. His picture often appears on the Athenian white figured vases, or vases buried with the dead. These represent him as an old man with a long beard, wearing a seaman's garb,—the short tunic and pointed hat. He stands in a skiff which he propels with a single oar. The Etruscans, on the other hand, seem to have associated him with all the horrors of death and the place which was his boat's destination, and depicted him with bestial face, pointed ears, long tusks, carrying a large hammer or snakes. The modern Greeks preserve the tradition in the figure of Charon or Charontas, the black bird or winged horseman, who carries people to the after-world. Consult Waser, "Charon, Charun, Charos" (Berlin 1896).

CHAROST, shā-rōt, Armand Joseph de Bethune, DUKE OF: b. Versailles 1728; d. 27 Oct. 1800. He was a descendant of Sully, and distinguished himself on many occasions in the military service of his country. He was particularly active in the promotion of agriculture and public institutions. Long before the Revolution he abolished the feudal services on his estates, and wrote against feudal institutions. He established charitable institutions in sundry parishes, provided for the support and instruction of orphans, employed physicians and midwives, founded and liberally endowed a hospital. In a year of dearth he imported grain into Calais at his own expense. In the provincial assemblies he spoke against the corvées. In the assembly of the notables he declared himself for an equal distribution of the public burdens. During the Reign of Terror he retired to Meillant, where he was arrested, and did not obtain his liberty until after the 9th Thermidor. In the testimonies given in his behalf by the revolutionary committees he was called the father and benefactor of suffering humanity. He returned to Meillant, where he established an agricultural society. No sacrifice was too great for him, and his vast fortune was scarcely sufficient for his enterprises.

CHARPENTIER, shahr-pahn-te-ah, François Philippe, French engraver and medalist: b. Blois, 3 Oct. 1734; d. there, 22 July 1817. He studied copper engraving in Paris, and invented the aquatint or nitric acid process in engraving, and sold his secret to Count Caylus. Among his engravings by this process are "Perseus and Andromeda"; "The Beheading of John the Baptist"; "A Shepherd"; "The Italian Concert"; and "The Children's Bacchanal" after De Witt. On account of his invention he was given the position of royal mechanic; in this capacity he perfected the lamps of light houses and devised a number of improvements in cannon and other firearms.

CHARPENTIER, Gustave, French composer: b. Dieuze 1860. He was a pupil of Passard and Massenet at the Paris Conservatory; and won the grand prix de Rome in 1887. He has written a number of songs: "Napoléon," a symphony; "La vie du poète," a symphonic drama produced at the Grand Opera in 1892; and an opera, "Louise," the most notable of his works, produced at the Opéra Comique in 1898. For the two latter he wrote both words and music; "Louise" was produced also in Germany, England and the United States with great success. Three other operas are "Marie," "Orphée," "Tête rouge." Charpentier was selected to the First Academy of Fine Arts in 1912.

CHARPENTIER, Johann Friedrich Wilhelm Toussaint, German mining engineer: b. Dresden, 24 June 1738; d. Freiberg, 27 July 1805. He studied law and mathematics at Leipzig, then took a position as instructor in mathematics at the mining school of Freiberg, where he devoted himself to the study of mining methods. He investigated the improved process of amalgamation used in Hungary and introduced it in Germany, besides furthering a number of other improvements. He wrote "Mineralogisch Geographie des kursächsischen Landes" (1778); "Beobachtungen uber die Lagerstätten der Erze hauptsächlich aus den sächsischen Gebirgen" (1795); "Beiträge zur geognostischen Kenntnis des Riesengebirges schlesischen Anteils" (1804).
CHARPENTIER, Louis Eugène, French painter: b. Paris, 1 June 1811; d. 7 Dec. 1890. He was a pupil of Gérard and Coutlet, and was professor of design at the Lycée at Versailles for over 20 years. He was best known as a military painter. His first picture of importance was ‘Bivouac of the Cuirassiers’; among other of his reputation is the subject of the French Army on the Saint Bernard; ‘Boîte of Tcherniawa’; ‘Imperial Guard of Magenta’; ‘Retreat from Inkermann’; ‘Wellington in Spain’; ‘Charge of Cuirassiers at Waterloo.’

CHARPENTIER, Marc Antoine, French composer: b. Paris 1634; d. there March 1704. He went to Rome with the intention of studying painting, but turned his attention to music and became a pupil of Carissimi. Returning to Paris he held the position of chapel-master at several places, finally at the Sainte Chapelle. He was the most prominent rival of Lully. He wrote two operas, ‘Acis et Galatée’ (1678) and ‘Médée’ (1693). He wrote 18 oratorios. One of these ‘Le reniement de Saint Pierre,’ was re-produced at Paris in 1903. His other works include 8 masses, 30 psalms, 60 cantatas, numerous smaller sacred compositions and some instrumental pieces.

CHARPIE, shahr-p’ee. See LINT.

CHARQUI, shahr-k’ay, a term applied in Peru and adjoining countries to sun dried meat. In the days of the Incas of Peru held a grand hunt (Quichua chasu) once every four years in each royal district of the empire. Often as many as 30,000 Indians were employed to surround the hunting grounds and to drive the guanacos and other wild animals in upon one another, when they were captured or killed. The flesh of the slaughtered animals was sun dried and divided out among the Indians. The guanacos and other llamas were shorn of their wool which was also given to the Indians to be used for making garments, while the very fine wool of the vicuñas was reserved for the use of the royal family and the temples. From the word charqui comes the expression ‘jerked beef’.

CHARRAS, shahr-raz’, Jean Baptiste Adolphe, a French republican soldier and statesman: b. Pfalzburg, Lorraine, 7 June 1810; d. Basel, Switzerland, 23 Jan. 1865. He took part in the revolution of 1830, was promoted in 1833 to the rank of lieutenant, wrote a series of able articles in the National on military affairs, which gave umbrage to the government and caused him to be sent to Algeria; distinguished himself there on the battlefield as well as in the training of native troops and the colonization of the country. After the revolution of 1848 he became under-secretary of state and representative for the department of Puy de Dôme. He was one of the victims of the coup d’état of 2 Dec. 1851, and was transported to Belgium in 1852, but expelled from that country in November 1854, at the request of Louis Napoleon, whom Chartras had denounced on many occasions, but most effectively in a letter of which 50,000 copies were printed in Belgium alone. A remarkable work from his pen, ‘Histoire de la campagne de 1815,’ appeared in 1857; and then, ‘Waterloo’ (1853), and an incomplete ‘Histoire de la guerre de 1813’ (1860).

CHARRAS, chår’ras or chühr’ras, a resinous substance which exudes from the Indian hemp tree and is collected and exported, forming a considerable article of trade in Asia. See HEMP.

CHARRIÈRE, shahr-ay-arah, Madame St. Hyacinthe de, French authoress, well known under the assumed name of Anais de la Tour: b. Utrecht, 4 July 1740; d. 20 Dec. 1805. In early life she became a paragon of honor at the court of the Stadtholder. Her affection for her brother’s tutor, M. de Charrière, a worthy but decayed Swiss nobleman, led her to forego her rank and family, and shortly after her marriage she retired with him to a small property at Neuchâtel. Her lively temperament was ill suited for the monotony of a rustic life, and accordingly she turned her hand to literary recreation, and her reputation was formed by her first novel, ‘Les trois femmes’; and the famous dramas of ‘Le toi et le vous; ’ ‘L’Emigré; ’ ‘L’Enfant gâté; ’ and ‘Comment le nommé-t-on,’ ‘Lettres neuchâteloises’ (1784); ‘Calliste, ou lettres écrites de Lausanne’ (1788), her masterpiece. All these productions do not only display much wit, truth and powerful description, but also breathe a spirit of philosophy, and have a strong moral tendency. Most of them were translated into German by her husband, and her friendship with Madame de Staël and Benjamin Constant brought her into prominence in the literary world.

CHARRON, sha-rown, Pierre, French preacher and writer: b. Paris 1541; d. 16 Nov. 1603. He studied law at Orleans and Bourges, and under the protection of Queen Margaret. In 1588 he went to Paris with the view of fulfilling a vow he had made to enter the Carthusian order, but owing to his age the prior of the order refused him admission, and the Celestines also declining to receive him, he continued a secular priest. In 1589 he went to Bordeaux and became very intimate with Montaigne, whom he tried to imitate, though he failed to catch his ease of style, and original, piquant wit. His principal works are ‘Traité des trois vérités’; and ‘Traité de la sagesse.’ The Roman Catholic zeal of the former drew upon him the rebuke of Dupleix-Mornay; and the extreme liberalism of the latter exposed him to a share of the charge of atheism, the treatise being condemned both by Parliament and the University. Consult Leibescher, ‘Charron et sein Werk: De la sagesse’ (Leipzig 1890); and Vinet, ‘Moralistes des 16e et 17e siècles’ (1904).

CHART, a representation of a portion of the earth’s surface projected on a plane. The term is commonly restricted to those intended for navigators’ use, on which are usually the contours, outlines of coasts, islands, etc., are represented.
A globular chart is a chart constructed on globular projection. Mercator's chart is a chart on the projection of Mercator. A plane chart is a representation of some part of the supercriticals of the earth, in which the spherical form is disregarded, the meridians are drawn parallel to the bases of arcs of small circles of the earth, and the parallels of latitude and the meridians are drawn parallel to each other. A selenographical chart is a chart representing the surface of the moon; and a topographical chart is a chart of a particular place, such as a small part of the earth, as a town, a mountain, etc.

Charts are designed to assist the navigator and to subserve the interests of commerce. For purposes of navigation they may embrace large areas, like one of the great oceans or seas, delineating the conformation of the shores and outlying dangers, and perhaps indicating the principal currents and winds that may be utilized in determining the most advantageous routes between specified localities. Charts may also embrace much smaller areas, but on larger scales, containing the conformation of a small part of the earth, as a town, a mountain, etc.

The Coast and Geodetic Survey issues four series of charts on the Atlantic and Gulf coasts of the United States, and three series on the Pacific Coast, designed for the uses of the surveyors and engineers. These charts are intended to serve for offshore navigation, or between the principal headlands, as Cape Cod, Cape Hatteras, etc., and between distant harbors, as Boston, New York, and Savannah. They show only the outline of the continent, the seacoast lights and geographic information that will be useful for the purposes intended. The second series includes "general charts of the coast," also designed for purposes of navigation. They are on a scale three times as large as that of the first series, and extend the service to the coast of Maine, the Gulf of Maine, Cape Cod, Cape Hatteras, etc., and extend the service to the coast of Maine, Cape Cod, Cape Hatteras, etc., and extend the service to the coast of Maine, Cape Cod, Cape Hatteras, etc.

Nearly all civilized nations have published charts of their coasts in greater or less detail, and the principal maritime nations copy those issued by other nations, and thus maintain for the use of their own seamen charts of all parts of the world to which their commerce may extend. Great Britain maintains the most extensive establishment for the purpose, and issues the most complete series of charts; she has also made the most extensive surveys of unsettled coasts for cartographic purposes.

The United States Coast Survey, a vast undertaking, was begun in 1807, carried on intermittently till 1845, and since then more systematically, save during the Civil War, under Professor Bache, Professor Pierce and their successors. The coasts of the United States are surveyed and the charts produced by the Coast and Geodetic Survey, and are available to all seamen in the Gulf Stream (q.v.). Unsurveyed foreign coasts and the Great Lakes are surveyed by the Bureau of Navigation, the charts being produced by the Hydrographic Office of the Navy Department. This bureau also duplicates charts and plans issued by other nations. The Coast and Geodetic charts are sold at from 10 cents to $1 each, being the cost of printing and paper. Naval vessels are supplied free. The charts are obtainable at Coast and Geodetic Survey agencies at all seaports of the United States. They exhibit accurate and minute topography as far inland as will supply landmarks for the navigator or serve for purposes of defense; the shore line at high water, and sanding to mean low water; soundings, contours and material of bottom at different depths; bars, channels, sailing ranges and directions; the conformation of the coast; compass variation; rocks, reefs, bars, shoals, beacons, lighthouses, light vessels, navigable; detailed explanation of lighthouses and signal stations. They are carefully corrected for every substantial change in any of those features. They range in scale from 1:12,000 (30,401 inches to the nautical mile) to 1:48,000 (12,160 inches to the nautical mile). The Coast and Geodetic Survey issues four series of charts on the Atlantic and Gulf coasts of the United States, and three series on the Pacific Coast, designed for the uses of the surveyors and engineers. These charts are intended to serve for offshore navigation, or between the principal headlands, as Cape Cod, Cape Hatteras, etc., and between distant harbors, as Boston, New York, and Savannah. CHARTA, Magna. See MAGNA CHARTA.

CHARTER, a term originally used to indicate the rights and privileges granted by the French kings to various towns and communities. One of the bureaus of archives of France is the Trésor des Chartes. The old charte setting forth the rights granted to the Normans by Louis X (1314-15) is still preserved under the title Charte Normand aux Normands. The first such charter in France is known as the Grande Charte, or the Charter of King John (1257). At present by the Charte was meant the fundamental law of the French monarchy, as established on the restoration of Louis XVIII in 1814. As is well known, it was the violation of an article of the Charte by the ministers of Charles X that led to the revolution of 1830, the expulsion of that monarch from the throne and the accession of Louis Philippe, who, on 20 Aug. 1830, swore to a new charter, sensibly modifying that of 1814 in a liberal sense. After 18 years' sway, Louis Philippe was himself expelled from France, 24 Feb. 1848, and the Charte, which he called to support was canceled. Consult Floquet, 'Charte aux Normands, avec ses confirmations' (Caen 1788).

CHARTER, a document by which a superior power grants permanent or continuing rights and privileges to an inferior, either a person or persons, corporation or institution, colony, municipality, etc. Originally it had the broader sense, now obsolete, of a conveyance of land. The mediavel charters ranged from a grant of political rights by a sovereign to an entire people, as with the Great Charter of England or the Golden Bull of Hungary, or colonial instruments of government conferring the broadest rights of sovereignty — down to permissive acts for abbeys and colleges or trading companies, or confirmations of rights already given (called confirmatory charters). The first-named class in modern usage is called a constitution. Thus, the agreements by which recent monarchs have deprived themselves or been deprived of absolute power and shared it with the people, as with Austria in 1860, Japan in 1868, etc., are essentially the same as Magna Charta. Charters in present usage are restricted to municipalities, corporations and institutions.

The charters for the American colonies were usually distinguished from "patents" by granting specific privileges of jurisdiction and legislation, and in general the powers needed to establish and continue a self-regulating community, instead of mere general grants of land and rights of settlement; but the two were often loosely used as interchangeable. Thus, in the acknowledgment of receipt of their charter in 1662, the Connecticut officials acknowledged also the "old charter," meaning the Warwick Patent. Strictly, they were all patents, as granted by the king under letters patent; but in use, only the grants to individuals were commonly termed patents, the word charter being reserved for those to companies and colonies already established. Of these three species, the first includes the patents to Lord Baltimore (1632), to Maryland; to George of Maine in 1639, to the Duke of York (afterward James II) for New York in 1664 and to William Penn for Pennsylvania in 1681. The second comprises those to the Virginia Company in 1606, 1609 and 1612, the Plymouth and London companies in 1606, the Council for New England in 1620, the Massachusetts Bay Company in 1629, the proprietors of Carolina (1663) and Georgia (1732). It also has the two charters of Rhode Island (1643, confirmed 1663) and Connecticut (1662): instruments of such complete self-government that those States made no change at the Revolution, the former living under its 17th-century charter till 1818 and the latter till it was forced to change it by the Dorr rebellion in 1842. The legal nature and implications of these documents were keenly disputed in the age when their interpretation was vital, and have been argued with scarcely less heat for historical reasons since. According to the English view, they were concessions granted by the government for political reasons and revocable at its pleasure for the same reasons; the title to the lands as well as to the political privileges lay with the government, and its right to vacate either was limited only by policy; and charter governments had only such powers as were specifically given them in the charters. James II put some of these theories in practice in the union of New England in 1685 and others were acted upon generally. On the colonial view, the charter was a compact between the government and the colonies, in consideration of the latter's having cleared and possessed the territory and annexed it to the Crown; and that the Crown possessed only political rights there, the land title being derived from purchase and occupation and their own courage and labor. As to the powers of the charter governments, Judge Story holds that they possessed full sovereignty and power of legislation and taxation, subject only to not contradicting the laws of the mother country. The truth is that neither side had any very definite views on the matter at the outset and both developed antagonistic ones under the stress of interest.

In the United States, charters (special or general) are granted by acts of the several State legislatures or by the national government. Thus, the National Banking Act, and the general railroad acts of most States prescribe the conditions under which corporations of those classes may organize without special permission and their articles of association are a charter. The act by which a county or township is set off as an administrative division of a State is not termed a charter. On the other hand, that by which a municipality is organized, as a city or borough, is always so termed; but it has the vital distinction from a private charter that it is not a contract; the municipality has no vested rights, being only a governmental agency and convenience; and the charter can be altered or repealed at any time by the legislature. A private charter, on the other hand, is a contract which cannot be repealed or modified by the public power unless such liberty was expressly reserved in the charter itself. (See CORPORATIONS LEGAL; DARTMOUTH COLLEGE CASE). Consult Cooley, 'General Principles of Constitutional Law in

CHARTER OAK, a tree nearly seven feet in diameter, formerly in Hartford, Conn., it blew down in a storm, 21 Aug. 1856 when its age was computed to be nearly a thousand years. A section of its trunk was preserved in the rooms of the Connecticut Historical Society; the remainder—currently believed to rival in miraculous powers of reproduction the loaves and fishes or the Mayflower furniture—was kept or sold for small souvenirs. It is thus generated from a tradition, first accredited to it in 1789, that in a hollow of it was concealed the charter of Connecticut rescued from Andros in 1687; earlier ones specify elm, others the houses of different persons. This is of little moment; but the adventures of the charter form a mystery which the latest investigations, instead of illuminating, render utterly insoluble. The contradiction of unquestionable facts is always the mystery without these is sufficiently peculiar. James II, wishing to make Connecticut a part of his consolidated New England under Andros (q.v.), found its charter in the way; and as the colony declined to surrender it he brought writs of quo warranto to vacate it, the last of which was returnable in February 1687. To delay or avoid voluntary surrender, yet escape forfeiture and entire outlawry of rights, they replied that they would much rather stay as they were, but that they could not, preferred a provincial union under Andros over annexation to any other province. The council chose to consider this a formal waiver of charter rights, and dropped proceedings under the writ; and on 31 Oct. 1687 Andros rode over from Norwich to Hartford, under orders to assume the government. Calling the governor and council together, he demanded surrender of the charter according to their dutiful assurances. The meeting was secret; what happened we know only from tradition and the brief account of a later intimate of the actors. The colonial officials protested and debated till after dark; that this was prearranged is not only morally certain in itself, but Trumbull's account of a long speech by the governor, to the conscience peculiarly deepens the certainty. Candles were lighted; the charter was (or the charter was) last brought in and laid on the table; suddenly some officious candle-smuffers put out all the lights, and when they were relighted no charter was to be seen. But if Andros had no longer a charter to suppress, equally the colony had no longer one to appeal to; the old government was just as effectually extinguished as if they had let him have the paper; they cannot have foreseen a revolution in England, and it is not evident what they intended to do with it. Most likely, from their previous actions, it was merely to save their face* from the humiliation of a formal surrender of the factors. No charge made against the officials, no appearance of ill-will to them, no report of the affair to England, seemingly no disclosure of it to the train of Massachusetts magnates who accompanied him (and may or may not have attended the meeting), no help by the missing document, and give no hint what Andros said or if he said anything, or whether he seemed puzzled or offended, or any of the immediate sequel of the business. The governor (Treat) had called a meeting of the General Court, which according to the situation and the annexation; the secretary inscribed it on the colonial records and wrote "Finis" on them; and the next day Andros publicly proclaimed his commission. When James was overthrown and Andros with him, the colony resumed its government, appealed to its charter brought from hiding, and the English authorities admitted without trial that it had never been vacated. But that was chance and not foresight. This, however, is only the beginning of mystery. The charter, obtained by Gov. John Winthrop from Charles II's council in April 1662, was engrossed in duplicate, and the official fees are entered on the English records. No other copies were made, nor could have been unless both the other were spoilt, any neither was lost. The first copy was sent to the colonial government, which acknowledged receipt of "the charter, the duplicate and the old copy of the former charter" (that is, the Warwick Patent). Duplicate of what? It is usually assumed to mean of the charter; but the facts to be cited prove that it was of the patent. Winthrop was to bring over the duplicate of the charter with him and a legislative committee was appointed to receive it from him. That he did not is conclusively shown by a letter from the colony to its agent, William Whiting, in 1686, instructing him to obtain it from James Porter in London, with whom Winthrop had left it, and use it in defending the colony's rights before the council. That Winthrop may have taken it across once more on official business, and left it there, is barred out by the fact that he never visited England again. That Whiting sent it back within the next year is equally negatived by the fact that he continued to need it there and the colony did not need it at all, that he would not have sent it without orders and they gave him no such orders, and that in his correspondence there is not letter of transmittal. Furthermore, a legislative committee of 1789 made acknowledgment to Joseph Wadsworth for safely preserving the "Duplicate Charter" when "our constitution was struck at." It is absurd to suppose they made him the grant for preserving a second copy when they had one safe already. Obviously, the one he preserved was the only one they had. On the other hand, Roger Wolcott, the first narrator (1759), distinctly says that "the charters were set on the table,* and that when the candles were relighted the charters were gone. Still more specifically, President Stiles of Yale writes in his 'Itinerary,' as from Wolcott, that Nathan Stanley took one copy and Governor Talcott's father the other. Wolcott was only eight at the time; but by 1714 he was in the council, in 1715 was on the very committee which made the grant to Wadsworth, and was certainly intimate with many who were present at the scene and probably helped arrange it. We have, then, the certain fact that there was but one copy of the charter in America in 1687, set against the positive assertion of one who must have known,
that two were abstracted. Still a third mystery is, that Wadsworth was not present at the meeting and voted not guilty; that Wolcott, who publicly honored Wadsworth as the savior of the charter, privately gives all the credit to others and does not even mention Wadsworth, and that the names he cites are really those of members present; and that if one of the actual perpetrators pass it to Wadsworth waiting outside, he and not they should receive the public acknowledgment. The writer can guess at solutions to these problems, but all solutions are guesses alike.

ALBERT C. BATES,

Librarian Connecticut Historical Society.

CHARTER-PARTY, a contract executed by the freighter and the master or owner of a ship, containing the terms upon which the ship is hired to freight. The masters and owners usually bind themselves, the ship, tackle and furniture, that the goods freighted shall be delivered (dangers of the sea excepted) well to the place of discharge; and they also covenant to equip the ship complete and adequate to the voyage. The charterer is bound to furnish the cargo at the place of lading and to take delivery at the port of discharge within specified periods called lay days; and penalties are annexed to enforce the reciprocal covenants. Consult Scrutton, 'Contracts of Affrightment as Expressed in Charter Parties and Bills of Lading' (4th ed., London 1899).

CHARTERHOUSE, a celebrated school and charitable foundation in London, England. In 1370 Sir Walter Manny and Northburgh, bishop of London, built and endowed it as a priory for Carthusian monks (hence the name, a corruption of Chartreuse, the celebrated Carthusian convent). After the dissolution of the monasteries it passed through several hands till it came into the possession of Thomas Sutton, who, in 1611, converted it into a hospital, richly endowed, consisting of a master, preacher, head schoolmaster, with 40 boys and 80 indigent gentlemen, together with a physician and other officers and servants of the house. Each boy is educated at a certain expense and each pensioner receives food, clothing, lodging and an allowance of about $150 a year. The pensioners, poor brethren, must be over 50 years of age and members of the Church of England. The Charterhouse School was removed to new buildings near Godalming, in Surrey, in 1872, the premises sold to the Merchant Taylors' School, a fine range of buildings being erected on the site. The non-academic department of the Charterhouse still remains in the old buildings. The special garb of the scholars has been discarded, and the Charterhouse is one of the great public schools of England. Several of the famous men who have received their education at the Charterhouse are Isaac Barrow, Addison, Steele, John Wesley, Blackstone, Grote, Thrilwall, Havelock John Leech and Thackeray. Charterhouse, and one of its poor brethren, Colonel Newcome, has been immortalized by Thackeray in 'The Newcomes.' Consult Brown, Haig, 'The Charterhouse Past and Present' (London 1879); Taylor, W. F., 'The Charterhouse of London' (London 1912).

CHARTERIS, Archibald Hamilton, Scottish clergyman and educator: b. Wamphray 1835; d. Edinburgh, 25 April 1908. He received his education at Edinburgh, Tubingen and Bonn, and in 1863 became pastor of the Park Parish, Glasgow. From 1888 to 1898 he was professor of Biblical criticism at Edinburgh, and in the latter year became professor emeritus. In 1892 he was a founder of the Assembly of the Church of Scotland. He was appointed chaplain in ordinary to the king in 1901. He published 'Life of James Robertson' (1863); 'Canoncity' (1881), 'New Testament Christian Scriptures' (1887) and 'The Church of Christ' (1905).

CHARTERS TOWERS, Australia, a mining township of Queensland, on the northern spurs of the Towers Mountain, 520 miles northwest of Brisbane. The place was first settled in 1871-72, when gold was discovered there. In 1877 it was incorporated as a town. Now it has railway connection with the coast by means of a railroad to Townsville. Pop. 15,037.

CHARTIER, shär-ťār, Alain, French poet and moralist: b. Bayeux about 1392; d. about 1440. He was educated at the University of Paris, and was appointed by Charles VI clerk, notary and secretary of the royal household—posts which he held under Charles VII. His contemporaries considered him the father of French eloquence. Although far from handsome it is said that he received one day while asleep a kiss from Margaret of Scotland, wife of the Dauphin, who explained her conduct to the surprised bystanders by saying that it was not the man she kissed, but the mouth whence flowed so many golden words. His poems are often graceful and nervous, and his vigorous prose contains many fine thoughts and prudent maxims. The subjects of his poems are mainly lovers' quarrels. However his 'Livre des quatre dames' and 'Le quadrilogue invictus' (1422) are filled with fine patriotic ardor. His works were edited by A. Duchesne (Paris 1617). Consult Delaunay, 'Étude sur Alain Chartier' with extracts from his writings; and Joret-Descariès, 'Alain Chartier' (1897).

CHARTISM, a working-class movement in England, 1838-48, the primary purpose of which was the attainment of certain political reforms. The Reform Bill of 1832 had failed to bring the expected advantages to the working class; the new poor law of 1835 was unpopular, and a period of general commercial depression and a succession of bad harvests had increased the sufferings of the people. The discontent resulting found definite expression in the 'Charters' or 'People's Charter,' prepared in 1838 by a committee of six members of Parliament and six workmen. It comprised six heads: (1) Universal suffrage, or a right of voting conferred on every male of 21 years of age, of sound mind, unconvicted of crime, and a native of the United Kingdom, as well as to every foreigner possessing the same qualifications, who had been resident in the United Kingdom for more than two years; (2) equal electoral districts; (3) vote by ballot; (4) annual Parliaments; (5) no other qualification to be necessary for members of Parliament than the choice of the electors; (6) members of Parliament to be paid for their services. (Of the above six
demands, Nos. 3, 5 and 6 are now embodied by statute). At first a portion of the middle class supported the movement, but they became estranged, and the Chartists became more and more a distinctively working-class party. The movement was not purely political; it was part of a distinctively social nature—a "louse-and-fork question"—and aimed at the improvement of general social conditions. Stephens, one of the leaders, is quoted as saying: "Chartism is not a political movement where the main point is gaining the ballot...". The Charter means a good house, good food, prosperity, and shorter working hours. Immense meetings were held throughout the country, numbering sometimes upward of 200,000, and popular excitement was great. Physical force was advocated by some as the only effectual means for the masses to obtain their demands. An association called the National Convention was embodied, and commenced its sitting in Birmingham on 18 June 1837. In June of the same year a monster petition in favor of the charter, purporting to be signed by 1,280,000 persons, was presented to the House of Commons, which refused to take it into consideration. The feeling among the Chartists increased, and in November a riot took place at Newport, in which 10 persons were killed and great numbers wounded. The year 1842 was the time of the most excitement; great riots took place in the northern and midland districts of England, and these, though not directly caused by the Chartists, were more or less connected with the movement, and the party was blamed for them. In 1848 a great demonstration was planned in London, but the precautions taken by the government in enrolling special constables and making other preparations for defense frightened the leaders and the demonstration was shorn of its imposing nature. From that year dates the decline of the movement; the repeal of the Corn Laws—which the Chartists opposed as likely to benefit only the middle classes—and the great expansion of trade following on that measure reacted favorably on the condition of the workers and stilled social tumult.

CHARTRAN, Shahr-tran, Théobald, French painter: b. Besançon, 21 Jan. 1849; d. 16 July 1907. He studied under Cabanel, and obtained the grand prix de Rome in 1877. He painted mostly historical pictures or portraits; among his works are 'The Body of Monseigneur Darboy lying in state in the Palace of the Archbishop of Paris', 'Angelica and Roger'; 'Vision of Saint Francis of Assisi, museum, Carcassonne'; 'Capture of Rome by the Gauls'; and several portraits, of which the best are those of Mounet-Sully as Hamlet, Sadi Carnot and Leo XIII. Later he spent a few months of each year in New York city and numbered among his friends and patrons President McKinley, Admiral Dewey, Andrew Carnegie and Cardinal Gibbons. His "Signing of the Peace Protocol at Washington," an episode of the Spanish-American War, was presented to the United States government by Mr. H. C. Frick of Pittsburgh. Consult Martin Jules, "Nos peintres et sculpteurs" (Paris 1897).

CHARTRES, Shahr-trs, Robert Philippé Louis Eugène Ferdinand D'Orléans, Duc de, grandson of Louis Philippe: b. Paris, 9 Nov. 1840. When but two years old his father and six years later the Revolution drove him along with his family into exile. The young duke was brought up in England and joined the Union army in the first campaign of the American Civil War in 1862. He married, 11 June 1863, Françoise Marie Amelie d'Orléans, eldest daughter of the Prince de Joinville. After the revolution of 4 Sept. 1870 in France, he served for two years in General Chanzy's army under the pseudonym of "Robert le Fort," and before the close of the war had succeeded successively to the ranks of captain and chief of squadron. He became chief of squadron in the Chasseurs d'Afrique, under his own name, was appointed colonel in 1878, but in 1883 was suspended from the active service. In 1888 his name was stricken from the army list because excluding members of royal families from serving in the army or navy. He published 'Souveneris de voyages' (1869).

CHARTRES, Shahr-trs (anciently Autricum, Civitas Carnutum), France, capital of the department Eure-et-Loir, 49 miles southwest of Paris, situated on the slope of a hill, at the foot of which flows the Eure, and partly enclosed by walls and ditches, surrounded by ramparts planted with trees, which form an agreeable promenade. Most of the houses are built of wood and plaster and have their gables toward the street. The streets of the lower town are narrow and crooked, and so steep in some parts as to be inaccessible to carriages. There are several public squares, one of which is of great extent. The only public buildings of note are the cathedral, the church of Saint Paul, contiguous to a huge barrack, once a Benedictine abbey, and the obelisk to the memory of General Marceau. The cathedral, one of the most magnificent in Europe, is rendered conspicuous by its two spires, one 665 feet high, surmounting the hill on which the city stands. It has 130 windows filled with painted glass of admirable workmanship; and in its chair Henry IV was crowned in 1594. It is also famous for its sculptures. Chartres is the seat of a bishopric, communal college, seminary and agricultural society, and has two hospitals, a cabinet of natural history, botanical garden and a public library of 127,409 printed volumes. Toward the end of the 11th century it was fortified, and in 1145 Saint Bernard preached, in its cathedral, the second crusade. Chartres has manufactures of woolens, hosiery and leather and is the great cattle and grain market of the fertile plain of Beauce and the department. It has a chamber of commerce and a branch of the Bank of France. It was taken by the English in 1417 and recovered in 1432. In 1870 it was occupied by the Germans and formed their base of operations against the army of the Loire. Pop. (1911) 24,103. Consult Pierval, 'Chartres, sa cathédrale et ses monuments' (1896); Adams, 'Mont Saint Michel and Chartres' (Boston 1913).
CHARTREUSE, shär-trəz, the French term for a Carthusian monastery, corresponding to the Italian Certosa. The order of the Carthusians (q.v.) was most rigorous in its rules, though each monk was allowed a decent cell and a garden of his own, so that the monasteries had often architectural charm. The famous monastery called La Grande Chartreuse is the original and supreme monastery of the order, and exists in the mountains not far from Grenoble in eastern France. Of the monastic buildings still existing, none is architecturally noble, and nearly all are of date later than the middle of the 17th century. Therefore it does not rank with the great showplaces of monasticism for the grandeur and splendor of its buildings, but has ever attracted travelers, curious or serious, as being the home of the most authentic exemplars of primitive monasticism in its rigor. At the Revolution the whole establishment was confiscated, the monks driven out and secularized or banished. But in 1816 the order of Carthusians was permitted again to possess the buildings and the tenants of the state at a nominal rent. They were again expelled from their ancient home by the government of the French republic in 1823 under the laws for suppression of religious houses. When the monks were this time dispossessed the entire rural population of the vicinity, who had all their lives experienced the large, wise beneficence of the monks in supporting the local hospitals, schools, churches and the like, would have defended their benefactors against the government if the government had not the Carthusians counseled patience and forbearance. Till this second ejection from their home the monks used to derive a revenue from the sale of certain medicinal agents prepared in their laboratories which enjoyed a high reputation; in particular the cordial liqueur Chartreuse. The other preparations were an elixir and a salve.

CHARTULARY, kär-tə-lār-ē, a collection of charters. When any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, it was customary for convenience and safety to have them classified and copied into a book or roll. Such book or roll has generally received the name of a Chartulary. Mabillon traces chartularies in France as far back as the 10th century, and some authorities say that chartularies were compiled even still earlier; but it was not till the 12th and 13th centuries that chartularies became common. They were kept by all kinds of religious and civil corporations, but also by private families. Many of them have been printed and their contents generally are of the greatest value in historical, archaeological and genealogical inquiries. The name is in Scotland applied to the record of feu-charters kept by the superior's law-agent. Copies of valuable historical documents, whose originals have been lost, are to be found in Chartularies. Some interesting English reprints are made in Grass, (Sources and Literature of English History) (London 1900).

CHARYBDIS. See Scylla and Charybdis.

CHASE, Frederic Henry, English Biblical scholar and Bishop of Chichester, b. 21 Oct. 1820. He was educated at Chist's College, Cambridge, and took orders in the English Church. He was lecturer in theology at Pembroke College 1881-90, and at Christ's College 1893-1901; principal of the Clergy Training School at Cambridge from 1887-91; Norrisian professor of divinity and president of Queen's College, 1901-05; and from the latter year bishop of Ely. He has published 'Chrysostom' (1887); 'The Lord's Prayer in the Early Church' (1891); 'Old Syriac Element in Codex Beza' (1895); 'Syro-Latin Text of the Gospel' (1897); 'Credibility of the Book of the Acts' (1901); 'Essays on the Gospels' (1905); 'Confirmation in the Apostolic Age' (1898-91).

CHASE, Frederick Lincoln, American astronomer: b. Boulder, Colo., 28 June 1865. He was graduated at the University of Colorado in 1886 and at Yale in 1891. From 1891 to 1911 he was assistant astronomer and in 1910-13 acting director of the Yale Observatory. He wrote 'Heliometer Triangulation of the Victoria Comparison Stars' in Annals of the Cape Observatory (1897); 'Triangulation of the Principal Stars of the Cluster in Coma Berenices' (1896); 'Investigations on 163 Stars mainly of Large Proper Motion' (1906); 'Parallax Investigations on 35 Selected Stars' (1910); 'Catalogue of Yale Parallax Results' (Vol. II, pt. 4, 1912), and miscellaneous papers in the Astronomical Journal.

CHASE, George, American lawyer: b. Portland, Me., 29 Dec. 1849. He was graduated valedictorian at Yale in 1870, and at Columbia Law School in 1873. He was assistant professor of municipal law at Columbia University 1874-78; professor of criminal law, torts and procedure 1880-91; member of the university council 1880-91. In 1891 the New York Law School was chartered through his efforts, and he was chosen its dean, a position he still holds. Publications: 'Chase's American Student's Blackstone' (4th ed., 1914); Chase's 'Stephen's Digest of the Law of Evidence' (2d ed., 1898); 'N. Y. Code of Civil Procedure' (12th ed., 1914); Chase's 'Cases on Torts' (2d ed., 1904); 'Chase's Pocket Code' (1911).

CHASE, Philander, American Protestant Episcopal bishop: b. Cornish, N. H., 14 Dec. 1773; d. Jubilee College, Ill., 2 Feb. 1852. He was graduated at Dartmouth College 1795, and was ordained priest by Bishop Provost 10 Nov. 1799. After missionary work in New York State and rectorieships at New Orleans, La., and Hartford, Conn., he set out as a missionary in districts west of the Alleghenies. In Ohio he organized various parishes, and in 1819 was consecrated the first bishop of Ohio. Between 1821 and 1831 he was for two years president of Cincinnati College, but chiefly engaged in perfecting plans for a theological seminary. He visited England, and through the influence of Lord Gambier and Lord Kenyon raised a large sum of money, $30,000, with which he founded the Theological Seminary and Kenyon College at Gambier, Ohio. In 1831 he resigned his bishopric and the presidency of the college and seminary, removed to Michigan 1832, was chosen bishop of Illinois 1835; again visited England and raised $10,000 with which he founded Jubilee College, Peoria County, Ill. Upon the death of Bishop Griswold in 1843, he was elected bishop of the diocese of New York, and installed in the Church. He wrote 'A Plea for the West' (1826); 'The Star in the West, or Kenyon
CHASE

College (1828); 'Defense of Kenyon College' (1831); 'A Plea for Jubilee' (1835); 'Reminiscences; An Autobiography' (1848).

CHASE, Pnum Earl, American scientist: b. Worcester, Mass. 18 Aug. 1820; d. Haverford, Pa., 17 Dec. 1886. He was graduated at Harvard, 1839; taught in Philadelphia and engaged in business for many years, but employed his leisure in physical and philological studies. In 1840 the Macellanic gold medal of the American Philosophical Society was awarded him for his 'Numerical Relations of Gravity and Magnetism.' The results of other mathematical and physical researches were published from time to time in the Proceedings of the American Philosophical Society, and brought him a wide reputation, both in the United States and abroad, as a man of unusual scientific powers and attainments. In 1871 he became a member of the faculty of Haverford College, Pa., and for a long time was professor of philosophy and logic. He published 'Elements of Meteorology' (1884).

CHASE, Salmon Portland, American jurist and statesman; b. Cornwall, N. H., 13 Jan. 1808; d. New York, 7 May 1873. He was the son ofIthamar and Janet Ralston Chase, the former of English and the latter of Scotch descent. After a preliminary education in schools at Keene, N. H., and Windsor, Vt., and under a tutor, he went to Ohio in 1820 under the care of his uncle, Philander Chase (q.v.), Episcopal bishop of Ohio, and attended the bishop's school at Worthington, near Columbus, doing farm work when not in the school room. He studied for a year at Cincinnati College but then returned to Keene, in 1824 entered Dartmouth College as a junior, teaching in country schools during the winter vacations, and graduated in 1826. He then went to Washington, D. C., for the next three years taught in a boys' school there, during which time he studied law, and in December 1829 was admitted to the bar. In March 1830 he went to Cincinnati, where he began his practice of law, soon becoming known as one of the best lawyers in that city. He also made an impression as a lecturer, delivering several lectures before the Cincinnati Lyceum, which he was largely instrumental in organizing. He published in the North American Review entitled 'The Life and Character of Henry Brougham' (July 1831) and 'Effects of Machinery' (January 1832). In 1832 he formed the project of publishing a collection of the laws of Ohio with notes and references, and his work, even though it did not reward him financially, became the standard edition and gave him a solid reputation throughout the West. He also wrote a most excellent historical sketch of Ohio. In June 1834 Chase became solicitor of the Cincinnati branch of the Bank of the United States, and in the following November became solicitor of the Lafayette Bank, these trusts affording him so lucrative a profit as to disturb him. Meanwhile on 4 March 1834 he had married Catherine Jane Garniss, who died 1 Dec. 1835; on 26 Sept. 1839 he married Eliza Ann Smith (d. 29 Sept. 1845), and on 6 Nov. 1846, Sarah Bella Dunlop Ludlow (d. 13 June 1852). Of his six children only two lived to maturity.

Early in his career Chase became identified with the anti-slavery movement. He was aroused not by the wrongs of the slaves altogether but by the dangers to white men, and his earliest act as an anti-slavery man (1836) was to defend the rights of a fellow citizen (James G. Birney) to express his mind freely. He indignantly denounced any sympathy with the disunion sentiments of William Lloyd Garrison (q.v.), declaring that he was not one of those 'abolitionists or anti-slavery men who regarded the Constitution as at war with moral obligations and the supreme law.' He states in his diary that he differed from Garrison and others 'as to the means by which the slave power could be best overthrown and slavery most safely and fitly abolished under our American Constitution.' He was a frequent speaker at anti-slavery meetings and lectures in Ohio and the neighboring States and even in the East, but he was neither an orator nor a good stump speaker. His great forte was the preparation of formal addresses and platforms, since in that he had time and not much more care and comprehensively to marshal his facts and thoughts, and accordingly from 1841 to 1848 he was often called upon by the Liberty and Free Soil men to undertake such tasks. But while Chase's powers of statement made him a valuable ally of the Ohio and slavery men, he became their leader in the period from 1837 to 1849 chiefly through his pronouncements against slavery and his legal services in connection with fugitive slave cases. He became known as the 'attorney-general of fugitive slaves,' but was defeated in every case in which he appeared for the defense. Some of his arguments were against indisputable historical facts—such as his absolute denial that Congress possessed power to establish slavery anywhere by any process, though he did concede that laws had been framed to support slavery in the District of Columbia in the territories, and (as regards fugitive slaves) in free States, but he declared Congress had no constitutional power to enact such laws. He held the Fugitive Slave Act of 1793 to be contrary to the Ordinance of 1787, which provided for recovery of slaves only from the "original States" and to be incompatible with the constitutional form of Federal government. In 1846, when a slave passed beyond the jurisdiction of the State in which he is held as such, he ceases to be a slave, because he continues to be a man and leaves behind him the law of force which made him a slave. The law was contrary to the letter and spirit of the Constitution, in denying 'due process of law' and authorizing *unreasonable searches and seizures'; the States and not Congress were responsible for the apprehension of fugitive slaves; and finally, "the legislature cannot repeal the laws of nature, cannot create any obligation to do wrong, or neglect duty. No court is bound to enforce unjust laws." These and other arguments were used in his various cases. In March 1837 he acted as counsel for an alleged fugitive slave. In 1850 he was counsel for Birney, who was accused of "harboring..."
her. Chase based his argument on the fact that Matilda had been brought into Ohio by her master and had then escaped, wherefore she was a free person and could not be a person held to service or labor in one State, under the laws thereof, escaping into another. The judge decided against Chase, and Matilda was re-
manded into slavery, but Birney appealed and the State Supreme Court reversed the decision. The most famous of the Ohio fugitive slave cases was that of John Van Zandt, who attempted to convey to safety some slaves who had escaped from their owner and were later recovered by force. One of the slaves escaped, however, and the owner sued Van Zandt to recover the slave’s value and the expense of recapturing the others and also to recover the penalty of $500 allowed by the act of 1793 against anyone who “after due notice harbored and concealed” a fugitive. Chase defended Van Zandt at the first trial in July 1842 and lost, but the award of $500 against Van Zandt was reversed on appeal, beginning 4 May 1847, which in 1847 sustained the lower tribunal.

Anti-slavery had already begun to play a prominent part in Ohio politics and to Chase fell the task of organizing, politically, the Liberty and Free-soil parties. In 1840, he had only a mild interest for Chase, though he was a delegate to the National Republican Convention that nominated Clay in 1832. In 1836, though a Whig, he voted for General Harrison, as he did also in 1840, showing no sympathy for his friend Birney, who in 1840 was the can-
didate of the new Liberty party. But in May 1841 Chase had deserted the Whig party for-
ever and had cast in his lot with Birney. Within a year he was practically the leader of the Liberty party in Ohio and for eight years organized conventions, prepared party addresses and bolstered up the anti-slavery press. He took part in the National Liberty Convention at Buffalo in 1843 and again in 1847, but through a shrewd move he practically dissolved the old Liberty party and secured a convening of the party members, now known as Free-
Soilers, at Buffalo in August 1848. This convention, over which Chase presided, nominated Van Buren for the Presidency. On 22 Feb. 1850, Chase, though a curiously pacific member of the party, was elected to the United States Senate. There he continued his opposition to slavery during the stormy scenes of the period of compromise in 1850, and was particularly outspoken, especially in his speech of 26–27 March 1850, in condemning Clay’s position and proposal. Chase usually acted with the Democrats, claiming to have been elected as a Democrat, and thereby losing a large share of the confidence of the Free-Soilers, but he gradually became estranged from the Demo-
crats, too, and in 1851 to 1852 spent much of his time in a futile attempt to build up a “Free Democracy”; finally in 1852 the nomination of Pierce on a pro-slavery platform compelled him to withdraw from the old Liberty party and to rejoin his old Free-Soil allies. In 1853, however, the Democrats secured a ma-
majority in the State legislature and therefore Chase failed of re-election to the Senate. In 1854, in conjunction with Sumner and Seward in the Senate, he became the leader of the opposition to the Kansas-Nebraska bill and on 24 Jan. 1854, in collaboration with Sumner, Giddings and others, issued the historic “Appeal of the Independent Democrats in Congress to the People of the United States,” but he could not prevent the passage of the bill. The politi-
cal result of the struggle was the rending of the Whig party and the formation of the Northern Whigs and independent Democrats of the Re-
publican party, largely due to Chase’s activities. In July 1855, therefore, the “Anti-Nebraska” Republican Convention of Ohio nominated him for governor and after a close contest he was elected. He made an excellent executive, intro-
duced many needed reforms and continuing his efforts in behalf of the negro, and in 1856 believed himself qualified for the Presidency, but he could not secure pledged votes sufficient for his nomination at the Republican conven-
tion and withdrew his name. In 1857 he was re-elected governor; thenceforth he was recog-
nized as a Republican leader, and on 2 Feb. 1860 was again elected United States Senator for the term beginning 3 March 1861. As a Senator he endeavored to obtain the Presidential nomination but was unsuccessful and in Janu-
ary 1861, at the solicitation of Lincoln (then President-elect), accepted the post of Secretary of the Treasury; he took the oath of office 7 March and thus relinquishing the senatorship.

Hardly had he assumed office when, in April 1861, the Civil War began. He rehabilitated the disorganized and almost bankrupt treasury; suggested and secured the enactment of new taxes and property confiscation acts; borrowed money, maintained the national credit, regulated commerce; provided the legal tender paper currency authorized by Congress; insisted upon the establishment of a national banking system and finally saw it put into operation; and admin-
istered his department and the financial affairs of the country in so creditable a manner as to distinguish himself as one of the great incum-
.bents of that important Cabinet office. (See United States, Finances of the, 1861.) De-
spite his numerous duties he never lost sight of the slavery question, supported Butler’s con-
tention that slaves escaping within the Union army lines were “contraband of war” and advo-
cated the arming of negroes. He opposed Lincoln’s combination of Democrats, Independ-
ent Democrats and Free-Soilers in the State legislature, he was elected to the United States Senate. There he continued his opposition to slavery during the stormy scenes of the period of compromise in 1850, and was particularly outspoken, especially in his speech of 26–27 March 1850, in condemning Clay’s position and proposal. Chase usually acted with the Democrats, claiming to have been elected as a Democrat, and thereby losing a large share of the confidence of the Free-Soilers, but he gradually became estranged from the Demo-
crats, too, and in 1851 to 1852 spent much of his time in a futile attempt to build up a “Free Democracy”; finally in 1852 the nomination of Pierce on a pro-slavery platform compelled him to withdraw from the old Liberty party and to rejoin his old Free-Soil allies. In 1853, however, the Democrats secured a ma-
ajority in the State legislature and therefore Chase failed of re-election to the Senate. In 1854, in conjunction with Sumner and Seward in the Senate, he became the leader of the opposition to the Kansas-Nebraska bill and
of departments, but no real Cabinet. Lincoln refused to accept the resignations, but on 3 March 1863 Chase prepared another resignation because Lincoln refused to nominate a revenue collector selected by him. Again on 11 May 1863 Chase became disgruntled because Lincoln refused to accept the proffered resignation. The minor differences between Lincoln and Chase were accentuated by their rivalry for the Presidential nomination in 1864, but the issuance in February 1864 of the so-called "Pomeroy Circular," critical of Lincoln, rendered impossible Chase's nomination and placed him in a delicate relationship with the President, wherefore on 22 February he again offered to resign and again was requested to remain. Finally in June 1864 another dispute arose over patronage in New York and though peacefully settled Chase, still sore because of Lincoln's renomination, decided once more to resign (29 June) and this time (30 June) Lincoln unexpectedly accepted it, appointing W. P. Fessenden (q.v.) as his successor.

Before his retirement from the Cabinet Chase had signed a desire to be chief justice of the Supreme Court and in spite of many objections Lincoln nominated him 6 Dec. 1864 to fill the post recently made vacant by the death of Chief Justice Taney (q.v.). He continued to advocate the universal enfranchisement of the negro, warmly sympathized with the work of the Freedmen's Bureau, and in 1866 became president of the "American Freedman's Union Commission," a benevolent society intended to advance the work of civilization. He took little part in President Johnson's dispute with Congress regarding reconstruction, but privately opposed the readmission of any seceded State until it had granted suffrage to negroes; he drafted the Fourteenth Amendment, which, somewhat extended, was accepted and passed by Congress, and later used it in his dissent from the court's decision in the Slaughter House Cases (q.v.). Chase considered the President's military governments abnormal, and even after Johnson's proclamation declaring the war at an end (2 April 1866) he still held military courts in Virginia and North Carolina (which were included in his circuit) until all possibility of claim that the judicial is subordinate to the military power is removed by express declaration from the President. In June 1867, however, he assumed his functions at Raleigh. Chase dissented from the Court's decision in the Milligan case (see MILLIGAN DECISION), Cummings and Garland cases and refused to sit in the trial of Jefferson Davis until late in 1868 when, however, the amnesty proclamation of 25 Dec. 1868 permitted Davis' release and the case was not tried on its merits. Though considering the trial impolitic and unjust, Chase presided with calmness and good judgment over the impeachment of President Johnson in 1868. Prior to this time he had allowed his friends again to bring his name before the Republicans as a candidate for the Presidential nomination, but soon became convinced that he could not secure the Republican nomination and entirely changed his attitude toward that party, which at first aimed to become the standard-bearer of the Democrats. However, he was not nominated and continued his work on the bench, writing numerous important decisions of the Court, such as that in the case of Texas v. White, wherein he expounded the nature of the government as "an indestructible Union, composed of indestructible States," reversing his previous theory of State suicide and he also in the case of White v. Hart in 1872, approving the method of reconstruction that had been adopted. He wrote the Court's decision in the case of Hepburn v. Griswold and thus in 1889 reviewed just and construed the statutes which as an administrative officer he himself had set in motion only a few years previously. The Court decided that the Legal Tender Act was unconstitutional in so far as it compelled the acceptance of legal tender paper currency in payment of debts contracted before the statute. By the subsequent decisions in the legal tender cases (q.v.), however, Chase was reversed, the Court holding the act constitutional. These contests were especially trying to Chase and the continual strain was soon found to affect him. In August 1870 he was stricken with paralysis but gradually improved, and though absent from the Court during the term of 1870-71 he sat during the terms of 1871-72 and 1872-73, proving that he was well enough also in 1872 again to desire the presidential nomination, but in 1873 he began to fail rapidly, on May 6 suffered a second stroke while in New York and passed away there the next day.

IRVING E. RINES.

CHASE, Samuel, American jurist, one of the signers of the Declaration of Independence: b. Somerset County, Md., 17 April 1741; d. 19 June 1811. His father, a learned clergyman, instructed him in the classics; later he studied law at Annapolis, being admitted to the bar at the age of 20. Having become a member of the colonial legislature, he distinguished himself by his bold opposition to the royal governor and the company. He took the lead in denouncing and resisting the Stamp Act, and became a most active adversary of the British government in his State. The Maryland Convention of 22 June 1774 appointed him to attend the meeting of the General Congress at Phila- delphia in September of that year. He was also present and conspicuous in the subsequent Con gresses during the most critical periods of the Revolutionary War. That of 1776 deputed him on a mission to Canada, and in 1783 settled the war with the British by the treaty signed at Paris. He was a member of the convention to adopt the new constitution, signed the Declaration of Independence without hesitation. In June 1783 the legislature of Maryland sent him to London as a commissioner to recover stock of the Bank of England and money belonged to the State. In 1791 he accepted the appointment of chief justice of the General
CHASE — CHASLES

Court of Maryland. Five years afterward President Washington made him an associate judge of the Supreme Court of the United States. Political cases of deep interest having been tried when he presided in the Circuit Courts, and his conduct having given much displeasure to the Democratic party, he was impeached by the national House of Representatives. The trial of the judge before the Senate is memorable on account of the excitement which it produced, the ability with which he was defended in his behalf and the nature of his acquittal. He continued to exercise his judicial functions with the highest reputation till 1811, in which year his health failed. Consult 'The Impeachment Trial of Judge Samuel Chase' (in the American Law Review, Vol. XXXIII, Saint Louis 1889); Smith and Lloyd, 'The Trial of Samuel Chase' (Washington 1805); Adams, 'History of the United States' (New York 1889).

CHASE, Thomas, American educator: b. Westerly, Mass., 10 June 1827; d. Providence, R. I., 5 Oct. 1882. He was a brother of Pliny E. Chase (q.v.). In 1855 he became professor of philology and classical literature at Haverford College, near Philadelphia; from 1875 to 1886 his president. Among his publications are 'Hellas: Her Monuments and Scenery' (1861); an address on 'Liberal Education: Its Aims and Methods'; a 'Latin Grammar' (1862); and editions of various Latin authors.

CHASE, William Henry, American military officer: b. Massachusetts 1798; d. Pensacola, Fla., 8 Feb. 1870. He was graduated at the United States Military Academy, became first lieutenant of engineers in 1819, captain in 1825 and major in 1838. He was engaged in repairing Fort Niagara in 1817-18; as superintending engineer for many important works in 1819-28; and had charge of the defenses in Pensacola harbor, Florida, 1828-34. He superintended the improvements of Mobile Bay; as senior engineer officer had charge of all the fortifications and river and harbor improvements at the mouth of the Mississippi, and took an influential part in all projects connected with the development of navigation around Pensacola. At the outbreak of the Civil War he entered the Confederate army, and was prominent in the seizure of the Pensacola navy yard.

CHASE, William Merritt, American artist: b. Franklin, Ind., 1 Nov. 1849; d. New York city, 25 Oct. 1916. He studied painting in oil at the National Academy in New York and subsequently in Europe with Piloty, acquiring a thoroughly German method. On his return to New York in 1878 he began to change his style of painting, gradually clarifying his color and showing an appreciation for the work of the French school. One of the most facile and brilliant technicians of the American school, Chase succeeded equally well with figure, portrait, and landscape, particularly his fish, which are especially celebrated. Examples of his work are in the Metropolitan Museum, New York, the Pennsylvania Academy and Brooklyn Institute Museum. He has made a specialty of portraits and figure-celebrity, with 'Ready for the Ride,' 'The Apprentice' and 'The Court Jester,' and portraits of American ladies. His more recent works include 'American Fish' (1905); 'Flying Clouds' (1906); and 'Portrait of an Artist' (1906); 'Portrait of Mrs. J.' (1910); 'Studio Interior' (1911); 'The Orangery' (1911); and 'Portrait of Mrs. H.' awarded the Proctor prize in 1912. He was appointed instructor at the Brooklyn Art School in 1881 and elected a National Academician in 1890.

CHASIDIM, ḥā-sēdīm, the name of a Jewish sect which appeared in the middle of the last century. See JEWISH SECTS.

CHASING, the art of indenting artistic or ornamental designs on metals. Figures on metal are often produced in relief by being punched out from behind, and sculptured or finished on the front with small chisels and gravers. It is this latter process that is properly called chasing, and the same term is applied to designs produced by hand-tools on more or less flat surfaces. The process is a very old one and is frequent in ancient Greek works of art. Phidias used it effectively. Benvenuto Cellini (q.v.) is the more modern master of chasing.

CHASKA, Minn., city and county-seat of Carver County, 22 miles southwest of Minneapolis, on the Chicago, Milwaukee Line of the Santa Fe and the Minneapolis and Saint Louis railroads, and on the Minnesota River. There are extensive brickyards here and the city contains also canning and pickle factories, foundry and machine shops and a flour mill. The electric lighting plant is municipally owned. Pop. 2,650.

CHASLES, shāl, Michel, French engineer: b. near Chartres, 15 Nov. 1793; d. Paris, 18 Dec. 1880. He entered the École Polytechnique in 1812, and on leaving was classed among the engineers; but with rare generosity he renounced his place as an officer in order to assure a career to one of his unsuccessful comrades. In December 1829 he addressed to the Brussels Academy a memoir on two general principles of geometry, duality and homography. The introduction to this memoir expanded into the well-known 'Aperçu historique sur l'origine et le développement des méthodes en géométrie,' the first edition of which was published in 1837. In 1841 he was appointed to the chair of machines and geodesy at the École Polytechnique, and in 1846 to that of higher geometry, which had just been instituted at the Sorbonne. Some of his published works are 'Treatise on Higher Geometry' (1852); 'The Three Books of Euclid's Porisms Re-established for the First Time' (1860); 'Treatise on Conic Section' (1865); 'Reports on the Progress of Geometry' (1870). These, his principal works, are geometric and homographic. His contributions to the 'Comptes Rendus' of the Academy of Sciences and to other scientific publications are extremely numerous, and though in the main geometrical, are not exclusively so. In particular he treated in several memoirs the question of astronomic problems and the geometric demonstration of a celebrated theorem of Maclaurin on the attraction of ellipsoids. Two of his memoirs on the properties of cones of the second degree, and on the spherical conics, were translated into English, and published, with additions, by Charles Graves in 1841. He contributed much to projective geometry (see GEOMETRY, PROJECTIVE) and to the method of
CHARLES — CHASSEUR

characteristics (q.v.). During his long life he was the recipient of many scientific distinctions, and he will always be cited as one of the great geometers of the present century.

CHARLES, Victor Euphémion Philarète, French critic: b. Mainvilliers, near Chartres, 8 Oct. 1798; d. Venice, 18 July 1874. The son of a Jacobin, and educated according to Rousseau, he acquired the point of view which, enlarged by life abroad, makes his essays so unique and instructive. In 1815 he assisted Valpy in an edition of Greek and Latin authors in England. In 1837 he became curator of the Mazarin Library and in 1841 professor of continental languages and literatures at the Collège de France. He has written in every imaginable prose form, from a romance to a riddle; but his enduring work is contained in 'Tableau de la marche et du progrès de la langue et de la littérature françaises depuis le commencement du XVIe siècle jusqu'en 1610' (8 vols., 1828; 'L'Antiquité' (1847); 'Le seizième siècle' (18 vols., 1847); 'Les Voyages d'un critique à travers la vie et le livre' (1866-68, 2d series); and 'Mémoires' (1876-78). His principal service to French literature lies in the fact that he was one of the first of the French critics to stimulate a lively interest in the literatures of England, Russia and Scandinavian countries.

CHASSEIGNAC, shá-sán-yák, Charles Louis, American physician: b. New Orleans, 25 Jan. 1862. He was graduated at the medical department of the University of Louisiana in 1883, was president and professor of genito-urinary diseases at the New Orleans Polyclinic from 1897 to 1906. He was editor of the New Orleans Medical and Surgical Journal; president of the Orleans Parish Medical Society; president of the Louisiana State Medical Society; one of the founders and president of the New Orleans Sanitarium and Training School for Nurses. In 1906 was appointed dean of the Graduate School of Medicine of Tulane University, continuing as professor of genito-urinary diseases. In 1915 he was managing editor of the American Journal of Tropical Diseases and in 1915 was elected consultant in genito-urinary diseases of the Charity Hospital of New Orleans. Has been a trustee of the Eye, Ear, Nose and Throat Hospital for many years.

CHASSE, shá-sá', David Hendrik, Baron, Dutch soldier: b. Thiel in Guelders, 18 March 1765; d. Breda, 2 May 1849. He began his military career when but 10 years of age; became lieutenant in 1781 and captain in 1787. After the failure of the revolutionary movement he took French service; was appointed lieutenant-colonel in 1793; and two years later found himself marching toward the Netherlands under the command of Pichegru. He afterward fought against the Austrians at Oudenaarde, gaining great distinction, and from Napoleon himself, because of his fondness for bayonet charges, the name of 'Général Baillyette.' He was made a baron by Louis Bonaparte in 1809. As lieutenant-general of the Dutch forces, in 1815, Chassé did not stay at Watertoorn against his old comrades, the French. As governor of Antwerp he defended the citadel for three weeks with 5,000 men against 60,000 Belgians and French (1832), but he was forced to surrender. He was a French prisoner of war until May 1833, when he was released and retired.

CHASSEPÔT, Antoine Alphonse, French inventor: b. 4 March 1833; d. Gagny, in the Seine-et-Oise, 14 Feb. 1905. He was an employee in the Paris police force, where he became an official in 1856, and in 1863 brought before the government the model of his breech-loading rifle, adopted three years afterward, and subsequently abandoned. It was about four pounds lighter than the needle-gun and about one pound lighter than the Martini-Henry rifle.

CHASSEPÔT, shás-pô, RIFLE, a breech-loading rifle, named after its inventor, and adopted as the firearm of the French infantry in 1866, after the value of the Prussian needle-gun had been shown in the war between Prussia and Austria. It is not now in use, having been replaced in 1874 by a much modified form of small-arms. It was a bolt-action gun with a peculiar system of obturation and a paper cartridge. In the war of 1870 it was a much better weapon than the German needle-gun (q.v.). It was considerably lighter than the needle-gun, the weight of the latter being 12 pounds, and that of the former less than nine pounds. In accuracy, penetrative power, length of range, lowness of trajectory, and lightness of fire, it was inferior to the Martini-Henry. To the needle-gun it was superior in length of range and lowness of trajectory, as was shown in the war of 1870, in which the French could open fire of 1,500 yards, while the effective range of the needle-gun was only 400 to 500 paces. This superiority, however, was neutralized by the fact that its lightness and its large charge had the effect of producing great recoil and of heating the barrel. At the commencement of an action the men would open fire at long range, but before closing with the enemy the barrel of their piece was so heated that the weapon could hardly be handled. From the recoil and heating combined, the soldier was obliged to fire from the hip, so that his aim was not accurate; while after much firing the breech became clogged. The chassepot weighed 9 lb. 5 oz., was 6 feet 2 inches long with bayonet, had a calibre of .433 inches, and fired a 386 grain lead bullet with a charge of 86.4 grains of black powder at a muzzle velocity of 1,328 feet per second. It was sighted to 1,312 yards (1,200 metres).

CHASSEUR, shá-sér, a male attendant upon persons of distinction, attired in a military dress, and wearing a sword. It is also the name given by the French to bodies of light infantry which act as skirmishers and sharpshooters. The name was originally given to some troops raised in 1815, in imitation of the jägers of the Austrian army, who were chiefly Tyrolese chamois-hunters, and unerring marksmen. The French Chasseurs are of two kinds, light cavalry and infantry. Every battalion of infantry has a company of Chasseurs, but the term is more particularly applied to that body of men called the Chasseurs de Vincennes, who were enrolled and armed with rifles in 1833, and quartered at Vincennes. The Chasseurs of the Italian army are called Bersaglieri. Garibaldi's Chasseurs, that took a prominent part in the
Italian war of 1859, and in the campaign against Francis II of Naples, in 1860, were known as Cacciatori dei Alpi, or Alpine hunters.

CHASIS, shas'sè, in automobiles, that part of the vehicle made by machinists, as distinguished from the body made by the carriage or coach builder. It includes the frame, wheels, and machinery. The frame consists generally of two fore-and-aft members and three or four cross members of pressed steel riveted together with gusset plates at the joinings. This frame is the foundation on which is mounted the power plant with its controls and transmission gear, and it is set upon the axles of the running gear or slung below them, according to type.

See Automobile.

CHASTELARD, shät-lard, Pierre de Boscobel de, French poet: b. Dauphiné 1540; d. 1563. He fell madly in love with Mary Stuart at the French court, and pored forth his admiration in innumerable poems. He figures as one of her escort on her return to Scotland after the death of her husband (1561). He had to return to France after this pleasing duty, but on his first opportunity he was again in Scotland (1562). Mary gave him a very gracious welcome, answered, it is said, a poem dedicated to her, and allowed him to accompany her singing with his flute. His indiscreet love led to a public trial at Saint Andrews and hanging. Consult Swinburne, Chastelard: a Tragedy (London and New York 1906); Hewitt, The Queen's Quhair (New York 1904).

CHASTELARD, a tragedy published in 1869, by Algernon Charles Swinburne, the scene of which is laid at Holyrood Castle, during the reign of Mary Queen of Scots. The tragedy is conspicuously one to be read, not acted. It is too long, too much lacking in action and of too sustained an intensity, for the stage. The style is essentially lyrical, full of exquisite lines and phrases; and as a whole, the play presents an intense passion in a form of adequate beauty. See CHASTELARD, PIERRE DE BOSCOBEL.

CHASTELIER, Jean Gabriel, Marquis de, b. near Mons, Belgium, 1753; d. Venice, 7 May 1832. He was educated at the Jesuits' College in the Collège de Fort. In 1776 he entered the Austrian service. After having served against the Turks, by whom he was severely wounded, he displayed his zeal for the house of Austria in the disturbances in the Netherlands. In 1796-97 he was employed in the negotiations of his court in Poland and Russia; was afterward with Suwarov in Italy, where he distinguished himself in several engagements with the French armies. In 1808, with Horneayr, he was the soul of the famous insurrection in the Tyrol, and all the political as well as military events which were connected with it. He was finally defeated at Tyrol and his army was routed 13 May. After the close of the war he received several appointments, and in December 1814 was made governor of Venice.

CHASTELET, shät-lä, Gabrielle Emilie Breteuil, brät-té-yè, Marquise du: b. Picardy 1705; d. Lunéville 1749. She was of an ancient family, was taught Latin by her father, Baron Breteuil, and was well acquainted with that language; but her favorite study was mathematics. She had a sound judgment and much taste, loved society and the amusements of her age and sex, but after the publication of the Philosophical Letters by Voltaire had roused the Jesuits' criticism against him, she abandoned all these pleasures, and in 1733 retired with him to the dilapidated castle of Cirey, situated in a dreary region on the borders of Champagne and Lorraine. She embellished this residence, formed a library, collected instruments, etc. Cirey was often visited by the learned men by Maupertuis, John Bernouilli, etc. Here the Marchioness learned English of Voltaire in the space of three months, and read with him Newton, Locke and Pope. She also wrote an analysis of the system of Leibnitz, and translated Newton's Principia with an algebraic commentary. Voltaire lived six years with her at Cirey, where they employed their time in the study of science, and in getting up lovers' quarrels for the pleasure of patching them up again. At the end of this time she went to Brussels to prosecute a lawsuit, which was terminated by an advantageous compromise, brought about by Voltaire. She also carried on a correspondence with the German philosopher, Wolf, until her death. Her Traité de la nature feu obtained the prize of the Parisian Academy of Sciences, and is published in their collections. Her husband, the Marquis du Chastelet Lomont, was high steward of King Stanislaus Lesczinsky at Lunéville.

CHASTELLUX, shät-lük, François Jean, Marquis de, French historian: b. Paris 1734; d. Paris, 28 Oct. 1788. He entered the army in 1749; distinguished himself as colonel in the Seven Years' War, and later served in the American Revolution as major-general under Rochambeau, and gained the friendship of Washington by his amiable character. He published numerous works relating to the United States, including 'Voyages dans l'Amérique septentrionale dans les années, 1780-1782,' 'Discours sur les avantages et les dangers qui ressortent pour l'Europe de la découverte de l'Amérique,' and translated into French David Humpsey's 'Address to the Army of the United States.' Consult Chastellux, Notice sur le Marquis de Chastellux (Paris 1823); and Pascallet, Notice historique sur la maison de Chastellux (Paris 1844).

CHASUBLE, chäz'obel, the outermost vestment worn by a priest in celebrating the mass: its name in Latin is casula, dim. of casa, house. In its original form it was a garment of circular or elliptical form like the South American poncho, with an opening in its centre through which the head of the wearer passed. But the form of chasuble now employed almost universally consists of a more or less oval front and back joined at the top, where is an opening to allow the head to pass through. The garment is usually of silk embroidered and decorated with gold or silver thread, and with a cross on the back. Chasubles of different colors, white (or cloth of gold), red, violet, green, black, are worn accordingly to the occasion; as white on all high festivals, violet in penitential times, red on the anniversaries of martyrs, black in masses for the dead, etc. In the present form of the chasuble the priest's arms are free, whereas in the ancient form, the garment covered the pet-
CHATARD—CHATEAUBRIAND

son like a cloak. See Costume, Ecclesiastical.

CHATARD, Francis Silas Mureau, American Roman Catholic prelate: b. Baltimore, Md., 13 Dec. 1834. He was graduated from Mount St. Mary's College, Emmitsburg, in 1853, and in 1856 took the degree of M.D. at the University of Maryland. After practising medicine a year, he entered the Urban College of the Jesuits in Rome, where he studied for the priesthood and was ordained 14 June 1863, obtaining the degree of D.D., August 1863. In November 1863 he was appointed vice-rector of the American College, Rome, and in 1868 was promoted to the rectorship, the institution flourishing under his management. Later he was made papal chamberlain to Pope Pius IX, who greatly esteemed him. On 26 March 1878 he was nominated bishop of Vincennes by Pope Leo XIII, and consecrated in Rome 12 May 1878. The title of the see was changed from Vincennes to Indianapolis 23 March 1898. Bishop Chatard has translated works from the French, and is much interested in the cause of education. He is at present assisted in his diocese by a coadjutor bishop, the Rt. Rev. Joseph Chartrand.

CHÂTEAUBRIAND, ū-ch ô-brân, CHÂTEAU LATOUR, and CHÂTEAU MARGAUX, famous vineyards, all in the department of the Gironde, France, furnishing the best of the red wines of Bordeaux. See Bordeaux Wines.

CHÂTEAU-TIERRY, ē-tē, France, town in the department of Aisne, on the right bank of the Marne, 38 miles south-southwest of Laon, and 59 miles northeast of Paris. It occupies the side of a hill, whose rocky summit is crowned by the ruins of the old castle of Thieray, and to have been built by Charles Martel, in 730. It is the birthplace of La Fontaine (to whom a fine marble statue has been erected), and was the scene of several conflicts during the campaign of 1814. On 9 Sept. 1870, it was occupied by the Germans, and became a few days later the temporary headquarters of the Emperor. Its chief buildings are a commercial college, a public library and an old cathedral. It possesses a court of primary resort and a communal college. The Champagne district begins here, and, besides its wine trade, it is famous for the manufacture of musical and scientific instruments and woven yarn; stone is quarried near by. Consult Poquet, 'Histoire de Château-Thierry.' 2 vols., 1840). Pop. 7,771.

CHÂTEAUBRIAND, shā-tō-brān, Fran-çois Auguste René, VICOUME DE, French author and politician: b. Saint Malo, Brittany, 4 Sept. 1768; d. Paris, 4 July 1848. He received a commission in the army in 1788, and at the commencement of the Revolution he hurried into Brittany to have the great commotions then taking place there. In the spring of 1791 his ardent and enthusiastic spirit led him to join an expedition to America for the purpose of exploring its Arctic regions, and discovering the northwest passage. He crossed the Atlantic, landed at the mouth of the great commercial river, where he had an interview with Washington. Returning to France in 1792 he married Celeste Buisson de Lavigne, a girl of 17, who brought him a small fortune. Out of his American experience largely grew his 'Les Natchez' (see Natchez, Les). Shortly after his return from America he quitted France and joined with other emigrants on the Rhine. At the siege of Thionville he was wounded in the thigh, and subsequently became an exile in England. Here his health gave way, and friendless and penniless he continued for a time to wear out his existence in London. He at last found means of earning a subsistence by giving lessons in French and executing translations for the booksellers. In 1797 he published his 'Essai historique, politique et moral sur les révolutions anciennes et modernes, considérées dans leurs rapports avec la Révolution Française.' It did not win very much success in England, and attracted no notice whatever in France. The essay is pervaded by a strong skeptical spirit in religious matters, but its author's views on this subject were soon to experience a sudden and important change. The death of his mother in prison, and the accounts of her last moments transmitted to him by his sister, who herself was no more by the time her letter reached her brother, made a lasting impression on Chateaubriand, and he became a firm believer in Christianity. In 1800 he ventured to return to France and take up his abode under an assumed name at Paris. Encouraged by the success of an essay on literature and the Mercure, he published in 1801 his 'Atala,' which was afterward introduced as an episode into his 'Genie du Christianisme.' In the following year appeared his celebrated work 'Le Genie du Christianisme,' which may be said to have caused a religious reaction, and inaugurated a new period in the social history of France. The object of Chateaubriand was to demonstrate the superiority of Christianity over all other religions in a poetic and artistic, as well as moral and beneficial point of view. Though a work more brilliant than profound, it is unsurpassed for beauty of language and description and the eloquence of its impassioned appeals. The main charm indeed of the book may be said to lie in its beautiful imagery, drawn from external nature, and more especially from nature as exemplified in the glowing scenery of the New World. In this respect Chateaubriand may be said to have revived in French literature the description of natural scenery and objects which had almost been unknown. His work attracted the attention and admiration of Bonaparte, and in 1803 he was appointed French minister for the republic of the Valais. This office he resigned in 1804.

In order to give life and tangible form to the theories propounded in the 'Genie du Christianisme,' he commenced 'Les Martyrs,' and to qualify himself for describing accurately the scenes amid which the poem is laid, made a pilgrimage to the East. In 1809 'Les Martyrs' was published, and is considered by many the best of his works. Some of the descriptions, such as of the ancient forests of Gaul, the assemblies of the Christians in the catacombs and the picture of Rome under the emperors, are drawn with marvellous beauty and effect. In 1811 appeared his 'Itinéraire de Paris à Jerusalem.' The restoration of Louis XVIII was hailed by him with enthusiasm, and a pamphlet entitled 'De Bonaparte et des Bourbons,' published by him in 1814, was said by the King to
have been worth to him an army of 100,000 men. On the second restoration he preserved the title of minister of state, but refused to take office along with Fouché. On the accession of Villèle to power Châteaubriand was appointed Ambassador to Berlin, then to London, and in September 1932, crossed the Alps to represent France at the congress of Verona. In 1824 he was summarily dismissed from office at the instance of Villèle, and the indignation which he felt at such treatment made him join the ranks of the opposition, where in the columns of the Journal de Debats he published a series of attacks against government. On the accession of the Martignac ministry he again returned to office, and proceeded as ambassador to Rome, but resigned this appointment on Polignac becoming Premier. On the revolution of 1830 he refused to take the oath of allegiance to Louis Philippe, and consequently forfeited his seat in the House of Peers and a pension of 12,000 francs. In 1831 a new work appeared from his pen, entitled 'De la Restauration, et de la monarchie élective,' in which occurs the following singular avowal: 'I am a Bourbonist by honor, a royalist by reason and conviction, and a Republican by inclination and character.' In the same year he published his 'Études ou discours historiques sur la chute de l'Empire Romain,' a work exhibiting more of the imagery of the imagination of the poet than the critical acumen of the historian. Owing to several pamphlets of a legitimist tendency issued by him, he was arrested in 1832, but defended by M. Berryer, and acquitted. In the latter years of his life he published an 'Essay on English Literature,' the translation of Voltaire's 'Paradise Lost,' and other works. His memoirs appeared after his death, under the title of 'Mémoires d'outre-tombe.' They possess a great interest, and contain many charming passages, but are at times disfigured by the ebullitions of personal vanity, which formed one of the principal weaknesses of Châteaubriand. He was an intimate friend of the celebrated Madame Récamier, whose feeling toward him amounted almost to worship. He was the first in France to draw attention to the literary remains of the Middle Ages and Christian antiquity. He was a renovator in imagination and asserted his generation to break with the imitation of imitation that had sapped the literary life of the 18th century. His style left its mark on poetry, history, fiction - on the very language. His effect on religion and morals was transitory, but in literary art he opened a new era. (See Genius of Christianity, The.) Consult Lenormant, M. Châteaubriand et ses mémoires, and also works upon his life and literary work by Villien, Saint Beuve, Phailhès, Châteaubriand, sa femme et ses amis (Bordeaux 1896), Lemaître, Châteaubriand (1912); Correspondance général de Châteaubriand, edited with introduction, etc., by L. Thomas (3 vols., Paris 1912-13).

CHÂTEAUNEUF DE RANDON, shà-tø-ñef-de-ràndô, France, small town in the department of Lozère, 12 miles south of Mende, on a hill. It was formerly fortified, and is celebrated for the four years' siege sustained by the English garrison in 1380, against the troops of Charles V, commanded by the chivalrous Duguesclin. During this siege the English governor, who had been hard pressed,
promised to surrender to Duguesclin at the expiration of 15 days, if no succour arrived. Before the end of the time agreed upon Duguesclin died, when his successor summoned the governor, who replied that he had given his word to Duguesclin, and would yield to no other. But he had of the same mind: "Then I will carry the keys to his tomb." Accordingly the governor sallied forth with the garrison to Duguesclin’s tent, and on his bended knees laid his sword and the keys of the town on the bier. In 1820 a simple commemorative monument was erected at the hamlet of Bitarelle, on the spot where this event occurred. Pop. 3,541.

CHATEAURoux, shah-tay-roo, France, capital of the department of Indre, 106 miles south-southwest of Paris, in an extensive plain, left bank of the Indre. It has straight, broad and tolerably well-paved streets, and spacious squares, with a public garden and some fine promenades. The cloth manufactures, in which the wools of Berry are almost exclusively used, are carried on, employing about 2,000 workmen. Cotton hosiery, woollen yarn, tiles, paper, hardware, tobacco and parchment are also made; and there are tanneries and dyeworks. There is likewise a considerable trade in grain, wine, iron, wool, poultry and cattle. The town owes its origin to a castle built in 950 by Raoul le Large, of Deols, still in a tolerable state of preservation. It was considerably extended in the reign of Louis XIII, who constituted it a duchy in favor of the descendants of Henry II of Bourbon, Prince of Condé. It was the prison of Richelieu’s niece, the Princesse de Condé, for 23 years. Charles of Bourbon sold it to Louis XV, who conferred it on one of his mistresses, at whose death it returned to the Crown. During the revolution of 1793 it was called Indreville. Across the Indre lie its beautiful suburbs, Christophe and Deols. The church of Saint André, the hôtel de ville with its Flemish paintings and souvenirs of Napoleon I, and the statue of Gen. Henri Bertrand, a native, are among the points of interest. Pop. 26,095.

CHATELAIN, shah-lahn, Emile Louis Marie, French philologist: b. Montrouge, 25 Nov. 1851. He is curator of the library of the University of Paris and secretary of the section of science, history and philology of the Practical School of Higher Studies at the Sorbonne. He is editor-in-chief of the Revue des Bibliothèques and was in charge of the Dictionnaires Quicherot. He is one of the noted classical philologists of France.

CHATELARD. See CASTELLAN.

CHATELARD, shah-tay-lar. See CHATELARD.

CHATELET, Belgium, manufacturing town in the province of Hainaut, on the Sambre, five miles east of Charleroi. It contains a number of smelting works and ironfoundries. Its chief industries are coal mining and the manufacture of cotton-stuff, knives, nails and potteries. Chatelet, opposite to it, has a pop. of about 11,500. Pop. 11,573.

CHATELET, shah-lay-t, was anciently a small château or fortress, and the officer who commanded it was called châteletain. The word is a diminutive of château, formed from castel-
CHATHAM

CHATHAM, William Pitt, 1st Earl of (*The Great Commoner*), British statesman: b. Westminster, 15 Nov. 1708; d. Hayes, Kent, 11 May 1778. He was the younger son of Robert Pitt, M.P. for the family borough of Old Sarum, and afterward of Bocornoc, Cornwall, educated at New College, Oxford. From boyhood he was a martyr to gout—indeed throughout his career he was persistently dogged by ill health; and he was compelled for health reasons to leave college without taking his degree, and was advised to travel. At the age of 23 he obtained a cornetcy in the Blues, and was returned M.P. for Old Sarum in 1735. He joined the opposition to Sir Robert Walpole, and in his maiden speech so incensed that minister that he declared “we must muzzle that terrible cornef of horse,” and Pitt was at once cashiered and his commission canceled. His speeches in the House, however, steadily advanced his reputation in Parliament and the country. He was at this time gainment to the Prince of Wales, who was at enmity with his father, and to whom the members of the Parliamentary opposition looked for promotion or place on his succession on the death of the old king. George II became the most prominent member of the House of Commons. His denunciation of Walpole’s convention with Spain in 1739 was followed a few months later by that statesman reluctantly embarking in a war with that country, which he conducted with lethargy. Pitt was the head and front of the opposition to Walpole, and succeeded in driving him from office in 1742. But though driven from office, he was still the power behind the throne. Pitt incensed the King by the freedom with which he denounced the policy of the British Cabinet as conceived in the interest of the King’s foreign dominion—“this absurd, ungrateful and pernicious partiality to the German interest. If ministers prefer the interests of Hanover, Parliament regards only the interests of Great Britain.” He also opposed the policy of buttressing Maria Theresa by means of British money and troops. Pitt afterward modified his views; but the King was difficult to placate. In 1746, a mark of appreciation of his patriotism, a legacy of £10,000 from the Duchess of Marlborough—a welcome wind-fall to a man whose private income was only £100 a year. In 1746 Pitt, who had cut himself adrift from the Prince of Wales, received the subordi-nate post of joint vice-treasurer of Ireland in the Broad Bottom administration, and later in the same year was made paymaster-general of the army. His refusal in the latter office to accept a commission on subsidies to foreign powers and other “perquisites” of the office—amounting to many thousands of pounds per annum,—which his predecessors and successors accepted, greatly increased his hold on the country. On the death of Pelham he pushed his claims to cabinet rank; but the hostility of the court stood in his way, and Sir Thomas Robinson, a creature of Newcastle’s, was appointed to lead the Commons. Pitt took his revenge by flaming both Newcastle and Robinson, and in November 1755 he was dismissed from office. He retired, not without any number of votes in the Commons—he placated no magnates and he gave no bribes; his strength lay with the people. He married on 15 Nov. 1754, Hester Grenville, the only sister of Earl Temple, and the marriage was one of unclouded happiness.

Pitt at this period might well have despairs. The personal hostility of the King appeared inappeasable, and without his consent he could not reach Eton and Trinity College, Oxford. From boyhood he was a martyr to gout—and throughout his career he was persistently dogged by ill health; and he was compelled for health reasons to leave college without taking his degree, and was advised to travel. At the age of 23 he obtained a cornetcy in the Blues, and was returned M.P. for Old Sarum in 1735. He joined the opposition to Sir Robert Walpole, and in his maiden speech so incensed that minister that he declared “we must muzzle that terrible cornef of horse,” and Pitt was at once cashiered and his commission canceled. His speeches in the House, however, steadily advanced his reputation in Parliament and the country. He was at this time gainment to the Prince of Wales, who was at enmity with his father, and to whom the members of the Parliamentary opposition looked for promotion or place on his succession on the death of the old king. George II became the most prominent member of the House of Commons. His denunciation of Walpole’s convention with Spain in 1739 was followed a few months later by that statesman reluctantly embarking in a war with that country, which he conducted with lethargy. Pitt was the head and front of the opposition to Walpole, and succeeded in driving him from office in 1742. But though driven from office, he was still the power behind the throne. Pitt incensed the King by the freedom with which he denounced the policy of the British Cabinet as conceived in the interest of the King’s foreign dominion—“this absurd, ungrateful and pernicious partiality to the German interest. If ministers prefer the interests of Hanover, Parliament regards only the interests of Great Britain.” He also opposed the policy of buttressing Maria Theresa by means of British money and troops. Pitt afterward modified his views; but the King was difficult to placate. In 1746, a mark of appreciation of his patriotism, a legacy of £10,000 from the Duchess of Marlborough—a welcome wind-fall to a man whose private income was only £100 a year. In 1746 Pitt, who had cut himself adrift from the Prince of Wales, received the subordi-nate post of joint vice-treasurer of Ireland in the Broad Bottom administration, and later in the same year was made paymaster-general of the army. His refusal in the latter office to accept a commission on subsidies to foreign powers and other “perquisites” of the office—amounting to many thousands of pounds per annum,—which his predecessors and successors accepted, greatly increased his hold on the country. On the death of Pelham he pushed his claims to cabinet rank; but the hostility of the court stood in his way, and Sir Thomas Robinson, a creature of Newcastle’s, was appointed to lead the Commons. Pitt took his revenge by flaming both Newcastle and Robinson, and in November 1755 he was dismissed from office. He retired, not without any number of votes in the Commons—he placated no magnates and he gave no bribes; his strength lay with the people. He married

The Seven Years’ War had broken out: Frederick of Prussia was threatened by a confederacy of five powers; France asserted her claim to the whole of the North American Louisiana and the Mississippi to Hudson Bay and was bent on hemming in the English colonists to the seaboard east of the Alleghenies. Pitt had a true appreciation of the value of sea power and he determined on the destruction of French influence in America. He began by expeditions against Rochefort, Saint Malo and Cherbourg, which while they did not achieve any decided success, were of assistance to Frederick in his conflict against the continental alliance. He spared no labor; the plans of campaign, the choice of commanders—in which he discarded seniority—the preparation of the armaments, were all in his hands. “The ardor of his soul set the whole kingdom on fire,” and he cultivated the loyal co-operation of the colonists in American campaigns. Louisburg was taken; the valley of the Ohio secured; the conquest of Canada was completed; the dominating influence in North America passed from France to Great Britain. By the triumph of Wolfe, the history of the United States began.”

The Second was the most enviable ever occupied by any public man in English history. He had conciliated the King; he domi-neered over the House of Commons; he was adored by the people; he was admired by all Europe. He was the first Englishman of his time; and he had made England the first country in the world.”

George III’s accession to the throne was followed by the undermining of Pitt’s influence: the young monarch was desirous of keeping the affair of community of interests in his own hands, and was under the influence of his mother and the Earl of Bute, his groom of the stole. Pitt became aware of the family com-
pact between France and Spain in September 1761, and wanted to declare war on Spain while she was unprepared, and failing to secure his policy, resigned office. He was offered the governorship of Canada or the chancellorship of the duchy of Lancaster; but accepted a pension of £3,000 a year for his own and two lives. In the following year, when Pitt's prediction became fulfilled and Spain declared war, he was called back and continued his task of the war, by which both France and Spain would perhaps have been totally exhausted; but peace was concluded in 1763. In 1765, Pitt fell heir to the estate of Burton Pynsent in Somersetshire, with a rent roll of £3,000 a year, which was bequeathed him by Sir William Pynsent, a man he had never seen, in acknowledgment of his public services.

Foreseeing the separation of the American colonies from the mother country if the arbitrary measures then adopted should be continued, he advocated a conciliatory policy, and in 1760 lent all the weight of his influence in securing the repeal of the Stamp Act. In the same year he again called upon to form a ministry, in which he took the office of Lord Privy Seal, and was raised to the peerage as Earl of Chatham. His acceptance of this honor was very unpopular; and in the Upper House he never became the dominating force he had been in the Commons. In the following year suppressed gout disordered his whole nervous system and drove him into intense mental depression; his intellect became clouded; he went into retirement and was inaccessible even to his colleagues in the cabinet; and so continued until his resignation in 1768. In January 1770 he again denounced the coercive measures employed against the American colonies; from that time till 1774 he was again in retirement; in that and the following year he again pleaded for conciliation, and in 1776 the colonies declared themselves independent. In May 1777 he unsuccessfully moved an address to the Crown praying for a stoppage of hostilities, but he was not willing to recognize American independence. On 7 April 1778, though laboring under severe illness, he appeared at the House on crutches, with his legs swathed in flannel, and made his way to his place; and though plainly not himself, spoke movingly on his old theme, the relations with the American colonies. At the close of the Duke of Richmond's reply he stood up again, pressed his hand on his breast and fell down in an apoplectic fit; and was conveyed to his country seat at Hayes, Kent, where he died a month later. Parliament made provision for his family, his debts were paid and he was honored with a public funeral and a magnificent monument in Westminster Abbey. Another was erected in 1782 at the Guildhall. His popularity in America was very great, and several localities were named in his honor, as well as Pittsburgh, Pa., and Pittsfield, Mass.

Bibliography.—Many biographies of Chatham have been written, but an intimate ‘Life’ is impossible to write, as the materials do not exist. A large volume of Chatham's correspondence is published, especially that from the papers of Lord and Lady Stanhope. A good summary appears in J. A. Froude, Life of Lord Brougham (1879). The works of Chatham are collected in a twelve-volume edition by Sir H. J. Massingham (1932). G. M. Trevelyan, Chatham’s Letters (1928); and J. R. Smart, The Life of Lord Chatham (1932), are the best and most satisfactory brief accounts of his life and work that has ever been published, and which is never likely to be superseded.

D. S. DOUGLAS,
Editorial Staff of The American.

CHATHAM, Canada, city and county-seat of Kent County, Ontario, on the Thames River, the Grand Trunk and the Lake Erie and Detroit River railways, 45 miles northeast of Detroit and 67 miles southwest of London. The Thames is navigable for steamboats from Lakes Erie and Huron. Chatham is noted for its rich agricultural, fruit and stock-raising district, and exports large quantities of grain, lumber, railroad ties, cordwood, potash, tobacco, soap and pork. It is the seat of a United States consular. It has large saw, flour and woolen mills; foundries and machine shops; manufactories of wagons and carriages, soap, candles, potash and tobacco; and breweries and distilleries. Pop. 10,770.

CHATHAM, Canada, county-seat and port of entry of Northumberland County, on the right bank of the Miramichi River, 12 miles from its mouth and one mile from Chatham station on the Chatham branch of the Intercolonial Railway, 98 miles northeast of Fredericton. It is the largest town on the north shore of the province. The harbor accommodates ships of large draught. Chatham has a large export trade in fish, tanning bark, deals, lath and finished lumber. Its manufactories include saw and pulp mills, foundries, shipyard, saw and door factories. Chatham has many handsome buildings, including two large hospitals, a very fine Central High School and the Ursuline Academy. Its natural attractions include Tecumseh Park, set amid beautiful scenery. It is called the "Maple City," and was incorporated in 1855. Pop. 4,000.

CHATHAM, England, now a parliamentary and municipal borough, naval arsenal and seaport, in County Kent, on the Medway, about 33 miles by rail from London, practically forming one town with Rochester. As a parliamentary borough it includes Gillingham and New Brompton, and returns one member. Chief features of Chatham are the naval and military establishments here and in the vicinity. The dockyard was founded by Queen Elizabeth in 1588, and during this reign Upnor Castle, on the left bank of the Medway, was erected to protect the dock and shipping. Despite the fire from the castle, however, in 1667 Van Ghent, a vice-admiral of De Ruyter succeeded in breaking the chain stretched across the river, burned and sank several ships, and retired bearing off the warship, the Royal Charles, as a
prize. The former lines of fortifications have been replaced by modern forts. With its recent extension the royal docks now extends far about three miles along the Medway, and is thoroughly equipped with building slips and floating docks, making it one of the most important naval bases in the kingdom. One huge basin has a frontage of 6,000 feet with a width of 800 feet. Up to 10,000 workmen may be at one time employed in and around the dockyard. The military establishments include extensive infantry barracks, and barracks for the royal marines; the headquarters of the royal engineers, arsenal and park of artillery, hospitals, etc. The old convict prison has been partly pulled down and replaced by naval barracks. The fortifications are intended as a defense for London, a protection against an invasion from the south coast. Chatham is one of the chief ship-building towns of England. Charles Dickens lived some time in Ordnance place, Chatham. The remains of a Roman cemetery have been discovered at Chatham. Pop. of municipal borough 42,250; of the parliamentary borough 92,668.

CHATHAM, N. J., borough in Morris County, 15 miles west of Newark, on the Passaic River and the Lackawanna Railroad. It is mainly a residential suburb of New York, Jersey City and Newark, but has important interests in the rose-growing industry of the district. In 1892 it was incorporated as a village as a city by act of legislature. The electric lighting plant and the waterworks are municipal property. The government is vested in a mayor and council, elected every year. Pop. 2,000.

CHATHAM ISLAND, the most important of the Galapagos Archipelago (q.v.), 600 miles from Ecuador, which owns the group, and uses Chatham, Charles and Albemarle as penal settlements for political offenders. Chatham Island came into international prominence when unsuccessful negotiations were opened with Ecuador in March 1900, to buy it for a Pacific coaling station.

CHATHAM ISLANDS, in south Pacific Ocean, belong to and are 536 miles east of New Zealand. The group, consisting of 29 square miles, are in lat. 44° 7' S.; long. about 176° 49' E. The group is of volcanic origin. Chatham, the largest island, is about 38 miles long and 25 broad. The other islands are Pitt Island, 12 miles long by 8 broad; and Ranga Tira, a mere rock. The harbor of Waitangi, on the west side of Chatham Island, is frequented by whaling vessels, which there supply themselves with fuel, provisions and water. There are few hills in the island, and the highest does not exceed 800 feet. In the interior of the largest island is a brackish lake. The soil is in many places fertile, and crops of potatoes and wheat have been successfully and extensively cultivated and exported. Turnips, cabbages, pumpkins and tobacco are also successfully cultivated. Fish and berries and shores abound in fish, many of them excellent; sharks of formidable size are numerous. Stock raising and seal fishing are prominent industries. The original inhabitants, now nearly extinct, are a cheerful and industrious people. Up to 1900 counting may be said they amounted to some 1,200. In 1911 the population was 453 (234 Europeans and 219 Maoris and Morioris); in 1915 the population was 267 of these 171 were males and 96 females. The Chatham Islands were discovered by Lieut. William Robert Broughton, of H.M. brig Chatham, and taken possession of by that officer in name of his Britannic majesty, 29 Nov. 1791.

CHATT, châ’tê, a wildcat (Felis miltis), ranging from Mexico to Paraguay, in warm lowlands and woods. The body, including the head, is from 24 to 27 inches long, the tail about 14 to 18 inches. The fur is soft and tawny spotted with black. This cat is by some naturalists considered a variety of the margay (q.v.).

CHATILLON-SUR-SEINE, shâ-tê-yôn-sûr-sâ-nil, France, a town, and capital of an arrondissement in the department of Côte d'Or, 45 miles northwest of Dijon, on the Seine. There are interesting mediaeval churches and a castle built by Marmont which is surrounded by a large park. Napoleon held a congress here with the Allies in 1814. Pop. about 5,000.

CHATMOS, an extensive morass, area about 6,000 to 7,000 acres, situated chiefly in the parish of Eccles, Lancashire, England. It is remarkable as being the scene of operations for reclaiming this lake, a branch of the Mersey. Trees are spread out on a large scale in the end of the 18th and beginning of the 19th century; also for offering one more field of triumph to George Stephenson, who carried the Liverpool and Manchester Railway over it after all other engineers had declared the undertaking impossible. The tree branches spread branches of trees and hurdles interwoven with heather on the surface of the bog, and placed a thin layer of gravel over all; upon this sleepers and rails were laid in the ordinary way.

CHATRIAN, shâ-trê-nil, Alexandre. See ERCKMANN—CHATRIAN.

CHATSWORTH, England, the celebrated estate of the Dukes of Devonshire, situated in the parish of Edensor, in Derbyshire. It was among the domains given by the Conqueror to his natural son, William Peveril. It was purchased in the reign of Elizabeth by William Cavendish, who commenced to build a mansion on it, which number, area, 350

Chattohoochee, a river in the northern part of Georgia, rising in the Appala-chian Mountains, and flowing first west and then south, forming, for a considerable distance, the boundary between the above State and Alabama. In its lower course, after the junction of the Flint River from the east, it is named the Apalachicola, and is navigable to Columbus for steamboats. Total course, about 550 miles.

CHATTHOOCHOEE STAGE, in American geology, rocks laid down in older Miocene, or according to more recent authorities, in Oligocene time along the Atlantic coast of what was then the continent of North America. Strata of the year 1837 they amounted to some 1,200. In 1911 the population was 453 (234 Europeans and 219 Maoris and Morioris); in 1915 the population was 267; of these 171 were males and 96 females. The Chatham Islands were discovered by Lieut. William Robert Broughton, of H.M. brig Chatham, and taken possession of by that officer in name of his Britannic majesty, 29 Nov. 1791.

and uncompacted sand, changing to limestones in the south. See Oligocene Series; Tertiary System.

CHATTANOOGA, Tenn., city and county-seat of Hamilton County, an important railroad, trade and manufacturing centre, on the south bank of the Tennessee River, and on the Southern, Central of G., Nashville, C. & Saint L., Cincinnati, N. O. & T. P., Alabama G. S. and other railroads. It is situated near the Georgia and Alabama boundaries, at the base of the Cumberland Plateau, 698 feet above the level of the sea. It is the centre of, and the largest place in, the quadrangle formed by Nashville and Knoxville, Tenn., Birmingham, Ala., and Atlanta, Ga., distant respectively 151, 112, 143 and 137 miles. The lines radiating from Chattanooga terminate in 43 important cities of nine States, and communicate with an area containing one-third of the population of the United States. The district around Chattanooga, as the gateway of the Cumberland Range between the three States, was one of the greatest strategic points during the Civil War, and is historic for many bloody and famous battlefields. To the southwest is Lookout Mountain, commanding a superb view of six or seven States; on the east is Missionary Ridge; and south by east, a few miles away in Georgia, is the field of Chickamauga, now turned by the government into a national military park of 6,000 acres. Adjoining the park is Fort Oglethorpe, a regimental cavalry post in connection with which, for purposes of the World War, there are a regular army camp, medical corps training camp, base hospital, prison for dangerous aliens; also a training camp for line officers, the third group of whom finished the course in April 1918. The medical camp is being enlarged and seems destined to be the chief medical corps training camp of the United States. At the southwest corner of the old city line is a national cemetery, one of the largest in the country, containing 13,362 graves. The whole region is a noted tourist resort, for historic and scenic reasons, served by 98 miles of street railroads, including the celebrated 4,750 feet incline up Lookout Mountain.

Public Buildings.—The city has many fine buildings, among which are the Municipal building, costing $200,000; the Hamilton County courthouse, costing $500,000, of Tennessee marble, a beautiful and imposing structure; the Federal building; the James building; the Hamilton building; the Times and the News buildings; Hotel Patten, costing $1,000,000; Read Hotel; Signal Mountain Inn, which is 2,200 feet above sea-level, although only 40 minutes distant from the business district, with golf, fishing, boating and bathing as attractions; St. John's, costing $150,000; W. W. C. A., costing $100,000; City High School and Central High School; Carnegie Library; Terminal Station, costing $1,000,000; Volunteer State Life Insurance Company building, costing $500,000; and many beautiful churches. The Baroness Erlanger Hospital, Pine Breeze Tuberculosis Sanitarium, Old Ladies' Home, Vine Street Orphans' Home, Frances Willard Working Girls' Home and Kosmos Cottage are the principal charitable institutions. For the benefit of education the city contains the University of Chattanooga, which has now new and modern buildings made possible by a $500,000 endowment; several preparatory schools, including one for girls; and the Chattanooga College of Law.

Trade and Manufactures.—The river here is navigable eight months in the year, and the Mussel Shoals Canal gives unbroken navigation to its mouth by the Chattanooga Packet Company, which operates boats and barges regularly to Ohio River points at a considerable saving in freight over the railroad rates; while northeasterward, steamers run to Kingston, and at high water to Knoxville, 200 miles, by water. But the great and growing importance of Chattanooga is in manufacturing, which it owes to its hydro-electric power derived from the Tennessee and Ocoee rivers (cost of plants $15,000,000), and the adjacent deposits of coal, iron (20,000 tons of coal and 8,100 tons of iron ore are mined daily), clays and many other minerals, and the forests. Articles made from wood, iron, steel and cotton can be manufactured more cheaply in Chattanooga than any other place in the South.

The United States Department of Commerce summary for manufactures shows a consistent increase at the census of 1914, as compared with that for 1909. This census covers only the factories in the corporate city; those in the immediate suburbs are large and increase the real totals very materially. In 1914 the value added by manufacture was $9,503,000, and in 1909, $7,602,000, the increase being $1,901,000, or 25 per cent. The value added by manufacture in 1914 formed 48.4 per cent of the total value of products, and in 1909, 47.4 per cent. The salaries and wages in 1914 amounted to $5,461,000, and in 1909 to $3,955,000, the increase being $1,466,000, or 36.7 per cent. In 1914 the number of salaried employees was 1,173 as compared with 972 in 1909, making an increase of 201, or 20.7 per cent. The average number of wage earners in 1914 was 7,085, and in 1909, 6,410, the increase being 675, or 10.5 per cent. The capital invested, as reported in 1914, was $20,615,000, a gain of $4,490,000, or 27.8 per cent, over $16,125,000 in 1909. The cost of materials used in 1914 was $10,149,000 as against $8,434,000 in 1909, an increase of $1,715,000, or 20.3 per cent. The cost of materials per establishment in 1914 was approximately $36,000, and in 1909 $45,000. The value of products in 1914 was $19,652,000, and in 1909, $16,036,000, the increase being $3,616,000, or 22.3 per cent. These figures cover only the factories in the corporate city. As very many large plants are in the immediate suburbs the industrial statistics of metropolitan Chattanooga are much increased. Chattanooga has a very active Chamber of Commerce with several hundred members; the Chattanooga Manufacturers' Association, embracing 130 of the most important of the city's 300 industries, and housing a permanent exhibit of Chattanooga made goods, showing a majority of the 1,200 varieties made there; the Chattanooga Wholesale Dealers' and Jobbers' Association, Retail Merchants' Association, Builders' Exchange, Business Men's Club, Society of Architects, Rotary Club and other organizations.

Banks.—Chattanooga has 11 banks, including three national banks, representing a total capital and surplus of $5,126,000. During the
year 1909, the bank clearings amounted to $76,882,444.93, while those in 1915 were $120,140,500, or a gain of more than $43,250,000, and in 1917 the total exceeded $100,000,000.

Government and Finances.—Chattanooga has the commission form of government—a board, mayor and four commissioners. The annual expenditures are about $700,000, the average annual item being $100,000 for schools. In 1855 the assessed valuation was $32,000,000, the debt about $3,000,000 and the municipal tax rate 16.50 on a thousand.

Schools, Churches, etc.—Chattanooga's school system has developed with the growth of the city. The pupils number more than 8,500 and the teachers and principals number about 200. Warmer Park is the municipal playground. There are 12 churches in the city.

Population and History.—Chattanooga, originally called Ross Landing, first appears in the census in 1850 with 2,545 people. In the Civil War, being a storm centre, it was nearly destroyed; but as in the case of some other Southern cities, the war was its making. It was an important military post, and the iron industry started in a small mill opened in order that the ruined railroads might be rebuilt. The attention of capital had also been called to its great advantages of situation. In 1870 it had a population of 6,093; in 1880, 12,892; and in 1890, 29,100. The growth of the city was retarded by the general business depression which followed the financial reverses of 1893; but a revival came with the concentration of some 70,000 soldiers there in 1898, and the consequent immense disbursements. Since then it has been rapidly moving forward. The 1910 Federal census credits the city with 44,604 people in the corporate limits, and the 1914 official estimate of the census bureau, with 57,000 in the same area. The directory census, multiple two and two-fifths, gives the city and immediate suburbs over 105,000. The incorporated area is less than seven square miles. The increase in school attendance, post-office receipts, bank clearings, deposits, manufacturing, etc., has been very large in recent years. A number of good industries have been added, some during the business depression. One of the greatest elements of success in expanding Chattanooga's industrial life, since the Chamber of Commerce organized a specialized industrial bureau, has been through analyzing the community needs and encouraging plants to manufacture commodities which have a home market for their products. Some of the important new lines added to the list since the bureau's inception are aluminum plate, stamped enameled ware, box-board paper, glass caskets, roofing, excelsior, handles, shovels, ferro-alloys, skirts, hames and singletees and breakfast foods. Chattanooga now has more than 30 factories producing over 1,200 different articles. The textile industry is developing in a large way at Chattanooga, the city enjoying its full share of resulting from the policy of manufacturing cotton near the cotton fields.

HAL F. WILSE, Secretary of Chamber of Commerce.

CHATTANOOGA, Battle of. At the close of the battle of Chickamauga, Ga., 20 September, the Union army, in withdrawing from the field, having interposed at Rossville, Ga., between Bragg and Chattanooga, advanced into that city the night of the 21st and morning of the 22d, and immediately began to fortify it. Bragg followed on the 22d, and soon established in front of the place, his left resting on the Tennessee River and Lookout Mountain, below the city, his centre extending across the plain to the foot of Missionary Ridge, his right being established at the foot of the ridge and reaching toward the Tennessee River above. The north point of the Lookout Mountain range is three miles southwest of Chattanooga, and Missionary Ridge the same distance east of it, the mountain and the ridge being parallel, running nearly north and south and about four miles apart. The Tennessee River touches the base of Lookout. The city lies to the northeast in a great bend of the river. The advance line of the Confederates was half way between the ridge and the city upon a low intermediate ridge, at the right of which was Orchard Knob, an isolated knoll rising some 60 feet above the plain.

Lookout Mountain commanded the river line to Bridgeport and Stevenson, the main depot of supply. The road was 60 miles over the Cumberland and the adjacent range of Walden's Ridge, all precipitous and barren mountains. The Union army was soon running short of supplies, the fall rains rendering the roads almost impassable. On 19 October, the day that Rosecrans had perfected the general features of a plan for regaining the river line of supplies, he was relieved from command and Gen. Geo. H. Thomas assigned, who at once ordered the preparations inaugurated by Rosecrans to go forward.

Immediately after the battle of Chickamauga General Hooker with the 11th and 12th corps was sent from the Army of the Potomac and arrived at Bridgeport, Tenn., 30 September. Sherman, in camp east of Vicksburg, had been ordered up with four divisions. Grant was sent to take general command. Upon arriving, 23 October, he approved the plans for opening the river, and directed their execution. General Hooker was to advance into Lookout Valley, and a co-operating force from Chattanooga under Gen. W. F. Smith was to seize Brown's Ferry below Lookout Mountain, throw a bridge there and form a junction with Hooker. These movements were successfully executed during 27 and 28 October. The 11th corps (two divisions) and Geary's division of the 12th corps entered Lookout Valley the afternoon of 28 October, the 11th corps proceeding to Brown's Ferry and forming a co-operation with General Smith's troops from Chattanooga. Geary, with six regiments of his division, halted near Wauhatchie Station. At midnight of the 28th Geary was attacked by Jenkin's (Hood's) division, six regiments, of Longstreet's corps, supported by Law's division. Schurz's division coming to Geary's support, Longstreet's troops after three hours' fighting withdrew to the east side of Lookout, and the Wauhatchie or Lookout Valley remained after in Union control. Abundant supplies by the river then reached Chattanooga by a short wagon-haul from Brown's Ferry. On 4 November, shortly after the battle of Wauhatchie, Longstreet's corps was detached by Bragg and sent to Knoxville.

3 View of Downtown Chattanooga from the Courthouse
The battle of Chattanooga, which occurred three weeks later, embraced three days' operations, 23, 24 and 25 November. At the opening Bragg's lines were as already described. Hooker, with Geary's division and Cruft's from the 4th corps of the Army of the Cumberland, occupied Lookout Valley, the Army of the Cumberland and the 11th corps were on the lines about Chattanooga, and Sherman with three divisions had crossed at Brown's Ferry and was concealed behind the hills above Chattanooga and on the opposite side of the river from the city.

General Grant's force for his firing lines was sweeping south they were to clear the ridge and the valley. As the engagement progressed, every feature of this plan was changed by unexpected developments.

At noon, 23 November, General Thomas, being directed by Grant to ascertain if the Confederates still occupied their lines and camps between the city and Missionary Ridge, paraded five divisions in full view of the Confederate positions, which, as was afterward ascertained, was at first supposed to be a review. Wood's division was in the centre advanced, Schurz's and Steinwehr's divisions of the 11th corps were reformed on the left, and Sheridan's and Baird's on the right. At a bugle signal at 1:30 p.m. the centre advanced rapidly, and, after a sharp contest, captured Orchard Knob, and forced the abandonment of the entire line of the Confederates through the centre of the plain, reversed the works at and near the Knob and held them. This was the first day's battle.

The night of the 23d Sherman with three of his four divisions which had reached his concealed camps opposite the city and north of it marched to the North Chickamauga, where 116 pontoon boats awaited him. These were filled with soldiers, floated down the creek to the river and thence to the opposite shore, and by

daylight of the 24th, 8,000 of Sherman’s troops were in line fronting Missionary Ridge, two miles from it, and opposite its northern extremity, and at 1 o’clock the three divisions, and one from the Army of the Cumberland which had covered the movement having crossed, the lines were advanced, and at 6 o’clock a range of unoccupied hills north of and overlooking the north end of Missionary Ridge was occupied without resistance, and strongly entrenched under the supposition that these formed the north end of the ridge contemplated in the order of battle. The mistake was due mainly to the misty weather, and the omission of any reconnaissance.

At 2.30 P.M. Cleburne’s division arrived at the north point of the ridge and entrenched.

General Thomas, having obtained Grant’s permission to make a demonstration against the Confederate position on Lookout, Hooker made ready to move at an early hour on the 24th.

The Confederates held the top of the mountain, which was a 1,700 feet above the valley, protected by perpendicular palisades varying from 75 to 250 feet high. From the foot of these walls of rock the mountain sloped westward to Hooker’s position in Lookout Valley eastward to the plain south of Chattanooga, while its north slope descended to the Tennessee River opposite Moccasin Point. It was approximately a mile and a half from the foot of the palisades to the valley. The battle took place on these slopes. No Units of the Corps reached the top of the mountain during the engagement. The morning of the 24th, Brown’s and Pettus’ brigades of Stevenson’s Confederate division, with a battery of four Napoleon’s occupied the summit, and Walthall’s and Moore’s brigades of Cheatham’s division the slopes of the mountain, Walthall’s holding the western slope and Moore’s the northern.

Hooker’s forces consisted of three brigades of Geary’s division of the 12th corps, two brigades of Grant’s division of the 4th corps, and two brigades of Osterhaus’ division of Sherman’s army. This latter division had been prevented from following Sherman over the river by the breaking of the pontoon bridge at Bridgeport. Hooker’s aggregate strength was something over 9,000. Walthall’s brigade, which sustained almost the entire attack until the western and northern slopes had been carried, did not number over 1,700. There were 250 men of Moore’s brigade on picket, which were mostly captured early in the engagement. The head of Hooker’s column crossed Lookout Creek at Light’s Mill near Wauhatche, at 8 o’clock in the morning, and, concealed by the fog which hung over the mountain, marched directly to the western slope until the head of the line reached the base of the palisades. His line then faced toward the north point of the mountain, distant about two miles.

After an advance of a mile and a half with Geary’s brigades, Cobham’s, Ireland’s, and Candy’s, in advance, part of Rear’s of Grant’s division in reserve, the troops struck the left flank of Walthall’s line protected by slashed timber. This was carried, and in the face of stout resistance the Confederates were driven around the north point of the mountain, and across its northern slope. As Geary’s attack opened, first Grose of Cruft’s division and next Wood and Williamson of Osterhaus’, successively joined the left of the lines, and advanced with the support of the troops on the slopes of the mountain. Until the northern slope had been carried to the Craven House, Walthall had no assistance. Moore advanced as he was being pushed back from the Craven House, but was immediately driven. Pettus marched at 1 o’clock and relieved Walthall after he had withdrawn some 400 yards from the Craven House. This enabled Walthall to procure ammunition, reform and take his place on the line again. This position was held until 3 o’clock in the morning, when, the troops and supplies from the top having been withdrawn and safely started across the plain for the Missionary Ridge line, this final line was also withdrawn, and the mountain abandoned. The troops on the summit, on account of the fog, could do little damage to the Union lines. Hooker was materially assisted by batteries on the elevated points in Lookout Valley, and those across-the river on Moccasin Point, which swept the northern slope. The morning the Union forces occupied the summit.

The capturing of Lookout Mountain decided General Bragg to withdraw his whole army from the plain to the crest of Missionary Ridge, except as heavy picket forces were left in the entrenchments at the base of the ridge.

Hooker’s losses at Lookout, and the next day at Missionary Ridge, which were small but not definitely reported, were: killed, 81; wounded, 330; captured, 22; killed, 51; wounded, 177; Walthall lost 845 captured, mostly from his long picket line at the base of the mountain. Moore’s missing were 199, and Pettus’ 9.

During the night of the 24th and the early morning of the 25th, Bragg concentrated his army on Missionary Ridge, and in the earthworks at its base. This was his first occupation of the crest of the ridge in force. His new line extended from Rossville, a distance of eight miles to the north end of the ridge, his divisions from Rossville northward being Stewart’s, Breckinridge’s (Bate’s), Hindman’s (Patton Anderson’s), Cheatham’s, Walker’s, Stevenson’s and Cleburne’s.

The battle of the 25th opened soon after 7 o’clock by an assault of Sherman upon the north end of the ridge, defended by Cleburne. Sherman’s force consisted of his own divisions of Morgan L. Smith, Hugh Ewing and John E. Smith, with the divisions of Jeff. C. Davis from the Army of the Cumberland, and Schurz and Steinwehr of the 11th corps. While the four brigades of Corse, Mathies, Raum and Giles A. Smith reached the crest at different periods, none was able to maintain position there, though Corse and Smith held on stubbornly to the crest until toward evening, when all were driven from the slopes. The fighting of the troops sent in was persistent and most courageous, but Cleburne, at first alone, and later supported by Stevenson’s division and division in reserve, the troops struck the left flank of Walthall’s line protected by slashed timber. This was carried, and in the face of stout resistance the Confederates were driven around the north point of the mountain, and across its northern slope. As Geary’s attack

opened, first Grose of Cruft’s division and next Wood and Williamson of Osterhaus’, successively joined the left of the lines, and advanced with the support of the troops on the slopes of the mountain. Until the northern slope had been carried to the Craven House, Walthall had no assistance. Moore advanced as he was being pushed back from the Craven House, but was immediately driven. Pettus marched at 1 o’clock and relieved Walthall after he had withdrawn some 400 yards from the Craven House. This enabled Walthall to procure ammunition, reform and take his place on the line again. This position was held until 3 o’clock in the morning, when, the troops and supplies from the top having been withdrawn and safely started across the plain for the Missionary Ridge line, this final line was also withdrawn, and the mountain abandoned. The troops on the summit, on account of the fog, could do little damage to the Union lines. Hooker was materially assisted by batteries on the elevated points in Lookout Valley, and those across-the river on Moccasin Point, which swept the northern slope. The morning the Union forces occupied the summit.

The capturing of Lookout Mountain decided General Bragg to withdraw his whole army from the plain to the crest of Missionary Ridge, except as heavy picket forces were left in the entrenchments at the base of the ridge.

Hooker’s losses at Lookout, and the next day at Missionary Ridge, which were small but not definitely reported, were: killed, 81; wounded, 330; captured, 22; killed, 51; wounded, 177; Walthall lost 845 captured, mostly from his long picket line at the base of the mountain. Moore’s missing were 199, and Pettus’ 9.

During the night of the 24th and the early morning of the 25th, Bragg concentrated his army on Missionary Ridge, and in the earthworks at its base. This was his first occupation of the crest of the ridge in force. His new line extended from Rossville, a distance of eight miles to the north end of the ridge, his divisions from Rossville northward being Stewart’s, Breckinridge’s (Bate’s), Hindman’s (Patton Anderson’s), Cheatham’s, Walker’s, Stevenson’s and Cleburne’s.

The battle of the 25th opened soon after 7 o’clock by an assault of Sherman upon the north end of the ridge, defended by Cleburne. Sherman’s force consisted of his own divisions of Morgan L. Smith, Hugh Ewing and John E. Smith, with the divisions of Jeff. C. Davis from the Army of the Cumberland, and Schurz and Steinwehr of the 11th corps. While the four brigades of Corse, Mathies, Raum and Giles A. Smith reached the crest at different periods, none was able to maintain position there, though Corse and Smith held on stubbornly to the crest until toward evening, when all were driven from the slopes. The fighting of the troops sent in was persistent and most courageous, but Cleburne, at first alone, and later supported by Stevenson’s division and division in reserve, the troops struck the left flank of Walthall’s line protected by slashed timber. This was carried, and in the face of stout resistance the Confederates were driven around the north point of the mountain, and across its northern slope. As Geary’s attack

opened, first Grose of Cruft’s division and next Wood and Williamson of Osterhaus’, successively joined the left of the lines, and advanced with the support of the troops on the slopes of the mountain. Until the northern slope had been carried to the Craven House, Walthall had no assistance. Moore advanced as he was being pushed back from the Craven House, but was immediately driven. Pettus marched at 1 o’clock and relieved Walthall after he had withdrawn some 400 yards from the Craven House. This enabled Walthall to procure ammunition, reform and take his place on the line again. This position was held until 3 o’clock in the morning, when, the troops and supplies from the top having been withdrawn and safely started across the plain for the Missionary Ridge line, this final line was also withdrawn, and the mountain abandoned. The troops on the summit, on account of the fog, could do little damage to the Union lines. Hooker was materially assisted by batteries on the elevated points in Lookout Valley, and those across-the river on Moccasin Point, which swept the northern slope. The morning the Union forces occupied the summit.

The capturing of Lookout Mountain decided General Bragg to withdraw his whole army from the plain to the crest of Missionary Ridge, except as heavy picket forces were left in the entrenchments at the base of the ridge.

Hooker’s losses at Lookout, and the next day at Missionary Ridge, which were small but not definitely reported, were: killed, 81; wounded, 330; captured, 22; killed, 51; wounded, 177; Walthall lost 845 captured, mostly from his long picket line at the base of the mountain. Moore’s missing were 199, and Pettus’ 9.
withdrawal of Confederate forces from his front. The four divisions which were ranged along the Orchard Knob line were, from left to right: Baird, Wood, Sheridan and Johnson. The line was two and a half miles long, and faced the ridge at distances from three-quarters to a mile from it. There were 11 brigades and 89 regiments in the lines as prepared for the assault. The formation was such as to present the appearance of being four lines deep. At a signal of six cannon shots from Orchard Knob the four divisions rushed for the earthworks at the foot of the ridge. On the summit opposed to this advance were 13 brigades and 16 batteries. The cannonading of nearly 100 guns from the crest was terrific, and the line was soon under rifle-fire from the works at the base, but the entire line of earthworks was captured as soon as the troops by running could reach them. Reforming their lines in the earthworks, Baird's division on the left and Johnson's on the right began the storming of the ridge. In Baird's division the horses of field officers had been left behind at the start, because as he announced he had intimations that the intention was to go to the summit, and it was easy to see that the stormers were too weak for mounted men to ascend. In the same way Johnson's men were informed at the start that the movement was to be an attack on the ridge. At the centre in Wood's and Sheridan's divisions the orders as understood were to stop at the rifle-pits, but the men ignored these and started forward, and soon orders were received to go to the top. The whole line of brigades gained the crest so nearly together that it has always been difficult to determine which, if any one, was the first.

The long lines of the storming party moved up the slopes with few checks, and in an hour had carried three miles of the crest and captured 37 guns and about 2,000 prisoners.

Just as the orders were given Thomas for this assault, the Hoke, who had descended Lookout at 1 o'clock and started to attack the south end of the ridge in Rossville Gap, reached that position. He had been detained by the necessity of rebuilding a bridge over a creek. He at once sent Osterhaus's division through the gap and turned it north along the east side of Missionary Ridge. Cruft's division assaulted and carried the south end of the ridge in the gap while Geary moved along the western base of the ridge and finally ascended to the crest, reaching it soon after the right of Thomas' assault had occupied it.

As Baird's division reached the crest, it turned northward and became hotly engaged with Wallhall's brigade, assisted by Jackson's and Moore's, of Cheatham's division. Darkness coming on, the fighting ceased. Wallhall's stand across the ridge had made it possible for Cleburne's, Stevenson's, Walker's and Cheatham's divisions to withdraw in order and unmolested. The centre and left retreated in general confusion, Bate's division, however, soon rallying for a stout resistance as rear guard.

Two myths of the battle have gained general currency. The movements of the Confederate troops which started from Lookout Mountain and were early supposed to have given rise to the report that Bragg was weakening his centre to concentrate against Sherman. But not a single soldier or gun was sent from the centre against Sherman during the day. On the contrary, three brigades, John C. Brown's, George Maney's and Alfred Cummings', were hurried from Sherman's front to resist the assault of General Thomas at the centre.

The second long perpetuated error is that when General Sherman advanced to the unoccupied hills beyond the north end of Missionary Ridge he had carried the ridge to the tunnel as was contemplated in the order of battle. He did not secure any portion of the ridge during the battle, although positions which were not fought desperately. Eleven brigades of his force were held as reserves and were not engaged, General Sherman thinking it necessary to guard against an attack upon his left. Bragg was promptly pursued. His rear guard made a stubborn stand at Ringgold Gap, but his army was first rallied at Dalton, where it remained until the opening of the Atlanta campaign in the spring of 1864.

The losses at Chattanooga, including the three days' battles and the affairs in pursuit to Ringgold, were for Grant: Killed, 753; wounded, 4,722; missing, 349; total, 5,824; for Bragg: Killed 361; wounded, 2,180; missing, 4,146; total, 6,687. Consult ['War of the Rebellion Records' (Vols. XXX and XXVI, Parts 1 and 2].

H. V. Boynton.

CHATTLE (O.F. chatel, property), property movable and immovable, not being freehold. The word chattels is originally the same word with cattle, all property being reckoned in early periods by the number of heads of cattle possessed, or their equivalent. The word 'capital' also has the same origin. From the fact that cattle were reckoned by the head, it appears probable that they were called caputia (from the Latin caput, the head), which became contracted by syncope into capita, and then capitalia, whence the legal term cattala, and our 'chattels' and 'cattle.' Hence the word chattels signifies originally only movable property, but in course of time came to be applied to all property not held in feudal tenure. Chattels are divided into real and personal. Chattels real are such as belong not to the person immediately, but dependently upon something. Any interest in land or tenements, for example, is a real chattel; so also is a lease, a rent for a term of years, an interest in advowson, etc. Chattels personal are goods which belong immediately to the person of the owner, and include all movable property. Chattels usually pass to the executor, except such, for instance, as trees, which may not be severed from the freehold, and therefore pass to the heir. But objects forming part of the real estate may become chattels upon being separated from it, as for example, ore, oil, timber, etc. Chattels personal, at common law, are transferable by agreement, when the transfer is a consideration; but if the transfer is made through a gift, the delivery of the chattel is necessary to confer title on the grantee.

CHATTLE MORTGAGE, a transfer of personal property as security for a debt in such manner that upon default the chattels become the property of the mortgagee. The absence of statute no special form is necessary, the terms depending to a great extent on the intention of the parties. Between the parties to a
mortgage, a delivery is not necessary, but to be binding on creditors, delivery to the mortgagee or notice to the creditors is necessary. In mortgage, title and possession pass; in pledge, possession passes, but title remains in the pledgor. At common law it was necessary for the mortgagor to be in possession of the mortgaged property at the time the mortgage was given, so as to be binding against creditors; but if the mortgagor acquired title after the mortgage had been given, it was good as between the parties, but not as to creditors. The quiet or chattel mortgage is considered in the nature of an executory agreement. See MORTGAGE.

CHATTERERS, formerly the popular name of certain insessoral birds of the family Ampelidae, genus Ampelis, as the Bohemian chatterer or waxwing (A. garrulus) and the chatterer of Carolina (A. cedrorum). Now the Cotingidae. See WAXWING.

CHATTERTON, Edward Kerke, English journalist and author: b. Sheffield 1878. He was educated at Oxford, went to London and entered journalism, wrote on art and the drama for several journals; became sub-editor of the Art Record in 1902; sub-edited John Ruskin’s manuscripts for the Library edition of Ruskin 1902-03; was London correspondent of the Sheffield Weekly Independent 1902; sub-editor of the Daily Mail and editor of the Lady’s Realm 1904-06, and its dramatic critic in 1904-08. In September 1914 he received a temporary commission in the Royal Naval Volunteer Reserve and was appointed to the command of a patrol yacht. His published works include ‘T. Sidney Cooper, R. A.: His Life and Art’ (1903); ‘Sailing Ships: The Story of their Development from the Earliest Times to the Present Day’ (1900); ‘The Marriages of Mayfair’ (1909); ‘Modern Journalism’ (1909); ‘Steamships and their Story’ (1910); ‘Down Channel in the Vivette’ (1910); ‘The Romance of the Ship’ (1910); ‘The Boy’s Book’ (1910); ‘Story of the British Navy’ (1911); ‘Fors and Aft’ (1911); ‘Ships and Ways of Other Days’ (1913); ‘The Romance of Piracy’ (1914); ‘Daring Deeds of Famous Pirates’ (1916).

CHATTERTON, Thomas, English poet: b. Bristol, 20 Nov. 1752; d. there, 25 Aug. 1770. At about 10 years of age he acquired a taste for reading, which became a ruling passion. Melancholy gave way to vivacity and vanity, and dreams of immortality. His father had accidentally obtained possession of a number of old parchments of the 15th century. Many of these were put to domestic uses in the family or served in the making of dolls, but several fell into the hands of Chatterton, who after a few days declared that he had discovered a treasure. He then procured glossaries of the old dialects of the country, and in 1768, when the new bridge at Bristol was completed, he inserted a paper in the Bristol Journal (A Description of the Friar’s First Passing Over the Old Bridge, Taken from an Ancient Manuscript). He was then but 16 years old. Upon being questioned as to the manner in which he had obtained it, he finally confessed, to the possession of several valuable old manuscripts, taken from an old chest in Redcliffe Church. He had been engaged for a year in the composition of several poems, which he attributed to different ancient writers, particularly to one Rowley. In 1769 he ventured to write to Horace Walpole, who was then engaged upon his ‘Anecdotes of Painters,’ giving him an account of a number of painters who had flourished in Bristol, which Ch. of the mortgagor at the time the mortgage was given, so as to be binding against creditors; but if the mortgagor acquired title after the mortgage had been given, it was good as between the parties, but not as to creditors. The quiet or chattel mortgage is considered in the nature of an executory agreement. See MORTGAGE.

CHATTOPADHYAYA, šhát-tôp-ádhy-á, Bankim Chandra, Indian novelist: b. 27 June 1838 at Katalpara in the District of Twenty-four Parganas, Bengal, India. A converted Chatter, Bankim Chandra Chattopadhyaya, Bankim’s father, was an official in the service of the government. Bankim Chandra was educated both at Hugli College and at the Calcutta Presidency College. He was the first to receive the degree of Bachelor of Science from the Calcutta University in 1858. In recognition of his services as a magistrate, the British authorities conferred on him the titles of Rani Bahadur and C.I.E. He was fond of literature even as a boy. At the age of 15, he published a book of poems entitled ‘Jatî O Manash.’ His first novel, ‘Durgesh Nandini,’ was published in 1864. This book created a literary sensation in Bengal and the author was hailed as a great literary genius. Tagore has won an international fame, but Bankim is called in Bengal, “The Emperor of Bengali Literature.” His principal novels are ‘Durgesh Nandini,’ ‘Kapal Kundala,’ ‘Mrinili,’ ‘Bish-Briksha,’ ‘Chandra Shekhar,’ ‘Krishna Kanter Will,’ ‘Debi Chowdhurani,’ ‘Ananda Math’ (‘Sri Ramkutir Shramtantrik’ or ‘Rajani,’ ‘Indria.’ Two of his most important religious books are ‘Krishnacharit’ and ‘Dharmatattva.’ Ever since the advent of the nationalist movement in India, Bankim Chandra’s ‘Ananda Math’ has become exceedingly popular, and is said to have played a role in the Sannyasi rebellion of 1772. The famous national song of India, “Bandh-Matarani,” appears in this book. This was used, as it is to-
day, as a rallying cry against the English. The song, in part, reads thus translated:

Mother, hark! Thou with sweet springs flowing,
Thou fair fruits bestowing,
Gale with sprays smelling,
Green with corn-crops growing,
Yet with all this power now,
Mother, wherefore powerless thou?

This song is a source of inspiration to the Nationalists of India. In his literary life, Bankim Chandra was influenced by Iswar Chandra Vidyasagar. And Bankim influenced Rabindranath Tagore. In elegance of language and in loftiness of thought, Bankim's novels can be counted among the very best in any literature.

CHAUCER, cha’ster, Geoffrey, English poet, "the father of English poetry": b. London about 1340, probably rather after than before; d. 1400. The traditional date for his birth, 1328, is disproved by known facts in his life. His father, John Chaucer, a wine-merchant, was known to the court, and therefore was able to obtain for his son a position as page in the household of the Count of Ulster, daughter-in-law of Edward III; here we first learn of Geoffrey, in 1357, and here he may have acquired much of his rather extensive though not very methodical education, besides accomplishments and experience. In 1359 he served in the war in France; he was taken prisoner, but was ransomed in 1360 for a sum which indicates powerful and appreciative friends. Throughout his life he frequently received pensions and gifts from the Crown and from John of Gaunt. During the next decade, while he was in the twenties, we know little of him, except that during part of the time at least he was at court as Yeoman of the king's chamber, an office which doubtless required more dignified social as well as humble domestic duties. In or before 1366, probably, he married; his wife, Philippa, was a damsel of the queen's chamber, and was, at least certainly a sister of Katherine de Swynnford, who lived in various capacities, finally as wife, in the household of John of Gaunt. This marriage doubtless strengthened the tie which we know existed between the poet and the Prince, though there are indications that Chaucer's wedded life was not altogether comfortable. During this time Chaucer must have written more or less poetry on French models; little of it has survived, however. Chaucer was not a precocious poet. From 1370 to 1380 he went on numerous diplomatic missions to the Continent, which he seems to have discharged with tact and judgment. Of these journeys those to Italy are of particular interest. On the first he was absent for six months in 1372 and 1373, with three or four months in France; and perhaps elsewhere; his main business was to arrange for an English port to receive Genoese trade. The numerous attempts which have been made to prove that he may have met Petrarch in Padua are opposed by a great weight of probability. He certainly learned the Italian language, and must have brought home Italian manuscripts. In 1378 he was in Lombardy for a month or two conducting negotiations with the noted condottiere Sir John Hawkwood and with the Lord of Milan. In 1374, between the two journeys, he received the office of comptroller of the custom and subsidy of wool, hides and woollens from the port of London, which kept him closely applied to its duties for nearly 11 years, except when he was away, so much so that at this time he rented a house built on the city-wall over Aldgate, 10 minutes' walk from the custom-house. In 1382 he received an additional customs office and in 1385 permission to discharge his duties through a deputy. It was probably in consequence of this that he moved into the quiet country, down the river at Greenwich whence he would come up to town, when occasion required it, by boat with the tide or on horseback. By nature vivid in energy and interest, he lost no time in devoting part of his new leisure to public duties. In 1385 he became justice of the peace for Kent and in 1386 he represented the county in Parliament. Chaucer's intimate attachment to the court party is illustrated by the fact that during the years 1386-89, when Richard II was deprived of absolute power, Chaucer was in misfortune; in 1386 he lost his custom-house positions, and for a time he was clearly in straitened circumstances. In 1387 his wife seems to have died. With the return of the royal party to power in 1389 Chaucer's fortunes revived, and he received the office of clerk of the king's works at Westminster and elsewhere. This he held only two years, and from then till his death little is known of his occupations. At times, in spite of pensions and the like, he seems to have been again in hard circumstances, was several times sued for debt, and wrote more than one poetic appeal for aid. In 1399 he rented a house in the garden of Westminster Abbey for a term (oddly) of 53 years or until his death. On 5 June 1400, the records of the payment of his pensions cease, and there is reason to doubt that he died late in that year, as has always been understood. It was his burial in the south transept of Westminster Abbey, followed two centuries later by that of Spencer, who was at one time Lord Keeper and Cornet. To judge from a more or less authentic portrait of him produced under the direction of his disciple Holcelve, and from his description of himself in the 'Canterbury Tales,' he was short of stature, fair, and late in life rather stout. Everything testifies to his charm of personality and character. The most convenient and essential thread by which to trace Chaucer's literary development is the growth of his originality. The usual division of his works into French, Italian and English periods is misleading and contradicts the facts. We may fitly begin with his translation of the 13th century French amorous and satirical allegory 'Le Roman de la Rose,' which he mentions in the 'Legend of Good Women,' and which was perhaps translated into English earlier than 1386, probably by many years. The extant incomplete Middle English translation was never attributed to Chaucer until 1532, but there is good reason to believe that of its three fragments the first, consisting of 1,705 lines, may be by him. The second, which originally was longer we do not know. It is certain that
the French poem influenced him strongly for many years, by its vision-form, its allegory and its park-like scenery; and longer yet by its tales, its satire and its pithy sayings. His first important original and first artificial French poetry is the 'Book of the Duchess,' written in 1369 to commiserate John of Gaunt on the death of Blanche, his first wife. It is undeniably pretty and fanciful, but it is strongly under the influence of 'Le Roman de la Rose' and other artificial French poetry, is ill-proportioned and is far from the directness and naturalness of Chaucer's later literary manner. Had he died in 1370 he would be obscure and probably unknown as a poet. Other poems which may date from much the same period, since they show no Italian influence and little originality, are the 'Complaint to Pity,' which shows him as a poetical lover in the artificial French mode, and the 'A, B, C,' translated from Dégulle-Vincent, and the 'Prose Translation of De consolatione philosophiae' of the late Roman philosopher Boethius, though usually deemed much later, may date from 1370–72.

Chaucer's three or four months in Italy in 1373 gave him literary breadth, independence and ideals. Before this, the only literatures with which he shows familiarity are the ancient Latin and the French. But the conditions, traditions and manners of poetry among the Romans were so different from those of Chaucer's own day and land, and his own temperament was so unlike that of the ancient Latin poetry which he had read, that he could respond to it far less readily than, for example, Dante did. The literary tradition which it was inevitable that he should begin by following was the French. But mediaval French poetry was in general either undignified and extemporaneous in manner, like the romances, or artificial, like the allegory. In Italy, in the works of the three great Trecentisti, especially Dante and Boccaccio, he found literary work which was contemporaneous in its interest but which had assimilated what the Romans had to teach,—Christian and romantic poetry written in a vernacular language. The influence of the 13th century Latin prose 'Légenda Aurea' was more immediate. The poetic English than French was, and of a more dignified yet natural character than was usual in French. It was inevitable that for a time he should be greatly under its influence; even though certain French modes and influences abode with him until the end, and though the differences between his two masters tended finally to free him from the domination of both and to leave him independent.

The most important of Chaucer's poems based on the Italian is his longest single poem, the 'Troilus and Criseyde.' There seems to be strong reason to deem it also the first, written 1373–77, though it is usually regarded as dating from about 1380–83. This story, of Criseyde's slow acceptance of Troilus' love, and quick transference of hers to Diomed, is a very free translation and expansion of Boccaccio's psychological epic 'Il Filostrato,' to which it must be admitted that much of the merit of Chaucer's poem is due. The traditional story is a prehistoric outgrowth on the Troy-sage. Criseyde is ultimately the same person as Homer's Briseis, but her love-story first appears in Benoît de Saint-Maur's 12th-century French poem 'Le Roman de Troie.' Less than a third of Chaucer's lines are translated from the Italian, and he has made important changes in the characterization and some in the plot.

The poem is too long and its analysis of emotion too difficult to account for. It shows humor, much sympathetic penetration and skill in dialogue and in situation, and has been called one of the most beautiful long poems in the language.

Chaucer's next important poem was probably the 'House of Fame.' It shows markedly in detail and sometimes in plan the influence of Dante's 'Divina Commedia,' though it should hardly be called an imitation or parody of it. The poet in an allegorical vision is carried by an eagle through interstellar regions to the dwelling of Fame, where he learns of the capriciousness of that goddess. The poem is ill-proportioned, rambling and sometimes confused and pointless, but in a high degree is free, fanciful and humorous. Of special interest are the glimpses it allows us of Chaucer's own circumstances and way of life. It is usually assigned to about 1384, but may have been written as early as 1379.

Much of the same merits, without some of these faults, make the 'Parliament of Fowls' one of the most attractive of Chaucer's lesser poems. It is almost certainly a complimentary celebration of the betrothal of Richard II to Anne of Bohemia, and would therefore date from 1381. The noble female eagle represents the future queen; of the three male suitors, the noble tercelet of course is the King, and the other two are two German princelings, for her marriage to whom during her early childhood there had been negotiations, which for literary reasons Chaucer makes contemporaneous. The poem is rich in its imagery, fanciful though not wholly original, in its plan, realistic in its humor and melodious in its verse (especially the roundel at the end).

Two other early poems Chaucer later included in the 'Canterbury Tales,' in each case without obliterating traces of their earlier history. The first is the 'Life of Saint Cecilia,' now the 'Second Nun's Tale.' This sweet and sympathetic story of the marriage of the Virgin and her husband with the legend of martyrdom was derived from the 13th century Latin prose 'Légenda Aurea.' The far more important 'Palamon and Arcite,' which took the first place among the 'Canterbury Tales' as that of the Knight, is a condensed adaptation of Boccaccio's epic 'Il Teseide.' It may probably have been written about 1384–86; assuredly not very much earlier. The idea, long current, that it was written early in the form of seven-line stanzas, and was recast in the couplet-form for the 'Canterbury Tales,' is disproved by both probability and evidence. An outgrowth on the Greek story of Theseus and the Minotaur, the poem narrates the rivalry of the imprisoned Theban princes for the love of Emily, the sister-in-law of Theseus. It is less intensive and psychological than the 'Troilus,' but is a brilliant romance of picturesque incident, now gay, now pathetic, and (for all its Athenian location) one chief source whence modern romantic writers drew their ideas of medieval love.

Among Chaucer's minor works, written at various times, mention should be made of several. The 'Complaint of Mars' is probably an allegory on a certain court-scandal. The
From his sense of confinement in the Legend Chaucer emerged directly, in 1387, into the multifarious freedom of the Canterbury Tales, the greatest collection of narrative poems in the world's literature. The frame-story, as it is often called, many subordinate tales fitted into the main plot, but it is of personal origin, but was familiar in mediaeval Europe; Boccaccio's Decameron, often wrongly assumed to have been Chaucer's model, is only one of several such collections, and it is most unlikely that Chaucer was familiar with it. Nor is there any good reason to suppose that the poem originated in any actual pilgrimage made by the poet. His design is no less original than it is simple. At the Tabard Inn, Southwark, on 16 April, about 30 pilgrims assemble, drawn from every class of middling English society, and the day after set forth on their 60-mile ride, lasting four or (more likely) three days, to the tomb of Saint Thomas à Becket in Canterbury Cathedral, one of the most popular shrines in mediaeval times. The inn proposes that by way of pastime they shall tell tales on the ride, and that on their return the teller of the best shall be given a supper, at his own inn, he is careful to stipulate. These pilgrims are described with immortal charm in a General Prologue, which appears from 1387 and is Chaucer's greatest work; its combination of sparkling realism, pungent satire, rich and delicate humor, penetrating knowledge of human nature and of the world, catholic and democratic sympathy, graphic and pathetic style and abundant and essential poetry has never been equaled. Of the pilgrims about a third are connected with the Church, and of them Chaucer has little good to say, except for the Clerk and the Humle but upright Parson, the perfection of whose character atones for all of Chaucer's satire on the Church. Among the others, the poet writes with a particular fondness of the military class, represented by the Knight and his young son; and with tolerant satire and an unerring eye for typical features, of the professional and mercantile classes.

Chaucer's original plan called for two tales from each pilgrim on the journey to Canterbury and as many on the return, together with an account of their interaction. The original plan was changed to the pilgrimage. Of this prodigious design he completed only about a fifth, 24 tales in all, several being incomplete, scattered over the whole journey to Canterbury. Most of the tales are connected with each other by passages, usually called prologues and links, in which the narrative of the pilgrimage is carried on, and which contain some of the best and liveliest writing in the poem. Several of the characters, such as the Pardoner and the Wife of Bath, reveal their own views and characters with extraordinary frankness; between others there are lively quarrels; tiresome tales are twice broken off by weary auditors; as the party is nearing Canterbury they are joined by a rascally canon who makes a dishonest living by feigning to practise alchemy, and whose sardonic and frightening master away by his indirect loquacity, entertains the company with a tale of another such impostor: throughout, commenting and keeping things harmonious and lively, moves the train's dear master, the Host of the Tabard Inn, the self-appointed personal conductor of the party.
Of the tales each is in general admirably adapted to the person who tells it; the pious tell of religion, the soldiers of chivalry, the vulgur of licentiousness. Most of them fall into well-recognized classes of medieval narrative poetry. The tales of the Knight, Squire, Wife of Bath, Friar, Summoner, Clerk, and the Nun's Priest are the group that has been most extensively and continuously studied (not wholly the same as the nine “groups” in modern editions, which do not seem quite to fit the facts), but that even they were by no means put in their final form. Chaucer's intentions as to arrangement can be seen at the growing by references to times, tales already told and such places along the road as Rochester, Sittingbourne and the Bleau Forest, but for every group of tales he may not have decided on the position, and the arrangement of modern editions may represent rather what he would have done than what he did. Some parts of the work were certainly known to the world before the author's death, and others may have been; but it seems very unlikely that the poem as a whole, as we have it, was put forth otherwise than by Chaucer's literary executors. The arrangement of none of the manuscripts can agree with his intention, and there are many other evidences that his death determined, as it were, a fortuitous end in some veracious sentence. Hardly any of the tales are original in their groundwork; originality in plotting was even less regarded as desirable in the Middle Ages than by Shakespeare; and they are of various and remote origins. The tales of the Squire, Merchant and Pardoner are ultimately Oriental; those of the Man of Law, Wife, Squire, and Clerk are moral tales of various kinds. The tale of the Nun's Priest is a marvelously witty beast-fable; the Physician's is the Latin story of Virginius, ultimately from Livy; the Ploughman's is the Latin story of Virginius, ultimately from Livy; the Ploughman's is the Latin story of Virginius, ultimately from Livy; the Wife of Bath's is the Latin story of Virginius, ultimately from Livy; the Clerk's and perhaps Franklin's are more or less rationalized fairy-stories, perhaps originally Celtic; the Monk's patterned after Boccaccio's ‘De Casibus Virorum Illustrium,’ is drawn from the Bible, Roman writers, Boccaccio and others; most of the fabliaux are probably developed from short humorous French poems, and the monk's no parallel has been found, and it may be based on fact; the Nun's Priest's is based on some branch of the Old French 12th-century animal-epic 'Le Roman de Renart'; the story of Melibea comes, through the French, from the Latin of the Italian Judge Albartano of Brescia; and the Parson's is from some refacimento of works by two theological writers, Raymond of Pennafort and Peraldus.

Chaucer probably worked on the ‘Canterbury Tales’ near the time of his death. The order and dates of the writing of most of them have not been determined, but there is little reason to believe that any except the Knight's and Second Nun's antedated the beginning of the poem as a whole. It is clear that the order in which they are now printed is far from being the order in which they were written; that the work was extended and filled in at various times and in divers manners, and that it was by a continuation of this process of inserting and joining the poems that Chaucer intended to complete the poem and make it continuous. In gradually building up the work Chaucer did not cover his tracks, and in several cases a change of plan is evident, for he was not always a careful polisher and reviser. A study of the 60 or more manuscripts of the poems shows a probability that by supplying the connecting links he had drawn the work together, at the time of his death, into eight volumes or continuous fragments.
lyric; the romances he knew, but their thin extravagance did not greatly appeal to him. In his best days, what he derived from literature was chiefly an ideal of style, his plots and occasional ornament. What makes his poetry vital and individual,—characterization, vivid episode and situation, descriptive touches of people and things, vivacious and penetrating side-thrusts or obiter dicta, humorous and satirical lights and flashes—derives from his intense interest in life, and his vast endowments of humor and observation. His most characteristic humor consists in odd juxtapositions of ideas and in the bold, spontaneous minuteness of his naturalness. The pleasurable effect of all is doubled by his spirit of bonhomie, tolerance and charity. The licentious character of some of his tales is due in part to the frankness of the time, in part to his dramatic instinct for the sort of tale which certain characters would be likely to tell, in part to his hearty appreciation of humor wherever found. He was not naturally romantic, but naturalistic, and investigation shows more and more that the faithful and naive reflection of contemporaneous conditions in his works, especially the 'Prologue' of the 'Canterbury Tales,' is quite equal to his nice observation of characteristic acts and habits. The thoroughly romantic and idealistic character of most of the literature of the Middle Ages and art of the Middle Ages throws Chaucer's individuality into high relief, and gives the modern a peculiar sense of kinship with him.

Chaucer's style carries on the tradition inherited by the later Middle Ages of a poetry orally sung or recited, yet modified by the more dignified manner which he learnt from the Italians. Hence his combination of informality with amenity, which gives him a magically gracious ease. It is this, with his perfect freedom from artifice, with his complete frankness, his instinct for a situation, his readiness to vary his mood, and his knowledge of what to select and (usually) what to omit, that makes him a consummate narrative-poet. Of all English versifiers he is one of the most melodious, provided a reader understands the chief differences between Middle and Modern English,—that the vowels have their Continental sounds, that in general all letters are pronounced (including especially the final e) and that many French words are still accented on the last syllable. His chief verse-forms, in order of date and increasing excellence, are the 8-syllable couplet, the 7-line stanza and the 10-syllable couplet; the two latter he was the first to use in English, having adopted and perfected them from the French.

Chaucer is frequently called 'The Father of English Poetry,' and the title is perhaps better deserved than such epithets usually are. While his style is a work of art, his musicality is of more real sense than at the beginning of another, the former line was not a native one. His was the dominant literary influence in England and Scotland during the barren century and more after his death, and he, his contemporaries, John Lydgate, John Vadel, John Theunynck, John John Lydgate, were repeatedly named as the three glories of English letters. At the end of the 15th century, the 'Canterbury Tales' were twice printed by Caxton and twice by others; in 1532, William Thynne brought out the first fairly complete edition of Chaucer's works. In the 16th century, as well because, owing to rapid changes in the language, his vocabulary seemed archaic and his verse unmelodious, as because the direct influence of Italian and ancient literature came in, his influence decayed. Nevertheless, especially in regard to style, it was strong upon Spenser, who calls him in celebrated phrase,

"Dan Chaucer, well of English underly.
On famest eternal truth fulfilled."

In the 17th and early 18th century there was a tendency not to take him very seriously, but he delighted and sometimes influenced Shakespeare, Milton, Dryden and Pope. Late in the 18th century, with the development of an interest in the past, in part romantic and in part historical, reviving appreciation of Chaucer was indicated and stimulated by the treatment of him in Warner's 'History of English Poetry' (1774) and by the admirable edition of the 'Canterbury Tales' by Thomas Tyrwhitt (1775-78; several times reprinted). His influence is more or less traceable on Wordsworth, Scott, Tennyson, Morris and Tennyson, to mention no others. Within the last 40 years knowledge of Chaucer has been added to and interest in him enlivened by the work of very numerous editors, investigators and critics, not only in England, America and Germany, but even France and Italy; notably Child, Furnivall, Skeat and Ten Brink. See 'Canterbury Tales; Troilus and Criseyde.'

Bibliography.—The ensuing bibliography, in which might also be mentioned numberless articles in many special periodicals, is arranged in the order of the following subjects: Editions, handbooks, biography, chronology, sources, criticism, philology, bibliography. W. W. Skeat, 'Complete Works of Geoffrey Chaucer' (6 vols., Oxford 1894; spurious works, Vol. VII, 1897); A. W. Pollard and others, 'Globe Chaucer' (London 1904); Skeat, 'Student's Chaucer' (New York 1895); 'Poetical Works' (3 vols., Grant Richards, London 1903); MacKaye, 'Complete Poetical Works of Chaucer, first put into Modern English' (New York 1912); A. W. Pollard, 'Canterbury Tales' (2 vols., London 1894); Percy MacKaye, 'The Canterbury Tales: A Modern Rendering into Prose' (Duffield, New York 1915); 'Detailed Comparison of the Eight Manuscripts of Chaucer's Canterbury Tales' (Heidelberg 1913); Skeat, 'The Prologue, etc.' (Oxford), also F. J. Mather (Boston 1899); Skeat, 'Man of Law's Tale, etc.' 'Gower's Works, etc.' (2 vols., Oxford); various reprints of manuscripts of Chaucer's several works by Chaucer Society, London; R. K. Root, 'The Poetry of Chaucer' (Boston 1906); Pollard, 'Chaucer Primer' (London 1903); W. Tuckwell, 'Chaucer,' a popular primer (London 1904); E. Ten Brink, 'History of English Literature' (Vol. II, London 1896); 'Life Records of Chaucer' (Chaucer Society, London 1875-1900); A. W. Ward, 'Life of Chaucer' (in 'English Men of Letters Series,' London 1875); J. W. Hales, 'Chaucer' (in 'Dictionary of National Biography'), his disentangled Wycliffe 54-67); Ten Brink, 'Chaucer Studies' (Münster 1870); J. Koch, 'Chronology of Chaucer's Writings' (Chaucer Society. London 1890); J. S. P. Tatlock, 'Development and Chronology of Chaucer's Works' (Chaucer Society 1907); J. L. Lowes, 'The Prologue to

CHAUDIÈRE, shód-dèyár', LAKE (Fr. caldron or place of boiling water), an expansion of the Ottawa River just above the city of Ottawa. It is noted in Indian legend and tradition, and the name Chaudière is, in this case, said to be a literal translation of the original Indian designation of this lake.

CHAUDIÈRE RIVER, a river of Canada, which has its rise in Maine, near the source of the Kennebec, and flows north for 120 miles and joins the Saint Lawrence about six miles above Quebec. Between two and three miles above its mouth it forms the Chaudière Falls.

CHAUFEUR, shó-fér' (Fr. a "stoker")

This term has recently come into use in the English language to designate at first the engineer or motorman of a steam-driven road carriage; but by extension it is now applied to any professional machinist who operates an automobile, electrically or otherwise propelled. During the Reign of Terror in France the word was applied to members of a band of outlaws who infested the northeastern portion of the kingdom. They were led by John the Skinner. They got drunk and murdered men and women and tortured others and in efforts to make them disclose hidden treasure. The band was not suppressed until 1803.

CHALMOOGRA, chál-mu'g're (Taraktogenos Kursii), a tree of the order Flacourtioaceae, which grows in eastern countries, and from the seeds of which an oil is obtained that has been long known and highly valued in India and China as a remedy in skin diseases. The oil has been introduced into Great Britain, and is said to be useful in rheumatism, sprains, etc. It has been used as a specific for elephantiasis and leprosy. Recent experiments seem to bear out its value in the treatment of the latter disease. Chalmoogra oil was formerly supposed to come from Gynocardia odorata.

CHAMONOST, shô'môn-ô', Pierre-Joseph Jesuit missionary: b. near Châtilly-sur-Seine, France, 1611; d. Quebec, 21 Feb. 1693. In 1632 he entered the Jesuit novitiate at Rome and in the following year was sent on his first mission to Huron country. He established the famous Christian settlement, known as Lorette, which after shifting several times was located finally on the river Saint Charles where it still exists. Consult Charlevoix, 'History of New France' (New York 1872).

CHAMONOT, Pierre Marie, French pioneer missionary: b. 1611; d. 1693. His father was a vine dresser who committed the care of his son to his brother, who was curé at Châtillon. Pierre ran away at the age of 10 in order to prosecute the study of music at Beaune Burgundy. In the course of a pilgrimage to Rome he came under the notice of the Jesuits, who induced him to become a member of their order and sent him as missionary to the Indians of Canada in 1630. He was stationed at Lorette, the Huron missions at Ossossane, where he collected material for a Huron dictionary. In 1640 he accompanied Brébeuf to a tribe living between Lake Erie and Lake Ontario and to the west of the dreaded Iroquois. The mission resulting in failure Chamonot went to Saint Michael where he remained for eight years until the settlement was destroyed by the Iroquois. Chamonot took the surviving Hurons to an island in Lake Huron and later to the Isle of Orleans. In 1655-58 he was stationed at Ondodaga in the Iroquois country, and in the latter year removed to Montreal. He returned afterward to spend his last days with the Hurons. Consult his autobiography (1688; New York 1888); Thwaites 'Jesuit Relations' (72 vols., Cleveland 1901).

CHAMON-EN-BASSIGNY, shô-mô, France, the capital of the department of Haute Marne, on a height between the Marne and the Suize, 145 miles southeast of Paris by rail. It is well built, has a fine town hall, a four-story communal college, public library, church dating from the 13th century, the ruins of a castle belonging to the counts of Champagne, and an iron bridge 1,960 feet long with 50 arches on which the railway crosses the Suize. There are manufactures of gloves, wax candles, hosiery, cotton, cutlery, leather, woolens, sugar, etc.; and a trade in grain, coal, and in the iron and iron goods of the department. Here was signed, March 1814, a treaty between Great Britain, Russia, Austria and Prussia, in which these powers pledged themselves to accomplish the overthrow of Napoleon and restore peace to Europe. Philip Le Bon, the first who advocated the use of gas for illumination, in France, was born here, and his memory is honored by a bronze statue. Consult Jolibois, 'Histoire de la ville de Chamon' (Chamon 1856). Pop. 14,870.

CHANCEY, Isaac, American commo- dore: b. Black Rock, Conn., 20 Feb. 1772; d. Washington, 27 Jan. 1840. He commenced his career in the merchant service, in which he became distinguished for seamanship, enterprise and energy. He entered the navy as lieutenant in 1799, and early in 1802 was appointed acting captain of the frigate Chesapeake, the flagship of a squadron ordered to the Mediterranean to
CHAUNCY — CHAUTAUQUA 387

operate against Tripoli. In the brilliant operations before Tripoli in 1804 he bore a distinguished part. In April 1806 he was promoted to the rank of commodore. In the year 1812 the naval superiority on the lakes became an object of high importance, and Commodore Chauncey, then in command of the navy yard at Brooklyn, was appointed to command on all the lakes except Champlain. He commanded the Mediterranean fleet in 1816-18 and negotiated the treaty of peace with Algiers.

CHAUNCY, Charles, American clergyman and educator and second president of Harvard College: b. Yardleyburg, England, 1592; d. Cambridge, Mass., 19 Feb. 1672. He was educated at Trinity College, Cambridge, where he became professor of Greek and of which he was afterward a fellow. From 1627 to 1633 he was vicar of Ware, and of Marston Saint Lawrence from 1633 to 1637. In both these relations he was in frequent conflict with his ecclesiastical superiors, first for substituting catechetical exercises for the prohibited afternoon sermon, and in 1629 for asserting that "idolatry was admitted into the Church," and "there is much atheism, popery and heresy in this town." In 1635 he was again before the Court of High Commission for objecting to the act of kneeling at the communion service. After the trial he publicly recanted. He came to America in 1638 and preached in Plymouth for three years. From 1641 to 1653 he was pastor at Scituate. In 1654 he was arranging to return to his former charge at Ware when he was chosen by the overseers of Harvard to succeed President Dunster. From this time until his death he was president of Harvard. In addition to volumes of sermons he published "The Doctrine of the Sacrament, with the Right Use Thereof" (1642); "The Plain Doctrine of the Justification of a Sinner in the Sight of God" (1659); "Antisynodalia Scripta Americana" (1662). Consult Fowler, "Memorials of the Chauncys" (Boston 1858) and Cotton Mather, "Magnalia" (London 1702).

CHAUS, kā'ūs, the common short-tailed jungle cat of southwestern Asia (Felis chaus), so called in India, where it wanders from the forests into sugar-cane plantations and marshy fields, in search of game birds, mice, etc. It varies from yellowish to dark brown in color, and when adult is unsporting. This wildcat has contributed to the mixed ancestry of eastern domestic cats (q.v.).

CHAUTAUQUA, shā-tā'k'wə, a popular educational centre on Chautauqua Lake in the southwestern part of New York State. The controlling organization is a corporation *not for profit,* conducted for educational purposes by a board of trustees. The property comprises about 200 acres on the upland terraces above the lake, at a high elevation, although lying in a lowland section of the State. Chautauqua is 70 miles south of Buffalo, 200 miles north of Pittsburgh and 450 miles west from New York. It is reached by the Pennsylvania and Erie railways. Chautauqua has numerous large and commodious school buildings on a hilltop with a beautiful lake environment; several thousand cottages in the woods; an hotel called "The Athenæum"; about 40 smaller houses for the boarding accommodation of the public; a few shops or "stores"; a so-called "Hall of Philosophy," which is a Greek temple with supporting pillars of masonry, open to the summer breeze, and seating 3,000 people; and a vast amphitheatre, all well roofed, well lighted by electricity and capable of seating 5,000 or 6,000. There are only about 500 permanent residents in Chautauqua. For nine months of the year it is a town of 1,000, but during the summer, while the classes are being held, has a population ranging from 20,000 to 50,000.

As an educational institution Chautauqua has become a centre of great importance. It may be considered primarily as an educational adaptation of the open-air public assembly such as the American mass-meeting or town-meeting, or the religious camp-meeting. The Chautauqua assembly was established by Bishop Vincent and Lewis Miller in 1874 at Fairport for Bible study and the training of Sunday school teachers. But the ideal and purpose of the assembly were gradually broadened; and to the specifically religious study a great variety of subjects were added. The religious spirit, however, still holds an important place in the assembly. The best exponent of the spirit of the institution was its chancellor, Dr. John H. Vincent. He infused into it the idea that all sound learning is sacred, and that the secular life may be pervaded by religion. The work done at Chautauqua has been thus summarized in one of the New York State bulletins: "For the many there are popular lectures, concerts, entertainments; for a somewhat less number there are philosophical, scientific and literary lectures in progressive courses; for the comparatively few are provided means for careful study under able and well-known instructors." The work may be further classified as follows: (1) School of English Languages and Literature; (2) School of Modern Languages; (3) School of Classical Languages; (4) School of Mathematics; (5) School of Sciences; (6) School of Education; (7) School of Social Science and History; (8) School of Library Training; (9) School of Home Economics; (10) School of Music; (11) School of Arts and Crafts; (12) School of Expression; (13) School of Physical Education; (14) School of Practical Arts. An important part of Chautauqua's influence is made effective through classes and courses offered by the Chautauqua Literary and Scientific Circle (C.L.S.C.), founded in 1878. The C.L.S.C. is a well-directed system of home reading in literature and science, carried on in connection with local reading circles, and practically aided by many good readers in a monthly bulletin, the Round Table. The course of reading occupies four years. Each year is devoted to one particular nation, the four being known as the "Modern European Year," the "Classical Year," the "English Year" and the "American Year." No attempt is made to teach languages or any of the exact sciences. The textbooks on England and the United States, Greece and Rome, and other subjects, social and economical, are prepared by good writers representing American colleges and universities. With the regular course in history are combined literary courses and studies in art, sociology and natural science. In the American year the subjects are American history, literature, government, diplomacy, social
institutions and the like. The course of reading is carried on by Chautauquans at home, but once a week they meet in social circles in neighborhoods and villages all over the country and, under the best local guidance they can find, devote the evening to the discussion of topics suggested and to other private reading. The total enrolment of Chautauqua readers has been about 400,000. By far the larger number fail to complete the four years' course, but it is estimated that about half have done consecutive reading for two years. A "saving remnant" of about 75,000 continued to the end and have won a simple certificate. The graduates are also encouraged to form local educational clubs and continue special study.

The "Chautauqua idea," of which much has been said and written, is best expressed by Bishop Vincent, who said: "Chautauqua pleads for universal education; for plans of reading and study; for all legitimate enticements and incitements to ambition; for all necessary adoptions of Jewish time and topics; for ideas and associations, which shall at once excite the imagination and set the heart aglow.... A college is possible in everyday life if one chooses to use it; a college in house, shop, street, farm, man, woman, for two years. The curriculum, which runs through all of life, a college which trains men and women everywhere to read and think and talk and do... this is the "Chautauqua idea.""

CHAUTAUQUA, Jewish, an institution founded in 1893 by Rev. Dr. Henry Berkowitz of Philadelphia, and incorporated in 1899, with a body of officers representing the chief cities in the United States for "the dissemination of a knowledge of the Jewish religion by fostering the study of its history, literature, etc." The departments for study and entertainment are modeled on those of other Chautauqua. This society has about 3,000 members, divided into various sections. Its courses include preparatory, two years, with readings in Jewish history and literature; Bible, four years; and special courses in post-Biblical history and literature, Jewish Characters in English Fiction, "Benjamin of Tudela," and Advanced Hebrew. The chief work of late years has been embodied in its summer assembly, at Atlantic City, N. J., which is held annually in July and lasts three weeks. It includes a summer school, popular lectures and conferences, literary and social entertainments, in which many prominent speakers participate. During the annual session the condition of religious schools, dependent and delinquent children, how to relieve congestion in large cities, the status of the Jews of Russia, the attitude of Jewish university students toward Jewishness, and other topics are the topics discussed. The average attendance at the morning sessions is from 150 to 350 persons and at the evening from 300 to 800 persons. During the summer of 1903 an English organization on the lines of the Jewish Chautauqua was formed at Ramsgate and is now known as the London Jewish Society. Until 1907 its official organ was the Menorah Magazine (New York) and there is also the Assembly Record (Philadelphia) and special series of various publications.

CHAUVEAU, shō'vō', Pi err e Joseph Olivier, Canadian statesman, orator and educationalist: b. Quebec 1820; d. 1900. He became a journalist at 17, was called to the bar, entered Parliament in 1844 and held portfolios in the government. In 1855 he was appointed chief superintendent of education for Lower Canada, and in 1857 founded the Journal de l'Instruction publique. He was first premier of the province of Quebec under Confederation, 1867-73, and was speaker of the senate, 1873-74.

CHAUVEAU-LAGARDE, lă gär'd, Claude François, French advocate: b. Chartres 1756; d. 1841. He studied law in his native town and began to practise in Paris shortly before the outbreak of the Revolution. He became celebrated for his eloquent defense of those on trial in the Reign of Terror. He was the advocate of Marie Antoinette at her trial and also of Charlotte Corday. Others of his clients were Brisot and Madame Elizabeth of France. His defense of Miranda saved the latter from the scaffold. In 1814 he was ennobled by the government of the Restoration and two years later he published an account of the trial of Marie Antoinette and Princess Elizabeth.

CHAUFENET, shō-vē'ně', William, American astronomer and mathematician: b. Milford, Pa., 24 May 1819; d. Saint Paul, Minn., 13 Dec. 1870. He was graduated at Yale in 1839, and became professor of mathematics and astronomy at the United States Naval Academy in 1844 and was the first director of the observatory there. He was made professor of astronomy at Washington University, Saint Louis, in 1859. In 1862 he became chancellor of the last institution. He wrote "Spherical and Practical Astronomy," "Elementary Geometry," and similar works. Consult "Memoir of William Chaufenet" (in the "Biographical Memoirs of the National Academy of Sciences," Washington 1877).

CHAUVINISM, shō-vin'-izm, a French word derived from Nicolas Chauvin, a soldier of the French Republic and of the First Empire. His name became a synonym for a passionate admirer of Napoleon, and the word Chauvinism was formed to signify the almost idolatrous respect entertained by many for the first Emperor, and generally any feeling of exaggerated devotion, especially of patriotism. A vaudeville, "La Coquarde Triâcolère," in
which there was a character named Chauvin, with a song that became immensely popular, fixed the word in the French language. The word is now used to express exaggerated patriotism of an aggressive type, jingoism.

CHAUFS-DE-FONDS, shō-de-fon', LA, Switzerland, town in the canton of Neuchâtel, on the left bank of the Aare River, 16 miles west of the town of Neuchâtel, at an elevation of 1,370 feet above sea-level, and is regularly built, with broad, straight streets, and stone houses. The most notable structures are the aqueduct, 13 miles long; the Protestant church; with a fine, vaulted roof; the hospital; the college, which contains the municipal picture gallery; the historical museum; and the library. Among the educational institutions is a watch-making and art-engraving school. Chaux-de-Fonds and the neighboring village of Locle are the chief centres of watch-making in Switzerland; and also manufacture articles in gold, silver, bronze and enamels, lenses and scientific instruments. Watch and clock making was begun here in 1705 by Jean Richard. Pop. 39,597.

CHAVES, shā-vēsh, Portugal, the ancient Aquae Flaviae, town of the province of Tras-os-Montes. The fortifications which once defended it are now in ruins. It is situated on the Tiomega river, here crossed by a Roman bridge. The site is surrounded by fertile meadows and vineyards.

CHAY-ROOT, ci', or CHOY-ROOT, choi', the roots of a small Rubiaceous plant of Hindustan, Oldenlandia umbellata, extensively cultivated on the Coromandel coast. The roots yield a dye which is used as madder.

CHAYOTE, chi-ō'tē, a climbing vine (Sechium edule), belonging to the Cucurbitacea, or gourd family. The leaves are strongly three-angled or lobed, with the broadly cordate base also showing to or four sharp corners. They are deeply cleft, with a rough surface with whitish veins at in color are of a deep fresh green. The pistillate flowers are solitary; the much more numerous staminate flowers are borne on special branches. Pollination takes place through the agency of insects. The ovary is always one-celled, with a single ovule. It is mealy and subsehent when young, becoming spiny with maturity in so varieties. The mature fruits are always in or less compressed, as though built up by long flat seeds. In general they are pear-shaped but vary in their proportions. They weigh about eight ounces to a pound each and fruits weighing three pounds have been reported. Flavor they resemble summer squashes. The edible mass of the fruit produced in large quantities in Porto Rico for domestic consumption and it has recently attained popularity in Australia and America, from which country many hundreds of tons are shipped annually to Paris and London. It bears ament well, an 8- or 10-day journey not affecting its condition. It is in common use as a vegetable in Madeira, Mexico, Central America, the West Indies, California and Louisiana. It was first reported in Europe by Francisco Hernández, who found the plant in Mexico about 1560 and described the fruit, as suggesting the flavor of roasted oysters, sweet potatoes or chestnuts. It produces tuberous roots which resemble the yam or cassava. In Mexico the young shoots are sometimes boiled and eaten like asparagus. Both the fruit and the vines are sometimes used for fancy basket-work and the manufacture of women's hats. The flowers yield an abundance of nectar and are said to be of value to bees. As an ornamental vine the chayote takes high rank, a single vine being reported as covering a fence 6 feet high and 50 feet long in a few months.

The fruit is eaten in a variety of ways—boiled and seasoned with pepper and salt; parboiled and fried; stuffed and baked; in puddings, tarts or fritters, etc.

The name appears to be a form of the Aztec word chayol, meaning "a head bristling with spines" or a "squash covered with spines." The popular names are in many cases corruptions of the Aztec term, as the Porto Rican tayote; but in the West Indies and Australia it is known as chocho; in Louisiana as miril-ton; and as "vegetable pear" in some parts of the British West Indies.

CHAZARS, chā-zārz, or KHAZARS, a people of the Finnic stock known in the 7th century on the shores of the Caspian; in the 9th century their kingdom occupied the southeast part of Russia from the Caspian and the Volga to the Dnieper. Their capital was long at Astrakhan, called by them Bandalshar. They were singularly tolerant of all religions, Jewish, Christian and Moslem; and a large part of the nation formally adopted the Jewish faith from Jews who fled from the persecutions of the Emperor Leo. It is not improbable that the modern Jews of Russia have at least an admixture of Chazar blood. Cyril converted many to Christianity in the 9th century. The power of the Chazars was destroyed in 965 by Sviatoslav. In the early part of the next century the destruction was completed by the Byzantine emperors and the Russians.

CHAZY, shā-zē, STAGE, in American geology, the limestone beds, 725 feet thick, typically developed at Chazy, N. Y. The name was first applied by the New York geological survey. The Chazy limestone was laid down around the border of the old Pre-Cambrian land in Canada and New York in older Ordovician time. It succeeds the Calciferous or Beckmanstown and is succeeded by the Lowville. Though a well-marked division in New York and Canada, it is not determined farther west, but the Saint Peter sandstone, which underlies the so-called Trenton limestone in Iowa, Michigan and Wisconsin, may be of Chazy age. See Ordovician.

CHE-KIANG, chē-ki'-ăng', or CHE-CHIANG, China, a maritime province lying north of Fu-kien and south of Kiang-su and including the Chusan Archipelago; area, 39,150 square miles. The province is of great commercial
importance, containing three treaty ports, Ning-Po, Wan-Chau (Wen-Chow) and Hang-Chau (Hang-Chow) all of which are connected with Shanghai by a railway under British control. The surface is mountainous and traversed by rivers, notably the Tsien-Tang and Ta-Kia which run down to the Eastern Sea. The Grand Canal, which has its gateway in Che-Kiang, affords the only means of internal communication apart from an extensive system of narrow foot roads. Trade in silk and tea is well developed, this province being, with Chiang-Su and Fu-Shien, the first to contain a treaty port, that of Ning-Po, opened in 1844. Beside tea and silk the province produces cotton and sedge for hats and mats, rice, ground-nuts, wheat, indigo, tallow and beans in abundance. It imports opium, cotton and woolen goods, tin and iron, kerosene oil, indigo and sugar. Coal is found in the north and iron ore in the south, and there are traces of copper, but none of these minerals exists in sufficiently large deposits to make mining remunerative. Che-Kiang is noted for its extensive system of education. It contains the great religious and literary centre of China, Hang-Chow (not to be confused with Hang-Kow or Han-Kow), where thousands of candidates yearly resort for the public examinations. The city of Hang-Chow is also the capital of the province, which is ruled by a viceroy. Marco Polo visited Che-Kiang in the 14th century, when it contained beautiful temples, now in ruins. The most magnificent architectural feature of the province is the temple of the Queen of Heaven, dating from 1680. Che-Kiang suffered severely during the Taiping rebellion in 1861. The Italians in 1900 laid claim to part of Che-Kiang as a sphere of influence and demanded the privilege of establishing a port on the coast to be called San Mun. There are thousands of native Christians. The population is estimated at 18,800,000. The foreign population is estimated at about 2,750.

CHEAT. See BROMES GRASS.

CHEAT RIVER, a river rising in the Alleghenies in West Virginia, and after the union of its forks, flows northwest and then northwest to empty into the Monongahela a few miles beyond the boundary line of Pennsylvania. Its length is about 150 miles.

CHEATHAM, Benjamin Franklin, American Confederate soldier; b. Nashville, Tenn., 20 Oct. 1820; d. there, 4 Sept. 1886. He served as captain of volunteers in the Mexican War, distinguished himself at Monterrey, Medulin and Cerro Gordo, and, after the expiration of his 12 months' term of service, was again mustered in as colonel of the Third Tennessee Regiment and served till the end of the war. He was major-general of Tennessee militia after his return, and was a farmer until 1861, when he entered the Confederate army, being one of the first Tennesseeans to enlist in that service, and was early appointed a brigadier general. He commanded at Mayfield, Ky., in September 1861, and at the battles of Belmont and Shiloh, served subsequently at Columbus, Ky.; was a division commander in Bragg's army when it entered Kentucky in September 1862, was soon after promoted major-general and was engaged at Perryville and Stone River, being wounded in the second battle, and at Chicka-

guga and Chattanooga, Nashville and other places. President Grant, who was his personal friend, offered him an appointment in the civil service, but he declined. He devoted himself chiefly to agriculture after the war, but served four years as State superintendent of prisons, and in October 1885 became postmaster of Nashville.

CHEBOYGAN, she-boi'gan, Mich., city and county-seat of Cheboygan County, on Lake Huron and on the Michigan Central and the Detroit and Mackinac railroads, at the eastern end of the Straits of Mackinaw. It became a city in 1886 and is governed by a board of 10 aldermen. It has a good harbor connected with lake ports by regular steamship lines. It is an agricultural centre, a popular summer resort and manufactures lumber, paper, leather and furniture and there are large tanneries, canning factories and shipyards. It has nine churches and an excellent public school system. Pop. 6,859.

CHECK or CHEQUE, a draft or bill on a bank, payable on presentation. A check may be drawn payable to the bearer, or to the order of someone named; the first form is transferable without endorsement and payable to anyone who endorses it; the second must be endorsed, that is, the person in whose favor it is drawn must write his name on the back of it. A person who obtains money or a check which he knows is drawn by one not entitled to draw for the amount specified therein is guilty of fraud and liable to criminal punishment. Prompt payment is demanded of a check; it is not for use as a continuing security. In case of delay, the drawer is no relieved of his obligation to the holder unless actual damage through the check passes for the bank on which the check was drawn. Certified checks may also be obtained from banks in the United States. This has effect on the drawer's liability, depending on whether it is procured by the holder or by the drawer. When procured by the former, the drawer and endorsers are freed from liability; when procured by the holder, he remains liable on the check.

In England the custom of crossing checks is common. This is accomplished in two ways, 1 by a general crossing, 2 by a special crossing. A general crossing makes it payable only when presented through a bank, but any bank will do. A special crossing names the bank by which the check must be presented. A check may be crossed either by the drawer or by the holder, who may convert a general into a special crossing. Only bankers have the privilege of crossing a check which has already been twice crossed. A check which is crossed either generally or specially may further be crossed by the words "not negotiable," which means that the person who takes it with these words on it does not obtain and is not capable of giving any better title to the check than that which the person from whom he took it had. A check so crossed is on very much the same footing as an overdue bill of exchange.

CHECKERBERRY. See GAUTHERTIA.

CHECKERED BEETLE, a beetle of the unicorn family Cleridae, so named because of
its markings. Some are ant-like in form and coloration. The adults are found on tree trunks and in flowers, where they subsist on sweet sap and nectar. The larvae live under bark and feed on food-living larvae. Some invade hives of the honey-bee and devour the young bees. For a synopsis of the North American species consult Annals of the Lyceum of Natural History of New York (Vol. V, New York 1849).

CHECKERS, chequers or draughts; Fr., jeu de dames; Germ., Damenspiel; Ital., giuoco di dama; Sp., juego de damas; Arab., la ab ed-dama: a game of skill played by two persons on the familiar board—divided into 64 squares. The pieces or *men* used are 24 wooden (bone or ivory) discs, 12 black and white (or red). For purposes of recording games and moves the squares are numbered as shown in the diagram:

As the game is usually played on the dark squares, it must be noted that in printed diagrams the white squares are invariably used to indicate the position of pieces—as in problems—and for numbering. Only 32 of the squares (the half) are used in checkers; but whether the dark or the light squares are used in play, each player must have the double corner of that color at his right. The black pieces are arranged on the squares 1 to 12: this is called the king side. The white pieces on those numbered 21 to 32, which is called the white side. The vacant squares 13 to 20 form the preliminary battle-ground. The general rules are simple. Black always has the first move, and at the beginning of each successive game the players change colors, taking alternately the black and the white pieces. The pieces are moved forward diagonally one square at a time except in jumping, when a piece may cover as many as six squares in one move. Each piece as it reaches the extreme opposite side of the board becomes a *king* and is "crowned" by having another piece of the same color placed on top of it. The king can move forwards or backwards—always diagonally—one square at a time, except as before, in jumping. By arranging the board it is possible for a king to jump nine pieces. A man can never jump more than three. The capturing piece jumps over the man "en prise" to a vacant square, beyond, and may continue to jump as many pieces in its path so long as there is a vacant square behind each. When a man, i.e., not a king, jumps a piece or several pieces and lands in the opposite king-row, the move is ended; he cannot move or jump out again until the other side has made a move. A king, however, can jump into a king-row and right out again so long as there is any piece in position to be taken. The theory of the jump is simple: Place the 24 pieces for play; black moves 11 to 15; white responds by moving 22 to 18, and black must jump over that piece from 15 on to square 22, taking the man on 18 off the board. The black piece now on 22 is liable to capture by the white pieces on 25 and 26: either 25-18, or 26-17. The former is the correct jump, 25-18, and the black piece is captured and removed from the board. This is a "level exchange," i.e., one for one. These moves form the "single-corner" opening, than which no other offers so great a scope for attack or defense. For many years, indeed, it was the only opening checker players knew of. When a piece is touched it should be moved if possible. Keeping a finger on a piece that has just been moved does not confer the right to move that piece back again at will; no move once made can be withdrawn except by consent of the opponent. When a player has a "jump" in which two or more pieces can be captured, and the half is withdrawn from the capturing piece before all the men possible have been taken, the move is completed; in other words, the player cannot retrieve the omission. When a player has a "jump" before him and fails to take it by making some other move instead, the opponent has the choice of one of three methods: (1) he can "huff" the piece that should have made the jump, i.e., take it off the board as a penalty; (2) he can compel the player to take his wrong move back and make the jump, or (3) if it suits his game, he can let the error stand as if it had not occurred. A "huff" is no move; the player entitled to do so must "huff" first and then make his move; if he makes his move first (overlooking the "huff") he cannot take the "huff" afterward. The "huff" is a peculiar movement. As there should be no talk whatever during a checker game, a player "huffing" picks the offending piece off the board, passes it near his mouth and blows upon it—just like blowing out a candle or placing it on his side of the table. The "huff" is not generally employed except in match play, where the rules are very strict and every move is timed by special clocks.

Contrary to general—and superficial—opinion, checkers is as profound and scientific a game as human ingenuity ever devised. "Everybody plays checkers, but there are few checker players." Some of the greatest experts, men who had spent 50 years and more in studying the mathematics involved in the game, have finally confessed that they had only begun to touch the fringe of the subject. Yet checkers is a game well worth cultivating on account of the mental faculties it calls into play; it imparts a fascination all its own, for its main principle is to arrive at an object by the most direct and decisive methods. Neither in regard to antiquity nor as an exercise in mental gymnastics need the game of checkers yield the palm to its more ornamental sister game, chess. In Butcher's translation of the 'Odyssey' we read that when the goddess Athene descended from the heights of Olympus and reached the gate of Odysseus, "she found the lordly wooers... taking their
pleasure at draughts in front of the doors.\textsuperscript{9} Checkers and chess are both unfathomable and beyond the comprehension of man.

(From the Library of Edgar Allan Poe.)

The average chess problem declares a white win or mate in two or three moves, and not infrequently contains 10 white pieces as against three or four black ones. On the other hand, the famous second position\textsuperscript{10} in checkers by Andrew Anderson contains three pieces a side—a king and two men each—equal forces, with an apparent "safe draw." Black, men on 3, 6; king on 1; white, men on 12, 13; king on 8. Black to move and win. If at the sixth move white goes 15-19, the shortest way by which black can win requires 79 moves all told; if white instead goes 15-11, it takes no fewer than 83 moves (counting both sides) for black to force a win. If black makes a mistake in the result it is a draw. In a problem by Mr. H. D. Lyman, with a king and three pieces a side, altogether 63 moves are necessary for black to win, and every white move is forced: black men on 1, 3, 28; king on 21; white men on 5, 12, 20; king on 29; black to move and win (No. 948 in Gould's). Again, Strickland's position (3 pieces to 4) and Bowen's "Twin\textsuperscript{11} (4 to 4) require 55 moves each to win. Without previous study of these positions, it would be quite beyond the intellectual range of a checkers problem solver to discover the correct moves under playing conditions.

There are 49 classified two-move openings in checkers; the variations of many of them run hundreds in number. (E. T. Baker's book on the "Alma" opening alone gives upward of 500 variations, and P. Ketchum's "Flora Temple\textsuperscript{12} branches of the "single-corner\textsuperscript{13} opening gives over 280 variations). The principal openings are: the Dundee, formed by the first move, 12-16; Bristol, 11-16; Kelso, 10-15; Derwent, 11-15; Double Corner, 9-11; Edinburgh, 9-13; Switcher, 11-15, 21-17; Single Corner, 11-15, 22-18; Cross, 11-15, 23-18; Double Corner, 11-15, 24-19; Ayshurst Lassie, 11-15, 24-20; Dyke, 11-15, 22-17, 15-19; Double Switcher, 11-15, 23-19, 19-21; Dis- sance, 11-15, 23-19, 9-14, 27-23; Centre, 11-15, 23-19, 8-11, 22-17, 15-18; Fife, 11-15, 23-19, 9-14, 22-17, 5-9; Glasgow, 11-15, 23-19, 8-11, 22-17, 11-16; Laird and Lady, 11-15, 23-19, 8-11, 22-17, 9-13; Maid of the Mill, 11-15, 22-17, 8-11; 17-13, 13-15; Ode to Kirke, 11-15, 22-19, 8-11, 22-17, 4-8; Souter, 11-15, 23-19, 9-14, 22-17, 6-9; Whitter, 11-15, 23-19, 9-14, 22-17, 7-11. As the openings after the second move they receive auxiliary titles, e.g., Kelso-Switcher, Kelso-Choice, Kelso-Exchange, Kelso-Cross, Kelso-Regular, Kelso-Double, Kelso-Side, etc. Other developments are the Boston Cross or Watero, Tillicoultry, Wagram, Paisley, Pioneer, Drummond, Nailor, etc. A gambit is a form of strategy in the early stages of a game in which a piece is sacrificed, for position.

Within the limits of this article it is only possible to indicate briefly the beginner's road to checkers. Let him number a board as in diagram, marking each square at bottom left-hand corner, so that the numbers will be visible when the squares are occupied. With a guide-book on the game wherein every move is numbered—it will be easy to follow the positions. In this practice the white squares would be used; in playing with an opponent, however, the board must be half-turned to bring the dark double corner to each player's right. The black square may then be used. The best opening to begin learning is the "single-corner."

To play a good end-game the 1st, 2d, 3d and 4th positions should be mastered, with a few of the simpler problems and early traps, such as the "goosewalk," etc. The calculation of the move\textsuperscript{14} requires some study and a good memory; it is useful only in end-games when there are five pieces a side or less. A knowledge of this theory is often a winning advantage. The "tricks," of the board are innumerable; beginning with the easy ones of over-running one king in a double corner with two kings, or of defeating two kings—one in each double corner—with three kings in the middle of the board (a problem frequently given up as a "draw") the result may travel by graduated stages into "bridge" positions, "gambits," long or short "shots," to draw with inferior forces, make "slip" moves, etc., etc. As in music, there are certain "themes" in checkers, such as throwing a piece to retard the opponent's advance or to draw him off a given line. The finest example of this type is by Hugh Byars (1889): B, 10, 11, 21; W, 18, 19; king on 22; W, to play and win—22-17, 21-25, 17-21, 18-9, 25-30, 21-25, 30-21, 9-6, 21-17, 6-2, 17-2, 9-7, 21-19, 6-2, 17-9, 2-7, W. wins. If white does not sacrifice the king at the 7th move, the black king would capture the piece on 19 and draw. A simpler theme, arrived at from three settings is: (a) B, 19, 22; W, 28, 32, 25, 6; to play and win—32-28, 28-32, 27-24, 19-26, 26-23, W. wins. (b) B, 12, 24; king 27; W, 20; kings 11, 26; W, to play—26-31, 27-23, 20-16, 12-19, 11-16, 24-28, 31-27, 23-32, 16-23; W. wins. (c) B, 21, 28, kings 2, 25; W, 30, 32, kings 5, 10, W, to play—25-22, 21-13, 23-18, 30-25, 21-25, 13-9, 25-30, 9-5, 30-23, 32-27, 23-23, 10-6, 2-9, 5-23, W. wins. A draw can often be secured with a piece down: B, kings 29, 30; W, king on either 17 or 18; by one move (to 22) white draws; again, 13; king on 17; W, king on either 15 or 23; by moves 8 and 9 and keeping control of that square and 22, white holds the two blacks in perpetual check.

Three B, kings on 13, 14, 15; and two W, kings on 22 and 23, with black to play, makes a tricky win for black; now remove the ones of from the king on 13, black to play, and white draws. The "slip" theme may be illustrated thus: B, men 5, 9, 11, 20; W, men 18, 24, 27, 32; W, to play—27-23, 20-27, 16-15, 11-18, 23-14, 9-18, 32-14, W. wins. The "in-and-out" or "waiting jump" is a simple trick rarely practiced by novices, although the possibility arises in perhaps 50 per cent of their games: B, men on 7, 16, 21, 24; W, men on 6, 25, 30; W, to play—30-26, 21-30, 6-2, 30-23, 2-18; thus in 3 moves and with one move clears the board. Perhaps the greatest fascination of checkers is the immense variety of "shots" or "strokes" that frequently crop up in play and are only too often overlooked. On a crowded board it is possible, by a series of...
forced moves, utterly to annihilate the whole forces of the opponent and compel immediate surrender. J. T. Denvirs 'Traps and Shots' (Chicago 1905) gives hundreds of brilliant examples occurring in actual play, and is the main manual for the 'Chicago Trap' on the cheque game. Many of the traps are provided with names, either after their discoverers or their home towns. Thus we have the Jaques Shot, the Steel Stroke, the Bailey Shot, the 'Brooklyn Trap.' In the 'Chicago Trap' the game is an impossible position, and the player who has committed them to memory and can lead up to them across board will achieve a dashing triumph over an adversary who has neglected or not yet reached the higher altitudes.

It may surprise many to learn that checker enthusiasts and their name is legion - even possess a tutelary deity of their own, yeptet 'Dama' - in Great Britain, 'Dameh.' It is also a testimonial to the game that its most ardent devotees are Scotsmen, doctors, lawyers and practical business men, besides a host of others - even ladies scattered throughout the English-speaking world. Almost every town, county, State, colony or country has its club and its champion. The greatest master of the game was the late James Whyllie, of Scotland; next comes his compatriot Andrew Anderson and Robert Martins. These modern pioneers were followed by a brilliant school of experts, the Barker brothers of Boston, the late Robert Yates of Brooklyn, J. T. Denvirs of Chicago, H. Pillsbury, Henry Spayth of Buffalo, Richard and Alfred Jordan, both champions of England, as also were J. Smith, W. Gardner, A. Hynd and H. Morrall. The champion problemists include Drs. Brown, Clute, Purcell, Dean, Schaefer, Lucas and Dr. Stayman of Kansas; the Hon. J. D. Danvier of Delaware; M. Priet, ex-champion of the United States; Mr. Melvin Brown (lawyer) of New York; the late W. W. Avery of New York, and the greatest living inventor of brain-puzzlers on the checker board, Mr. H. D. Lyman, secretary of the American Surety Company of New York. The British Isles have perhaps the largest number of experts; Richard Atwell, Fred Allen, W. Buchanan, F. W. Drinkwater, J. Drummond, F. Dunne, D. Gourlay, J. A. Kear, R. M'Culloch, J. Robertson, J. Strickland, J. Tonar, J. Strudwick. On the literary side of American checkers special credit is due to Messrs. Denvirs, Ketchum, Spayth, Stearns, Whitehill and Yeomans. The roll here given could be multiplied many times without approaching the aggregate of prominent checkers, past and present.

Bibliography.—The literature of checkers is copious; books were printed on the game in Spain in 1547, 1590, 1597, 1610 and 1650; in Paris, 1668; in London, 1694; and the first in America (New York) in 1846. Several of the older works still survive in periodical new editions, among the chief being Anderson, 'Game of Draughts Simplified' (Philadelphia); Atwell, 'Scientific Draughts' (London 1905); Call, W. T., 'The Literature of Checkers' (New York, 1897); 'Draughts: 1000 Best Games' (Northampton, Eng., 1913); Drummond, I., 'Draughts' (London and New York); Dunne, F., 'Draughts Praxis: A practical guide to scientific play' (London 1912); Gould's 'Problem Book' (London); Kear and Atwell's 'Encyclopædia of Draughts' (Bristol 1902); Lee's 'Guide to the Game of Draughts' (new ed.); Lyman's 'Problem Book' (New York); Spayth, H., 'Checker Player' (Buffalo 1895 et seq.); Stearns, L. M., 'The Draughts Marvel and Twentieth Century Checker Compendium' (Manchester, N. H., 1909); Sturges, J., 'Guide to the Game of Draughts' (London 1808-1904). There are hundreds of other publications, to most of which the reader will be directed in the works shown above.

HENRY F. KLEIN, Editorial Staff of The Americanana.

CHEDDAR, ched'dar, England, a parish in Somerset County, at the foot of the Mendip Hills, 18 miles southwest of Bristol. The dairies in the neighborhood have from the 17th century been famous for the excellence of their cheese, which is made from the whole milk, and the whey skimmed off, heated and added to the curd. Pop. 1,794.

CHEDORLAOMER, kéd-ór-là-ó'mér, a king of Elam, mentioned in the 16th chapter of Genesis. He made his country so strong and penetrative as far west as Canaan, and ruled over its southeastern part. After remaining tributary to him for 12 years the local princes rebelled and were reduced by Chedorlaomer with the assistance of Amraphel, king of Shinar, Arioch, king of Ellasar, and Tidal, king of Goiyim.

CHEDUBA, chē-doo'ba or chē-do'o-ō-bā, or MAN-AUNG, Burma, an island in the Bay of Bengal, about 25 miles off the coast of Aracan, forming a township of Kyauk-pyu district; area, 250 square miles. On the island is a town of the same name. Cheduba is well wooded and fertile, but unhealthy. On the northwest coast inflammable gases are discharged in some quantity. The principal product is an excellent tobacco. Rice, indigo, pepper are also produced, and petroleum is found. Pop. 24,000.

CHEECHA, chē-chā. See GECKOS.

CHERRYBLE BROTHERS, two merchants introduced in Charles Dickens' novel 'Nicholas Nickleby.' They are twin brothers of a very genial and liberal disposition and become staunch friends of the hero. It is said that the novelist reproduced in these characters two cotton-spinners of Manchester named Grant.

CHEESE AND CHEESE-MAKING.

Cheese is the curd of milk, including principally the casein and fat, coagulated, cooked, drained and pressed into solid form. Nearly all cheese is made from cows milk, and originally it was a product of the farm. Now by far the greater portion is made in factories especially fitted for the purpose. The standard factory-made American cheese is practically identical with the English cheddar cheese, and is often so called.

In the manufacture of cheese a milk rich in fat is preferred, the cheese being nearly all fat and casein. By artificial souring of the milk coagulation is produced, so that the whey or watery part may be separated from the curd. The curd is the raw material operated on; the casein is a proteid substance that may be compared to lean meat, and is coagulated by acid. It is that part of the curd that remains when
the fat, sugar and ash are extracted. The first process of manufacture is to heat the milk (preferably sweet milk) to about 84° F. It is then tested with rennet for ripeness. A graduated cup provided with a long straw is held half filled with milk and a little rennet added. Rennet, in its commercial form, is a preserved extract from the fourth stomach of a calf. Being of a peptic character it tends to coagulate the milk and if the rate of coagulation is allowed to go on from 17 to 20 seconds it is sufficiently ripe for treatment. Enough rennet is then added to the supply of milk to coagulate the whole in 25 or 30 minutes. The proportions vary with conditions, but about four ounces of rennet extract to 100 gallons of milk is perhaps an average quantity. When the milk is coagulated the solid portion or curd in the vat is separated from the watery portion, by allowing the latter to drain off. This waste usually becomes food for pigs. Gang knives and a longiboot are used to cut the curd into cubes of a third of an inch or more, the knives being set a little less than half an inch apart and passed through the curd horizontally and perpendicularly. After one turn the curd is allowed to prevent settling. This allows the curd to shrink and tends to expel a portion of the whey. The stirring may be done with a curd-rake, but factories more commonly employ what is termed an automatic curd-agitator, which is attached to the vat and driven by steam power.

The mass of curd is next heated very slowly to about 92° F. This cooking process may continue several hours, lasting until the operator finds that the curd will string about a quarter to a third of an inch on a hot iron. The whey is then drawn off. The curd is next turned and piled, to rid it of the excess of moisture. When deemed sufficiently solid it is ground and salted. The grinding may be done in one of several kinds of mills, a common form having two cylinders with teeth rotating toward each other, which operation picks the curd to pieces.

After grinding, the curd— or cheese, as it may now be called— is dipped and put into hoops to give it form for pressing. Common sizes of hoops are 14½ × 10 and 13½ × 6 inches. An iron bandage or rim is placed about the hoop to give it solidity, and a cloth wrapped about it to keep the cheese together and secure cleanliness. Pressure is then applied, at first lightly, and then increased, the cheese being usually turned over during the operation. The pressure is maintained for 16 to 18 hours, after which the cheese is ready to be cured.

Curing-rooms are built both above and below ground, the latter being preferred as being easier to maintain at a cool temperature. High temperature is very deleterious to cheese, diminishing its value by melting and leaking of fat, while the texture and flavor are also impaired. A temperature below 65° F. should always be maintained in the curing-room, and 40° is better. Ventilation must be provided, and the usual arrangement is an upright draft-pipe, run high enough to catch the wind, and with branches that run in the funnel to the wind. The process called ripening takes place in the curing-room, determining the particular flavor of the cheese. The ripening is caused by bacteria, as is proven by making cheese from sterilized milk, in which case it retains the flavor of new-made cheese for a very long period. Dairy bacteriologists are endeavoring to isolate the different species of cheese bacteria, that they may be cultured alone and incorporated in the milk in varying quantities for cheese-making. In this way the maker would be certain of securing a particular flavor for his cheese, whereas now it is a matter largely of chance as to what bacteria predominate.

The method described above is that followed in practically all the factories of the United States and Canada. About 90 per cent of the cheese manufactured is of this character. The remainder is farm-made, or made in urban dairies, or else is manufactured by some other process in imitation of some foreign cheese, as the Swiss Gruyère or Emmental, Limburger, Neuchâtel, Bri, etc.

The constituents of milk which determine its value for cheese-making are the fat and casein. Milk may contain from 3 to 8 per cent of fat and from 2 to 5 per cent of casein, the average proportion being about a pound of fat to two-thirds of a pound of casein. Since the cheese yield increases with the fat in the milk, managers of cheese factories have had to prevent settling of milk rich in fat, and perhaps this knowledge is largely responsible for the fact that in 1900, in the factories of the United States, 100 pounds of milk made almost 17 per cent more cheese than it did in 1890.

The analysis of cheese is largely a matter of securing a correct average, as a cheese varies in properties at the centre or at the circumference. A wedge is generally taken as a sample, cut from the centre to the rind, or sometimes a plug, taken at one-third the distance from the rind to the centre. The usual test of cheese is to find the proportion of fat. For this purpose the Association of Official Agricultural Chemists of the United States Department of Agriculture have adopted the following method:

For the estimation of fat in cheese about 5 grams should be carefully weighed, and transferred as completely as possible to a test bottle. From 12 to 15 c.c. of hot water are then added and the bottle shaken at intervals, keeping it warm until the cheese has become a creamy emulsion. This may be greatly facilitated by the addition of a few drops of strong ammonia to the contents of the bottle. After the contents have become cold the usual amount of acid should be added and the bottle shaken until the lumps or curd are completely dissolved. The bottles are then placed in the machine and whirled, the test being completed in the same manner as with milk. To obtain the percentage of fat the reading should be multiplied by 18 and divided by the weight in grams of cheese taken.

Some cheese is colored by the makers, though the best requires no coloring. Saffron and annatto are used for this purpose. Various herbs are also incorporated with the milk at the time of making the curd, to alter the appearance or flavor of the cheese. Common among these are sage leaves, marigold and parsley.

A small proportion of the cheese produced in the United States is imported. From 5,000,000 to 7,000,000 pounds a year of Swiss cheese are brought in, also some from France, Germany and England. In 1910 40,817,524 pounds of cheese were imported, while the exports were but 2,546,709; the month of October 1910 was $7,053,570; the exports about $442,000. Such cheese is usually named from the locality whence it comes, though sometimes the name becomes distinctive of a special make, as the Roquefort, which is made from the milk of
sheep, mainly the Lizarac breed; the Kakhalval (Bulgarian), a white cheese made of sheep's milk; the Parmesan (Italian), which is kept three or four years and polished with linseed oil; the Limburger (German), characterized by its strong odor; and the Brie (French), which is also odoriferous.

Previous to 1850 practically all the cheese made in this country was a farm product. Jesse Williams started the first cheese factory in the United States in Oneida County, N. Y., in 1851; between then and 1860 factories were established in New York State at the rate of three or four a year, and from the latter date the growth of the industry in New York was rapid, as follows: 1860, 17 new factories; 1861, 18 more; 1862, 25; 1863, 111; 1864, 210; 1865, 52; 1866, 46. Since that date the growth has been a normal one.

The United States census classes butter, cheese, and condensed milk factories together, and gives the total establishments in 1914 as 7,982. These concerns manufactured in 1914 products worth $370,818,729, but most of this value is milk and butter, cheese representing only about one-sixth of the industry. The factory production of cheese in 1914 was 377,506,109 pounds, in value $50,931,925, or about 13½ cents a pound. Nine-tenths of this production was full cream cheese.

Wisconsin, where the industry began in 1864, has been the leading State in cheese-making for some years, with an annual production valued at about $9,000,000; other States average: New York $6,600,000, Minnesota $4,300,000, Illinois $2,000,000. Considerably higher figures have been given by some authorities, but this is due to other products of the dairy, as condensed milk, being figured in with the cheese.

For further information regarding cheese see Decker's 'Cheese Making' (1905), the United States census reports and reports of the New York State Agricultural Experiment Station and the Wisconsin Agricultural Experiment Station; also the yearbooks and bulletins of the Department of Agriculture.

CHARLES H. COCHRANE.

CHEESE-FLY, a small, black, dipterous insect (Phipolia casei) bred in cheese, belonging to the Muscidae, the same family to which the house-fly, blow-fly, etc., belong. It has a very extensible ovipositor, which it can sink to a great depth in the cracks of cheese and lay eggs there. The maggots, well known as the cheese-hopper, is furnished with two rocky claw-shaped mandibles, which it uses both for digging into the cheese and for moving itself, having no feet. Its leaps are performed by a jerk, first bringing itself into a semi-circular attitude, when it can project itself 20 to 30 times its own length. It infests not only cheese, but also smoked meats, doing much damage in packing-houses.

CHEESE-HOPPER. See CHEESE-FLY.

CHEESE-RBNNET. See Beetraw.

CHEETAH, CHITA, CHEETAH, or HUNTING LEOPARD, a large tropical cat (Cynalurus jubata) forming an offshoot of the Felidae. Its length and slenderness of limb give it a fleetness in running short distances, such as is probably attained by no other large mam- mal. Its claws are short, blunt and practically non-retractile. It pursues its prey by chase rather than by stealth; and ordinarily exhibits more dog-like than cat-like qualities, among these being great docility. It can usually stealthily come upon its prey if occasion demands. It is about the length of a leopard, but stands much higher, is rufous or tawny in color, spotted with black, except on the throat. It is commonest in the African jungles, and thence is more sparsely distributed to India. In India it is tamed and trained by the natives as a hunter. It is treated like a falcon, leashed, hooded and kept blindfolded until the game is in sight, when it is loosed and darts upon the quarry, which it drags down and holds until the huntsman comes. The ancient monuments show that this leopard was employed by the Assyrian and Egyptian sportsmen to remote antiquity; and it is known that in the 14th century the returning Crusaders introduced the cheeta into Europe where it was used for some centuries.

CHEETHAM, Samuel, English theologian: b. Hambleton 1827; d. 1908. He was educated at Christ's College, Cambridge, was fellow there in 1850 and assistant tutor 1853–58. From 1863 to 1866 he held the chair of pastoral theology at King's College and in 1879–82 was archdeacon of Southwark. From 1875 to 1880 he edited the 'Dictionary of Christian Antiquities.' He published 'A History of the Christian Church during the First Six Centuries' (1894); 'The Mysteries, Pagan and Christian' (1895); 'Medieval Church History' (1899); 'History of the Christian Church since the Reformation' (London 1908).

CHEEVER, Ezekiel, American school teacher: b. London, England, 25 Jan. 1614; d. Boston, Mass., 21 Aug. 1780. He received a good classical education and emigrated to America in June 1637, in order to enjoy religious freedom. With Davenport and Eaton he was one of the founders of New Haven, Conn., where he married and taught school in his own house, Michael Wigglesworth being one of his pupils. About 1650 he removed to Ipswich, Mass., where he was the first master of its Free, or Grammar, School; in 1661 he went to Charlestown in a similar capacity, and in 1670 was called to Boston as headmaster of its free school and remained there the rest of his life. His 'Latin Accidence: an Elementary Grammar of the Latin Language,' was for a century the most popular introductory Latin textbook used in New England, 18 editions having been printed before the Revolution (10th ed., 1767; 20th ed., Salem 1785). He also wrote 'Scripture Prophecies Explained, in Three Short Essays,' an edition of which was printed in Boston 1757. His funeral sermon was preached by his pupil and friend, Cotton Mather, Cotton Mather, 'Ezekiel Cheever, Schoolmaster' (Boston 1905).

CHEEVER, George Barrell, American clergyman: b. Hallowell, Me., 17 April 1807; d. Englewood, N. J., 1 Oct. 1890. He was graduated at Bowdoin College in 1825 and at the Andover Theological Seminary in 1828. In 1839 he became pastor of the Allen Street Presbyterian Church in New York, and from 1846–67 was pastor of the church of the Puritans, New York. He distinguished himself as an
anti-slavery advocate in the pre-Civil War period. He was editor of the New York Evangelist from 1845 to 1846, and at different times connected with the New York Observer and Independent. He was an able and vigorous writer and speaker, and the author of a large number of works in prose and verse. Among his publications are 'Studies in Poetry' (1830); 'God's Hand in America' (1841); 'Poetry of America' (1845); 'The River of the Water of Life' (1849); 'The Voice of Nature and Her Foster-Child, the Soul of Man' (1852); 'Lectures on the Life, Genius and Insanity of Cowper' (1856), arguing that Cowper's religious troubles proved him sane instead of insane; and 'God Against Slavery and the Freedom and Duty of the Pulpit to Rebuke It' (1857). One of his most effective works was 'Deacon Giles' Distillery.'

CHEFOO, chi-foo, or chi'foo', China, a treaty port in the province of Shantung, the most easterly of Chinese provinces. Its population includes about 400 foreigners and 80,000 Chinese; its currency is the Chefoo tael and the Mexican dollar; its exported products are vermicelli, peanuts, bean cake, bean oil, silk, silk waste, silk pongee, straw braid, thread lace and hair-nets. In 1883 the port was opened to foreign trade. Although it is not a foreign settlement it has a recognized foreign quarter which is well kept and has clean roads. The entire city, Chinese as well as foreign, is well lighted by electricity. An international committee, consisting of six foreigners and an equal number of Chinese, looks after the interests of the foreign quarter, as the consul of the United States at Chefoo wrote on 17 June 1916; and voluntary contributions of residents enable the committee to meet necessary expenses. The trade of the district with the United States and Europe passes mainly through Shanghai, Tientsin and Japanese ports. The net value of Chefoo trade during 1915 was $22,312,696. The number of steamers entering the port in 1915 was less than in any year since 1900—it was 1,693, of 1,434,569 tonnage; and the principal nationalities represented were British, with 527 vessels; Chinese, 588 vessels; Japanese, 494 vessels; Russian, 47 vessels; American, 26 vessels.

CHEHALIS, ché-hál'is, RIVER, Washington, in the southwestern part of the State. It has its rise in Lewis County, flows north-northwest and through Chehalis County, into Gray's Harbor. Its length is 125 miles, and is navigable for light steamers some distance from the mouth.

CHEILOGNATHA, or CHILOGNATHA, kí-log'na-tha, also known as Diplopoda, one of the two orders of Myriapoda, including the millipedes (q.v.) and other forms. See Myriapoda.

CHEILOPODA, or CHILOPODA, kí-log'ó-da, one of the two orders of Myriapoda, represented by the centipedes (q.v.). See Myriapoda.

CHEIROMANCY, or CHIROMANCY, kí-ró-mán'-sí. See Palmistry.

CHEIROMYS, kí-ró-mí's, a generic name sometimes given to the Aye-aye. See Aye-aye.

CHEIROPTERA, kí-róp-tér'-a, an order of mammals, the bats, closely related to the insectivores and characterized by the immense extension of the forelimbs so as to form wings, and by other adaptations of the skeleton for an aerial life. The order is divided into two sub-orders: Megachiroptera and Microchiroptera. The former consists wholly of the great fruit-eating bats of the Old World tropics; the latter contains all the remaining families. They are separated principally by dental features. See also Bats.

CHEIROOTHERIUM, kí-ró-thé'r-ï-úm. See Labyrinthodonts.

CHEKE, chék, Sir John, English scholar: b. Cambridge, 16 June 1514; d. London, 13 Sept. 1557. He was educated at Saint John's College, Cambridge, and made Regius professor of Greek. In 1544 he was appointed tutor to the future Edward VI, and appears likewise to have assisted in the education of the Princess Elizabeth. On the accession of Edward he was knighted, became Secretary of State in 1553 and was also a privy-councillor. On the King's death he became Secretary of State for Lady Jane Grey, for which he was committed to the Tower by Mary. After a few months, however, he was set at liberty and settled in Strasbourg; but his connection with the English Protestant Church gave offense to the Roman Catholics in England, and his estates were confiscated. He supported himself by teaching Greek, but in 1556, having been induced to visit Brussels, he was arrested by order of Philip II and sent prisoner to England. Under threat of the stake he recanted and received the equivalent of his forfeited estates. His chief distinction was the impulse given by him to the study of Greek. His best work is his translation of the 'Gospel of Saint Matthew,' edited by Goodwin (1843).

CHEKHOFF, or TCHEKHOV, Anton Pavlovitch, Russian author: b. Taganrog 1860; d. 1904. Of humble parentage, he proceeded to a good education, studied medicine at the University of Moscow, and practised only about a year in a small cholera hospital. At the age of 19 he began writing short stories under the pen-name of 'Chekhonte.' The favorable reception accorded his first volume of stories encouraged him to desert medicine for literature, where his scientific training was to prove of inestimable value. His mental trend was from the first inclined to the banal aspects of Russian life. With grim satire he seized on all that was petty, mean and sordid in human character, and with Gorky, became one of the most prominent exponents of the Russian school of sordid realists. Chekhov's writings reveal a crowded stage of humble characters—aristocrats are excluded—photographed from life, merchants, students, priests, schoolmasters, saloon-keepers, magistrates, neurotics, lunatics, officials, etc., with all their mean sordidness and narrow-minded simplicity. Where he introduces doctors—which is frequently—he revels in describing physical and mental diseases, of which latter 'The Black Monk' is the best example. An atmosphere of sadness and hopelessness pervades his characters and impresses itself upon the reader; his vivid portrayal of poverty and squalor, dishonesty and vice, frivolity, drunkenness, misery and coarseness, is certainly depressing even if true to life. Yet Chekhov is withal a great master; brilliant, of
penetrating psychology, with a remarkable flow of language, and a weird faculty of suddenly turning a humorous situation into a painful tragedy. His attempts at dramatic writing are less successful, being, at first, the feeble dramatizations of some of his stories. One of his best plays is described elsewhere (see Cherrv Cherry Orchaid); others are 'Ivanoff'; 'The Seagull'; 'Uncle Vanya, or Country Life'; 'A Marriage of Calculation'; and 'The Three Sisters.' Of his works are translated into French and German, some into English. Among his numerous stories are 'The Sorceress,' 'Agatha,' 'The Enemies,' 'The Nightmare,' 'The Twilight,' 'The Steppe,' 'A Melancholy Tale,' 'A Stranger's Story,' 'Room No. 6,' 'The Gabled House,' 'The Kiss,' 'Philosophy at Home,' 'Sorrow,' 'The Biter Bit,' 'In Exile,' 'Sleepy-Eye,' 'Street Scene in Russia,' 'From a Doctor's Practice.' He left 10 volumes of works.

CHEL-AB-KU-KIL, or AB-KU-KIIL-CHEL, an Indian priest of Yucatan who flourished in the 15th or 16th century. His name is mentioned in almost every Yucatanic legend, and fragments of history composed by him are found in documents of the missions of Yucatan and Central America.

CHELAN, chē'lan, LAKE, Washington, in the mountains of Okanogan County, 70 miles long, about 3 miles wide, and the largest lake in the Northwest. Its chief inlet is Stehekin or Pierce River, on which, about three miles distant from the lakes, are the famous Rainbow Falls, 300 feet high. The outlet is Columbia River. Chelean, Moore, Stehekin and Johnstown on its banks, are summer resorts.

CHELARD, shē-lâr, Hippolyte André Jean Baptiste, French musician and composer; b. Paris, 1 Feb. 1789; d. Weimar, Germany, 12 Feb. 1861. After studying in the various musical centres of Europe, he brought out his first comic opera, 'Casa da Vendere,' in Naples in 1815. In 1846 he settled in Paris as a teacher of violin and violoncello. In 1827 his lyrical opera, 'Macbeth' (with words by Rouget de Lisle), was very successful and procured for him the place of chapel master to the king of Bavaria. He went to London in 1832, where he conducted German opera. In 1836 he was made chapel master to the Grand Duke of Weimar. He produced other operas and cantatas, the most successful of the former being 'Der Student' (1831); 'Mitternacht' (1831); 'Die Hermannsschlacht' (1835).

CHELLÉN, chē-lā'ēn, this name is given by French archeologists to certain leaf-shaped flint implements found near Chelles in the department of Seine-et-Maine, and supposed to be the oldest relics of prehistoric man in Europe. The name is also given to the epoch, early Pleistocene, in which the makers, who were on the Neanderthal, lived. The climate then was warmer and moister than now, so much so that the hippopotamus and rhinoceros inhabited Europe. It is impossible to say what was the equivalent of the Chellean Epoch in the United States, though, perhaps, it was equivalent to the Wisconsin glaciation, when the continental ice sheet in the glacial period, if not altogether pre-glacial. See GLACIAL PERIOD; ANTHROPOLOGY; PLEISTOCENE.

CHELLES, shēl, Jean de, French architect and sculptor of the 13th century. He is best known for his work on the southern portal of Notre Dame in Paris. This beautiful entrance remains as it was constructed in 1227.

CHELMINSKI, chēl-mëns'kē, Jan, Polish painter; b. Brzostov, Russian Poland, 1851. He studied in Warsaw under Kossaks and under Wagner, Brandt and Franz Adam at the Academy, Munich. In 1884-87 he was in the United States and resided afterward in London and Paris. In his early career he portrayed mostly hunting and military subjects, and attained a great success. The principal works of this period are 'Stag Hunt in the Time of Louis XV' (1876); 'Morning in the Ukraine'; 'Empress of Russia on a Fox Hunt.' His principal later works are a series of battle pictures portraying the deeds of the Polish legion in the Napoleonic wars. Other recent canvases are 'Outskirts of Soissons 1814' (1907); 'Pursuit of a Courier, 1812' (1910).

CHELMSFORD, chēl-mërz'fôrd, Frederic Augustus Theobald, 2nd Earl of, in the English peerage: b. 31 May 1827; d. London, 9 April 1905. Entering the army in 1844, he served in the Crimea and through the Indian mutiny. As deputy adjutant-general he served in the Abyssinian campaign, was made aide-de-camp to Her Majesty, and adjutant-general to the forces in India (1868-76), and in 1877 was appointed commander of the forces and lieutenant-governor of Cape Colony. He restored Kaffraria to tranquillity, and was given the chief command in the Zulu war of 1879, which was a series of great difficulties with the transport, and some disasters, such as those of Isandlwana and Isandlwana, he gained the decisive victory of Ulundi on 4 July, before the arrival of Sir Garnet Wolseley, who had been sent to supersede him. On his return to England he became lieutenant of the Tower, a post which he held till 1889. He was appointed lieutenant-general in 1882, in 1888 general and in 1893 was retired.

CHELMSFORD, Frederic John Napier Thesiger, Jo Baon: b. 12 Aug. 1886. He was educated at Winchester College, and at Magdalen College, Oxford, 1892, and was a fellow of All Souls' College, Oxford, 1892-99. He has served on the London school board and the London county council; was governor of Queensland, 1905-09, governor of New South Wales, 1909-13, and in 1916 was appointed vice-roy of India.

CHELMSFORD, England, a municipal borough and capital of the county of Essex, 30 miles northeast of London by rail, situated near the confluence of the Chelmer and Cann. There is a good municipal water supply and the streets are lighted by electricity. The church of Saint Mary is a fine old building of the 14th or 15th century. Among the public buildings are the corn-exchange and the shire-hall containing the Court of Assize. There are manufactories of agricultural implements, electrical apparatus and motor cars, and a considerable trade in corn and malt is carried on. On the banks of the Chelmer are several large flour-mills. The town gives name to a parliamentary division of the county and the Romans had a station on the site of Chelmsford and Roman remains have been found in the neighborhood. Pop. 18,008.
CHELMSFORD, Mass., town in Middlesex County, five miles southwest of Lowell, on the Boston and Maine and the New York, New Haven and Hartford railroads and on the Merrimack River. The town contains several old residences of historic interest, the Adams Library and Silver Lake. The Middlesex County Training School is situated here. The town has large agricultural interests and manufactures of rice, woolens, and textiles; and large cotton-scouring establishments. The government is vested in a board of three selectmen. Pop. 5,010.

CHELONIA, κέλονία, or TESTUDINATA, τέσ-δύ-δι-νάτα, an order or sub-class of Reptilia (q.v.) containing the turtles and tortoises, and one of the most sharply defined groups of vertebrates. The body is enclosed in a more or less well-developed bony box, from which the head, neck, tail and two pairs of limbs protrude, and into which they may be completely retracted in some tortoises and terrapins. This box is a unique feature among reptiles and is divided into a dorsal shield or carapace composed of numerous dermal bones usually arranged regularly and supported on the ribs and vertebral spines, and a ventral shield or plastron likewise composed of dermal bones, among which are incorporated the clavicles and interclavicle. Both carapace and plastron are usually encased in horny plates, which do not correspond to the bony portions except for the head, neck and tail which are flexible, the vertebræ are immovably ankylosed with the carapace. The skull is very compact, with a small brain cavity, and exhibits many structural peculiarities, of which two of the most apparent are the complete fixation of the quadrate bone and the substitution of horny cutting plates for teeth on the margins of the jaws. Both shoulder and pelvic girdles are permanently enclosed within the shell, and the latter may be firmly united to both carapace and plastron. The limbs may be flattened paddles in the sea turtles, or true walking legs with free toes in the other groups. All chelonians have well-developed lungs; but some aquatic forms have additional respiratory organs, the most peculiar being the gill-like in the pharynx and oesophagus, or respiratory sacs in connection with the rectum. Pulmonary respiration is maintained partly by the movements of the neck and limbs in and out of the shell and partly by the hyoid apparatus. Without any known exceptions, chelonians are oviparous, and, after burying the eggs in the earth, allow them to be hatched by the warmth of the sun. Except in the colder regions turtles are found throughout the world, and are mostly inhabitants of fresh water, though a considerable number are terrestrial and a few marine. Between 200 and 300 living, and a great many extinct, species are known, many of the latter belonging to families not represented in the present fauna. The chelonia are divided into four sub-orders:

1. Atheca, in which the carapace is of leathery consistency and is supported by numerous small, irregular, separate bones free from the ribs. There is one family (Dermatemydidae), containing the leather-turtle (q.v.).

2. Triomychoida, with a true carapace composed of dermal bones united to the ribs, but covered by a leathery skin, and lacking the marginal bones; the pelvis is free from the plastron. There is one family (Trionychidae), the soft-shelled turtles. See 3. Cryptodira, in which the carapace is covered with horny plates and provided with marginal bones, and the pelvis is free from the plastron. It embraces the following families: Chelonidae, including marine turtles, as the green, loggerhead and tortoise-shell turtles; Testudinidae, land-tortoises and gopher tortoise; Chelydridae, snapping-turtles and alligator-turtles; Cinostridae, terrapins and mud-turtles; and several others confined to the tropics of both hemispheres.

4. Pleurodira, in which the carapace is similar to that of the Cryptodira, but the pelvis is ankylosed to the plastron, and the neck folds in a horizontal instead of a vertical plane. They are all inhabitants of fresh waters in the tropical parts of both the Old and New Worlds. Representative families are the Pelomedusidae, tartaruga (q.v.) and Chelydidae, matamata (q.v.).

Consult Gadow, 'Amphibia and Reptiles' ('Cambridge Natural History,' London, 1901), and Baur, in a bulletin of the United States National Museum.

CHELSEA, chélsé, England, a metropolis and parliamentary borough in Middlesex and western suburb of London (area, 659 acres), on the north side of the Thames, chiefly distinguished for containing a royal military hospital. A building was originally commenced here by James I as a theological college, but was never finished. In the reign of Charles II the erection of the present hospital for sick, maimed and superannuated soldiers was begun. It was carried on during the reign of King James II and finished in that of William and Mary by Sir Christopher Wren, in 1692. The whole expense of this structure amounted to £150,000, and the extent of the grounds is now about 66 acres. The pensioners maintained here number about 550, and consist of soldiers maimed or disabled in the military service or who have served for 21 years. All pensions are granted by the commissioners of Chelsea Hospital, but most of the recipients are superannuated, or old-pensioners. Their number amounts to about 85,000. It is from them that the in-pensioners are selected. The Duke of York's school for the children of soldiers, formerly situated near the hospital, has been removed to Dover. There are great military barracks, but these are not within the boundaries of the borough. Chelsea is replete with literary associations—Swift, Steele, Smollett, Turner the painter, Leigh Hunt, Rossetti, Whistler and Carlyle have resided here. Carlyle is known as 'the Sage of Chelsea.' The borough returns one member to Parliament. Pop. (1911) 60,385. Consult Beaver, 'Memorials of Old Chelsea' (1892); Blunt, 'A Historical Handbook to Chelsea' (1900); Davies, 'Chelsea Old Church' (1904); L'Estrange, 'The Village of Palaces: Chronicles of Chelsea' (1880); Martin, 'Old Chelsea' (1889).

CHELSEA, Mass., city of Suffolk County, separated from East Boston by Chelsea Creek, and from Charlestown by the Mystic River. It is a suburb of Boston, and is connected with it by ferries, electric and steam railroads; and the Mystic River is crossed here by a bridge 3,000

CHELSEA HOSPITAL—CHELSEA WARE

feet long. Chelsea has a United States Marine Hospital, United States naval powder magazine, Soldiers’ Home, Fitch Public Library and Odd Fellows’ and Masonic halls. It has extensive sewer, water, gas, and machine-shop products, leather, cordage, brass goods, pottery, iron and steel, etc. In 1909 there were 110 manufacturing establishments, with $11,021,000 capital and 3,554 hands and an annual output valued at $17,021,000. It has numerous churches, high and graded public schools, weekly newspapers and two national banks. Chelsea was settled at Winnismimmet in 1630; was a part of Boston until it was organized as a town in 1738, and was incorporated as a city in 1857. In 1914 a destructive fire swept over the manufacturing section of the city, causing a loss of over $17,000,000. The burned-out section, however, has been almost entirely rebuilt. Pop. (1910) 32,452.

CHELSEA HOSPITAL. See CHELSEA.

CHELSEA VILLAGE, now a part of New York. The name is still preserved in Chelsea sewer, which runs between South and Tenth avenues and Twenty-sixth and Seventy-first streets. Clement C. Moore, the author of ‘Twas the Night Before Christmas, owned here a farm in the early part of the last century. He sold it off in lots, and the place was called Chelsea Villas.

CHELSEA WARE (soft porcelain). There is doubt as to the date when the Chelsea (London) factory was started. Both 1730 and 1744 are claimed. The earliest dated Chelsea pieces (two extant 4goat and bee 5 decoration milk jugs) have incised triangle and "Chelsea, 1745" marks. They are of such expert workmanship as to create a supposition that the factory had been already operating for some years. Chelsea ware appears to have had a high reputation and large sale in France as early as 1745. Charles Gouyn was manager of the factory in 1747. In 1750 Nicholas Sprimont held that post, to become proprietor by 1759. The Duke of Cumberland and Sir Edward Fawkener financed the works to their loss, but Sprimont became bankrupt and sold the factory to Charles Cox in 1769. The latter sold out the next year to William Duesbury, owner of the Derby porcelain factory. Duesbury ran the works till 1784, when he transferred the entire plant to Derby. See DERBY.

Characteristics. Early pieces (to 1749) were thick and badly potted, the frit (artificial) paste being difficult to manipulate. Numerous pieces were white; no gilding was in use then. Decoration simple, with tendency to Meissen (Dresden), Sévres and Chinese styles. Forms were often after silversmiths’ ware. From 1750 to 1753 we find Japanese patterns. Chelsea figures are said to show better finish than Bow ware and to be rather thinner in the face than Derby figures. The "spur" marks, bare of glaze, are a characteristic of this ware. The rococo scroll more often decorates the foot of the Derby and Chelsea figures, whereas the same scroll forms the foot of Bow figures. In general they are firmer and more finished than Bow ware. Chelsea and Derby ware as to cause much discussion as to provenance of pieces. Differences in paste and glaze are the points connoisseurs depend on largely.

Product. Rococo vases, figures of Chinese, harlequins, animals, Cupids, groups, dinner, tea, coffee and dessert services, épergnes, beaters, candlesticks, cups with stands, small seals representing animals, birds, etc.; tables for serving, knives and forks, scent bottles, caudle cups, etc. Figures vary from one inch to over two feet. Finest pieces are said to have been produced in Chelsea’s last period.

Decoration. Plain white and simple decoration came first, with Oriental and Continental, especially Dresden patterns. Underglaze blue (cobalt) and enamel overglaze colors followed. Sprimont colors were very brilliant compared with the Derby ware. Chelsea figures are very fine (some have the noted "bocage" raised flower and foliage decoration) and came from the hands of such sculptors as Nollekins Senior, Roubilliac and Bacon. Kandler’s and Acier’s Meissen (see DRESDEN) figures were frequently closely copied. Beautiful decoration and done by such painters as Zachariah Bowman, Sir Thomas Thornhill, Willinson ("exotic" birds), and by John Hall, later noted as engraver. Other artists were Boyer, Askew, Barton, Gauron, Dyer and Mills. Chelsea’s beautiful ground colors consist of the "chestnut," "Chelsea claret," "marzarin" blue, pea-green, turquoise, termed "celeste," etc. Her elaborate gilding is sometimes chased or even raised.

Glaze. The large proportion of lead caused great brilliancy; it made the underglaze blue spread with its soft absorbent qualities, so as to form a lovely blue tinge over the entire surface. This plumbiferous glaze had a softness and richness that experts termed "luscious," "sensuous," etc.; its softness often causes the surface to show wear. Late pieces often show cracks from defective firing.

Paste. First paste was soft and of uneven density, rendering it opaque in the denser portions and translucent in the remainder of the body. This created the appearance of the so-called "grease spots" or "moons" when held up to light. Later (1757-69) the body becomes whiter and more evenly translucent (a phos- phatic paste).

Marks. First "Chelsea, 1745" and incised triangle. Then anchor impressed in relief on oval medallion or painted (red), sometimes in gold. W. M. Binns says the gold belongs to last period. Next came two anchors (last reversed) touching, in red used to about 1758, then red or gilt till 1768. Oriental style pieces often have "Chinese seal" mark. The mark of trident and crown is on some pieces.

Chelsea-Derby Period (1770-84).—Duesbury substituted Derby features (see DERBY) in body, glaze, style (several decorations), and decoration. The wonderful Chelsea "claret" color disappeared. Gold stripes were favored. Products were services, vases, etc., as before. Decoration ran to festoons and other floral motifs, figures, landscapes, biscuit flowers, medallions, masks, etc. The mark is an anchor with the script "D."

CHELTENHAM — CHEMICAL ANALYSIS

CLEMENT W. COUMBE.

CHELTENHAM, chel'ten-am, England, a municipal and parliamentary borough and popular watering-place in the county of Gloucester, seven miles northeast of the city of Gloucester, on the river Chelt, a short tributary of the Severn, 120 miles from London by rail. It is a city of gardens, protected by hills and surrounded by beautiful scenery. Cheltenham spas first occasioned the rapid growth of the town, but the baths and springs are less frequent than formerly. The springs were discovered in 1716 by accident, but became famous in 1788 through a visit paid to them by George III. The parish church is a fine old Gothic structure, and the Roman Catholic and Congregational churches are two of the finest in England. The town is also noted as an educational centre. There is a college for boys (founded in 1843), with an attendance of 200 scholars; and the ladies' college, with 500 pupils. There are also two training colleges for teachers. Among other public institutions may be mentioned its libraries, assembly-rooms, the college museum, pumprooms and numerous places of fashionable resort. There are hospitals, orphanages, etc. Cheltenham returns one member to Parliament. The town has a large brewery and ironworks. Pop. 48,942.

CHELYUSKIN, chel'-yoos'kin, Cape (formerly Northeast Cape, and sometimes called Cape Severo), the easternmost point of northern Asia, on a peninsula of the same name, which forms the western arm of the eastern half of the Taimyr Peninsula. It is named after a Russian officer who led an expedition thus far in 1742 and died before the fatigue of the journey; it was not revisited till 1878, when Nordenskjöld, in the Vega, spent 19 and 20 August here. Lat. of the west is 77° 36' 37" N., that of the east 77° 41' N.

CHEMICAL AFFINITY, the force or tendency which causes two or more dissimilar substances to combine in definite proportions to form a new substance, whose properties are distinct from those of any of the constituents. The word "affinity" was originally employed in this sense because it was believed that a kind of relationship exists between substances that are capable of combining with one another. No such idea as this is entertained in modern times, and it might even be said that the tendency toward combination is (in general) stronger in proportion to the dissimilarity, or lack of obvious relationship, between the substances combining. In the time of Aristotle the constituent particles of bodies were conceived to be endowed with qualities somewhat akin to love and hate. After the advent of Galileo these notions were exchanged for equally erroneous but more mechanical ones, and the ultimate particles were represented, in thought, as provided with hooks and other similar devices, by means of which their combinations were conceived to be effected. Later, when the law of universal gravitation was propounded by Newton, the force impelling the atoms toward one another, and holding them in their complex groupings was first pictured as a special form, or manifestation, of gravitational action. This latter view may possibly be true, but if so we must modify our present views with regard to gravitation somewhat, and assume that it follows different laws, when acting at molecular distances, from what it does when acting at distances that are appreciable to the senses. The modern tendency appears to be rather in favor of viewing chemical affinity as an electrical manifestation, though this conception has not yet been developed in a wholly definite and satisfying form. (See ELECTRON.)

It was formerly thought possible to arrange the elements in the order of their chemical affinity, so that each element of which they would expel all those that preceded it from their combinations, and tables of this sort were published two centuries ago (in 1718) by Geoffroy. Later, it was found that no such definite law exists; and Claude Louis Berthollet's famous "Essai de Statique Chimique" (Paris 1803), pointed out that the combination of substances depends not only upon the affinity that such substances have for each other, but also upon the relative quantities in which they are present. For example, if barium sulphate and potassium carbonate are melted together, the former is always partially converted into carbonate; but in order to effect its total conversion into carbonate, it is necessary that the quantity of carbonate of potassium present shall be at least six or seven times as great as the equation BaSO₄ + K₂CO₃ = BaCO₃ + K₂SO₄ would appear to require. In recent times the necessity of taking account of the relative masses of the constituents has been fully recognized, and a good idea of the important results that have followed may be had from Nernst's "Theoretical Chemistry from the Standpoint of Avogadro's Rule and Thermodynamics," (1909), with his wife, in "Scientific Papers" by C. S. Palmer). Numerical estimates of the "affinity" of various substances have been obtained by many methods, but the results are not always in as good accord with one another as could be wished, and a discussion of the differences would require a volume. For a brief but excellent review of the different methods consult W. C. D. Whetham, "Solution and Electrolysis." See DISSOCIATION; ELECTRON; EQUILIBRIUM (Chemical); and SOLUTIONS.

CHEMICAL ANALYSIS is the art of determining the constituents of which a given substance is composed. The analysis is "qualitative" if it is made solely for the purpose of discovering what those constituents are. It is "quantitative" if the object is to ascertain the quantity of each that is present. It is hardly necessary to say that in the examination of an unknown substance a qualitative analysis must be made before a quantitative examination is attempted, because the methods that must be employed in quantitative work depend altogether upon the nature of the constituents that are to be determined. An analysis is said to
A Garniture of Vases and Ornaments. Dresden Style (late 18th Century)
be "ultimate" when its object is merely to discover what elements are present, and in what quantity each occurs. It is said to be "proximate" when it is made for the purpose of learning how these elements are combined with each other, and what radical or other proximate compounds are present. Chemical methods are known, which suffice for the ultimate analysis of any compound that may be proposed; but chemical science has not yet been developed sufficiently to formulate equally general methods for proximate analysis. Many methods are known for the recognition of certain of the organic radicals, but most of the problems that arise in proximate analyses are of such a nature that special means must be devised to fit each special case.

**Qualitative Analysis of Inorganic Substances.**

In the qualitative analysis of inorganic substances, the color that a given compound communicates to the flame of a Bunsen burner often affords useful information as to the nature of the compound, and a systematic examination of the substance in the flame of the blowpipe may afford much additional information. When the substance is partially volatilized in the flame of the Bunsen burner, or by the electric spark from an induction coil, and the light of the flame (or the spark) is examined through the spectroscope, many of the elements can be recognized, even when present in exceedingly small quantities, by the occurrence, in the spectrum, of certain characteristic bright lines, or groups of such lines. (See **Spectroscopy**). The usual method employed, however, for the detection of the commoner bases and acids, is known as the "wet process," and consists in bringing the substance into solution, and noting the behavior of this solution when certain reagents are added to it. Even in the analysis of inorganic substances (see the annexed table in the present section) troublesome combinations sometimes occur, and in such cases the reaction that might naturally be expected at a certain stage in the examination may be modified to a considerable extent by the action of another. An adequate account of conditions of this sort cannot be given in the present article, and they are not stated with any degree of completeness in the more elementary manuals on inorganic analysis. Good accounts of the various difficulties of this sort will be found, however, in Douglas and Prescott's "Qualitative Chemical Analysis," to which the reader is referred. The existence of difficulties and limitations being recognized, a general scheme for the detection of the commoner metallic elements may be given, which will be found to work satisfactorily in the majority of cases.

The first step in making an analysis in the wet way is to ensure the absence of organic matter, which might seriously interfere with the subsequent reactions. If organic matter be present, it may usually be detected by heating a part of the compound in a closed tube. If it blackens, or gives off a characteristic emphumastic odor, organic matter is probably present, and it must be destroyed either by the continued application of heat, or (if there appears to be danger of losing any essential part of the inorganic substance by volatilization) by warming it with strong sulphuric acid. The organic matter being destroyed by either of these methods, the next step is to bring the substances into a state of solution. Water, either cold or hot, should first be tried as a solvent. If this does not suffice, hydrochloric acid, nitric acid or alkaline solvents may be tried. If these reagents fail to effect solution, one part by weight of the substance may be mixed with five parts of sodium carbonate and five of potassium carbonate, and the whole heated in a porcelain crucible until quite indurated (this may take 30 minutes). The crucible and its contents are then allowed to cool, and are immersed in dilute hydrochloric acid, or (if silver is suspected to be present) in dilute nitric acid. In this way most of the commoner insoluble substances may be brought into a state of solution. For methods that are applicable to substances that resist this mode of treatment, the more advanced treatises on analysis must be consulted. In case a part of the substances to be analyzed dissolve for the original reagents, a separate examination of the solution so obtained should be made, the insoluble part being reserved for subsequent treatment, by the method indicated above.

The commoner metals (which are the only ones that can be considered in the present article) may be divided into seven general groups, according to their behavior when treated with certain reagents that are known as "group reagents." These classes or groups are as follows:

1. Metals forming chlorides that are insoluble in water, and which are precipitated as chlorides upon adding hydrochloric acid to their solutions. (Silver, lead and mercurous mercury).

2. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphides that are insoluble in ammonium sulphide, \((\text{NH}_4)_2\text{S}\). (Mercury, lead, bismuth, cadmium, copper and silver).

3. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphides that are soluble in ammonium sulphide. (Arsenic, antimony and tin).

4. Metals whose insoluble compounds in water, and which are precipitated from neutral solutions, by ammonium sulphide, either as sulphides or as hydrates. (Iron, manganese, cobalt, nickel and zinc are precipitated as sulphides; aluminium and chromium as hydrates).

5. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are insoluble in ammonium chloride, (Barium, strontium and calcium).

6. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are soluble in ammonium chloride. (This group contains the single metal magnesium).

7. Metals which remain in solution when treated by any or all of the foregoing reagents, and all of whose important compounds are soluble. (Potassium, sodium, lithium and ammonium).

The separation of the groups that are defined above may be effected as follows: Hydrochloric acid is added to the solutions until examination, drop by drop, until no further precipitation takes place. The white precipitate which may occur at this stage consists
of the chlorides of the metals of Group 1, and
is to be preserved for further examination. The
solution is filtered, and a drop or two of hydro-
chloric acid is added to the clear filtrate, to
make sure that this reagent is incapable of
inducing further precipitation. Sulphuretted
hydrogen gas is then passed through the filtrate
until the liquid smells strongly of the gas. If a
precipitate is formed, it is composed of the
sulphides of the metals of the second and third
groups. Silver, however, will not (in general)
be present, because it is ordinarily completely
precipitated in the first group, and has there-
fore been already removed by filtration. Lead
may not be completely precipitated in the first
group, and hence its sulphide may occur in the
present precipitate. The mercury in the present
precipitate represents mercuric mercury in the
original solution. The mixed sulphides of Groups
2 and 3 are removed by filtration and are
washed until the wash water is no longer acid.
They are then boiled with ammonium sulphide.
This reagent leaves the sulphides of Group 2
undissolved, but dissolves those of Group 3. Fil-
tration is then done, and the sulphides of Group
2 are removed on the filter paper; and when the
filtrate is acidified by the addition of hydrochloric acid,
the sulphides of Group 3 are thrown down again.
The clear filtrate from which Groups 2 and
3 were removed by sulphuretted hydrogen gas is
next made slightly alkaline by the addition of
ammonia and heated almost to boiling. Ammon-
ium sulphide is then added, and the whole
is kept warm for some time. The sulphides (or
hydrates) of Group 4 are thus precipitated, and
may be isolated by filtration. The filtrate
from this operation is next boiled to expel
all the sulphuretted hydrogen and ammonia and
ammonium chloride are added. The solution is
then heated to the boiling point and treated
with a solution of ammonium carbonate
\((\text{NH}_4)_2\text{CO}_3\). This causes the precipitation of
the carbonates of Group 5, which are removed
by filtration. The filtrate is boiled, and then
treated with a solution of sodium phosphate,
\(\text{Na}_3\text{HPO}_4\), to which one-sixth of its volume
of ammonium has been added. Magnesium, the
metal of the sixth group, is thrown down (if
present) in the form of a white crystalline pre-
cipitate having the formula \(\text{Mg}_{2}(\text{NH}_4)_2\text{P}_2\text{O}_7\).
This is again removed by filtration, and the
filtrate will contain, in solution, the metals of
Group 7.
The several groups being thus separated, it
remains to examine each group by itself, to see
how its components may be isolated or other-
wise recognized.

Group 1. The chlorides of this group, as ob-
tained in pursuing the general scheme outlined
above, may be separated very readily. Thus if
the precipitate of mixed chlorides be treated with
boiling water, the chlorides of silver and mer-
cury will be unaffected; but the chloride of lead
will dissolve, and may therefore be isolated by
filtration. The mixed chlorides of silver and
mercury may be separated by treatment with
hot ammonia. This reagent dissolves silver
chloride, which is again precipitated in the form
of chloride upon neutralizing its solution with
nitric acid. The hot ammonia does not dissolve
mercurous chloride but transforms it into a
black substance that contains mercury, chlorine,
nitrogen and hydrogen, and remains behind
upon the filter paper.

Group 2. All the silver present being as-
sumed to be removed in the first group, the
mixed sulphides of Group 2 are washed until
the wash water is clear; the filtrate, to
make sure that this reagent is incapable of
inducing further precipitation. Sulphuretted
hydrogen gas is then passed through the filtrate
until the liquid smells strongly of the gas. If a
precipitate is formed, it is composed of the
sulphides of the metals of the second and third
groups. Silver, however, will not (in general)
be present, because it is ordinarily completely
precipitated in the first group, and has there-
fore been already removed by filtration. Lead
may not be completely precipitated in the first
group, and hence its sulphide may occur in the
present precipitate. The mercury in the present
precipitate represents mercuric mercury in the
original solution. The mixed sulphides of Groups
2 and 3 are removed by filtration and are
washed until the wash water is no longer acid.
They are then boiled with ammonium sulphide.
This reagent leaves the sulphides of Group 2
undissolved, but dissolves those of Group 3. Fil-
tration is then done, and the sulphides of Group
2 are removed on the filter paper; and when the
filtrate is acidified by the addition of hydrochloric acid,
the sulphides of Group 3 are thrown down again.
The clear filtrate from which Groups 2 and
3 were removed by sulphuretted hydrogen gas is
next made slightly alkaline by the addition of
ammonia and heated almost to boiling. Ammon-
ium sulphide is then added, and the whole
is kept warm for some time. The sulphides (or
hydrates) of Group 4 are thus precipitated, and
may be isolated by filtration. The filtrate
from this operation is next boiled to expel
all the sulphuretted hydrogen and ammonia and
ammonium chloride are added. The solution is
then heated to the boiling point and treated
with a solution of ammonium carbonate
\((\text{NH}_4)_2\text{CO}_3\). This causes the precipitation of
the carbonates of Group 5, which are removed
by filtration. The filtrate is boiled, and then
treated with a solution of sodium phosphate,
\(\text{Na}_3\text{HPO}_4\), to which one-sixth of its volume
of ammonium has been added. Magnesium, the
metal of the sixth group, is thrown down (if
present) in the form of a white crystalline pre-
cipitate having the formula \(\text{Mg}_{2}(\text{NH}_4)_2\text{P}_2\text{O}_7\).
This is again removed by filtration, and the
filtrate will contain, in solution, the metals of
Group 7.
The several groups being thus separated, it
remains to examine each group by itself, to see
how its components may be isolated or other-
wise recognized.

Group 3. When the sulphides of Group 3 have
been isolated, some information may be had at
once from the color of the precipitate. Thus
arsenic sulphide is yellow, antimony sulphide
is red and tin sulphide is black. If only
one of these elements is present, it may therefore be detected by the color of its
sulphide. If more than one are present, the
mixed sulphides are treated with a solution of ammonium carbonate \((\text{NH}_4)_2\text{CO}_3\).
The sulphides of antimony and tin are unaffected,
but the sulphide of arsenic passes into solution,
and after filtration it may be again thrown
down by the addition of hydrochloric acid. The mixed sulphides of antimony and tin are trans-
f erred to a porcelain dish, and heated with a
small quantity of hydrochloric acid, to which a
few crystals of chlorate of potash have been added. By this treatment they are reduced to
the form of chlorides. The solution containing
the mixed chlorides of antimony and tin should
then be somewhat diluted, and a piece of plat-
ium foil wrapped in zinc should be added. By
the electrolytic action so set up, antimony and
tin are thrown down, in the metallic state, upon
the platinum foil; and the foil will be blackened
in spots, if antimony be present. In any case
the foil should be washed and boiled with
hydrochloric acid diluted with its own bulk of
water. In this way any tin that may be present
is brought into the form of the chloride, which
dissolves; the antimony remaining unaffected.
The presence of tin chloride in solution may be
readily demonstrated by the addition of a solu-
tion of cuprous sulphate in the form of a
precipitated hydrochloric acid. The solution is
reduced to the form of a higher chloride, and a
precipitate of \(\text{Hg}_2\text{Cl}_2\) (calomel) is thrown down. If
no tin is present, this precipitate is not
formed.

Group 4. The metals of Group 4 are ob-
tained, in the general scheme of separation out-
lined above, in the form of sulphides and hydrates. The precipitate containing them is to be treated in a porcelain dish with cold dilute nitro-hydrochloric acid. The sulphides of nickel and cobalt remain unaffected, and may be removed by filtration, since the other metals pass into solution. The precipitate that is undissolved should be tested in a borax bead before the blowpipe. (See Blowpipe Analysis.) Cobalt gives a blue bead, while nickel gives a reddish-brown one. If both metals are present, the color is intermediate between these two. In the reducing flame the reddish-brown color due to nickel changes to a gray, while the blue of the cobalt remains unaltered; hence the reducing flame should be tried, if no decided indication of cobalt is obtained in the oxidizing flame. For other and more exact tests for distinguishing cobalt from nickel, special treatises on qualitative analysis should be consulted. (For example, Scott's 'Standard Methods of Chemical Analysis'.) Nickel and cobalt being removed from the metals of Group 4 by the means indicated above, the filtrate containing the remaining members of the group is boiled until all the sulphuric hydrogen is expelled. A sufficient volume of water is added, and the solution is again boiled until the greater part of the acid is driven off, when the remaining solution is diluted with water. The small amount of free acid that is still present is neutralized with sodium carbonate, care being taken that no permanent precipitate is formed. The solution is allowed to cool, barium carbonate is added in the cold and the whole is allowed to stand for 15 minutes. The precipitate contains the aluminium, chromium and iron in the form of hydrates, and also the excess of barium carbonate. The filtrate contains manganese and zinc. The precipitate is removed by filtration, dissolved in dilute hydrochloric acid, gently warmed and made alkaline by ammonia. By this process the hydrates of aluminium, chromium and iron are thrown down, free from barium. This precipitate of the hydrates is collected on a filter, dried, transferred to a porcelain dish and dissolved in concentrated nitric acid. A few crystals of sodium chloride are then added, and the solution is boiled for several minutes. Upon adding sodium hydrate in excess, the iron is thrown down in the form of hydrate, the aluminium and chromium remaining in solution. The iron being removed by filtration, the filtrate is divided into two portions. One of these portions is made acid with nitric acid, and ammonia is added in excess. Aluminium hydrate is thrown down, if aluminium is present. The other portion of the filtrate is made acid with acetic acid, and lead acetate is added. If chromium is present, a yellow precipitate of chromate of lead, PbCrO₄, is thrown down. The filtrate from the treatment with barium carbonate, which may contain zinc and magnesium, is heated to boiling, and the barium that it contains is completely precipitated with dilute sulphuric acid. The precipitate of barium sulphate is removed by filtration, and the filtrate is boiled, after addition of sodium hydrate in excess. If manganese is present, it is precipitated in the form of the hydrate, and may be removed by filtration. The filtrate from this operation is acidified with acetic acid, and treated with sulphuric hydrogen gas. If zinc is present, it is thrown down in the form of a white precipitate of zinc sulphide, ZnS.

Group 5. The metals of this group (barium, strontium and calcium) are isolated, in the general scheme, in the form of carbonates. To separate them from one another, the mixed carbonates are dissolved in dilute acetic acid, and a portion of the solution is tested for barium by the addition of potassium chromate, K₂CrO₄ (not the bichromate, K₂Cr₂O₇). If barium is present, a straw-yellow precipitate of barium chromate, BaCrO₄, is thrown down. If barium is not present, we may proceed at once to the tests for calcium and strontium; but if it is present, it must first be removed from the solution by cautiously adding potassium chromate until no further precipitate is formed, and then filtering. In this case it is necessary to remove the excess of chromate of potassium before testing for calcium and strontium, because these two metals cannot be separated in the presence of that reagent. For the first solution the filtrate containing the strontium and calcium (which must be perfectly free from barium chromate, even though several successive filtrations may be necessary in order to make it so,) is made alkaline by ammonia, and ammonium carbonate is then added until the carbonates of strontium and calcium are all precipitated, the potassium chromate remaining in solution. After filtration and thorough washing, the mixed carbonates of strontium and calcium are dissolved in hot acetic acid, and the solution is boiled. Dilute sulphuric acid is then added; and if the acid is sufficiently dilute, a white precipitate of sulphate of strontium is thrown down, while the sulphate of calcium (which is formed at the same time) remains in solution. After standing for 15 minutes or more, in order that the precipitation of strontium sulphate may be complete, the solution is filtered, and the clear filtrate is tested for calcium by first adding a little ammonia until an alkaline reaction is obtained, and then adding a solution of oxalate of ammonia. If calcium is present, a white precipitate of calcium oxalate is obtained.

Group 6. This "group" contains magnesium only. Hence the presence of magnesium will be made apparent at once in the course of the preliminary separation into groups.

Group 7. Potassium, sodium, lithium and ammonium belong to this class. These metals are characterized by the high solubility of all their important salts. Ammonium, being used in the separation of the groups as a reagent, is sure to be present in the final solution that has been designated as containing the metals of "Group 7." Hence if it is desired to test for that substance, the test should be made upon a specimen of the original solution to which the ammoniacal reagent has been added. The test is very simple, and consists merely in heating some of the proposed solution with milk of lime (calcium hydrate in suspension). All salts of ammonia are decomposed in this way, with the liberation of ammonia gas, which may be recognized by its smell or by its turning moist red litmus paper blue. The general nature of the reaction involved in the liberation of ammonia gas may be illustrated by the treatment of ammonium sulphate. We have (NH₄)₂SO₄ + Ca(OH)₂ = CaSO₄ + 2NH₄ + 2H₂O. Sodium, potassium and lithium may be sought for in the final filtrate obtained in the separation of the funda-
mental groups, since no compounds of those metals have been used as "group reagents." They are best identified by means of the colors that they communicate to the flame of a Bunsen burner. For performing a test of this sort, the filtrate containing these metals should be evaporated to dryness in a porcelain dish, and the residue ignited until any ammoniacal salts present are eliminated by volatilization. The dish is then allowed to cool, and its contents are moistened with a few drops of distilled water. A piece of platinum wire is next thoroughly cleaned, moistened with hydrochloric acid and held in the Bunsen flame until it ceases to communicate any color. The wire is then dipped into the solution in the dish, and again held in the flame. Potassium salts give a fine blue color, lithium salts a red and sodium salts an orange yellow. If sodium is present in any considerable amount, its strong, brilliant flame-color is almost certain to obscure the colors due to any other elements present. Chemists therefore make use of colored glasses that are practically opaque to sodium light, using them as screens through which to view the Bunsen flame. The commonest glass of this kind is the "cobalt-blue" glass, which is used for the detection of potassium, since it is quite transparent to the flame-color of that metal.

For methods of examination adapted to the detection of gold, platinum and others of the less common metals, reference must be made to books on chemical analysis.

The metals that exist in a proposed substance being known, it remains to discover in what chemical combinations they are present. It is usually impossible to learn, by mere qualitative analysis, which of the acid radicals that may be present is combined with any given one of the metals; but it is possible to ascertain that certain kinds of compounds (such as sulphates, chlorides and the like), are present and a chemist of experience, who is familiar with the kind of work in hand, can often infer, with considerable probability, how the bases and acids are associated with one another. In the present article it is not possible to discuss this difficult phase of analysis, but a few of the more common tests for the presence of acid radicals may be given.

There is no general scheme for the detection of these radicals, by which they are separated into groups like the metals, and eventually isolated singly. In examining a substance for them, all that can be done is to apply certain tests, largely independent of one another, and best carried out by dividing the original solution into a number of parts, each of which is to be examined for a single class of acid radicals, and then thrown away.

When a solution of barium chloride is added to a neutral or slightly alkaline solution, a precipitate of the corresponding barium compounds is thrown down if the solution tested contains sulphates, phosphates, borates, oxalates, fluorides, carbonates, silicates, tartrates, sulphites, hyposulphites, arseniates, arsenites or chromates. (If the original solution contains lead, silver or mercury in any amount at all, in the place of the chloride, because otherwise a precipitate of the chlorides of these metals would also be obtained). The mixed precipitate just obtained is isolated by filtration, washed and treated with dilute hydrochloric acid. All of the compounds named pass into solution, with the single exception of the sulphate; and if a white, insoluble precipitate remains after the mixture with dilute hydrochloric acid, the presence of sulphates in the original solution is demonstrated. The hydrochloric acid solution is next made alkaline by ammonia, when a precipitate will again be thrown down, if the original solution contained oxalates or phosphates. If, however, it is thrown down at this point; and, therefore, if any precipitate is obtained, confirmatory tests for oxalic and phosphoric acids should be applied to the original solution before the presence of those substances can be regarded as really proved.

If the original solution contains a carbonate, it will effervesce upon the addition of hydrochloric acid, owing to the liberation of carbon dioxide. If it contains a sulphite, the addition of hydrochloric acid will liberate sulphur dioxide, which is readily recognized by smell. If it contains a hyposulphite, sulphur dioxide will also be liberated, but the solution will at the same time become turbid from the liberation of free sulphur. If it contains an alkaline silicate (other silicates are not soluble in considerable quantity, the addition of hydrochloric acid will cause the silicate to separate in the form of a gelatinous precipitate, which, when dried and ignited, is gritty. The presence of the arsenic acids may be established by Marsh's test for arsenic (see ARSENIC). If a tartrate is present, the original compound, when obtained in the solid state by evaporation or otherwise, is blackened by heat, with a characteristic odor suggestive of burnt sugar. The presence of a fluoride in the original substance is established by the liberation of hydrogen fluoride (see FLUORINE) when that substance is heated gently with concentrated sulphuric acid. The presence of a chromate is indicated by the precipitate from the addition of barium chloride, exhibiting a greenish black color.

As a confirmatory test a solution of lead acetate may be added to a neutralized sample of the liquid under examination. If a chromate is present, a yellow precipitate of chromate of lead is thrown down, which is soluble in caustic soda, but insoluble in acetic acid; a solution for the presence of borates, a sample of the original liquid is acidified with hydrochloric acid, and a piece of turmeric paper is wetted with it, thoroughly dried before a flame and finally moistened with a solution of sodium carbonate. If a borate is present, the color of the paper, where wetted with the sodium carbonate, changes to a greenish black.

To test the chlorides and certain other salts, a fresh specimen of the original solution should be chosen, and if it is not already acid, it should be made so with nitric acid. A solution of nitrate of silver is then added, whereupon a precipitate will be thrown down if chlorides, bromides, iodides, cyanides or sulphides are present. (Cyanide of mercury, however, gives no precipitate at this point). The precipitate should be removed by filtration, thoroughly washed and then treated with hot ammonia. The chloride, bromide and cyanide of silver dissolve, while the sulphide and iodide remain behind, unchanged. The sulphide is black, while the iodide is yellowish. For methods of distinguishing be-
between the chloride, bromide and cyanide precipitates reference must be made to the works on chemical analysis. It may be said, however, that the cyanide, when heated, is reduced to metallic silver, with the liberation of hydrogen gas. The presence of an iodide, when this is made doubtful by the black precipitate due to a sulphide may be further investigated by the iodide of starch test. See IODINE.

Nearly all of the nitrates and acetates are soluble, and hence precipitation tests are not commonly used for the detection of nitric and acetic acids. Color tests are usually employed instead. To test for acetic acid, the original solution may be made neutral, and a few drops of ferric chloride added. If acetates are present, the solution takes on a dark red color, owing to the formation of ferric acetate. To test for nitrates, a portion of the original solution is mixed with a solution of ferrous sulphate in a test tube, and strong sulphuric acid is poured down the side of the inclined tube, in such a manner as to mix with the contents, but not form a layer at the bottom of the tube. If nitrates are present, a purplish or reddish ring, changing to a dark brown, will be observed at the surface of separation of the two liquids.

**Quantitative Analysis of Inorganic Substances.**

Quantitative analysis is far more difficult than mere qualitative analysis, and cannot be treated adequately in a general encyclopedia. As has been said, unless the nature of the substance is known in some manner a preliminary qualitative analysis must be made. Several usual methods of making quantitative analyses will be described below.

**Electrolytic Method.**—When the substance to be analyzed is an alloy, or a simple mixture of metallic salts, its metallic components may often be readily separated by the electrolysis of its solution, the separation of the metals being based upon the known fact that in electrolysis the nature of the deposit depends largely upon the nature and degree of concentration of the solution, the sizes of the electrodes and the strength of the electric current that is employed. By systematic study of the effect of these conditions in the electrolysis of mixtures of metallic salts, it is found to be possible to deposit one metal upon the cathode, while the others remain in solution. The electrolytic method has been developed to a considerable extent, and promised to be of great value. Thus far, however, it is not in extensive general use. For details concerning it, consult Classen, 'Quantitative Analysis by Electrolysis,' and various papers published by Prof. Edgar F. Smith, a few years ago, in the Journal of the Franklin Institute. Scott's 'Standard Methods of Chemical Analysis' contains the latest details concerning electrolytic methods. See also the article ELECTROLYSIS.

**Gravimetric Methods.**—Strictly, any method of analysis in which the quantity of each constituent is determined by weighing is a gravimetric method; but the term is usually understood to exclude the electrolytic method just mentioned. In gravimetric work the components that are to be weighed may be separated by fire-methods, or by selective precipitation from solution, as in the scheme of qualitative analys-
alkaline solution, the mixture will be precisely neutral. As an illustration of the method that is followed, let it be assumed that a manufac-
turer has received a carboy of oil of vitriol, and wishes to
know what proportion of pure sulphuric acid it contains. If the acid were quite free from
water, 49 grams of it would be exactly neu-
tralized by 1,000 cubic centimeters (that is, one litre) of any normal alkali solution. It is more con-
venient to work with one-tenth of this
quantity of acid and reagent; so that the ex-
periment will consist in weighing out 4.9 grams of
the oil of vitriol, diluting it with water,
adding a piece of litmus paper, and letting a normal alkali solution pass into it (prefer-
ably from a graduated burette) until the acid is
precisely neutralized. If 100 cubic cen-
timeters of the alkali were required to effect
the neutralization, the given sample of oil of
vitriol would be known to contain 100 per cent of
its weight of sulphuric acid—or to be en-
tirely free from water. On the other hand, if
only 53.9 cubic centimeters of the normal alkali
solution were required to effect neutraliza-
tion, the sample would be known to contain
53.9 per cent of its own weight of sulphuric
acid.
As an example, suppose it is des-
ired to ascertain the percentage of sodium
oxide present in a given sample of crude soda
ash, without raising the question as to whether
the sodium actually occurs as oxide, hydrate
or carbonate. The formula of sodium oxide is
Na₂O, and its molecular weight 46.05—62.
As it contains two atoms of sodium to the
molecule, we weigh out 3.1 grams (not 6.2
grams) of it, dissolve in water and dilute
and add litmus paper as before. Then into the
solution we pass a normal acid solution until
neutralization is effected. If 46.7 cubic cen-
timeters of the normal acid solution are re-
quired, the alkali present in the sample, when
computed as sodium oxide, constitutes 46.7 per
cent of the weight of the whole. This process is
called "acidimetry" when it is used for esti-
mating the strength of acids, and "alkalimetry"
when it is used in estimating the strengths of
alkalis. As a further illustration of volumetric
methods the estimation of chlorine (known as
"chlorimetry") may be considered. If the sub-
stance to be examined is bleaching powder, 10 grams of the powder are dissolved
by rubbing with water in a mortar, and the
solution is diluted till it occupies a litre. It
is then well shaken, and 100 cubic centimeters
are drawn off into a beaker, by means of a
pipette, and treated with a decinormal solution
of arsenious acid (As₂O₃) until a drop of the
mixture, when withdrawn by a glass rod, gives
no blue stain upon filter paper that has been
soaked in starch liquor and iodide of potassium.
The number of cubic centimeters of decinormal
arsenious acid solution required is to be multi-
plied by the constant multiplier 0.00355, and the
product is the weight of available chlorine in
grams, contained in each gram of the original
powder. (For explanation of the multiplier
0.00355, and for full details of this process and
of volumetric analysis generally consult Fran-
cis Sutton, 'Systematic Handbook of Volumet-
ric Analysis'.)

The analysis of gases is of so special a
character that it is treated under a separate
heading. See GASOMETRIC ANALYSIS.

ORGANIC ANALYSIS.

In the analysis of organic compounds, no
general scheme can be given, corresponding
to that which is used in the systematic examina-
tion of inorganic substances. The number of
possible organic compounds is so large that
practically nothing can be done in the way of
effecting a "proximate" analysis of a compound
concerning whose general nature we have no
preliminary information. For the more or less
general methods that have been developed for
the examination of special classes of organic
substances, advanced books on organic analysis
must be consulted. The ultimate analysis of
an organic substance consisting of oxygen, hy-
drogen and carbon may be effected by burning
the substance in a glass tube in a current of
oxygen gas. The carbon is converted into car-
bon dioxide, which is absorbed by potash and
estimated quantitatively by observing the gain
in weight of the potash; and the hydrogen is
converted into water, which is similarly esti-
mated by absorption of calcium chloride. The
oxygen of the original compound is then esti-
mated by difference. When nitrogen is also
present, the process is somewhat more com-
plicated. In this case the gases of combustion
may be passed over red-hot metallic copper to
absorb the oxygen, and the nitric acid may be
measured in the free state, the oxygen being
finally concluded by difference, as before.

CHEMICAL CRYSTALLOGRAPHY.

Chemical Crystallography is concerned with
the relations between the chemical constitution of
crystallized substances and the structure of their
crystals as revealed by their form and physical
characters.

In 1800 Abbé René Just Hûty announced
that to every specific substance of definite
chemical composition, there corresponds a
crystal form peculiar to and characteristic of that
substance. Despite the many controversies in-
volving polymorphism, and isomorphism, this law
needs little modifying and it is still the belief
that each chemicaly definite body crystallizes
only in one symmetry class and has for any
definite temperature and pressure constant
angles and constant volume just as it has a
definite molecular weight and a definite
chemical structure. Furthermore, all the in-
vestigations prove that substances in any way
chemically different possess different shape and
volume.

The observation by Mitscherlich in 1819 that
the phosphates of ammonium and potassium and
the arsenates of ammonium and potassium occur
in very many cases (generally consult Fran-
cis Sutton, 'Systematic Handbook of Volumet-
ric Analysis').

The analysis of gases is of so special a
character that it is treated under a separate
heading. See GASOMETRIC ANALYSIS.
CHEMICAL CRYSTALLOGRAPHY

For many years criteria were sought by which substances truly isomorphous could be recognized; for instance, similarity in their chemical molecules and reactions, close relations in symmetry and angles and above all capacity to crystallize together in homogeneous mixed crystals in which the physical characters are continued functions of their chemical composition.

It is now established that except in the isometric substances, the replacement of one element by another necessarily produces some change in the angles and sometimes even in the symmetry, and while the change increases in general with increasing chemical dissimilarity there are no sharp lines which can be drawn and series exist with striking resemblances in angles and physical characters and little or no chemical resemblance.

Von Groth in 1870 broadened and systematized the field of chemical mineralogy by directing attention to the definition of the changes produced by the replacement of one atom or group by another. For instance, he showed that the derivatives of benzene, CH₄, underwent definite changes of structure by the substitution of new atoms or groups, and that even while the crystal might change there remained a striking similarity in angle in certain zones, and the alteration consisted chiefly in an elongation or shortening of this zone axis, usually a crystal axis. The axial ratios given below show that the change is principally with reference to the c axis.

The study of the changes which result in the crystal structures of different substances when certain atoms or atomic groups are replaced by others necessitates extremely accurate and reliable chemical determinations. A deeper insight into the results has been obtained by use of the so-called "topical ratios" or "molecular distance" ratios of Muthmann, which may be explained as follows:

In the space lattice the crystal elements a, b, c and a, b, c are theoretically the angles and relative lengths of the sides of the elementary parallelloepdons of the crystal structure, but the parameters a : b : c cannot be used directly for comparison between volumes of elementary parallelloepdons because in each such proportion one term is unity and the ratio between the units is not known.

The assumption, however, is that the volumes of the elementary paralleloepdons are directly as their molecular weights and inversely as their specific gravities and the quotient of the first by the second is called the molecular volume. By appropriate formulation the relative molecular volumes of different substances may be combined with their respective crystal elements and the topical parameters x : y : z obtained and the relative dimensions of the elementary paralleloepdons of different substances with the same type of space lattice compared term by term, thus making clear the changes which will be produced in any structure by the substitution of one element for another.

For instance, the rhombic series of isomorphous sulphates and selenates of potassium, rubidium and caesium exhibit the same forms and their corresponding angles vary less than one degree. The calculated topical ratios are:

<table>

</tr>
<tr>
<td>Rb₂SO₄</td>
<td>4.050</td>
</tr>
<tr>
<td>Cs₂SO₄</td>
<td>3.666</td>
</tr>
</tbody>
</table>

It may be noted that these Tutton values differ from that of one atom of sulphur or selenium lies between two of the alkali metal and all three extended in the direction of ω because in passing from the sulphate of one metal to that of the next in the periodic classification or from selenium to selenate the principal change is the vertical direction ω whereas in passing from sulphate to selenate of the same metal the horizontal directions x and y are more changed.

Such a series as that mentioned, Tutton calls a Eutropic series, the interchangeable elements belonging to the same group in the periodic system, and in such a series the angles and the physical properties of the crystals are functions of the atomic weights of the interchangeable elements. He uses the term Isomorphous in a broad sense to include substances which bear some definite chemical analogy, crystallize in the same symmetry class, develop the same forms and differ in angles only by a few degrees, rarely over three.

Possibly the most important general result of the study of morphotropic changes is the proof that the atom has a definite place and exerts a definite influence on the structure, for this must be so if the substitution of one particular element for another produces a quantitative and definitely oriented change in structure in whatever salt the substitution is made.

Polymorphism or Physical Isomerism.— That an element or compound may occur in two or more distinct crystalline forms was first observed by Mitscherlich in 1821, who found that by slowly cooling fused sulphur, monoclinic crystals were developed and that these on standing passed spontaneously, without again being fused, into the usual orthorhombic crystals.

This property, now known as polymorphism, was formerly attributed to a difference in the number of the chemical molecules in the so-called physical molecules, but is now regarded as due to the existence of different positions of equilibrium in the homogenous arrangement of the atoms, each position being most stable at a particular temperature.

Many substances have been shown to present two or more solid "phases," each characterized by specific form, optical properties, melting point, specific gravity and layered in general each "phase" has certain temperature limits beyond which it cannot exist it is possible for two modifications to exist under the same conditions when once formed, though one is the less stable and sometimes passes gradually or suddenly to the more stable modification.

Polymorphism must not be confused with "chemical isomerism" in which the differences between two substances with the same percentage composition are due to the different number of atoms or the different linking of the atoms in the chemical molecule.
The distinction between polymorphism and chemical isomerism can sometimes be made by melting or dissolving the substance. In the resultant amorphous condition all differences due strictly to crystal structure disappear.

In chemical isomerism the contrary, fusion or solution does not destroy the differences. Le Verrier states that in such fusions or solutions of polymorphic substances crystals of either modifications grow further on being placed in contact with the amorphous liquid mass, but such a solution or fusion will in contact with a chemical isomere usually grow only in their kind of crystal.

Adding one chemical isomere to the other raises or lowers the melting or freezing points, whereas adding one polymorphous form to the other does not, there results always the melting point of the more stable form.

Polymorphism must also be distinguished from "polysymmetry" or the tendency of crystals of a substance of a certain grade of symmetry to unite to apparently simple forms of higher symmetry. For instance, substances which are orthorhombic, monoclinic or triclinic often unite to apparently hexagonal forms, and although twin lamelles usually reveal the composites structure, at times repeated twinning may yield a structure in no way distinguishable from that of a hexagonal crystal.

In such a case, however, the physical properties are those of the original less symmetrical material and intermediate states usually can be found, whereas in the polymorphous substance the "phases" differ in their physical characters.

When a fused compound capable of assuming different "phases" of crystals, the temperature falls steadily until the transformation temperature is reached when the rate suddenly changes and coincidentally the physical properties and crystalline form change. For instance, according to Lehmann, the ordinary orthorhombic crystals of ammonium nitrate melt at about 168 degrees. If such a melted mass is gradually cooled there form eight-rayed skeleton crystals, isotropic in polarized light, which at 127 degrees suddenly become doubly refracting, increase in size and become rhombohedral. An 87 degrees acicular orthorhombic crystals develop regularly about the rhombohedral crystals. These phenomena are obtained in reverse order if the cooled mass is reheated gradually.

Morphotropic Relations Between Polymorphs.—An interesting empirical relation exists between polymorphic modifications which may be expressed as follows: If comparable "set-ups" have been chosen then the products of each crystal volume by the corresponding specific gravity are in simple mathematical ratio. By crystal volume is meant the volume of the unit pyramid. For example:

**Enantioismorphism.**—Pasteur in 1849 showed that racemic acid decomposed by solution into two varieties of tartaric acid and that while the solution of one possessed the power to rotate the plane of polarization to the right the solution of the other rotated it to the left. Thus it was known that the crystals of these two varieties are enantioisomorphic mirror images of each other (like right and left hand). Further study led to the discovery that the same relations existed in other so-called optically active compounds.

Such a result is attributed to enantioisomorphic chemical molecules and resultant enantioisomorphic crystal structures, the structure of the racemic acid corresponding to an interpenetration of the two enantioisomorphous structures.

**Structure Indicated by Formula.**—An interesting relation between chemical composition and crystalline form was shown by Tschermak in 1903. If the repetition of equivalent directions in the crystal corresponds to repetition of corresponding atoms or groups this is likely to show even in the simpler formula. Thus, many rhombohedral minerals show three-fold arrangement in the formula which may be written as A₂B whereas in tetragonal minerals there is a tendency to the four-fold A₂B in isometric to either three-fold or four-fold, and in hexagonal the six-fold, A₂B may be assumed. A corresponding sometimes to one member as O, Cl, H₂O, and sometimes to a pair. Examples are:

- Rhombolite, Proutite... 3 Ag As A... Hemitate. 
- Tetragonal... Zircon... O₂Si₂... Cassiterite O₂Si₂
- Isometric... Beryl... Bi₂SiO₆... Senarmontite
- Hexagonal... Beryl... 6 Si O Al₂... Ca Sn

**CHEMICAL INDUSTRIES.** See **FIRE PROTECTION.**

**CHEMICAL INDUSTRY.** The According to the statistics published (1916) in the report of the United States Census Bureau covering the special census of manufactures taken for the year 1914, the American chemical industry ranks among the largest manufacturing interests in the country. Oftaken only by such industries as those of iron and steel, woven goods and cotton manufactures—for it must be remembered that cattle killing, the making of boots and shoes and of clothing, as well as several other "assembling" industries, are not accounted as manufactures proper by the census statisticians—it also represents a wider diversity of interests than any other of the great industries which combine to represent the source of revenue that has made the United States the most prosperous of nations.

At the same time, it is somewhat remarkable to recall what a brief period of existence this industry has had in the United States. Great
as the proportions are to which it has attained to-day, not one of its products are known to have been made in America prior to about 100 years ago: to-day, scarcely a State in the Union that does not possess some chemical establishments, and less than a century ago, not one such factory anywhere in the country.

According to the best reports that are obtainable, the first attempt to manufacture chemicals in any considerable quantity was made in 1810, when 8,000 pounds of copperas were produced in Vermont, and a lesser amount in Maryland. Three years later an equally successful attempt was made to manufacture alum in Maryland, and, in 1816, a Baltimore house began to make chemicals, paints and medicines for the general trade. It is true that some oil of vitriol had been made in Philadelphia as early as 1793, but the quantity was so small as to be scarcely worthy of notice except as a historical incident. According to the census reports of 1820, there were but two chemical manufactories in the entire State of New York.

In spite of this small beginning the chemical industry spread so rapidly that, by 1830, it had become a trade of considerable importance to the country. Prior to about 1815, everything needed in this line had been imported from Europe and as this necessitated the addition of transportation and other charges to the original cost, the American manufacturers who had need of such products in their factories and shops were very glad to learn that such materials might be produced in their own land. For economy's sake, if for no other reason, therefore, they were ready to patronize any local firm that would undertake to make the chemicals they required, so, in 1830, the census reports told a different story.

Whereas, in 1820, the chemical industry had been worthy of slight notice, 10 years later it had been extended to such a degree that the 30 firms then engaged in the business represented an invested capital of $1,158,000, and an annual product of fully $1,000,000. Alum, copperas and several other articles were then so largely manufactured in America that the foreign product had been almost entirely excluded from this market. And in addition, the list of American productions then included calomel and a number of other mercurial preparations, Rochelle and Glauber's salts, ammonia, oil of vitriol, sulphate of quinine, tartar emetic, Prussian blue, chrome yellow, chrome green, red lead, saltpetre, borax and camphor, acetate and nitrate of lead, prussiate and bichromate of potash and tartaric, nitric, muriatic, oxalic and acetic acids.

Great as this advancement was, however, those who compare this first report of a practically servant industry with the census figures that were gathered in 1914 will have a striking illustration of the manner in which these great manufacturing interests have extended their operations.

A summary of the chemical industry in 1909 shows 140 establishments in operation, with a combined capital of $483,729,410. There were engaged in conducting the business, as officers, firm members and clerks, 17,671 persons, whose salaries amounted to $96,743,333; and 70,426 employees, whose wages amounted to $38,658,201. The cost of materials was $235,113,971, and the value of the products was $425,084,540—the value added by manufacture being, therefore, $166,968,565.

The rapid growth of the industry may be noted by comparing with the above figures those of the special census of 1914, as follows: In that year there were 2,461 establishments employing $722,988,871 capital. Officers, firm members and clerks numbered 24,670, whose salaries aggregated $36,631,100. Employees numbered 80,768, whose wages amounted to $33,021,371. The cost of raw materials used amounted to $340,216,702 and the value of the product was $547,801,957—the value added by manufacture being $207,585,235.

Among all the strictly chemical products the most important is and has long been sulphuric acid, owing to the supremacy which it maintains over all other known chemicals in the promotion of the great manufacturing interests. A comparison of the quantities produced during the several census years, therefore, as well as a comparison showing the reduction of prices that has obtained, will give the reader a very good general idea of the marvelous advancement that has been made in the manufacture of chemicals in the United States.

Among the allied industries the refining of petroleum takes first rank in value of output, reaching nearly $400,000,000; with the fertilizer industry second, with products valued at over $168,000,000. The latter figures are particularly interesting because, if for no other reason, they indicate quite clearly the growth and development of the agricultural interests of the country.

Of course, the history of the farming industry in the past has been a record of gross ignorance and prodigal wastefulness, especially in the matter of fertilization. Through carelessness, or, perhaps more often, through want of thorough knowledge of his trade, the American farmer has permitted vast quantities of valuable manorial materials to soak into ground where they could be no use, or to find their way to the sea. In the old days, instead of devising some method of preventing such waste in the future, the agriculturist continued his primitive methods, until, at last, the manufacturer of artificial fertilizers came to his assistance, and, by the aid of chemicals and mechanical devices, converted worthless matter into valuable merchandise.

To obtain a general idea of the use to which this product of the chemical arts is put by the farmers of the United States it is only necessary to make a brief computation. Thus, for example, we may say that 300 pounds of fertilizers are used on an acre of land; and, as the total output of the country aggregated 33,654,000,000 pounds, it is easy to see that it would require no less than 112,200,000 acres to exhaust such a product. As the figures of the Agricultural Department now show that large areas of this country are already becoming unprofitable as farming lands unless artificial fertilizing is to be used to enrich them, it is not surprising that great manufactories for the making of such materials should have been established in so many sections of the country, and that the output of fertilizers in 1914 should be five times that of 1900.

As classified by the census bureau, the chemical industry has two grand divisions: The gen-
CHEMICAL INDUSTRY

eral chemical industry, and the allied industries—those in which the processes of manufacture are essentially chemical. The latter group includes (1) manufacture of resins and tanning extracts; (2) manufacture of essential oils; (3) manufacture of explosives; (4) the fertilizer industry; (5) paint and varnish industry; (6) petroleum refining; (7) manufacture of soaps; (8) wood distillation. The general chemical industry covers the manufacture of strictly chemical substances, and is subdivided according to products, as follows:

Acids, comprising chiefly sulphuric, nitric and mixed acids, and other acids used largely in commercial quantities for manufacturing purposes. In 1914 there were 194 establishments making sulphuric acid. Their combined output of acids for sale reached a value of $15,395,133. At least as much more was made and used in the plants making it, and did not pass directly into commerce. The output of 50-degree (Baumé) acid was 1,677,649 tons (of 2,000 pounds), of which 451,121 tons were sold for $2,709,350; of 60-degree acid, 795,489 tons, of which 545,562 tons were sold for $3,754,966; of 70-degree acid, 298,080 tons, of which 272,186 tons were sold for $8,042,422; and of oleum or fuming acid 77,758 tons, of which 62,354 tons were sold for $888,495. The production of 50-degree acid exceeded in quantity that of 1909 by only 2.1 per cent, but the output of 60-degree acid was 320 per cent, and of the 66-degree acid 49.9 per cent greater than that of 1909.

Nitric acid was made in 52 establishments, whose combined output was 78,589 tons, of which 14,685 tons sold for $1,501,625—an increase of 17.3 per cent since 1909.

Mixed acids (sulphuric and nitric) were made by 37 establishments, with an output of 112,124 tons, of which 42,725 tons were sold for $2,204,480—an increase over 1909 of 49.4 per cent in the quantity made though but 18.5 per cent in the price received.

Citic acid was made in three establishments whose production was 2,657,840 pounds, valued at $1,516,336—an increase of 95.1 per cent in value, and 26.4 per cent in quantity.

Muriatic or hydrochloric acid was made in 31 establishments whose output was 337,167,882 pounds, of which 170,876,878 pounds were sold for $1,348,805—a decrease of 15.9 per cent in quantity and 23.3 per cent in value as compared with the figures for 1909.

Oleic acid was manufactured in seven establishments, the output aggregating 23,187,570 pounds, of which 21,932,736 pounds were sold for $1,301,353—an advance of 34 per cent in quantity and 54 per cent in value over 1909.

Acetic acid was made in 13 establishments, the output aggregating 75,303,375 pounds, of which 70,617,637 pounds were sold for $1,272,294—showing an increase of 24.1 per cent in quantity made, and a decrease of 4.8 per cent in the price received.

Nitric acid was made in 10 establishments whose combined output was 14,351,404 pounds, valued at $1,242,492—an increase of 8.7 per cent.

No other acids reached a production value at $1,000,000.

Alums engaged 19 establishments with a total output of 313,712,000 pounds, valued at $3,467,-969—an increase of 13.5 per cent in quantity and 14.7 per cent in value.

Bleaching Materials were made in 51 establishments, and their output was valued at $4,964,403, an increase of 54.4 per cent since 1909. These products include chloride of lime or bleaching powder, chloride of soda and other hypochlorites, hydrogen peroxide (or dioxide), sodium (and other) peroxide (or dioxide), bisulphites of soda, lime, etc.; calcium sulpho- dioxide, lime-sulphur solutions, etc. Hypochlorites constitute the most important class, aggregating 222,152,000 pounds, valued at $2,578,629, an increase over 1909 of 90.2 per cent in quantity and 44.3 per cent in value. Of the total value, $1,714,837 was gained by electro-chemical processes. Hydrogen peroxide engaged 20 establishments whose combined output was 32,594,807 pounds, valued at $1,303,596—an increase of 49.7 per cent since 1909.

Cyanides were made in six establishments, the production amounting to 16,450,225 pounds, valued at $2,398,674—an increase of 23.5 per cent over the figures of 1909.

Plastics, including pyroxylon (under various trade names: celluloid, fibrol, viscoloid, xylonite, etc.), viscose, artificial silk, rubber substitutes, and all plastic materials based on rubber, gutta percha, fibrin, casein, gluten, gums, glue, etc., as cementing agents, engaged 24 establishments which produced materials valued at $13,895,784—an increase over 1909 of 85 per cent.

Sodas and Sodium products were made in 68 establishments. The output was 1,371,105 tons of soda, valued at $22,616,696, and 198,049 tons of sodium salts valued at $8,280,572. The increase since 1909 was 41.7 per cent in quantity and 12.7 per cent in value.

Gases, compressed and liquefied, were made in 127 establishments whose output was valued at $8,097,720—an increase of 56.2 per cent over 1909.

Electric Chemicals—those made by the aid of electricity—included aluminum; phosphorus; silicon; sodium; carbon in its allotropic form of graphite or plumbago; chlorine; oxygen; hydrogen; ferro-alloys; copper, titanium, and vanadium compositions and bismuth; carbon; aluminum; caustic soda; caustic potash; sodium peroxide; chloride of lime and other hypochlorites; bisulphite of carbon; and muriatic acid. The electrical production in the iron and steel industries is not included. These substances were manufactured in 36 establishments, and the output was valued at $29,661,649—an increase of 60 per cent over the 1909 value.
The products of largest value were ferro-alloys, $2,839,482; caustic soda and potash and lye, $2,309,511; hypochlorites, $1,714,387; and chlorates, $1,131,316.

Potash and potassium products engaged 39 establishments whose total output was valued at $4,094,927.

Coal-tar Products were made in 40 establishments whose output was valued at $8,839,506. These figures do not include the by-products of coking plants. Of the total value, the manufacturers of synthetic dyes produced $4,652,947, and the manufacturers of coal-tar medicines, $774,350.

Fine Chemicals.—This division includes the high grade chemicals rated "C.P.," or chemically
pure, as well as many laboratory products. Their combined value was $10,316,519.

**THE ALLIED INDUSTRIES.**

**Dyestuffs and Extracts.**—The manufacture of natural dyestuffs and tanning extracts engaged 112 establishments, whose total product was valued at $20,576,769—a increase of 29 per cent since 1909.

**Essential Oils** were made in 108 establishments (of which 53 were in Michigan and 29 in Indiana) whose total output was valued at $2,565,361—an increase of 44.7 per cent since 1909.

**Explosives** were made in 111 establishments, the combined output aggregating in value $414,453,339—an increase of 35.5 per cent since 1909.

**Fertilizers** engaged 1,124 establishments whose combined output was 16,827,000 tons, valued at $163,388,405—an increase of 50.5 per cent since 1909.

**Paints and Varnishes** were made in 855 establishments, of which 618 were devoted to paints and 257 to varnishes. The paint production was valued at $312,553,084, and the varnish parity at $130,936,720, a combined value for this section of $449,049,820—an increase over the 1909 figures of 16.9 per cent. A subsection is made of the 46 additional establishments which manufacture boneblack, carbon black and lampblack, to the value of $2,949,797—an increase of 38.1 per cent since 1909.

**Petroleum Refining** engaged 176 establishments whose combined products were valued at $396,361,405—an increase of 67.2 per cent since 1909. These establishments consumed as raw material 191,262,724 barrels of crude oil, and produced naphtha and gasoline, illuminating oils, fuel oils, lubricating oils, greases, paraffin wax, etc.

**Soap manufacture** engaged 513 establishments, whose combined production was, in value, $135,340,499—a decrease of 2.5 per cent from the 1909 figures. The output comprised 2,604,288,000 pounds of hard soaps, 57,000,000 pounds of soft and liquid soaps and 45,419,827 pounds of glycerine, the last named valued at $7,562,463 above the value of the soap production.

**Wood Distillation** was conducted in 101 establishments, the output being valued at $10,236,352—a very slight increase over 1909. The figures include the output of 14 establishments engaged in making turpentine. Other products were 7,196,975 gallons of wood alcohol, as well as acetate of lime, acetone, formaldehyde, acetic acid, wood cresote, etc.

Chemical production comprises such an infinite variety of combinations of raw materials that it is almost impossible to give anything like a detailed view of the subject without going far beyond the restrictions which space fixes upon such an article as this, and yet it is to this variety of raw materials, as well as to its almost numberless combinations, that the chemical industry owes its unique position in the commercial world. Although it is impossible to give all the raw materials and their combinations, it may be said in brief that scarcely any substance on the face of the earth, from the purest water to the blackest tar, fails to find a new utility in the chemist's hands. And thousands of industries exist not only in the United States, but in foreign lands as well, solely to supply the raw materials needed in the chemical industry.

Some little idea as to the enormous quantities of raw materials thus consumed may be gained by figures for some of the principal substances as given in the 1914 census. The amount of petroleum so used was 28,689,400 tons; of iron pyrites, 1,581,600 tons; of nitrate of soda, 412,748 tons (all from Chile); of sulphur, 82,248 tons.

In the United States the manufacturers of chemicals have such a wide range of territory from which to select their location that they have not infrequently constructed their plant in some position of convenience to their natural products. The markets for such chemical productions, however, are far apart, but they may be classified in a list of such attractive points as the great centres of the textile manufacture, of the dyeing, and bleaching works, the great oil refineries, the artificial manure works, etc.

The processes that are used in the making of chemicals are almost as varied as its products, and yet there are certain mechanical steps that are utilized by all of them. Such, for example, are the grinding, furnacing, dissolving, separating, evaporating, filtration and the like. In some of these processes, the conditions are such that are imposed by the chemist, the demand for quicker, surer and more economical methods. Some of the present-day chemical operations are still the result of a long and complicated treatment. There are instances in which crystallization and decomposition take place very slowly, for both are hastened or retarded by many physical conditions; both heat and cold, like extreme agitation and absolute quietude, are often required by the chemist. Moreover, when we remember that some of these long and complicated processes include, perhaps, a continued series of dissolvings alternating with as many crystallizations, it is not difficult to imagine why it should be necessary for manufacturers to have such an abnormally large capital before they can establish themselves successfully in the industry of producing chemicals.

Moreover, it is not money alone that is needed for one to be able to successfully conduct a manufacturing chemical establishment. A quarter of a century ago money and a little knowledge was all that was required of the ordinary manufacturer. To-day, however, all this has changed. During the past 30 years scientific Germany has devoted much time and attention to chemical researches, and with such results that the rest of the world's manufacturers have had all they could do to keep abreast of the times. To-day it is the chemical laboratory that is the pulse of the entire factory. It must be well equipped with the most modern apparatus, operated by workers of rare skill for each step in the process is watched and regulated by a continuous series of tests by the laboratory force.

Chemical engineering is another branch of the industry to which much attention has been devoted during the past 20 years. It has come to be of importance as a factor in the adjustment of plants to the exigencies of the many difficult and complicated operations to which the works must be adapted has led to the establishment of courses
in chemical engineering by several of the leading institutions of technical education.

The effect of the European War upon the chemical industry of the United States has been remarkable. Prior to the outbreak of that great conflict, the world trade in many chemicals was supplied principally by Germany, Austria and England. But since the war closed the ports of Germany and Austria, and the English markets turned to the manufacture of munitions, the chemical trade of the United States has faced an unprecedented demand not only in its own country, but from abroad. While figures for the home trade are not available, the records of the Bureau of Foreign and Domestic Commerce as to the exports from year to year show the response of the chemical manufacturers to the foreign demand. The open figures following are those of the exports of leading chemicals for the year ended 30 June 1914. The following tables are for the fiscal year ended 30 June 1914 — the year immediately preceding the war.

Acids: sulphuric, 82,020,246 pounds, valued at $1,990,532 (in 1914, 12,131,750 pounds, valued at $276,982). Other acids, a value of $22,717,355 (in 1914, $357,053).

Copper sulphate, 17,978,242 pounds, valued at $2,469,437 (in 1914, 7,375,775 pounds, valued at $330,007).

Dyes and Dye-stuffs, a value of $5,102,002 (in 1914, $356,919).

Extracts for tanning, a value of $5,902,709 (in 1914, $639,941).

Sodium compounds, a value of $12,649,854 (in 1914, none at all).

All other chemicals exported, $62,765,752 (in 1914, $16,201,563). The total value of chemicals exported was $113,597,711 (in 1914, $18,011,358).

Among the "Allied Industries," the only notable increase in exports was in explosives, which reached a value of $467,082,000 (in 1914, $6,272,000).

As to the geographical distribution of the increased export trade in chemicals, it is interesting to note that France and Great Britain took the lion's share of all of the Allies, with the United Kingdom, and Japan and Japan being the other principal buyers. The increased exports of copper sulphate were taken by Greece, Italy, Canada, Mexico, Argentina, Brazil, Dutch Guinea and Uruguay. The dyestuffs (chiefly natural dyes) went to Great Britain, France, Italy, Spain, Japan and Canada. The sodium compounds were bought by France, Great Britain, Holland, Norway, Canada, Mexico, Cuba and Latin America. The tin and chromate of potash went to Japan and Russia. The tanning exports went to nearly every part of the world, many countries being purchasers for the first time.

It is worthy of note that in 1906 (the latest complete figures available) the total trade of the world in chemicals, drugs, dyes and fertilizers, amounted to $592,467,000, and that the contribution of the United States to this market was but $41,000,000, or about 7 per cent. Germany's export chemical trade at that time was $1,500,000,000, or about 25 per cent. The United Kingdom, $63,019,000, or 11 per cent of the whole. While the figures for these latter countries have not changed considerably, the advance of the chemical exports of the United States to $113,600,000 establishes a new world's record for the United States.

CHEMICAL MINERALOGY. See MINERALOGY.

CHEMICAL SENSE IN ANIMALS. See ANIMALS, CHEMICAL SENSE IN.

CHEMISTRY, the science which deals with the composition and transformations of matter, had its origin in remote antiquity. In its earliest form it was purely empirical, a mass of disconnected facts which were brought to light in the natural course of development of various industries. In the extraction of metals from their ores, in the preparation of drugs and medicines, in the processes of dyeing and the like, many chemical data were discovered; and of such facts a large number were known to the ancient Egyptians. Indeed, one plausible derivation of the word "chemistry" is from Khem, an early name for Egypt, which has reference to the blackness of its soil. With this name the Arabic word chema, to hide, seems to have some relation; and when we remember that much ancient learning was preserved by Arabian scholars, the descriptions of chemistry as the Egyptian science, or as the hidden or occult art, become intelligible. Secrecy was a characteristic of its early practitioners.

The one fundamental fact of chemistry is, that matter can undergo apparent transformations of kind, one substance being converted into another. For instance, wood becomes charcoal, and iron is changed to rust; and facts like these were evident even to the most primitive observers. As philosophy developed, these data were necessarily considered, the nature of matter was discussed and attempts were made to correlate and explain the phenomena. Much of the early speculation was vague and mystical, and has little significance to-day; but a part of it was intensely practical, and gave a definite purpose to investigation. If matter can be transformed from one substance to another, why should not the possibility of change be utilized? It may be that, as the Alchemists, it was seen, had certain properties in common, and so transmutability between them was almost taken for granted. Thus alchemy arose, with its search for the philosopher's stone and its attempts to convert base metals into gold; and from alchemy the chemistry of to-day is lineally descended. The discoveries, even the failures, of the alchemists laid the foundations of our modern science, and pointed out the best paths for investigation to follow.

The Greek philosophers, and especially Aristotle, in their attempts to interpret matter, assumed the existence of four elements, namely, earth, water, air and fire. These names, however, denoted properties rather than things, and implied the attributes of coldness, wetness, dryness and heat. The properties of matter were determined by these conditions, and could be expressed by the varying degrees under which the latter were displayed. Of chemical combination, as we understand it, the ancients seem to have had no conception. They attempted to solve the problems of the universe by reasoning alone; the experimental method as a test of truth had not become a court of last appeal. To the alchemists, on the other hand, and to
their successors, the alchymists, who applied chemistry to medical uses, experiment was the essential thing; and in their hands true knowledge rapidly increased. The alchemical elements, salt, sulphur and mercury, were still names of properties; but they represented concepts which stood far to the right of the earlier ideas, since they were based upon more exact observations. Speculation had not been dethroned, but it was no longer an absolute rule.

To trace the history of chemistry during its formative period would be impracticable in an article of the present scope. It is enough to say that the modern distinction between elements and compounds was first clearly stated by Robert Boyle in 1661. An element is a substance that cannot be further decomposed, but which is obtainable from a compound body, and from which the latter can again be prepared. He also held that chemical combination consisted in an approximation of the smallest particles of the elements, and that the atomic hypothesis which had been current in philosophy from the very earliest times. With these teachings of Boyle modern chemical theory practically began.

The chemical researches of the 18th century were many and varied, but most of them, at least during the earlier decades, were essentially qualitative in character. The fundamental importance of exact weight and measure came into recognition with extreme slowness. Throughout the greater part of the century one theory dominated chemical thought, the theory of phlogiston, proposed by Becher, but developed and completed by Stahl. The phenomena of combustion had always attracted the attention of chemists, and the new theory was devised to explain them. Every combustible body was supposed to contain a peculiar non-isolable substance, phlogiston; and when combustion took place this substance was thought to be expelled. Thus lead, when heated in the air, undergoes a change analogous to that produced by combustion, and yields a calx, or, as we call it now, an oxide. This calx, combined with phlogiston, was thought to exist in the ordinary compounds in the form of phlogistic acid. When calcination occurred. In this speculation no account was taken of the weight of the several bodies, and the fact that the calx was heavier than the metal, that a gain, not a loss, was observed, seemed to offer no difficulty to the believers in the phlogistic doctrine. To phlogiston a negative weight was ascribed, and by this device the real difficulties of the problem were comfortably laid aside.

1774 Joseph Priestley, himself a believer in phlogiston, discovered oxygen; and so made, though unwittingly, the true interpretation of combustion possible. In 1766 Cavendish had discovered hydrogen; and in 1781 he proved that water was produced by the union of the two new gases. Cavendish had determined the composition of the atmosphere, and in these researches the foundations of a new chemistry were laid. The two chief architects to build upon the foundation were a Frenchman, Lavoisier, and an Englishman, Dalton.

Lavoisier used the chemical balance as an instrument of research, proved that matter was constant in weight, and could neither be created nor destroyed. In any chemical change the weight of the substances engaged in the reaction remained unaltered. Studying combustion he showed that it was merely combination with oxygen; and he pointed out that respiration was a phenomenon of the same character. He also gave greater precision to the idea of an element, and also to the names of the elements, since they were based upon more exact observations. Speculation had not been dethroned, but it was no longer an absolute rule.

Lavoisier died in 1794, a victim of the French Revolution; and it was not until 1803 that the next really great forward step in chemistry was taken by Dalton, who then first announced his famous atomic theory. To support this doctrine, which, being quantitative in form, had little in common with the atomistic speculations of the philosophers, Dalton established the laws, the laws of definite and multiple proportions. That every chemical compound has a fixed and definite composition was recognized by Lavoisier and by other writers before him, but the fact was disputed by Berthelot, and it remained for Dalton to give its statement a precise form. Dalton then went further, and found that to every element a definite combining number could be assigned, and that when two elements united in more than one proportion, even multiples of that number appeared. Thus, taking the hydrogen weight as unity, the standard of comparison, oxygen always combines with other elements in the proportion of eight parts or some simple multiple thereof, and so on through the entire list of elementary bodies. Each one has its own distinct combining weight, and this was a condition which Dalton sought to explain. Fractions of the weights did not occur, fractional atoms could not exist, and the two thoughts were connected by Dalton. Chemical union, to his mind, became a juxtaposition of atoms, whose relative weights were indicated by their combining numbers; and so the atomic conception was for the first time given a firm foundation. First, every element is composed of similar atoms which have constant weight. Secondly, chemical compounds are formed by the union of these atoms in simple numerical relations. Upon these fundamental statements the entire system of chemical philosophy rests, so that for a hundred years the history of chemistry has been the history of the atomic theory. All chemical calculations are based upon the atomic weights of the elements, and in all chemical formulæ they are implied.

Since Dalton's time great labor has been expended upon the exact determination of atomic weights, and in the discovery and description of new elements and compounds. The general conclusions which have been established by this class of researches may be summarized as follows: Every chemical substance is either an element or a compound. The elements, which are not artificially separable into any simpler bodies, at least by no means yet discovered, are comparatively few; the compounds are innumerable. More than a hundred thousand compounds are already known. A compound may be separated into its elements...
or built up from them; and its composition is absolutely invariable. In this respect compounds differ from mechanical mixtures, in which any proportion may occur. Flour and sugar may be mixed together, but they still remain flour and sugar, each with its properties unchanged; no combination here takes place. In combination, as when gaseous hydrogen and gaseous oxygen unite to form liquid water, they do so only in one fixed proportion and the characteristics of the original substances disappear. This fact of combination, the union of two or more bodies to form others which are widely different from them, is clear; but its mechanism is not yet understood. The elementary atoms of the compound are drawn and held together by some form of attraction, but its precise nature is unknown. The object of chemistry is to discover the laws which govern the union or the decomposition of substances, and to determine the limits within which such changes are possible. For the study of compounds, at least for the purpose of ascertaining their composition, two methods are employed. First, analysis, in which the component parts of the compound are separated, and individually identified. Secondly, synthesis, in which the parts are forced to unite, and to form the compound which happens to be under investigation. Furthermore, analysis may be either qualitative or quantitative. In one case we merely ascertain what substances are present, in the other we determine their exact quantity. The elements now known, about 80 in number, are given in the following table, together with their atomic or combining weights and their symbols. The latter are abbreviations whose use will be explained presently.

In addition to these elements there are several others which are as yet incompletely known. Among them, polonium, actinium and ionium may be named. New elements are not infrequently discovered, and argon, helium, neon, xenon, krypton and radium have all been brought to light within recent years.

With the help of the elementary symbols and numerical atomic weights, a chemical formula can be constructed, and these formulas are of great help in chemical calculations and reasoning. Some of the symbols are initial letters only, as H, O, N, C, for hydrogen, oxygen, nitrogen and carbon; others are formed of two letters, like Ca for calcium and Zn for zinc. Sulfur is represented by the Latin names of the metals, such as Ag for argentum, silver, Fe from ferrum, iron, etc. Even the formula of a compound is made by writing the proper symbols in juxtaposition, so that NO means a compound of nitrogen and oxygen, H\textsubscript{2}O a compound of hydrogen and oxygen, and so on. When two elements form more than one compound, these are distinguished by subscript numerals, as in the examples PCl\textsubscript{2} and PCl\textsubscript{4}. In these substances one atom of phosphorus unites with three and five atoms of chlorine respectively. In every case the symbol of an element means one atom of the element, and therefore that relative quantity of it which is indicated by its atomic weight. In water, H\textsubscript{2}O, two atoms of hydrogen weighing two units combine with one atom of oxygen weighing 16 units; and thus the formula tells us in shorthand that the compound contains two parts of one element to 16 parts of the other. No matter how complex a formula may be, this simple rule invariably applies, and by its means the composition of the substance represented can be calculated. The symbols, moreover, can be combined into equations, from which we may compute the outcome of a given chemical reaction.
process. This subject, however, is much too abstruse for discussion here. Its details are developed logically from the atomic theory.

To the philosophers who preceded Dalton an atom was supposed to be the smallest particle of any substance which could possibly exist. Thus water might be subdivided and subdivided until, in theory, a limit was attained, and an atom of water was the result. By chemical means a new order of divisibility had now to be recognised, and the supposed atom of water was itself found to be complex and separable into still smaller particles of oxygen and hydrogen. The latter are the atoms of the chemist; the former clusters of atoms are known as molecules. This distinction was not developed immediately; its full recognition came slowly, and it derived its importance from certain laws relative to gases which were discovered, partly by Boyle, partly by Gay Lussac and generalized in 1811 by Avogadro. Avogadro's law may be concisely stated as follows: Equal volumes of gases under like conditions of temperature and pressure contain equal numbers of molecules.

A molecule is now defined as the smallest particle of any substance which can separately exist; thus we have HBr, and can take part in chemical change. Another law, discovered by Dulong and Petit in 1819, was also highly important, for it was shown that the specific heat of an element was inversely proportional to its atomic weight. In other words, the elementary atoms have all the same capacity for heat, and this rule gave us an important check in ascertaining the true weights of the atoms. The law of Avogadro and the law of Dulong and Petit were brought together by Cannizzaro in 1858, and the system of atomic weights and chemical formulae now in use, which differ in certain essential particulars from those that were first adopted, was the result of the combination.

In the early days of scientific chemistry the science was divided into two great sections, organic and inorganic, the one dealing with animal and vegetable products, the products of life, and the latter with substances derived from mineral sources. In this way, the chemistry of the metals, the earths, the commoner oxides, bases and salts, was for the time being the simpler, and during the first half of the 19th century it received the lion's share of attention. At first it was supposed that the two fields of research were absolutely distinct, and that no organic compound could be derived by artificial means from inorganic sources. This belief was overthrown by Woehler, in 1827, who showed that urea, an organic body, was easily prepared from organic ammonium cyanate, and since then a vast number of organic syntheses have been effected. Curiously enough, urea and ammonium cyanate, although very different substances, have the same percentage composition, containing the same elements in exactly the same proportions. Later it was found that isomerism, as this semi-identity is called, was exceedingly common, and here was a noteworthy phenomenon which called for explanation. Different molecules can be converted into each other, isomerism being the simplest of organic chemistry that the growth became most immediately evident, and to this branch of the science we may now turn our attention. It is here that we find the best illustrations of what is chemical structure, therefore, came into being. What is the arrangement or grouping of the atoms within any given molecule?

The earlier attempts at the solution of this problem have now lost all historical interest, and their consideration is of value to professional students of chemistry alone. If we were to trace the successive stages we should find evidence of a systematic growth in chemical theory; but definiteness was hardly possible until after Cannizzaro had established the true system of atomic weights, and formulae had been adjusted in accordance with them. Between 1850 and 1860, however, a new property of the atoms began to be recognized, and this, taken in connection with the formulae based on Avogadro's law, was the key to the problem. The theory of valence, which is the expression of the newly-discovered property, is as follows: Every atom, as regards its union with other atoms, has a certain atom-fixing power, which is known as its valency, or valence.

Let us take hydrogen as our standard of reference and consider some of its simplest compounds. In HCl, hydrochloric acid, one atom of hydrogen is united to one of chlorine. So also we have HBr, HI, KC1, AgBr, etc. These elementary atoms, which combine only in the ratio of one to one, at least to form permanent compounds, are univalent, that is, their power of fixing or uniting with other atoms is unity. In water, on the other hand, H2O, a single oxygen atom holds two of hydrogen in combination, and so oxygen is called a bivalent element. In H2S, CaC12, ZnI2, we have illustrations of still other compounds in which a bivalent atom is united with two of the univalent type. Nitrogen, phosphorus, arsenic, aluminium and some other elements go still farther, and are trivalent, so that the compounds formed by them have such formulae as NH3, PH3, AsH3, AlCl3 and so on. Carbon, a quadrivalent substance, forms normally compounds of still more complex type, such as CH4, CCl4, or, when it unites with two dyad or bivalent atoms, CO and CS2. For brevity the valency of the various elementary atoms may be indicated by chemical symbols, as monads, dyads, triads, tetrad, etc. The rare metal vanadium is a pentad, having a valency of five, and sesquivalent tungsten is a hexad. In many cases valency seems to be a variable property of the atom, as, for example, when we consider the two chlorides of phosphorus, PCl and PCl5. In cases like these the higher figure may be taken as showing the maximum atom-fixing power of the element, a power which is only partially exercised in the lower compounds.

In the theory as thus stated there is no mere speculation; it is a statement of definitely observed facts. It tells us that the atoms unite, not arbitrarily, but in accordance with certain rules; and these help us in our comprehension of known compounds and the discovery of new ones. Indeed, an enormous advance in chemical discovery followed the application of these principles: an advance not only of scientific importance, but of economic and commercial value also. It was set the task of organic chemistry that the growth became most immediately evident, and to this branch of the science we may now turn our attention. It is here that we find the best illustrations of what is
meant by chemical constitution or structure, and the best examples of isomerism.

It has already been pointed out that organic chemistry in its beginnings dealt with animal and vegetable substances, the products of living organisms. Other artificial bodies, derived from these, were also included in its territory. All organic compounds were characterized by the presence in them of carbon, this element being ordinarily combined with hydrogen, oxygen, nitrogen, or all of these and sometimes with other elements also. Organic chemistry, as its domain was enlarged, in time received a new definition, and to-day the term broadly signifies the chemistry of carbon compounds. It is true that some compounds, such as the metallic carbonates, are more conveniently described as inorganic in character; but these minor exceptions affect the definition but slightly.

At first sight the almost innumerable organic substances appear to be hopelessly complex, and some, indeed, such as alumina, are so; but a closer inspection reveals order among them, and, in general, an ultimate simplicity. Their great number is due to the fundamental properties of the carbon atom, which, being of low valency, can unite with four other atoms simultaneously; and which, moreover, may combine with other atoms of its own kind to form rings or chains that serve as nuclei for the development of long series of substances. Most of the latter are derived from hydrocarbons, compounds of carbon and hydrogen, and these are exceedingly numerous. Marsh gas or methane, CH₄, contains the largest proportion of hydrogen, and is the type upon which the quadrivalency of carbon is predicated; it is, furthermore, the first member of a series of hydrocarbons, CH₄, C₂H₆, C₃H₈, and so on up to C₆H₁₄, and perhaps even farther. In this series each compound contains one atom of carbon and two of hydrogen more than the hydrocarbon preceding it, and this regular difference establishes what is known as an homologous series. Nearly all organic substances can be arranged in series of this kind, so that the chemist is able to master a great number of details by a single effort of the memory. Moreover, the increase of carbon atoms in a homologous series varies regularly, step by step, in their physical properties. Thus CH₄ is a gas, C₂H₆ a heavier gas, C₃H₈ a volatile liquid, the following terms are liquids which grow less and less volatile, while above C₄H₁₀ the hydrocarbons are waxy solids. Ordinary paraffin is a mixture of these higher hydrocarbons, and the whole group, therefore, is known as the paraffin series. Common petroleum consists chiefly of its liquid members. From these hydrocarbons, with oxygen, a parallel series of alcohols is derived: such as CH₃O, methyl or wood alcohol, C₂H₅O, ethyl or ordinary alcohol, C₃H₇O, amyl alcohol or fusil oil, etc. By further oxidation the alcohols yield a set of acids, among which acetic acid, the acid of vinegar, is the one most familiarly known. This single family of hydrocarbons is the key to thousands of other substances which are directly producible from them. Some of these products illustrate very nicely the mode of a chemical reaction known as substitution, as when, from CH₄, hydrogen atoms may be successively withdrawn and replaced by univalent atoms of chlorine. Thus we get the following compounds: CH₄, CH₃Cl, CH₂Cl₂, CHCl₃, and finally CCl₄; the fourth one being the familiar body chloroform. So also acetic acid, CH₃COOH, by substitution with chlorine, gives C₂H₅ClO₂, C₃H₇ClO₂, and CH₅ClO₂, but here the process stops and cannot be carried further. The one remaining atom of hydrogen in acetic acid is differently combined from the others, and here we begin to see the sort of evidence by which differences of chemical structure may be determined. When we study the numbers of organic compounds, especially with regard to their possibilities of chemical change, we find that certain combined atoms behave differently from other combined atoms of like kind. We also discover groups of atoms which can be shifted collectively from compound to compound; clusters which act almost like elements and are perfectly definite in their nature. The group NH₂ is so much like a metal in its compounds that it is given a distinct name, ammonium, and is conventionally treated as if it were really a metallic body. CN, cyanogen, resembles chlorine in some of its relations, and such groups as CH₃, methyl, and C₂H₅, ethyl, are encountered at every turn. They do not exist separately in the constitution of organic compounds, as known as compound radicles. Every such radicle has valency, and this is essentially residual in its nature. Thus in methyl, CH₃, three of the four units of affinity belonging to the carbon atom are satisfied by hydrogen, leaving one unit unoccupied. Methyl, therefore, is a univalent radicle, and acts almost as if it were an independent element.

The chemical formula which we have so far considered belong to the class known as empirical formulae; they give the number and kind of atoms in a molecule, but tell nothing as to their arrangement or mode of union. With the conception of valency and a knowledge of radicles we are now prepared to construct rational or constitutional formulae, and from these it is possible to infer what sort of changes a given molecule can undergo, and to understand wherein isomeric bodies differ. For example, there are two bodies having the empirical formula C₂H₄O₂; one, methyl ether, is a gas; the other, common alcohol, is a liquid; the evidence between them is evident at a glance. Their rational or structural formulae exhibit the cause of difference as follows:

\[ \text{H} - \text{C} - \text{O} - \text{H} \]

\[ \text{Methyl ether.} \]

\[ \text{H} - \text{C} - \text{O} - \text{H} \]

\[ \text{Ethyl alcohol.} \]

In the first, two methyl groups appear united by an atom of oxygen; in the other, the carbon atoms are directly combined, and the bivalent oxygen connects carbon and hydrogen. The lines which connect the symbols represent units of valency, and which are known as CH₂ in one compound and CH₃ in the other, and are the other end for well-known radicles. For further illustration we may recur to the case of acetic acid, in which, as we have seen, three hydrogen atoms behave differently
from the fourth. This condition is shown in the following structural expression:

\[
\begin{align*}
H & \\
\text{H-C-C-O-H} & \\
\text{H} & \\
\end{align*}
\]

Here we see the three replaceable atoms directly connected with carbon, while the fourth is linked to oxygen; the latter element also being combined in two ways. The known facts are clearly and simply presented to the eye by a convenient symbolism, a method of formulation which has been of immense value as a guide to practical research. In order to succeed, an experiment upon any of these compounds must be in accord with the facts of molecular structure, for the latter indicate limitations which cannot be disregarded.

In two of the foregoing formulæ the linking of carbon with carbon is clearly indicated, but only by single units of valency, or bonds as they are sometimes called. In other cases, however, more complex unions occur, and double or triple linkages are common. The formulæ for two hydrocarbons may be cited to illustrate this principle, thus:

\[
\begin{align*}
\text{H-C-H} & \\
\text{H} & \\
\end{align*}
\]

\[
\begin{align*}
\text{C} & \\
\text{C} & \\
\end{align*}
\]

\[
\begin{align*}
\text{Ethylene} & \\
\text{Acetylene} & \\
\end{align*}
\]

The second of these bodies is now widely known as an illuminating gas. Each compound is the starting point of an homologous series, exactly as with the paraffins; but the ethylene series exhibits a striking peculiarity. If we add to ethylene successive CH₂ groups, which characterize chemical homology, we get a sequence represented by such formulæ as CH₄, C₂H₆, C₃H₈, and so on indefinitely. In all of these compounds the ratio between carbon and hydrogen is the same, and their per centage composition is identical; such a series is called polymeric. The different members of the series, however, yield different derivatives, and they are further distinguished from one another by their molecular weights, the weight of the molecule being the sum of the weights of the atoms contained in it. These molecular weights can be directly measured by ascertaining the actual weight of definite bulks of the several substances in the condition of gas or vapor. According to Avogadro's law, equal volumes of gases contain equal numbers of molecules; if, therefore, a litre of one gas is twice as heavy as a litre of another, the weight of its molecule must be double that of the latter. By experiment, then, we can determine the relative weights of molecules, and so discover whether a compound is formed from a larger or smaller group of atoms.

One other class of organic substances demands attention here, the so-called aromatic bodies, which start from the hydrocarbon C₆H₆, benzene. In the compounds previously considered the carbon atoms are united in a chain-like manner, but in benzene there is good reason to assume that they form something like a ring. Around this ring of carbon atoms the hydrogen atoms are grouped, and by successively replacing them with other atoms or radicals, a myriad of substances may be generated. The details of this theory, which was put forth by Kekulé in 1866, are too abstruse for full development here, but its influence upon chemical research and chemical industry has been overwhelming. From benzene, which is a product of coal-tar, aniline is produced, and the derivatives of aniline give us a perfect rainbow of artificial dyes. To benzene, other hydrocarbons are closely related, and their derivatives are often curiously interesting. Among them we have artificial indigo and artificial alizarin, the latter being the coloring principle of madder. Both compounds are identical with the natural substances, and both are important commercial products. Medicines, like saccharin, antipyrin, acetanilid and phenacetin; perfumes, like musk and violet; and flavoring substances, such as vanillin, are now prepared by synthesis from the hydrocabons of coal-tar, and thousands of workmen find employment in the new industries which are based upon these processes. The investigations which created these new sources of wealth have been in great part guided by theoretical considerations, and at the very foundation of all this work we find the conception of chemical structure, and Kekulé’s interpretation of the constitution of benzene. The atomic groupings represented by the structural or rational formulæ are not visionary and their study has led to the greater material well-being of mankind.

It must not be supposed that the rational formulæ represent the arrangement of the atoms in space, for that is not their purpose. It is not likely that the atoms of a molecule all lie in one plane, and yet, these formulæ suggest no other mode of grouping. The tridimensional structure of molecules is, generally speaking, almost entirely unknown; and yet, in certain cases, there are clues to a partial solution of the problem. Various organic substances have optical properties which are easiest explained by assuming that the atom of carbon is essentially a tetrahedron in form, and that its four valencies are forces exerted from the centre toward the four solid angles of the body. By means of this hypothesis many curious facts are interpreted and many new discoveries have been made. Formulae based upon the tetrahedral carbon atom are called stereochemical formulæ, and the study of their space relations is known as stereochemistry. This subject is quite modern and does not admit of detailed discussion here.

That the elements are connected with one another by various relationships is a fact which was early recognised; they were therefore soon classified into groups according to their like¬nesses. Thus chlorine, bromine and iodine are closely allied and form strikingly similar compounds; lithium, sodium and potassium resemble one another very clearly, and so do the metals, calcium, strontium and barium. Such a grouping was of great service in classifying many chemical facts, and in due time it was seen to be related to the property of valency. A general law connecting all the elements was, however, not discovered until the decade ending in 1870, during which time three investigators, Newlands, Mendeleéf and Lothar Meyer, working independently, developed the periodic system. Upon arranging the elements in the order of their atomic weights, a regular periodic variation in their properties are observed; the first interpretation of it was due to Mendeleéf. The nature of his work may be partly shown as follows:
Beginning with lithium and arranging the elements in the order above indicated, a table of the following form can be constructed, although only three lines of it are given here:

<table>
<thead>
<tr>
<th>Li.</th>
<th>Be.</th>
<th>B.</th>
<th>C.</th>
<th>N.</th>
<th>O.</th>
<th>F.</th>
<th>Ne.</th>
</tr>
</thead>
<tbody>

<td>52.</td>
</tr>
</tbody>
</table>

Under the symbol of each element its atomic weight is written, rounded-off, in some cases, for convenience. Let us now consider the first line. Lithium, which begins the scheme, is univalent, glucinium bivalent; and carbon quadrivalent, a regular increase in valency. Nitrogen is in its stablist compounds trivalent, oxygen bivalent and fluorine univalent; thus showing a steady decrease. Neon, which was not known in Mendeleéef's time, and argon, which falls just below it, are elements of no valency, and these form no compounds. These elements, with their regular rise in valency to carbon and fall to neon, form a single period. In the next line, beginning with sodium (Na), the period is repeated; and this happens again in the third line; so that all of the elements in the same vertical column are alike in valency and intimately related in their properties and their compounds. Regular step-by-step variation horizontally, and likewise vertically, characterizes the table, which may, with certain qualifications, be extended so as to include all the elements known.

At the third place in the third line of the table, as given above, a blank appears. This place, when Mendeleéef developed his periodic law, was left blank by no known element; and in the fourth period of the completed scheme two similar gaps occurred. These indicated unknown elements, and Mendeleéef, from the properties of the adjacent elements, predicted what their properties should be. Since then the predictions have been verified; and having all the properties which Mendeleéef foresaw, fill the vacant places. They are scandium, gallium and germanium. The connection between the elements was more intimate than any one had supposed, so much so that the unknown could be accurately prophesied. All physical properties appear to rise and fall from element to element in this regular periodic way; and we can now see what sort of elements are likely to be discovered in the future, and where they will stand in the tabular arrangement. The properties of an atom, thermal, electrical, optical, etc., seem to be in great measure dependent upon its weight. The distinctly chemical property of the atom, its valency, may be related to its form, as stereochemical evidence would seem to indicate; but here we have few facts to go upon and speculation would be premature.

The wonderful regularity of the periodic law, with its verified predictions, lead us at once to reiterate the old question as to the ultimate nature of matter. Is it really various in kind, or is it at bottom only one? Are the elements, in the last analysis, elementary? To such questions no final answer can yet be given, but they cannot be silenced; and one of the most marvelous discoveries of science has some bearing upon the problem.

When a beam of white light passes through a glass prism, it is broken up into a bundle of rays which give to the eye the so-called seven primary colors. If this phenomenon be observed through the form of instrument called a spectroscope, a continuous band of color is seen ranging from red at one end to violet at the other. Suppose, now, that instead of examining white light, we repeat the experiment with a colored flame and see what will happen. Sodium compounds, for instance, when introduced into a non-luminous gas flame, give out an intense yellow light; and this, viewed through a spectroscope of low power, yields a spectrum consisting of a single, narrow, yellow line. Lithium, under similar conditions, exhibits a red line; barium, a group of several green and yellow lines; and, in short, every substance which is capable of coloring a flame gives a spectrum which is not continuous. Each spectrum is made up of bright, colored lines, with dark spaces between; and every line is absolutely characteristic of its element, provided it be first heated hot enough to be converted into vapor, yields its own definite spectrum of one or many lines, which can be recognized in a spectroscope. The vapor of iron, as obtained in an electric spark between iron terminals, gives a spectrum containing a multitude of bright lines, and every one of them belongs only to iron. The process by which substances are thus identified is known as spectrum analysis; and it was discovered by Bunsen and Kirchhoff more than 50 years ago.

Bunsen applied the method to the analysis of the salts contained in a mineral water, and saw lines which belonged to no known element. He was thus led to find two new metals, rubidium and caesium, and soon afterward, by similar means, other chemists discovered thallium and indium.

Shortly after its invention the spectroscope was turned toward the heavenly bodies, in order to see what tales their light had to tell. It was at once found that they are all composed of matter like that with which we are familiar on the earth, although varying in complexity. The sun was proved to be an intensely heated body, containing a large number of our chemical elements in gaseous form, and the fixed stars were similar in character. The whiter and hotter stars contain comparatively few substances, the colored and cooler stars contain more. The nebula, those bodies which represent the first step in the formation of planets and systems, were found to be vast clouds of incandescent gaseous matter, in which hydrogen and helium predominated; chemically, therefore, they were extremely simple. From the simplest nebula to the complexity of our earth there was regular chemical gradation, suggesting that the evolution of the one from the other had been accompanied by an evolution of the so-called elements also. A strong argument in favor of the unity of matter was thus brought to light, even to the wonder of the world. The general opinion now is that our elements are really complex, although our present resources are not adequate to decompose them.

Very recently this opinion has been strengthened by a group of remarkable discoveries con-
Chemistry

connected with the rare metals, thorium and uranium. These elements and their compounds were found to emit invisible radiations, or emanations, which affect the photographic plate, and also give certain measurable electric properties. This trait of radioactivity, as it is called, led to the discovery of two or three new metals, which are associated in the mineral kingdom with uranium, and one of these, radium, has the new power to an extraordinary degree. The radiations are of several kinds; and are still the subject of active investigation; but one or two of the conclusions so far reached are pertinent to the present discussion. In the case of radium, the emanation consists of chemically inert gaseous particles which are continually being generated and given off from the parent material. The elements thorium and uranium behave in a similar manner. In short, radium, a metal like barium, is an unstable element, and it spontaneously, but very slowly, decomposes, yielding helium as its final product. J. J. Thomson, studying electrified gases, is led to the conclusion that the negative charge resides upon certain corpuscles, as he terms them, which are not the simple atoms of the elements of hydrogen in magnitude, and which are the same for all substances. Particles smaller than the chemical atom are thus being identified, and so the belief in the actual complexity of the elements is receiving close attention.

Although the principles of valency and the conception of chemical structure are best developed and exemplified in the study of organic compounds, the inorganic side of chemistry is by no means to be neglected. Here we find the simplest illustrations of chemical nomenclature, and some of the greatest fields of industrial activity. Sulphuric acid, soda, bleaching powder and many other inorganic substances are of immense commercial importance; and the processes by which metals are extracted from their ores all fall within this department of chemistry. Information upon these practical subjects will be found elsewhere, under the proper headings, such as Iron; Phosphorus; Salt; Soda; etc.; but a few general notions belong here.

The nomenclature of inorganic chemistry is quite simple. Compounds of two elements are described by giving their names and adding the termination -ide to part of the second title. For example, copper unites with oxygen to form copper oxide; zinc and chlorine give zinc chloride, and so on, the names thus expressing the composition of the substances. When multiple proportions appear a numeral prefix is added to the class name, so that we have such combinations as iodine monochloride, ICl, iodine trichloride, ICl₃, and the like. In some cases this mode of nomenclature is varied, as when certain well-defined classes of compounds are to be designated. Thus we have the iron compounds FeCl₂ and FeCl₃ (the symbol Fe from ferrum), which are commonly called ferrous and ferric chloride respectively. The terminations ous and ic denote lower and higher stages of union and are used for convenience or economy. The rule requiring them to be avoided. Such compounds as PCl₅ and PCl₃ may be named either phosphorous and phosphoric chloride, or phosphorus trichloride and pentachloride, according to preference; but the latter form is the more precise and clear.

Any compound of a metal with oxygen, then, is an oxide; with chlorine, a chloride; with sulphur, a sulphide, etc.

Three of the largest and most important classes of compounds are acids, bases and salts. In order to define these rigorously, some previous wordage of chemistry is required; but an indication of their character is easily given. The acids, as their name implies, are usually sour in taste, but not invariably so, and the stronger members of the class are violently corrosive and able to dissolve metals. They are most commonly derived from the non-metallic elements, and several acids may be formed from one of the latter. Here again we have the ous and ic nomenclature, as in sulphurous acid, H₂SO₃, and sulphuric acid, H₂SO₄; the latter containing the higher proportion of oxygen. From nitrogen we get nitrous and nitric acids, HNO₂ and HNO₃, and so on with simple descriptive names throughout the long list of these compounds.

The bases are the direct opposite of the acids in their properties, and have, when soluble in water, an alkaline or soapy taste. The taste of ordinary kitchen soda is a good example of this peculiarity. Certain vegetable coloring matters are changed in hue by acids and alkalis, the latter name being applied to the stronger soluble bases. Blue litmus, for instance, becomes red in contact with an acid, but an alkali restores its original tint. When acid and base are mingled in proper proportions, they neutralize each other, and a salt is produced which no longer affects litmus. To illustrate further: Soda is a base, and when it is mixed with sulphuric acid it generates sodium sulphate. With sulphurous acid it yields sodium sulphite; and the two terminations ate and ite correspond to the other terminations ous and ic. Nitric acid, with bases, forms nitrates; acetic acid, acetates, etc., the nomenclature being simple and easy. Many of the salts are important commercial articles.

From one point of view an acid is a substance which contains hydrogen replaceable by a metal, and a salt is the compound so produced. Zinc, for instance, reacts with sulphuric acid to form zinc sulphate, and free, gaseous hydrogen is liberated. An acid, then, contains hydrogen plus something else, and the latter is a distinct radicle in each case which exhibits a definite valency. The simplified formulae may help to make this point clear:

<table>

</tr>
</tbody>
</table>

That is, potassium (symbol K from kalium) replaces hydrogen atom for atom; and the radicles, NO₃, SO₄, and PO₄, are univalent, bivalent and trivalent respectively. A knowledge of these simple principles enables the chemist to classify the facts in his mind, and to write numberless formulæ without overloading his memory with details. Learning the names of a language, only the grammar is easy of acquisition. Fluency in its use can only be gained by practice.

Between allied departments of science no sharp dividing line can be drawn, and this is
peculiarly true with respect to chemistry and physics. The two sciences merge into the common ground of the we are and of the we are not. Electrical phenomena and their properties can be fully understood separately. Physics treats primarily of the different forms of energy, light, heat, electricity, mechanical force, etc., and all of these appear in the phenomena of chemical change. Furthermore, electrical phenomena are described in physical terms, and are identified by physical properties such as weight, color, specific heat, melting point, boiling point, electrical conductivity and the like. Considerations of this kind have received much attention during recent years, more than ever before; and so a great department of knowledge has been developed, known as physical chemistry. Avogadro's law, the periodic law and the revelations of the spectroscope all fall partly within this field, but other important portions of it deserve some notice here.

Between chemical change and heat the relation is exceedingly intimate. No chemical change takes place without either the liberation or the absorption of heat, and every change is to some extent dependent on temperature. At very low temperatures, like the temperature of liquid air, all chemical action ceases, and the most oppositely energetic substances lie side by side indifferent to one another. At very high temperatures all unions are broken up, and here again the chemical forces cease to be operative. Most of the changes which we observe are effected at ordinary temperatures, and a slight warming may arouse an apparently inert mixture to chemical activity. The application of heat, then, may either instigate or prevent chemical union, according to circumstances.

As a general rule, with some apparent exceptions, every chemical union develops heat and every decomposition absorbs it; and the study of these relations has received the special name of thermochemistry. Furthermore, every chemical change is attended by its own special, definite quantity of heat, and these quantities vary from substance to substance. Hydrogen, burning, that is, combining with oxygen, gives out the largest amount of heat of any substance known; carbon yields much less, phosphorus or sulphur less still, weight for weight being consumed. For such reasons the heat value of any fuel is important in its chemical composition, and hence careful analyses of coal, which is a variable mixture containing chiefly carbon and hydrocarbons, have great practical importance. From the composition of a coal its calorific value may be calculated, although a direct experimental measurement of it is to be preferred. In general laws, however, thermochemistry is still rather deficient, and its larger meanings are yet to be discovered.

Like heat, radiant energy, the energy of light, may cause either a chemical union or a chemical decomposition. Hydrogen and chlorine, mingled in cold and darkness, do not readily unite, but upon sudden exposure to strong sunlight they combine with explosive violence. On the other hand, silver salts, under suitable conditions, may be kept for years without any change. These things are not the concern of the chemist. The photographic film is a laboratory in which light is the agent. We have already seen, in considering spectrum analysis, that every substance, when intensely heated in the form of gas or vapor, emits light which is peculiar to itself; but there are still other relations between matter and light that have chemical importance. Color is in many cases a measure of the capacity for selecting or absorbing certain rays, and rejecting or transmitting others; and this is often a characteristic distinction between various classes of compounds. For example, salts of cobalt are commonly red, of nickel green, of copper blue or green, and so on. Many of the optical properties of substances seem to depend upon their chemical composition, and in one set of phenomena this fact has economic importance. Certain bodies have the power of twisting or rotating a ray of polarized light, and among carbon compounds this property is directly connected with the stereochemical structure. Sugar is one of these optically active compounds, and by measuring the amount of rotation which a sample can produce its degree of purity may be determined. This process is practically applied in all sugar refineries for estimating the value of raw sugars or syrups, and also in assessing customs duties. The polariscope used for such purposes is often called a saccharimeter.

Of late years the department of chemistry has been greatly developed upon its electrical side, both theoretically and practically. Electricity may be generated by chemical change, and this happens in all forms of the galvanic battery. For many years, previous to the perfecting of the dry batteries of that class supplied all the electrical power that had any industrial significance. Electricity may also produce chemical change, and it is especially effective in bringing about decompositions. Indeed, many thinkers have sought to identify chemical attraction or affinity with electricity, and even the property of valency is commonly ascribed to electrical charges carried by the atoms.

From a purely chemical point of view, probably the most important electrical phenomena are those of electrolysis. When a current of electricity passes through a compound solution, the latter undergoes decomposition, and the dissolved substance, acid, base, or salt, is separated into two parts which move with unequal velocities in opposite directions. The conducting liquid is called an electrolyte, and the separated parts, or rather particles, of the compound in solution are termed ions. One ion is positively the other negatively electrified, and they tend to accumulate at opposite poles. Under suitable conditions the separation can be made permanent, and this fact is the basis of all our processes in electrometallurgy. From solutions of gold, silver, copper, nickel, etc., the metal is electrically set free, to be deposited upon properly arranged surfaces. Electroplating and electrotyping are operations of this kind. In the electric furnace, however, the electricity acts as a source of heat, and the latter is the effective decomposing agent. In manufacturing chemical preparations many electrolytic processes are now employed. In liquids which do not conduct a current electrolysis does not take place.

Suppose, now, we employ several precisely similar cells, to effect a variety of electrolytic changes. Let one current liberate hydrogen from water, another deposit silver, another copper, and so on. Then, upon measuring the quantities of the different substances which have been set free, we shall find them to be exactly proportional to their
chemical equivalents, an equivalent being the ratio between the atomic weight of an element and its valency. For univalent elements, the atomic weights and equivalents are identical, for bivalent elements the equivalent is half the atomic weight, and so on through the list. If, then, one gram of hydrogen is liberated, the same current in a circuit will pass if the hydrogen is 18 grams of univalent silver, or one-half of 63.1 grams of bivalent copper, etc. This fundamental proposition of electrolysis is known as Faraday's law. Furthermore, the separated ions all carry equal electrical charges per unit of valency, 96,500 coulombs for a univalent ion, and twice that for a bivalent ion. The relation between electrical and chemical phenomena is of the very closest kind, and Faraday's law is absolutely general.

When two or more substances act upon one another chemically, the entire process is termed a reaction. Very many of the reactions which are observed in the laboratory take place between bodies in solution, and hence the study of these reactions merits a great deal of attention. No complete theory of solutions has so far been developed; why one substance should dissolve easily in water, another slightly; and a third not at all, remains unexplained; some generalizations have been reached, and these are of the most suggestive character. Some of the phenomena are electrolytic in their nature, and others go to prove a remarkable parallelism between bodies in solution and bodies in the gaseous condition.

In Avogadro's law the volume of a gas is defined by conditions of temperature and pressure, and equal numbers of molecules occupy equal spaces. The power of exerting pressure is one of the distinct properties possessed by all gases, and this is a consequence of the fact that the molecules are in rapid and continuous motion. Substances in solution are also found to exert pressure, and the latter can be measured by various means. The pressure is proportional to the strength of the solution, and although it is not easily detected, it is often very great. The movement of the sap in a plant is due to the osmotic pressure of the dissolved substances that it contains. In 1887 Van 't Hoff, studying the electrolytes, stated the simple law that equal volumes of solutions, at equal osmotic pressures, contain equal numbers of molecules, and Avogadro's law was directly paralleled. A body in solution and a gas obey precisely similar laws. We have already seen that from the actual weight of a gas its molecular weight can be determined. Now, from the behavior of substances in solution their molecular weights can also be ascertained. A saline solution does not freeze so easily as pure water, and its boiling point is higher; the depression in one case and the elevation in the other being proportional to the molecular weight of the dissolved substance. These facts are directly connected with Van 't Hoff's generalization, and the law is of almost daily application in scientific research. The actual measurement of molecular weights has been enormously extended by means of the new laws.

Both gases and solutions, however, sometimes exhibit apparent anomalies. In certain compounds, when vaporized, the salt not to agree with Avogadro's law, and such facts require explanation. The seemingly anomalous substances, as such, do not exist in the state of vapor, but are split up, or dissociated, into other things. For example, ammonium chloride, NH₄Cl, at a certain temperature, is decomposed into a mixture of two gases, hydrochloric acid and ammonia, NH₃ + HCl, which, on cooling, reunite and reproduce the original compound. Twice as much vapor as is required by theory, and specifically half as heavy, is produced by this transformation, which is but one of a large class, all well understood.

In the case of solutions it was found that many compounds, especially the acids, bases and metallic salts, caused a lowering of the freezing point that was twice as great as should be expected. Here again a splitting up of molecules, a true dissociation, exactly like that observed in gases, had occurred. Furthermore, the anomalous compounds were all electrolytes; that is, their solutions conducted electricity and were electrolytically decomposed; while normal substances, like sugar, were not. Solutions, then, were to be divided into two classes, differing essentially and also just in their relations to Van 't Hoff's law. The explanation of these differences is given by Arrhenius in his theory of electrolytic dissociation.

As interpreted by this theory, an electrolyte, when dissolved, is dissociated into its ions, partially in a strong solution, and entirely in one which is infinitely dilute; a statement which leads to some remarkable conclusions. For instance, the ions of common salt, sodium chloride, are atoms of sodium and chlorine. In a dilute solution the salt itself ceases to exist as such, while atoms of sodium and of chlorine wander about, chemically separated, but still in equilibrium with each other. Sodium sulphate may be regarded as made up of two parts, sodium ions and ions of an acid radicle, SO₄, and these are separated apart during solution to move about independently. According to this view electrolysis is not primarily a decomposition of the salt: it is rather a sorting out of the atoms of the uncombined ions, which receive different electrical charges and concentrate separately at the two electrical poles. Some ions are single atoms, others are more or less complicated groups such as CO₃, SO₄, NO₃, PO₄, etc., which cannot be, or at least have not been, independently isolated.

In the study of chemical reactions the ionic theory of Arrhenius has been fruitfully applied. By means of it we are now able to better discriminate between acids and bases, and to interpret more rationally the phenomena of neutralization. Acids are all characterized by the presence in their solutions of hydrogen ions, single atoms with a univalent radicle, two atoms for each bivalent radicle, etc. Thus in hydrochloric acid the ions are H and Cl; in sulphuric acid 2H and SO₄, and in phosphoric acid 3H and PO₄. In bases, on the other hand, ions of hydroxyl exist, and this is a radicle of the formula HO, in which the oxygen is half combined. Caustic soda, NaOH, for example, dissociates in solution into the ions Na and H₂O; caustic lime, CaOH₂, into Ca and 2HO, and so on. When a dissolved base and a dissolved acid are brought together, the H ions of the latter and the HO ions of the former combine to form water, H₂O, and vanish from the reaction. The salt which is produced

vol. 6 — 26
is represented by the remaining ions, and as the characteristic features of acid and base are gone, the result is neutral. Nearly all reactions in solution, but not quite all, are reactions between ions rather than between the actual compounds with which we originally began.

By the time of Lavoisier, chemistry was hardly more than a minor subdivision of natural philosophy. It was just coming into recognition as a true science, and its votaries were few. Its great development has taken place in little more than a century, and now it touches many other branches of knowledge, affects all departments of industry and gives employment to tens of thousands of men. In every part of it there is intense activity, and discovery follows discovery faster than they can be assimilated. Mineralogy is to all intents and purposes a branch of chemistry, for minerals are classified upon the basis of their chemical composition, and the first step toward the establishment of a new species is its chemical analysis. Physiology is in great part a chemical science; respiration, assimilation and excretion are chemical processes; within the living organism, plant or animal, substances are undergoing transformations which only the chemist can follow or identify. The chemistry of vital processes, biochemistry, is almost a science by itself, so large is its field and so varied are the problems with which it has to deal. Medicine is indebted to chemistry for almost a new pharmacopoeia, for not only have new remedies been created, but in place of old drugs, crude and bulky, the compact and more elegant active principles are now employed. Anaesthetics, such as ether, chloroform and nitrous oxide; hypnotics like chloral; the remedies derived from coal-tar; and alkaloids like quinine, morphine and cocaine are a few of the contributions with which chemistry has enriched medical practice. Even antiseptic surgery depends upon chemical preparations for its success.

The chemistry of agriculture is separately treated elsewhere, but a word may fairly be said upon the relations between chemical science and the arts. Every manufacturing industry is directly and profoundly affected by the results of chemical research. A century ago the whole manufacturing establishment in the world even thought of maintaining a chemical laboratory; to-day hundreds are in operation for the benefit of the intelligent manufacturer. Coal gas is a chemical product; its by-products are ammonia and coal-tar; and from the latter, as we have already seen, hundreds of useful substances, discovered within the last half century, are prepared. Better and cheaper soap and glass owe their existence to chemical improvements in the making of alkalis; chemical bleaching has replaced the slow action of sunlight and dew; chemical dyestuffs give our modern fabrics nearly all their hues. In metallurgy every metal is extracted from its ores by methods which rest on chemical foundations, and analyses of fuel, flux and product go side by side with the smelting. The cyanide and chlorination processes for gold, the Bessemer process for steel, are good examples of the advance in chemical metallurgy; but before they can be adapted for the dynamiting of ground or other chemical invention, must have done its work underground. Waste products are made useful, and new applications of old materials are discovered by the chemist; even curiosities like the rare mineral monazite are brought into play. Monazite furnishes the oxides of thorium and cerium, from which the mantles of the Welsbach burners are made. Every year brings its improvements, and chemical patents by the hundred are annually issued to inventors.

The facilities for chemical training have increased side by side with the demand for chemical services, and in every university or technical school chemistry has become a leading study. Even the preparatory schools are now equipped with chemical laboratories, and the science has come to be recognized as an important part of a liberal education. Apart from its practical bearings its disciplinary value is very great, and this consideration is now given due weight by teachers.

One more phase of chemical activity remains to be noticed, the organization of chemical societies. Of the larger national organizations the English society is the oldest, the French next, then comes the German and then the American. The American society now numbers over 7,000 members and has nearly 50 local sections in continuous operation. In its three journals it publishes over 7,000 pages each year. There are also many smaller organizations devoted to chemistry, and some to special subdivisions of it, such as electro-chemistry. Applied science is represented by the Society for Chemical Industry, an Anglo-American association of great strength.

F. W. Clarke,
Chemist for United States Geological Survey.
assiduously than heretofore. In considering a reaction, the modern chemist endeavors to compute, as far as possible, the free energy available in order to determine not only what takes place, but also the reason why.

Another subject which has had the attention of many workers of late is colloid chemistry. This has to do with uncrystalline bodies which divide themselves into very minute particles, much larger than colloids, yet small enough to be kept in constant motion by the bombardment of surrounding molecules. The more finely divided a substance is the greater is the proportion of the surface of its particles to their volume, and, as every surface has its own peculiar qualities in regard to what may be spread out upon it, many phenomena are met with that do not take place in a non-colloidal condition. Inasmuch as all body juices are colloidal in their nature, this study has thrown a great deal of light upon problems of physiology.

Electrochemistry (q.v.) has shown marked advances. The high temperature of the electric arc has provided the means, not only for the fixation of nitrogen in the first instance, but for the combining of the elements yet existing toward each other. It has made possible the reduction of many rare metals from their ores, thus bringing them into use. The electrolytic refining of copper and the electric steel furnace are products of electrochemical research, as is the aluminum industry.

In applied chemistry we find research active but industry still unwilling, in many cases, to "let in the theorist." On the other hand, chemical control of works and processes of manufacture is growing apace. This and the results of research are the most evident indications of the progress of the science to those unfamiliar with chemical processes. Much has been said of the "scientific management" of men in devising economies of work in manufacturing processes, but much has also been done in the scientific management of materials in relation to their chemical reactions during the processes of industry. We shall address ourselves principally to applied chemistry and note some of the processes which have been worked out.

Power—This is the first great requirement in nearly all manufacture and is of vast importance in electrochemical industry (q.v.). Water power is not used to its full extent. In the United States the conservation statutes which withhold it under fear of private control or monopoly have had an important bearing on this. Another bright method of converting water into steam is by burning coal in the form of a very fine powder. This ensures complete combustion, avoids smoke and promises marked economy. The burning of coal powder is in general use in the Portland cement industry to obtain the high temperatures needed in the operation. It is necessary that the coal be milled as it is fed into the fire, as in a powdered condition it is easily exploded. A problem yet to be solved is a way to avoid the damage done to boilers to which cinder-like charcoals obtained in combustion. As soon as this is overcome, the steaming power of coal will be materially increased.

Gas-engines are competing with those steam driven, but they are still more expensive to install and more difficult to operate. On the other hand, coal gas, by which these engines are propelled, is increasing in use. The development of by-product ovens for making coke for the manufacture of pig iron, in the place of the wasteful beehive coke ovens, has provided a new source of coal gas in large quantity. Another prospective cheapening of gas to the consumer lies in the fact that the consumer must learn the expensiveness of demanding candle power in the place of heat units as the standard of gas furnished by public service corporations. The increased light obtained by the use of mantles of the Welsbach type from gas low in illuminating power and much cheaper to produce should bring this about.

Motor Fuels.—These are all chemical products, and while the needs have not been fully met, the outlook is encouraging. The use of automobiles is increasing faster than is the production of gasoline, so there is a problem to be solved. One way to meet it is by "cracking" petroleum, whereby the more complex, heavier bodies are in effect chemically split down into lighter bodies by other methods, and the products are then sold. There is, however, a limit to the number of times heavy petroleum may be cracked, owing to their tendency to revert to their elemental carbon and hydrogen if the process is carried too far. Heavy trucks are now beginning to use the cheaper kerosene, starting the motors with gasoline or alcohol. What is needed is either a successful kerosene carburetor or an oxidizing agent to prevent the fuel from carbonizing in the cylinders.

The art of making ethyl (grain) alcohol from sawdust and other wood waste, and from the sugar in the waste liquors of sulphite pulp mills has been developed to a qualified commercial success. The leading raw material for this purpose is molasses, which is a waste product of the sugar industry of the United States and the West Indies. Vast quantities are produced from this source for industrial use today. Frost-damaged corn, of which nearly every year there is considerable, is also used. If the raw material is not corn or potatoes, or if cellulose as in sawdust, these products are first reduced to sugars and then fermented to alcohol and carbonic acid gas. The alcohol is then distilled off. Alcohol more or less mixed with petroleum bids fair to become important as motor fuel in the United States.

With the growth of the by-product coke industry there will be a larger production of benzole from coal-tar than the color, explosives, and other industries evidently need, and the excess will be available as motor fuel.

Size of Apparatus.—This has grown, especially in the smelting industry, iron blast furnaces in the United States reaching a capacity of 500 tons daily. On the other hand, chemists have become more than ever alive to the fact that increase in size of apparatus may only be availed of after careful study, because questions of temperature, pressure and, in general, the ways of stuff in the mass, are not to be guessed at. This has taught manufacturers the principle that every new process should be tried out in a small factory before a large plant is built. Many problems of physical chemistry are still unsolved, and the phenomena of chemical
action in the mass differ in surprising measure from laboratory experiments made under different physical conditions.

Iron and Steel.—The greatest contribution to iron manufacture within the past 25 years was made by James Gayley, by bringing air to a stable, low temperature before it enters the blast furnace. A given temperature within the furnace is provided for, but if the water content of the air varies, the operation of the furnace becomes irregular. Now the warmer the air is the more humid it may be. For instance, if one cubic mile of air at maximum humidity at 95 degrees Fahrenheit were cooled to 32 degrees, there would be given off 140,000 tons of water, or 35,000,000,000 gallons. It had always been noticed that blast furnaces worked better in winter than in summer, but the reason was not known. By the Gayley process the air is refrigerated and thus a great part of the water is extracted. The saving amounts to a dollar or more in the cost per ton of pig iron.

The Siemens open-hearth process for making steel has supplanted the Bessemer method in part, because, although the open-hearth process is much slower, it is under far better control and the product is more even and generally better. In many of the largest steel works the conversion from iron to steel is first done in part in Bessemer converters and continued in open-hearth furnaces. This saves a great deal of time. In some of the most modern works steel is made in two steps; first in Bessemer converters, and from these into electric furnaces. The economy of beginning with molten iron from a blast furnace and finishing it as electric steel without once allowing the metal to cool may readily be seen, while the quality compares with that of crucible steel.

For making steels of the best quality and greatest purity the old method of refining in crucibles is still in use although the electric furnace is supplanting it in part. Owing to the amount of electric current required and the short life and heavy expense of carbon electrodes, the process is costly, although less so than it is to produce steel in crucibles.

Steel Alloys.—Very interesting and valuable strides have been made in the production of alloys with steel. Some have been known for a long time; others are of recent discovery. Nickel, for instance, gives to steel tenacity and ductility; nickel and chromium, hardiness; manganese increases tenacity and improves the working qualities; tungsten is added to make self-hardening and other special steels; titanium produces great stiffness, especially in rails; and the presence of no more than one-quarter of 1 per cent of copper in steel sheets is remarkably effective in preventing rust. Certain proportions of tungsten, chromium and molybdenum, in conjunction with special tempering, make the Taylor & White high-speed tool steels. Vanadium gives great hardness. Silicon makes steel and iron brittle but hard, and a steel low in carbon but high in silicon content has a strength four or five times greater than ordinary iron and loses less current when installed in electrical machinery. A very high silicon content makes iron resistant to acids and alkalies.

Sulphuric Acid.—This is the most widely used of all chemical products and touches, at one point or another, a vast number of manufactured articles in daily use. When sulphur is burned out of metallic condition, the elemental sulphur, the compound SO₂ or sulphur dioxide is formed. These choking fumes, similar to all of us, constitute the anhydride of sulphurous acid, but to produce the anhydride, or body which with water produces sulphuric acid, another atom of oxygen is needed in the molecule. In other words, it is required to change SO₂ to SO₃. The formula for sulphuric acid is H₂SO₄, while that of water is H₂O. The relation, then, of SO₃ to sulphuric acid may be seen in the following equation:

SO₃ + H₂O = H₂SO₄

Sulphuric Trioxide.

Acid.

The standard method has been to bring the sulphurous fumes into great leaden chambers and there to effect a union with oxygen by means of oxides of nitrogen, which are ultimately recovered. This must be done in the presence of water so that the resultant acid may be called chamber acid as it is called is weak, and the excess water must be boiled off.

A later method of producing the anhydride of sulphuric acid (SO₃) is accomplished by what is known as catalysis, whereby a foreign body causes a chemical action to take place between others without apparent change in itself. For instance, if the fumes of burning sulphur or sulphur dioxide are brought together with air, which contains one-fifth oxygen, in the presence of platinum sponge, under the proper conditions, then great clouds of sulphuric anhydride or SO₃ (the trioxide) will fall to the floor of the apparatus. This is the principle of the contact process and it is in wide use wherever the anhydride is especially needed. The old chamber process, however, has also been improved, so that it is not clear which process is cheaper to make an acid of 93-95 per cent concentration. Chamber acid is more cheaply produced in the old way than by making SO₃ and then adding dilute acid to it. (No one would think of adding water to SO₃ in practice because the reaction would be too hot and lively for convenience).

A notable change in the industry in the United States within the last few years has been the manufacture of sulphuric acid by copper and zinc smelters in order to get rid of the sulphurous fumes from the roasting of their ores, which vitiated the air for miles around the smelters, ruined vegetation, killed farm crops and were considered to be inimical to health. It was made possible by the invention of Dr. Frederick G. Cottrell. He found that by the conduction of high tension electric currents through vapors under proper conditions, suspended bodies were precipitated from the air as the currents passed through them, along with any excess of moisture contained in the air. This saved the day for many copper smelting corporations that were in immediate danger of being compelled by law to shut down owing to the fumes which they produced. A considerable part of the sulphuric acid produced in the United States is now made from smelter fumes. The Cottrell process has been partially worked out with reference to other problems, such as the smoke nuisance in cities, and with reference to fog at sea. The
method proposed for overcoming fog is to sail an electrically operated small aeroplane, merely large enough to carry the necessary apparatus, attached to the bow of a ship. Then with one part of the high tension currents would pass between them and the intervening fog should be precipitated. It is interesting to record that Dr. Cottrell turned over all the proceeds from his patents on electrolytic precipitation to be expended for research in the advancement of science.

Nitrogen Compounds.—This has been one of the fields of greatest achievement of late years. Nitrogen, of which four-fifths of the air is composed, is needed in combination for fertilizer, for food, for the manufacture of dyestuffs, explosives, medicines,—in short, nitrogen in combination is needed constantly for a vast number of purposes. Formerly the only source of supply was the great beds of nitrate of soda found in Chile, but not only was this exhausted within 100 to 150 years at the present rate, but in the event of war, a blockade of the Chilian ports makes the production of explosives impossible. For despite the inexhaustible volume of air, there is no other combination of elements which can be utilized for the production of nitrogen in any chemical combination except at the temperature of the electric arc or, until lately, under conditions unknown to man. Leptominous plants, such as clover, cowpeas, alfalfa, etc., take up nitrogen from the air and not only use it but enrich the soil with it when they are ploughed under. Other plants do not accomplish this and neither do laboratories or factories to this day, save in a roundabout way. The industry started at Niagara Falls under the invention of an American chemist, Charles S. Bradley. The product proved too expensive to persuade the investors in the enterprise that it was worth while, and the work was discontinued. Then two Norwegians, Birkenlind and Eyde, took it up and have developed an enormous industry. With the great water powers of Norway, available to industry, they develop electric currents and produce nitric oxides from the nitrogen and oxygen of the air. These oxides, brought in a stream of air, are reduced by an initial reaction which is sold all over the world. The process calls for vast quantities of power, and in Germany, with the war on and the supplies of nitrate of soda approaching an end, and the ports all closed, and no great water power development available in the country, something had to be done if the war was to continue. Without fixed nitrogen, no explosives may be made. At this point the process of two chemists, Haber, a German, and Le Rossignol, a Frenchman, was used. Thereby an electric spark is passed through the mixed gases, a little ammonia will be formed. Ammonia is a combination of three atoms of hydrogen with one of nitrogen. Not much ammonia is formed, though, because at that temperature, a solution of sulphuric acid, producing salt cake (sulphate of sodium) and muriatic (hydrochloric) acid. The salt cake was heated with coal and limestone (calcium carbonate) until the mass had fluxed, when the reaction took place; that is, there was an exchange of acids and bases, the sulphate of sodium becoming the carbonate and the lime becoming the sulphate. We need concern ourselves no further with the details of the process because it is practically obsolete.

In 1861 Ernest Solvay of Brussels patented the so-called Ammonia process, which is that by which the major portion of the soda used to-day is made, although we shall soon note another process that is crowding it wherever there is abundant power for electricity. In the Solvay process, salt (sodium chloride) is treated with ammonium bicarbonate, or successively with ammonia and carbon dioxide, at a low temperature. Sodium bicarbonate and ammonium chloride are formed and the former being nearly insoluble in water, precipitates out. The mother liquor (of ammonium chloride) is drawn off, treated with caustic lime, which frees the ammonia which is recovered and produces calcium chloride.
CHEMISTRY, PROGRESS OF

By using magnesia instead of lime the chlorine may be saved and the magnesia used continuously. The bicarbonate of soda is changed to the carbonate by heating. Caustic soda is made by neutralizing the carbonic acid with lime. The still newer method, resulting in caustic soda as the first product, and a very successful one, is the electrolytic process, which is by no means as simple as it looks. Methods differ in detail, but in principle of the same type is led into an electrolytic cell, through which a current of electricity is passed which splits the sodium from the chlorine, each element approaching its opposite pole. The sodium combines with the water to form caustic soda and the chlorine is collected. A very lively industry is developed at Niagara Falls, N. Y., and elsewhere, under several modifications of this process. See ELECTROCHEMICAL INDUSTRIES.

Chlorine.—The electrolytic production of soda and improved methods of transporting gases in iron containers has facilitated the use of chlorine in bleaching, in chemical manufacture and in the destruction of noxious bacilli in supplies of drinking water. A surprisingly small amount of the disease (tuberculosis) is dissolved in water and seems effectively to destroy them. Since the water supply of New York City has been chlorinated, no single case of typhoid fever has been traced to this source. The gas, condensed to a liquid, is shipped in cylinders under pressure and it has replaced the use of bleaching powder in many instances. It was the first German poison gas of European warfare.

Flotation.—An improved method of concentrating ores has been found to consist in grinding the rock to a very fine powder and then feeding it into a tank containing water and a slight amount of oil. As bubbles are caused to rise in the water, the metal-bearing particles attach themselves to the bubbles and float to the top, while the lighter gangue of limestone or other rock falls to the bottom. The phenomenon is regarded as due to the fact that the oil wets at once the metallic surfaces and the surfaces of the bubbles, which carry the oil and the metal to the top. The particles of rock, on the contrary, not being of the oil, do not attach themselves, and so fall to the bottom. By this means a 20 per cent concentrate may be obtained from a 2 or 3 per cent ore. The process has come into very widespread use.

Artificial Precious Stones.—Very small diamonds are produced by heating a piece of iron, as pure as possible, with sugar charcoal in a carbon crucible in an electric arc furnace, according to the discovery of Moissan. Under these conditions the iron melts and dissolves a great deal of carbon. At about 4,000 degrees Centigrade, when the iron volatilizes in clouds, the crucible is plunged in cold water. The sudden cooling solidifies the outer layer so that the inner core becomes solid at enormous pressure. This separates some of the carbon from the iron and when the latter is dissolved away by means of an acid, a few microscopic diamonds are found, with graphite, in the residue. No large diamond has been produced synthetically. Gold and silver have been produced in the reduction of other precious stones. Rubies and white, yellow and blue sapphires are among the principal stones made. They are synthetically correct, consisting of alumina fused with additions of chromium and iron oxides, titanic acid and other materials, according to the content of the stones as found in nature. They cannot be distinguished from natural gems.

Coal-Tar Industry.—At the present time, that industry is in a state of high fever. Tar is the generic name for all that part of coal which does not remain behind as coke, on distillation, and which does not go through the gas pipes into the gasometer. It consists of a large series of bodies, from benzole, which is lighter than water, to pitch. The pitch is used for roofing and very lately an American process has been developed for coking it. The lighter bodies are used for preserving woods, and, with the still lighter ones, as the starting point for a vast variety of chemical products. These include the long list of coal-tar colors, explosives, photographic and pharmaceutical preparations, synthetic perfumery and innumerable other products.

Despite the great use of coal in the United States, the country has not been as large a producer of tar as might be expected, because petroleum water gas has been greatly used in cities, and this produces practically no tar. The (let it be said) has been made chiefly in ovens of the so-called beehive type in which everything, all the precious content of the coal except the coke, is wasted. This condition is in process of correction; by-product ovens are rapidly supplanting the beehive type and the amount of available tar is increasing. At present it is estimated that nearly one-half of the coke produced in the United States is still made in beehive ovens. Until the outbreak of the war, the principal use for tar in the United States was for some of the pitch, the other bodies being exported or used to enrich city gas or wasted. In fact, the light oils from nearly all coal tars found their way to Germany, if they were saved at all, for there was the great coal-tar color and product industry of the world. Then came the war, the closing of German ports and general anarchy of trade. Within an area the size of the State of New York, a great part of the dye-stuffs, all of a certain oil, do make a whole new industry. The mining of the coal-tar product industry, was located. But the very same things needed to make dyes, etc., are needed to make munitions. The same raw materials are needed for both. What the color maker wanted the explosives works needed, and the latter were willing to pay any price. This is what gave the by-product coke-oven industry, which was slowly developing in America, its rapid development. The coal-tar industry has since then grown in the United States by leaps and bounds. At the outbreak of the war, there were six factories making dye-stuffs from intermediate products imported from Germany. Now, after less than four years, there are nearly 100 concerns making finished products with the old ones greatly enlarged, and over 40 factories making intermediates. What the future of the industry will be when the demand for the lighter oils of tar for munitions has been met, is hard to tell. But it may be recalled, is an excellent fuel for explosion engines and it will probably become a rival to gasoline.

Medicines.—The advances made in physiology in connection with physical chemistry
have enabled intelligent physicians to comprehend the reactions which take place with many medicines, and thus to proceed with greater understanding and—less doses. When the chemical structure and reactions of a body are known it is desirable that it be dispensed in a pure state, and this need has brought about marked improvements in pharmaceutical chemistry. Many synthetic bodies, built up under careful supervision and with knowledge of their structure, have supplanted indefinite decoctions made by soaking the soluble juices of plants and letting them go as the concentrated extract of something chemically unknown.

Rubber.—Synthetic rubber has been produced by causing certain hydrocarbons to polymerize, which is, in effect, to cause their molecules to join in large groups. But very little has been produced and in view of the improved culture of gum-producing trees and plants, and the better harvesting of the latter, the product may still debar the theory the synthetic product will replace the natural one economically, as was the case with indigo before the war.

Perfumes.—A growing knowledge of the structure of the molecules of organic compounds has enabled chemists to provide the synthetic fragrances and esters of great olfactory power and by mixing these to obtain odors desired. Musk and other standard perfumes are now produced synthetically in factories. The sense of smell, what olfactory phenomena are, and what their relation to life is, remains unstudied. The medieval Saracens were far ahead of us in the understanding of this sense.

Sewage.—It has been found that sewage, if aerated or "activated" as it is called, by letting air bubble through tanks containing it, will separate by oxidation into two types of bodies; the sludge, which precipitates and is available as a nitrogen fertilizer, and the effluent, which is a clear solution. By treating the effluent with chlorine, its danger of disease is removed and it ceases to pollute the streams into which it flows. The economic treatment of city sewage, so that the recovery and sale of inoffensive sludge as fertilizer pays the treatment costs and half the cost of labor, is brought to an end, has not yet been generally attained. Of considerable promise is the Miles process whereby sulphur dioxide is mixed with the sewage which reduces all the soaps and fats. With the fats removed by means of a recoverable organic solvent, the sludge is good nitrogen fertilizer. The outlook for its early achievement is favorable.

Paper.—There are certain combinations of carbon and hydrogen that are known as sugars. The parts are all alike in that they are made up of carbon atoms strung together as in a chain, with hydrogen and oxygen atoms stuck on along the side of the chain. Now suppose you take a number of these sugar molecules, as the smallest particles imaginable are called, and bunch them together, so that a lot of these units are combined into one big complex one. Then you have a series of resins or gums and starch. This is what chemists call polymerization. Now let us take these raw materials and by chemical chicanery and tricks cause them to bunch their molecules again, to polymerize, and, if we carry it far enough, we get cellulose. That is, we should if we could. But trees and plants do this with ease; they start with water and carbonic acid gas, from the air, and this they manufacture into sugar, the sugar into starches, gums and other things, and finally into cellulose, of which their cells are made. Cellulose is the framework of cells, and all organic life is made up of it, with juices and sap and solutions of one sort or another wandering around within them. Cotton is nearly pure cellulose. Paper is cellulose; little filaments of it, matted or felted together.

Now the varieties of cellulose and the differences in their structure, both physical and chemical, are beyond the knowledge of to-day. Cotton, as we have already said, is nearly pure cellulose and yet there are 60 different varieties of it listed, and they all differ from each other in the structure of their fibres. So we may say that the art of making paper, which has already entered the list of chemical manufacture, is one that presents innumerable unsolved problems.

The main source of available supply is wood. Mechanical pulp, which is the cheapest, consists in the fibres of soft wood, torn asunder by grinding diagonally the edges of the natural wood with a stone, in the presence of water. Their particles contain a large part of the gums and other substances of the tree which are less stable than cellulose. So they oxidize on long exposure and the process of oxidation, whether it be slow as in this instance or rapid as with fire, is likely to be contagious, and the cellulose is in time changed to oxy-cellulose, which is an amorphous powder with no mechanical qualities whatever. That is why newspaper lacks durability. It also explains why old-fashioned hand-made paper, made of linen rags, is more durable than modern paper, even though it be made of linen, too. The chemical treatment is more severe and drastic in the modern machines than in the old hand beaters, whereby the chemical structure of the cellulose seems to be attacked and thus rendered more susceptible to oxidation.

A better quality of pulp is made by the sulphite process, discovered by a Philadelphia chemist named "Aaron Thomas and hand. Mills for cooking chips of wood with a solution of calcium bisulphite, with a view to dissolving out by the sulphurous acid which is set free all organic substances except the cellulose. It takes place under heat and pressure. The cellulose fibres of the chips are then bleached and treated with water and strained until they are thoroughly separated from each other. It requires about 20 per cent of sulphite pulp mixed with the mechanical product to make a good quality of newspaper.

A stronger quality of sulphite pulp is provided by the Mitscherlich process in which a weaker acid is used. This points the way to improvements in the art such as the lately developed, so-called Kraft paper, a very strong wrapping paper made of undercooked sulphite pulp. This has developed into what is known as the "sulphate process," which, by its milder chemical treatment of the wood, is finding increased application.

The tendency of research in the preparation of pulp is to conserve the chemical structure of the cellulose and to find new sources of supply, owing to the using up of spruce and other
CHEMISTS AND DRUGGISTS — CHEMNITZ

CHEMISTS AND DRUGGISTS, Laws Relating to. In the United States the terms "apothecaries," "druggists" and "pharmacists" are used more or less indiscriminately to designate those licensed to compound and sell drugs and poisons. In England there is a legal distinction applied to these; apothecaries being constituted the lowest type of the profession with rights of practising, limited to a few classes of cases; chemists and druggists are compelled to pass an examination on the course of pharmacy and receive a license to compound and sell drugs and medicines; pharmacists are obliged to pass a second examination. In the United States the statutes generally require of those wishing to adopt this profession to pass an examination before a State board, or to produce a diploma from a recognized college of pharmacy. There are in addition State and municipal ordinances which state the conditions under which certain drugs or poisons may be sold, prescribing also regulations as to labels on containers of poison, and the entry of such sales in a special book open to public inspection. The certificate or prescription of a physician is required for certain drugs or liquors. Carelessness in compounding a prescription, if it lead to death or serious injury, is considered gross and is a penal offense. In case it result in death, the offense is usually manslaughter.

CHEMITYPE, a term used in engraving to include various relief processes by which a drawing or impression from an engraved plate may be printed to fit it for printing on an ordinary printing press. One of these, devised by C. Püll of Copenhagen in 1843, depends on filling up the lines of the engraved zinc plate with some metal or alloy, and etching away the zinc.

CHEMNITZ, or KEMNITZ, Martin, German Protestant theologian: b. Treuenbrietzen, Brandenburg, 9 Nov. 1522; d. Brunswick, 8 April 1586. He was the son of poor parents; received his education at Magdeburg and Frankfort on the Oder, and in 1544, to obtain the means of continuing his studies at Wittenberg, became a schoolmaster in Wrienen. In 1550 he became librarian to Duke Albert of Prussia. He then wrote his 'Loci Theologici,' a valuable commentary on Melanchthon's system of dogmatics. Being invited to Brunswick, as minister, he attacked the Jesuits in his 'Theologia Jesuitarum Praecipua Capita' (1562), and, when the Council of Trent thought itself assailed in this work, he wrote his 'Examen Concili Tridentini,' a work of great historical value. With Joachim Möllin he wrote 'Corpus Doctrinæ Prutenicum' (1567). He gradually became attached to the Lutheran doctrines as distinguished from those of Melanchthon, and did much to spread the Lutheran doctrines among the Saxon and Swabian churches. Consult his 'Life' by Lentz, C. (Leipzig 1866); Mummm, R., 'Die Polemik des M. Chemnitz gegen das Konzil von Trent' (Leipzig 1905).

CHEMNITZ, Saxony, town at the base of the Erzgebirge and at the confluence of the Chemnitz River with three other streams, 51 miles south of Dresden and 22 miles north of Leipzig. The town consists of an older inner town, almost circular in form, intersected by narrow streets, completely surrounded by modern suburbs.

Ellwood Hendrick.
Among its numerous squares and public places are the Hauptmarkt, which contains the old Rathaus, the Neumarkt; the Königs-Platz; and the church of Saint Peter and the Technical Schools. The city owns its water, gas and electric works, maintains a municipal pawnshop. Its educational institutions include a gymnasmum, schools of agriculture, commerce, engineering and the various crafts. There is also a municipal library of over 35,000 volumes. It is the principal manufacturing town of the kingdom—the "Saxon Manchester" its townsfolk call it—its industry consisting in weaving cottons, woolens and silks and in printing calicoes, chiefly for German consumption. It also has large manufactories of glass, dyestuffs, chemicals, leather, vehicles and beer. It supplies the world with cheap hosiery, and makes mixed fabrics of wool, cotton and jute for the markets of Europe and the United States. It has several extensive machine-factories, producing locomotives and other steam-engines, with machinery for flax and wool-spinning, weaving, and mining industry. Created a free imperial city as early as 1125, Chemnitz suffered much during the Thirty Years War; but later in the century the construction of cotton manufactories reviving its prosperity. Its growth during the last 20 years has been phenomenal. Pop. 287,340.

CHEMOSH, kě-mṓš, the national god of the Moabites, who were on that account called "the people of Chemosh" (Num. xxxi, 29; Jer. xlviii, 46). In Judges xi, 24, Chemosh is mentioned as the god of the Ammonites, but the whole narrative here applies to Moab, and not to Ammon. Milcom was the national deity of the Ammonites. The Moabite Stone was erected to commemorate victories achieved by the aid of Chemosh. In the inscription upon it Ashtar-Chemosh is mentioned, apparently a goddess associated with Chemosh. Human sacrifices seem to have been occasionally offered up to Chemosh (2 Kings iii, 26, 27). The worship of Chemosh was introduced among the Hebrews by Solomon, who "built an high place for Chemosh, the abomination of Moab, in the hill that is before Jerusalem" (1 Kings xi, 7). Some have identified Chemosh with the sun, others have looked upon him as a war-god. These identifications are valueless. Chemosh doubtless bore the same relation to the Moabites as did Yahwe to the Hebrews.

CHEMOTROPISM, kě-mṓt-rṓ-pism, orientation (q.v.) by diffusing molecules, as where animals are mechanically attracted to their food by the sense of smell. This is positive chemotropism. Negative chemotropism consists in movements away from some reagent. Odoriferous particles are diffused or radiate from a center, and this attracts or repels an organism analogous to heliotropism (q.v.). The chemical effects of the diffusing molecules on certain elements of the skin, says Loeb, influence the tension of the muscles, just as the rays of light influence the tension of the muscles on heliotropic animals. Thus maggots of flies are positively chemo-tropic toward certain chemical substances which are formed, for instance, in decaying meat and cheese. The blow-fly (q.v.) has the same positive chemotropism for these substances as its larva and is accordingly led to the meat. This explains the instinct of the blow-fly and similar insects, which compels them to lay their eggs on the food appropriate for their young, neither experience nor will playing any part in their processes. Chemotropic phenomena also occur in plants, and depend on alterations of growth produced by the exciting substances. Consult Loeb, 'Comparative Physiology of the Brain and Comparative Psychology' (New York 1900).

CHEMULPO, chě-mů́l-pṓ, Korea, town on the western coast at the mouth of the Han River, 25 miles by road west-southwest of the capital, Seoul. It is one of the three treaty ports opened in 1883 to foreign commerce, the volume of which has since steadily advanced, in spite of the drawbacks resulting from the great difference between high and low water here (33 feet), and the want of wharves. The imports attain a value of $7,227,000 in some years; the exports, $1,950,000. The chief imports are cotton and woolen goods, railway machinery, metals, oils, textiles, mineral fuel, and timber; the chief exports are rice, beans, millet, ginseng, wheat, paper and cowhides. The majority of foreigners are Japanese. In 1900 a railroad connection was established with Seoul. Improvements have made the Japanese river navigable. Small steamers owned by Japanese run to Seoul in summer, and Chemulpo is connected by telegraph both with China and Japan. At the outbreak of the Russo-Japanese War, a Japanese squadron landed in Chemulpo, 8 Feb. 1904. On the following day a Japanese squadron under Admiral Urin destroyed a Russian cruiser and gunboat outside the harbor. Pop. about 26,000, of which 14,000 are Japanese.

CHEMUNG, shě-mŭ́n′g, Battle of, in the Revolution, 29 Aug. 1779, the decisive engagement of John Sullivan's campaign, to harry the Iroquois country. The Indians and their Tory allies made a stand in force at the Chemung River, about a mile southeast of Newtown (Elmira), N. Y. Three or four companies of British troops and Canadians numbering about 250; and the entire fighting strength of the Six Nations. These Indians the Tory authorities state as 550; but this seems impossibly small, and Sullivan and his officers, from a careful estimate of various factors, place it at 1,200 or 1,300. Sullivan had about 5,000. The Indians were led by their Napoleon, Brant (Thayendanegea); the Tories by Col. John Butler, with Sir John Johnson, Maj. Walter N. Butler and Captain MacDonald. Their line was in advance of the river, resting on a bend at the right. From the bend ran a breastwork half a mile long, flanked by bastions and having a dwelling in front turned into a blockhouse; it was concealed by a mass of pines and scrub-oaks, some of them cut from other places and stuck down to make a seemingly thick virgin forest. From their left a thin line was continued about a mile and a half to a steep ridge parallel to the river, where a strong detachment was posted; and a mile further east was another ridge parallel to the first, with a breastwork and another company, the two advance detachments designed to take the Americans in flank and rear. Along the front of the main breastwork ran the road to Newtown, exposing the whole American flank.
CHEMUNG SERIES—CHENY

to a raking fire. The entire works formed a magnificent ambuscade; but Sullivan, who was no Braddock, guessed the utility of the ridges and knew when to take the British in rear, while the main body with artillery attacked the front. Steadied by Brant, a warrior of great force and sagacity, the Indians not only made a stubborn resistance for two hours, yielding inch by inch, but even stood up against the bayonet, something almost unknown in Indian history. At first thrown into a panic by the artillery, Brant rallied them to a fresh and tenacious fight; and noting Poor’s turning movement, threw a strong detachment with a battalion of rangers to the hill to oppose it. But at length Poor, having cleared the crest, burst on the rear with a bayonet charge; and both Indians and whites fled across the river in rout, the Indians leaving their packs and weapons behind, and 11 dead, though they usually carry all these away with them. Fourteen other dead Indians were in fact found under the leaves, two canoes were found covered with blood and the Indians told their western villages that they had many killed and wounded. The Americans had 6 killed and 40 or 50 wounded.

CHEMUNG SERIES, in American geology, the great series of shool-water sediments, mostly light gray shales and ripple-marked sandstones, that were laid down in Upper Devonian time in the great northeastern bay of the interior sea that covered much of what is now the Mississippian Valley. This northeastern bay stretched across lower Michigan, Ontario and central New York, reaching nearly to the Hudson River. The Chemung Series includes the Catskill Group and divided into the Chemung and Portage Stages. It is typically developed on the Chemung River in New York. It reaches its maximum thickness of 8,000 feet in eastern Pennsylvania, but thins out and diminishes in the south and west. The oil sands of Pennsylvania, from which have been taken many millions of barrels of petroleum, are in part of Chemung Age.

The Chemung corresponds to part of the series of shales and limestones laid down in the Northwest Territory and Manitoba, Canada, probably to part of the Devonian strata that extend along the main range of the Rocky Mountains in Canada and to an unknown fraction of the great thickness of Devonian strata in Nevada. In Europe the Old Red Sandstone, a series of sandstones and shales estimated as possibly 10,000 feet thick, is in many respects like the Catskill Group of the Chemung, and contains similar fossils. This great sandstone formation is found in South Wales, England and Scotland, near the Baltic Sea in Russia, in Spitzbergen and in Greenland. See Catskill Group; Devonian System; Old Red Sandstone.

CHENAB, ché-nôb’, in Hindustan, one of the five rivers of the Punjab. Its affluents are the Ravi and the Sutlej; length about 600 miles. Its greatest depth is 14 feet; its greatest width 134 miles. At Wazirabad it is crossed by a great iron railway bridge more than a mile long.

CHENAVARD, chá-na-vár’, Paul Joseph, French historical painter: b. Lyons, 9 Dec. 1808; d. 12 April 1895. He studied at Paris and spent some years in Italy, and acquired a reputation by his picture of Mirabeau Replying to the Marquis de Dreuilly. After the revolution of 1848 he received a commission to paint large compositions for the decoration of the Pantheon. Among these are ‘The Deluge’ and ‘The Passage of the Rubicon.’ The Pantheon having been restored to the Roman Catholic worship, he was not permitted to finish the task. Consult Germain, ‘Les artistes Lyonnais’ (Lyons 1910).

CHENERY, Thomas, English journalist and Orientalist: b. Barbadoes 1826; d. 11 Feb. 1884. He was educated at Eton and Cambridge. He was called to the bar, but sent out as Times correspondent to Constantinople and was chiefly located there during the Crimean War. Afterward he was constantly employed on the Times staff until 1877, when he became its editor, a post which he held till within 10 days of his death. As a singularly thorough Hebrew and Arabic scholar he had few equals among his contemporaries, and his translation of the Arabic classic, the ‘Assemblies of Al Hariri’ (1869), led to his appointment to a chair of Arabic at Oxford in 1868. He was one of the company of Old Testament revisers, and besides other works published an edition of the ‘Machberoth Ithiel’ (1872), a Hebrew version of the ‘Assemblies.’

CHENY, Charles Edward, American clergyman: b. Canandaigua, N. Y., 12 Feb. 1836. He was graduated from Hobart College, A.B., 1857, following which he took the course at the Protestant Episcopal Theological Seminary at Alexandria, Va., and received the degree of D.D. from Iowa College in 1861. He was ordained in the ministry of the Protestant Episcopal Church in 1858, and after two brief pastorates in New York State became rector of Christ Church, Chicago, in which relation he has continued ever since. During the years from 1869 to 1873 he became involved in ecclesiastical difficulties growing out of doctrinal views concerning baptism, and, in 1873, he joined Bishop George David Cummings, D.D., in the organization of the Reformed Episcopal Church, and 14 Dec. 1873 was consecrated bishop of the Reformed Episcopal Church, with jurisdiction over the churches of the Northwest, subsequently becoming bishop of the Synod of Chicago, in which position he continues, retaining also the diocese of Christ Church. In 1908 he received the degree of S.T.D. from Hobart College. He is a member of the American Historical Association, American Geographical Society, Chicago University Club, Chicago Historical Society, Chicago Literary Club, the Illinois Society of the Sons of the Revolution and the Illinois Society of Mayflower Descendants. Besides a volume of ‘Sermons,’ published 1860, he is author of ‘What Do We Believe?’ (1880); ‘The Enlistment of the Christian Soldier’ (1892); ‘A King of France Unnamed in His-
CHENEY — CHENOPODIUM

Cheney, John Vance, American poet and essayist: b. Groveland, N. Y., 29 Dec. 1848. He was librarian of the public library at San Francisco, 1887-94, and of the Newberry Library, Chicago, from 1894-1909. He has published 'The Old Doctor' (1885); 'Thistle-Drift' (poems, 1887); 'Wood Blossoms' (1888); 'The Golden Guess' (a volume of essays, 1893); 'That Dome in Air' (essays, 1893); 'Queen Helen' (1895); 'Out of the Silence' (1897); 'Lyrics' (1902); 'Poems' (1905); 'The Time of Roses' (1908); 'At the Silver Gate' (1911). Editor of 'Wood Notes Wild', by Simeon Pease Cheney, with appendix and notes (1892); Caxton Club's edition of Derby's 'Phoenixiana' (1897); 'The Caxton Club Scrap-Book' (1904). Member of the Authors' Club and of the National Institute of Letters.

Cheney, Seth Wells, American engraver: b. South Manchester, Conn., 25 Nov. 1810; d. at 10 Sansom St., Philadelphia, 7th Apr. 1885. Upon the death of his father in 1829 he joined his brother John in Boston, where he entered the latter's profession, that of an engraver. A position in the Athenæum enabled him to study and work from casts, engravings, and copies. In 1832 Washington Allston's picture, 'Mother and Child,' which was afterward burned. In 1833 he studied in Paris at the atelier of Delaroche. His great power was in the expression of character in individual heads. He never attempted historical or genre subjects, and only rarely would he group two or more heads. James Russell Lowell, Theodore Parker and William Cullen Bryant are among the best known of his studies. Consult 'Memoir of Seth W. Cheney,' by E. D. Cheney (Boston 1881) and Koehler, S. R., 'Catalogue of the Works of John and S. W. Cheney.' His wife, Ednah Dow Cheney (b. 1824; d. 1904), was an author of note. She was active in the Freedmen's Aid societies and was a pioneer of the woman suffrage.

Chenier, shā-nē', André Marie de, French poet: b. Constantine, 30 Oct. 1762; d. Paris, 25 July 1794. He went to France when very young and entered the army, but left six months after to devote himself to literary pursuits. He was for about three years secretary to the French embassy at London, but in 1790 returned to Paris. Advocating the doctrine of a limited monarchy, he made himself equally offensive to the Royalist and the Jacobin parties. In consequence of his attacks on the Jacobins he was condemned by the revolutionary tribunal, and executed. Although but little known in his own day, Chenier has long been regarded as one of the finest French poets of his century, his chief characteristics being purity of form combined with vigor of thought and diction. He wrote idyls, elegies, odes (including one to Charlotte Corday), dithyrambs, philosophic pieces, etc. The maturity, breadth and soundness of his judgment in poetical composition, are indicated on 'In his lifetime.' Similar in spirit to this, and of perfect Pindaric form, is the 'Dithyrambic on the Tennis Play' (1791). In his prison of Saint Lazare he composed a beautiful elegy, 'The Girl Captive,' and the 'Iambes' which owing to their spiritual affinities, are often likened to the poems of John Keats. Consult Beq de Fouquieres, 'Lettres critiques sur Chenier' (Paris 1881); Faguet, 'André Chenier' (Paris 1902); Heller, 'André Chenier' (Montpelier 1871); Henry VII); Valse, 'Chenier et les Jacobins' (Paris 1881).

Chenier, Marie Joseph de, a French dramatist, younger brother of André M. Chénier (q.v.); b. 11 Feb. 1764; d. 10 Jan. 1811. He was a Jacobin, and a member of the Legislative Assembly during the Revolution. His tragedies — 'Charles IX' (1780); 'Henri VIII' and 'Calas' (both 1791); 'Caius Gracchus' (1793); and others — brought him fame and success by the accordance of their republican and revolutionary sentiments with the public opinion of the time, rather than by their merits as compositions. His national songs were approved by the best test of such productions — popularity; one of them, 'The Parting Song' ('Partant pour la Syrie'), is hardly less famous than the 'Marseillaise.' His satires are full of spirit, point and wit, but are sometimes rancorous and unjust. His translations from the ancient and modern poets were excellently rendered. Consult 'Marie-Joseph Chénier als Kritiker und satirischer Dichter' (Leipzig 1911).

Chenille, shē-nil', a round fabric or trimming, made by uniting with two or more sets of warps, either by weaving or twisting, a fine filling or weft, which is allowed to project beyond the warps. This filling is cut at its outer edges and the fabric is then twisted, assuming a cylindrical shape with weft projecting radially from the central line of warps. The name is applied, also, to lace, carpets and cloth made wholly or in part from silk threads twisted or woven to resemble the tufted trimming of the same name.

Chenomorphae, ke-nō-mōr'fē, an order of desmognathous birds, first proposed by Huxley and nearly equivalent to the Lamellirostres and Anseres (q.v.) of other authors. The palate is closed anteriorly by a thick bony bridge, but the lower is well developed; the margins of the beak are more or less toothed; the tongue is thick and fleshy; and the down is uniformly distributed over the skin. All of the species are more or less aquatic; most of them are web-footed; and the young are precocial, or able to run from birth. Three very distinct families are recognized: the Anatidae, or ducks, geese and swans (q.v.); the Palaeeioi, or screamers (q.v.); and the Phamacoideae, or flamingoes (q.v.).

Chenonceaux, shē-nōn-sō. See Bléré.

Chenopodiaceae, ke-no-pō-di-ā'sē-ē, a family of apetalous dicotyledons, consisting of more or less succulent herbs or shrubs, belonging to about 80 genera and 600 species. They are mostly innocent weeds, but several, as spinach and beet, are employed as pot-herbs; others for the manufacture of soda. See Chenopodium.

Chenopodium, ke-no-pō'dē-īm, or Goosefoot, a genus of plants belonging to the family Chenopodiaceae (q.v.), of which it is the type, and distinguished by its usually perfect flowers, having mostly five small green scales for the calyx, about five stamens, no corolla and a fruit consisting of a membranous
coat enclosing one black, flat and shining seed. A
number of the species have received the name of
goosefoots, from a fancied resemblance to the
webbed foot of the goose. The best-known or more
remarkable species are:

1. C. album (lambs quarters, pigweed), a
common annual, found in cultivated and also
waste ground. It has a leafy angular stem, which, as
well as the whole plant, is white-
medly. The young plants are much used in
North America as "greens."

2. C. bonus-henricus (Good King Henry, or
wild spinach), a perennial, in Europe not un-
common in country churchyards and places sel-
dom disturbed, sparingly naturalized in North
America. It has bright green, broad, succulent
leaves, which were in common use as spinach
before the introduction of the present cul-
tivated plant. The early shoots are sometimes
used as a substitute for asparagus.

3. C. quinoa, the quinoa of Peru, a perennial
inhabiting the high table-land of the Cordilleras,
where, at the conquest of the Spaniards, it was
one of the important farinaceous grains used
as food. It is still largely cultivated for its
nutritious seeds, which are made into soup and
bread, and, when fermented with millet, make
a kind of beer. The plant is from four to six
feet high and has many angular branches, dull
glaucus leaves of a jagged triangular outline,
on long narrow stalks, and flowers forming
large compact branched heads and succeeded by
minute short flat seeds of a black, white or
red color.

In medicine, Chenopodium ambrosioides, is
used extensively as a remedy for the round
worm as well as the tape-worm. The oil is the
official part used, in doses of 5 to 15 drops, and
it is a very efficient anthelmintic, particu-
larly for the round worm, Ascaris lumbricoides.

CHENOWETH, Alexander Crawford,
American engineer: b. Baltimore, Md., 5 June
1849. He was graduated at Dickinson College
in 1868 and studied engineering at the Ren.
selaer Polytechnic Institute. In 1870 he was
engaged on the engineering force of Prospect
Park, Brooklyn, as assistant engineer of the
Middleton-New Haven Railway 1871, assistant
under General Eden of the public works of
Washington, D. C., contractor for dock and
railway work of the West Shore Railroad in
1882 and consulting engineer to President Prado
of Peru. He prepared the foundation for the
Bartholdi Statue of Liberty in New York har-
bor 1884, was assistant engineer of the Croton
aqueduct commission 1885 and resident engi-
near 1889-95. In the latter year he resigned
to undertake construction work for the United
States government at Sandy Hook. He spe-
cialized in foundation work and was awarded
many medals and prizes. He invented a steel-
concrete pile for pier and foundation work;
the Chenoweth reinforced concrete revetment
for maintaining the banks of the Mississippi,
Missouri and Colorado rivers. He discovered
at Manhattan Island, a village site of
prehistoric Indians from which he excavated a
collection of implements now in the American
Museum of Natural History, New York.

CHENOWETH, Caroline van Dusen,
1846. She has lectured on English literature
and history and is the author of "Stories of
the Saints" (1880); "Child Life in China"
(1882); "School History of Worcester, Mass.
(1899); "An Undistinguished Citizen" (1900);
"History of the Second Congregational Church,
Mass." (1908); "Stories of Stonewall Farm"
(1913); and contributions to various magazines
and reviews.

CHENSTOCHOW, chen'sto-kov', Poland,
town in the Russian government of Piotrkow,
on the Wartha, 135 miles southwest of War-
saw, on the Warsaw-Vienna Railway. It con-
sists of the old and new towns and contains
several cotton-mills, foundries, paper-mills,
flour-mills and breweries. There is considera-
ble trade in the products of these plants and
also in lithographs, printing and religious em-
blems. Near the town is the famous monas-
tery of the Order of Saint Paul the Hermit,
which is visited annually by about half a mil-
lion pilgrims. A great object of veneration is
the picture of the Virgin, made of dark wood,
and known to Polish Catholics as the "Black
Virgin." It is attributed to Saint Luke the
Evangelist and is said to have been brought to
the monastery in the 16th century by Dr. Wal-
ter Lynch, bishop of Cloufert, Ireland, then
exiled from his see. The monastery was at one
time strongly fortified and in 1655 was unsuc-
sessfully besieged for 38 days by Swedish
troops. Pop. 69,500.

CHEOPS, ke'ops, the name given by
Herodotus to the Egyptian despot whom the
Egyptians themselves called Khufu. He be-
goined to the rulers who had for their capital
Memphis; lived about 2800-2700 a.c., and built
the largest of the pyramids. According to
Herodotus he employed 100,000 men on this
work constantly for 20 years. Several monu-
ments bearing his name have survived.

CHEPHREN, ke'fr'en, or CHEPHREN,
king of Egypt, the successor of Cheops and
the builder of the second pyramid. The former
is the form of his name as it is found in
Herodotus, the latter is the name given to him
by Diodorus. Herodotus informs us that his
reign was in all respects as tyrannical as that
of his predecessor, and that the Egyptians,
animated by a feeling of hatred against these two
kings, under whom they had suffered all kinds of
oppression and during whose reigns the
temples had never been opened, avoided even
the mention of their names; and hence, instead
of naming the pyramids after their builders,
named them after a shepherd called Philiion,
who used the land in the neighborhood of the
pyramids for pastureage. Diodorus adds that
the pyramids were intended to serve as tombs
for their builders, but as the people threatened
to break them open and remove the bodies, both
the kings desired their friends to bury them in
some spot where their bodies would remain
undisturbed. Herodotus makes Chephren the
brother of Cheops; but Diodorus says that
Chembis, who is the Cheops of Herodotus, was
succeeded by his son, Chabrys, who may per-
haps be the same with the Chephren of Herod-
otus. His reign lasted 56 years.

CHEPSTOW, chep-stow, England, town
and port in county of Monmouth, on the Wye
River, two miles from its junction with the
Severn and 14 miles north by west of Bristol.
It is pleasantly situated on a slope descending
gradually to the river and has spacious, well-
paved and well-lighted streets. The principal edifices are the church, a fine specimen of Norman architecture, and the old castle, the ruins of which is crowned by a lofty gallows. The town stands on the banks of the Wye. The ruins of Tintern Abbey are in the vicinity. There is a river and coastal trade. The beauty of the environs is an attraction to visitors. Both the town and the castle are referred to in 'Domesday Book.' Pop. 2,953.

**CHEQUER**

**CHEQUEREN,** chek-wen', the leaves of *Euphymia chequen,* of the family Myrtaceae. A shrub of Chile and Bolivia, whose leaves are rich in volatile oil and are used as a tonic expectorant in much the same manner as Eucalyptus.

**CHEQUERS ESTATE,** an official country residence for British prime ministers, presented for that purpose by Sir Arthur Lee, K.C.B., M.P., in 1917. The actual transfer of the property to the nation may not take place during the lifetime of the present owners; and Sir Arthur Lee will be maintained in perpetuity as the official country residence of the Prime Minister for the time being, or, failing him, the full privileges of residence to be offered in turn to the Chancellor of the Exchequer, the Foreign Secretary, the American Ambassador, the speaker and four other Cabinet ministers. Chequers stands in a sheltered hollow of the Chiltern Hills, about 36 miles from London. The history of the manor goes back to the 12th century; it contains a number of antenom nial relics, including the a valuable collection of manuscripts and autographs, letters of Napoleon, Washington, Charles I, Pitt, Franklin, etc. The area of the estate is about 1,500 acres, consisting of gardens, grounds, farms, woods and Coombe Hill. The hill, 852 feet high, was presented to the nation in 1913.

**CHER,** shahr, France, inland department having on the north Loire, east Nièvre, south Allier, west Indre et Loire, Cher, between lat. 46° 26' N. and 47° 38' E., and long. 1° 50' and 3° 3' E. Its capital is Bourges, in the department of Berry in the district of Bourbonnais. It is named from the river Cher, which traverses it southeast to northwest. Area, 7,199.34 square kilometers, or 2,779 square miles; capital, Bourges. This department is included in the basin of the Loire, which forms the greater part of its eastern boundary. The climate is mild and pleasant. The surface is in general flat, but is diversified in the north by chains of insignificant hills. The soil varies but is fertile in the neighborhood of the Loire and Allier. Heath and sand prevail in the northern districts. The forests occupy above a sixth of the area and furnish large quantities of fuel for the iron-works and timber for shipbuilding. Pastures are extensive and sheep very numerous. Grains, chestnuts, hops, vegetables, fruit and wines are among the important products. The best wines are those of Chignin and Sancerre. Beets, buckwheat and flax are also grown. The minerals consist of iron, lithographic stones, coal, building and granit-stones, flint, marble, ocher and potter's earth. The preparation and manufacture of iron, called Berry-iron, is the principal branch of industry. The manufactured articles are metal goods, fine and common cloth, woven goods, faience, porcelain and earthenware, sacking, bees-sugar, nut oil, paper and glass. The department is divided into three arrondissements, 29 cantons and 290 communes. Bourges is the capital. Consult Frémont, 'Le département du Cher' (Bourges 1862). Pop. 337,810.

**Cher,** a river of central France, rising in Auvergne in the department of Creuse and joining the Loire from the left near Tours; length, 220 miles. It is navigable to Vierzon. This river gives name to the department of Cher.

**CHERASCO,** käh-räskö (ancient Clarasum), Italy, a town in Piedmont, in the province of Cuneo, near the confluence of the Stura and Tanaro, 36 miles south of Turin and 22 miles northeast of Coni. Its fortifications, once of great strength, were demolished by the French in 1801. It was repeatedly the object of contest between the French and Austrians in the wars of Italy, terminated in 1831 by a peace concluded here; and in 1796 Napoleon, by what is called the Armistice of Cherasco, obtained a free passage for his troops through the Sardinian states. The town is well built, and has several silk-mills. It has a domed church, two triumphal arches, a gymnasi-um and a technical school. It markets grain, wine and truffles, and manufactures silk. Pop. 9,312.

**CHERAVERSE,** chे-rä, S. C., town in Chesterfield County, 88 miles northwest of Columbus, on the Atlantic Coast Line, the Seaboard Air Line and other railroads, and on the Pee Dee River. It contains lumber plants, cottonseed oil mills, box factories, planing mills and saw and door factories. For a time during the Civil War the Confederates maintained a supply depot here. The town was taken by Sherman 3 March 1865, when a vast amount of stores, including 3,600 barrels of gunpowder, was destroyed. The waterworks are municipally owned. Pop. 2,873.

**CHERBOURG,** shahr-boo, France, a seaport in the department of La Manche (The Channel), 196 miles west-southwest of Paris, on the north coast of France, on the peninsula of Cotentin, and nearly due south of Southampton. It has a strongly fortified arsenal, and consists of the old or civil town and the new or military (Fort Militaire), the latter quite distinct from the former, and separated from it by the fortifications with which it is surrounded. Apart from its consideration as a naval station, Cherbourg is unimportant; it is the works by which it has been converted into a great naval fortress and place of arms that give it its special importance. These altogether have cost 8,000,000 and were chiefly carried out under Napoleon I, Louis Philippe and Napoleon III. Foremost among them must be mentioned the digue, or breakwater, stretching across the entrance to the roadstead, which was formerly open to heavy seas from the north. It is more than two miles in length, of very massive construction, covers an area of 3,700 acres and consists of a western or longer and an eastern or shorter portion, the latter having a very obtuse angle pointing toward the north. There are a fort and lighthouse there, and, also, at either end. The breakwater alone cost about £2,700,000. The eastern entrance to the harbor, between the breakwater and the island of Pelee, is about 500 yards wide; the western en-
trance, between the breakwater and Fort Chavagnac (on a rocky islet), is about 1,000 yards. It is the latter that large ships of war must pass through.

The Port Militaire has three great basins for war vessels—an outer accessible at all states of the tide for vessels of the largest class; a floating basin communicating with this by gates; and a third communicating with both by similar gates. The aggregate water area of the three basins is about 50 acres, the depth of water being from about 30 to 50 feet. They have been excavated from the solid slate rock which forms the foundation of the entire dockyard, much of the excavated material being used in the construction of the breakwater. There are also slips for vessels of the largest dimensions, dry docks, building sheds, masthouses, boiler-works, and in short everything necessary for the building and fitting out of ships of war. The numerous forts and other works with which Cherbourg is defended render it, if not impregnable from the sea, at least very difficult of attack.

The commercial town has quite a modern aspect, the streets being generally wide, regular, well paved and clean, but it is neither dull and uninteresting. There is an outer harbor, entered from the sea by a passage between two jetties, and an inner harbor or floating dock. The principal industries of Cherbourg are centred in the works of the dockyard, the commercial trade, and manufactures being otherwise comparatively small. The Hôtel de Ville possesses a notable collection of paintings. The celebrated artist, J. F. Millet, was born near by.

Cherbourg is supposed to occupy the site of a Roman station, which is said to have borne the name of Caesaris Burgum. Aigrol, king of Denmark, we are told, resided here about 945 A.D. William the Conqueror founded a hospital in it, and built the castle church. The English held possession of the place till about 1200. The castle, in which Henry II frequently resided, was one of the strongholds of Normandy, and escaped the fate of the town, which, about 1295, was pillaged by an English fleet from Yarmouth; but it sustained afterward three membrades, in 1420, 1426, and 1450. In 1578 the town was taken by the English without opposition, notwithstanding that the garrison was large. They kept possession of it eight days, destroyed the fortifications, carried off the artillery and the bells, and only retired after having exacted a heavy ransom from the inhabitants. The completion of the fortifications was celebrated by Napoleon III in 1858, the festivities being graced by the presence of Queen Victoria. A statue of Napoleon I was unveiled on the occasion. It was after leaving Cherbourg that an end was put to the career of the Confederate cruiser Alabama, when it was sunk by the Federal cruiser Kearny, 19 June 1864.
Greek colony, is situated on an island formed by the Don, the Aksai and one of its branches, and is built on piles, as a protection from the inundations which continue from the beginning of April till the end of June. New Cherkeska, founded in 1805, has a large cathedral and carries on a considerable trade. It is the seat of government of the Don Cossacks. Pop. about 40,000.

**CHERSMIDE, Sir Herbert Charles, English general:** b. Wilton, Wilts, 31 July 1850. He was educated at Eton and entered the army in 1868, and after successive promotions attained the rank of major-general in 1898. He was with the Egyptian army, 1883–88; consul for Kurdistan, 1888–89; military attaché at Constantinople, 1889–96; and governor of Queensland from 1901–05. He was created G.C.M.G. in 1899.

**CHERNOZEM, čerⁿô-zēm (Russian черноzeros, 'black earth'), Russian name for a fertile dark-colored soil which covers nearly all the southern half of European Russia and extends into Asiatic Russia. Similar soils are found in Galicia, Rumania, Bulgaria, and around Magdeburg and Hildesheim in Germany and in the prairie regions of the United States and in the pampas of Argentina. Chernozem contains from 6 to 20 per cent of humus with about 5 per cent of nitrogen. There is also about one-fifth of 1 per cent of phosphoric acid and from one-third to one-quarter of potash. Such soil is rich in plant food, is of great depth and continues to bear the same crops year after year without deterioration. Under certain weather conditions, however, it becomes hard and compact so that crops fail. Consult Kossovitsch, P., 'Die Schwarzerde' (Vienna, 1912).

**CHEROKEE** ('uplanders,' own name; also, rendered Tsarakí, Tsalakí and Tsalagui), the largest and most important Indian tribe originally east of the Alleghenies, perhaps the highest in culture and intellectual receptivity north of Mexico. They are of Iroquoian stock, but are believed to be identical with the Tallagawi of Delaware tradition, a large tribe once occupying the Ohio and Alleghany valleys, till driven south by the Delawares and Iroquois. Their own tradition, that they came from the west and exterminated a certain "moon-eyed people," does not contradict this. The first white men who encountered them were those of De Soto's expedition in 1540. Our first definite information finds them located along the south—Allegheny and Appalachian ranges and the Piedmont region adjoining, from Virginia to Georgia and Alabama, a range about 120 miles square—and divided into two main branches speaking different dialects: the Otari Tsarakí or Atali Tsalakí (Upper Cherokee), whose main settlements were around the headwaters of the Tennessee and Cumberland; and the Erati Tsarakí or Elati Tsalakí (Lower Cherokee), centred in northern Georgia and southern North Carolina, around the headwaters of the Savannah and Chattoogaee. These location names, however, had become fixed tribal names, and persisted after the Upper Cherokee had been forced south into the region of the others. They were further divided into seven clans, forbidden to intermarry. Lying close to the stream of immigration in the southern colonies, they fill the most conspicuous place in the Indian wars, trade and immigration from the 17th and 18th centuries; and their chief southernmost town, Etowah, gave a name to the famous frontier fortress Ninety-Six (96 miles from it). At the beginning of the 17th century they are said to have had 64 towns and 16,000 warriors, the latter declining to 3,000 by 1709 and 1,500 by 1793; but the figures are very dubious. At any rate, they had many villages of well-built log houses, and the Upper Cherokee were agriculturists, raising large crops of corn, beans and pumpkins; the Lower were chiefly hunters. They sided with the English in the early colonial struggles, and in 1730 formally recognized the supremacy of the English king (though it may be doubted if they attached that interpretation to their marks). In 1755 they ceded a large tract of land to South Carolina under Governor Glenn, and Fort Loudon was built in their territory, it is said by their own request. But after the reduction of Fort Duquesne in 1758, the slaughter of some Cherokees for having shown the whole tribe atame, and they required the massacre ten-fold. The folly of the then governor of South Carolina (Littleton) prevented an arrangement from being made, and a fearful Indian war desolated the borders till 1761, when the harring of their lands for a month and the burning of 14 villages caused them to sue for peace. Their principal chiefs at this time were Atakullakullu or Little Carpen-ter, and Oconostoa. In 1773 they made a large cession to Georgia.

In the Revolution, like most other Indians, they joined the English, their natural interests being against the Americans; and also like the others, their alliance won no victories for England, but helped her to lose the country from the immeasurable odium it excited. General Pickens at last subjugated them; and by a treaty at Hopewell, 28 Nov. 1785, they acknowledged the sovereignty of the United States. This was confirmed by that of Holston, in 1791, with a cession of territory; and other treaties and cessions followed in 1793, 1804, 1816, etc., ending 27 Feb. 1819. The United States on its part solemnly guaranteed to the Cherokees the possession of all lands not ceded by them, recognized their allegiance as a nation, and in 1802, authorized the President to expel trespassers, especially surveyors, by force. In 1790 a portion of the tribe emigrated to Louisiana; and others, mainly Lower hunters, later removed from time to time beyond the Mississippi, till in 1817 there were some 3,000 north of the Arkansas in the present Indian Territory. But the remainder showed an adaptability not equalled by any other Indians, and began a vigorous civilized career, which however only postponed their evil day for a few years. Two influences conduced to this besides their character,—the missionaries and the half-breeds: for almost alone among Indians, the mixture of white blood has prospered with the Cherokees. This blood, however, was singularly fine—that of the best Scotch families, in some cases noble: the Rosses, Adairs, McLeods, McDonalds, etc. After the rising of 1745 a number of these, irreconcilable or "wanted," emigrated to the Carolinas; in the Revolution, not unnaturally, they became Loyal-
Cherokee

ists; when it ended and a fresh outlawry menaced them, some of them and their sons pushed on into the Cherokee country, settled there and intermarried with the native women. The Moravian missionaries had been working among the Cherokees since 1740 and had baptized a considerable number before the Revolution. In 1799 some of the tribe earnestly requested teachers and clergy. A great council was held at Tellico on the Tennessee, at which the Upper chiefs agreed to the plan, but the Lower dissentied. In 1804, however, schools and missions were opened, a large part of the tribe was soon christianized, and the sons of the chiefs attended the schools. The American Board worked successfully among them later.

The Cherokees were now perfectly peaceable, industrious and rapidly growing civilized in the genuine sense; and they did good service to the United States in the War of 1812. In 1810 they abolished the clan system and blood feuds. In 1815, however, five of the chiefs agreed to sell their lands to the United States for $12,000,000. In 1826, the United States Congress passed the Cherokee Citizenship Act, which granted citizenship to the Cherokee Nation.

In 1828, the Cherokees were forced to sell their lands to the United States. The Cherokee Nation was divided into four districts: Eastern, Western, Southern and Northern. The Cherokee Nation v. United States, 1831, decided that the United States had the right to grant eminent domain over the Cherokee lands.

In 1832, the Cherokee Nation was forced to sell all of its lands to the United States for $2,000,000. The Cherokee Nation v. Southern Kansas Railway, 1889, decided that the United States had the right to grant eminent domain over the Cherokee lands.
fact four trunk lines traverse it. In 1892 they sold their great western extension, known as the Cherokee Outlet, and it forms the larger part of northern Oklahoma. Their region is the whole of Indian Territory north of the Arkansas. Their government was by an elected principal chief, and a legislature with two branches. The open policy of the United States government to substitute allotment in severalty for tribal ownership as fast as possible, and put an end to the anomaly of independent tribes within the United States. The Cherokees created a generation of good living and civilization having not only tamed and elevated the Indian character in them, but greatly modified even the Indian physiognomy; there are scores of full-blooded Indian ladies in Tahlequah, whose names are distinguished from whites only for the swiftness of skin. A thorough system of public schools among them has been one of the chief instrumentalities in refining both face and character at once.

The 1915 annual report of the superintendent of the civilized tribes stated there was contained in the Cherokee nation a total of 4,420,068 acres, of which 22,880 acres were reserved for town sites, railroad rights of way and other purposes; 4,346,203 acres were allotted to 40,193 citizens and freedmen; and the remainder, consisting of 50,905 acres, was sold except an 80-acre tract which was involved in litigation, and a 226-acre tract included in what is known as Big Lake, the title to which had not yet been definitely determined. The tribal affairs of the Cherokee nation were completed with the exception of the disposition of the 306 acres above mentioned, by the delivery of approximately 750 deeds; the completion of the per capita and equalization payments to citizens and freedmen of the nation; and payment of the amounts due, to citizens and freedmen enrolled under the act of 1 Aug. 1914.

CHEROKEE, Iowa, city and county-seat of Cherokee County, 60 miles northeast of Sioux City, on the Illinois Central Railroad and on the Little Sioux River. The State hospital for the insane is located here and there is a Carnegie library. There are also here railroad repair shops, butter factories, mill machinery and novelty works. The city was settled in 1850 and was incorporated in 1872. The government is vested in a mayor and a unicameral council. The waterworks are municipally owned. Pop. 4,884.

CHEROKEE NATION v. GEORGIA, the historic case (1831) on the relations of the Indian tribes toward the United States government. (For the preliminary history, see Cherokees.) (For the law restricting white men's entry into the Cherokee country, 10 men to guarantee the safety of the Cherokees were as follows: By six successive acts, from 20 Dec. 1828 to 22 Dec. 1830. Georgia laws and jurisdiction were extended over all inhabitants of the Cherokee territory, and all persons residing there were liable to arrest and imprisonment. Cherokee laws, usages, legislative assembly and courts were abolished, and execution of their writs prohibited. Cherokees were declared incapable of testifying against or making contracts with white men, but the execution of the Cherokee laws against selling land to white men was punished as murder; their lands were ordered surveyed and distributed by lottery among the citizens of Georgia; their improvements and gold mines were confiscated; and white men were forbidden under penalty to enter their country, unless by permit of the governor and taking the oath of allegiance to Georgia. The Cherokees appealed at once (early in 1829) to President J. Q. Adams, to make good the government's treaty guarantees; but he, as his predecessor, left it to Jackson, who, as an old Indian fighter, sympathized with Georgia, refused to interfere and advised the Cherokees to submit or remove. Their next resort was to the Supreme Court, but the Georgians took care not to let suits in the State courts come to a decision, and so give opportunity for appeal. At length, however, a case was found. When the Georgia authority over the Cherokee country became operative in 1830, a Cherokee named Cornett or George Tassels killed an officer serving a writ of ouster, and was sentenced to be hanged; a writ of error was obtained from the Supreme Court 12 Dec. 1830, citing the State to appear; the legislature instructed the State officials to ignore it, and the sentence was carried out. The Cherokees' council then applied to the Supreme Court for an injunction to prevent Georgia from exercising her laws within the Cherokee country; the State put in no appearance, and the case was decided from the arguments on the other side: These were: That the Supreme Court had jurisdiction over cases between States of the Union and foreign countries; that the Cherokee Nation, by repeated acknowledgement of the United States in solemn treaties, was such a foreign country, sovereign and independent. Chief Justice John Marshall for the court—Story and Thompson dissenting—decided that they were not a foreign nation in the meaning of the Constitution,—since, for example, an attempt by any other foreign nation to form a connection with them, or to trespass on their land, would be an invasion of the rights or territory of the United States; that they were a domestic or dependent nation; in a state of pupilage, their relation to the United States being like that of a ward to its guardian, that their title to their land was only that of occupancy, the United States succeeding to it whenever their own possession lapsed; that their appeal lay to the President; that the Supreme Court could not call out force to resist the extension of Georgia laws over territory claimed as its own; that it could pass on the title to land, upon suit properly brought, but this question was a political one.

A second case, though not cited under this head, properly belongs with this. Under the law restricting white men's entry into the Cherokee country, 10 men to guarantee the safety of the Cherokees were arrested and sentenced to four years' imprisonment, in September 1831. Eight were released on making submission; two refused; and one, Rev. Dr. Worcester, brought suit for a habeas corpus in the Supreme Court, which gave decision in March 1832, and to the law subsequently appears to have reversed its former one. It held that all the acts of the Georgia legislature with respect to the Cherokees were unconstitutional and in violation of the treaties and
CHERRY—CHERRY ORCHARD

laws of the United States, and ordered the prisoner released as condemned on a void statute. The State refused to comply; but in place of waiting till the next term of the Supreme Court, to see if it would call on the United States authorities to enforce the decree, the prisoners made submission and were released. It is probable that Jackson's famous "John Marshall has made his decision—now let him enforce it," would have prevented them from regaining freedom till their term was up. Consult Cherokee Indians, 'Protest against land belonging to their nation being treated by the State of Georgia as its own' (Washington 1830); 'The relations existing between the nation and the State of Georgia' (Washington 1831); Ross, J., 'The Cherokees; their loyalty and suffering during the Civil War' (Philadelphia 1864).

CHERRY, the name of various species of trees and shrubs of the genus Prunus, family Amygdalaceae, closely related to the almond, peach, plum and apricot plum, thus comprising one of the most important groups of fruits—the drupaceous or stone fruits. Cherries are characterized by white flowers, usually in umbel-like fascicles, or in racemes, and subglobular, mostly red, yellow or black fruits, with a bloom, and containing nearly globular, smooth stones. Few of the native species have attracted horticultural attention except for ornamental purposes, but some, especially the wild black cherry (P. serotina), are highly prized as cabinet woods and for interior house-finishing.

The cultivated cherries have been derived almost wholly from two European species, P. avium and P. cerasus. The varieties of P. avium belong to three groups; hearts, heart-shaped, firm, light or dark, sweet fruits; bigarreaux; heart-shaped, firm, light or dark, sweet fruits; and dukes, light, somewhat acid fruits. Of these four groups the bigarreaux are the most important; they are largely grown in California and shipped to the Eastern markets. The hearts are somewhat grown for home on both the Atlantic and Pacific coasts, in Europe and in Australia. The varieties of P. cerasus are divided into amarelle (light-colored) and morello (dark-colored) groups. The morellos are the leading European cherries and most popular in the eastern United States, especially in western New York, where they are largely canned for market, as well as shipped in the fresh state.

Besides these important species and their varieties, a few others have horticultural value, notably, P. mahaleb, a hardy, rather small European species, which is used as a propagating stock; P. pennsylvanica, the pin, wild red, or bird cherry; P. besseyi and P. pumila, the sand cherry, which seem to grade into one another, the former producing sweet fruit, the latter acid, and which, being natives of the plains region, seem worthy of the attention of the hybridizer.

Cherries are propagated by budding upon either species; tested by the following label: being in more general favor, especially in the West, because they are harder, easier to grow, easier to bud and are freer from blight in the nursery. Sweet cherries succeed best upon well-drained light loams where the moisture is abundant but not excessive; sour kinds will stand heavier but not wet land; neither prove profitable upon very rich soils. The ground should be thoroughly and deeply plowed and harrowed; the sweet kinds, which are large spreading bushes, should be set 25 to 30 feet apart and the sour kinds 15 to 20 feet. The land should be kept clean by frequent cultivation until midsummer, when a clover crop should be sown. This must be turned under the following spring, and the land well and the liberal applications of potash and phosphoric acid should be given and the trees protected from the attacks of insects and fungi by systematic spraying.

Two insects are most dreaded. One is the cherry aphid, which attacks the foliage in May. It is particularly troublesome upon the sweet kinds. Kerosene emulsion and fish-oil soap are each useful in controlling the pest. The other is the cherry slug, a shiny, dark-green "worm," the larva of a four-winged black fly. It eats the soft tissue of the leaves between the veins. It may be controlled with air-sprayed lime or arsenites. See FUNGICIDE.

The most important diseases of the cherry are brown rot, leaf-blight and black rot, which are treated under PLUM. Consult Bailey, 'Cyclopedia of American Horticulture' (1914).

CHERRY, Wild, the bark of Prunus sero-
tina collected in autumn. This is very extensively used in medicine as a vehicle basis, the syrup of the bark being used very extensively in cough remedies. It contains a small amount of hydrocyanic acid.

CHERRY-LAUREL (Prunus lauroceras-
su), a shrub closely allied to the common cherry, but having evergreen leaves. It was introduced into Great Britain in the 16th century, and is well known as an ornamental shrub. It yields the celebrated laurel-water. This is a powerful poison, the strength of which (like that of peach-kernels, bitter almonds, cherry-leaves, etc.) depends upon the presence of prussic acid. Laurel-water is usually made by extracting the leaves and flowers, or the leaves only, by distillation. This shrub is often called the common laurel, another evergreen species being distinguished as the Portuguese laurel; both are distinct from the true laurel.

CHERRY ORCHARD, The. Chekhov's realistic drama of Russian life. 'The Cherry Orchard,' was first performed, with enormous success, at the Moscow Art Theatre in 1903, only a few months before the death of the author. Chekhov's literary activity was coincident with the deep depression that in the eighties of the last century spread over the "Intelligentsia" of Russia, owing to the disappointing reaction following the war with Turkey. As a trained physician, Chekhov understands the diagnosis of this almost universal discomposure and depicts it in his stories and plays. The title of 'The Cherry Orchard' has a double meaning: it refers both to the actual orchard on the destruction of which hinges the plot of the play, and to Russia itself. The people of the play represent various types of Russian character. Madame Ranevskaya through weakness and mental inertia sacrifices her great estate and its chief glory, the famous cherry orchard; her daughter Vavara is alive inactive; Lopakhin is the prosperous grandson of a former serf, into whose hands the estate passes;
the uncle Gàyëv is a type of the Russian who talks but who does nothing. The student Trofimov is a dreamer and idealist who sees what is the matter with Russia, and asserts that "in order to live in the present we must first redeem the past, and that can only be done by suffering, by strenuous, uninterrupted labor." With the faithful, unselfish-old serf Fiers is contrasted the selfish young footman, Yasha. Though the play ends with the prospect of a gloomy future for Madame Kanevskaya and her daughter, Trofimov sees the vision of a regenerated Russia; "Mankind goes on to the highest truth, and to the biggest happiness possible on earth, and I go in the very van." But the poor old serf Fiers is left behind forgotten and soon to die, and the sound of axes is heard in the cherry orchard. In its sincerity, its truth, its subtle characterization, and its idealism, 'The Cherry Orchard' is representative of the best in modern Russian drama. It was first produced in New York in 1921 by George Calderon in 1912 and by Julius West in 1916.

NATHAN HASKELL DOLÉ.

CHERRY VALLEY, N. Y., village in Otsego County, 68 miles west of Albany, on the Delaware and Hudson Railroad. During the Revolutionary War the village was the scene of a massacre. On 11 Nov. 1778 Joseph Brant with the Indians and Walter Butler with 200 Tories and English attacked the little garrison here, killing 16 of the latter and 30 of the non-combatants, including women and children. Nearly all the buildings were burned and 71 prisved off and treated with great severity. Consult Halsey, 'The Old New York Frontier' (New York 1901).

CHERRY VALLEY MASSACRE was led by Lieut. Walter N. Butler, a Mohawk Valley Tory leader, son of the famous Col. John Butler. He had been captured at German Flats in the summer of 1780 and sentenced to death as a spy, but, spared on the intercession of friends, he escaped. Lafayette, seeing the exposed situation of Cherry Valley, had fortified it with a blockhouse the preceding spring; and Col. Peter Gaver, an experienced officer of high reputation, solicited the command. For some reason, however, it was given to Col. Ichabod Alden, a Massachusetts officer, not used to Indian warfare. During the summer the inhabitants lived in the fort and went wary; but by November they had returned to their dwellings. On the 8th, Colonel Alden received a message from a friendly Indian that at a great meeting of Tories and Indians at Tioga it was resolved to attack the place; and the people pretended to be invited to take refuge in the fort again. Alden pooh-poohed the report as an idle Indian rumor, assured them that he would guard against a surprise and sent out scouting parties. The party that should have beaten up Butler's went to sleep by a campfire on the night of the 9th, and awoke as prisoners of the enemy. Butler obtaining a company of his father's rangers, induced Brant, the great Mohawk chief, to join him with a few hundred of his Indians, picked up a band of French and English deserters, and surprised the Tories as he went on, and with about 700 men approached Cherry Valley. Securing from the prisoners, under threat of torture, all information as to the conditions there—as that the officers of the garrison lodged with families near the fort, instead of in it—the expedition camped about a mile southwest of the village on the night of the 10th. It snowed in the night, turning to rain in the morning. The enemy approached under cover of the thick mist, an Indian fired on a stray settler and wounded him, but he escaped and warned the colonel, who thought the assailant only a struggling Indian, and paid no attention to the matter. The rangers stopped near the village to examine their guns, and the Indians sprang forward, the ferocious Senecas in advance, under their chief, Sayenqueraughta. In the massacre that ensued, 32 settlers, mostly women and children, the colonel and 15 soldiers, were slain; 30 to 40 prisoners were taken, also nearly all women and children; and the village was reduced to ashes. Most of the prisoners were released the next day, and sent back to effect an exchange for Butler's mother and younger brothers and sisters, in the power of the Americans.

CHERRYVALE, Kan., city in Montgomery County, 160 miles southwest of Kansas City, on the Atchison, Topeka and Santa Fe and the Saint Louis and San Francisco railroads. Brickmaking, oil refining, zinc smelting, glassmaking and iron founding are the principal industries. There are deposits of oil and gas nearby. The city has a Carnegie library. It was settled in 1870 and incorporated nine years later. It is under the commission form of government and owns its waterworks. Pop. 4,304.

CHERSO, kèrsó, a long, narrow island, in the northern Adriatic, belonging to Austria, yielding wine, olives and other fruits. It is situated on the Gulf of Quarnero, between Veglia and the mainland, and forms part of Istria. It is about 35 miles long, and the area is 105 square miles. The town of the same name stands on the west coast, and has a population of about 4,725. Pop. of island about 10,180.

CHERSONSESUS, kèrsö-nësö̅s (Greek, a peninsula). This name has been given to several peninsulas, as (1) the Cimbrian Chersonesus, now Jutland; (2) the Taurian Chersonesus, the peninsula formed by the Black Sea and the Sea of Azov—the Crimea; (3) the Thracian Chersonesus, the great peninsula in Thrace, now the peninsula of the Dardanelles; (4) the Golden Chersonesus, in India beyond the Ganges, supposed to be the Malay Peninsula.

CHERT, a crypto-crystalline (not visibly crystalline) variety of quartz closely related to flint, but less translucent and having a more splintery fracture. In geology the term is applied to a considerable range of siliceous rocks, from the impure flints largely formed from the siliceous remains of organisms, sponges and diatoms, found in limestones and other stratified rocks, to the jasperate quartz formed by the alteration of limestones or limy sandstones. Cherts of this last type grade into jasper. See FLINT; JASPER; QUARTZ.

CHERTSEY, chërsë or chërt'së, England, town in the county of Surrey, 22½ miles southwest of London, on the London and Southwestern Railway, is pleasantly situated on the right bank of the Thames, over which there is
a handsome bridge, connecting with the north or Middlesex side of the river. The houses are mostly of brick, and in general well built. The church of Saint Peter has a square embellished tower, and contains a tablet to the memory of Charles James Fox. There was here formerly a great monastery of the Benedictine order, founded in 666, of which the ground plan only is now traceable. The chief industries are manufacturing iron, engineering, boat- and steam-launch building and carriage building, and there is a large trade in flour, malt and agricultural produce for the London market. Pop. 13,816.

CHERUB (plural, cherubim), a celestial spirit, which, in the angelic hierarchy, is placed next in order to the seraphim. All the several descriptions which the Scripture gives us of cherubim differ from one another, as they are described in the shapes of men, eagles, oxen, lions and in a composition of all these figures put together. The hieroglyphical representations in the embroidery upon the curtains of the tabernacle were called by Moses (Ex. xxvi, 1) cherubim of cunning work.

CHERUB, The. See ESSEX, PHOBES AND CHERUB.

CHERUBINI, kär-roō-bé'né, Maria Luigi Carlo Zenobi Salvatore, Italian composer: b. Florence, 14 Sept. 1760; d. Paris, 15 March 1842. In 1773 he produced a mass, which, with other of his compositions, attracted the attention of the Grand Duke Leopold, who enabled him to become a pupil of Sarti of Bologna, under whom he studied from 1778 to 1782. As early as 1780 he produced his first opera, 'Quinto Fabio,' at Alessandria, and in 1784 he had already produced eight operas in the theatres of Italy. In 1785 he composed for the London Italian opera 'La flauta Principessa' and 'Giulio Sabino' (1786); in 1788 he produced in Turin his 'Ifigenia in Aulide'; and in the winter of the same year he brought out his 'Dééphomede', and in 1791 his 'Lodoiska,' at Paris. The latter opera established his name, and was followed by 'Blissia' (1794); 'Médée' (1797); 'L'hottellerie Portugaise' (1798); 'Les deux journées' (1800); 'Anacréon' (1803); and his ballet of 'Achilles at Scyros' (1804). In 1806 he visited Russia and Paris, and in Vienna, in 1809, 'Pimmallone' at Paris; in 1813, 'Les Abencerrages'; in 1814, 'Bayard à Mézières'; in 1821 'Blanche de Provence'; and in 1833, 'All Baba.' He excelled in sacred music. His celebrated Mass in F for three voices, his grand 'Requiem,' his 'Messe Sacree,' are the noblest monuments of his genius. Haydn and Beethoven pronounced him the greatest sacred composer of the age. In 1822 he became director of the Conservatoire of Paris, with which he had been connected from the date of its foundation in 1795. He is greatly indebted to him for its prosperity. The most important of Cherubini's literary works is one on counterpoint — which is a standard publication. He was enthusiastically devoted to his profession, and his independence as an artist frequently manifested. Napoleon for a long time could not forgive him, because on one occasion, when he rudely contradicted him on some point of music, the artist replied: "Citizen Bonaparte, in the art of war you are pre-eminent, but you should leave music to those who understand it." Consult Bellasis, E., 'Cherubini,' Memorials, Illustrative of his Life (London 1874); Berlin, 'Memoire' (Paris 1878); Wittmann, M. E., 'Cherubini' (Leipzig 1895).

CHERUSCI, kër-rüs'së, the most celebrated of all the German tribes. It is difficult to determine their exact position, owing to the fact that ancient writers sometimes confound the national league formed by the tribe, properly so called. It seems probable, however, that the tribe was situated in that part of Germany lying between the Weser and the Elbe, and having the Harz Mountains on the north and the Sudetic Range on the south. This tribe was known to the Romans before 50 A.D., and it is mentioned by Caesar as a people of equal importance with the Suevi. Their territory was first entered by the Romans under Drusus, the stepson of Augustus; and a year or two later they entered into an alliance with the Romans, and served in their armies. But when Varus attempted to make them tributary to Rome, and subject them to the Roman laws, they formed a confederation with many smaller tribes, and having decoyed Varus into the forest of Teutoburg, they destroyed his whole army in a battle which lasted three days, and in which he himself was slain (9 A.D.). Upon this the Cherushci became the chief object of the attacks of the Romans. Germanicus, victorious over the Massi and Chatti, marched against the Cerusci, whose leaders, Segestus and Arminius (the latter of whom had carried off the daughter of the former), were at war with each other. Segestus, pressed by Arminius, called Germanicus to his aid, who delivered him, indeed, from his danger, but was obliged to return after several campaigns without having obtained any permanent advantages. In the end the Cherushci were overcome by the Chatti in the second half of the 1st century of our era; but this seems to have been owing more to internal dissensions among themselves than to any natural superiority in their opponents. Before the end of the 4th century they appear as members of the great confederation of the Franks, and after that they are lost sight of.

CHERVIL, a popular name for several plants of the family Apiaceae. Leaf chervil or salad chervil (Anthriscus cerefolium) is an annual herb native to southern Europe, and has long been cultivated in Europe, but very little in America, for its sweet-scented compound leaves, which are used like parsley for garnishing, flavoring soups, stews, etc., and as a pot-herb. It is of easy cultivation and yields its leaves in about eight weeks from sowing the seed. In some localities it has escaped from the gardens and has become a weed. Turnip-rooted or crown chervil (Daucus carota bulbosum) is a biennial or annual herb native to southern Europe and has long been cultivated for its small, grayish or blackish, carrot-like roots, which are eaten either like beets or as a flavoring in soups, stews, etc. Since its seeds lose their vitality quickly they should be sown in the autumn, or else stratified until spring. If sown in the fall they need not be expected to appear before spring. Except as just mentioned, the cultivation of tuberous-rooted chervil resembles that of carrots.
CHESAPEAKE BAY — CHESAPEAKE AND OHIO RAILWAY

CHESAPEAKE BAY, in Maryland and Virginia, and dividing the former State into two parts, is the largest inlet on the American coast of the United States, being 200 miles long and from 4 to 40 broad. Its entrance, 12 miles wide, is fringed by the north cape Charles, and on the south Cape Henry, both promontories being in Virginia. The bay has numerous arms, which receive many navigable rivers such as the Susquehanna on the north, the Potomac, Brandywine and York on the west, and the James on the southwest. Unlike the shallow sounds toward the south, this network of gulfs and estuaries, with its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and Norfolk and the arsenal of Washington. Extensive oyster beds are to be found in this bay.

CHESAPEAKE BAY DOG. See Dog.

CHESAPEAKE AND DELAWARE CANAL, connecting Chesapeake and Delaware bays. It is 14 miles long, 9 feet deep. The cost of construction was $4,000,000. See Canals.

CHESAPEAKE AND LEOPARD, Affair of, 22 June 1807. The Chesapeake was a 40 gun frigate destined to relieve the Constitution in the Mediterranean; Capt. James Barron was to go out in her as commander of the Mediterranean squadron. She had been refitted at the Washington navy-yard, and made final preparations at Norfolk, reporting ready for service on June 14. On June 22nd she got under way, but expecting no attack from powers at peace with this country, was in no shape for immediate action, and being four months behind time, could not wait. The gun deck was obstructed with various lumber, sick seamen were lying on the upper deck, the cables were not stowed away, the powder-horns were not filled and the crew was raw and not exercised at the guns. At this time, in the heart of the Napoleonic wars, the high wages and relatively safe employment of the American merchant and even naval service, with the rights of American citizenship immediately obtained, raised the normal rate of desertion from the British navy so much that its officers were much embarrassed and greatly incensed; and Great Britain claimed, as for many years afterward, the right of searching neutrals for deserters and contraband. At the same time, her press-gangs crimped for service any strays who could be caught, of any nationality, and rarely gave any redress. Early in 1807 a British fleet lay off Norfolk watching to intercept some French frigates in the Chesapeake; and a boat's crew deserted bodily and escaped to Norfolk. The captain was told that they had enlisted on the strength of false information. In the Chesapeake, and under an assumed name; and meeting the latter and another deserter in the streets of Norfolk, was deposed. Another vessel, the Melampus, reported three deserters gone to the Chesapeake, but it was proved that they were not deserters but officers, and Berkeley, at Halifax, on complaint of his officers, ordered any of his vessels to overhaul and search the Chesapeake on meeting her outside the United States jurisdiction. The order was carried out by the 32-gun flagship, Leopard, Captain Humphreys, after consulting with the local commandant at Lynnhaven, followed the Chesapeake out beyond Cape Henry, hailed her, and sent a boat with a copy of Berkeley's order. Barron, who believed that he had no deserters aboard except the Melampus, which were not really such, honestly denied having any, but refused the right to search; the messenger lieutenant at once left and within five minutes the Leopard closed. Humphreys announced that he should carry out his orders. Barron at once called his men to quarters, and did everything that skill, coolness and courage could do to prepare for action, but the Leopard almost at once poured one whole broadside into the Chesapeake, and then two more in rapid succession, without the possibility of her opponent replying. Three of the latter's men were killed, Barron and 17 others wounded, and it was certain that the vessel would be sunk in a short time if the fire kept up, and Barron, to stop a useless massacre, struck his flag. The one English deserter was hunted out and hanged, the three Americans taken and imprisoned. The mass of the country was on fire with indignation; the extreme Federalists at first justified the English course but were compelled by public feeling to exhibit some patriotism. Even Jefferson, whose unwise course had brought on the catastrophe, interdicted British cruisers from American ports, and demanded disavowal and reparation from Great Britain, which were not given; but he did nothing to prevent the recurrence of such outrages. The unfortunate Barron, who had behaved like a brave man and good officer, and whose instructions had bound him to do nothing to bring on collisions, was made the scapegoat of the popular fury. His own captain screened himself by accusing him, and a court-martial on board his own vessel from 4-8 Jan. 1808. Capt. John Rodgers president, after acquitting him of all blame in every respect but one, found him guilty in not preparing for action as soon as he read Admiral Berkeley's order, and sentenced him to five years' suspension without pay or emoluments. The gross injustice of this is now admitted. One of the judges was Stephen Decatur (q.v.), who never ceased reflecting on Barron till the latter challenged and killed him.

CHESAPEAKE & OHIO RAILWAY. The road had its origin in the charter of a company by the legislature of Virginia on 18 Feb. 1836, to build a branch from the Richmond, Fredericksburg & Potomac Railroad, through the county of Louisa, Va., and was styled The Louisa Railroad. The road was built under this charter from Hanover Junction (now Doswell), on the Richmond, Fredericksburg & Potomac Railroad, 26 miles from Richmond, to Louisa Court House, 13 miles, and was operated by the Richmond, Fredericksburg & Potomac Railroad Company. Subsequently it was extended in short sections at various times under several acts of the legislature to Jackson River, 10 miles east of Covington, Va., on the west, and to the Adena Railroad on the east, between which points it was being operated in the spring of 1861. Prior to this time, however, in 1850, its name was changed to "Virginia Central Railroad Company."

In 1853, the State authorized the construc-
tion of the Covington & Ohio Railroad, from Covington, Va., to the Ohio River; work was stopped by the Civil War after about $3,000,000 had been expended by the State. When the war was over, the State having been dismembered, Virginia and West Virginia united in efforts which resulted in combining the Virginia Central and the Covington & Ohio railroad companies, in 1868, under the name of Chesapeake & Ohio Railroad Company and the completion of the road westward to Huntington, on the Ohio River, in West Virginia, in the year 1873.

In 1878 the road was sold under foreclosure and reorganized as The Chesapeake & Ohio Railway Company.

Under legislative authority the road was extended from Richmond to Newport News, in 1880, and to the government reservation at Fort Monroe, in 1882. In the meantime it had been extended westward from Huntington to the Big Sandy River, the western boundary of West Virginia, and established connection with the Elizabethtown, Lexington & Big Sandy Railroad Company, in October 1880, opening up through service to Lexington, Cincinnati and the West and South. In 1888 the road was again reorganized and secured control, through stock ownership of the Maysville & Big Sandy Railroad Company and the new railway bridge at Cincinnati, giving it a direct line from tidewater to Cincinnati, Ohio.

In 1892, the Elizabethtown, Lexington & Big Sandy Railroad Company, extending to Lexington, Ky., was acquired, and in 1895 through to Louisville, Ky., was established by an agreement with the Louisville & Nashville for the joint use of its line from Lexington to Louisville. In the same year The Chesapeake & Ohio Railway Company became owner jointly with the Cleveland, Cincinnati, Chicago & Saint Louis Railway Company of the Louisville & Jeffersonville Bridge Company, giving entrance into Jeffersonville, Ind., and connection with the Big Four Railway northward.

The Richmond & Allegheny Railroad located in the James River Valley, 231 miles long, between Richmond and Clifton Forge, Va., was acquired in January, 1890, affording a low grade route from the Ohio River to Newport News. Entering into Washington Wharf, was secured in 1891, under agreements for the joint use of tracks of the Richmond & Danville Railroad Company (now the Southern Railway Company) and the Washington Southern Railway Company.

A number of subsidiary lines and branches have been built penetrating mineral and timber regions; among them are the Big Sandy Railway, Kentucky, the Guyandot Valley Branch, Coal River Railway, Caban Creek Branch, Point Creek Branch, Gauley Branch, Loup Creek Branch, Piney Creek Branch, the Greenbrier Railway, in West Virginia, and the Warm Springs Valley Branch, Craig Valley Branch and Buckingham Branch, in Virginia.

The eastern termini of this railway are Waterford, Va., and Fort Monroe and (by ferry transfer) Norfolk, Va. From these places it extends westward, passing through the agricultural, tidewater and Piedmont regions, crossing the Blue Ridge Mountains and the Shenandoah Valley of Virginia, thence through the iron ore regions, across the Allegheny Mountains to and through the coal and timber fields of West Virginia, to the Ohio River, at Huntington. One of its lines continues on to the Ohio River, in the third boundary line of Kentucky to Cincinnati, Ohio, and another extends from Ashland, Ky., through the Blue Grass region to Lexington and Louisville, Ky., and Jefferson, Ind.

As of 1910 the road to the company's line and sidings comprised 3,992.7 miles of track; the mileage operated, exclusive of second track and sidings, was 2,385.6, of which 2,123.5 miles are owned, 37.9 miles are leased and 224.2 miles used jointly with other railway companies. Steel rails 125 and 100 pounds to the yard are the standard in use. Facilities for handling traffic are excellent in every respect. It is essentially a low grade line from Cincinnati to the coast. Crossing the mountains the maximum grade ascending eastward in the direction of heavy traffic is only 30 feet to the mile.

In the fiscal year 1916 the number of revenue tons of freight carried one mile was 10,296,523,340; the tonnage of coal handled was 26,979,519; and passenger miles run were 281,348,788. In the same year the mileage the road consisted of the following: Locomotives, 827; freight cars, all classes, 44,770; passenger, baggage and express cars, 370. In 1894-95 it was recommended as follows: Locomotives, 355; freight cars, all classes, 13,808; passenger, baggage and express cars, 212. The increase in freight car and locomotive capacity is greater than appears from their number, as the average capacity of freight cars increased from 25.1 tons each to 49.7 tons, and the locomotives are of much greater power.

The capital stock outstanding (1916) was $62,792,600, and the total bonded indebtedness was $181,535,169.54. The gross earnings for year ending 30 June 1916 were: $48,239,012.10, operating expenses, $31,789,179.22; net earnings, $16,449,832.88; taxes, $1,587,407.06; interest on mortgage debt, $1,919,989.10; fixed charges, $8,175,199.15; net income, $6,879,215.84.

**CHESAPEAKE AND SHANNON, Battle of, 1 June 1813**

In the War of 1812, the former vessel (See Chesapeake and Leopard, AFFAIR OF THE), cruised to no purpose from December 1812, till it returned to Boston 9 April. Her captain, Evans, left her on account of ill health, and about the middle of May was replaced by Capt. James Lawrence, famous for the brilliant victory of the Hornet over the Peacock. He accepted again his will; nearly all the officers and crew were new, and the latter second-rate, totally untrained and sulky over questions of prize money. On 25 May Captain Brooke of the Shannon, lying outside, sent away his consort, the Tenedos, to have a fair chance to fight the Chesapeake alone, and repeatedly urged Lawrence to arrange a duel between the ships. In theory they were evenly matched; they were of almost exactly the same length; the Chesapeake now carried 50 guns, the Shannon 52; the Chesapeake had News, fifteen and crew against the Shannon's 330, but the latter had been trained for seven years under Brooke himself, kept in constant artillery and other practice, and was a thoroughly disciplined fighting machine, men used to each other and the officers. On 1 June, however, Lawrence, whose experience had made
him despise British skill and courage alike, sailed out to meet his enemy, and at 5.30 P.M. they engaged. After a couple of broadsides, the Chesapeake’s broadsides and the musketry fire from her tops swept the Shannon from side to side, without the latter being able to fire a shot in reply, beating in the stern ports and killing or wounding every man on the quarter-deck and the after part, including the men at the wheel. Just before the vessels struck, Lawrence ordered up his boarding party; but almost at the same instant he fell mortally wounded by a musket ball, and was carried below. Not a living person was on the quarter-deck, and Broke, with 50 broadsides rushed on board and the vessels parted. H. S. was in deadly peril from his own guns, which killed his first lieutenant as the latter pulled down the American flag, and so fierce was the resistance from that end or so of the American crew who had rallied at the Shannon’s shot of the first broadside that of the boarding party were killed or wounded, including Broke himself. Had the rest of the crew shown even decent pluck, not one of the British would have escaped; but the upper party, heavily overmatched, were killed or driven below, and though the dying Lawrence called out from the cockpit, “Don’t give up the ship! Blow her up” the remnant refused to go above, and surrendered. The Chesapeake lost 61 killed and 85 wounded; the Shannon 33 killed and 50 wounded. The former was towed into Halifax as a prize, turned into a British war vessel and in 1820 was broken up. Lawrence died four days after the battle.

CHESAPEAKE STAGE. The rocks of the Chesapeake Stage, a younger Miocene of the Atlantic coast, are clays and marls in the north, and marls and limestones in the south. They differ chiefly from the older Miocene, or Chattahoochee and Chipita Stages, now called Oligocene, in the character of the fossils, particularly in the north; these fossils indicating that the climate was much colder in the newer than in the old Miocene. This change of climate is believed to have been due to a change in the direction of the Gulf Stream, which flowed farther from the coast than before. The stage is well developed at Duplin County, N. C., at Yorktown, Va., and along rivers in Maryland. Strata of this age are found at Martha’s Vineyard, Mass., and in Texas. See Miocene Series; Tertiary System.

CHESLEDEN, chês’el’den, William, English surgeon and anatomist: b. Somerby, Leicestershire, 1688; d. Bath, 10 April 1752. At the age of 22 he began to give lectures on anatomy, and in 1711 he was chosen F.R.S. In 1713 he published a treatise on the ‘Anatomy of the Human Body,’ long a favorite manual of students and to read his lectures for more than 20 years, during which he gradually rose to the head of his profession. In 1723 he published a ‘Treatise on the High Operation for the Stone.’ In 1733 he published his ‘Osteographia, or Anatomy of the Bones.’ Cheselden obtained in 1737 the appointment of chief surgeon to Chelsea Hospital, a post he held till his death.

CHESHIRE, chês’Her, Joseph Blount, American Protestant Episcopal bishop: b. Tarboro, N. C., 27 March 1850. He was graduated at Trinity College in 1870, and practised law from 1872 to 1878. He was ordained to the priesthood in 1880, and, after holding various rectorships, became bishop of North Carolina in 1893. He received the degree of D.D. from the University of North Carolina in 1890 and from the University of Virginia in 1891. He is the author of a number of monographs on local, State, and Church history, and of ‘History of the Protestant Episcopal Church in the Confederate States’ (1911).

CHESHIRE, or CHESTER, England, a maritime county, bounded by seven other counties in England and Wales, by the estuaries of the Dee and Mersey and by the Irish Sea. Its area is 1,026 square miles, of which the greater part is under cultivation. The surface is generally level, the soil mostly a rich reddish loam variously clayey or sandy. There is some of the finest pasture land in England; and cheese, the main product of the Cheshire farmer, is made in great quantities. Extensive tracts of land are cultivated as market-gardens, the produce being sent to Liverpool, Manchester and other cities. Minerals abound, especially rock-salt and coal, which are extensively worked. Cotton manufacture is carried on at Stockport, Stalybridge and in the northeastern district, shipbuilding at Birkenhead and other places. There are numerous railroad lines and a splendid system of canals, among them the famous Manchester Ship Canal. The principal towns are Chester, the county town, Macclesfield, Stockport, Birkenhead and Stalybridge. The various divisions of the county return eight members to the House of Commons. Pop. 954,779.

CHESHUNT, chês’Hunt, England, town in Hertfordshire, seven miles south of Hertford, and 14 miles north of London, on the Lea. From 1792 to 1905 it was the seat of Cheshunt Theological College. Consult ‘Cheshunt College’ (London 1868). Pop. 12,954.

CHESLEY, Mary Russell, Canadian social reformer: b. Dartmouth, Nova Scotia, 1847. She was educated in her native place and early became interested in social problems, notably in the suppression of the liquor traffic. She became president of the Women’s Christian Temperance Union. In 1891 the Society petitioned the Nova Scotia legislature for the political enfranchisement of women and when the petition was denied Miss Chesley became very prominent in the movement, making a noteworthy reply to an attack on women suffrage by Attorney-General Longley of Nova Scotia. She has written ‘The Mission of Women’ (1895); ‘The Delusion of Militarism’ (1909) and many articles on woman suffrage and prohibition.

CHESNEY, chês’ni, Charles Cornwallis, English soldier and author: b. 29 Sept. 1826; d. 19 March 1876. He was a well-known military engineer, but was still better known as a writer on military themes, publishing ‘Campaigns in Virginia’ (1863); ‘Waterloo Lectures’ (1869); and ‘Miscellaneous’ (1871). The last-named volume contained essays on Generals Grant and Lee. He was a nephew of F. R. Chesney (q.v.).
CHESNEY — CHESS

CHESNEY, Francis Rawdon, English explorer: b. Annalong, County Down, Ireland, 1783; d. Mourse, 30 Jan. 1872. He was gazetted to the Royal Artillery in 1805. In 1830 he inspected the route for a Suez canal which he proved to be practicable. His first exploration of the route to India, by way of Syria and the Euphrates, was made in 1831, and he made three other voyages with the same object. The idea was taken up by the government, who made a grant of £20,000 after his first expedition, but owing to the opposition of Russia it was never brought to a practical issue. He commanded the artillery at Hongkong from 1843 to 1847. In 1850 he published his 'Expedition for the Survey of the Rivers Euphrates and Tigris,' and in 1868 a 'Narrative of the Euphrates Expedition.' Consult 'Life,' edited by Lane-Poole (1885).

CHESNEY, Sir George Tomkyns, English writer: b. 1830; d. 1895. He was a colonel in the army, and later a general and K.C.B. and sat in the House of Commons for Oxford from 1892-95. But he will be longest remembered for his remarkable realistic 'Battle of Dorking' (q.v.) (1871) and his brilliant novel, 'The Private Secretary' (1881).

CHESNUT, Victor King, American botanist: b. Nevada City, Cal., 28 June 1867. He was graduated at the University of California in 1890 and pursued post-graduate work at the University of Chicago and at Columbia University. In 1894 he became assistant botanist in charge of poisonous plant investigation, carried on by the United States Department of Agriculture. From 1904 to 1907 he was chemist of the Montana Experiment Station. In 1907 he became assistant chemist in the division of drugs, bureau of chemistry, United States Department of Agriculture. He has written 'Principal Poisonous Plants in the United States' (1898); 'Thirty Poisonous Plants of the United States'; and 'Preliminary Catalogue of Plants Poisonous to Stock' (1898); 'Plants Used by the Indians of Mendocino County, California' (1902); 'The National Museum in Drug Research' (1906); 'Determination of Pepsin in Liquids' (1913).

CHESNUTT, Charles Waddell, American author: b. Cleveland, Ohio, 20 June 1858. While still a child he was taken to North Carolina, where he was educated, becoming subsequently principal of the State Normal School at Fayetteville. He removed to New York and entered journalism temporarily, returning later to Cleveland, where he was admitted to the bar in 1887. He has written 'The Conjure Woman' (1899); 'The Wife of His Youth and Other Stories' (1899); 'Life of Frederick Douglass' (in 'Beacon Biographies') (1899); 'The House Behind the Cedars' (1900); and 'The Marrow of Tradition' (1901); and 'The Colonel's Dream' (1905).

CHESS. Chess is a game of strategy consisting of regularly developed attack and defense with a definite ultimate objective toward which all operations are directed and to which they are subordinated. It may aspire to the dignity of both art and a science. It cultivates both memory and reason and what may be called "geometrical sense" and at the same time is one of the most fascinating recreations. Steinitz, Zuckertort and Blackburne, noted masters of the game, have developed such intellectual powers, in play, that they have not infrequently engaged successfully in as many as 14 games simultaneously, without looking at the board. With 32 men on each board at the opening, and 64 squares on each board to cover, this is surely remarkable.

Chess is a very ancient game, probably long antedating any extant records. Although the first authentic literature on chess came from the Arabs and Hebrews, in Granada, about the 11th century, it is quite clear that it was already widespread among Mohammedan nations. It is probable that it originated in China, and passed into India, where it was known as 'Charatarunga' and was played by four persons, and that from India it spread to Persia about the beginning of the 7th century of our era. It was then adopted by the Arab conquerors of that country and introduced into Europe.

The accompanying engraving shows the pieces, which are manufactured in various modified forms, in position at the opening of play, and the board upon which the game is played.

The board is divided into 64 squares, and the opposing forces occupy the limits of these squares.

The four squares counting from the king's square to the right are called the king's side, and the four squares from the queen to the left, the queen's side of board. The squares counting from the white to the black are called files, and in a direction perpendicular to the files, rows. For purposes of description, each square on the board is designated in two ways, in accordance with its relation to the position of the black or white rear men, as originally set in the preceding diagram. Each file is named after the rear row piece standing thereon. The rows are numbered consecutively across the board. If white plays, the position of the white piece is designated by naming the file on which it stands, while the row is numbered from the white side; similarly, if black plays, the row is numbered from the black side.
The rear men are named as indicated in the diagram and are known as pieces. The front row men are called pawns. Where there are two pieces of the same name, they are distinguished as king's or queen's pieces, throughout the game, in accordance with their greater nearness to the king or queen, as originally set.

In notation the abbreviations are as follows:
- King: K
- Queen: Q
- King's bishop: B
- Queen's bishop: B
- King's knight: Kt
- Queen's knight: Kt
- King's rook: R
- Queen's rook: R
- Pawn: P

The movements of the pawns and pieces are as follows: Each pawn moves straight forward one square at a time. On its first move, however, it may, at the option of the player, advance two squares, if there is no piece in the way. It cannot take an opposing piece directly in front. It captures an opposing piece only when it is one square diagonally to the right or left. The captured piece is then removed from the board, and the capturing pawn placed on the square. All other chess men capture an opposing piece by stopping on the square it occupies, as they move. Should a pawn, in moving two squares, pass the diagonal of an opponent's pawn, the opponent may "take it in passing" by moving on to the square it crossed. Should a pawn succeed in reaching the eighth row, the player may replace it by any piece he desires.

The rook may move in a straight line up or down the file, or row, any number of squares at the option of the player unless obstructed by his own or an opposing man. If the obstruction is by an opposing man, it may be captured or not, as the player wills.

The bishop moves diagonally in any one direction and any distance over the board, unless similarly limited, when it has a similar right of capture.

The knight has a peculiar move over two squares, one diagonally and the other straight, leaping over the intermediate square whether occupied or not. Thus, in the diagram, the knight on K.Kt. square is at liberty to move to K.R3 or K.B3—leaping over the pawns and if it may move up to K.Kt. square on the next move. He cannot leap into a square which is occupied by one of his own men, but if occupied by an opposing man, he may capture him.

The queen combines the rook and bishop moves in the sense that she may either traverse the board in a straight or diagonal line, any distance at the option of the player so far as the same is unobstructed, with the right to capture any enemy's pawn or piece in her way, as above.

The king moves in any direction one square. Once during the game, he has, however, a right, termed Castling. This is effected by placing the king's or queen's rook—as the case may be—next to the king and causing the king to leap over the rook to the square on the other side. This can only be done if there are no pawns or pieces intervening between the king and the rook and only in the event of the king and the rook used in castling not having threatened the enemy in the move. The king does not traverse a square which an opposing piece or pawn can reach in one move.

When either king in the course of the game is brought into a position where he could be captured by an opposing piece, his player must be notified of that fact and unless the king can either be moved out of the "check" position, the hostile piece taken or some piece interposed to annul the "check," should neither of these resources be available, he is "checkmate" and the game is lost. He is not permitted to move into "check," and if no other piece on his side can be moved, and a move into "check" is the only possible move, the situation is one of "stalemate" and the game is a "draw." To put the opposing king into a position of "checkmate" is the sole object of chess strategy. Rapid "checkmate" is often illustrated by the following game:

**White**

1. P—K4
2. K. B.—B4
3. Q—R3
4. Q takes B. P. (checkmate)

**Black**

1. P—K4
2. K. B.—B4
3. Q—R3
4. K. Kt.—B3

and while easily frustrated, may be studied by the beginner to see how variously "checkmate" may be avoided.

As in warfare, chess strategy consists in rapid mobilization against the vital points of your enemy's defense and the opening moves are directed toward securing open lines of communication in the rear, with a well-supported attack. A few simple points in that connection should be noted by the beginner. Seek as early as possible to form some definite plan of attack. In developing your plan make the advantageous capture of enemy pieces subsidiary to that end and not a principal object. This will be almost impossible at first but always keep it before you as an end to be attained. Never study your own move until you have first sought to divine the purpose of your opponent's move. On the other hand "camouflage" your own purpose by the avoidance of a too obvious scrutiny of the part of the board that particularly interests you. Remember that a purposeless move, or move into a position from which your adversary may easily drive you, is a step toward loss of the game. In this connection, note that it is usually to your advantage to bring out your major pieces early in the game. Beginners are usually too fond of early and frequent play with the queen. It is only against inferior players that such tactics are fruitful. The pawns should support one another and not become isolated. Two or three are usually retained in a position to protect the king, after castling, which is often done rather early in the game in order to bring out the rook and protect the king. Use your knights and king's bishop in developing an early attack. A knight in an advanced position from which it cannot easily be driven is very hampering to your opponent and gives the opportunity for diverse strategy. Avoid placing your knight on the rook's file as it loses half its power thereby. The bishop is often more valuable than a knight on an open board. In considering the exchange of a knight for a bishop, this detail may determine, in the absence of other reasons. Do not develop simple "tenderness" for a piece, as beginners often do, refusing an exchange to the loss of position. The "openings" in chess have been so carefully studied and each move, with its possible answers, has been so carefully.
analyzed, that the beginner cannot do better than study some of the more prominent ones, in order to obtain an early acquaintance with its tactics and strategy. He should also carefully play over games by the great masters. Many of these have been annotated by prominent players, and their comments, while at first hard to follow, will gradually become more and more illuminating, as the student's "chess sense" develops. Chess problems will also develop the player's ability.

There are two classes of chess openings, the gambit, in which one or more pieces are sacrificed in order to obtain a strong attack, and those without any sacrifice. While theoretically the gambit is a lost game, with perfect play on your opponent's part, it is practically very safe and usually develops a more fascinating situation. Lately chess masters have rather avoided the gambit in matches, but with it the game is full of varying interest and the policy has been a loss to chess. The gambit may be either on the king's or queen's side. The former offers a more exciting game.

The following game between Anderssen (white) and Kieseritzki (black) illustrates the king's bishop's gambit.

White Anderssen Black Kieseritzki
1. P-Q4 1. P-Q4
2. P-K4 2. P takes P
5. B takes KtP 5. Kt-KB3
6. Kt-KB3 6. Q-Q3
7. P-Q3 7. Kt-R4
8. Kt-QB3 8. Kt-QR4
11. P takes Kt 11. P takes B
12. P-QR4 12. Q-R3
13. P-KN4 13. K-Q1
14. Q-B3 14. Kt-K1Q
15. B takes P 15. C-B3
16. Kt-KB3 16. Q-B4
17. Kt-Q5 17. Q takes KtP
18. B-Q6 18. Q takes R (ch)
19. P takes R 19. Q takes E
20. Kt-Q3 20. Q-R3

White mates in three moves. The Muniz gambit with its double sacrifices affords an intensely instructive opening. It develops as follows:

White Black
1. P-K4 1. P-K4
2. P-KB4 2. P takes P
3. Kt-QB3 3. P-KKt4
4. B-B4 4. P takes Kt
5. Castles 5. P takes Kt

An old Scotch gambit known as the Evans' gambit not often played now, on account of a defense revived by Steinitz, but not given here, is also very instructive for the beginner.

White Black
1. P-K4 1. B-B4
2. KKt-B3 2. B-Kt-B3
4. P-QKt4 4. B takes KtP.
5. P-B3 5. B-B4
6. P-Q4 6. P takes P
7. Castles 7. P-Q3
8. P takes P 8. B-K3

If on the fourth move above the game should proceed 4. P-Q3. 4. P-Q3 it then develops into the conservative Giuoco Piano opening, illustrative of the theoretically safe game. Another type of the conservative game, known as the Ruy Lopez and developing a more lively attack is as follows:

White Black
1. P-K4 1. P-K4
2. KKt-B3 2. Kt-QB3

The following simple problem will serve as an introduction to problem solution. Place the men as follows: Black—K on Q.R1, R on Q.Kt1, R on Q.R2, P on Q.Kt2; White—R on Q.R1, R on K.R8, K on Kt6, Q on K4. White to play and mate in two moves. The only difficulty for the beginner in this problem is to determine the opening move, which should be Q—K.R5.

FREDERICK C. GRANT.

CHEST, in man and the higher vertebrates, the cavity formed by the breast bone in front and the ribs and backbone at the sides and behind, shut off from the abdomen below by the diaphragm or, in birds, mammal, the lungs, passing be the thoracic cavity. The thoracic cavity contains the heart and lungs. The diaphragm separates the thoracic cavity from the abdominal cavity. The heart is a muscular pump that circulates blood throughout the body. The lungs are two organs located in the thoracic cavity, responsible for the exchange of gases between the body and the atmosphere. The ribcage protects the heart and lungs. The ribs are connected to the spine by intercostal muscles, which help expand the chest cavity during breathing.

CHEST, NAVAL, the name given in England to certain funds collected for the benefit of seamen of the British navy. In 1590 a sum of money was given to the navy from the monthly pay of all sailors to support a fund for the relief of disabled or superannuated seamen. The money was kept in a chest, and was known as the "chest at Chatham." The fund was better organized and was transferred to Greenwich in 1803, the name chest being still retained. It is managed by the Board of Ordnance, and an annual report is made to Parliament. Disabled sailors, if their injuries are not permanent, receive a sum of money. If permanently disabled, a pension is paid them for one year, for several years or for life.

CHEST DEFORMITIES. These are congenital or secondary to disease either of the bony skeleton of the chest or to a disease within the chest. The congenital deformities usually result from failure of development of some one or more of the ribs. They are extremely rare. funnel chest is a rare congenital anomaly. The acquired deformities result mostly from tuberculosis of the spinal vertebrae (Pott's Disease), from poliomyelitis, where the deformity usually follows muscle unbalance, or...
from syringomyelia, a chronic disease of the spinal cord. See Pott's Disease.

CHESTER, Colby Mitchell, American naval officer: b. New London, Conn., 27 Feb. 1828. He was graduated at the United States Naval Academy in 1853; fought under Farragut in the famous battle of Mobile Bay; became captain 12 June 1856; was commandant of cadets at Annapolis 1850-94; commanded the Galena, Richmond, Newark, Minnesota 1893-97; the Cincinnati during the war with Spain, and the Kentucky 1900-1901. From 1897-98 he was commandant-in-chief of the South Atlantic squadron; from 1901-02 was at the Naval War College; in 1903 became rear-admiral; and from 1 Nov. 1902 to 28 Feb. 1906 was superintendent of the United States Naval Observatory. He was engaged upon special duty under the Navy Department until May 1908, when he was assigned by the Secretary of State to represent the United States at the Ninth International Congress of Geographers at Geneva, Switzerland, in July of that year. Also represented the National Rivers and Harbors Association of America at the Sixth International Congress of Navigation at Petrograd, Russia, and the American Association of Navigation Societies at the Second International Congress of Aeronautics held at London, England, in June 1908. Later he was engaged upon a special mission, under the supervision of the State Department, to investigate commercial affairs in Russia and the Near East, holding, at the same time, commissions from the New York Chamber of Commerce and the New York Board of Trade and Transportation Associations. After retiring from active duty in the navy, 1 July 1909, he occupied himself with writing and lecturing, in Europe and the United States, upon the subjects of international law, geography, aeronautics, commerce, etc.

CHESTER, George Randolph, American author: b. Ohio 1869. He left home at an early age and engaged in various occupations; began newspaper work as a reporter on the Detroit News; later on the Cincinnati Enquirer, becoming Sunday editor of the latter. He began writing for newspaper syndicates and later for magazines. Many of his stories have been dramatized and produced with great success. His works include 'Get-Rich-Quick-Wallingford' (1908); 'Cash Intrigue' (1909); 'Making of Bobby Burnt' (1909); 'Art of Short Story Writing' (1910); 'Young Wallingford, Early Man' (1910); 'Wallingford and Blackie Daw' (1913); 'Wallingford in His Prime' (1913); also in collaboration with his wife, Lillian Chester, 'The Ball of Fire' (1914); 'Cordelia Blossom' (1914); 'Runaway June' (1916); 'Gangs of the Enemy' (1915); 'Pay' (1915).

CHESTER, Joseph Lemaux, American genealogist: b. Norwich, Conn., 30 April 1821; d. London, England, 26 May 1882. His earlier life was taken up chiefly with mercantile pursuits. His literary tastes found expression in contributions to the Knickerbocker. From 1845 to 1855 he was musical editor of Godley's Lady's Book, and in 1852 became one of the editors of the Philadelphia Inquirer and of the Daily Sun. In 1858 he went to England to sell some patent rights, but not succeeding in the undertaking, settled in London, and devoted himself to genealogical investigation. For more than 20 years he collected materials illustrating the ancestry of American families, made special researches for clients, and investigated the English descent of noted Americans, especially that of George Washington. His greatest work was the editing and annotating of 'The Marriage, Baptismal and Burial Registers of the College Church or Abbey of Saint Peter, Westminster,' dedicated to the question of whether King John cost him 10 years' labor, and which he generously allowed the Harleian Society to issue as one of its publications. He was a founder of this Society in 1869, and edited five of its volumes. He was also a member of the Royal Historical Society, and of many other learned societies in England and America. His non-genealogical writings were 'Greenwood Cemetery, and Other Poems' (1843); 'Treatise on the Law of Repulsion' (1853); 'Educational Laws of Virginia: the Personal Narratives of Mrs. Margaret Douglas' (1854); 'John Rogers, the Compiler of the First Authorized English Bible, the Pioneer of the English Reformation, and its First Martyr' (1861), a work of great industry and research.

CHESTER, England, an ancient and episcopal city, the capital and county town of Cheshire, 16 miles southeast of Liverpool. The two main streets cross each other at right angles and were cut out of the rock by the Romans, 4 to 10 feet below the level of the houses. The houses in these streets were curiously arranged; in the front parts of their second stories, as far back as 16 feet, from a continuous paved promenade or covered gallery, open in front, where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. These arcades, called the Rows, together with the walls and the halftimbered construction of many of the houses, with ornamental gables of the 16th century, render Chester perhaps the most picturesque city in England. Saint John's Church, now partially in ruins, is supposed to have been founded by Ethelred in 698. Chester still preserves its old walls, two miles in extent, and the gateways have been rebuilt during the 19th century. Many modern improvements have been made in the city, but with due regard to the quaint architectural features. Electric lighting has been installed; a modern sewage system, including precipitation works, has been introduced; public baths, markets, a free library, a museum, and a hospital are maintained by the municipality. Chester has manufactures of lead; iron foundries, chemical works and a ship-building yard. It manufactures boots and shoes for export. Its principal trade, however, is in cheese, for which it is a famous market. The improvement of the Dee is bringing back to Chester some of its former importance as a port; there is an increasing importation of ores and timber and an export of manufactured iron. Chester is the terminus of several railway lines. Pop. 39,026.

CHESTER, Ill., city and county-seat of Randolph County, on the Mississippi, 70 miles south of Saint Louis, on the Saint Louis, Iron Mountain and Southern, the Cape Girardeau and Northern, and other railroads. It is the seat of the Southern Illinois Penitentiary and the Illinois Asylum for the Criminal Insane.
and contains a public library. The city has manufactories of flour, furniture, hose, shoes, foundry products, wagons and knit goods. Pop. 27,000.

CHESTER, Pa., a city and port of entry of Delaware County, on the Delaware River, and the Philadelphia, Wilmington and Baltimore, the Baltimore and Ohio, and the Philadelphia and Reading railroads, 15 miles south of Philadelphia. The favorable location and excellent shipping facilities of the city have given it a diversity of industries. Chester is the local trade centre of a very prosperous agricultural and manufacturing district. It is the site of the Roach shipyards, where several vessels of the United States navy have been built. According to the Federal census of 1910, Chester has over 128 factories, employing $3,506,000 capital and 8,000 hands, and having annual products to the value of $10,400,000. The principal industries were ship-building, foundry and machine-shop work, and the manufacture of cotton, woolen and worsted goods. The United States census of manufactures for 1914 recorded 153 industrial establishments of factory grade, employing 7,127 persons, of whom 6,295 were wage earners, receiving annually $3,506,000 in wages. The capital invested aggregated $25,148,000, and the year's product was valued at $21,021,000; of this, $7,920,000 was the value added by manufacture. There are national banks having approximately $7,000,000 capital and a surplus of $575,000, several private banking houses, several daily and weekly newspapers. Chester is connected with Media, Darby and other surrounding towns by electric railways. It is the seat of the Pennsylvania Military College and Crozier Theological Seminary and Swarthmore College is nearby. The notable buildings are the United States government building, including the post-office; the city hall, erected in 1724, of great historic interest; Chester and Homospatich hospitals and the public library. Besides the educational institutions mentioned, there are public schools, with about 6,000 pupils, and public school property valued at $500,000; a public market; and several churches. Chester Academy was established by the Swedes in 1643, under the name of Upland, and is the oldest town in the State. It was incorporated in 1858. In 1913 it adopted the commission form of government. Pop. (1914) 40,000.

CHESTER, S. C., capital of Chester County on the Cheraw and Chester, the Chester and Lenoir and the Seaboard Air Line railroads, 65 miles north-northwest of Columbia. It is a trade centre, cotton is the chief shipping product. It has four banks, a city hall and a court house. The valuation of its property is $5,000,000. Pop. 4,754.

CHESTER STAGE, the youngest of the limestones laid down in the interior sea that covered, in Lower Carboniferous or Mississippian time, much of what is now the Mississippi Valley. Limestones of this stage are found in Texas, Arkansas, Kentucky, Tennessee and Alabama, and in places reach a thickness of 600 feet. Some of the Lower Carboniferous limestones of West Virginia correspond in age to the Chester. The characteristic fossils include several genera of lamellibranchs and brachiopods. See CARBONIFEROUS.

CHESTERFIELD, Philip Dormer Stanhope, 4th Earl of, English statesman and orator: b. London, 22 Sept. 1694; d. 24 March 1773. On the accession of George I, General Stanhope, his great-uncle, procured him the place of gentleman of the bed-chamber to the Prince of Wales; and the borough of Saint Germain, in Cornwall, elected him to Parliament, though he had not yet attained the legal age. He soon acquired distinction as a speaker, which he maintained also in the Upper House after his father's death in 1726. In 1728 he was appointed Ambassador to Holland, and succeeded in delivering Hanover from the calamities of the war by which it was threatened. He was afterward, in 1744, appointed lord-lieutenant of Ireland, and on his return in 1746 received the place of Secretary of State; but in 1746 retired from public affairs, and devoted the remainder of his life almost entirely to study and the society of his friends. His talents as an author were displayed in several moral, critical and human essays, in his parliamentary speeches, which were printed at a later period, and particularly in a collection of ‘Letters to His Son’ (1774), which have become famous. To the charms of wit and grace he united good sense, a thorough knowledge of the manners, customs and the political condition of Europe, and a vast acquaintance with the languages and literature of all nations. His advice and recommendations to his son grace of manners as the most essential quality for a man of the world, and even instigates him to licentious irregularities. Another series of letters addressed to his godson, and published in 1789, show Chesterfield in a more favorable light. (See CHESTERFIELD'S LETTERS TO HIS SON.) Consult Browning, ‘Wit and Wisdom of Lord Chesterfield’ (New York 1891); Birrell, ‘Lord Chesterfield’ (New York 1905); and biographies by Ernst (London 1863); Craig (London 1907). A collection of hitherto unpublished letters appeared in ‘Nineteenth Century and After’ (ed. by R. Louden, London 1912).

CHESTERFIELD, England, town in Derbyshire, on the Midland Railway, 24 miles north of Derby. It has a large market-place and five principal streets, and is in part partially built. Among its public buildings are a large parish church, noteworthy for its crooked wooden spire 250 feet high, a commodious townhouse, guild-hall, grammar-school, the Stephenson Memorial Hall and the Chesterfield Institute. The principal manufactures are gingham, lace, earthenware, leather, etc., but a majority of the working people are employed in connection with the collieries, iron-mines, quarries and blast furnaces of the vicinity. There are also iron-foundries, corn-mills, and engine works. Mrs. Radcliffe, the celebrated romance writer, was born at Chesterfield, and a branch of the Stanhope family takes its title of earl from the town. Pop. 37,400.

CHESTERFIELD INLET, Dominion of Canada, an inlet of Hudson Bay, near its north-west extremity 250 miles long and 25 miles across at its widest part. It receives the waters of several rivers, contains numerous small islands and connects with interior lakes.

CHESTERFIELD'S LETTERS TO HIS SON. The letters of Philip, 4th Earl of Chesterfield, a leading statesman of his age, to his (illegitimate) son, Philip Stanhope, are to be
Chesterton—Chestrut

distinguished from the letters to his godson and successor of the same name. Neither set was meant for publication. The 'Letters to His Son' were written between July 1761, when the boy was five and one-half years old, and June 1770. Composed in English, French and Latin, they were designed to convey instruction—both by repeated precept and varied example—in language, history, literature, good manners, morality, and a general knowledge of mankind. At the age of six the boy receives Dryden's 'fine lines':

When I consider life 'tis all a cheat;
Yet, fooled with hope, men favor the deceit.

For a knowledge of men, advises Chesterfield, read La Rochefoucauld and La Bruyère. Study the French character-skeches, comparing them with persons you know. Better read one man than 10 books. Human nature, ever the same in essence, is varied in its operations. Discover the ruling passion deep in the heart of the individual; do not trust him where that is concerned. Avoid vulgar liaisons—curiously come at the root of sin and cultivate the best in all domains of life, but do not necessarily enter the lists as champion of anything. Let people enjoy quietly their errors both in taste and religion. Do not tell everything; acquire the art of dissimulation, and distinguish between this and simulation—never lie. The greatest fools are the greatest liars. Lecky's estimate of Chesterfield is severe: 'His delicate but fastidious taste, his low moral principle, his hard, keen, and worldly wisdom.'

But the father loved his son and knew how to be a friend. His letters are full of real, not feigned, interest, and have something for every reader. And he did well to insist upon cultivating 'the graces' in an age marked by coarseness of language and conduct in both men and women, when bull-haunting and cock-fighting were deemed genteel. Neither the son nor the godson became a pattern of wit and good breeding; but it is unfair to say that the solicitude of their mentor was lavish on them in vain. A complete edition of Chesterfield's 'Letters to His Godson' did not appear until 1890 (Lord Carnarvon's). Consult also the essay by Sainte-Beuve; and 'Cambridge History of English Literature' (Vol. X).

Lance Cooper.

Chesterton, Gilbert Keith, English author and journalist: b. London 1874. He was educated at Saint Paul's School, London. He early began reviewing art books, and his fresh and piquant style soon attracted attention. He has essayed criticism, biography, poetry and fiction, and has specially excelled in the first named, the agreeably pungent flavor of his obiter dicta and the heterodoxy of his literary judgments drawing large circles of readers. Among his works are 'Wild Knights'; 'The Defendant'; 'Browning' (1903); 'The Napoleon of Notting Hill' (1904); 'Dickens' (1906); 'Tremendous Trikes' (1909); 'George Bernard Shaw' (1909); 'What's Wrong with the World' (1910); 'Alarms and Discursions' (1911); 'The Victorian Age in Letters' (1913); 'The Flying Inn' (1914); 'A Short History of England' (1917).

Chesterton, Md. town and county seat of Kent County, 30 miles east of Balti-

more, on the Pennsylvania Railroad and on the Chester River. There are basket factories, phosphate manufactories and planing and strawboard mills. It is the seat of Washington College, organized in 1773. Pop. 2,735.

Chestrut, James, American soldier and statesman: b. near Camden, S.C., 1815; d. Feb. 1885. He was graduated at Princeton in 1835. From 1842 to 1852 he served in the South Carolina legislature and from 1854 to 1858 was a member of the State senate. A vacancy occurring in the United States Senate, he was appointed to fill the unexpired term, and was formally elected senator (C. J. Jan.), 1859. He resigned on 10 Nov. 1860, in anticipation of the secession of South Carolina, but his resignation was not accepted, and he was formally expelled, 11 July 1861. In the meantime he had been appointed delegate to the Confederate Provisional Congress. He was commissioned colonel in the Confederate army and detailed as aide-de-camp on the staff of Jefferson Davis. In 1864 he was promoted brigadier-general and assigned to a post on the coast of South Carolina. In 1866 he was a member of the National Democratic Convention that nominated Horatio Seymour for the presidency.

Chestrut, che'snut, a genus of trees, and shrubs (Castanea) of the family Fagaceae. The species are characterized by long male catkins and bristly ovariads (burs) which contain rounded nuts. Three species are of wide economic use, their wood being used for many purposes, their bark for tanning and their nuts for food. In America the most important species is the common chestnut (C. crenata), which is a tall spreading tree often attaining a height of 100 feet and a girth of 10 or more feet in the forests, which are usually upon high gravelly or sandy land or mountain sides where clay and loam are absent or but slight evidence. Its range is from New England to the high lands of Alabama and westward to southern Michigan. During the closing half of the 19th century this species attracted the attention of horticulturists, who have produced about a score of improved varieties worthy of being cultivated for their nuts. The Japanese chestnut (C. crenata) has long been cultivated for its large nuts, which are produced by very young trees and are highly prized for food. The trees are rather dwarf, compact and symmetrical, and free from the attacks of blights, qualities which, together with their ease of propagation, have commanded them to orchardists throughout the world. During the closing years of the 19th century it came into prominence in America. The European chestnut (C. sativa), a native of southern Europe, northern Africa and western Asia, is a large tree which forms great forests throughout its range. Its nuts are probably more widely used as food than those of either of the other species, being a principal article of diet in the western countries bordering the Mediterranean Sea. In America it has become popular with orchardists on account of its large nuts. Of the three species the American produces the finest flavored nuts, but they are generally much smaller than those of the other two species.

Another American species is valued for its
nuts. The chinquapin (C. pumila), which is usually less than 10 feet tall, but occasionally attains a height of 30 feet or even more, is found from Pennsylvania to Florida and westward to the Pacific coast. It bears small, smooth, ovoid pointed nuts about half the size of ordinary American chestnuts. They are as yet little cultivated and have produced few varieties.

The various species and their varieties are readily propagated from seed. The seedlings are, however, generally grafted with choice varieties, and when the grafted plants are one or two years old they are set in orchards and cultivated like other fruits or are allowed to care for themselves. In places where chestnuts grow naturally, the sprouts which arise from the stumps of felled trees are often grafted with European or Japanese varieties, and the land pastured with sheep. The principal enemy of the chestnut in North America is the chestnut bark disease, produced by a parasitic fungus. This has caused the death of large forests of the trees in the northern portion of their range and threatens the destruction of all the native chestnut trees. So far, no wholly satisfactory method of fighting it has been discovered.

Chesuncook, ché-sun'kóok, Lake is in Penobscot County, Maine. It is really an expansion of the Penobscot River, is 20 miles long and 2,500 feet above sea-level.

Chettik, chêt'ık, a tree of Java, the Styrchnos nux-vomica yielding a very virulent poison called by the same name, more powerful than that obtained from the upas-tree. It causes violent convulsions. There is no known antidote.

Chettle, Henry, English dramatist and pamphleteer; d. about 1607. He was editor of Greene's 'Groatsworth of Wit' (1592), wrote 13 plays of considerable merit, and was part author of 35 others, including 'Robin Hood' in two parts; 'Patient Grisel', 'The Blind Beggar of Bethnal Green', and 'Jane Shore'. In 'The Castle of Peril' (1598) he is mentioned as one of the 'best for comedy amongst us.' Of his other works, his 'Kind-Hart's Dreae' (1592?) and 'Englands Mourning Garment' (1603), are of interest, the former as containing an apology undoubtedly intended for Shakespeare as one of those whom Greene had attacked; the latter having a stanza supposed to be addressed to Shakespeare as 'silver-tongued Melicert.'

Cheval, shé-vá', A (Fr. Cheval, horse); on horseback, astride any object. In a military sense, a body of troops is said to be à cheval of a river, if one wing is stationed on the right and the other on the left bank.

Chevalier (Lat. caballus, horse, Fr. Chevalier), an honorary title given especially in the 18th century, to younger sons of French noble families. Brought up in comparative luxury, and left at the death of their fathers almost penniless and provided for, these men generally lived at the expense of others, as a sort of aristocratic parasite, even when they did not prefer recourse to such less honorable means of livelihood as gave occasion to the synonym for swindler, chevalier, d'industrie. In the plays of the 18th century the chevalier is a constant figure. Both the Old and Young Pretender were each called the Chevalier by their partisans. The word is at present often used with its old meaning, and a chevalier may mean a young horseman. The chevalier was originally so called because he rode a horse; but as only the nobles and those connected with the life of the upper classes could afford horses, the term chevalier came to have the sense we attach to it to-day.

Chevalier, shé-vá-vý', Albert, English comedian; b. 21 March 1801. He is of Italian, French and Welsh blood. His first appearance was at the age of eight. For many years he was associated on the stage with the Kendals, John Hare, etc. For four years he appeared in music halls, then he came into vogue as a drawing-room entertainer with his coster ballads. He has made tours in England and America and has given 1,000 recitals at Queen's Hall, London. Besides 100 sketches, monologues and plays, he has published a volume of reminiscences, 'Before I Forget' (1901).

Chevalier, Michel, French economist; b. Limoges, 13 Jan. 1806; d. Montpellier, 28 Nov. 1879. He was educated as an engineer in the School of Mines, joined the Saint Simonians and suffered six months' imprisonment for promulgating the free doctrines of Père Enfantin's party. On his liberation he denounced his extreme doctrines, and was sent to the United States and to England on special missions. He spent two years in America, traveling, investigating and making his report to the French government and writing frequent letters to the Journal des Débats. He visited the United States, Mexico and Cuba. He negotiated with Richard Cobden a commercial treaty between England and France in 1860. He became a counselor of state (1830), professor of political economy in the Collège de France (1840), member of the Chamber of Deputies (1845), and member of the Institute (1851), senator in 1860, and grand officer of the Legion of Honor the following year. He published 'Letters on North America' (1830); 'On the Materials of Interest in France'; 'Essays on Industrial Politics'; 'Course in Political Economy'; 'History and Description of the Ways of Communication in the United States' (1840-48); 'Mexico: Ancient and Modern' (1863). He was a strong advocate of free trade, and a specialist on questions of currency.

Chevaux-de-Frise, shé-vů-dě-frěz (Friesland horses, so called because first used at the siege of Groningen, in that province, in 1658), armed beams of square timber or iron used to defend the fronts of ramps, breaches, etc., by closing them up. They are usually from 15 to 18 feet long, and connected by chains, each being perforated with small holes to receive rods of wood or iron, pointed at their extremities, and when moved in any direction making a sort of hedge of spears. In their original form they were made of spears, sword-blades and other steel instruments such as were readily found at hand in the army equipment.

Cheverus, shě-vróö, Jean Louis Anne Magdeleine Lefebvre de, French bishop and cardinal of the Roman Catholic Church; b.
CHINQUAPIN

CHEVES — CHEVREUL

Mayenne, France, 28 Jan. 1768; d. Bordeaux, 19 July 1836. He was ordained priest in 1790. Refusing to take the constitutional oath regarding the clergy, he was imprisoned at Paris as constable in 1791. Evading the government, he went to England. There he engaged in missionary work, but in 1796 he came to Boston, Mass., where he was noted for his graceful and winning pulpit eloquence. In an epidemic of yellow fever in the city he ministered bodily and spiritually to the sick. He studied the language of the Akenaki Indians on the Penobscot and the Passamaquoddy in Maine, visited their settlements and remained among them at his first visit three months; and every year thereafter he repeated his visit to them, built them a church and procured for them a missionary priest, who thereafter till his death, 20 years later, devoted himself to their spiritual care. On the occasion of a visit of President John Adams to Boston, the two seats of honor at a public banquet were reserved for the chief magistrate and the priest. Mr. Adams' name headed the list of names of subscribers to a fund to erect a church for Cheverus' congregation. In 1810 Cheverus was consecrated bishop of Boston and entered on the duties of the episcopate with a zeal and industry that taxed his strength to the utmost, and his physicians in 1823 counseled his return to his native land. There the French King, Charles X., named him bishop of Montauban, and, in 1829, bishop of Bordeaux and a peer of France. Here in a visitation of cholera he placarded his episcopal palace as a maison de sécours or dispensary. At the instance of King Louis Philippe the Pope, Pius VII, in 1836 created him a cardinal. The position that Boston now holds in the Catholic Church is due to the earnestness, zeal and skillful administration of Cheverus during his years of labor there. Consult 'Life,' by Huen-Dubourg (1837).

CHEVES, chèvè, Langdon, American statesman; b. Rocky River, S. C., 17 Sept. 1776; d. New Orleans, 25 June, 1847. He began to study law at the age of 18, entered upon his profession with superior natural qualifications and after severe discipline he rapidly attained eminence and wealth in its practice. He was a member of Congress before and during the War of 1812, and was a zealous supporter of the party which carried the declaration of war. He was chairman of the Naval Committee in 1812, and of the Committee on Ways and Means in 1813, and constantly opposed the restrictive system. When Henry Clay was sent as commissioner to Ghent, Cheves succeeded him as speaker of the House. He retained this office till 1815. The National Bank under injudicious management had come hard pressed and was on the verge of stoppage in 1819, when Cheves was elected president of its board of directors. By a rigorous system of retrenchment, and by making credits only upon sufficient securities, the bank was saved, and specie payments maintained at the then nominal rate. In 1822, but elected to Eng. office after three years, he became, chief commissioner under the treaty of Ghent for settling some of its provisions.

CHEVET, chè-vèt, a variety of the apse, almost exclusively confined to French Gothic churches. The extreme end of the chancel or choir is called the chevet. The apses or chapels are made to radiate around the choir aisle. There are generally five apses, but, especially in early architecture (from the 11th century), constructed with four apses are met with. Henry III introduced the chevet into England, in a part of the edifice of Westminster Abbey. In some French churches there are only three; but in others there are seven, and in still others, nine apses, the second one of which was generally dedicated to the Virgin Mary.

CHEVILLARD, shè-vè-yèr', Camille, French composer; b. Paris, 14 Oct. 1859. His father was the famous 'cellist, Pierre Chevillard. He was self-taught in composition and studied the piano under G. Mathias. For many years he was assistant conductor to his father-in-law, Lamoureux, whom he succeeded in 1899. He continued the Concerts Lamoureux and maintained the high standard established by his predecesor. He received the Chartier prize for chamber music in 1903, and was president of the French Society for Chamber Music. His compositions include a symphonic ballad, a symphonic fantasy, a string quartet, a piano trio, a sonata for violin and piano, and a sonata for piano and 'cello.

CHEVIOT, shè-vè-èt, Hills, a range on the borders of England and Scotland, stretching southwest to northeast for about 35 miles, the larger part of the range being in Northumberland, England, and the lesser part in Roxburghshire, Scotland. Their culminating point, known specially as the Cheviot, has a height of 2,676 feet; Carter Fell, the next in height, is a little more than 2,000 feet high. They are clothed for the most part with a close green sward, and are pastured by a celebrated breed of sheep admirably adapted for hilly districts, and known in many of the more elevated districts of Great Britain. They form the head-waters of the Tyne, Tweed and other rivers of the border country.

CHEVIOT SHEEP, a breed of sheep of large carcass and valuable fleece, which has been pastured from time immemorial on the Cheviot Hills, on the borders of England and Scotland, and whose hardy and warlike endurance is justly regarded as the most valuable mountain sheep of Great Britain. The peculiar features of the Cheviots are the absence of horns in both sexes; white or mottled-gray face and legs, an erect, long and clean head, destitute of wool, while both the throat and neck are well covered, long open ears well covered with hair, and altogether a fine, open, sprightly countenance, with every indication of hardiness. The fleece weighs from three to four pounds, and the weight of the carcass varies in ewes from 12 to 16, and in wethers from 16 to 20 pounds per quarter. The Cheviots, though originally confined to a small area, are now spread over all parts of the kingdom, and, except on the most barren and stony grazings, are far more profitable than the heath breeds.

CHEVREUL, shè-vèr', Michel-Eugène, French chemist; b. Angers, 31 Aug. 1786; d. Paris, 9 April 1889. He was educated in his native town, and when a youth went to Paris, and was employed in the chemical factory of Vauquelin. In 1813 he became professor of
physical science in the Charlemagne Lyceum; in 1824 he was made director of dyeing in the chemical laboratory of Gobelsius, and in 1830 succeeded Vaucqin in the chair of chemistry at the Museum of Natural History. He was the author of ‘Lectures on Chemistry Applied to the Art of Dyeing’ (1831) and other treatises on chemistry and dyeing, and an important work on the ‘Principles of Harmony and Contrast of Colors’ (1839), which has been translated into English. He was a commander of the Legion of Honor, and the centenary of his birth was celebrated in Paris with much enthusiasm.

Chevrel’s studies and discoveries had a deep and far-reaching effect upon the scientific development of organic chemistry. He led the way to the use of proper methods of analyses and the establishment of scientific rules of procedure with the use of fixed nomenclature in all chemical investigation, which, he insisted, should be, above all things, exact. He is one of the most original figures of his age and he has left a very definite impression on the page of chemistry.

CHEVREUSE, chê-vrœz, Marie de Roban Montesson, née de La Roë, Duchesse, or daughter of the Duke of Montesson, French political adventurer: b. December 1600; d. Gagay, near Paris, 12 Aug. 1679. When scarcely 17 years old, she married the Duke of Luynes who died four months afterward. She next became the wife of Claude de Lorraine, Duke of Chevreuse. A great friend of Anne of Austria, by whom she was made superintendent of the royal household, she incurred the hatred of Richelieu, and succeeded so well in making herself obnoxious to him, that he determined to have her arrested; but, made aware of his project, she assumed man’s attire, crossed the Somme by swimming and fled to England (1637). For years she was an exile from France, and King Louis XIII had been so much inspired by his mistress with such fear of her uncontrollable spirit and cunning, that in his will he forbade her return to France. In spite of this, Anne allowed her to return, without, however, showing her the same degree of confidence as before; though she made her as presentable as possible. Afterward she engaged in new plots against Mazarin, mostly acting in concert with Cardinal de Retz, and was once more compelled to leave France, fleeing to Flanders. She soon returned to France and made her peace with Mazarin, and became his helper in several political intrigues. Throughout all these adventures and audacious intrigues the Queen had a soft place in her heart for the pretty, clever and charming Duchess, whom she learned, however, not to trust altogether.

CHEVROTAIN, chêvrot’-tān (Fr. Chevrot, lat. caper, goat) a family (Tragulidae) of ungulates, which, though belonging to the same family, differ in many respects from true deer; they resemble the true Cervidae in certain minor peculiarities, and the musk-deer in others; but anatomically they are, in the main, distinct, especially in such of the more important characteristics as make naturalists class them by themselves. The chevrotains are divided into two genera, one African, and the other Asiatic, the latter genus (Tragulus) being that of the true chevrotains. These form a group of diminutive, horsetail-like creatures, standing only about 12 inches high, found in southern India, Ceylon and the Malay Peninsula. They are usually reddish, tawny or mouse-gray in color, except the Indian mouse-deer (Tragulus memecel), which has a peculiarly stiff manner of walking, and given to hiding in thickets and inaccessible caves. They may, however, be readily tamed. They are considered as a survival of the Miocene form to which is also attributed the ancestry of the deer.

CHEVY CHASE, chē’vē chāz, the name of a celebrated border ballad probably founded on some actual encounter occurring between Percy and Douglas, although the incidents mentioned in it are not historical. It is this ballad that Sir Philip Sydney speaks of when he says, in his ‘Defense of Poetry,’ ‘I never heard the old song of Percie and Douglas that I found not in my heart moved more than a trumpet’; and which is made the subject of a critique by Addison in Nos. 70 and 74 of the Spectator. On account of the similarity of the incidents in this ballad to those of ‘The Battle of Otterbourne,’ and the battle of the two halves have often been confounded; but the probability is that if any historical event is celebrated at all in the ballad of Chevy Chase, it is different from that celebrated in ‘The Battle of Otterbourne,’ and that the similarity is to be explained by supposing that the incidents were borrowed.

There are two versions of the ballad bearing the name of Chevy Chase, an older one and a more modern one. The older version is sometimes called ‘Hunting of the Chevrot,’ which is its original title. It begins thus:

The Perse owt of Northumblande,
And a vowe to God mayd he,
That he would haste in the hunteyns
Off Chvivat within dayes thre,
In the mauger of doughtie Dogles.
And all that ever with him be.”

Neither the exact age nor the name of the author of this version is known. From the fact that it is mentioned in the ‘Complaynt of Scotland,’ written in 1548, where it is called the ‘Huntis of the Chevot,’ it is clear that it was known in Scotland before that time, and since James of Scotland is mentioned in the ballad, it may be Infer that it was written before the reign of Henry VI, for James I did not ascend the throne of Scotland till two years after Henry VI had become king of England. As for the author, it is true that a manuscript of the ballad contained in the Ashmolean collection at Oxford is subscribed by one Rychard
Sheale, but it is likely that this Rychard Sheale was merely one who had frequently recited the ballad, and perhaps the person who committed this old version to paper. This is probably the vanity of Sir Richard's grandson, Francis, who was acquainted, since he speaks of it as "evil apparelled in the dust and cobweb of an uncivil age."

The age of the more modern version is no better known than that of the older one, but it is said by Dr. Rimbault to be no later than the reign of Charles I. The version which forms the subject of the critique by Addison in the above-mentioned numbers of the Spectator. The following is the opening stanza as given in Percy's Reliques:*

* God prosper long our noble king, Our lives and safetys all, A woeful hunting once there did In Chevy-Chace befall."

CHEW, Benjamin, American jurist: b. West River, Md., 1722; d. 1810. He studied law in Philadelphia in the office of Andrew Hamilton and later in London. He returned to Philadelphia in 1754 and held successively the offices of register of wills, attorney-general and chief justice of Pennsylvania. He joined the ranks of the Loyalists on the outbreak of the Revolutionary War, resigned the office of chief justice and retired to private life. His stubbornness in refusing to sign a parole led to his imprisonment at the Castle of York, Va., in 1777. During the battle of Germantown his mansion there was badly damaged in the bombardment. From 1790 to 1806 Chew was president of the High Court of Errors and Appeals, which was abolished in the latter year.

CHEW, Ng Poon, Chinese-American editor: b. Sun Ning, China, 1860. He was educated at the American School, San Francisco, and at the Theological Seminary there. He was destined for the Taoist ministry by his parent, but becoming a convert to Christianity he entered the Christian ministry. In 1889 he resigned and established the first illustrated Chinese weekly and also the Chung Sai Yat Po, the Chinese daily newspaper in the United States. In 1906 he was made adviser to the Chinese consulate general. He is a recognized authority on matters pertaining to Asiatic customs and Chinese-American relations. His published works include 'Non-Exclusion' (1905) and 'Treatment of Exempt Classes of Chinese in America' (1908).

CHEWING-GUM, a resinous gum used as a masticatory. The habit of chewing gum is perhaps peculiar to the United States. At first the resinous exudations of the spruce, cherry, etc., were employed in their native state; but with the increase of the habit the spruce supply nearly failed, and recourse was had to other ingredients. The gum resins of sweet gum, tamarack and certain other forest trees are also used. Balsam of tolu is a constituent of certain kinds of gum, while paraffin has also been employed. Paraffin is also very largely used as an adulterant in the cheaper grades of gum, which in consequence crumble when chewed. Of late years a gum known as chicle, an elastic gum from the nasberry, a tree of tropical South America, somewhat similar to the India-rubber tree (q.v.), has come to the front as the foundation of most of the chewing-gum. The chicle gum is chopped into fine particles, dried and then cooked in steam-jacketed kettles. At this stage sweetening and flavoring ingredients are added to the mass, which is mixed mechanically. The resulting "dough" is then kneaded on a table and rolled between rollers having knives set into their faces. The knives cut the sheets into suitable sizes for the market, and, after drying, the sticks are wrapped, packed and shipped. The practice of chewing gum is probably harmless, and in mild cases of indigestion which may be somewhat beneficial, by mechanically stimulating the flow of saliva. Pepsin, mint and similar substances are often mixed in with the gum; thymol being added in the so-called antiseptic gums, but it is safe to say that the success of any particular brand depends more upon its sweetness and flavor than upon any beneficial properties. In 1914, 2,689 persons were engaged in the manufacture of chewing-gum in the United States, in 74 establishments with a capital of $10,625,000; the salaries and wages amounted to $1,648,000. Raw materials to the value of $7,322,000 were turned into a finished product valued at $17,159,000.

CHEWINK. See Towhee Bunting.

CHEYENNE, shi-en' (Sioux, "red," i.e. foreigners = enemies; their own name = "ours") an important Indian tribe of the great Algonquin stock, and its westernmost member except the Blackfeet. In the 18th century they lived on the Cheyenne River in eastern North Dakota, but were gradually driven southwest by the Sioux to the forks of the Big Cheyenne near the Black Hills, where Lewis and Clark found them in 1803. Originally settled agriculturists, their acquisition of horses turned them, like the other plains Indians, into nomad raiders and led to their foraying even to Mexico, and claiming lands as far apart as the upper Missouri in northern Montana, and the forks of the Platte, though they numbered but little over 3,000. The first United States treaty with them was made in 1825 in the former locality. They had already fraternized with the Sioux; and when their location at the mouth of the Cheyenne was unsatisfactory, one section (the "Northern Cheyenne") joined the Ogallalla Sioux in driving the Crows from the Powder and Tongue river valleys in southeast Montana, while the remainder (the "Southern Cheyenne") moved south and formed a confederacy with their Algonquin kinsmen, the Arapaho, on the Arkansa. In 1851 a treaty was made with the Northern band at Fort Laramie, on the North Platte, to cut roads through their lands. A number of treaties were made with the Southerns, but it is alleged that the commissioners neither made them intelligible nor executed them fairly; the Cheyenne, with their Indian allies, committed the usual atrocities which were their one method of retaliation; the settlers clamored for their extermination; the military compelled them to bow them by heavy punishment; the Indian Department blamed both and wished peace. The Indian commissioner in 1864 sent some 400 Cheyenne and Arapaho to a camp at Sand Creek, Colo.; Col. Colby at Cheyenne killed 29 November (see SAND CREEK MASSACRE), and butchered 131 men, women and children. A bloody and costly war followed; the next year the tribe consented to go upon a reservation, except a band called the "Dog Soldiers,"
who held out. In 1867 Hancock burned their village at Pawnee Fork, and another war with them began. On 27 Nov. 1871, Custer inflicted a crushing defeat upon them at the Washita in the post-office, the Kettle, the chief, and compelling them to return to their reservation. The Northern band all this time remained peaceful, despite urgent solicitations from their brethren and the Sioux. Fresh trouble broke out in 1866 and 1868. The Northern Cheyennes are on reservation in the Tongue River Valley, Custer County, Mont.; the Southern Cheyennes are united with the Arapaho, in Oklahoma; their reservation was on the Canadian River, near El Reno, but was opened up in 1892. The tribe numbers about 3,055, and is governed by a council of five chiefs. The Cheyennes are a tall, finely built race, the best physically of all the plains Indians except the Osages; but rather dull intellectually. Their language is one of the most difficult even of Indian tongues. They live in tepees, observe the Sun Dance, and maintain a complex social organization. Consult Dorsey, 'Field Columbian Museum Publications' (Chicago 1905).

CHEYENNE, locally sh'än, Wyoming, city, capital of the State, and county-seat of Laramie County, on the Union Pacific, the Colorado and Southern, and the Burlington Route railroads, 110 miles north of Denver. Cheyenne, named after the local Indian tribe, is situated in the southeastern part of the State on a plateau near the Laramie Range, 6,075 feet above sea-level. A Boulevard three miles in length extends northwest to Fort D. A. Russell, an important United States military post, with buildings and equipment valued at $7,000,000, commemorating the Union officer, Maj.-Gen. David Allen Russell, who was killed at Opequan, Va., in 1864. Cheyenne was founded and the fort built in 1867, by Union Pacific Railroad engineers and United States army officers, who reached this point, and here the Union Pacific Railroad established its main work and repair shops which have contributed largely to the industrial prosperity of the city. Coal, iron, oil and other valuable mineral deposits are worked in the vicinity, and besides numerous manufactures of commodities for local consumption and export, dry-farming, cattle and sheep-grazing are large and important industries. Cheyenne is the centre of an extensive meat-growing region, shipping beef, cattle and sheep to eastern markets, and is also the supply depot for a large amount of the game hunting trade and sport of the Rocky Mountains. Cheyenne is attractively laid out with broad streets and boulevards, and enjoys the distinction of having been the first city in the United States to be lighted by electricity. It has modern gas plant, electric street car system, an up-to-date fire department, and a municipal system of waterworks, including five storage reservoirs and a filtration plant which purifies the water. Black Hills and ornamental lakes cover 800 acres. "Frontier Days," an annual celebration providing the largest Wild West show of its kind in the world, is a feature of civic life which attracts thousands of visitors. Cheyenne was selected capital of Wyoming Territory in 1869, and was almost destroyed by fire in the same year. The city is administered by three commissioners under the commission form of government. Its chief buildings are the State capitol, the Federal building and post-office, the Kettle, the chief, and compelling them to return to their reservation. The Northern band all this time remained peaceful, despite urgent solicitations from their brethren and the Sioux. Fresh trouble broke out in 1866 and 1868. The Northern Cheyennes are on reservation in the Tongue River Valley, Custer County, Mont.; the Southern Cheyennes are united with the Arapaho, in Oklahoma; their reservation was on the Canadian River, near El Reno, but was opened up in 1892. The tribe numbers about 3,055, and is governed by a council of five chiefs. The Cheyennes are a tall, finely built race, the best physically of all the plains Indians except the Osages; but rather dull intellectually. Their language is one of the most difficult even of Indian tongues. They live in tepees, observe the Sun Dance, and maintain a complex social organization. Consult Dorsey, 'Field Columbian Museum Publications' (Chicago 1905).

CHEYENNE, châ'né, Edward Potts, American educator and sociological writer: b. Wallingford, Pa., 17 Jan. 1861. After graduating from the University of Pennsylvania in 1883, he took a post-graduate course there, and later traveled abroad, studying in German universities and in the British Museum. Upon
his return he was appointed professor of European history in the University of Pennsylvania. He has written 'Social Changes in England in the 16th Century' (1896); 'Social and Industrial History of England' (1901); 'A Short History of England' (1904); 'Background of American History' (1905); 'Readings in English History' (1908); 'A History of England from the Defeat of the Armada to the Death of Elizabeth' (2 vols., Vol. I, 1914); also monographs and reviews articles on history and economic subjects.

CHÉZY, shā-zē, Antoine Léonard de, French Orientalist: b. Neuilly, France, 15 Jan. 1773; d. there, 31 Aug. 1832. He began his studies in the École Polytechnique, and afterward attended the lectures of Audran, Cauuin and Silvestre de Sacy, on Oriental literature. Unassisted, he taught himself Sanskrit, and became so proficient in it that, in 1815, a chair of Sanskrit was formed expressly for him in the College of France. Among his productions is a free French translation of the Persian poem, 'Medjouin and Leila.' He also published Kaflidasa's drama of 'Sakuntala,' in the original, with a translation accompanied with notes. Consult Klein, 'Chézy, Wilhelmine Christine von' (Paris 1830).

CHÉZY, Wilhelm von, German novelist and historical essayist: b. Paris, 21 March 1800; d. Vienna, 13 March 1865. He was the son of A. L. Chézy (q.v.). He acquitted himself creditably as a journalist, and wrote many popular tales: 'The Wandering Pupil' (1835); 'The Six Noble Passions' (1842); and 'The Last Janissary' (1855), among them; as well as 'Chivalry in Picture and Word' (1848).

CHHATISGARH, chūt-tēs-gār', India, the southeastern division of the Central Provinces, comprising formerly the districts of Raipur, Bilaspur and Sambalpur, and several small feudatory states. In 1906 Sambalpur was given to Bengal, and the district of Drug constituted out of parts of Raipur and Bilaspur. Its area is 21,240 square miles. It is mainly a vast fertile plateau, and has of late become a great centre of the Indian grain trade. Dongargāon is the capital. Pop. 3,246,767.

CHABRERA, Gabriele, kē-ā-brē-rā', Italian lyric poet: b. Savona, 8 June 1552; d. Savona, 14 Oct. 1637. Impatient of dependence on the great, he again and again abandoned the courts of noble patrons. He visited Rome and resided a considerable time at Florence and Genoa, settling finally in his native place. Wherever he went he was loaded with presents and honors. Pindar and Anacreon were his models among the poets, and his countrymen named him "the Italian Pindar," but his Pindaric odes have little grace and force, being labored rather than spontaneous. Some of his little songs after Anacreon are models of elegance and grace. He wrote epic and dramatic poems also. He showed himself a master of complex rhythms ambitious and new in form, and a master of the Italian language such as had never before appeared. He was the last of the great Italian writers until the appearance of Manzoni in modern times. He left a charming autobiographical sketch. His collected poems were published under the title of 'Rime.' Chaibrera showed little originality in anything except a few of his lyrics; but his strict adherence to Latin form had a strong influence upon succeeding Italian literature.

CHIAJA, ki'ā-yā, a fashionable driveway in modern Naples, commencing at the Largo Vittoria and extending for a mile along the coast. On one side is the public park, the Villa Nazionale and on the other side are many handsome and imposing buildings and hotels.

CHIAN, ki'an, or CYPRUS TURPENTERINE, a greenish-yellow, non-acid turpentine or resin obtained mainly from the island of Chios (Scio), yielded by Pistacia terebinthus, of the order Anacardiaceae, a large tree, native to the Mediterranean islands and shores. The turpentine, now used only in medicine, exudes from the tree in small quantities during the warmer months, but it is obtained at other seasons by making incisions in the bark.

CHIANIA, kē-ā'nē-a (the ancient Clanis), a river of central Italy, originally a tributary of the Tiber, watering a perfectly level valley, which its overflow rendered once the most pestilential district of Italy. The bed was abandoned in 1789-1816, and in 1823 extensive hydraulic works were undertaken for further improving the river course, and for leading a north branch, through canals, to the river Arno, a few miles below Arezzo, the south stream reaching the Tiber through the Paglia at Orvieto. The double stream is 60 miles long, and one-half to one mile broad; and the district has since become one of the most fruitful in all Italy.

CHIANTI, kē-ān'tē, a district in Tuscany, province of Siena, Italy, where what is now the best-known red wine of Italy is produced. Chianti wine is full flavored and astringent, with an alcoholic strength of about 20 per cent.

CHIAPANECs, chē-ā-pā'néks, or CHAPANECs, a tribe of Indians inhabiting the state of Chiapas in the southern part of Mexico. They were at one time very powerful and evidently were well advanced in agriculture and picture writing. They also had made some progress in mechanical art and lived in well-made houses. They were never conquered by the Aztecs but the Spaniards easily overcame them. A few remaining members of the tribe still exist in central Chiapas. They are supposed to have entered Mexico at a time much anterior to the arrival of the Aztecs, from whom they borrowed a part of their religious ideas and some of their culture. They also borrowed from the Mayas of Yucatan and northern Guatemala. So long as they have been known to history and tradition, the Chiapanec have been a cultured race. See MEXICO — ETHNOLOGY.

CHIAPAS, chē-ā'pās, Mexico, a state of this republic on the Pacific slope, bordering on Guatemala, having an area of 27,111 square miles. The capital is Tuxtla-Gutiérrez. The state is in many parts mountainous, and is also in many parts traversed by fine streams, including the Rio Chiapas. At Palenque are the ruins of an ancient Aztec city of great beauty and magnitude. The valleys have a rich soil and produce maize, sugar, cotton, etc. Some of the largest rubber plantations in the world are now being laid out here. There is a considerable export of logwood. Trade is, however, in a
backward state for lack of roads. Education is free and compulsory, but the law is not strictly enforced. The state forms part of the Central American table-land, and has a fine climate, although the whole region is largely clothed in primeval forests. Pop. 438,843.

CHIARI, kê-âr'e, Pietro, Italian novelist and comedian: b. Brescia 1700; d. Brescia 1788. After completing his studies he entered the order of Jesuits, but soon changed the monastic for the secular life and devoted himself solely to letters. He resided at Venice, with the title of poet to the Duke of Modena, and in the space of 10 or 12 years brought more than 60 comedies on the stage. Chiari and Goldoni were rivals, but the public adjudged the palm to the latter. Chiari's dramas in verse fill 10 volumes; those in prose, four.

CHIARI, known to the Romans as CLARIUM, Italy, town in Lombardy, in the province of Brescia, 14 miles west of Brescia and 36 miles east of Milan. It is well built, has several churches, two convents, an elementary school and a hospital, and in 1892 it became a seat of secondary education. It was a student of foreign literatures, especially English and German, and was editor of literary journals. His verse is mostly lyrical and has been collected under titles: 'Poems' (1874); 'In Memoriam' (1875), 'Lacryme' (1879), etc. It gave proof of deep poetic sensibility. He translated some of Heine's poems and published critical essays on English and German poets.

CHIAROSCURO, kê-âr-ô-sô'kô-rô, or CHIAROCSUCRO, kê-âr-ô (lt. chiaro, clear; 'scura, dark), the painting art of judiciously distributing the lights and shadows in a picture. A composition, however perfect in other respects, becomes a picture only by means of the chiaroscuro, which gives faithfulness to the representation, and therefore is of the highest importance to the painter; at the same time it is one of the most difficult branches of an artist's study, because of the want of precise rules for its execution. Every art has a point where rules fail, and genius only can direct. This point in the art of painting is the chiaroscuro. The drawing of a piece may be perfectly correct, the coloring may be brilliant and true, and yet the whole picture remains cold and hard. This we find often the case with the artistic at at least the real nature; and it is one of the great merits of this sublime artist that he left his masters far behind him in chiaroscuro, though he is considered not so perfect in this branch as Correggio and Titian, who were inferior to him in many other respects. The mode in which the light and shade are distributed on any single object is easily shown by lines supposed to be drawn from the source of the light which is shed over the figure; but chiaroscuro comprehends, besides this, aerial perspective and the proportional force of colors, by which objects are made to advance or recede from the eye, produce a mutual effect and form a united and beautiful whole. Chiaroscuro requires great delicacy in conception and skill in execution; and excellence in this branch of art is to be attained only by the study of nature and of the best masters. Chiaroscuro is also understood in another sense, paintings in chiaroscuro being such as are painted in light and shade and reflect only, without any other color than the local one of the object, as representations of sculpture in stone or marble. There are some fine pieces of this sort in the Vatican, at Rome, by Polidoro da Caravaggio, and on the ceiling of the Paris Bourse by Meynier and Abel de Pujol.

CHIASTOLITE, kê-âs-tô-lît, a variety of the mineral andalusite, occurring in stout crystals of prismatic aspect, and distinguished by containing carbonaceous impurities that are distributed through the interior according to a geometric scheme, so that the cross section of the crystal presents a twocrossed appearance or shows a distinct colored cross. In the United States it is found at Lancaster and Sterling, Mass., and in Canada at Lake Saint Francis. Also called "macle." The name "chastiolite" is derived from a Greek word signifying "arranged diagonally."

CHIAVARI, kyâ-vâ're, Italy, a seaport in the province of Genoa, on the Gulf of Rapallo, 23 miles southeast of Genoa. It has narrow streets lined with substantial houses and open arcades; statues of Garibaldi and Mazzini, attractive public gardens, a technical and nautical school and a gymnasion. Silks, lace and furnishing are manufactured, and fishing and trading are carried on. Pop. 13,700.

CHIANA, kyâ-vén'â, Italy, a town on the Mera 38 miles north-northwest of Bergamo, in the province of Sondrio, Lombardy. It stands in a valley in the midst of magnificent scenery on the road to the Splügen, and at the junction of two passes through the Alps, and has an important transit trade. Pop. 4,788.

CHIBCHAS, ch'e-b'chás, or MUSICAS, a tribe of Indians who, at the time of the conquest of Colombia, occupied the upland country in and around Bogotá. When the expedition under Gonzalo Jiménez de Quesada came into contact with the Chibchas in 1836, after a toilsome, unpleasant and dangerous journey up the Magdalena River, through jungle and forest and over rugged mountains, they were a fairly civilized people living in well-built towns and villages, cultivating the land and carrying on extensive trade and commerce. An organized government, a highly developed religion, a complicated mythology and a powerful and much venerated priesthood and ruling class bound the Chibchas into a compact nation which was fully aware of its superiority over the other races by which it was surrounded and with which it did business. The Chibchas were skilful artisans, and their work in gold, silver and precious stones was almost the equal of the best of the kind done by the native races of America. In their size, construction and architecture their temples only fell short of the excellence of the sacred edifices of the Peruvians, Aztecs, Mayas and more advanced
races of Guatemala. Though they fought valiantly in defense of their homes and their ruler and priests, the Chibchas were defeated by Quesada and their country renamed by him New Granada (Nuevo Reino de Granada); and their capital city was baptized Santa Fé de Bogotá and dedicated to the service of the king of Spain (1538). At the time of the conquest the Chibchas had amassed vast quantities of gold, which the Spaniards seized. They had considerable scientific knowledge and possessed a hieroglyphic system of writing much like that in use among the neighboring cultured native races. They traded the products of their cold upland country for those of the temperate and hot lands; and they mined emeralds and salt, for which they had a constant and ready market. These are to-day still two of the most important industries of Colombia. The salt and the emeralds from the Chibcha mines were carried down the Magdalena River and distributed all along the neighboring sea coast, and from there carried far into Central America and some of them are believed to have reached the capital of the Aztecs before the discovery of America. The Chibchas also excel in weaving, the spinning of skins and the making of pottery. Their worship was diffuse and religious, but their system, which was based on nature worship, had much affinity with the various creeds of Central America and Mexico.

CHIBOUQUE, chi-book', CHIBOUK, CHIBUK (Turk. Chibuk, pipe), a long Turkish pipe having generally a wooden stem, an amber mouthpiece and a clay bowl. The stem, which is usually from four to five feet long, is generally wound with silk, cotton or other thread. This is frequently kept wet to cool the smoke of the pipe by evaporation.

CHICA, or CHICHA, che-chi'da, a South American word having several meanings. (1) A species of Sterculia, the seeds of which are eaten in Brazil. They are about the size of a pigeon's egg and have an agreeable taste. (2) A red coloring matter prepared by the lighter parts of the Orinoco and the Rio Negro from the leaves of a plant native to that region called Bignonia chica, and with which they paint their skin, in order to be better able to resist the rays of the sun. It is of a beautiful vermilion color, and, although of a resinous nature, is not liable to become liquid under the influence of heat. It is soluble in alcohol, and stains cotton orange-yellow. It is extracted by boiling the leaves in water, decanting the decoction and allowing it to settle and cool when a red matter falls down, which is formed into cakes and dried. It is also called cajamaru. (3) A dance popular among Spanish South Americans. It is said to have been introduced into Spain by the Moors, and to have been the origin of the Jondo, the chaconne, the cachucha and the bolero and other similar dances known by distinct names in different parts of Spain, which some writers declare to be the chicha under a more decent form. It is similar in character to the dance of the Aegris-menes performed at the feast of the Venus, and still popular among the modern Greeks.

CHICA, che'kä, PITOM, pe'tô, or POSSO, a kind of beer made from maize, in general use in Chili, Peru and other mountainous regions of South America. It was the national drink of the natives long before the appearance of the Spaniards. The most ordinary method of preparing it is to steep the grains of maize until they begin to sprout, when they are exposed to the sun. The malt thus prepared is then ground, mixed with warm water and left to ferment. The beer, when ready, has a dark-yellow color and a pleasant and somewhat bitter and sour taste. It is consumed by the Indians in great quantities. When Chica has been buried for some time in the earth in pitchers it has a violently intoxicating effect.

CHICAGO, chik'a-lo', or CICA- COLE. India, a town in the Ganjam district, Madras Presidency, near the coast, about 567 miles northeast of Madras, at one time famous for its fine muslin manufactories. On two occasions, namely in 1791 and 1806, it suffered much from famine, and in 1876 a flood did considerable damage to the town. Pop. 20,000.

CHICAGO, Ill., the second city in the Union, is in Cook County, and lies on the southwestern shore of Lake Michigan. The dome of the courthouse is in north latitude 41° 53' 2" and longitude 87° 36' 47" W. The city has a shore line on the lake of 24.5 miles and extends 10 miles inland. The city area, 186.07 square miles, covers a great part of the alluvial plain formed by the Chicago and Calumet rivers. The Chicago River is formed by the junction of two small rivers, the north and south branches, thus dividing the city into three portions commonly known as the North, South and West sides, respectively. Calumet River is the outlet by which the shallow sheet of water known as Calumet Lake empties into Lake Michigan. The land on which the city is built is level and lies quite low, the elevation above Lake Michigan being only 25 feet. The two rivers form natural harbors, which have been improved by dredging. The shore of Lake Michigan is broken by few bays or inlets, and harbors are infrequent, and as a rule, not commodious. Wherever, therefore, a river is found, navigators eagerly use it, so far as its depth permits, as a refuge from the storms of the great lake. Still, rivers so small as these afford inadequate facilities for the development of such a city as Chicago has grown to be, and one of the needs of the early future is provision for a commodious harbor, with sufficient depth of water, proper dockage and protection from storms.

Early History.—In the early days of French exploration it was found that the Indians used the Chicago River as one line of travel by which the Mississippi could be reached. Passing up the river and its south branch, portage of only four or five miles brought the traveler to the Desplaines River, down which his canoe passed to the Illinois River, and so to the Mississippi. This route seems to have been used by white men for the first time in 1673, when Joliet and Marquette, returning from the Illinois River, were shown by the Indians the Chicago portage. It may be that they descended to Lake Michigan by the Calumet. Pére Marquette spent the winter of 1674-75 in a cabin on the south branch of the Chicago River, being unable on account of physical weakness to prosecute his journey to the Illinois villages. It was in the following springtime that the devoted missionary died, while endeavoring to make his
way to Mackinac by the east shore of Lake Michigan.

The French seem later to have had a fort at that point; although it was probably a mere stockade, and no regular garrison was kept in it. This fort is mentioned by James Logan in his report to the governor of Pennsylvania in 1718, and also in the Treaty of Greenville, 1795. However, the Chicago portage was abandoned by the French, as they found other routes of travel safer and more convenient.

About the time of the Revolutionary War a colored man from San Domingo, Jean Baptiste Point de Sable (or au Sable), made his way to the Chicago River and established himself there as an Indian trader. Here, about 1777, he built a house of squared logs which may be regarded as the beginning of continuous settlement at Chicago. This house he sold in 1796 to a French trader, who in turn sold it in 1803 to John Kinzie, the first American settler. The house, known as the old Kinzie mansion, stood on the north bank of the river opposite the site of Fort Dearborn was later built, and was in existence until 1837.

Kinzie was an Indian trader, and no doubt thought the Chicago a convenient centre for his business. He brought his family to his new home in 1804, the same year in which the fort was built, and thereafter continued his residence there until his death (1828).

Fort Dearborn was a mere stockade, with two blockhouses. The quarters for the garrison were enclosed in the stockade. It was situated on the south bank of the river, not far from the lake. At that time the river took a sharp turn to the south just east of the fort, and made its way into the lake over a heavy sandbar not far from what is now the eastern end of Madison street. The bar was not capable of being crossed by anything larger than a small boat, and the schooner—which, in 1804, brought the stores for the garrison had to anchor and land passengers and cargo in boats. The first garrison consisted of one company of infantry (of the First regiment). The site of the fort was on a reservation of six square miles, ceded to the United States by the Indians in Wayne's treaty made at Greenville in 1795.

The settlement at Fort Dearborn made little growth until after the War of 1812. It was in the wilderness, being reached from Detroit by a trail through the woods, and from Mackinac by lake schooners of which usually two came each year, in spring and fall.

The massacre of 1812.—In 1812 the second war with Great Britain broke out, and at the outset in the Northwest all the advantage lay with the British and their Indian allies. Mackinac was captured, thus securing to the British the control of the upper lakes, and General Hull, in command at Detroit, sent orders that Fort Dearborn should be evacuated, and that the surplus stores should be divided among the Indians. These orders were executed, and on 15 August the garrison, escorting a number of women and children by the road which wound along the lake shore. At a point among the sand hills near the eastern end of the present Eighteenth street the savages attacked in force, and the whole body of whites were captured or destroyed. Two of the women and 12 children were butchered during the fight and a number of the wounded men were killed afterward. The Indians then burned the fort and divided the plunder.

In 1813, the fort was fully restored, Fort Dearborn was reconstructed on a somewhat larger scale than before, and under protection of its garrison a small village slowly grew up.

Political Jurisdictions.—In the old days of French and British occupation of the territory, including the valleys of the Wabash, the Illinois, and the Mississippi rivers, west to the Mississippi and north to Lake Michigan, was commonly known as the "Illinois Country." The main French settlements were at Vincennes, on the Wabash, at Kaskaskia on the river of that name, and at Cahokia and Fort Chartres, on the Mississippi. In 1763, by the Treaty of Paris, the French government yielded to Great Britain all claim to land east of the Mississippi, and thus the Illinois country became British. By the Quebec Act of 1774— one of the legislative acts of the British government which led to the Revolutionary War—all of the newly-acquired land between the Ohio and the Great Lakes was included in the province of the Ohio, and placed under the arbitrary military government at that time prevailing over Canada.

In 1778 a small army of Virginia troops sent out by Gov. Patrick Henry, under command of Col. George Rogers Clark, seized Kaskaskia and Vincennes, and thus replaced British authority by American throughout the Illinois country. The treaty of peace of 1783 drew the northern line of the new republic through the Great Lakes, instead of through the Ohio River, as doubtless would have been done had it not been for Clark's victorious expedition, and thus the site of Chicago became finally American and not British. Virginia organized the Illinois country as a county—the county of Illinois—and under that government it continued from 1778 until the cession of all the Northwest by Virginia to the United States, in 1783.

While Clark's expedition determined the exclusion of British authority from the Illinois country, there remained a dispute as to jurisdiction over it among several of the states of the Union—Virginia, Pennsylvania, and Virginia claimed all the territory between the Ohio, the Mississippi and the lakes, on the ground mainly of conquest. New York claimed the same territory, on the ground of a treaty with the Iroquois, who were asserted to have extended their conquests as far as the Mississippi. Massachusetts and Connecticut claimed, under their original charters, to own all the land between their northern and southern boundary lines of latitude west of New York as far as the Mississippi. Under these various claims Chicago is in territory claimed respectively by Virginia, New York and Connecticut. The conflicts were settled by acts of cession on the part of the various States to the United States.

After the Virginia act ofcession of 1783 the authority of that State was withdrawn from the Illinois country and for several years the French villagers were a law unto themselves. In 1787, however, the ordinance for the government of the Northwest Territory was established by Congress, and thus the Chicago area came legally into that Territory. In 1790 Governor St. Clair visited Kaskaskia and formed Saint Clair County from the southwestern portion of the Illinois country. The wilderness north of that had practically no white population, and

hence no local government was needed. In 1796, however, the county of Wayne was organized, which included Detroit and the Chicago area. It was in this year that the British finally withdrew their garrison from Detroit, and the new county was named from the victor over the Indians in the campaign of 1794, who also made the Treaty of Greenville in 1795. In 1800 the Indiana Territory was organized, in which all of Illinois country was included, and in 1809 the Illinois Territory was created, including all west of the Wabash River and north to British America. When the boundaries of Wayne County were changed, in 1803, the Chicago area was left out, and it was not included within any county until 1812, when the county of Madison was formed. Under the laws of the Territory of Illinois, Chicago was included in Edwards County in 1814, and in Crawford County in 1816. In 1818 Illinois was admitted to the Union as a State. Under the laws of the State Chicago was successively included in Clark County, organized in 1819; in Pike County, 1821; in Fulton County, 1823; in Peoria County, 1825; and finally in Cook County, 1833.

The ordinance of 1787 seemed to indicate that a State in the northern part of the Northwest Territory west of Lake Michigan should have as its southern boundary a line drawn east and west through the southern extremity of that lake, and the bill for the admission of Illinois was originally drawn accordingly. Mr. Nathaniel Pope, delegate in Congress from the Territory, however, succeeded in having the bill amended so as to secure the present northern boundary for Illinois. Had this not been done Chicago would be in the State of Wisconsin.

Origin of the City.—In 1830 Chicago was a hamlet of log houses inhabited by something less than a hundred people. These log houses were nearly all on the North and West sides. The beginning of the city as a prosperous town was due to the Illinois and Michigan Canal, authorized by act of Congress in 1827. By this act the State was granted alternate sections of land on both sides of the canal route, and the canal commissioners proceeded to lay out towns and sell lots in order to secure funds. One of these towns was Chicago, at the eastern terminus of the canal, and the lands plotted therein were sold in 1830. The town was bounded on the east by State street, on the north by Kinzie street, on the west by Des Plaines street and on the south by Madison street. Buildings began to be erected and slowly immigration began to come. The early settlement of Illinois had been in its southern counties and was derived mostly from southern States. The new migration, beginning with 1830, came in the main by way of the lakes and was largely from the eastern New England being especially represented. In 1833 Congress made an appropriation for a harbor at Chicago. Piers were built out into the lake, a channel was cut through the old sandbar and the spring freshets scoured it out. It was in 1834 that, for the first time, a schooner sailed up the river. By 1837 the town had grown to have a population of 4,170, and in that year it was incorporated as a city.

Early Railroads.—The canal, from which so much was expected, did not prove the wonderful success that was hoped. It was not finished till 1848. Meanwhile, however, railroad construction began and opened up the prairie interior of the State, while the application of steam to navigation made it comparatively easy to transport passengers and freight between Chicago and Buffalo. In 1849 the Galena and Chicago Union Railroad (the beginning of the present Chicago and Northwestern) was put in operation and in 1856 the Michigan Southern and the Michigan Central railways from the east reached Chicago, and others speedily followed in all directions.

Population and Area.—The growth of the new city in population, slow at first, finally became very great. Chicago is now the second city in the United States in population. The area was extended also by successive annexations of contiguous territory. Between 1837 and 1915 the city's area increased from 2.53 to 198,997 square miles. The 4,446 people of 1837 became 4,479 in 1840, 28,269 in 1850, 109,206 in 1860, 298,977 in 1870, 503,298 in 1880, 1,099,850 in 1890, 1,698,575 in 1900, 2,185,283 in 1910 and the United States census bureau of 1915 estimated the population of the city at 2,422,747. Chicago has a very large foreign population. In 1910 there were 781,217 (35.7 per cent of the total population) foreign born persons in the city. Among this number were 162,281 persons born in Germany, 121,786 in Russia, 132,059 in Austria-Hungary, 65,463 in Ireland and 63,035 in Sweden. There were also 705,109 persons of native birth with foreign parentage. Only 20.4 per cent of the population, 445,139 persons, were native born of native parentage. The negro population in 1910 was 44,103, about 2 per cent of the total.

The Great Fire of 1871.—The year 1871 was memorable for the great fire which swept a large part of Chicago from the earth. Beginning at a little before 9 o'clock on Sunday evening, 8 October, in a small barn on the West side, the flames spread through all the three sections of the city, and were not finally extinguished until Monday night, 9 October, at 10 o'clock, when a welcome rain fell. The main business and residential portion of the city was devastated. The total area of the burnt district was 2,024 acres, nearly three and a third square miles, and the value of the property destroyed was estimated at $187,000,000. The loss of life can only be conjectured—perhaps it amounted to 300 persons. The destitution which for a time fell upon the city was relieved with lavish generosity from all parts of this country and of Europe.

This appalling disaster did not daunt the people of Chicago. They began at once to rebuild the city and to reconstruct business. While many insurance companies were obliged to suspend, still some $46,000,000 were realized from this source, and fortunately the bank vaults in every instance but one were found to have preserved their contents intact. Within two years the burnt area was again covered with buildings, and of a more solid type than before the fire.

The Columbian Exposition.—In 1892-93 a World's Fair was held in Chicago, to commemorate the discovery of America four centuries before. An act of Congress, passed in the spring of 1890, authorized an international exposition in Chicago as an illustration of the
development of the new world which Columbus found, made appropriations for the share of the United States government, and provided for a national commission to supervise the work. In Chicago a corporation was formed under the laws of Illinois, to undertake the practical details. Funds were provided from private subscriptions to the stock of the exposition company. A large portion of the proceeds from the city, the proceeds of which were devoted to the exposition, from a special appropriation by Congress, from gate receipts and from various concessions. The site was Jackson Park and the Midway Plaisance, an area of 666 acres being included, with a frontage of two miles on Lake Michigan. Buildings were erected on an elaborate scale, and with taste which met wide approval. J. L. Olmstead planned the landscape work and the architectural work was done by Daniel Burnham and other leading architects. The great building devoted to manufactures had a ground area of nearly 31 acres and a floor and gallery space of 44 acres. In the central hall 75,000 people could be seated, while the entire building would seat 300,000. The standing army of Russia might have been drawn up under its roof. The entire cost of the fair was estimated at upward of $43,000,000. The number of paid admissions throughout the six months from May to November was 21,500,000, the whole number of admissions being 27,529,401.

Chicago and the Federal Government.—

In Chicago are held United States courts as follows: The Circuit Court of Appeals and the Circuit Court of the seventh judicial circuit, and the District Court of the northern district of Illinois.

The Chicago post office includes the central office, 47 carrier stations, 4 stations without carriers and 302 substations. There are 3,898 employees in the main office and stations and 2,051 carriers and collectors. The receipts for the year 1915 were $23,495,730.76. During the same period the pieces of mail handled numbered 981,037,196 first-class and several million of second-class matter.

By the apportionment under the census of 1910 Illinois has 27 members in the House of Representatives. Six of the Illinois Congressional districts lie wholly in Chicago and four more are partly in Chicago. Two representatives in Congress are elected in the State at large, as the legislature has not redistricted the State on the basis of the last census.

The port of Chicago showed vessels entered for the year 1915 to be 5,055, of a registered tonnage of 7,739,174, while the number cleared for the same period was 5,097 vessels of a tonnage of 7,834,152.

Of the lake commerce of Chicago in 1915, 8,409,573 tons were received or shipped from the Chicago River, and 7,763,753 tons at the Calumet River. Practically all of the commerce of the Calumet River consisted of iron ore amounting to 4,414,964 tons, as compared to 2,403,916 tons received at Gary during the same period, and 1,131,193 tons of limestone at Calumet. The lake commerce of Chicago has slightly declined during the past decade, even though there has been a large increase of tonnage received and shipped from the Calumet harbor, at the south end of the city. This is largely due to the obstructions in the Chicago River by bridges and to the crookedness of the river. The city has recently completed a $5,000,000 pier extending 3,000 feet into the lake for the use of passenger boats and package freight. In 1915 the amount of package freight received at the Chicago River amounted to 824,754 tons and the shipments were 432,678 tons. The receipts of the Chicago custom- house for 1915 were $9,417,660. The internal revenue receipts for the same year were $115,947,189.89, or a total of $25,094,780.89.

Chicago and the Government of Illinois.

The general assembly of the State of Illinois numbers 51 senators and 153 representatives, one senator and three representatives being elected from each district. Of these districts 14 are wholly and 4 partly in the city of Chicago.

The Supreme Court of Illinois consists of seven judges elected one in each of seven districts for a term of nine years. Chicago is in the seventh judicial district. The five counties composing that district had in 1910 a total population of 2,618,847, of which Chicago had 2,185,283.

Cook County forms a judicial circuit of the State of Illinois, and has a Superior Court of 18 members and a Circuit Court of 20 members. These courts have concurrent jurisdiction in law and equity. The members are elected for a term of six years by the voters of the county. The population of Cook County, outside of Chicago, in 1910 was 219,050.

Three judges of the above courts are designated by the Supreme Court of the State to sit as an appellate court, with appellate jurisdiction over the Circuit, Superior and County Courts. In like manner six other judges are designated by the same authority to form two branch appellate courts.

The Criminal Court of Cook County is formed by the judges of the Circuit and Superior Courts, who alternate in the duty of holding such court. One judge of the Circuit Court is also assigned to hold the Juvenile Court, which has jurisdiction under the act to regulate the treatment of delinquent and stray children. Cook County also has a County Court and a Probate Court, each consisting of one judge, elected by the people of the county, for a term of four years. All these courts sit in the city of Chicago. The Municipal Court, consisting of a chief justice and 30 associate justices, takes the place of the old system of justices of the peace, and is in a very real sense the people's court, having civil and criminal jurisdiction of a primary nature.

The administration of the court provides for specialized courts, such as the boys' court, dealing with offenders between the ages of 17 and 21, the morals court, the court of domestic relations and the automobile speeders' court. A psychopathic laboratory is also maintained in connection with the criminal branch of the court.

As has been noted, Chicago contains 2,185,283 of the 2,405,233 people of Cook County—their taxable value of property in Cook County, which, by State law, is one-third of the assessed full real value, is $1,078,824,261 (1914). The taxable value of property (1914) in Chicago was $1,000,797,060, or over 90 per cent of that of the county. Moreover, many of the people residing in Cook
County outside the limits of Chicago have their business in the city. From these facts it is plain that Cook County is largely identical with Chicago.

The affairs of the county are administered by a county board of 15 members, elected for a term of three years. Ten are elected in the city and five from that part of the county outside the city. The president of the board is designated by the people at the election for county council.

The City Government.—The city is incorporated under the general laws of the State for municipal corporations. The constitution of Illinois forbids special charters for corporations, and the statutes provide in detail a scheme of government for cities.

Local legislation and general administrative oversight are vested in the city council. This body consists of 70 aldermen and the mayor. Each of the 35 wards elects two members for a term of two years. One-half of the members of the council are chosen each spring. The mayor presides over the council.

The mayor is the administrative head of the city. He is chosen by popular election for a term of four years. He has the power to propose the budget, to pass on all ordinances passed by the council and may veto separate items in the budget. The city council may, however, by a two-thirds vote, override the mayor's disapproval. The mayor has directive control over the administrative departments. He appoints the heads of departments, subject to the approval of the council. All other employees of the city government, except about 400 employed principally in the law department, are under the merit system.

The city treasurer and the city clerk are elected by the people. The main administrative departments are those of finance, law, public works, police, fire, health, public service, buildings, local improvements, municipal courts and public welfare. The board of education, the public library and the municipal tuberculosis sanatorium have special taxes levied for their support, but are, strictly speaking, departments of the city government. Each of the administrative departments has a single head, except the library, educational system, house of correction, board of local improvements for the construction of street improvements by special assessment and the municipal tuberculosis sanatorium, which are administered by boards appointed by the mayor. The city budget is made annually by the city council and the same body levies a tax to meet the greater part of the expenses. Water rates provide the cost of water supply. A very large proportion of the city's revenue, practically one-half, is derived from licenses.

The board of education forms a branch of the city government. The 21 members are appointed by the mayor, subject to the approval of the city council. Seven are appointed each year for a term of three years. The city council at the request of the board of education levies an annual tax on city property for the maintenance of the school system. The tax for the support of the schools may not exceed 1.2 per cent on the assessed value of property. An additional tax, usually one-half of 1 per cent, is levied for the purchase of sites and the construction of new buildings. In 1915 the school board received in taxes $14,536,608.63, of which $10,043,883.73 were levied for the operation of schools and $4,492,724.90 for new buildings and sites. Besides revenue from taxes, the board of education received on leases of school property and from other sources, in 1915, $1,760,893.44. The total income of the school board annually amounts to over $16,000,000. The public schools offer free education through all grades up to and including the high schools, and the law makes elementary education required. The board of education also maintains the Chicago Normal School for the training of teachers. There are 23 high schools with an enrolment of more than 23,000 pupils, and 284 elementary schools. Students finishing the high school course are prepared to enter college. The total enrolment of pupils in the public schools in 1915 was 317,004, with 7,865 teachers.

The Park System.—The parks of Chicago are in the main under control of three boards, one for each of the three sections of the city. These boards are municipal corporations, created under State law and are independent of the city government. The members of the Lincoln Park board, the members of the West Park board are appointed by the governor of the State. The members of the South Park board are appointed by the judges of the Circuit Court of Cook County. There are also a number of smaller park boards in the outlying sections of the city and some of the park districts have their own boards of control. The park system forms a girdle around the central portion of the city from Lincoln Park on the north shore to Jackson Park on the lake shore at the south. The various parks are connected by a series of boulevards. The total area of parks was 3,915.4 acres in 1915. There were also 74.25 miles of parkways and boulevards. Funds for the parks are obtained by taxes levied by the boards on the property within their respective districts and by the sale of a limited amount of bonds.

Chicago has been greatly interested in the development of a park system including not less than 10 acres to 75 acres, scattered through the congested portions of the city and equipped with gymnasiums, swimming pools and assembly halls. The equipment in constant use throughout the year and the parks serve as neighborhood community centres. There are 24 such parks and many other smaller playgrounds.

A metropolitan park district was created in 1913 by an act of the State legislature providing for the acquisition of forest areas in and near the city. Several large tracts aggregating 5,000 acres have already been purchased. The proposed forest preserve area forms a ring around the city and lies just outside of the present city limits.

The Chicago Sanitary District.—The Chicago sanitary district was authorized by act of the State legislature in 1889, ratified by vote of the people in the same year and organized in 1890. The water supply of the city is taken from the lake, being conveyed to the main treatment plant at a series of stations at varying distances from the shore. The city drainage also was of necessity carried into the lake, either directly or by way of the river. Contamination of the
water supply it was hoped to avoid by carrying the pumping stations farther into the lake than it was supposed the sewage outflow would go without purification by air and sun. As the city grew, however, it became manifest that the lake water was dangerous to health, and in the end the plan was devised of cutting a canal between the south branch of the Chicago River and the Desplaines River, with a pumping plant capable of turning the water of the south branch into the canal. Then, by connecting all the sewers with the river, it was intended to convert the city drainage into the Desplaines. As all parts of the city could not be included in the new drainage area, and also as a great part of that area must be outside the city limits, a drainage district was created known as the Chicago sanitary district. The construction and management of the canal within that district was entrusted to a board of nine trustees, elected by the people. Funds were provided by bonds of the district and by taxation. The total cost of the work was $60,000,000. Earth was broken 3 Sept. 1892, and the water of the lake was turned into the canal 2 Jan. 1900. Since that date it may be noted that the Chicago River no longer flows into Lake Michigan, but into the Mississippi.
The sanitary district as originally created comprised all of Chicago north of 87th street and some 43 square miles north of Cook County outside of Chicago. The assessed value of taxable property in the district is $1,098,037,554, of which $1,000,797,060 belong to that portion within the city—a percentage of 90.2. By law the board was authorized to effect loans to the amount of 5 per cent of the value of the taxable property in the district, provided that the total should not exceed $15,000,000. The tax levy of the district must not exceed one-half of 1 per cent of the assessed value of taxable property in the district.

By the statute of 1903 large additions of territory were made to the sanitary district so as to protect the lake water both north and south of the original area and the district now has an area of 386 square miles, of which 198,997 miles are in the city of Chicago. Subordinate canals have been cut in each of these terraces connecting them with the main canal. The north shore channel is about eight miles long and the Sag Channel still incomplete, to drain the Calumet region, will be 16 miles long.

The main channel of the canal from river to river is 28.05 miles long. The width on the bottom varies from 110 to 202 feet. The minimum depth of the water is 22 feet. A project for a navigable waterway from Lake Michigan to the Mississippi River was started by the appropriation of $3,000,000 by the Illinois State legislature in 1915. The State waterway will connect with the sanitary canal at Joliet and provide for an 8-foot channel to Utica. It is proposed later to complete this work to the Mississippi River. The sanitary district has established at Lockport an electric generating plant at which electrical power is created by the water passing through the sanitary canal. The city street lights are supplied with current from this water power. In 1915, 28,123,134 kilowatt hours of electricity were generated and 8,243,432 kilowatt hours of heat were produced. The sanitary district also sells electricity to commercial users to a limited extent.

The hydro-electric plant is the largest publicly owned electric light plant in the country, and on the whole has been quite successful. Prior to the building of the sanitary canal the death rate from typhoid in Chicago was very high, but now it is one of the lowest in the country.

Public Works.—The city department of public works has charge of the paving, repairing and cleaning of streets and alleys, of the construction and maintenance of sewers and of the city waterworks. There are in the city approximately 31,094.44 miles of streets, of which 2,059.34 miles are paved, and 1,592.07 miles of alleys. This is exclusive of the many miles of parkways and boulevards under the care of the various park boards. The city sewers empty into the drainage canal which diverts the city's refuse from the lake.

The waterworks system, which has cost up to 1915 $61,697,000, is owned by the city. The plant has largely been built out of the annual revenue which in 1915 amounted to over $6,500,000 annually. The debt of the plant is $30,160,000. Its purpose is to cover the cost of the supply and to make extensions to the plant. The pumping stations provided the city during the year with about 213,000,000,000 gallons of water. The per capita use is 236 gallons per day—more than twice that in any other city of the country. The number of miles of pipe was 2,641 in 1915.

The City Library.—The Chicago Public Library contains 627,619 volumes. The main library building on Michigan avenue between Randolph and Washington streets, cost $2,000,000. The income of the library board (the members of which are appointed by the mayor) is about $425,000, mainly derived from taxation. The library maintains 33 branch reading-rooms and 109 delivery stations in different parts of the city. The T. B. Blackstone Memorial Branch Library is an Ionic building of granite and marble, with shelving capacity for 25,000 books.

The City Corporate.—The city corporate, that is, the city exclusive of the board of education, public library, park boards and the Municipal Tuberculosis Sanitarium, has a total ordinary revenue of about $30,000,000 per year. This is also exclusive of the amount received for the operation of street railways which amounts to almost $3,000,000 per year.

Institutions of Private Endowment.—The public spirit of Chicago citizens is manifest in many institutions endowed by private munificence for the public good.

The Chicago Art Institute is devoted to maintaining an art gallery and to conducting education in art. The museum contains excellent examples of the old masters and of modern painters, besides sculptures, etchings, engravings and many other appropriate art objects. The enrollment in the school is over 2,900 in all branches. The Ryerson Library of Art, a beautiful wing of the main building, contains about 8,000 volumes. It also contains extensive and valuable collections of photographs and lithographs.

The Newberry Library has an endowment of $2,500,000 and occupies a building valued at
$500,000. The library, used wholly for consultation, has 356,033 books and pamphlets.

The John Crerar Library has an endowment of $3,400,000. The books, which are confined to branches of science, number 348,500, besides 115,000 pamphlets, all used for consultation only.

The library of the Chicago Law Institute, which has quarters in the county courthouse, numbers 55,000 volumes.

The Chicago Historical Society has a collection of 40,000 books and 75,000 pamphlets, besides other material relating to the history of the Central West.

Higher education is represented by the University of Chicago, by the professional schools of Northwestern University, by the Medical School of the University of Illinois, by the Loyola University, by the Armour Institute and the Lewis Institute and by various independent schools of law and medicine.

The University of Chicago (q.v.) opened its doors for instruction in 1892. The buildings are situated on the South Side, fronting on the Midway Plaisance, one of the south parkways. Its assets amount to about $50,000,000. The enrolment of students in 1915–16 numbered 8,510. The university consists of graduate schools and colleges of arts, literature and science, a divinity school, a law school, a medical school, a professional school for teachers, and of various other activities, including a press department, which publishes both books and periodicals.

Northwestern University maintains in the city its schools of medicine, law, pharmacy, dentistry and commerce. The College of Liberal Arts and Graduate School, the College of Engineering and the School of Music are in Evanston. The total assets of the university, including grounds and buildings, amount to $10,500,000. The total number of students in all departments (1915–16) was 5,293, and the members of the faculties numbered 452.

Loyola University was organized in 1909. It had in 1915–16 127 instructors and 1,542 students. The Bennett Medical College is affiliated with this institution.

The Lewis Institute is a polytechnic school on the West Side. It was opened for instruction in 1895, the enrollment at that time amounting to $1,600,000. The enrollment for 1915–16 included 3,280 students.

The Armour Institute, on the South Side, is also a polytechnic school. The endowment amounts to $4,500,000, and the enrollment of students, 1915–16, was 1,424.

The Field Columbian Museum (q.v.) is an outcome of the Exposition of 1893. The museum was incorporated in that year, and was at the outset encircled by many of the most valuable exhibits which had been made at the Exposition. The original endowment of $1,250,000 was the gift in large part of one citizen. Large acquisitions have been made, especially in the fields of American ethnology. The collections are at present housed in one of the remaining buildings of the Jackson Park. By the will of the founder, the late Marshall Field, $8,000,000 was left to the museum for a suitable building, which is now under construction as part of the project for the beautification of the Lake Front.

Churches.—Religious organizations number some 1,150 churches and missions.

Business.—Manufactures and commerce form the basis of Chicago's prosperity. With the development of the West and the extension of railroads the industries of the city have grown to enormous magnitude. The manufactures of iron and steel, the agricultural implements and the beef and pork packing are among the largest. The receipts of live cattle at the Union Stock Yards for the year 1915 were 3,262,752, of sheep 3,510,015, and of hogs 7,652,071. The total value of all live stock received at the Union Stock Yards in the year 1915 was $370,938,156. The Chicago elevator warehouses have a capacity of 50,426,000 bushels of grain.

The census of 1910 records (for 1909) 9,656 manufacturing establishments for Chicago, with a capital of $971,841,000, an average number of 293,977 wage earners, salaries and wages amounting to $240,037,000, and a product valued at $1,281,313,000. The value of manufactured products in 1904, amounted to $955,036,000—an increase of $336,277,000 or 44 per cent in the five year period. This product actually turned out has no necessary relation to the amount of sales for that year.

Chicago is an important railway centre, besides being favorably situated on Lake Michigan for marine commerce through the Great Lakes. Twenty-three through lines of railroad have terminals in the city. There are no roads passing through Chicago. It is necessary, therefore, for transfers both of freight and passengers to be made from one line to another. This greatly complicates the transportation system of the city, and among the vital improvements of the near future should be a complete reorganization of these matters, in aid of saving time and labor and cost both for freight and passengers. The old Illinois and Michigan Canal connecting Chicago with the Mississippi River of course is obsolete, but the Drainage Canal may be made the means of connection under modern conditions, providing an adequate amount of work is done on the Illinois River, so that freight may pass directly from the Great Lakes system to the Mississippi system of water transportation.

The Plan for a More Beautiful and Convenient City.—Chicago, like most other cities, has grown to an extent entirely unforeseen at the outset, and on lines resulting from circumstances and conditions of the locality. The original reason for the settlement was the location in the vicinity of a harbor of Lake Michigan and near the carrying place between the waters of that lake and the affluents of the Mississippi. The ground was flat and marshy, being therefore in many ways entirely inconvenient for city building. As population increased streets extended toward the north and south along the shores of the lake, and westward over the prairie. It was very difficult to provide suitable pavements for the streets and at the same time suitable foundations for large buildings. Such buildings had to be erected on piles, which clogged the ground deeper than a clay sub-stratum. In later years concrete piles have been carried down to the bedrock. There was a time when it became necessary to grade the streets up, and this involved the correlative necessity of lifting the
buildings along these street lines. In the main, streets have been made at right angles, with an occasional diagonal following the line of some old highway leading out into the State. On the south side the Illinois Central Railroad occupies the lake shore for several miles, thus preventing ready access to the beach and largely cutting off the city from the use of the lake.

After the World’s Fair of 1893 serious study was given to the question of a possible re-creation of city lines in such a way as to secure further development in accordance with fundamental principles of beauty and advantage. The Commercial Club of the city appointed a Commission of 28 of its members, and the Mayor of the city also appointed a very large committee of citizens, to consider the same question. This was in 1909. After careful study a systematic plan was evolved looking toward the re-creation of the lines of city growth in a very important way. It was suggested that the heart of the city should be connected in a systematic manner with the surrounding districts by two great arterial systems, rectangular and diagonal. Certain existing streets should be widened and made the main arteries of commerce. It was further proposed to extend the park system by completing the existing park belt, by securing another system of parks more remote from the present settled area and by adding a considerable number of small parks. In order to complete the existing park system the plan contemplates filling in shallows on the South Side between the centre of the city and Jackson Park, thus creating a system of islands which are to be improved and connected by bridges, leaving a waterway of lagoons between this new parkway and the mainland. The lake front on the North Side is now being improved by an extension of Lincoln Park on made land. When this extension is completed the lake frontage on the north side of the river for eight miles will be park or boulevarded. The plan also contemplates reconstructing the location of the railway passenger stations and freight-yards in such way as to facilitate as much as possible the removal of freight-yards from the center of the city and at the same time make communication convenient and rapid for railway passengers. This last of course involves a complete subway traction system. The plan also involves the creation of a civic centre for the main administrative buildings, so situated as to be easy of access from all parts of the city.

This plan is a very extensive one, and of course will require many years to carry to completion. At the same time, when completed it will make the city far more beautiful, and far more convenient, and will provide for its future development in a way that is systematic rather than haphazard. The City Beautiful will become also the City Comfortable.

Harry Pratt Judson, President of the University of Chicago.

CHICAGO, University of, located at Chicago, III. A Baptist institution known as the University of Chicago was founded in 1857, and was compelled to close its work in 1886. Shortly after the closing of that institution, a movement for the founding of a large university was begun by the American Baptist Education Society at the suggestion of John D. Rockefeller (q.v.). The present university was chartered in 1890, and opened to students in 1892; Mr. Rockefeller contributed the larger part of the original endowment fund to which he has since added gifts amounting to about $40,000,000. The university was organized under the leadership of William R. Harper (q.v.), who was its president until his death, and largely directed and controlled its administrative and educational policy. In accordance with the charter, the president and two-thirds of the trustees must be members of a Baptist church, but there is no denominational control.

The university includes the following departments: (1) the Schools, Colleges and Academies; (2) the University Extension Division; (3) the University Libraries, Laboratories and Museums; (4) the University Press; (5) the University Affiliated Schools. The Schools, Colleges and Academies include: (1) the Schools, which are the Divinity School, the Ogden (Graduate) School of Science, the School of Education, the Law School and the Medical School (partly organized); the School of Technology, the School of Fine Arts and the School of Music are yet to be established; (2) the Colleges, the College of Arts, the College of Literature, the College of Science, the College of Commerce and Administration and the University College and College of Education; (3) the Academies, the University High School, directly under University control and numerous other secondary schools affiliated with the University. Each College is divided into a Junior College and a
Senior College, the former including the first half of the curriculum, corresponding to the work of the usual college Freshmen and Sophomore years, the latter the work of the Junior and Senior years. The academic year for all departments is divided into four quarters of 12 weeks, and each quarter into two terms of six weeks each; the courses are arranged with the work of 12 weeks or six weeks as a unit, and students may enter upon their work at the beginning of a quarter and may be absent from the university during any quarter they desire. The summer quarter has a large attendance of teachers, and others outside the regular student body, but an increasing number of regular students continue their work in the summer. Instructors from other universities are added to the staff for this quarter. The courses are classified as majors and minors, a major course requiring four to five hours of classroom work for 12 weeks, a minor course four to five hours work. The course for six weeks; the regular work of a student during each term of a quarter is three minors or the equivalent. The Colleges of Arts, Literature and Science confer the degree of A.B., Ph.B. and the full course of the full work of the Junior and Senior Colleges; the College of Commerce confers the degree of Ph.B. The work of the Junior Colleges is largely prescribed for each degree; the work of the Senior Colleges of Arts, Literature and Science is elective, with the limitation that the student may not elect more than half his work from any one department; the electives are further limited by the degree to be received. The work of the Senior College of the College of Commerce and Administration is divided into four divisions: (1) Business; (2) Business Teaching; (3) Secretarial; (4) Philanthropic Service. The University College is conducted by the university in the centre of the city, and is designed chiefly for the benefit of teachers. It confers the degrees of A.B., Ph.B. and S.B. on the fulfillment of the requirements for the degrees in the other colleges. The Divinity School includes: (1) the Graduate Divinity School, for college graduates; (2) the Seminary; (3) the Danish-Norwegian Theological Seminary; (4) the Swedish Theological Seminary. The Graduate Divinity School offers courses leading to the degrees of B.D., A.M. and Ph.D.; certain studies are prescribed for all courses; the others are elective, depending upon the degree to be obtained. The English Theological Seminary offers resident courses in the summer quarter, and non-resident courses during the other quarters; the course covers four years work. The Graduate School of Arts and Literature and the Ogden School of Science confers the degrees of A.M., M.S., Ph.M. and Ph.D. The Law School was organized in 1872; it requires for admission the equivalent of three years of college work, and confers the bachelor's degree (A.B., Ph.B. or S.B.) after one year's work in the Law School, the degree of Doctor of Laws (J.D.) is conferred on the completion of the full course (three years); special students who maintain a high standard are allowed to take the bar examination. The Medical School offers the courses of the first two years of the medical curriculum only; Rush Medical College (q.v.) is affiliated with the university and provides a full medical course. In 1917, however, a basis for a great new medical school was laid through the provision of a fund of $5,461,500. The Rush Medical School will be an integral part of the new medical school and will be used for graduate instruction. The Presbyterian Hospital, the McCormick Memorial Institute and the Sprague Institute are also parts of the new plan. Within the university quadrangles will be built the A. B. Dilling's Memorial Hospital, the Max Epstein Dispensary and a complete equipped medical college conferring the degree of Doctor of Medicine. The School of Education offers courses for the training of teachers which lead to the degrees of A.B., Ph.B., S.B. The University Extension Division offers corresponding courses, which entitle the student completing them to university credit; for fuller description of these courses see the article on UNIVERSITY EXTENSION. The University Library comprises the great society libraries, the branch libraries and the traveling libraries of the University Extension Division. The Yerkes Observatory, founded in 1892, is located on Lake Geneva, Wis., near the town of Williams Bay; it offers special facilities for advanced work in astronomy. The university press publishes books, pamphlets and departmental journals. The journals are The Journal of Political Economy, The American Journal of Sociology, American Journal of Semitic Languages and Literatures, Biblical World, The Astrophysical Journal, Journal of Geology, School Review, Botanical Gazette, American Journal of Theology, The Elementary School Teacher, Modern Philology, The University Record, Weekly Calendar and Classical Philology.

Women are admitted to all departments of the university, but those who enter the Divinity School are not expected or encouraged to take up the work of public preaching. The students maintain a Men's Club, Greek letter fraternities, a Dramatic Club, a Glee Club, an Athletic Association, and numerous smaller societies and clubs. Some of the students, nearly one-third, live in the university dormitories on the campus; a few live in their fraternity houses; but the great majority live in the city and its suburbs. All students are required to wear the academic cap and gown on formal occasions. The university campus lies between Washington and Jackson Parks, facing the Midway Plaisance on the south. The buildings, of which there are 40, are built of Indiana limestone, all in the same general style of architecture, an English Gothic; they are grouped in accordance with a fixed plan, which is not yet worked out in all detail, but allowed for numerous additions. The library contains 545,000 volumes, bound and catalogued, 100,000 volumes uncatalogued and about 250,000 pamphlets. The students (on the basis of nine months' attendance) number about 10,000 and the faculty 400. The general assets of the university amount to about $41,400,000 about half of which represents buildings, grounds and equipment, the remainder representing investments. The current expenses now reach about $2,100,000 annually.

Though the University of Chicago is the youngest of the large universities of the United States, it has taken a leading position. Its
standards of scholarship are the highest, and it carries out the true university ideal, offering the best of opportunities for graduate and research work, and emphasizing that part of its work. Its policy is in many ways unique, notably in the 18-month session or quarter term. Two other characteristics of the university are the quarter system, which permits a student to take his work when it is most convenient for him and saves him from losing a year because of some enforced absence for a few weeks, and the maintenance of a large enough force of instructors to keep the classes small, thus ensuring students individual attention. Through these affiliations it has exerted a wide influence on the educational institutions of the Middle West, particularly; and through its University Extension Department it has come into close touch with the general public and the work of "popular education."

**CHICAGO AND ALTON RAILROAD**, a system operated in Illinois and Missouri by a combination of two standard-gauge railroads, the Chicago and Alton Railroad Company (old) and the Chicago and Alton Railway Company, effective 14 March 1905. The company purchased the property of the Saint Louis, Peoria and Northern Railway Company and all the other lines over which the leased stock of the Chicago and Alton Railroad Company, whence its title. The Chicago and Alton Railroad Company, operating under a charter of the State of Illinois, dated 18 Feb. 1861, was originally the Alton and Sangamon Railroad Company, afterward known as the Chicago and Mississippi Railroad Company. The new company on 3 April 1900 leased for a term of 99 years the Chicago and Alton Railroad with its leased lines and agreed to pay as rental the interest on the bonds of the Chicago and Alton Railroad Company, the rentals payable by the Chicago and Alton Railroad Company under the leases of the Joliet and Chicago Railroad, Kansas City, Saint Louis and Chicago Railroad, and the leased stock and all surplus taxes and the surplus net earnings of the leased properties. It owns one-third of the stock of the Joliet Union Depot Company and one-twelfth of that of the Kansas City Terminal Railroad Company. The company was admitted as a member of the Terminal Railroad Association of Saint Louis, and became the owner of one-fourteenth of the capital stock of the terminal company. For the fiscal year ending 30 June 1915, the company operated 1,052.49 miles of track; of this it owned 687.68 miles and operated 327.79 miles of leased lines, and in addition operated jointly with the Cleveland, Cincinnati, Indianapolis and Saint Louis Railway Company the lines between Warren and East Saint Louis, 178.85 miles. The system also comprised 253.08 miles of second track, 1.72 of third track and 1.63 miles of fourth track, 449.07 miles of sidings, giving a total length of all tracks, 1,757.99 miles. The operating divisions of the system, exclusive of trackage rights are: Sherman, III., to Grove, III., 50.66 miles; Chicago, Ill., to East Saint Louis, Ill., 279.95 miles; Coal City Line, Joliet, Ill., to Mazonia, Ill., 26.92 miles; Dwight, Ill., to Washington and Lacon, Ill., 80.77 miles; Rock Island, Ill., to Kansas City, Mo., 253.17 miles; Bloomingdale, III., to Godfrey, Ill., 150.83 miles; Mexico, Mo., to Cedar City, Mo., 50.10 miles; Godfrey, Ill., to Wann, Ill., 7.36 miles; The number of passengers carried in 1915 was 3,677,113, an increase of 5.94 per cent over 1914; 7,864,283 tons of revenue freight were carried, a decrease of 7.31 per cent; but, on account of an increase in the average rate per ton, there was a gain of 3.47 per cent, the total freight revenue amounting to $9,200,546.54. The total earnings for the year to 30 June 1915 were $14,245,623.76; operating expenses, $11,072,706.51, yielding net earnings, $2,169,887.75. Other income of $97,236.96 gave a total of $2,757,820.75.

**CHICAGO, BURLINGTON AND QUINCY RAILROAD**, popularly known as the "Burlington Route," a system operating in Illinois, Wisconsin, Minnesota, Iowa, Missouri, Nebraska, Kansas, Colorado, Wyoming, South Dakota and Montana. The nucleus of the system originated in the Aurora Branch Railroad Company, chartered 12 Feb. 1849, a name changed to Chicago and Aurora Railroad Company, 22 June 1852, and to the present corporate title of Burlington and Quincy Railroad Company. The leased portions of the system were the section of the main line from Chicago to Mendota and the branch from Aurora to West Chicago. The construction, consolidation and purchase of the system has enlarged to its present size. The Burlington and Quincy Railroad Company operated the Burlington and Quincy Railroad Company for 99 years and operated by the railway company until 1 July 1907, when the lease was canceled and the railroad resumed control and operation.

**Mileage.**—The length of road operated and controlled 30 June 1915 was 9,365.94 miles; of this mileage 9,008.41 miles were owned absolutely by the company. The mileage is located as follows: 1,671.58 miles in Illinois; 222.49 miles in Wisconsin; 23.61 miles in Minnesota; 1,365.12 miles in Iowa; 1,122.30 miles in Missouri; 2,850.34 miles in Nebraska; 259.32 miles in Kansas; 394.36 miles in Colorado; 134.38 miles in Montana; 279.95 miles in South Dakota; and 684.96 miles in Wyoming. The roads east of the Missouri River total 4,387.94 miles, the roads west of the Missouri River 4,620.47 miles. The principal sections are: Main line, Chicago, Ill., to Denver, Colo., 1,077.01 miles; Dec. 1902 the company was admitted as a member of the Terminal Railroad Association of Saint Louis, and became the owner of one-fourteenth of the capital stock of the terminal company. For the fiscal year ending 30 June 1915, the company operated 1,052.49 miles of track; of this it owned 687.68 miles and operated 327.79 miles of leased lines, and in addition operated jointly with the Cleveland, Cincinnati, Indianapolis, and Saint Louis Railway Company the lines between Wann and East Saint Louis, 178.85 miles. The system also comprised 253.08 miles of second track, 1.72 of third track and 1.63 miles of fourth track, 449.07 miles of sidings, giving a total length of all tracks, 1,757.99 miles. The operating divisions of the system, exclusive of trackage rights are: Sherman, Ill., to Grove, Ill., 50.66 miles; Chicago, Ill., to East Saint Louis, Ill., 279.95 miles; Coal City Line, Joliet, Ill., to Mazonia, Ill., 26.92 miles; Dwight, Ill., to Washington and Lacon, Ill., 80.77 miles; Rock Island, Ill., to Kansas City, Mo., 253.17 miles; Bloomingdale, Ill., to Godfrey, Ill., 150.83 miles; Mexico, Mo., to Cedar City, Mo., 50.10 miles; Godfrey, Ill., to Wann, Ill., 7.36 miles; The number of passengers carried in 1915 was 3,677,113, an increase of 5.94 per cent over 1914; 7,864,283 tons of revenue freight were carried, a decrease of 7.31 per cent; but, on account of an increase in the average rate per ton, there was a gain of 3.47 per cent, the total freight revenue amounting to $9,200,546.54. The total earnings for the year to 30 June 1915 were $14,245,623.76; operating expenses, $11,072,706.51, yielding net earnings, $2,169,887.75. Other income of $97,236.96 gave a total of $2,757,820.75.**
year, $5,081,115.35; 22,708,392 passengers and 31,758,791 tons of freight carried; the capital stock of the Company was $110,839,100; the funded debt $181,690,000.

CHICAGO GREAT WESTERN RAILROAD COMPANY, popularly known as the "Corn Belt Route," a system operating in Illinois, Iowa, Minnesota, Missouri, Kansas and Nebraska. The company was organized 11 Aug. 1909, under the laws of the State of Illinois, for the purpose of purchasing the properties formerly owned by the Chicago Great Western Railway Company, and sold under judicial decree.

Mileage.—For the fiscal year ending 30 June 1915, the company operated 1,427.10 miles of railway, of which 1,410.13 (less 68.96 miles in Minnesota, between Mankato and Randolph, leased to the M. St. P. R. & D. E. T. Co.) are owned and 85.93 are operated under trackage rights. The line extends from Chicago, Ill., via Oelwein, Iowa, to Minneapolis, Minn., 471.27 miles; from Oelwein to Kansas City, Mo., 364.02 miles; from Kansas City to Council Bluffs, 283.64 miles; Hayfield, Minn., to Clarion Iowa, 99.71 miles; Randolph, Minn., to Winona, Minn., and Osage Iowa, 208.47 miles; total, 1,427.10 miles. The Company also owns all the stock of the Wisconsin, Minnesota and Pacific and Mason City and Fort Dodge railroad companies, operating in 1915, 208.47 miles and 383.35 miles, respectively, which are included above. The earnings and expenses of each line are kept separate.

Equipped. The rolling stock consisted of 292 locomotives, with a total traction power of 9,769,000 pounds; 11,110 freight cars; 179 passenger cars and 472 miscellaneous cars. The total operating revenues for year ending 30 June 1915 were $13,920,684; the operating expenses, $10,450,727; taxes, $580,026, leaving a total net revenue of $2,889,931. Compared with the year 1914 both the gross revenues and operating expenses for the year 1915 decreased, the latter in a lesser ratio, so that the net revenue showed a decrease of $1,905,090.

Business and Funded Debt.—In 1915 there were 2,825,496 passengers and 157,642,318 passengers carried one mile compared with 2,396,685 and 138,735,465, respectively, in 1910, the year of reorganization. The average rate per passenger per mile was 1.950 cents in 1915 as against 1.905 cents in 1910. The comparative revenue tonnage was 5,642,764 and 4,623,102, and tons hauled one mile 1,378,504,602 and 1,189,185,332. The rate per ton mile was 7 mills in 1915 and 7.19 mills in 1910. The permanent capital of the company authorized at $96,000,000 is represented by two classes of stock divided into shares of $100 each, of this amount $59,076,915 were outstanding 30 June 1915, leaving $36,923,085 still issuable. The statement of the funded debt of proprietary lines on 30 June 1915 was as follows: Mason City and Fort Dodge Railroad Company; issued and outstanding, $12,000,000; funded debt per mile, $31,980.39. The funded debt of the Chicago Great Western Company, 30 June 1915, was issued and outstanding, $25,881,000; funded debt per mile, $25,008.21. The mortgages are secured by valuable leaseshold of long tenure. The proprietary lines, being new, have not yet developed their full earning capacity.

CHICAGO HEIGHTS, Ill., city in Cook County, 28 miles south of Chicago, on the Michigan Central and other railroads. The city manufactures iron and steel goods, carriages, chemicals, glass, lumber, cars, linseed oil, pianos, brick and fireproofing materials. It has a hospital and a Carnegie library. Chicago Heights was settled in 1835 and received its city charter in 1900. The waterworks are municipally owned. Pop. 14,525.

CHICAGO, INDIANAPOLIS AND LOUISVILLE RAILWAY. The company which built the first portion of the Chicago, Indianapolis & Louisville Railway was the New Albany & Salem Railroad Company, chartered 8 July 1847, to build a railway between the points named in its title, a distance of 35 miles. Work was begun in 1849 and the road was completed and opened to traffic in January 1850. Amendments to its charter empowered the Company to extend the road to any place within the State, and work was begun on an extension to Michigan City in 1850, and was completed and opened to traffic in 1851. The section from Crawfordsville to Lafayette was built by the Crawfordsville & Wabash Railroad Company, completed in 1852, and was purchased by the New Albany & Salem Railroad Company. The company did not prosper and in 1857 it defaulted interest on its bonds, and in 1858 was turned over to D. D. Williamson, of New York, as trustee, and operated by him until October 1868, when a suit for foreclosure was brought and the road went into the hands of a receiver, passing the next year, under foreclosure sale, to the first and second mortgage bondholders, who organized a new company under the name of the Louisville, New Albany & Chicago Railway Company. Various law suits kept the road in the courts for several years from this date, but in May 1881 a consolidation was effected with the Chicago & Indianapolis Air Line Railway.

In January 1882 the northern extension of the line was completed to a point near Hammond, where a junction was made with the Chicago & Atlantic Railroad, thus giving a line into Chicago. Work was completed on the southern extension to a point four miles north of Indianapolis in October 1882 and, using the tracks of the Lake Erie Western for these four miles, in May 1883 trains were run through from Indianapolis to Indianapolis. Subsequently the unfinished portions of the road were completed and the company used its own tracks for the entire distance. In 1889 the company took a 30 years' lease from the Louisville Southern Railroad for its line from Louisville to Burgin, Ky., and another for its Lexington extension. In March 1890, during disputes growing out of the action of newly-elected directors of the lessee road, the Louisville Southern Company took possession of both of the leased branches of its road by force, and a very stormy period of litigation followed.

On 1 March 1886 the company bought the Orleans, West Baden & French Lick Springs Railway and completed its lines within one year. On 1 April 1886, the Company bought all of the stock of the Bedford & Bloomfield Railroad Company, amounting to $600,000. Both of these lines are now merged in the present company.
In June 1879 the Chicago & Western Indiana Railroad Company was organized for the purpose of acquiring the Chicago terminal to several different railroads desirous of entering the city, and the Louisville, New Albany & Chicago became a fifth owner in the concern. In November 1882 the Belt Railway Company of Chicago was formed for the purpose of connecting the various railroad terminals, warehouses and other facilities in the city. The five companies that formed the Chicago & Western Indiana Railway Company became the stockholders in this new corporation.

In August 1883, the receiver for the Louisville, New Albany & Chicago Railroad was appointed at the instance of its creditors. In October of that year the consolidated mortgage interest was defaulted, and a reorganization plan was proposed. On 1 July 1887 the purchasing committee under the plan of reorganization delivered the road to a company organized under the name of the Chicago, Indianapolis & Louisville Railway Company. On 15 March 1889 the capital account showed a stock issue of $50,000,000 in common stock, and a bonded debt of $13,177,000.

In September 1899 the company began the operation of the Indian Stone Railway, extending from Clear Creek to Harrodsburg, a distance of 10 miles, which was constructed under contract with the company in 1898-99.

In May 1902 control of the Chicago, Indianapolis & Louisville Railroad passed to the Louisville & Nashville Railroad Company and the Southern Railway Company, these two companies having acquired 51% of the capital stock of the first named company. In September 1902 a contract was entered into with the Illinois Central Railroad Company for the joint use of 10 miles of their road west from Switz City, for a period of 25 years, thus giving the Chicago, Indianapolis & Louisville Railway an entrance into valuable coal fields. A similar contract was made in May 1903 with the Pennsylvania Company for the joint use of that part of its track between Switz City and Goshen Junction.

Equipment and Earnings.—On 30 June 1915 the company owned 508.79 miles of main track, 275.62 miles of siding and used under contract 113.62 miles of track, making a total of line operated 622.41 miles. The equipment comprises 147 engines, 6,743 freight cars, 120 passenger cars and 155 company service cars. For the fiscal year ended 30 June 1915 the total earnings were $6,559,664.95 and the operating expenses were $4,678,021.14, leaving a net revenue from railway operations of $1,881,643.81. The gross income was $1,794,814.43; the total deductions from gross income were $1,555,040.99, leaving a net income of $239,773.46.

CHICAGO JUNCTION, Ohio, village in Huron County, on the Baltimore and Ohio Railroad, 60 miles southwest of Cleveland. It has fine sulphur springs, owns the worksmans and lighting plant. The repair shops of the Baltimore and Ohio are the principal source of employment. Pop. 2,950.

CHICAGO, MILWAUKEE AND SAINT PAUL RAILWAY, a system operated by the company of the same name in Illinois, Wisconsin, Michigan, Minnesota, Iowa, Missouri, South Dakota, North Dakota, Montana, Idaho and Washington.

History. The organization was chartered as the Milwaukee and Saint Paul Railway Company, 5 May 1863, the projectors being the purchasers of the foreclosure of the Western Division of the La Crosse and Milwaukee Railroad. The Milwaukee and Western, the Milwaukee and Horicon, The Ripon and Wolf River railroads, and the Eastern Division of the La Crosse and Milwaukee Railroad were subsequently acquired by purchase, and under authority of an act of the legislature of the State of Wisconsin, the present name was adopted 14 Feb. 1874, when the total length of completed roads owned equaled 1,399 miles.

Equipment, Earnings and Funded Debt.—During the fiscal year ending 30 June 1915 the company operated 10,075.61 miles of main track, of which 1,823.59 miles were located in Wisconsin; 475.95 miles in Illinois; 1,936.54 miles in Iowa; 1,250.73 miles in Minnesota; 379.93 miles in North Dakota; 1,794.89 miles in South Dakota; 147.68 miles in Missouri; 245.41 miles in Michigan; 10,500,000 in common stock, and a bonded debt of $13,177,000.

In September 1889 the company began the operation of the Indian Stone Railway, extending from Clear Creek to Harrodsburg, a distance of 10 miles, which was constructed under contract with the company in 1898-99.

In May 1902 control of the Chicago, Indianapolis & Louisville Railroad passed to the Louisville & Nashville Railroad Company and the Southern Railway Company, these two companies having acquired 51% of the capital stock of the first named company. In September 1902 a contract was entered into with the Illinois Central Railroad Company for the joint use of 10 miles of their road west from Switz City, for a period of 25 years, thus giving the Chicago, Indianapolis & Louisville Railway an entrance into valuable coal fields. A similar contract was made in May 1903 with the Pennsylvania Company for the joint use of that part of its track between Switz City and Goshen Junction.

Equipment and Earnings.—On 30 June 1915 the company owned 508.79 miles of main track, 275.62 miles of siding and used under contract 113.62 miles of track, making a total of line operated 622.41 miles. The equipment comprises 147 engines, 6,743 freight cars, 120 passenger cars and 155 company service cars. For the fiscal year ended 30 June 1915 the total earnings were $6,559,664.95 and the operating expenses were $4,678,021.14, leaving a net revenue from railway operations of $1,881,643.81. The gross income was $1,794,814.43; the total deductions from gross income were $1,555,040.99, leaving a net income of $239,773.46.

CHICAGO JUNCTION, Ohio, village in Huron County, on the Baltimore and Ohio Railroad, 60 miles southwest of Cleveland. It has fine sulphur springs, owns the worksmans and lighting plant. The repair shops of the Baltimore and Ohio are the principal source of employment. Pop. 2,950.
CHICAGO AND NORTH WESTERN RAILWAY

prised 1,983 locomotives and 68,776 cars of all kinds.

The number of passengers carried during the year amounted to 16,065,456; 858,452,321 passengers were carried one mile at an average rate per passenger per mile of 2.091 cents. The number of tons of revenue freight carried were 32,959,392; 8,135,986,375 tons of revenue freight were carried one mile at an average rate per ton per mile of 781.3 cents. The earnings from passenger traffic during the year were 19.63 per cent of the total earnings, a decrease of $1,092,786, or 5.32 per cent, compared with the previous year. There was a decrease of 47,885 tons, or .14 per cent, compared with the preceding year in the amount of freight carried, the earnings from freight traffic were $63,953,798.62, being 69.95 per cent of total earnings, a decrease compared with the preceding year of $361,936.17, or 2.09 per cent. The number of tons of all agricultural products carried during the year was 7,742,673 tons — an increase compared with the previous year of 8.10 per cent. Agricultural products comprised 23.49 per cent of the total tonnage carried, as compared with 21.70 per cent of the total tonnage of 1914. The number of tons of commodities other than agricultural products carried during the year was 25,216,719 tons — a decrease compared with the previous year of 625,388 tons, or 2.43 per cent — the per cent of the total being 76.51 per cent against 78.30 per cent in 1914. The gross earnings for the year ending 30 June 1915 were $91,435,374, the operating expenses $61,971,700, yielding net earnings of $29,463,673; income from other sources $3,649,713 gave a total net income of $33,113,386. The total payments were $21,145,104, leaving a surplus of $11,968,282. During 1915 two dividends, aggregating 7 per cent, were paid on the preferred stock, and two dividends, aggregating 5 per cent, were paid on the common stock. The total amount of the capital stock of the Company at the end of the fiscal year 1915 was $233,636,300, during the year 1915 it was increased by $506,000 of common stock issued and sold. The sum of $482,133,154 was paid into the treasury. The amount of capital stock per main line mile of road owned was $24,163.91. The funded debt at the close of the fiscal year was $482,133,154 — a decrease in the year of $4,748,000; the sum of $123,893,800 is held in the reserve. The amount of the funded debt per main line mile of road owned was $49,684.79. The total capitalization of the company per mile of road was $24,164.

CHICAGO AND NORTH WESTERN RAILWAY, popularly known as "The North Western Line," a system operated by a company of the same name in Michigan, Illinois, Iowa, Wisconsin, Nebraska, Minnesota, North Dakota, South Dakota and Wyoming.

History.—The Company was organized 6 June 1859 to take over the property of the Chicago, Saint Paul and Fond du Lac Railroad Company, sold under a foreclosure of 2 June 1859. The Chicago, Saint Paul and Fond du Lac Railroad Company had been organized 31 March 1855, to consolidate the Rock River Valley Union Railroad Company with the Illinois and Wisconsin Railroad Company, the latter chartered 12 Feb. 1857 to build a railroad north to the Canadian line, and then across any railroad in Wisconsin. The Rock River Valley Union Railroad Company, so named 9 Feb. 1859, was previously the Madison and Beloit Railroad, chartered by the legislature of Wisconsin 19 Aug. 1848; it was leased in 1854 by the Galena and Chicago Union Railroad Company which had been incorporated by the State of Illinois, 16 Jan. 1856, to construct a railroad from Chicago to Galena lines as they might deem advisable to unite with those of any other railroad company. The Galena and Chicago Union Railroad Company began to build their road in 1847, and their Chicago to Freeport section is the earliest built portion of what now constitutes the great Chicago and North Western System. The Chicago, Saint Paul and Fond du Lac Railroad Company, involved in the great financial panic of 1857, became bankrupt in 1859, and its reorganization as the Chicago and Northwestern Railway Company was authorized by the legislatures of Illinois and Wisconsin.

Operation, Equipment, etc.—By extensions and by the acquisition of other railroads, chief of these undertakings being the acquisition with the Galena and Chicago Union Railroad Company (1864), the Madison Extension (1871), the Menomonie Extension (1882), the Elroy Route (1875), the Port Pierre Extension (1882), the acquisition of the Iowa line (1884), the Fremont, Elkhorn and Missouri Valley Railroad Company (1903), of the Manitowoc, Green Bay and Northwestern Railway (1909), the Milwaukee, Sparta and Northwestern Railway (1912), and the Saint Louis, Peoria and Northwestern Railway (1913), the Chicago and North Western Railway Company was operating, 30 June 1915, 8,107.82 miles of railroad. Of this it owned 7,946.12 miles, leased 82.93 miles and had 76.78 miles of trackage rights on branches of the Union Pacific Railroad, the Chicago, Saint Paul, Minneapolis and Omaha and other railroads. Of the total mileage 2,170.03 are located in Wisconsin, 1,633.14 in Iowa, 1,192.95 in Nebraska, 1,063.15 in South Dakota, 824.53 in Illinois, 650.30 in Minnesota, 130.34 in Wyoming and 14.28 in North Dakota. In addition to the above the company had in operation 1,106.32 miles of second, third and fourth main track, and 3,406.53 miles of sidings and yard tracks, making a total mileage of 3,513.85 and operated of 12,620.77. The operating divisions of the system are: Wisconsin Division, 348.46 miles; Northern Wisconsin Division, 332.72 miles; Galena Division, 414.81 miles; Southern Illinois Division 205.7 miles; East Iowa Division, 346.66 miles; West Iowa Division, 222.80 miles; Iowa and Minnesota Division, 335.99 miles; Northern Iowa Division, 383.57 miles; Sioux City Division, 456.70 miles; Madison Division, 696.01 miles; Lake Shore Division, 381.35 miles; Ashland Division, 673.73 miles; Peninsula Division, 464.44 miles; Minnesota Division, 499.88 miles; Dakota Division, 841.85 miles; Eastern Division, 897.41 miles; Black Hills Division, 809.27 miles. In addition the Chicago and North Western Railway Company owns a majority of the capital stock of the Chicago, Saint Paul, Minneapolis and Omaha Railway Company, and has contracts and agreements with other railroad companies as follows: With the Chicago, Burlington and Quincy Railroad, severing the joint use of the bridge over the Mississippi.
River at Clinton, Iowa, at an annual rental of $20,000; with the same company and the Chicago, Rock Island and Pacific, giving them joint use with this company of certain sidings at Clinton, Iowa; the Chicago, Saint Paul, Minneapolis and Omaha, for joint running arrangements between Chicago and Saint Paul, and divisions of earnings upon a pro rata per mile, with the Chicago Great Western Railroad; granting that company the joint use of the buildings in Zumbrota, Minn., with the Union Pacific Railroad Company, the Southern Pacific Railroad Company, the Oregon Short Line Railroad Company and the Oregon Railroad and Navigation Company, providing for the establishment of a through route between Chicago and the Pacific Coast, and with the Chicago, Saint Paul, Minneapolis and Omaha Railroad, and Northern Pacific Railroad companies, providing for the establishment of a through route between Chicago and Northwest Pacific Coast points in Oregon and Washington.

The rolling stock on 30 June 1915 comprised 1,840 locomotives, 1,959 passenger cars, 68,242 freight cars, and 3,626 work cars, including 4 rotary snow plows. The total operating revenues for the year were $80,279,675, comprising freight, $51,923,800; passenger, $20,528,443; other transportation, $6,694,249; incidental, $1,633,121. The operating expenses amounted to 67.78 per cent of the operating revenues or $56,571,573, leaving a net revenue from railway operations of $24,408,102. This less the railway tax accruals, 5.59 per cent of operating revenue amounting to $1,516,943, and uncollectable railway revenues, $7,254, left a railway operating income of $19,663,904. A non-operating income from the rentals, dividends, funded and unfunded securities, etc., of $2,799,999, made a gross income of $22,463,904.

With deductions from gross income, rental payments, interest on funded debt, etc., $10,769,853, and the disposition of net income in sinking funds $204,053, and dividends 8 per cent on preferred stock and 7 per cent on common stock — total appropriations $1,113,698 — the balance income for the year was $80,380. Of the operating expenses for the current fiscal year, $32,920,905 or 42.4 per cent was paid employees for labor. The outstanding funded debt which had been decreased during the year by $4,298,000 was, on 30 June 1915, $210,581,000. The Company's authorized capital stock is $200,000,000, of which the following had been issued to 30 June 1915: Common stock and scrip held by the public, $130,117,028; common stock and scrip owned by the company, $2,338,502; preferred stock and scrip held by the public, $22,395,120; preferred stock and scrip owned by the company, $3,624; total capital stock and scrip, $154,854,485. 

CHICAGO, ROCK ISLAND AND PACIFIC RAILWAY COMPANY, an Illinois corporation operating besides the main parent line of the same name the Chicago, Rock Island and Gulf Railway, the Morris Terminal Railway, and under lease, the Choctaw, Oklahoma and Gulf Railway, the Rock Island, Arkansas and Louisiana Railway and Kansas City Short Line Railway, the Rock Island, Stuttgart and Southern Railway, the Rock Island and Dardanelle Railway, the Peoria and Bureau Valley Railway, the Keokuk and Des Moines Railway and the White and Black River Valley Railway, a total mileage of 8,530.17. The parent company owns the entire capital stock of all these companies with the exception of the three last named.

The Chicago, Rock Island and Pacific Railroad was incorporated by act of the Illinois legislature, approved 27 Feb. 1847, under the name of the Rock Island and LaSalle Railroad Company, the intention being, as defined in the act, to extend the railroad "from the termination of the Illinois and Michigan Canal at LaSalle, Ill., to Rock Island, on the Mississippi River, and the capital stock was fixed at $300,000.

The charter amended by the legislature changing the name of the corporation to the Chicago and Rock Island Railroad Company, authorizing it to continue its projected railroad by way of Ottawa and Joliet to Chicago and to increase its capital stock to $3,000,000, was approved on 7 Feb. 1851.

Construction was begun in April 1852, and the first passenger train was run from Chicago to Joliet, a distance of 40 miles, in October of the same year. The full line authorized by the charter, from Chicago to Rock Island, was completed and opened for operation in 1854.

The lines of the affiliated proprietary companies were built subsequently up to 1906, and were leased or acquired for traffic operation by the Chicago, Rock Island and Pacific Railway Company. In 1915, on the application of the American Steel Foundries, a corporation, receivers were appointed to take charge of and operate all the railroads, lands, properties, assets, rights and franchises of the company. The results of the operations for the fiscal year ending 30 June 1915 were as follows:

1. Total operating revenue (increase, $2,272,047.83, or 3.3 per cent), $70,947,898.88; operating expenses (increase, $1,885,794.78, or 3.7 per cent), $53,521,615.06; net operating revenue (increase, $386,253.05, or 2.3 per cent), $17,426,274.82; taxes and uncollectable railway revenue (increase, $50,110.43, or 1.5 per cent), $3,386,379.84; operating income, $14,039,894.98; miscellaneous income, $1,367,916.26; total income, $15,407,811.24; interest and rentals, $16,142,487.76; balance of income carried to profit and loss — deficit, $1,734,676.52. The authorized capital stock of the company is $75,000,000. The amount of capital stock outstanding 30 June 1915 was $74,877,200; of this amount $51,477,50 was owned by the company and held in its treasury. The total investment in road and equipment up to 30 June 1915 had been $318,635,234.90. The equipment on the same date comprised 1,674 locomotives of all classes, 1,163 cars in passenger service, 45,674 cars in freight service, 4,469 cars in company's service, and 1 steamer.

CHICAGO SUMMER SCHOOL. See Summer Schools.

CHICHEN-ITZA, ché-chén-ēt'za' (at the mouth of the well of the Itza), an ancient city of Yucatan whose ruins are fairly well preserved. According to the traditional history of the Itza tribe, the city stood in the southern part of the peninsula in the Yucatan, where, according to the calendar, the Itza tribe held their period in their tribal life, settled at the mouth of the overflowing well, built a great city known as Chichen Itza, and prospered. It is probable that the Itza derived their name from that of
their great culture god Itzamnà, or Zamán. Chichen Itzá retained great prominence among the pre-Columbian cities of Yucatan for a long time during which it became a centre of learning and of a very extended commerce which stretched out its arms into Central America and Southern Mexico. As the holiest shrine of the Itzá it exercised a strong religious influence over the peninsula of Yucatan, Campeche, Chiapas and Guatemala, into all of which districts four great paved roads led from the heart of the capital. The remains of the capital of the Itzá to-day consists of a number of fairly well-preserved buildings to which fanciful names have been given, and the ruins of many others which have been completely destroyed. The "Nunnery" is a two-story building on a terrace 32 feet high. The edifice itself, which is reached by a flight of stone steps 56 feet wide, is richly sculptured on the outside. The "Church" is a one-room building of very imposing height, built over a stairway. The "Akab-tribi" (the place of writing in the dark) is a building built on the level ground. It is 48 feet wide by 149 feet long; and the roof is reached by an outside stairway 45 feet wide. The "Castle" which is 86 feet square, has a diameter of 200 feet. A 40-foot square at the base and 75 feet high, is reached by a grand stairway 37 feet wide on the west; and by another 44 feet wide on the north. The latter has solid stone balustrades terminating at the bottom in immense serpents' heads each 10 feet long and with open mouths and protruding tongues. The building is rich in carved wood and stone and the main doorway is 20 feet wide. The "Gymnasium" consists of what is supposed to have been the circus of the city. Two immense parallel stone walls 274 feet long and 120 feet apart enclose the court which is open at both ends. A short distance from each end is a terraced building both supposed to have been temples. The "House of the Tigers," at the end of the gymnasium, has massive sculptured pillars and stair posts, and carved sapote lintels, while the walls and ceilings are adorned with very elaborate paintings in bright colors, depicting different scenes. The "Red House" (Chin-chan-chob) contains tablets of carved hieroglyphics like those found in Guatemala. The "Cabanol" consists of two rectangular terraces one above the other, the first 150 by 223 feet, the second 58 by 80 feet, on the latter of which is a round tower with dome-shaped top. The tower is 22 feet in diameter and 24 feet high and through the centre of it there runs, from top to bottom, an immense column of stone round which passes a circular corridor, and between this and the outside wall a second corridor. These corridors are probably contained stairways. Great stairways 45 feet wide of huge, intertwining stone serpents lead up the sides of the terraces to the tower. In one part of the city there is a great number of square stone columns from three to six feet high standing in rows from three to five feet apart around an open space some 400 feet square and also irregularly in other directions around various mounds. Several hundred of them have been counted while others lie buried. Heaps of ruined mounds, fallen walls, sculptured pillars and other ruins extend over the plain in the vicinity of the buildings already described show that the completely ruined part of the city is vastly larger than the part that is still standing to command the wonder and admiration of the present generation.

CHICHESTER, England, a municipal borough and episcopal city, near the southwest corner of the county of Sussex, 28 miles west of Brighton. It is well built and has wide streets. Its old wall, still in good preservation and lined with lofty elms, gives it a very picturesque appearance. Its principal edifice is the cathedral, an ancient Gothic structure, founded in 1078, with one of the most graceful spires in England, and containing among many monuments one of the poet Collins, who was born and died here. It has a fine old octagonal market-cross. The site of the city was known as Regnum during the Roman occupation, and was the headquarters of Vespasian. During the great Civil War the city changed hands three times in the course of 13 months (1642-43). It is now the headquarters of the Sussex County council. Pop. 12,591.

CHICK-A-DEE (an onomatopoeic word, imitating the note of the bird), a local name for the black-cap titmouse. See TITMOUSE.

CHICK-PEA, the popular name of Cicer arietinum and other plants of the genus Cicer, growing wild along the shores of the Mediterranean and in many parts of the East, and producing a short puffy pod with one or generally two small wrinkled seeds. It is an important article of French and Spanish cookery, and the plant is cultivated in Egypt, Syria, India, Mexico, etc. When roasted it is the common parched pulse of the East. It is sometimes used as a substitute for, or as an adulterant of, coffee. In Mexico it is an important food, known under the name garbanzo. The herbage serves as fodder for cattle. The chick-peas are leguminous plants of the vetch tribe, differing from the vetches mainly in the fruit. A dozen species are known, having the flowers solitary or in small axillary groups.

CHICKAHOMINY (the river of the coarse-ground corn, an Algonquin word), a river in Virginia, about 75 miles in length. It is an affluent of the James and runs parallel to it for many miles from its source northwest of Richmond. As its course was between the Union armies and Richmond, on and near it occurred many of the mortifications of McClellan's Peninsula campaign in 1862, including the battles of Williamsburg, Hanover Court-House, Fair Oaks, Mechanicsville, Cold Harbor, Savage's Station, Frazier's Farm and Malvern Hill (q.v.). The second battle of Cold Harbor under Grant occurred 3 June 1864.

CHICKAMAUGA, chik-em-a'ga, Battle of, fought near Chickamauga Creek, and on Georgia soil, 19-20 Sept. 1863. General Rosecrans (q.v.) having forced Bragg (q.v.) out of his fortified position in Middle Tennessee by a campaign of strategy, prepared to gain possession of Chattanooga, gateway through the mountains to the Gulf States, and a most important railroad centre for the Confederacy. Bragg held the city. Rosecrans' army lay along the western base of the Cumberlands, with headquarters at Winchester, Tenn. His army was composed of three corps of infantry, the Fourteenth, Gen. George H. Thomas; the Twentieth, Gen. Alex. McD. McCook; and the Twenty-first, Gen. Thomas L. Crittenden. Gen.
D. S. Stanley commanded the one corps of cavalry. McCook's corps was the right wing, Thomas' the centre and Crittenden's the left. Stanley's cavalry guarded the right flank and Minty's brigade of cavalry the left.

The plan of campaign involved the repair of the railroad to the Tennessee River, the collection of supplies for a month's absence from any base, and ammunition for two battles and the throwing of Rosecrans' army to the rear of Chattanooga and advancing to it from the south. His centre and right were ascending Lookout before Bragg became aware of the character of the movement. He then evacuated Chattanooga and moved to La Fayette, 26 miles south and behind Pigeon Mountain, the next range east of Lookout, leaving his rear-guard just below Lee and Gordon's Mill at the crossing of the Chickamauga. Crittenden having accomplished his purpose north of the Tennessee withdrew through Sequatchee Valley to the river, crossed both that and the Sand Mountains and entered Lookout Valley near the north point of Lookout Mountain. A reconnoitering party, 9 September, discovered the evacuation of the city. Passing around the point of the mountain, Crittenden, leaving one brigade in the city, proceeded at once, by way of Rossville Gap, to operate to the left of Thomas, who had descended Lookout at Stevens' Gap. McCook was further to the right, having crossed Lookout at Winston's. The grand strategy of the campaign had been entirely successful. The army had been thrown over three formidable mountain ranges and a wide river, all within the immediate territory of General Bragg, without opposition, almost without discovery and entirely without loss. To possess Chattanooga it remained necessary to concentrate the widely separated corps in it, or between it and Bragg.

Erroneous dispatches led Rosecrans to believe that Bragg was retreating on Rome. He ordered pursuit, and found Bragg occupying the gaps in Pigeon Mountain in force and preparing movements against each separate corps. These failed, and Bragg held his ground until the arrival of Longstreet, with two divisions from the Army of Northern Virginia, issued, 18 September, orders of battle designed for interposing between the Union army and the city. At this time the main bodies of the two armies confronted each other across the upper end of Chickamauga, and Longstreet was arriving at Ringgold. Crittenden's corps was concentrated at Lee and Gordon's Mill.

During the afternoon of the 18th Gen. Bushrod Johnson from Ringgold, in command of five brigades, including Hood's division of Longstreet's corps, forced a crossing at Reed's Bridge, after a sharp defense by Minty's cavalry. Walker's corps, after failing at Alexander's Bridge, which was defended by Wilder's brigade of mounted infantry, crossed at a ford below. During the night about two-thirds of Bragg's army crossed the Chickamauga, and early in the morning of the 19th, he formed line of battle directly on Crittenden's left flank and in contact with it. Bragg's plan was to drive Crittenden's corps back through Chattanooga in the centre, and both on McCook at the right, and force the whole into the mountain. His plan of battle was interfered with and finally destroyed by an undiscovered night advance of Rosecrans' centre and right, by which he passed several miles beyond Bragg and thrust his lines across the La Fayette road and eastward to the Chickamauga, and so gained position between Bragg and Chattanooga. The head of Thomas' corps, which struck Forrest's cavalry at Jay's Mill, was Brannan's division. The fighting, desperate and at close quarters, continued until 1 o'clock, when Forrest and his supports were repulsed. Soon both armies were rapidly advancing toward this vortex of fierce fighting. It was of desperate character on both sides, continuing from noon until sunset, with alternate success and repulse for each side, the field finally remaining in possession of the Union forces. The fighting throughout the day had been largely in forests thick with underbrush, and so all within the limits of point-blank range. At nightfall Cleburne's division burst with great force upon the lines of Johnson's and Baird's divisions, which were well in advance at the centre. They gradually withdrew from under the fire which continued for an hour after dark. At the close of the fighting for the day Rosecrans' army held La Fayette road between Bragg and Chattanooga, and Bragg's plan of battle for the day had been effectually defeated.

On the Union side the entire force except five brigades had been engaged. Of Bragg's army three divisions and one had not been engaged, and two brigades did not arrive until the second day. At the close of the first day's battle the Confederate line extended from Hall's Ford to Jay's Mill. The Union line was brought back nearer to La Fayette road, which was the axis and the objective of the battle. The Confederate line ex-
tended far beyond the Union left. Counting by brigades, the Union line was overlapped on its left by four brigades of cavalry, two fighting dismounted, and two brigades of infantry, and on its right by two brigades of infantry. The Confederates had 15 brigades in their reserves, concentrated Longstreet's second and third lines, Law's and Kershaw's divisions, at the centre. The Union army had five, an overlapping force for the Confederates of four brigades, and an excess of 10 in the reserves. The Union line had strengthened its front by logs, stumps, stones and fence rails. Counting by divisions from left to right, it was formed as follows: Baird, Johnson, Palmer and Reynolds east of the La Fayette road; Brannan, Negley, Davis, Sheridan and Wilder's Mounted Brigade west of it, with Wood and Van Cleve in reserve. The Confederate line, from right to left, was thus composed: Pegram and Armstrong of Forrest's cavalry, Breckenridge, Cleburne, Stewart, Thomas, Johnson, Hindman, Preston, with Walker, Liddell, Cheatham, Law and Kershaw in reserve.

The Confederates attacked about 9 o'clock. Breckenridge moved against Baird; the left brigade, striking Baird's rude works, was broken and its commander mortally wounded. The other two brigades swung around full in the Union rear, but were driven back after sharp fighting. Cleburne and Stewart assaulted in succession and were both repulsed. At 11 o'clock Negley, in rear of the Brotherston house, had been replaced by Wood from the reserve, and sent to the left. Brannan, on the left of Wood, had also been ordered to the left, but the Confederate attack developing on his front, he did not move. Upon the supposition that he had gone, Wood was ordered to close on Reynolds, the next division to the left of Brannan. Wood moved promptly to find Reynolds. This left a gap, just as Longstreet, with a column of three divisions, Bushrod Johnson in the front line, Law in the second and Kershaw in the third, was moving to attack Wood's position. This broke the Union centre. Davis' and Sheridan's divisions to the right of the break were rushed toward the gap, but failed to reach it. At noon Forrest's cavalry in front and on both flanks by Johnson's and Hindman's troops were forced off the field in confusion. Rosecrans, Crittenden and McCook, being with the right wing, were driven off the field with that portion of the army which left it. Brannan's division, the first on the left of the break, swung back nearly at right angles, and took position on Snodgrass Hill, a quarter of a mile in the rear, on which also rallied other portions of the Union army that had been scattered or broken. At noon Forrest's cavalry, opposite Cloud's, had crossed La Fayette road and captured the field hospitals of the Union left wing.

The four divisions of Baird, Johnson, Palmer and Reynolds maintained their lines around Kelly field. At 1 o'clock General Thomas had formed parts of Brannan's, Wood's and Negley's divisions, with various fragments, on Snodgrass Hill. Negley had left at noon with two regiments of infantry and 40 of guns. General Thomas then found himself with only one battery. About 1:30 the hill was assaulted by five brigades, that of Fulton overtopping Brannan's right and gaining the valley in his rear. At this juncture Gordon Granger arrived from McAfee's Church with Whitaker and Mitchell's brigades of Steedman's division, and promptly attacking, drove the Confederate force, which had crossed the ridge, over it again, and extended General Thomas' line for a half mile along the crest. About the same time Van Derveer's strong brigade arrived from its successful charge on Breckinridge in the Kelly field and strengthened Brannan's line. Longstreet's assault continued with little intermission until sundown. Finally 11 Confederate brigades were participating in the attack on Snodgrass. For its defense Thomas at the last had five brigades and about one-half of two others. There was little fighting on the Kelly field after 1 o'clock, though Bragg ordered a general attack for 3. It was not delivered until about sundown. At 3 Longstreet, from Snodgrass Hill, asked Bragg for re-enforcements, but was informed that the right wing had been so beaten back that it could be of no use to him. Longstreet's last assault was with troops that had not been engaged. Their attack began at 4:30 and lasted until 6. They gained a salient of the Union line and held it for an hour, with a loss of 36 per cent, but were finally dislodged by Gen. Charles H. Grosvenor's regiment.

At 5:30 General Thomas began withdrawing his army. The four divisions on Kelly field retired in succession from right to left. Reynolds and Palmer were not attacked. The Confederate attack ordered for 3 o'clock was delivered just as Johnson and Baird were leaving their lines, and some captures were made, though both reached the forest west of the La Fayette road without disorganization and followed the rest of the left wing through McFarland's Gap to Rossville. At 7 o'clock the Snodgrass Hill line began to retire from left to right. Steedman's withdrew at 6, sundown. Fighting in his front had ceased. An hour later Frigg and Kelly, passing down the ground which Steedman had occupied, captured the greater part of three Union regiments which were temporarily attached to the left of his line, and by mistake had not received notice of the withdrawal. The attack on the right was also fired by troops of Van Derveer's brigade at Kelly's and Trigg's lines, which, after capturing the isolated troops, attempted to move on Van Derveer's position. Davis' division, which had been cut off at noon, reached a point on its return near General Thomas' right at sundown. General Sheridan, who had continued to Rossville, marched toward the field from that point, reaching Cloud's an hour after sundown. Both of these divisions acted as supports for the flanks, while the position was being withdrawn. General Thomas withdrew the army without molestation through McFarland's Gap to Rossville, and during the night placed it in strong position in the gap at Rossville, along the adjacent crests of Missionary Ridge and across the valley to Lookout Mountain. It was thus firmly established between Bragg and Chattanooga. Holding his lines through the next day, at night he withdrew toward Chattanooga.

General Rosecrans crossed the Tennessee with an effective force of a little above 60,000. Two brigades and an additional regiment were detached. A maximum figure for his force at
the opening of the battle would be 55,000. It is difficult to approximate Bragg's force. A week after the battle he reported 38,846 effective, and his losses to have been 18,000, which would make his force in action 56,846. Gen. R. E. Lee, writing to President Davis of Bragg's strength, five days before the battle, said: "His total effective force will therefore be 76,219, as far as numbers as I can operate with." This did not count Longstreet's re-enforcement, according to General Lee's figures, but a large part of Longstreet's forces never reached Bragg. In view of General Lee's statements, and the known overlapping of the Union lines, and the preponderance of his reserves, it would seem that Bragg's force can be fairly fixed at 70,000.

Few, if any, of the great battles of the war show an equal percentage of casualties, considering the numbers engaged and the time of fighting. The losses in killed, wounded and missing for Rosecrans were 16,179, and for Bragg 18,000. For the troops actually engaged these figures give a percentage of 33 for each side. Longstreet's division lost 44 per cent, nearly all on the second day. Bushrod Johnson's division lost 44 per cent and Preston's 33 per cent in the attack of an hour and a half on Snodgrass Hill; and Gracie's brigade of the latter division lost 50 per cent during the same time. The brigade losses in Cheatham's division ranged from 35 to 50 per cent. The loss in Breckinridge's division was 33 per cent and in Cleburne's 43 per cent. Bates' brigade of Stewart's division lost 52 per cent. The Confederates assaulted throughout the second day.

On the Union side Steedman's division lost 49 per cent in four hours, and all of these but one were killed or wounded. Brannan's division lost slightly over 30 per cent; Van Derveer's brigade of that division only two less than 50 per cent; Davis' division a little over 50 per cent; Van Cleve's division 23.5 per cent. Among the Union brigades Buell's loss was 45 per cent, Carlin's 53 per cent, Hazen's 34 per cent, Dick's 25 per cent, Connell's 37 per cent and Croxton's 39 per cent. Consult 'War of the Rebellion Records,' Vol. 23, parts 1 and 2; Vol. 30, parts 1, 2, 3 and 4. Any good history of the United States.

H. V. BOYNTON.

CHICKAMAUGA NATIONAL MILITARY PARK. Park in Georgia, on the site of the battle of Chickamauga, a few miles southeast of Chattanooga, Tenn., near the Tennessee and Georgia line. Congress, in 1890, passed an act authorizing the establishment of a park on the site of the battle of Chickamauga. In carrying out the project the States of Georgia and Tennessee gave $400,000 and Congress appropriated $725,000. To the United States Federal government the citizens of each State sold and the States ceded jurisdiction over lands and roads included in or relating to the battle-field of Chickamauga, as well as the sites of those actions which took place about Chattanooga, and which were part of the engagements. The total area of the park is 15 square miles, but to all intents and purposes it embraces a much larger tract. It is the object, so far as possible, to preserve the conditions as they existed at the time of the battle, and in order to make clear the positions and movements of the troops engaged, monuments, historical tablets and other guide marks have been set up at the proper points. Several lofty observation towers have been erected, which command a view of the battle-field. A large part of the park is forest land, but a considerable portion has been cleared of underbrush and small timber, in order to permit free access and unobstructed views. An impressive set of edifices and elaborate ceremonies 19-21 Sept. 1895. It is the first time that a battle-field has been so completely marked and set aside as a monument of the event which happened within its boundary. See BOYNTON, HENRY V.

CHICKAREE, the American red squirrel; a popular name, imitative of its cry. It is a small animal, about seven inches in length of body, with a tail about the same length. See SQUIRREL.

CHICKASAW, chik'a-sá, the most active and warlike tribe of the great Muskogean (q.v.) Indian stock; a branch of the Choctaw (q.v.), and according to their own tradition, not separated till the Mississippi eastward. They occupied northeastern Mississippi, and the adjacent part of western Tennessee to the Ohio. Their chief settlements were on the head-waters of the Tombigbee and Yazoo, about the present Pontotoc and Chickasaw counties, and trail led to them from the site of Memphis, 160 miles off, their principal Mississippi landing. They were first found by De Soto, who reached the village of "Chicaca" with 200 houses, on the west bank of the Yazoo, 17 Dec. 1540, and remained there till March; but when he undertook to impress some of the Indians as porters, he was repeatedly assailed, the village fired, his path barred by a stockade and he lost many men before he beat them off. English traders penetrated thither in the 17th century. After the French settlement at Mobile, the rivalry of the two nations first set them against the French, and for a time cut off the Mississippi trade from both; but with the French, as the only real colonists in that region, they were in constant and envenomed hostility for many years, and Bienville and D'Artaguet led expeditions against them again and again, not even a nominal peace in 1740 putting an end to their warfare. With Oglethorpe of Georgia they had friendly relations. At this time they had four large contiguous settlements, with the houses in each scattered over a space 1 to 2 miles wide and 4 to 10 long; the chief was called Choookka Pharaab, or Long House. Their sachem was called the mico. In 1765 Governor Johnstone of West Florida induced them and the Choctaws to hold a council with him at Mobile, where a trade tariff was framed; but the white traders among them soon precipitated fresh troubles. After the Revolution, at the great general treaty of Hopewell, 28 Nov. 1785, their mico Pio and others made a treaty delimiting their lands from the Ohio River to the Mississippi State line. Their number was then estimated at 800 to 1,200. The reliability of these estimates may be judged from the fact that they are said to have had 10,000 warriors when they crossed the Mississippi, 450 in 1755, 750 in 1764 and 500 in 1768. In 1793 they joined the whites against the Creeks, and continued friendly to the settlers. In 1805, 1816 and 1818, they gradually
ceded all lands north of the Mississippi line. About 1800, as the hunting grounds narrowed, the tribe began to migrate west of the Mississippi, as did the Cherokees and others. In 1822 there were in Mississippi 3,625 on a reliable count, with eight towns, and a progressive civilization; they were industrious farmers and cattlemen, marketing live stock among the whites. By the treaty of Pontotoc Creek, 20 Oct., 1822, they made another large cession of lands; and by that of Washington, 24 May 1834, they gave up all the remainder, the two cessions comprising 6,442,400 acres, or over 10,000 square miles, for which they received $3,646,000. On 17 Jan. 1837 they bought of the Choctaws for $530,000 a district on the Red River west and south of the Washita (the extreme western part of the subsequent Indian Territory, now incorporated in Oklahoma), to be inalienable except with the consent of the Choctaws; relinquished their governmental organization and became a part of that nation, with the other tribes; and lost representation in its government. A considerable number, instead of remaining with the tribe, scattered through the Choctaws, buying and taking up lands at pleasure. They lagged behind the Choctaws in this respect; the agents of the military carried off several hundred; the government annuity made them lazy; and they opened no schools till 1851. Aggrieved at being represented in the Choctaw government only according to numbers, instead of equally as a tribe, they appealed to the President, and on 27 June 1855 were given separate title to their district as the Chickasaw Nation. They organized a government with a council and two-chambered legislature, and advanced rapidly. In the Civil War, as slaveholders, and having Southern agents, they joined the Confederate side; lost about one-fourth of their people, and were liable to the penalties of treason. By the treaty of Fort Smith, September 1865, they were conditionally restored to their rights. On 28 April 1867, old treaties were renewed; but they were forced to sell to the government 7,000,000 acres of land, nearly 11,000 square miles, for $315,000, the money to go to their former slaves unless they admitted them to full true citizens. There were thirty years for the year, but finally acceded on 10 Jan. 1873. The nation in 1915 numbered 10,966, of whom 5,659 were blood Indians, 645 of intermarriage descent and 4,662 freedmen. Under treaties with the United States government, the lands in the Chickasaw and Choctaw nations were held in common by members of both tribes, the Choctaw lands comprising 6,953,848 acres and the Chickasaw lands 4,707,903 acres. Owing to their allied interests citizens of both nations had the right to select their allotments of land in either or both nations at their options. In view of this common interest, matters pertaining to these two nations are treated under one head. There have been allotted to citizens and freedmen of these two nations a total of 8,691,386 acres, at the sale price. In addition to this, there are 431,080 acres reserved for various purposes, not including reservations made therefor for coal leases. Tracts comprising 2,431,301 acres were sold for $14,053,760. Over one-half of the sale price, together with interest thereon, was collected and deposited in the United States Treasury to the credit of these nations. See also Choctaw; Indian Affairs.

CHICKASAW BAYOU or BLUFFS. Battle of, fought 29 Dec. 1862. On 8 Dec. 1862 General Grant ordered Gen. W. T. Sherman to organize at Memphis, Tenn., an expedition which in cooperation with Adm. D. D. Porter's gunboat fleet should reduce Vicksburg. On the 22d the expedition rendezvoused at Friar's Point on the Mississippi, ready to move up the Yazoo River in rear of Vicksburg. Sherman had the four divisions of Gen. F. Steele, Geo. W. Morgan, M. L. Smith and A. J. Smith, aggregating about 30,000 men. The transports, preceded by the gunboats, entered Yazoo River on the 25th, and on the 26th and 27th the troops were landed on its south bank, confronting the bluffs overlooking the swamps through which ran Chickasaw Bayou. Gen. J. C. Pemberton, commanding the Confederate forces in Mississippi, was at Grenada opposing Grant, who was moving south from Grand Junction and Corinth on the line of the railroads. On the 21st Pemberton heard that the fleet and transports were moving down the Mississippi for the supposed purpose of attacking Vicksburg, and at the time was held by Gen. Martin L. Smith with the brigade of Gen. S. D. Lee. Vaughn's brigade was immediately ordered to Vicksburg, and was soon followed by the brigades of Gregg and Barton. Pemberton arrived at Vicksburg on the 26th and the last of the three brigades during the night of the 27th. Pemberton disposed his forces, under Vaughn, Gregg, Barton and Lee, on a line from Vicksburg on the left to Haynes' Bluff on the right, a distance of 13 miles, on high ground overlooking Chickasaw Bayou and the Yazoo River, S. D. Lee holding Walnut Hills from Vicksburg to Snyder's Mill on the right, a distance of 10 miles. Lee, a good engineer and a fine officer, strengthened his position by works for his batteries, and rifle pits on the slope of the bluff, which rose about 200 feet above the Bayou. Between this position and where Sherman had landed was bottom land, almost wholly densely wooded, intersected with bayous and low, swampy ground. There were but two roads through this area, and these were obstructed by earthworks and felled timber. By these Sherman advanced on the morning of the 27th, Steele on the left, Morgan on the right. On the 28th Vaughn and J. L. Smith met Morgan on the right of the road. There was heavy skirmishing on the 27th and 28th, the Confederate outposts were driven in, and on the night of the 28th the Union troops lay parallel to Chickasaw or Walnut Hills bluff and about 600 yards from its foot. The main assault on the bluff was to be made by Morgan, supported by Steele; while, to make a diversion in favor of Morgan, A. J. Smith, with M. L. Smith's division and one brigade of his own, was to cross a lake, a mile below Morgan, by a narrow sand-bar, and attack. On the 29th, 93,674 acres have been reserved for various purposes, not including 431,080 acres segregated for coal and asphalt, but including reservations made therefor for coal leases. Tracts comprising 2,431,301 acres were sold for $14,053,760. Over one-half of the sale price, together with interest thereon, was collected and deposited in the United States Treasury to the credit of these nations. See also Choctaw; Indian Affairs.
gan to give the signal for assault; that we will lose 5,000 men before we take Vicksburg, and may as well lose them here as anywhere else. Morgan replied that Sherman’s entire army could not carry the position in his front, but that he would order the assault. De Courcy’s brigade of Morgan’s division, and the two brigades of Blair and Thayer of Steele’s, were formed for the assault. The signal was given by a heavy artillery fire upon the Confederate lines, and at 12 o’clock the three brigades went forward. By some misunderstanding Thayer’s brigade, with the exception of the 4th Iowa, diverged too far to the right, but De Courcy, Blair and Thayer (with the 4th Iowa), about 6,000 men, after clearing the obstruction in front and floundering through deep mire and tangled marsh, under a terrific fire of artillery, finally made a lodgment on the hard tableland at the foot of the bluff, where an abandoned line of works gave shelter, and where some of the men stopped. All formation was broken up, brigades and regiments mixed, but on went the main body, pushed up the bluff, and reached different points of Lee’s works, where they were met by flank raids by such a withering fire from the rifle-pits that ran diagonally up the slope of the hill, and so severe a cross-fire of shell and canister from the batteries, that the men faltered and, no support being in sight, fell back to the point of starting, leaving about 1,500 killed, wounded and captured. Lee lost 115. More to the right, where A. J. Smith was to demonstrate, the 6th Missouri gained the levee at the foot of the bluff, but not able to go farther under the hot fire poured upon them from above, the men sought shelter by digging with hands and bayonets into the bank of the levee, where they remained until night covered their withdrawal, after a loss of 57 killed and wounded. Sherman thought of renewing the assault in the morning, but after a personal examination, he came to the conclusion that the enemy’s centre could not be broken without crippling his army beyond the power to act with any vigor afterward, and proposed to attack Haynes’ Bluff, higher up the Yazoo. Preparations were made to assault at 4 o’clock on the morning of 1 Jan. 1863. Admiral Porter, who was to co-operate in this attack, found the fog so dense on the river that he could not move his boats. The attack was deferred and then abandoned, and by sunrise, 2 January, the troops were all embarked on transports and sailed for Milliken’s Bend. The Union loss in the assault on Chickasaw Bluffs and in the skirmishing preceding it was 1,213 killed and wounded, and 363 missing. The Confederates lost 177 killed and wounded, and 10 missing. Consult ‘Official Records’ (Vol. XVII); The Century Company’s ‘Battles and Leaders of the Civil War’ (Vol. III); Greene, F. V., ‘The Mississippi’; Sherman’s ‘Memoirs’ (New York 1888).

E. A. CARMAN.

CHICKASHA, chik’-ə-shə, Okla., city and county-seat of Grady County, on the Rock Island, Union, Oklahoma Central and Santa Fé railroads. The city has an altitude of 1,100 feet above sea-level, has a delightful climate and an abundance of good water. Grady County is ideal for the raising of wheat, corn, cotton, alfalfa, fruits and stock, and the rapid growth of the city is due to the extent and value of the agricultural crops. The commercial business interests of Chickasha are large and growing rapidly. The city has three large cotton gins, two of the largest cottonseed-oil mills in Oklahoma, the plants being among the largest in the world, one of the largest cotton compresses in the South, the only cotton-oil refinery in State, large flour-mills and elevators, 33 wholesale and manufacturing and commission houses. The United States census of manufactures for 1914 reported 29 industrial establishments, employing 430 persons, of whom 337 were wage earners, receiving annually $235,000 in wages. The capital invested aggregated $1,315,000, and the year’s output was valued at $1,720,000; of this, $443,000 was added by manufacture. The large railroad machine shops located here employ nearly 1,000 persons. Chickasha is the largest stock feeding and cotton concentration point in the State. There are five banks with a combined capital and surplus of $670,000. Chickasha has an admirable school system, many fine churches, a Carnegie library, a Federal building costing $150,000 and is the home of the Oklahoma College for Women. The city owns and operates its own water system. Pop. (1910) 10,320; (1914) 13,873.

CHICKEN. See Fowl.

CHICKEN-FLEA, the common name of Sarcopsylla gallinacea, a pest of young chickens in tropical and subtropical regions, and destructive from Florida to Texas. It is smaller and shorter than the cat-flea, with the eyes and antennæ in the higher part of the head, and it does not hop. It abounds mostly in shady places, under old houses, and in carthen floors. It is first observed to infest young chickens and turkeys, and its number and pertinacity kills young chickens, while being more or less permanently parasites on hens. See Jigger; SARCOPSYLLA.

CHICKEN-LICE, several species of bird-lice (Mallophaga), orouse-like wingless insects, afflicting chickens and hens. Unlike the louse (Pediculus), which obtains its nourishment by suction, the bird-lice have free jaws adapted for cutting feathers, and they draw blood from the skin of their host. The large chicken-louse (Goniocotes abdominalis) is less common than the lesser chicken-louse (G. holoaster); it is only one millimeter long, while the first-named kind is three millimeters long. Quite a different kind is the common hen-louse (Menopon gallinum), which is the most abundant and annoying of all. It differs from the others in its light color and greater activity, running among the feathers and from them upon the hands of persons handling fowls. It is from one to one and a half millimetres long, rather slender and of a pale straw-yellow color. Fowls should be allowed plenty of ashes and road dust in which to roll. An infected henney should be well fumigated and white-washed, and insect-powder should be dusted upon the birds themselves.

CHICKEN-MITE, or POUltTY-TICK, a small mite (Dermamyssus gallinae) which gathers on fowls at night and sucks their blood. It is about one millimetre high, light gray, with dark patches, but red when gorged with blood.
It swarms in cracks and corners of the hen-house and should not be confounded with the bird-tick (D. avium).

**CHICKEN-POX**, varicella, an acute, specific, infectious disease, characterized by a definite incubation period, an eruption of successive crops of vesicles which persist for a certain length of time and a well-marked clinical course of short duration. It is one of the mildest of the eruptive fevers. The disease is usually epidemic, but sporadic cases do occur. It very frequently accompanies small-pox, and great care must be exercised not to confound mild cases of small-pox with severe cases of chicken-pox. The stage of incubation is usually about eight days, although it may vary from 8 to 18 days. The child may be feverish in some cases, have a slight chill, pain in the back and legs, nausea and vomiting. The eruption usually develops within 24 hours after the first onset. There are first raised red papules which in a few hours are transferred into raised hemispherical vessels filled with clear serum. At the end of 36 to 48 hours, this clear serum may become purulent, and the vesicles then begin to shrivel, and in from three to four days are changed to dark-brown crusts which fall off and rarely leave a scar. Fresh groups occur during the first two or three days of the illness; as a rule there are not very many in number. In delicate children the number may be large, and gangrene may set in unless great care is taken in the treatment of the vesicles. Chicken-pox is very contagious, but is not dangerous, and the first treatment should be the complete isolation of the patient.

**CHICKEN-SNAKE**, a name given in the Southern States to several different, but allied snakes that occasionally eat birds and small poultry, although their principal prey is rats and mice. Search for these brings them about farm buildings, but they do little harm as compared with their beneficial service. The blotched chicken-snake is a variety (confinis) of the pilot blacksnake (Coluber obsoletus), and is gray with brown black blotches, which become less marked in autumn. The chicken-snake is another variety (quadrisulcata) of the same species, yellow or olive, with four blackish stripes and a strong black line from the eye to the nostril. Both are common throughout the Southern States, where they reach a length of six or seven feet. (See BLACK-SNAKE). The red chicken-snake is a local name of the cornsnake (q.v.).

**CHICKEN-TICK**, an arachnid of the family Argasidae, and related to the mites, but very much larger. Originally an inhabitant of tropical America, this tick (Argas minitus) has been found to annoy poultry in Texas and Florida. It is about a quarter of an inch long, usually very flat, unless gorged with blood. The surface of the body differs from that of other ticks in having scattered pits with a raised edge; it also differs from ordinary ticks in the head being covered by the body, in the spiracles being placed between the third and fourth pairs of legs and in having no pulvilli between the claws. It was originally found in Texas among ordinary ticks taken from cattle. The young is six-footed. Of 10 other species of Argas, A. reflexus of the Old World lives on pigeons and occasionally attacks man; the Persian Argas (A. persicus) in Persia attacks man and poultry.

**CHICKERING**, Jonas, American piano maker; b. New Ipswich, N. H., 5 April 1797; d. Boston, Mass., 8 Dec. 1853. The instruments made by Chickering were works of art. Before his death his Boston factory was turning out 2,000 pianos a year. The firm has been carried on continuously by his sons, and their pianos have a high reputation among musicians everywhere. Some of the most important developments in pianoforte construction have first been introduced in the Chickering piano.

**CHICKWEED** (Alis media), an annual plant, of the family Alismataceae, abounding throughout temperate regions of the world in ill cultivated or neglected places. It grows in waste places throughout North America, and may be used when young as a substitute for spinach and other greens.

**CHILCA, ché-kía'nah** Spain, town in Andalusia, 12 miles southeast of Cadiz. It stands in a plain on both sides of the Lirio, and about a mile northeast of Barrosa, famous for the defeat of the French, under Marshal Victor, by the British under General Graham, in 1811. It consists of well-built houses of hewn stone, white as snow, and generally enclosed by gardens. The principal buildings are a magnificent hospital, two parish churches and a large and well-decorated theatre. The manufactures consist of linen, starch, earthenware and other articles, and there is a considerable trade in corn, wine and fruit. The baths of Chilca, which have a temperature of 60°, and are said to be very efficacious in cutaneous affections, are much frequented. Pop. 11,490.

**CHICLAYO, ché-kía'yo** Peru, city in the northwest in the department of Lambayeque, on the coast, is near a valuable sugar district, and the shipping of the sugar is its chief occupation. It is the residence of a United States consular agent. Pop. 13,000.

**CHILE-GUM**, chék'i- or chék'kä-, an elastic gum produced by the bully-tree, naseberry or sapodilla (Chlorophora septata) of West America. It is largely imported into the United States for the purpose of being manufactured into chewing-gum.

**CHICO, chék'o** city in Butte County, 95 miles north of Sacramento, on Chico Creek, and on the Butte County and the Southern Pacific railroads. It has a natural park of 2,000 acres, a Carnegie library and a State normal school. Its industrial establishments include match factories, flour-mills, machine shops and foundries, electric-car shops, etc. Dairying, fruit-growing, lumbering and mining are also important. Pop. 3,750.

**CHICOPPEE, Mass.**, city in Hampden County, on the Connecticut River, at the mouth of the Chicopee, four miles north of Springfield, and on the Boston and Albany and Boston and Maine railroads. It is connected with Holyoke and Springfield by electric street railway lines. The 7,000 feet of Chicopee Falls, Williamamsett and Fairview are now included in Chicopee city, which has manufactures of cotton, artillery, bronze, bicycles, rifles, swords, paper, rubber tires, automobiles, etc. The United States census of manufactures
for 1914 recorded 62 industrial establishments of factor grade, employing 9,119 persons, of whom 8,423 were wage earners, receiving an annual wage of $5,131,000 in wages. The capital invested aggregated $23,501,000, and the year’s production was valued at $28,869,000; of this, $1,751,000 was the value added by manufacture. Manufacturing power is furnished by the Chicopee River, which contains numerous power houses, church, public and parish schools, national and savings banks. Pop. 28,000.

CHICOPEE RIVER, rises in Worcester County, Mass., flows south-southwest into Connecticut River. It has an abundance of water power which is utilized for manufacturing by the numerous towns on its banks. It is 20 miles long from the mouth to Three Rivers. It drains an area of 700 square miles. It has a rapid fall and supplies extensive water power.

CHICORY, or SUCCORY, a perennial herb (Cichorium intybus) of the family Cichorieae. It is a native of Europe which has become naturalized in many parts of the world, having escaped from gardens in which it was grown as a pot herb and salad, for its roots, which, while young, are used like carrots. In many places it has become troublesome as a weed. The plant may be cultivated like other root crops upon rich, deep, well-drained soil. It resembles dandelion in its leaves, but the perennial roots send up a branched flower-stem which bears leaves of various shapes and flowers of various colors, blue predominating, but pink and white not being uncommon. The dried roots have been widely used as a substitute for or adulterant of coffee.

CHICOUTIME, shé-koo-té-má, Canada county of the Quebec province, formed from Saguenay in 1853. Several smaller sheets of water are scattered over its surface, and the Saguenay intersects it, receiving in its course several small tributaries. The surface is rocky, rough and broken, but near the streams are fertile and cultivated strips. A great deal of lumber is cut and sawed on the small streams emptying into the Saguenay. The Hudson Bay Company have several stations in the county. The capital is Chicoutimi, with a population of 5,580. It is the seat of a Roman Catholic bishopric and of a classical college founded in 1873.

CHIEF JUSTICE, the title of the presiding justice of the Supreme Court of the United States, and of the presiding justice of the several State Supreme Courts. Various other courts in the United States are also presided over by a chief justice. The chief justice of the United States is the highest judicial officer of the republic. Among his functions are those of administering the oath of office to the President and Vice-President at their inauguration, and of presiding over the Senate when that body is resolved into a high court for the trial of impeachments. In official dignity he ranks next after the President. In England the superior judges of the King’s (or Queen’s) bench and of the Court of Common Pleas are called chief justices, the former being known as Lord Chief Justice of England, and ranking all other judicial officers except the Chancellor.

(See Chief Justice or Lord Chief Justice.) The following is a list of the persons appointed as chief justices of the Supreme Court of the United States from its establishment, some of whom, however, never served:

- John Rutledge, of South Carolina, appointed by Washington, 1 July 1795; rejected by the Senate, 15 Dec. 1795.
- William Cushing, of Massachusetts, appointed by Washington, 26 Jan. 1796; declined promotion from his associate justiceship.
- Oliver Ellsworth, of Connecticut, appointed by Washington, 4 March 1796; resigned 1800.
- Roger Brooke Taney, of Maryland, appointed by Jackson, 15 March 1836; died, 12 Oct. 1864.
- Salmon Portland Chase, of Ohio, appointed by Lincoln, 6 Dec. 1864; died, 7 May 1873.
- George H. Williams, of Maine, and Caleb Cushing, of Massachusetts, appointed by Grant 1873; rejected.
- Morrison R. Waite, of Ohio, appointed by Grant, 21 Jan. 1874; died, 23 March 1888.
- Melville W. Fuller, of Illinois, appointed by Cleveland, 20 July 1888; died, 4 July 1910.
- Edward Douglass White, of Louisiana, appointed by Taft, December 1910.

CHIEF JUSTICE, or LORD CHIEF JUSTICE, in England; the presiding judge in the king’s or queen’s bench division of the High Court of Justice, and, in the absence of the Lord Chancellor, president of the High Court, and also, ex officio, one of the judges of the Court of Appeal. The chief justice of the Court of Common Pleas, previous to 1881, was the presiding judge in the common pleas division of the High Court of Justice, but the office is now merged in that of the chief justice of England. The title chief justice is also generally given in the various British colonies to the heads of the different judicial establishments, as in Canada, Australia, etc. In Canada there is not only a chief justice at the head of the Supreme Court of the Dominion, but also chief justices in the separate provinces.

CHIEF MOUNTAIN OVERTHUST. See Lewis Overthrust.

CHIEF OF STAFF. See General Staff of the Army.

CHIRMSEE, kēm’zā, the largest lake in Bavaria, circle (also known as Bayrisches Meer), Isar, district Trostberg. 48 miles southeast of Munich; greatest length, 9 miles; greatest breadth, 6 miles; area, 35 square miles; depth, about 400 feet. It is of an irregular shape, very much indented and contains three pretty islands—Krautinsel, Herrenwörth and Frauenwörth.

CHIERI, kye’rē, Italy, city in the province of Turin, eight miles east-southeast of the town of Turin. It is walled and well built, contains the largest Gothic church in Piedmont, which in the early period became celebrated for its manufactures of satin, which are still flourishing. It has a
gymnasium, a technical school, a theatre and linen, cotton and silk factories. In the 11th century it was an independent republic. Pop. 15,454.

CHIETI, kyē'tē, Italy, capital of province of same name, on a hill near the right bank of the Pescara. It was anciently one of the largest and most important towns in this part of Italy, and was for some centuries in possession of the Greeks, from whom it passed successively to the Romans, Lombards, Franks and Normans. In 1802 it was taken by the French troops. The modern town, which is well built and adorned with several handsome edifices, is the see of an archbishop and the seat of a superior civil and criminal court, and has manufactures of woolens, and a trade in silk, wine, wheat and oil. Pop. 26,897.

CHIFF-CHAFF, a small European bird (Sylvia hippocastanum or Phylloscopus collybita), of the thrush family. It is noted for its cry, 'chiff-chaff', from which its name is derived. Its head, back and upper wings are ashy brown, and its under parts are brownish green dashed with yellow. In length it is between four and five inches, and it frequents woods, hedges and thickets. Its food consists of the larvae of various insects and some of the smaller moths.

CHIGI, ke'jē, a noble Italian family, founded by Agostino Chigi (d. 1520) of Siena. He became a patron of the fine arts and banker for the Popes. Peruzzi built for him the well-known Villa Farnese. Raphael painted there the 'Triumph of Galatea' and 'The Legend of Psyche.' Sodoma ornamented it with his fresco 'The History of Alexander and Roxanna.' Consult Cugini's 'Agostino Chigi il Magnifico.' The family was further distinguished by five cardinals and one Pope, Fabio Chigi (1632), afterward Alexander VII (q.v.). Flavio Chigi: b. 1810; d. 15 Feb. 1885, was one of the papal guards until 1848, when he was made bishop of Mira in partibus, nuncio at Munich, but was sent to Paris (1873) and later in the same year was made cardinal.

CHIGNECTO, shik-nēk'tō, BAY, Canada, an inlet at the head of the Bay of Fundy, separating Nova Scotia from New Brunswick. It is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of Saint Lawrence.

In October 1888 work was begun on the construction of a ship railway across the neck of land connecting Nova Scotia with the main land of Canada, under the encouragement of an annual subsidy from the Canadian government. The contract for the work, valued at $4,000,000, was obtained by a British firm in London, and the work was successfully completed in 1890. The railway is 18 miles long, with a grade of 1 in 200, and is built to a width of 38 feet, and is of wrought iron throughout.

CHIGNON, shēn-yōn, (Fr. chignon, the nape of the neck), a peculiar arrangement of the hair, worn by women, a knot or mass, natural or artificial, arranged low on the back of the head, at the nape of the neck. This style of hair-dressing was common in the 18th century, but fell into disuse and was revived in the last half of the 19th century, but is not now in vogue.

CHIGO, chē'gō. See JEGGER; SARCOPTES.

CHIHUAHUA, chē-wā'wā, Mexico, state bounded on the north by the United States, on the east by Coahuila, on the south by Durango and on the west by Sinaloa and Sonora. It is the largest of the Mexican states, having an area of 89,998 square miles, or about double that of the State of New York. The Sierra Madre Range traverses the state, and the Sierra de Tarahumares lifts its peaks (Buda de Cerro Prieto, Jesús y María, Mesa de Tabascotes, etc.) to a considerable height; otherwise the surface is an undulating table-land, the elevation of which varies from 3,500 to 7,000 feet above sea-level. The largest of the elevated plains lying between the mountain ranges is the Chihuahua, Giganete, Bolsón de Mier, etc. The Rio Grande forms the northern boundary, separating the state from the United States; but this river, which rises in Colorado and flows through New Mexico, is almost dry by the time it reaches Mexico territory, the greater portion of its waters having been utilized for the irrigation of lands in the country of its origin. The climate is temperate and healthful and the soil fertile wherever watered. Agricultural products consist of corn, wheat, several kinds of vegetables and fruit, including grapes. Cotton is also grown successfully in the Torreon district. The forests are found mostly in the mountainous districts of the west. Chihuahua has considerable mineral deposits, its silver mines being among the richest in the state. Some of them were worked by the Indians at the time of the Spanish Conquest. The state's production of lead is also noteworthy and zinc is also abundant. Over 5,250 mining properties are recorded for its entire area. The state extends from north to south by the Mexican Central Railway. A considerable portion of the population is creole or white; the rest consists of Indians partly civilized. There are some Apaches in the mountains. In recent years the number of foreigners, chiefly Americans, has secured control of the industries and have already raised the state to a leading place in the republic. A flourishing Mormon agricultural colony was founded in 1880 west of Ciudad Juárez. The state suffered severely in many revolutions which followed the fall of the Diaz régime, being overrun with bandits, who despoiled the residents, both native and foreign, and practically brought all the various industries to a standstill. The state was invaded by United States troops under General Pershing in March 1916, who were dispatched to capture the bandit, Francisco Villa, who had made a murderous raid on Columbus, N. M., a few weeks previously. Pop. (1910) 455,265. The capital is Chihuahua.

CHIHUAHUA, Mexico, capital of the state of the same name, the northern border of which forms the dividing line between Mexico and the United States, and one-third of the width of the first named country. Altitude, 4,973 feet above sea-level. Distance from the United States border at El Paso, Tex., 225 miles and
from Mexico city, 999 miles. It is well provided with transportation facilities, being on the lines of the Mexican Central and Kansas City, Mexican and Orient railway, and the initial terminal of the Chihuahua and Pacific Railway. Is the centre of one of the most important stock raising and mining producing districts south of the Rio Grande. It is the first point of importance reached in the journey from the northern boundary of the country to the City of Mexico. It is an important supply point for miners whose properties are situated in the mountain regions to the west and southwest. Among the manufacturing establishments of the city are extensive rolling mills and iron works, a brewery, a soap factory, a manufactory of clothing, broom factory, mineral water factory, manufactory of agricultural implements and various smaller industries. Since the outbreak of the revolutionary movements within the last few years it has been the starting point, its industries and social life have come practically to a standstill.

A few miles distant from and connected with the city by railway, are the Santa Eulalia Mineral Springs and the Hot Springs, for which great merit is claimed. The principal buildings of a public character are the new penitentiary; the old cathedral, completed over 200 years ago by the contributions of a rich miner, at an outlay of almost $1,000,000, the recently built opera-house, one of the largest and finest in the republic; the Government Palace, the palatial home of ex-Governor Ahumada; the new municipal palace and the Mineral Bank. It was here that the patriot Hidalgo suffered imprisonment and was executed in 1811. The tower or dungeon in which he was confined is sacredly preserved and will ever be reverently visited by tourists. In the plaza adjoining the Government Palace a splendid monument has been erected in his honor. The Alameda, situated in the business centre, is utilized on Sunday evening of every week by all classes as a promenade, the occasion being always enlivened by excellent music provided by the state government. An aqueduct built over 200 years ago conveyed water into the city, and a modern built street railway provides means of local transportation. A museum of minerals recently established by the state has already become one of the city's chief places of interest. Advanced methods of primary education are receiving much attention, both from the state and municipal governments, and higher education is provided by a normal school for young women, a college for young men and a number of clerical and other institutions of advanced instruction. A library connected with the preparatory school contains 6,000 volumes. The principal scientific organization is devoted to the study of medicine and is known as the "Medica Mutualistas." Financially, Chihuahua is one of the best equipped cities in the republic. It has four local banks—the Mining Bank, with a capitalization of $5,000,000, the Chihuahua Exchange Company, the Chihuahua Investment Company and the Commercial Bank; besides which there are branches of the National Bank and the bank of Sonora, and an agency of the bank of London and Mexico.

CHILAN BALÁM, ché-lán', h-lán', the Books of, a series of Maya writings dating back to the end of the first century of the Christian era. They were written by a priest or chilan by the name of Balam, in the Maya language with Latin characters which had already replaced the ancient Maya system of writing throughout Yucatan. The books of Chilan Balam seem to have been a collection of Maya stories and records which had been, at the time of the conquest, and probably long previous to it, written in the ancient Maya script. Balam either copied these manuscripts or retold the Maya stories as he knew them from his connection with the Maya people, for he is supposed to have been a full-blooded Maya Indian. These books, we are told, recite all the old traditions which still lingered in the memory of the natives of Yucatan with whom the writer came into contact. They lay long in manuscript, and were copied in whole and in part several times. Brinton, the American scholar, had a copy of them made and published under the title of "Maya Chronicles," in the first volume of his "Library of Aboriginal American Literature." The name given to them by Brinton admirably defines their scope, for they are, in reality, a record of the divisions of time, for the most part, with legends, stories and events that are collected around the "Katuns," or dates. These books are very valuable for the light they throw on Maya customs and habits previous to the coming of the Spaniards to Yucatan. They also serve as a starting point from which to reckon back the Maya time as given in the few existing manuscripts written in the old Maya script.

CHILBLAIN, or FROSTBITE, a mild or severe inflammatory reaction from the effects of severe cold on the toes, fingers, nose, chin, ears, etc. In mild cases there is swelling only, with an inflammation of the skin. This disappears and the part is apt to be tender. In severe frostbite there is ulceration and sloughing of the part. The treatment for mild chilblain is by slow raising of the temperature of the chilled part to that of the body. Too rapid heating results disastrously.

CHILCOTT, Ellery Channing, American agriculturist: b. East Hamburg, N. Y., 8 April 1859. He was educated in the common schools and at the Friends' Institute of East Hamburg. From 1882 to 1892 he was owner and manager of a stock ranch in Campbell County, S. D., and at the same time acted as United States deputy surveyor. He was elected to the State senate in 1892, was professor of agriculture 1892-97, professor of geology and agronomy and vice-director 1897-1905 of the South Dakota Agricultural College. From 1903 to 1905 he was agriculturist of the United States Experiment Station, South Dakota, and in the last named year was placed in charge of dry-land agricultural investigations of the bureau of plant industry. He wrote "A Study of Cultivation Methods and Crop Rotations for the Great Plains Area" (1910), bulletin issued by the Department of Agriculture.

CHILD, Francis James, American scholar and educator: b. Boston, Mass., 1 Feb. 1825; d. Cambridge, 11 Sept. 1896. He was Boylston professor of rhetoric and oratory at Harvard from 1851 till 1876, when he exchanged for the
CHILD—CHILD LABOR

461

chair of English literature which he held until his death. His principal work, 'English and Scottish Ballads' (10 large volumes), a subject in which he was pre-eminent, was published in this country, he improved and enlarged for publication 1882–98. Among his other works are 'Four Old Plays' (1848); a collection of 'Poems of Sorrow, Comfort, Counsel and Inspiration' (edited 1863), and 'War Songs for Freeman' (edited 1882). He was published in 1855, the 'Poetical Works of Edmund Spenser,' five volumes, with notes, introduction and explanations, the best edition of Spenser to date.

CHILD, Frank Samuel, American Congregational clergyman: b. 20 March 1854. He was educated at Hamilton College, N. Y., and after graduating from Union Theological Seminary in 1878 was ordained to the ministry. Since 1888 he has been pastor of the First Church of Fairfield, Conn. He received the degree of D.D. from Hamilton College and Litt.D. from Alfred University; is president of the Fairfield Historical Society and lecturer on literary and historical subjects, corresponding secretary of the Francis A. Palmer Fund for Education, trustee of several colleges and other educational and benevolent institutions and a contributor to the press. He has published 'An Old New England Town' (1895); 'The Colonial Parson of New England' (1896); 'A Colonial Witch' (1897); 'A Puritan Wooling' (1897); 'The House with 50 Closets' (1899); 'An Unknown Patriot' (1899); 'Little Dreamer's Adventure' (1900); 'Friend or FoE' (1900); 'Fairfield, Ancient and Modern,' a history (1909); 'An Old New England Church,' a history (1911) and numerous historical pamphlets upon Colonial New England.

CHILD, Sir Josiah, English merchant: b. London 1620; d. there 1699. The work by which he is known is entitled 'Brief Observations Concerning Trade and the Interest of Money, by J. C.' (London 1668). An enlarged edition was published in 1690, under the name of 'A New Discourse on Trade.' The work has been several times reprinted. It was written in defence of the reduction, by legal enactment, of the rate of interest on money from 8 to 6 per cent, and recommends a further diminution to 4 per cent. He was for some time chairman and governor of the East India Company, and wrote several papers, without signature, in defense of the traffic with the East, arguing, in opposition to those who complained of the drain of coin, that the India trade percolated through other countries with which Britain traded and thus returned indirectly a surplus in cash. In his essay on trade he advocated the compulsory emigration of paupers to the colonies, and suggested the appointment of corporate officers called 'fathers of the poor' to superintend those who were left. He became very wealthy, and his children by three marriages, lived themselves with the highest nobility. Charles II made him a baronet (1678). His son became Earl Tynney, but the title is now extinct.

CHILD, Lydia Maria Frances, American prose writer: b. Medford, Mass., 11 Feb. 1802; d. Wayland, Mass., 20 Oct. 1880. She was married to Fred Child, a Boston lawyer, educationalist, diplomat and soldier in 1828. Her first novel, 'Hobomok,' was written and published in 1821. From this time until her death she continued her literary activity. She was an ardent abolitionist, and published more than 75 anti-slavery books, entitled 'Appeal for that Class of Americans Called African,' one immediate result of which was the loss of her former literary popularity in the Southern States. From 1843 to 1844 she edited her husband'sedited the 'Anti-Slavery Standard.' She began the publication, in 1826, of the 'Juvenile Miscellany,' which she continued for eight years. This was the first monthly periodical for children published in the United States. Among her numerous works, some of which had a very large circulation for their day, are 'The First Settlers of New England' (1829); 'Philodendia, a romance of Greece in the days of Pericles' (1835); 'Fact and Fiction' (1846); 'Issac T. Hopper: A True Life' (1852); 'Progress of Religious Ideas' (1855); 'Looking Toward Sunset' (1864); 'Mirra: A Romance of the Republic' (1867); and 'Aspirations of the World' (1878). A collection of her letters, with an introduction by John G. Whittier, and an appendix by Wendell Phillips, was published in 1882.

CHILD LABOR. The term 'child labor' is difficult to define because what is regarded as labor in one community or under certain conditions is often not so regarded in other communities or under other conditions; neither is there agreement as to the length of childhood. The definition of the term depends upon the state of public opinion and upon the crystallization of that opinion in the form of restrictive and constructive measures for the benefit of children. In the early days of the movement in England to protect children from economic exploitation, the term was understood to apply only to the employment of very young children in mills and mines. Gradually its application was broadened to include the work of children in many other establishments and occupations and the minimum age limit for employment was raised. To-day in the United States, not only the employment of children by merchants, manufacturers and mine operators is considered child labor, but also the independent activity of boys and girls for gain, as in the so-called street trades of newspaper selling, bootblacking and peddling, in which the child is virtually in business on his own account. There is also a growing conviction that the labor of children in agricultural pursuits and domestic service, which are not now regulated by law and heretofore have been commonly looked upon as wholly beneficial occupations, also may be objectionable under certain conditions. The possibility of exploitation in any line of work now generally recognized as more enlightened public opinion has caused a steady expansion in the application of child welfare principles, until now every use that is made of children industrially is subject to careful scrutiny. The United States bureau of the census in its report of the 13th census uses the term 'gainful workers' as applied to children, to include all workers except those working at home merely on general household tasks, on chores, or, at odd times, on other work. There is no definite period fixed as the result of scientific inquiry to mark the limit of childhood
CHILD LABOR

in respect of ability to labor, but for purposes of regulation in this field the age of 16 years is generally accepted as marking the transition from childhood to youth.

Extent.—According to the United States census for 1910, there were engaged in gainful occupations in this country 1,990,225 children from 10 to 15 years of age inclusive, or 18.4 per cent of all the children belonging to this age group. Nearly half of these were under 14 years, the number of such children exceeding by more than 100,000 the corresponding number in the census report for 1900; this increase, however, was confined to those in agricultural pursuits, and the number of children under 14 years of age engaged in other occupations was reduced almost half (from 186,358 to 95,839).

The bureau of the census attributes the increase in the number of child agricultural workers to the more exacting nature of the instructions given to the census enumerators in 1910 as compared with those given in 1900, rather than to any marked change in the actual extent of child labor on the farms.

Public opinion against the employment of older children (those 14 and 15 years of age) has been steadily growing, and even before 1910 several States had forbidden the employment of children under 16 in certain dangerous occupations, but not until after this census was taken did any State, with the single exception of Montana, attempt to establish an age limit higher than 14 for employment in the common kinds of work other than agriculture and domestic service. Therefore we find a far smaller decrease in the number of older child workers, 461,806 children 14 and 15 years old being reported in non-agricultural occupations in 1910, as against 501,849 10 years earlier. The distribution of child workers in the United States, among industries, by age groups, according to the census of 1910, is as follows:

* Home farm and working out.
† Hat factory employees not included.
‡ Total workers are not given in the volume and had to be computed; may include a few not semi-skilled who were with the unclassified.
Census figures are necessarily inadequate for the purpose of revealing the actual extent of child labor, inasmuch as they are gathered at a certain time of the year and therefore cannot show conditions existing in seasonal occupations. The data for 1910 were collected in the month of April, when, for example, very few fruit and vegetable canneries were in operation, and consequently only 49 children 10 to 13 years of age were reported as employed in such establishments out of the entire 240 in the city when the fruit and vegetable seasons occur. Great numbers of canneries are running and children of these ages are quite generally found at work in them, especially in those States which have granted specific authorization to this industry for their employment. Furthermore the number of children engaged in street trading is evidently understated in the census report, probably because many parents, in replying to the questions of enumerators concerning the occupations of their children, did not regard newspaper selling, bootblacking or peddling as within the meaning of that term and hence a large number of boys and girls so engaged were probably returned as having no occupation. This is indicated by the return of only three newsboys, including adults, for Chattanooga, a city of 45,000 inhabitants; and of only 243 newsboys 10 to 15 years of age for the great city of New York, while 240 of the same ages were reported for Toledo whose population is only one-thirtieth of New York city's. In neither of these two cities were children of these ages forbidden in 1910 to sell newspapers. For eight cities with more than 25,000 inhabitants no bootblacks whatever, either adults or children, were reported. In view of these facts and the lack of any report as to workers under 10 years of age (about whom no statistics have as yet been published by the bureau of census), the number of children under 16 years of age engaged in gainful occupations in 1910 must have been somewhere in excess of 2,000,000.

Effects.—As to the physical effects of child labor very little is known, aside from the findings of a few isolated studies and the opinions of individual observers not based on prolonged investigation. Professor Teleky of the University of Vienna has shown that child laborers are especially susceptible to tuberculous and that for the period of years covered by his study there was a steady increase in the general sickness rate and industrial strain among children who left school to go to work. He urges that the employment of children under 16 years be prohibited, and that the hours of labor for those between 16 and 18 years be rigidly curtailed to afford opportunity for continued education and recreation.

The lists of accidents to workers reported by State factory inspectors show that employees under 16 years of age suffer more mishaps than do those who are older, in proportion to the total number of such employees. This is to be expected because of the inexperience and natural spirit of playfulness in children which make them more liable to accident than adults, especially when employed about dangerous machinery or in other places where the risk is great; and so, among the working classes, one not infrequently finds crippled children whose condition is due to misfortune met with in the course of work.

The effects of labor upon the schooling of children are manifest wherever the system of child employment is found. In the States of Mississippi, Alabama, South Carolina, North Carolina, Arkansas, Georgia, Texas, Tennessee, Florida and Louisiana, in the order given, had the largest percentages of children under 14 years of age at work in 1910, and were also among those having the highest percentages of illiteracy in their total population. These same States have been the last to enact compulsory school attendance laws,—in several of them the application of the requirements adopted is subject (1918) to local or county option. In any community the presence of child labor and the absence of compulsory education produce illiteracy, for the child cannot be both at work and in school at the same time, and, as practically the only opportunity for the beginning of education comes in childhood, the child who neglects it or is denied it almost certainly becomes the illiterate adult.

If the child attends school irregularly or attends regularly but works at other hours, the effect is evident in his standing or scholarhip. He fails to keep up with his class and is obliged to repeat the work of grades that is intended to require only one year for completion. In other words, he becomes retarded. This effect of retardation among working children is brought out by several studies made by the National Child Labor Committee. In the city of Toledo it was found that 55 per cent of the children who were attending four public schools and devoting their time outside of school hours to trading in the streets were enrolled in grades below those in which they naturally belonged according to their ages, while of the entire number of pupils only 36 per cent were retarded. In the State of Colorado 5,000 boys and girls under 16 years of age were found at work in the sugar-beet fields in 1915; they were kept out of school to assist in the cultivation and harvesting of the crop and as a result 54 per cent of them were backward, as against only 11 per cent of the non-beet-working children, and yet their teachers declared that they would have been just as far advanced as the others if they had attended as regularly. Child labor in any form must not be allowed to interfere with attendance at school, if the benefits of education are to be realized.

Remedies.—The remedies for child labor conditions may be divided into two groups, one embracing restrictive measures and the other constructive ones. The restrictive measures are found in legislation adopted by the States and the municipality for the control of child employment and in the machinery provided for the enforcement of such legislation. A State child labor law of general application, in order to be effective, must prohibit employment below a certain age limit in ordinary occupations, fix a higher age limit for dangerous work, regulate the hours of labor of children above the minimum age limit and require of them the completion of a certain amount of schooling, proof of age and physical fitness as qualifications for official work-permits, make certain officers responsible for the enforcement of the law and fix the penalties for its violation.
The age limits commonly adopted by the States of this country are 14 years for ordinary occupations in factories, workshops, stores, offices, restaurants, etc.; 16 years for dangerous work such as mining, quarrying, the operation of dangerous machinery and employment in the dusty trades or where pitch, acids, dyes, gases, etc., are made or used; and 18 years for extra-hazardous occupations about railroads, blast furnaces, hoisting machines or where phosphorus, explosives or liquors are made or handled.

A majority of the States limit the work-day of children between 14 and 16 years to 8 hours. In some States this regulation does not apply to all kinds of establishments, but factories are affected wherever it has been adopted. Other States prescribe a nine-hour work-day for such children, some allow 10 hours and a few place no limit whatever upon hours of labor. Work at night by children under 16 years of age is prohibited by almost all the States.

The range in the requirements for the issuance of work-permits to children between 14 and 16 years is very great. A few States make practically no requirements while others demand completion of the elementary school course of eight years, physical fitness for work as determined by authorized physicians, as well as documentary proof of age and written promise of legal employment. The permit is issued in most States by the local public school authorities, in a few others by the State factory inspectors or board of health. It is kept on file by the employer of the child for examination by inspectors and therefore serves as the basis for the enforcement of the child labor law. Its careful issuance under strict requirements is therefore a very important part of any program of child protection.

The machinery provided for enforcement of the law varies with the nature and stage of development of the industries carried on in each State, and also depends upon the extent to which the law applies to these industries. For example, in Mississippi, where at the present writing the child labor law affects only mills, factories and canneries, and where the number of such establishments is comparatively small, one factory inspector is charged with the duty of seeing that it is obeyed; in New York the law applies to factories, stores, offices, restaurants, hotels, tenements, bowling alleys, barber shops, place of amusement, bootblack stands, mines, quarries, distilleries, breweries, to delivery and messenger service and to newspaper selling, and there is required to ensure its observance an elaborate organization which includes divisions of factory, mercantile and home-work inspection employing 150 inspectors. Most of the States have a department of labor or an industrial commission which is responsible for the enforcement of all State laws concerning the employment of children as well as of all other labor acts.

The adoption by the States of such a variety of standards led to a movement having as its object the bringing about of some degree of uniformity in the legislation on this subject, and a so-called Uniform Child Labor Law was drafted by the National Child Labor Committee and recommended to the States for adoption by the United States Commissioners on Uniform Laws of the American Bar Association. This effort had some effect, but the desired degree of uniformity was not attained. A few of the States neglected to pass laws embodying even the essential minimum standards. Attention was then turned to the possibility of control by the Federal government and as a result the Federal constitution grants to Congress the power to regulate interstate commerce, agitation was begun for the passage of a bill forbidding the shipment in interstate commerce of goods produced (1) in mines or quarries where children under 16 years of age were employed; (2) in factories where children under 14 years were employed; (3) in factories where children between 14 and 16 years were employed more than eight hours a day; and (4) in factories where such children worked at night. This bill was enacted into law by Congress in 1916 and on taking effect (in 1917) established a uniform minimum standard throughout the country so far as child labor in mines, quarries and factories is concerned, because practically every such industry throughout the country are shipped in interstate commerce. The States are, of course, free to adopt standards higher than those fixed by the Federal law. Various forms of child labor are affected by its provisions are still subject only to State regulation.

The constructive measures in the program of child labor reform embrace compulsory attendance at school, the development of industrial education and the providing of opportunity for further instruction and recreation through the establishment of special schools, libraries, clubs, playgrounds, baths, etc. These form what is generally referred to as the constructive side of the movement, while restrictive legislation is known as the prohibitory part. These two elements are necessary in any well-balanced program for social welfare and especially so in child labor reform, because when the child is denied employment in industry a substitute that is better both for him and for society must be offered in its place.

CHILD PSYCHOLOGY—CHILD STUDY

Aims and Methods.—The necessity for a special study of childhood, especially for a child psychology, arises from a few essential structural and functional differences existing between the adult and the child. These differences are not only physical, but physiological and psychological; and they include differences of kind as well as of degree. Besides the obvious anatomical differences in the child—such as shorter legs and a relatively longer trunk and larger head—and the less obvious physiological differences—such as a higher pulse rate, a relatively greater heart action and a correspondingly faster respiration—there is a most marked difference in psychological processes. Some of these the human child seems to exercise even in infancy, while others come in weak form in later childhood; but a few are entirely wanting before maturity. For all these reasons, the old notion that the child is a miniature copy of man has long been eradicated by psychologists. But despite these reasons for making childhood a separate branch of investigational life, the study of children, overlaps into genetic psychology (q.v.), and may just as properly be further subdivided into child physiology, child pathology, child sociology, etc. Lately every phase of child welfare and mental health has come to be grouped under the general name of child study. The field as a whole covers every phase of child-life, individual and collective, and involves everything known or knowable about the growth and development of human beings from birth to maturity. To treat of so comprehensive a subject in a single encyclopedia article is obviously impossible. The reader will find some of its more important subdivisions treated elsewhere under their appropriate headings; while this article will be confined to the narrower field of the physical and mental life of the child. Even of these two phases of the subject space permits but a mere outline of its aims and methods and a general statement of some of its principles and results.

History.—As scientific interest in children arose first in the classroom, it is but natural that the earliest students of child-life should have been educators. It is indeed with such educational reformers as Rousseau, Basedow, Comenius, Pestalozzi, and Froebel that child study may be said to have originated. The interest aroused by them in the child as a separate entity proved so strong that the 19th century saw the birth of a well-nigh universal child study movement. In Germany Preyer's "The Mind of the Child" was the first important manifestation of this interest, while Darwin's published extended observations of early childhood gave considerable impetus to child study in England. But it remained for Stanley Hall, the famous American educator, to make child study the popular subject that it is to-day both here and abroad. The field which had formerly been pre-empted almost exclusively by educators, for child study was long considered as only a handmaiden of pedagogy, has rightly been entered by psychologists and anthropologists in the numerous phases of the subject—from child labor to juvenile delinquency and children's courts (q.v.). Naturally a vast literature has already grown up on this subject, while the number of child study federations runs into hundreds.

Vol. 6 — 30
method is generally more scientific. Notable specimens of collective studies of children are Sully's 'Studies of Childhood' and Baldwin's 'Mental Development in the Child and in the Race.' But a sufficiently large number of individual studies, once analyzed and interpreted, may yield results that are equally reliable. As both methods have their obvious limitations, neither of them is self-sufficient for scientific child study and each should be used to supplement the other. Another method, which really partakes somewhat of the nature of the two methods already mentioned, is known as the 'questionnaire method.' This involves reports on the child's behavior made by parents, teachers and others in response to special lists of questions prepared for them. In so far as this method depends upon partial and untrained observers, it is open to the same objections as the diary method. The accuracy of the final conclusions reached by this means is often still further impaired by arbitrary classification and interpretation on the part of the question-framer, who cannot be aware of the conditions under which the information solicited was obtained. For these reasons this method, save under exceptionally favorable circumstances, has proved of little scientific value. Few psychologists have ever used it, and fewer still use it at present.

Finally, mention might here be made also of another means— it is in no sense a method— of getting indirect light on the intricate problems of child study. This is a sort of 'reminiscent introspection' by adults, usually authors, attempt to resurrect for us their childhood experiences. The famous autobiographies of Tolstoy, Loti and John Stuart Mill afford such reminiscences. The danger of reading into such recollections elements belonging to a later period of development is indeed very great. Even in cases of unquestioned sincerity such reminiscences of childhood are apt to assume the nature of romantic autobiography.

Such other methods as are used in child study are not peculiar to this subject, but are borrowed from the other sciences—physiology, anatomy, geometry, etc.—dealing with the physical nature of man. These, therefore, need not be described in the present article.

Principles and Results.—The fundamental principle of child study, that the child is not to be considered an adult in miniature, has already been referred to. Another essential consideration which must ever be borne in mind in this connection is that, both psychologically and physiologically, the child is a more dynamic being than the adult. The latter need not be considered to grow, whereas the former must live and grow. The adult's physiological existence is better co-ordinated and regulated; hence there is greater equilibrium in his case. The child, on the other hand, owing to continuous growth and consequent readjustment, is in a constant state of development and growth. Hence the fact of concentration, which unenlightened teachers and ignorant parents vainly deplore. A third guiding principle in child study is that children vary less among themselves than adults, presenting a uniformity which increases inversely as their ages. Still another controlling truth is the most significant recognition that play is the child's chief business in life. The old notions that play in the child serves no purpose other than that of mere recreation, or that it is but an outlet for surplus energy, have long been abandoned. In their stead—and there seem to be no ground for abandoning the view that play in childhood has a very important ulterior end has won universal acceptance. The recognition of the educational and biological significance of play, a direct corollary of the general theory as to the meaning of infancy, has revolutionized modern child-training and education.

The most concrete results of child study have, naturally, been physical or physiological. In these respects the division of the period of childhood into different stages, according to marked lines of development, may be considered the most important step. While there is still no complete agreement among writers on child study as to the exact years marking the boundaries, these three periods may be accepted as approximately correct: (1) Infancy, the first six years—about a year less for girls; (2) Childhood, the 7th to the 12th year—about two years less for girls; and (3) Adolescence, from the close of childhood to about the 25th year—about two years less for girls. The impossibility of establishing very exact boundaries here is due to numerous variations from the normal stages of physical development. Such individual differences may result from various causes—prenatal tendencies and environmental influences—and must always be reckoned with in making general deductions from child study. In spite of these difficulties, however, it has been determined that all normal children grow very rapidly during the first five years, at a slower rate from 5 to 12, faster again till about the 14-15th year, and at a rapidly decreasing rate thereafter till the age of maturity. But even these generalizations must be qualified by the statement that the rates of growth here indicated do not necessarily imply parallel or uniform development in height and weight or for all parts of the body. For a child of seven may happen to have the weight of an eight-year-old and the height of one—i.e., six years is but six years.

Adolescents, however, the essence of childhood, and especially the differences between the growth of boys and girls ever be lost sight of. For instance, the rate of growth before the close of the prepubertal period is faster for girls than for boys, making the former heavier than the latter. Again, girls attain the normal height of adulthood at the age of 18, while boys are not full-grown men before the 20th or 21st year. Sexually, too, girls mature considerably earlier than boys, passing through the period of adolescence (q.v.) about four years sooner, as already indicated.

While on the psychological phase of child study the results so far obtained are naturally more vague, their importance must not be underestimated. Apart from such lessons of general psychology as have a bearing on the mental development of the child, perhaps the most practical result in this new field of study is the formulation of a graduated scale of child development by which the normal growth of mentality can be readily ascertained. This standard is known as the 'Mental Age-Scale of Intelligence,' which has been found so nearly correct for the average child that, with
some modifications and extensions (see Mental Tests), it has been adopted by students of child psychology and teachers everywhere. Still, it cannot be said that experimental psychology or child study have the other biological sciences. Even the typical child mind has not yet been satisfactorily determined, a task performed for the adult mind long ago. Yet until this is accomplished by child psychology, it can hardly be considered a science. But even so the psychology of childhood has, to quote Professor Thorndike, acquired facts concerning instinctive tendencies, the gradual maturing of capacities, the tendencies useful or harmful in children's habits of observing, associating and reasoning, the actual kinds and amounts of knowledge which they may be expected to possess at different ages and under different conditions, their likes and dislikes, the relation of their mental to their physical well being, and the like.

Specifically, and according to the periods of childhood already outlined, the following facts have been fully established in regard to the child's mental development.

1. The infant is at first essentially a sensory and motor animal whose mental life, apart from the emotions of anger and fear, is confined almost exclusively to sense-perception. With the acquisition of language comes the earliest indication of conscious meaning. Then the mental life of the child really begins. Imagination develops rapidly and tends to obliterate for the child the dividing line between fact and fancy, which is so exasperating to the adult, whose imagery is never so vivid as that of the child. In general, spatial perception precedes temporal, and both come much before color discrimination. Ideas of time-intervals dawn rather late upon the child's mind, and the sense of rhythm is often a very slow acquisition. The modes of learning for infancy seem to consist of the "trial and success method" and unconscious imitation.

With the advent of childhood come conscious imitation, a rapid extension of purposive activity, an enlargement of the field of sensation, perception and imagination, and an enrichment of mental life generally. Actual experiments have shown that an average child doubles or trebles its power of sense discrimination between the years of 6 and 16. There is probably a corresponding rise in the child's entire mental life at this stage of development. It is certain, at any rate, that the power of immediate memory keeps on increasing till about the 15th year, after which it remains stationary. The power of logical memory, however, continues to increase. In emotional life childhood differs but little from adulthood. Every emotion known to the latter, with the single exception of the sexual, are experienced in the former, though naturally in a cruder and simpler form.

The most striking characteristics of the adolescent period, which is decidedly a period of transition, are the rapid growth of the emotions, the higher sentiments, and of individualism, which are either effects or corollaries of the sexual awakening that comes in this period and largely dominates many of its manifestations. Altogether, it is a very critical period in the life of the young man or woman — as critical psychologically as infancy is physically — a period calling for more patience, tact and sympathy in parents and teachers than any other. It is then that intellectual, aesthetic, moral or religious life really begins.

Among the general results of child study mention should be made at least of the conclusion reached by psychologists that childhood, though necessarily a preparation for adulthood, is to be passed through by the child entirely for its own sake. Life really its various stages be hurried or compressed, save under very unusual circumstances. For it is believed that the best possible preparation for adulthood is to absorb fully the various influences and experiences characteristic of each preceding age; that, in other words, the person who displays the characteristics peculiar to each age in the fullest degree will ultimately attain a higher type of manhood or womanhood than one upon whom adult characteristics are forced prematurely. In this connection passing mention must be made, too, of the quickening of the parental conscience as one of the far-reaching results of child study, thanks to which the serious responsibilities of parenthood are coming to be better realized. The vogue of "eugenic marriages" and the cry for "better babies" are but superficial manifestations of the deeper tendency making for an enlightened parenthood. See Adolescence.

CHILD BIRTH, Painful. That women in travail have always suffered more or less pain seems probable, since the writer of Genesis quotes God as saying in the primeval curse: "In sorrow thou shalt bring forth children." Yet there are many reasons for believing that labor for the primitive woman was more purely a physiological process and therefore less painful than it is to-day. Normal physiological processes are painless. The sensation of pain is caused by the abnormal and is usually suggestive of pathology. Childbirth being a natural function of woman should be physiological and therefore relatively painless.

Very easy and practically painless labors are still observed but they are now the exception since most women suffer more or less intense pain during the second or expulsive stage of labor. The more difficult labors of to-day result from several factors, the more important being the intermarriage of races, the development of the brain, the survival of the physically unfit, and the abnormal methods of dressing and living in civilization. This has developed in woman a more sensitive nervous system which is less able to endure the shock of pain.

The belief that pain is an inevitable accompaniment of labor has recoiled most mothers to endure it, while the joys of successful motherhood have caused them to forget it. There is, however, no logical reason why women should suffer during labor. Suffering, physical or mental, produces surgical shock; it increases the dangers of puerperal complications and delays the convalescence. When labor becomes pathological and therefore painful, the physician should endeavor to minimize and relieve this pain with the same skill he shows in the care of other painful conditions.

The conduct of labor among all primitive peoples was purely intuitive and very little or no assistance was given. In difficult cases the older women of the tribe would assist with pressure, massage and nauseating drinks. In the earlier stages of civilization some of the older women assisted during labor and the priests gave spiritual assistance (mental suggestion) or mechanical assistance in difficult cases.

The ancient Greeks appreciated the increased susceptibility of the nervous system of women during pregnancy. "The law in Carthage and Athens forbade the pursuit and punishment of a criminal or murderer who sought refuge in the house of a woman who was pregnant or had recently given birth to a child." (Englemann). There is also considerable evidence in the Greek literature that an attempt was made to relieve the suffering of labor by anesthetizing agents and other means.

To mention the various drugs which have been used in the attempt to relieve the pain of labor would necessitate the listing of every drug thought to have hypnotic, sedative, analgesic or anaesthetic properties. Hypnotism and mesmerism have been used successfully and the value of mental suggestion has long been appreciated.

The drugs most used by the ancients were probably cannabis indica (Indian hemp; hashish), mandragora and opium. Of these opium is still employed, although its limitations have been recognized for at least a century. W. P. Dewees wrote in 1819, "I have in a number of instances seen opium exhibited with a view to mitigate the severity of the pain, when labor advanced slowly, and have never failed to observe that the force of the contraction was diminished at the time it was required to be the strongest." James Y. Simpson in January 1847 used ether to produce analgesia in midwifery and inaugurated the first consistent effort to relieve the severe pain of labor. Florence Nightingale in March of the same year announced the anaesthetic properties of chloroform, and Simpson in November read his paper entitled, "Notice of a New Anesthetizing Agent as a Substitute for Subluride Ether in Surgery and Midwifery." Because of superstition and religious prejudice these anaesthetizing agents at first were opposed by both the profession and the laity. However, following its use by Queen Victoria in 1854, chloroform à la reine became the fashion and analgesia was maintained for many hours in large numbers of cases. Brodhead Smith in a letter to the same time, led that he had used chloroform analgesia for 28½ hours. Simpson himself used it for over 13 hours.

Chloroform being more pleasant and more efficient quickly replaced ether. While the fact that it is more dangerous than ether was soon discovered, from the greater number of fatalities in surgical cases, the delusion was long maintained that the pregnant woman had a special tolerance for chloroform. Within recent years most authorities have shown a preference for ether because of its greater safety, and, with the newer methods of administration, its efficiency has been increased to some degree. Both have proved of great value in many thousands of cases. Some deaths undoubtedly have resulted from their use but they have been the means of saving hundreds of lives.

Both ether and chloroform have the fault of opium in that they weaken the uterine contractions and anesthetize the fetus in utero. Because of their limitations and slightly greater dangers these anaesthetics are gradually being supplanted by nitrous oxide-oxygen analgesia. Kikowitsch of Petrograd applied nitrous oxide-oxygen analgesia to 25 obstetrical cases in 1880. He found that three or four inhalations of this mixture rendered the labors painless without clouding the consciousness. He observed that its action was different from that of opiates, ether and chloroform, in that the uterine contractions were often stimulated and at the same time was there any diminution in their frequency or strength. The following year Winckel of Dresden used the nitrous oxide-oxygen analgesia in 50 cases with satisfactory results. The apparatus, which consists of a rubber bag like a pillow, is inconvenient, it must be confessed, but this is entirely subordinate; in abnormally painful labor it is at any rate an extremely important remedy. (Winckel). But owing to its cost, the impurity of the gases used, the crudeness of the apparatus, and the fact that it was often given to the stage of asphyxia, nitrous oxide did not become popular at that time.

Dr. J. Clarence Webster of the Presbyterian Hospital, Chicago, was one of the first in America to use nitrous oxide in obstetrical practice. In 1904 he began to use this anaesthetic in operative obstetrics when ether and chloroform were
CHILDE HAROLD'S PILGRIMAGE

contraindicated. Gradually its use was extended to normal cases as a substitute for ether during the delivery of the child. The use of the nitrous oxid-oxygen analgesia during the entire painful stage of labor has been developed during the past few years largely as a result of the constantly increasing demand for painless childbirth.

Von Steinböckel of Gratz in 1902 suggested the use of scopolamin-morphine analgesia in obstetrics. Gauss of Freiberg in 1906 made the first report of these drugs given in small graduated doses based on a revised concept of the semi-sleeping condition of the patient he called this treatment the "Dämmer schlaf" (Twilight Sleep). This method has been tried by many physicians with varying degrees of success and failure. Given under the most favorable conditions to selected cases the results have been satisfactory in from 70 to 90 per cent of the cases. Most users of scopolamin and morphine are now advocating these drugs only for the initial stage of labor. Some anesthetic is usually needed for the delivery of the child.

In March 1915, Dr. Webster announced the very satisfactory results which were being obtained at the obstetrical staff of the Presbyterian Hospital, Chicago, from the use of the nitrous oxid-oxygen analgesia during the painful stage of labor. This announcement was made after various members of our staff had tested the method thoroughly on all types of patients and it had been found efficient, easily administered and not too expensive for general adoption. Influenced by the papers of this staff, together with papers from obstetricians in other cities, this analgesia has been used successfully in several thousand cases during the past two years. It is of considerable significance that the obstetricians who have used the nitrous oxid-oxygen analgesia long enough to develop a technic not one has questioned its value in the management of labor.

While the drug may not be entirely free from the element of danger, the writer believes that the proper use of any of these drugs or anesthetizing agents is less dangerous than is the shock of severe pain. With proper care during pregnancy, with the labor, skilfully conducted, and with proper facilities for the adaptation of the various anesthetizing agents to her individual needs, it is possible for the mother of to-day to have a relatively painless childbirth.

CHILDE HAROLD'S PILGRIMAGE

Byron's 'Childe Harold,' despite diversity of critical opinion and the fact that it has become hackneyed through use in guidebooks and school *readers,* still remains the most famous descriptive poem in English. It was written, says Byron, "as a mark of respect for what is venerable and of feeling for what is glorious." The poem is divided into four parts, or "cantos," again following the mind line stanza of Spenser's 'Fairy Queen.' Though usually termed a "descriptive" poem, 'Childe Harold' is really a series of descriptive, reflective and lyrical stanzas strung on a slender thread of narrative formed by the wanderings of its eponymous hero through the countries described. But Harold figures only slightly even in the first canto, still less in the second, is scarcely mentioned in the third, and disappears entirely in the fourth. He was, in spite of Byron's too strenuous denial, never other than the poet himself.

Byron's travels through Spain, Portugal, Albania and Greece, in 1809 and 1810, furnish the subject-matter for cantos I and II, which upon their publication in 1812, caused their author to exclaim, "I awoke one morning and found myself famous." Their popularity, such as few poems have ever attained, was due largely to their posing, their showy rhetoric, and their satire, which exactly suited the taste of the age. Except for the fine stanzas on Greece (II, 73-90), however, they contain little of value. But the third and fourth cantos, published in 1816 and 1818, respectively, belong to a higher order. Within the intervening years Byron had written copiously, had grown famous, had become for a time the darling of English society, had met the great people of his day, had married—unhappily—his half-cousin, and his storm of unmerited abuse, had quitted England forever. His earlier poses and affectations are now laid aside, and his style is direct and mature. Canto III is devoted to Waterloo, the Rhine and Switzerland; canto IV, to Italy, with its landscapes, historical associations, great men and great events, cities, buildings and works of art. But not one half of the matter is descriptive; for the poet usually passes from description into reflection, and from this into the purely lyrical. In Italy his wanderings are easily traced, from Venice, through Ferrara and Florence, southward to Rome; but 'Childe Harold' is far from being a guidebook. Byron selects only what arouses his emotions, and presents objects only as colored and interpreted by his own personality. Yet so essentially just and adequate are many of his descriptions, such as those of Venice, Rome, the Pantheon, the gladiator, that they have become identified with the objects they describe. The contemporary popularity of 'Childe Harold,' however, was not due solely to the splendor and energy of these descriptive passages. The spirit of the age spoke in its pleas for justice and liberty, and for social, political and religious reform; and the contemporary interest was reflected in the poet's reflections on the French Revolution and Napoleon, and by political allusions and prophecies. Added to all this was the daring revelation of the poet's own complex and brilliant personality.

Despite the diversity of critical opinion, it may safely be said that 'Childe Harold' contains much poetry of a high order. Byron's passion for the grander aspects of nature finds expression in verse that fairly rises to the sublimity of his themes (on the Rhine, III, 50-56; on Night and Storm on Lake Geneva, III, 85-97; on the Marble Cascade, IV, 69-72; on the Ocean, IV, 178-84). Again, as no other poet, Byron possesses the historic imagination, can summon the spirit that was Greece, the grandeur that was Rome, and make them feel the desolation of once great and now fallen states (on Athens, II, 73-90; on Venice, IV, 1-19; on Rome, IV, 78-82). With all its lapses into empty rhetoric, its moral platitudes, its too ostentatious parade of the poet's "bleeding heart," 'Childe Harold' still possesses, as Swin-
burne has said, "the splendid and imperishable excellence of sincerity and strength."

Marion Tucker.

CHILDE ROLAND TO THE DARK TOWER CAME. 'Childe Roland,' one of the most powerful and impressive, and perhaps the most widely discussed, of Browning's shorter poems, is a narrative monologue in which "Childe" (or "young lord") Roland, a medieval knight, tells the story of his quest of the dark tower; though to whom he speaks, and when, and where, we never know. The poem, which is in 34 six-line stanzas, was written in one day, 3 Jan. 1852, in Paris, and was first published in the volume entitled 'Men and Women' in 1855. Its title was suggested by a single disconnected line spoken by Edgar in 'King Lear' ("Childe Roland to the dark tower came"); III, iv, I, 187); and its grotesque imagery is perhaps to be understood only in the light of the unreal and fantastic world of Edgar's fancy. The strangely impressive setting proposed a succession of pictures as by Albrecht Dürer, in turn terrific and grotesque, fantastic in the general impression but sharply realistic in detail. In spite of Browning's assurance that the poem is "only a fantasy," commentators have offered various interpretations of its supposed allegory, not one of which is without inconsistencies that render it invalid. Probably the poem is best taken, as the poet evidently intended it should be, simply as an effort of the imagination from which each reader may gain what he will. Possibly a broad and safe interpretation, if the reader insist upon one, is that Childe Roland's quest is the journey of life, with its dangers, failures and successes, its pursuit of an ideal through perils both real and imaginary, and its final triumph through sheer power of will. The climax of the poem is superb in the crashing finality of its long-drawn trumpet blast, defying fate and all unseen malignant forces, and claiming victory even in the midst of apparent defeat. Among the many competing interpretations may be mentioned that by John Esten Cooke in The Critic (5:201, 24 April 1886); by Arlo Bates, in The Critic (5:231, 8 May 1886); by Mrs. Orr in her 'Handbook to Browning'; by J. Kirkman and others in 'The Browning Society Papers' (1:21); and by William Lyon Phelps in his 'Browning: How to Know Him' (pp. 231-244).

CHILDEBERT, shēl-di-běr or ch’il-dèb’ert, three kings of the Merovingian dynasty, France. (1) CHILDEBERT I.: b. about 495 A.D.; d. 558. On his father's death in 511 he succeeded to the kingdom of Paris; his brother, Clodomir, King of Orleans, having been killed in battle. Childebert and his brother, Clotaire, King of Soissons, determined to seize and divide his dominions, and murdered his two eldest sons and their followers. Childebert afterward quarreled with Clotaire and laid waste his territory. (2) CHILDEBERT II.: b. about 570; d. 596. On the death of his father in 575, he was proclaimed king of Austrasia, and subsequently, by the death of his uncle, Gontran, succeeded to the kingdoms of Burgundy, Orleans and part of that of Paris. (3) CHILDEBERT III., sur- named the Just: b. about 683; d. 711. He was proclaimed king in 695, on the death of his brother, Clovis III. His kingship, however, was merely nominal, the true sovereign being Pepin le Gros or d'Héristal, who, under the title of mayor of the palace, exercised the real authority.

CHILDERMAS (ch’il-dér-más) DAY (Feast of the "Holy Innocents"), a festival celebrated by the Roman Catholic Church, 28 December, in commemoration of the massacre of the male children in and near Bethlehem by Herod soon after the birth of Christ. Consult Matthew ii, 16-18.

CHILDREN, Defective. Under the term "defective children" are included deaf, blind, feeble-minded, epileptic, crippled and incurable children. The treatment of the deaf and blind is generally recognized as an educational problem, and will therefore be discussed under BLIND, EDUCATION OF THE; DEAF, EDUCATION OF THE.

The Problem.—The problem of the feeble-minded has come to be recognized as one of the most difficult and acute social questions. It has long been known that a considerable number of the inmates of reformatories and prisons were mental defectives but until recently there was no means of determining what proportion of them belonged to this class. Within the past few years there have been devised the Binet-Simon tests, and other tests for ascertaining the mentality of children. These tests have been applied to inmates of reformatories in large numbers, and it has been discovered that from 5 per cent to 25 per cent of the boys, and from 20 per cent to 50 per cent of the girls in such institutions are distinctly feeble-minded. It is more difficult to ascertain the mentality of adults, but it is generally agreed that a considerable proportion, ranging from 10 to 40 per cent of the adult inmates of jails, prisons and reformatories are feeble-minded.

Dr. Henry H. Goddard, director of the department of research of the Training School for Feeble-minded Children, at Vineland, New Jersey, who has made extensive studies along this line, says that every feeble-minded child is a potential criminal. The feeble-minded child becomes a criminal, not because of deliberate viciousness, but because he has not the mental capability or the will power to withstand the ordinary temptations of life, and because he is readily susceptible to the influence of vicious associates who make use of him to promote their own ends, and initiate him into criminal ways. Many crimes of violence are committed by persons of defective mentality, especially by the high-grade feeble-minded who have come to be known as "morons" who are easily excited or frightened, and who are not restrained by motives of conscience or prudence.

The studies of Goddard and other investigators have shown that the feeble-minded woman is twice as prolific as the normal woman, and that the large majority of feeble-minded children are the offspring of feeble-minded mothers. The feeble-minded woman has usually been in pursuit of the normal male who is an object of pursuit and becomes the mother of illegitimate children and partly because she is not restrained by the ordinary consideration of prudence. If the feeble-minded woman consorts with the normal man there is more than an equal chance that the offspring will be defective; if she consorts with an inebriate or a syphilitic the probability of de-
fective offspring is greatly increased; if she consorts with a feeble-minded man her offspring is sure to be defective.

Under former social conditions a large part of the feeble-minded children died in infancy or early childhood; but with the gradual improvement in housing, nutrition, and the general care of mothers and children among the poorer classes, together with the establishment of institutions for feeble-minded children, the lives of such children are preserved, and apparently their numbers are increasing more rapidly than the normal class. The number of feeble-minded children in the community is unknown. Indeed an exact definition of feeble-mindedness has not yet been established; but the estimates of the best qualified experts indicate not less than one feeble-minded person out of every 300 of the population, which would indicate a total of not less than 300,000 for the United States. Some experts estimate a much larger number.

Much attention is being given to the question as to how the multiplication of the feeble-minded can be checked. The most important propositions to this end are instruction of the public as to the danger of the marriage of the feeble-minded, marriage restriction laws, sterilization and segregation of the feeble-minded, especially young women of child-bearing age. Instruction is only a partial remedy because those who need it most are incapable of profiting by it. Marriage laws are a valuable but partial remedy for the reason that the feeble-minded multiply their kind regardless of marriage.

Sterilization has been decreed by the laws of 12 States but it is practically operative only in the State of California. The first State to adopt a sterilization law was Indiana, but the law has been inoperative there since 1911. A few operations have been performed in North Dakota, but the law is a dead letter in the remaining nine States which have adopted it.

Sterilization is a legitimate measure for the prevention of feeble-mindedness, but its efficacy is impaired in two ways: first, by the fact that all of the laws thus far enacted provide that the operation shall be performed only on adults; and second, by the fact that while public sentiment has quite readily sustained the enactment of sterilization laws, it has not sustained their execution. The indications are that only after a long time, if ever, will this difficulty be overcome by the education of the public.

Special Institutions.—Under these circumstances, segregation is being advocated, even by those who favor sterilization, as the most practical and available method of prevention. It is urged that special institutions be provided for all feeble-minded children who cannot be properly cared for in their own homes. Heretofore most of the institutions established have been *schools* for the care and instruction of the young. As the children have grown up, they have remained in the institutions, because there was no other place for them, but the care of adults was a secondary proposition, and the admission of adults was exceptional. Feeble-minded adults were cared for, if at all, by sending them to insane hospitals, reformatories or almshouses, where they do not belong.

A few States, recognizing the importance of caring for adults, have established *colonies* for the care of the adult feeble-minded: for example, Massachusetts, New York, New Jersey and Minnesota. Other States, like Pennsylvania and Illinois are moving for similar institutions.

With the recognition of the facts of the heredity of feeble-mindedness, the rapid multiplication of this class of defectives, and the significance of feeble-mindedness as a factor in crime, there has come about an active movement in Massachusetts, New York, Michigan, Pennsylvania and other States for adequate custodial provision for the adults—at least for the young women of child-bearing age. The plan proposed is the establishment of colonies such as have already been established in New York, Massachusetts, New Jersey, Indiana, Minnesota and other States. The colony consists of a collection of buildings of a simple character, located upon a large farm. The colony is organized with a view to utilizing the labor of the inmates in such a way that they shall contribute as much as possible to their own support by the use of simple industries such as gardening, poultry, rug-weaving, basket-making and so forth for girls; and farming, redeeming waste land, care of stock, simple carpentry and so forth for boys.

In Massachusetts and New Jersey, wooden buildings are being erected of a very simple character, and the more intelligent inmates are used as caretakers for the low grade inmates, under careful supervision. The children receive such education as their natural endowments warrant, but it is deemed useless to carry on expensive educational processes in the effort to develop lost gifts. By this system, the expense of maintenance is largely reduced without sacrificing either the happiness or the comfort of the inmates. These children of a larger growth find happiness in the performance of simple tasks on the simple forms of recreation such as folk-dancing, out-door games, calisthenics, moving pictures and so forth.

A large number of the adult feeble-minded are already under care in institutions which are not designed for them and are unsuitable for them: prisons, work-houses, reformatories, jails, almshouses and insane hospitals. In most of these institutions, the cost of their maintenance is much higher than in a colony for feeble-minded. This is especially true of girls in reformatories, where the cost of maintenance is nearly double what it would be in a properly organized colony. It would be for the advantage of all concerned if, instead of enlarging their reformatories, the different States would build separate institutions for the feeble-minded contingent in the reformatories.

It is generally recognized that provision for feeble-minded young women is more urgent than for feeble-minded young men for the reason that the feeble-minded woman is more prolific than the normal woman, and the feeble-minded man is much less likely to contribute to the increase of the defective population. The
CHILDREN, DELINQUENT

number of feeble-minded persons in the United States is not known, but it is very large, probably there are not less than 250,000 of whom perhaps 75,000 are women of the child-bearing age, of whom less than 10,000 are as yet provided for in suitable institutions, leaving 65,000. Provision for this number is by no means practicable. We are already caring for about 75,000 insane ones.

Epileptic Children.—Epilepsy is one of the most dreadful afflictions to which the human race is subject. The disease is obscure and to this day it is very imperfectly understood. The disease may begin at any age, and the early paroxysm is progressive and its progress is usually accompanied by a gradual decay of the mental faculties, taking the form of feeble-mindedness or insanity. There is no specific cure. All that can be done is to provide proper food, under medical advice, to provide congenial employment, suitable out-door exercise and recreation. Only a fraction of those afflicted recover probably not more than 10 per cent.

The epileptic is peculiarly unfortunate because he is debarred from many of the ordinary pursuits of life. He cannot be employed on any vehicle. He cannot be a house painter, or a salesmen, for he cannot work safely about machinery. The disease often makes its victim morose or even dangerous. It is cruel to both classes to incarcerate them in a hospital for the insane as is often done, or to keep them in an almshouse.

Ohio was the first State to establish a separate institution for epileptics. Several States have followed the example of Ohio. It should be generally adopted, both as a measure of humanity to a most unfortunate and most wretched class, and as a measure of protection to the rest of the community.

Crippled Children.—The first institution for crippled children was the New York Hospital for Ruptured and Crippled Children. It was established in 1863. In the 28 years from 1863 to 1890, only 5 institutions were established: 2 in New York city, and 3 in Philadelphia. In 1913, the Russell Sage Foundation found 35 institutions devoted to crippled children, including 9 orthopedic hospitals, 14 convalescent hospitals or homes and 12 asylum houses. Many general hospitals have orthopedic departments, and many other institutions receive and care for convalescent or chronic cripples. Many of these are designed especially for them. The cripples housed in institutions are remarkable for their courage, cheerfulness and optimism. They expect to get well and they endure their sufferings with a fine spirit of philosophy and hopefulness. This spirit is largely due to the influence of the orthopedic surgeons who have built up the beneficent institutions.

State hospital schools for crippled children have been established in Massachusetts, New York, Minnesota and Nebraska. These institutions are most important because they reach crippled children in rural districts who otherwise would never hear of an orthopedic surgeon. The care of crippled children is very expensive, but is highly economical because it makes productive children of many who otherwise would lead a miserable life of dependence. See CHILDREN, NEGLECTED; CHILDREN, DELINQUENT.

H. H. HASTINGS H. HART,
Director Department of Child-Helping, Russell Sage Foundation.

CHILDREN, Delinquent. A delinquent child is one who commits an act which would be counted a crime, if performed by an adult. In most States of the United States, children who are declared incorrigible, knowingly associate with vicious persons or frequent vicious places, are classed as delinquents.

Up to the year 1823, juvenile criminals were tried in the criminal courts, associated with adult criminals, and received like punishment with them; but in that year, the New York House of Retuge was established. Children sentenced for crime were sent to the house of refuge, where they became the wards of the board of trustees, who were given authority to release them on parole when they gave evidence of reformation.

From this beginning grew up the juvenile reformatory system of the United States. Gradually the idea of punishment retreated into the background and the idea of guardianship, training and reformation came to the front. Sentences for fixed terms of imprisonment, or commitments for an indefinite period, to be determined in accordance with the child's progress in character and self-control.

In 1855 the Ohio State Reform School was built at Lancaster, on the cottage plan, without prison bolts, bars or walls. "Elder brothers" took the place of guards. The boys were treated as pupils rather than prisoners. From that time the cottage system gradually found favor until it is now in general use. The early cottages were built for 50 to 60 children each. The size of cottages has gradually decreased until cottages for 25 to 30 children are common. The Children's Village at Dobbs Ferry, N. Y., the State Industrial School at Industry, N. Y., and the Thorn Hill school near Pittsburgh, Pa., have cottages for 20 children each, and the cottages recently built for the New York Training School at Yorktown Heights are designed for only 16 boys each.

In the most modern institutions for delinquent girls, the entire plan of the institution is on the cottage basis, with its own dining-room, kitchen and laundry. In some institutions, every girl has a separate room, while in others a part of the
girls sleep in dormitories, and the rest in single rooms. It is generally recognized that separate rooms should be provided for at least a part of the girls.

There has been a steady advance in the quality of employees in juvenile reformatories. Men and women of the highest character and attainments are now sought for superintendents because it is recognized that the task calls for a high degree of talent and training. In many reformatories, there has been a corresponding increase in the quantity of subordinates, particularly cottage managers, and teachers of industries, and in the school of letters. In schools for delinquent boys, it is common to have a man and wife in each cottage, the wife serving as house-mother, and the husband being employed in the school or in the shop or on the farm and acting also as house-father. In schools for delinquent girls, each cottage has a house-mother and in some schools there is also a housekeeper or assistant. These house-mothers are now chosen with great care, with reference to their intelligence, refinement, devotion, patience and tact.

The school for girls at Sleighton Farm, Darling, Pa., employs for the most part, as caretakers and teachers, the mothers of the young women who are college graduates. The Home School for Girls at Sauk Centre, Minn., prefers as cottage mothers mature women of intelligence and motherly spirit. All managers of juvenile reformatories attach great importance to educational education. Many reformatories have endeavored to provide instruction in tailoring, shoemaking, farming, sewing, dressmaking, cooking and other branches of housekeeping through the ordinary domestic tasks of the institution under instruction of ordinary employees. Experience has demonstrated that this method of instruction is ineffective, especially in large congregate institutions. In cottage institutions, with small groups of girls, the art of housekeeping can be taught in the regular work of the cottages, but even under those conditions, special, trained teachers are needed to supplement such teaching. In boys' schools, special teachers must be employed for carpentry, blacksmithing and so forth, in order to attain any practical success in vocational training.

Nearly all of the reformatories for boys are located on large farms; one acre for each boy is considered a suitable amount. The farm is used partly as a means of vocational training, partly for the wholesome effect of life on the land, even for boys who will go back to city life, and partly to supply an abundance of good milk and fruit and vegetables. It is doubtful whether these farms are profitable from a commercial point of view, but the other considerations undoubtedly justify the location of such institutions upon farms.

It is indispensable to success in the work of the juvenile reformatory that the children shall be trained for life, first by normal living, as much like that of a good family as possible, with the best possible instruction in mind, manners, morals and religion; second, by a well devised and rational plan of vocational instruction.

The work of the juvenile reformatory, always difficult, has been made doubly hard in recent years by two circumstances: First by the beneficent work of the juvenile court, with the probation system. Formerly the juvenile reformatory was the instrument of first aid, and many of its inmates were children guilty of minor offenses, who were readily impressed by the good influences of the industrial school. To-day the hopeful cases are placed on probation by the juvenile court. If they do not succeed, they may be placed on probation a second or a third time; and it is only after the probation system has proved ineffectual, that they are sent to a juvenile reformatory. The result is that children are committed from one to two years older than formerly, and are more familiar with evil and hardened by resistance to the restraining influences of home and Sunday school, day school and the juvenile court.

The second circumstance is the increasing proportion of defective children in the reformatories. The probation plan fails with many of them and while normal children are paroled and made good, these poor children, lacking the intelligence and the will to withstand evil, fail on parole, and are sent back. These "defective delinquent" children need an entirely different discipline and training. They clog up the schools and hinder the proper work. They should be sent to separate institutions where they can be properly trained and cared for at a cost not more than two-thirds of that in a good reformatory.

HASTINGS H. HART,
Director of Department of Child-Helping,
Russell Sage Foundation.

CHILDREN, Dependent. A dependent child is one who is orphaned, homeless, or has no fit and responsible guardian to provide for his needs or, in general terms, one who is dependent upon the public for support.

Strictly speaking, this definition would include the major part of the children who are commonly classed as "delinquent" or "defective," but in practice delinquent and defective children, who are cared for as such, are omitted from the category of dependent children. The children recognized and recorded as dependent include children declared dependent by the juvenile court and other courts, children in orphanages and children's homes, normal children in almshouses, children placed in family homes by public authorities, and children placed in families by private orphan asylums, infant asylums and lying-in hospitals.
The question of the proper care of dependent children is one of the utmost importance, calling for the exercise of the highest wisdom, because they have a certain inherent capacity to become useful members of society, and because they are in no manner responsible for their unfortunate condition and who are absolutely dependent for their welfare and prosperity upon the fidelity and wisdom of those assuming the responsibility of providing for them.

In former years it was a common thing for dependent children to be committed to the public almshouse, especially when the mother of the children was sent there; but it has long been understood that the almshouse was an absolutely unsuitable place for the care of any child, and in many States of the Union commitment of children beyond the age of one or two years is forbidden by law.

For a great many years, the favorite plan of caring for dependent children in the United States was the orphan asylum plan. By the orphan asylum plan is meant the bringing up children to young manhood and womanhood in orphan asylums. The argument was as follows: The child having been left behind should be provided for the home; and it was believed that a substitute could be provided which might be better than the original article. It was recognized and admitted that in many cases the child could not have a fair opportunity in his own home because his parents were vicious, incompetent or diseased, or for other reasons the child's own home was unfit. In the institution, however, it was believed that all of these difficulties could be overcome. In the institution it was possible to control absolutely the environment and conditions under which the child shall live. His food can be prescribed by a physician, and weighed out if necessary, and proper ventilation and cleanliness can be ensured. The institution can select the people who are to care for the child, direct his education in letters and in morals, his industrial and religious training. The child will never be tardy or absent from school, will never be on the streets at night, will never miss his study hours. Under these favorable circumstances it would appear as if the institution might do far better for the child than even a reasonably good family home. Notwithstanding this plausible argument it has long been recognized, both by those who have had charge of institutions and those who have not, that institutional life is not the most desirable condition for a child, especially when continued for long periods.

The reason for this view is institutionalism. Institutional life, even under the most favorable circumstances, is contrary to the nature of the child. The cooking is done by steam, the washing is done by steam, the house is heated by steam, the food is different in kind and quality, is cooked in large quantities and by different methods than those which prevail in ordinary homes. The dining-room is arranged and ordered under a different plan. The entire arrangements are different from ordinary homes. The bell rings for the child to get up in the morning, to go to bed, return from play, to go to school and return from school; all day long the bell! That means that someone else is planning his life for him; someone else is doing his thinking for him; the child does not acquire initiative, independence or courage. He does not learn to spend money or to make a bargain for his services. He does not learn to fend for himself in his dealings with persons meeting him in life.

In the best institutions for children efforts are made to overcome these difficulties by adopting the cottage system, with the children in small groups, providing a kitchen and dining-room for each cottage, creating as close as possible a relationship between the children and the superintendent; sending the children to other schools to mingle with other children; giving the children small wages to be expended under advice of older people, and so forth. Nevertheless, in the great majority of the institutions, these difficulties still exist.

In 1853 Mr. Charles Loring Brace, of New York city, organized the New York Children's Aid Society. He declared that for the greater part of the dependent children of the community institutional care is entirely unnecessary. He took children by the thousands from the streets and alleys of New York and sent them to farm and village homes to grow up in the normal life of the community. He maintained that the child placed in a good family home had better chances of success in life than a child brought up in an institution, even a good institution.

There arose a vigorous controversy between the advocates of the orphan asylum plan and the advocates of the child-placing system. This controversy was carried on in the National Conference of Charities and Correction for more than a quarter of a century, but it was finally closed in the brief, but admirable, report of the Hon. Thomas M. Mulry, a leading Catholic layman, chairman of the Committee on Neglected and Dependent Children. He said: "All workers agree that the home is the natural place to properly develop the child. . . . There is a growing tendency on the part of many of the poor to shirk the responsibility of the parents, and to transfer to others the duty which is strictly their own, to hand their children to the public care." He referred to the report of Mrs. Elizabeth E. Williamson, chairman of the committee of 1899, "The good work accomplished by the institutions in the past was fully recognized, as well as the fact that the institution has an important place to fill in the future on the disciplinary and educational lines and the care of those children who are prevented by circumstances from being placed in homes. It was said that many children are kept longer than necessary in the institution, because, having no relatives, there were no persons to claim them; and such children it was thought might well be placed in good homes, provided the families were of the same religious faith as the child. The earlier they are placed in such families, the better it is for the child.

The placing-out-out system needs the most careful supervision; and those interested in the work realize how prone to selfishness people are, and that many wish the children only for the work they can obtain from them. . . . This does not mean, to play and to land, that meals, to play the return from play, to go to school and return from school; all day long the bell! That means that someone else is planning his life for him; someone else is doing his thinking for him; the child does not acquire initiative, independence or courage. He does not learn to spend money or to make a bargain for his services. He does not learn to fend for himself in his dealings with persons meeting him in life. . . .

Your committee is emphatically of the
opinion that the 'ounce of prevention is better than the pound of cure,' and it strongly urges upon all charitable people the absolute necessity of preserving the home wherever possible. Orphanages and children's homes abound throughout our cities, our towns and our farming sections for every orphan child, if the people will but open their hearts and brighten their homes by studying in what way they may best show their love for their less fortunate fellow-beings.

In January 1899 there was held in Washington, D. C., the celebrated White House Conference, which was called by President Theodore Roosevelt. The President invited about 200 delegates, representing every State in the Union, public officials and philanthropists, workers for children and the different religious organizations. This conference, after a full discussion, adopted a platform which contained the following statements: "Home life is the highest and finest product of civilization. . . . Children should be treated as children, and not as to the relative merits of the orphan asylum plan and the placing-out system. It recognized the legitimate work to be done by institutions, but urged the use of the family home plan to the utmost.

In January 1909 there was held in Indiana, the State of Indiana showed 110 inmates of orphanages and asylums for each 100,000, but in 1910 it showed only 96. In the State of Massachusetts at least 15 institutions for dependent children have been closed and have gone out of business. In both of these cases there has been a corresponding advance in the number of children placed in family homes. The different organizations in the State of Massachusetts have under their supervision at least 10,000 children placed out in family homes.

There is a gradual advance in the standards of institutions for dependent children: First, as to the quality of the superintendent and other employees. A higher degree of education, training and general fitness is demanded than formerly. Second, as to the education and training of the children. Many institutions, especially those in cities, send their children to the public schools, where their progress usually compares well with the children of the rest of the population. The better and more urgent and compelling reasons.

As to the children who for sufficient reasons must be removed from their own homes, or who have no homes, it is desirable that, if normal in mind and body and not requiring special training, they should be cared for in families whenever practicable. The carefully selected foster home is for the normal child the best substitute for the natural home. Such homes should be selected by a most careful process of investigation, carried on by skilled agents through personal investigation, and with due attention to the physical, mental, moral, and spiritual training and development of each child on the part of the responsible home-finding agency is essential.

This platform was adopted by a conference composed of representative philanthropists, including trustees and officials of charity organizations, juvenile reformatories, orphanages, children's homes, children's aid societies, children's home societies, societies for the prevention of cruelty to children and so forth. It was adopted unanimously without a single dissenting vote.

There is still a difference of opinion as to the question how far and in what cases institutional treatment of dependent children may be necessary; but there is practical unanimity of opinion that the family home is the best place for dependent children, and the placing-out methods are increasing in favor. In some parts of the country States there is even a marked decrease in the relative number of inmates of orphanages and children's homes, as is indicated by the returns of the census.

Take, for instance, the States of Massachusetts and Indiana. In the State of Massachusetts the census of 1904 showed 129 in orphanages and children's homes out of each 100,000, but in 1910 it showed only 96. In the State of Indiana the census of 1904 showed 110 inmates of orphanages and asylums for each 100,000, but in 1910 it showed only 96. In the State of Massachusetts at least 15 institutions for dependent children have been closed and have gone out of business. CHILDREN, DEPENDENT

be placed-out at wages agreed upon between the placing-out agency and the employer; usually with the proviso that a portion of the wages shall be paid as interest for the subsequent use of the child.

Formerly the practice prevailed widely of placing-out children on an indenture contract, under which the foster parent assumed certain obligations as provider, clothing, medical care, school and religious leadership, agreeing further to pay a stipulated sum to the child on the expiration of the contract, provided the child had stayed out his time. It is now quite generally agreed that the indenture plan is undesirable and that the placing-out agency should reserve the right to remove the child whenever in their judgment it may be for its interest. Where the indenture plan is continued the indenture usually contains a provision under which the child may be removed at the discretion of the placing-out agency. In Indiana and some other States the law requires that indenture contracts shall reserve this right.

Placing-out is an exceedingly technical, difficult and responsible undertaking. It requires agents trained, experienced and conscientious. The placing-out method has been justly discredited in many communities for lack of these qualities. It has been undertaken by many irresponsible people: keepers of baby farms, matrons of lying-in hospitals, poormasters and other people whose chief object has been to dispose of the child with the greatest speed and the least possible trouble and expense.

There is an active demand for the older boys and girls by people who wish to save the expense of hiring servants. Even well-meaning people often err thoughtlessly by expecting and exacting too much from such a child. Only the unceasing vigilance of a faithful and tactful agent can protect the child against the comparative danger of overwork, deprivation of school privileges and financial injustice.

The following is an outline of the essential standards required in order to carry out properly the placing-out system:

1. A careful case study of the family history, home conditions, character and capability of parents, responsible relatives, physical condition, mental condition of the child and also, in the case of older children, their capabilities and aspirations.

2. A determination of the question whether the child is a proper subject for placing-out, taking into account his mentality, his physical condition, the probability of the rehabilitation of his home and the question of the responsibility of grandparents, older brothers and sisters and other relatives. If it is proposed to sever the parental relations permanently, and especially if it is proposed to place the child for adoption, this question should be determined by a court of record. If the child is to be boarded out, or placed under such conditions that he may be readily recalled at any time, the question may be determined by a responsible public officer, a competent superintendent of an institution, or a competent agent of the placing-out agency.

3. The preparation of the child for his foster home by medical treatment, surgical treatment, physical care, training in manners and so forth. Under skilful direction, these preparations can usually be accomplished in a few weeks. It often makes a great difference as to the quality of the home secured and the whole future prospects of the child. Most agencies undertake to do this work properly equipped "receiving home"; but some agencies, for example, the children's aid societies in Boston and Baltimore, prefer to use private families, even for this work. The New England Home for Little Wanderers has recently established in Boston a complete and thoroughly equipped laboratory for the physical, medical and psychological examination of children and for securing whatever treatment may be necessary to put them in the best possible condition.

4. The inspection and study of foster homes offered for dependent children in order to determine, first, whether the home is a desirable one, and second, what kind of child should be selected for this particular home. The study of prospective homes requires experience and good judgment. The amateur will often approve a home which would be instantly rejected by an experienced agent. This study involves the intelligence, character, spirit, disposition and comfort and refinement of the home, the character of the neighborhood and the community, the opportunities of school, church and social life and many other important elements. The foster homes which prove to be the most satisfactory are usually those of people of moderate means, good character, cheerful dispositions and genuine purpose to help a needy child.

5. The discharge of the child to the home. This is the most critical point in child-placing. You may have a good child and a good home but they may not be adapted to each other. The proposed foster parents often make a mistake in their selection from lack of experience. They need the guidance and help of a trained adviser.

6. The supervision of the placed-out child. When an organization has taken the responsibility of selecting a home and placing the child in it, when the child is incapable of exercising any choice, it thereby incurs a sacred obligation to see to it that the child does not suffer for lack of friendly watch care, and it must employ responsible agents who can be depended upon to exercise both judgment and courage. The obligation is too sacred and the responsibility too great to depend upon volunteers, no matter how willing or faithful they may be. The volunteer is liable to be influenced insensibly by local or personal consideration, and the volunteer cannot be held to the same accountability as a trained and paid agent.

7. Supervision by the State. It is now recognized that the great mother State is under obligation to exercise fostering care over all dependent and neglected children, whether in or out of institutions for children. It has long been the practice, in case an orphan child is heir to any property, to appoint a guardian, who shall conserve the sacred property rights of the child; but if the orphan child had no property and only his body and soul needed looking after, it was not deemed necessary to appoint a guardian, because there did not seem to be any sacred rights to be conserved. It is beginning to be recognized that the child who has no property is all the more in need of a responsible
CHILDREN, DISEASES OF

are seen in babies who are born with congenital rickets, or with a defect or absence of a portion of the spinal column; a condition known as spina bifida, in which the spinal coverings are exposed to the naked eye. A baby may be born with a very large head, due to the accumulation of excessive fluid in the ventricles of the brain. This condition is known as hydrocephalus. Indeed the head of the fetus may attain such a large size that in some instances it has to be punctured in order to render birth possible.

Nearly every organ of the body is subject to malformation or error of development before birth. Defective closure of the normal bony structures leads to certain malformations, such as harelip, cleft palate and hernia of the brain and its coverings. Defects in the abdominal wall sometimes lead to a hernia in which the liver and intestines may be exposed to view. An incomplete development of the bladder may result in a condition known as ectopia vesicae, characterized by a deficiency in the abdominal wall as well as the anterior wall of the bladder, whereby the mucous membrane of the bladder becomes exposed.

Malformation of the heart is common in these antenatal diseases. In some instances, however, where there is inflammation of valves or muscles, the disease may possibly be acquired as a direct infection from the mother, instead of constituting an error of development.

There are malformations of the extremities, such as webbed fingers or webbed toes and club feet. There are deformities about the genitalia, such as undescended testicles, imperforate hymen and hermaphroditism. There are congenital dislocations of the joints, curvature of the spine, imperforate anus, hypertrophic stenosis of the pylorus and occlusion of the esophagus. Indeed, one can hardly think of any organ of the body without considering some congenital malformation or some arrest in development which may be found in any museum of anatomy or pathology.

Accidents and Injuries Resulting from the Act of Birth.—The life and health of the human individual is not only determined at birth, but is menaced in certain ways during the act of birth itself. A long, difficult labor, instrumental delivery, a rigid birth canal which delays the expulsion of the baby's head and subjects it to great pressure may in some instances result in such injury to the skull or its contents as fracture, hemorrhage into the coverings of the brain, or meningeal hemorrhage, which may in turn ultimately bring about paralysis, idiocy or convulsions.

The extremities may also be injured during birth. Fractures of the long bones may occur as an unavoidable accident in difficult labors.

Diseases of the First Days of Life.—A newly born baby presents certain phenomena, which occurring in later life would be considered pathological, but which, in the present instance, may be spoken of as physiological. The most striking example of these is the jaundice which appears from the first to the sixth day of life and disappears ordinarily in a week or two without causing any disturbance of health. Of course, in this connection we do not include those cases of congenital obstruction of the bile duct, inflammatory disease of the liver, and septic infections, where jaundice may indicate a
severe, if not a fatal disease. Another physiological phenomenon of the early days of life is the desquamation of the outer layers of skin which happens to nearly every new born baby. Ordinarily, this occurrence is of no serious consequence, but when the desquamation is excessive, it partakes of the nature of disease. Albumin is frequently present in the urine of newly born children, but disappears soon, and as a rule, has no pathological significance.

Newly born babies become easily infected. The infection may occur through the open umbilical wound, through the broken external integument, or through any mucous surface. Almost any of the known micro-organisms, such as the pus organisms, the pneumococcus, or the tetanus bacillus may cause infection. In the newly born baby these infections rapidly tend to become generalized. For instance, the infection which enters the body through the navel shows a striking tendency to gain access to the circulating blood and produces symptoms of general septicemia, with abscess formations in remote parts of the body, high fever and great prostration. In the event of death, it is obvious that the same antiseptic and aseptic precautions which are employed with reference to the mother should also be employed in the care of the baby.

Another disease manifestation, probably due to pus organisms, which is spoken of as pemphigus of the new born, is characterized by the formation of multiple bullae or blisters occurring on the trunk and the extremities. This variety of pemphigus must be differentiated from the syphilitic variety, which is limited usually on the palms and soles and is associated with other syphilitic manifestations.

The eyes of newly born babies are particularly susceptible to infection. This usually involves the mucous membrane which lines the lid and covers the eyeball. The milder cases are caused by a simple pus infection, the organism being contained in the vaginal secretions of the mother. The severer infections are usually due to the organism of gonorrhea and result in gonococcal ophthalmia, a very dreaded disease of the newly born. Though the infection may be caused by filth contamination from without, it usually results from the presence of the disease in the mother. In the child there is a greater or less permanent loss of vision. It has been estimated that from 25 per cent to 30 per cent of blindness in adults is caused by gonorrheal ophthalmia. The disease, however, can be prevented in the new born baby by the use of the Crede method of prophylaxis, which consists of dropping one or two drops of 1 per cent nitrate of silver solution into the baby’s eyes immediately after birth.

Resistance to Disease in Infancy.—The healthy baby, as soon as he becomes a bona fide member of society, is a happy mortal. During the early part of his life, he sleeps almost continuously, awakening only to get his food. He gains steadily in weight and has a normal temperature. He has a fresh pink skin that is full and elastic and colors readily, and frequent loose and green stools. The treatment for this condition is simple, particularly when it is recognized early. If the milk is flowing too freely, the baby should be fed not oftener than at four-hour intervals and be allowed the touch of the maternal breast no longer than twenty minutes at a time. In the more severe cases, breast feeding should be discontinued for 12 to 24 hours, and a bland, non-irritating diet substituted, such as water or weak tea sweetened with saccharine.
Constipation occurs in both breast-fed and artificially-fed babies. It is sometimes due to excess of fat in the diet and sometimes to a deficiency of water. Such cases differ from the purely alimentary type in that the fever and other symptoms continue even when the food is withdrawn or modified in such a way as to prevent intestinal fermentation.

To summarize and to supplement very briefly treatment of the alimentary disturbances in infancy, the following points should be emphasized: (1) Every newly born and young infant is entitled to receive its natural food, breast milk. (2) Overfeeding is to be avoided. It is as disastrous as underfeeding or starvation. (3) An excess of fat or sugar is capable of producing general toxic symptoms. (4) Simple milk mixtures, i.e., milk, diluted with plain water or with cereal water, with the addition of 3 to 5 per cent of sugar will in most cases give satisfactory results. Normal infants require daily a quantity of milk equal to one-tenth of the body weight. After the fifth month of the baby's life, he should receive one and one-half times his birth weight in milk, or milk compound of his weight exclusive of the sugar and starch added. (5) The technique of successful feeding consists in the careful preparation and proper administration of the food. This precaution is also an important disease preventive. (6) In feeding sick infants it is frequently possible upon careful and intelligent inquiry, to ascertain which food element in the milk mixture is producing harm. Thus the proper modification may be made. (7) In some children, cow's milk produces toxic symptoms. Attempt should therefore be made in such cases to administer breast milk, skim milk, or some adaptation of cow's milk which is low in fats and sugars. Every baby, especially if he is sick, is a law unto himself, and should be studied as an individual. No one's dictum or rule of thumb or recent discovery is ever as important in solving the feeding problem as a knowledge of the general principles of food and digestion. (8) Prolonged starvation lowers resistance and predisposes to disease and death. (9) Prolonged and excessive use of laxative drugs is harmful, since it irritates the delicate mucous membrane of stomach and bowel. The indiscriminate practice of giving laxatives is based on tradition, not upon a knowledge of facts. Their use does not, as a rule, improve or cure the alimentary disease or assist in digestion or assimilation of food. (10) Scalded or boiled milk may be used when raw milk causes indigestion and diarrhoea. (11) Sometimes an infant's feeding difficulties or his alimentary disturbance may be due to an inherited or infectious disease, an anatomical malformation, or a constitutional vice.

The Respiratory Diseases.—Second in frequency to the diseases of the alimentary tract are the respiratory disturbances. Their most frequent manifestations in infancy and young childhood is the common cold, or as it is sometimes called, la grippe. This disease may occur either epidemic or endemic, and is frequently carried by nurses, parents or anyone suffering from a cold. The babies whom it affects suffer from catarrhal inflammation of the throat, nasal mucous membranes, larynx, trachea and bronchial tubes. At times, they
are restless and at other times, somnolent. They frequently present gastro-intestinal symptoms, such as anorexia, diminished tolerance for food and loss in weight. These symptoms, however, are present without any intestinal lesions. La grippe is frequently complicated by more severe respiratory diseases, such as bronchopneumonia, middle ear infection, kidney infection, meningitis, or heart disease, peritonitis and sometimes pyelitis, i.e., a disease in the pelvis of the kidney which is manifested by a large quantity of pus in the urine.

The most important factor in the treatment of grippal disorders consists in their prevention. The baby should be protected from other children and adults who are suffering with catarrhal symptoms. He should be fed and cared for in such a way that his resistance to disease shall be maximal. He should be properly clothed and kept in well-ventilated apartments or out of doors, when the weather permits. If he falls ill, he should be loosely clad and kept in a well-ventilated moderately warm room. Physical and mental rest of every kind should be avoided. Nourishment should be continued if the patient is able to take it. The baby should not be depleted by the excessive use of laxatives. Drugs should be administered only when they are indicated or advised by the medical attendant.

Bronchitis, which is of frequent occurrence in young infants and children, develops usually in association with many of the acute infectious diseases, notably with measles and whooping cough. It gives rise to very definite signs and symptoms, the most prominent of these being cough, fever, and the so-called rales, which, on examination, are heard diffusely distributed over the lungs. When bronchitis confines itself to the larger bronchi, it develops into capillary bronchitis, one of the forms of bronchopneumonia.

Although bronchopneumonia may occur as a primary disease, it is, as a rule, either secondary to gribboph infections or to bronchitis, or it occurs concomitantly with the acute infectious diseases which have already been mentioned. It is a disease peculiar to the extremes of life, occurring most frequently in infants and the aged. In infancy it may occur in feeble children, in those who are prostrated, either by malnutrition or by a previous disease. It is characterized by a gradual onset, usually of fever, which in very delicate or feeble children may be moderate or absent, followed by high fever, rapid breathing, cyanosis or blueness of the skin and visible mucous membranes, rapid pulse, short hacking cough, and usually great prostration. In some of the severe cases there occurs a retraction of the soft parts of the thorax, such as the intercostal spaces and the muscular attachments at the lower end of the sternum. Bronchopneumonia produces the highest mortality in those children who are already affected by another disease. There is not, as yet, any specific remedy for bronchopneumonia. The present treatment is symptomatic. The best hygienic condition should be provided for the sick infant. The sick room should be ventilated; pure fresh air should be provided for. The nutrition should be maintained. Stimulants should be used and a proper amount of milk and of every kind should be avoided. Unnecessary manipulation of the child, including excessive bathing and handling, should not be permitted.

Lobar pneumonia, which is the most frequent type in adults, may occur at any age and affects previously healthy children. The onset is usually sudden. The disease begins with vomiting, sometimes with rigor or convulsions. The face is flushed, fever is high, and respirations are rapid. The patient is prostrated almost at once. He complains of headache and general weakness, and refuses food. The pulse is usually rapid. Very often the patients show marked nervous symptoms. Sometimes convulsions occur early in the disease. Death is not uncommon. While the base of the left lung is the most frequent location of the disease, any portion of the organ may be involved. In some instances, both lungs may be attacked. There are four successive stages: Congestion, red hepatization, gray hepatization, and liquefaction. During hepatization, the air cells are filled with fibrin and red and white blood cells, the red predominating. In the gray stage, the white predominates. In favorable cases, resolution begins in about a week or 10 days. Occasionally a resolution is delayed, so that the temperature falls gradually instead of critically.

Pleurisy is the most frequent complication. This disease sometimes takes the purulent form, which is also called empyema. This complication protracts the fever and causes embarrassment of respiration. The patient suffers profuse perspiration, irregular temperature, circulatory embarrassment, and emaciation.

Pericarditis, endocarditis, meningitis, and middle ear diseases are occasional complications. It is a noteworthy fact that notwithstanding the severity of lobar pneumonia, the mortality is not high, usually 3 to 4 per cent.

The treatment of lobar pneumonia, like bronchopneumonia, should be conducted along the lines of hygiene. The patient should lie comfortably in a well-ventilated room. Cool or tepid sponging may be employed for the temperature. Pain should be relieved by sedatives. Excessive medication should be avoided, and stimuli be employed only when cardiac failure is threatened.

The Nervous Diseases of Children.—The nervous system is incompletely developed at birth, so that its functions are easily disturbed during the first years of life. Thus young children are more easily predisposed to nervous disorders than adults. There are certain nervous diseases that are peculiar to infancy and childhood, due either to abnormal development at birth or to hereditary influences. As an example of abnormality, may be cited the baby born with a congenitally small head and brain, constituting a condition known as microcephalus, and the baby born with a large head and a large brain, hydrocephalus. And as an example of inherited nervous disease arising shortly after birth, we have the cerebellar ataxia.

Those children who are born with a deficient thyroid gland, and those in whom it degenerates shortly after birth, suffer from myxedema, a condition of idiocy also known as cretinism. Such children are usually dwarf-
ish, with thick lips, thick tongue, depressed nose, coarse hair, and coarse skin. They usually present a protuberant abdomen and umbilical hernia. They develop slowly, both physically and mentally, and suffer from more or less permanent mental impairment. The majority of them are benefited by the internal use of thyroid gland extract in appropriate doses.

Mongolism is a conditionakin to cretinism, except that it does not depend upon alteration in the thyroid gland. The afflicted child does not yield to thyroid treatment. The mongols are undersized, have a peculiar obliquity of the eyelids, and small, somewhat flattened skulls. Like the cretins, they are slow in mental and physical development. While they are usually kind and affectionate and in most instances learn to talk about the fourth or fifth year, they nevertheless remain always subnormal and can be educated only to a limited degree.

Eclampsia is a condition peculiar to the head during the act of birth, as the result of which they are apt to have meningoe haemorrhage and destruction of meninges and brain tissues. Important brain cells are separated from their nerve connections following such tissue destruction so that certain nerve fibres which derive their origin in these cells undergo degeneration. This condition explains the numerous cases of paralysis, convulsions and idiocy which result from head injuries at birth.

Infants are predisposed to convulsions, which occur under a variety of conditions and have their origin in various ways. They may be primarily central, i.e., their source lies in affections of the brain itself, such as inflammation of the brain (encephalitis), inflammation of the brain coverings (meningitis), abscess of the brain, hemorrhage into the brain, and brain tumors. Another class of convulsions is due to toxic conditions, resulting, for example, from the use of such drugs as strychnia, etc., from bacterial infections such as are produced by tetanus and hydrophobia; or from toxic processes produced by perverted chemical products in the body, such as uremia, which occurs in diseases of the kidneys, or the poisoning of the body by poisons. Epileptic attacks sometimes occur as the result of toxic products in the gastro-intestinal tract arising from severe alimentary disturbances. Similarly when the body is overpowered by the toxic products of an acute infectious disease, such as pneumonia or scarlet fever, convulsions not infrequently occur at the onset. Burns of the external integument, if very severe, frequently cause convulsions. The explanation in this case is also to be sought in the production of nervous symptoms by the action of the burn on the injured tissues.

Tetany or spasmodhilia may assert itself in the form of active convulsions. The disease condition depends upon an excessive irritability of the nervous system and is usually due to faulty nutrition. In addition to convulsive attacks, spasm of the larynx may be present or spasms of the hands and feet, the so-called carpo-pedal spasms. Many of the convulsions of the first years of life arise in this way. Spasmodhilia is usually associated with rickets.

Epilepsy, a diseased state characterized by convulsions, may occur at any period of childhood. As a rule, it depends upon fine structural changes in the nerve cells of the central nervous system. In early infancy it is sometimes difficult to differentiate recurrent convulsions from true epilepsy.

Although most of the nervous diseases of adult life occur among children, there are a number which are peculiar to infancy. Among these may be mentioned amaurotic family idiocy, an inherited disease characterized by blindness, progressive mental deficiency, and paralytic symptoms; myotonia congenita, infantile cerebral palsy of the muscular type, and noddling spasm. Infantile spinal paralysis may be included in this list, for although it may occur at any age, it is much more frequent in infancy and young childhood than in later life.

Diseases of Nutrition.—The most frequent disease manifestation occurring as a result of improper nutrition is rickets or rachitis, a disease affecting the bones which occurs most frequently in young children. The early symptoms are characterized by restlessness, possibly pain, sweating, and pallor of the skin and mucous membranes. The bones, being deficient in mineral matter, are soft. The skull bones are parchment-like, and when pressed upon, instead of being flattened, they crackle and are easily depressed. When the earlier florid stage disappears, it is noted that the head is large, that the bones of the skull are thickened, and that the junction of the bony with the cartilaginous portion of the ribs is marked by bead-like nodes, which constitute the so-called rachitic rosary. The chest is frequently deformed; the abdomen is enlarged and protuberant. In these children, normal development, such as learning to walk and diction, is delayed.

In many of the rachitic children, every vestige of the disease disappears in later childhood. In a certain number, however, where the deformities have been severe, they may remain permanent unless relieved by surgical treatment. The treatment of rickets is essentially one of proper hygiene and food. Some what older children may be given fresh fruit, vegetables, animal broth, and, if advised by a physician, minute doses of phosphorus, 1/200th of a grain, given internally two or three times a day.

Infantile scurvy, another nutritional disorder, is due to errors of diet, such as, for example, absence of fresh food. The disease as it occurs in young infancy, is characterized by hemorrhage under the periosteum of the bone and sometimes by hemorrhages from the mucous membrane into the muscular structures and under the skin. Scurvy manifests itself by fretfulness, swelling among children's arms and legs, so that they are painful when moved, and swollen and spongy gums which bleed readily. The disease is sometimes mistaken for rheumatism. If it is detected early, it yields readily to treatment. In fact there is no more striking phenomenon in treatment of disease than the rapidity with which these cases recover when given daily doses of orange juice.

The Fevers of Infancy and Childhood.—Fever forms as important and prominent a symptom in the diagnosis of infancy as it does at any later stage of life. The newborn baby frequently shows a febrile reaction during the first hours or days of life. This, in some
cases, is due to the retention of urinary products which have failed to be eliminated. In other cases it may be due to infections to which new born babies are prone and which may result in a more or less generalized sepsis. In bronchial glands, Schlossman and Schinz assert infants and young children show a relatively higher temperatures than adults. In pneumonia, for example, it is common for a child to have a temperature ranging from 105 to 106 or 107 degrees, and yet recover. Most of the acute infectious diseases, active tuberculosis and the eruptive diseases, such as scarlatina and measles, are accompanied by high temperature reaction; though in uncomplicated diphtheria or whooping cough it may be moderate or low. Fever frequently occurs in intestinal disorders as the result either of food disturbances or infection. It occurs often in infections of the nose and throat. In some children, the temperature elevations are always higher than in others of the same age or weight. This difference is a manifestation of individuality and is dependent upon the nervous constitution and in some instances upon the strength and general resistance of the child to infection.

The cause of fever in infancy and childhood is often obscure. Sometimes it may be protracted for weeks without offering any indication of its origin. If, after a careful examination of visible mucous membranes, the heart, lungs, abdomen and skin, no adequate explanation is found, the examination should be continued further. Not infrequently, high fever is caused by disease of the middle ear, which may result eventually in abscesses. Consequently, in every instance of obscure fever, the ear should be examined by an expert. Occasionally in female children (rarely in males), fever is caused by urinary infection. This condition, which is spoken of as pyelitis, is caused by a disease process in the pelvis of the kidneys and may last with a high temperature for days or weeks. One of its most prominent symptoms is the presence of a large quantity of pus in an acid urine. In the vast majority of such cases, the infection is due to the colon bacillus, which has taken on a pathological activity. The normal habitat of this organism is the bowel, where it is, as a rule, harmless, and plays, probably, a physiological role in normal digestion.

Naso-pharyngeal disease and chronic inflammation of the tonsils with enlarged cervical glands is not an infrequent cause of protracted fever, and its persistence is an indication for the removal of the tonsils and adenoids. Occasionally a considerable collection of pus is located at the base of the tonsil, in which case radical cure can be effected only by operative procedure.

It should be stated again that tuberculous processes in the lymph nodes, particularly in the bronchial glands, may give rise to a tubercle reaction whose origin it is difficult to explain. The X-ray examination of the thorax or the occurrence of a positive tuberculin reaction on the skin sometimes gives a clue to the diagnosis in this latter group of cases. A general survey of this kind, only the most salient points have been touched. For greater detail covering the various diseases, the reader is referred to the appropriate articles.

CHILDREN, Legal Codes Relating to. Legislation in behalf of dependent, neglected, delinquent and defective children has been accidental and unsystematic until within the past few years. A progressive governor recommends the creation of a juvenile reformatory, a State home for dependent children, a school for feeble-minded children or a State board of children's guardians; or a philanthropic legislator introduces a bill for such an institution, and straightway it is created, without any intelligent study as to whether it is needed or whether something else is needed.

In 1908 the British Parliament enacted an elaborate Children’s Act, which was characterized by the Hon. Herbert Gladstone as "the Children’s Charter."

In 1911 a bill, prepared by Judge George S. Addams, of the Cleveland juvenile court, was passed by the Ohio State legislature, providing for a children’s code commission. This commission consisted of two eminent lawyers, Judge Daniel Babst and Arthur D. Baldwin, Esq. After a careful study of the children's laws of Ohio and other States, they produced a comprehensive children’s code, covering the care, training, protection and supervision of dependent, neglected, delinquent and defective children, including juvenile courts. The code authorized the board of State charities to supervise and certify all public or private institutions and associations which receive and care for children. The board was also authorized to become guardian of such children and place them in family homes.

The Ohio children’s code marked a new era in children’s legislation in that it aimed to cover all of the obligation of the mother State toward children who lack proper care and training.

The governor of Missouri, in June 1915, appointed a children’s code commission of 23 men and women to revise the existing laws relating to children, to prepare such new legislation as might seem desirable, and to bring together in one code all the laws relating to children. No funds were provided by the State, but the commission raised $1,500 by subscription for expenses.

The commission organized seven sub-committees on general laws for the protection of children, disabled, neglected children; defective children; destitute children; child labor and education; and health and recreation.

The commission submitted a code consisting of 42 bills of cases. A general survey of this kind, only the most salient points have been touched. For greater detail covering the various diseases, the reader is referred to the appropriate articles.
in its recommendations. The legislation enacted 11 out of the 42 bills submitted and the remainder went over to the next legislature. Much of the legislation adopted was distinctly progressive.

The governor of Minnesota, in August 1916, appointed a commission of 12 members to revise and codify the laws of the state relating to children.9 Although the time available was only six months, the commission worked with extraordinary industry, unanimity and wisdom.

In February 1917, they submitted to the legislature a code consisting of 41 bills, of which 35 were enacted into law. It is unquestionably the most advanced and coherent body of law relating to children in the United States. Chapter I is an act to give the State board of control general duties for the protection of defective, illegitimate, dependent, neglected and delinquent children; with authority to act as guardian of children and to provide for child welfare boards in the several counties of the State to aid in the performance of such duties.10 Chapter II defines the duties of the State institutions for the care and custody of children. Chapter III relates to crimes by and against children. Chapter IV regulates child labor and provides a minimum wage commission to establish proper wages for women and children. Chapter V, on education, deals with compulsory school attendance and the education of defectives. Chapter VI, on recreation and health, regulates parks and playgrounds and midwifery. Chapter VII relates to the support of children by relatives and communities. Chapter VIII provides for the regulation of private institutions and societies for the care of children and the supervision of placed-out children by the State board of control. (The supervision and certification of private agencies and institutions for children is authorized in Chapter I). Chapter IX relates to illegitimate children. It provides for an examination, on request of a mother, to determine the identity of an illegitimate child and, when the paternity is judicially established the father shall be subject to all the obligations for the care, maintenance and education of such child, and to all the penalties for failure to perform the same, which are or shall be imposed by law upon the father of a legitimate child of like age and capacity.11

A National Committee for Standardizing Children's Laws was created in 1915 to promote the enactment of children's codes, and the National Child Labor Committee is working in the same direction. Movements are in progress for children's codes in several States. Michigan has a permanent commission created by the legislature of 1917.

CHILDREN, Neglected.—The term "neglected children" is often confused in the minds of people and even in the laws of the State with the terms "dependent," "dependent and neglected," but while these conditions shade into each other so that the same child may even be in all three conditions, neglected, dependent and delinquent, nevertheless, it is important to distinguish these three classes, as clearly as possible, both in language and in law.

A delinquent child is one who has transgressed the law or is incorrigible, or who knowingly associates with criminals or vicious persons. A dependent child is one who is orphaned or homeless, or has no responsible relative or guardian to care for him. A neglected child is one whose relatives or guardians fail to perform their duty, do not provide a proper home, do not care properly for him or treat him with cruelty. It might even be a father who spends his earnings in dissipation, leaving his family to suffer; a well-to-do widower who brings to his home a woman of bad character and puts his daughters under her charge; a mother who is slatternly, lazy and dirty, and who allows her children to run the street without restraint; a mother who leads an immoral life in her own home; parents who do not send their children to school or who send them out to beg or to steal, or who beat them cruelly; quarrelsome and divorced parents whose conduct deprives their children of home life and alienates them from their natural protectors.

In many communities there have been organized societies for the prevention of cruelty to children, which are designed for the protection of neglected children and whose services are invaluable. About 150 such societies are registered in the United States. Some of the societies for the prevention of cruelty are militant. Their policy is to deal swiftly and sternly with recreant parents and to make them realize that neglected children have a powerful and active friend acting swiftly and aggressively against those who do them wrong. Other societies are constructive in their policy. When they find a child who is neglected or ill-treated by his parents or employers, they first seek to discover the cause of such conduct. Is it because the parents are ignorant or because they are following the practices which prevail in their native country or because they have not been able to adjust themselves to the novel conditions which they find in this country? Can the home conditions be remedied by admonition, advice or supervision? If so the effort is made to rehabilitate the home before resorting to extreme measures, and arrest, trial and punishment are used only after milder measures have failed. This method has been used successfully in Boston and Philadelphia.

In the smaller communities, it is difficult to maintain, separately, aid societies for the care of dependent children and societies for the prevention of cruelty, to care for neglected children. It is very desirable that the two functions should be united in one society and the constructive method lends itself readily to this
consolidation. Most of the societies for the prevention of cruelty to children co-operate closely with the juvenile courts. In New York city the society furnishes investigating officers for the children's court, maintains a detention home for children awaiting trial, and has officers in attendance upon all sessions of the court to attend to the interests of children. See CHILDREN, DEFECTIVE; CHILDREN, DELINQUENT; CHILDREN'S COURTS.

CHILDREN, Spirit of Modern Legislation Affecting. Prior to the year 1899 children who committed offenses against the law were dealt with by the courts as criminals. They were arrested by the police, detained with adult criminals in police stations and jails, arraigned in police courts, where they listened at the trial of older criminals. They were indicted by the grand jury, tried in the criminal court, convicted of crime, and sentenced like older criminals. This process was demoralizing and depressing. Efors were made in some communities to avoid these evils. In some parts of Canada and in Boston, children were tried separately from adults, but they were still regarded as "juvenile criminals." In 1899 the legislature of Illinois enacted the first "juvenile court law," which revolutionized the treatment of juvenile offenders throughout the United States, and has affected it also in foreign courts. The juvenile court law of Illinois rejected the title "criminal" for children under 16 years of age, and classified them as "juvenile delinquents." It took children from the jurisdiction of the police court and other criminal courts and placed them under the circuit court, which is a civil court, and a court of chancery. They were no longer tried under the criminal laws but under the civil laws. This means that they were no longer regarded as enemies of the State, to be hunted down by the police and punished according to the enormity of their offense, but that they were regarded as wards of the State, to be reformed, trained and guided into wholesome and decent lives. This law has resulted in a complete change of practice in dealing with delinquent children. Instead of a warrant for arrest, a summons is issued to the parents or custodian, to bring the child to court. Instead of confinement in jail, pending trial, the child remains at home, or is kept in a "detention home" apart from any prison. Instead of a policeman or a deputy sheriff, his father or mother brings him into court. Instead of an indictment for crime, there is a petition alleging that the child is delinquent. Instead of a prosecutor employed to make a case against the child, there is a probation officer appointed by the court to represent the interests of the child. In short, the case is not "The State of Illinois versus Harry Jones," but "The State of Illinois versus Harry Jones." The court seeks to ascertain the facts not as a basis for inflicting a penalty, but as a basis for doing whatever may appear to be for the best interests of the child. Proceeding on this basis, a preliminary investigation is made by a probation officer for the information of the court. The ordinary rules of evidence are modified and the probation officer is allowed to give hearsay evidence, or the child is encouraged to tell his own story of the case. A jury may be called, but the jury cannot hear any testimony of the child himself; it can only find that he is in the condition of delinquency. When the testimony is concluded, the judge does not pronounce a sentence. He may make an order returning the child to his own home, with an admonition to his parents; or he may make an order placing the child on probation, under the care of a probation officer, either in his own home or a foster home; or he may make an order, committing the child to a juvenile reformatory—not for punishment, but for training and education. The juvenile court idea commended itself to the practical judgment of jurists and legislators, and juvenile court laws have been enacted in most of the States of the Union. In many States the chancery principle has been adopted; in others the jurisdiction of the juvenile courts continues, but, in general, the effort is made to free the child from the stigma of crime, to separate him from the adult criminal, to surround him with good influences and to give him the opportunity of leading a normal, wholesome and happy life. Most of the juvenile court laws provide that, whenever possible, the child shall be brought into court not on a warrant but on a petition; and that the child shall not be confined in any jail or prison where adult prisoners are kept. The success of the juvenile court depends largely upon the spirit and temper of the judge. In some cities as in New York and Philadelphia, the juvenile judges were frequently changed, but experience proved that this plan is undesirable, and now, as a rule, the juvenile judges serve for several years in succession. It is generally recognized that the essential feature of the juvenile court is the probation system. Under this system the boy or girl is placed under the watch-care of a selected probation officer, a man or a woman chosen with special reference to their wisdom, tact and patience. The probation officer makes a preliminary investigation of the case before the trial is held, visits the child from time to time in his home, advises the parents, admonishes the child, and acts as the representative of the court. If the child's home is unfit he may be placed in a foster home under the watch-care of the probation officer and then the probation officer stands as his next friend and adviser. There is increasing effort to select probation officers of high character, intelligence and wisdom. In the large cities they are selected by civil service examinations which are generally conducted in such a way as to bring of the criminalness of the candidate. In connection with the probation system a plan has been evolved known as the Big Brother and Big Sister Movement, originated by Ernest K. Cottle, Esq., formerly chief probation officer of the Children's Court of the Borough of Manhattan in the City of New York. This plan enlists young men and women who co-operate with the probation officers and become responsible for the personal oversight and guidance of one or two individual children. The relation between the big brother and the little brother is made as humane and close as possible. The big brother, in his own way, undertakes to establish a relation of friendship and confidence with the boy and to
assist in building upright character. In Massachusetts, New York and Illinois State probation commissions have been organized to direct the work of probation officers, both for adults and juveniles.

CHILDREN OF THE ABBEY. The, a once famous romance, by Regina Maria Roche (q.v.), published in 1798. The Earl of Dunreath, marrying a second time, is induced by the machinations of his wife to cast aside her stepdaughter, for a luckless marriage. It is with the children of this marriage that the story deals. The motherless Amanda is the heroine; and she encounters all the vicissitudes befitting the heroine of the three-volume novel. These include the necessity of living under an assumed name, of becoming the innocent victim of slander, of losing a will, refusing the hands of dukes and earls, and finally with her brother, of overcoming her enemies, and living happily in the highest society forever after.

CHILDREN OF EARTH. In 1913 Mr. Winthrop Ames, of the Little Theatre, New York, offered a prize of $100 for the best play by an American author. The manuscripts were to be submitted anonymously. In June 1914 the judges, after having gone through 17 manuscripts, awarded the prize to Miss Alice Brown, of Boston, for her play of New England life, ‘Children of Earth.’ This piece was given its first production at the Booth Theatre, New York, on 12 Jan. 1915. It was hailed in the press as an effort showing high literary and poetic quality, but it failed of popular appeal because it was a middle-age romance and lacked true, red-blooded passion. The heroine, worn out with self-sacrifice, and grown old in the service of her conscience, experiences a last mad flame of youth in a wild, unexplainable adventure with one Peter Hale. This flame finally dies down in the last act, and our New England heroine is finally crushed by circumstance.

Though the play has literary quality, it is defective dramatically. It is too intent on externalizing New England types. But none of the New England characteristics are deeply ingrained in the characters; they are superimposed upon them in order to furnish a genre picture.

There is the passion of great souls in Mary Ellen and Peter Hale; they are too detached in their poet’s love, too lukewarm in their determination to take from life what it has to give them. The consequence is that when the New England conscience drives them back into conventionality, both the theatre audience and the reader are unconvinced of the logical reasons for the action. The other characters in ‘Children of Earth’ are types, not human beings definitely interwoven into the plot. That is why the play failed on the stage. In its printed form, while it leaves one unsatisfied, it at least convinces one that here is an American drama with literary quality which dominates over its dramatic effectiveness. The play was reviewed by Clayton Hamilton in The Bookman (41:62).

MONTROSE J. MOSES.

CHILDREN OF THE Ghetto, a noted book by I. Zangwill (q.v.), published in 1882. It is, as the author says, ‘intended as a study, through typical figures, of a people whose persistence is the most remarkable fact in the history of the world.’ The book raises problems that it does not solve; but the masterly and sympathetic exposition of the Jewish temperament invites a better comprehension of that wonderful race.

CHILDREN OF GIBEON, a popular novel by Walter Besant (q.v.), published in 1886. Like his ‘All Sorts and Conditions of Men,’ it deals with society in both the west and east ends of London, and their relations to each other. The plot is so ingeniously managed that it seems entirely plausible; the studies of London wage-earners and London slums are faithful, without being too repulsive; and the tone of the book is cheerful, while many social problems are touched in the course of an entertaining story.

CHILDREN OF THE SOIL, a novel of modern Polish life, by Henryk Sienkiewicz, published in 1894. There are interesting side issues to the story, involving questions of property, of the social order, of marriage. The work as a whole is realistic, sane in spirit, genial and broad in its conception of life and character.

CHILDREN IN THE WOOD, The, or THE BABIES IN THE WOOD, an old English ballad, telling the story of two children whom their uncle wished to murder and who were left to die in the woods, by the man who was ordered to kill them. The authorship is unknown, and the date uncertain; it appears in the Stationers’ Register of 1595, and was probably written about that time. An old play, published in 1601, has a similar plot, and the source of the two is supposed by some critics to be the same.

CHILDREN OF THE WORLD (Kinder der Welt). This novel (1873), by Paul Heyse, is the literary echo of the discontent and rebellion against the existing order—political, religious, social and economic—which began in the universities of Germany, spread through the land in the period between the Revolution of 1848 and the Franco-Prussian War. It is a perfect example of the ‘Tendenz-Roman’ which such eras of unsettled thought and altered human values engender. Except in its treatment of women which, although erotic, is romantic in the extreme, the book is the philosophy of Schopenhauer and David Strauss reduced to novel type. Every problem of the age is set forth in the person of one of the characters. There is the ascetic-erotic-intellectual hero, without honor in the university because of his freedom of thought; the unawakened but erotic heroine, natural daughter of a landed aristocrat, without morals; the ugly but talented feminist musician; the highly spiritual, ill-nourished carpenter brother of the hero; the hounded young socialist-atheist; the kindly old artist with no vision beyond the nearest fence; the over-fed, material, unspiritual, vengeful teacher of the godless; and the decent, good-natured, unassuming, unpretentious do-gooder with their fellows. ‘Children of the World’ has been called the ‘romance of pessimism’ and ‘the apotheosis of atheism.’ The very name, in which ‘Children of the World’ is contrasted
with 'Children of God,' i.e., the clergy, is argumentative. The wonder is that in spite of its faults, its lack of spontaneity, its persistent preaching, and its iconoclastic tendency, the book remains good fiction. The characters all say too much and do too little, but so they would in real life; they are all exaggerated types, but the exaggeration is not that of unreality but of that violation of the norm which accompanies social rebellion.

EDITH J. R. ISAACS.

CHILDREN'S AID SOCIETY, an association for the rescue of neglected, dependent or wayward children. The first society so-called was founded in 1853 at New York by Charles L. Brace. It trains the children and seeks to find situations and homes for them preferably in country districts. Similar societies have been founded in all cities and are accomplishing marvels in rescue work. See CHILDREN, DEPENDENT.

CHILDREN'S BUREAU, a bureau in the Department of Labor (in the Department of Commerce and Labor in 1912-13), established by law of 9 April 1912. It is authorized to investigate and report to the department all matters pertaining to child life or welfare. The birthrate, infant mortality, accidents and diseases of children, child labor, juvenile courts. State labor laws, and in relation to children all come within the province of the bureau. The chief of the bureau is nominated by the President and confirmed by the Senate. Miss Julia C. Lathrop was the first chief.

CHILDREN'S COURTS. Special judicial institutions for dealing with cases of juvenile waywardness or parental remissness in a reformative rather than a retributive spirit. The general theory of these courts is that, for obvious reasons, children should not be judged in ways and by means designed for their elders; that, in other words, the delinquent child is not to be regarded and treated as a criminal, but merely as an unfortunate needing the special supervision or protection of the State. The most advanced view of the matter is that such children, being themselves the victims of unfavorable environment over which they have no control, must be dealt with in a way socially and educationally. From this standpoint, the children's courts may well be considered a sociological and educational agency rather than a legal institution. Their inception and development, at any rate, were more in line with the former than the latter, as we shall see presently. They received both their impetus and their general character from the enlightened modern view of juvenile delinquency, and were made imperative by the scientific results attained in the general field of child study (q.v.).

History.—Although the juvenile court is a comparatively new institution — less than 20 years old, in fact — there is no unanimity among writers on this subject as to where and when the very first real children's court was established. Claims of priority are made for the States of Massachusetts, Rhode Island, Colorado and Illinois — which leaves the honor safely to the United States. The uncertainty on this point is due partly to failure to discriminate between the actual establishment of children's courts and the sundry legislative enactments that preceded them. Thus Massachusetts, which passed the first statutory law on the subject of probation and granted children separate trials as early as 1869, has the best claim to priority in children's court legislation — legislation which practically started the children's court movement in America. Illinois, with her official juvenile court established at Chicago in 1899, seems to have an equally valid claim to priority in the matter of actual children's courts. The Illinois innovation gave such impetus to the juvenile courts' movement that children's courts began to pass in New York, Rhode Island, Kansas, Wisconsin, Pennsylvania, Colorado and elsewhere. The second children's court was established at Philadelphia in 1901. New York City and Baltimore followed suit in 1902, and Saint Louis a year later. It is neither possible nor desirable to enumerate all the others, since there is hardly a city worthy of the name that has not established some kind of juvenile court. An idea of the rapid growth of the movement may be had from the fact that in the years 1903-07 no fewer than 18 States either established children's courts or adopted legislation to that end.

Of course, the children's court movement has not been confined to the United States, since it originated and is best developed. Among its foreign promoters, Canada may be ranked first, since her juvenile court legislation antedates even the famous Juvenile Court Act of Illinois. Indeed, the Chicago court itself seems to have been fostered in South Australia, which created a State children's department in 1895 and a juvenile court three years later that served as a model for the very efficient children's court of Toronto. Since then every important country in Europe and at least one in Asia has been studying and adopting the American juvenile court system in one form or another. Several international congresses for the study of juvenile court problems have already been held, and the world-wide interest in this new movement is most encouraging. Both England and Germany have very comprehensive laws on the subject, though the former has made greater progress in juvenile court legislation than any other country in Europe, as may be judged by its sympathy Children's Charter.

Scope and Procedure.—As children's courts are still in a formative stage, neither their scope nor their methods of procedure are uniform or well-defined. Both vary in different cities and States, depending upon local conditions. In general, their scope has broadened steadily throughout the country and their methods have been more advanced in the Western States than in those of the East. Beginning as institutions for dealing with juvenile offenders, their scope has gradually been extended to include every phase of juvenile delinquency, parental neglect, and maltreatment of children, however caused or legally defined — every conceivable offense, in short, committed by or against children. The broadest view of the functions of children's courts, therefore, seems to make the local child-welfare agencies; and much of the opposition to these institutions has been aroused by such liberal interpretations of their scope. But neither in theory nor in practice do all children's courts claim such seemingly unlimited jurisdiction. The juvenile court of Saint Louis, for in-
CHILDREN’S COURTS

stance, confines itself to delinquent and dependent children; that of Chicago, to delinquent, dependent and neglected children; while that of Philadelphia deals with all these and incorrigible juvenile offenders. Parental and other contributory causes of juvenile delinquency were recognized and dealt with as early as 1907 by the laws of Colorado, which established the first complete children’s court in the world. This type of juvenile court is empowered even to proceed criminally against parents, guardians and all other persons chargeable with serious offenses involving children. Other children’s courts—notably that of Indianapolis, perhaps the most complete and efficient children’s court in the world—have found themselves drawn into the affairs of the home, encroaching, that is, upon the field of the domestic relations court. This process went so far in the city of Indianapolis that its juvenile court and the domestic relations court were actually combined in 1911. Adult contributory delinquency laws are now quite common, many States having followed the example set by Colorado—Virginia, Rhode Island, New York, and Kentucky in others since. Thus does the growing realization that the erring or wayward child is but a product of home, school and society continually enlarge the scope of children’s courts. In line with this general tendency juvenile court laws, which originally applied to children under 16, have recently raised the age limit to 18 years. Indeed, a few children’s courts—those of Denver and Buffalo, for instance—have jurisdiction even of adolescents (“adult delinquents”) between the ages of 16 and 21.

Under such varying circumstances, uniformity in children’s courts’ procedure can hardly be expected. This depends very largely upon the particular judge in charge, the nature of the community concerned, and the laws under which proceedings are conducted at any given place. The general attitude of these courts being corrective rather than punitive, their hearings are usually very simple and informal—even private at times. No juries are called, and no charges or criminal accusations can be made against the child. The offense may be, since a child cannot be considered a criminal under juvenile court laws. The rules of evidence are partly or wholly disregarded. Such information as may be needed is usually obtained before the hearing by a probation officer, who conducts all preliminary investigations and reports the facts to the judge. The latter may supplement these data by such additional information as parents and others can furnish upon the child’s character, environment and antecedents before disposing of a particular case. Invariably, too, the child is privately interviewed by the judge and encouraged to tell his own story in confidence. Once a child is found delinquent—verdicts of “guilty” and “not guilty” are, of course, out of the question in strictly juvenile cases—many courses are open to the judge. The child may be (1) returned to his home on probation, that is, in charge of a probation officer; (2) placed out in some foster home until ready to return to his own; (3) committed to the care of some children’s society available for the purpose; or (4) sent to a reformatory institution. The order of enumeration is, obviously, the order of preference. The child’s natural home, if not positively forbidding, is by all means to be preferred. Next comes the temporary home for such children as must, for whatever reason, be kept beyond parental control. Only when neither of these courses are deemed expedient should society care be invoked, and, as a very last resort, the reformatory is to be used. The best juvenile court judges—and this is one test of their fitness—is to resort to institutional care with increasing reluctance. In any case the delinquent child passes automatically into the custody of the court and becomes a ward of the State. The spirit of the most progressive and efficient children’s courts is indicated by certain delinquency laws, which expressly stipulate that the treatment of the child under them “shall be as nearly as possible like that of parents.” Unfortunately, far too many children’s courts are not yet conducted in this enlightened spirit. Some of them (a gradually decreasing number) still cling to the traditional manner of court procedure—even to the rules of evidence, criminal charges and the pronunciation of guilt or innocence.

Results.—The success of any particular children’s court depends very largely upon its judge and probation officer, both of whom should be broad-minded and large-hearted persons, fully in sympathy with the problems of child-life and conversant with the essential teachings of child psychology. Special insight into local conditions and resourcefulness in the disposition of cases are, of course, other necessary qualifications in the juvenile court judge; just as maturity, a high moral purpose, and tact are among the indispensable qualifications in a good probation officer.

The general results of the establishment of children’s courts have been manifold and far-reaching. The juvenile courts have accomplished at least four distinct and important results. They have (1) separated the child offender from the adult criminal, thereby rescuing him from crime-breeding association and criminal court procedure; (2) made the former victims of retributive justice objects of sincere solicitude and offense; (3) helped to lead parents to a better realization of their responsibility for the child’s waywardness; and (4) obviated the necessity of jailing the juvenile offender, thus making the life-long sting of “convict children” forever impossible.

CHILDREN'S CRUSADE—CHILDREN'S LIBRARIES

DAVID A. MODELL.

CHILDREN'S CRUSADE, The, a singular movement in 1212, preached in France by Stephen, a peasant boy, and in Germany the same year by Nicholas, also a peasant boy. Some 90,000 children left their mothers and schoolmasters in the spring to rescue the Holy Land from the infidels, and ships were placed at their disposal. The French contingent embarked at Marseilles in August; part perished the same month by shipwreck on the island of San Pietro, and the rest were sold into slavery to Mohammedans. The German contingent reached Genoa in August, and was utterly dispersed by various disasters before the spring. See CRUSADE.

CHILDREN'S LIBRARIES. In a concrete sense, special collections of books intended for juvenile readers and usually kept in separate rooms of general public libraries. From a broader point of view, however, children's libraries may be defined as an educational agency seeking to acquaint the young with the world's best literature and to cultivate an abiding love for good reading. Their work, therefore, supplements and transcends that of the public schools which exercise but a limited influence on the child's outside reading.

History and Development.—Active library work with children is a comparatively recent development—not more than 35 years old, at the utmost. Owing, however, to the laxity with which the libraries of any country have been used, there is considerable uncertainty as to just when and when the institution originated. Sporadic and usually abortive efforts in this direction appear to have been made as early as 1885, when a children's library was opened in New York by a public school principal (Emily S. Hanaway). A more successful effort was made, also in New York, the following year, when a separate library for children was opened as a branch of the Aguilar Free Library. But these forerunners of the children's library movement do not appear to have been generally imitated before 1890, when a children's reading room was opened at the Brookline (Mass.) Public Library. Soon thereafter special provisions for children in public libraries were made at Buffalo, Cleveland, Pittsburgh, Philadelphia, New York, Lowell, Medford, Brooklyn, Pawtucket, New Haven and elsewhere. By 1896 Milwaukee, Denver, Detroit, Omaha, Seattle and San Francisco—the movement spreading more rapidly in the West—all had their children's departments. To the Minneapolis Public Library, however, seems to belong the honor of first recognizing the full importance of the children's library movement by making adequate provisions for library work with children in 1893. By 1897 the movement had assumed such proportions that the American Library Association made the subject of children's libraries a component part of every progressive public library in the United States. The best of these carry on systematic work with children and have all the delightful adjuncts of children's rooms. In some instances even—in such cities as Brooklyn (N. Y.), Cleveland and Griffin (Ga.)—children's libraries are housed in entirely separate buildings, which naturally afford many exceptional opportunities. This indicates how juvenile readers have come to their own in our public libraries since the day of "children's corners," designed quite as much as to exclude children out of the way of adult readers as for their own good. In most of the larger cities of the United States children's libraries are now completely organized and fully supervised. In such cities the central library serves as model for the various branches, all of which are administered and conducted in accordance with the general principles formulated by the supervisor.

Some idea of the general growth and popularity of children's libraries may be had by a glance at a few actual figures. In 1914 there were over 1,500,000 volumes intended specially for juvenile readers in but 51 of the larger libraries in the country, which shelved some 300,000 alone. By a very conservative estimate half a million children held library cards the same year, drawing more than eleven million books for home use in the few libraries above mentioned. Of course such large library centers as those of Pittsburgh (Pa.) and New York, where children's libraries constitute an entirely separate system, present figures even more impressive. In 1915 the various children's library branches of Pittsburgh had 119,678 volumes and a circulation of 702,139. During the same year the combined circulation of all the children's branches of Greater New York exceeded seven and a-half million volumes (7,631,462, to be exact), while the number of children using the 44 branches of three of its boroughs (the boroughs of Manhattan, the Bronx and Richmond) was 1,608,753. The great popularity of children's story hours, an important and seemingly indispensable phase of library work with children, may be judged from the fact that 119,678 children attended them in 1915 in Pittsburgh alone. In New York, exclusive of the boroughs of Brooklyn and Queens, 2,489 story-hour groups gathered during the same period in the various branch libraries and the Central Children's Room. At the latter, on one special occasion, the number of auditors was 270.

The children's library movement abroad has not, on the whole, kept pace with its rapid development in the United States. Not even England and Germany have caught the full educational momentum more rapidly in the West—all had their children's departments. To the Minneapolis Public Library, however, seems to belong the honor of first recognizing the full importance of the children's library movement by making adequate provisions for
CHILDREN'S LITERATURE

well organized library system. Both joined the movement very recently. Germany, for instance, opened her first children's library only in 1929, despite progressors' attempts. In 1916 there were at least 10 such libraries in Moscow alone. But the American example is gradually making itself felt to the ends of the civilized world—in Sweden, New Zealand, Japan, etc. — and there is probably no large book-reading community anywhere that has not some kind of children's library or reading room.

Aims and Means.—Besides the chief aim of children's libraries—the general aim already mentioned, which may be called inspirational or direct and perhaps the secondary aim, which may be called informational. This consists in teaching library children, directly or indirectly, the intelligent use of libraries and their accessories, including such books as the library has on reference and card-indexes. Speaking relatively, the second aim is really a means to the more general lack for which libraries are maintained; for, obviously, the better children learn how to use the resources of their own libraries the more they necessarily contribute to the efficient use of the adult department.

The attainment of these general aims involves various more or less distinct lines of work with children, which naturally varies both in kind and degree with local conditions. In general, according to an eminent librarian (Arthur E. Bostwick), "a typical children's department of an American library carries on all of or the following kinds of work: (1) Controlled and guided circulation of books for home use; (2) use of books and periodicals as in an ordinary reading room; (3) reference use of books, largely in connection with school work; (4) work with very young children, chiefly by means of picture books; (5) explaining books by asking questions, etc., always in connection with courses of reading; (6) story-telling to selected groups." The three great factors in carrying on these manifold activities are, of course, the children, the books and the librarians; and although the success of any particular library centre depends upon all three, only the second and third elements can properly be considered in this article.

The selection of books for a children's library is at once the most difficult and most important task of the children's librarian. Great diversity of opinion prevails on this subject among librarians themselves, and while the problem of children's reading is a new and very serious one (see CHILDREN'S LITERATURE), the conscientious librarians are trying hard to solve it. Since the establishment of children's libraries, policies as to the choice of books have varied all the way from puritanical exclusion of everything not positively didactic to latitudinarian inclusion of everything the child will read. Such extreme views of the function of children's libraries have naturally put their supervisors on their guard, with the result that, although the golden mean has not yet been generally attained, far higher standards of book selection prevail in children's rooms than in the average adult department. The best children's libraries follow neither moral nor literary criteria, but the recognized tastes and book selection reflects the tastes, but provide enough books in sufficient variety to supply the normal needs of boys and girls of all ages and of all ages. Special attention, too, is given in children's rooms to the mechanical features of the books selected—such as in 1916 there were at least 10 such libraries in Moscow alone. But the American example is gradually making itself felt to the ends of the civilized world—in Sweden, New Zealand, Japan, etc. — and there is probably no large book-reading community anywhere that has not some kind of children's library or reading room.

Next in importance to the quality and quantity of the books in a children's library are the personality and qualifications of the children's librarian, upon whom the success of the children's room largely depends. Consequently, the most experienced assistants—experienced in dealing with children as well as in library routine—are coming to be employed in the best children's rooms. The librarian must be as intimately the whole range of juvenile literature and be in thorough sympathy with the rising generation of book readers, whose reading they must guide and direct, if they would make the most of their valuable knowledge of children's books and special library experience, aptitude for work with children is an indispensable requisite in the children's librarian. Indeed, so important and responsible is her position that she has been its alone of which (The Carnegie Library of Pittsburgh) devotes itself exclusively to the professional training of children's librarians—"a training that may well be made as broad and as cultural as is required for the profession of teaching."

DAVID A. MODELL.

CHILDREN'S LITERATURE. Books written for or suited to the young. From a stricter point of view, literature comprises books specially written for children. In either case, books about childhood intended for adult readers are excluded and will not be considered in this survey. But it is really impossible to define children's books without instanting titles of children's favor. Such a list would show, for one thing, that quite as many works not written for children have found favor with them as those that were. Thus, parts of 'The Bible,' Homer's 'Odyssey,' 'The Pilgrim's Progress,' 'The Arabian Nights,' 'Gulliver's Travels,' and 'Baron Munchausen'—none of them intended for children—are just as much children's books as 'Alice in Wonderland,' Andersen's 'Fairy Tales,' 'The Water Babies,' and 'Peter Pan'—which were expressly written for juvenile readers. That the former should be much relished by children and the latter also by adults, proves conclusively the impossibility of drawing a hard-and-fast line between juvenile literature and other literature. Anything that interests or comes within the comprehension of children generally may therefore be considered as belonging to the large and miscellaneous class of children's books.
CHILDREN'S LITERATURE

History.—The difficulty of formulating a satisfactory definition of children’s books adds to the perplexities of the historian of juvenile literature and helps to account for the woeful want of chronological definitiveness in many histories of children’s literature. Thus, while some of these date the beginning of children’s books from 1715—that is, from the appearance of Isaac Watts’s ‘Divine and Moral Songs’—others go back as far as the 7th century—to a Latin work by one Aldhelm, Abbot of Malmesbury, and to the school texts of the Venerable Bede. For our purposes this sketch need not extend beyond the 15th century, before which children’s books can hardly be said to have existed. What are now considered such by some imaginative historians were mainly lesson texts, written in Latin and intended generally for pupils in monastic schools. Such works belong rather to the history of education than to the history of children’s literature. However, the pseudo juveniles of Aldhelm, Bede, Alcuin and even Aelfric, whose ‘Colloquy’ was one of the most interesting beginnings of books for the young, we come to the peculiar 15th and 16th century productions whose nature and purpose we shall now consider.

The Early Period.—During the 15th century real attempts at the writing of children’s books were made by various authors, whose chief purpose was moral or other instruction. This appears in their very titles: ‘The Babees Boke; or, A lyttel Reporte of how Young People should behave’ (circa 1475); ‘The Boke of Curtesye’ (1460); Simon’s ‘Lesson of Wysedom for all Manner Childrym’; and the like. All these were written in Latin—one of them, ‘Stans Puer ad Mensam’ (‘The Page Standing at the Table,’ 1430) still preserves its Latin title—and most of them in rhyme. Not only was their general tone moral or didactic, being intended to inculcate lessons in manners and conduct, but their appeal was very limited, being addressed mostly to boys of noble families destined to serve as pages, esquires, etc., on to the rank of knighthood. There was not even the sugar-coating of narrative or the blending with didactic humour that in later times may be judged from such titles as James Janeway’s ‘Token for Children; an Exact Account of the Conversion, Holy and Exemplary Lives and Joyful Deaths of Several Young Children,’ and Francis Cockin’s ‘Dyvine Blossoms; Prospect or Looking Glass for Youth.’ Small wonder therefore that, in view of such unimaginative vehicles for religious instruction as these—and their number was appalling—such a gem as Bunyan’s ‘The Pilgrim’s Progress’ was eagerly seized upon by juvenile readers, written though it was for their elders.

But, dull and forbidding as were these early attempts at children’s books—the hornbooks, chap-books, tokens, primers, etc.—which reached their culmination in such works as Franklin’s ‘Poor Richard,’ they were the un doubted forerunners of real children’s literature, whose rise we must now consider. As such, their historical importance should not be underestimated.

The Period of Transition.—The rise of real children’s books—that is, books specially written for children—dates from the second
half of the 18th century. It was then that such educational reformers as Rousseau, Froebel and Pestalozzi insisted on the necessity of childhood which culminated in modern Child Study (q.v.). Obviously, before this general awakening to the special needs and problems of the child as a child, his reading appeared to involve no special difficulties. One of the first manifestations of this new realization—the realization that the child is not merely a diminutive adult, but a being with tastes and interests peculiar to himself—was the founding of a children's magazine (Weissach's Kinderfreund).

But the turning point in the development of children's literature seems to have been reached by 1760, when John Newbery (q.v.), the first publisher of books for children, issued a small collection of nursery rhymes under the title of 'Mother Goose's Melody.' It was five years later that Goldsmith, who probably edited the little volume just mentioned, published his 'History of Margery Two-Shoes,' which is generally considered the first real children's story written—and it is still a favorite with youthful readers. But no publisher, assisted by Goldsmith, Dr. Johnson and lesser celebrities driven to hack-work, published hundreds of little volumes for juvenile readers, whose appetites he both stimulated and sought to satisfy. This prolific and ambitious publisher ran the gamut of children's reading, from young folk's magazines to grammar-texts and a 'Circle of Sciences,' a sort of compendium of universal knowledge. The tone of most of the Newbery publications, however, was still didactic. Such titles as 'The Renowned History of Giles Gingerbread, a little boy who lived upon learning,' 'The Whitsundie Gift, or the Way to be Happy,' and 'The Valentine Gift, or how to behave with honor, integrity and humanity'—and they are not by any means exceptional—sufficiently indicate the type of thing produced by the philanthropic publisher of Saint Paul's Churchyard, as Goldsmith once called John Newbery.

A somewhat similar service to children's books was rendered in America by Isaiah Thomas, the long-lived Massachusetts printer and bookseller, the pioneer publisher of juvenile literature in the western world. Drawing freely upon Newbery's list, he needed but to alter the English titles and give the stories a New England setting to make his reprints interesting to children of Colonial and Revolutionary times. In such stories as 'The Juvenile Biographer' (containing accounts of Mistresses Allgeo, Careful and Lovebook, together with the narratives of Mr. Badmouth and other heroes) the English text is easily recognizable. They represented no very great advance, it must be admitted, over the least cheerful New England primers. Nor were such of the Thomas publications as were written in America tinged by less sombre sternness. 'Godly Children the Parents' Joy'; 'A Dying Father's Legacy to an Only Child'; and Jane way's 'Token for the Children of New England'—were the self-explanatory titles of some of the Thomas publications as were written in America far too distinct in such children's books—they were in no sense real literature—to make them delightful reading for healthy boys and girls. For that they had still to wait.

In Germany the educator, Basedow and others originated a type of literature which, intended for children and used in childhood which culminated in modern Child Study (q.v.). Obviously, before this general awakening to the special needs and problems of the child as a child, his reading appeared to involve no special difficulties. One of the first manifestations of this new realization—the realization that the child is not merely a diminutive adult, but a being with tastes and interests peculiar to himself—was the founding of a children's magazine (Weissach's Kinderfreund).

But the turning point in the development of children's literature seems to have been reached by 1760, when John Newbery (q.v.), the first publisher of books for children, issued a small collection of nursery rhymes under the title of 'Mother Goose's Melody.' It was five years later that Goldsmith, who probably edited the little volume just mentioned, published his 'History of Margery Two-Shoes,' which is generally considered the first real children's story written—and it is still a favorite with youthful readers. But no publisher, assisted by Goldsmith, Dr. Johnson and lesser celebrities driven to hack-work, published hundreds of little volumes for juvenile readers, whose appetites he both stimulated and sought to satisfy. This prolific and ambitious publisher ran the gamut of children's reading, from young folk's magazines to grammar-texts and a 'Circle of Sciences,' a sort of compendium of universal knowledge. The tone of most of the Newbery publications, however, was still didactic. Such titles as 'The Renowned History of Giles Gingerbread, a little boy who lived upon learning'; 'The Whitsundie Gift, or the Way to be Happy'; and 'The Valentine Gift, or how to behave with honor, integrity and humanity'—and they are not by any means exceptional—sufficiently indicate the type of thing produced by the philanthropic publisher of Saint Paul's Churchyard, as Goldsmith once called John Newbery.

A somewhat similar service to children's books was rendered in America by Isaiah Thomas, the long-lived Massachusetts printer and bookseller, the pioneer publisher of juvenile literature in the western world. Drawing freely upon Newbery's list, he needed but to alter the English titles and give the stories a New England setting to make his reprints interesting to children of Colonial and Revolutionary times. In such stories as 'The Juvenile Biographer' (containing accounts of Mistresses Allgeo, Careful and Lovebook, together with the narratives of Mr. Badmouth and other heroes) the English text is easily recognizable. They represented no very great advance, it must be admitted, over the least cheerful New England primers. Nor were such of the Thomas publications as were written in America tinged by less sombre sternness. 'Godly Children the Parents' Joy'; 'A Dying Father's Legacy to an Only Child'; and Jane way's 'Token for the Children of New England'—were the self-explanatory titles of some of the Thomas publications as were written in America far too distinct in such children's books—they were in no sense real literature—to make them delightful reading for healthy boys and girls. For that they had still to wait.
and abound in real pictures of humble folks worthy of a Charles Dickens. But throughout these and all her longer works, the acquisition of knowledge is considered as but a means to a better understanding of the catechism. The imaginative child's fancy must still content itself with very low flights, if it can rise at all.

Pretty much the same may be said of the juveniles of Sarah Kirby Trimmer, a more famous writer of the Sunday School group, who has been called the parent of the didactic story books—such as 'Easy Lessons for Children' (1780), 'Easy Introduction to the Knowledge of Nature' (1782) and 'Sacred History for Young Persons' (1785)—were intended for use in the Sunday Schools, which Mrs. Trimmer had helped to open. But it is not for her religious writing as much as for her 'History of the Robins' (1789), which represents the earliest attempt to teach children kindness toward the animal world, that Mrs. Trimmer is best remembered.

Among the many other writers of this school, mention must be made of Mrs. Sherwood, for her 'Fairchild Family' (1818-47), including 'Little Henry and His Beaver,' 'The Female Elevator's Journal,' and 'A Visit to a Distant Colossus in America' was Elizabeth Wetherell, author of 'Queechy' and 'The Wide Wide World,' works far above the average religious or Sunday School story written in America during the last century—such are exemplified by the Elsie and the Pansy books. In the better stories of this class, though there is an unmistakable religious background, the picture of life is generally vivid and the narrative of considerable interest. The stories of Charlotte Yonge are among the very best religious tales extant.

(3) With the gradual advance made in the literary qualities of children's books, special attention to juvenile poetry came as a matter of course. One of the first writers to pen a volume of verses specially for the delight of Isaac Watts (q.v.), a man belonging to an earlier age than we are now considering. His name must be mentioned here as a worthy predecessor of the better known children's poet, Eliza Marina Phinney, the poet of Dr. Watts—and such a charming hymn as 'Holy Angels Guard Thy Bed' is among the best in the language—show the truest understanding of childhood, childhood seen in retrospect and with an adult's sadness over the lost joys of innocence.

Much more didactic were the Taylor sisters, Jane and Ann, whose poetry makes a far greater appeal to juvenile readers than anything Watts ever penned. Their 'Original Poems for Infant Minds' (1804), containing verses of real merit, seek to emphasize such social virtues as generosity, honesty and truthfulness—an emphasis no longer religious, it will be noticed, but distinctly ethical. Their aim was to interpret the world through the eyes of childhood, an ambitious undertaking in which they hardly succeeded.

Far more successful in this respect were the children's verses of William Blake, whose 'Songs of Innocence' (1789), though chronologically belonging to the 18th century, in form and spirit. So happily are the modern regard for childhood and the latter's responsiveness to adult sympathy blended in Blake's verses that they suggest the best children's lyrics of Wordsworth and Christina Rossetti. Indeed, nothing finer than his 'Songs of Innocence,' with its remarkable imagery and grace, was added to children's verse before Robert Louis Stevenson's delightfully reminiscent 'Child's Garden of Verses' (1885), which has been the forerunner and inspiration of a great many volumes of poetry for children.

(4) The literary heights reached in children's verse during the 19th century marked but one of the important phases of the rapid development of modern children's literature. Another—perhaps an outgrowth of the first—was the new and increasing zeal for putting the classics within the reach of the young. By the middle of the last century four most noteworthy and very successful manifestations of this salutary tendency appeared. Kingsley's 'Greek Heroes' (1856), Lamb's 'Adventures of Ulysses' (1806) and Hawkins' 'The Fairy Book' (1852) and 'Tanglewood Tales' (1853) practically unlocked for children the rich granaries of Greek mythology, to the infinite delight of generations of eager readers. This was a great step forward, for children that the wonderful flowering of children's literature in the latter half of the century may well be attributed very largely to the classic influence we are here considering. Then it was that the reading child first came into full possession of his literary heritage, the accumulated treasures of imaginative Man.

Classification.—From the early times when children's books were yet non-existent—when children and adults heard the same tales with a common naiveté—to the present fine specialization in books intended for the young, millions of volumes have been published under the general head of Juvenile Literature. With this multiplicity has come also great diversity, so that it is no mean task merely to classify satisfactorily this wealth of material. This becomes the more difficult in that there are no definite types of children's literature more than of any other, and this, naturally, makes for greater variety. For these and other reasons no adequately classic verse for children's books will here be attempted. Only a few of the more common types can be considered, and under these general headings: (1) Fairy Tales, Myths and Fables; (2) Historical, Biographical and Other Narratives; (3) Children's Poetry; and (4) Juvenile Pictures. Nor can the treatment even of these be more than summary in the present article. For a fuller study of the subject, the reader is referred to the bibliography appended to this article.

Fairy Tales, Myths and Fables.—Despite the great variety of other books for children that have grown, like mushrooms, since Perrault's pioneer collection of 'Mother Goose Tales' ('Contes de ma Mère L'Oye,' 1697), nothing has displaced the fairy tale in favor with younger children. After Perrault's greatest contributions to fairy tale literature were made by the Grimm Brothers with their 'Household Tales' ('Kinder- und Hausmärchen,' 1812-15) and by their most distinguished successor, Hans Christian Andersen, is one of the 19th century's finest and best (1835), best translated into English by Mary Howitt. Among other literary fairy tale-
lections, to the making of which there is no end, mention should be made of Kennedy's 'New World Fairy Book' ; Rhys's 'Fairy Gold' ; Scudder's 'Children's Book' ; Jacobs' 'English Fairy Tales' and its companion volume, 'More English Fairy Tales' ; and Lang's long Rainbow Series. More in the nature of wonder stories are the Alice books of Lewis Carroll, Ruskin's 'King of the Golden River,' Kingsley's 'Water Babies,' and 'The Arabian Nights.' The Norse myths, and those of W. F. Macdonald have such a unique spiritual quality and a distinctive tone of mystery that they may be considered among the best modern specimens of their kind. As a general rule, however, the modern fairy story, cultivated by many mediocre writers, is apt to be lacking in imagination, art and taste.

Mythological tales, which are based upon primitive man's interpretation of nature, run back naturally to the beginning of time. The best myths have come down to us from ancient Greece, and we have already mentioned the three great writers—Kingsley, Lamb and Hawe thorne—who first familiarized English-reading children with these most delightful narratives, so rich in unmeaning poetic force. Of the many other versions of the classic myths of Greece, Bulfinch's 'Age of Fable' and Moncrieff's 'Classic Myth and Legend' are perhaps the fullest and best. Next to the Greek myths, the Old Norse myths are particularly interesting to children. They have been admirably retold by Brown ('In the Days of Giants') and Mabie ('Norse Stories Retold from the Eddas'). The mythology of the American Indian, equally full of color, mystery and elemental nature, has been strangely neglected by modern writers of children's books. Longfellow's 'Hiawatha' is still the most beautiful presentation of Red Indian myths. There are, of course, many other kinds of mythical tales, but the three here mentioned possess the best characteristics for juvenile readers.

The fable (q.v.), which is probably of Indian origin and was one of the earliest forms of story-telling everywhere, has been made familiar to children by the master touch of Aesop. Aesop's fable has never yet been surpassed, if it ever shall be equalled. This form of imaginative literature makes its peculiar appeal to younger children and performs a special mission in their ethical education. Some of the best of Aesop's fables—edited times without number—are 'The Dog in the Manger,' 'The Lion and the Mouse,' 'Belling the Cat,' 'The Shepherd Boy and the Wolf,' and 'The Town Mouse and the Country Mouse.' The other two great fabulists were La Fontaine in France and Krylov in Russia, but neither has enjoyed such universal popularity abroad. 'Select Fables from La Fontaine,' translated by Elizier Wright, and 'Krillof's Original Fables,' translated by Harrison, are perhaps the best two selections from these fabulists available in English. A general collection from Aesop, La Fontaine and others is found in Wiggins's and Smith's 'The Talking Beasts; A Book of Fable Wisdom,' and Excellent selection of fables not otherwise available in English is found in the book, 'Aesop's Fables,' translated by John Bousfield, which is a standard work of the kind.

Modern fairy tale, L. F. S. 'Wonderful Adventures of Nils.'

Historical, Biographical and Other Narratives.—For children who have outgrown the world of make-believe these classes of books afford most welcome substitutes. The best kind of historical narrative for children is that which emphasizes the romantic and biographical elements. Such narratives have been written by Scott ('Tales of a Grandfather'), Greenwood ('Merry England of George II'), and Dickens ('Hero Tales from American History'), Eggleston ('Stories of Great Americans for Little Americans'), Baldwin ('Fifty Famous Stories Retold') and many others.

From history stories to historical biography is a natural transition. This type of biography has been written for children since the middle of the 19th century, when the Abbots, authors of hundreds of juveniles, popularized it. More recent examples—and naturally better ones—are Tappan's lives of Alfred the Great, William the Conqueror, Queen Elizabeth and Queen Victoria. Two excellent and very comprehensive sets of historical biographies (one in 36 volumes) are 'Life Stories for Young People,' and the 'Children's Pictorial Library.' The former is translated from the German by G. P. Upton. Mention should here be made, too, of Marshall's 'Child's English Literature' for the abundant biographical material this well-written work contains.

Besides such special biographies, there are scores of others that are not necessarily historical or romantic. Good examples of such biographies suited to young readers are the 'Life, Letters, and Journals of Louisa Alcott' and Richard's 'Florence Nightingale.' Two excellent collected biographies are Mrs. Lang's 'Red Book of Heroes' and Mrs. Wade's 'Wonder Workers,' the latter dealing with eminent contemporaries.

Other kinds of instructive narratives that children like to read include every conceivable subject—from books of travel and geographical descriptions to animal stories and nature study excursions. Naturally, these cannot be enumerated here. A few good specimens of the types mentioned are the following: 'Many Adventures of Sandy' at Many Lands,' 'Little People Everywhere,' 'Peeps at Great Cities' and 'The Little Cousin Series'—the last consisting of 40 volumes by various authors—are admirable travel books; such works as Burroughs' 'Birds and Bees' and 'Squirrels and Other Fur-Bearers,' Roberts' 'Kindred of the Wild' and 'Haunters of the Silences'—rather than the more romantic Seton stories ('Lives of the Hunted,' 'Wild Animals I Have Known,' etc.)—represent the best type of animal story; while Ball's 'Starland,' Morley's 'Insect Stories,' Thompson's 'Water Wonders Every Child Should Know,' Andrews' 'Stories Mother Nature Told Her Children' and Buckley's 'Fairyland of Science'—every one combining science and narrative in happy proportions—will serve to indicate the diversity of nature-study narratives, the best of which are as fascinating as fairy tales.

Children's Poetry.—It is common knowledge that a child's love of animal stories that may be classed either as fables or as fairy tales are Kipling's Jungle books and 'Just So Stories.' In a class by itself stands that highly literary and charmingly imaginative modern fairy tale, L. F. S. 'Wonderful Adventures of Nils.'
tale age readily catch the swing of ballads, which they greatly enjoy even when the meaning of these vigorous poems happens to transcend their understanding. Among the best old ballads are 'Adam Bel,' 'Chevy Chase,' 'Sir Andrew Barton,' 'The Battle of Otterburn,' 'Fair Rosamond,' 'Sir Cauline,' 'The Heir of Linne,' 'The Blind Beggar's Daughter,' 'Glyn of the Clough and Wyllyam of Cloudestay,' and the cycle of Robin Hood poems. Good collections of such ballads are available in Bates' 'Ballad Book,' Mabie's 'Book of Old English Ballads' and Lanier's 'The Boy's Percy.' A special collection of the Robin Hood series has been made by Perkins ('Robin Hood'). The great popularity of these old ballads does not suffer even when their tales are retold in prose, which has been done repeatedly—best perhaps by Pyle ('Merry Adventures of Robin Hood') and Tappan ('Old Ballads in Prose'). For older children there are, in addition, the more modern ballads of Scott, Coleridge, Wordsworth, Browning, Tennyson and others, which are well represented in Palgrave's 'Golden Treasury,' 'The Oxford Book of English Verse' and almost any comprehensive collection of children's poetry.

Didactic narrative poetry for children has been well written by the Taylor sisters, whose 'Original Poems for Infant Minds' has already been characterized; the Lambs, authors of those charming 'Tales from Shakespeare' and other excellent Juveniles; the Carys, authors of the delightful 'Ballads for Little Folk'; Dr. Hoffman, author of the ever popular 'Slovenly Peter'; and many others. Lyric verse for young readers is equally abundant. William Blake, already mentioned for his beautiful 'Songs of Innocence,' and William Allingham, author of many natural and graceful lyrics, seem to have perfected this type of poem. Other children's poets of the earlier period are Christina Rosetti, referred to elsewhere, Mary Howitt, Celia Thaxter and Lucy Larcom (most of them represented in Whitier's 'excellent anthology of Child Life'). The children's verses of Robert Louis Stevenson, whose 'Child's Garden of Verses' has never yet been excelled, of Eugene Field and of James Whitcomb Riley—not to mention their numerous imitators—are distinctly reminiscent of childhood at play; their appeal is therefore quite as much to adults as to children. Romantic poetry, which appeals to children in adolescent years, has been written by Scott, Longfellow, Tennyson and all the other great poets. Much of it can be appreciated in later childhood. When the child's taste for poetry has grown to the appreciation of the best romantic poets, he no longer needs any special children's poetry. For anthologies of children's verse, the reader must be referred to the works cited in the bibliography.

Juvenile Fiction.—From Goldsmith's 'Margery Two-Shoes,' Day's 'Sandford and Merton,' and 'The Moral Tales' of Mrs. Edgeworth to such modern children's stories as 'The Happiness of Mrs.形式的' and 'The Happy Prince,' there has been a far cry indeed. Yet, everything in narrative form that marked this long evolution comes somewhere under the general head of juvenile fiction. Naturally there are many different types of children's stories—some writers enu- merate no fewer than a dozen. For our present purpose, however, two broad classes will suffice: (1) Stories of Adventure, and (2) Stories of Character. The latter can always be determined accurately to which class a child's story really belongs, the two general types not being mutually exclusive—a good story of adventure may abound in delineation of character, and effective character stories are not necessarily devoid of thrilling narrative. The determining consideration will be simply the predominance of either of these elements in stories possessing both.

That the child's earliest interest is in the adventure story, the story concerned with events rather than with character, is shown by the undying popularity of the fairy tale and wonder story as nursery literature. This interest naturally carries over into animal stories of the non-fictional type, stories of travel and romantic tales of every kind. Perhaps the best romantic story for children who have just emerged from the cycles of Arthurian, Carolingian and other legends—those fascinating adventure stories that no reading boy or girl should miss—Wise, 'The Last of the Mohicans' and 'The Two Admirals' there is not a narrative that any normal boy—and Cooper is decidedly a boy's author—will skip, any more than he can abstain from devouring the tales of mystery by Jules Verne. The genre of romance originated by Cooper has been done by Captain Marryat, Mayne Reid, Ballantyne and many others, whose thrilling tales of adventure on land and sea continue to enchant boys to this day.

Differing more in degree perhaps than in kind are such children's classics of adventure as 'Treasure Island,' 'The Three Musketeers,' 'Mysterious Island,' 'The Count of Monte Cristo,' and 'Kidnapped,' 'Captains Courageous' and 'Adventures of Billy Boswell.'

The juvenile character story may deal with school-life, the home and many other things. The forerunners of the modern school story, a very prolific branch of juvenile fiction, were Harriet Martineau's 'Crofton Boys' and 'Tom Brown at Rugby.' Unfortunately these masterpieces have not been often duplicated in recent times, when the average school story is apt to be devoid of characterization and interest. Among the best modern school stories are Vachel's 'The Hill,' Coolidge's 'What Katy Did at School,' Brown's 'The Four Gentlemen,' Richards' 'Peggy,' and, especially, the works of Arthur Stanwood Piel. He has written some 'Tuttledegs' of the kind.

The home story, a type as ill-defined as any other kind of children's stories, includes such excellent things as Alcott's 'Little Women,' 'Little Men' and 'Under the Lilacs,' Richards' 'Hildegard Series;' Pyle's 'Nancy Rutledge,'
CHILDREN'S PLAYGROUNDS

Ewing's 'Jackanapes,' 'Lob Lie-by-the-Fire' and 'Six to Sixteen'; Yonge's 'The Lances of Lynwood'; Martin's 'Emmy Lou'; and Howell's 'A Boy's Town' — to cite but a few of the thousand-and-one stories coming under the present classification.

Finally, there are numerous other varieties of juvenile fiction which are represented by such diverse genuine classics as 'Rebecca of Sunnybrook Farm,' 'The Prince and the Pauper,' 'The Story of a Bad Boy,' 'Mrs. Wiggs of the Cabbage Patch,' and to Briscoe's 'Betty Leicester.' These few titles of modern children's books indicate the great advance made in juvenile literature since the days of the Edgeworths, Thomas Day and the other early writers of so-called children's stories. With all that, however, and despite the fact that streams of juveniles are continually pouring from publishers' presses, there is still a woeful dearth of unexceptionable juvenile fiction, especially of realistic stories.

The bulk of the literature on children's books has appeared in the form of magazine articles, many of them in library journals. Moses, in 'Children's Books and Reading' (pp. 269-72) gives a fairly comprehensive list of such periodical literature up to 1907. Later references will be found in Fay and Eaton's work cited below. The more important books on the subject in English include Ashton, J., 'Chap-Books of the Eighteenth Century' (London 1882); Fay and Eaton, 'Institution in the Use of Books and Libraries' (Boston 1915, chaps. XIII-XXI); Field, E. M., 'The Child and his Book' (London 1891); Field, W. T., 'Fingerprints to Children's Reading' (Chicago 1907); Ford, P. L., 'History of the New England Primer' (New York 1897); Lee, G. S., 'The Child and the Book' (ib. 1907); Lowe, O., 'Literature for Children' (ib. 1914); Lucas, E. V., 'Old-fashioned Tales and Forgotten Tales of Long Ago' (London 1905); Moses, M. J., 'Children's Books and Reading' (ib. 1907); Olcott, K. J., 'The Children's Reading' (Boston and New York 1912); Pearson, E., 'Banbury Chapbooks and Toy Book Literature in the Eighteenth and Nineteenth Centuries' (London 1890); Reppier, A., 'The Children's Books' (in her 'Essays in Idleness,' Boston 1893); Grahame, Kenneth, 'The Cambridge Book of Poetry for Children' (New York 1916). Two excellent works in German are Koster's 'Geschichte der deutschen Jugend- litteratur' (Hamburg 1906) and Wolgast's 'Das Elfen unserer Jugend- literatur' (Leipsig 1903). Judicious lists of children's books are published by most public libraries. A very helpful and comprehensive one has been compiled by G. W. Arnold, 'A Mother's List of Books for Children' (Chicago 1909).

David A. Model.

CHILDREN'S PLAYGROUNDS.

Special provisions made by progressive modern communities, through public or private agencies affording children better opportunities for free or directed play. Socially and educationally, the children's playground is a phase of the general Child Welfare Movement (q.v.) which began with the great awakening to the special needs and interests of childhood in the closing decades of the last century.

History.—Like many other great movements, the playground movement in America began very simply and unpretentiously. Boston was its first home, and 'three piles of yellow sand' placed in the yards of the Children's Mission in 1886, its first concrete manifestation. This Boston idea, borrowed from Berlin, had little to do, however, with the subsequent development of the playground movement in the United States, which did not really begin before 1898. The earliest playgrounds were opened mostly under private auspices — charitable or philanthropic societies, especially social settlement movements — and to Briscoe's 'Betty Leicester,' in honor of taking the first municipal action on the purchase of playground sites (1872). In 1887 both Pennsylvania and New York enacted State legislation on the subject of playgrounds. Chicago established her first summer playground in 1892; Boston officially joined the movement in 1898, and the first municipal playground in New York was opened a year later. This last proved so successful that in 1903, in response to popular demand, similar playgrounds were established in several parts of New York city. The movement received much additional stimulus from the action of the New York Department of Education, which in 1898 took over a number of private summer playgrounds and placed them in charge of a special committee. Since then the playground movement in America has grown enormously. Numerous special societies devoted to playground interests now exist all over the country, and several national conventions, called by the Playground Association of America, have aroused world-wide interest.

According to 'The Year Book for 1915,' published by the above-mentioned national association, no fewer than 460 cities maintained playgrounds in 1915 at a total cost exceeding $4,065,377 and with the help of more than 7,500 paid directors or play leaders. The actual number of playgrounds in the United States the same year was 3,594, with 28 cities maintaining playgrounds unrecorded. In 1914 and 1915, 116 cities opened their first playgrounds. The rapid growth of the movement in intent has been equally significant, for at least 70 cities maintain special classes for the professional training of playground attendants and directors. Even normal schools and teachers' colleges now offer regular courses in playground supervision. The great numbers of young men and women with talent for leadership and knowledge of child activities.

Management and Equipment.—In proportion as the educational and social importance of playgrounds becomes better understood their ownership tends more and more to pass from private associations to municipal agencies. But so great is the demand for additional playground facilities, especially in the larger centres of population, that both private and public ownership are apt to continue side by side for some time, as even together they cannot supply the ever-increasing demand—a demand so disproportionate to the supply that many cities have had to rope off streets at certain seasons for want of playground space. An estimate of the total number of private and municipal playgrounds may be formed on the basis of the figures given in the above-mentioned 'Year Book, which shows that in 1915, 182 cities supported their playgrounds by municipal funds, 112 by private means and 130 by both.
The tendency toward the municipalization of children's playgrounds, though unmistakable, cannot therefore be said to be very strong. Whether such playgrounds are municipally owned, their actual management is placed in the hands of either the park department, the school board or some separate department specially created for the purpose.

The equipment of children's playgrounds, like their size and number, varies, naturally, with local conditions. The average school yard playground has a sand pit, a frame swing, a number of other swings and teeters, a spring-board, basketball standards, a standard for high jumping, a tether ball equipment, a net for volley ball and a supply of playground balls, besides special provisions for sewing, basket-making and raffia work. But many playgrounds have far more meagre facilities, which may consist of only jumping standards, horizontal bars and sand pits and playgrounds, if for boys, make provisions for baseball, basketball and tennis; those intended for girls, however, will have little or no apparatus, as dancing and singing are their chief diversions on such playgrounds. The largest and best equipped playgrounds, such as are maintained by Chicago, include large fields for baseball, field houses, libraries, clubrooms, assembly-rooms, gymnasium, swimming and wading pools, etc. The broadest scope is given in such playground centres to play and social activities, which include singing, folk-dancing, story-telling, pageants and amateur theatricals.

The general tendency as to hours and seasons is to make children's playgrounds available during as large a part of the day and as many days in the year as seems possible. Some playgrounds, especially those located in parks provided with field houses, are open throughout the year. In 1915 there were at least 575 playground centres in 97 cities open all year round. Some, by electric lighting, are made available also in the evenings. The open hours of school playgrounds are naturally limited to non-instruction periods. The recent tendency, too, has been toward greater supervision and more tranquil leadership, experience having proved the unsupervised playground educationally undesirable.

**Objects and Results.**—The object sought by the promoters of the earliest playgrounds was very simple. It was merely to keep children off the streets and away from their physical and moral dangers. But as the playground movement developed its objects were interpreted more broadly. The importance of play as an educational factor coming to be more clearly understood, the direct influence of play in character and social ideals could not be overlooked. The connection existing between unbalanced juvenile energy and waywardness suggests another very important gain from the playground movement, which has helped to make American youth more fit and healthy. Finally — to mention only the more significant benefits of playgrounds — children's playgrounds, by bringing together the various racial elements under the most favorable circumstances, exert a most salutary socializing influence on America's cosmopolitan population, and an influence making for greater comity and tolerance among peoples with natural or acquired animosities.

**David A. Modell.**

**CHILDREN'S THEATRES.** The early educational plays, or, strictly, dialogues for children, under the severe pedagogics of the 18th and 19th centuries, were as near to the character of real plays as the shorter catechism is to roasting comedy. For certainly they contained no elements of play, the healthy demand of educationists of the present time. It is, of course, necessary to observe a distinction between the children's play which grew entirely 'for fun' and the play written to meet some more or less didactic purpose. In the bibliography below, the one will be found classed under 'Home Plays' and the other under 'School Plays and Pageants,' although the two may occasionally have a tendency to overlap.

In the medieval ecclesiastical plays boys and young girls frequently took very important parts (consult Muntzious's 'History of Theatrical Art,' Vol. II, p. 88, for some curious facts); and 'Hamlet has made everyone familiar with the boys of the chapel of the Elizabethan Court (consult 'The Children of the Chapel Royal and Their Masters' by John M. Manly, Cambridge History of English Literature, Vol. VI). The first children's educational theatre on record, apart from 'School Drama' (see College Dramatics), was, appropriately enough, in France. This theatre was built on her estate for the education of her children, by Comtesse de Genlis, who had been influenced by the nature theories of Rousseau. History, language and simple moral lessons were the subjects. The method was not far removed from the kindergarten system which also is, in principle, dramatic. For the rest, private theatricals at Christmas, and on other special occasions, carry us forward to our own times.

In 1903 in the Educational Alliance Building on the east side of New York, 'The Children's Theatre' was founded by Miss Alice Minnie Herts, with Mrs. Sheridan Fry as director of plays. Miss Herts' book, 'The Children's Educational Theatre,' written after seven years' close experience, explains the reason of its origin, the enthusiasm with which the undertaking was supported, and the wide influence it has exerted. It also prescribes exactly how similar theatres can be organized all over the country. The dramatic impulse, say the author, 'is a primitive impulse, not to be confused with dramatic talent, which is a specialized form of it. This instinct cuts a new and safe channel for a hitherto undirected stream of human energy. The demand of children for interesting entertainments is often met by nothing better than cheap vaudeville or moving picture shows.' Miss Jane Addams, in 'The Spirit of Youth, also expresses the same; interweaving the delightful little character studies
of a close warm-hearted observer. Short stimulating essays on the subject, by Dr. Eliot of Harvard, Miss Van Vechten, and Miss Stanley, are incorporated in Miss Herts’ volume. This theatre, after many haphazards, is still in existence. In 1911 the Educational Players, a body of young amateurs, an offshoot from the Children’s Educational Theatre, gave pupils. Its members (generally free) in the public schools; and a few of their plays were written with these special school audiences in view. A ‘Handbook of the Educational Player Method,’ by Mrs. Sheridan Fry, is worthy of a classic place in the literature of pedagogy for the skill with which the author relates herself to the psychology of the child. The model rehearsal illustrated in the book is a work of fine art in its own way.

In 1913 the Educational Dramatic League was founded with Mrs. August Belmont as president and Mrs. Sheridan Fry as colleague. This powerful organization (a national, not a local body) is doing excellent work among the schools, and in the social, civic and recreation centers. The League works co-operatively with the schools and centers; lending books of plays, costume plates, costumes and even sets of screens for backgrounds, for merely nominal sums to its members. It serves in some sort as a clearing house, introducing teachers or leaders, and holding classes to instruct school teachers and others how to direct their own plays.

The aims of the Educational Dramatic League are exactly those forwarded by Miss Herts and Mrs. Sheridan Fry, who founded the Children’s Educational Theatre, with the advantage of extended scope. The League does not encourage the making of actors, but seeks to guide the existing dramatic instinct of the child, for the profit of all concerned, both intellectually and emotionally. The visiting side of the work is being developed, and various charitable and other institutions gladly welcome the merriment that these youngsters are able to carry with them from outside. When cast for a part in a play a child refers to the history, geography and customs of the country or locality in which the play has been set, builds up the particular costume, studies the literary and eloquentary values of his or her part, to fit it to the ensemble, and directly and indirectly absorbs many a lesson in an entertaining way, the work not being without its difficulties at every step. So that, far from the child lying in danger of finding itself drawn into the net of that fell disease, “stage-struckness,” it has been very properly urged that our little hero or heroine receives such a foretaste of the difficulties of the actor’s lot, robbing it of all glamour, that the experience proves an almost unfailing antidote—except in the case of either the elect or the incurable—not to be prevented or gainsaid under any system.

Nothing is more popular or more fruitful of good results in the settlement and neighborhood and recreation centers of the large cities than this dramatic activity of the children. In the Little Theatre of Hull House, for example, the productions of children’s plays are given every year. The Boston Women’s Educational and Industrial Union has established an association, the Children’s Players, organized from among college and private dramatic clubs. At

the House of Play, a little theatre in Washington, D. C., the best plays for young people are regularly given by children, under the auspices of the Drama League. In such ways (and volumes of instances might be quoted) highest art appreciations are formed and the taste educated against inferior work.

Aside from the foregoing types of plays and acting, the readiest method of developing the dramatic instinct has been by dances, action songs and games. In the natural sequence these have, as times and occasions permitted, developed into the festival and the pageant. In the olden pastoral life of civilized, and even uncivilized peoples, it was usual for the young to join with the adults in the sports and pastimes of the festal days. The only concern the schools of organized communities had with these till lately was in the granting of holidays to the children. Then came the rise of machinery and factories, the spread of large cities and the consequent depopulation of the rural districts (particularly in Anglo-Saxon countries). With the introduction of these changeful old-fashioned revels were gradually forgotten, and the natural instinct of the people for shows and showing was kept afloat only through spectatorship, fatuous and empty enough, for the most part. It could hardly be a matter of surprise that the sober-sided Puritans resisted these stupid entertainments, not realizing causes. But since it has been clearly demonstrated that there is no more refining influence than where the people of all ages are freely encouraged to play in common, especially when that play has a picturesque and emotional and intellectual tendency, our Puritan friends have been among the staunchest supporters of this community art. Meanwhile, it became the custom for the schools to initiate more or less formal celebrations on state occasions, on festival and commemoration days, and at the commencement or close of the school year. These, however, were only a little less severely disciplined than the regular lessons. John Ruskin, himself of Puritan Scotch descent, is said to have been the first to instigate a change from these methods in his suggestions for the revival of the ancient spirit of May Day. Since then the growth of the genuine festival cheer, both in and out of schools, has been in the ascendant. Commencement exercises and other such functions have partaken of the freer spirit of olden time revelry; and a wide appeal for the use of dramatics, even during lesson-hours, for the sake of a fuller and richer education, has met with pronounced success in Europe, the United States and the English colonies. Declamation, dramatization, singing, dancing, historical and fancy costume-making are now being treated as integral parts of the curriculum of the finer sort of school, where formerly these subjects were accounted mere "fads and frills," appropriate only for the overtime of worn-out teachers and pupils. Educationists of distinction are now generally of the opinion that the various branches of children’s dramatics coordinate all other subjects (language, history, geography, etc.), that they considerably augment young people’s power of understanding all other lessons by visible and tangible aids and supply the fundamental test of all literature—the oral. Then, again, not only does the pupil
gain a lively impetus in his general work by study and rehearsal on his own account, but also in spontaneity and often stimulating co-operation with other performers. At every point do the enthusiastic teachers desery some gain resulting from these methods, not the least gain being the world-wide demand for a more intellectual theatre, with which the children's dramatic movement has been concurrent.

Since the Ethical Culture School of New York, under the leadership of Mr. Percival Chubb, began experiments in communal dramatic forms some years ago, the practice has had great extension on all sides. The schools themselves have developed new types of festivals and pageants. The various training centres for teachers, the Boston Normal School, the Brooklyn Training School and the Teachers' Training College of New York have all made interesting experiments. These have had much direct and indirect influence on the children's performances and promoted many productions. The procession of the seasons, the anniversaries of the births and deaths of famous men and women in every field, the circumstances (and how they influenced the play) of world events and innumerable other topics, as well as the time-honored festivals (Christmas, New Year's, Twelfth Night, Easter, Arbor Day, Fourth of July, Michaelmas, Harvest Thanksgiving) are being celebrated in most creditable performances in many schools and settlements; the tenor of these productions being likely to live long and happily in the memories of the young participants.

In 1910 eleven settlements in Brooklyn united in presenting the "Pageant of Patriots," showing the youth of various American heroes before an enthusiastic audience of 10,000 people. On 7 June 1914, under the auspices of the People's Institute and of Social Centre P. S. 63, the "Festival and Pageant of Nations" was given in New York city. The folk costumes and much of the character and customs of the nations, of foreign peoples living in New York, were represented. Before a cheering crowd of 20,000 people 2,000 children and 1,000 adults gave this most successful performance.

For all manner of information toward making and shaping, spreading and showing every sort of play for young people, consult Miss Constance Mackay's invaluable guide, "How to Produce Plays for Children," written from the standpoint of the new stage art; also the works below.

Bibliography.—Play Lists: Whereas it was formerly necessary for thousands of amateur producers distant from the big cities to depend almost entirely upon textbooks, they have now the advantage of being able to consult two well-informed spirited institutions, the Drama League of America and the before mentioned Educational Dramatic League, New York, which is constantly making additions to a collection of printed and manuscript plays not to be found in the ordinary current lists of plays. Inquirers are also invited to address Miss Kate Opie, "The Power of Purim and Other One-act Plays for Jewish Religious Schools," (Theatrical Review, 1915); Tabor Department The Drama League of America, at the New York and Chicago centres. The special pamphlet, "Plays for Children," contains many useful suggestions, a catalogue of useful books on costumes, reference books, etc., as well as classified lists of selected plays in English, French, German, and often on stimulating co-operation with other performers. At every point do the enthusiastic teachers desery some gain resulting from these methods, not the least gain being the world-wide demand for a more intellectual theatre, with which the children's dramatic movement has been concurrent.

Home Plays: Arkwright, Ruth, "Brownkinds and Other Fancies" (New York 1911); Bell, F. E. E., "Fairy Tale Plays and How to Act Them" (New York 1906); Bulivant, H., "Home Plays," a miscellaneous collection of 27 plays for boys and girls by various writers (New York 1911); Burrows, Edith M., "Cheery Comedies for Christmas" (Boston 1913); Carter, Mrs. Elsie H., "Christmas Candies" (New York 1913); Chapman, J. J., "Four Plays" and "Dumpling's Isle and Other Plays" (New York 1911); Dalkeith, Lena, "Little Plays Told to the Children" (New York 1907); De Mille, W. C., "Christmas Spirit and Votes for Fairies" (New York); Dugan, Caro, "The King's Jester and Other Plays" (New York 1899); Goodlander, M. R., "A Book of Fairy Plays: Nine Short Plays" (New York 1915); Harper's "Book of Little Plays," by Margaret S. Brisco, J. Kendrick Bangs, Caroline A. Crewe, Margaret E. Sangster and others (New York 1910); Harris, F. CHILDRESS — CHILE

CHILDRESS, Tex., town and county-seat of Childress County, 200 miles northwest of Fort Worth, on the Fort Worth and Denver Railroad. There are railroad repair shops located here. The waterworks are municipally owned. Pop. 3,818.

CHILDS, George William, American philanthropist and publisher: b. Baltimore, Md., 22 May 1829; d. Philadelphia, 26 Nov. 1893. He published the Philadelphia Public Ledger, 1864-94, which he made one of the first cheap newspapers in the United States. Under his management the Ledger attained a large circulation and wide influence. He educated over 800 children. He gave a Shakespeare "Shorial" to Crichton Park, a memorial window in Westminster Abbey to Cowper and Herbert and assisted in establishing a home for printers at Colorado Springs. He published 'Recollections of General Grant' (1885), and 'Personal Recollections' (1889).

CHILDS, Thomas Spencer, American clergyman: b. Springfield, Mass., 19 Jan. 1825; d. 21 March 1914. He was educated at New York University and at Princeton Theological Seminary. He entered the Presbyterian ministry and held pastorates at Hartford, Conn., 1851-66; Norwalk, Conn., 1866-70; Washington, D. C., 1882-90. In 1870-79 he was professor of biblical and ecclesiastical history at Hartford Theological Seminary and in 1880-82 was professor of mental and moral science at the University of Wooster. In 1889 he joined the Protestant Episcopal ministry and from 1894 to 1901 was archdeacon of Washington. In the latter year he became rector at Chevy Chase. He published 'Justification' (1861); 'Hints to Christians' (1862); 'The Heritage of Peace' (1868); 'Christ His Own Witness' (1880); 'The Voice of God to the Nation' (1901); 'Christian Unity and Church Unity' (1902); 'Mormonism and the Labor Question' (1904).

CHILE, chēl', or CHILI, chēlī (the republic of), situated on the western coast of South America, between the Andes Mountains and the Pacific Ocean, is bounded on the east by Argentina and Bolivia and on the north by Peru. In length it surpasses even Argentina (q.v.), for it extends from lat. 55° 59' S. to 16° 52' S. in a curving line of the total length of which is nearly 2,700 miles, but its greatest width is only 248 miles, and in the narrowest part the measurement from west to east is less than 70 miles. The total area is 292,419 square miles. Besides the Andean Cordillera on the east, there is a parallel western coast ridge or cordillera with moderate elevations, and in the valley between the two, from Santiago, the capital, to the south, are found the best agricultural districts and many towns. Compared with the other South American countries, Chile ranks as the seventh in size. The northern part of Chile is a hot desert; the southern a cold region of almost incessant rains; but between these extremes lies a great extent of territory blessed with a temperate and healthful climate. Dividing the republic, for convenience of characterization, into five zones, in the lower three, despite its nearly absolute lack of vegetation, are the chief resources of the national wealth — the deposits of nitrate of soda, mines, etc. The second zone, extending toward the south, is less torrid. Rain falls several times in the year;
and though mining is the chief industry, small areas are also devoted to agriculture. The third zone, in the centre of the country, has a temperate climate and fairly abundant rains. Cattle-raisin, mining and the cultivation of cereals, vines and fruits are the leading industries. In the fourth zone, where rains are more copious and the climate cooler, the chief products are wheat, cattle and lumber. The fifth and most southerly zone, extending to Cape Horn, is cold and rainy. From 43° 30' southward, about 1,150 miles is a district of islands and uplands, rich in forests, fisheries and lands suitable for stock-raising.

**Physiography.**—The country is a valley enclosed between two lines of mountains. On the east is the Cordillera of the Andes, diminishing in height to the south, where its line is crossed by various rivers and lakes. On the west a parallel, lower range, the coast Cordilera, is interrupted from about 42° S. lat. by many arms of the sea. It contains the line of the coast that forms Chile's western boundary. Geographical contrasts and extremes are here illustrated. The Longitudinal Valley, admirably fertile between 30° and 42° S. lat., is prolonged in the arid desert of the north, but in the south is submerged beneath the ocean, becoming a drowned valley. The Cordillera of the coast is, geologically, older than that of the Andes. It is lower and less continuous, but so far resembles it that it presents, generally speaking, an abrupt slope to the west, while sinking much more gradually to the east. In Tarapacá it rises, almost from the sea, to heights varying from 1,000 to 7,000 feet. In Atacama it averages 3,000 feet, culminating in Peñarave (7,300 feet). Farther south it recedes from the sea and sinks in height till it disappears below Tres Puntas. It rises again to some 7,000 feet in the central provinces, notably in Róbles and Campaña, near Valparaíso. South of the river Ropel the range becomes lower and more complicated. Further south it splits into two parallel low spurs. South of the Bio-Bio it is known as the Cordillera of Nahuelbuta. Still further toward the south it shares with the valley, its companion throughout, that plunge already mentioned; but its peaks and high plateaus form the line of the islands clinging to the curved shore-line, though only at one point, the peninsula of Taitao or Taytaya, is it visibly united to the continent.

Rivers that rise on the western side of the coast Cordillera form the smaller hydrographic system of the country; and the larger hydrographic system, the available source of unlimited power for industrial uses, includes rivers which have their source in the Andes and flow to the Pacific Ocean. North of lat. 28° S. all the rivers, except the Azufre of Tacna and the La Restinga that fall on their watersheds at another portion of the year. In the region just below this, to lat. 35° S.,—and particularly in the Valparaíso-Santiago section—are rivers swollen by the melting snow on the mountains in November, December, January and February and by rains that fall on their watersheds at another period. The more important of these annual floods is the former, which brings down into the agricultural valleys alluvial silt to renew their fertility. But below lat. 35° S. the rivers are subject to floods, especially in June and July, rather than in the season from November to February, because the melting of snow on the mountains affects the total volume of water much less in these latitudes. Navigable rivers are comparatively few, and in any event they would be called upon to play a less important role here than that assigned to the great inland waterways of Argentina and Brazil, since the ocean itself facilitates communication with, or between, the different parts of this narrow country. The Andean rivers of the country rise at great altitudes and accomplish their descent to the coast by a series of cascades and great waterfalls, not at a single point or two, but in many widely separated regions.

Above the southern limits of the arid zones are saline depressions in lieu of lakes, although in remote ages, before radical changes of climatic conditions had occurred, the lake region embraced these northern districts. Lakes are still numerous in the south and are often found at imposing elevations. There are almost startling variations of temperature between the hours of sunlight and the mainland hours of darkness. Rainy places among the mountains and in the northern zones generally. The severity of winter's cold is confined to the Far South and the high Andes. Snow never falling on valley or foothill north of lat. 36°. The difference occasioned in climatic conditions by the cold current from the south that flows northward along the west coast is noteworthy. The mean annual temperature on the west coast, whenever the influence of this current (the so-called Humboldt current) is felt, is 5° to 7° F. lower than that of places in the same latitude on the east coast. The Humboldt current reaches Chileo Island and thence flows northward to the equator. South of Chileo, therefore, or, more exactly, from Taytaya Peninsula southward, we find other climatic influences and conditions: and this statement applies to the entire territory of Magellan (Territorio de Magallanes) which, embracing nearly one-fourth of the total area of the Republic, extends along the Pacific Coast from lat. 47° S. to the southern extremity of South America. On the southeast it is, indeed, separated from the Atlantic Ocean by outlying portions of Argentina; nevertheless the most important eastern outlet is secured to it by Chilean control of both sides of the Straits of Magellan. It has thus practically no coastal line on either ocean. The main divisions of the territory are the islands and channels north of the Straits of Magellan, up to the Peninsula of Taytaya; north continental section, central continental sections, and the larger hydrographic system; south continental section—Chilean Patagonia—peninsula of Brunswick; western islands and channels of Patagonia; islands, and channels south of the Straits of Magellan; Tierra del Fuego (Chilean portion); and the islands and channels of the Fuegian Straits.

The total area of the Territorio de Magallanes (66,861 square miles, almost equally divided between the continental part and the islands) is much greater than that of Rumania and only a little less than that of Uruguay. The Territorio de Magallanes, written by Lautaro Navarro Avaria, shows that the territory has received more immigration during the last few years than has been available for the development of other portions of Chile. A great majority of the immigrants were men who came to take part in sheep-

raising and various industries, or who were attracted by reports of the discovery of gold. The population at the date of the last census was only 23,650, 80 per cent of which was in the city of Punta Arenas and the town of Porvenir, and 20 per cent in the rural districts devoted to stock-farming. The climate is the wildest, but sheep thrive uncommonly well on the immense pastures. The maritime traffic of Punta Arenas, despite its geographical remoteness, is very little inferior to that of Valparaiso, because its position on the Straits of Magellan makes it the port at which a thousand vessels—warships, merchant steamers, sailing vessels—call each year, to renew provisions or effect repairs of engines, or to spend a few hours waiting a favorable moment for passing the more or less dangerous points. See Juan Fernández Islands.

Flora and Fauna.—The essential characteristics of the Chilean flora were impressed upon it by the primitive isolation before the Argentine Pampas were lifted out of the waters that covered them. Even now the country is, on that eastern side, shut in by the Andean Cordillera, and on the north it is cut off from the rest of the continent by the desert; formerly its separateness was like that of a Pacific island; and so naturally it is distinguished botanically by the large number of indigenous species peculiarly its own. Among these are two genera and five species of *Fragaeanus* (the monkey-flower), and several species of *cactae*. The potato is said to have come originally from Chile. It is still found wild in Chiloé and the adjacent islands and mainland. The bean and peppers are also indigenous, and maize and quinoa were grown in the country before the Spanish conquest. The forests of the Juan Fernández Islands, in so far as they have maintained their primitive character, may be classified with subtropical evergreens, because all their trees and shrubs, with the single exception of the michai (Berterea corymbosa), which sheds its leaves in July and August, remain green throughout the year, thus showing adaptation to a temperate and uniform climate. Even a tree by nature deciduous, namely, the pehuen (*Austrocedrus chilensis*), retains its leaves all winter long when naturalized in Masatierra. Decidedly less noticeable in the fauna than in the flora are the insular or separate characteristics just referred to, although the fauna also differs from that of other South American countries to the extent of excluding jaguars (so common in regions just beyond the Andes), venomous snakes, monkeys, lizards (save in the northern zones) and river turtles. There are 12 genera and 25 species of rodents. In this order are included the beaver-like coyú and the chinchilla. Among carnivora we find the wildcat, puma and fox. Characteristic ruminants are the huemul deer and the small pudú (the latter peculiar to Chile), and those wild members of the llama family, the vicuña and guanaco or huanacon. Birds, great and small, are the condor, the white and the black albatross, pelican, giant petrel, penguin, rhea (South American ostrich), cormorant, the barking guá-guá, tuco-tuco, the swift, humming-birds, and three species of humming-birds (one peculiar to Chile). Fish, comparatively rare in the rivers, abound in the ocean near the coast and in the channels of Magallanes Territory, and are taken in great numbers in the northern harbors. Chilean waters are also visited by whales and at least six species of seals.

Political Divisions and Cities.—The republic of Chile is divided into 23 provinces and the territory of Magallanes. In alphabetical order, with their areas and populations, capitals and populations, they are as follows:

Total (1914): 289,829,3,596,541

Population.—In 1907, the date of the last census, the population numbered 3,249,279, and in 1917 it was estimated as nearly 4,000,000. The great majority of the population is of European origin. The indigenous inhabitants are of three branches, the Fuegians, mostly nomads, living in the extreme south, the Araucanians (100,000), the ancient rulers of the country, who so long bravely resisted the white invaders, live in the valleys or on the western slopes of the Andes; the Pangues, who inhabit the northern coast regions and perform the bulk of the labor there. Immigration is small, but is encouraged by the government. The total number of immigrants between 1905 and 1914 was 25,544. Colonies (agricultural settlements) are encouraged and their number and importance are increasing.

History.—The dominion of the Incas of Peru included the northern and central portions of Chile—at least to lat. 37° S. In 1535 the Spanish conquerors of the Inca empire sent their first expedition southward along the Pacific Coast; but the task of adding this territory to the Spanish possessions in Perú and Upper Perú (Bolivia) was not undertaken in earnest until 1541; nor was it brought to a successful conclusion without desperate fighting in the second half of the 16th century. Pedro de Valdivia suffered defeat and death in 1553 at the hands of Launce, the young Indian leader, and not of the famous Caupolican as many writers have asserted. Both Barros Araña and Frazariz deprive Caupolican of the glory that Erría first bestowed upon him. The Araucanians offered a stubborn resistance, and even as late as the 18th century they made
good their prior claim to a large part of the country below lat. 37° S.

In September 1810 was formed the first national government, to rule the country during the captivity of the king of Spain, whom they emained host as prisoner. From that time forward the design to achieve independence was never relinquished, though the events of the years immediately following were of a character to discourag patrioic aspirations. Chileans were defeated and compelled to return to a nominal subjection; the main success was won with the help of Argentine troops under General San Martin (see ARGENTINA), and the independence of the country was proclaimed in 1818. A constitution, adopted in 1824, and remodeled in 1828, was given in 1833 its final shaping, substantially the form which it still retains, though modifications demanded by the progress of the country have been made. Independence was recognized by a formal arrangement with Spain, and embodied in the treaty of 1844. In 1853 a war broke out between the mother country and Chile and Peru, hostilities continuing until 1859. After an interval of peace, the War on the Pacific began. For many years the rights of Bolivia and Chile were in dispute; the main string was bordering on the Pacific Ocean remained without definition; but in 1874 an agreement was entered into between the two countries which apparently disposed of the question at issue. The exploitation of these lands by Chilenos increasing, Bolivia reopened the dispute by imposing an export tax on the nitrate, obtained in Bolivian territory. A Chilean company refused to pay the tax, alleging that it contravened the treaty of 1874. The Bolivian government's reply was an order for the sale by auction of the property of the offending company, on 13 Feb. 1879. Thereupon the Chilean government sent a man-of-war to seize the port of Antofagasta. It soon became apparent that Chile would be obliged to deal with Peru against whom a secret offensive and defensive alliance had been formed by Bolivia and Peru in 1873. On 5 April 1879 Chile declared war against the latter republic. Tacna and the rich copper mines of Arequipa were occupied by the presidents of Peru and Bolivia with their troops; the defense of Iquique was entrusted to a sufficient force, and at Lima a reserve of about 10,000 men was held in readiness to meet the Chileans at any point that might be attacked. The plans of the allies seemed to have been well laid, and some initial successes fell to them. Two Chilean warships, the Esmeralda and the Corvadonga, blockading Iquique, were attacked by the Peruvian frigate Independencia and the monitor Huascar. The Esmeralda was sunk by the Huascar, but the latter on 18 October fell in with the Cochrane and Blanco of the Chilean navy north of Point Mejillones. A fight of great severity ensued. Only 86 men were left alive on board the Huascar, out of the complement of 216, when she was obliged to surrender. This vessel was repaired and added to the Chilean navy. Pisagua was captured from the Bolivians by Chilean warships. On 18 Nov. 1879, the allies were defeated by the Battle of San Francisco. Before the close of the same month they scored a dearly bought success against the Chilean forces in the battle of Tarapaca. Chilean divisions commanded by General Baquedano invested the town of Moquegua, and on 23 March 1880 entered Torata. Two months later the city of Tacna (now the capital of the Chilean province of that name) was taken (26 May). The tenacity of the allies, assisted by 3,200 Bolivians, commanded by Admiral Montero, and the Bolivian President, General Campero, sustained a crushing defeat. Arica, the port of this district, was attacked by the land and sea forces of Chile in June, and fell after the most desperate resistance in order to emphasize the defeat and to cripple the more important members of the alliance, the Peruvian coast was laid waste, Mollendo was destroyed, Callao and other ports blockaded and an expedition under Baquedano's command made ready to proceed to Lima. See PERU.

As the fruits of her victory, Chile took from Bolivia the districts of Cobija and Atacama; from Peru the coast line north of the present international boundary, and, exceptionally, the province of Tacna. Thus Chile's territory on the Pacific was extended northward from the old boundary, at lat. 24° S. One of the allies was cut off from communication with the rest, and the frontier of the Pacific Ocean; and a strategic frontier was established against the other ally. A truce, instead of a treaty, was concluded between Bolivia and Chile after the war, the sentiment of the Bolivians being utterly averse to any permanent arrangement which did not give them access to the sea. Renewal of negotiations for a definite treaty, which should include the cession of a seaport, was repeatedly urged by Bolivia, but without effect. Peru, by the terms of the treaty of Ancón (1883), surrendered to Chile absolutely the valuable nitrate district of Tarapacá, but with respect to the Tacna-Arica region a peculiar convention was made. It was agreed that Tacna-Arica should be governed by Chile for a period of 10 years, and that, at the end of the decade, the vote of the inhabitants should decide whether it would be better for the province to revert to Peru or to be administered by Chile in the future—the country was occupied by the presidents of Peru and Bolivia with their troops; the defense of Iquique was entrusted to a sufficient force, and at Lima a reserve of about 10,000 men was held in readiness to meet the Chileans at any point that might be attacked. The plans of the allies seemed to have been well laid, and some initial successes fell to them. Two Chilean warships, the Esmeralda and the Corvadonga, blockading Iquique, were attacked by the Peruvian frigate Independencia and the monitor Huascar. The Esmeralda was sunk by the Huascar, but the latter on 18 October fell in with the Cochrane and Blanco of the Chilean navy north of Point Mejillones. A fight of great severity ensued. Only 86 men were left alive on board the Huascar, out of the complement of 216, when she was obliged to surrender. This vessel was repaired and added to the Chilean navy. Pisagua was captured from the Bolivians by Chilean warships. On 18 Nov. 1879, the allies were defeated by the Battle of San Francisco. Before the close of the same month they scored a dearly bought success against the Chilean forces in the battle of Tarapaca. Chilean divi-
were all those who disapproved of his vigorous liberalism on principle, and all who were jealous of his great ambition. In 1898 the country was plunged into civil war. The operations of the forces of the revolutionists were directed by a junta representing Congress. The President assumed the powers of a dictator for the defense of his position; but he was deposed, and died by his own hand, on 19 Dec. 1891. The opinion prevailed in Chile, when this conflict was at its height, that the United States government, through Minister Patrick Egan, was showing favor to the cause of Balana, and discriminating against the Congressional party. The fierce resentment felt by the latter expressed itself in an attack upon sailors of the United States cruiser Baltimore, who became involved, while on shore, in a brawl with Chilean sailors. There was a riot of the populace in the streets, and several of the Baltimore's men were seriously or mortally wounded. When a report of this indignity reached Washington, suitable representations were made by the authorities there, but unfounded. After the destruction of the ship, representations were made to a merely provisional government at Santiago. The latter not only refused the demand for satisfaction, but insisted that the men who had been assaulted should be handed over to Chile for trial as criminals. The management of Chilean affairs was entrusted to President Montt, and the demand of the United States was emphasized by sending of two additional warships to Chile. The new government apologized for the discourtesy of the provisional government, as well as for the attack upon men wearing the uniform of the United States; and compensation was made to the wounded sailors, or to the families of those who had died.

Chile and Argentina had agreed that their common boundary should be a line running along the crest of the Andes, which was erroneously supposed to be the watershed throughout. Discovery of this error occasioned disputes at first, and finally a resort to arbitration. By mediation of the Ambassador of the United States, an agreement was reached as to the northern districts. The more intricate southern portion was surveyed by a boundary commission under Sir T. W. Holdich; and King Edward was proclaimed emperor of the Argentine in 1902. On 28 May 1902, the plenipotentiaries of Chile and the Argentine Republic concluded two important agreements, the first of which provides for the arbitration of all questions not affecting constitutional precepts, or that cannot be settled by direct negotiations. It is entitled a "General Treaty of Arbitration," and the desire is expressed in its introductory clause "to settle by friendly methods whatever questions may arise between the two countries."

The second agreement is entitled a "Convention on Naval Armaments," which has "the object of removing all causes of anxiety and suspicion." The two governments renounce the acquisition of war vessels they have in construction, and the consent of four new acquisitions; agree, moreover, to reduce their respective fleets until they arrive at a prudent equilibrium."

On 25 May 1905 Señor Alejandro Lira signed the A. B. C. peace treaty at Buenos Aires. Diplomatic relations with Peru were severed in 1909 but no serious results ensued. On 10 July 1911 King George of England rendered his award in the Alsol claim, assigning $935,000 to the Alsol firm. The original amount of the claim was $3,000,000 with interest. Chile paid the amount 13 November through the government of the United States. In 1913 the railway from Arica on the coast of Chile to the Bolivian plateau was completed. The control of this railway is to be retained by Chile for 15 years, that is, until 1928. In 1915 Chile felt very keenly the effects of the Great War; the suspension of her credit in Europe, the loss of her export market and the obligation to secure her imports from new sources. Readjustment soon took place, however, and in some cases on a healthier basis. Bad credit practices have been destroyed; desirable re-}
of Tacna, Serena, Valparaíso, Santiago, Talca and Concepción; one or more justices of the peace in each department of the republic; and sub-delegation of minor district judges. Juries exist only for suits involving the question of abuse of the freedom of the press. Senators must not be less than 30 years of age, and must have a fixed income of $2,000 a year. Deputies also must be not less than 36 years of age; and, they must be possessed of a fixed income of $500 per annum and, also like senators, serve without salary. Every married male Chilean of 21, or unmarried man of 25, not civilly disqualified by judicial act, is an elector. It is provided, however, that he must be able to read and write and must have a certain amount of property. The literacy test disfranchises considerably more than one-half of the possible electorate. This makes the members of the Congress the choice of a few electors. The President, who must be a native Chilean of not less than 30 years of age, is chief of the executive branch. He is elected by representa- tives who are themselves, by direct vote of the whole electorate, sent to a special congress for the purpose. The President is forbidden to leave the country either during his term of office or in the following year without sanction of Congress. His salary is $15,000 per annum. He is assisted in his duties by a Council of State of 11 members, five of whom he appoints, while six are appointed by the Senate. With the sanction of the Council of State, the President may convene extraordinary sessions. In the event of the President’s death or abdication, the Minister of the Interior becomes Vice-President and chief of the executive branch. The President is, ex officio, chief of the army. The executive is represented in each department by a public prosecutor, who initiates civil and criminal prosecutions and is an officer dependent on the ministries of justice and of the interior. Limitations of the presidential influence and its subordination to the legislative power appear very clearly in the circumstance that the Cabinet must resign if it encounters an adverse vote in Congress.

Education.—In many parts of Chile education scarcely touches the common people; but, so far as the upper and middle classes are concerned, the educational system is fairly well developed. Elementary education is free, but not compulsory; and although there are schools of some kind in all towns, 75 or 80 per cent of the population as a whole must be called illiterate. The University of Chile in its various departments (including law, engineering, mine- ine, philosophy and the fine arts) has an attendance of 1,300. Other public educational institutions are the National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lyceums of secondary instruction for men; and 15 lyceums for girls; 6 normal schools; a conservatory of music; a commercial institute; also schools of fine arts, agriculture, arts and trades, for the blind and for deaf-mutes, professional schools for girls and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic Uni- versity has courses of engineering and law. There are several schools of history and fine arts; an astronomical observatory and meteorological observatories; botanical gar- dens and, in various parts of the country, 41 public libraries, with 240,000 volumes. At Copiapó, La Serena and Santiago there are mining schools; and agricultural schools at Chillán, Concepción, Ancud and other cities. In 1916 the Chilean legislature voted to es- tablish a school of mining at Antofagasta owing to the importance which that province has assumed in the exploitation of the mineral wealth of the nation; and with a view to train- ing native engineers and to encourage the extensive development of mining in the Antofagasta and promoting their exploitation. Exceedingly interesting are the statistics relating to instruction in Magallanes Territory, for it is shown that 77.77 per cent of all inhabitants of that territory, above the age of six years, can read and write; 1.89 per cent can read but cannot write; and only 20.33 per cent are entirely unlettered. But the percentage of illiteracy in Chile as a whole is, as we have just said, nearly four times greater. Comparing the Chilean electorate by representatives who are themselves, by direct vote of the whole electorate, sent to a special congress for the purpose. The President is forbidden to leave the country either during his term of office or in the following year without sanction of Congress. His salary is $15,000 per annum. He is assisted in his duties by a Council of State of 11 members, five of whom he appoints, while six are appointed by the Senate. With the sanction of the Council of State, the President may convene extraordinary sessions. In the event of the President’s death or abdication, the Minister of the Interior becomes Vice-President and chief of the executive branch. The President is, ex officio, chief of the army. The executive is represented in each department by a public prosecutor, who initiates civil and criminal prosecutions and is an officer dependent on the ministries of justice and of the interior. Limitations of the presidential influence and its subordination to the legislative power appear very clearly in the circumstance that the Cabinet must resign if it encounters an adverse vote in Congress.

Education.—In many parts of Chile education scarcely touches the common people; but, so far as the upper and middle classes are concerned, the educational system is fairly well developed. Elementary education is free, but not compulsory; and although there are schools of some kind in all towns, 75 or 80 per cent of the population as a whole must be called illiterate. The University of Chile in its various departments (including law, engineering, medicine, philosophy and the fine arts) has an attendance of 1,300. Other public educational institutions are the National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lyceums of secondary instruction for men; and 15 lyceums for girls; 6 normal schools; a conservatory of music; a commercial institute; also schools of fine arts, agriculture, arts and trades, for the blind and for deaf-mutes, professional schools for girls and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic University has courses of engineering and law. There are several schools of history and fine arts; an astronomical observatory and meteorological observatories; botanical gardens and, in various parts of the country, 41 public libraries, with 240,000 volumes. At Copiapó, La Serena and Santiago there are mining schools; and agricultural schools at Chillán, Concepción, Ancud and other cities. In 1916 the Chilean legislature voted to establish a school of mining at Antofagasta, owing to the importance which that province has assumed in the exploitation of the mineral wealth of the nation; and with a view to training native engineers and to encourage the extensive exploitation in the Antofagasta and promoting their exploitation. Exceedingly interesting are the statistics relating to instruction in Magallanes Territory, for it is shown that 77.77 per cent of all inhabitants of that territory, above the age of six years, can read and write; 1.89 per cent can read but cannot write; and only 20.33 per cent are entirely unlettered. But the percentage of illiteracy in Chile as a whole is, as we have just said, nearly four times greater. Comparing the Chilean electorate by representatives who are themselves, by direct vote of the whole electorate, sent to a special congress for the purpose. The President is forbidden to leave the country either during his term of office or in the following year without sanction of Congress. His salary is $15,000 per annum. He is assisted in his duties by a Council of State of 11 members, five of whom he appoints, while six are appointed by the Senate. With the sanction of the Council of State, the President may convene extraordinary sessions. In the event of the President’s death or abdication, the Minister of the Interior becomes Vice-President and chief of the executive branch. The President is, ex officio, chief of the army. The executive is represented in each department by a public prosecutor, who initiates civil and criminal prosecutions and is an officer dependent on the ministries of justice and of the interior. Limitations of the presidential influence and its subordination to the legislative power appear very clearly in the circumstance that the Cabinet must resign if it encounters an adverse vote in Congress.

Education.—In many parts of Chile education scarcely touches the common people; but, so far as the upper and middle classes are concerned, the educational system is fairly well developed. Elementary education is free, but not compulsory; and although there are schools of some kind in all towns, 75 or 80 per cent of the population as a whole must be called illiterate. The University of Chile in its various departments (including law, engineering, medicine, philosophy and the fine arts) has an attendance of 1,300. Other public educational institutions are the National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lyceums of secondary instruction for men; and 15 lyceums for girls; 6 normal schools; a conservatory of music; a commercial institute; also schools of fine arts, agriculture, arts and trades, for the blind and for deaf-mutes, professional schools for girls and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic University has courses of engineering and law. There are several schools of history and fine arts; an astronomical observatory and meteorological observatories; botanical gar-
wheat, maize, barley, potatoes, rye, oats and forage plants. In the irrigated valleys of the north — in Tacna, Tarapacá, Atacama and Coquimbo — maize, gives two crops annually. Other products are grapes, many of the sub-tropical fruits, tobacco, sugar-beets, honey and hemp. Vineyards exist from the northern extremity to Llanquihue. In the north, from Tacna to Aconcagua, the slopes of the irrigated valleys are clothed with the luxuriant green of the vines. And in these irrigated valleys, from Atacama to Chile's northern boundary, there are generous crops of figs, pomegranates and olives. Some of the Chilean tropical fruits are exceptionally fine. There is an immense grazing area in Magallanes Territory, near the Straits of Magellan; and sheep and cattle thrive in that part of the country. The horses, bred in the central zones are short-bodied but powerful animals. Many conditions favoring agricultural development are present; but other conditions are very unfavorable. Nearly all the soil is worked; wheat is grown to a great extent on the Colchagua or Longitudinal Valley, especially from Cautín up to Aconcagua, in the provinces of Valdivia and Llanquihue on the south and Coquimbo on the north, is in the hands of wealthy families of Spanish descent who have been "absorbed into the local oligarchy." Although the law provides that land shall be divided up into equal shares among all children, a kind of patriarchal system prevails; and although a mansion or hacienda may shelter a group of families, the agricultural estates themselves are not split up. Consequently in these central provinces large estates are the rule. There is little modern enterprise; antiquated agricultural methods are still favored; leisurely and wasteful ways persist. Life on the haciendas is often very pleasant. Many of the houses are large, well built, delightfully equipped and money is plentiful. In the irrigated valleys of the north also much of the land is held by the ruling classes. There remain districts not yet absorbed for dwellings, but the chief drawback of these is isolation, lack of transportation facilities and labor.

In 1913-14 the principal crops, with their acreage and production, were as follows: Wheat 1,018,380 acres, 4,778,952 cwt.; barley, 152,085 acres, 2,389,157 cwt.; oats, 121,615 acres, 1,267,815 cwt.; maize, 58,609 acres, 752,791 cwt.; beans, 76,188 acres, 737,626 cwt.; potatoes, 81,299 acres, 197,348 tons; vines, 162,902 acres, 45,981,056 gallons of wine. On 31 Dec. 1913 the livestock of Chile comprised 4,745,047 horses, 38,193 mules, 1,968,620 oxen, 4,602,317 sheep and 221,384 pigs. Dairy farms and the production of butter and cheese is on the increase. In Patagonia and Tierra del Fuego large tracts of country are devoted to sheep-farming.

The total wool production of Chile in 1916 was 20,000,000 pounds, more than twice that of Peru, the other great wool growing country of South America on the Pacific coast. As Chile does not export agricultural products to any great extent, the European War did not have a marked effect on the agricultural situation. In the latter part of 1914 the closing of the nitrate fields deprived the farmers in the south temporarily of a good market for their products, but they found a ready market in the United States of America. The government has now adopted measures of consideration for mothers working in factories. A special room is provided in factories where mothers may keep their children under one year of age, and may spend one hour of the working day in caring for them without any loss in wages. The shutting down of the nitrate plants in the latter half of 1914 seriously affected over 50,000 laborers in the nitrate industries. The government was obliged to transport large numbers with their families to the agricultural districts where their presence served to depress the wages of the agricultural laborers. Early in 1915, the nitrate market greatly improved and the nitrate laborers were all returned to their own field of high wages. All manufacturing establishments of the central provinces also suffered severely in the first year of the war because the mills curtailed production. The miners were little affected by unemployment although employers complained of their inability to secure adequate currency for the payment of their men. The agricultural
laborers suffered least of all as agriculture was little affected and the war tended to raise the price of agricultural products.

Mining.—The deposits of nitrate of soda, or Chilean saltpetre (salitre), are in Táchira, Tarapacá, Antofagasta and Atacama, and their preservation is due to the rainlessness of those northern provinces. Measured from north to south, the deposits extend about 300 miles. Less than one-fourth of the total area of the salitreas has as yet been thoroughly investigated; but surveys of 2,242 square miles in that region, which was once the bed of an inland sea, were followed by the publication of the statement that 244,000,000 tons remained as a supply for the future. The annual exportation of salitre previous to 1915 exceeded 2,000,000 tons, valued at five-sixths of the entire export trade. But the exports of nitrate in 1915 were worth $77,781,158, as compared with $111,454,397 in 1913. The development was below normal for reasons stated under Banking and Finance. (See above, Commerce). In 1914 the exports of salitre fell to $40,474,663 quintals (101.4 pounds); but in 1916 it had risen to 64,781,125 quintals, or more than 3,000,000 tons, the largest in the history of the nitrate business in Chile. The return of profit from the exportation of nitrates and iodine [a by-product of the extraction of nitrate from the raw ore] is more than twofifths of the entire public revenue. The exports of nitrate in 1917 were less than in 1916 owing to the lack of shipping facilities to transport the stock on hand. The Chilean government, on 16 April 1917, sold at auction large tracts of nitrate lands and purchases were made by 11 companies, three of whose bids amounted to more than $1,000,000 each. Only two of the tracts offered were not sold.

Next in importance are copper ores, which abound in the ancient cordillera of the coast and the lower slopes of the Andes in the central and northern zones. The copper output of Chile is increasing, but is still the development of large copper properties in which North American capital is invested. Copper exports advanced from $10,337,351 in 1913 to $15,143,802 in 1915. During 1916 Chile exported the largest amount of copper in her history, 120,756 tons as arsenical copper. This amount was $41,353,000 in 1915. This increase was due to the large output of the Churiquimata and Teniente mines. In 1917 the copper mines of Chile were being increased, enlarged and improved. Iron mines in the Coquimbo district are also being developed by American capitalists. Large quantities of gold were obtained during the first century of the Spanish conquest by the use of unpaid native labor. In the 18th century the output of silver was large enough to be, in the words of Friar León, for Chile is much less a land of precious metals or precious stones than the equatorial lands of South America; but, in addition to copper and iron, Chile has coal in various sections of the country. The principal mining center is the coastal region south of the river Bio-Bio, as far as the port of Lebu. Deposits have been found still farther south. The coal fields of the province of Arauco, it is estimated, contain over 1,800,000,000 tons. The coal mining companies have invested this amount, $7,500,000 and now produce over 1,000,000 tons of coal per year. The product of these mines is from 10 to 20 per cent below the standard in the United States and Great Britain. Native coal is used in the factories at Lota and Coronel; on Chilean steamers and railways. The most interesting development of coal mining in South America is at Lota and adjoining regions in the province of Concepción. The territory of Magallans has no mineral resources that can be compared with those of the provinces of the north and centre of the republic. Veins of coal (lignite), not of the best quality, have for a number of years been mined at the Loretas, near Punta Arenas, and copper ores are obtained at Cutter Cove on the peninsula of Brunswick. There are washings of auriferous soils at some points in Tierra del Fuego and the Minas River; and calcareous and other ores exist. Mining is still in the initial stage in Chile. The number of work-people employed in mining in 1914 was 71,106, of whom 43,979 were engaged in nitrate of soda workings, 8,105 at coal mines and 11,142 at copper mines. But the absence of good coking coal has been a great handicap to the iron industry. Plants were being made, in 1917, to use charcoal in the smelters, and Swedish and Belgian experts, familiar with the iron industry, were experimenting in Chile where good charcoal is abundant.

Antofagasta is one of the departments of Chile richest in mineral wealth. Alum, salt, sulphur, nitrates, aluminum, borax, carbonate of lime, chloride of sodium, cobalt, carbonate of soda, nickel and potassium are found in various parts of the district. One of the largest known deposits of low-grade copper is at Churiquimata and is being worked by the Chile Exploration Company. Other extensive deposits exist at Caspana, Cerro Gordo, Conchi, Chacaya, Chon-Chon, Desesperado, El Cobre, Huacazul, Huanta-Jayita, Lagomar, Lomas Bayas, Mantos Blancos, Moctezuma, Noguay Tanymayo, San Lorenzo and a score of other places, some of which yield high-grade ores. There were copper smelters at Coloma, Churiquimata, Gatico, Antofagasta and several other places; and additional smelters were being projected in 1917. Iron, in various combinations, exists through the province; and mercury, blue vitrol, gypsum, trinitrate of potassium among its unexploited wealth. The gypsum covers the desert plains over large areas.

Manufactures.—The more important industries of Chile, after the chemical and metallurgical, are those concerned with the manufacture or preparation of food substances, beverages, textiles, clothing, leather, woodworking (including furniture and carriage building) and pottery. In 1917 there were over 6,200 factories, employing 80,697 operatives, of whom 27,138 were women and 6,443 children.

Six Chilean concerns make china and glassware and the "Fabrica de Vidrios" (Window-glass Factory) and the "Sociedad Nacional de Vidrios" (National Window-glass Company), both in Santiago, employ over 2,000 workmen. The latter has a capacity of over 25,000 pounds of glass a day. The manufacture of plate glass was begun in 1917. Beer and wine bottles, demijohns and other heavy utility glassware are made by the "Sociedad de Vidrios," which has a capacity of 36,000,000 bottles, which was (1917) sufficient to supply
the entire demand of the country. Several packing-houses had begun to carry on a profit-
able trade in fresh meat. The most important of these was La Compañía Frigorifica de Puerto Natales, with a capital of $100,000, and a capacity of 500,000 sheep a year, which was under construction at Ultima Esperanza, in Magallanes Territory. All the refrigeration plants were paying dividends of the 100 per cent a year, so great was the rush of business caused by the European War. The annual consumption of paper and paper products in Chile was, in 1917, a little less than $4,000,000, of which over $3,000,000 was imported. The local product consisted principally of colored poster, cover paper, wrapping paper and cardboard.

There are more than 100 factories in Chile manufacturing ready-made clothing, underwear, shirts and waterproofs. A very large part of the output of these factories is sold in the local market as imported goods. The knitting industry developed greatly between 1900 and 1917. On the latter date there were 17 factories in Santiago alone. One cordage factory, La Santiago, was owned and managed by Chileans in 1917 and was unable to supply the local demand. It was making an extensive propaganda to encourage the growth of hemp in Chile. The Santiago Lumber and Ship Company manufactures half the packing boxes in Chile and has a large output of shingles (1917). The European War called into being several furniture factories in Chile, and numerous establishments for the manufacture of food stuffs. Forty of these were represented at the Chilean Industrial Exposition opened at Santiago in September 1916; yet these were only a small part of the food producing factories of the country. More than 150 factories are engaged in the making of alcohol, liquors, beers and other drinks; and about 40 in the manufacture of mineral waters. In 1915 there were 139 establishments in Chile turning out paper and paper products. Of these 99 also did a general printing and binding business and 17 conducted lithographing establishments. The amount of the output of these factories was, in 1916, over $6,000,000. More than 90 per cent of the machinery used in the paper business in Chile is European.

The total number of factory employees is distributed as follows: brewers, 2,125; glass and pottery, 1,053; food products, 12,068; gas and electricity, 1,208; shipyards, 1,034; clothing, 14,016; furniture and wood products, 12,393; building supplies, 1,365; textiles, 2,508; metal products, 6,800; paper and printing, 4,731; leather and furs, 12,279; drugs and chemicals, 2,871; tobacco products, 1,735; carriages and other vehicles, 1,530; miscellaneous, 731; total, 80,697.

Tariffs—Imports, being subject to specific duty or charges by weight (instead of ad valorem duty, as in the United States), may be dutiable on net weight, gross weight, weight including packing or weight including containers. No brief statement can summarize the prevailing rates. The import duties on all classes of goods except those which, from motives of public policy, are admitted duty-free; but it is important to note that the application of a specific tariff results in the payment of identical duties on articles having the same name and general description, even though there may be a wide range of quality. To make this quite clear and to emphasize the difference between the American procedure in this respect and the practice in the United States, a concrete instance may be cited, as follows: Suppose two different articles, one worth $1,000 and the other $2,000, were imported into the United States. The duty, if calculated on an ad valorem basis of 40 per cent, would be respectively $400 for the first and $800 for the second. But if these articles should be imported into Chile, the duty would be assessed regardless of the difference in quality. The effect is to encourage the importation of costly articles. Consult Filsinger, E. B., 'Exporting to Latin America,' New York and London 1916.

Commerce.—In 1915 the value of Chile's imports from the United States was $17,800,611; in 1914, $13,627,618; and in 1913, $16,616,618. In 1913 the last normal year before the war in Europe, the figures for Chile's foreign commerce were: Imports, $120,274,001, exports, $144,653,312; Great Britain leading in both exports and imports. This is followed by the United States and France. Chile's principal exports were: Nitrate of soda, 2,666,000 tons (metric tons of 2,204.6 lbs. in this item and each of the following): copper, 69,106 tons; oars, 63,515 tons; wheat, 52,291 tons; borax of lime, 42,001 tons; copper, 37,712 tons; bran, 14,855 tons; iron ore, 14,100 tons; wool, 12,786 tons; beans, 10,840 tons; hides, 5,681 tons; wheat flour, 5,612 tons; whale oil, 3,109 tons; iodine, 43,975 tons. The 12 leading Chilean ports, whose rating is based upon the value of their imports, are, in the order of such rating: Valparaiso, Talcahuano, Antofagasta, Iquique, Resguardo, Valdivia, Punta Arenas, Taltil, Coronel, Tocopilla, Coquimbo and Correa. On the other hand, the 12 leading in exports take rank as follows: Iquique, Antofagasta, Mejillones, Tocopilla, Taltil, Calcha Buena, Valparaiso, Coloso, Punta Arenas, Pisagua, Junin and Talcahuano. The imports during 1914, as classified by the Central Statistical Office of Chile, were, with values in United States gold: Oils, varnishes, paints and coal, $18,487,181; textiles, $17,838,117; mineral products, $15,972,919; vegetable products, $14,161,999; machinery, instruments, tools and apparatus, $11,192,688; arms, ammunition, 4,225; glass and pottery, 1,053; food products, 12,068; gas and electricity, 1,208; shipyards, 1,034; clothing, 14,016; furniture and wood products, 12,393; building supplies, 1,365; textiles, 2,508; metal products, 6,800; paper and printing, 4,731; leather and furs, 12,279; drugs and chemicals, 2,871; tobacco products, 1,735; carriages and other vehicles, 1,530; miscellaneous, 731; total, 80,697.

The effect of the European War upon Chilean commerce is described in the following paragraphs:

"The United States in 1915, for the first time, ranked first both in exports from and imports into Chile, receiving more than 42 per cent of Chilean exports and selling to Chile more than 33 per cent of the goods imported. Before the European War, the order of importance of countries in trade with Chile, both export and import, was Great Britain, Germany and the United States. But with the exports from Chile to the United States were $16,765,000 greater, the imports from the United States were $1,510,121 less in 1915 than in 1914. In other words, the increase in exports to the United States was greater than the total amount of imports from this source." (Supplement to
Commerce Reports, Annual Series, No. 41b, 10 Nov. 1916). In fact, the total imports from all countries showed a decrease of $42,538,977, while the total value of exports to all countries showed an increase of $10,179,052 in 1915 over 1914.

Currency.—Although Chile is nominally on a gold basis, the currency is convertible paper. Hitherto there has been no limit to the fluctuations in the exchange quotations, because there has been no fixed unit of value as a basis for rates. Theoretically, the gold unit does indeed exist, namely, the gold peso, representing 0.599103 grammes of gold. It is fine, or, say, 0.54918 grammes pure gold, of which the par value in terms of currency of the United States is $0.365, and its equivalent in British currency, 18d. But this law is not in operation, and the actual circulation is composed of government notes which are quoted on the market at rates fluctuating between 18 and 25 cents per peso. In 1913 the rates fluctuated in the neighborhood of 7½d., thus showing a depreciation in the paper currency of about 25 per cent. The action of the government in authorizing its conversion office to issue notes against gold at a fixed rate of 12 per cent on peso in 1916 indicates the possibility of the adoption of the gold exchange standard, in a manner analogous to that of Argentina (q.v.), Brazil, Mexico (in time of peace) and Panamá. The basis of exchange in Chile is the 90-day London bill, which is quoted in terms of pence per one paper peso (consult ‘Latin American Monetary Systems and Exchange Conditions,’ by Joseph T. Cosby, New York 1915, and ‘Modern Foreign Exchange,’ by V. Gonzales, 1914). Rates of exchange prevailing in Chile before the European War contrast with those prevailing in 1915, as follows: New York—sight currency of United States—$1.00 = 5.06 Peso paper, on 7 Feb. 1913, but 6.64 Peso paper on 22 May 1915; London—90 days = 10 1/32d. = 1.00 Peso paper on 7 Feb. 1913, but 7½d. = 1.00 Peso paper on 23 May 1915.

Banking and Finance.—Banks with offices in Santiago or Valparaíso or both are Banco de Chile, Banco de Santiago, Banco Alemán Transatlántico, Banco Comercial de Chile, Banco Español, Banco de Chile y Alemania, The Anglo-South American Bank, Ltd., Edwards y Compañía, Banco Germánico de la América del Sur, London and River Plate Bank, Deutsche Süd-Amerikanische Bank Akt. Ges., Banco de la República, Banco Italiano, Banco Frances de Chile. Many have established branches. The Anglo-South American, with headquarters in London, has branches not only at Santiago and Valparaíso, but also at Punta Arenas, Chiloé, Coquimbo, Copiapó, Serena, Iquique and Antofagasta. In the provinces we find, besides branches of the foregoing, The Banco de Concepción, Banco de Talco, Banco de Curico and Banco Comercial de Curica and Banco de Punta Arenas. The Banco de Chile is the national banking house of the government, though not strictly a government bank. There is, in fact, no government bank in Chile. Banking is carried out on rather more conservative lines than in most Latin countries. Interest is charged on time deposits, and deposit accounts, and advances are made rather more freely than is the habit with English joint stock banks. With the German, Italian and Spanish banks there is a certain amount of co-operation of the home banks supporting the Chilean houses, which adds greatly to their strength and influence, especially in financing big commercial undertakings. During the first 3 months of 1916 the deposits in the National Savings Bank increased 12 per cent over those of the corresponding period of 1915 and the deposits increased 17 per cent. The annual deficit in the national finances, which had become traditional, was changed in 1916 into a surplus. A government institution known as the Caja de Crédito Hipotecario lends on lands and buildings, 50 per cent of their market value. A private concern called the Banco Hipotecario de Chile carries on a similar business; and, organized under the same law (that of 1857) are the private institutions Banco Garantizadora de Valores and Banco Hipotecario de Valparaíso. The function of all four is, primarily, to assist agriculture but making loans on real estate for long terms. Some of these banks are of relatively modern origin. In the course of 20 years deposits have increased more than 20-fold in their “cajas de ahorrros,” as they are called. Foreign banks, duly incorporated under the laws of the country, are allowed to do business in Chile. There is, however, at present a project of law requiring them to invest or maintain in Chile the capital they declare for use in that country, and limiting the deposits they can receive in proportion to such capital. There were, in 1917, six foreign banks doing business in Chile, each having many branches. A comparison of the financial movement during the year ending 31 Dec. 1914 with that for the previous year shows that the European War caused—such is the statement in a memorandum by Chile—no impairment of the integrity of the banking situation, notwithstanding the fact that the foreign banks were constrained to remit to their home establishments the greater part of the funds that they had in the country. But it is necessary to place aside that statement another entitled “The Finances of Chile” in The Americas (Vol. I, No. 3), to the effect that the nitrate industry of Chile suffered perhaps more severely than any other industrial or financial interest of the country, because approximately two-thirds of the nitrate exports before 1914 were taken by Germany and Austria-Hungary, and these, of course, were cut off; that the effect upon the general business situation was serious, and the government was a direct and heavy loser in its revenues. Fortunately the government had large gold credits in Europe. These credits are understood to have been accumulated for the purpose of establishing the currency system on a gold basis; but, inasmuch as they are available for discharging other government obligations, it seems probable that the gold standard will be postponed.

The total funded public debt, as shown by recent figures, amounts to $215,256,035, of which $173,664,000 is on account of external, and $41,640,035 internal loans. The first public loan was for $5,000,000, raised in London in 1822. Others followed, and all were paid off. Then, from 1883 to the present time, Chile placed a series of loans, sometimes in Europe and sometimes in the United States, on favorable terms; and the acquisition of the nitrate fields, after the successful war with Peru and Bolivia (see above: History), placed
a vast source of wealth at Chile's disposal, enabling her to meet all requirements of the government, including the large increase in expenditures by the War and Navy departments; but this, unfortunately, did not prevent an excessive issue of paper. The annual expenditure approximated $70,000,000 gold in 1917 (on December 31), $131,470,000 Foreign Affairs; $2,160,000 Justice; $5,800,000 Navy; $7,400,000 War Department; $5,280,000 Public Works; $15,400,000 government railways; $9,000,000 public debt service, etc.). The budget for 1918 is as follows:

With the gold at 36½ cents American money and the silver peso at 23 cents, this amounts to a total of $61,890,280, almost $58,000,000 less than the budget for the preceding year. In February 1917 the Chilean Congress authorized a loan of 20,000,000 pesos, $7,600,000, for the extension of railway lines and the improvement of the condition of those now in existence. The profits of the fiscal year 1916-17 were ordered to be applied to certain railway construction. Congress also appropriated 380,000 pesos ($130,870) to enlarge the Alameda station; and 406,000 pesos for construction of the Lingue—Pichilemu line. The budget provides annually for the development of water and drainage-systems in the chief cities and for the construction of port works, which will represent an outlay, when completed, of more than $26,000,000. The revenues and expenses of the country have increased in 20 years as follows: In 1894, income $25,945,000 and expenses $20,739,000; in 1913, the last normal year before the war, the fiscal revenue amounted to $77,575,000 and expenses amounted to $80,800,000; in 1917 the government for 1914 attained the sum of $95,520,000; in 1915 the fiscal budget was reduced to $63,362,000, approximately.

Transportation and Communication.—The Longitudinal Railway, with a total length of 1,355 miles, extends from Iguique to Puerto Montt, through the Longitudinal or Central Valley (see above: Topography) and with branches to the chief ports. Thus a double system of intercommunication, by both land and water, is maintained. Besides this central line there are three transandine railroads and the independent lines of the nitrate fields—in all 4,521 miles. Other lines under construction increase the total to 5,684 miles (3,541 owned by the Chilean government and 2,143 miles privately owned). The Trans-Andean line, via Juan de la Pena and Santiago, from Llai-Llai, with Mendoza, on the Argentine side of the Cordillera of the Andes. Another mountain-climbing line is the international railway from Antofagasta to Oruro and La Paz in Bolivia, a distance of 719 miles. A railway built by the Chilean government with the co-operation of Bolivia connects the port of Arica with La Paz. This road—a short line between the Bolivian plateau and the Pacific Coast, was opened to traffic in 1913. Steamship routes are, at present, still those which were followed in colonial days, although a single Japanese line crosses the Pacific. Between Panama and Valparaíso, with calls at all the larger ports, and occasionally at the smaller ones also, English, Chilean, and other lines maintain regular service at highly remunerative rates; and by the southern route through the Straits of Magellan come and go vessels of all maritime nations. Coastwise shipping gives employment to many Chileans. In the aggregate, the shipping of Chilean ports exceeds—and relatively to populations very greatly exceeds—that of other Latin American countries. There are, moreover, 21,000 miles of public road, 528 miles of navigable rivers and 660 miles of navigable lakes. The length of telephone line in operation is 44,000 miles, with 55,000 miles of wire. There are 17,492 subscribers. A chain of wireless telegraph stations was nearing completion in 1917. These are located at Arica, Antofagasta, Coquimbo, Valparaíso, Talcahuano, Valdivia, Puerto Montt, Punta Arenas, and one on the Juan Fernández Islands.

The telegraph service is chiefly performed by the State, which owns about 18,000 miles, with 367 offices out of the total of 22,500 miles. In the interest of public education, the government has made a practice of circulating newspapers, reviews and other periodical publications free of postal charges. The number of post offices is given as 1,114, handling over 65,000,000 pieces of mail matter annually.

Army and Navy.—All males born in Chile, whether of native or foreign parentage, are, under the law of 1910, subject to compulsory service from the ages of 18 to 45; and the nominal strength of the permanent army is 23,216, of which number 17,132 are in the land forces. A system of military instruction and drill is enforced which practically renders a much larger number available in an emergency; the National Guard comprising all other men between the ages of 20 and 45. Plans for the army include three regiments of field artillery, two of mountain artillery, one section of machine guns, four companies of signal corps, the garrison, six regiments of cavalry, 16 of infantry, and one battalion of railway troops, besides the administrative units. The war strength of the first line is estimated at 150,000 men. The artillery units are armed with Krupp guns (f and 72 centimetres); the infantry with 7 millimetre Mausers. The police (about 500 officers, 1,000 non-commissioned officers and 6,000 men, organized on a military basis) are in charge of Santiago, the provincial and departmental capitals, etc. Establishments for military instruction are the Military Academy and school, cavalry school, artillery school, school for non-commissioned officers, and staff college, where higher studies can be pursued. The Chilean navy includes various classes: the armor-clads Captain Pratt, O'Higgins and Esmeralda; 4 protected or armored cruisers, 3 torpedo gunboats, 13 destroyers, 6 modern torpedo boats, 1 mineship and 1 hospital ship. Two Chilean dreadnoughts being built in England; 5 subs purchased for the British navy; and two submarines were
taken over by Canada. There is a naval academy at Talcahuano and a government naval school at Valparaiso.

**MARRION WILCOX.**

CHILE SALT PETRE, or CUBIC NITRE, is nitrate of sodium, NaNO₃, which, however, is not really cubic, but crystallizes in very obtuseangled rhombohedra. It is found in beds in the rainless district of Tarapaca, in Chile, where it occurs sometimes of great purity, but is generally mixed with other salts (one of which is iodate of sodium), and with sand and clay. These deposits cover more or less completely an area of more than 600 square miles. From the mines it is brought down by rail to the coast, and it is there transferred to ships, originally by means of rafts formed of inflated skins. The freight cost of the Chilkoot Pass is the most expensive, for when the first cargo was taken to Liverpool, about 1830, its character was not known, and as it could not find a purchaser it was finally thrown overboard. The next cargo went to France, where its value was recognized, and ultimately quantities were brought to England. The demand for it has gone on steadily increasing. It is used either in mixed artificial manures, or alone as a fertilizer. In the latter case, the bushel weight of which it is said to increase. It was anticipated that it might be used for making gunpowder, but the deliquescence of the salt has been found an insurmountable difficulty. It is, however, easily transformed into nitre by double decomposition with chloride of potassium, and large quantities are imported into Strassfurt, in Germany, for this purpose. It is, besides, substituted, whenever practicable, for nitrate of potassium as a source of nitric acid. The sole drawback to its general use for this purpose is the presence of chlorides, which, giving off hydrochloric acid, render the nitric acid impure. Of late the industry at Tarapaca has been greatly developed. The crude salt or "caliche," as it is called locally, is broken up and the nitre is extracted by lixiviation with steam and boiling water. The liquor flows continuously from one tank to another gathering more and more of the salt till it has gained the desired strength, and it is then allowed to cool, and the nitrate crystalizes out. From the mother liquor, the world's supply of iodine is obtained.

**CHILI MILLS,** machines for pulverizing ore as a preliminary to securing the values. In these machines vertical rollers run in a circular enclosure or die. The rollers and dies are now usually of steel although stone is sometimes used.

**CHILIASM,** kil' Lance, the belief that Christ will come to earth and rule the world from Jerusalem for 1,000 years. The Latin word millennium means the same thing. The Revelation of John is the chief authority of the Chiliasmists. Papias, Justin Martyr, Irenæus, Tertullian and Lactantius were Chiliasmists, but Origen was opposed to the notion. Papias, bishop of Hierapolis, says, in the millennium every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, every berry 36 times 25 gallons of wine; and if a saint comes to pluck a berry it will cry out, *Pluck me, O saint; I am better tor being plucked, praise the Lord.* The Fifth Monarchy Men were, of course, Chiliasmists, only they maintained that the Golden Age had begun, and that they were of it.

**CHILKAT, ch'il' kät, INLET, the western arm of the terminal part of the Lynn Canal, an inlet in Alaska, in about lat. 50° 10' N. It is in the territory in dispute for a considerable time between the United States and Canada which was finally settled by the treaty of 1846. It is 15 miles north and south and about 20 miles long.**

**CHILKOOT, ch'il'kōt, INLET, the eastern arm of Lynn Canal, an inlet in Alaska. It is again subdivided, its principal arm being called Taig, an inlet which stretches for 15 miles north and south in about long. 135° 20' W.**

**CHILKOOT PASS, a pass over the mountains in the northern part of Alaska, traversed by thousands of gold-seekers in the Klondike gold fields' excitement in 1896-98. By way of the Chilkoot Pass the first cargo was taken to Liverpool, about 1830, its character was not known, and as it could not find a purchaser it was finally thrown overboard. The next cargo went to France, where its value was recognized, and ultimately quantities were brought to England. The demand for it has gone on steadily increasing. It is used either in mixed artificial manures, or alone as a fertilizer. In the latter case, the bushel weight of which it is said to increase. It was anticipated that it might be used for making gunpowder, but the deliquescence of the salt has been found an insurmountable difficulty. It is, however, easily transformed into nitre by double decomposition with chloride of potassium, and large quantities are imported into Strassfurt, in Germany, for this purpose. It is, besides, substituted, whenever practicable, for nitrate of potassium as a source of nitric acid. The sole drawback to its general use for this purpose is the presence of chlorides, which, giving off hydrochloric acid, render the nitric acid impure. Of late the industry at Tarapaca has been greatly developed. The crude salt or "caliche," as it is called locally, is broken up and the nitre is extracted by lixiviation with steam and boiling water. The liquor flows continuously from one tank to another gathering more and more of the salt till it has gained the desired strength, and it is then allowed to cool, and the nitrate crystalizes out. From the mother liquor, the world's supply of iodine is obtained.**
Pass at an elevation of 3,500 feet, to the head of Lake Lindeman, a total distance of 28½ miles. From the latter place to Dawson City is 548 miles. The Chilkoot Pass route is the old trail used for generations by the Indians, and for many years was the only one taken by miners and prospectors to reach the interior. It is by far the shortest route to the Yukon. The difficulties and dangers attending this route are many, and the steepness and roughness of the ascent have proved fatal in numerous instances. This unaccustomed to endure hardships. The summit of the Pass is 13 miles from Dyca, the first six miles being traversed by a good wagon road. Owing to the winding of the Dyca River that stream had to be crossed several times by ford or ferry. The trail then enters a narrow cañon with steep, rocky sides, which it follows to Sheep Camp, four and a half miles farther on, which point is the timber line. From Sheep Camp to the summit the rise is from 1,800 feet in three and a half miles, to 1,000 feet in half a mile, and here masses of broken rock make the ascent, which is in some places almost perpendicular, difficult and hazardous. As a general route to the Klondike and to the country over the mountains Chilkoot Pass has been superseded by the railway through White Pass.

CHILLAN, chél-yan, Chile, capital of the province Nuble, about 56 miles northeast of Concepción. It consists of an ancient and a modern portion, the former built by the Spanish conquerors, who made it a place of some strategic importance. It was burned by the Araucanians, and has been destroyed by earthquakes. The old town was founded in 1579, and destroyed by an earthquake in 1835. The new town was built shortly after the latter date, and is regularly built and has a Franciscan missionary church and a normal school. To the southeast are sulphur baths, which were discovered in 1905, and to the east is the volcano of Nevada de Chillán, 9,528 feet high. Pop. 34,269.

CHILLED IRON, iron cast in metal molds called chills, where, on account of the rapid conducting of the heat, the iron cools more quickly on the surface than it would do if cast in sand. The effect of this chilling is to leave the interior of the casting soft and tough while the surface is hardened. This property of iron is taken advantage of by iron founders to harden specified parts of castings, those parts of the molds being of iron while the rest is of sand. It is used in making axle-boxes, hubs, plowshares and some hammers and anvils. The iron selected for making chilled castings should be entirely free from silicon which interferes with the hardening, and it should have a comparatively small content of carbon. Minute percentages of sulphur and manganese, on the other hand, contribute to the desired result.

CHILLIANWALLA, Battle of, an engagement in India between the Sikh forces in considerable strength, and the British commanded by Lord (afterward Viscount) Gough, fought 13 Jan. 1849. The Sikhs were completely routed, but the loss of the British was very severe. 60 officers were killed and 66 wounded, and 731 rank and file killed, and 1,446 wounded. The Sikh loss was 3,000 killed and 4,000 wounded. On 21 February, Lord Gough attacked the Sikh army, under Shere Singh, in its position at Gooperat, with complete success; and the whole of the enemy's camp fell into the hands of the British.

CHILLICOTHE, chil-i-kothé, Mo., city and county-seat of Livingston County, on the Wabash, the Chicago, Milwaukee and Saint Paul, and the Hannibal and Saint Joseph, 97 miles east of Saint Joseph. It is a farming trade centre and has several manufacturing industries. It is the seat of the Chillicothe Normal School, State Hospital, State Industrial School for Girls and Saint Mary's Hospital, and is near the noted health resort, Laurel Mineral Springs. It has several daily and weekly newspapers, electric lights and street railroads, and five banks. Pop. 6,265.

CHILLICOTHE, Ohio, city, county-seat of Ross County, on the Scioto River, Paint Creek, the Ohio and Erie Canal, the Baltimore and Ohio Southwestern, the Norfolk and Western and the Cincinnati, Hamilton and Dayton railroads, 50 miles south of Columbus, the State capital, to which the Scioto Valley railroad system gives trolley service. The city is the centre of an agricultural coal and mining region; and it has flour, pulp and paper mills, foundries, the machine and repair shops of the Baltimore and Ohio Southwestern Railroad and numerous other local industries, banks, national and savings, trust, building and loan companies, and an active chamber of commerce. The United States census of manufactures for 1914 recorded 46 industrial establishments of factory grade, employing 1,758 persons, of whom 557 were wage earners, receiving annually $852,000 in wages. The capital invested aggregated $2,905,000, and the year's output was valued at $4,083,000; of this, $1,512,000 was the value added by manufacture. Public safety and public service, police and fire departments, both with motor equipment, parks, city hospital and Enderlin welfare home, are all administered under a mayor and city council. The public library, school buildings, churches, Masonic Temple, Elks Hall, auditorium, the Agricultural and Industrial Building, the well-kept homes and lawns, the broad and tree-lined streets, are all characteristic of the "Old Town Beautiful," as it is called, and its residents. Chillicothe has an interesting history. In its neighborhood are several ancient mounds of pre-historic aborigines, and the sites of villages of the Chillicothe Indians, one of the four Shawnee tribal divisions, the latest of which was destroyed by Kentucky rangers in 1787. Chillicothe was settled in 1796 and here 1800-03 Gen. Arthur St. Clair set up his Territorial government, as governor of the Northwest Territory. It was incorporated in 1802 and following the agitation for statehood led by a quartet of the residents—Thomas Worthington, Nathaniel Massie, Edward Tiffin and Duncan McArthur, it was here, on 29 Nov. 1802, that a constitution for the State was adopted in compliance with the requirements of the Federal constitution, resulting in the young State's creation in the spring of the succeeding year, Edward Tiffin being elected first governor. From 1803-10 and 1812-16 Chillicothe was the capital of Ohio. When Ohio, on 10 July 1819, celebrated its 100th birthday as a State May 1903, it was peculiarly fitting that Chillicothe should have
been chosen as the place for the celebration, for all the historic memories of the early years of the State's existence clustered about this city. Again, 9 May 1912, the fourth Constitutional Convention of the State met here for one session and much of the Chamber of Commerce. Pop. (1910) 14,508; (1916) 15,500.

CHILLIES, the fruits of the capsicum, used to make cayenne pepper, pickles and chilli vinegar. See CAYENNE PEPPER.

CHILLINGHAM WHITE CATTLE. See WHITE CATTLE.

CHILLINGWORTH, William, English Anglican divine and controversialist: b. Oxford, October 1602; d. Chichester, Sussex, 30 Jan. 1644. He was matriculated at Trinity College, Oxford, in 1618, and in 1628 was made a fellow of the same college. Having been won to the Roman Catholic Church through the arguments of the Jesuit Father Fisher, Chillingworth entered the English college at Douai, where Laud, then bishop of London, by correspondence implanted in his mind doubts regarding the foundation of the Roman Catholic system; and endeavored to make a thorough investigation. Chillingworth returned to England after a few months abroad. The result was that he declared for Protestantism and in 1634 set forth, in a treatise that was not published and is now lost, the grounds of his conclusion. Laud procured his nomination to a church benefice in 1635, but Chillingworth's scruples about subscription to the 39 articles and acceptance of the Athenasian creed was an obstacle that could not then be overcome. In 1637 was published his great work, The Religion of Protestants: a Safe Way to Salvation. In the preface he explained away his former scruple about the 39 articles, and the next year was named prebendary and chancellor of Sarum. When Gibbon in his autobiography explains his own religious experiences, which closely resemble those of Chillingworth, he insinuates that the reconverted convert afterward repudiated privately the cardinal doctrines of the Church of England.

CHILLON, şeh-y'oun or shil'on, Switzerland, a castle on the Lake of Geneva, six and one-half miles southeast of Vevey, once an important stronghold of the counts and dukes of Savoy, and the prison-house of Francis Bonnivard, prior of Saint Victor, Geneva, from 1530 to 1536. It stands on a rock rising 22 yards from the shore of the lake, and is reached by a bridge. It probably dates from the 9th century. Bonnivard was confined in it by the Duke of Savoy because he had assisted the republic of Geneva, with which the Duke was at enmity. Byron's poem: 'The Prisoner of Chillon,' founded on this incident, has made it well known.

CHILOÉ, şeh-i-lo', Chile, province of, consists of the island of that name on the west coast, which is separated from the mainland by the narrow Strait of Chacao on the north and by the Gulf of Corcovado 30 miles wide on the east, and has a length of 115 miles, and an extreme breadth of 43 miles, and of a number of neighboring islands, mostly uninhabited; total area, 6,797 square miles; almost all Indians living on the principal island. Chiloé proper is hilly in the interior, and everywhere covered, except immediately along the shores, with nearly impassable forest. The climate is mild and not unhealthy, although inordinately wet. The Indians belong to a subdivision of the Araucanian family; they are a gentle and honest race, mostly engaged in fishing and lumbering, timber being at present the chief export from the island, though immense deposits of coal have been reported. In the eastern part the soil is fertile and well cultivated. Corn, wheat, barley and hemp are produced extensive and domestic animals are plentiful. Oysters, which are very scarce elsewhere in South America, are found in large quantities in the Chiloé Archipelago. The potato here, as in other parts of South America, grows wild. The Spaniards discovered the archipelago as early as 1558. Chiloé was the last part of Spanish America under Spanish rule, which it was not rid of until 1826. The capital and chief seaport, Ancud, on the north coast, has a good harbor, is the seat of a bishop and has a population of about 3,797. Pop. of province 95,756.

CHILON, ki-loon, son of Damagetus and one of the so-called seven wise men of Greece. He flourished about the beginning of the 6th century B.C., and was a native of Sparta, and one of the Ephors, a body of magistrates which he is said to have originally introduced. A collection of his sayings may be seen in Orelli's 'Opuscula Graecorum sententiosae.' (1819). Chilon claimed that the great virtue of man was prudence and a proper judgment as to coming events.

CHILOPODA, ki-lo-po'da, a group of myriapods represented by the centipede (q.v.). In these animals the body is composed of from a few to between 100 and 200 segments; the body is flattened, and there is but a single pair of legs to each segment. There are three pairs of mouth-parts, that is, a pair of jaws succeeded by two pairs of accessory jaws; while the first pair of legs are modified to form the poison fangs, which contain at their base a poison sac, the ducts from which open by a minute pore, out of which the blood oozes when the creature bites. The Chiilopoda are divided into four families:—Lithobiidae, Scolopendridae, Geophilidae and Scutigeridae.

CHILPERIC, chil'pe-rēk, two Merovingian kings: 1. CHILPERIC I, king of Soissons from 561 to 584. He never was acknowledged king of all the Frankish land, but divided the kingdom with his three half-brothers; he had, however, great power throughout their dominions by reason of his influence with the nobles. The murder of his wife, Galswintha, involved him in a war with her brother-in-law, Siegfried of Austrasia. 2. CHILPERIC II, King of Neustria from 715 to 720. He was several times at war with Charles Martel (q.v.), but was forced to submit to him, and was in 719 made king of the Franks. Consult Sergeant, 'The Franks' (New York 1898).

CHILTERN HILLS, a range of flint and chalk hills in England, extending through Oxford, Hertford and Buckingham shires; loftiest summit, 905 feet. These hills were anciently covered with forests and were infested by numerous bands of robbers. The steward of the Chiltern Hundreds is an officer of the
CROWN, appointed to protect the people of Bucks from the robbers of the Chiltern Hills. This often happens, a sinecure, as a member of Parliament can only resign his seat by accepting an office, he accepts this sinecure, which he immediately vacates for the benefit of others.

CHILTERN HUNDREDS. See CHILTERN HILLS.

CHILTON, Robert Hall, American soldier: b. Loudoun County, Va., 1817; d. Columbus, Ga., 18 Feb. 1879. He was graduated at West Point 1837; became captain of the First Dragon in 1846; served in the gallant and meritorious conduct at Buena Vista, Mexico, 23 Feb. 1847. In this battle Jefferson Davis, afterward President of the Southern Confederacy, but then colonel of the First Mississippi Rifles, was severely wounded, and Chilton bore him from the field, a life-long friendship resulting from the event. He became a brigadier-general in the Confederate service, 20 Oct. 1862, was chief of staff to General Lee, and inspector-general of the Army of Northern Virginia. After the war he was engaged in business in Columbus, Ga.

CHILTON, William Edwin, American legislator: b. Saint Albans, W. Va., 17 March 1858. He was educated in public and private schools, by private tutors and at Shelton College. He has been engaged in law practice at Charleston, W. Va., since 1879; was admitted to the Supreme Court of the United States in 1891. He was appointed prosecuting attorney of Kanawha County in 1883, was chairman of the Democratic State Executive Committee in 1886-90, and was twice elected for West Virginia in 1892-97 and United States senator for West Virginia 1911-17.

CHILTON, Wis., city and county-seat of Calumet County, 75 miles northeast of Milwaukee, on the Manitowoc River and on the Chicago, Milwaukee and Saint Paul Railroad. It has a large trade in the agricultural products of the surrounding districts. It has cheese manu- factories, grain elevators, condensed milk factories, canning factories, machine shops, boiler works, flour mills, sash, door and blind factories. Pop. 1,600.

CHIMÆRA, ki-me’râ, a fire-breathing female monster reported to be of divine origin, brought up by Amisosarus, king of Caria. According to the description of her given in the Homeric poems, the fore part of her body was like that of a lion, the middle like that of a goat and the hind that of a dragon. She laid waste the fields of Lycia and all the country round. Hesiod says she had three heads, one for each of the three animal parts composing her body. She was destroyed by Belerophon with the help of Pegasus. This mythical monster is supposed to have had its origin in the volcanic of the same name, near Phaselis, in Lycia, round the top of which, according to popular belief, dwelt lions, round the middle goats and at the foot poisonous serpents. The word Chimæra early came to be used for a irrealis, or utopian, or unnatural product of fancy, a wild dream, owing to the strange, unnatural form of the being described by the poets.

In ichthyology, one of a family of oceanic, elasmobranch fishes, Chimeridae, of primitive structures, a few species of which survive from Cretaceous and Lower Eocene time; noted for their extraordinary appearance. The body is covered with no living species exceeding three feet, have a shark-like body, heads furnished with strange fleshy projections, especially in the male, where they serve as “claspers,” or the snout may be extended into a sharp beak. The tail is continu- ted into a sort of whip, often nearly as long as the body. One species is frequently caught in the North Atlantic, and others exist in the North Pacific and in the Japanese and South seas. Most of them inhabit deep water, where the young are born from eggs laid in leathery cases, like those of rays, on deep bottoms. Consult Boulenger, Fishes (London 1910).

CHIMÆROIDEA, one of the primary divisions of fishes, the equivalent of Holoccephali (q.v.).

CHIMANGO, shé-mân’gô, a carrion hawk of South America (Ibycter chimango), closely related to the Caracara (q.v.). The plumage is black, with whitish streaks in the adult, which are lacking in the young. Chimangos are particularly numerous in the Falkland Islands. Darwin describes them as without fear of man, frequenting inhabited re- gions and feeding on all kinds of refuse.

CHIMAY, shé-ma’, Jeanne Marie Ignace Thérèse de Cabarrus, Princesse de, Hispano-French adventureress: b. 1773; d. 1818. She was the daughter of the Comte de Cabarrus, Minis- ter of Finance in Spain. In 1789 she was married to the Marquis de Fontenoy, but was divorced from him in 1793, when she married the revolutionist Tallien. She induced the latter to join a plot for the overthrow of Robes- pierre, and was one of the chief promoters of the revolution of July 1794. Her husband became displeased with her social activity and freedom of manners and left her to join Napoleon’s Egyptian expedition. They were divorced in 1802 and three years later Jeanne married the Comte de Camaran, later Prince de Chimay. She now settled down to a peaceful life. She was never admitted to court circles, although the first beauty of her time. Consult Houssaye, ‘Notre Dame de Thermidor’ (Paris 1866).

CHIMBORAZO, chém-bo-râ’so or chim- bô-râ’zo, Ecuador, a peak of the Andes, in the province of Quito, lat. 1° 20’ S. and long. 79° W. Though not the loftiest summit of the Andes, it rises 20,700 feet above the sea-level, and its top is covered with perpetual snow. The mountain has no crater, though it is built of volcanic rock. This mountain was ascended in 1802 by Humboldt and Bonpland, who, though they failed to reach the summit, yet mounted to the great height of 19,390 feet, a greater elevation than ever was before attained by man. Their further ascent was prevented by a chasm 500 feet wide. In 1880 the sum- mit was reached for the first time by Mr. E. Whymper.

CHIMES. A set of bells from 3 to 12 in number, generally of considerable weight, tuned to the notes of the diatonic scale with sometimes one or two additional half tones. In England these are most often hung “free,” i.e., so as to swing, and then are called also a “ring”
or "peal." A set of bells tuned to the chromatic scale, with a compass of three or more octaves and hung fixed or "fixed," i.e., so as not to swing, is called a chime. Tunes are played automatically on chimes where the bells are hung fixed and on carillons by a revolving drum and hammer mechanism like that of a music box. A chime hung fixed is also played by a chimer, who with his hands operates the levers of a clavichord-like stand, one lever for each bell. A carillon is also played by a carillonneur who uses both hands and feet on keyboards similar to those of an organ, connected with the clappers. In England a method of playing upon bells hung free, called "change-ringing," has long been in vogue. In this method each bell is separately swung by means of a rope by an individual ringer. The bells are thus made to sound one after another in a mathematically defined changing sequence. From the bell to the order in which they started. This in complicated changes often involves several hours of ringing. Great expertise is shown by companies of men in this art but the product of their skill is a regularly repeated series of patterns of sounds rather than music. On chimes only a few simple tunes can be accurately played. On a carillon, however, the chromatic characteristic combined as it is with the extended compass and range in the size of the bells—from several tons to a few pounds—enables the master of its keyboard to play not only the notes of a great variety of music but to interpret sentiment, and produce effects beyond the power of any other musical instrument. While England, because of its many bells, has been poetically called "the ringing isle," bell music has been still more a characteristic of Belgium and Holland and French Flanders through centuries. There carillons, and the great church and town hall towers which contain them, are maintained entirely at the public expense, and the bell music of folk songs, patriotic airs and national hymns, heard day and night and on market and feast days, is a considerable feature in the life of the people. Summer evening concerts in the Low Countries when the city carillonneur plays on the carillon clavier always have brought hundreds together to listen. Such concerts by Josef Denyn, the unrivalled master of the art, on the finest carillon in the world at Mechlin, Belgium, 45 bells, attracted thousands before the Great War. Antwerp's carillon then numbered 47 bells, Ghent's 52, Bruges' 47, Courtrai's 49, Mons' 47. In all there were recently about 70 carillons in Belgium and northern France. In Holland there are also about 70; among the finest are Middelburg, 41 bells; Delft, 40; Amsterdam (Palace), 37; Utrecht, 42; Arnhem, 47; The Hague, 37 and Appingedam, 25. Carillon destruction by Germany has undoubtedly been great. The bells of Ypres, 44; of Termonde, 40 and of Saint Peter's at Louvain, and of Aars are destroyed, and probably many or possibly all others in the occupied regions. The oldest chimes in the United States are those of Christ Church, Philadelphia; Christ Church, Boston; and Trinity Church, New York. California University, Berkeley, has 12 fine bells. Among English Carillons are Cattistock, 35 and Eaton Hall, 28 bells. In Ireland, Queenstown Cathedral has a carillon of 42 bells—the finest bells in the United Kingdom. Where chimes and carillons originated is not known. Tradition takes us back to the 12th century and the abbey of Eynard in Holland. But it is not until early in the 16th century that authentic records, principally in certain Low Country towns, appear. Louvain had 8 bells in 1525; Hoorn, 10, in 1526; Oudenburg 10, in 1539; Alkmaar 11, in 1541; Ghent 16, in 1543. Thereafter the development of this musical instrument was rapid. D. G. Rossetti, Thackery, Stevenson, George Macdonald, Thomas Hardy, Victor Hugo, Georges Rodenbach, De Amicis and others have written of carillon music. Longfellow's "Belfry of Bruges" is especially well known. Consult Rice, William Gorham, 'Carillons of Belgium and Holland' (New York and London 1914, 1915); 'The Carillon in Literature' (New York and London 1916); Robinson, F. E., 'Among the Bells' (London 1909); Starmer, W. W., 'Royal Academy of Music Lectures' (London 1916); Van der Ven, D. J., 'De Toren Zingen' (Amsterdam 1917); Loosjes, A., 'De Torenmuziek' (Amsterdam 1917).

WILLIAM GORHAM RICE.

CHIMES OF NORMANDY, The (Les Cloches de Corneville), opera comique in three acts by Robert Planquette, libretto by Cholley and Gabet, first produced at Paris, 19 April 1877. While called an opera comique, 'The Chimes of Normandy' is rather in the operetta class, the most typical of which are Offenbach's famous series of operas bouffées. The story is simple and romantic, if not tall. The music is unaffected and spontaneous and its first success, which was conspicuous even for those days and for audiences which saw many a popular hit, has been repeated wherever the opera has been given. The legend of the chimes is the best known number, but there is scarcely a dull moment in the entire work and half a dozen of the songs are household favorites the world over. The lilting barcarolle, 'On bellow rocking,' the cider song, 'In the last act 'That night I'll ne'er forget' and the spirited finales of the first and second act come readily to mind.

LEWIS M. ISAACS.

CHIMNEY (Fr. cheminée, related to Latin caminum, oven), an upright structure of stone, brick, etc., enclosing one or more flues or passages through which smoke and gas from the fire in a stove, furnace or fireplace may escape into the open air. Originally the term chimney included both the fireplace and the shaft. How far the Greek and Roman architects were acquainted with the construction of chimneys such as we know them, is a matter of dispute. That kitchens and baths were provided with chimneys appears certain, but how far other apartments were so provided is doubtful. An ancient mosaic found in Algeria, and representing a Roman country mansion, shows chimney stacks projecting above the roof. Of course in southern Europe fires are less necessary than in northern Europe. Chimneys require much attention to make them secure and prevent their smoking, so great an annoyance to domestic comfort. It seems at present to be acknowledged that it is much better to exclude the cold, damp air from the flues, by narrowing the aperture at the top, than to give larger
vent to the smoke at the risk of admitting a quantity of air to rush down the flue. For this reason chimney pots are of great use. The longer a chimney the more perfect is its draft, because the loss of the internal air, the longer the chimney towards is in proportion to the difference of weight between the column of air included in a chimney, and an equal column of external air; and the heated air in the chimney being lighter than the external air, the longer the chimney the greater is this difference. Short chimneys are liable to smoke, and fireplaces in upper stories are therefore more apt to smoke than those in the lower ones. Two flues in the same chimney should not communicate with each other short of the top. In manufactories tall chimneys are built for the purpose of carrying away the great quantities of smoke, which would otherwise be highly deleterious to the health of those living in the neighborhood. In chemical works, especially, the chimneys are sometimes built to an immense height. Such chimneys are constructed from the inside, by which the expense of the scaffolding is saved. The shafts of most early chimneys were round and the chimneys contained both the shaft each from the side of which the smoke generally issued, the top being crowned. In France and Italy chimneys came to form a decorative part of the national architecture.

**CHIMNEY SWALLOW**, the common swallow of Europe (*Hirundo rustica*), so-called in Britain, where it makes its nests about buildings, and in niches of the outside of old chimneys, walls, etc. (See SWALLOWS). In the United States the name given erroneously to a very different bird, the chimney swift. See SWIFTS.

**CHIMOIO**, Africa, town in the Portuguese possessions, near the border of Mashonaland, 118 miles from Beira on the coast. A railway connects it with Fontesvilla, 28 miles northwest of Beira, and is being continued inland to Salisbury.

**CHIMPANZEE**, chim-pân-zê or chim-pân-zé, an anthropoid ape (*Anthropopitheus niger*), native to the equatorial region of Africa, from the Atlantic Ocean to the Nile, within a belt about 20 degrees wide. In this extensive territory it exhibits much diversity and has many local names, but whether these indicate more than one species is still to be determined.

This ape would measure in an average specimen about 5½ feet tall, but the spread of its arms and hands would be nearly 6 feet, and the girth of the chest about 35 inches. Old males often exceed these measurements, but there is not such a disparity in size between the sexes as in the gorilla. The massive structure of the bones and muscles imparts great strength, but it certainly is not so prodigious as that reputed of the bigger gorilla. The forearm and hand are longer than in the other anthropoid apes (q.v.) except the gibbons, in conformity with their more arboreal habits; the skull is brachycephalic, the ears are proportionately large and stand out from the head, and the nostrils are wide. The skin on the face is naked and yellowish, surrounded by long black hair that hangs over the head and shoulders and depends from the elbows. The body is covered with shorter hair, typically shining black, but brown on the back in some specimens, especially those taken along the Ituri River in the Kongolese region. Male chimpanzees are much more deliberate and oftentimes the chimpanzee is wilder and more timid than the always ferocious gorilla, and in captivity it is far more tamable than that irreclaimable beast, which is more primitive in every way.

Chimpanzees are forest-dwellers, and are not easy to find and observe, and still less to catch. They go about in family parties, probably mated for life and frequently gather into bands of two or three families. During the day their time is spent mainly in some big tree, dozing, nibbling at young shoots and "loaing" quietly. In the early morning and again late in the afternoon they descend to the ground and grasp for roots and tubers, or search for fruit and the leaves of certain succulent plants of which they are fond. An intelligent traveler-naturalist, Major Cuthbert Christy, writing recently of his observation of these apes in the Kongo forests, says that where a large troop has been feeding one might believe a herd of real pigs had been at work. Fruit is also gathered in the tree-tops, including fruit, insects and birds' eggs. The appetite for fruits makes the chimpanzee a menace to the plantations, especially when bananas are in edible condition. The natives guard the plantations, and as the animal is timid toward man this usually saves the crop; but when he cannot run away, the chimpanzee at bay is a formidable foe, using his long, sinewy arms and sharp teeth with deadly effect. He is even said to be a match for the leopard. The stories of his capturing and carrying off negro women or children are not substantiated.

The presence of chimpanzees in a neighborhood is quickly known to the people, for at intervals during the day, either singly or in chorus, they indulge in bouts of far-echoing, half-human, half-maniacal shouts and hoots, rising crescendo to what seems like fiendish laughter... till the forest rings with the sound. Just at daybreak this forms a kind of concerted uproar that lasts for several minutes.

At night each adult climbs a tree, usually of small size, and by bending down branches and heaping leaves and twigs on them, constructs a platform big enough for a bed, on which he or she lies down and spends the night. These little platforms are believed to be used only once, and old ones are common sights in the forest; when the female is about to bring forth the one or sometimes two young, borne by her annually, she builds a similar platform-bed, and there the little ones are born and rest until able to travel or be carried away. The chimpanzees are so heavy that the big ones are clumsy in climbing about, as compared with smaller monkeys, and when in haste to make their escape from men, whom they will avoid and flee from whenever possible, they take to the ground. At the first sign of danger, says Major Christy, the wary old male forsakes his family, comes down from the tree, does a few acrobatic swings and a drop, and makes off along the ground, not exactly on all fours, though something like it, using his great arms to help himself along, ... to push swinging branches and creepers out of the way rather
CHIN-FLY—CHINA

than for running with. When on all fours his
fingers are doubled on the palms of his hands
so that he walks on his knuckles. The arms
are not so much needed or actually used for
progression as has hitherto been believed.
Chimpanzees have been seen in menageries
and zoological gardens in Europe since the
middle of the 19th century; and many accounts
have been given of their docility and submis-
sion to training, in which they exhibit an ability
to learn to do things, and handle implements in
a way that is most interesting and amusing.
This is also true when they show much affection
for kind trainers. They are very susceptible to
diseases, especially of the lungs, and rarely
survive long in captivity; and as they grow to
adulthood they are likely to grow fretful, morose
and even dangerous. Consult Hartmann, 'An-
thropoid Apes' (New York 1886); Elliot, 'A
Review of Primates' (New York 1912), and
general works on natural history. See APE;
GIBBON; GORILLA; ORANG-UTAN.

ERNST INGERSOLL.

CHIN-FLY, a horse bot-fly (Gastrophilus
masculus) which has been confused with the
horse-bot (G. equi). This species is smaller than
the bot, densely hairy, with the thorax
rust-colored. The abdomen is whitish at base
and the wings are not spotted. It deposits its
white eggs in the nostrils of stallions about the
tongue. It is usually found in Europe. It has
been found common and troublesome in Kentucky. Also, in Europe it
is a pest of the ass, mule and goat. See
BOT-FLY; HORSE BOT-FLY.

CHIN-KIANG, chén-kiáng, or CHIN-
KONG-POO, China, city in the province of
Kiang-Su, on the right bank of the Yang-tse-
Kiang, near the junction of the Grand Canal,
150 miles from Shanghai. In 1861 it was made
a treaty port. It is advantageously situated
for trade, as the river is navigable for large vessels,
and the canal connects it with the country north
and south of the great river, but with the
construction of railroads the canal is about to lose
its former importance. Extensive suburbs
stretch along the river and the canal. Chin-
Kiang forms the key of the empire, as the block-
ade of the river and canal at this spot would in
a great measure prevent all communication be-
tween the north and south. The city was for-
merly fortified, but has been dismantled. It
has a bund or river-fronting esplanade, club-
house and churches. In 1842 it was taken by
the British after a determined resistance on the
part of the Manchu garrison. It was also taken
by the Tai-ping rebels in 1853. They defeated
the Imperialists here on 1 Jan. 1856, and finally
abandoned the city in 1858. In 1889 a native
mob destroyed half the foreign houses. Goat-
skins, silk, rice, hides, wool and fancy products
are exported, and opium, cotton and sugar are imported. The foreign trade amounts
to about $16,000,000 annually, the traffic having
gradually declined within the last few years,
partly owing to railway freights having entered
into competition with river steamers. Pop.
about 160,000.

CHINA (CHUNG-HUA MIN-KUO), an
immense territory, stretching from the centre to
the eastern extremities of Asia, and occupying
nearly a third of the surface of that continent,
between lat. 18° 20' and 56° N., and long. 73°
and 135° E.; bounded north by Siberia; west
by Russian Turkestan, the Russian Pamiir, Cash-
mere, etc.; south by India, Burma, Anam and
the China Sea; east by Siberia, Korea and por-
tions of the Pacific Ocean (Eastern Sea, and
Yellow Sea); greatest length, west to east,
about 3,000 miles; greatest breadth, 2,400 miles;
area, about 4,300,000 square miles. This vast
territory is usually divided into China Proper,
which forms its nucleus, and the following
dependencies:

Manduria (Chinese, T'ung-tan-Sheng) com-
prises the extreme northeast portion of the
Chinese Republic. It is bounded on the north by
the river Amur and Russian territory, east by
the Russian maritime province, west by Mongo-
ia, and south by the Gulf of Lia-Tung and
Korea. With the exception of Mukden, Hei-Jung-Kiang and Kirin, the
respective capitals of which are Mukden, Tsitsi-
har and Kirin. The total area is 280,000 square
miles. Mongolia is the name given to the vast
levels of desert land which, interspersed with
innumerable oases, stretches out in a great
plain, 700 miles by 1,200 miles, along the
southern frontier of China. Its total area is 2,288,000
square miles is taken up by the Gobi desert.
The population is estimated at 1,000,000.

Kashgar and Yarkand. Sutu-garia or Deun-
garia, the smallest of the tributary states of
China, lies to the northwest of Turkestan, on
the banks of the Ili River, at the junction of
Mongolia, Turkestan and the Russian province
of Semiplatkinsk. Its area covers 147,900 square
miles, and its population is said to be almost to
half a million. Tibet comprises the mountain-
ous region lying between Turkestan and Nepal
and Assam. On the east it adjoins China Proper,
and on the west Cashmere. It covers an
area of 651,500 square miles, and its capital is
Lhasa. The authority exercised by the Chinese
over their dependencies is by no means uniform.
Some of the dependencies are directly connected
with the empire, while others are merely tribu-
tary; and Tibet is so independent as to do little
more than profess a nominal allegiance to the
Republic of China.

CHINA PROPER (anciently Cathay; Chinese,
Chung Kuo, *Middle Kingdom*) forms the
south-eastern portion of the republic, and occu-
pies less than a third of its whole extent. Not
including the island of Hainan, it lies between
lat. 20° 20' and 41° N., and long. 98° and 123°
E. China is bounded, north by one of the most
remarkable of human structures, the Great
Wall, which proceeds directly over mountain
and valley, and for a length of 1,250 miles forms
the barrier between China and Mongolia; on
the west it is bounded by Tibet; on the south
by Burma, Tonkin and the China Sea; and on
the east by the North Pacific Ocean. There are
CHINA

The official "census" so-called of 1910, with enumerations, only approximate to actuality reduces the number of souls in the Chinese Empire to about 325,000,000. The number of foreigner in the empire in 1915, the Japanese far outnumbering all others, was not far from 200,000.

Physical Features.—The coast-line, forming an irregular curve of about 2,500 miles, gives about one mile of coast for every 500 miles of area. It is not deeply penetrated by gulfs, the only one of great extent being that of Pe-chi-Li in the northeast, but numerous indentations form safe and capacious roadsides. With exception of a bold and rocky peninsula in the province of Shan-Tung, the shore from the Gulf of Pe-chi-Li south to the island of Chusan is flat, and in many places so little raised above the sea-level as to be extensively inundated during a continuance of strong winds. From Chusan to the mouth of Canton River it is usually rocky; from this point southwest, flats chiefly prevail. A peninsula of some size juts out in the extreme south from the Tung-Tung province, separated from which by a narrow strait is the large island of Hainan. Chusan Island and archipelago are also of importance, but most of the innumerable islands dotted round the Chinese coast are very small. The large island of Formosa, off the east coast, now belongs to Japan. Many lighthouses have been planted along the coast. Owing to the exclusive policy of the Chinese and their dislike of foreigners, a great part of the interior of the country must be regarded as still almost terra incognita. The surface is mostly mountainous. The general slope is from west to east, and the mountains are a continuation of those of Tibet and central Asia. Branches of the Kuenlu-traver.

Rivers and Lakes.—No country of the world is better watered than China. The Yang-tse-Kiang, which traverses the country centrally from west to east, has a course of some 3,000 miles, and forms a splendid inland waterway up which ocean steamers can sail for 1,100 miles to Ichang, a port opened to foreign trade. The Hoang-Ho, farther north, and next in size, has a course of over 2,500 miles, but it is little used in its mid course, except by a few vessels, is a good waterway for small craft. The Pearl River is a large distributary of the Yang-tse-Kiang, which joins the Hoang-Ho before it joins the sea. The Yang-tse-Kiang all the way from the highlands of Yunnan to the eastern seaboard. Between the main mountain system, and following courses which may be roughly described as parallel, run the two great rivers of China, the Hoang-Ho and the Yang-tse-Kiang. Here lie the central and richest Chinese provinces. The lower Hoang-Ho is an immense delta plain, consisting generally of a deep alluvial soil of unparalleled fertility. This plain has a length of not less than 700 miles, and a width varying from 150 to 500 miles. It is dotted by a denser population than any other portion of the earth's surface of similar extent.

Climate.—The greater part of China belongs to the temperate zone, only a small portion of the south lying within the tropics. It has what is called an excessive climate, and has a far greater range of temperature than is usual within the same parallels of latitude. Peking, the capital, is nearly a degree south of Naples, and yet while the mean temperature of the latter is 63°, that of the former is only 54°. In summer, however, the heat reaches from 90° to 100° in the shade, while the winter is so cold the rivers usually continue frozen from December to March. At Hongkong, notwithstanding the influence of the sea in checking extremes, the thermometer in June and July, the hottest months, frequently stands at 90°, and in winter, from December to March, sinks nearly to the freezing-point. At Canton, snow, though rarely, has sometimes fallen. At Shanghai, generally 31° 20', the range of temperature is still greater, the maximum reaching 100°, and the minimum falling at least 20° below freezing, or 12° F.
In the south the climate is of tropical character, the summer heat rising to 120°. Here the southwest and northeast monsoons blow with great regularity, and nearly divide the year. In the north they are more variable. The violent hurricanes known as "typhoons" are not uncommon in the Chinese seas.

Geology.—The geology of China is very imperfectly known, but there is no doubt that all the leading geological formations are found in China. Primary formations are most largely developed in the mountainous regions of the west, where granite, gneiss and primitive schists prevail. The same formations exist to a more limited extent in the southeast, where bleak mountains of granite give that district a distinguishing feature. The secondary formation, including the carboniferous and cretaceous system, occupies a considerable area, and the coal fields of China are perhaps the most extensive in the world. The tertiary formation has its largest development in the northeast, and probably underlies the greater part of the alluvium which covers the surface of the Great Plain. A surface feature of a great part of northern China is the earthy deposit known as "loess," which covers an immense area both in the plain and valley, forming a yellowish-brown soil of the utmost fertility.

Mineralogy.—China is well supplied with useful minerals. Gold, though not thought to be very abundant, is obtained by washing the sand of several of the rivers, particularly those of the upper branch of the Yang-tze, and in the mountainous and almost inaccessible regions of Yünnan. Silver is also found in the same regions. The quantity suffices for a large annual export, chiefly in payment of various foreign goods. Copper, besides forming the ordinary currency in limited mercantile transactions, is worked to a great extent for economical purposes. Mercury or quicksilver, in the form of cinnabar, is of frequent occurrence, and is much used both for coloring and medicine. Its poisonous fumes are even said to be inhaled like opium or tobacco. There is no want of iron either in the form of rich hematite, or in that of the carbonate or the carbo-magnesio. But smelting is not carried on to any considerable extent. Lead, tin and zinc exist, but owing either to a deficiency in quality, or ignorance of the method of extracting them economically from the ores, the native products fall short of the consumption. Some authorities regard the coal-fields of China as equal in value to all the other coal-fields of the world together, and some time they must certainly become of immense economic importance to the country. The area of the coal deposits in the southeastern part of the province of Hunan is about 21,700 square miles. The coal occurs as both bituminous and anthracite, but as most of it is raised without machinery, by the rudest forms of manual labor, the price is necessarily high, and the quantity mined is trifling. Defective means of communication partly account for the backward state of coal-mining. Coarse mixtures of culm and earth are used as fuel to some extent, while other still more inefficient and less attractive combustibles are employed. Among other mineral substances may be mentioned the manganese, in sum, and more important than all, inexhaustible beds of kaolin or porcelain earth, the early possession of which by the Chinese, and their great skill in working it, has given the name of China to the beautiful ware which so long monopolized the market of Europe. Jade appears to be found in China in its most perfect form in the mountainous districts, being wrought into trinkets and into ornamental articles of various kinds. Various precious stones also are found, and agates especially are admirably wrought.

Zooology.—China is said to possess about 200 indigenous mammals and over 760 birds, most of which are found in adjacent parts of Asia, and some are also European. Among the mammals are several species of the monkey tribe, one of them being the so-called Cochin-China monkey, marked by a striking variety of stripes and colors. Another is the proboscis monkey. Tigers and leopards were at one time so numerous as to have been regularly hunted in state by the emperors, but these animals have been exterminated, except in a few localities, especially in Yünnan and Manchuria. A small species of wild cat is sought for as game, and served at table as a delicacy. Bears are frequently mentioned, and their paws are said to be in high request among Chinese gourmards. Other wild animals include the lynx, badger, civet, marten and weasel. The elephant, rhinoceros and tapir occur in some localities of the southwestern. Both camels and elephants are employed as domestic animals, the former only in the north. Bats are numerous, and one large species is extensively used as food. To the indigenous animals already mentioned may be added the wild hog, porcupine, raccoon-faced dog or Chinese fox, and several species of rats, more especially one of a yellow color, larger than those of Europe, and much prized for its skin. Several species of deer are met with, one being the musk deer. In birds, as above indicated, China is extremely rich. Pheasants in particular are famous, both for variety and for beauty. Among others are the well-known gold and silver pheasants, the former one of the most gorgeous of the feathered tribe. The peacock is also indigenous, and fowls akin to our common domestic variety. Birds of prey include eagles, hawks, etc. Song birds, such as the nightingale and thrush, are well known and much appreciated. Water-birds of almost every kind abound, such as ducks, geese, swans, pelicans, etc. The mandarin-duck is a Chinese species famed for beauty of plumage. But perhaps the most remarkable water-bird is the fishing cormorant, the training of which forms an important employment, and is so complete, that when a bird has secured a fish which from its size he cannot manage singly, his neighbor does exactly the same, and they complete the capture. The reptiles of China include several large serpents not regarded as dangerous, and one species at least which is very venomous. Tortoises are common and are often kept in gardens and pleasure-grounds. No country is said to possess a greater number and variety of indigenous fishes than China. All its waters — its rivers, lakes, pools, canals and even ditches — are full of fish. This is partly owing to the artificial means by which the natural supply is vastly increased, the addition of water-nitre, gypsum, etc., being carried to distant parts and deposited in ponds, where the fry are fed with various species of lentils or with yolks of eggs.
Botany.—The flora is naturally extensive and varied. In the south it is tropical in character, farther north sub-tropical, and still farther there are many plants and trees identical or nearly so with those of middle Europe. Among trees commonly found in China the bamboo (if this gigantic grass should be called a tree), as in India, is perhaps the most valuable of all on account of the almost endless uses to which it is applied. Oaks of different species are common, and the economical uses of the various parts—the wood, bark and galls—are perfectly understood. Even the acorns of some kinds are ground into flour and converted into a farinaceous paste. Coniferous trees are represented by numerous forms of pine, yew and cypress, some of them of great economic importance. The tallow and camphor trees abound, as also the mulberry and paper-mulberry. Palms are not abundant, but the cocoaanut flourishes in Hainan and on the adjacent coast. The Pandanus or screw-pine is abundant in the south, but the date-palm is not known. The chestnut, walnut, willow and hazel are all indigenous. The fruit-trees include the fig, mango, guava, litchi, loquat, orange, peach, pomegranate, quince, nectarine, plum, apricot, etc. Producing lacquer or varnish and medicinal herbs of various kinds (including ginseng), are also well known. Among shrubby plants, the first place is unquestionably due to the tea-plant, of which further mention is made below. The next in importance is the mulberry, on the leaves of which the silk-worm is nourished. Among flowering shrubs or trees are the rose, with its numerous varieties, the hydrangea, the passion-flower, the lagerstroemia, Indian pride, the Chinese tamarisk, various species of cactus and the camellia. The Chinese flora is particularly rich in varieties of the azalea. Altogether the abundance of flowering-plants, shrubs and trees is a feature of the Chinese flora. Dwarfing is a favorite occupation, and the Chinese horticulturists force plants to assume the most fantastic forms.

Agriculture.—This first of arts has always been held in the highest estimation in China. During the period of the Empire the empire was divided into counties, each provided annually to an appointed spot with a large revenue, and, taking the plow in his hand, drew a furrow and sowed some seed. A similar festival is held in the capital of each province. The agriculture of the Chinese has been lauded in high terms by almost all who have had opportunities of witnessing it. In the important processes of stirring the soil, eradicate weeds, economizing manures, and applying them in the form best fitted to nourish the crop and bring it to maturity, plants producing lacquer or varnish and no small degree of skill. On account of the dense population, every square foot of land that can be made to raise food is kept in constant service and at the highest point of fertility. Every mountain slope is terraced and tilled, sometimes to the height of 8,000 feet, wheat or other grains being the usual crop in these places. The farmers slavishly follow a routine which has been handed down without change from untold generations, and not only display no inventive power, but obstinately refuse to profit by the inventions of other countries. Their implements generally are of the rudest description and though improved European and American plows have been sent out and urged on their acceptance, they reject them with disdain, preferring a rude shapeless thing drawn by oxen or buffaloes. They appear to have no idea of raising improved breeds of horses and cattle by the arts so well known and practised in other countries. The only animal of which the Chinese can be said to have furnished us with an improved breed is the pig. Their asses and mules are also of good quality, as is the principal food of the people, is the staple crop. The rich alluvial plains which cover a great part of the surface are admirably adapted for its culture, and, by careful management, yield amazing crops—not one merely, but in the south latitudes two crops of rice in the hot season besides a winter green crop usually plowed in for manure. In the neighborhood of Ningpo, lat. 30°, where the summer is too short to mature two crops in succession, they are still obtained by an ingenious device. The rice is sown in seed-beds and afterward planted out in drills. A first planting is made about the middle of May, and in two or three weeks after, a second planting is made in the intervals between the previous drills. When the rice is sown in August the other is still green, but being stirred and manured, and having plenty of light and air, comes rapidly forward, and is reaped in November. All the steps of the process are conducted with the greatest care; and the water-wheel, worked by the hand, or by an ox or buffalo, is kept in daily operation from the first planting of the crop till it is nearly ripe. The reaping instrument is not unlike our sickle; and the crop, when not threshed on the field, as is generally the case, is carried home and built up into stacks, resembling those of Europe. The rice is not always grown on alluvial flats, and there is a variety, known as dry-soil rice, that is cultivated like any ordinary cereal. The sides of the hills are often laid out in a succession of gently sloping terraces, and planted with rice in drills running across the declivity, thus admitting of being irrigated by streams which, retarded at every step, move slowly forward without acquiring any impetus. The same mode of culture is also applied with crops. In the north the crops principally consist of our ordinary cereals and legumes—wheat, barley, peas and beans. Vegetables of various kinds are generally grown for household use. Varieties of the cabbage tribe are extensively cultivated for the sake of the oil extracted from the seeds. The raising of green crops to be plowed in as manure is generally common where rice is cultivated. Two kinds of plants are chiefly employed; one of these, a clover, grown on ridges similar to those which form the intervals in our celery beds. Among other crops regularly and extensively grown may be mentioned sugarcane, used chiefly in a green state; indigo; the castor-oil plant; and numerous plants grown for their roots. The opium poppy was once so extensively cultivated that the demand for the imported article fell off very greatly. Maize, buckwheat and tobacco may also be mentioned as cultivated crops. Three other plants of the greatest economical use elsewhere are extensively grown as to form important branches of Chinese agriculture, deserve a separate notice. The first is the mulberry.
quantity of raw silk annually exported, and the general use of silk for dress, especially by the wealthier classes of the country, it is evident that a large area must be appropriated to the cultivation of this tree, and millions of persons employed in the different processes of reeling and spinning with it. The plants are not allowed to exceed from four to six feet high, and are planted in rows, often along the banks of canals. The mulberry farms are small, and are generally worked by the farmers and their families. The Chinese silk is much heavier than the Italian, and preferred in fabrics requiring lustre and firmness. Whether it owes its quality to a particular variety of mulberry, or to the climate or soil, has not yet been definitely ascertained. The second plant more particularly deserving of notice is the cotton-plant. That cultivated in China is of the same species as the ordinary American, namely, Gossypium herbaceum. The difference in the quality of cotton used in the manufacture of nankeen appears to be of a more stunted habit than the ordinary cotton. It is chiefly cultivated in a level tract around Shang-hai, forming part of the Great Plain, and is the staple summer crop. The culture differs from that of other cottons, more especially the cotton districts of India. The third plant, the tea-plant, is cultivated in two varieties—Thea bohea and Thea viridiss; and though it was long supposed that the former only yielded black and the latter green tea, it is now known that both kinds of tea are obtained from each. The great tea provinces are Kwang-Tung, Fu-Kien and Che-Kiang. In the first the Thea bohea is grown, and the tea is of inferior quality; in the other two the Thea viridiss, which yields all the finer qualities and furnishes the greater part of all that is exported to Europe. In these two provinces, where the culture is most extensive and carried to its highest perfection, the tea plantations are usually formed in a deep rich loam, never on the low lands, but on the low hilly slopes. The tea farms, as common throughout China in all kinds of culture, are small, and their management, including not merely all the steps of the culture of the tea-tree, but the preparation of the leaves for market, is almost invariably confined to the farmer and his family. The leaves are gathered thrice—about the middle of April, when the leaf-buds are beginning to unfold; about a fortnight after, in the beginning of May, when the leaves are fully grown; and when the leaves again are newly formed. The first gathering yields the finest and most delicate tea, but with considerable injury to the plants.

Manufacture.—In all the arts necessary to the comfort of life and to the arts conducing to luxury, the Chinese have made considerable progress. One peculiar feature in their processes is the general absence of machinery. Except in a few industries the great moving power is manual labor. The silk stuffs of China have long borne a high name, and in several qualities are still unsurpassed. The loom in common use is worked by two persons, one of whom sits on the top of the frame, where he pulls the treads and assists in making the thread, and the other must be made on the machine while in operation. By means of it the workman can imitate almost any pattern. The crapes and flowered satins, and damasks for official dresses, manufactured by the Chinese are particularly excellent. Everybody wears silks. It was formerly the prescribed attire of high officers, and soldiers were not considered in full uniform without it. The finer kinds form the ordinary dresses of the opulent, while the poorest classes of the town and country wear them for costume or in public. The quality, at least on gala days. The embroidery of silk is carried on to an amazing extent, the perfection to which it has been brought creating an almost unlimited demand, both domestic and foreign. The clothing of the inhabitants. Steam-power has latterly been utilized in the reeling and spinning of silk. In cotton goods the Chinese make good and substantial fabrics, but the cheapness and good appearance of the foreign goods have given rise to a large importation. Nankeen, once so common in Europe, is still produced as before, and continues to form an important branch of domestic manufacture. Cotton mills and factories of all kinds are now established. Linen seems not to be made in China. Flax is not grown, but a good substitute for it is found in the fibres of two or three plants, especially ramee, from which the beautiful grass-cloth, similar in appearance to linen, is commonly woven. West Indian fabrics are made only to a very limited extent. The consumption of leather in China is not great, and the manufacture of it is very imperfect. The porcelain of China has been famous from the earliest periods. The manufacture of the finest forms of it being long known to the Chinese alone, gave them the monopoly of the world, and though in elegance of shape and design they must now yield the palm to Europe, for quality of material and rich gorgeous coloring they still hold perhaps the foremost place. Paper is an article that has been made in China from an early period and with great success. The manufacture of glass is not carried on to a great extent, and this is one of the few arts which, at least in regard to its finer processes, the Chinese have condescended to learn from Europeans. In beautiful lacquered ware the Chinese continue unsurpassed. Much of its excellence appears to be owing to the fine varnishes which they have learned to extract from native plants. Except in some few articles the Chinese are backward in the manufacture of metal goods; but recently, and under European leading, machinery, small arms and ordnance, warships, etc., are being produced in the country, as well as soap, matches and other articles. Many small articles made by hand display much finish and delicacy of workmanship. See CHINESE ARCHITECTURE AND ART.

Trade and Commerce. The inland trade of China is conducted by the unusual fact that it derives from a system of water communication, ramifying like net-work over all its provinces, is of incalculable magnitude. Its rivers and canals are so covered with junks and barges and swarms of smaller boats that there does not seem much exaggeration in the estimate which makes the tonnage belonging to the Chinese little short of the combined tonnage of all other nations. The inland commerce, however, is much hampered by the rarity of good roads.

By the opening of the principal ports the foreign commerce has been immensely increased. Till 1842 the trade with foreigners, exclusive of that carried on by the mainland

CHINA

of a tael, called mace or tsien, candroean or fan, and cash or le, used in reckoning bullion, gems, drugs, etc., 19 cash making 1 candroean, 10 candroaeans 1 mace. The only native coin now current is the cash, a small piece of thin circular copper about three-quarters of an inch diameter, with a square hole in the middle for convenience of stringing. Native silver bullion, called sycee, and gold bullion of similar shape, and usually stamped with the names of the banker and workmen, and the year and district in which it is cast, are used in large transactions. All taxes are paid in sycees of 98 per cent fineness. Private bankers are found in all large towns, and some of them pay interest on deposits. They issue paper money, which passes current in the particular districts where they are known. The Mexican dollar has been made a current coin all over the empire. In Shanghai, Tien-Tsin, Han-Kow and the northern ports, the talon is commonly used.

Railroads.—Railway history began in 1876 when the Wu-Sung line was built. The lines in working order are: Shanghai to Wu-Sung (opened 1898); Kai-Ping to Pe-Tang; from Tien-Tsin to within a short distance of the Great Wall, by way of Chang-Ho-Oan, and with connection to Peking (built by Li Hung-Chang's advice; length 298 miles). Of lines conceded and projected in 1897, the list is as follows: (a) The Russian line through Manchuria, with branch to Port Arthur and Ni-u-Chwang (began in 1897, and completed 1904; length of main line 1,200 miles, branch line 600 miles). (b) The German line to Chia-Chuan (total length, 621 miles). (c) The Franco-Belgian line from Peking to Han-Kow (the first line to be constructed by Imperial decree). The line will connect with Tai-Yuan-Fu and Singan-Fu. (d) The Anglo-German line from Tien-Tsin to Chin-Kiang with connections to Tsi-Nan; total is about 620 miles. (e) The English line from Tai-Yuan to Fu-Chau (298 miles); and two lines from Shanghai, one in the direction of Su-Chow, length 298 miles. In 1911 commanded that all railway trunk lines should revert to government and that provincial control should cease. The concessions granted for railroads in 1913 include one to a British firm, from the city of Shih-Shi in Fuhchou through Honan and Kweichow, a distance with branches of 800 miles, the contract being signed 18 October. On 23 October two railways in Shantung were contracted for by German parties, one to join the Hankow main line. On 24 June 1914 an agreement was made extending the German line to Su-Chau, one of the richest cities in China, and through populous regions especially rich in canals. Another line westward was provided for, both to form ultimately a part of the state system, and to draw a portion of the loan. To French parties was granted through the Banque Industrielle de Chine, a concession to build a railroad through the southern provinces, 1,000 miles long from Yam-Chau near Pakhoi on the Gulf of Ton-Kin, through Nan-Kin, to Yunnan and to Szechuen. The same bank secured in March

through the town of Kiachta, with the Russians, was jealously restricted to the mouth of Canton River. By the Treaty of Nankin, in the above year, Hongkong was ceded to Great Britain, and Canton and four other ports were thrown open, namely, Amoy, Fu-Chau, Ningpo and Shanghai. At subsequent dates other ports have been added to the list of treaty-ports for foreign commerce, and about 30 ports are now open, the most northern being Niu-Chwang, in Manchuria, and the farthest inland being Chung-King, on the upper Yang-tse, some 1,500 miles from the river's mouth. Steamers do not go higher at present than Ichang (1,100 miles), the trade above this being carried on by junks or other craft. Several other of the ports are on the Yang-tse. Of all the Chinese ports, Shanghai, at the mouth of the estuary of the Yang-tse, carries on much the largest trade. Regardless of the war, the trade here in 1916 was greater than ever before. The direct foreign commerce exceeded the returns in the year 1913, $222,000,000, and the increase over 1915 was $100,000,000.

Among the countries which maintain commercial relations with the Chinese the principal are Great Britain and her dependencies, Hongkong and India, Japan, the United States and Russia. The latest trustworthy statistics relating to the foreign commerce of China are set forth in "The Americas" (New York, July 1916, Vol. II, No. 10), from which we quote as follows: "Official returns of the trade of China in 1915 have reached this country from Shanghai. The net commerce, not including the trade of Hongkong, and excluding of a considerable total of goods carried by Chinese vessels not within control of the Maritime customs and plying between coast towns and treaty ports, has been (stated in Haikwan taels, equaling 62 cents U. S.): 1915, imports 4,541,475,719: exports 4,183,164; as compared with 1914, imports 569,241,382, and exports 356,226,629, etc. It is shown by the complete statistics for the decade 1906-15 that 1915 was "China's record year for exports, in spite of interference with commerce on the part of the foreign dyes, antimony and other Chinese products, also higher prices, raised the total of exports. A drop in imports was accounted for by a boycott of Japanese goods and by the fact that, owing to short-ages of dyes, colored cottons were not obtainable in usual quantities and at reasonable prices, and as white is the mourning color in China, the undyed materials could not be marketed." The total trade of China through the treaty ports of Hongkong was 252,605,127 Haikwan taels. Excluding the trade of Hongkong, China's total trade with the United States in 1915 amounted to 97,622,700 Haikwan taels; with Great Britain 103,493,356; and with Japan 197,928,351 Haikwan taels (1 Haikwan tael = 62 Chinese cents). The Chinese, in carrying on their extensive dealings, domestic and foreign, have in all 24 weights and measures, but of these only 6 are in common use, namely, the liang or tael = 15/16 pound; the chien = 1/3 bound; the shih = 11/16 pounds avoirdupois; and the ping = 133½ pounds used in weighing bulky articles; and decimals
an agreement to loan $30,000,000 for harbor improvements at Pu-Hau and trolley lines and public conveniences in Peking. On 31 March 1919, the Chinese Corporation agreed to a loan of $40,000,000, at 5 per cent for 45 years, for further extensions of the Shang-Hai-Nau-Kin line. Active work in all these enterprises, however, has been for the most part suspended because of the European situation. Inclusive of 13,000 miles in Manchuria, the total mileage of Chinese railways in operation in 1915 was 5,960, with 2,273 miles under construction. Railway receipts in 1915 amounted to 50,933,059 taels (approximately $33,106,488): expenditures, 36,558,916 taels ($23,768,495).

People.—The Chinese belong to that variety of the human race which has been called Mongolian, but in them its harsher features, as represented in the genuine Tartars, are considerable. The characteristic of low stature, have small hands and feet (the last often artificially made so small in the females as to become a deformity), an olive or yellowish complexion, much modified by the degree of its exposure to the open air; prominent cheek bones, and a nose pressed upward at the outer extremities, black hair, scanty beard. In bodily strength they are far inferior to Europeans, but superior to most Asiatics, their great assiduity and patient endurance of fatigue making them highly prized as laborers throughout the Indian Archipelago. Some of the finest physical specimens of the race are to be seen among the coolies or porters of Canton. The Chinese are deficient in courage, yet often display great contempt for death. In their moral qualities there is much that is amiable. They are strongly attached to their homes, hold age in respect, toil hard for the support of their families, and in the interior, where the worst kind of foreign intercourse has not debased them, exhibit an unsophisticated and pleasing simplicity of manners. In the great mass these qualities are counterbalanced, or rather subordinated, by numerous vices—treachery, lying, gambling, opium-smoking, etc.

Education and Philosophy.—The Imperial treasury department of China in 1910 published an official census of China in connection with a readjustment of the impost duties that are destined to pay its war indemnities. It appears from this census that the empire contains 426,040,000 inhabitants, and that China Proper—with its 18 provinces—contains 407,330,000. In the provinces, the number of inhabitants per square mile is greatest in Ho-Nan and least in Kan-Su. In the dependencies the density of population is far less. In the North China Proper is about 800 per square mile. The population of the United States as a whole is about 20 persons per square mile. The population of China Proper is about 800 per square mile. If the whole population of the United States and 40,000,000 more were crowded into the State of Texas the density of population would be about equal to that of the Yangtse Valley and of the plains extending north and south between the lower courses of the Yangtse and the Hoang rivers. Ngn-Hui but a little larger than New York State has more than three times the population. Che-Kiang province, slightly less than area than Kentucky, has more than 10 times the number of inhabitants, and between Kwan-Tung and Kansas the ratio is 21 to 1.

No census figures based upon official returns are obtainable for the dennitement of the nature of the population in these regions makes even a close estimate difficult. The data for 1910 may be given approximately as follows:

426,040,000

Religion.—Judging by the multitude of temples and joss-houses seen in every quarter, and the endless number of ritual acts performed on high festivals and in the ordinary intercourse of life, the Chinese are a most religious people. The religion of China is Confucianism, founded by Kung-Fu-Tse or Confucius, about 550 B.C. Another religion is Taoism, introduced about the same time by Lao-tze, and numbering a good many adherents. (See Confucius, Lao-tse.) Among the great mass of the people a form survives, or a curious mixture of religious ideas and forms. In the conduct of daily life they are under the dominion of innumerable superstitions, living in dread of demons whom they constantly endeavor to ward off or appease. Their belief in feng-shui, or the influence of "aspects," works against the introduction of railroads and other modern improvements. Attempts to introduce Christianity were made by the Nestorians as early as the 6th century, but the celebrity of the Jesuit missions has thrown all others into shade. The Roman Catholics now claim to have about 1,000,000 adherents among the Chinese. Various Protestant bodies carry on missionary operations in China. There are now probably over 50,000 native Protestants. During the Boxer massacres many native Christians were martyred.
this official system, of purely literary competition for appointment to office, had become in effect little more than a method of training the memory and for producing experts in penmanship, while educating the literary tastes. Such a discipline, however, bore slight relation to the exercising of the judgment, to the provocation of original thought, or to informing the student concerning the world outside of China, while but slightly fitting him for the practical duties of statesmanship or the exigencies of life. The real function assigned for this official system of education was that all the people, individually and in mass, were presumed to be so well versed in the maxims of Confucius and so thoroughly indoctrinated in ancestral ethics, that both private and public virtue was supposed to be automatic. The clash with Occidental civilization exposed the weakness of this antiquated system, and it came to an end during the revolution, out of which arose the Chinese Republic. For a quarter of a century, this then the multitude of examinations had greatly changed, the reformed curriculum including such subjects as the history of Western nations, political economy, civic administration, finance, taxation and the physical sciences. In the meantime, examination halls, with their hundreds and thousands of stalls, in which students spent days, and in which some might be found dead or exhausted, are now no more, for schools and colleges on Western models have taken their places. Though in one sense the Chinese, who almost worship letters, are the most literary of peoples, probably not 10 per cent can read books; though a much larger percentage of the males know the characters needful in their crafts or trades. Until very recently, female education, so far as it existed, was mainly a private or a family affair. Of late years, largely through missionary influence and example, the education of women has made surprising progress and the tendency is now strongly toward more equality in intellectual training without regard to sex. The second great purpose of education was personal culture, looking to the right conduct of life. China, like all old nations with unique or advanced civilization, had a body of traditional literature to which they first sought. After the dateless evolution of writing, Confucius—the Ezra of China—in the 6th century B.C. collected the literary inheritances of the past and reduced the ancient traditions to systematic and easily communicated form. The literary bequests of the sage, preserved by his pupils, became the textbook of the nation, the basis of family and school training and the social bond of a then comparatively small community. Nevertheless the people thus equipped with a commonplace of culture more potent than the sword, even a deathless literature, was to enter upon a career of expansion and to erect a political structure that should ultimately as an empire include not only China proper but also most of eastern Asia within China's own boundaries. In time this culture influenced also many distant, neighbor, vassal or pupil nations, to whom Great China was suzerain, teacher or model. Mencius (B.C. 372-289) made popular the ethics of the sage, applying them especially to the needs of the individual. He gave his work so democratic a tone and flavor that when, 2,000 years later, Chinese and especially Japanese scholars put the American Declaration of Independence and the Constitution of the United States, they thought that surely the barbarians must have studied Mencius! It is no wonder, therefore, that the first universal Emperor, Shih Huang Ti (256-210 B.C.), who abolished feudalism, built the Great Wall and unified China in imperialism, and in what he perhaps meant to be benevolent despotism, ordered, as tradition loves to state, the destruction of literature and the decapitation or exile of hundreds of scholars. The reformers of scientific mind remembering that Shi Wang Ti was a centralizer and unionist of strenuous proclivities, use freely the salt of critical opinion here. The reputed tyrant acted less from hatred of literature as such than fear of the democratic sentiments of Mencius and of the ultra-conservatives, who, though men of letters, were rather too bigoted adherents of feudalism and their feudal patrons and hopelessly wedded to old-time notions. Under another dynasty, early in the 6th century, ancient texts were recovered, ink and paper replaced the iron stylus and the bamboo slats and civil service examinations were established. Then in succession followed Buddhism, the study of Sanskrit and the printed books of India— to issue later in the blending of Mongol and Hindu ideas— the foundation of the Han Lin or Imperial Academy (Forest of Pencils), printing by means of cut blocks and later by "living" or movable types (made not indeed of zinc and antimony but of various materials) the compilation of dictionaries and encyclopedias and the creation of the drama and the novel. The era of the Sung dynasty (960-1126) was the Augustan or Golden Age of literary splendor. Whole libraries of books, on a multifarious variety of subjects, attest the mental fertility of the age. To a large degree, this epoch has been prolonged to our day. It was not, however, until the 11th century that the various systems of Confucianism, Taoism, Buddhism clashed in a contest that for a generation threatened anarchy to the whole empire. During a time of apparently boundless national prosperity a school of politicians arose (A.D. 1021-1066) with socialistic or populist notions which they first sought to engraft on existing literature and then proceeded to put into practice. Their theories and methods show a startling resemblance to modern discussions and experiments. At their acme of temporary success they demanded the overthrow of existing institutions. Against these innovators, a school of writers and party agitators arose (1099-1086) in opposition, who contended for the ancient principles of the sages. At first the radicals won, but after some years the people demanded the return of the old order and the conservatives gained power. This bloodless struggle compelled deep thinking on vital themes. After a generation of thought, a re-statement of the old faith, or neo-Confucianism, issued (1130-1200) in which it seemed as though all systems had entered and passed through the crucible and taken the form of a creed. No longer a mere ritual, or phase of philosophy, the new system of belief, which has since influenced half of Asia, showed itself to be a fusion of Taoism and Buddhism with Confucianism, or Universism, as the chief element; for in this neo-Confucianism, the ethics of the sage are paramount. Yet this
"medley of pantheism" is a true creed, which, in both China and neighboring nations, has been often enforced with a cruelty quite equaling that of the southern European. To-day, against this creed Mohammedanism and Christianity concentrate their forces. The compromise made by the State through Yuan Shi Kai and his supporters, seems to be much like that of those persons in the State churches of Europe and among ourselves, who, while subordinating dogma and the peculiarities of sects, conform partly to mild ritual and forms supposed to be needed for upholding society and keeping control of the masses. Modern science, while seriously disturbing some of the elements in the "pantheistic medley" of the modern Chinese gentleman's creed, seems on the whole to harmonize finely with the ancient ethics, which seem also to the average Chinese man to be so pleasantly modern, while capable of being merged into the rising tide of Christianity.

Customs, Manners, Dress, etc.—Among the Chinese people elegance is carried to an extreme. They scrupulously avoid all contradiction in conversation, and are careful not to use any offensive or irritating expressions. From the same source arises the tedious, frivolous and often burdensome and extravagant compliment for which they are remarkable. But even here a wish to please and gratify is sufficiently evident. An invitation to dinner is written on a slip of red paper, and is sent some days before; it is usually in this style: "On the ______ day a trifling entertainment will await the light of your countenance; Tsau Sanwei's compliments." This is followed by another card naming the hour. The dinner itself is sumptuous, wine and spirits are drunk freely, and the whole affair goes off with a great deal of boisterous merriment. Fresh pork, fish and fowl form the staple articles of food, with vegetables of various kinds. Beef and mutton are rare. Opium and tobacco are in common use. The usual beverage among all classes is tea, of which the Chinese consume enormous quantities.

In ordinary cases, strict separation prevails between the male and female branches of a household. Betrothment is entirely in the hands of the parents, and is conducted through the medium of a class of persons called mei-jin, or go-betweenes, whose office of matchmaking is considered honorable. The marriage itself is conducted with much ceremony, pay processions and other convivialities. Besides, one wife, strictly so-called, a man who can afford it may have several subordinate wives. A wife may be divorced on several grounds that we should deem frivolous. Infanticide is common among the very poor, the female children being almost the only victims.

The return of the new year is an occasion of unmixed festivity and hilarity in China, and New Year's Day is a universal holiday for rich and poor. At this season all accounts are expected to be adjusted, and if this is delayed or neglected the creditor has sometimes recourse to the expedient of carrying off his debtor's door. On New Year's morning all shops are shut, and this usually continues for several days. There are also various festivals throughout the year, most of which are universal in China. Porters play by the wayside waiting for employment; and hardly has the retiree of a great official seen the latter enter the house when they pull out their cards or dice and squat down to a game. Dress, like other things, undergoes its changes in China, and fashions alter there as well as elsewhere; but they are not as rapid or as striking among European nations. Regarding dress, there are certain restrictive laws in operation. The mandarins or officials have some special peculiarities of dress, and their respective ranks are indicated by the nature of the knob or button they use. Pig tails, often carried in the hair, the wearing of the queue or pig-tail, perhaps the most noticeable external peculiarity of the Chinese as regards costume, was a sign of loyalty to the Manchu dynasty, but with their deposition and proclamation of the republic, is now a thing of the past. The headdress of married females is becoming, and even elegant. The copious black hair is bound upon the head in an oval-formed knot. No caps, bonnets, hoods, or veils are worn abroad; a light bamboo hat, or an umbrella is the custom. Part of an extraordinary practice, peculiar to China, of compressing the feet of females (especially those of the better class) into unnatural form and dimensions is now rapidly passing away under the influence of things, since the republic was ushered in.

Dwellings-houses are generally of one story. The common building materials are bricks, slat earth, matting or thatch for the walls, stone for the foundation, brick tiling for the roof and wood for the inner work. The fronts present no opening but the door. The walls are often stuccoed, but not painted, and the bricks are occasionally rubbed smooth with stones and the interstices pointed with fine cement. The general interior arrangement of a Chinese dwelling of the better sort is that of a series of rooms of different dimensions, separated and lighted by intervening courts, and accessible along a covered corridor, communicating with each, or by side passages leading through the courts. Streets are generally so narrow as to be mere lanes. The most characteristic Chinese structures are the pagodas, built generally with a number of stories, each marked off from the rest by a peculiar projecting portion.

Government, Laws, Army and Navy, etc.—In our supplementary remarks we have glanced at the abolition of the Manchu system of government, which was a modification of the older Chinese system and at the reforms made under the republic, but it is more than probable that much of the old routine in administration will remain. The provinces, either singly or by twos, are under a governor and sub-governor, and each province has also a chief criminal judge and a treasurer. Particular magistrates preside over particular districts and cities, and instead of being permanent are changed about once in three years. The great object aimed at is to maintain a strict surveillance and mutual responsibility among all classes; in other words, to bring the people in fear of the government and infuse a universal distrust. The chief protection of the people is in a body of laws, called Ta-Tsung-Liuh-Li, that is, "Statutes and rescripts of the great pure dynasty," resting on Confucianism, and all agreeably to which, with occasional violations, all public functions are discharged. The new
CHINESE COUCH AND FURNITURE
code of laws that is being drawn up for the Chinese republic is to be based on a Japanese professor of law. The old distinctions of Manchu and Chinese have, however, been abolished and the reorganized national army, equipped with modern weapons and appliances, has shown its effectiveness in recent years quite satisfactorily. Number of Khans, foreign mounted on the fortifications; and there are arsenals superintended by Europeans. The navy contains several cruisers and other war vessels of the modern type, but the Chinese lost their most powerful ships in the war with the Japanese, and their navy is now of comparatively little strength. Three protected cruisers were built in 1897 in Germany for the Chinese fleet, and several sea-going torpedo boats, ordered before the war, have been also added. The revenue of the republic is derived from customs, excise and the land and salt taxes. Calculating on the basis of statistics for 1901, if the customs duties, including the sum payable in lieu of the fikin or in land-transit dues, he computed at about 500,000,000, if payable in gold, would be about $20,000,000.

China had a national debt before the war of 1894–95, and at the close of that contest she assumed a new indebtedness of $167,500,000. The Burgess amount, while the foreign powers were to receive by way of indemnity for the Boxer outrages in 1900 was $337,500,000, payable in 39 annual instalments. The whole of the Chinese customs revenue, if payable in gold, would be equivalent to about 6 per cent of the indemnity.

History.—The early history of the Chinese is shrouded in fable, but it is certain that civilization had advanced much among them when it was only beginning to dawn on the nations of Europe. The names of numerous dynasties belonging to a period two or three thousand years before Christ are still preserved, but how much, if any, of their early history is authentic, cannot be determined. The Chow dynasty, which was founded by the Emperor Ku, was overthrown in 1100 B.C. by the Shang dynasty, which was succeeded by another called Chou. The Chou dynasty was overthrown in 221 B.C. by the Emperor King Shih Huang Ti, who founded the great empire of the Han dynasty. He united China under one authority and in doing so was aided by the Confucian teachings.

The Chou dynasty was overthrown in 221 B.C. by the Emperor King Shih Huang Ti, who founded the great empire of the Han dynasty. He united China under one authority and in doing so was aided by the Confucian teachings.
new dynasty, which he called that of Tae-Ping, or Universal Peace. After the capture and execution of Tien-Te his place was taken by Hong-Sin, who identified Shan-Ti with the God of Christianity, and regarded himself as called of God to make the old true religion of China again predominant. For a long period the insurgents succeeded in maintaining their ground against the imperial forces, and it was not till after the lapse of several years that the latter were enabled in some degree to quell the uprising. Hong-Sin and his adherents maintained their organisation by the victorious party, and the wholesale massacres perpetrated on the insurgents, they were unable to stifle the spirit of revolt. In October 1856 the crew of a vessel belonging to Hongkong were seized by the Chinese on the allegation that they had been concerned in a piratical attack on a Chinese vessel. The men, on the remonstrance of the British authorities, were afterward brought back, but all reparation or apology was refused. The attitude taken by this matter led to a declaration of war, and in 1857 the Chinese fleet was almost totally destroyed, and Canton was taken by the French and English troops. A treaty was at length concluded with Lord Elgin on behalf of the British, by which important privileges were secured; but an attack on the French and English ambassadors who were on their way to Peking to have the treaty ratified by the Emperor led to the renewal of the war. The allied forces marched toward Peking, and after twice defeating the Chinese troops entered the city. This brought the Chinese to their senses, and the treaty was ratified. Meantime the T'ai-Ping rebellion had been gaining strength, and the trade of Shanghai and Canton was materially interfered with. The British thereupon decided to assist the Chinese in quelling the insurrection, and the services of a young engineer officer, Capt. Charles Gordon ("Chinese Gordon," afterward so well known in connection with the Sudan,) were lent to the government for that purpose. The rebels were gradually driven from their posts and in July 1864 Nanking, their last stronghold, was taken. But the empire was still disturbed by rebellion in other parts. The Chinese, in Turkestan, wishing to take advantage of the weakness to which the Chinese government had been reduced by the T'ai-Ping rebellion, revolted almost simultaneously, but apparently independently, with those in the province of Yunnan in the southwest. In both cases the rebellion resulted in the temporary separation of the provinces from the empire. In 1883 hostilities broke out between China and France in consequence of the warlike operations of the latter in Tonkin and her claim to the protectorate over the country; but the matter was arranged early in 1885. In 1894 war broke out with Japan in connection with Chinese misgovernment in Korea, and in this struggle Japan had almost an uninterrupted success both by land and sea, driving the Chinese out of Korea and invading China at several points. Peace was concluded in 1895, China agreeing to give up Formosa and pay a large indemnity to Japan, to open additional ports to foreign commerce at certain places, to recognize the independence of Korea. In the autumn of 1897 two German missionaries were murdered in the province of Shan-Tung, and the admiral commanding the German squadron on the China station immediately effected a landing in the bay of Kiao-Chau, which, after much discussion, was finally leased to Germany early in January 1898. This acquisition of Chinese territory by Germany attracted much attention among other powers whose territory might be affected. It was followed at brief intervals by the leasing of the town and harbor of Port Arthur in the Liao-Tung Peninsula to Russia, and the leasing of the bay of Wei-hai-Wei to Great Britain. On 22 September of that year Great Britain in the newly acquired spheres of influence, with special reference to the treaties existing between China and the United States, advising that China be regarded as hereinafter as an open market for the world's commerce, and that all possible steps be taken to establish much-needed administrative reforms and to preserve and strengthen the imperial government in its integrity. On 20 March 1900 Secretary Hay announced that all the powers concerned had accepted the proposals of the United States, and that he would consider their consent final and irrevocable. In May 1900 a secret society, colloquially known as the *Boxers,* rose in the provinces of Shan-Tung and Pe-chi-Li and massacred native Christians and European missionaries. The Boxers were encouraged by the empress-dowager and the palace-party at Peking, who placed themselves at the head of a movement directed against foreigners. The ministers at the Empress's request asked the British and Americans to desist from any further action, Macdonald being at the time of the British legation—determined to requisition guards for their protection, and these arrived on 31 May. On 4 June the Boxers destroyed the Peking-Tien-Tsin Railway, and by cutting communications isolated the Europeans in Peking. Soon after the chancellor of the Japanese legation and Baron von Ketteler, the German Minister, were murdered in the streets. In hope of relieving the legations, Admiral Seymour put himself at the head of 2,000 European troops and blue-jackets and set out from Tien-Tsin for Peking, but had to retire. Meanwhile the Chinese had been manning the Taku forts at the mouth of the Pei-Ho, and making preparations for closing the entrance to the river. The commanders of the allied fleets—British, French, Russian and German—in the Gulf of Pe-chi-Li summoned the Chinese commander to surrender. He refusing, they opened fire on the 17 June, bombarded and destroyed the forts. The allied forces were again reinforced by the independence of Korea. On 23 June, and the native portion of the city was taken on 14 July. All this time the legations at Peking were closely besieged and con-
stantly bombarded. The smaller legations having been destroyed or rendered untenable, their occupants, together with a number of natives, took refuge in the British legation, which, from its extent and strength, offered a better prospect of protection. The legation was ill supplied with provisions, and the defenders were reduced to extremities, when the relief force of 12,000 men, comprising British, American, French, German, Russian and Japanese troops, captured Peking on 15 August. Before the arrival of this force the empress-dowager and her court, with the Emperor Kwang-Su, had fled from the capital, and it was impossible, with the troops and transport available, to overtake them.

Troops of various nationalities had been dispatched from Europe to North China with all possible haste, and Count von Waldersee, the German commander, had been accepted by all the allies as commander-in-chief, but international jealousies soon made themselves apparent, and complications seemed likely to ensue. In October 1900 it was announced that Lord Salisbury was to go to Germany by which the two powers bound themselves to the principle of the open door in China, to abstain from seeking to obtain for themselves any territorial advantage, and to take such steps as might be agreed on for the protection of their interests, as against any other power seeking territorial aggrandizement. Subsequent military operations consisted chiefly of punitive expeditions to the south and west. Negotiations for the payment of indemnity in the USA were not urged on, and on 4 December the powers sent a joint note to the Chinese peace commissioners, demanding among other acts, the execution of the leaders in the massacre of foreigners and the payment of an indemnity, which in October 1901 was fixed at $735,000,000. On the ratification of the indemnity agreement, the foreign troops were withdrawn from Peking. Later, through the good offices of the United States, the indemnity was reduced, being fixed at $37,500,000.

After the Boxer episode the Imperial Court returned to Peking and again assumed governmental powers. Yet, while the dynasty was showing a disposition to reform abuses and conform to the world's general customs and laws, two currents of influence were at work from the Manchus. The idea among diplomats and writers from 1902 to 1908 seemed to be that of the imminent "break-up of China," while the determined purpose of the newer generation of enlightened natives was to have a new China with a new form of government. Meanwhile Russia and Japan were moving to their clash in Korea and Manchuria. The vital question to the Chinese millions, however, was this—dismemberment by foreigners, or the five countries maintained in unity—whether under empire, constitutional monarchy or republic. Which?

All question of the "break-up of China," its dismemberment and division as spoil among alien Powers, all suggestion ofigroup of foreign "colleges" in the United States of America, through the logic of events, entered the field of Far Eastern politics as a power to be henceforward reckoned with. This was especially manifest in the negotiations resulting from the Boxer riots. The action of Admiral Lewis Kemp, U.S.N., following the precedents set by President Washington, in his refusal to join with the allies in making war on China by attacking the Taku forts, when as yet no hostile shot was fired by a soldier or sailor employed by the Chinese government, was fired, gave the Americans the "inside track," making China ready and glad to listen first and accede to whatever the United States proposed, in good faith or otherwise. The Americans set the precedent to all the powers, of prompt evacuation and retirement of their military forces, thus teaching that China must work out her own salvation. The old policy of European predatory aggression was further disapproved and the unprecedented settlement since the foundation of the American government, of considering the Asiatic nations, not as material for conquest and spoil, but for humane treatment and fair dealing, was followed. Not only was the outrageously heavy indemnity demanded by the Powers reduced one-half, but, after satisfying all possible demands for loss by the Boxer rioters—the missionary societies for the most part waiving or declining to make claims—the sum of $13,000,000 was set aside, to be paid back to China. Under this arrangement, at the suggestion of the Washington government, nearly a thousand young men and women, appointed after competitive examinations, have been sent to the United States to be educated. Distributed in our schools, colleges and universities, these young people have cut off their queues and adopted the costume and clothes which are now becoming uniform throughout the world. Through the Cosmopolitan Clubs now so numerous and other means of culture they have gained knowledge of the world at large.

Greater in influence on China, even than the United States, has been Japan, especially since that military clash, in 1904-05, between organized intelligence and the ignorance of despotism, manifest in the Russo-Japanese War. In the one case, an army and navy, in which practically every man could read and write, made proof, in the field and at sea, under scientific leaders, of what Japanese soldiers and sailors are capable. The struggle was not one of religions, or races, or civilizations, but of equally brave men under varying capacity of leadership, and was virtually the victory of education over illiteracy, of preparation and experience over ignorance. While the battle of Mukden was pending, the writer made prediction that if the Japanese, victorious as they were sure to be, guarded from loot or dishonor the tombs of the Manchu dynasty at Mukden—in Chinese ideas, blessing or cursing of ancestry or spirits, whether of Mikado, Son of Heaven, or common folks being vastly more significant than in the case of contemporaries—they would have the heart of China in their hands; in a word, that the Chinese would look at once to the Japanese as their models and teachers. As matter of fact, before they had fully attended to their own wounded, the Japanese set a guard around the Manchu tombs, which were kept inviolate. Thereupon, victory being assured and known throughout China, none of the Peking government assent cordially to the provisions of the Portsmouth treaty (q.v.) in which it had no part, promising Count Komura faithful co-operation, but from all over China students at once crossed the sea to Japan, until
the schools in Tokio were embarrassed by the largeness of the invasion. No fewer than 20,000 Chinese young men and hundreds of girls, from 1904 to 1910, studied in Japan from a few months to six years. The overwhelming majority of them were found to be, in the eyes of the Peking government, seditous, and many were openly plotting to destroy the Manchu dynasty. Returning home, they began direct agitation for a change of government, this time in co-operation, financially and morally, with their countrymen in America, Hawaii and other lands. From the first the note of their public harangues and secret meetings was this—

"Let us gain the world's sympathy. Refrain from injury to the life and property of the foreigners. If we do not, our cause is lost. Let us strike at the Manchu dynasty, and make clear our object to the world, acceptance of modern conditions; friendship, not isolation."

The last of the 35 or more (general or local) dynasties that ruled China was the Ching. It was begun by Man, or Manchu, who were Tartar chieftains began to be powerful about A.D. 1500. Summoned early in the 17th century by a faction of the Ming emperors, to help in a civil struggle, these men of the horse and tent rode into China like a whirlwind. Once in and securing victory for their patrons, and seeing at once the wealth and weakness of the land, they refused to return. In 1644 the Ming dynasty ended. Beginning the conquest of the empire, the Manchus compelled all subjects to shave the fore-skull and adopt the queue, as the symbol of loyalty. The Manchus camped in China as the Turk in Europe, virtually monopolizing the military and most of the civil offices and revenues, keeping apart from the Chinese, but in time yielding to luxury, weakening in their primitive race-fibre, losing their language and customs, and virtually being conquered by the superior brain and ability of the people they ruled. At first the Manchus seemed to be "the most improbable race in Asia," but in the end, while the Chinese yielded notably to the spirit of the age, the Manchus appeared for the most part incapable of responding to the necessities of the modern world. Reformers and thinking men saw that their continuance in office boded disaster and meant the ultimate pillage of China by foreigners. Young men educated abroad, on coming home, found the situation intolerable. Already two generations of reading people (probably 8 or 10 per cent of the whole population of the empire) had been enlightened; first, by the teachings of Christian missionaries; second, by the floods of printed matter, in Chinese, sent out by the Society for the Diffusion of General and Christian Knowledge, in which books on science, true history and biography of famous men and women of the West were numerous; and third by those tens of thousands of Chinese who had lived abroad. The death of the Emperor and Empress Dowager, in November 1908, and the appointment of Prince Chun as regent of the infant named to fill the throne hastened the inevitable. The Peking government, attempting to read the signs of the times and yielding to pressure, promised a modern constitution and a national legislature, sent commissions abroad to study systems of government, but postponed the day for several months. Embroidered in the Diet, which would mean in effect the transfer of power from the Manchus to the people. This postponement, with the dismissal of Yuan Shi Kai from all his offices, as the result of a Manchu reaction, served only to irritate the revolutionists and to precipitate their action. Now appeared a leader, a Christian and a man of science, the physician, Dr. Sun Yat Sen, converted in an American Congregational church in Hawaii and long a resident in America and in London, in which city he had been kidnapped by minions of the legation, but released on the instant demand of the British government. With extraordinary powers of reticence, organization and influence he spoke and acted at the right moment. In the main he represented southern China. Probably seven-tenths of the new men, working for the reform of China, were educated in the United States. In the north, the man of destiny was Yuan Shi Kai, a worthy pupil and successor to Li Hung Chang. Meanwhile the elections to and formation of provincial assemblies proceeded, following the Japanese precedent for or Manchu, whose Tartar chieftains began to be powerful about A.D. 1500. Summoned early in the 17th century by a faction of the Ming emperors, to help in a civil struggle, these men of the horse and tent rode into China like a whirlwind. Once in and securing victory for their patrons, and seeing at once the wealth and weakness of the land, they refused to return. In 1644 the Ming dynasty ended. Beginning the conquest of the empire, the Manchus compelled all subjects to shave the fore-skull and adopt the queue, as the symbol of loyalty. The Manchus camped in China as the Turk in Europe, virtually monopolizing the military and most of the civil offices and revenues, keeping apart from the Chinese, but in time yielding to luxury, weakening in their primitive race-fibre, losing their language and customs, and virtually being conquered by the superior brain and ability of the people they ruled. At first the Manchus seemed to be "the most improbable race in Asia," but in the end, while the Chinese yielded notably to the spirit of the age, the Manchus appeared for the most part incapable of responding to the necessities of the modern world. Reformers and thinking men saw that their continuance in office boded disaster and meant the ultimate pillage of China by foreigners. Young men educated abroad, on coming home, found the situation intolerable. Already two generations of reading people (probably 8 or 10 per cent of the whole population of the empire) had been enlightened; first, by the teachings of Christian missionaries; second, by the floods of printed matter, in Chinese, sent out by the Society for the Diffusion of General and Christian Knowledge, in which books on science, true history and biography of famous men and women of the West were numerous; and third by those tens of thousands of Chinese who had lived abroad. The death of the Emperor and Empress Dowager, in November 1908, and the appointment of Prince Chun as regent of the infant named to fill the throne hastened the inevitable. The Peking government, attempting to read the signs of the times and yielding to pressure, promised a modern constitution and a national legislature, sent commissions abroad to study systems of government, but postponed the day for several months. Embroidered in the Diet, which would mean in effect the transfer of power from the

Manchu dynasty.
empire are conservative and opposed to innovations. The first troubles of the new state came from mutiny, riots and looting by the unpaid troops. At least $300,000,000 are needed to support the army, to maintain public works and national development on a large scale. Months of trouble and anxiety followed, because the six powers, Great Britain, France, Germany, the United States, Italy and Japan, were too much to bear and to impose necessary money to China, imposed hateful conditions — viz., the right and power to dictate how the money should be spent and to have foreigners on the board of audit. This, to the Chinese mind, means not only loss of national sovereignty, but sooner or later, foreign intervention. Stiffened by the precedent of Japan in 1865 and 1868, when money was borrowed in London by free men, at 10 per cent, rather than at 4 or 6 per cent, with political dictation, in order to maintain the sovereignty inviolate, China waits before accepting the gifts of the Greeks. Sun handed over the seal of the Republic to Yuan Shi Kai, who had been elected President of the Chinese Republic in November, 1911.

The provisional government was much centered in the personality of Yuan Shi Kai. The man of power and poise was a thoroughly typical Chinese, having never been outside of China except in Korea in 1882-85. He was to be the one-man President of the Chinese Republic, for a period of 3 years. Yuan Shi Kai was made President of the National Convention, under which a national council was to be called and a permanent president chosen by a two-thirds majority in a session at which three-fourths of the members were present. The term of the provisional government was fixed at six months, at the end of which time Yuan Shi Kai, as he declared in beginning his administration, would either retire or seek reelection. The names of the chief departments were changed and great reforms were proclaimed. These to some extent were put in force. The new premier and cabinet officers were chosen on the theory of a coalition of sections, parties and interests. Until the new Parliament should be elected, the functions of such a body were performed by a National Council, composed of five members from each province chosen by the provincial assemblies. This Parliament was to consist of a House of Representatives of 966 members, chosen by those male citizens over 21 years of age who were eligible to vote at the polls; a Senate, which was to have 274 members, elected by the provincial assemblies or electoral bodies in Tibet, Mongolia and Turkestan. The army, navy and departments of justice and education were to be reorganized.

The Nanking Constitution, accepted by Yuan Shi Kai, while it defined the provisional president's powers, did not fix his term of office or settle the method of the election of future presidents. On 10 March Yuan formally took the oath of office and the seat of government was transferred from the Southern capital to the Northern capital, that is from Nanking to Peking. On 29 April the new Parliament, or National Assembly, of the Chinese Republic was formally opened; 177 senators and 500 representatives being present. Most of the delegates from the provinces of China proper were dressed in black coats of the European style. The other divisions, Mongolia and Tibet, were well represented. Dissensions in the Cabinet were developed, rising and subsiding in which the President and the Southerners, or Cantonese, were in opposition to each other on the question of Cabinet formation. The Southrons insisted that there should be government
by party, the Cabinet to be either wholly neutral or formed from one of the three parties then existing, and that the ministers of one of them, the Tungmenhui, should resign their portfolios. To this Yuan Shi Kai was opposed and he gained the victory. The retiring ministers then allied themselves to another party in opposition to the government. During the ensuing summer numerous local outbreaks broke out in southern China. In August, when a plot against the Republic was unearthed, two of the leaders in Peking were arrested and summarily shot. The Parliament made severe criticism of this act of the chief executive, but when Yuan made public the full facts, a majority of the members justified him, and on 6 October Yuan Shi Kai was elected by the National Assembly permanent President of the Republic, no limit being set to his term of office. On this same day, Russia and Japan formally acknowledged the Chinese republic, the United States and some other countries making no move in this direction.

It was hoped at home and abroad that by the co-ordination in harmony of the legislative and executive branches, a true republican government in China would be the result. Yet here China's initial experiences tallied with those of Japan's, showing how much alike are human experiences in the application of political science. In Kyoto in 1868, in the re-bound from despotic one-man power of the Shogun and in compliance with the oath of the Mikado, put into his mouth by liberal revolutionists, a deliberative assembly was called and twice in 1869 and in 1870, met in Tokio. Members being utterly without experience and ignorant of the problems pressing upon the nation for quick solution, the gathering became first a mere debating society and then an obstructive force, hindering good government. It was dissolved and no national assembly was called again, until after violent agitation, in 1889, or 21 years later. Moreover, many of the men who led in the revolution of 1868, which placed the Mikado in supreme power, had hoped for a limited monarchy after the English fashion, with the sovereign responsible to the Parliament. Instead of this, arbitrary government by a bureaucracy, or committee of a few ministers held its own and ruled the empire until 1889. Exemplary and idealistic, the Liberal, after a generation of agitation, felt themselves betrayed by the men who had so long and exclusively held the power, in that the Prussian instead of the English model had been followed and that all the legislative powers of the Imperial Diet comprised a mere fraction of what had been hoped for. China, in 1912, not only lacked the experience of the other nations, in which a republican form of government has been successful, but even that preliminary intellectual preparation, through philosophy and the critical study of history, that had lent such power and so admirably fitted the Japanese leaders to change the system in vogue for over 600 years. From the start, without understanding the pressing problems facing the nation, the one purpose of the Chinese Parliament of 1914, especially among the Southern members, seemed to be to hamper the President in every possible way, preventing his obtaining the necessary money for national reconstruction, to reduce him to a mere figurehead and to place all power in the hands of the Cabinet. The action of the President in signing the First Treaty annexing Kwantung to Japan, without consent of the National Assembly, was repudiated by a large majority in the votes taken 29 April and 5 May. The truth between the two parties now ended and threats were made of a second revolution in the South. Yuan answertd these by red in southern China. In August, when a plot against the Republic was unearthed, two of the leaders in Peking were arrested and summarily shot. The Parliament made severe criticism of this act of the chief executive, but when Yuan made public the full facts, a majority of the members justified him, and on 6 October Yuan Shi Kai was elected by the National Assembly permanent President of the Republic, no limit being set to his term of office. On this same day, Russia and Japan formally acknowledged the Chinese republic, the United States and some other countries making no move in this direction.

No quorum being left for business, Yuan nominated 71 members of the Assembly to form an Administrative Council. This body, legislative and advisory, was to take the place of or represent the Premier, the Cabinet, the nine ministers and the provinces. With this body Yuan exercised full government powers and, with the approval of its members, issued on 11 Jan. 1914 a proclamation dissolving the National Assembly and, later, the district councils in the provinces, as being seditious in character and as hindrances to national administration. In a new draft of the constitution, amended by a convention of his own nominees and published 1 May 1914, the power of the President is increased by his virtual domination of the single-chambered legislature, which has no more control over the "fixed expenditures" prepared by the government, than has the Imperial Diet of Japan. An advisory council was abolished, but a "Council of the Cabinet and all authority over the provinces and the army and navy is centralized in the executive. It was this concentration of power that enabled the government to suppress with comparative ease the uprising in the south, organized and led by Sun Yat Sen.

In the industrial and financial spheres, matters improved through the more efficient system of taxation in the provinces, returns from the salt tax, the extinguishment of loans. Concessions for further railway building were granted to foreigners, French and British, and the British and Chinese corporation and for the exploitation of the oil wells in Chi-li and Shen-si by a Chino-American company. The suffering and distress problems were lessened. Buildings were provided for in arrangement with the American Red Cross organization, the idea being prevention as well as cure. During May and June 1915 a commercial delegation of 18 honorary commissioners from the Chinese cities visited the United States and was well
received, while preparations on a large scale were made for the development, especially of the soil and agricultural resources of Manchuria with a view to self-sufficiency.

China has always been a church nation and religion an affair of state, dully graded, provided for and safeguarded, the Emperor in the great temple of Heaven in Peking, worshipping with imposing sacrifices the supreme impersonal power, the people under their several governors paid homage to the spirits of Heaven and Earth; and the common people rendered honor to their ancestors. Apart from ritual and social ethics, Chinese religion may be defined as Universalism, through which man is expected to be in obedience to and in harmony with the universe and the laws which govern it, to make recognition of its order, to observe the seasons and in all human relations to be in mutual obligation and dependence upon each other. In a word — the word which Confucius consecrated — reciprocity is the keynote of the harmony of China's social system, which means each individual consecration to human brotherhood. The sudden change from monarchy to a republic involved a double duty: the ethical bonds holding the nation together.

In accordance with Chinese habits of thought the necessity of official sanction and encouragement to law and order was quickly and keenly felt, though nothing had been said about religion in the provisional constitution. Yielding to this demand, President Yuan proposed in 1913 the establishment of the ancient Confucian system, but this was stoutly opposed by the men of other religions, Buddhist, Mohammedan and Christian. A certain amount of compromise seems to have been made by Yuan as representing the nation, when, solemnly entering the great temple in Peking, he paid homage and offered sacrifice to Heaven, and proclaimed anew the old system, in so far at least as duties to the State are concerned. At present among leaders of thought, Chinese ideas as to religion are in solution or process of transition. In judging of this, as of all measures affecting the mass of Chinese, the answer is a question of time: the majority of people are governed by the force of tradition and habit, only a small fraction being interested in any reform or radical change that disturbs the daily routine of life, which for them finds its best comfort in Universism.

The outbreak of the World War in 1914 made Chinese territory again the scene of conflict. Under pressure from her ally, Great Britain, Japan sprang joyfully to the double task of settling several old scores with Germany and of eliminating German occupation and influence not only from China but from the eastern hemisphere. In short, Japan proved herself an apt pupil in all the European methods so long employed in the Far East. She was quite ready to enforce, at a sacrifice of blood and treasure, her new version of the Monroe Doctrine; withal, more than willing to practise on the Chinese those arts of diplomacy backed by strength which European nations from over a century made use of on China and old Japan.

With her fleet and army equipped with the latest modern resources of offense in the high air and the deep sea and on land and water, the plan was to capture Tsingtau, on which the Germans had expended $60,000,000 and to control the lines of traffic in Shantung which radiate from this seaport. Against the protest of Chinese troops under General Kamio were landed and marched inland 150 miles north of the prosessed objective, thus violating the neutrality of China. The activities of blockade, march and siege, lasted from 11 September until 11 November, when the army under Liu Pu-yi marched into Tsingtau. The Japanese victors found a model city, with fine architecture, hospitals, pavements, sewers, perfect sanitation, which in 1913 had a population of 60,484 souls, 55,672 being Chinese. From 1903 to the outbreak of hostilities commerce had increased tenfold. It was now to be seen what disposition would be made of the prize of war, which, as the Japanese government had acknowledged before the world, belonged to China. Against the spirit, method and details revealed in the unfolding of the policy of the new trespassers on her soil, China made protest, declaring that her sovereign rights had been ruthlessly violated. In preparing political morality these fresh aggressors, despite professions of good faith, showed no more conscience or mercy in diplomacy or actions than European powers during the previous century, or in any of China's numerous humiliations. Being virtually without a navy or army — all the available Chinese troops having been utilized to prevent threatened revolutionary uprisings in the southern provinces — China had to submit to the violations of her sovereignty as ordered from Tokio. The custom houses and conquered area were put under the control of Japanese officers. These aggressions were followed on 18 Jan. 1915 by the presentation of 21 peremptory demands from Tokio, the Japanese Minister, Mr. Hoki, presenting them personally at night and directly to the President of the Chinese Republic. Under the plea of "maintaining the peace of Eastern Asia and of further strengthening the friendly relations existing between the two neighboring nations," it was demanded that China should agree to what Japan might arrange with Germany to transfer its rights in Shantung to any foreign power, to open new ports, to extend the leases of Port Arthur, Dairen, and of the railroads to a period of 99 years, to allow an equal voice to Japan in all matters relating to South Manchuria and Inner Mongolia, and her people equal privilege with the natives, to employ Japanese instructors and advisers, to buy 50 per cent of war munitions in Japan, to have arsenals and technical schools worked jointly by the two governments, to allow Japanese to build railways and work mines in specified places and have full freedom for the Japanese to propagate religious doctrines. In explaining to foreign governments, at their request, the meaning of her negotiations with China, Japan replied that of the 21 articles under negotiation, 10 were demands and 11 were requests. After 25 meetings between the plenipotentiaries of China and Japan, the matter was not yet settled in April. Meanwhile the British and Russian diplomatic envoys had made protests and the representatives of the two billions of dollars of British money invested in China, especially in the Yang-tse region, sent complaints to London, warning of the impending danger not only to China but
to Europe. After much had been conceded by the Chinese commissioners, negotiations were at deadlock, while every day the real nature and true details of Japan's "requests" were coming public. One of the points of struggle related to the mines of the Han Yeh Ping region, where are coal, iron and limestone in close proximity. Japan, poor in metals, having sunk millions in yet another steel foundries, was compelled to import 75 per cent of her iron and steel, wished control of these mines in China for her military equipment. Moreover, the Japanese, having seen China and in other lands the part results secured by the employment of foreign experts and advisers, and having herself, in a generation or two, been raised to the position of a world power, largely through the aid of the peaceful army of 5,000 yashi, or salaried foreigners in her employ and in every line of human achievement, from 1870 to 1900, may be said, in this special measure to have introduced into diplomacy the principle we may designate as yashism. In a word, she would imitate her European teachers, the tradition always had a solid substratum of force in dealing with the Orientals and forcing their goods and employees upon them. Finding the Chinese resistant to her demands and warned by her ally, Great Britain, the government in Tokio modified its demands both in tone and amount, and on 26 April made presentation of these, but this time requiring immediate compliance. In answer, given 1 May, China granted the rights of residence, lease and business to the Japanese, refused the long leases, demanded that the Japanese, like other aliens, submit to the laws of China, that Kiao-chau be unconditionally retroceded, and the right of participation in negotiations with Germany after the war be given her, intimating also that this was the final word. In answer, Japan withdrew the most objectionable group of demands, but left open for "future discussion" the negotiations begun but not yet settled. adding, on 6 May, that an answer was desired at once, and the Tokio Government mobilized its military forces for the invasion and coercion of China.

Apart from any question of political ethics, or any attempt at condemnation or justification of Japan, let it not be forgotten that her actions toward China, or that she has done no worse than those against herself, or rather against the insurgents, either of 1868-69, or in the years from 1870, or in the great southwestern rebellion of 1877. Then and now, her force, unwavering determination to modernize herself and to compel China to be modern also, has been shown, as well as her equal zeal in humane efforts after victory. In this, also, she has equaled Great Britain after the Boer War; in a word, Japan imitates the Anglo-Saxon nations.

In China the opinion of the executive council was still divided when, on Friday, 7 May, the ultimatum was received from Tokio, giving 48 hours for decision. Having no military to withstand the aggressor, the Chinese government, now powerless under the Anglo-Saxon nations, had to hand over her sovereign rights. In return for Japan's sacrifice of life and treasure, Kiao-chau, which had been under German control since 1907, was to be handed over to China on conditions that virtually ignored China's sovereignty in the matter. The new peace arrangement gives Japan control of a railway of great strategic importance, with valuable rights and privileges for the Japanese, but probably no greater than for other foreigners. New treaty ports are to be opened, the leases of Port Arthur and Dairen are extended to 1997, that of the South Manchurian Railway to 2052 and the steel foundries given to 2007. What may be the full meaning of the other concessions made to Japan, only time will show.

But this time Japan, while probably succeeding in her supreme and underlying purpose of forcing China to change from medieval to modern conditions and thus furnish, for Japan's advantage, in a better and more speedy way than any other, a market and field of enterprise for her people, also preserved the unity of China and thus forestalled her "breakup" and division by European powers.

A boycott of Japanese goods began which ruined thousands of traders from Nippon, involving a loss of millions, while on 7 May began the "great speech" of Yuan Shih Kai. A Chinese people making for national unification and increase of power to withstand all foreign aggression. All these events weakened in China the prestige of the republican government and the personal influence of Yuan Shih Kai. An agitation in favor of the restoration of the monarchy began and soon assumed dangerous proportions. After consultation with natives and foreigners, Yuan Shih Kai decided that the best form of government for China would be found in a return to monarchy. Expert legal advisers, one of them an eminent American, gave the same opinion—that a republic for China was premature and that a monarchy was best suited to her conditions. Advice was received from Japan on 28 October to Yuan Shih Kai to arrest this movement, the gist of the words from Tokio being that in the present uncertainty of the status of the Powers, owing to the war, any change of government was inadvisable. After officially and with promptness recognizing the Chinese Republic, Japan felt that she was trifled with when a monarchy was proposed. So insistent was this advice that, when a Complimentary Mission to Tokio from Peking, designed to arrange for recognition of the monarchy, arrived in Tokio, 16 Jan. 1916, it was virtually refused an official interview. Nevertheless, an election was ordered by Peking and carried out, the apparent results being overwhelmingly in favor of Yuan Shih Kai being emperor. Preparations for the induction into office on New Year's Day, but this date found the strong man of the empire still engaged in a diplomatic duel with Japan and at the same time confronted by a possible rebellion which promised to involve all southern China, and the formal ceremonies of induction into office were postponed. The opening of the spring of 1916 found the opposition of Japan so strong and the indication of widespread revolt so menacing that Yuan, on 24 March, issued at 1:30 a proclamation deposing the emperor of China and proclaiming the return to republican government. With the confession of sin common to the rulers of eastern Asia, Yuan took upon himself all the faults of the country, and especially the blame of
not opposing the monarchical movement with proper vigor, and officially canceled his official acceptance of the throne on 11 Dec. 1915.

To the judicially minded student, surveying the long perspective of Japanese history, it would appear that China has attempted or passed through almost every form of government known to man, while still preserving the body social intact, two or three things seem plain: (1) that China is an avvil that will wear out, by passive resistance, every hammer that beats it (and Japanese know this far better than Occidentals); (2) that it makes far less difference to her millions what the frame of government may be, while the social bond is so strong and local freedom, as heretofore, is maintained; and (3) that so long as China's classic literature endures, pure despotism cannot exist and the spirit of liberty will survive all native dictators or foreign conquerors.

In local matters, the Chinese are as well fitted for republican government as are any other people, but how to generate sufficient power at the centre is still a problem. One may summarize the needs of China as (1) a strong central government; (2) a separate and harmonious monetary system; (3) a uniform currency; (4) development of her natural resources; (5) elementary education; (6) public works; (7) absolute freedom in religion; (8) philanthropic reforms.

Author of The Mikado's Empire; China's Story, The Mikado: Institution and Personality.

CHINA. Diplomatic Relations with American intercourse with China began in 1784 with the arrival of the Empress of China near Canton, which for a century had been the only port open to foreign over-sea commerce. The supercargo of this vessel was Samuel Shaw, who was appointed first American consul at Canton by John Jay in 1786, and was later reappointed by Washington in 1790. For over half a century, American commerce (largely via the Northwest coast and Hawaii) continued with no official supervision beyond an American trader acting as consul without salary; and without recognition as an accredited representative by China. The opening of American diplomatic relations with China, necessitated by the steady increase of American enterprise and interests in the Pacific and the Far East—which finally attracted the protective and encouraging attention of the American government to favor new enterprises, as illustrated by the famous Wilkes expedition of 1838-42—was more directly the result of the British attack on Canton in 1840 in a demand for trade as a right, and of the subsequent treaty of Nanking which accorded to the British privileges of residence at five ports and ceded the island of Hongkong. Caleb Cushing, appoinaly commissioner and envoy extraordinary to China by President Tyler in 1843, arrived at Macao in an American steamer, in February 1844, en route to Peking; but, yielding to the arguments of the Chinese governor against the propriety of the step, he awaited the arrival of Tsengy, the Emperor's commissioner. In July 1844, he negotiated the treaty of Wanghia granting privileges of trade and residence at five ports, of extra-territoriality, of most-favored nation, of reception of consuls by Chinese officials on equal terms, and of direct diplomatic correspondence with Peking. It also established port regulations. For over a decade after the ratification of the treaty, successive American commissioners or ministers—Alexander H. Everett, John W. Davis, Humphrey Marshall, Robert W. McLane, Peter Parker—maintained legations, without personal interviews with the tranquil, elusive Chinese commissioner, who directed foreign affairs by literary conventionalities and masterly inactivity. Attempts to communicate directly with the Imperial government at Peking were without success. Meantime, Americans shared in the series of irritations and annoyances from the failure of treaty stipulations which culminated in the Arrow affair of 1846, compelling England to declare war—in which France joined, but to which the American government refused to become a party. Marshall who arrived in 1852 at the culmination of the Taiping revolt found Yeh, the Imperial official, too busy to talk or to do more than to trifle through literary excuses and evasions. McLane (1853-54), was as unsuccessful, and found the insurgent chiefs even more elusive; and, after a fruitless conference with the Imperial commissioner, recommended co-operation by a united Anglo-Franco-American fleet. Parker (1855-57), also failing to bring Yeh to a personal interview, promptly recommended the "contemplated plan of concurrent action" with Great Britain and France, and later suggested the American occupation of Formosa as a means of securing satisfaction; but the American government remained neutral, hesitating to become involved in hostile demonstrations. In 1857, experience having shown the necessity of a revision of the treaty and a more rigid enforcement of its provisions and the British and French having invited the United States to aid their demands on China by armed cooperation, the American government ap-
pointed William B. Reed with instructions to co-operate with the allies only by moral support and peaceful means, but to demand suitable guarantees for trade privileges, and to resist retaliation with direct diplomatic intercourse at Peking. Mr. Reed was unable to induce the tranquil, arrogant Yeh to meet him, or to recognize the need of a change in the treaty. Overcome by Yeh's literary skill which seemed to elude any form of literary retaliation known to the western mind, he concluded that vigorous coercive action was necessary to secure redress. Finally, accompanying the British and French fleets to Taku, and thence to Tientsin, after the Anglo-French hostilities which he had tried to prevent, and aided by Dr. W. A. Martin (a missionary), he negotiated a treaty (signed 18 June 1858), granting the opening of new ports, the right of direct correspondence with the privy council at Peking and the annual visit of the minister under certain restrictions, and recognizing somewhat apathetically the right of Christians to practice and quietly teach their religion. Later, at Shanghai, he negotiated a supplementary convention for the protection and revision of tariff. He also secured by convention an indemnity of $735,000 in satisfaction of claims of American citizens for damages by the recent war between China and Great Britain. Less than half this sum was subsequently awarded to claimants by the American commission; and in 1885, Congress rather tardily voted the return of the unexpended balance—an unusual event in international relations.

In 1859, ratifications of the Reed treaty were exchanged by J. E. Ward at Pehtang on the coast, after a fruitless attempt to have the ratifications exchanged at Peking as provided in the treaty. Although Ward reached the capital, and was entertained there with imperial munificence, he could obtain no audience with the Emperor without the humiliating kotow before the throne, and he refused to grovel, prostrate himself or kneel. He was criticized for retiring from Peking, but was sustained by his government.

The United States had no share in the Anglo-French expedition of 1860, which obtained the establishment of permanent legations at Peking and resulted in the creation of a new Chinese board, the Tsung-li-yamen, or foreign office.

In turning the tide of war for the suppression of the Taiping insurgents which for ten years desolated the country, China recognized the valuable services of an American, Frederick T. Ward (predecessor of Charles Gordon), who fell at the head of his men in 1862 and was awarded posthumous honors by the Emperor. Anson Burlingame, appointed minister in 1862, was the first American representative to reside in Peking. He was successful in a policy of peaceful forbearance and cooperation in diplomatic action. By securing the cooperation of other diplomatic representatives, he aided in preserving the integrity of China and the recognition of the Taiping revolt. He also aided China in the suppression of the coolie trade and negotiated with the Tsung-li-yamen for a treaty requiring freedom of immigration. After he left the American diplomatic service, in 1867, he was chosen by China as a representative to all the great foreign powers with which China had treaty relations, and especially to inaugurate diplomatic relations with the United States. In California and other parts of the Pacific Coast still welcomed Chinese labor for the development of resources, he negotiated with Secretary Seward at Washington the Burlingame treaty, which recognized the right of citizens to change their homes and allegiances, and the mutual advantages of free migration and immigration, and guaranteed every privilege and complete protection to Americans in China and equal rights to Chinamen in the United States. In 1872, two years after a furious anti-foreign riot at Tientsin, China began a new policy by sending a number of young men to be educated in the United States, a policy which she later abandoned because of the danger of estrangement from Chinese institutions. In 1876 China sent her first resident ministers to the United States and other powers.

To meet objections to the immigration clauses of the Burlingame treaty—objections resulting from a reversal of feeling in the Pacific Coast on the completion (1869) of the first overland railroad (which brought laborers from the eastern States) and culminating in California during the disorder attending the railroad strike of 1877—the American government appointed the special Angel commission of 1880 which negotiated the Peking treaty of November 1880, modifying the Burlingame treaty by a clause providing for regulation of the admission of Chinese laborers. This treaty began a policy of restriction and exclusion, to which Congress quickly responded by an act of 1882, suspending the admission of Chinese laborers for ten years and requiring certificates from other Chinese. The act of 1882 was amended in 1884 by more stringent provisions, and again in 1888 by the Scott act which was criticized as an abrogation of the Chinese immigration treaty of 1880 by indirect legislation, and as also a legislative intervention while a newly negotiated treaty to adjust the matter was pending ratification at Peking. The Chinese minister criticized the Scott act as a disregard of treaty obligations and later made a strong protest against the new act of 1892 (the Geary law) which continued previous acts in force for ten years. By these acts American trade interests and opportunities were jeopardized.

The American government later made amendments for the Scott act by paying of long-pending claims of Chinese laborers, and by the negotiation of the treaty of 1894 which accepted the main provisions of the abortive treaty of 1888 and reconciled the differences between the two governments. In 1904 China terminated the treaty of 1894, and soon thereafter Congress re-enacted without term all existing laws. Meantime relations improved. There were new sources and evidences of better feeling. In 1895, at the close of the Chinese-Japanese war, ex-Secretary J. W. Foster of Washington was appointed by China as counsel of the Taiping revolt at Shimonoseki. In 1899, following the American acquisition of the Philippines, Secretary Hay, refusing to participate with other powers in the "sphere of influence" or partition policy in China, proposed the policy of the open door,
equality of opportunity, maintenance of territorial integrity and autonomy.

In 1901, the United States co-operated with other foreign powers represented at Peking in condemning the excesses of the Chinese prop in March, 1900, and joined in the guarantee of China's independence and integrity, and although the pact was justified by China's feeble condition as a sovereign state, the Chinese government made a formal protest stating that it "will not allow itself to be bound by any agreement entered into by other nations" in which she has no part.

JAMES M. CALLAHAN.

Professor of History and Political Science, West Virginia University.

CHINA, Educational Progress in. It was admirable wisdom, indicative of little courage, for China to reform its venerable system of education. Less than a year after the Treaty of 1860, Dr. Martin writes in his 'Lore of Cathay,' "large bodies of Chinese troops might have been seen learning foreign tactics under foreign drill masters, on the very battle grounds where they had been defeated. But happily China did not confine itself to a reform of war methods. It took steps to modernize its entire educational system, not in one bound, which would have been too radical, but in a series of measures extending over a few decades, that were safer and more effective for a nation of such antiquity, whose scholars, in charge of its government, were chosen for more than 12 centuries by competitive examinations."

The first step was establishing in 1862 a school for training official interpreters, as the necessity of studying foreign languages and literatures—English, first, then French, Russian, German, and in 1899 Japanese—became keenly felt. The school grew into a college in 1866, with the number of students increasing in 1910 to 120, departments in law and science being added. Dr. W. A. P. Martin was president for 25 years. Two auxiliary schools were opened later at Shanghai and Canton. Naval schools rapidly followed, with a Naval College at Nanking in 1896, a government mining and agricultural college at Wu Chang in 1892, a telegraph college at Tientsin in 1879. Despite some opposition on the score of disloyalty to Chinese tradition, an education commission was appointed in 1906, and 212 students to the United States for training in four-year instamts of 25 students each for 15 years—though all were yalled in 1881. Most of them, according to the educational figure of the East, have risen to various government positions, medical, telegraph, torpedo, and otherwise. As early as
1871, Li Hung-Chang advocated the Tientsin University, which was organized in 1896. Besides preparatory classes in English, etc., a four years' course was arranged in the schools of civil and mechanical engineering, mining and law, the Boxer outbreak, with the German occupancy of the buildings, abruptly closing the institution.

The Nan Yang College came next in 1897 at Shanghai, whose students, with the elements of Chinese education, were to receive a thorough course in English and Western Sciences, preparing also for the government competitive examinations. In April 1897 it became an imperial polytechnic college. Throughout the nation more and more enthusiasm for further reforms was aroused. Before the close of the century all schools where western science and language were taught were overcrowded with students. Reform clubs arose in increasing numbers. The young Emperor was a zealous student of foreign writers and thousands of scholars followed his example. The edicts in 1898 and sweeping reforms under his direction made Chinese history, despite the wave of reaction that imprisoned the Emperor and put an end to many reforms and reformers for a time. The Peking Imperial University alone remained. After the Boxer outbreak, however, and on the return to power of the Empress, she adopted a more liberal course and resumed the work of reform. Not only did she abolish old methods for examinations, regulate the education of students abroad, and provide more thorough instruction in history, politics, and modern learning, but she opened new colleges in 1901–02 in 10 provinces, instituted normal colleges and had commissioners sent to various countries to study their system of education, commerce, agriculture, manufactories, armies, marine, etc. Boards of education were appointed in various provinces; lecture halls opened, middle schools established, the University at Tientsin begun anew in 1903, and night schools were started for officials to study English. In Chihli province alone in 1906 were 35 lecture halls, 3 technical schools, 24 normal, 24 middle, and 166 boys' higher primary schools.

The controlling authority of the Chinese system of education is vested in the minister of education at Peking, created by imperial decree in 1905. There are five subordinate departments: general supervision, professional, general and technical education, and finance. Boards of education exist in every province with educational clubs. No effort is spared to train the people along the lines of modern education. The course of study in the lower primary is five years, with kindergarten for children from two to six, taught by specially trained women. Apart from the middle, high schools and provincial colleges and universities there are normal schools, and women's, technical, industrial, law, military, and a few medical. A police training school was organized in Tientsin in 1902 and was followed by others elsewhere. Great changes for the better have been instituted in prison life. There were now legal and medical examinations, and reformatory schools in several provinces. The facilities for the education of girls, for whom formerly no provision was made, are extending rapidly. In 1908 Peking opened its first women's normal college and the girls' schools are revolutionizing the people's home and social life.

China is most liberal to its students studying abroad. Those sent to the United States receive $900 yearly. In gratitude for the $5,000,000 of over ten millions of the Boxer indemnity, China pledged itself to send to the United States 100 students each year for four years and 30 thereafter for 28 years, all to be chosen without regard to province, race or religion. The Tsin Hua College, near Peking, was opened in 1911 and after a brief interruption, a year later instruction was resumed. Here students are trained before being sent to America—a direct outcome of our government's generosity.

In 1913–14 Tong Kaison, a Yale graduate, was president, and Ts'ru Yet-sung, with degrees from Yale and Wisconsin, dean. It has a high and middle school course, a Chinese and an English department. Provision is made for the promotion of athletics. Its team represented China and the college in the Far Eastern Olympic Games at Manila only two or three years ago. China's half century struggles for reform in education have succeeded despite almost insurmountable obstacles. Perfection has by no means been reached, but the outlook is hopeful from the popular enthusiasm for the new system. All depends on the character and calibre of the men who have returned or who are to return from abroad.

CHINA AND JAPAN. When in 1823 in response to the Russian ukase claiming exclusive possession of the Pacific coast of North America to the 51st parallel, John Adams told the tsar's minister, Baron de Tury, that "we should contest a normal, or Russian naval establishment on this continent, and that we should assume, distinctly, the principle that the American continents are no longer subjects for any new European colonial establishments," he not only gave the first clear expression in action to the Monroe Doctrine (q.v.), but he unconsciously perhaps dictated the future history of the Pacific Ocean and in large measure the peaceful progress of China and Japan through American influences. Thus ushered into the world's politics, the United States, after resisting the tsar's demand and by diplomacy alone forcing it back to parallel No. 55, prevented the Russian advance southward in America, and later gained California, Alaska and the Aleutians with nations whose lands were then whiten by whaling and trading ships. Once California and Oregon were ours, the incentive was quickly given to tap the markets of Asia and awaken the hermit nations to commerce. After Monroe came Fillmore. The latter, on the day that M. Matsumoto (q.v.), the late emperor of Japan, was born, 3 Nov. 1852, ordered Commodore M. C. Perry (q.v.) to proceed, by the shortest route—around the Cape of Good Hope—to Yedo Bay to negotiate a treaty.
Perry's triumph was a "brain victory," won by tact, patience and consummate knowledge of human nature and especially of the Japanese variety of it. He opened a new era in the treatment of Oriental nations, apologizing from force, the door of international brotherhood might be opened. On the spot at Kurihama, where, in 1853, stood the pavilion for the reception of the President's letter, rises to-day in Japan marks the memorial pillar inscribed in gold by Marquis Ito (q.v.), to the erection of which the Mikado, leading his people, subscribed. At Yokohama, where the conferences of Commodore Perry and Professor Hayashi were held to discuss ethics, humanity, and treaty business, and the first industrial exhibition in Japan of American tools, inventions and products was held, the United States consulate and the Union Church have been upreared. Thus led forward, the hermit Japan entered the school of experience, when the authentic, was to emerge as the pupil of the Anglo-Saxon nations and the champion of their principles in Asia, the teacher of China and the middle term between the civilizations of the Orient and the Occident, a phase of national life consequent upon the clash of old and new ideas, Japan from 1870 engaged the service of hundreds, yes even thousands, of Yatoi (hired specialists) from America and Europe, to rebuild the foundations of the empire, and for 30 years, besides sending thousands of her sons abroad, put herself under the tutelage of an army of teachers from western countries, who were active in every department. Yet what has been phenomenally true of Japan has been, in the working of leaven, true of China also, only her larger mass hindering the visibility of real progress. Perry's success with Japan really opened a new era in the whole Chinese world of eastern Asia. The spirit of America's commerce, education, diplomacy, missions and the political policy of the United States have been the greatest factors not only in the awakening of China, but in influencing and regulating the policies of the aggressive European nations in their dealings with China and the neighbor nations of Japan, country by country, people by people. China, a very young nation, being, according to the unanimous verdict of critical scholarship and all the evidence in hand, no older than the Germanic nations, coming to national self-consciousness in the 5th century of the Christian era. Naturally then she has taken quickly to western culture in the 20th, as in the 5th and 15th century. The Chinese, being an old race, with all the limitations of senility are more slow in their mental movements than the Japanese, who show all the peculiarities of a young race. Yet in both empires progress, through the combination of old and new forces, has been real.

Surveying the past 50 years and especially what has been done within the 20th century, it is well to show still further wherein the Chinese and Japanese are alike or different from each other, and also wherein they have human traits in common and systems in harmony with or in contrast to the nations of the West. We may ask, how far these movements or evolutions are to be attributed to agencies within or without these countries. There are those who consider Japan almost wholly a self-reformed nation, while others think that all transforming agencies have come from without. The truth lies in the golden mean between these extremes of opinion. China's vastness of area and density of population prevent external observers and students and certainly the average Occidental, from any clear perception of leavening principles and transmitting elements within so large and venerable a body politic. They may note what is phenomenal, while they are usually blind to the psychic changes in the Far East. Hence, for example, the real energies of the native secret societies and sects within the Chinese empire cannot be definitely gauged, yet that they have been for centuries a real force, frequently showing themselves in both bloodless and bloody manifestations, the Boxer insurrection of 1900 and the Republican revolution of 1912, demonstrate. That these sects yet exist in great potency is certain. Until western diplomatists discern that China, equally with Turkey or Russia, and what survives of old Japan, is a church nation, with a fixed creed upheld by the government and maintained by force, and that China always has been, and is still, a persecuting nation, there can be no sound diplomacy. Failure to grasp this adds mystery to the Chinese problem and accounts largely for the discreditable surprise at the Boxer outbreak in 1900, foreseen by the missionaries, but to the approach of which so many diplomatists in Peking were blind. This politico-ecclesiasticism, based on the Confucian writings and philosophy, is the foundation of a social system that has survived the fall of over 30 imperial dynasties, and is still the most potent check upon and the most effective weapon of government, whether by pure Chinese or alien rulers like the Manches were. Hence to attack that dogmatic system is treason in a native, a horrible offense in a foreign missionary, and only tolerable in the Mohammedans because they are so numerous and powerful. The maintenance of this dogma by the sword of the normal magistrate, himself ex officio an orthodox Confucian, has been the cause of persecutions during the ages with bloodshed abundant. This is the real reason of so many reactions and of repeated discontents. China has again and again raised hopes among Occidental people that she was about to modernize her laws and people, only to dash the expectation of optimists to the ground. Even in this 20th century she has, after founding schools and universities, apparently on modern lines, even appointing American and European officers and teachers, cast these persons aside, and neutralized their methods, ostensibly because natives or Japanese were preferred, but in reality to maintain her dogma of Confucian orthodoxy, because the degrees from Peking demand adherence to Confucianism. Whatever modifications China has made in her system are as yet simply external, nor will there be any real progress in the western sense of the word until Chinese bigotry and persecution are abandoned and the union of church and state given up. The plea of China is that innovators under the pretext of progress are seditious and that reforms by natives must and will bring down the destruction of established government. But this is only another phase of that Chinese indirection of mind, which Dr. Arthur Smith in his book on 'Chinese Characteristics' has exposed with such masterly skill. The certainty of the Chi-
inese union of church and state, the instances of bigotry and bloody persecution, and the great slaughter of Chinese in the name of orthodoxy during the last century, were mere sacrifices of a shedder of blood for opinion's sake, quite equal to Russia or the mediaval states of Christendom, are shown by that life-long scholar of Chinese, J. J. M. DeGroot of Leyden, in his monumental "Sciences and Religious Practices of the Chinese."7 In weight of scholarship based on original research this work outweighs all that has thus far been written on the subject of China's politico-religious status. In the future these sects will doubtless play a very important part, and probably with more effect on China's internal structure, than either the Tai Ping rebels or the "Boxers" (q.v.). Such possibilities must exist as long as China represses thought and opinion for conscience' sake by her absolutism in religious matters. Nor is it likely that she will find any better solvent for her problems than the complete separation of church and state and the granting, not only of academic freedom, but of perfect liberty of conscience to her people. So long as she believes to grant abuses to schools and to the masses, there will be no end to internal disorders and to foreign complications. In this matter of self-reformation, as the past has already proved, the elements tending to reconstruction and the evolution of the Chinese along more modern lines are most likely to arise from among the natives who have been educated or helped by the teachers from foreign countries. The overwhelming majority of such men of modern mind are Christian, though others are far from lacking. Almost all the knowledge of China by the western world comes from aliens, who have studied, surveyed, and described the country, and who in addition to propagating their dogmas have given the Chinese pretty nearly all the exact science they possess. One cannot ignore the services of those physicians, engineers, advisers, financiers, customs officers, who, with or without Chinese pay, have for a century or more served China's people. It was an American, Ward, who showed the possibilities of the Chinaman as a soldier. What other Americans have done in China is set forth in the book "America in the East." It was an American, S. R. Brown, "A Maker of the New Orient," for example, who established the first (Protestant) Christian school in China, brought the first Chinese students to America, and demonstrated the ability of the Chinese youth to absorb western learning and methods. Among his pupils was Yung Wing, who, after graduating with honors from Yale College, brought to the United States under government patronage, six score Chinese lads as students, one of whom, Sir Liang Chang, has since been Chinese envoy at Washington. In a word the efforts of the lay and clerical teachers, helpers and healers of the Chinese, especially since the opening of the ports, and within the last 60 years, reveal a force that has in the peaceful American, rather than the conquering European, way helped to give credibility to the theory one of the greatest China's foreign teachers, S. Wells Williams: "The regeneration of China will be accomplished like the operation of heaven in meal, without shivering the vessel." The Japanese are not compacted wholly of Oriental stuff. They differ from the Chinese physically and psychically. Though they form a race having in it many elements, Tartar, Korean, the Chinese governing, may be a branch of the Aryan family of humanity, and the Japanese are thus allied in some measure with the "white" races. In mind and temperament they differ from the Chinese, not only as insular people dwelling on volcanic soil, continually shaken by earthquakes may be supposed to differ from continents inhabiting stable lands in river valleys, but also in culture and aims. So long as that half of Asia dominated by Confucius and Buddhist culture was virtually isolated from Christendom and the West, the nations of China, Korea and Japan were hermits, who had little to do with each other. The activities that mark Occidental diplomacy were unknown. It was Japan's frank facing modern requirements and her determination to shirk no responsibilities that compelled China to awake from her sleep and aloofness. Her release of the Chinese coolies, in Yokohama harbor, from the Peruvian ship "Maria Lula," in 1873; her liberty, both in school and to the masses, there will be no end to internal disorders and to foreign complications. In this matter of self-reformation, as the past has already proved, the elements tending to reconstruction and the evolution of the Chinese along more modern lines are most likely to arise from among the natives who have been educated or helped by the teachers from foreign countries. The overwhelming majority of such men of modern mind are Christian, though others are far from lacking. Almost all the knowledge of China by the western world comes from aliens, who have studied, surveyed, and described the country, and who in addition to propagating their dogmas have given the Chinese pretty nearly all the exact science they possess. One cannot ignore the services of those physicians, engineers, advisers, financiers, customs officers, who, with or without Chinese pay, have for a century or more served China's people. It was an American, Ward, who showed the possibilities of the Chinaman as a soldier. What other Americans have done in China is set forth in the book "America in the East." It was an American, S. R. Brown, "A Maker of the New Orient," for example, who established the first (Protestant) Christian school in China, brought the first Chinese students to America, and demonstrated the ability of the Chinese youth to absorb western learning and methods. Among his pupils was Yung Wing, who, after graduating with honors from Yale College, brought to the United States under government patronage, six score Chinese lads as students, one of whom, Sir Liang Chang, has since been Chinese envoy at Washington. In a word the efforts of the lay and clerical teachers, helpers and healers of the Chinese, especially since the opening of the ports, and within the last 60 years, reveal a force that has in the peaceful American, rather than the conquering European, way helped to give credibility to the theory one of the greatest China's foreign teachers, S. Wells Williams: "The regeneration of China will be accomplished like the operation of heaven in meal, without shivering the vessel."
modern principles of defense and engineering. Gradually an efficient fleet of battleships, cruisers and gunboats was organized. A beginning had also been made in China of railways and steamship lines. One part of China's vast system of revenues, the imperial customs of the empire, elaborated since 1863 under the British Sir Robert Hart and honestly administered, has given China her surest source of cash income for general purposes and the purchase of foreign equipment. Every part of every form of individual or government service to be free from bribery and routine corruption seems to the normal Chinaman something unearthly, and the imperial customs under Sir Robert Hart have won unbounded admiration from the Chinese.

In 1894, when the war broke out which did so much to prick the bubble of Chinese prestige of greatness and mass, and which, paradoxical as it may seem, evoked mutual respect and drew the Chinese and Japanese more closely together in reciprocal understanding, China had, in addition to her military mobs in the various provinces, the beginnings of scientific military system. This in time might have become national. Even then as seen to undisclosed foreigners China appeared from a military point of view admirably armed. On the humane side of provision for sick and wounded soldiers and in the nobler features of civilization, China was woefully deficient. As soon as hostilities broke out the vast difference between the two nations was manifest. China went to war without surgeons, hospitals, nurses or the manifold apparatus of civilization for protecting non-combatants, saving life and mitigating the horrors of war. China had not yet become a signatory to any of those conventions of nations in the interests of mercy, nor was there a Red Cross organization within her borders. Her recognition of the international code of war was slow and her acceptance of it slight. On the contrary Japan, having her object lessons given by Christian missionaries, had provided hospitals, surgeons, Red Cross Society and equipments for surgery, healing and hygiene, and these were in splendid condition, while 1,400 trained nurses were ready for work. Japan had in 1857 signed the Geneva and other conventions and had diligently educated her army officers in the commentaries and usages of the signatory nations, while her naval commanders were well versed in the laws of search and capture. When in 1894 her fleets and armies went forth into Korea, Manchuria and China proper, there was with each field-marshals, besides a hospital corps ready to minister to friend or foe, an expert lawyer, versed in international law, who went as adviser to see that nothing was done by the Japanese which should infringe the laws of nations. Two notable books, 'International Law during the Japanese War,' by S. Takahashi, and 'La Guerre Sino-Japonaise au Point du Vue du Droit International,' by Professor N. Ariga, the one from the military and the other from the naval college in Tokio, are the literary monuments of this habit of the Japanese, which, in 1904, has developed into a college of five international law experts. These, after being consulted at all points during the progress of the negotiations of 1903-04, have gone upon deck and field with the military and naval men into Manchuria to insure, in every detail, harmony with the laws of nations.

The war of 1894-95, which wrought such great results for the world with reviewing in its main outlines, since it blew to pieces and forever China's doctrine of Whangti, or world-sovereignty, the tenacious adherence to which over Korea had brought on the war. After being again served by China as they had been in the birthday matter, the Japanese determined to take no further chances with her rulers. In Korea, after the bloody struggle in Seoul between the native Liberals and Reactionaries in 1884, followed by the armed conflict between the Japanese and Chinese troops, a convention was made dated 7 May 1885 between Li Hung Chang and the Marquis Ito, that both governments withdrawing their troops would not again land soldiers in Korea without mutual agreement. For awhile there was peace in the Land of the Morning Calm, but when the Tong Hak uprising took place, the soldiers from Seoul were overcome and the whole kingdom seemed to be in danger of anarchy, the pro-Chinese faction at court asked for aid from Peking to put in the Loyalists. Then to the amazement of the world the Chinese government violated the treaty of 1885 by first forwarding troops and then notifying the Japanese minister in Peking, using the words 'four tributary states' concerning Korea. China thus reasserted her ancient claim of suzerainty over Korea as a vassal state, notwithstanding that Korea had been recognized as sovereign and independent by Japan and other nations. The government in Tokio interpreting this as a direct insult, on 12 June 1894 announced the despatch of a body of troops under strict discipline to Seoul and five days later invited China to undertake with Japan financial and administrative reforms in Korea in order to preserve the peace of the Far East. The Peking government curtly refused and demanded the recall of the Japanese troops. The reply from Tokio was that pending an amicable settlement of questions in dispute, any further despatch of Chinese forces into Korea would mean war. China had already ordered her soldiers in Manchuria to cross the Yalu River and having chartered the British ship 'Kow-Shing' despatched 1,100 soldiers to reinforce the Chinese camp at Asan in Korea.

What follows the world knows. With astonishing secrecy and celerity, the armies of Japan occupied Korea and after the decisive battle of Ping Yang drove the Chinese out of the peninsula, crossed the Yalu and in Manchuria conquered an area larger than their own empire, while her navy was out at sea off the ocean and captured the great fortresses of Port Arthur and Wei-hai-wei. After annihilating nearly all the drilled troops of China at Ping Yang, the Japanese fought military mobs, making war chiefly with the forces of only a portion of the empire. During the war the majority of the Chinese people scarcely knew that there were any real hostilities adverse to their empire, nor did they learn for years afterward just what had happened, but the military success of Japan over the rest of Europe and Enlightened some of the Chinese mandarins and scholars. To-day we find China with a new army, formed on modern principles and drilled chiefly by Japanese officers, while in
June 1904, having become a signatory to the Geneva and other conventions made to mitigate the horrors of war, she has entered still the panoply of civilization, which means the world in brotherhood.

The Japanese swung to the quick, because neither China nor western nations had recognized them as highly civilized people, were confirmed in their pride and resolve to make the so-called white race understand and appreciate them, when Russia, France and Germany joining to deprive them of the lawful fruits of conquest, forcibly compelled them to be satisfied with the occupation of Formosa and indemnity in money. Had the Japanese been possessed of four battleships, they would in 1895 have declared war against Russia. As it was, they who never forgive an insult, resolved to nurse their wrath, keep it hot by buying battleships, and in cool science and unwearied perseverance began to invent explosive powders, perfect munitions and equipments and enlarge an army and a fleet that should some day wipe out the insult and show that the Japanese count none other as the suzerain of their empire. Meantime, China,profiting by her fresh experience in humiliation, began to inquire more earnestly into the secrets of western power. A tremendous impetus was given to the reading of all kinds of information about Japan and the western nations, to the building of railroads and to the renovation of educational methods. The ferment of ideas caused something like a great reform movement in 1897, which, led by progressive literati and apparently sanctioned and even controlled by the young emperor, seemed apparently about to sweep over the whole empire. New schools and universities were planned and a newspaper called Chinese Progress was published. The purchase and sale of official rank was to be abolished. The stirring and patriotic brochure "China's Only Hope," recommended by the emperor, fed the flaming zeal of the reformers who were led by Kang Yu Wei. Even the abolition of the queue, the changing of the Chinese national dress, the adoption of the Western alphabet, the calling of a national parliament and a journey of the emperor and empress dowager to Japan to see for themselves the pitiful condition of China were advocated in memorials. Reform seemed to be ready to spread like a prairie fire, when suddenly in September, Li Hung Chang was dismissed from office and the Emperor virtually dethroned by the Empress Dowager. This act "carried within itself the fruitful seeds of the Boxer outbreak." Yet although the missionaries felt what was in the air, the diplomatsists looked on the episode as a "Manchus family quarrel," and ignored the warning of those living close to the masses of the people.

Meanwhile the disturbing influence of American prosperity and expansion were felt in both Europe and Asia. Within a year after Pittsburgh achieved the supremacy of the world in the making of cheap steel, Russia, Germany and Great Britain precipitated themselves upon the shore of the Yellow Sea, grasping at the position which had been by Japan and for the same reason,—to obtain possession of the rich coal and iron deposits in Shan-ti, said to be worth ten Pennsylvanians. Germany seized Kia Chau, Russia Port Arthur, and Great Britain Wei-hai-wei, in readiness for the supposed impending "break-up of China" and its expected partition. The torpedo that sunk the Maine in Havana harbor interrupted the European program, postponed the partition of China and united the British, Americans and Japanese in the determination to keep China intact and the door of commerce open. In 1900 the United States, now a world power, was in Asia with force and had a policy—the policy of freedom and uplift—which for a century or more, the Americans in Asia, as traders, teachers, healers and apostles of democracy and fair play had been steadily developing. Meanwhile in China the old territorial integrity could not be so ruthlessly violated nor the ancient social systems invaded without protest. The introduction of railways had thrown thousands of men out of old methods of employment. The tremendous commercial intrusions, which disarranged old customs and made the problem of livelihood to millions so very serious, brought on a fierce reaction both of the scholars and the people and especially of the Buddhist priests, creating an atmosphere favorable for the outbreak of another of those sectarian revolts against the official orthodoxy of China, to put down which the Chinese have shed more blood perhaps than all the religious wars and inquisitions of Europe. This time the heresy was joined with and the cry raised in the name of patriotism. The heretics became the people called "Boxers" or the Fists of United Harmony. The triple pressure of hunger, superstition and patriotic revolt at the territorial incursions of the foreigner at last burst out into a storm, which in blind wrath against everything alien, smote first the railways and foreign workmen and then the teachers of the foreign religion and their converts. The mob reached Peking and surrounded the legations, which were hastily isolated, fortified and for months successfully defended. The foreign powers hastily made preparation to defend and then succor their nationals, but the United States seemed to be the only one that beside its prompt despatch of a military force had a definite policy, which was in recognition of the sovereignty of China to relieve its own citizens and then withdraw its military from Chinese soil. It is absurd to suppose any real harmony or co-operation between the orthodoxy Chinese government and the heretical Boxers. Whatever may be one's opinions on the subject or the form of the encouragement alleged to have been given directly by the Empress Dowager, it is a fact that no hostile shot was fired by a Chinese regular soldier or sailor, until the seven allied nations, in which the Americans were not included, had made war on China by firing on the Taku forts, 17 June 1900. Against this unwarranted proceedings and overt act of war the American Admiral Lewis Kempf protested and in the crime of attacking peaceful Chinese he refused to participate, his conduct becoming the basis of the triumphal diplomatic policy of the United States government. Briefly stated, the situation was this: A riot of fanatical sectarians, by encouragement by foreign sympathetic motives, rose in rebellion against the government already impoverished and weakened by foreign aggression. When unable to put down the uprising in Shan-si, the Pei-ho valley and the vice-royalty from which Li Hung Chang had
been removed—though the whole Boxer movement was wisely handled and thoroughly suppressed by able viceroys in the central and southern parts of China—the seven allied nations, including Russia, assembled in the Chinese forts. When also the Chinese, of course, attacked their enemies in Siberia, the Russians perpetuated the massacre at Blagoveschken and then marched their soldiers to Peking. The combined relieving force fought the opposing Chinese. The Japanese, having the largest and best furnished of the contingents, led the van. The Russians as very slow marchers came next, so that the Americans and British contingents had to march during the hottest hours of the day. It is certain that the celerity, character and discipline of the Japanese soldiers on this expedition excited the surprise and admiration of military critics of every nation represented, while on the other hand the fanatics agreed to the imprisonment of various other those of Muscovy bred contempt of Russian slowness, heaviness and low grade of intelligence in the mujik or common soldier of the tsar.

After the capture of Tien-Tsin 14 July, the Japanese or Americans alone could then have pressed on to Peking and won in a fortnight, but jealousies and unnecessary delays kept the relieving column idle until 4 August. The unspeakable robberies, violation of women, brutalities and generally barbarous conduct of the most of the European troops, by the way and in the capital, demonstrated the hypocrisy of the claim to be called Christian and in contrast to the conduct of the Japanese proved that the terms "Oriental" and "Occidental," as applied to morals, are purely traditional and destined soon to pass away. The Imperial city was captured on 15 August, the Chinese court escaping to the westward remained wholly away from Peking until January 1902. On 28 August bodies of soldiers, representative of the eight allied nations, marched through the Forbidden City as a token of China's humiliation. Li Hung Chang was recalled to office and with Prince Chang commissioned to treat with the Powers, only one of whom, the United States, seemed desirous of peace. During the "peace" negotiations, the German army kept up a series of attacks and massacres of Chinese called "punitive expeditions" which in general character were a disgrace to civilization. An indemnity equal to $330,000,000 was imposed on the Chinese government in expiation of the Boxer outrages, and for her self-defense in the war following the attack on the Taku forts. Various safeguards for the legations were arranged and arms and ammunition prohibited, and the Tsung-li-Yamen was transformed into the Ministry of Foreign Affairs which was to take precedence of the other ministries. Except legation guards, the foreign troops were to be withdrawn in September 1901. The Imperial edict of February 1902, accepted the terms imposed. On 9 April 1902, the Manchurian convention between China and Russia received the imperial seal. The Russians were to evacuate Manchuria within eight months, but to retain control over the railroads.

It was after this Boxer uprising that what we have called the Russian and the American foreign policies and systems of diplomacy had by contrast their most signal illustration. As soon as order was restored and the preliminary diplomatic arrangements made, the United States recalled all its military force, except a small legation guard, and Russia, too much occupied with what had been done, and not only emphasized her recognition of China as a sovereign Power, but set a commendable example to the other governments by dealing justly with the Chinese in the matter and method of payment of the indemnity, thus illustrating again the fixed American policy of helping rather than taking advantage of Asiatic nations. Russia, on the contrary, demanded the right to occupy Manchuria with her troops and to make Port Arthur the terminal of her Siberian railway, began thenceforth the military possession of Manchuria, the building of the city of Dalny (q.v.), and the making of Port Arthur (q.v.) both a city and an impregnable fortress, and initiated various other those of Muscovy bred contempt of Russian slowness, heaviness and low grade of intelligence in the "mujik" or common soldier of the tsar.

As early as 28 July 1903 the Japanese government expressed to Russia its alarm at the Manchurian situation. When Russia formulated new demands at Peking and seemed to consolidate rather than relax her hold on Manchuria, showing also increased activity along the Korean frontier, doubts were raised in Tokio as to the limits of Russia's ambition. Through his minister in Tokio, Baron Komura and his envoy, Mr. Kuri- no in Saint Petersburg, the mikado notified the tsar through Count Lamsdorff that wishing to remove every cause of future misunderstanding desired to enter 'upon examination of the condition of affairs in the Far East in order that their interests meet, with a view to a definition of their respective special interests in those regions.' Negotiations were opened and after long delay on the part of Russia the tsar announced that while willing to respect the independence and territorial integrity of Korea, Russia declined to extend the same engagement to China and requested Japan to acknowledge Manchuria and its littoral as entirely outside her sphere of interest. The tsar furthermore requested the limitation of Japanese control in Korea, even proposing a mutual zone covering all Korean territory north of the 39th parallel. Other negotiations, followed by exasperating delays in Saint Petersburg, took place, Russia meanwhile heavily reinforcing both her army in Manchuria and her fleet in eastern seas, purchasing and transporting also large stores of ammunition and coal to Port Arthur. On 5 February, Japan telegraphed the termination of her negotiations, severing diplomatic relations with Russia and withdrawing her representa- tion. Then followed hostilities, begun simultaneously, both parties claiming that the other had fired the first hostile shot. In the war that
followed, the Japanese surprised Europe with the rapidity and brilliancy of their victories on land and sea, China remaining neutral except to take precautions against the violation of her frontiers. At the request of the German emperor, the American secretary of state urged upon three of the nations most interested, the limitation of the area of hostilities, to which they promptly responded. From the side of the Japanese it must be remembered that they were smarting under the sense of long-continued Russian aggression in Sakhalien and Kuriles, begun very early in the 19th century. In 1861 a Russian man-of-war proceeded to the island of Tsushima, on which the Russian flag was hoisted and a settlement was made (though not until Japanese blood had been shed in resistance), which would have constituted a title of ownership had not Great Britain interfered. The Russians were finally compelled through British intervention to abandon their claim and leave. By the usual plan of “joint occupation,” with the intention the Japanese empire had ended in China’s loss of a territory as large as France and its incorporation into the Russian empire, the Russians gained complete possession of Sakhalien. After the restoration of the empire in 1868 it was foreseen by the Japanese statesmen that Russia would be their chief danger, for already signs of her movement in Korea were menacing. This fact was the strongest determining element in the creation in 1871, in place of the old clan contingents, of a powerful army and navy for national defense.

It is more than probable, as history has clearly shown in the past and as the racial constitutions intimate, that progress in Japan and China will proceed from varying levels and in different channels. In the island empire the centre of national life is in the one unchanging dynasty and national amelioration has issued from the government downward. Any sure advance for Japan in the future will be from the same source and in a similar direction. On the contrary among the Chinese people, to whom the existence of this or that dynasty makes no vital difference, reform will arise in and proceed through their social system and not from throne or court. In China real and permanent progress has been less direct than in Peking than directly traceable to the work of men who rose from the people and who had been instructed by foreign diplomats, teachers or missionaries. These men have trained the people through the schools, the press, the churches, and the hospitals, reaching all parts of the empire by means of the printed word, book, tract, newspaper or by personal influence upon China’s leading men, whether in or out of office. In Japan before Perry’s advent there were hundreds of men already enlightened, keenly alive to European aggression in Asia, and moving for the unification and reform of the nation. The great motive supplying the force of their lives came from no foreigner but from their own inborn patriotism and self-sacrifice. Nevertheless, when fullest credit is given to the propulsive power of her Bushido, or the Knightly Code, it must be remembered that Japan, after her first contact with Europe, never was truly a hermit nation. For 200 years more the Dutch at Nagasaki fertilized the Japanese productive genius, and opened to commerce and western influences. In 1868 when the men rich in Dutch culture and the “Mikado-reverencers” gained possession of the imperial person in Koto, they began to relay the foundations of the empire by seeking for knowledge in every part of the world. Teachers, advisers, engineers and experts of all sorts were imported by the hundreds, who during 35 years have literally taken off their coats and, by example and teaching, re-cried and handicraft have shown the Japanese how to do those very things which they are now doing so well. The configuration of the Japanese Islands has fitted them to profit to an extraordinary degree by the adoption of the forces of steam and the Chinese most needed, that is, immediately after the abolition of feudalism and in the transit to industrialism helping to unify them politically and consolidate them into a marvulously compact nation. In China, railways will re-distribute into whose valleys the river and littoral populous, is now congested in the river and alluvial plains, will develop and distribute the wealth of the mines, will abolish the almost periodical famines, and by adding healthy movement and contact of the inhabitants of distant provinces develop in the Chinese that patriotism (as distinct from race pride which is already so intense), the lack of which has been the cause of China’s many woes, and will give that middle term of a large intelligent and practical body of men of affairs between the throne and the masses, so notable in Japan and which China so sorely needs. The progress in both Japan and China has necessarily been thus far mostly of the material, educational and economic sort, for neither the Chinese nor the Japanese take kindly to the abstract thought or science of the West. It is an exceptional thing to get a Japanese or Chinese to listen patiently to the presentation of even though anything done in an unemotional strict argument of proposition. Hence, therefore, in its doctrinal form, Christianity has made but slight progress, and the chief experience noted by foreigners in the reception of an Occidental creed of any historic name, by Chinese or Japanese has been its simplification. It seems quite certain that Christianity as known and practised by the countries of the Extreme Orient is to a very hopeful degree expressed in practical forms or in reform. Nor is it at all likely that in approaching what Jesus taught these peoples will ever receive or assimilate also that Greek philosophy, Roman tradition and doctrinal achievement, and the ethnic peculiarities which form so large a part of popular Christianity in America and Europe.

The chief role which the Japanese are to play in the future—with probability the development of reserves of power greater than the average Occidental suspects in them—will be as the teachers of the Chinese, who number one-fourth of the population of the world, by interpreting to the sons of Adam the ideas and systems of the West, themselves acting as
the middle term between Occident and Orient. The Japanese have learned how vain it is to trust in material progress alone. The old sanctions and motives being being tamed or dissolved, they are seeking new guarantees for decency and progress. In answer to the impotent fears of many Japanese that their national solidarity, centred in the throne and imperial household and from age eternal, will be imperilled, and the similar terror of the Chinese conservatives, lest the whole edifice of society and morals fall to ruins, history has but one reply. Inexorable fact and reasonable probability, shows that dogmatic theology, as a political engine, must certainly give way before the advance of education and science; while if anything is certain from the record of the past it is that the first secret of Occidental progress lies in the fact that Greece, Rome and the northern nations of Europe, early in their careers, dropped ancestor worship and put the moral responsibility of the individual in the fore, making mental initiative a duty and not a crime. The Chinese and Japanese must find other ground for action than that of the ancestral, if they are to have the bonafide life and perpetuity than in ancestral worship and their traditional, communal civilization. Happily the events of the last few years in the Far East show steady progress in the direction which history assures us is the only right one. The real line of advance had been in the direction of an increasing sense of both personality and individuality.

Having in our survey of China given the Chinese and average Occidental view of the situation in 1916, we shall in this instance present what may approximate the view of the Japanese and of the scientific student of international affairs.

The logic of events and the general movements of civilization, within the last 50 years and especially from about the year 1880, have not only forced China and Japan, once hermit nations, into a new alignment with the western Powers, but into unexpected relations with each other. Of old, Spain, Portugal, Holland, England and Russia were the countries most industrious at the task of seizing and occupying the land of "the heathen," when whole continents were confiscated as prizes, or given away in the name of God, but in our days Great Britain has led all others. The new dogma of imperialism dominating European Powers in the 20th century means first the exploitation of the weaker nations, through capitalism and then the use of the governments in support of these advance agents of civilization, leading sooner or later to trade wars, to military occupation and to annexation. Great Britain, having led the way and set the example, rules 22 per cent of the earth's surface and 25 per cent of its population. Russia, France and the United States have followed. These four countries are, with China and Brazil, the six greatest landowners of the world controlling 62 per cent of the earth's area. All of these, except China and Brazil, whose boundaries were long ago fixed by treaty and who, more or less, possessions of other peoples to enlarge their domain. The white man, imaging himself the favorite of Heaven, has appropriated nearly all of Africa, much of Asia, both continental and insular, and Polynesia. Only the Monroe Doctrine has prevented European Powers from reappropriating much of republican America.

It is this lust for land, pelf and power, shown by the white man, that has conditioned the modern history of the Far East.

In the reawakening of national consciousness in the three nations, China, Korea and Japan, the Central Empire suffered first, having her frontiers invaded and her soil invaded, while indemnities, or some less extortionate, have been forced from her. This nibbling and dismembering process, begun with the loss, in 1841, of Hongkong to Great Britain, has continued to this day. From her old-time area, Upper Mongolia and much of Manchuria has become the possession of Russia; Annam or Cochinchina of France; and Formosa of Japan. Korea, weak and helpless, desolated her borders in order to make her territory forbidding to the covetous. In Japan, far-seeing spirits, over a century ago, discerning her eastern trend on the continent and the descents of Russia southward on Japanese soil, sounded the alarm by voice and writings; but only to be imprisoned or hounded to death as alarmists and to have their bonafide life and perpetuity by the Yedo authorities. Only at a late hour did the Shogun's government awake to reality and begin the defense of the north and, in 1850, the expulsion, with British aid, of the Russians from the islands of Tsushima, near which, in 1905, Admiral Togo destroyed the Muscovite's naval power in the Far East. While in her hermit isolation, tortoise-like Japan, governed by Yedo, sought to defend herself by closing her shell, reckoning all aliens alike. To the three peaceful missions, sent by Presidents Jackson, Polk and Fillmore, to the unofficial calls of Glyn and Cooper, and to the private enterprise of Mr. King, in 1839, she gave firm refusal, to all but Perry. He refused to be refused, and his visible power, firmness and tact won. As soon as the intellectual movement in critical scholarship and historical investigation and the study of Dutch, begun two centuries previously, ripened to the coup d'etat in Kioto in January 1868, the new, centralised, Imperial government came into power and instantly made bold assertion of the national consciousness. This was done by at once signing treaties in the name of the mikado, raising the first real, national army ever known in Japan, building a modern navy, sweeping away feudalism and inaugurating a definite foreign policy. This latter was manifested by the abolition of the long existing dual sovereignty of the Riu Kiu archipelago (Loo Choo Islands) long tributary to both China and Japan, the assertion of ownership of these and other outlying islands (such as the Bonin and other groups), the protection of her citizens in foreign lands, the establishment of consulates and legations abroad, the sending of hundreds of students to America and Europe and the importation of an equal number of salaried expert teachers and advisers (yatoi) from the Occident, to relay the foundations of the empire. In a word, the Japanese, confessing their defects and tiding their errors, faced the situation. Instead of playing off one nation against another, they determined to find out the secrets of power in each and to apply these to their own needs. When some Riu Kiuans had been wrecked on Formosa and killed by the native head-hunters, the govern-
ment in Tokio, in 1874 lived up to its duties by sending a force to Formosa to chastise the savages. When the English vessel entered Yokohama harbor, loaded with Chinese coolies kept against their will, Japan freed them and then communicated in friendly terms with China and Peru on the basis of international law. In her further dealings with Korea and China, she refused to negotiate except according to the laws of nations. China, thus stimulated and compelled by a rival deemed inferior, began to see the necessity of providing what she had never possessed before, a standing army and a navy.

Meanwhile the three Powers of Chinese Asia—almost the only ones that still preserved their sovereignty—forced into new and embarrassing relations by the military and political activities of the Occidentals in or near their borders, found themselves at odds with each other. The old dogmas of statecraft, that had ruled the world of Confucian ideas in eastern Asia, were being challenged and jostled. Especially was China's attitude of superiority and her claim to ultimate hegemony, so long tacitly or openly expressed to the neighbor and pupil nations around her, offensive to the mikado's empire, as being anarchistic and anomalous. A war party formed in Japan for the invasion of Korea, that had taunted her island neighbor with being a traitor to Oriental culture. Happily, instead of hostilities, the government in Tokio offered the olive branch and a treaty was made in 1876. This action was followed by the United States and by China, in 1882, by which little Korea, though having few of the necessary features of a modern state, was dragged out, in all her poverty and weakness, into costly and perilous international relations. Only for two or three decades did she attempt to keep up the forms, or farce, of a state in the modern world of interrelations, while still her people had the mind of hermits. How hard old ideas and mental habits die is seen in China's attempt to hold both Riu Kiu (over which a long controversy arose, which it was hoped would be settled by the suggestion of Gen. U. S. Grant of a joint high commission) and Korea as vassals, despite the fact of her own recognition of Korea as a sovereign state. In 1894, these differences of opinion and rose to the climax of war. Then, not for the first time on the bloody field, but initially as to modern armaments with steam and electricity, the two powers met—China fractional and divided and Japan united. The result of war's arbitrament was to clear the ground for the future history of Asia by abolishing forever the effete dogmas of universal and of dual sovereignty.

Now Japan illustrated the axiom that precept whispers while example thunders. Not the professions of amity and benevolence but the policy and action of Europe bade Japan follow up her advantage by aggression. As the pupil of the Anglo-Saxon nations, Japan—her sons having already read and mastered Eng. Lit. with a thoroughness hardly to be paralleled in their compelling example. Dwelling on a chain of volcanic islands, with little arable soil and a fast growing population, Japan, like insular Britain, must needs have a larger food area and room for industrial expansion. Imitating England even to flattery, she sought fresh territory in other lands on the near continent, demanding, as indemnity, or the price of successful war, what the nations of the continent country very near the condition of waste land; which was, however, on the westward route to Europe and further toward those nations and parts of the world whose ideas she had adopted and with which she was joined in brotherhood, having turned her back on Chinese culture. England, by waging nearly 50 trade wars in almost within as many years, had shown her what to do by seizing coaling stations, islands and vast territories, from the size of India to those of the dimensions of coral reefs, thus expanding her possessions in every direction, so as to have a never ceasing drum beat and a midnight as well as a noonday sun, and one shining on her possessions during 24 hours of each day. Even the history of the United States, thanks to American missionaries and teachers, was a familiar object lesson urging to action and embrace of opportunity. Once but a narrow strip between the Alleghenies and the Atlantic Ocean, though already possessed of more.liberty than thong and bridle, the American people had extended their domains beyond the Mississippi and the desert, and out from the Pacific, even possessing Alaska, Hawaii and the Philippines. The Americans taught and enforced the Monroe Doctrine. Why not the Japanese have one also? Hers, too, seemed manifest destiny. Hindered in 1905 by the combined force of Russia, Germany and France, that were angry at the idea of Japan becoming so apt a pupil and doing what they had done, even making the European nations model her models, Japan yielded to their mandate. She accepted, in lieu of Manchuria, Formosa, with a money indemnity sufficient to buy the battleships that in due time should enable her to win back what she had lost. The experience, in 1900, of marching with the Russians to Peking, did not tend to raise respect for the Russian military. Unable to see that the Moscovites had any more right to Chinese territory than they had, the Japanese, after the failure of polite diplomacy, faced their rival, now become enemy, in arms in 1904-05. They won a foothold on the continent, with control of the routes to Europe and then proceeded to follow the example immediately before their eyes, of the United States, of the United States, of the Philippines. This they did by absorbing Korea. Still following out the principles of the Monroe Doctrine, they determined that eastern Asia should no longer be the seat of exploitation, colonization and conquest by European or other foreign powers. In 1915 Japan settled her old scores and eliminated Germany from China and the islands of the Pacific. Still carrying out her purpose, of cementing the friendship and consolidating the power of the nations under similar conditions of culture, she resolved to rouse China into a fuller national consciousness in order to prevent that "break up" so heartlessly planned by European powers. Japan's underlying idea was to change China from a continent into a group of islands, to open a market and hinder China's further dismemberment by the nations that had already seized most of the lands and continents not their own. That the Japanese motive was ethically as well founded as that of the Europeans' policy toward Asiatine cannot, when studied in the light of
history, be denied. In carrying out her policy of 1915 toward China, Japan simply employed the methods taught her and the weapons which had already been used upon herself and upon China for a century or more and approved by most Christian governments. Didactic they were, but no more than many other methods of foreign conquest. For our guide, we see that Japan sought no conquest of China’s territory, but aimed rather to influence her colossal neighbor by means of education, employment of her experts, the right of conquest, the extension of influence, and proselytization of religion, with freedom of conscience and unhindered modern civilization—all of which methods other foreigners had repeatedly used before her. Terrible as these demands seemed and ruthless as were the methods, real or apparent, as set forth in the hysterical exaggerations of the journalists in Peking and writers in American magazines, they were no more than Christians had made—often at the point of the bayonet and at the mouth of cannon, when forcing tariffs, collecting indemnities, or laying exorbitant mulcts on both Japan and China. So far as history has recorded, the United States is the only country in which the national conscience, in the case of the Chinese Boxers, was awakened in 1895 in that of the Boxer outbreak in 1900, revolted against injustice and demanded and made return or reparation to the wronged. In 1915 Japan resolved to forestall European aggression—which might yet have another recrudescence after the war, when Europe should awake from her international insanity. What President Monroe’s ultimatum in 1823 meant to the Holy Alliance and Fillmore’s message through Webster to Austria in 1850, and Cleveland’s word in 1895 to Great Britain in the Venezuela matter—all of them republishing the Monroe Doctrine—Japan’s actions have meant to all conquering nations who talk about such monopolies as “the control of the Pacific,” “British Supremacy,” or “interests” of any sort, which are opposed to international law. Seeing that it was highly probable that, after the waste of the Great War, European nations would expect to do, what Holland did with Java, Britain with India, and France with Africa—pay their national debts by grinding the faces of the Asians—Japan took opportunity by the forelock. Her motives in the China affair of 1916 were at least as honorable and even as altruistic—so far as intelligent self-interest would allow—as were the motives of the European powers that once seized America, Africa, Asia and Polynesia. The actual result, for the benefit of mankind, was to awaken China from her almost soulless slumber and to give her a new soul, uniting the nation as never before and replacing race pride with patriotism. That this idea of defense against the land-hungry nations of Europe was not a new or even recent one, born of the ambitions of an upstart people who had borrowed modern artillery and diplomacy, is clear to all familiar with that notable body of historical literature, produced in Japan since the Russian descents on Korea. From the example of the humbled China of 1860 before them is seen in the answer given to Dr. J. M. Ferris in New York, in 1866, when questioning the first two students arriving from Japan, as to what brought them so far, even to America. “We came to learn how to make big cannon, so that we shall not be conquered” was their instant and ingenuous reply. In contrasting the relative action and prolonged policy of Japan and China, in their first meeting with the nations of the West, we note a startling difference. Building another Great Wall of conquest, trusting to her traditions and choosing intrigue as her chief weapon of defense, by playing off one selfish power or sordid interest against another, China made, during the decades of her humiliation, no serious effort, as did Japan, to win and hold a place of honor among the nations, by interior reformation and appropriate outward respect. Never, until late in the 19th century, did China make decent recognition of either foreign governments or international law, ignoring even the existence of her people abroad, and so ultimately had to yield in impotent fear to all threats. On the other hand, Japan acknowledged the age-long folly of her isolation, broke the crust of inherited conceit, confessed her defects, sought for alien talent and industry over all the world according to the mikado’s oath of 1868, abolished feudalism, re-created her industries and kept most scrupulously all her engagements, whether of treaties, “gentlemen’s agreements” or Open Door arrangements, as those who deal with facts do not fear to agree. Had China awakened, 70 years ago, from sloth, ease and age-crusted conceit, as she did awake after 7 May 1915, there would have been, for neither Japan or China, any Anglo-Japanese Alliance, or Russo-Japanese War, and no German-Japanese War. It has been the supreme purpose of Japan to have China realize these truths. The very fact that the Japanese have felt the wounds and retain the scars at which others jest, explains her terrible sincerity in teaching China the lesson of 7 May 1915. That China should employ Japanese political, financial and military advisers (Japan having aided and benefited by over 5,000 of them, chosen from at least 20 nations) is in no way strange. Of the 3,938 foreign employees in China there were, in 1914, 1,105 British, 1,003 French, 533 German, 436 Russian, 174 Americans and others, but only 245 Japanese. As for partial control of China’s armed forces, why should not China profit from the Japanese, as well as from Occidentals, to gain what she has never had—uniformity and the best results—in place of the waste, inefficiency and the confusion arising from the variety of arms and ammunition, including infantry rifles of 10 or a dozen calibres? As for the right to propagate religion, only the decadent and bigoted nations still in mediaeval darkness would think of opposing the proposition. Japan, since she opened especially since 1873, has far surpassed some European nations in freedom of conscience. The hostile critics of Japan, who argue from forebodings rather than realities, seem to forget the history of European, British or American aggressions from Monroe to McKinley, or else they imagine that one code of morals rules the West and another the East. One may perhaps sum up the newspaper reports, magazine articles and those recent books.
which are journalism but not literature, exag
erating the diplomatic demands of Japan and giving a sinister interpretation to all her ac
tions. Indeed, in the proverb, "a guilty con
science needs no accuser," since the only new
element in the case of 1915 was that it was
Japan, and not an Occidental power, that by
provocation roused China to new life. It is
reasonably certain that those who fatten on
Chinese customs and national characteristics and who "lamb chop" big contracts, or enrich themselves or debase the Chinese with opium, liquor and drugs, want to keep things as they are and misrepresent
Japan, whose first purpose is to change things
for the better. So far from China having been
nationally awakened before 7 May 1913, the mass of her people are still like those Ameri-
cans who, while their feet are wet with the
slush of Inauguration Day, want the date
changed, but forget all about the matter when
their feet are dried. Yuan Shi Kai is reported
to have said in 1916, "As soon as the trouble is
over, we indulge in all kinds of pleasure for
getting all the former humiliations." Notwith-
standing all that has been said, China's terri-
torial integrity has not been disturbed by Japan,
even though other powers have not only
threatened but have also seriously injured and
even mutilated it.

If China—that is, the 400,000,000 of her
people—has really awakened this time, then the
shame of the Chinese may change the destiny of the Far East. With the self-refor-
mation that has come from the Japanese
goad, this unwieldy mass of humanity has
shaken off much that in this 20th century world
is a hindrance to growth in true nationality.
A new spirit of independence and patriotism has
emerged, so that it does not severely tax our credence to suppose that 7 May
will hereafter be celebrated like our own 4 July,
as Independence Day, in a holiday truly national and from which point in time the nation, oldest
in the world, started on a new career of uni-
versal education and of industrial, commercial
and political prosperity.

To the thoughtful student of humanity's
progress, or one who has freed his mind, even
in part, from ethnic, racial, creed and com-
mercial prejudice, it would seem that the chap-
ters of history opened in the Far East since
Washington's time, who commissioned Major
Grey as the first American agent in eastern
Asia, are of the highest interest and happiest
augury. It seems to be demonstrated that the
general American policy that has left on Asia
the mark of the school, college, church, hospital,
missionary healer, honorable merchant and
truthful and just diplomatist is not only the
best in morals, but reveals the one method, as
yet unexcelled, for the promotion of commerce,
mutual prosperity and the peace of the world.
The Monroe Doctrine, as established in 1823
and enforced by James Monroe, Millard Fill-
more, Abraham Lincoln and John Hay, can be
in accord with justice and righteousness, only
as it is applied not only to America but to the
whole world. It means that nations have the
right to attach to its products the phrase "in
such peace as they are able to maintain. If
America support Japan's contention and Japan
America's, Europe will be forced to acquiesce,
and peace in the Pacific will be secured" is the
general verdict of the latest and ablest writers
on this theme.

WILLIAM ELMER GRIFFIS,
Author of "The Mikado's Empire," "America in
the East," "China's Story," "The Japanese
Nation in Evolution." etc.

CHINA DECORATION. The decoration of
china, and, indeed, of all kinds of clay wares,
falls into two groups: (1) Controlled by
method, and (2) controlled by producer. The
former group deals with the fact that a decora-
tion can be introduced at any stage of the man-
ufacture; the latter concerns itself with the
various handicrafts employed.

Decorations may be used under the glaze,
either on the unburned or burned clay; in the
glaze, as a natural coloring; on the glaze, after
the hard-glaze fire.

Decorations on the clay usually take the
form of "sgrafitto" (incising); inlaying, or "pâte-
-sur-pâte;" or "kintsugi." In the two latter it is
important that the inlaid or overlaid clay should be similar in composition to the main
body, or the fire will cause them to separ-
ate. The body piece, formed either in a mold or upon the wheel (see Pottery Manu-
facture), is kept in the kiln until the design, lightly sketched in India ink, is
carefully followed. In inlaid work a channel is
tooled out of the body, and filled in
with clay of a different color. In "pâte-
-sur-pâte" no cutting out is necessary, but usually
the background is stained a dark color and the
design is laid on in white. The beautiful works of M. Solon are of this class.

On the burned ware under-glaze decoration
may be either painted or printed. Most of the
modern hotel and restaurant ware is printed
under the glaze.

For some classes of work a coloring added
to the glaze itself is very effective. By this
means are produced the flowing and flashed
effects much followed by the Japanese and by
many French ceramists. In America the Ded-
ham Pottery has worked in this direction.

For work over the glaze a lower fire is em-
ployed, many more colors are available, and
the processes of decoration include painting, gilding, printing, and ground-laying.

Ceramic colors are made from certain me-
talllic oxides which with are blended a fusible
flux, so that the mixture may melt and attach
itself to the glaze. Various fluxes are in use.
They are composed of red lead, borax and
quartz sand in varying proportions. These in-
redients are melted together, and the resulting
glass is finely ground. For blues the oxide of
cobalt is used; for greens, those of copper and
chromium; for yellows, antimony and lead; for
reds and browns, iron; for dark brown, manga-
nese; and for grays, nickel and iodium. Gold
produces rose color and purple, and a pink is
also made from tin oxide and chromic acid. In
some cases the colorant and the flux are melted
together; sometimes they are united only in the
grinding-mill. For under-glaze work, as
well as for the coloring of clays and glazes,
the list is not so full. Some of the oxides fail
under the higher temperature, and must there-
fore be baked in the mold and become glazed
in the second group, decoration is considered
as a handicraft. Division of labor is the rule
in a manufactory, and thus a piece of china
may pass successively through the hands of the
ground-layer, the painter, the printer and the glider, together with the use of adhe-
sors. To the ground-layer falls the task of dis-
tributing an even tint over the whole piece or upon some part of the design. Using a stiff oil,—
linseed boiled with litharge or lead acetate,—
he dilutes it with turpentine, and brushes a thin coating upon the part. Then he mixes the dabs of oil with a soft linen pad, and then spreads the color, a fine dry powder. A certain quantity adheres to the oil, and a smooth tint is the result. If only part of a design is to be covered, the free portions are painted with a water-color mixed with molasses. The work is oiled and dusted as before, and is then immersed in water, when the water-color is washed up, taking with it any of the ground color which may have settled upon it.

The painting of china scarcely needs a de-
scription. The colors are as already explained, and the painting depends upon the personal skill put forth. The colors are mixed in turpentine and fat oil just as the painter pleases, for each artist mixes his own palette. The colors change somewhat in the fire, but not as much as is often supposed. The main difference is a great gain of brilliancy.

The gilder is mainly employed to embellish the work of others. He uses pure gold, as pure as it can be purchased. This is received in the form known as "coffee gold," a brown granular mass. Mercury is added of about the same weight as the gold and the whole is ground perfectly fine. When mixed with the proper oil this can be used freely as a paint and the oil and mercury are driven off in the fire. Gold thus prepared needs to be burnished after firing; but there is another form of gold, known as bright or liquid gold, which is much cheaper, and therefore largely used on common wares. In this case the gold is dissolved and the solution is mixed with certain oils. The fire removes everything but the metal, which is left as a brilliant film on the china.

Printing. The copper plates has been in use ever since 1756, but for many years has taken an inferior position. At first it was employed for fine engravings and decorative subjects, but lately only for borders and outlines. The pattern is imposed on a plate of planished copper, and the printer makes this plate quite hot upon his stove. The color, mixed in a very stiff oil, is also kept hot and, with this the engraving is charged. An impression is taken upon thin paper, and this print is handed to a woman who cuts away the superfluous paper and presses the print on to the china. A bath of cold water removes the paper, and the color, rendered hard by the low temperature, remains firmly fixed. The fire completes the process.

Lithographic printing is now very popular in China decoration. The process was introduced from France some years ago, and the prints were made abroad; but recently the more successful manufacturers have established their own lithographic departments. The prints are made in the usual way from stone or wood, and no color is applied to the stone itself. The impression is taken in varnish, and the color is dusted on the printed paper. On account of the transfer the order of impression is reversed, the print which is first on the paper becoming uppermost when the impression is transferred to the china. The paper used is double, consisting of a sheet of tissue paper cemented on to a stiff backing. The stiffness is necessary to withstand the pressure of the machine, and when printed the tissue is stripped from the sheet and proves flexible enough to accommodate itself to the surface of the ware. The printing is done in vitrifiable colors, of course, and the finished china is fired in the usual way.

CHINA. Great Wall of the White Wall, the Wall of 10,000 Li, the largest artificial de-
defense structure on the face of the earth, a bar-
rier extending for about 1,500 miles in the north of China proper, of which it partly forms the boundary. Its western end is in the deserts of central Asia, its eastern reaches the sea to the northeast of Peking, and it has an exten-
sion to the Sungari River to the northeast. It was erected as a barrier against the inroads of
the barbarous tribes, and part of it dates from about 214 B.C. The greater part, however, was constructed during the latter half of the 14th century. It is carried over height and hollow, and avoids no inequality of the ground, reaching in one place the height of over 600 feet above the level of the sea. Earth, gravel, brick and stone were used in its construction, and in some places it is much more substantial than in others. Its greatest height, including the parapet on its top, is about 50 feet. It is strengthened by towers at regular distances. The average height of the wall is about 22 feet and the width 20 feet. The towers are about 40 feet high. Consult Gill, "The Great Wall of China" (London 1909).

CHINA INK, or INDIAN INK; a black solid substance, which, when rubbed down with water, forms a very pure black indelible ink. It has been used in China from time immem-
orial, and both there and in Japan is employed for writing, small brushes being the implements made use of. In Europe it is used by draftsmen, artists, etc. It is manufactured in various ways and from various materials, but consists essentially of fine lampblack incorporated with a gluey substance, the whole being dried and consolidated into cakes and sticks. Some kinds are made with animal or ivory black, with lampblack got from camphor or oil of sesame. There is generally added some per-
fume—a little musk or camphor. Many at-
tempts have been made to imitate Chinese ink, some of which have been tolerably successful. Almost all the imitations consist of carbon ground up with gum, gelatine or fish-glue, but the quality and tint may vary according to the special carbon employed and the process of manufacture. Good Chinese ink should have a velvety black appearance, with a gloss which becomes very conspicuous on rubbing. The color it gives on paper should be pure black and homogeneous, and if water be passed over it it should not run or become streaky. See INK.

CHINA INLAND MISSION founded 1855 by the Rev. J. Hudson Taylor, has had a remarkable history, and many denominational socie-
ties have learned from it valuable lessons in faith, economy and the pre-eminence of spiritual methods. It has been carried on without the backing of any distinct constituency and without direct appeals for financial aid. The Reverend Taylor first went to China in 1853, in connection with the Chinese Evangelization.
Society. From Shanghai he made numerous island journeys and four years later resigned from the Evangelization Society and began independent work in Chekiang province. After a visit to England in 1865 there followed, as the result of a remarkable spiritual experience at Brighton, the formation of the China Inland Mission, and on 26 May 1866 Mr. Taylor returned to Shanghai with a party of 15 missionaries. The work was organized under a directorate, the districts mapped out and the 11 great inland provinces, whose 250,000,000 people had never heard the Gospel of Christ, were opened up. Believing in medical work, the mission now maintains 9 hospitals, 68 dispensaries, 27 physicians and a great number of trained nurses. Over 35,000 persons are now in fellowship with the churches, and over 50,000 have been baptized since the commencement of the work. The annual income raised ranges from $200,000 to $291,000.

CHINA ROOT, the root or rhizome of *Smilax china*, a climbing shrubby plant closely allied to sarsaparilla, for which it is sometimes used. *Vitis cycloides*, a species of vine, is known by this name in Jamaica. It is a native of Eastern India, Japan and China. In the United States the roots of smilax have been used as substitutes of China roots, and similar smilax roots have been used in Latin America.

CHINA ROSE, the name given to a number of varieties of garden rose chiefly derived from *Rosa indica* and *R. semperflorens*, both natives of China. The name is also given to *Hibiscus rosa-sinensis*, one of the mallow tribe, common in China and the East Indies, and an ornament in greenhouses.

CHINA SEA, that part of the North Pacific Ocean bounded on the north by Russia, on the northwest by China, on the west by Anam and the Malay Peninsula, on the southeast by Borneo, and on the east by the Philippines. It contains numerous islands, receives several considerable rivers, and forms the important gulf of Siam and Tongking. The waters of this sea are very mutable, depending much upon local circumstances.

CHINA-TREE, Wild, a common name for the soapberry-tree (*Sapindus marginatus*). It is a handsome tree, sometimes growing as high as 60 feet. The flowers are white and the oval berries are very saponaceous. It grows from Florida westward to Arizona and northern Mexico, and in southern Kansas. The wood is very hard, and heavy, weighing nearly 60 pounds to the cubic foot. It is also a name given to a native tree of India, *Metha Asaropharach*, the pride-of-India. It is extensively cultivated in warm countries as a shade tree.

CHINA WAX. See Wax.

CHINANDEGA, chè-nán-dá-gá, Nicaragua, a town capital of the department of the same name, 26 miles northwest of Leon, and 10 miles from the port of Corinto on the Pacific, with which and with Managua it is connected by rail. It is a place of considerable trade. Pop. about 15,000. In 1849 an agreement was entered into by the government of Central America with the same name, 26 miles northwest of Leon, and 10 miles from the port of Corinto on the Pacific, with which and with Managua it is connected by rail. It is a place of considerable trade. Pop. about 15,000. In 1849 an agreement was entered into by the government of Central America with

CHINAWARE, the name given to porcelain made in the Chinese Empire and imported as "China ware," now chiefly confined to the soft porcelain made in England, of which bone-ash is the characteristic ingredient. This class of ware is called "bone china" by the potters and dealers of America. Bone china was used at Bow and at Chelsea, near London, as early as 1750 and has been extensively employed ever since. Bone china consists of kaolin, pigmatite, or Cornwall stone, and bone-ash. The clay and rock are found in Cornwall; England; the bone is largely imported from America and the Argentine. The proportions in a dry mix are about as follows: Kaolin, 40; stone, 20; bone-ash, 40. The heat at which the kilns are burned ranges from 2,300° to 2,400° F. Bone china is not made to any great extent in America, though some few manufacturers have put it forth as a side line. The particular merits of this ware lie in its snowy whiteness, and in the soft glaze which makes it possible to produce very beautiful decorations over the glaze. For rich services this class of china is unrivaled. See PORCELAIN.

CHINCH, the popular name of certain fetish American insects of the family Lygaeidae, genus *Rhoparochromus*, resembling the bed-bug, very destructive to wheat, maize, etc., in the Southern and Western States. The name is also applied to the common bed-bug (*Cimex lectularius*).

CHINCHA, chén-chá, ISLANDS, a group of small islands off the coast of Peru; lat. 13° 38' S.; long. 76° 28' W. The islands are granitic, and destitute of vegetation, and the coasts bold and difficult of access. Immense deposits of guano used to exist here, but after being exported for 34 years the supply became exhausted in 1874.

CHINCHAYOCOCHA, chén-chá-kó'chá, a lake of Peru, in the department of Junin, 13,330 feet above the level of the sea, 36 miles long and 7 broad, with an area of about 300 square miles. It is the source of the river Jauaga, and abounds in fish and wild fowl.

CHINCHILLA, chin-chíl'a, or ERIOMYS, a genus of South American herbivorous rodents allied to the cavius, which they resemble in the general shape of the body, in the limbs being longer behind than before, in the conformation of the rootless molar, and by the nature of the fur, which is much woolly than silky. *C. lamyi* is about 15 inches long from the muzzle to the tip of the tail, and is covered with a beautiful pearly-gray fur, which is highly esteemed as stuff for muffls, pelisses, linings, etc. The chinchilla lives gregariously in the mountains of western and southern South America, principally in Peru, Chile, Bolivia and Argentina, and makes numerous and very deep burrows. It is gentle and sportive, loses none of its gaiety in captivity and is very cleanly. It is a very lucrative to the family Chinchillidae, which contains two other genera, one (*Lagidium*), including a large chinchilla-like rodent of the Andes; and the other (*Lagostomus*), containing that large numerous burrower of the pampas called "vicecacha." The word derives its name from the Spanish Chinché, bed-bug, on account of a certain odor which it gives off. This derivation must not be confused with that of the town Chin-
CHINCHILLA DE MONTE ARAGÓN—CHINESE ARCHITECTURE AND ART

CHINCHILLA DE MONTE ARAGÓN, chín-ché'l-yá, Spain, city in Murcia, in the province of Albacete, 10 miles southeast of the city of that name; situated on a rocky eminence. It is surrounded by a wall and commanded by a castle. Its handsome parish church has three naves, and a lofty tower containing six bells; the interior is richly decorated and contains pictures and other works of art. Quarries of granite, alabaster, gypsum and limestone are wrought in the vicinity. It has manufactures of cloth, linen, leather, earthenware and glass, and a trade in the agricultural produce of the district. Pop. 6,795.

CHINCHOLLE, shan-shol', Charles Henri Hippolyte, i-pé-lé, French journalist and novelist, b. at Chatellerault, France, 16 July 1845; died at Paris, 21 Aug. 1902. In the earlier portion of his career he was secretary to the elder Dumas, with whom he occasionally collaborated, and from 1872 was a member of the staff of *Figaro*, where he gained a reputation on matters of passing interest. He was an extremely versatile writer, but his style is wonting in finish. Beside his one-act farce, *Oncle Margotin*, which ran 300 nights in 1870, and *Le Mari de Jeanne* (a drama in three acts) and other plays, his romances and other works include *La Plume au Vent* (1865); *Alexandre Dumas Aujourd'hui* (1867); *Les Pensées de tout le Monde* (1868); *Dans l'Ombre* (1871); *Le Lendemain de l'Amour* (1880); *Le Catalogue de l'Amour* (1881); *Paula, Histoire d'une Neurosée* (1888); *La Ceinture de Clotilde* (1884); *Les Survivants de la Commune* (1884); *Les Jours d'Assinthe* (1885); *Le Vieux Général* (1886); *Femmes et Pois* (1886); *La Grande Prêtresse* (1887); *Biographie du Général Boulander* (1889).

CHINCHON, chén-chon', Spain, a town 25 miles southeast of Madrid. Peruvian bark was named *chinchona,* now habitually misspelled *cinchona,* after a Countess of Chinchon, wife of the governor of Peru in 1638.

CHINDE, Africa, a town on the only navigable mouth of the Zambezi. Here the inland steamers meet the ocean steamers of various European companies; and here, too, Great Britain has obtained from Portugal a small piece of land called the "British Concession," for commercial purposes, and a residential district called the "Extra Concession." It is the entrepôt for Nyasaland and northeastern Rhodesia.

CHINDWARA, chín-wá'rá, India, a district in the central province of Nerbudda, situated on the southern slopes of the Salpura Mountains. Its area is 3,915 square miles. Large forests cover the greater portion of the country and a great supply of coal has recently been found there. In the upper part of the district over 2,000 feet above sea-level the climate is very mild, and it sometimes is cool enough to form a reason for rain as an average amount for about 36 inches. Pop. 517,000, of whom more than one-half are Hindus.

CHINESE ARCHITECTURE AND ART. The fine arts in China are as varied in character and as rich and fastidious in design as those of the peoples most successful in art; but they are known to Europeans in a very unequal fashion. Thus the architecture of the vast country, contained in the old provinces of China, as large as the United States west of the 100th parallel, and as diversified in soil and climate, is so little known that the essays on the art written even by former residents in China deal obviously with certain very limited places only—the neighborhood of a certain city, the borders of a certain river and the like—and are, moreover, the studies of men not conversant with the construction or with the decorative buildings of any part of the world. The history of this architecture is yet to be written. The photographs now obtainable, having been made during the years since 1890, open up a new world of architectural art. It is enough to say here that there exist two systems of building; the one being a framed construction, usually of wood and elaboration, the other a solid masonry construction carried out in brick or stone according to the resources of the neighborhood and the cost of the building. The framed system of building is closely akin to that used in Japan; and it is there that we can best study the wooden temple-tower and the wood-framed hall of reception. As for the masonry buildings, they are often large and massive, as is well known to all who have observed the small gateways of the great fortified cities and the famous "Great Wall" which protected Pekin and its neighborhood from northern invasion. In the way of more decorative buildings less is known of the system of design, but several peculiarities may be mentioned. Thus there is a marked preference for the octagonal form in towers, and everywhere throughout the central provinces these buildings, called by the Europeans pagodas, rise above the hills and show over the groups of houses. The often involved structure of the polygonal arch, that is, one with the intrados at least many-sided instead of curved, is to be noted as indicating how much that is attractive we have still to discover. The decorative gate-ways (palisads) and the buildings nearly to the torii of Japan and to those edifices called *toras* in the peninsula of India, are often admirable designs in the way of purely decorative architecture, monumental architecture having no direct utility. The dwellings of the Chinese, even the palaces of the princes, do not seem to include many-storied and ponderous structures, but cover immense tracts of ground with gardens, among which stand buildings of no great height, but of a singular beauty of construction, especially in the roofs, and very richly decorated within. The dwelling-houses of the people are generally walled with brick and are not striking in their external appearance. The roof is an essential feature in Chinese art. It is commonly built with a hollow upward curve, the result of a very interesting system of construction, with light wood-work. This slightly concave surface covered with glazed ridge-and-furrow tiles richly colored is an important feature in Chinese architectural composition. Painting in such a style as this is a recognized element of external design; and it has been truly said that the special and dis-
tistinguishing feature of Chinese exteriors is gaiety. Even the slightly-built one-story shops of the great towns are bright with vermillion and green; and the signs, painted with the very ornamental Chinese ideographs, help in this effect.

Chinese painting reached a great development as early as the 8th century A.D.; and there is every probability that it had then been a great school for several centuries. Landscape was one of its especially favored branches. While in Europe no one dreamed of landscape art for its own sake, the Chinese impressionist designers were producing admirable studies, both in color and in monochrome. Some few of these are in European museums, their authors and dates having been fixed by careful comparison, but the much more modern Japanese landscapes, in painting, monochrome and woodcut, are the best material from which to gain a general idea of that ancient landscape art. A highly religious art was developed in the 12th century A.D. At that time Buddhist religious feeling was strongly expressed in the art of some painters, while others affected rather a kind of decorative realism, that is to say, a close observation of natural forms and colors and to influence a highly decorative system of design. These paintings have been little known to Europe, because they are preserved in temples and almost inaccessible palaces; and again it is Japan which has opened to us, through her own art, a knowledge of the older arts of China. A few, ancient paintings known to Europeans are of surprising interest; and they open up to us a whole system of design in form and color on the flat surface, which the West is now studying, much to its own advantage. The paintings best known to us are of some purely decorative character, those on porcelain having attracted the attention of Europe ever since the 16th century. These paintings are closely connected with the system of inlay which in the form of cloisonné enamel (see Enamel) is another of the great art industries of China. The porcelains affect a more close and careful study of the natural forms in flowers and birds, a costume of figures and the like, whereas the enamels are more severe and are confined more closely to the making of admirable patterns; but the two systems differ only as one and the same artist might change his style according to the material and demands upon him. A similar method of decoration by the free use of natural forms, conventionalized but still retaining much of their character, is seen in the splendid embroideries which have been little known to the West until within a few years. The textile fabrics - silks, brocades and velvets - have been known to collectors for many years, but very few national museums have provided themselves with any number of them: they present an inexhaustible treasure of beautiful design in strong and positive colors. It may be stated here that brilliant color is a specialty of the Chinese artist. Where, as in a fine cloisonné enamel, a Japanese artist works in dark and sombre colors, the Chinese will use a sky-blue ground, upon which to observe and divide the subject into its deep ultra-marine blue, violet, reddish-gray, dark green, apple green, vermillion, bright yellow and white, with dividing lines of gilded metal, and many passages of gradation from one color to another. No people have equaled the Chinese in the decorative use of bright, pure colors.

Sculpture in the sense of a grand and permanent art of form is less the business of the Asiatic artist than painting, or than decoration properly so-called. Sculpture in the form of carving in ivory and wood and bronze figures of small size has always attracted great attention in China and has reached an extraordinarily a state of excellence in spirit, movement, and skillful composition. Thus, a bronze figure will express perfectly the character and the sentiment of the occasion, while yet losing nothing of its sculpturale value; and a group of "The Seven Wise Men" seated around the trunk of a bamboo will be rendered in cheap glazed pottery or in minutely carved ivory with equal skill and at a price proportionate to the labor expenses and the prime cost of the material. The ivory group may have cost a hundred times as much as the piece molded in clay, fired and then glazed and painted, but it is not on that account a finer design, the characters are not more perfectly expressed nor the attitudes of the figures more forcible or more effects used with equal skill; there is great evidence of an old traditional skill of sculpture excelling in the larger as well as in the smaller scale of work. Relief sculptures, especially those in wood, in soft stone and in the surface of lacquer, which has generally a wooden background prepared to receive the impressed and sculptured coat of the viscous material, are as effective for their decorative purpose as are the sculptures in the round. Finally there must be mentioned the lapidary's art, in which the Chinese have always excelled, for the most marvelous carvings in agate, jade and rock crystal, that is to say, in the hardest materials known, are unmatched in the world, and they are as artistically perfect as the carvings in the softer stones; their essential characteristics perfectly understood and always observed. The conventional way of rendering in hard material the most delicate leafage and sprays of twig and blossom is perfectly maintained, figures and the like, wherein the beauties of these carvings is carried through beneath those delicate undercut sprays.

Bibliography.—There exists an extensive literature on Chinese art, much of it contemporaneous with the great art epochs, by Chinese writers and inaccessible to Westerners. The following works are of recent date and deal with some phase of Chinese art: Binyon, 'The Flight of the Dragon' (London 1911); id., 'Painting in the Far East' (ib. 1913); Boerschmann, 'Die Kunst der Chinesen' (Berlin 1911); Bushell, 'Chinese Art' (2 vols., London 1904-06); Chüta Itô in 'The Kokka,' Nos. 197, 198; Chavannes, 'La sculpture sur pierre en Chine au temps des deux dynasties Han' (Paris 1893); Cram, 'Chinese Architecture' in 'Dictation: Architecture and Building' (New York 1902); — Fenollosa, 'Epochs of Chinese and Japanese Art' (ib. 1912); Fisher, 'Chinese Art' in 'Reperatorium für Kunstwissenschaft' (Vol. XXXV, Berlin 1912); Giles, 'An attempt to Carry out the Idea of a New Chinese Art' (Shanghai 1905); Glaser, 'Die Kunst Ostasiens' (Leipzig 1913); Hirth, 'Fremde Einflüsse in der chinesischen Kunst' (Munich 1896); id., 'Études de C'est from a Collector's Note
CHINESE CERAMICS

Until a little over a generation ago the foreigner in China found both difficult and dangerous personally to investigate the inside conditions prevailing in that country's ceramic industry. The technique and history of China's wares, therefore, remained a mystery to Westerners, and written evidence was largely erroneous if not supposititious. The pottery and porcelain pieces themselves, in museums and private collections of Europe and America, were the main source from which to gather information. Père d'Entrecelles (a Jesuit priest) sent some letters home (1715-1717) containing a remarkable account of some technical processes used in preparing the different clays, glazes and colors. Julien's translation (published 1856) of the Chinese work entitled "Ching-té Chén t'ao lu" was scholarly, but, failing to have expert knowledge of the technique of ceramics, he was uncertain about some of the processes used, and led future writers astray. Franks (1867) aided much with his classification and intelligent system; Dr. S. W. Bushell's "Oriental Ceramic Art" (1899) revolutionized the field of knowledge on the subject. Cosmo Monkhouse's "History and Description of Chinese Porcelain" (1901) assisted the work. Then came a translation of the 16th century 'Album of Hsiang Yuan-pien', the result of the life residence of Captain Brinkley contained in his voluminous work 'China' (1906) afforded further insight into the facts. But, greatest factor of all in deciphering the mysteries of Chinese ceramics was the founding of the Chinese republic. Access to the many sources of reliable information have lately become comparatively easy; internecine warfare induced many wealthy natives to part with treasures which in times of peace none could purchase. The opening up of railroads has led to the large-scale supply of Chinese wares through excavation of graves centuries old. With our present knowledge we can not only decipher the characteristics and history of wares back to the Sung Dynasty (960-1280), so long hoped for, but we have an insight into productions of the T'ang Dynasty (618-906) wares in undreamed of splendor. The following meanings of several Chinese terms used in ceramic lore will aid to a better understanding of the subject: The body or paste of (1715-1717) porcelain, (remarkably termed "tesu", is composed of kaolin, a native weathered pegmatite (silicate of alumina), which is very free from impurities, and petuntse (or pe-tun tesu), a fusible, finely comminuted clay, derived from the same felsparic rock as the kaolin. Both are products of decomposed granite. The glaze (termed "yu") which covers the porcelain body is also composed of petuntse, but all Chinese glazes contain some proportion of lime to increase the fusibility of the petuntse, it is the lime which is the tint characteristic of Chinese porcelain, besides conducing to the brilliancy of the glaze. The Chinese term for earthenware, as differentiated from the fused porcelain and stoneware body, is "wu". The finished product of the kiln is known as "yao" (similar to our term "ware"). Thus Kuan Yao is "Imperial ware" (Kuan meaning Imperial), and Sung Kuan Yao is "Imperial ware of the Sung Dynasty". Ting Yao is the ware produced by the kilns at Ting-chou, or wares of the Ting type. Early Chinese Pottery.—The earliest pieces of Chinese stoneware to come to our knowledge are an imperfectly baked earthenware with a green or thin yellow glaze (sometimes unglazed). They belong to the Han Dynasty (206 B.C.-220 A.D.). By the time of the T'ang (618-906 A.D.) the potter's and all other arts were flourishing, and most beautiful forms had come into being. In Shosoin, the noted storehouse at Nara (Japan), are hard pottery vessels with beautiful blue, yellow and green glazed ornament on a bare body, others have green and orange glaze. They belonged to the Japanese Emperor Shomu, who died in 756. Some of the vessels were made to hold the ashes of his dead son and grandson. In T'ang times there was a demand for good pottery, and the potter was given a considerable amount of power. The potter's wheel was invented by the T'ang, and by the 9th century C.E., pottery was already well-known. The Japanese sought and acquired much of the beautiful T'ang pottery, and the pieces from the T'ang have acquired the name "Yao" pottery. The pieces have enabled connoisseurs to identify confidently such pieces in their possession as examples of the T'ang Dynasty and, therefore, made before the middle of the 9th century C.E., yet perfect as to form, potting and glaze. Human and animal types and statuettes in this early pottery also are extant, beautifully sculptured. Berthold Laufer's researches into examples taken from tombs of the Han period (206 B.C.-220 A.D.) in this century show an earthenware usually having green glaze. Recent excavations on the Pien-Loh Railway have, practically, crowded the Peking market with pieces, probably dating back as far as the Han period—Han Wu. Altogether we are now fairly assured of the following facts. Ch'ing-té Chén pottery kilns became famous early in the 7th century, under the name of Ch'ung-nan, with the Imperial Court patronage; the ware was termed "Ceramic Jade" (T'ao Yu). But, during the Wei Dynasty (220-265) the T'ung-ou kilns produced refined ware. In the T'ang Dynasty (618-906) Show Yao (yellowish ware) was made in Anhui province; Yuseh Yao (greenish ware), Shu Yao (white ware of Sau-chuan), Pi-te Yao, or "secret color" ware (for Imperial use only in the T'ang period). The T'ung pieces. The process of "marbling" was also used in T'ang Yao. But the finest ware prior to the Sung Dynasty was the noted Ch'üi Yao, made middle of the 10th century. It was "sky color, mirror clear, paper thin, resonant, glossy," etc. T'ang ware was of "plaster-like" body and ran from faience to stoneware, even to true porcelain. Soft lead glazes were used colored with metallic oxides to green, purplish brown, blue, amber. Some ware has felspathic glazes in termed "tea-dust" green; some have "frothy" patches, same as Sung ware, in gray or bluish gray. Ornament is mostly incised with a point, or stamped or carved low relief. Colored glaze fills in the cavities. Sung Dynasty Wares (960-1280).—This period is called the Golden Age by the Chinese. Court patronage brought successful potters into the artist class. Sung wares were as follows: Ting Yao, made at T'ung-chou (in the North), first, then moved to Ch'ung-nan (South), the present Ching-té Chén. Yu Yao, made at Yu-chou; Kuan Yao, made at K'ai-feng Fu; Lung-
CHINESE CERAMICS

ch'uan yao, Ch'in yao, Chien yao. There were also a number of minor kilns. T'ing yao was a "semi-porcelain" and has been called "father of our white porcelain." It was covered with a glaze thicker and less transparent than later porcelains, and its soft appearance has caused it to be called "soft" or "soft" porcelain. Dillen calls it "kaolin stone-ware." Forms, at first, were copied from bronze vessels. Product was: Plates, saucers, wide-mouthed bowls, etc., Often, being baked in very hot ovens, the foot is glazed but rim bare. Rarely was there any cracking. Some pieces plain, others have molded relief pomeon, phoenix, day lilies, scroll-work, "key" pattern, etc. The Yuan Dynasty, following the Sung, contained the same wares, evolving little new. Forms of these dynasties are bold. Some pieces show ornament painted in red, blue and green enamels, but carving, molding and incised work are most frequent, depending on beautiful opalescent ephratic glazes. In a study of these early Chinese wares it must be borne in mind that the main inspiration of the potter was to make from clay the closest possible imitation of jade— the most precious stone of the Celestial. Hence we get these glazes of opalescent ("shallow-fat") deity of the golden yellow, yellowish blues, etc.; they are the celadons. They are the ultima Thule of present-day collectors.

Chinese Porcelain Period—in discussing Chinese porcelain we must always have the clear understanding that there are three oven heats entering into the "firing." First there is the grand-feu (1,350° Centigrade) heat needed to create a vitrification of kaolin and petuntse, producing the porcelain body and glaze, and fusing the underglaze colors. Next comes the demi-grand-feu obtained by placing pieces in those parts of the oven which have the least heat. Lastly there is the muffle oven heat (from 830° to over 1,000°) which fuses the enamel colors to the surface of the already baked ware.

Ming Dynasty (1368-1644)—Kaolinic (ephatic) wares had been made (7th century) long prior to actual porcelain. These, usually opaque, are at times slightly translucent and resonant, but are classed as stone-ware. A true porcelain, of mediocre quality, was made by the 5th century (Chang Dynasty), and blue-under-glaze decorated pieces were produced in the 14th century (Yuan Dynasty). But it is to the Ming Dynasty we must look for the first real supplies of true porcelain. The Ching-te Ch'eng kilns had pieces show so numerous and important as to leave all others forgotten. These potters favored blue-and-white and polychrome decoration. The "classic" types fall into the 15th century. From Yung Lo's reign (1403-24) we get white bowls extremely thin and translucent. The decoration is incised and traced with fine slip (liquid paste). The finer examples extant are the noted so-called "eggshell," the Fo t'ai ("bodiless") of the Chinese connoisseur. The decoration is unnoticeable unless held up to bright light, and it is almost paper thin. Few of the many similar pieces extant can date so far back. In the Hsian Tê period (1426-35) we find the Hsien hung ("bright red" or "rouge vi") transmutation glaze. Few examples of this exist, even in China. It is similar to the later Lang yao, the Western collector's sang de boeuf. The Pao-

shi-hung ("precious stone red"), is also transmutation glaze and likewise derived from silicate of copper. The next important period is the reign of Wan Li (1573-1619). More specimens of this period are extant than probably any other of the Ming reigns; mostly blue-and-white. The porcelain blue of the 15th century was no longer procurable and we notice the blue has acquired a purplish tinge. Extant are some boxes for holding cakes, sweetmeats, etc.; they are oblong, square, rounded, with many dragon designs in dark blue. Shipments are now being made abroad and pieces show frequently hurried workmanship of export ware already. The body is white and termed "unctuous"; glaze is lustrous but bluish. The kilns of Yü-hsing were turning out a reddish yellow or brown earthenware; it is the ware known in Europe at that time as "boccoro," and has relief decoration, like other wares of this period. Relief and pierced work in combination are found. Large polychrome jars and bowls in designs, covered and filled in with demi-grand-feu glazes (translucent, violet, purple, yellow, green). Flat wash decoration appears in sơn ts'ai (three-color)—green, yellow, aubergine. Red underglaze in various tones is used now. Enamel overglaze decoration is done largely; a characteristic of this reign being enamel decoration in combination with underglaze blue. Marked mono-chrome Wan Li pieces are rare. The last three emperors of the Ming Dynasty are not mentioned in Chinese ceramic works, and what wares we know of are inferior; of coarse body, crude design, impure colors. China had serious internal troubles and potters were not patronized by the wealthy.

Ming glazes were thick and usually applied before baking. Foot rims are plain, without grooves or beading as later on K'ang Hsi wares. Body is close grained, white and fine texture; the edge of the foot is bare of glaze and the baking has given it a brown color. Ming vases have thick, massive body; feet favor "double gourd," square body and gourd-shaped neck, bottles of globular body and tapering neck, melon-shaped pots with lobed sides, ovoid jars. Other pieces are barrel-shaped garden seats, porcelain plaques for furniture inlays, screens. Dishware has various forms.

The noted Faksien or Tê-hua white porcelain ware was made at Tê-hua Hsien. It is the blanc de Chine of the collector. Body is white, very translucent, and has satin-like glaze of a cream or ivory whiteness. Many of the old examples exist, including statues of Kuan-yin (godess of Mercy), Kuan-yu (god of War); Bodhidharma (Apostle of the Buddhists), Manjusri (Buddhist Trinity), etc. Some pieces have nothing but their plain charm of delicate body and glaze to show; others have incised designs; others again have high relief decoration, such as plum, dragons, phoenixes. The latter variety are the least valuable. This ware was made till late into the 19th century and is recent being against.

Ch'ing Dynasty (1644-1912)—Little of interest occurred until the reign of K'ang Hsi (1662-1722). This is the greatest period in Chinese ceramics; it is also the most prolific. Three-fourths of the Western collections belong to this period. The wonderful blue-and-white was produced at this time. The red is the

sang de beruf so greatly prized by Western collectors. Derived from copper oxide, the secret of production of this marvelous brilliant red glaze has been lost. In spite of the wonderful control these potters had over the oven's heat, no two pieces of this ware are alike. The glaze is more or less streaked. It is well known that native connoisseurs. Other noted glaze colors were: Shē pí lā (snake-skin green), shan wu huang (eel yellow), chi ts'ui (turquoise), huang pan tsien (spotted yellow). Their monochrome yellow (qian long hua) is best known. Green, souffle red (ch'ui), and souffle blue are beautiful. Most honored, generally, by the Western world were the blue-and-whites. The Kao pien-yao or so-called soft paste blue decorated ware has been called a "masterpiece." Another marvel of art and technique is the hard-paste porcelain "egg-shell" ware, thin as paper, nearly as translucent as glass and of wax-like body. Another greatly admired blue-and-white is the "hawthorn pattern" (plum blossom), the Me-kuo and Kiu Kuo blue, and the Me-kuo blue, is most dear to the depth and purity. The Dutch and the West India companies carried immense quantities to Europe, mostly a second "export" made-to-order quality of considerable beauty, but the highest class pieces are those of the "export." They are deeply colored and the flower patterns are finely detailed. On the other hand, the iron oxide or "kinfisher" blue (fei ts'ui) is another. The green monochromes about equal the blues in number: "Apple," "leaf," "cucumber" (Kua pí lā) greens are famous.

Chen Lung Period (1736-95).—The product of this reign is highly refined. In it we find the well-known armorial china, certain sets of ware decorated with the coat of arms of the European and American owners. They have caused much trouble and discussion among collectors through the writer Chaffers erroneously attributing the ware to the English town of Lowestoft. Even to this day, after full proof of its being of Chinese manufacture it is often termed "Sino-Lowestoft." Snuff bottles of this and the next reign are scarcely equaled and are highly prized. The paste of this reign is whiter, less blue than former periods. Underglaze red (wu li hung) painting is much used, some combined with the underglaze blue. Greatest of monochromes now is the wondering famille rose ware, in "egg-shell" saucers, dishes, plates, coffee and tea services of lovely finish. The "rouge red" and "ju-jube red" (derived from gold) and pinks are admired the world over and pieces are formed copper oxide, was revived from early wares, and assumes irregular effects in the firing: maroon, sang de beruf, even "peach-bloom" variegations. An underglaze red style of painting was done now. Another style of polychrome decoration was done in washes of different glaze colors. The "three-color group" (underglaze transparent green, yellow and aubergine) was continued from the Ming style. This same sa line (three color) combination was also done in muffle (enamel) colors.

Certain similarity in color combinations of Chinese wares led the French connoisseur, Jacquemart, last century to group them into families; thus we get the famille noire, famille verte, and famille rose. The first is done by overlaying a dull black pigment with transparent green enamel washes, producing a greenish black. The lead of the green flux creates some iridescence on the surface. In this period, we have statues of Buddhist and Taoist deities, demigods, sages and Chinese native figures. In the famille verte group we have combinations of underglaze blue with the onglaze son t'ai (three-color) and the coral red (iron oxide). The tracing of the design in brown black, all covered with green, forms one type of this "family." In another an overglaze blue takes the place of the underglaze. Familie verte is costly and highly prized — even those pieces which are second rate. The motifs are traced in with red or brown black outline and the spaces filled in with washes. The beautiful apple green used is a characteristic of K'ang Hsi pieces. Sometimes the red and blue are absent. Touches of gilt occur.

K'ang Hsi monochromes (1722-35).—Numerous. We find the pale yellow ("husked chestnut") on white glaze. The American's "peach bloom," the Chinese pin-huo-"t'sing," is a pale red becoming pink in some parts, mottled in others, with russet spots displayed on a background of celadon tint. It is a grand-feu transmutation, is underglaze, and is a "sport" or freak demonstration. Blue monochromes are innumerable in this period, such as the "blue souffle," applied by insufflation; most noted, however, is the "green" turquoise or "kingfisher" blue (fei ts'ui) is another. The green monochromes about equal the blues in number: "Apple," "leaf," "cucumber" (Kua pí lā) greens are famous.
CHINESE EMPIRE—CHINESE IMMIGRATION

ware made in China on which the Western painter has improved the underglaze designs with overglaze decoration and some gilding.

CHINESE IMMIGRATION. Until the California gold-mining years of 1848 there were literally no Chinese laborers in the United States. From 1840 to 1850, according to the records of immigration, only 35 came over, and those all in the year June 1849 to June 1850. During the next decade 41,397 Chinese came to the port of San Francisco, of whom about 6,500 returned to China, leaving the net Chinese population in 1860 34,933, nearly all in California. For some years the general feeling continued to be favorable, as labor was deemed to be almost impossible to obtain; and the Chinese laborer, and above all, the Chinese house servant, seemed to make industrial progress and lives of refined leisure possible. In 1858 the Reed Treaty was negotiated, and no restriction was placed on immigration. In 1862 the California legislature appointed an investigating committee on the subject; but it was still felt to be only a local nuisance, not calling for any hasty or severe measures. Even as late as 1868 the Burlingame Treaty with China, though reprobatmg enforced immigration (coolies under contract), asserted the right of migration to be inherent in the human race; and on 27 July 1872 a resolution of Congress, in response to anti-immigration measures in the East, repeated this assertion as to the right of human beings to expatriate themselves, and declared that its restriction was contrary to the fundamental principles of the republic. This meant European immigration; but it proves that even then the Chinese question had not become acute enough locally to force California politicians into making it a national issue. Within a few years after this, however, it was not only the burning issue of the Pacific Slope, but had emerged into the national arena. Those who saw the excessive strain placed on democratic institutions by ignorant European immigrants, felt that assimilable, were appalled at the prospect of operating them by the inassimilable and purchasable brute vote of the Pacific Slope. If they were made voters, they would force a permanent political division on the lines of race; and if not, would form a dangerous class of Chinese immigrants. Thus, white industry, order, sanitation, public morals and statesman-like forecast united in the conviction that this class of immigration must be prohibited or severely restrained. These valid objections and fears were reinforced by others, unsound or exaggerated. The numbers arriving were vastly swollen in popular imagination, and the departures suppressed. The actual number of Chinese in the United States in 1870 was 62,376, an increase of some 27,000 in 10 years; 69,298 had come over within 10 years, and 34,850, or over one-half, had gone back.

After attempts at restriction by local legislation, which were invalidated by the Federal courts as in violation of the United States treaties, California appealed to Congress for a national law; but that body evaded the question till 1876. Then the exigencies of the Hayes-Tilden campaign compelled both parties to bid for California's electoral vote by anti-Chinese platforms and platforms; and Congress (the House, 6 July, the Senate 17 July) appointed a joint special committee to investigate the subject. It met at San Francisco 18 October, heard a mass of testimony and made a very voluminous report, taking the strongest grounds in favor of a restrictive law (Senate report 689, 44th Congress, second session, 27 Feb. 1877). At this time the Chinese population was about 100,000. Nevertheless, the party pledges were not redeemed in Congress till 1879, when the Republican, the bill was passed; but it was vetoed by President Hayes as being in conflict with the Burlingame Treaty. In 1880 a commission was sent to Peking to negotiate a new treaty permitting the restriction. This treaty, signed 17 Nov. 1880, ratified by the Senate in March 1881, gave the United States the power to regulate, limit, or suspend the immigration of new Chinese laborers, but not to prohibit it altogether; permitted laborers already in the country to remain, and restricted the immigration of Chinese merchants, students, teachers or travelers to exercise their functions without
molestation, each class to have all the privileges and advantages of the most favored nation. (2) Section 2. Passed April 13, 1880, ch. 105, 105,465.) Under guise of giving effect to this treaty, Congress, in March 1882, passed an act suspending Chinese immigration altogether for 20 years. This was vetoed by President Arthur on the ground that so long a suspension was virtually absolute prohibition, and not in accord with the spirit of the treaty. On 6 May another bill was passed to meet this objection, suspending fresh immigration for 10 years, both of skilled and unskilled laborers, permitting those already here to remain, but forbidding their naturalization. The provisions of this act were minutely severe. The exempted Chinese must have certificates of identity issued by the Chinese government, and the only Chinese laborers who could be permitted to return after once departing were those who had a living wife, parent or child in the United States, or $1,000 worth of property, which was made answerable for their default.

This was "amended" on 1 Oct. 1888 by the Scott Act, striking out all permission to return for any purpose, forbidding the issue of return certificates and declaring all that were issued void,—in a word, absolutely barring America to any Chinese workman once outside it. A treaty was at this time pending between the United States and China by which the Chinese government was to prohibit the emigration of laborers and the United States was to protect those in the country from violence, which it had shamefully failed to do, but the Scott Act enraged the former government, and it refused to ratify the treaty. On the expiration of the 1882 act in 1892, the "Geary law" of 5 May extended it for another 10 years, with further severities, not called for by any dangers at hand. On 7 Dec. 1904 a convention with China restored the conditions of return to the status of 1882. On 3 March 1901 it was enacted that a Chinaman can only be arrested under these acts on sworn complaint of certain specified United States officers. In 1902 the suspension was renewed for another decade. With the general intent of these acts there is little difficulty in concurrence; but some of the provisions, and the petty acrimony of their execution, exhibit a spirit of panic which is neither dignified nor sensible. The whole situation is the very essence of the danger; if it is insignificant it is harmless. The Chinese population in 1890 was 107,488; in 1900, 89,863; and 71,531 in 1910. In 1915 the District Court of Montana (223 Fed. Rep. 801) and the Circuit Court of Appeals of New York rendered decisions which in effect assure to Chinese students in the United States (in accordance with existing treaty rights) continuance of privileges accorded the subjects of the most favored nations.

CHINESE LACQUERWORK. See LACQUERS AND LACQUERWORK.

CHINESE LANGUAGE. The. Among the oldest of human scripts, the Chinese system of writing has had an astonishing effect upon the life and structure of the language itself. It has conditioned largely the development of both the native speech and the written form of the vernacular, making the acquisition of Chinese one of the most easy and yet the most difficult, in the linguistic field. There is, apart from syntax, virtually no grammar. From one point of view Chinese is the unaltered baby-talk of mankind, fixed, too early in its history, for writing. This, while allowing for endless development in forms visible to the eye, has robbed the soil and closed the avenues of growth to what meets the ear. The whole language, spoken and written, is of monosyllables, each intended to represent a word or thing. It is true that these are often combined to make compound words. Various other devices have been elaborated, which enlarge the powers of conception and expression, while expanding the field of description. These verbal combinations, and especially the compound written forms, appeal powerfully to the mind through the eye. The striking characteristic in the Chinese and Turanian languages is the unchangeability of the root, the reverse of the case in Semitic and Aryan languages. The meaning of a word is determined, not by giving it a name as a "part of speech," nor by inflection, or terminology; but wholly by its place in the sentence. The same character occurs in manifold forms as noun, verb, adjective, adverb or other part of speech. To the native, or expert scholar, this is not so difficult, for the notable device of using auxiliary words is constant and universal. There are hundreds of these words, which, having long served as more or less correct conceptions of things, according to their shape, size, use, nature or relation, act as so many ready-made agents of classification. The categories which they suggest or furnish enable the Chinese to extend the powers of both thought and language, and on perception of a new idea or object, at once to catalogue or classify the novelty, whether native or foreign, when first presented to the mind. Where we say 50 "head" of cattle, a "flock" of sheep, a "brace" of partridges, or a "span" of horses, a few tens of times, the Chinese employ these aids to memory and classification in hundreds of instances. It seems clear that, as concerning the luxuriants of the written characters and the comparative poverty act the sounds of the spoken vernacular, nature's law of compensation has been strikingly illustrated. Not a few sounds in vogue in ancient times—as for example, those in the classic poems and old rhyming dictionaries—have been lost; while of the written characters or logograms, at least 25,000 words are still in use, and the Great Dictionary of Kang Hi in the 18th century contains 44,449. It is quite possible, counting obsolete words and remembering the great demands made by the modern age, that 80,000 characters may be legitimately considered as in the Chinese repertoire. Since the recent revolutions and the establishment of a republic, Chinese editors, writers and government departments have found in the word-coinages and characters contributed by the Japanese a rich addition to the resources of both speaker and penman in China. Beginning as early as 1870, the literary men of Japan, who used the script of China, and not a few of whom were at home in the Chinese classics, began, from the storehouse of the past, to mint new expressions for Occidental and modern ideas and things. These, after trial and long use, have been accepted in China. Thus a rich infusion of terms of comparatively the oldest of languages, with the newest of needed additions in a mighty nation, suddenly brought
FACE TO FACE WITH A NEW WORLD OF THOUGHT.

In neither case has any modification of the syntax or structure of the two languages been sought or wrought. There are many written forms, or styles, of writing, six at least of these being long running hand. There is no alphabet in China, though in modern days 26 or more characters have been selected and are used arbitrarily for their phonetic value only and chiefly to transliterate foreign names. In modern days, also, some pinyin, chiefly by missionaries, in Romanizing the colloquial in various provinces. Among prominent educators, chiefly American, plans are under way for a reform of the divergent scripts of China, Korea and Japan. While all three have a common basis of inheritance and culture, yet they differ in their written forms. The three ways of expressing thought, in writing, are thus found in adjoining countries,—the ideograph, or logogram (China); the syllabic (Japan); and the true phonetic sign, or alphabet (Korea). There seems no insurmountable obstacle—while leaving the vernaculars of the three countries untouched—toward the creation of one standard system of writing, as in most of Europe, for all the lands which value the Chinese inheritance.

CHINESE LITERATURE. In this article we propose to sketch the history and treat of the influence of the blackboard in molding not only the thought and character of the Chinese people, but also those of the neighbor and vassal nations included in the circle of Chinese culture, rather than to catalogue the books or to comment upon them. Only the great landmarks in the literary field of the centuries, and what in the present are rooted in antiquity and are true outgrowths of the same, will come under our view. The mental attitude of the Chinese author is ever upon the past, as the sure dwelling-place of perfected ideals. The typical man of China looks not upon ‘the judgment of posterity,’ but hopes ever for the approval of the ancients. ‘How can I face my ancestors?’ is his question. Hence the two great systems of philosophy, the first founded upon the authority of the fathers of Chinese order, and the second upon that in which knowledge is discoverable by intuition, and resting upon reason and science. ‘Chinese language was hieroglyphic, each character being meant for a picture of the object represented—as in the still recognizable forms for moon, sun, field, etc. Ages ago, however, all such vestiges passed from sight. The invention of the hair pencil, in place of the stiff stylus, and the necessity of holding the pen and paper in the manner now common, revolutionized the old form of script. The ‘grass character’ or running hand, completed the separation of idea and form. While this showed the copiousness of the language, as it issues from the pen, it does but reveal also the poverty of vocables in the native speech. There is no common language of the lips in the Chinese republic, nor is there the verbal unity, such as exists even in Russia. A linguistic map of China would suggest a crazy quilt, lacking all unity. The ‘mandarin dialect,’ so-called, comes nearest to being a standard spoken language, and possibly offers a ground plan, on which the hoped-for future linguistic unity of the Chinese republic may become a possibility. This speech of educated men, especially of officials and those who travel, has even been under literary cultivation and is an excellent medium of thought. Hardest of all for foreigners is the mastery of the four tones. By means of the device of uttering the same sound in various vocal forms, depending chiefly on pitch, the same word or sentence is made to bear widely different meanings, and to serve varied purposes. True, this is one of the devices tending to pauperize the spoken language, even while eking out the popular resources of sound, and to expand the written language. With a stick on the sand or earth, or with pencil or paper, educated natives of various lands, under the Chinese world of culture, can converse all day; even when the opening of their lips means instant confusion, the eye, in this case, having supreme advantage over the ear. The writer has often been amused, while among his Oriental friends, at the discussions consequent upon his interrogations put to them. Controversy might run high owing to the paucity of sounds and the very large number of homophones (from five to a thousand, or more, characters, to express one sound). When no pen, pencil, blackboard and chalk, stick and earth were at hand, understanding and final settlement were reached by using the forefinger of one hand as the chalk, and the heel of the other hand as a spoke, to give something like graphic visibility to the argument or answer. One can quickly tell what a spoken word means, when he sees the characters with which it is written, but otherwise has more or less difficulty. Some amusing blunders in foreign books, especially those of tourists, have arisen from lack of knowledge of the ideograph. To reduce the mass of written words into categories of thought, the ancient tables of 514 radicals, or root ideas, have been grouped under 214 heads. Knowing these—and every mature pupil is expected to have them by heart—a bright learner quickly discerns in a new character the basic idea. Then, according to his education, culture, imagination and experience, he can recognize a meaning new or old, or dissect a sentence. Such knowledge serves very much, as with us, as a classical education does helping one to dissect new or unfamiliar words. Undoubtedly the greatest value in Chinese language was hieroglyphic, each character being meant for a picture of the object represented—as in the still recognizable forms for moon, sun, field, etc. Ages ago, however, all such vestiges passed from sight. The invention of the hair pencil, in place of the stiff stylus, and the necessity of holding the pen and paper in the manner now common, revolutionized the old form of script. The invention of the hair
Mencius, with the general cultural apparatus of education, such as commentaries, dictionaries and works that treat of language, and its contents, as the vehicles of thought; (2) history, including biography; (3) ethics and philosophy; (4) poetry. Other literary matter, such as the most romantic, drama, modern newspaper, works of science, American inventions are hardly recognized as literature, in the true sense of the term, or as worthy of notice by the literary critic as such. The characteristics of Chinese literature are terseness and absence of anything like obscenity or low forms of language; while in poetry the general themes relate to the sadness of things, as shown in the abounding sorrows of life, the brevity of human existence and the beauty of nature. There is little personification, nor is there much that is infused with the idea of the personality of Deity, or the individuality of man. The Unseen Power is rather conceived of as Abstract Right, or a bundle of laws and facts, or as a sort of omen. The outlook is that of brotherhood and mutual duties. The whole literature is instinct with the spirit of freedom and the necessity of the individual's obedience to the laws of the great impersonality and the idea of being save by obeying the face of heaven's decrees. China's history has repeatedly verified the thesis that so long as her deathless literature animates her people, despotism cannot permanently exist. The literature of China is the key to her history. Her social system is based on her literary inheritances, and has remained intact during the 25 centuries of her recorded history, during which time over 30 dynasties have risen, ruled and been overthrown. When the scholars of China and Japan first heard of American democracy and the revolt from the tyranny of Great Britain, then ruled by a German king, they ascribed their thought and action to the knowledge which the barbarians had, in some way, gained from the writings of Mencius! By the native orators, in 1911, who preached and agitated for a republic, justification was sought and impassioned appeals were made to the writings of this famous commentator, Mencius. If the writings of the sage and gave to the text of Confucius that political significance which they have never lost. So vast and powerful in its influence is this classic literature, that it has had the threefold effect of furnishing the norm and philosophy of government, besides serving as the basis of training for office, through a series of competitive examinations over 1,000 years old and only recently in form abolished. This exaggerated veneration and devotion to the ancient classics have checked the development of intellect, of thought and literary expression; putting all originality more or less under ban, while acting as an invincible force in creating models of style. A modern essay, state paper or argument is so saturated with quotations or allusions to the classics, or to the ancient or medieval standard literature; nor is any written language or colloquial speech richer in literary memorabilia, than that of China. So widely disseminated is this fact by oral and written forms; whether he, nor his speaking, any missionary, or any other, can always gather a crowd, upon the streets, in a Chinese city by quoting from the classics and asking attention to their exposition. Hence, therefore, the two great streams of thought, or rather the river and the rill; the one, which is wholly Confucian and based on authority of the ancients; the other, that which is intuitive, or based on science; though each is like the other in literary method and form. Both historic and literature were shaped and unfolded in a feudal period, when China was a state of small area. The legendary and semi-historical ages had passed and a relatively high state of civilization had been reached. Letters and writing, songs and annals, wise maxims and a considerable mass of products of the pen were already in existence, when Confucius was born (551 B.C.). His work was almost wholly that of an editor. He invented or taught nothing new, but rather made the teachings handed down from the ancients the norm of his own thought and expression, while setting in order the rich inheritances of the past. From the first utterances of the Chinese soul, which were in poetry, he selected, from the classics, and in four-word lines, 311 pieces, testing their merits also with the lute. Poetry has ever been the delight and occupation of Chinese literary men, though in later ages when the pronunciation changed, the more ancient suffered, and in many of the odes the primitive sound-forms cannot be recovered. The seven-word stanza, with the "surprise line" in the last verse, has also been in use. Modern collections abound, but the standard thesaurus, issued in 1707, is in 900 chapters or books, containing 48,900 pieces. The eras of the Tang (618-905) and Sung (960-1278) dynasties were especially rich in poetry. Some attempts have been made in recent times, but so far without striking success, to frame poetical thought on Occidental models. Love of nature, the spirit of fraternity and sympathy with humanity mark the Chinese poet. In his lines there is little about romantic love, but much in praise of wine, and of the glories and beauties of the external world; yet with frequent touches of tender sentiment and with bursts of sublime admiration and awe, in view of creation's wonders. Briefly stated, the five classics, or king, of Confucius, and the basis of every Chinese education are: (1) History (2) The Book of Changes; (3) The Odes; (4) Rites and (5) His own Annals. History begins with the canon, which Confucius found to his hand and he added, as his own work, the annals of spring and autumn. The result of his labors, however, has been that the sage shines more brilliantly as a moralist than a historian; and, except for the style, the annals are not highly valued. Indeed, it cannot be said that history, in its modern sense, existed, until there arose the father of Chinese history, Szu Ma Chien, who was born 145 B.C. He compiled and reduced into books containing nearly half a million characters, the story of the nation's life; though neither he nor his pupils were able to explain the origin of the Chinese people. It is only fabulists, or myth makers, later than Confucius, who attempt to bridge the gulf of ignorance on this point. Often edited and revised, the standard edition of Szu Ma Chien's work was published in 1777. Out of the study, among all other historical works of a later date, is the colossal 'Mirror of History' of Szu Ma Kwang (1019-80). China's most orig-
inal thinker, Lao Tse, taught a philosophy resembling in its main features that of India, though without leaving behind the same atmosphere, which he has been responsible for the system of "Taoism" that is associated with his name. The 'Tao Te King,' traditionally from his pen, has been translated into English. Men- cius (372-289 B.C.) expounded Confucius, and made his writings popular. He was the greatest and clearest of China's thought. After his era, the chief literary events were, the burning of the books by Shi Wang Ti, who had abolished the Confucianism, built the Great Wall, put many literary men to death and destroyed much literature, in order to prevent, as he pretended, reaction to the old order of things; the coming of the Buddhists and the diffusion of Chinese culture through their efforts, not only in continental countries of Asia, but by their missionaries in neighbors' lands and islands, from Japan to Java. Without disturbing or intermingling with the purely national product of letters, the stream of Buddhist literature, both original and in translation, has flowed on, instructing the masses and the people. Hopes and fears are saturated or colored by Buddhist conceptions. On the other hand, the Chinese scholars have held generally to the Confucian ethics, doctrines and philosophy, finding in the classics the basis of both erudition and culture and also of statecraft, ethics, sociology and religion. Nevertheless Buddhism has powerfully modified the thought and methods of Chinese thinkers. In the 12th century, after a prolonged outbreak of populism, the two systems, Confucianism and Buddhism, came to clash. A century of intellectual activity and profound thinking followed, during which China's foundations of ethical and intellectual concepts were re-examined, along with the claims of the rival religious systems. The result was a restatement of philosophy, which became the creed of educated men in all the countries of China. While claiming to be orthodoxy Confucianism, this representation of the old faith and traditions showed that the Chinese and Hindu cultures had combined. The two views of the universe were harmonized in the system of Chu-Hi, which, until recent years, in China and Japan, remained the accepted standard of intellectual orthodoxy. Another renaissance of philosophy in a more original form took place in the 15th century, when Wang Yang-Ming (Japanese Oyomé) promulgated a system of idealistic intuitionism. In this, the seat of authority was declared to be, not in the dicta of the ancients, nor in the sacred text, or inspired utterances of Confucius, but in the vision of truth, as dissolved through reason and tested by science and experience. Man, by looking within, must find reality. Then, seeing the truth, he must act upon it. Discrimination prompts duty. A clear vision of righteousness is a revelation from heaven. Thus, what begins in intuition becomes pragmatism in its noblest form. Though his system was at first branded as heresy and the advocate cast into exile among savages, Wang's doctrines became a cult, enthusiastically propagated by his followers, and, under later emperors, Wang Yang-Ming was canonized. About 1600 A.D. this philosophy, introduced into Japan and there developed and applied, was the efficient cause and instrument, excelling all others, in making modern Japan possible. Thence, reacting to China and kindling anew the older mind, it has been powerful in making the Chinese Republic. A new confusion of thought and a fresh direction of the imagination were given, by the advent of the Mongols (1200-1368), who brought into the drama and the novel, which before had existed only in rudimentary forms and the acceptance of the theatre, whether permanent or itinerant, has existed in nearly every village, or is utilized for private amusement. The people go to see the actors more than the plays, each of which is usually less than an hour in length; though in public theatres many of these comedies and dramas—tragedy being non-existent—are linked together so as to make a day's performance. The manuscripts of the popular plays are in the possession of the families of the actors. The novel, coming through Mongol conquests from the homeland of stories, Central Asia, was in China gradually developed; until, from the 16th century, the people of China have been fed with fiction almost as generously as in Western countries, where it usually treats its themes under four or more heads: (1) Plots and Court Politics; (2) Love and Intrigue; (3) Popular Beliefs and Superstitions; (4) Violent Actions and Lawless Characters—the latter, in great variety. In all the repertoire of Chinese fiction, the most popular one, in both China and the surrounding pupil nations, because of its easy fascinating style and multitude of constantly thrilling actions, is that of 'The Three Kingdoms,' dealing with their wars in the 3rd century A.D. Other novels, which quite equal our most sensational and blood-stirring stories, rich in incident and action, are based on historical events, journeys to strange lands, real or imaginary, or legends illustrating or exaggerating wonders in nature and human history. Among the greatest literary events, of far-reaching importance to China, have been the journeys of passionate pilgrims to India, from which country after many years' stay and bibliographical collection, they brought back, from this Treasure Land in the West, books that mightily influenced the popular life of the Chinese. As in the similar case, of the Aryan and Semitic languages, in which, for example, are the drama of 'Sakkoontal' in the East, and the Occidental scholars, naturally content with the classical literature, or products of erudition, have overlooked or ignored the humble mental pabulum of the people. In modern and recent times, translations from standard Occidental literature, especially in philosophy, science, history, travels, biography and the monographs by native authors, on a vast variety of subjects of modern interest, have been numerous and widely circulated by Chinese publishers, and especially through the Society for the Diffusion of Useful Knowledge. Wall and fence literature, on every theme, practical, ethical and theoretical, still holds its own. Journalism, which has never been popular with men in office, who fear publicity, flourishes, and is notably on the increase. The native action, now borrow plots, themes and coloring from Western literature and often employ ideas, motives and moral coloring derived from Christianity. A new figure in the literature of the world is the native Chinese, educated abroad,
who writes not only on science and politics, using his own tongue and script, but wields a powerful pen in European languages, thus opening for us large windows into the mind of the Chinese, while enabling foreigners to understand their methods of thought and literary presentation, thus hastening the day of the union and reconciliation of the Occident and the Orient.

William Elliot Griffis,
Author of 'China's Story in Myth, Legend, etc.'

CHINESE OLIVE, the fruit of Canarium commune, order Amyriddaceae, a tree of the Asiatic Archipelago yielding an oil which is used as a condiment and for lamps.

CHINESE PAVILION, a semi-musical instrument composed of a pole with several transverse brass plates of some crescent or fantastic form, generally terminating at top with a conical pavilion or hat. On all these parts are hung small bells, which the performer causes to jingle by shaking the instrument held vertically up and down. It is employed only in military bands, and is more for show than use.

CHINESE SWALLOW'S NESTS, curious productions, which sell at a high price in China, though they have no special points of recommendation beyond many other gelatious ingredients in soups. They were formerly supposed to be made of some species of the rose-spored Algae, as Spharococcus lichenoides; but this is now ascertained to be a mistake, and it is known that they are formed of dried saliva from the mouth of the bird itself. The nests are the production of certain species of swifts (not swallows) of the genus Collocalia which breed in caves on islands of the tropical Pacific and Indian oceans. All species of swifts secrete an abundant mucous saliva which is utilized along with other materials in constructing the nests; but species of Collocalia only form their nests of saliva exclusively.

CHINESE TARTARY, an old name of Eastern or Chinese Turkestan.

CHINESE WHITE, a pigment prepared from the white oxide of zinc (ZnO), introduced into the arts in the latter part of the 18th century as a substitute for the white lead. Its color is not changed by exposure to air. It is used also as a water-color paint and in this form is known as body-color paint. Though it is not as heavy in body as white lead yet, when mixed with water colors, it renders them less transparent.

CHINESE WINDLASS, a differential windlass, in which the cord winds off one part of the barrel and on to the other, the amount of absolute lift being governed by the difference in the diameters of the respective portions. It is a good contrivance in the respect that great power may be attained without making the axle so small as to be too weak for its work.

CHING-HAI, ching-hi', or CHIN-HAI, China, seaport in the province of Che-Kiang, about 18 miles from Ningpo. Ching-Hai has no foreign commerce of its own, not being a treaty port; but it is a resort for native traders from the Chusan Archipelago, and from here Chinese merchandise is sent to Ningpo. There is a missionary station and a native academy for students who compete in the civil service examinations at Ningpo. Pop. (1910) estimated 140,000, mostly Chinese. It was taken by the British in 1841.

CHING-TU, ching-tu', China, city, capital of the province of Sze-Chuen, situated on the Min River, 150 miles from its junction with the Yang-tse-Kiang and 175 miles from the treaty port Chung-King. Ching-Tu is in one of the largest fertile plains of China, and is surrounded by mountains rich in the minerals of commerce. By way of the Min River and canals nearby, trade is carried on with the places in the valley of the Yang-tse-Kiang. The walls around the city are 12 miles in extent. Famous in Marco Polo's time, it is still one of the richest cities in China, with clean streets and canals. It has telegraphic and postal connection with many other places in the province, and railways to K'ui-chou-fu and farther east have just been completed. Good roads connect the city with Ichang and the Yang-tse ports. It has an arsenal with modern equipment, and goods of European manufacture are found in some shops. Pop. about 1,000,000.

CHINGLEPUT, chin-gul-pit', or CHENGALPAT, or THE JAGHIRE, India, a coast district in the province of Madras, area, 3,079 square miles, surface rocky, water scarce, crops scanty. In the fertile localities grain and fruits are raised which are shipped to the Madras markets. Some manufacturing of cloth is carried on. The chief towns are Conjeveram, Saint Thomas' Mount, Saidapat, Tiruvotiyur and Chingleput. This tract of country was obtained in 1760 and 1763 by the East India Company from the Nabob of Arcot. It was invaded by Hyder Ali in 1769 and again in 1780, when it was nearly depopulated by famine and emigration. Pop. 1,312,122.

CHINGLEPUT, or CHENGALPAT, India, town in the district of the same name, 15 miles west from the Bay of Bengal, 36 miles southwest of Madras, situated in a basin surrounded by hills. In 1751 it was taken by the French, retaken the following year by the British under Clive. A railroad enters the town. It has Roman Catholic and Protestant missions, a hospital, the reformatory school of the Madras presidency, civil and criminal courts and a dilapidated fortress which at one time was of considerable extent and well fortified. Pop. about 11,000.

CHINIOT, India, town in the Jhang district of the Punjab, 80 miles west of Lahore. It is famed for wood-carving, and has manufactures of coarse cloth. Its trade principally in wheat, cotton and other agricultural products, is of considerable importance. Pop. 15,685.

CHINQUIYU, sheh'-ne-k'eu', Charles Pascal Telesphore, Canadian clergyman: b. Kamouraska, Quebec, 30 July 1809; d. Montreal, 16 Jan. 1899. He was a Roman Catholic priest from 1833 to 1858, when he joined the Canadian Presbyterian Church. He lectured in England in
CHINKARA—CHINOOK WIND

1800, 1874 and 1882 and in Australia 1878-80. He wrote 'The Priest, the Woman and the Confessional?' (1874), a work that has had an enormous circulation in English-speaking countries, and has been translated into French, Italian, Spanish and Dutch; 'Fifty Years in the Church of Rome' (1886); 'Papal Idolatry' (1887); 'Forty Years in the Church of Christ' (1889).

CHINKARA, chin-kā′rā, the common gazelle of India. (See GAZELLE.) Also the name for a horned antelope, Gazella quadriceps. This animal is found in the hilly parts of India. It has the additional pair of horns above the hinder angle of the eyes. The female is hornless.

CHINOLINE, kī-nōl′lin. See QUINOLINE.

CHINON, shē-noon', France, antique town in the department of Indre-et-Loire, beautifully situated on the Vienne, 31 miles southwest of Tours. Crowning a lofty rock are the ruins of its vast old castle, the French Windsor of the Plantagenets, the death-place of Henry II, and later the residence of several French sovereigns, who, in 1429, Joan of Arc revealed her mission to the Dauphin. A farmhouse across the Vienne is pointed out as Rabelais' birthplace. Chinon has manufactures of druggists, serges, earthenware, baskets, wines, rope, etc. Pop. 5,943. Consult De Gouy, 'Chinon et ses monuments' (1874).

CHINOOK, chi-nook' (Tsiniuk, the Chehalis name of this tribe), the best known division of the Chinookan family. They held territory on the north side of the Columbia River, in Washington, from the mouth of the river to Grays Bay. They have become very much mixed with the Chehalis, a cognate tribe, and the language of the southern division of the Chinookan family has become practically extinct. The Chinook, owing to their proximity to the early settlement of Astoria, became well known to the white traders, merchants and trappers. There was much mixed with the Chehalis, a cognate tribe, and the language of the southern division of the Chinookan family has become practically extinct. The Chinook, owing to their proximity to the early settlement of Astoria, became well known to the white traders, merchants and trappers. There was much mixed with the Chehalis, a cognate tribe, and the language of the southern division of the Chinookan family has become practically extinct.

CHINOOK JARGON, an Indian trade language probably of considerable antiquity, which is known to have been in use along the Pacific Coast of North America from California into Alaska for more than a century. It has had incorporated into it at times numerous foreign words, but the body of the language is still essentially Indian. This jargon was named after the Chinook tribe at the mouth of the Columbia River, who first introduced it to the traders and settlers at Astoria. The white hunters, who entered the Columbia River region, accepted it as the easiest means of communication with the natives. This so-called Chinook jargon is made up of Chinook, Nootka, Salish and half a dozen other tribal tongues, and undoubtedly it had its origin in the extensive trading carried on all along the Pacific Coast, long before the first white man visited the mouth of the Columbia. It consisted of commonly recognized words and phrases, which have been variously estimated as numbering from 500 to 1,000. Among these there existed, at the close of the last century, a few French, English and Russian words and phrases; but the great body of the vocabulary was Indian, in which Chinook predominated. This Chinook lingua franca is rapidly disappearing from along the Pacific Coast, but it is spreading and growing in importance in the interior of Alaska, where it promises to be as useful in the development of trade and communication as the languages of the past in the regions from which it is now being crowded out. Apparently the Chinook jargon was never a steady quantity, for obsolete words form a part of the collection of almost all vocabularies made of it. Moreover, the jargon differed in different parts of the territory in which it was spoken. Consult Hale, Horatio, 'Manual of Oregon Trade Language' (1880).

CHINOOK WIND, a warm dry wind from the Rocky Mountains over the plains that stretch from their eastern base. The moisture-laden winds from the Pacific Ocean striking the lofty barriers of the Cascade and Rocky Mountains are forced to precipitate their moisture as rain and snow. When the ranges are crossed the winds lose most of their moisture and, descending the eastern slopes of the mountains they become warmer, because in descending the air is condensed, the atmospheric pressure at the base of the mountains being much greater than at the summit. The winds are, however, still dry, all their moisture having been precipitated in crossing the mountains. In the descent of 10,000 feet or so to the plains of Montana
the prairie province of Canada, the winds be-
come so warmed by the increased pressure
that they give a mild climate to regions far north.
In the west of these winds that cattle on
the prairies of Alberta can graze in the fields
all winter, a snowfall of a foot or more
appearing in a few hours before the warm, dry
breath of the Chinook. Not all the warm winds
of Montana and the regions north and south
have their origin on the west of the Rockies. Various
causes contribute to the formation of descend-
ing air, and when the descent is a number of
thousands of feet, the winds resulting are
always warm. Such winds blow over prairie
regions west of the Missouri, but not always
directly to the Rockies. Similar warm winds
are known in other parts of the world, as in
Switzerland, where they are called Fohn winds.

CHINQUAPIN. See Chestnut.

CHINS, or KUKIS, a tribe living in the
mountainous region between Lower Bengal and
Upper Burma. They form a collection of tribes
belonging to the Tibeto-Burman group of the
Indo-Chinese, and consist of three divi-
sions: Northern Chins, who inhabit the Chin
Hills and a small part of the country to the
north of them; the Central Chins (known as
Kamis, Kwemis, Moos, Chinboks and Chi-
bops) live in the Pakokku Chin Hills and the
northern Arakan district; and the Southern
Chins of the Arakan Yoma. The Chins are,
for the most part, a warlike race, divided
strictly into clans over which their leaders
and upper classes have almost despotic power and
influence. They are uncleanly in habits,
treachery and given to intemperance.

CHINSURA, chin-soo'ra. British India,
town beautifully situated on the Hugli, and
now included in the town of Hugli, 20 miles
north of Calcutta. It is a military station, was
formerly a Dutch settlement and contains many
neat houses in the Dutch style. The Armenian
church, erected in 1695, is a building of great
antiquarian interest. Chinsura is noted for the
manufacture of cheroots, and has several schools,
among them some belonging to the University of
Calcutta.

CHINTRUIUL, chin-troo'le, Antoine,
French landscape painter. b. Pont-de-Vaux,
He was a pupil of Corot, obtained a medal at
the Paris Exhibition, 1867, and that of the
Legion of Honor in 1870. His sunlight effects
have been greatly admired. The Louvre con-
tains his 'Thicket With Deer' (1873); and his
'Rain and Sunshine' (1873), his best work.

CHINTZ (Hindi, zini, spotted, varie-
gated), a cotton cloth gaily printed with
designs of flowers, etc., in five or six different
colours. The name was originally applied to
stained or painted cloth made in India. It was
a favorite in the time of Queen Anne, long
before cotton prints became cheap. The name,
being highly respectable, has since been applied
to goods lacking the graceful and artistic char-
acter of the genuine article. The Chintzes of the
Corinthian past were celebrated in the time of
Marco Polo, 13th century. They are
mentioned also by Barbossa, a Portuguese, who
visited India soon after the passage of the Cape
of Good Hope by Vasco de Gama: "Great
quantities of cotton cloths admirably painted,
also some white and some striped, are held in
the highest estimation."

CHIO, ke'o. See Chios.

CHIOCCOLA, ke-o-kok'a, a genus of trop-
ical plants of the family Rubiaceae, consisting
of small, often climbing, shrubs, with opposite
stipulate leaves and bell-shaped or funnel-
shaped, yellowish flowers in small clusters.
The fruit is a white berry with two seeds. The
bark of the root of C. brachiatu is a violent
emetic and purgative. It is also considered a
remedy for snake bites by the people of Brazil.

CHIoggia, ki-o'jia, or CHIOZZA, Italy,
important seaport town, 18 miles southwest of
Venice, on an island at the southern end of the
Venetian Lagoon, connected with the mainland
by a stone bridge of 43 arches. It is founded
on piles, has a beautiful cathedral; its harbor,
the deepest in the lagoon, is guarded by forts
and batteries. It is one of the strongest places
in the Venetian lagoons. The cathedral dates
from 1633, the Board of Trade building from
1322. The inhabitants have always been dis-
tinguished by quaint customs, costumes and
dialect, and the fisheries have long been im-
portant. The other principal trades are flax-
spinning, shipbuilding and the manufacture
of sails, bricks, candles and lace. The rivalry of
Genoa and Venice was decided here, 23 Dec.
1379, by the victory of the Venetian fleet.
Pop. (1911) 35,052.

CHIOS, ki'o's (now called by the natives
Chio), Italianized into Chi'o, one of the most
beautiful and fertile islands in the Aegean Sea
and archipelago, seven miles off the coast of
Asia Minor, at the entrance to the Gulf of
Smyrna; about 30 miles long from north to
south, by 8 to 15 miles broad, with a coast-
line of about 110 miles; an area of 500 square
miles and a population of about 74,000, almost
all Greeks. The northern part is more moun-
tainous than the southern part. The climate is
delightful. Earthquakes are common, and one
in 1881 caused the death of 3,556 persons, and
the destruction of property to the value of
$15,000,000. The wine produced on the north-
west coast, the Vinum Arvisium of ancient
times, is still esteemed. Other products are
figs, also noted in classical days; mastic, silk,
lemons, oranges and olives. Goats' skins are
also exported. The capital, Chios, about the
middle of the east coast, contains about 13,000
inhabitants, and has a harbor touched by vari-
ous services of steamers and doing a good
trade. On the west coast is a rich monastery,
Nes-Moni, founded in the 11th century. In
ancient times excellent marble and potter's clay
were quarried in the mountains, and recently
pits of antimony and ochre have been worked.

Chios is one of the places which contended
for the honor of giving birth to Homer. It
formed in early times one of the most pow-
erful of the Ionian states and contributed 100
ships to the Greek force defeated by the Per-
sians in the sea-fight off Miletus (494 n.c).
After the Persian victory the town and tem-

cles of Chios were burnt and many of the
people enslaved. In more recent times the
island was taken by the Genoese (1346), and
by the Turks (1566), in whose hands it re-
mained up to 1913, except for a short interval.
Revolt against Turkish rule in 1821-22, dur-
CHIPMAN.—CHIPEWA.

...ing the Greek war for independence, the Chiotes were ruthlessly massacred and sold as slaves. During the Balkan War 1912-13, a Greek expedition wrested the island from the Turks, which by the treaties of London (May. 1913) and Athens (Nov. 1913) was awarded to Greece. From 1914 during the great European War the Chioites were in the service of considerable military and naval activity. See WAR, European.

CHIPMAN, Nathaniel, American jurist; b. Salisbury, Conn., 15 Nov. 1752; d. Middlebury, Vt., 15 Feb. 1843. He was an officer in the American army for a part of the Revolutionary War, and was admitted to the bar in 1779. He served as State's attorney for four years. In 1780 he was elected assistant judge of the Supreme Court; in 1789 chief justice and one of the commissioners to adjust the differences between Vermont and New York. In 1791 he was a member of the committee called to decide the question whether Vermont should accede to the Union, and a joint commissioner with Lewis R. Morris to attend Congress and negotiate for the admission of Vermont into the Union. In 1793 he published "Sketches of the Purging System," and "Reports and Dissertations." In 1796 he was again elected chief justice of the Supreme Court and appointed one of a committee to revise a code of statute laws for Vermont. The revised laws of 1797 were written by him. He was a United States senator (1798-1803). In 1816 he was again elected chief justice of the Supreme Court. From 1816 to 1843 he was professor of law in Middlebury College. In 1833 he published "Principles of Government: a Treatise on Free Institutions, including the Constitution of the United States," which contained portions of his former treatise.

CHIPMAN, Ward, Canadian jurist; b. Saint John, New Brunswick, 10 July 1787; d. there, 26 Dec. 1851. He was the son of Ward Chipman (1754-1824), a Massachusetts Loyalist who went to New Brunswick after the American Revolution. He graduated at Harvard in 1805, and succeeded his father as agent for the Crown in the Maine boundary dispute. After holding minor legal offices he became puisne justice of the Supreme Court (1825), and was chief justice of New Brunswick (1834-51). He was the last judge to sit in the provincial legislative council.

CHIPMUNK, an American ground-squirrel, a small animal of the genus Tamias, about six inches long, with a slender furry tail, nearly as long as its body, and a coat of reddish-brown fur, striped with white on the back; from the marking it is called Tamias striatus. The eastern species has two white stripes, and the western chipmunk, Tamias quadrivittatus, which extends on the common ground all over the Rocky Mountain regions, bears four stripes. The ground color also is extremely variable according to habitat. This little creature is often found sitting in the shade, stones, and again and again to sit erect and dart sharp glances at objects that generally delight the presence of man, and escape with great rapidity, when need arises, into some hiding-place. Its home is a burrow in some woodland place, tunnel-like in structure, sometimes fully 20 feet long, and always deep enough to be below the frost-line: It is enlarged into chambers at intervals. One of these, supplied with dried leaves, grass, and like material for bedding, is the sleeping apartment, and the others are storehouses. In them the chipmunk stores his winter supplies of small nuts and acorns, especially the sweet beech-nuts. These he carries home, often several at a time, in his distensible cheek pouches. They are his chief food; but he also eats, also, birds, small mammals, and insects. The breeding season is in May; and the young are usually from four to six in number. The chief enemies of the chipmunk are the fox and the weasel. The former is dangerous only in the open, as he is too large to disturb the chipmunk at home. But the weasel can attack him in his burrow; and to escape him the chipmunk makes an opening for possible escape, at the far end of his burrow. For consideration of the various species of Tamias, consult Allen, J. A., "Bulletin of the American Museum of Natural History" (Vol. III, New York 1890). Consult also Thompson, Seton, Life Histories of Northern Animals (New York 1890).

CHIPEWA, chip'-wa, Canada, village in the province of Ontario. It is situated at the confluence of the Chippawa and the Caledonia, about two miles above the falls, on the term a of the railway from Queenston and contains an extensive steam-engine manufactur y, and one of the largest factories of stoves in the province. On 5 July 1814 the battle of Chippawa (q.v.) was fought here between the Americans and the British, when General Brown defeated the English under Riall. Pop. 700.

CHIPEWA, Battle of, 5 July 1814, an action of the War of 1812, remarkable for the defeat of a force of British regulars by an inferior number of Americans. In pitched battle on an open plain, without advantage of position and with weaker artillery, Major-General Riall, commanding the British forces, had about 1,500 line infantry—the King's regiment, the 100th, and the Royal Scots, with dragging and artiller ymen, and 600 skirmishers—north of the Chippewa River, which enters Niagara on the Canada side just above the rapids. The bridge from Chippawa village crossed it near its mouth. Joseph Brown's Americans were on the south beyond Streeter's Creek, and Brown started on the morning of the 5th to build another bridge across the Chippawa, to outflank Riall, whose skirmishers crossed the river and harassed the work of the camp from the woods on the west, and Peter B. Porter's militia brigade was sent to drive them out. As it approached the river Riall's army crossed the bridge on its right flank, and it fled in panic about 5 p.m. Riall thereupon deployed his force as advanced on the plain toward Brown. Scott's brigade of 1,300 was about to cross the creek bridge for a Fourth of July parade and, the creek being lined with woods, only learned of the disaster at the last moment. Scott's troops crossed the bridge under fire and drove the British back, threw his wings forward to avoid being outflanked, the left wing reaching into the woods. Both sides advanced, with pincers to head and fire, till the flanks touched and the centres were 200 feet off; when the British, unable to endure the deadly musket-fire in front and the
CHIPPENDALE — CHIPPENDALE FURNITURE

artillery now sweeping diagonally through the ranks, broke and ran for the Chippewas. The battle lasted less than an hour; and when Rupp's brigand came to Scott's camp, the enemy was deserted by the enemy. Riall lost 137 killed and 305 wounded of the regularly a third of his entire force, besides 73 skirmishers; Scott, 45 killed and 227 wounded; and Porter, 22 more. The victory was won by superiority in numbers. The victory Adams, "History of the United States" (Voll VIII, Chap. 2).

CHIPPENDALE. Thomas, English cabinetmaker; d. London, November 1779. He is supposed to have gone to London from Worcester before 1750. The style of furniture named from him was less heavy and severe than that of his successors, and was elaborate, delicate and baroque, with classical tendencies. He wrote a "Cabinet Maker's Director" (1752).

CHIPPENDALE FURNITURE. Thomas Chippendale was the son of a woodcarver of Wetherby, Yorkshire. The employment in which the great cabinetmaker did his best work was from 1735 to 1760; then his production shows decline. His furniture shops and showrooms were in St. Martin's Lane, the Strand, London. These furniture galleries were the rendezvous for the London court's nobility and beau during the reigns of George II and George III; even royally patronized was it by being a woodcarver and a woodcarver his leaning was to that form of decoration. Fane gave him the term "upholsterer" (upholsters of that day were called upholsters). Neither inlay or painting entered into his decoration, and the serpentine fronted sideboards ascribed to him (many experts claim they were by Hender Shearer, in fact, with the doubt whether Chippendale's ever made sideboards. Mahogany was the popular furniture wood at this time, so that most of his pieces are in the American fine-grained Spanish mahogany, but some pieces in satinwood and rosewood. Chippendale brought out a book of patterns or examples of designs entitled "The Gentleman and Cabinet-Maker's Director," displaying engravings of styles he termed "Gothic, French and Chinese taste." They represent, in their hideous repulsiveness, nothing we know of as to the Chippendale pieces. Chippendale's "Gothic," called also "Cathedral-Gothic," furniture arose (about 1760) when Gothic architecture was becoming fashionable; Chinese motifs soon came the fad; hence we find some pieces in composite Gothic and "chinoiserie." From the latter Chippendale used pagodas, mandarin hats, lattice, fret and other motifs. French style copied Louis Quinze, using the "opposed C's," etc. The "swallow" or "beehive" fronted, is in this style.

Characteristics of Production. — If Chippendale did not make sideboards, he produced massive curving tables with marble or mahogany tops, with "wine coolers" beneath or on the sides. Butams, followed firmer oak and walnut varieties, but were of "enframed or solid mahogany. A bookcase often figures on top with paneled or glazed fronts; the latter had beautiful "lattice" or tracery panels. Bookcases rarely had carving, but they were handsomely decorated, with "fretwork" friezes, some had serpentine fronts (highly prized). A "broke" podiment is favored. Chippendale's tables were various: writing tables, plain or "let DOWN" with plain and "galleried" top, in two pieces, molded rims, etc. His writing tables (called "pedestals") were generally very commodious. Foremost among "Chinese taste" or "lattice" tables were favorites. Chippendale period mahogany! dining tables resemble modern forms, but, his curved ones, too costly these days; plain pieces, therefore, have often recent carving, to enhance the price. His tilting tripod often shows very fine, carved decoration. Chippendale's wardrobes were true masterpieces, nearly always having plain cornices even when elaborate carving adorns the rest of the piece. In the latter case Louis Quinze (see Furniture, European), feet are usual but in simpler pieces we find the plain French ogée feet. His chests of drawers have, generally, serpentine (very thin) fronts, and are equipped with handsome brass keyhole escutcheons and brass handles. The "high-boy," that came into being in the 17th century is still made. A much admired Chippendale piece is the settee. It is in two "chair-backs" and three "chair-backs" varieties fashionable in the "Queen Anne period" behind the settee, and rare, there are many takes on the market, usually made up from the backs of two or three sages, or perhaps from arm-chairs, for the originals were made especially and are wider even than the arm-chair backs. Imitations were made in Holland and Portugal but of inferior workmanship and much "crococe" elaboration that was foreign to Chippendale. In chairs Chippendale made two distinct varieties — the "plain" and the "fine," the plain were for everyday use in the living-room, the latter for display in the drawing-room. These chairs are in the following styles: Dutch (with pierced slats); "ladder-back"; "French quiver"; Gothic or "Cathedral-Gothic"; "Chinese taste." A Chippendale chair innovation was the making of wider fronts (to allow for hoop-skirts) in combination with reduction of the breadth in the back. It is often erroneously claimed that Chippendale originated the pierced slats, which created such an appearance of lightness. There are however extant Queen Anne chairs which show perforation of the splat in an elementary form. As before, the arms of arm-chairs frequently reach only part of the way from the back to accommodate the ladies' skirts. The "claw-and-ball" foot of the Queen Anne period early in this era, alternated with the ogée and the club-shaped feet with a ball beneath. The four-poster bedsteads of Chippendale are often very elaborate with their pierced-work cornices and Louis XV carved motifs, the foot-post receiving especial carefully carved decoration and massive claw-and-ball feet, but the characteristic Chippendale bed-post shows only slight enrichment and somewhat slender proportions. Those in Gothic and "Chinese taste" have square feet after 1750. Besides mahogany, these beds are found in cherry, maple and birch. A popular piece of furniture of this period was the fire-screen. Chippendale made them in three styles — the tripod, "horse" and folding screen. The tripod ("pole-screen") had screens either "hammer" or shield shape sliding up and down the poles; "horse" screens had two sup-
ports, each on four legs. Chippendale chair-cases are noted; these cases for "grandfather" or long chairs, are mostly in the French style, rococo at first, then Gothic, followed by Chinese taste. Their decoration runs to freework more than carving, except those in the French style. His tea-caddies are in demand and show careful work from this master hand. Most are in Louis XV style with cabriole legs; ogee, or claw-and-ball feet in chased brass. Their brass handles and key escutcheons were of exquisite design. Among other pieces of this master cabinetmaker we find consoles, window-seats (now very rare), dumb-waiters, etc. The Chippendale typical support is the cabriole ("bandy") leg surmounted by a scallop shell or acanthus drop; and his unique furniture leg is the pierced square, the term describing the idea very graphically. His favorite motifs in decoration were: Scallop-shell, fret, oval, acanthus, dolphin, wyvern, ram's head holding swags, squirrel, crow, a bird with long tail and long bill, lion, masque, quatrefoil, ribbons, flowers, bells, pagoda, Chinese urns, mermaids, canopied with bells, at each corner, opposed Cs or roccoco style, eagle, etc.

*Irish* Chippendale.—Certain pieces of furniture consisting of side-tables (with mahogany or marble top), china cabinets and clothes-presses, are met with in Ireland of construction, design and decoration similar to the work of Chippendale. Their source of creation has never been determined, even after much research. They show good workmanship, but these pieces when compared with true pieces of Chippendale, the poverty of the carving contrasted with the rich depths and sharp edges of the master's work stamps these pieces as *Irish* Chippendale: all the carving is flatter. Other characteristics are found. Half way down the leg is a circlet or *garter* in relief. The scallop shell is on the top of the leg in true Chippendale style, but it is larger, more like that of the Queen Anne style. Grimacing masks appear on some pieces, some are slightly tilted out of the perpendicular. The reason for exposing these pieces of furniture as Irish creations is supported not only by the fact that they appear to have been all first discovered on that island, but also by the knowledge that the same dark grade of mahogany was imported to Ireland from San Domingo in West Indian trade.

CLEMENT W. COYCMBRE.

CHIPPENHAM, England, municipal borough of Wiltshire, 13 miles northeast of Bath, on the left bank of the Avon, here crossed by an ancient stote bridge of 22 arches. It consists of one principal street, with others diverging from it. It contains two large parish churches with lofty spires, an old town hall, etc. The town was once the seat of important cloth manufacturers, is an important mart for cheese and has rising and tanning industries, with stone quarries in the neighborhood. The population of Lansdowne, is three and one-half miles distant. Pop. 5,332.

CHIPEWYA, chip'ë-wë-a. (1) Michigan, an eastern county of the Upper Peninsula, bordering on lakes Superior and Huron, and bounded east by the river St. Mary, and west by Lake and Mackinac counties. The surface is hilly and partly covered with forests of pine. Capital, Sault Sainte Marie. (2) Wisconsin, a county in the northwestern section, about 50 miles from the Mississippi River, traversed by the Chippewa and several smaller rivers, about 4,300 square miles. Sandstone is abundant, and much of the surface is well wooded. Capital, Chippewa Falls.

CHIPEWYA, a river of Wisconsin, which has its rise in the north of the State, and after receiving several tributaries flows west into Lake Pepin, an expansion of the Mississippi.

CHIPEWYA (puckered up from roasting, a term said to have been derived from the peculiar puckered shape of their meccnas, which were gathered in front), a shortened form of *Ojibway* (Ojib, to pucker, and *ubow*, to roast); one of the largest North American Indian tribes. They covered, at one time, over 1,000 miles of territory, from east to west. They were stretched along the shores of lakes Huron and Superior and spread westward across the intervening country into North Dakota. It is hard to define accurately the Chippewa country as the Chippewas bledge readil, in the course of long years, with other members of the Algonquin race to which they belong. Moreover they frequently changed their habitat in places. The Chippewa were one of the native races with which the French came early into contact; and so we have had frequent, though somewhat uncertain, accounts of them from French sources. They are known to have occupied considerable territory in Wisconsin, some of it as far back as the time of the discovery of America by Columbus. According to native tradition some of the Chippewas have lived in the territory in and around lakes Huron and Superior ever since the beginning of the race. At the time of their discovery they were a semi-civilized people, cultivating corn, beans and certain medicinal plants and collecting wild rice. They were forest dwellers and, even when they surged westward, they preferred to keep to the wooded country, though they emerged from it in places. They were a hardy race, good hunters, brave warriors and possessed of considerable intelligence. Their medicine men were famed throughout the lake region and the eloquence of their tribal orators, the skill of their story tellers and the wisdom and cunning of their great tribal leaders still form the subject of the stories of the old men on the Canadian reservations.

The Chippewas, driven from their homes in northern Wisconsin about the beginning of
the 18th century and forced the Sioux across the Mississippi River. They continued their conquest until they reached Turtle Mountains in North Dakota and established their western headquarters near the head-waters of the Red River. In the meantime other Chippewa bands had entered western Ontario, overrunning the peninsula between lakes Huron and Erie and forced the Iroquois to retire eastward. They were constantly at war with the white settlers as they attempted to move westward until 1815 when they made a treaty of peace with the United States government, which has been fairly well kept by them ever since. The Chippewas now in the United States are on reservations or private lands in Minnesota, Michigan, Wisconsin, North Dakota and Kansas.

The Chippewas were always friendly with the French who gave them the reputation of being honorable and very faithful in the keeping of all their treaties and obligations into which they had once entered. They were expert canoemen and made long voyages by water, often coasting for hundreds of miles along the shores of the Great Lakes, where, in the latter days of their prosperity, they made friends everywhere. They were separated into more than a score of tribal divisions and were a fairly numerous people; though, on account of the extent of territory they covered, no accurate estimate of their numbers when they were a power in the land can be made. There are now about 33,000 Chippewas, one-half of which is in Canada and the other in the United States.

JOHN HUBERT CORYN.

CHIPPUEWA FALLS, Wis., town and county-seat of Chippewa County. It is on the Chippewa River and the Chicago, Milwaukee, and Saint Paul and the Minneapolis, Saint Paul and Sault, Sainte Marie railroads, 12 miles northeast of Eau Claire. It contains the County Insane Asylum, the State Home for the Feeble-Minded, the county courthouse, the Rock battleground, near the city, is of interest as the scene of a Sioux-Ojibway conflict. The city has fine water power, carries on a considerable trade in lumber, and manufactures beet sugar, chairs, sashes and doors, flour, shoes, hats, beer, leather goods, and other products. It is especially noted, however, for the pure spring water which is obtained from the Chippewa Springs and which is shipped to all parts of the United States and to the Orient. It has daily and weekly newspapers, two national banks and an assessed property valuation of $2,000,000. Settled in 1838, it was chartered as a city in 1870. The government is administered under a general State law by a mayor and a council. Pop. 8,893.

CHIPPING SPARROW, one of the most widely spread and familiar of North American sparrows (Spizella passerina), seen in summer by every roadside and in every garden of the United States east of the high plains and northward to Labrador and Great Slave Lake. The "chippy" is of small size, has the streaked brown and gray plumage of the sparrow and is to be distinguished from the house sparrow. It has a dark cap and plain white breast. It comes from the south in early spring and makes its home fearlessly near the house, forming a nest next in some bush or vine, where its pretty, trilling song is heard until "late summer. The nest, made of grasses and fine twigs is always lined with horsehairs; and this sparrow is often called "hair-bird." The five eggs are greenish blue, sparsely speckled with brown. They are young, of which two broods are frequently raised, on aphids, small caterpillars and other (usually injurious) insects; and at other times is a diligent eater of weed-seeds. Both these services contribute to the beneficial effect of its otherwise delightful presence, and its home, should be shielded from harm.

CHIPS FROM A GERMAN WORK-SHOP, by P. Max Müller (5 vols.). A collection of special studies incidental to the author's editing of a library of the "Sacred Books of the East." The several volumes cover various fields, as follows: (1) 'The Science of Religion'; (2) 'Mythology, Traditions and Customs'; (3) 'Literature, Biography and Antiquities'; and (4) "Chiefly the Science of Language", (5) 'Miscellaneous' and later topics. Although they are the result of "occasional work," their wealth of material and thoroughness of treatment, and the importance of the views presented, give them not only interest but permanent value. On many of the points treated, discussion is still open and some of the views advanced by Professor Müller may come into doubt; but his contributions to a great study will not soon lose their value.

CHIQUICHQUI PALM, ché-kè-ché-kè (Leopoldinia piaassaba), a native of Brazil, where it is called piaassaba. It grows in swamps and along river banks. Its thin-stalked leafy leaves are used for thatching, and it is the source of a fibre which is used for making brushes.

CHIQUIMULA, ché-kè-moo-là, Guatemala, Central American town in the department of the same name in the east of Guatemala, 55 miles northeast of the city of New Guatemala. It is in a mountainous region, has valuable mineral deposits and a delightful climate. Pop. 6,500.

CHIQUINQUIRA, ché-kèn-kè-rà, Colombia, South America, the largest town in the department of Boyacá, near the Suarez, 42 miles west of Tunja; was an Indian place of pilgrimage before the conquest. In the Latin American Conventual Chapel is a miraculous picture of the Virgin, and the place is visited annually by some 60,000 pilgrims. Its educational facilities are good, there being one state college, one private college of philosophy and letters, three colleges for women and one higher school for men. The permanent population is about 13,000.

CHIQUITOS, ché-kè-tóz, a race or stem of Indians inhabiting western Bolivia. The chief occupation of the people when first discovered by the whites was agriculture. They rejected Spanish rule and were not subdued until 1691, when the Jesuits established a mission among them. The soil here is rich, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little cultivation. The policy of the Jesuit missionaries has made the Chiquito language the predominant one among the natives. It is copious, and is said to have a separate vocabulary for female use. The size and decorations of the churches and the perfection of the church music in which the natives
take a part, are a curious monument of the perseverance of the Jesuit missionaries, which has succeeded in implanting in the midst of these solitudes a fragment of European civilization. In the year 1769 the Jesuits were expelled from the place, by Spanish authority. Since then they did not prosper, and their numbers have decreased. They still cultivate the soil, which is fertile, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little ambition to raise large crops. The native population is about 22,000, distributed among several missions.

CHIRIMOYA, ché-re-mó-yá, The Anona Humboldtiana, is considered by many to be the best of the indigenous fruits of America. The word is Aztec in origin and is said to mean "The fruit of the gods." It is highly esteemed in the days of the Aztec empire that the districts of Mexico, famed for growing the best varieties of chirimoyas, were required to pay their full contributions to the Federal government in this fruit. The interior resembles uncolored ice cream in appearance and consistence, and for this reason English and American residents in the districts where the chirimoya is sold not unfrequently call it natural ice cream. The chirimoya grows in the hotlands of its habitat and in the medium-temperature and the colder-temperature altitudes. It varies in size from that of a large apple to an ordinary pumpkin. It contains numerous large, dark, hard seeds.

CHIRIQUI, ché-re-ké', Panama, formerly one of the administrative divisions of Colombia, adjoining Costa Rica; area, 6,500 square miles. It is well wooded, and has rich pasturage, especially on the Atlantic Coast, where the climate is very moist. The Cordilleras that occupy the interior reach their highest point in the volcano of Chiriqui (11,265 feet). Chief town, David. On the north coast is a spacious lagoon about 35 miles long and extending inland from 12 to 15 miles, with a depth of water for the largest ships. Pop. 45,000.

CHIROGALÉ, kój-ro-gálé, or MOUSE-LEMUR, a small lemur of the genus Chirogale, native exclusively to Madagascar, especially C. Coquereri. It lives in trees and at the approach of the dry season curls up in a hollow place in a tree and sleeps until the rainy season is over. Like hibernating animals of cold regions, it accumulates a large deposit of fat before becoming torpid, and when it wakes it has regained its normal condition. It feeds on fruits and insects and builds nests somewhat like a bird's. Four other species are known whose habits are similar, generally, to those of the lemurs (q.v.), especially the galagos, to which they are closely allied.

CHIROMANCY, kój-ro-mán-sí, the practice of attempting to foretell the future of a person by inspecting the lines of his hand, in the markings of which chiromancy professes to see a line of life and a line of fortune. In the general acceptance of the term, chiromancy, among students of the so-called art of palmistry, is restricted to the sense of foretelling the future by means of an examination of the palm of the hand, while chiromancy is applied to the interpretive science of the hand. It will be thus readily seen that the two terms have a tendency to overlap one another. As a science chiromancy or palmistry deals with the "seven mounts" of the hand, their lines and the interlacings of the latter. The names given to these mounts, Jupiter, Saturn, Apollo, Mercury, Venus, Mars and the Moon at once connect the practice of chiromancy with the art of divination as carried on by means of a study of the stars. The mount of Jupiter is situated at the base of the first finger; that of Saturn, the middle finger; that of Apollo, the ring finger; that of Mercury, the little finger; that of the Moon, the wrist; that of Venus, the thumb; while that of Mars is on the forefinger of Mercury. The system lays down four great lines: life, head, heart and fortune, the first three of which are termed the "trinity of human existence," that is to say, sensation, intelligence and action. Length of life, possibility of disease, ill health and other misfortunes are determined by the line of life which, following the mount of Venus, meets the line of the head; intellectual quality by the line of the head crossing the palm obliquely from Jupiter to Mars; estimate of character and were generally favorable, while short, obscure or ill-defined lines bore the opposite import. So it was with the mounts. All clearly-defined mounts denoted a certain quality in the individual, while the dimness or total absence of the mount indicated weakness or absence of the quality. In general, the mount indicated the qualities connected in mythology with the character whose name it bore. Thus Jupiter denoted joviality, love, honor; Saturn, wisdom, prudence, success; Apollo, noble aspirations and love of the beautiful; Mars (the god of war), courage and resolution; Mercury (the culture god), love of science, industry, trade, commerce and the activities of life; the Moons (the gods of dreams), a dreamy disposition and strong moral character; Venus (the goddess of love) amorous temperament and love for physical beauty. All these mounts were modified in an almost infinite variety of ways, by intersection of lines, shape of fingers formed by these intersections and their relation to one another, to the lines and to the mounts, as well as to the shape and formation of the palm, the fingers, the nails and other physical attributes.

Chiromancy is a very ancient practice and seems to have been at one time in pretty general use among most of the peoples of Europe, of India and of Egypt. It very probably had its origin in the ceremonies by the medicine men, diviners and priests of various primitive tribes, to determine good and bad omens. The Assyrians, Hebrews, Chaldeans, Greeks and Romans paid particular attention to the study of chiromancy. From a purely priestly institution it degraded until it became a tool in the hands of unscrupulous fortune tellers who were often as ignorant and credulous as the Ignorant and credulous they were. When it arrived at this latter stage, it had reached a position where it was looked upon as being as exact a science and as worthy of careful study as any of the sciences of the age. Men of the highest rank, position, intelligence and educa-
tion gave their time to its study. Already, in the early Middle Ages, it had begun to claim the attention of the studious; and, a little later, the art was being practised by a professional class, who took the place of the eiglist treatise, and exploited the rich and poor alike. But all who practised palmistry were not of this class: for there were many who, undoubtedly believed in the art, which was taught in schools and colleges, etc., in an age of extreme ignorance, the temptation to exploit a willing public became gradually greater; and chiroiiany degenerated into palmistry and the latter into "fortune telling".

CHIRON, k'ir-o'n, in Greek mythology, the son of Kronos (Saturn) and Philyra. Kronos assumed the shape of a horse, in this amorous desire, to deceive his wife Rhea. The shape of Chiron, therefore, was half that of a man, half that of a horse. In point of fact, Chiron was one of the Centaurs. It was celebrated throughout all Greece for his knowledge of medicine, and the greatest princes and heroes of the time were represented as his pupils. He was particularly skilled in surgery. When Hercules drove the Centaurs from Mount Pelion, they took refuge in the woods of Neda, but their ancient enemy pursued them; even into this retreat and unfortunately the old teacher was wounded with a misdirected arrow. The speedy operation of the poison in which the arrow had been dipped rendered remedies useless, and Chiron suffered the severest tortures. The gods, at his prayer, put an end to his life, though his nature was immortal by reason of his descent from Kronos. After his death he was placed among the stars and became the constellation Sagittarius.

CHIROPODY, the treatment by experts, male and female, of hand and human foot diseases and malformations, first becoming definitely known to science in the latter part of the 18th century. In 1785 a publication appeared in London for the title "Chiropractic," treating in a scientific manner the causes of corns, warbs, bunions, etc., with a detail of the most successful methods of removing all deformities of the nails and of preserving or restoring to them and hands their natural soundness and beauty.

When this and subsequent announcements of a similar nature first became known, the name was made the subject of much jesting and adverse criticism. It was then a fad, but the name was condemned as "new-fangled." This evidently did not discourage the cultivators or patrons of the science, for during the same year, or early in 1786, a "chiroprist" opened his establishment in the English capital and did a thriving business.

By degrees the idea of having special care taken of the hands and feet spread throughout Great Britain. One hundred years after the establishment of a "Chirodopical Establishment" in London, a novelist in a magazine story referred to a lady who had "finished her chiropristy," and in the same year a popular London weekly, referring to the operations of chiroprists as "chiroiary," gave the stamp of authority to that name as expressive of the craft specifically.

During the past 10 years chiropody has made vast strides in popular estimation as a useful if not essential factor in the acquisition of perfect personal comfort and cleanliness. In all large cities the list of operators in this line includes many men and women highly skilled in the proper treatment of diseased and mal-formed hands and feet. This is particularly true of the United States, notably New York city, where all barber shops of any pretensions now have a woman in attendance who undertakes to cleanse and purify the hands of customers while they are under the soothing influence of razor and lather brush.

Latterly there has been a clear distinction drawn between the specialists who, like the women who have their headquarters in the palaces of tonsorial artists, attend only to the hands, and others, mostly men, who give their attention principally to the feet. The former announce themselves to be "manicures," the latter "chiroprists." The chiroprist, as a rule, is fully qualified in both divisions of the work; the service of chiroprists and manualists has become so essential and elaborate that it now embraces an extended vocabulary of its own. Surgical instrument makers have a special department for implements used by chiropodal operators. The skill with which these implements are made, inculcated, and manipulated by competent operators is little short of marvelous. Holding the hand or foot of the subject gently, yet with a vise-like grip, they deftly turn their wrists to bring the instruments exactly to the required position around or beneath each nail, and, although the slightest error in movement may mean the crippling of the person under treatment, accidents of any kind are very rare indeed. See BUNION; CORN; NAIL; WART.

CHIROPRAXIC. Defined.—Chiropractic is a name given to the study and application of a universal philosophy of biology, theology, theosophy, health, disease, death, the science of the cause of disease and art of permitting the restoration of the trinity relationships between all attributes, by the proper use of the proper forms; to harmonious quantities and equalities by placing in juxtaposition the abnormal concrete positions of definite mechanical portions with each other, by hand; thus correcting all sublubinations of the coccyx inclusive, for the purpose of permitting the re-creation of all normal cyclic currents, through nerves, that were formerly not permitted to be transmitted, through impingement, but have now an assumed, in normal size and capacity for conduction as they emanate through intervertebral foramina—the expression of which were formerly excessive or partially lacking—named disease.

Historical.—The first Chiropractic adjustment of a vertebra was given in September 1895, by Dr. D. D. Palmer. Neither the art nor science was formed at this time. Its growth remained practically dormant till 1908, since which time his son, B. J. Palmer, D.C., Ph.C., has developed it into a well-defined non-therapeutical philosophy, science and art that has no resemblance to any therapeutical method.

Health (equality) is restored by completing the mental and physical circuits; restoring the current of cycles of mental impulses acting through the material agency; the full quota of positive with an equivalent negative; permitting the regaining of the intelligent immateriality into the mechanical corporeal; to
reconstruct the normal psychophysical unit; to make as one the triunity of creation, transmis-
sion, and expression; to re-establish equilibrium between the abstract and concrete, all of which
is induced by replacing specific disordered con-
crete mechanical anatomy which permits adjust-
ment between that one law of two principles —
cause and effect —the rules and manner of declaration of which are unique and unlike any
theories of stimulative or inhibitive movements
or applications used by any other school.

Premise.—"And in the beginning, God, as
true to science, as philosophy. Deceives a
man—he's dead, showing that life centres in
brain and is there known as mind; passes to
spinal cord and is there known as nerve force;
thence to spinal nerves, there known as mental
impulses.

To section spinal cord induces degeneration;
pressure upon spinal cord induces paralysis;
constriction upon a spinal nerve causes disease
to all tissues beneath. Section, pressure and
constriction are relative terms, each producing
its degree of effect.

The steamfitter closes a valve to shut off
steam; plumber shuts a faucet to diminish flow
of water; electrician turns off the button to
stop the flow of electricity; the same is also
tru e above, etc. Each section, or any section,
pressure or constriction reduces the flow of
life from brain (where originated) to tissue
cell (where expressed) as function.

Section is impossible except with surgery or
mortal methods; pressure impossible except
by traumatic fractures or dislocations; con-
strictions though are frequent occurring with
everybody, no vertebrate excepted.

The brain is eneased within a solid bone, the
skull; the spinal cord passed through the spinal
foramen where fractures or dislocations are
rare but subluxations of vertebrae are frequent
and therein enters constriction.

These vertebrae are 24 in number, separate
from each other, they become subluxated by
jars, twists, wrenches, strains, etc., thereby de-
creasing the lumen from which issue spinal
nerves on each side on their way to every
tissue of a body. This orifice is formed by
mothed of two vertebrae in juxtaposition.
Nerves, passing through (being soft and en-
tirely unyielding by two movable hard sub-
stances) should one of its halves become dis-
torted it decreases the lumen and, the nerves
having no avenue to escape, become constricted.
Constriction does to nerves what a foot upon
a hose would do — decreases the diameter and
circumference, thereby diminishing the carrying
capacity, the distant manifestation being notably
observed by the physician in pathology and felt
by the patient in symptomatology.

The subluxation could be at 3d lumbar —
the effect noticeable at ankle, three feet away.
The Chiropractor palpates for this vertebral sub-
luxation, finds it, adjusts it; opening the fora-
men, releasing the pressure upon the nerve, per-
mitting carrying capacity to reach normal, nerve
force flows to affected part — health is restored.

This would take place in exact inverse ratio
as the contraction from this area to the brain
flow to produce heat; or the plumber opens a
faucet to permit a full stream of water to flow
to water flowers; or the electrician turns on
the bottom to permit electricity to return to the
globe for light.

Ease resides in origination, disease in peripher.
Perich. That cause which makes ease dis-
 ease is on the path between. As electricity
exists in only three degrees, viz., enough, not
enough or too much, so life exists in three de-
 grees; balanced, in mims or excess. Endless
complications, that seem to exist, represent not
true causes (e.g., constipation) or too much
(e.g., diarrhea).

Chiropractic finds the cause of every dis-
order — adjusts it. That which confuses and
has bewildered the masses for ages is now a
simple process. Physicians have studied ex-
pressions. Chiropractic investigates source and
transmission.

Chiropractic is an art, science and philosophy
of locating and adjusting causes rather than
Treating effects; a process of restoration of
life rather than stimulating and inhibiting
effects present in an organ. Chiropractic is
based upon the clinical hypothesis that man is
a triune being; spiritual, mechanical and chemi-
cal; rather than the laboratorial deduction that
he is but chemistry and physics. That which
cures or heals is Innate Intellectuality which
resides within the body of the patient; not any
thing that may be taken from outside invades
the chiropractor opens the channels, intellectual
life flows in quantity and speed intuitively —
health is the inevitable result.

Statistics.—At the present time there are
between 8,000 and 9,000 chiropractors in the
United States. One or more are located in 19
foreign countries. The attendance in the
various competent schools is over 1,300 an-
nually. Chiropractors have now received
licenses in several States and a number of States
have chiropractic bills and examining
boards. Among the latter are Connecticut,
Nebraska, Kansas, North Dakota, Oregon, Ar-
kansas and New York. The chiropractors in
their legislative policy are opposed to any one
method being placed in dominance over any
other method. They hold that each method best
knows its problems, therefore can best regulate
them if given control of the same by State
legislative enactment. Chiropractors through
their national organization have been successful
in 85 per cent of actions. So chiropractic was not the practice of osteopathy
or medicine. There are several scientific
journals published devoted to the development
and advancement of Chiropractic. Conventions
are held. Each State and many cities have
thoroughly established societies.

Educational.—There are several competent
schools. The Palmer school of Chiropractic
at Davenport, Iowa, is the oldest and one of
the largest. The course of study in these institu-
tions in point of hours equals 4,037, which is
slightly in excess of the average four years
medical school excluding the hours used in
medical schools for materia medica, major
surgery, etc. Studies taught are anatomy,
physiology, symptomatology, pathology, minor
surgery, obstetrics, microscopy, chemistry, bac-
teriology, gynecology, biology, in addition to
which a course essential to Chiropractic, viz.,
cycles, equations, metric system, serious circula-
tion, intellectual adoption, adjustment, palpation,
nerve tracing, analysis, Chiropractic
orthopedics, anamnology, restoration, sphythology,
etc. Among the other modern good schools is
the Universal Chiropractic College, also located at Davenport, Iowa; The Pittsburgh College of Chiropractic; The Carver Chiropractic College; Oregon Chiropractic College; Otterbein College; and Chiropractic College. These institutions maintain a residual course of sufficient length in which 100 per cent of attendance is required.

B. J. PALMER, D.C., Ph.C., President of the Palmer School of Chiropractic, Davenport, Iowa.

CHIROPRACTIC, the interpretive science of the hand. See CHIROMANCY.

CHIRODES, in zoology, a genus of Saurians, resembling the Chelides in their verticillated scales, and the Amphibia in the obtuse form of their head; but distinguished from the former by the want of posterior feet, and from the latter by their possession of anterior limbs. There is only one known species, a native of Malaysia: Euprepis concolor (Cuvier). It is about the thickness of a man's little finger, and from 8 to 10 inches long. Body flesh-colored, and covered with demi-rings on back and belly, alternating on the sides; eye very minute.

CHIRU, chë'roo, a large antelope (Panthelops hodgsoni) native to the plateau of Tibet, found at an elevation of from 13,000 to 18,000 feet. It is about 32 inches tall, and pale in color. The buck has a black face, and long horns like those of the gazelle; the doe is hornless. It is wary to a degree that makes the autumnal hunts of the native a matter of patience as well as of skill. It has a thick covering of woolly hair of fawn-gray color. This fine antelope is related to the saiga of eastern Russia.

CHISEL, an edged tool for cutting wood, iron or stone, operated by striking its upper end with a hammer or mallet, or by pressure. The form of chisel used in carpentry is the most familiar; one used in turnery has the cutting edge in the middle of the thickness, one used in metalurgy has the upper part flat for receiving the blow of the hammer, and the lower part in the form of a wedge for penetrating iron plates or bars. Some of the "cels" found in Europe in prehistoric times are believed to have been used as chisels, and these tools were known also to the ancient Egyptians. In ancient times chisels were made of stone and later of various kinds of metals. The more civilized tribes of America were acquainted with the chisel. The Aztecs, Zapotecas, Mixtecas and races of Yucatan, Guatemala and other parts of Mexico made chisels of copper and stone.

CHISELMOUTH. See CHUR.

CHISHOLM, Jesse, pioneer, guide, scout, interpreter and trader: b. Tennessee about 1805; d. March 1865. His father was a Scotchman and his mother a Cherokee Indian. He migrated to the West while the Cherokees occupied lands in Arkansas, being mentioned as one of the members of the tribe which accom-

panied Captain DICKINSON on his expedition against the Towakony Indians in Texas, about 1827. He was one of the interpreters in the council held with the Wichita and Comanche tribes in the Red River country by Col. Henry Dodge and Gov. Montfort Stokes, in 1834, and was prominent as a mediator in most of the councils, negotiations and treaties made between the government and the wild tribes of the Southern Plains from that time on. He became a trader among the Comanche, Kiowa and other tribes of the plains, and during the course of his trading expeditions he rescued by ransom nine captive children and youths (mostly Mexican) all of whom were adopted and reared in the family with his own children. His home was at Camp Holmes, on the Canadian River. He also established and maintained trading posts near the present towns of Lexington and Oklahoma City. At the outbreak of the Civil War he was for a time prevailed upon to aid the Confederate authorities in negotiating treaties of alliance with various tribes in the Indian Territory but, in the latter part of 1861, he was found among the refugee Indians who followed Opothleyahola northward to an asylum in Kansas. Tiring of life in the refugee camps, he soon drifted westward to the mouth of the Little Arkansas, where the Wichita and affiliated tribes of Indians had settled temporarily and where he engaged in trade. In the spring of 1865, he went south from the Arkansas to the valley of the upper Washita on a trading trip, the road over which he traveled being ever afterward known as the Chisholm Trail, destined to become famous during the days of the overland cattle traffic. In the autumn of that year he was active in persuading the hostile Comanche and Kiowa leaders to attend the peace council at the mouth of the Little Arkansas. He was reputed to have a speaking knowledge of 14 Indian languages, hence the frequent demand for his services as an interpreter by army officers, explorers and surveyors. Consult Lieutenant Whipple's narrative in the 'Pacific Railway Reports,' also the Historical Society Collections in Vol. V, pp. 90, 93; Vol. VII, p. 486; Vol. VIII, p. 177; also Andreas's 'History of Kansas' (p. 1385).

CHISHOLM, William Wallace, American official: b. Morgan County, Ga., 6 Dec. 1830; d. De Kalb, Miss., 13 May 1877. After the Civil War a fusion of white Unionists and negroes elected him sheriff. In 1877 a long standing personal and political feud between Chisholm and an opposing faction, led by John W. Gully, came to a head. On 26 April Gully was waylaid and murdered. His friends accused Chisholm and his party of the crime. Chisholm and four others were arrested on the morning of 29 April, and his wife, daughter and son accompanied him to jail which was shortly after attacked by the mob; Chisholm and his daughter receiving cuts and bruises, the former proved fatal, while the son was killed in his father's arms by a shot from one of the leaders of the assailants. In December 1877, Walter Riley, a negro, confessed that he had murdered Gully, and denied any knowledge or complicity in the murder of Chisholm or the latter's associates. Consult Wells, 'Chisholm Massacre' (1878); 'Kemper County Vindicated,' gives the Democratic side of the affair.
CHISHOLM v. GEORGIA, in the United States Supreme Court, the case which led the several states to protect themselves from legal responsibility to individuals, while retaining legal powers of aggression. The constitution provides (Art. iii, sec. 2): "The judicial power shall extend to all cases — between a State and citizens of another State." Under this provion, Chief Justice Marshall, in a series of cases, held that the Constitution of a State was not a party to a suit, and that a person seeking redress in a State court, even though that court had jurisdiction, might not appeal to the Supreme Court. This was done in the case of Chisholm v. Georgia, in which the Supreme Court held the suit to be one between a State and a citizen of another State, and therefore beyond the jurisdiction of the United States courts. In that case, Chief Justice Marshall held that the Constitution of a State is not a party to a suit in that State, and that a person seeking redress in a State court, even though that court had jurisdiction, might not appeal to the Supreme Court.

CHITALDEUG, a town in Mysore, British India, capital of a district of the same name, 128 miles north-northeast of Seringapatam; noted for its great fortress, which was unsuccessfully attacked by Hyder Ali in 1776, captured by him in 1779, and made the place of imprisonment of General Matthews by Tippeko Sahib in 1783.

CHITTRON, Gr. κχτρον, tunic), or CHITINE, κχτις (CaHNaO₃), the horny substance which gives firmness to the tegumentary system and other parts of the Crustacea, Arachnidae and insects; probably also the carapace of the Rotatoria consists of it. It is left when the above structures are exhausted successively with alcohol, ether, water, acetic acid and alkalis. It is colorless and amorphous, and is usually classed a proteins. It is dissolved by concentrated mineral acids without the production of color. It is not dissolved by solution of potash, even when boiling; neither does it give the characteristic reactions with Milton's or Schultze's tests.

CHITON, κχτις (Gr. κχτρον, tunic), a genus of Mollusca and the common name of the same, the shells of which are boat-shaped, and consist of a median series of symmetrical plates, folding over each other, and implanted in the mantle, the marginal zone of which is studded with spines. It is the typical genus of the family Chitonidae of the class Amphineura. The chitons cling firmly to rocks, etc., by means of the powerful feet, many of them resisting the heaviest test of the surf. Only very small species (Chatogeula, etc.) are found on the eastern Atlantic Coast, but larger species occur in Florida and the Gulf of Mexico, while California has the giants of 8 or 10 inches, also the sponges Chitona, and Consult Cooke, "Mollusca" (New York 1895).

CHITON, κχτις, the undergarment of the ancient Greeks. In the earliest times it was worn by the men only; in later times there were two forms, and the chiton was worn by both sexes. The Dorian chiton was sleeveless, reaching about to the knees, and the left arm was less opened than the right side. The Ionian was a long tunic reaching to the feet, closed on the sides, sometimes sleeveless, but often with short or long sleeves. Both forms were usually worn belted in at the waist.

CHITOR, or CHITTORE, India, a town and fort of Hindustan, in the native state of Oodeypore, Rajputana, on the Ganmeri River, about 70 miles northeast of the town of Oodeypore. The town was for several centuries capital of Oodeypore, and was far more prosperous and wealthy than it is at present. It still contains many temples. The fort, formerly considered one of the strongest in India, stands upon a high rock overlooking the town. Pop. 15,108.

CHITRAL, chit-thral', British India, a native state, having Yasin and Gilgit on the east, Swat, Dir and Bajaur on the south, Kafiristan on the west and the Hindu Kush Mountains on the north and northwest. It lies entirely in a southwestern seat of the Chitral or Kunar, or Kashi River, a tributary of the Kabul, and on it is about lat. 36° N., stands the town of Chitral at a height of more than 3,000 feet above sea-level. The people are Moslems, but
mostly speak a language closely akin to that of their neighbors in Kirthanian. Upper Chitral, with its capital, Mastuj, is closely connected with Gilgit. Lower Chitral enjoyed till recent times undisturbed independence; but in 1894 an English resident and small body of troops were surrounded and besieged in Chital, the consequence of which was that in March 1895 an abortive attempt (the main body by the Swat Valley, the other from Gilgit), which after some sharp fighting advanced triumphantly through extremely difficult country, relieved the besieged and annihilated all opposition.

CHITTAGONG, India, district in the presidency of Bengal, Hindistan. The district has Tipperah on the north, the Chittagong Hill Tracts on the east, Arracan on the south and the Bay of Bengal on the west. Its area is 2,492 square miles, and it has a population of 1,443. The Blue Mountain, in 1890, the northernmost, attain a height of 5,600 feet. The principal river is the Karnaphuli, or Chittagong. The level lands, chiefly on the coast, and the valleys are very fertile. The principal exports are timber, canvas, coarse cloths and elephants. A considerable amount of rice is raised by the Mohammedans. The city of Chittagong, the capital of the district, is situated on the right bank of the Karnaphuli, 12 miles from its mouth and 220 miles east of Calcutta, and is the second port of Bengal. It consists of a series of detached houses on little hills. Although its climate is unhealthful, it is an important industrial and trade centre, among its exports being rice, jute, jute manufactures and tea. Pop. about 25,000.

CHITTAGONG WOOD, the wood of several Indian trees, especially of Chickrasia tabularis, of the family Meliaceae. It is a light colored beautifully grained wood used by cabinet-makers. It is light in weight but does not wear well in changeable climates, as it warps in the weather. The wood of Cedrela toona receives the same name.

CHITTAM-WOOD, or AMERICAN SMOKE-TREE (Cotinus cassinoides), belongs to the sumac family. It is a small tree with wide-spreading branches growing to the height of about 40 feet. It grows in Tennessee and Alabama and westward to Missouri and Oklahoma. A rich dye for commercial use is extracted from the orange-yellow wood, which weighs about 40 pounds to the cubic foot.

CHITTENDEN, Frank Hurlbut, American entomologist: b. Cleveland, Ohio, 1858. He was educated at Cornell University, was editor of Entomologica Americana; in the following year was appointed assistant entomologist in the United States Department of Agriculture. He has written several department bulletins on insect pests, including 'The Colorado Potato Beetle' (1897); 'The Harlequin Squash Bug' (1892); 'The Common Red Spider' (1899); 'The Asparagus Miner' (1911); 'The Broad-Bean Weevil' (1912); 'The Potato Tuber Moth' (1912); 'The Spotted Beet Weevil' (1913).

CHITTENDEN, Hiram Martin, American military engineer: b. New York, 25 Oct. 1858. After graduating from the United States Military Academy (1884), he rose through various grades to be lieutenant-colonel of volunteer engineers and chief engineer of the 4th army corps in the Spanish-American War 1898–9. He retired as brigadier-general in 1900. He has supervised engineering government works in the Yellowstone National Park and elsewhere, and has published 'The Yellowstone National Park: Historical and Descriptive' (1893); 'Reservoirs in the Arid Regions' (1898); 'Reservoir System of the Great Lakes' (1898); 'The American Fur Trade of the Far West' (1901); 'War and Peace' (1911); 'Water Supply System of the Spring Valley Company' (1912); 'Letters to an Ultra-Pacifist' (1916).

CHITTENDEN, Russell Henry, American university professor and director: b. New Haven, Conn., 18 Feb. 1856. He was graduated with the degree of Ph.B., at Sheffield Scientific School (Yale), 1875, Ph.D., 1880; Heidelberg University 1878–79; (L.L.D., University of Toronto, 1903; Sc.D., University of Pennsylvania, 1904; L.L.D., University of Birmingham, 1911; Washington University, 1915). He became assistant 1875-77, instructor 1877–78, 1879–82, and professor of physiological chemistry in 1882, and director of the Sheffield Scientific School, Yale, in 1898 and until 1911. His paper on physiological chemistry at Columbia 1898–1903, and is member of referee board of consulting scientific experts to the Secretary of Agriculture, member of the National Academy of Sciences, American Philosophical Society; president of the American Society of Naturalists, 1893, American Philosophical Society, 1895–1904, American Society of Biological Chemists, 1907. He is author of 'Digestive Proteolysis' (1895); 'Studies in Physiological Chemistry' (4 vols., 1894–1901); 'Physiological Economy in Nutrition' (1905); 'The Nutrition of Man' (1907), and also many papers on physiological subjects in American and foreign journals.

CHITTENDEN, Thomas, American colonial and State governor: b. Enfield, Conn., 6 Jan. 1730; d. Williston, Vt., 24 Aug. 1797. He was one of the pioneers of Vermont, settling upon the New Hampshire grants in 1774, and acquiring a fortune from his lands. In 1778 he became governor of Vermont, before its formal separation from New York, and was recognized. During the Revolutionary War the English and the Continental Congress received overtures from him, his terms being recognition of Vermont's statehood. He retired from public life in 1796.

CHITTISM. SeeKRITIM.

CHITTOOR, chit-too'. or CHITTUR, India, a town 100 miles west of Madras. It contains courts and public offices, an English church and a Roman Catholic chapel. Until 1908 it was the capital of the North Arcot district. Pop. 15,108. There is a town of the same name in the state of Cochin, Madras, with about the same population.

CHITTY, Joseph, English lawyer and legal writer: b. 1776; d. London, 17 Feb. 1841. He acquired great reputation by his legal textbooks. These comprise a 'Treatise on Bills of Exchange' (1799); 'Treatise on the Parties to Actions and to Pleadings' (1808); 'Treatise on the Law of Negligence' (1813); 'Treatise on the Criminal Law' (1816); 'Treatise on Com-
CHIUSSI.—CHIVALRY.

Commercial Law (1818); Collection of the Statutes of Practical Utility (1833-37); The Code of the Ministry of the Interior (1834).

CHIUSI, kyoo’se, Italy, town in the province of Siena, 102 miles north-northwest of Rome, on an olive-olive eminence in the Val di Chiana, not far from the small Lago di Chiusi. In ancient times, under the name of Clusium, it was one of the 12 republics of Etruria, and the residence of Lars Porsena. When Italy was overrun by the barbarians, it fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana, Chiusi has begun to flourish again along with the whole district. It is in connection with the discovery of Etruscan antiquities, however, that the place is chiefly heard of. During the 19th century immense quantities of these remains were found in the neighborhood of the grooves that served the ancient Etruscans as tombs. They consist chiefly of sun-dried, black earthenware vases, ornaments, relieves and carved stonework, and are preserved in the museums at Chiusi and Florence. They represent Etruscan products and imports from Greece. The earliest graves show the Greek wares and must reach well back into the 8th century B.C. Succeeding graves contain Greek vases of the 7th century and from the beginning of the 6th century are found the chamber tombs, often richly decorated. Three thousand Etruscan and 500 Latin inscriptions have been found in Clusium. Beneath the town is a series of underground passages which seem to belong to the old Etruscan system of drainage. Pop. 6,000. Consult Dennis, 'Cities and Cemeteries of Etruria' (London 1907); and Giometti, L., 'Guida di Chiusi' (Poggibonsi 1904).

CHIVALRY (Fr. chevalerie, from cheval, Lat. caballus, ‘a horse’), a term which indicates strictly the organization of knighthood as it existed in the Middle Ages, and in a general sense the spirit and aims which distinguished the knights of those times. The chief characteristics of the chivalric ages were a warlike spirit, a lofty devotion to the female sex, a love of honor and a thirst for glory.

To explain the nature and origin of chivalry we must consider the character of the ancient German tribes. The warlike spirit was common to them with other barbarous nations; but there were certain traits in their character peculiarly their own. Among these was their esteem for women. This is dwelt upon by Tacitus, and is sufficiently apparent from the early native German historians. This regard for the female sex was diffused by them through every country into which they spread, though with considerable difference in the forms in which it developed itself. In France it became that refined gallantry for which the nation has been so long conspicuous; in Spain it assumed a more romantic and glowing character, displaying much of the fire of Oriental feeling; in Germany itself it became faithful and tender attachment to the wedded wife. Engraved upon this primitive regard for woman amongst the Germanic tribes, the moral and aesthetic principles of the Christian religion, its ideals of chastity, marriage and loyalty, and in particular the widespread veneration paid to the Virgin Mother of Christ, powerfully contributed to the development of the institutions of chivalry. We may be bold in answer to the peculiar regard for the female as a characteristic of the Teutonic tribes, that women were held in high esteem by the Romans. It is true that wives and mothers were treated with great respect by the Romans, and that the nation affords more numerous instances of female nobleness; this esteem was rendered to them, not as females, however, but as the faithful companions and patriotic mothers of citizens. It had somewhat of a political cast. But this was not the case with the Germans. There is another trait of the German character which deserves to be considered in this connection, which is very apparent in their literature, and the lives of many individuals; we mean, that indefinite thirst for something superior to the realities of life, that schnen, to use their own word, which hardly admits of translation, which has produced among them at the same time so much excellence and so much extravagance. These, the Teutonic race, their warlike spirit, their esteem for women and their indefinable thirst for superhuman greatness, together with the influence of the feudal system and of the Roman Catholic religion, afford an explanation of the spirit of chivalry—an institution which, to many observers, appears like an isolated phenomenon in history, and leaves them in doubt whether to despise it as foolish or admire it as sublime. The feudal system divided the Christian Teutonic tribes into masses, the members of which were united, indeed, by some political ties, but had little of that intimate connection which bound men together in the communities of antiquity, and which has produced like effects in our own and a few preceding ages. They still preserved, in a great measure, the independence of barbarians. There was, however, one strong bond of union which gave consistency to the whole aggregate; we mean the Roman Catholic religion. The influence of a common religion was of great service to mankind; during the ages of turbulence and violence, in giving coherence to the links of the social chain, which were continually in danger of parting. To this cause is to be ascribed the great uniformity of character which prevailed during the ages of chivalry. The feudal system enabled the gentry to live on the labors of the peasants without the necessity of providing for their own support, and to indulge the love of adventure incident to their warlike and ambitious character. If we now combine the characteristics which we have been considering—a warlike spirit, a lofty devotion to the female sex, an indefinable thirst for glory, connected with feudal independence, elevation above the drudgery of daily toil, and a uniformity of character and purpose, inspired by the influence of a common religion—we obtain a tolerable view of the chivalric character. This character has quite developed itself in the age of Charlemagne. The courage exhibited by the warriors of his age was rather the courage of individuals in bodies. The independence, the individuality of character, which distinguished the errant knight who soared so high in another age, was achieved by his single arm, was the growth of a later period. The use of the war-horse, which
formed so essential an instrument of the son
of chivalry, was not common among the Ger-
man until the time of their wars with the
Huns... Indeed, Tacitus mentions it in his ac-
count of Germany; but it was not in common
use among them till the period mentioned. After
it was introduced, cavalry was considered among
the Germans as a means of progress in the early
years of their national existence, the army was
much superior to infantry, which was, in fact, despised.

In the 11th century knighthood had be-
come an established and well-defined institu-
tion; but it was not till the 14th that its honors
were confined exclusively to the nobility. The
Crusades gave a more religious turn to the
spirit of chivalry, and made the knights of all
Christian nations known to each other, so that
the great uniformity is the forward to be per-
curred among them throughout Europe. Then
arose the religious orders of knights, the
Knights of Saint John, the Templars, the Teu-
tonian, etc. The whole establishment of
knighthood assumed a ceremonial character,
and, degenerating, like every human institu-
tion, sank at last into quitoxic extravag-
ances, or flittered away its spirit amid the
forms and punchlows springing from the pride
and the distinctions of the privileged orders of
society.

The education of a knight was briefly as
follows: The young and noble stripling, gen-
erally about his 12th year, was sent to the court
of some baron or noble knight, where he spent
his time chiefly in attending on the ladies and
 acquiring skill in the use of arms, in riding,
etc. This duty of waiting about the ladies became, in the sequel, as injurious to the
morals of the page as it may have been
salutary in the beginning. When advancing
age and experience in the use of arms had\nqualified the page for war, he became an
escuyer (squire or squire). This word is gen-
erally supposed to be derived from escu or
acudo (shield, escutcheon), because among other
officers it was the squire's business to carry the
shield of the knight whom he served.

The third and highest rank of chivalry was that
of knighthood, which was not conferred before
the 21st year, except in the case of distinguished
birth or great achievements. There are
individuals prepared for this by confessing, fasting, etc.;
religious rites were performed; and then, after
promising to be faithful, to protect ladies and
orphans, never to lie or utter slander, to live in
harmony with his equals, etc. In France there
were 20 vows of knighthood, he received the
accolade; a slight blow on the neck with the
flat of the sword from the person who dubs him
knight, who at the same time pronounced a
formula to this effect: “I dub thee knight, in
the name of God and St. Michael (or in the
name of the Father, Son, and Holy Ghost). Be
faithful, bold, and fortunate.” This was
often done on the eve of battle, to stimulate
the new knight to deeds of valor, or after the
combat, to reward signal bravery.

Chivalry exercised, in many respects, a salu-
tary influence at a time when governments were
uncharted and laws little regarded. Though it
often carried the feelings of love and honor to
a fanatical excess, yet the reverence paid to
them contributed to prevent mankind, at this
period of lawless violence, from relapsing into
barbarism; and as the feudal system was
unavoidable, it is well that the evils were somewhat
alleviated by the spirit of chivalry. The
influence which chivalry had on poetry was very
great. The troubadours in the south of France,
the trouvères in the north of the same country,
the minstrels in Great Britain, the inns of
horse-gers in Germany, sang the achievements of the
knight whose hospitality, in Provence arose the “Courts of Love,” which de-
cided the poetical contests of the knights. At
these, amorous songs (chansons), duets (ten-
sons), pastoral songs (pastourelles) and poeti-
cal colloquies (sirventes) were performed. In
Germany the chivalric spirit produced one of
the most noble epics, the Nirolungenlied
(Q.v.). It was the spirit of chivalry which led
to the Crusades, and from the intercourse with
the East which grew up during this period the
wonders of Oriental enchantment were intro-
duced into the romantic or chivalric poetry, and
European literature received a great stimulus.

Chivalry poetry, however, existed apart from
any influence of this kind, and really begins
with the mythological cycle of King Arthur's
round table and the feats of his knights, which
furnished materials that found poetic treatment in
various European countries. A second

cycles is that of Charlemagne and his paladins,
his 12 peers, which remained a poetical foundation
of chivalric poetry for many centuries.

Alexander the Great also became a great hero
of chivalric poetry. The cycle of Amadis,
which belongs, perhaps, exclusively to Spain,
does not rest on any historical ground. For
further information consult the essay on chiv-
ality written by Sir Walter Scott; Heeren's 'Es-
say on the Influence of the Crusades'; 'Mé-
moires sur l'ancienne chevalerie, par Lacurne
de Saint-Palaye' (2 vols, with engravings);
Gautier's 'La Chevalerie'; Heine am Rhyn's
'Geschichte des Rittertums'; Gautier, 'La Chev-
alerie'; and 'Don Quixote.' See also DUKE;
TOURNAMENT.

CHIVASSO, ké-vás'só, Italy, town on the
Po, in the province of Turin, 14 miles northeast
of the city of Turin. It was formerly strongly
fortified, and contained the residence of the
dukes of Montferrat. The fortifications were
destroyed by the French in 1804. It markets
wheat and cattle. It is 43 miles south of
San Genesio, two miles south. Pop. 10,894.

CHIVE, chív, or CIVE, a perennial herb
(Antium, schoparium), of the family Liliaceae.
It is a native of Europe, Asia and the northern
parts of North America, but has been intro-
duced in temperate climates as a vegetable. It
has small, flat, clustered bulbs which much
laterally to form clumps. The leaves, which
grow in dense profusion, are tubular, five to
eight inches long; and the flowers, which are
borne in umbels, are purplish, pinkish or violet.

Aside from the use of the leaves as a flavoring
for soups, stews, salads, etc., the plants are
frequently used for ornamental purposes, since
they make excellent edgings for flower-beds.
They are readily propagated by division, a pro-
cess that should be performed as soon as the
clumps become very dense. The leaves do well
in any good garden soil with no attention ex-
cept weeding, and they may be clipped for use
frequently during the growing season. Their
flavor resembles that of onions.
CHLADNI, Ernst Florens Friedrich, German physicist, one of the founders of the science of acoustics: b. Wittenberg, 30 Nov. 1756; d. Breslau, 4 April 1827. He adopted the profession of jurisprudence, which he practised first in his native town, and afterward at Leipzig, but his natural taste led him to study music, and to the study of mathematics. The backward state of the theory of music compared with the other physical sciences early opened up to him a neglected mine of scientific discovery; and at the age of 19 he set himself resolutely to investigate it. By covering plates of glass with fine sand, and causing them to vibrate, he discovered the fundamental fact in the science of acoustics, that the communication of vibrations in material bodies is subject to constant mathematical laws. (See Sound.) His scientific investigations led him to travel through the principal countries of Europe and visit its principal capitals. He invented the euphone about 1789 and the cylinder 1800, instruments more curious than useful, in which musical sounds are produced by friction, and by the revolution of a glass cylinder causing the vibration of chords. His scientific works are of different value. The first of them, 'Entdeckungen über die Theorie des Klanges,' appeared in 1797; 'Acoustics' (1802); 'Neue Beträge zur Akustik' (1817); 'Ueber Feuermeteore.' (1820).

CHLADNI FIGURES are figures made by sand on vibrating plates with free edges and indicating the position of the nodes. They depend in shape on the shape of the plate and the mode in which it is made to vibrate. They were studied experimentally by Chladni in 1787. Consult Lord Rayleigh, 'The Theory of Sound' (London 1894-95).

CHLAMYDOPHORUS, a genus of armadillos, containing the pichiagio or truncated armadillo. It is found principally in the Argentine and Bolivia. See ARMADILLO.

CHLAMYDS, kli'mis. (1) In ancient Greek costume, a light and freely flowing scarf or plaid, worn as an outer garment. It was oblong in shape, generally twice as long as its width, and was worn, according to taste or circumstances, in different ways. The chlamys of the youth was probably of a yellow color, while that of the soldier was scarlet. It was also carried by hunters and travelers, and some Romans are recorded as having adopted it. (2) In zoology, the name of a genus of coleopterous insects, belonging to the sub-tribe Cylid, and the family Chrysolinae. There are but few North American species, none of large size.

CHLOASMA (Gr. xλοαςμα, greenish), a peculiar pigmentation of the skin, of a yellowish brownish to blackish shade, and due to a number of causes: (1) mechanical; (2) chemical; (3) thermal; (4) parasitic. Scratching is one of the most frequent mechanical causes. The irritants of mustard plasters, capsicum, cantharides,—all may cause an abnormal skin pigmentation. Sunburn is a frequent cause, a bringing out of the spots with greater vividness. Paroxysmal eruptions have been known to cause it. In addition there are a large number of miscellaneous conditions associated with these liver spots. Pregnancy, menstruation, constipation,—one or all may emphasize their characters. Certain diseases, such as syphilis, Addison's disease (q.v.) in particular, and forms of anemia are associated with excessive pigmentation. In only a small proportion of the cases has the liver anything to do with the condition.

CHLOPIICKI, niô-pîls'ki, Joseph, Polish general: b. Galicia, 24 March 1772; d. Cracow, 30 Sept. 1854. He served under Kosciusko, during the Polish revolution (1794), and then engaged in Napoleon's service, under whom he took part in the battles of Eylau, Friedland, Smolensk, and Moskowa. After the fall of Paris in 1814, he conducted back to Poland the débris of the Polish-French contingent, and was created general of division by the tsar. On the outbreak of the Polish revolution of 1830, he was elected dictator, but soon resigned that office, fought at Grochow and Wavre, and later retired into private life.

CHLORAL. The tri-chlor substitution-product of acetol aldehyd, obtainable from aldehyd by the action of chlorine gas. In its practical manufacture, however, it is formed by passing chlorine through cold absolute alcohol; a crystalline alcohochrome of chloral is thereby formed, from which the chloral itself is afterward set free by the action of sulphuric acid. Chloral is a colorless liquid at ordinary temperatures, having the formula CCl₃CHO. It freezes at about -100° F. and boils at 208° F. It combines directly with water, forming chloral hydrate (q.v.), CCl₃CHOH₂O, a substance commonly but incorrectly called "chloral." CHLORAL HYDRATE, CCl₃CHO + H₂O, a crystalline solid composed of trichloral aldehyd with one molecule of water. The crystals are single, colorless and transparent rhomboids melting at 135° F., and with an aromatic penetrating and smarting taste and slightly acid odor. They are freely soluble in water, alcohol, turpentine, chloroform and ether. Chloral hydrate is a powerful germicide but is rarely used as such save to preserve anatomical preparations. It is a vesicant and a local anesthetic. In small doses it causes burning sensations of the stomach, but on much, it produces a sleep of slow action. Full medicinal doses, 5 to 15 grains, cause a slowing of the pulse, dilatation of the arterioles, lowering of blood pressure and slowing of the respiration. On the nervous system it acts as a depressant, causing a deep sleep by direct action on the brain cells. Large doses cause poisoning with symptoms of collapse, coma with a feeble, thready pulse, lowering of temperature, cyanosis or lividity, cold perspiration, dilated pupils, and loss of reflexes. Death results from respiratory and cardiac paralysis. Treatment of poisoning is by rousing the patient to maintain respiratory centre, artificial heat, artificial respiration, hot coffee by mouth or rectum and cardiac stimulants. Chloral is particularly valuable in insomnia from overwork and in many of the convulsive disorders of children, such as epilepsy and delirium. Its action is possibly due to the formation of chloroform in the general circulation, by the action of the alkaloids contained in the blood, in accordance with the equation CCl₃CHO + OH⁻ → CHCl₂ + H₂O + CHO⁻OH. The last form in this equation being that of potassium formate. It is also useful in states associated with high arterial tension, if the heart is not weakened. Within recent years a large number of allied drugs have been introduced. They have similar
actions but are more palatable or are thought to cause less heart depression. Among these may be mentioned chloralamide, chloretone, chloralose and urethane.

CHLORALAMIDE, klō-rál'a-mid, or CHLORAL FORMAMIDE, for'ma-mid, a substance formed by gently heating together formamide and chloral. It is usually obtained in lustrous, colorless crystals with a slightly bitter taste. It has the chemical formula C₆H₆ClNO. OH, melts at 240° F, and is soluble in 9 parts of water and in 1½ parts of alcohol. It is not decomposed by dilute acids, but is decomposed by alkalis, and also by water at temperatures above 140° F. See also CHLORAL.

CHLORALIMIDE, a substance occurring in long, colorless, needle-like crystals, with the formula C₆H₆ClNO. NH. It is prepared by heating chloral and ammonium chloride until chloroform ceases to be given off. It is insoluble in water, but dissolves readily in alcohol, ether, and chloroform. It is used in medicine as an antipyretic and anesthetic, and must not be confused with chloralamide (q.v.). By some physicians it is recommended as more effective than either chloral hydrate or urethane.

CHLORASTROLITE, klō-ras-trō-līt, a mineral found in the form of rounded pebbles of radiated structure on the shores of Isle Royale, Lake Superior, and derived from the trap rock in the vicinity. It is bluish-green in color, with a hardness of 3.5 and a specific gravity of 3.18. It is susceptible of a high polish. According to Hawes it is an impure variety of prehnite, but for optical reasons Lacroix classes it under thomsonite. Its name is from the Greek and signifies "green star," in allusion to its color and its stellated cross-section.

CHLORATES, the metallic salts of chloric acid. They are all more or less soluble in water, potassium chlorate being least soluble. They are all decomposed by heat, with the evolution of oxygen. See CHLORIC ACID.

CHLORIC ACID, a colorless, strongly acid liquid, having the formula HClO₃ and a specific gravity of 1.28. It combines with bases to produce the salts known as chlorates. Potassium chlorate is formed directly when chlorine gas is passed through a warm, concentrated solution of caustic potash. By treating this salt with sulphate of ammonia and adding barium hydrate, barium chlorate, Ba(ClO₃)₂, is formed, from which chloric acid is set free by the action of dilute sulphuric acid. The clear solution is decanted from the precipitated barium sulphate and evaporated over strong sulphuric acid in a vacuum, until the residue contains 40 per cent. of pure chloric acid. A further concentration leads to decomposition. This aqueous acid is colorless and has a pungent odor and a sour taste. When exposed for a time to the light it changes to perchloric acid. Chloric acid has powerful bleaching properties, owing to the facility with which it parts with its oxygen. Paper that is dipped into a strong solution of the acid takes fire spontaneously upon drying owing to the great rapidity of its oxidation. The most important salt of chloric acid is potassium chlorate, which is largely used in the preparation of oxygen gas, in the manufacture of matches, and in medicine. It crystallizes in monochine plates having a specific gravity of 2.35.

CHLORIC ETHER, a name given (1) to spirits of chloroform, a liquid consisting of one part of chloroform to nine of alcohol, and (2) to chloride of ethyl, CH₂Cl, which is obtained by passing dry hydrochloric acid gas through alcohol. The latter is a colorless, mobile liquid, having a sweet taste and the hydrosol ether-like smell. It has anesthetic properties similar to those of ether. When mixed with an equal volume of alcohol it is known as "alcoholated mutatic ether." See also CHLORAL.

CHLORIDES. See HYDROCHLORIC ACID.

CHLORIMETRY, the art of estimating the quantity of chlorine present in bleaching-powder or any other hypochlorite. Several methods are employed, depending for their success upon the affinity of the chlorine for hydrogen. See CHEMICAL ANALYSIS.

CHLORINE, klō-rin, a gaseous element, discovered in 1774 by Scheele, who named it "dephlogisticated marine air." The term "dephlogisticated" had exactly the same import as "oxygenated," which was soon afterward introduced by Lavoisier. Davy showed that the substance is not a compound of oxygen, but a simple body or element, and from its peculiar yellowish-green color the name "chlorine" was given to it. Chlorine gas is obtained by heating a mixture of hydrochloric acid and finely powdered perchloric acid, and may be collected either in bottles over warm water in the pneumatic trough, or by simply leading the delivery-tube to the bottom of the collecting-bottle, and allowing the chlorine to displace the air. The reaction is:

$$\text{MnO}_3^- + 4\text{HCl} \rightarrow 2\text{H}_2\text{O} + \text{MnCl}_2 + 2\text{Cl}^-$$

Deacon's process for the commercial manufacture of chlorine consists in passing a mixture of hydrochloric acid gas and oxygen over tiles that are soaked in a copper salt preferably oxchloride of copper, and then dried and heated to a temperature of about 200° to 250° F. At this temperature the specific gravity of the acid gas is decomposed with the formation of water and liberation of chlorine; the copper salt exercising an obscure influence, and being in its original form at the close of the operation. Chlorine is now largely (and perhaps chiefly) manufactured by the electrolysis of a solution of chloride of sodium (common salt).

Under ordinary atmospheric conditions chlorine is gaseous, but it condenses into a mobile yellow liquid at a pressure of about six atmospheres. It also liquefies at the ordinary atmospheric pressure at about 28° F below zero. It has the chemical symbol Cl, and its atomic weight is usually given as approximately 35.4 for H = 1. It is two and a half times heavier than atmospheric air, and has an insupportable, suffocating odor. When pure it occasioned immediate death to an animal immersed in it; but even when largely diluted with common air it cannot be respired with safety. It occasions a severe sense of stricture at the breast; which renders it impossible to make a full inspiration. Chlorine is somewhat soluble in water; the solution having the color and odor of the gas. If
the solution be cooled, long yellow crystalline needles deposit, consisting of a hydrate of chlorine. When exposed to sunlight the solution gradually loses its color, oxygen is liberated, and the water contains hydrochloric acid in solution. The great affinity of chlorine for hydrogen is one of its most characteristic properties, and is exhibited in a number of reactions. If equal volumes of hydrogen and chlorine gas be mixed in the dark and then exposed to diffused daylight, gradual combination takes place; and if the mixture be exposed to direct sunlight the gases combine at once with an explosion and produce hydrochloric acid. This is the only compound these substances form with each other, and it is one of the most important of the acids. When a lighted taper is immersed in a jar of chlorine, it burns with a smoky flame; this is due to the combination of the chlorine with the hydrogen only, and the liberation of the carbon. Similarly, when hydrocarbons like turpentine and olefiant gas are mixed with chlorine and ignited, a red flame with a copious deposit of carbon shows that the hydrogen and chlorine are alone combining. Chlorine gas is inflammable if burned in an atmosphere of hydrogen. Several of the elements catch fire when immersed in chlorine, for instance, phosphorus, arsenic, antimony, and copper; while others combine with it at a higher temperature, sometimes with vivid combustion as in the case of potassium. The binary compounds of chloride with the other elements are termed chlorides, and next to the oxides they are the most abundant and widely distributed substances in the earth, many of them being also of great importance for manufactures. Common salt, the chloride of sodium, is the most plentiful of all, and forms large rock masses in various parts of Europe, and occurs dissolved in the waters of the ocean and of many salt lakes. In the United States rock salt is mined in Michigan, New York, Ohio, Kansas, Louisiana, Utah and California. It is the ultimate source of all the hydrochloric acid and chlorine of commerce. Other chlorides, as of potassium, calcium, etc., are met with, but in no case nearly so abundantly as common salt. As a class, the metallic chlorides are crystalline salts, readily soluble in water, some being even deliquescent. The chloride of silver, the subchloride of mercury, and one or two others are, however, insoluble in water, while a few are decomposed by water. From its wide affinities and great activity in the Free state, chlorine is one of the most useful and powerful instruments with which the chemist deals. By it such metals as platinum and gold are attached and made soluble in water, while its power over organic substances is very great, and has resulted in the formation not only of a number of compounds by simple union with it, but of a great number into which the chlorine has entered more intimately and produced what are called substitution compounds.

Chlorine is largely consumed in the arts. Thus it is used in the manufacture of potassic chlorate, in the conversion of the yellow to the red prussiate of potash, in the preparation of chloride of sulphur for vulcanizing, and above all as a bleaching and disinfecting agent. The last property is exercised by chlorine by virtue of its power of decomposing water by combining with the hydrogen and liberating oxygen, which latter substance is the true agent in the operation, and which converts the coloring matter into colorless compounds. Berthollet was the first to apply chlorine to the process of bleaching. The method of using it has been successively improved. It consisted at first in subjecting the thread or cloth to be bleached to the action of the gas itself; but this way was unequally produced, and the texture was sometimes injured. It was then applied in a dilute aqueous solution. The thread or cloth was prepared as in the old method of bleaching, by boiling first in water, and then in alkaline lye; it was then immersed in the diluted chlorine, and this alternate application of alkali and chlorine was continued until the color was discharged. The offensive suffocating odor of the gas rendered this mode of using it, however, scarcely practicable; but the odor was found to be removed by a weak solution of potash; lime immersed in water, being more economical, was afterward substituted. Later a compound of chlorine gas, called bleach, prepared by exposing slaked lye to chlorine gas; the gas is quickly absorbed by the lime, forming a compound of the hypochlorite and the chloride of lime, or bleaching-powder, as it is called, and this, being dissolved in water, forms the bleaching-liquor, now generally employed (Bleaching Materials). In using it the cloth is first commonly steeped in warm water to clean it, and is then repeatedly washed with an alkaline solution so diluted that it cannot injure the texture of the cloth; the cloth is then washed and steeped in a very weak solution of the bleaching-powder, again washed, acted on by a boiling lye as before, and again steeped in the solution; and these operations are performed alternately several times. The cloth is lastly immersed in very dilute acid, which reacts on the bleaching-powder and liberates chlorine; this then attacks the coloring matter, and the cloth soon acquires a pure white color. It is next repeatedly washed with water to remove the last traces of the lime salts, and then it is exposed to the action of a hyposulphite in order to render inoperative any chlorine that may remain. (See Antichlor.) The cloth is finally washed, dried, and dressed. When sulphuric acid is used as bleaching agent, chlorine it is found more difficult, in the subsequent washing, to remove the calcic sulphate formed, on account of its sparing solubility in water. To avoid this, chloride of magnesia has been substituted for the chloride of lime. It is easily prepared by adding sulphate of magnesia to a solution of chloride of lime and straining off the clear fluid. It has the same bleaching power, is easily removed by washing, and is said to leave the cloth in a more supple state than when ordinary bleaching-solution has been employed. Another important application of chlorine gas and of bleaching-powder is to the destruction of disease germs. Acid vapors, sulphurous acid in particular, under the form of the fumes of burning sulphur, are often employed for that purpose; but chlorine is superior to any other agent, and is now widely employed for the purposes of fumigation and disinfection. In medicine, chlorine gas dissolved in water is used extensively for bactericidal purposes. It is employed as a mouth-wash for similar purposes, being both a deodorant and a bactericide; and internally has been used for its
CHLORIS—CHLOROFORM 577
germicidal properties, particularly in typhoid fever. See CHEMISTRY, PROGRESS OF.

CHLORIS, klō'ris (Gr. κλορίς, pale green as seen in flowers) and the wife of Zephyrus, identical with the Flora of the Romans. (2) The daughter of the Orchomenian Amphion, the wife of Neleus and the mother of Nestor. (3) The daughter of the Theban Amphion and of Nicotho. When the children of Nicotho were killed she alone escaped along with Amyclas, and became so pale from terror that her former name of Meliboea was exchanged for that of Chloris.

CHLORIS, a greenish-yellow bird, about the size of a lark, mentioned by Aristotle. It is said to have been yellow underneath and, by some, has been identified with the yellow wagtail. The name was applied generically and specifically to the European greenfinch, which is now generally called *Ligurinus chloris*. The word is also used to designate a genus of warblers.

CHLORIS, or PRAIRIE CHLORIS (*Chloris verticillata*), a genus of grasses, of which there are some 60 or more species, mostly natives of warm, dry countries. About 10 of these species are found on the prairies, from Kansas to Ontario. It is a pretty annual grass frequently cultivated in greenhouses for the sake of its ornamental and curious appearance.

CHLORITE (*L. chlorites*, stone) GROUP, in mineralogy, a group of minerals crystallizing in the monoclinic system, exhibiting a green color from the presence of ferrous iron and chemically definable as hydrous silicates of aluminum, ferrous iron and magnesium. They are usually secondary minerals, derived from pyroxene, amphibole and other forms. They exhibit a marked basal cleavage suggestive of mica; but they differ from mica and its allies by not containing any considerable amounts of calcium or of the alkalies.

CHLORITE SCHIST, shist. As chlorite is a general name for green, secondary, hydrated silicates, containing alumina and iron, derived particularly from augite, hornblende and biotite, so chlorite is used as a prefix to various names of rocks that contain such silicates, for example, chlorite schist. In the wide belt of Algonkian and Archean rocks stretching from Labrador to the west end of Lake Superior are great areas of chlorite schists resulting from the alteration of sedimentary as well as igneous rocks.

CHLORODYNE, klōrō-dīn or -dēn, a proprietary mixture of uncertain composition and best represented by the National Formulary formula, which is a mixture of chloroform, cannabis indica, morphine and tincture of capsicum. Practically all of the chlorodynes on the market contain morphine, and hence are dangerous poisons. Their sale should not be permitted save on a physician's prescription.

CHLOROFORM (CHCl₃, trichloromethane) or Chloroformum, a heavy, clear, colorless, mobile and diffusible liquid of a sweet burning taste and characteristical etheral odor formed by the action of the sun's rays on a mixture of chlorine and marsh gas; also by the action of caustic potash on chloral or chloroacetic acid, or by the action of nascent hydrogen on tetrachloride of carbon. It is prepared on a large scale by distilling water and alcohol with bleachings-powder (chloride of lime). Slaked lime is sometimes added. Its vapor density is four times that of air. Its specific gravity should not be below 1.49, and it should be soluble in 200 volumes of cold water, and in all proportions in alcohol, ether, gasoline, benzine and fixed and volatile oils. It is volatile, even at low temperature, boils at 140° F. and freezes at —115° F. It should not be exposed to the light, as it is liable to decomposition with the liberation of hydrochloric acid and chlorin.

As used in medicine it is a liquid consisting of 99 to 99.4 per cent by weight of absolute chloroform and 1 to 0.6 per cent of alcohol. It is not inflammable, but its vapor burns with a greenish smoky flame. It is an excellent solvent for a variety of substances, as caoutchouc, resins, fats, sulphur and phosphorus, many alka- lids and other organic substances. It is anti-septic and prevents the growth of deleterious micro-organisms, but has no antiseptic action. Medicinally it is used as an aqua, emulsion, liniment, spiritus and pure U. S. P. chloroform. Its physiological action is allied to the alcohols, but it is much more energetic. Externally chloroform is an irritant, and if confined on the skin it can cause blistering. It is irritant to mucous membranes, and, taken into the stomach, causes a sense of warmth and burning with increased production of gastric secretions. In large doses it causes violent gastro-enteritis.

Its chief use in medicine is as a general anaesthetic, for which purpose it was first used by Simpson, of Edinburgh, in 1848. As an anaesthetic its vapor is inhaled; it thus enters the circulation through the blood circulating in the lungs. When so administered the stages of anesthesia closely resemble those induced by others of the alcohol series, but in chloroform the anesthesia is very rapid. There is first a stage of excitement, with heightened cerebral activities. This is soon followed by a gradual dissolution of the mental faculties, usually in an order the reverse of their complexity. Thus the highest faculties of judgment, memory, etc., are attacked first, then unconsciousness gradually sets in. The spinal cord centres are then affected; there may be a slight catarrhal irritation, which is followed by paralysis, and then by loss of sensation and of the reflexes. The automatic centres of breathing and the heartbeat are only slightly affected. There may be some lessening of the heart action, following an initial stimulation, and similar respiratory changes. The patient thus in complete anesthesia is motionless and senseless, unable to feel or move, his automatic functions of most vital importance to life-maintenance alone functioning. It is in this stage that operations are performed, although minor operations may be performed in the early stages of primary anesthesia.

When the administration of chloroform is pushed too far, or there is a peculiar susceptibility to its effects, as in delicate individuals, poisoning results. It is usually rapid in onset, is attended with cyanosis, weak, trembling pulse and reduction of blood pressure. The vaso-motor system seems to be paralyzed and death is due perhaps to this alone, although other factors seem to be involved at times. Following
CHLOROPHYLLE — CHLOROPHYLL

chloroform anesthesia, nausea, and vomiting are apt to occur. Chloroform is a safe anesthetic, deaths to the proportion of 1:3000 or 1:4000 are said to occur; but ether, which has a proportion of 1:16000 is preferred by many. This is so particularly in America, whereas in Europe chloroform is preferred. See Anesthetics; Ether.

CHLOROPHANE, in mineralogy, a variety of fluor spar, or fluorite, which when warmed, shines with a green phosphorescent light. Fine specimens are found at Trumbull, Conn., and in the mica mines of Amelia County, Va.

CHLOROPHYCEAE (Gr. χλωρος, light green, and φυξίς, seaweed). A group of Algae which is characterized by the fact that the green chlorophyll (q.v.) of its members is not masked by other pigments. Certain Algae of a yellowish green color which were formerly considered to belong to this group have been assigned by Luther and many other systematists who have worked with him to the order, the Heterokontae. These are not only characterized by the possession of great quantities of the yellow pigment xanthophyll, but also by the fact that they store up part of the products of their metabolism in the form of starch, whereas it is all transformed to starch in the true Chlorophyceae.

The Chlorophyceae show a remarkable diversity in form and structure. They range all the way from the unicellular Chlamydomonas and the other clade free-swimming Volvocaceae, which exhibit close affinities to the lowest forms of animal life, the Flagellate Protozoa, to the fixed many-celled filaments of Spirogyra, or the enormous complicated multinucleate cell of the Siphonae. This latter structure is unique in the vegetable world; in Caulerpa, for example, we have what is apparently a plant fully endowed with roots, stem and leaves and several inches in length, while all that really is there is a mass of protoplasm containing many nuclei and surrounded by a single cell-wall. This structure, of course, represents not a single true cell but a mass of cells whose inner walls are undeveloped, as is evidenced by the occurrence among the Chlorophyceae of forms in which the appearance of these cell-walls or septa is only partial.

Asexual reproduction by motile spores or zoogonidia is found in most Chlorophyceae, although the Conjugate never propagate themselves in this manner. Non-motile asexual spores are often found. In many of the unicellular forms, the normal mode of reproduction is by cell division.

Sexual reproduction is found in the most varied forms. The cells which unite may be equal or unequal in size, and either motile or non-motile. In the case of Spirogyra, sexual union takes place between two ordinary vegetative cells in place of their filaments. In a few instances, traces are found of an alternation between sexual and asexual generations.

The cells of the Chlorophycean are all nucleate, and in almost all cases contain chloroplasts (q.v.) with pyrenoids, or masses of reserve protein. The cell-wall, though usually made up of cellulose, often exhibits the mucilaginous tegument which is one of the slimy character of the algae in pond-scum is due.

The habitat of most Chlorophyceae is fresh water, and most fresh-water algae belong to the class. The majority of the Siphonae, however, and several other species of the green algae are marine. Consult Lemmerman, E., 'Flagellate, Chlorophyceae, Coccosphaerales and Silicoflagellatae' (Kiel 1898); West, G. S., 'A Treatise on the British Fresh-Water Algae' (Cambridge, Eng. 1904).

CHLOROPHYLL (Gk. χλωρος, light green, and φυξίς, leaf). The green coloring-matter possessed by almost all plants that are not of a parasitic or saprophytic habit. It is soluble in alcohol, chloroform, carbon disulphid, olive oil, benzine and other organic solvents, and when dissolved exhibits a red fluorescence and a very characteristic absorption-spectrum. Willstätter has pointed out that there are four pigments in green leaves, all of which used to go under the name of chlorophyll. These are chlorophyll a, blue-black in the solid state and green-blue in solution, of the formula C34H47O5N2Mg; chlorophyll b, C35H45O5Mg; green-black in the solid state and pure green in solution; and chlorophyll c, C37H39O5N2, and the yellow xanthophyll, C30H22O5. All of these he has isolated in a pure state. There is good evidence that these substances are not mere artefacts of the isolation-process, but exist as such in the living leaf, whereas it is all transformed to starch in the true Chlorophyceae.

The cell-wall, though usually made up of cellulose, often exhibits the mucilaginous tegument which is one of the slimy character of the algae in pond-scum is due.

The habitat of most Chlorophyceae is fresh water, and most fresh-water algae belong to the class. The majority of the Siphonae, however, and several other species of the green algae are marine. Consult Lemmerman, E., 'Flagellate, Chlorophyceae, Coccosphaerales and Silicoflagellatae' (Kiel 1898); West, G. S., 'A Treatise on the British Fresh-Water Algae' (Cambridge, Eng. 1904).
experiments. For example, he has produced a number of substances in which the magnesium of chlorophyll is replaced by other metals. Consul Jørgensen, I., and Stiles, W., 'Carbon Assimilation,' in *New Phytologist*, 1915.

**CHLOROPHYLLITE**, klō-rö̅-fil't, an alteration product of the mineral ilolite. The only difference in composition is a larger percentage of water, but there is a marked decrease in hardness, from 7 to from 1.5 to 3, and also in transparency. The characteristic blue color of ilolite is changed to a dull green, while a basal cleavage is highly developed. Its specific gravity is 2.7. It is found at Unity, N. H.

**CHLOROPLAST** (Gk. χλωρίς, light green, and πλαστός, formed). The chlorophyll (q.v.) or green coloring-matter of plant-cells is not diffused throughout their mass, but is collected in certain special bodies known as chloroplasts. These chloroplasts may be of the most varied shapes; they may be granular, as is the case in most flowering plants, or spiral bands, as in *Spirogyra*, or flat plates, as in *Mesocarpus*. The chlorophyll-containing material is in the form of starch-grains, oil-drops, and highly-refractive masses of protein known as pyrenoids.

Bodies of the same general character as chloroplasts, but differing from them in the absence of chlorophyll, are known as leucoplasts or chromoplasts according as they are colorless or pigmented. Chloroplasts, leucoplasts and chromoplasts are all known as chromatophores. In all embryonic cells, all the chromatophores have the appearance of leucoplasts, being small, transparent, highly-refractive bodies, b] granular, spindle-like, or thread-like form. It is because of this common origin that the chromatophores, or as they are also called, plastids; are classed together under a single heading.

In those phanerogams that lack a green color, the chloroplasts are replaced by other chromatophores. In the fungi, however, which likewise lack chlorophyll, there are no chromatophores of any sort. The chromatophores of the blue-green, red and brown algae contain chlorophyll, but in addition other pigments known as phycocyan in the blue-green algae, phycoerythrin in the red algae, and fucoxanthin in the brown algae.

The chloroplast, as the chlorophyll-bearing organ, is undoubtedly that part of the cell which is most directly concerned in the assimilation of carbon dioxide. This process is very imperfectly understood, but is believed to involve the action of an enzyme. (See CHLOROPHYLL.)

Plihens new claims that the chloroplast is liquid, and of a colloidal nature. He explains its relative permanency of shape by supposing that it is in equilibrium with the surrounding cell-contents as to surface-tension. He accounts for the contraction of the chloroplast into a spherical shape when the cell is treated with a thin dilute alcohol as due to a disturbance of this equilibrium.

In most plants the chloroplasts are sensitive to light, and place themselves in the cell in such a manner as to offer the greatest surface possible to the light and least surface possible to an intense illumination. Thus the plate-like chloroplast of *Mesocarpus* presents its face to a weak light, its edge to a strong one. The chloroplasts of *Lemna trisulca* group themselves in planes parallel to the surface of the leaf when moderately illuminated, but are perpendicular thereto if the illumination be intense. In cases the position in the dark is less definitely determined. On account of these light-reactions of the chloroplasts, the suggestion has been made that they act in a manner analogous to sense-organs, but this idea of a specific sensitivity on their part has been opposed by Pfeffer.

**CHLOROSIS** (Gr. χλωρός, green), is a diseased condition which first manifests itself almost exclusively in females at the time of puberty or in the early years after its establishment. If it occurs later it is probably the recurrence of an earlier attack. The manifest symptoms are a characteristic pallor which often shows a greenish-yellow tint and gives the disease its name, chlorosis or "green-sickness"; lassitude, tendency to fatigue, to headache and vertigo; loss of appetite and anamolies of appetite, digestive disturbance; sometimes dilatation of the heart and anemic heart murmurs; dyspnea; slight rise in temperature; disturbance of the menstrual period and other hysterical manifestations. The red corpuscles of the blood are but slightly reduced but there is insufficiency of hemoglobin. There is evidence to show that the hemoglobin is not reduced but diluted by the marked increase in blood plasma.

The disease has come to be recognized as due to a disturbance of the secretory function of the sexual glands. As such it is variously explained. It has been thought that there is a deficiency of the hormone substances secreted by the ovary into the general circulation and therefore an interference with blood formation and likewise with the formation of the bone marrow. But the alteration of the blood is not always present in chlorosis nor is there evidence of insufficiency of the bone marrow. These features separate chlorosis from anemia as does also its different response to iron. Another theory is that of intoxication produced in the blood through disturbance of the ovarian activity. When asphyxia occurs at puberty and at each subsequent menstruation there is a new formation of interstitial cells in the ovarian (Graafian) follicles and an accumulation of lipoids produced by these cells, upon which sexual characteristics depend. Anything which disturbs the normal relativity between the number of lipoids produced and the number utilized in the process of maturation produces an increase of these in the ovary and in the blood, with resulting intoxication of the organism. This produces the symptoms of chlorosis, the insufficiency of hemoglobin, cardiac, vasomotor, respiratory and other disturbances already noted. The follicular disturbance affects directly the menstrual function, causing amenorrhea, and the uterine issue. The action of iron has been found to be inhibitory to the ovarian lipoid secretion, hence its value, according to this theory of chlorosis, in this disease.

The presence frequently of hysterical symptoms as well as response to certain environmental elements in the treatment points to a psychical etiology also for chlorosis. That portion of the nervous system which controls the activity of the endocrine glands (glands of inner secretion) is no less than the voluntary nervous centres at the service of the psychical
attempts to adapt to environment the attitude of the patient toward the world. The disease occurs at the period when psychological and physical development are taking place. In some cases, which are made with much difficulty. Stimulation and inhibition of psychological impulses are not well adjusted. The chlorosis, therefore, is one mode of expression of inability of the individual to adjust to the demands of development in the social environment, which at this period of stress comes to definite expression and may manifest itself again at further strenuous periods. Psychotherapy should therefore also be considered in treatment. Consult Faia, ‘The Ductless Glandular Diseases’; Pende, ‘Endocrinologia’; Jelliffe and White, ‘Diseases of the Nervous System’ (2 vols., ed. 1917).

**SMITH ELY JELLIFFE**

**CHLOROXYLON** (Greek, χλάρω, green, and ὕλη, wood), a genus of plants of the order Meliacae, distinguished by the fact that the fruit has only three cells and is split into three parts. The satinarwood tree of India, Chloroxylon swietenia, sometimes grows to a height of 50 or 60 feet and is a native of Ceylon and the Coromandel coast. The wood is hard and light-colored, having a satin-like lustre and is sometimes mottled or curled, somewhat resembling boxwood but deeper in color. It is mainly used for articles of turnery, for the backs of brushes and often as veneering for cabinet-work. The tree also produces a gum, a wood oil and an ethereal oil from the leaves.

**CHMELNIKIJ, kměň-ňit-ské, Nikolai Ivanovich, Russian writer:** b. 1789; d. 1846. He contributed largely to the reformation and elevation of the Russian stage. Among his comedies are ‘The Babblers’; ‘Air Castles’; ‘The Waverer.’

**CHMIELNICKI, kmy-če-nil-ské, Bogdan, Cossack chief:** b. 1593; d. 25 Aug. 1657. He was the son of a Polish nobleman, who settled among the Cossacks of the Ukraine. This people, who had long defended the eastern boundaries of Poland against the Tartars and Russians, were at that time subjected to grievous oppression. Their religion was persecuted, their freedom circumscribed and the castle of Kudak, called the curb of the Cossacks, was built to restrain them. Thus exasperated, they seized Kudak and massacred the garrison, but were soon subdued. After their defeat at Kumenka, Bogdan was sent to the Polish court, where he was favorably received, but suspicion soon drove him forth and finally made him a scourge of Poland. Availing himself of the hatred and prejudices of the Cossacks, he entered upon a conspiracy against the Poles, and sought the alliance of the khan of the Tartars. Chmielnicki became master of the Ukraine and carried terror, devastation and death as far as Lemberg and Zamosc. Under the new king, John Casimir, the war was continued with equal ferocity on both sides until Chmielnicki was checked. He sought the protection of Turkey, of Russia (1654), and again that of Poland (1656), and finally lived in retirement under the sovereignty of the Tsar of Russia. An equestrian statue commemorating Chmielnicki was erected at Kiev in 1873.

**CHOATE, Joseph Hodges, American lawyer and diplomat:** b. Salem, Mass., 24 Jan. 1832; d. New York, 14 May 1917. He was graduated at Harvard University in 1852 and at the Harvard Law School two years later. After six years in a Boston firm for a year he went to New York city, where he achieved remarkable success as a lawyer. In 1856 he became active as a Republican in supporting John C. Fremont. In 1884 he became a member of the famous legal firm of Evarts, Choate and Beamam. He won great distinction as a trial lawyer, conducting many celebrated cases in State and Federal courts and International tribunals. He successfully defended Gen. Fitz John Porter, prosecuted the infamous Tweed Ring, appeared in the Tilden trial in the Chinese Exclusion cases, the Income Tax cases of 1894, etc. In 1894 he was president of the New York State Constitutional Convention. In 1897 he was a candidate for the United States Senate but was defeated by T. C. Platt. President McKinley appointed him in 1899 to succeed John Hay as ambassador to the court of Saint James, in which capacity he served with distinction till 1905. He was elected Hon. Bencher of the Middle Temple of England on 10 April 1905. In 1907 he served as ambassador and leading delegate of the United States to the International Peace Conference at The Hague, and his activity as a public-spirited citizen was manifested as a trustee of the Metropolitan Museum of Art and of the American Museum of Natural History, a governor of the New York Hospital (1877–1917) and in many other ways. Among his published writings are ‘Addresses in Abraham Lincoln, Admiral Farragut, Mr. Choate, The Supreme Court of the United States,’ etc., and ‘The Two Hague Conferences.’

**CHOATE, Rufus, American lawyer:** b. Ipswich, Mass., 1 Oct. 1799; d. Halifax, N. S., 13 July 1859. He as a child showed remarkable precocity; was graduated at Dartmouth College in 1819; was admitted to the bar and began practice in Danvers in 1823; removed to Salem in 1828; and was a member of Congress in 1830–34, resigning in the latter year. Removing to Boston in 1834, he entered upon a large practice. He was successor of Daniel Webster in the United States Senate in 1841–45; resuming his legal practice in Boston at the expiration of his senatorial term. He traveled in Europe in 1850 and was a delegate to the Whig National Convention in Baltimore in 1852. After Webster’s death Mr. Choate was acknowledged the leader of the Massachusetts bar. He made many political speeches, the most brilliant, while a United States senator, including those on the Oregon Boundary, the Tariff, the Fiscal Bank Bill, the Smithsonian Institution and the Annexation of Texas. His style is peculiar and characteristic, but hardly to be commended as a model for imitation; it is rich, vivid and glowing, instinct with passion and colored with all the hues of fancy, but sometimes, it must be admitted, a little extravagant and exaggerated. The most remarkable feature, however, in his written compositions, is the structure of his periods. These are not the short and compact statements, involving but a single proposition, in which most writers of our times express their thoughts; but they recall and renew the continuous sweep and long-resounding march of the prose writers of the
16th century. They are often of breathless length, containing clause after clause, modifying, enlarging or limiting the leading idea. His 'Addresses and Orations' appeared in a sixth edition in the tribe, in one of the lands. thurs Chocotaw (1870); Nelson, 'Memories of Rufus Choate' (1874); Whipple, 'Recollections of Eminent Men' (1886).

CHOB, cho'be, a Bantu people in southeastern Africa, extending from the Limpopo to the sea. On the coast they are called Mindon-gaard. They encase our faces.

CHOCK, a piece of wood employed on a shipboard as a wedge to support various articles liable to be displaced by the motion of the vessel. It receives different names according to the purpose for which it is used, as* anchor-chocks* to support the anchor; *rudder-chocks* to keep the rudder immovable in the event of accident rendering it unmanageable. Chocks are also used to support casks, boats and other curved objects. It is probably analogously to shock in derivation.

CHOCOLATE. See COCOA.

CHOCOTAW (properly CHAHTA, the chief *Chactas* in Chateaubriand's 'Atala' is an episode of the largest tribe of the great Muskogean (q.v.) stock and before its deportation the most advanced in husbandry and general culture of any except the Creeks. They were called *Flatheads* by the French (not to be confused with the northwestern tribe of the same name), from a habit of flattening their children's skulls with bags of sand; and they had a burial custom of disinterring the corpses after a few days, cleaning the bones and preserving them. They are rather short, stout and slow, compared to the taller and more active Chickasaw (q.v.); and were nicknamed *tubbies*, though not on that ground, but from the customary final word of their war-chief's names, meaning 'killer.' The Chickasaw was one of their subdivisions, or perhaps merely the more warlike and adventurous portion, till after the whole had crossed the Mississippi; and while using a dialectic language of their own for common service, still employed Choctaw for oratory. The Choctaw occupied central and southern Mississippi, and their towns were on the two coasts, of the Mississippi; and in the 18th century their chief towns lay in two groups, one some 200 miles north of New Orleans (about the present Choctaw County, Miss.) and the other about half way from the Chickasaw to Mobile. These villages a century earlier had been numerous and widely distributed; they are stated at 40, and the tribe as having 2,500 warriors. It was first found by De Soto in his expedition of 1540. At their town of Mavila (Mobile probably, Choctaw Bluff, Clarke County, Ala. on the north bank of the Alabama), was fought perhaps the bloodiest and most destructive single battle ever known between red and white men on the continent. The village was burned, 20 of De Soto's men killed and 900 of the Indians slain—the Spanish chroniclers say 2,500 to 3,000, which may be discounted. Tristan de Luna met them again in 1560. The French, in settling this region about 1700, came immediately in contact with them, and established friendly relations with them, contrasting strongly with the permanent hostility of the Chickasaw, against whom and the Natchez the Choctaw aided the French. The latter planted forts in their country and sent missionaries among them. In the final struggle between France and England, however, the English aided the Choctaw and Chickasaw, including the chief Red Shoes. After the Revolution the Choctaw shared with the other Indians in the general treaty of Hopewell, 28 Nov. 1785, by which the sovereignty of the United States was recognized, a portion of the Choctaw lands ceded and then were returned the possession of the rest. By 1800 some 500 of them had migrated to the Arkansas (Indian Territory) and it is said that the rest were much less unwilling to go than the Cherokee and Creeks. They did good service to the Americans in the Creek War 1813-14. In 1820, by the Treaty of Doak's Stand, they ceded part of their lands for an equivalent amount on the Arkansas; and in 1830, by that of Dancing Rabbit Creek, they gave up the rest—19,000,000 acres, or nearly 30,000 square miles, to the United States, for 20,000,000 acres in Indian Territory and $2,225,000 in money and goods. In 1837 they removed with the Chickasaw to their new lands, between the Arkansas and Canadian rivers on the north and Red River on the south. How the Chickasaw first amalgamated with and then separated from them is told under CHICKASAW. They made good progress, received the missionaries of the American board and several Church denominations, were given a well-equipped school system and established a government consisting of a head chief, a council of 40 chiefs, a two-chambered legislature and a regular judiciary system, with trial by jury. Like all the southern tribes, they were slaveholders and in 1860 had some 5,000 negro slaves. Their superintendent and agents were Southerners, and they joined the Confederate side in the Civil War. Though their land was not overrun, their progress was brought to a standstill and their population reduced by a third; and after the war, they were for a time deprived of their rights. On being restored, they had to part with a section of their lands to the government, which settled other tribes there. For a time, a territorial government was formed, with the superintendent as governor, and the land had to make a allowance to their emancipated slaves. A grammar of their difficult language was published in 1870. In 1915 there were 25,168 Choctaws proper in the Territory, besides those who had taken up lands in several; and 1,500 still remaining in Mississippi.

The lands located in the Choctaw Nation comprise 6,953,048 acres, which under treaties with the United States government, owing to their close affiliation with the Chickasaw Nation owning an additional 4,707,903 acres, total 11,660,951 acres, are held in common by the members of both of these tribes of Indians. See CHICKASAW; INDIAN AFFAIRS.

CHOCZIM, ho'tsin (properly KOTHIN), Russia, fortified town, on the right bank of the Dnieper, opposite to Kharkow, now a few miles from the Austro-Hungarian frontier. In 1718 the Turks caused it to be regularly fortified by French engineers; but it was taken by the Russians in 1730, 1769 and 1788. As it is completely commanded by the hills which surround it, its value as a fortress is now small. Its chief importance is as a mili-
tary station. The inhabitants are engaged chiefly in agriculture. Here John Solieski defeated the Turks in 1673. Pop. 19,361.

CHODAT, šo-dā. Robert, Swiss botanist: b. Montier-Grandval, Jura-Bernois, 6 April 1865. In 1889 he became a professor of botany in Geneva University and was doyen of the Faculté des Sciences there, from 1898 to 1906, and rector of the university from 1908 to 1910. He has contributed numerous professional papers to botanical journals, and has published many important monographs, including 'Principes de botanique' (1906); 'Sur le polymorphisme des Algues' (1908); 'Les Ptéridospides des temps paléozoiques'.

CHODKIEWICZ, hód-kě-á-vich, Jan Karol, Polish general: b. Lithuania 1560; d. Chocim, 27 Sept. 1621. He served in the Spanish army under the duke of Alva and also under Maurice of Nassau. Later he returned to Poland and took part in crushing the Cossack revolt and the campaigns against Wallachia. In 1602 he went to Livonia as commander of the Polish army and three years later he inflicted a crushing defeat on Charles IX of Sweden at the battle of Kirchholm. He made an unsuccessful campaign against Russia, and he drove back the Turks who had an army of nearly 200,000 trained men (1620–21).

CHODZIECKI, hód-dź-vě-té-kě, Daniel Nicolaus, German designer and engraver: b. Dantzic, 16 Oct. 1726; d. Berlin, 7 Feb. 1801. He was instructed in miniature painting by his father, and subsequently painted snuff boxes. He was encouraged to study enameling, and soon attracted attention by the beauty and finish of his productions, some of which came under the notice of the academy of Berlin, and procured him a commission to make a set of designs for their almanac. The manner in which he executed these established his reputation. He thenceforth devoted himself almost exclusively to designing and engraving; he produced the plates for Klopopock's 'Messiah,' 'Don Quixote,' Lavater's 'Physiognomy,' editions of Shakespeare, Voltaire, La Fontaine and many other works.

CHODZKO, kód-zko, Jacob Leonard, Polish bishop: b. Oly, 6 Nov. 1800; d. 1877. Having traveled as secretary of Prince Oginski through nearly all Europe, he established himself in 1826 at Paris, where he published a memoir of the prince, with an introduction entitled 'Observations sur la Pologne et les Polonais' (Paris 1827), and commenced collecting materials for a history of his country from the death of Augustus III. Afterward he published the 'History of the Polish Legions in Italy, Under the Command of General Dombrowski' (1829). During the revolution of July 1830, Lafayette appointed him his aide-de-camp; and after the outbreak of 29 November of the same year in Warsaw, he acted as agent of the revolutionary government in France. He was an active member of the French-Polish and American-Polish committees, and after the failure of the revolution, as member of the national Polish committee of France.

CHÖNIX, ké-niks, a measure of capacity among the ancient Greeks. Its size is variously given, and it is probable that it actually differed in the different states of Greece. Some ac-
counts represent it as containing three cotyle, or about 1.487 pints English; others make it equal to 1.982 pints; and still others give it as equal to 3.964 pints. This varies much, owing to the fact that it was originally the daily ration of a man. Recent discoveries would seem to indicate that the chœnix was about 1.5 liters.

CHÆRILUS, ke-ři-lús, the name of several Greek poets, among whom Chærilus of Samos is the best known. He lived in the 5th century a.C., was the contemporary and friend of Pindar, and composed a poem entitled 'Persies,' celebrating the victory of the Greeks over Xerxes. The fragments of the poem still extant have been collected and explained by Nâke (Leipzig 1817). Another Chærilus, of Iasus, in Caria, is mentioned by Horace as an example of an extremely bad poet. He formed part of the train of literary men who were selected to accompany Alexander the Great on his expedition to the East.

CHOIR. In religious worship, an organized body of singers. In ceremonial Christian religions, the choir officials and choristers, or other singers taken collectively, are termed choirs, but not as the choir. Typical choral organizations, such as those of Catholic and Episcopal cathedrals and churches are usually divided into two sets of voices, the one sitting on the north and the other on the south side of the chancel, and are known by the respective titles of Caædars and Decani from their nearness to the Cantor (or Precentor) and to the Decanus (or Dean). In most cathedrals and collegiate chapels, the Decani side is held to be the side of honor, the best voices are placed there, and all the verses or soli parts, if not otherwise directed, are sung by that side, which is also considered the 'first choir' (coro primo) in eighth-part music.

In architecture, the eastern limb of a cruciform church or the eastern portion of any church. In the latter case it is more commonly styled the chancel (q.v.), and is frequently constructionally lower and narrower than the main part of the building. The ordinary daily services in a cathedral or collegiate church are held in the choir. While architecturally the choir is applied to the entire portion of the church east of the crossing, the eastern limb is itself divided into three portions: (a) the 'ritual choir,' containing the stalls for the singers and comprising the western portion of the architectural choir; (b) the presbytery, next east of this, containing seats for the laity (a term sometimes applied to all of the choir east of the 'ritual choir' ); (c) the sanctuary, containing the altar and sedilia, and divided from the remainder by a low railing. In certain cases there is even a fourth division called the recito-choir, comprising one or more bays east of the sanctuary. It should be noted that the 'ritual choir,' or place for the singers, does not invariably correspond with the architectural choir. Sometimes it includes the crossing and one or more bays of the nave, or again, as at Westminster Abbey, London, and in Spanish cathedrals generally, it is entirely in the nave, from the remaining portion of which it is separated by a massive wall or screen. In buildings where the ritual choir is the east of the crossing, the choir screen is placed between the eastern piers of the crossing. In many cathedrals, the organ is placed upon the
choir screen. In several cathedrals the choir is quite as long as the nave, and in some parish churches even longer, but the usual proportion of choir to nave is as one to three. In many French churches the choir terminates polygonally with encircling chapels and this termination is known as the choir aisle. The cathedral of Saint John the Divine in New York city is built after this plan. In England the square east end is the most common in Gothic churches, although in Norman ones the semicircular apex is not infrequent. In the Middle Ages, the choir, as the most indispensable portion of the church, was erected first, the nave, regarded practically as a stately approach to the choir, was built later, a century or more sometimes intervening between the completion of the choir and that of the nave. The cathedral of Saint John the Divine in New York is being erected after the medieval custom. The choir was completed for consecration and service in April 1911, and the construction of the nave was begun in 1910.

CHOCER INVISIBLE, The, a novel by James Lane Allen, published in 1897. It is one of his most popular and pleasing stories, and was enlarged from an earlier story called 'John Gray.' Its scene is the Kentucky of 100 years ago and the fresh picturesque descriptions of pioneer life in Kentucky give the tale historical value.

CHOISEUL-AMOIS, sha-wa-zel-anbois, Etienne François, Duc de, French statesman: b. 28 June 1719; d. Paris, 7 May 1785; he entered the army in early life and after distinguishing himself on various occasions in the Austrian War of Succession, returned to Paris, where his marriage with the daughter of the financier, Crozat, gave him the command of great wealth, and his intimacy with Madame de Pompadour furnished the means of gratifying his ambition; as he gratified hers by the expulsion of the Jesuits, whom he had come to hate as much as she did. After having been ambassador at Rome, where he obtained from the Pope, Benedict XIV, the celebrated encyclical letter intended to appease the disputes which had arisen on the bull Unigenitus and at Vienna, where he concluded with Maria Theresa the treaty of alliance against Prussia, he became in 1758 Minister of Foreign Affairs. At the same time he was made a duke. He succeeded the marshal of Belle-Isle as Minister of War in 1761, and the same year he became also Minister of Marine. His administration was distinguished by many useful reforms. He reorganized the army and navy which the disasters of previous wars and the neglect of previous administrations had suffered in vital decay; negotiated the famous Family Compact which united the various members of the Bourbon family, and restored Cortica to France. His fall was brought about in 1770 by a court intrigue supported by Madame du Barry, the new favorite of the king. He was recalled to court on the accession of Louis XVI in 1774, but not again intrusted with power.

CHOISEUL-GOUFFIER, goo-fyair, Marie Gabriel Auguste Florent de, Count de, French antiquarian and diplomat: b. Paris 28 Sept. 1799; d. Feb. 1817. He was colonel in the Queen's regiment, lived at the court of Marie Antoinette, and was the friend and co-worker with Talleyrand. He early displayed a particular interest in everything relating to Greece. His wish to visit that country was gratified in 1776, and in 1782 appeared the first volume of 'Voyage pittoresque de la Grèce,' which attracted much attention and procured him a call at the French Academy in 1784. The other volume appeared in 1824. The first was entirely revised by him before his death. The same year he was appointed ambassador to Constantinople, where he remained till 1791. The appointment of ambassador to London was then offered to him, but he remained at Constantinople and sent his official correspondence to the exiled French princes. This correspondence having fallen into the hands of the republicans the convention gave orders for his arrest, but he escaped taking refuge in Saint Petersburg, where Paul I made him a privy-councillor, director of the Academy of Arts, and superintendent of the imperial libraries. He returned to France in 1802 when his friend Talleyrand again took office and resumed his seat in the Academy. He was made a peer of the realm immediately after the restoration. He also became a member of the privy council, with the rank of Minister of State and Lieutenant-General. His antiquarian researches were chiefly inserted in the memoirs of the National Institute, and his very valuable collection of antiquities is now in the museum of the Louvre.

CHOISEUL-PRASLIN, pra-lan, Eugène Antoine Horace, Comte de, French statesman: b. 23 Feb. 1837; served in the navy from 1853 to 1865, held some minor offices, and in 1869 was elected to the Corps Législatif. He was first elected to the National Assembly in 1871, and has been several times a member of the chamber of deputies. He is considered one of the leaders of the Republicans. In 1871 he was Minister Plenipotentiary to Italy; in 1880 he became Secretary of State in the ministry of foreign affairs; and in 1887 was sent on a botanical expedition to Ceylon and the United States. He was interested in the botanical garden of the University of Paris and as very influential in the Republican majority.

CHOISY-LE-ROI, sha-wa-lee-ree, or CHOISY-SUR-SEINE, France, town in the department of Seine, seven miles south of Paris, on the left bank of the Seine. Its broad, straight streets, elegant houses, and fine avenues, with the proximity of the Seine, contribute to render it one of the most agreeable towns in the vicinity of Paris. It owes its importance to the pleasure château built here by Milé, de Montpensier in 1662, which was acquired later by Louis XV as a residence. It was destroyed during the Revolution. The church and the town hall were built in the reign of Louis XV. Among its monuments is a bronze statue of Rouget de Lisle, author of the 'Marseillaise,' who died here in 1838. In its cemetery is his tomb. It manufactures of wax cloth, soap, hats, chemical stuffs, glass, morocco leather, earthenware, porcelain, and vinegar, and some trade in wine, vinegar, coal, etc. Pop. 15,908.

CHOCHE-CHERRY (Prunus virginiana), so called from the astringent nature of the fruit, a shrub from the New England region. It is only a small tree, belonging to the family Amygdalaceae. For commercial uses the wild black
CHERRY (Prunus serotina), which is closely allied to F. virginiana, is valuable. Its wood is one of the best American woods for cabinet making. The bark has medicinal properties as a pectoral tonic and febrifuge. The range of choke-cherry is wide, flourishing along river banks and in rocky situations, from Canada to Florida, and west to Colorado and Texas.

CHOKING, a stoppage caused by a morsel of food, a drop of liquid, etc., passing into the larynx or upper opening of the windpipe, instead of the gullet, or an obstruction of the esophagus itself. It is usually followed by a violent coughing which lasts, in slight cases, till the offending substance is expelled. Sometimes, however, a larger mass—e.g., a half-chewed piece of meat—is drawn into the opening of the windpipe, completely blocking it, and arresting respiration altogether. This condition is one of extreme danger; the sufferer becomes purple in the face, and if not at once relieved will die of suffocation. The obstructing substance is usually within reach, and may often be dislodged if a by-stander promptly pushes his forefinger to the back of the throat and attempts to draw the obstruction forward. A child may sometimes be saved by holding it up by the heels and shaking it, or slapping its back. If these measures fail relief may be obtained by means of a sharp-pointed knife promptly pushed into the windpipe to admit air to it below the obstruction. In the case of an animal, remove the obstruction with the hand when possible. Cause the animal to swallow the obstructing substance, if possible, by giving it water, oil or belladonna solution. Carefully push the obstruction down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases the gullet has to be cut into by a surgeon.

CHORAGOGUE, kōl'a-gōg. See CATHERACTS.

CHOLERA, kö'ler-ə, Asiatic, an acute, infectious disease, endemic in some localities and epidemic in others, characterized by vomiting and purging of a peculiar rice-water-like fluid, and a stage of collapse.

It is usually ushered in by vomiting, purging and gripping pains in the stomach, and death may follow in from 1 to 24 hours. If life is retained longer than this time the patient may possibly recover. The mortality is 30 to 80 per cent.

It originated in the East Indies and was not known to migrate for 1,000 years. The oldest Sanskrit writings show that it was known many hundred years before the birth of Christ. There are abundant proofs of epidemics in the 17th and 18th centuries, but it did not spread into Europe until 1830. The Russians took it from India through couriers and stage-coaches. Another cause of the dissemination of this disease was then when it was in Marseilles it broke out in Paris, jumping Lyons, the second largest city in France, notwithstanding the fact that quarantines were in full force.

It was first observed in the United States in 1832, having been brought by immigrants from Great Britain to Quebec whence it found its way across the border to New York. It was also epidemic in the United States in 1835 and 1836. In 1848 it was brought into the country by way of New Orleans, traveled up the Mississippi Valley and thence across the continent to California. Other years in which it prevailed with greater or less severity were 1849, 1854, 1856, 1867, 1873, 1884, 1892, 1893.

Since 1873 it has had no positive foothold in the United States or Great Britain, but in the Philippine Islands it has prevailed since 1901 though it is now under control. It has prevailed in the Orient since 1901 and it was severe in Russia from 1902 to 1910, but in 1911 it was prevalent in Italy, North Africa, Madeira, Asia Minor, Arabia and Turkey. It still prevails in India where it is always endemic. Several cases were brought to the United States on a shipboard in 1911, and a number of so-called cholera-carriers were detained until the evidences of the disease disappeared. There was no extension of the disease from the port of entrance (New York).

Biology.—The undoubted cause of the disease is the comma bacillus which was discovered by Koch in 1884. It is about half as large as the tubercle bacillus, but is somewhat thicker. Under high magnification it resembles a bent rod, or a short spiral. It is about 0.5 mm. in length. It will grow in water at ordinary temperatures, and was isolated from the water tanks at Hamburg during the epidemic of cholera which visited that city in 1892. It is said to live at temperatures ranging from —15° to 104° F. The bacteria are located chiefly in the intestines, as, according to Dr. Koch, none have been found to exist in the blood or in any of the other organs. In the lower section of the lower intestines they are found in greatest abundance, also in the saliva, but not in the blood. It is said that the bacilli cannot live in the stomach.

In post mortem the organisms were found by Koch in the intestines but not in other internal organs. They have often been found in the faces of persons who are apparently healthy, during an epidemic, such persons being the so-called cholera-carriers.

The symptoms of the disease are apparently due to the absorption from the intestine of toxic material generated by the bacilli.

It is asserted that these comma bacilli destroy the blood corpuscles within a pretty wide range, and it is fair to conclude that they also destroy more or less of the surrounding tissues.

Transmission.—The disease is contagious but not highly so. Those who wash in the clothing and bedding of cholera patients often contract the disease, and so do those who come in direct contact with the body, as undertakers, orderlies, etc., but such attacks are probably due to the epithelial hygienists in the vomit of the part of the victims. Physicians and nurses
suffer with comparative infrequency from cholera. Animals may be readily immunized to the disease by first injecting a suitable culture of the dead organisms and following it with the injection of a culture of living organisms. Many human beings have a natural immunity to it. It is demonstrable that it may be conveyed by vegetables, especially by raw ones, by milk and by other forms of food.

The two agencies by which it is most frequently conveyed are house flies, which carry the bacilli directly from the *dejecta* of cholera patients to milk and other food, and water which is constantly polluted in the countries in which cholera is present. Military camps and barracks are notorious breeding places for cholera. In certain parts of India the water for bathing is also used for drinking purposes and it seems impossible to prevent the natives from thus using it and from suffering the inevitable consequences.

Melville ("Military Hygiene and Sanitation," 1912) states that cholera has disappeared from the British army in India since the water supply has been improved and regulated by boilling, its development is favored at the sea-level, by a moist soil, and by a high temperature. It is common to all ages and usually attacks the debilitated in preference to the robust.

**Pathological Anatomy of Cholera.**—After death the stomach contains more or less of the whey-like albuminous fluid and is full of cast-off epithelium. The small intestines usually contain a large quantity of the whey-like fluid and epithelium. The glands of Brunner, the solitary and agminated patches, are thickened and very prominent. The solitary glands of the large intestines are also infiltrated and swollen. The liver is more or less advanced in fatty degeneration. The kidneys have a pale, white appearance, due to the epithelium blocking the tubes. The bladder is empty and contracted. The lungs are congested. The right caviities of the heart are distended with blood, while the left caviities are empty and contracted.

**Clinical Pathology.**—When the disease runs its typical course it has three stages: (1) The preliminary or stage of invasion. (2) The stage of collapse. (3) The stage of reaction. It is preceded by a period of incubation which ordinarily lasts from two to five days.

In the stage of collapse there is still profuse diarrhea with pain and straining. There is also great exhaustion and great evidence of shock; the countenance is ghastly, there is sub-normal temperature, and a scarcely perceptible pulse. This condition is frequently followed by a stage of reaction, during which the stools are at first yellow from the biliary coloring matter, then whitish, resembling rice water, and they contain blood, mucus, etc., and have an alkaline reaction. The glandular secretions are arrested with the exception of those of the sweat glands; the "cold sweat" is characteristic of this stage. In nursing women the secretion of milk is sometimes maintained.

3. If the patient is at the stage of reaction the warmth and color will gradually return to the surface, the pulse will again become perceptible, urine will again be secreted, the stomach will become less irritable, and the stools less frequent. Relapses are not uncommon and a patient may apparently be convalescent when suddenly his bad symptoms return with uremia, unconsciousness and death. Complications are always possible. Those which occur most frequently are the typhoid condition, nephritis, pneumonia, pleurisy, abscesses in various portions of the body, and the formation of diphtheritic membrane upon the mucous surfaces. The diagnosis of the disease is seldom difficult, and can almost always be readily made during an epidemic. The prognosis is uncertain, varying greatly with the type of the epidemic and the resisting power of the individual.

**The Prevention and Treatment of Cholera.**—While the treatment of this disease must vary in accordance with the local conditions there are certain methods and regulations which may be regarded as generally applicable.

No specific treatment has as yet been discovered for it, and living writers with extensive experience in India, where it has been more prevalent during the past ten years than in all the rest of the world, declare that a symptomatic and expectant plan of treatment is as good as any. Latham and English, like others who have worked among Asiaties, admit great difficulty in carrying out preventive measures for a germ disease which is conveyed by polluted water. Natives in India simply will not take the precautions which are indispensable, in regard to drinking water, to prevent the spread of cholera, precautions which are always necessary when the water supply comes from storage tanks, wells, polluted rivers, etc.

The adequate protection of such people is a hopeless task, but there are always more or fewer white people in each country who must also be protected and with whom an appeal to reason is not apt to be disregarded.

In countries in which cholera is epidemic or endemic, therefore, the areas in which water is collected, that is to say water sheds, must be protected, religious pilgrimages by which cholera is constantly carried from one country to another must be discouraged by government, and the milk supply, which is so easily contaminated by polluted water, by flies, and by other food, must undergo rigid public supervision.

Preventive measures on the part of local and general governments will also consist in keeping the public streets absolutely clean, in efficient drainage, in careful collection and disposal of garbage and sewage, in fumigation and disinfection of public and private buildings and private property wherein such attention may be called for. Preventive measures on the part of individuals may consist in (1) Frequent and thorough disinfection. (2) Personal hygiene. (3) The treatment of all forms of diarrhea and of bowel disorders in general.

1. Haffkine's method of preventive inoculation is as efficient as any which has yet been tried. It consists in the subcutaneous injection
of a culture of living and virulent cholera microbes. An injection of nine minims has been found sufficient as an average dose for an adult. The germs die shortly after their injection, and yield a protective immunity from cholera for a few weeks or months though it was not found that it had materially lessened the mortality from cholera in India.

- An adequate system of personal hygiene those who are new arrivals in a cholera infested district are usually more susceptible to the disease than those who are acclimated.

As far as possible, in the presence of cholera, fatigue, worry, the use of unripe fruits and uncooked vegetables must be avoided. Decomposed food, especially fish, must be avoided with religious care, also stale milk, unboiled or dirty water and alcohol in all forms. Food should be carefully screened from flies; flies should be kept out of the house and should not be allowed to breed in yards and stable. Milk and water should be boiled, the hands and vessels of all kinds should be kept scrupulously clean and if a water filter is required only one of some standard variety should be used.

3. In the preventive treatment of bowel disturbances salines and purgatives should be avoided and a choice may be made from the following astringents: chlorodyne, laudanum, catechu, kino, aspirin, black pepper and opium, lead and opium, and chalk and opium. If a person has diarrhoea, when cholera is epidemic it will be wise for him to go to bed and remain there until his diarrhoea is relieved.

Treat during the disease varies according as the stage is that of (1) invasion, (2) collapse or (3) reaction.

1. In this stage it is essential that the patient be in bed, in the recumbent position and that the bed be warm and the body dry. The room should be darkened and kept at a temperature not exceeding 70° F. The patient must be kept quiet, he must have little or no company and be given plenty of iced water, but not enough to provoke vomiting. For the relief of the crises in the bowel he may inhale chloroform, or be rubbed with a suitable anodyne liniment, or applications of turpentine or mustard may be applied to the abdomen. Morphine may be given hypodermically if necessary. The antitoxic sera have been used in various countries in the treatment during this stage but without very satisfactory results. The Japanese are the only ones who speak with confidence of this method of treatment.

2. In the stage of collapse it is necessary to stimulate the patient as vigorously as his strength will allow. Alcohol in the form of brandy, whisky, or champagne may be given by mouth, also nitrite of amyl, nitro-glycerine, and hypodermics of ether. A very efficient form of treatment consists in the intra-venous injection of a normal saline solution. A pint may be injected in the course of ten minutes and this may be given as many as three times if conditions warrant it.

3. In the stage of reaction the bladder and kidneys must be carefully attended to for there is sometimes suppression of the urinary secretion or retention of urine within the bladder. In such cases heat may be applied over the kidneys, or wet or dry cupping be practised. The retained urine must be withdrawn with a catheter. If the diarrhoea continues hot injections of a suitable astringent may be slowly administered, and bismuth may be given by mouth.

In all cases the food must be simple and easily digested, the stools disinfected, the clothing sterilized, and the hands of nurses and attendants sterilized.

ANDREW F. CURRIER, M.D.

CHOLERA INFANTUM, an acute infectious disease of infants, due in large part to a definite micro-organism, the Bacillus shiga, or allied species, characterized by acute gastrointestinal inflammation, with nausea, vomiting, diarrhoea, high temperature, wasting and prostration. Death may result in a very short time. The child may be attacked suddenly, but it is more liable to occur in children who have been somewhat run down from a mode of indigestion. The child is then taken with the cholera-like diarrhoea, passing thin serous or rice-water discharges, 10 to 20 a day. The temperature rises abruptly from 103° to 105° F. and there is constant vomiting. There is rapid emaciation and prostration, the child having strength only to moan or cry with a sharp irritable sound. Dullness, stupor, and at times convulsions precede death. Treatment should be prompt and requires skilled medical attendance. Acute summer diarrhoea of infants is not necessarily cholera infantum. In fact cholera infantum is not a common disease, whereas the acute diarrhoeas of children, resulting from tainted foodstuffs, are very common. Every case of summer diarrhoea, however, should receive vigorous treatment, because it offers an opportunity for the Bacillus shiga to develop cholera infantum.

CHOLESTERIN, kó-'les-trin (Gk. χολή, bile, and στερεός, solid). An unsaturated monatomic secondary alcohol which is found in small amounts in most animal fluids, and is abundant in the nervous system in wool-fat, in the yolk of eggs, and more particularly in gallstones, where it usually is the chief ingredient. Its empirical formula is still a matter of dispute. Obermüller considers that it is C_{27}H_{46}O while Maunther and Suida regard it rather as C_{28}H_{50}O. Windaus considers that its structural formula is

\[
\text{CH}_4 \rightarrow \text{CH}_3 \cdot \text{CH}_2 \cdot \text{CH}_3 \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CH} = \text{CH}_2 \cdot \text{CH} \cdot \text{OH}
\]

At any rate, it is more or less closely related to the terpenes.

Cholesterol that has been crystallized from a heated aqueous solution contains one molecule of water of crystallization. Its melting-point is 148.5°C. It consists of thin plates of a nacreous lustre, and is greasy to the touch. Cholesterol, together with certain other
lipoids or fat-like bodies, is to be found in the cell-walls of the red blood corpuscles. This is perhaps to be connected with the fact that cholesterin prevents the hemolytic action of certain poisons, for example, saponin.

Substances closely related to cholesterin are found in fuses, in wool-fat, in the tissues of sponges and of the silkworm, and in all vegetable fats, being found in the largest quantities in the fats of the pea and of the Calabar bean. These substances, called "cholesterins," in a loose sense, may be distinguished from cholesterin proper by various color reactions or by the determination of their melting-points. The commonest vegetable analogue of cholesterin is known as phytosterin, and vegetable fats may be distinguished from animal fats on account of the fact that whereas animal fats in general contain traces of cholesterin, vegetable fats contain traces of phytosterin. Consult Windaus, A., article on "Sterine" (in Biochem. Hdb. Beilstein, Vol. III, 1911); Bang, J., "Chemie und Biochemie der Lipide" (1911). v. Fürth, O., "Probleme der physischen und pathologischen Chemie" (1912).

CHOLET, shō-lā', France, town in the department of Maine-et-Loire, on the right bank of the Maine, 32 miles southwest of Angers. It has a tribunal of commerce, consulting chamber of manufactures and communal college. Its manufactures include handkerchiefs and cotton goods, called cholettes, flannels, and woollen stuffs, which industries in this and surrounding territory employ between 50,000 and 60,000 operatives. There are also wool and cotton spinning-mills, bleachfields, dyeworks and tanneries. There is a great trade in cattle, lumber and grain, the markets for which are attended by a large concourse of buyers from other parts. Granite is quarried near by. The first considerable growth of the town was when a colony of weavers settled here under Edouard Colbert, Count of Malevire. Here during the Vendee War, two actions were fought in 1793, in both of which the Royalists were decisively defeated. Pop. 21,058.

CHOLIAMBUS, kō-lo-am-būs (Greek, xolíobphos, the lame iambus; also called skason, from skazo, to halt; or versus Hippoacticus, because the satirist Hippox of Ephesus made use of it, or perhaps invented it), an iambic trimeter, the last foot of which, instead of being an iambus, is a trochee or spondee, which gives it a lame motion, as, for instance, Martial, l. i. prav. v. 3.

Car in theatrum, Cato sevère, venisti?
An idem tantum vegeras, ut exire?

We perceive, from the construction of the choliambus, that it may be applied with advantage to produce a comic effect. The Germans have happily imitated this verse, as well as all other ancient metres. An instance of a German choliambus is—

Der Choliamb scheint ein Vers für Kunstfreunde.

CHOLIC (Gk. xolíb, bile) ACID (CaH₄O₇), a non-nitrogenous acid produced by decomposing the true biliary acids with an alkali. It does not form an organically bound ester; it is found in the contents of the intestine, and in the excrement. It is crystalline, sparingly soluble in water, but readily soluble in alcohol and ether. The cholates are rather obscurely crystalline; they are not very soluble in water, but rather more so in spirit. Both the acid and salts have a bitter taste.

CHOLINE, kō-līn (Gr. xolíb, bile), a basic body (C₈H₂₄N⁺NO₃⁻) found in both plants and animals. In animals it is apparently one of the reduction compounds of proteins, being methyl oxyethyl ammonium hydroxide. It is of interest in medicine chiefly because of its close affinities to two very poisonous compounds, into either of which it may be converted. By oxidation it builds neurine, a highly poisonous body; and by hydration it becomes an alkaloid-like body closely resembling the plant alkaloid muscarine, from the poisonous mushroom Amanita muscaria. Thus choline may be one of the auto-intoxicating substances that may be developed in the human body if its normal metabolism is disturbed. It may also be a factor in the so-called ptomaine poisoning.

CHOLMONDELEY, chōl-mon'del-i, Mary, English novelist. Her fictions have been extremely popular and include 'The Danvers Jewels'; 'Sir Charles Danvers'; 'Diana Tempest'; 'A Devotee'; 'Red Pottage'; 'Moth and Rust'; 'The Lowest Rung'; 'Notwithstanding.'

CHOLOCRHOME, kōlō-k्रό̃m (Gr. xolíb, bile, xrhõma, color), or CHOLOPHÆIN, the brown coloring matter contained in bile and in the intestines, and the substance coloring the faces and the skin in jaundice. It is also a general term for bile pigment of every kind.

CHOLOPHÆIN, kōl-o-fē'n, also known as biliphaein (from L. bilis, bile, and Gr. pharm, dusky); an impure bilirubin.

CHOLOS, shō'loz, in Peru, the name for those who are partly of white, partly of Indian parentage, the most numerous class of the community.

CHOLULA, chō-loo'loa, Mexico, city in the state of Puebla. It is 12 miles west of La Puebla, with which it is connected by rail, and 60 miles southeast of the city of Mexico. The streets are regular and spacious, the houses mostly of one story, and flat-roofed. It is well built and contains a pyramid of clay supposed to have been built by the aborigines in honor of one of their deities and surmounted by a half-ruined chapel, probably erected by Cortés. Cholula, at the time of Cortés, was a flourishing city of 20,000 houses and a large number of temples. It was the chief city of a semi-independent state settled by a tribe of the Nahua race. The inhabitants carried on a considerable trade and had a more or less democratic form of government. It was visited by Cortés in 1519, and in spite of his friendly reception by the inhabitants, he massacred a number of them, suspecting them of plotting against the Spaniards. Pop. about 9,000.

CHONDROMA. See TUMOR.

CHONDRO-SARCO'MA. See TUMOR.

CHONDROSTEI, kōn-dro-stē'i, an order of acanthopterygious fishes of lowly organization, the sturgeon, paddle-fishes and their fossil predecessors. The internal skeleton is but little ossified, the vertebrae and most of the skull remaining in a stage of pure cartilage; but the skull is enclosed by close-fitting dermal bony plates. There are no true scales, but a small number of longitudinal rows of large bony
plates, with granules on the intervening skin. The elongated snout, stout body, large fins and strongly heterocercal tail complete the aspect of these survivors of a once dominant race that flourished from the Lower Devonian through the Mesozoic, except the Cretaceous period, from after the Eocene steadily diminished, until of seven great families only two remain, represented by a few species that exhibit degeneracy from the ancient type. Consult Woodward, 'Vertebrate Paleontology' (Cambridge 1896).

CHONDROUS (Gr. Χόνδρος, gristle, cartilage) κόνδρις, the genus of seaweeds to which carrageen or Irish moss (chondrus crispus) belongs.

CHONOS, chó'nos, ARCHIPELAGO, or GUAYTECAS ISLANDS, a group of islands belonging to the Chilean province of Chiloé, lying off the west coast of Patagonia, mostly between lat. 44° and 46° S., and long. 74° and 75° W. Two are large, but they are nearly all semi-barren and scantily inhabited by Chonos Indians. Magdalena is the largest island, and the only settlement of any importance is Molina. 

CHOP-STICKS (Chinese, kwái-tá, nimble or diligent lads), two smooth sticks, about the thickness of a quill, of bamboo, wood, or ivory, which are used by the Chinese for conveying meat or vegetables, particularly rice, to the mouth. The chop-sticks are used in various manners, serving partially the purposes of a fork and a spoon. The most curious mode of using the chop-sticks is when a bowl of rice is brought close to the lips, the mouth held wide open, and the grain dexterously dashed into it, with the chop-sticks, held one on each side of the forefinger, and piled with a rapid motion quite suggestive of the Chinese title.

CHOPIN, shó-pán' (Franaçois), Frédéric, Polish pianist and composer: b. Zelazowa Wola (near Warsaw), 1 March 1809; d. Paris, 17 Oct. 1849. Chopin, in the words of Saint-Saëns, "revolutionized the divine art and paved the way for all modern music"—certainly for all piano-forte music. His father, Nicholas Chopin, was born in 1770, at Nancy, Lorraine, and emigrated to Warsaw, in 1787, where he was at first a bootmaker, and subsequently a professor of French in the Lyceum. He was reputed to have Polish blood in his veins, and, in 1806, he married a Polish girl, Justina Krzyzanowska, the daughter of "poor but noble parents," who bore him three girls beside Frédéric, who inherited from her the intense love of his native country and its art, which is one of his most striking characteristics. He got his first lessons on the pianoforte from a Bohemian composer named Zywny, and made such rapid progress that he was able to play a concerto in public before he was nine years old. Three years later he entered the Lyceum and also took lessons in counterpoint and harmony from the head of the Warsaw Conservatory, Joseph Elsner, who was able to teach the value of hard work, had sense enough to recognize his genius and to allow his striking individuality free play. While a student at the Lyceum, he wrote a one-act comedy with his sister, and otherwise showed such an interest in the stage that it seems strange he did not, in subsequent years, write an opera.

The earliest compositions of Chopin were national dances (mazurkas, polonaises, waltzes, a krakowiak, etc.). Some of these were played at the public concerts he gave at Vienna, in August 1829 and again the following year, on which occasion the critics put their fingers on some of the most marked peculiarities of his style—the unconventional accents in his phrasing, and the melancholy tints in the style of his shading. In March 1830, having made up his mind to visit Paris and London, he gave a farewell concert at Warsaw, which was successful that two more had to be given. In November he became traveling virtuoso, visiting Breslau, Dresden, Prague, Vienna, Munich and Stuttgart. This trip was financially a failure, and he had to write home for money to pay his fare to Paris. He was 22 years old when he reached that city, which was thenceforth to be his home. At Stuttgart he had heard of the capture of Warsaw by the Russians. There was much sympathy for unfortunate Poland in Paris, and Chopin profited by it, and he soon became a favorite of the aristocracy, and a friend of the men and women of genius who at that time made Paris their permanent or temporary abode; Meyerbeer, Liszt, Berlioz, Mendelssohn, Heine, George Sand, the Countess La'Agoult, Cherubini, Bellini, Halévy and others. Among these his genius found sympathetic appreciation, but the musical world in general never suspected that he was an epoch-making composer, even after he had lived in the French capital for 18 years. He is underestimated, wrote George Sand, and Liszt said: "Whoever could read in his face could see how often he felt convinced that among all these handsome, well-dressed gentlemen, among all the perfumed, elegant ladies, not one understood him." Had his contemporaries even suspected his real greatness he might have lived in luxury from the sales of his compositions (which have since his death enriched many publishers), or from a few public concerts. As it was, his concerts grew fewer and fewer, and he had to support himself by giving lessons. As a teacher he was much in demand.

Worshipped by women, Chopin had a mind most susceptible to feminine charms. One of the young ladies he fell in love with, Constantia Gluck, assisted him at his farewell concert at Warsaw. She wore his engagement ring, but married another man. The adagio of the F minor concerto is an echo of his transient infatuation. In 1836 he proposed to Maria, the daughter of Count Wodziński, but she refused him. In the following year, Liszt introduced him to the brilliant novelist, Mme. Dudevant, known to the world as George Sand. At first, Chopin did not feel attracted to her, but she knew how to overcome his coyness and ensnare his affections. A French writer says of her that "when she was writing she would often ask Chopin to sit down by the piano and improvise, and inspired by his playing, she wrote some of her finest novels. For a time, no doubt, her vivid imagination and sympathetic appreciation of his music stimulated his genius, too. A romantic episode in his life is the four months he spent with George Sand and her son and daughter on the island of Majorca in quest of health this summer (1838) that he wrote the most marvelously inspired of his works, the 'Pre-
CHOPIN

Ludzs, as is proved by his letters and George Sand's "Histoire de ma vie." The natives, on discovering that he was suffering from consumption, shunned him as if he had the plague, and he found it difficult to secure satisfactory lodgings. This, combined with the rainy weather, aggravated his illness. George Sand found him "a detestable invalid," whereas his pupils declared after his death (his friendship with the novelists was so great) the three years after the return from Majorca) that she had killed him by her fickleness and cruelty. He visited England in 1848, but was already so weak that he usually had to be carried upstairs. His last days were made comfortable through a gift of $5,000 from a noble Scotchwoman and pupil of his, Miss Jane Stirling. Mozart's Requiem was sung at his funeral, and he was interred near the graves of Bellini and Cherubini in the cemetery of Père-la-Chaise.

Music is, as Rubinstein remarked, the most aristocratic of the arts, and Chopin was the most aristocratic of musicians. No other composer equals him in the elegance and polish of style, which resembles that of the best Parisian literary circles, or in the French side of his genius. Equally fascinating, and much more vital, is his Polish side. Chopin contributed a new national element to the world language of music (as did the Hungarian Liszt in his day, the Bohemian Dvořák and the Norwegian Grieg afterward). This Polish element characterizes all his works more or less, but particularly the songs, mazurkas and polonaises. Of the songs there are 17; they are simple in structure, but delightfully melodious, and several of them are as realistic reflections in music of the moods of the poems as are the best songs of Germany. The mazurkas, of which there are 56, are like as many orchids; no two are alike, yet all resemble one another. They are in three-four time, graceful, melancholy, tender. To most pianists they are music of the future; only those who can properly interpret them who have mastered the Polish "zai" and the Polish "rubato." The zai is a "compound of pain, sadness, secrecy, rancor, feint," such as naturally characterizes a nation with a tragic history like that of Poland. The tempo rubato is misrepresented in the biographies of Chopin, the writers of which have attached too much importance to Chopin's alleged injunction to his pupils that the left hand must keep strict time, while the right hand melody fluctuates freely. Berlioz attested, on the contrary, that Chopin "could not play strictly in time." There can be no doubt that in his playing, as in Liszt's, Rubinstein's, and Paderewski's, both hands frequently retarded and accelerated, scoring the metronomic regularity of the dance hall. The mazurkas have the varietum et mutabile, the coquetish quality, of woman; they represent the feminine side of Chopin's genius, as do the dainty, graceful, lively valses (13 in number) which have been called "dances of the soul and not of the body," and the 19 nocturnes, with their sweet melodies and dreamy, languorous harmonies. It is no longer possible to estimate the importance of Chopin's works. This exalted, exquisite, feminine side of Chopin's genius. The refinement of his style and the exaggerated accounts of his ill-health and feebleness (before his last illness) have distorted his image. He really had the "soul of a lion;" many of his works betray a strength, a virility, not surpassed by any other master.

To this class of his works belong his 15 polonaises, his four scherzos, three ballades, three impromptus, four fantasias, three sonatas and most of the 27 etudes and 25 preludes. The polonaises represent the chivalrous, martial side of Chopin's and Poland's genius. The scherzos are of marvelous originality, with a strong undercurrent of sadness. Ballades are a mark of Poland. The ballades are a creation of Chopin's genius, in form as well as in content; they are legends without words. The impromptus, also, apart from their contents, give evidence, like the ballades, the scherzos and the fantasies, of Chopin's skill in creating new patterns of musical form. The sonatas contain some of his best inspirations; they have been criticized for lack of coherence, but, as a matter of fact, there is quite as much coherence between the movements as in the sonatas of Beethoven. The etudes are infinitely more than technical studies; they include some of Chopin's most poetic pieces. The preludes Rubinstein considered the pearls of Chopin's work, and it may be said that on every page, they contain more of the essence of musical genius than the same number of pages by any other master. Like many of the other works, they reveal Chopin as one of the three or four greatest creators of new melodies, harmonies, modulations and rhythmic variations and combinations in the whole realm of music. He started out with what he called the "perhaps bold but noble determination to create a new epoch in art," and he succeeded. Schumann pronounced him "the boldest and proudest poetic spirit of the time" and called the G minor nocturne a "terrible declaration of war against a whole musical past." Chopin revolutionized the art of writing piano-forte pieces as thoroughly as Wagner did the method of writing operas. Liszt and all other subsequent pianists followed in his footsteps. By the use of the sustaining pedal to unite the tones of scattered chords he marvelously enriched the harmonic capacities of the piano-forte, and at the same time added countless new tints and shades to its color scheme. He was the soul of the piano-forte, as Rubinstein called him, the most idiomatic of all writers for that instrument.

All of his works are for or with piano-forte. Beside those named, mention must be made of two concertos; a trio with violin and 'cello; a 'cello sonata; an introduction and polonaise for the same instrument; several fantasies and sets of variations; three ecossaises; a berceuse; a bolero; a barcarole; a tarantella; three rondo's. Of the books on Chopin the best is Huneker's, which also contains analyses of all the pieces and a complete bibliography. Niecke's work in two volumes is more elaborate, but less commendable in its judgments. Liszt's book on Chopin is not always reliable, but contains valuable hints. Other books and essays are by Karasowski, Kleczynski, Janotha, Willeby, Bennett, Schuch, Niggl, Hadow, Ehler, Lenz, Johnson, Finke. The valuable volumes of Chopin's works are excellently discussed by Huneker; consult also the essay on the 'Greater Chopin' in his 'Mezzotints in Music.'

Henry T. Finck,
Musical Editor of 'New York Evening Post.'
CHOPIN, a Scotch liquid measure containing two imperial pints. The choin, in name at least, was derived from the French, with whom a similar measure was in use till the introduction of the metric system. The French choppine was not a uniform measure, but varied according to localities. That of Paris was a little over four-fifths of an imperial pint.

CHOPIN, chef-pén', an elevated shoe or clog, introduced into England from Venice in the reign of Queen Elizabeth, and which became the fashionable wear of court ladies during that reign. The Venetian chopines were made of wood covered with leather of sundry colors, white, red, yellow and sometimes gilt. Some were of great height, the height of the chopine being regarded as a mark of the rank of the wearer. To such a degree of extravagance was this carried that women of rank could not walk without being supported. This silly fashion does not seem to have been carried to the same excess in England. Hamlet (act ii, scene 2) addresses one of the players, "Your ladyship is nearer to heaven than when I saw you last by the altitude of a chopine."

CHOPTANK RIVER rises in Kent County, Del., flows southwest into Maryland, and near the south extremity of Talbot County, spreads into an estuary several miles wide and nearly 20 miles long, through which it empties into Chesapeake Bay; total course, 100 miles. It is navigable for sloops to the mouth of Tuckahoe River, a distance of about 50 miles.

CHOPUNISH, chop-pun'ish, or NEZ PERCE, a tribe of North American Indians, also known as Nimiapu, or Sahaptian, the principal tribe of the Sahaptian confederation, who now live on the Nez Percé Reservation in Idaho, and numbered 1,534 in 1906. At the same time there were 83 on the Colville Reservation in Washington. The name Nez Percé originated from the custom formerly followed of piercing the nose. In the Nez Percé War of 1877 the tribe was under the control of Chief Joseph, who forbade his men to interfere with any white non-combatants. See SAHAPTIAN INDIANS.

CHORAGIC, kö-rā'jik, MONUMENT, in ancient Greece, a monument erected in honor of one who had gained a prize as "choragus," or organizer of the play and chorus. The remains of two very fine monuments of this sort are still to be seen at Athens, namely, those of Thrasylus and of Lysicrates, the last popularly called the Lantern of Demothenes.

CHORAGUS, kö-rā'gūs, or, CHOREGUS, among the ancient Greeks, the musician who directed each of the choruses furnished by the 10 Attic tribes for the public festivals; also the citizens who defrayed the expense of each chorus. The word was first used in Oxford University in 1626, but did not last long. The person of the Greek choragus was inviolable, as well as those of the members of the chorus. The choragus who was adjudged to have performed his duty best received an ornamental tripod, engraved by a skilful artist, and bearing the name of the tribe which had gained the victory, of the citizen who had paid the expense, and of the master who had trained the choir. These tripods were set up as public monuments on pillars or other structures. A street in Athens which contained a great number of such monuments was called the Street of the Tripods. The most remarkable of these monuments was a uniform structure, called the monument of Lysicrates. (See CHORAGIC MONUMENT; CHORUS.) Consult Gardner, E. A., 'Ancient Athens' (New York 1902); Weller, C. H., 'Athens and its Monuments' (New York 1913).

CHORAL, or CHORALE (Ger. choral and corale). This form of melody, to which sacred songs or hymns are sung by the congregation in unison, may almost be said to belong exclusively to the German Protestant Church, this style of music having been introduced by Luther in the early part of the 16th century. These hymns were written by Luther in the vernacular, founded on the simpler tunes, and arranged to music which was more rhythmic than that in general use. This change appealed to the people and brought out the wonderful power of music to kindle religious passion. This change also had a great effect upon church music throughout Germany, and within a short time after its introduction a literature of remarkable dignity, simplicity and earnestness was produced. During the 16th and 17th centuries many excellent examples of chorales were brought forth, probably the most important, though not the first, of the early collections being the 'Enchiridion,' or hand-book, published by Luther and his friend Walther, at Erfurt, in 1524. This book contained a preface by Luther himself, and was undoubtedly the foundation for the extensive number of collections which continued to appear till the latter part of the 17th century, but which, for many reasons, religious as well as political, shortly after that time ceased to be popular. Chorales were generally accompanied on the organ, and this custom, together with that of playing and writing so-called figured chorales, soon led to a greater development of harmony and counterpoint, so that the art of playing became of first importance to the successful singing of the chorale.

Many of the chorales were original, many were revisions of old church tunes, and some were adapted from altogether secular sources. Of these latter, the most famous collection was that of Claude Goudimel, published in Paris in 1563, the majority of which were soon incorporated into the German collections, and one of which, 'Old Hundred,' became very popular in England. Others taken from secular sources are 'Herz Christ der einig' Gott's Sohn,' taken from 'Ich hört' ein Fräulein klagen,' and 'Herzlich tut mich verlangen,' which appears several times in Bach's 'Matthäus-Passion,' taken from 'Mein Gemuth ist mir verwirret.' On the other hand, there are many based upon church tunes, such as 'Der Du bist drei,' taken from 'Herr Jesu, du bist mein Trost, und Ruh,' and Mendelssohn's 'Allein Gott in der Höh,' set by Ehr.'

The authorship of many chorales is, however, obscure and uncertain, such as the 'Es ist gewiß, Gott, nicht lang,' which is ascribed by Luther, but of his authorship of the famous 'Ein feste Burg' is unerz Gott' there is but little doubt, and it has been incorporated into the compositions of Meyerbeer in 'The Hugue-
CHORAL SERVICE—CHORAL SOCIETIES

NOTES (501) of Mendelssohn in his ‘Reformation Symphony,’ of Wagner in his ‘Kaiser Marsch,’ and of Bach in one of his cantatas. One of Johann Crüger’s chorales, ‘Nun danket alle Gott,’ became well known in England from its incorporation in Mendelssohn’s ‘Lobgesang.’ See also choral society.

CHORAL SERVICE. A service with intoned responses, and the use of music throughout wherever it is authorized. The service is said to be partly choral when only canticles, hymns, etc., are sung; wholly choral, when, in addition to these, the verses, responses, etc., are sung.

CHORAL SOCIETIES. A choral society is a body of amateur singers formed for the purpose of studying and performing large choral works. Formerly all chorus singers were professional musicians, and the chorus that took part in the production of an oratorio did not usually number over 40, while the orchestra was frequently limited to ten. To-day all choral societies consist of amateurs and are much larger than their professional predecessors, while the orchestra is only slightly increased in size. An average chorus numbers 150 to 200 voices, while the orchestra varies from 35 to 60 men. It is possible that the magnificent effect of the chorus formed to celebrate the centenary of Handel’s birth by performances given in Westminster Abbey and the Pantheon in London in 1873 may have been a great factor in the formation of choral societies in England. This chorus was the largest that had ever been formed up to that time. It numbered 274 and the orchestra 251. At a subsequent festival in 1791 the chorus and orchestra were said to have numbered over 1,000, while for the Handel Festival held in the Crystal Palace in London in 1874 the chorus numbered 3,200 and the orchestra over 500.

It is very doubtful, whether such a large body of singers and players is very materially more effective than a smaller one. The impression on first hearing an enormous chorus is nearly always one of disappointment at the lack of musical formation, made that the large hall necessary for such a large chorus and audience causes a loss of quantity of tone, but this is disproved by comparisons made at a Sangerfest held in Philadelphia, Pa. Here the effect of the entire mass chorus of 5,000 male voices was not much greater than that of a single society of 250 voices. There was a difference, of course, but the volume was not 20 times greater, not even twice as great.

A well-balanced chorus of from 200 to 500 voices is now generally acknowledged to be more effective and much easier to command than the overgrown chorus assembled for a festival. Choruses of this size are very numerous in the United States, Germany and England, where choral work, both religious and secular, is highly appreciated and supported. It is remarkable that France and Italy, both musical countries and more devoted to vocal than to instrumental music, have not cultivated choral music more generally. Even Berlioz in writing out his list of an ideal musical force to have at command makes his orchestra almost equal in number with his chorus, showing that he had a professional chorus in mind, and that therefore in his time (died 1869) a choral society of amateurs was perhaps unknown.

The Berlin Singakademie, still in existence and world renowned, was the first permanent choral society. Founded in 1771 with 27 members it now numbers 600. Mendelssohn was at one time its conductor.

In the United States the first choral society was the Stoughton (Mass.) Musical Society (1786), the outgrowth of a ‘sacred singing school’ founded in 1774. The Handel and Haydn of Boston (1815) was of much greater importance, however, and is to-day one of the most important choral societies in the New World. Until 1847 the president of the society was its conductor, but with the increase of musical ability and criticism it was felt that the time-honored custom would have to be given up. Under Bergman (1852) and Zerrahn (1854) it increased in numbers and ability. Within the last few years under Mollenhauer a thorough reorganization took place and the society rapidly recovered the position which it had to some extent lost.

The Cecelia Society, founded in 1900, under the direction of B. J. Lang, has done good work in the field of oratorio. In New York a number of choral societies, the Handel and Haydn, the New York Choral Society and the New York Sacred Music Society, dating from 1819 to 1849, fostered the taste for choral music. More than 20 years no continued effort was made to carry on the work, until in 1873 Dr. Leopold Damrosch founded the Oratorio Society which, beginning with about 50 members, now numbers nearly 300. Walter Damrosch, son of Dr. Leopold Damrosch, succeeded him as conductor, and Frank Damrosch, another son, was conductor from 1898 to 1912, when Louis KOENEMENICH assumed control. Frank Damrosch is also conductor of the Musical Art Society, devoted to the performance of older church music, and the People’s Choral Union of 2,000 voices drawn from the laboring classes. The organization has three classes of members—those constituting the elementary class, that of the intermediate class, and that of the choral union proper. Any self-supporting man or woman may join the elementary class, where thorough instruction as to the proper use of the voice and the rudiments of music is given. From this class the pupils are promoted to the advanced class, whence upon graduation they pass to the choral union. The attendance at the various classes numbers about 2,500, 450 and 1,200 respectively. Meetings are held every Sunday, and once, in May, a public concert is given. Another important New York society, the Arion, was founded in 1854. Its membership is about 1,200.

Philadelphia has had several notable choral societies, the Handel and Haydn, the Beechoven, the Cecilian and the Philadelphia Chorus, conducted by Henry G. Thunder, Michael H. Cross, Chas. M. Schmitz and W. W. Gilchrist. These have all passed away, but in their stead is a new and vigorous chorus of 300 voices, founded in 1897 and conducted by Henry Gordon Thunder, son of Henry G. Thunder.

In Baltimore the Oratorio Society, under Pache, and in Washington the Choral Society.
under Kaspar, are presenting standard works in an adequate manner.

In the West the German element of the population forms male choruses. But there is no lack of mixed choruses, which meet yearly for a great singing festival. In making these festivals a means for the spreading of musical culture and intelligence, Theodore Thomas and Frank van der Stucken were indefatigable.

In Chicago the Apollo Club (1872) under Harrison M. Wild, and in Saint Louis the Choral Symphony Society (1870) under Ernst, are bending public taste toward the great choral works.

While the giving of music festivals involves the forming of a large chorus in conjunction with orchestra and soloists, it does not appear that such bodies of voices are appropriately styled choral societies in the strict sense; hence only passing mention is here made of the Springfield, Worcester and Cincinnati festivals, all of which have large and efficient choruses conducted by Chadwick, Goodrich and Theodore Thomas.

A difference, however, must be made between these choruses and the Bach Choir of Bethlehem, Pa. This unique organization of abroad a vocation is under the direction of J. Fred Wolle has devoted itself to the presentation of the works of John Sebastian Bach, and in the remarkable series of festivals held since 1900 it has succeeded in achieving a national reputation for itself. It produced the great Mass in B minor for the first time in America, besides giving the Matthew Passion, the Christmas Oratorio and other works in a most impressive manner. To some extent this was no doubt due to the unusual and reverential surroundings, the old Moravian town, the venerable church in which the performances were held, the announcement of the performance by a choir of trombones in the belfry. All these details no doubt helped greatly to create an atmosphere of simplicity and sincerity that affected the audiences that gathered from far and wide, but the real effect was the chorus work, which was done with an earnestness and devotion that were most impressive and caused the often inadequate solo and orchestra to be forgotten.

CHORALE. See CHORAL; CHORAL SOCIETIES; MUSIC; GREGORIAN CHANT.

CHORAZIN, kór-ázîn, Palestine, one of the cities in which Christ's mighty works were done, but named only in his denunciation (Matt. xi, 21; Luke x, 13). It was known to Saint Jerome, who describes it as on the shore of the sea, two miles from Capernaum. Robinson locates it at the modern Tell Hóm, three miles northeast of Capernaum, but this location is doubtful. Though the town was evidently of some importance, judging from the extensive ruins to be seen there, it has received little attention in ancient writings, the only mention of it being in the New Testament. It has been identified with the modern Kerazeh.

CHORD (from the Greek word chordé, a string of gut). 1. In music, the simultaneous and harmonious union of different sounds, at first intuitively recognized, but afterward reduced to a science by the invention of the laws or rules of harmony. Chords may consist of two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of them and are divided into concords and discord. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor chords. The common chord of Trans harmonica perfecta is the basis of all harmony and consists of a base note or prime, with its third and fifth above. These three sounds are the distance of a third from the other. When the lowest of the third is the greater third, as above, the chord is a major chord; but when the lowest third is the lesser, the chord is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than a perfect fifth; the common chord admits of two inversions, according as one or other of its notes is made the base, or lowest note of the chord.

By adding another third above the common chord, a chord of four parts is conducted which is called the chord of the seventh, because the highest note is a seventh above the base. When the chord of the seventh is produced on the fifth of the scale it is then called the dominant seventh, which is the key-note of the chord. It then consists of a major third, perfect fifth and seventh, the minor, which is the next harmonic produced by nature above the fifth. The chord of the seventh may be formed also on any of the notes of the major or minor scale taken as bass notes, but has no harmonic value excepting the varieties of major, minor and diminished seventh. The chord of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature it requires a resolution and is therefore always followed by a common chord, whose fundamental bass is a fifth below that of the seventh.

2. In geometry, a chord is the straight line which joins the two extremities of the arc of a curve; so called from the resemblance which the arc and chord together have to a bow and its string, the chord representing the string. The chord of a circular arc is obtained by multiplying the radius by twice the sine of half the angle, which the arc subtends at the centre.

CHORDATA, kör-dâ'ta, the most advanced in development of the phyla, or branches, of the animal kingdom, the phylum which is characterized by the presence of a notochord (q.v.) and in its higher classes by the presence of a backbone and spinal cord. It includes all the vertebrates (mammals, birds, amphibians, reptiles and fishes), and also Amphioxus, the ascidians, and Balanoglossus. Compare ABDOCHEORDA.

CHOREA, or SAINT VITUS' DANCE, is a disease of the central nervous system characterized by disturbances of spontaneous and co-ordinating movements. It occurs usually in the later years of childhood or less frequently the earlier years of adolescence and is more common in girls than in boys. The motor symptoms vary from slight unrest and irritability to marked disturbances. In mild cases the choreic movements are limited to the face and to single parts of the body, such as the face and the entire body musculature may be involved. The movements in the incipient stage are often scarcely noticed. There are at first slight,
irregular, jerky movements with a tendency to drop articles, due to a relaxation of grasp occurring simultaneously with the muscular jerk. There are also premonitory symptoms of listlessness, depression, nervous irritability, loss of appetite and sometimes anaemia. Psychic manifestations may accompany the development of the chorea in the form of night terrors, transitory hallucinations, all of which are only temporary and belong to the less severe forms. Distinct delirium, stupor and acute dementia belong only to the severer form for which the prognosis is unfavorable. The usual course of chorea is from 6 to 10 weeks, but not infrequently it extends to three or four months, or the movements may persist for many months due to the nervous condition of the child. Recurrent attacks are also frequent. All of this points to a broader view of the causation than is usually accepted. There is fundamentally present, probably, an inferior or slowly developing psychomotor-cerebellar integration, which is inadequate to the grade of motor adaptation demanded by the rapidly growing body. Chorea is therefore a fatigue symptom arising from a slight degree of infection or excess of motor activity. Rheumatic and other infections aid in reducing the physiological efficiency, but probably have not the specific etiological value that has been assigned to them. Ancestral syphilis, by interfering with the normal development of the nervous system, is a causative factor in certain choreas.

The best treatment for chorea is rest in bed during course of the active symptoms. Excitement of all kinds, play or intellectual effort should be avoided. There should be a full nourishing diet and during convalescence gentle exercise in the open air. Arsenic is of distinct value, but its administration should be very carefully supervised. Neosalvarsan may be used intravenously in some cases with advantage. In chronic chorea much can be done in overcoming the persistent motor disturbance by judicious training through passive and voluntary movements under guidance. The voluntary movements are very simple at first and gradually become more complex, thereby assisting in establishing once more freedom and precision of movement through co-ordination.

There are also habit choreas which may be hysterical imitation or may be milder forms of convulsive tics, from which, however, true chorea can be differentiated. There are also choreas appearing in adults. The most serious of these is the chorea of pregnancy. It usually occurs with the first pregnancy and may recur with succeeding pregnancies. It soon ceases after the termination of the pregnancy. (For hereditary chorea see HUNTINGTON'S DISEASE.) The name Saint Vitus' Dance was acquired from a dancing mania common at one time in Germany and which was said to be cured by pilgrimages to the shrine of Saint Vitus. The name is also premonitory symptoms of listlessness of mental and physical excitement. Consult Jelliffe and White; 'Diseases of the Nervous System' (2d ed., 1917).

SMITH ELY JELLIFFE.

CHORION, kōr'ī-on, the outermost of the membranes that surround the embryo. It is a most important structure in its developmental history as it comes into close contact with the decidua and is incorporated into the placenta, constituting the fetal part.

CHORLEY, chör'li, Henry Fothergill, English critic and miscellaneous writer: b. Blackley Hurst, Lancashire, 15 Dec. 1808; d. London, 16 Feb. 1872. His criticisms appeared mostly in the Athenaeum of London, displaying fine perception and exquisite taste in matters connected with literature and music. His novels, however, 'Conti'; 'The Lion,' and 'The Prodigy' are failures from the popular point of view, although finely written; and his plays, with the exception of 'Old Love and New Fortune,' are weak.

CHORLEY, England, municipal borough and market town, in Lancashire, on the Chor, 22 miles northwest of Manchester. It consists of wide and well-built streets, and contains an ancient parish church, various other churches and chapels of modern date, together with a spacious town-hall, several large schools, club-houses, theatres, etc. The principal trade is that of cotton goods, but there are also bleaching, calico-printing and dye-wood works, floor-cloth works and iron foundries. In the vicinity are coal, lead and iron mines and limestone quarries. One of the reservoirs of the Liverpool corporation waterworks is here situated, with a capacity of 48,300,000 gallons. Pop. 30,315.

CHOROID. See Eye.

CHORON, shō-rōn, Alexandre Étienne, French musician: b. Caen, 21 Oct. 1772; d. Paris, 29 June 1834. Besides being a talented musician he was an excellent scholar, linguist and mathematician. He labored assiduously to promote musical education in France, founding his famous *conservatoire* in 1818. He had become a music publisher in 1805, and for some years he published the works of the best masters. He composed a song *Mélodie* which is still popular in France. His most ambitious work was his *Introduction à l'étude générale et raisonnée de la musique,* which, however, he did not complete. Choron wrote several instructive works on music and composed a number of church pieces. He trained many composers and singers who afterward became famous.

CHORUS, originally a special feature in the Greek drama. During the most flourishing period of Attic tragedy the chorus was a troop of male performers, wearing masks and representing male or female characters, who, during the whole representation, were spectators of the action. In the intervals of the action the chorus chanted songs relating to the subject of the performance and which were intended either to augment the impression or to express the feeling of the audience on the course of the action. Sometimes it even took a direct part in the action by observations on the conduct of the dramatic characters, by advice, consolation, exhortation or dissuasion. It usually represented a part, generally the oldest portion of the people, where the action appealed, sometimes the counsellors of the king, etc. The chorus was an indispensable part of the representation. In the beginning it consisted of a great number of persons, sometimes as many
as 50; but the number of the tragic chorus was afterward limited to 15; while the chorus in comedy numbered 24. The exhibition of a chorus was also one of the forms of the choros, and was called choragogy. (See Choragus.) The leader or chief of a chorus was called coryphæus, who spoke in the name of the rest when the chorus participated in the action. The chorus was often divided into two parts, who sung alternately. The members of the chorus were not stationary, but moved from one side of the stage to the other; from which circumstance the names of the portions of verse which they recited, strophe, antistrophe and epode, were derived. But whether or not the chorus sung in unisons, or octaves, and were very frequently accompanied by flute. With the decline of ancient tragedy the chorus was omitted. Some modern tragedians, as Racine in France and Schiller in Germany, have attempted, with more or less success, to imitate or revive the Greek chorus. Shakespeare has employed choruses founded on it.

Chorus, in modern music, is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs and concerted pieces for selected voices. The singers themselves are also called the chorus.

Chose, shōz, a thing, a chattel, a piece of property; the subject-matter of an action. Chose is used in divers senses, of which the four following are the most important: Chose local, a thing annexed to a place, as a mill; chose that which is movable, and may be taken away or carried from place to place; chose in action, otherwise called chose in suspense, a thing of which a man has not the possession or actual enjoyment, but has a right to demand as one of other preceding; chose in possession, a thing which a person has not only the right to enjoy, but also its actual enjoyment.

Chosen. See Korea.

Chosi, chō’she, Japan, a prefectural town, on the east coast of Nippon, 72 miles by rail from Tokio, on the Tonegawa. Fish oil manufacture is the chief industry. The city contains a fine temple situated on an eminence in its centre. Pop. about 19,000.

Chosroes, kōs’rō-ez, or Khosrú, properly KAI KHSORU, (a) a legendary Persian king, referred to by Omar Khayyam. (b) Chosroes was king of Persia: d. 579. He succeeded to the throne in 531, and his memory is still venerated in the East, where his virtues obtained him the titles of the Magnanimous and the Just. At his accession Persia was involved in a war with Justinian, which Chosroes terminated successfully, obliging Justinian to purchase peace by the payment of a large sum of money. In 540, however, jealous of the victories of Belisarius, the great general of the empire, Chosroes violated the peace, invaded Syria, laid Antioch in ashes, and returned home laden with spoils. The war continued till 562, when the emperor again purchased peace, by an annual tribute of 30,000 pieces of gold. The peace continued for 10 years, when the war was renewed with Justinian, the successor of Justinian, when Chosroes was again successful. His zeal for the administration of justice sometimes led him to acts of cruel licentiousness. Nor was he averse to building schools and academies and attained considerable proficiency in philosophy himself. His reputation obtained him a visit from seven sages of Greece, who still adhered to the Pagan religion; and in a treatise with Justinian he required that they should be exempted from the penalties exacted against those who continued to favor Paganism. It was in the reign of Chosroes that the Turks first became known to Europeans, first as friends, afterward as enemies, of the Persian king.

Chosroes II, king of Persia, grandson of the preceding: d. 628. He ascended the throne in 591, on the deposition of his father. He was assisted by the Emperor Mauricius, and on the assassination of the latter by Phocas (602) he took up arms against the empire, and refused to make peace at the solicitation of Heraclius, the succeeding emperor. By a long series of successes he raised the Persian power to the highest point, and reduced the empire to extremity. Heraclius, however, taking courage from despair, succeeded in a series of brilliant campaigns in recovering his lost provinces, 622–27. Chosroes, repeatedly defeated, was completely overthrown in the great battle of Nineveh. He fled with his favorite wife, Sira, but after witnessing the massacre of his numerous sons he was thrown into a dungeon and assassinated by command of his son Siroes.

Chota Nagpur, chō’ta nāg-poor’. See Bihar and Orissa.

Chouans, shoo-ən, a name given to the royalist peasantry of Brittany and Lower Main, who carried on a petty warfare against the Republican government from an early period of the French Revolution. The name Chouan was finally extended to all the Vendéens. The name was derived from the first chief of the Chouans, Jean Cottereau, who with his three brothers organized these bands in 1792, under the inspiration of the Marquis de la Rouart, an ardent leader of the Royalists. Cottereau was the son and grandson of persons engaged in the manufacture of wooden shoes. He had joined a band of dealers in contraband salt, and acquired the surname Chouan from the cry of the screech-owl (echat-huant), which he used as a signal with his companions. He was killed in an engagement with the Republican troops, 28 July 1794. After the death of Jean Cottereau, the Chouans became quite lawless, engaging in guerrilla warfare and highway robbery. About 1800 they ceased to rob and terrorize, and although an effort was made in 1815 to revive the insurrection, they were suppressed by General La Marque.

Chouans, The, a romance by Balzac, the novelist's first important work. The title, when it appeared in 1829, was The Last Chouans. Bretagne in 1800. In 1846 it was rearranged in its present form. The author made a profound study of the scenery of Bretagne and the manners of its people before he wrote his romance, and his pictures of both scenery and people have the stamp of reality and truth.

Chouinga, chou’ing-ga, a gazelle-like Indian antelope, remarkable for the fact that
the buck has four horns. See Four-horned Antelope.

CHOUTEAU, shoo-tô, Auguste, pioneer, trader and government peace commissioner: b. New Orleans 1749; d. 24 Feb. 1829. In command of a boat, and accompanied by his young brother Pierre (afterward known as Pierre Chouteau the Elder), in August 1763, they joined the Laclede expedition to open up the fur-trade in the region west of the Mississippi. In the winter they selected a position on the western bank of the Mississippi, 61 miles above Saint Genevieve, for their principal trading post, and named this Saint Louis. Auguste had command of the party which commenced operations there, 15 Feb. 1764. Both brothers, in time, became heads of large families; acquiring wealth and a reputation which for over a century was a passport that commanded safety and hospitality among the Indians of the Northwest.

CHOUTEAU, Auguste Pierre, American fur trader and pioneer: b. Saint Louis, Mo., 9 May 1786; d. Fort Gibson, 25 Dec. 1838. He entered the United States Military Academy in 1804 and was appointed an ensign in the 2d United States Infantry, in June 1806. He served on the Southwestern frontier as an aide-de-camp on the staff of Gen. James Wilkinson for a brief term, resigning from the service in January 1807. During the following season he commanded a trading expedition up the Missouri River, which was accompanied by a military detachment, under the command of Ensign Nathaniel Pryor, which had been detailed to escort the Mandan chief, Shehaka, back to his people in Dakota. The expedition was attacked by the Arikara Indians and driven back down the river with the loss of a number of men killed and wounded. In 1809 he ascended the Missouri River to the Rocky Mountains with a trading expedition, returning the following year. During the War of 1812, when a general Indian uprising threatened the Mississippi Valley seemed imminent, he served as captain of militia. In 1815, he formed a partnership with Jules de Mun for the purpose of engaging in the Indian trade in the upper valleys of the Arkansas and Platte rivers. The expedition met with disaster, first having to fight the Comanche Indians, at a place always afterward known as Chouteau's Island in the Arkansas River, and subsequently being imprisoned by the Spanish authorities at Santa Fé, where their goods were confiscated, and whence they were expelled. About 1819 or 1820, Auguste P. Chouteau took charge of the Chouteau trading post on the Grand, or Neosho, River, where he made his home during the rest of his life, and General Irving through Georgia and the Overland route to their "tour on the prairies," in 1832. At that time he also had another trading post near the lower falls of the Verdigris River, to which Irving referred as the Osage Agency. In 1834, he accompanied the Leavenworth-Doebler party to visit the Wichita, Kiowa and Comanche tribes of Indians. In 1835 he established another trading post at Camp Holmes, on the Canadian River. Two years later he transferred the business of this post to a new one which was built near the present town of Lexington, Okla. He served as a commissioner in negotiating a treaty with the Wichita and other tribes of Indians in council at Camp Holmes that same year. Consult Latrobe, Charles J., 'The Rambler in North America in 1832 and 1833'; James, 'Three Years among the Indians and Mexicans' (Missouri Historical Society, edited by Walter B. Douglas 1916); Mooney, James, 'Custer History of the Kiowa' (17th Annual Report, Bureau of American Ethnology, part 2, pp. 170-72); Catlin, George, 'Letters and Notes on the Manners, Customs and Condition of the American Indians'; Gregg, Josiah, 'Commerce of the Prairies.'

CHOUTEAU, Pierre, the Elder, pioneer, trader and one of the founders of the city of Saint Louis: b. New Orleans 1759; d. 9 July 1849. He was a brother of Auguste CHOUTEAU (q.v.) whose business travels and enterprises he shared. He was father of Auguste Pierre CHOUTEAU (q.v.) and of CHOUTEAU, Pierre, 2d; b. Saint Louis, 19 Jan. 1789; d. 8 Sept. 1865. Early engaged in business with his father and uncle he became a leading merchant in the fur-trade in Saint Louis and a principal or head of most of the companies successively formed for conducting this business. In 1834, with Messrs. Pratte and Cabanne, he purchased the interest of John Jacob Astor in the American Fur Company, and in 1839 formed the house of P. Chouteau, Jr. & Co., which monopolized the fur-trade of the West and Northwest.

CHOUTEAU, Pierre, Jr., American fur trader, son of the preceding: b. Saint Louis, 19 Jan. 1789; d. Saint Louis, 8 Sept. 1865. He worked for his father and began trading in fur early in life. After establishing posts for the sale of skins throughout the trans-Mississippi region he purchased the fur-trading interests of John Jacob Astor.

CHOW-CHOW, a Chinese or pidgin English word meaning chopped up or broken and mixed. It is applied to a confection of mixed fruits made in China; to a mustard pickle of assorted ingredients made in India; and in the United States and Great Britain to a similar pickle usually compounded of chopped cabbage, green tomatoes, green or red peppers, spices, vinegar, mustard-seed, cucumbers, etc.

CHOWCHOW, a diminutive breed of Siberian sledge-dogs, improved and developed in China, whence they began to be imported into Europe and America at the beginning of the 20th century. These dogs have the form and coat of their more useful progenitors, and are very compact and sturdy of frame, and lively in disposition. The tail is carried tightly curled over the back. In color they are either all black, even to the tongue and inside of the mouth, or all white, blue, red or yellow. This breed was not recognized in American bench-shows until 1902.

CHOWDER (French chaudire, "kettle"), a dish of French origin, composed chiefly of vegetables, pork or fish or shell-fish, boiled together. Perhaps the most distinctive feature of the chowder is that made from clams, either from the soft-shelled variety or the hard-shelled round clam or quahog. Chowder is a favorite dish on the New England coast and among the Newfoundland fishermen. A fish chowder is made as follows: Salt pork cut into small strips or dice is cooked for a few minutes in a deep
iron kettle. Sliced or chopped onions are slightly browned in the pork fat, and onions and pork are then removed. A layer of sliced pork is then laid in the kettle, then a layer of fish (small ones entire or large fish in slices), a layer of salt pork, one of onions, and so on alternately to the requisite amount. The fried salt pork and onions are also distributed throughout the fish, which should be seasoned throughout with salt, pepper, thyme and savory. A very common ingredient is ship-bread or other hard crackers laid in between the other layers. A small quantity of water or of milk, or both, is poured into the kettle, and the whole is boiled, without stirring, until cooked through. In adding the water or milk it must be remembered that chowder is a stew,—not a soup. Foreign cooks make a soup of clams, potatoes, onions and tomatoes, which passes under the name of clam chowder. Genuine chowder is never disturbed until it is served, and in camps is portioned out in layers, direct from the kettle.

CHOWN, Samuel Dwight, Canadian clergyman: b. 11 April 1853. He was educated at Grey's Commercial School and Victoria University; ordained to the Wesleyan Ministry in 1879; was secretary of the social reform committee of the Methodist Church in Canada, 1902-10; associate general superintendent, 1910-14, when he was elected general superintendent.

CHRESTIEN DE TROYES, krɛtɛ̃-ɛ̃ də trwo. French trouvère (troubadour): b. Troyes about 1150; d. about the end of the 12th or beginning of the 13th century. He translated Ovid's 'Ars Amanti' into French, and probably wrote some works based on the classics, but his fame rests upon the still extant romances of Arthur and the Knights of the Round Table, the materials for which were obtained from Geoffrey of Monmouth's rather credulous 'History of Britain.' They are entitled 'Iric et Guide'; 'Percival le Galois'; 'Le Chevalier au Lion'; 'Cligé'; 'Chevalier de la Table Ronde'; 'Lancelot du Lac'; and 'Guilainme d'Angleterre'; but the authorship of the last named is doubtful. Two others of his works, 'Tristan, ou le roi Marc et la reine Yseult, an Lancelot à l'épée,' have been apparently lost. His language and versification were models for troubadours and romancers for a long time; and from him the Arthurian poets to the end of the 13th century borrowed episodes, themes, situations, characters and all manner of poet's devices. Christien was a master of invention, fashioned for himself a competent literary vehicle and made most effective use of his large knowledge of men and manners. Consult Förster, 'Christian von Troyes sämtliche erhaltene Werke' (1884).

CHRIMHILD, krɛm-hilt. See NIBELUNGENLIED.

CHRISM, a mixture of olive oil with balm (apobalsamum), which, being blessed by the bishop, is used in the Roman Catholic Church in the administration of the sacraments of baptism, confirmation, holy orders and extreme unction, and in certain rites; as in consecrating the instruments of the divine service, such as sacred vessels, church edifices, altar stones. The chrism of the Greek Church is compounded of olive oil and a great variety of spices. In the Roman Catholic Church the holy oils are blessed by the bishop on the Thursday of Holy Week.

CHRISOM, kриз-ом', the name of the white linen cloth laid by the priest on the child in Roman Catholic baptism, to signify his innocence. By olden usage it was generally presented by the mother as an offering to the Church, but if the child died before the mother was churched, it was used as a shroud. By a common abuse of words, Chrisom came to mean the child itself, being first applied in the old bills of mortality to denote such children as died within the month of birth.

CHRIST, krιst, Wilhelm von, German philosopher: b. Geisenheim 1831; d. 1906. After 1861 he was professor at the University of Munich. He published numerous works including 'Die metrischen Ueberlieferung der Pindarischen Oden' (1868); 'Metrisk der Griechen und Römer' (Leipzig 1879); 'Attikusausgabe des Demosthenes' (1882); 'Griechische Litteraturgeschichte' (latest ed., 1904); editions of the 'Iliad' (1884); 'Pindar' (1887) and the 'Poetica' and 'Metaphysics' of Aristotle (1895).

CHRIST, (Greek Christos, the anointed; Messiah, from the Hebrew, has the same significance). See CHRISTIANITY; JESUS.

CHRIST, or CRISS-CROSS ROW. See Hornbook.

CHRIST, Disciples of, a denomination of Christians in the United States commonly known as the Christian Church, or Church of Christ, and sometimes called Campbellites. Among the Protestant bodies of America they rank fifth in number. Their strength is greatest in the Ohio and Mississippi Valley States. In September 1809, Thomas Campbell, a Scotch minister of the seeders' branch of the Presbyterian Church, then living in western Pennsylvania, issued a 'Declaration and Address,' deploring the divided state of the Church, and urging as the only remedy a complete restoration of apostolic Christianity and the rejection of all human creeds and confessions of faith. The Christian Association of Washington, Pa., was formed for the purpose of promoting the principles set forth in this declaration. Mr. Campbell's son, Alexander, just from Glasgow University, Scotland, at once gave his splendid ability and learning to this new movement. It was not the intention of the Campbells to form a distinct religious body, but to effect the proposed reforms in the churches. Their plea was so opposed that they were compelled to act independently, and the first church in the new movement was organized at Brush Run on 4 May 1811. The Disciples maintained that having accepted the Bible as their only rule of faith and practice, and the only divine basis for the union of all Christians, they were led to reject infant baptism and adopt believers' immersion only. They observed the Supper each first day of the week, and heartily and practically accept and exalt the doctrine of the divinity of Christ. Their church policy is congregational, and they have no distinction of clergy and laity and recognize the local church with its elders and deacons as the highest ecclesiastical authority though they frequently hold conventions in the interest of world-wide missions and benevolent work, but not for legislative purposes. In recent years the Disciples
of Christ have made great advance in numbers and along all lines of religious activity, until their statistics for 1916 show 14,194 ministers, 17,236 churches and 2,283,003 communicants. They report about 10,000 Bible schools, with an enrolment of about 900,000 children. They raised $1,503,716 for missions, home and foreign, in 1915, and about $1,350,000 for other purposes. Among the several universities and colleges of high rank controlled by the Church are Drake University, Des Moines, Ruth College, Indianapolis, Hiram College, Ohio, and Valparaiso University, Indiana.

CHRIST. Order of the Knights of an order instituted in 317 by King Diniz of Portugal for the defense of the faith, the confession of the Moors, and the extension of the Portuguese monarchy. It was modeled on the Spanish orders of the Alcántara and Calatrava and adopted the regulations of the Cistercian. The property from the suppressed Templars was given it as endowment. Papal approbation was secured with difficulty. The knights joined in several Crusades and received great additions to their own possessions and in time the order became so rich and powerful as to excite the jealousy of the Portuguese monarchs. Subsequently their possessions were transferred to the Crown as were the offices of administrator and grand master. The headquarter is Lisbon, and which is 70 miles northeast of Lisbon. John III, in 1523, made the order a monastic one. It was secularized in 1797 and afterward became a mere honorary order. In 1823 it was extended to Brazil. It survived there after the fall of the empire in 1889.

CHRIST, Papal Order of, a branch of the Portuguese order instituted for Italians by Pope John XXII (1316-34). It later became merely an honorary order.

CHRIST IN ART. The representations of the person of the Saviour which for a succession of ages have constituted one of the most important subjects of Christian art, and have occupied the highest genius of Christendom, are all ideal. The attempt to represent the personal appearance of the Saviour can hardly be traced back further than the age of Constantine. The origin of Christian art, in deed, has been traced to the catacombs of Rome, and is not to be considered as springing directly from Pagan art, although the great Italian masters of the Middle Ages may have derived much instruction from classical models; but the painting and sculpture of the early Christians were chiefly allegorical, representing the moral of the gospel parables or similar symbolic representations of Christian doctrine, without regard to historical accuracy of portraiture. At a later period legends arose of various likenesses of the Saviour having been preserved by miraculous means. For example, King Algarus of Edessa had a napkin sent him by the Saviour himself, in which he had caused his likeness to be miraculously impressed by placing his face in it. A portrait is said to have been similarly impressed on a handkerchief of Saint Veronica, and Saint Luke is said to have taken one himself. An apocryphal letter of Lentulus, the predecessor of Pilate, addressed to the Roman Senate, contains a description of the person of Jesus. One of the earliest professed portraits of the Saviour is in the Calixtine Catacomb near Rome. He is represented with the hair parted on the forehead, and falling over the shoulders in long waving locks. In regard to this common representation it may be observed that when Saint Paul wrote his first epistle to the Corinthians there were probably many Christians who were acquainted with the world who remembered the personal appearance of the Saviour, and if this representation of it had been correct he would hardly have written to a Christian church that it was contrary to nature and a shame for a man to have long hair. The great painters of the Middle Ages, to whom we owe the ideal representation of Christ, probably founded somewhat upon these early notions. A Christ of the 4th century with an oval face, Oriental features, parted hair and a short straight beard is said to have been the model for the Byzantine and Italian painters till the time of Michelangelo and Raphael. Consult Jameson, Mrs., 'History of Our Lord, as Exemplified in Works of Art' (2 vols., London 1883); Kraus, 'History of Christian Art' (Freiburg 1903).

CHRIST CHURCH, College of, a notable institution in Oxford, England. In 1526 Wolsley obtained from Clement VII a bull for the suppression of 22 monasteries, the site of one of which he chose for a new college, to be called the Cardinal College, and which he named in 1529 the Charterhouse in honor of Carthusius. It was a model for the Byantine and Italian painters till the time of Michelangelo and Raphael. Consult Jameson, Mrs., 'History of Our Lord, as Exemplified in Works of Art' (2 vols., London 1883); Kraus, 'History of Christian Art' (Freiburg 1903).

the college. Dean Liddell (1855–91), who was also responsible for the restoration of and additions to the college buildings. In 1913 it had 326 undergraduates. The buildings about the great quadrangle include the cathedral, and the Hall of William Rufus at Westminster, the most splendid example of its kind in England. Christ Church is one of the foremost colleges in Oxford and has always been famous for its distinguished members. Among these may be mentioned four Prime Ministers of England in the 19th century — Canning, Peel, Gladstone, Salisbury and Rosebery. Through it have passed Lyttelton, Mansfield, John Locke, William Penn, Ben Jonson, Camden, Sir Philip Sidney, John and Charles Wesley, Dr. Pusey and John Ruskin. Consult Thompson, H. L., ‘Christ Church’ (London 1900).

CHRISTABEL. Coleridge’s ‘Christabel,’ though a fragment, is among all his works second in fame only to the ‘Ancient Mariner.’ The first part was written in 1797, the second in 1800; and between them and the date of its publication in 1816—a delay due largely to Coleridge’s uncertain wants—Sir Walter Scott, Charles Lamb, Wordsworth, Southey and many others of taste and authority had become familiar admirers of the poem. Except for a certain disappointing harshness in the reviews of the day, this success was repeated in a wider public for the printed form, and may be said still to hold.

But then, remains a fragment of a long narrative poem. The second canto leaves off with the baron’s anger at his daughter’s jealousy and his dispatching Tracy, the bard, to Lord Roland’s castle at Tryermaine. It is a common opinion that Coleridge never told how the poem was to end. But in Gillman’s ‘Life’ (p. 301) is supplied an account of Coleridge’s plans for its completion in a third and fourth canto, by making the supernatural being change from Geraldine to Christabel’s absent lover. ‘Christabel’ is revoluted without knowing why — by the suit paid her; but finally yields to her father’s entreaties and is led to the altar. The real lover returns just in time with the ring token. The supernatural being appears, the bell tolls and the mother’s voice is heard, and with joy the marriage and the reconciliations take place.

The metrical beauty of ‘Christabel’ is one of its greatest claims. It is based on the principle of accent, rather than syllable counting. There are four accents to the line, with a variation in syllables as the poetic necessity and passion itself may vary. With so delicate an instrument as this, Coleridge shows himself easily to be one of the great masters of English verse.

The main idea of ‘Christabel’ is that the virtuous people of this world may save the wicked; may have a power deeper far than the power of evil. Around this idea Coleridge weaves the story; with the framework of popular romance and legend; the pure maiden, the mother’s love; the natural—supernatural effect, to use his own phrase; the innumerable lovely cadences; the half-magic imagery; the enchantments; the poigniant and lyrical beauty everywhere evident.

STARK YOUNG, Professor of English, Amherst College.

CHRISTADELPHIANS. *brothers of Christ,* a small body of Christians, owning John Thomas, M.D., an Englishman, as their founder. He came to this country in 1832, and was for a time connected with the Disciples of Christ; but fell away from their opposition of the doctrines of that body concerning baptism, and other subjects. He announced his belief that the existing churches were apostate and began to form societies which held with him to the Bible as the only rule of faith and practice and to the idea of restoration of primitive Christianity. Several years later, the distinctive name of Christadelphians was adopted. This was in the early years of the 19th century. Christadelphians do not hold to the ordinary view of the Trinity, believing that the Holy Spirit is not a person but an effluence of divine power. They are premillennialists, believing that Christ will come and set up his kingdom in Palestine, and that at the end of the thousand years the righteous will receive the reward of eternal life and the wicked will be sentenced to eternal death. They baptize by immersion and govern their churches by the congregational system. They have no conferences or associations but hold firstest gatherings. There is an ordinary meeting every month. They have 70 societies, or churches, and 1,500 members, an increase of less than 90 in the past 10 years. They are scattered over 24 States. The Christadelphian Advocate, Waterloo, Iowa, is their organ. Consult ‘Dr. Thomas, His Life and Work’ (Birmingham 1880), and ‘Who are the Christadelphians?’ (1869).

CHRISTCIRCUMCISED, England, a parliamentary and municipal borough in Hampshire, situated at the confluence of the Avon and Stour, about one mile from the sea. It is famous for its great priory church, dating in part from the early part of the 12th century. The church is over 300 feet long and contains a magnificent altar-screen. The famous south coast health resort, Bournemouth, is included in the borough. Pop. 5,104.

CHRISTCIRCUMCISED, New Zealand, town, capital of the province of Canterbury, and the see of the primate of New Zealand, situated on the Avon River, seven miles from the sea, and is the terminus of the Great Northern and Southern Railways. A railway tunnelled through the Lyttleton Hills connects it with Lyttleton, the nearest port. It was founded by the Canterbury Association, a colonizing body of Anglican churchmen formed in 1850, and its streets were given the names of English dioceses. It is one of the two chief centres of the Middle Island. Socially it is one of the principal towns of New Zealand. Its seaside resort, New Brighton, is famous throughout the island. It contains a number of handsome buildings, including a fine cathedral, the government offices, Saint Michael’s Church, the Supreme Court, museum, library and college, and has a flourishing trade and manufactures. Pop. 80,193.

CHRISTEN, krěst’en, Ada. See BREDEN, CHRISTINE.

CHRISTIAN I, king of Denmark and Norway: b. 1426; d. Copenhagen, 21 May 1481. He reigned from 1448 to 1481, and in 1479 founded the University of Denmark.

CHRISTIAN II, king of Denmark, Norway and Sweden: b. Nyborg, Fünen, 2 July
CHRISTIAN III—CHRISTIAN VII

1481: d. Kallundborg, Zealand, 25 Jan. 1559. He was grandson of Christian I. In 1501 he was named successor to the crown and took part in the government of Norway, which he conducted with great severity. On his accession to the throne in 1513 he aggrandized his own influence in favor of the privileges of the lay and clerical aristocracy in his dominions, including the independent administration of justice; but all his efforts were bent toward strengthening the royal power, particularly in Sweden, which refused to acknowledge him. To strengthen himself against Steen Sture, the administrator of Sweden, who had set himself in opposition to the union of Calmar formed in 1397 between Norway, Sweden and Denmark, he married Isabella, sister of Charles V of Germany, in 1515. He had already a mistress called Dyeveke, the daughter of a Dutch woman who kept an inn in Bergen, Norway. She exercised a great influence over the King, and by her liberal spirit and knowledge of the institutions of Holland tended greatly to improve the administration of his government. She became a sort of prime minister and had great influence in originating those wise laws which gained for this king the love of his subjects. But she incurred the hatred of the nobility, and on 1517 died of poison. Soon after war broke out with Sweden, and making all the preparations and alliances in his power, Christian sent an army into Sweden commanded by Otto Krumpen, who defeated the Swedes in the decisive battle of Bogesund (Ulrikehamn), 19 Jan. 1520, in which Steen Sture, the administrator, was killed. Stockholm, under the command of the widow of Sture, stood a siege of four months, and on 4 November, Christian was crowned king of Sweden.

Subsequently Sweden revolted under Gustavus Vasa, who had expelled the Danish garrisons and been proclaimed administrator. To find the means of defense Christian convoked the Diet toward the close of 1522. Instead of attending it the nobles and prelates assembled at Viborg in Jutland, proclaimed the deposition of Christian, and called his uncle, Frederick, to the throne. Christian fled to the Netherlands to claim the succession of his brother-in-law, Charles V. Gustavus, already master of Sweden, put an end to the union of Calmar in 1523, and was proclaimed king. Christian remained nine years in exile without obtaining aid from Charles, and then visited England and Germany and adopted the Reformed faith. At length, with the assistance of Charles, he equipped a fleet in Holland, landed in Norway in 1531 and was proclaimed king by the Norwegian Diet, which had refused to recognize Frederick. The commander of the Danish fleet, a bishop, having offered him a safe conduct, he repaired to Copenhagen to negotiate with Frederick, who disavowed the admiral and retained him prisoner. He was confined for 12 years in the Castle of Sonderborg, island of Alsen, in a dungeon of which the door was walled up, the only access being by the window, and his only attendant a Norwegian dwarf. In 1544 Christian III somewhat relaxed his confinement, and in 1549, on renouncing his right to the crown, he was permitted to reside in the Castle of Kallundborg in Zealand, where he was subjected to a less severe surveillance, until his death in 1559.

His misfortunes were chiefly due to the enmity excited by his reforms and his violation of the capitulation entered into at his coronation. Consult Behrmann, 'Kong Christiern II, Historie' (1815).

CHRISTIAN III, king of Denmark and Norway: b. 1502; d. Kolding, Denmark, 1 Jan. 1559. He succeeded his father, Frederick I, and introduced the Reformed faith into Norway and Denmark. In his reign Norway was reduced to the status of a province.

CHRISTIAN IV, king of Denmark: b. Frederiksborg, Zealand, 12 April 1577; d. Copenhagen, 28 Feb. 1648. He was the son of Frederick II and succeeded to the throne as a minor in 1588. He early gave numerous proofs of a sincere love of religion and justice and a high esteem for science and art. He made his celebrated voyage to the North Cape to learn the boundaries of his kingdom and protect the rights of his subjects in that remote region from any foreign interference with their coasting trade. He was afterward, in consequence of the claims advanced by Sweden to Lapland, engaged in what is called the Calmar War with Charles IX and his successor, Adolphus, and terminated it by an advantageous peace, in which he stipulated for the free navigation of the Baltic. In the Thirty Years' War he was a well-located by Tilly at Lutteram-Barenberge in 1620, but afterward, in conjunction with Gustavus Adolphus, obtained the Treaty of Lübeck 1629. He has the merit of having laid the foundation of the Danish navy, extended the trade of his subjects to the East Indies, introduced a judicial system of finance and finance, and several expeditions for the discovery of a northwest passage. He founded Christiania, the capital of Norway, which was named after him. He was succeeded by his son, Frederick III.

CHRISTIAN V, king of Denmark and Norway: b. 15 April 1640; d. Copenhagen, 23 Aug. 1669. He succeeded his father, Frederick IV, in 1670, and carried on a long and fruitless war against Sweden.

CHRISTIAN VI, king of Denmark and Norway: b. 30 Nov. 1669; d. 6 Aug. 1746. He succeeded his father, Frederick V, in 1730.

CHRISTIAN VII, king of Denmark and Norway: b. Copenhagen, 29 Jan. 1749; d. Rendsburg, Holstein, 13 March 1808. He was the son of Frederick V, whom he succeeded in 1766. In the same year he married Caroline Matilda, sister of the British monarch, George III. He afterward traveled for three years in England, Germany, Holland and France and became a member of several learned academies. Youthful indulgences, however, had weakened his intellect and obliged him to confide the charge of public business to his ministers, and more especially, it is said, to his favorite physician, Struensee, who, though he had gained the affections of Christian and his young bride, was very unpopular as a statesman, and made innovations which provoked the hostility both of the nobility and the army. Notwithstanding the unfortunate circumstances of Christian's reign, several important improvements took place under it. Serfdom was abolished in the duchies, trade and commerce promoted, the Schleswig-Holstein Canal constructed and excellent roads formed throughout the kingdom.
Christian was succeeded by his son, Frederick VI.

**CHRISTIAN VIII**, king of Denmark, and Duke of Schleswig-Holstein and Lauenburg; b. Copenhagen, 18 Sept. 1786; d. there, 20 Jan. 1848. He was chosen king of Norway in 1814, but, unable to hold it against Bernadotte, he abdicated in October of the same year. His rule was comparatively unimportant, the most notable event being the King's proclamation in 1846 that Schleswig and Holstein were inseparably united to Denmark. He was succeeded by his son, Frederick VII.

**CHRISTIAN IX**, king of Denmark; b. 18 April 1818; d. Copenhagen, 29 Jan. 1906. He was the fourth son of the Duke of Schleswig-Holstein-Sonderburg-Gliickstadt and succeeding Frederick VII on 15 Nov. 1863. On his accession he quickly encountered difficulties. The son of the Duke of Augustenburg laid claim to the duchies of Schleswig and Holstein, although his father's rights had been bought out in 1852. The intervention of Prussia and Austria (1864) wrested the duchies from Denmark after a short war and Christian was compelled to renounce all his rights over them. Two years later Prussia and Austria quarreled over the spoil; after a short struggle Austria and Hanover were defeated and the latter annexed by Prussia. The remaining 40 years of Christian's reign were uneventful except for the continual turmoil of domestic politics. But if the country under which he ruled was small and comparatively unimportant, the members of his family certainly filled exalted positions. He married, in 1842, Princess Louise (1817–98), daughter of the Landgrave William of Hesse-Cassel. Of the six children of the union one son became king of Denmark (Frederick VIII); another king of Greece (George I); one daughter was empress of Russia and is the mother of the deposed Tsar, Nicholas II, while the other daughter is the dowager Queen Alexandra, mother of King George V of Great Britain. His grandson is the king of Norway, Haakon VII. Christian IX was a true constitutional ruler, democratic and modest to a degree rarely found among royalty.

**CHRISTIAN X**, Carl Frederick Albert Alexander Vilhelm, king of Denmark; b. Charlottenlund, 26 Sept. 1870. He is the son of King Frederick VIII and Queen Louise. He was married 26 April 1898 to Princess Alexandra of Mecklenburg and succeeded to the throne on the death of his father, 14 May 1912.

**CHRISTIAN I**, German prelate, Imperial chancellor, diplomat, and soldier, one of the most picturesque figures of the Middle Ages; d. Tusculum, Italy, 25 Aug. 1183. He was made archbishop of Mainz in 1165. He was chiefly celebrated for his military exploits under Frederick Barbarossa, for whom he opened the way to Italy. He died of fever after scorning a hostile Roman army away from the walls of Tusculum, whether he had gone in response to an appeal for help from Pope Lucius III. A contemporary described Christian as a mighty, powerful man mounted on a very fast horse. Over his shirt of mail he wore a hyacinth-colored tunic; a gilt steel helmet on his head, and was armed with a ponderous battle mace. In this guise he once fought and laid out nine armed opponents single-handed.

**CHRISTIAN, Prince of Schleswig-Holstein, uncle of King George V; b. Augustenburg, Isle of Alsen, 22 Jan. 1831; d. London, 29 Oct. 1917.** He was the son of Duke Christian August, who in 1848 placed himself at the head of his adherents to resist by force the claims of Denmark upon the duchies. Father and son narrowly escaped capture by the Danes at the same time. The Duke hurried to Berlin to beg the intervention of Prussia. Prince Christian, then 17, joined the newly-constituted Schleswig-Holstein army with his elder brother, Frederick. They were defeated at the battle of Idstedt and he finally had to seek a new home. The death of the Danish King Frederick VII in 1863 reopened the Schleswig-Holstein question. But Bismarck had long kept the annexation of the duchies in mind, a policy he carried out by war in 1864. Prince Christian came to England in 1865 and in the following year he married Princess Helena, third daughter of Queen Victoria. He was created *Royal Highness* by order of the Queen, and with his wife settled down as an English country gentleman. He served during the War in the South African War (1900); the surviving son, Prince Albert, is an officer in the British army. Of his two daughters, one is married to a German, Prince Aribert of Anhalt. See SCHLESWIG-HOLSTEIN.

**CHRISTIAN, Edward, English jurist; b. London 1774; d. Cambridge 1823.** He was chief justice of the Isle of Ely and Downing professor of law, Cambridge (1800–23). He was the author of various works, among which are treatises on the bankruptcy laws and on the game laws. He also edited an edition of Blackstone, to which he added numerous notes.

**CHRISTIAN, Thea**, a novel by Hall Caine, published in 1897. For the most part the scene is laid in the London of to-day. The details of London life are spectacular, and the object of the book seems to be to show the inadequacy of London churches to save the city. A novel by Miss Marie Corelli is entitled 'The Master Christian.'

**CHRISTIAN ARCHAEOLOGY**, that department of archaeological science which, through the study of inscriptions, monuments, frescoes, household and ecclesiastical utensils, seeks to throw light upon the ideas, customs and events of the early Christian communities. It may be said to have a beginning in the days of peace following the Diocletian persecutions. The Acts of the Martyrs were collected and critically examined, but in the 5th century the reading of some of these Acts was forbidden in the Roman Church by Pope Gelasius because of the mixture of legend and fact they contained. The Acts written between the 8th and 10th centuries have very little critical value, although they contain an element of truth, as the name of the martyr, the date of his death, the name of the judge of the trial, above all, his place of burial, for the Catacombs were still visited. Le Blant, in his 'Supplement to the Acta Sincera Martyrum of Ruinart,' has shown how it is possible to separate the facts in these Acts from their setting of rhetoric and legend.

From very early times it was the custom to mark in the local calendar the Church feasts celebrated each year. Each church had its own calendar. The most ancient that have
come down to us are those of Rome, Tours and Carthage. Later, calendars of the principal churches were drawn up, and the 'Martyrology of Jerome,' made in Italy about the middle of the 5th century and revised at Auxerre, in France, toward the end of the 6th century, is the source from which are derived existing manuscripts. Other martyrologies are those of St. Bede, in the 8th century, of Rabanus Maurus, of Adon, bishop of Vienne, in the 9th century, and of Usuard, compiled about the year 875. The Roman Martyrology was revised by Cardinal Baronius in 1598.

In addition to the martyrologies there is also the 'Liber Calendar,' so called from Popel Libertus, in whose pontificate it was compiled. It contains a list of the Roman consuls and the Roman prefects from 254 to 354, the epoch of Pope Liberius, the date of the death of the bishops of Rome during the same period and also the date of the death of many martyrs, together with the names of the places where they suffered martyrdom and where they were buried. It also contains the primacy of the Roman Church: Christmas, Easter, the Chair of Peter and some of the more solemn feasts of the martyrs.

The 'Book of the Popes' ('Liber Pontificum') is a collection of biographies of the Popes from Saint Peter to Stephen VI (891). Until recent years its authorship was assigned to Anastasius, the librarian, who lived in the 9th century. Duchesne and Mommsen both agree that the collection as we have it is a second edition and that it is an expansion of certain primitive catalogues of the Popes, some of which date as far back as the 2nd century.

In the opinion of Duchesne, the biographies of the Popes from the 6th to the 9th centuries were written by contemporaries. The 'Book of Popes' has been edited in the 17th century by Fabrott (Paris 1647), by Bianchini (Rome 1718), by Muratori and by Migie in the 19th. The text may now be said to be fixed by the edition of the Abbe L. Duchesne (Paris 1896-92).

Of great importance in determining the toponography of the Catacombs and the churches and shrines of the early Church are the guidebooks written by the pilgrims of the Middle Ages. The earliest of these is the 'Itinerarium' of John the Priest, which belongs to the end of the 6th century. John was sent by Theodolinda, queen of the Lombards, to Gregory the Great to obtain relics of the martyrs. These he did not obtain, but he brought back with him oil from the lamps that burned before their tombs. On each phial he inscribed the name of the martyr and the place of his burial. The original catalogue written by John is still preserved in the treasury in Monza.

The best known guidebook is that of William of Malmsbury, compiled in the 12th century, perhaps for the use of the Crusaders. Other guidebooks are those preserved in the monasteries at Einsiedeln and Salzburg. They throw much light on the toponography of the Catacombs. To these some parallel have been added to the monks of the 8th century who we owe many collections of inscriptions, that have since perished. The 'Codex Palatinus' of Heidelberg contains more than a hundred, some of them in metre, taken from the papal tombs of the 4th, 5th and 6th centuries. Other collections of inscriptions from Rome, Ravenna, Germany and Switzerland are preserved in Saint Gall, in Switzerland, in Verdun and Würzburg.

During the Middle Ages the study of ancient Christian monuments was neglected, but interest in them was revived at the time of the Renaissance and discoveries in the 16th century made possible scientific examination. Anthony Bosio, chargé d'affaires of the Order of Malta, spent 30 years in the Roman Catacombs, reproducing mural paintings, deciphering and copying inscriptions. He has been called the "Founder of Christian Archaeology," but this title belongs by better right to John Baptist de Rossi, who by his explorations and writings has given to the study the character of an exact science. He was a Roman, who, at the age of 24, began the study in 1842 under the direction of Padre Marchi, and his 50 years' labor accomplished much in reconstructing the artistic, doctrinal and family life of the Christian community of early Rome. He died in 1890, leaving his work to be carried on by Armellini, Marucchi, Wilpert and Stevenson. His classic 'Roma Sotterranea' has been translated into English by Northcote and Brownlow.

**CHRISTIAN ARCHITECTURE**

The term "Christian architecture" is used especially to denote Gothic art and Gothic and Romanesque art taken together; and this because it was assumed that those styles were peculiarly the creation of the Christian organization, as distinguished from the neo-classical styles of the Renaissance and later epochs, which had obviously been developed from the study of ancient Greco-Roman architecture.

Styles which are in a strict sense Christian are (1) the Latin style, identified with the basilicas of the Western Church built from the 4th to the 9th century, and most numerous in Italy, especially in Rome and Ravenna. The Christian basilicas are extremely simple in construction and design. The entrance is generally from a square peristyle, like a cloister; though the narthex or vestibule often replaces it. A nave from 30 to 50 feet wide is divided from two aisles by rows of columns often taken from
classical buildings. These columns carry the clerestory wall which rises above the aisle roofs and between the windows of the clerestory, and above and below the windows there are large flat surfaces commonly filled with simple geometric patterns and the like. There are sometimes two additional aisles. The aisles and the nave all stop against the transept, which is often higher and generally wider than the nave and is the most striking part of the building, but in many of the smaller basilicas and early Christian churches it is merely a simpler version of the larger building. The transept, that is, farther from the entrance doors, an apse projects, and this originally contained the seats of the bishop and his clergy. The high altar had different places at different periods, but the middle of the transept, on the axis of the great nave, was the more usual place and a baldacchino or permanent canopy was built over it—a feature which was preserved in later Italian churches; (2) the Byzantine church of Hagia Sophia, Constantinople, and spread over the Balkan Peninsula, parts of Asia Minor and Syria, with offshoots in Egypt and Persia, and with more recent developments among the churches of Russia; (3) the Romanesque style, developed from the attempt of the church builders to roof their naves and aisles, choirs and apses, with vaulting, copied at first from the Imperial Roman examples, which were numerous throughout western Europe, but always with inferior materials and skill; then developing into a more florid style, taking different characteristic forms according as it was influenced more or less by Eastern intercourse, and spreading over Europe from Hungary to Scotland and Spain; (4) the Gothic style, which is the Romanesque style carried to its ultimate sequence in the way of vaulting, but greatly changed by the very perfection of that constructive process, the buildings growing larger and lighter, more open and with a constant tendency of the walls to disappear until the building becomes a stone roof supported on light uprights, with no wall surface except under the great windows; the windows themselves were very rich in color, and filled the large parts of the upright screen or enclosure of the buildings. These are the four great divisions of Christian architecture in the strictest sense; all these styles are treated in the general article ARCHITECTURE.

There are exceptional forms, less important but very interesting, hardly to be classified under the above general divisions. Thus, there exists in Syria a style of building which was entirely unknown until the explorations of the Comite de l'Asie du Levant (about 1860-65) and which has been studied since by an American expedition. This is a Romanesque of singular simplicity and consistency of design, the buildings being entirely of stone, roofed and fitted in every part with solid stone, and the whole style growing out of Imperial Roman construction as adapted to a country where stone was the material most easily procured. The resulting style was, however, generally unrestrained by Greco-Roman traditions. The general design and the sculptured detail alike were singularly free from original, local, or external influence. It has been pointed out by French critics that the quality of clearness and original thought in design is present in all the earlier and finer buildings. The Christian symbolism, which, in its more elaborate forms, is shown most perfectly in the mosaics of central Italy (see the Latin style above), is seen in its simplest form in the Byzantine and later styles of Syria and of Esther, of singular simplicity and charm. Again, although the Gothic architecture of Europe reached its culmination at the close of the 13th century, and was less energetic, less fruitful of new thought during the 14th century, this was followed by an independent and most attractive style in the 15th century, which on the Continent we call generally the Florid Gothic or Flamboyant style, whereas in England it took the shape of the formal and rigid Perpendicular and passed into the Tudor style with its far vaulting. (See VAULT.) Yet again, as the Italians never understood Gothic architecture nor sympathized with it, there are only a few monuments which are strictly Gothic, but the great cathedrals of western Europe, and especially the French churches throughout the peninsula and in Italy, are Gothic in detail, and are adorned by a magnificent system of sculptured and colored decoration. It is to be noted that from the beginning of the 15th century onward the artistic design is less and less dependent on church buildings; the important dwellings of the nobles in the country, and of citizens in the towns, modifying greatly the style of the day and sometimes taking the lead away from ecclesiastical structures. It is entirely a matter of private judgment how far this change tends to remove those later styles from the field of Christian architecture.

CHRISTIAN BROTHERS. See BROTHERS OF THE CHRISTIAN SCHOOLS.

CHRISTIAN BROTHERS COLLEGE. Roman Catholic institution situated in Saint Louis, Mo., conducted by the Brothers of the Christian Schools. In 1855 it was established and incorporated with power to confer degrees. The modern language department is given special attention, the pupils being required to converse and write in French, German and Spanish. Practical education in their several trades is also taught. Draughting and designing are emphasized in the scientific department. There are also com-
mmercial and preparatory departments. Literary and musical courses are aided by the various organizations which contribute to the development of good taste. The graduates of this college are among the distinguished men of the country. The value of the college buildings and grounds is $50,000, and the total annual income $40,000. The library contains about 22,600 volumes. The student enrolment in all departments in 1916 was 340, and there were 40 instructors.

CHRISTIAN CHURCH. The a body of believers who adopt this simple Biblical name and accept the Bible as their rule of faith and practice, in devotion to the principle of unity and as a testimony against sectarianism. Another body, commonly known as the Disciples of Christ, are also called Christians in some sections, and in consequence the two denominations, which are in no way ecclesiastically connected, are confused in the popular mind, and one is taken for the other. The Christians, for the sake of distinction, have been called the Common Christians, but the denomination itself objects to it. In rejecting sectarian names it does not arrogate to itself the idea of exclusive right to the use of the name, nor deny that those using distinct denominational titles are Christian. They recognize all believers as Christian as such, but welcome them to their fellowship, holding, however, that those who assume the name Christian, a family name, should also welcome all followers of Christ into their fellowship. They believe that other names are divisive, but that this name is unifying.

The Christian Church dates back in its earliest beginning to 1794. Three separate divisions united to constitute it. One of these arose in Virginia, led by Rev. James O'Kelly, who left the Methodist Church, with a number of followers, on account of dissatisfaction with the discipline and methods of that Church. They chose for the new organization, formed in 1794, the name Christian. The second branch was formed in Vermont in 1794, by the Rev. Smith and Abner Jones, Baptists who disserted from the Calvinistic doctrines and the polity of the Baptist churches. Other Baptists came to their standard, which affirmed the Bible as their creed and practice of the Christian Church, under the new birth (John iii, 1-7) as the only test of church membership and Christian fellowship, leaving each individual in full possession of the right of individual interpretation in all matters of opinion on theological questions.

In the United States and Canada the Christian Church now has 71 annual conferences, with 1,500 ministers and 113,000 members. They work under a congregational form of government. Their national body is the American Christian Convention, with headquarters at Dayton, Ohio, Rev. J. F. Burnett, D.D., secretary. To this people belong the distinction of having published the first religious newspaper ever published in the world — The Herald of Gospel Liberty, now published at Dayton, Ohio. The Christian Church also publishes The Christian Sun, Elon College, N. C., The Christian Vanguard, Toronto, Canada, The Christian Missionary, Dayton designation. Many churches were organized in connection with this movement. The third strand was Presbyterian in origin. In Kentucky differences arose in 1800-01, among Presbyterians in the Crane Ridge revival, and Barton W. Stone led those who withdrew and formed a new organization with the same name and similar principles as the Virginia and Vermont bodies. Each of these movements was unknown to the others until later on when they came together, agreed to principles and polity and united in the organization known as the Christian Church. In 1832 a joint meeting between Barton W. Stone, representing, with others, the Christians, and Messrs. Smith and Johnson, the Disciples of Christ, took place, the outcome of which was an agreement to unite under the name Christian. The agreement was not fully carried out, but many Christians followed Stone in uniting with the Disciples of Christ, whose name in that section was Christian. The Christian Church holds to the following principles:

1. The Lord Jesus Christ is the only head of the Church.
2. The name Christian is the only appellation needed by the Church.
3. The Holy Bible, or the Scriptures of the Old and New Testaments, are a sufficient, and should be the only, rule of faith and practice.
4. Christian character, or vital piety, is a just, and should be the only, test of membership, or fellowship in the Church of Christ.
5. The right of private judgment and the liberty of conscience are a right and a privilege that should be accorded to and exercised by all.

Under these principles the Christian Church contends for the oneness of the people of God and the blessings of truth in a wholesome evangelical toleration, in all matters which rest for solution on mere human opinions. Thus the Presbyterians went into the water without becoming Baptists; the Baptists continued baptism without exclusiveness, and the Methodists fellowshipped both without becoming Calvinists, conflicting elements were harmonized in the spirit of brotherly love. The body was one in Christ and each one held to the truth as he saw it.

Deprecating the divisive character and the evils of human creeds and party shibboleths, they determined to take the Bible as their only confession of faith and practice and welcome them to their fellowship, holding, however, that those who assume the name Christian, a family name, should also welcome all followers of Christ into their fellowship. They believe that other names are divisive, but that this name is unifying.
midian. They hold to the divinity of Christ, to the vicarious atonement, to the lost condition of the unregenerate, to salvation through Christ. They use either mode of baptism common in evangelical churches and practise open communion at the Lord's table. As is common in all denominations today, there are a few among them who do not adhere to some of these teachings.

As a whole the Christian Church stands for an evangelical Christianity, for the divine inspiration of the Scriptures, recognizing their authority as final in all matters of faith, practice, and doctrine. They steadfastly maintain, not that they have no creed, as some ignorantly or willfully affirm, but that they have no creed but the Bible, allowing nothing in the way of any human expression of doctrine to displace them in this position. Consult Burnett's 'Origin and Principles of the Christians' (Dayton, Ohio, 1903).

J. PRESSLEY BARRETT, 
Editor of 'The Herald of Gospel Liberty.'

CHRISTIAN CHURCH, Divisions and Statistics of the. The term Christian Church is here used in a comprehensive sense. Some religious bodies adopt it as a denominational title; a few claim the exclusive right each to be considered as the one and only Christian Church. The broad use of the name here includes all religious bodies which worship Christ as divine, or revere Him as a great religious teacher and example, and wish to be called by His name.

Divisions of the Christian Church.—There are three main divisions of the Christian Church: (I) The Roman Catholic; (II) the Eastern Orthodox; (III) the Protestant. A separation took place between the Eastern and Western sections of the Christian Church in the 11th century, the Western section adhering to the primacy of the bishop of Rome, the Eastern section adhering to the primacy of the patriarch of Constantinople. Thus was created the first and second divisions; the third division, the Protestant, arose from a schism in the Western section, begun in 1517 by Martin Luther, in what is known as the Reformation and resulting in a division of the Church in the West into the two great bodies of Catholics and Protestants.

I. Western Division—The Roman Catholic Church.—The Holy Catholic Apostolic Roman Church lays claims to be the oldest, the original, Christian Church, tracing its beginning to the appointment of the disciple Peter by Christ himself as the chief Apostle, and delivery to him of the keys. Peter resided at Antioch and then at Rome, according to tradition, where he was martyred in A.D. 67. He heads the list of bishops of Rome, in which office the Church has had 259 successors. While other bodies claim an origin quite as early and equally apostolic (see Armenian and Syrian Orthodox), the Church which had its capital at Rome from the beginning was the chief, and at the Council of Nicaea in 325, the Eastern Church, including the Eastern capital at Constantinople. The first great separation in the Christian Church occurred in the 11th century, over the filioque controversy and other differences, the Church at Rome adhering to the doctrine that the Holy Ghost proceeds from the Father and the Son, and the Church at Constantinople maintaining the view that He proceeds from the Father alone. The Roman Church, including western and southern Europe and Africa, excepting Egypt, recognized the primacy of the bishop of Rome, whose other ecclesiastical title, at least standard, was that of Jesus Christ Supreme Pontiff of the Universal Church, Patriarch of the West, Primate of Italy, Archbishop and Metropolitan of the Roman Province, and Sovereign of the Temporal Dominions of the Holy Roman Church. Connected with the Roman Catholic Church are bodies in Europe, Asia and America, called Uniates, who represent secessions from the Eastern Churches, at various times. The great body of the Church uses the Latin ritual, which obtained from the beginning, but the Uniates, in consideration of acknowledging allegiance to the Pope and accepting the dogmas and sacraments of the Roman Church, are allowed to use their own rites, which are chiefly in the Greek, the Armenian, the Syrian and the Coptic, and certain other privileges in matters of doctrine and practice to which they had been accustomed. The Roman Catholic Church is world-wide in its territorial range, having churches and members in all continents, countries and populations.

II. Eastern Division—Eastern Orthodox Churches, specifically the Holy Orthodox Catholic Apostolic Eastern Church. This division includes properly the Hellenic, Russian, Syrian, Rumanian, Serbian and other Orthodox Churches, which, though independent of one another, are in general agreement in matters of doctrine, worship and practice, accepting the seven ecumenical creeds (those adopted before the division of the 11th century), and having rituals of the same general type, though differing in language.

1. The Greek Orthodox Church. In the separation between the Western and Eastern sections of the Christian Church, Constantinople, which had been the eastern capital of the Roman Empire, became the capital city of the Eastern Church. Constantine the Great had issued an edict of toleration for Christianity in the 4th century, and a patriarch had been at the head of the Church in the East long before the separation. The patriarch of Constantinople is still the head of the Greek Christians of Turkey.

2. The Hellenic Orthodox Church is the national church of Greece. It is independent of the Greek Church of Turkey, and is governed by a synod of bishops.

3. The Orthodox Church of Russia, embracing the empire, was for some time under the control of the patriarch at Constantinople, but became independent in the process of time and had its own patriarch until the patriarchate was abolished by Peter the Great, to be restored in 1717 after the dethronement of the Tsar.
Archbishop Tikhon, of Moscow, is the new patriarch.
The Serbian Orthodox Church embraces Serbia, with a patriarch resident at Belgrade.
5. The Orthodox Church of Austria-Hungary consists of Serbs, Rumanians and Russian
thenians resident in the empire, under distinct heads.
6. The Orthodox Church of Montenegro is under the rule of bishops.
7. The Orthodox Church of Bulgaria, embracing Bulgaria and Macedonia, is under the care of an exarch.
8. The Syrian Orthodox Church is composed of Syrians by birth and descent who speak only the Arabic language, and has two patriarchates, one at Antioch and the other at Jerusalem. There are several thousand of these Christians in America, where they are under the care of the Russian Orthodox Church.
9. The Orthodox Church of Rumania is under the supervision of the metropolitan of Bucharest.
10. There are still in existence the ancient patriarch of Alexandria, and of Mount Sinai,
with a reduced number of sees and followers; also the Orthodox Church of Cyprus.
11. The Armenian Church.—Although not in the Orthodox Eastern Communion it is, an ancient Church of the East, which traces its origin through shadowy tradition to the Apostles Bartholomew and Thaddeus, and claims a vigorous renewal and organization under Gregory the Illuminator in Armenia, before the close of the 3d century, resulting in the acceptance of Christianity by the king, making Armenia the first Christian country. The patriarch, or catholicos, has his seat at the foot of Mount Ararat in Transcaucasia. Persecutions have widely scattered the Armenians, a considerable number of whom are in America.
12. There are a number of Churches, the Coptic or Jacobite Church of Egypt and Syria,
the Church of Abyssinia, the Nestorians and Chaldeans, which are not orthodox; but for want of a more suitable classification they are included with the Eastern Churches, together with numerous dissenting sects in Russia, the Raskolniks, or schismatics; also similar bodies in other countries where the Eastern Orthodox Church is found in strength.

Division.—This division embraces practically all the Christian bodies not included in the first two divisions, and they are great in number and in diversity of belief, government and practice. The multiplicity of small bodies with their differences manifests the diversity of Protestantism; on the other hand, the fact that the overwhelming mass of Protestants are found in the great evangelical communions, like the Anglican, the Baptist, the Lutheran, the Methodist, the Presbyterian and the Reformed, manifests the orthodoxy of Protestantism.

Protestantism historically began with the Reformation of Luther; but there were reformers before Luther, and divergences from Roman Catholic belief and discipline before his day, as witnessed by Waldo, of the 12th century, and John Huss, burned at the stake as a heretic in 1416, and the Waldenses (q.v.) and the Bohemian Brethren (q.v.). Out of the Reformation led by Luther in Germany, beginning in 1517, and by Zwingli, Knox and others in other countries, have grown through the mutations of the centuries and by division and subdivision the ecclesiastical organizations known collectively as Protestantism (q.v.).

1. Evangelical Lutherns.—The direct outcome of the Reformation, this communion, called "Lutherans" by Catholic contastants, a name opposed by Luther as "sectarian," embraces in its numerous branches most of the countries of the world. These bodies are practically one in belief, holding either to the Augsburg Confession or to the Book of Concord, or to both; but using the episcopal form of government in Scandinavia and other parts of Europe and the congregational or presbyterian systems in the United States and elsewhere. In Germany, (a) United Evangelical State Church is reckoned as about seven-eighths Lutheran and one-eighth Reformed; (b) Old Lutherans and other Lutheran organizations which are without state connection; (c) Evangelical Lutheran Church of Sweden; (d) of Norway; (e) of Denmark and Iceland; (f) in Russia, including Poland and Finland; (g) in Hungary; (h) in Holland; (i) in Switzerland; (j) in France; (k) in the British Isles; (l) also in various European countries; (m) also in Asia, Africa and South America; in the United States; (n) General Synod; (o) General Council; (p) United Synod South; (q) Synodical Conference; (r) Norwegian Church; (s) Synod of Ohio; (t) Synod of Iowa; (u) eight other smaller bodies. Other bodies of Lutheran origin are (v) German Evangelical Protestant Church and (w) German Evangelical Synod, both of which were originally from the Evangelical State Church of Germany. Also, Swedish Evangelical bodies, outcome of the Waldensian movement in Sweden; (x) Swedish Evangelical Mission Covenant, and (y) Swedish Evangelical Free Mission.

2. Reformed and Presbyterian Churches.—In Continental Europe, the Reformation proceeded along two distinct lines, the Lutheran and the Reformed, the latter being more emphatically Augustinian, or Calvinistic, in doctrine. Led by Zwingli, Calvin and others, it also differed from the Lutheran in the eucharist. Churches were organized as follows: Reformed Church in (a) Germany; (b) in Switzerland; (c) in Austria; (d) in Hungary; (e) in Bohemia; (f) in Holland; (g) in France. In Prussia and other German states the Reformed and Lutheran Churches were united in 1817 in the Evangelical State Church. Holland continues to be a stronghold of the Reformed Church, whence it was early planted in the East Indies, Africa and America. (h) Reformed Church in America and (i) Christian Reformed Church came here from Holland; (j) Reformed Church in the United States and (k) Hungarian Reformed Church came from Germany and Hungary respectively. (l) Waldensian Church of Italy, antedating all the Reformed Churches, properly belongs to this group, or to the Presbyterian. The Presbyterian Churches proceeded from the Reformation in the British Isles, led by Hamilton, Wishart and Knox, and established in 1560. In doctrine and practice the Presbyterian Churches are in general harmony with the Reformed Churches of the Continent. Existing bodies of the Presbyterian name, omitting small organizations, are: In Scotland, (a) Church
of Scotland; (b) United Free Church; (c) Free Church; (d) Reformed Presbyterian Church; (e) United Original Secession Church; in England and Wales, (i) Presbyterian Church of England; (j) Commissioners of Ireland; (k) Presbyterian Church in Southern Africa; (l) Presbyterian Churches in Australasia; (m) Presbyterian Church in Canada; in the United States; (n) Presbyterian Church, Northern; (o) Cumberland Presbyterian Church; (p) United Presbyterian Church; (q) Reformed Presbyterian Church, Synod; (r) Reformed Presbyterian Church, General Synod; (s) Associate Reformed Synod of the South; (t) Welsh Calvinistic Methodist Church. Other small bodies in the United States and elsewhere are omitted. The Reformed and Presbyterian Churches hold the doctrine of the Reformation and are in an "Alliance of the Reformed Churches throughout the World holding the Presbyterian System."

3. The Church of England and its branches in various parts of the world constitute the Anglican Communion. The Church of England is the first constituted church in the United States and is termed the Church of England and, when necessary, the Church of England and Ireland. The Church of England is the Church of the Roman Catholic Church in the reign of King Henry VIII, about a century after Luther's break with that body. Christianity was carried to the ancient Britons from the adjacent continental countries, as is supposed, and it is claimed that the Church of England, which holds that it has an unbroken apostolic succession for its prelates and clergy, was always a national Church, and was not continuously subject to the see of Rome. The branches are: (a) Church of England; (b) Church of Ireland; (c) Episcopal Church of Scotland; (d) Protestant Episcopal Church in the United States; (e) Church of England in Canada; (f) in the West Indies; (g) in India and Ceylon; (h) Holy Catholic Church in Japan (missionary); (i) Holy Catholic Church in China (missionary); (j) Church of England in Africa; (k) in Australia and Tasmania; (l) in New Zealand and Melanesia. There are independent sees in Newfoundland, South Africa, South Sea, South America, and other countries, which hold relations direct with the archbishop of Canterbury, the primate of England. The various branches meet in conference at Lambeth at long intervals. (m) The Reformed Episcopal Church of the United States, Canada and England historically belongs to the Anglican group, though it is not in union with it.

4. The Baptist Churches.—These date back through the Anabaptists to within a few years of the time of Luther. Anabaptist churches, which received the test of baptism as essential, were formed in Switzerland as early as 1523, and sprang up later in Holland, Germany, England, whence the modern type came to the United States. Baptist churches use almost without exception the congregational or independent form of government, and hold to the principle of baptism of believers only by immersion. They are divided by national boundaries, and in the United States by differences in doctrine, practice, etc. The chief bodies are in (a) Baptist Union of England and Wales (omitting some small bodies); (b) Baptists in Scotland; (c) in Ireland; in the United States, where the great majority of Baptists are found—

(d) Northern Baptist Convention; (e) Southern Baptist Convention; (f) National Baptist Convention (two colored bodies claiming the same name); (g) Primitive Baptists, very conservative; (h) Church of the Brethren, 900 smaller bodies; (j) Baptist churches of Canada; (k) Baptist churches of Australia. Considerable numbers of Baptists are found in Germany, Russia, Sweden and other European countries; in the mission fields of Africa and South America. Similar in doctrine and practice are the (l) German Baptist Brethren, or Dunkards (four bodies); and the Churches of God (Winebrenner).

5. Congregationalists.—The first churches of this order—full autonomy or independence of the local church—were formed in England in the last quarter of the 16th century, one of which emigrated to Holland and thence to the United States in 1620. (a) Congregational Union of England and Wales; (b) Congregational Union of Scotland; (c) Congregational Union of Ireland; (d) Congregational Conference of the United States; (e) Congregational Churches of Canada; (f) in Africa; (g) in Australasia; (h) in Holland, Sweden, and other parts of Europe; also in mission fields of Turkey, India, China and Japan.

6. Friends or Quakers (George Fox, Drayton, England, founder), date from the middle of the 17th century. They regard the sacraments as spiritual, and do not observe them by outward rites, and they are non-resistant. Persecution drove English Friends to the United States, Canada and elsewhere. In England, (a) Yearly Meeting of Friends; in the United States, (b) General Conference of Friends, Orthodox; (c) Society of Friends, "Hicksite"; (d) Society of Friends, "Wilburite"; (e) Society of Friends, Primitive.

7. Mennonites.—A group of 12 or more small bodies in the United States and Canada, and other bodies in Europe, who regard Menno Simons, a Waldensian preacher of the 16th century, as their founder. They came to the United States from Germany, Holland, Switzerland, Russia, in our colonial days. They reject infant baptism, and hence do not have a chrism and hold to the principle of non-resistance.

8. Moravians.—A body rising out of the Huss movement in Bohemia and Moravia, whose official name is Unitas Fratrum. Their headquarters are at Herrnhut, Germany, there being three branches, (a) German, (b) British, (c) American. They hold close relations with the Union of Bohemians and Moravians, which has a small representation in the United States.

9. Methodist Churches.—Originating in 1739 in England, tant baptism was practiced, were formed in Switzerland as early as 1523, and sprang up later in Holland, Germany, England, whence the modern type came to the United States. Baptist churches use almost without exception the congregational or independent form of government, and hold to the principle of baptism of believers only by immersion. They are divided by national boundaries, and in the United States by differences in doctrine, practice, etc. The chief bodies are in (a) the Wesleyan Methodist Church; (b) the Primitive Methodist Church; (c) the Wesleyan Reform Union; (d) the United Methodist Church; (e) the Independent Methodist Churches; in the United States; (f) Methodist Episcopal Church; (g) Methodist Episcopal Church, South; (h) Baptist Union of England and Wales; (i) Baptist churches of Scotland; (j) in Ireland; in the United States, where the great majority of Baptists are found—

(d) Northern Baptist Convention; (e) Southern Baptist Convention; (f) National Baptist Convention (two colored bodies claiming the same name); (g) Primitive Baptists, very conservative; (h) Church of the Brethren, 900 smaller bodies; (j) Baptist churches of Canada; (k) Baptist churches of Australia. Considerable numbers of Baptists are found in Germany, Russia, Sweden and other European countries; in the mission fields of Africa and South America. Similar in doctrine and practice are the (l) German Baptist Brethren, or Dunkards (four bodies); and the Churches of God (Winebrenner).
American Wesleyan Methodist Church; (n) Primitive Methodist Church; (o) five other small bodies; (p) Methodist Church of Canada; (q) Australian Methodist Church; (r) New Zealand Methodist Church; (s) Methodist Church of Japan. The latter is the product of three Methodist bodies; there are also large numbers of members in the mission fields of Asia, Africa, Europe, South America and elsewhere. Four other bodies in the United States of Methodist principle, which have been represented in the Ecumenical Methodist Conference, decennial, are (t) Evangelical Association; (u) United Evangelical Church; (v) United Brethren in Christ; (w) United Brethren in Christ (Old Constitution).

10. Disciples of Christ.—A considerable body in the United States and other countries, with non-sectarian name and principles, with which may be classified the Christians, an organization which, although having a name and principles, neither has any creed but the Bible. The former are often called by the name of the latter. Both originated in the early part of the 19th century. Another small body known as the Christian Union may be included in this group.

11. Unitarians.—A liberal body, in the United States, England and Hungary, who do not accept the doctrines of the Trinity or the divinity of Christ. They arose in the United States early in the 18th century, and in Hungary about a century earlier.

12. Universalist Church.—This body arose in the United States at the close of the 18th century. It holds to the final salvation of all persons.

13. New Jerusalem Churches.—Two small bodies descended from the movement begun by Emanuel Swedenborg, in England, near the close of the 18th century.

14. Adventists.—A group of half a dozen bodies of premillennialists, baptizing by immersion, and congregational in polity, arising in 1840-50, the chief of which are, (a) Advent Christians and (b) Seventh Day Adventists. The latter is represented in most of the countries of the world.

15. Plymouth Brethren.—A group of four or more bodies, calling themselves simply Brethren. They hold premillennial views, have unpaid, unordained preachers and baptize generally by immersion. Found in England, Canada, the United States and other countries.

16. Church of Jesus Christ of Latter-Day Saints, commonly called Mormons, from the Book of Mormon which they accept as inspired revelation. There are two bodies, (a) the Utah branch, known as Polygamy as a divine revelation, and practised it, but promised to discontinue it when Utah was admitted as a State. It is a large body and has missionaries and followers in many countries besides the United States. The (b) Reorganized Branch, protests against polygamy.

17. Salvation Army, an organization of workers, with a mission to those not reached by the churches. It originated in England in 1876, and is found in many parts of the world.

The Christian Church, founded by Mrs. Mary Baker Eddy, in the last quarter of the 19th century, on the doctrine that spirit is immortal and dominant, and that through it evil and disease are to be overcome. It has churches, or temples, in other countries besides the United States.

19. There are many other small bodies of Christians in the United States and the rest of the world, which cannot be classified.

IV. Statistics of the Christian Church.—Three things must be said as to the world statistics of the Christian Church: First, it is impossible to array them in detail by countries, for the reason that some of the large communions, to say nothing of many small bodies, do not present the necessary data; for example, the Church of England makes no returns, even for England and Wales, either of communicants or church population. Second, though most of the Churches of the United States and a number in other countries make official reports of communicants, and a number in other countries give official reports of population, and decennial censuses give more or less accurate returns of communicants or population, estimates, more or less uncertain and vague, have to be used for the rest of the world. Third, some of the returns, or estimates, are not even recent, but 10 years or more old and some nearly twice that. It should be understood that the totals, except for the various communions, are to be taken as approximate, not as exact.

Of the population of the world, estimated at 1,691,751,000 by the National Geographic Society, of Washington, D. C., 609,414,000 is Christian. This number includes members, or communicants, and adherents, making together what is called "church population." Distributed among the three great divisions of Christianity—Roman Catholic, including Uniates, i.e., those of the Eastern Orthodox division who have acknowledged the supremacy of the Pope, Old Catholics, etc.; Eastern Orthodox, including Armenians, Jacobites, Copts, Abyssinians and Russian Schismatics; Protestants, including evangelical and non-evangelical, orthodox and heretical, bodies— we have these results: Roman Catholic, 294,583,000; Eastern Orthodox, 120,729,000; Protestant, 194,102,000. These figures show an increase over these heretofore given by 'Whitaker's Almanac,' London, and other authorities, of 21,723,000 in the Roman Catholic division, of 729,000 in the Eastern Orthodox, and of 22,452,000 in the Protestant. Later and more accurate statistics, from many of the countries of Europe especially, would probably make important changes in these totals. The following table gives a distribution of the three divisions by continents:

<table>

The Christian faith greatly outnumbers any of the other faiths of the world and is the most aggressive, active and prosperous. If Confucianism be regarded as a religion, and the discipline of the ancient sage be classified with Taoists, as is commonly done, this ethical cult
stands second, with 308,830,000, according to accepted estimates, Islam coming third, with about 229,370,000, and Hinduism fourth with 210,000,000. The combined strength of Confucianism and Moslemism falls more than 80,000,000 short of the total of Christians.

The Christian following in the world, though unquestionably gaining on the total population, has not yet reached the half-way mark, which is 845,675,000. It has passed the one-third stage, having over 30 per cent. It is not possible to say with much certainty what the gain of the Christian Church has been in the last quarter of a century, but it is probably from 50,000,000 to 60,000,000. The Eastern Orthodox Churches are gaining little, if any, outside of Russia; but the Roman Catholic Church and the Protestant bodies are making advances, both divisions being active and successful in missionary work in all parts of the globe.

As Christianity is a development of Judaism, the Jewish Bible being also the Christian Bible, with the Christian Gospels and Epistles added, the two faiths may be classified together for comparison with the other faiths of the world, the two having more in common, despite some radical differences, than either has with any other religion. Adding to the Christian population of the world 609,414,000, the Jewish 13,980,715, we have a grand total of 623,394,715. Of the Jews, 9,986,447 are in Europe, and the next largest number, 2,144,061, in North America.

Of the three divisions of the Christian Church, the Roman Catholic has a little more than 46 per cent of the entire Christian population of the world; the Protestant a little less than 32 per cent, and the Eastern Orthodox the remaining 20 per cent.

The Roman Catholic division is first in Europe, in South America and in Oceania. The Eastern Orthodox division is first in Africa.

The Protestant division is first in North America and in Asia.

In Europe the Roman Catholic Church predominates in numbers in the countries of Austria-Hungary, Belgium, France, Spain, Portugal and Italy; the Protestant churches are first in Great Britain, Germany, Scandinavia, Holland and Switzerland. The Eastern Orthodox Churches are first in Russia, the Balkan States, Greece, and Turkey.

The Christians embrace nearly six-sevenths of the population of Europe, thirteen-fourteenths of that of North America and four-fifths of that of South America. It is a minority faith in Asia and Africa, having about one-sixteenth of the population of the latter and one fifty-sixth of the population of the former. Putting it in another way, of every 100 inhabitants of the world, 36 are Christians; of Europe, 85; of North America, 93; of South America, 82; of Asia, 2; and of Africa, 6.

The Protestant communions and bodies, as described under the head of divisions:

HENRY K. CARROLL,
Author 'Religious Forces in the United States,' etc.

CHRISTIAN DOCTRINE, Development of. The evolution of Church doctrine, and with its slighter shades of meaning, of dogma, creed, precept and tenet, since the Apostolic Age; Church doctrine is based on truths contained in the Scriptures of the Old and New Testaments, Christian theologians recognizing in these Scriptures the depository of all knowledge necessary for the teaching of salvation.

Presented by a recognized authority,—a teacher, a school or a sect,—doctrine, as a principle or exact rule of conduct, which is to be considered true and obeyed on its own merits, differs slightly from dogma which is formulated as essential and to be accepted as authoritative.

In pre-Christian times, the precepts of Moses, Pythagoras and other teachers were considered authoritative by their followers. In "Academic Questions," records *Trinity* and *Fourth Gospel*, which the philosophers and teachers called *dogmata,* and which it was criminal to doubt. The Mosaic ordinances are thus classed as Hebraic *decrees,* or doctrines, in Ephesians ii, 15; Colossians ii, 14. The first Christian doctrinal and moral instruction given by the apostles was delivered by Peter, on the Sunday of Pentecost 30 A.D., a few weeks after the crucifixion of Jesus Christ, and the nucleus of the Apostolic Church was formed. Four years later, in face of persecution, through the martyrdom of Stephen and the conversion of Paul at Damascus, Christianity began to spread outside of Jerusalem, and from 34 to 44 made rapid progress through Palestine, Phenicia and Syria as far as Antioch. Paul made his first missionary journey in 47-48, and at Pentecost in 49, disciplinary decrees and doctrines were formulated for future guidance by the Apostolic Council in Jerusalem. Between 49 and 64, Paul made missionary journeys to different parts of the Empire, including Spain, presenting the Christian gospel, receiving undergoing terms of imprisonment at Rome, and writing the Epistles to the different churches and congregations, from which subsequent Christian doctrine was formulated. As generally accepted, Peter were martyred at Rome by Nero in 67, and three years later, with the siege and destruction of Jerusalem in 70, Hebrew nationality ended. During the 2nd century, however, Hebraic Christianity could no longer spread, though diversity of opinion arose over points of doctrine among Ebionites, Docetae, Essenesians, Gnostics, Manicheans, and in Dynamic, Patri-passian, Monarchian and Sabellian Unitarian circles. At Alexandria, Egypt, with its great universities, libraries, learned professors and throngs of eagerly inquiring and active-minded students,—where the Hebrew philosophy of Philo and the Greek teaching of Plato had blended with the doctrine of Moses and the prophets for a modified teaching of contemporary thought,—the first serious attempt was made by Christians to adjust the facts and truths of the gospel and the relations of Christian doctrine to reason and philosophy. Tertullian, 200 A.D., the first to accept the *Trinity* to the conception or revelation (from human life) of the Triune Godhead, and Origen the Adamantine 185-254, spiritual as well as speculative in his outlook, are the commanding figures of the period. According to Justin Martyr,—the first of the great teachers to develop the doctrine of the Logos or the Divine Word which is God, incarnated in Jesus Christ, —the Gospels included in the New Testament Canon were being read in Christian assemblies on Sundays in 150 A.D. The circulation of apocryphal apostolic writings and the formulation of apocryphal canons to uphold their teachings had to be combated, and great weight came to be laid upon tradition as a source of evidence respecting the teaching of Jesus and the apostles. The principal churches were honored as the witnesses and trusted guardians of these traditions, and the authority of the acknowledged Scriptures was considered final and conclusive. Unity, holiness and catholicity became fixed doctrines of the ever-growing church communities over which the bishops presided, and the bishop of Rome as the acknowledged successor of Peter, the leader of the apostles and vicar of Jesus Christ, was head of the united Church. During the 34th century, the doctrines of Christianity had become such a power, that shortly after the opening of the 4th century, Constantine the Roman emperor-convert, by the Edict of Milan in 313, decreed the toleration of Christian worship throughout the empire and gave Imperial sanction to Church doctrine. Five years later, in 318, Arian of Alexandria, denying the doctrine of the Incarnation of Jesus as the Word which is God, was opposed by Athanasius *the father of orthodoxy,* and the first ecumenical council of bishops convoked by Imperial decree from all the churches assembled at Nicaea in Bithynia, 325. It culminated in the formulation of the Nicene Creed. In 381 the first ecumenical council of Constantine reaffirmed the Nicene Creed in opposition to Apollinarianism (qv.), a modified form of Arianism. In 431 the Council of Ephesus defined the doctrine that Mary was the Mother of God, which was opposed by Nestorius, bishop of Constantinople. In 451, the celebrated Council of Chalcedon, disciplining Eutyches, formulated the orthodox
doctrines of the Trinity which has ever since been regarded as the limit of human wisdom on this subject. In 589 the Council of Toledo, Spain, inserted filioque — and the Son — in the Creed, to affirm the procession of the Spirit from the Father, and the Son. In 831 the doctrine of Transubstantiation (G.v.) was adopted by Paschal, bishop of Rome. In 820, the Greek Church under Photius, archbishop of Constantinople, separated from the Roman Church over the insertion, two and a half centuries before, of filioque in the Creed. Abelard (1059-1142), the greatest of scholastic philosophers, in concept and conceptualism applied psychology and logic to the Ephesian doctrine of 431. In 1409 the Council of Pisa attempted to heal the great schism which had existed since 1309 over the rival popes of Rome and Avignon; the abuses it entailed creating popular demands throughout all Europe for reform. In 1439, the Council of Florence formally sanctioned the seven sacraments of baptism, confirmation, unction of the sick, the Lord's Supper, marriage and ordination. In 1517 the need for reform of abuses which had crept into Church practice culminated in Luther's protest, and Protestantism created that revival of religious feeling throughout Christendom which, by a reactionary influence, resulted in a reawakening of religious zeal within the Catholic body. (See Reformation and Counter-Reformation). With this dual Reformation came the division of Christian doctrine into Protestant and Catholic fields of thought. After 1530 appeared the Protestant confessions of faith, Lutheran, Anglican, Calvinistic, etc. Justification by faith, individual responsibility, the right to believe and worship according to one's conscience became the cardinal points of Protestantism. The Bible is the one rule of faith and practice; the decrees of any spiritual representative, of any body or convention, are not considered infallible or obligatory. Since then Protestant Christian doctrine has had innumerable expositors, disputing every possible shade of opinion. (See Christianity; Christology; Creeds and Confessions; Incarnation; etc.).

The Council of Trent 1545-63, with the greatest deliberation and care, confirmed the Catholic position on doctrine. Since then the only additions considered necessary by the Catholic Church, to give greater force to existing doctrine have been the formulation of the Ephesian definition of 431, conceptualised as the education of women had by Abelard 1099-1142, finally promulgated as the doctrine of the immaculate Conception (G.v.) in 1854, and the Papal infallibility (G.v.) of doctrinal teaching, promulgated in 1870. Consult Newman, Carin, De Legatione Christiani (London 1827); Fisher, G.P., 'History of the Catholic Church' (New York 1887). See also Canon Law; Declarative.

Charles Leonard-Stuart, 
Editorial Staff of The Americanana.

CHRISTIAN ENDEAVOR, Young People's Society of a society distinctly religious in all its features; organized 2 Feb. 1881, in Williams Congregational Church, Portland, Me., by the Rev. Francis E. Clark. From one small association it has expanded into more than 77,500 societies in all parts of the world, with an aggregate membership (1917) of 3,875,000. In addition to the main organizations in the United States it has been found necessary to form branches, among which are the Junior, organized 29 March 1883, by the Rev. Charles A. Savage, pastor of the First Congregational Church, Berkeley, Cal.; the Intermediate organized 1891, by the Rev. A. Z. Conrad, pastor of the South Congregational Church, Worcester, Mass., and the Mothers', suggested by Mrs. Amanda B. Fellows, of Chicago, and organized in April 1893 at Topeka, Kan., by Mr. F. C. Barton. Among other special branches are the Floating societies for work in the United States navy and among seamen generally; and various other organizations whose fields of labor lie among the Chinese, the Indians, convicts in prison, etc. The first Christian Endeavor society in England was organized in 1887, and was followed by similar ones in other countries, and the constitution has been printed in more than 60 different languages. The movement is interdenominational and international, with societies in more than 80 denominations and 60 nations. Any society belonging to an evangelical church which adopts the leading principles as set forth in the constitution, including the prayer-meeting pledge, and which guarantees these principles by the name Christian Endeavor, either a corporate or personal affiliation with a denominational name, is admitted to all the privileges of the organization. In the United States the Presbyterian Church has the largest number of societies; in Canada and Australia the Methodists are in advance of all others. In some of the American States, the Disciples of Christ, and in others the Congregationalists claim the largest number.

The distinctive features in the Christian Endeavor movement are its work among the young people, leading them to consecrate their lives to the active service of God; the weekly prayer-meetings, which each member takes a pledge to attend regularly (unless unavoidably detained), and to take a part in; the consecration meetings held once a month, at which special efforts are made to consecrate the member has been faithful to his pledges; the committee work training the members in practical service; and the unions, city, county, district, State, national and international, which emphasize and illustrate the fellowship of the movement. The amount of good accomplished in training the young people in the practical work of Christianity and fitting them to take up the work of those dropping out of active service can never be fully estimated. The increase and efficiency standards set before the societies the most practical and helpful plans for definite religious training ever presented by any organization. As a result of this training it has enrolled (1917) more than 100,000 comrades of the Quiet Hour, who practise daily communion with God; more than 35,000 members of the Tenth Legion, who give at least one-tenth of their income to the service of God; more than 8,000 Christian Endeavor experts who have passed an examination on the history, principles and methods of the movement; more than 3,000 life-work recruits who have devoted their lives to the minisry, in some other form of Christian service, and more than 50,000 members of the International Peace
Union, pledged to promote the principles of brotherhood and fellowship among all nations. Christian Endeavor Week, the week in which the 2d of February occurs, was adopted in 1913 and is observed with appropriate exercises by the societies in all parts of the world. Through it a great impetus is given to all departments of the work.

The World's Union of Christian Endeavor has held conventions at Washington, D. C., in 1896; in London, England, in 1900; Geneva, Switzerland, in 1904; Agra, India, in 1909, and Chicago, Ill., in 1915, which were attended by representatives from all over the world. The United Society of Christian Endeavor is a bureau of information, which simply seeks to spread the idea of the movement throughout the world. Its headquarters are in Boston. *The Christian Endeavor World* is the international publication of the movement.

**William Shaw, General Secretary.**

**CHRISTIAN ERA, the era or epoch introduced by the birth of Christ.** It was calculated back about the year 532 by a monk, Dionysius Exiguus, a resident of Syria. It is thought that he fixed the advent 4 years later than our years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in 4 B.C., which is, however, the generally accepted date among Biblical scholars. They give the probable date as follows: *circa* 4 B.C. — Birth of Jesus; *circa* 28-29 A.D. — Beginning of public work; 30 A.D. — Death of Jesus. There are no historical data for determining the day of His birth; the Church after much volubility finally settled on 25 Dec. The Christian Era is sometimes called the Dionysian Era.

**CHRISTIAN KNOWLEDGE, Society for the Promotion of.** The oldest and greatest of the religious associations connected with the Church of England. It is popularly referred to as the *S. P. C. K.* It was founded in 1698, although it did not receive its present name till 1701, and had for its objects:

1. To promote and encourage the erection of charity schools in all parts of England and Wales.
2. To disperse, both at home and abroad, all possible religious knowledge, in general, to advance the honor of God, and the good of mankind, by promoting Christian knowledge both at home and in other parts of the world by the best methods that should offer. It now has a wide distribution in all parts of Great Britain and the colonies. It partakes at the same time of the nature of an educational association, a missionary society, a Bible society, a religious tract society and an emigrants' spiritual aid society. The publishing and book-selling business shows in some years total sales of $450,000; the works published being in very various departments of literature, and including several admirable series on Early British, Diocesan, and Ecclesiastical History from the Monuments, Early Chronicles, etc.

The Protestant missionaries who labored in the south of India in the 18th century were supported chiefly by this society, and it is now chiefly engaged in supplying to the mission-field through their London Missionary Society in which they work in the vernacular. Besides translations of the Bible and Prayer-book, it provides for pioneer missionaries, grammars, dictionaries, reading-books and general literature to instruct them in the language of the country in which they have to use. In Scotland a similar society was organized in 1709.

**CHRISTIAN AND MISSIONARY ALLIANCE.** Christian Missionary Alliance was the title adopted when the Christian Alliance, which had been founded in 1887 and the International Missionary Alliance in 1889. All who have made open profession of belief in Christ may become members by subscribing to the principles of the order and enrolling their names. The objects of the Alliance are *Wide diffusion of the Scriptures in its fullness, the promotion of a deeper and higher Christian life and the work of evangelization, especially among the neglected classes in distant heathen countries.* Connected with the Alliance are the Missionary Training Institute, Institute for the Training of Home Workers, Beracha Home and Beracha Orphanage.

**CHRISTIAN REFORMED CHURCH in North America, The.** This Church is largely the result of three secession movements out of the Reformed (Dutch) Church (q.v.). The first of these movements took place in 1822 in the States of New Jersey and New York. Its leader was Rev. Solomon Froeligh, D.D., assistant professor of theology in the Dutch Church. The reasons advanced for seceding from the old denomination were its laxness in disciplining offending members, indiscriminate administration of sealing ordinances and toleration of Hopkinsian teachings. In 1827 the seceders, calling themselves the *True Reformed Dutch Church,* numbered 25 congregations and 12,000 members. The Church dwindled slowly but surely until 1890, when they formed a union with the main part of the present Christian Reformed Church.

This main part was composed largely of Hollanders who, in 1847 and the decade following, had settled in Michigan, Wisconsin, Iowa, and other northwestern States. In 1849 these people—all stanch Calvinists—had united themselves with the (Dutch) Reformed Church. From the very beginning, however, some were dissatisfied with the Church's indifference in language, neglect of catechetical preaching and teaching, too much fraternizing with un-Calvinistic denominations, the singing of hymns and laxity of doctrine. Objections were also made against allowing freemasons to be church members. In 1877 this dissatisfaction led to an open disruption. Under the leadership of the Rev. K. Vanden Bosch, about half a dozen churches in Michigan withdrew and styled themselves the *True Dutch Reformed Church.* In 1876 they opened a theological school in Grand Rapids, Mich., the denominational stronghold.

This True Dutch Reformed Church was much strengthened, numerically and morally, by a third movement of secession which took place in the early '80s. This movement, the result of anti-Masonic agitation, the General Synod of the Reformed Church refusing to take such decided action as the complainants desired. In 1882 the seceding congregations, about half a dozen in number, by Rev. L. J. Huls, united formally with the Church which had withdrawn in 1857.
After this union the numerical increase of the denomination, which was slow at first, began to show the rapid growth the Truth is capable of. The Union, with 250 congregations, 175 ministers, 40,000 communicants, a total of 90,000 souls; about 25,000 catechism scholars and some 20,000 pupils in the Sabbath schools. These congregations are scattered through the Northern States of the Union, as well as along the Atlantic Coast, from Massachusetts to New Jersey. In recent years a few have been organized in Washington and California. About half a dozen congregations are found in the Saskatchewan and Manitoba provinces of Canada, while four affiliated churches, supported by the denomination, are found in the Argentine Republic. The different local churches are joined in 13 classes or presbyteries. Six delegates of each of the latter, three ministers and three elders, constitute the Synod, the highest Church court of the denomination, meeting biennially (in even years), the third Wednesday in June. The Theological School and Calvin College, located in Grand Rapids, Mich., have about 350 students enrolled. The faculty is composed of 17 professors. The Christian Reformed Church is very zealous in its mission efforts. This is one of the main causes of its rapid growth; continual immigration from the Netherlands and the formation of new settlements supplying the material for the increase.

The denomination also carries on mission work among the Navaho and Zuni Indians in New Mexico. Near Gallup, N. M., "Rehoboth Missions," a flourishing boarding-school for Navahos children, gives a Christian education to some 100 Indians boys and girls, while in Zuni a day school has 24 children enrolled. Five other stations, with Rehoboth as centre, are manned by ordained missionaries who labor in connection with governmental boarding-schools for Navahoes in New Mexico. Both in Patterson and in Chicago Rescue Missions are maintained; in the first named city a Jewish Mission Home of the denomination was opened in 1915, while in Rochester, N. Y., a House of Prayer has been established. In Ogden, Utah, work is done among the Mormons. The free Christian primary schools found in all the principal Dutch settlements are supported largely by the Christian Reformed people, something which applies to the Seman's Home as well. The word "Person" (spelled with a capital letter), is also used as a term for God, but Christian Science does not hold that God is a human being. Of God it is said that "He is all-inclusive" ('Science and Health,' p. 331); which statement is to be regarded as consisting with the idea of imparted identity and individuality. Indeed, one of the leading points of Christian Science is that God is the Life, Mind and Soul of man, yet that man, as the reflection of God, possesses perfect identity and individuality. As understood in Christian Science, therefore, God creates man and the universe; He governs the individuality and continuity of each creature; and He maintains this infinite creation as the expression of the Father's great heart.

Since Christian Science is based on the teaching and example of Jesus, it has a definite and emphatic view of him and his mission. To begin with, it distinguishes between Jesus and the Christ as between what is human and what is divine. In the strictest sense, Christian Science the word "Jesus" usually refers to the person whom Christian Scientists regard as Teacher and Way-shower. The word "Christ" may refer to him, to his spiritual selfhood, or to his office as the Messiah, Saviour or Christ. Usually, however, Christian Scien-
Christian Science, therefore, distinguishes completely between the real, ideal man and the human or mortal sense of man. For this purpose and for every purpose, it distinguishes between ultimate reality and mere appearance, semblance or illusion. Acknowledging God as the origin of all that really is, Christian Science does not find an origin for aught else, but consistently denies that anything which is not of God can have an origin or real existence. Says Mrs. Eddy, "The mirage, which makes trees and cities seem to be where they are not, illustrates the illusion of material man, who cannot be the image of God." ('Science and Health,' p. 300). In this connection, Christian Science declares that Christianity was originally based on the truth or reality of being. Its basic requirement was the knowledge of the truth concerning God and man, "the truth" denoting absolute reality as opposed to which is absolutely apparent, seeming or false. Attention is drawn to sayings of the Master, such as the following: «For this cause came I into the world, that I should bear witness unto the truth." If I came that they might have life and may have it abundantly.» This is life eternal, that they might know thee, the only true God and Jesus Christ, whom thou hast sent. "Ye shall know the truth, and the truth shall make you free.» Such sayings imply that the human or mortal sense of life is false, and they imply that abundant and eternal life is to be gained by finding and realizing the truth of being. The human situation was stated by Saint John in these words: "Beloved, now are we the sons of God, and it doth not yet appear what we shall be." He did not mean that we shall ever be different from what we really are. He meant that we are the sons of God, though the reality of being doth not yet appear. He did not foresee a loss of identity; he discerned the realization of true identity. Mrs. Eddy has consistently said: "The real, ideal man appears in proportion as the false and material disappears." «Mortals will disappear, and immortals, or the children of God, will appear as the only and eternal verities of man» ('Science and Health,' pp. 69, 476).

According to Christian Science, then, no form of evil possesses the nature of substance, but every phase of evil is only an aspect of error; truth or the understanding of reality being the universal remedy. For instance, take its teaching in regard to sin. Sin is primarily wrong thinking; it is always punished by the loss of harmony or the suffering which it entails; it is forgiven as it ceases, for goodness always receives its reward. The impulse to sin is always ignorant or deceitful; at worst it is a false sense of pleasure in sin. So Christian Science is spiritually educational; it makes much use of the truths that sin cannot give genuine pleasure; that the consequences of concious indulgence are cumulative; and that happiness must be sought and can be found in active goodness. This religion also emphasized the power of good, of the absolute. True goodness carries to detect sinful motives, to unmask sinful inducements and to dispel sinful persuasions. In this manner the reformative work of Christian Science has been conspicuously successful.

The prevention and cure of disease is within
the mission of Christian Science for the same reasons that it was within the mission of original Christianity. What are disease and health? In the last analysis not only disease and health but mortality and immortality are concepts resulting from contingent modes of thought. On one hand is material sense, which has no principle—no cause or substance—and is simply an illusion, a dream of pain and pleasure in matter that includes sickness and death. On the other hand is spiritual sense, which is created and sustained by God, the divine Principle of all true being. What Saint Paul wrote to the Romans on this subject was both Christian and scientific: "To be carnally minded is death, but to be spiritually minded is life and peace." In these words he declared that life is a condition of mind or thought; he analyzed causation as wholly metaphysical. The mentality which sickens and dies in material; that is, to say, material thought; while the thought which lives and enjoys the perfect attributes of life is spiritual; that is to say, emanating from Spirit or God. In other words, it is Spirit, God, the divine Mind, that gives life and health to man, and gives it through mental, not material, thought; that is, it is a mental and spiritual quality, and it is to be gained and preserved as such; that is, through the understanding of and obedience to the spiritual law which emanates from the divine Mind. Disease, on the other hand, even the most physical disorder is a palpable evidence of false belief. It is a condition incident to the supposition that man is a material selfhood and governed by a law of suffering, disability and death—governed by laws which divine Life, Truth and Love could never make. Every lack of health, from the beginning to end, is only a subjective condition of mortal thought; it is a particular result of the general supposition that life inhabits matter and is mortal. Christian and scientific treatment of disease, then, depends on the distinction between absolute or real being and the human or mortal concept of man. Freedom from disease follows the absolute knowing of the truth concerning God and man. To cope successfully with disease it must be resolved into false belief and dealt with on a mental plane, in accordance with the divine law by which Truth destroys error. Healing comes to pass when the supposed law of disease and death is broken by the actual law of Life, and the unity of being is such that one individual can help another to obtain this victory. In so far as hygiene and sanitation denote cleanliness and purity, Christian Science is in full accord; and it commends not only a clean body and clean surroundings, but a clean mentality; not only pure food, but pure thoughts. Jesus intimated to the Pharisees that for outward cleanliness to be more than superficial it must be the result of inward cleanliness. Christian Scientists usually conduct their own charities, and they contribute funds with an ease that is remarkable to observers. During the Great War, for instance, Christian Scientists have contributed and expended relatively large sums to assist the suffering from the war both before and since the United States entered it; and they have carried on a varied and systematic work for the welfare and comfort of soldiers and sailors in this and other countries.

The Church of Christ, Scientist, or Christian Science Church, was organized at Boston in 1879. It consists of The Mother Church, The First Church of Christ, Scientist, in Boston, and branches thereof throughout the world. The number of regularly organized branches in the United States is 1,766, of which 1,582 are in the United States. The governing body of the denomination is the Christian Science Board of Directors; but each congregation has its own debtors and creditors.

The Christian Science Publishing Society publishes Mrs. Eddy's writings (see bibliography at end of article under Eddy, Mary Baker) and issues the following periodicals: The Christian Science Quarterly Bible Lessons, a quarterly containing the "lesson-sermons" which are read in the Sunday services of this denomination; The Christian Science Journal, a monthly accompanied by directories of churches and a practical, Der Hildesheimer, a monthly; Christian Science Sentinel, a weekly; and The Christian Science Monitor, an international daily newspaper. This paper, founded in 1908 by Mrs. Eddy to injure no man, but to bless all mankind, has now become well known wherever the English language is spoken.

GORMAN P. SMITH,
Committee on Publications, Boston.

CHRISTIAN UNION CHURCHES, a small body of Christians, organized in 1861, partly in protest against the preaching of politics. Rev. James F. Given; who left the Methodist Church in 1860 because the Civil War was advocated from its pulpits, drew together those who were of his way of thinking and they organized the Christian union, at Columbus, Ohio, in 1861. Their principles are: (1) Christ as the only head of the church; (2) the Holy Bible as the only rule of faith and practice; (3) the only fruit the only test of fellowship; (4) each local church to be self-governed; (5) the union of all Christians as an ideal; (6) political preaching disallowed. Its doctrines are Evangelical. Its representative is The Christian Union. Excelsior Springs, MO. The denomination is strongest in Ohio and Missouri. In 1916 it reported 16,825 members, with 356 ministers and 530 churches. Consult Carroll's "Religious Forces of the United States" (1912).

CHRISTIAN UNIVERSITY, a coeducational institution in Canton, Mo.; organized in 1853, under the auspices of the Disciples of Christ; reported at the end of 1915: Professors and instructors, 16; students, 72; volumes in the library, 10,000; grounds and buildings valued at $40,000; productive funds, $20,000; benefactions, $3,000; income, $5,000; number of graduates, 2,000.

CHRISTIAN VIEWPOINT OF THE ORIGIN AND DESCENT OF MAN. See MAN, CHRISTIAN VIEWPOINT OF THE ORIGIN AND DESCENT OF.

CHRISTIAN WOMAN, A, a novel by Emilia Pardo Bazán. In this interesting tale the author presents a very realistic picture of modern Spanish life, into which are introduced many current social and political questions.
CHRISTIAN YEAR—CHRISTIANIA

CHRISTIAN YEAR. The. 'The Christian Year,' by the Rev. John Keble, is a series of psalm and canticle thoughts in verse for the Sundays and holy days throughout the year. In other words it represents an attempt to make poetry an instrument of religion; in consequence, the writer is interested more in his audience than in the aesthetic effect of his work. It is intended to be an aid to the reader of the Book of Prayer of the Established Church of England; its object, in the words of the author, will be attained if any person find assistance from it in bringing his own thoughts and feelings into more entire union with those recommended and exemplified in the Prayer Book.

It has, also, an historical significance, inasmuch as it still remains the most satisfactory expression in poetry of the spirit which inspired the Oxford Movement. Although it does not contain the best of Keble's poetry, it is the work by which he is most widely known, and by which, in all likelihood, he will be chiefly remembered. When published in 1827, its success was immense, and, in its last edition of 1888, it sold 60,000 copies, which is the most successful series of religious poems ever published. Before Keble's death in 1866, 95 editions were called for; before the end of 1887, the work had run into 109 editions—the editions in each case varying from 3,000 to 5,000 copies. It is still popular.

It is not difficult to account for the success of 'The Christian Year.' The different poems expand, elaborate, and illuminate some of the most familiar and most cherished Scriptural scenes, events and texts. It is doubtful if most people are not "athletic readers"; that most do not think strenuously, or use their imagination effectively, while they are reading. A substitute, or aid, such as Keble supplies, does not ordinarily fail to attract attention and gain wide currency. There is, also, in 'The Christian Year' enough of true poetic quality to sustain the whole; in general, Keble's taste is on the side of the angels. 'The Christian Year' is a kind of poetical analogue of the Rev. Samuel Rutherford's 'Religious Letters.' Certain devout souls are pleased with such rapturous expression; other souls, just as devout, but more reserved, are displeased. It has been said that 'Christian Year' contains some passages not infrequently to the commonplace... He lacks the art to conceal art; or, better, the glow of feeling which effects the concealment unconsciously. A little coldness is the defect of his verse, just as it is the defect of a most amiable and virtuous life. The interested student will find John Campbell Shairp's criticism in the 'North British Review' well worth reading.

WALDO H. DUNN.

CHRISTIANA CASE. On 11 Sept. 1851, Edward Gorsuch of Maryland, his son, a party of friends and a United States deputy marshal, having secured a warrant from a Philadelphia commissioner for the arrest of a fugitive slave (alleged to have been Gorsuch's own son), came to Christiana, Lancaster County, Pa., approached the house where the fugitive had taken refuge and demanded possession of him, firing two shots at the house. The neighborhood was aroused, and several armed colored men appeared on the scene, as also did Casimir Pinckney, who, as the coroner, was on the way to persuade both parties to disperse. The deputy marshal ordered them to join his posse; they urged him to withdraw for his own sake; Gorsuch and two of his party fired at the colored men, who returned the fire, killed Gorsuch and his son, and forced the rest to fly. The fugitive slave escaped. The two Quakers were indicted for treason; the grand jury found bills against them; and they were tried 24 Novem-

CHRISTIANITY, Isaac Peckham, American editor and diplomatist; b. Johnstown (now Bloekerk), N. Y., 12 March 1812; d. Lansing, Mich., 8 Sept. 1890. He was one of the founders of the Republican party and espoused its cause as editor of the Monroe Commercial. In 1875 he was chosen United States senator from Michigan and in 1879 became Minister to Peru.

CHRISTIANIA, krēs-tē'ā-nē-a, Norway, capital, city and port, province of Aggershus or Christiania, at the head of the long narrow inlet called Christiana Fjord, about 60 miles from the open sea or Skager Rack. High hills rise around it on both sides, excepting toward the bay, but at considerable distances, particularly on the north. The most interesting building in the town is the fine old castle of Akerhus (built about 1300), with its church and planted ramparts crowning a point jutting out into the fjord and commanding a fine view, but of no military value. It now serves as an arsenal and prison. On a gentle elevation and in the midst of a beautiful park stands the royal palace—a massive square building, without any architectural ornament, but commanding delightful views of the fjord and its beautifully winding shores. The hall in which the Storting holds its sittings is a very plain building. The other public edifices are the military academy, cathedral, university, etc. Attached to the university is a museum, containing a fine collection of antiquities. The climate of Christiania is delightful. It is screened from violent winds; and even in winter, when severe, the weather is seldom variable, but bright and settled and free from damp and fog. In summer it is warm but not sultry, with a light and buoyant atmosphere. The few manufactures of the city consist of woolen cloth, furniture, liquors, iron-ware, tobacco, paper, leather, soap, spirits, glass, etc. There are also some extensive breweries. The exports are principally timber, deal planks and iron. The environs of the city are exceedingly beautiful, the approximate to it by the magnificent fjord, at the head of which it is situated, exciting the admiration of all visitors. The fjord is frozen for upward of two months in the year, for about 20 miles from Christiania to the sea; and the harbor is kept open by means of ice breakers. Christiania forms a separate official district and is administered by a magistracy composed of the burgomaster and two councilmen. It has good waterworks and several electric-light lines. The educational institutions include, besides the university, two higher military schools, a gymnasiurn, a technical school and a number of Latin schools and Realshulen. The
Museum of Art contains many meritorious paintings by Scandinavian and foreign artists, but no great masterpieces. The Industrial Art Museum has fine ancient and modern specimens of Norwegian handicraft. There are three theatres and a municipal library of 55,000 volumes. The city was founded in 1624 by Christian IV, on the site of the town of Oslo, which dated from 1048 and was burned in 1624. Pop. 247,583. Consult Annéus, 'La ville de Christiania, son commerce, sa navigation et son industrie: Résumé historique' (Christiania 1900).

CHRISTIANIA, University of, the state university of Norway, founded under Frederick VI, in 1811–12. Previous to that time during the union of Denmark and Norway, Norwegian students went to Copenhagen for their university training. The awakening of the national spirit demanded that an institution of higher learning be established at home. It was started by voluntary subscriptions and during the 19th century both the state and individuals contributed to the erection of many buildings. The institution is controlled by the Ministry of Religion and Education. The library contains about 500,000 volumes; there are a botanical garden and an observatory. The student enrolment is about 1,600.

CHRISTIANITY. Christianity is a name for the religion which was founded by Jesus Christ. At first it was regarded as an heretical sect of Judaism, and, in appearance, it was little more. Its Founder was a Jew who always spoke with respect of his ancestral religion, attending upon its worship and reverenced its sacred books. Its earliest adherents were Jews who were devotedly attached to the traditions and customs of their people, and who were far from supposing that in becoming disciples of Christ they were taking a step which would, at length, separate them from the religion of their fathers.

It is, indeed, a matter of dispute whether Jesus himself contemplated such a result. Some believe that he hoped to do the work of a reformer and to induce the Jewish people to adopt his Gospel ideals without divorcing them from the traditions and customs of their people, and who were far from supposing that in becoming disciples of Christ they were taking a step which would, at length, separate them from the religion of their fathers.

In view of all the circumstances this supposition seems improbable. The ritualism and traditionalism of late Judaism and the radical ethicism of Jesus were too diverse to admit of reconciliation. As he himself expressed it, his countrymen who were accustomed to the old wine skins of Judaism (Luke v. 27–39). Accordingly, the separation which Jesus' experience at the hands of his countrymen had betokened became more and more complete as time went on. The teaching of men who discerned and emphasized the contrast between Judaism and Christianity—especially that of the apostle Paul—the intense missionary spirit of the early Christians and the downfall of the Jewish state in 70 A.D., were among the circumstances which completed the separation of the two forms of faith and started Christianity on its career as one of the great world religions.

In speaking of the religion of Christ, we must refer primarily to his own teaching and that of his early disciples. This we may the more properly do since all Christians agree that for obtaining a knowledge of the principles of their religion recourse must be had to the writings of the New Testament as being, in some sense, primary and formative. Despite the differences of opinion which have obtained in the Christian world, there are certain great, general convictions which Christians share in common and which may be said to underlie or constitute the claims of the Christian religion on its own behalf.

Chief among these claims is this, that the unique personality, teaching and influence of Jesus Christ gave him a supreme place among the religious teachers of the world. All Christians would assert the incomparable elevation and excellence of the morality which he taught and illustrated, and would maintain that the influence of his example upon the life of the world has been most salutary. They would agree that a revelation of God is to be seen in the person and lifework of Jesus, however widely they might differ as to the method, nature and scope of that revelation. It is a general Christian conviction that the moral effects of Christianity in the world have been such, on the whole, as to constitute an evidence of its divine origin and character. These introductory considerations must now be further elaborated.

Christianity and Christ.—How did Christ become the Founder of a new religion? We must answer: By the personal influence and inspiration which he exercised upon those who associated themselves with him. He did not adopt the methods of the political organizer. He created no party; led no uprising; elaborated no formal program. Other founders of religions have generally been the authors of elaborate books of rules and doctrines; Jesus wrote nothing. He was not an organizer or an aggressive leader of men. He advocated no revolution, except the moral revolution of the inner life. He moved quietly about along the highways and among the villages of Galilee and Judea, speaking to men about God and life and duty, and thus initiating a movement which has trait separating himself or his disciples from the congregation of Israel. In view of all the circumstances this supposition seems improbable. The ritualism and traditionalism of late Judaism and the radical ethicism of Jesus were too diverse to admit of reconciliation. As he himself expressed it, his countrymen who were accustomed to the old wine skins of Judaism (Luke v. 27–39). Accordingly, the separation which Jesus' experience at the hands of his countrymen had betokened became more and more complete as time went on. The teaching of men who discerned and emphasized the contrast between Judaism and Christianity—especially that of the apostle Paul—the intense missionary spirit of the early Christians and the downfall of the Jewish state in 70 A.D., were among the circumstances which completed the separation of the two forms of faith and started Christianity on its career as one of the great world religions.

In speaking of the religion of Christ, we must refer primarily to his own teaching and that of his early disciples. In speaking of the religion of Christ, we must refer primarily to his own teaching and
CHRISTIANITY

an incomparable knowledge of God's nature and will. If we can trust the earliest reports of his teaching, we must say that he never separated his message from his personal claims as the bearer of it. However unwarranted the historic theories of Christ's person may have been, they sprang from a legitimate impulse. The Christian religion implies and necessitates some theoretic estimate of Christ.

Christianity and Scripture.—Christianity has sometimes been described as the religion of a book. It would be more correct to say that it is a religion with a book. It is certainly not a book-religion in the sense in which Mohammedanism or Confucianism is. It does not appear, as it were, ready-made in the writings of any single sage or prophet. Its sacred books are its products, not its cause. Its program was not first elaborated in a book and then carried out in life and action. Christianity did not begin with a body of rules or laws. It is, or, at any rate, originally was, a religion in which motives and principles are primary and whose nature it is to create its own externals.

Nevertheless, the conception that the religion of Christ had its chief source and warrant in the divine teaching of God is today among Christians still has a wide popular acceptance. A similar view prevailed in Judaism concerning the religion of Israel. The Mosaic law was believed to have had its origin in heaven and to have been prescribed, by divine authority, the complete religious duty of man. This law was the antecedent warrant for all that was to be believed and practised. This conception of an authoritative book in which the laws and principles of the system were incorporated in advance was transferred to the earliest Christian writings and became the popular working theory of the subject.

Nothing is plainer, however, than that such a view, alike of the Hebrew and of the Christian Scriptures, is quite unhistorical. The Mosaic law was a comparatively late codification of rules and maxims which were developed and collated through a long period of time. In its present form it was later than the preaching of the great prophets whose teaching represents the first period of religious development. In like manner the writings which compose our New Testament were produced after Christianity had been, for a considerable period, a vigorous force in the thought and life of the world. Its oldest books, the earlier letters of Paul, were incidental products of his missionary activity. They were addressed to individuals, particular congregations or groups of congregations, and dealt largely with local conditions. They could not have been written with the remotest thought, on the part of the apostle, that he was contributing to an authoritative canon of Scripture. They were doubtless highly prized and carefully preserved by their recipients, yet not carefully enough to prevent several of them from being lost. At first they were not thought of as sacred Scripture—they were not placed on a level with the Old Testament; for example; that character they acquired only afterward when they became available in various controversies for the refutation of heresy.

What are the words of Jesus were carefully treasured from the first and the various early efforts to preserve them in writing were the germs of the New Testament canon. They were probably preserved for a generation or more in oral tradition only and after various redactions and compilations took form in our present Gospels toward the end of the 1st century. Speaking broadly, then, we may say that the New Testament is the earliest available literary product and record of primitive Christianity and possesses unequalled historical and practical value because it acquaints us most closely with Christ and with the first effects of his work in the world. The New Testament contains the original documents of the Christian religion.

Its Theological Basis.—Christianity is one of the great monotheistic religions. In general, its theistic presuppositions were derived from Judaism, on whose soil it took its rise. By its monotheism it is differentiated at once from polytheistic religions, such as those of ancient Greece and Rome, and from pantheistic systems, such as Brahmanism and Buddhism. In common with Judaism, Christianity not only understood that the world has a creator, but understood that creator to be one and indivisible. Man is not himself a part of the whole but a separate soul; or, rather, he is not himself a part of the whole but a separate soul. Thus Christianity is one of the great monotheistic religions. It is the religion of the one God, of the one Lord, of the one Father. It is the religion of the one Jesus Christ, of the one Son of God. It is the religion of the one Holy Spirit. It is the religion of the one Church. Finally, it is the religion of the one faith, of the one hope, of the one love.

Its Theological Basis.—Christianity is one of the great monotheistic religions. In general, its theistic presuppositions were derived from Judaism, on whose soil it took its rise. By its monotheism it is differentiated at once from polytheistic religions, such as those of ancient Greece and Rome, and from pantheistic systems, such as Brahmanism and Buddhism. In common with Judaism, Christianity not only understood that the world has a creator, but understood that creator to be one and indivisible. Man is not himself a part of the whole but a separate soul; or, rather, he is not himself a part of the whole but a separate soul. Thus Christianity is one of the great monotheistic religions. It is the religion of the one God, of the one Lord, of the one Father. It is the religion of the one Jesus Christ, of the one Son of God. It is the religion of the one Holy Spirit. It is the religion of the one Church. Finally, it is the religion of the one faith, of the one hope, of the one love.

So far all Christians would theoretically agree. When, however, we proceed to inquire as to the moral character of God, Christian speculation illustrates wide diversities of view. Men necessarily represent God to themselves by means of analogies drawn from their own life and experience. Hence in different ages, with their differing ideals and standards of life, various human analogies have been used to purport forth the nature and attributes of Deity. The Christian idea of the one personal God, at once gracious and holy, has, accordingly, varied in its form from age to age or within the same age among people of different religious affiliation. Now one aspect or attribute of his nature has been magnified, now another. But amidst all such divergences of emphasis, there has been a continuous and constant effort to conceive the character of God according to the highest ethical standards, and to represent him embodying in himself all possible moral perfections.

Many modern Christian divines hold that the truest and most satisfying analogy with which to describe God is that which Jesus chiefly employed, namely, that of fatherhood. His favorite name for God was the Father. The descriptions which he gave of the nature and action of the Father show that for him fatherhood meant original, self-imparting, all-embracing love. Hence the apostolic summary of the Christian doctrine of God: "God is love." Is true to the thought of Jesus. The kindred formulæ: "God is spirit," that is, of a spiritual nature, as opposed to what is material and local, and: "God is light," that is, perfect purity and beneficence, emphasize special aspects of God as fatherly love. Thus the Christian idea of God is best expressed by saying: God is Father; God is love.
Christianity and Judaism.—Historically speaking, Christianity arose out of Judaism. Jesus declared that he had not come to destroy, but to fulfil, the law and the prophets. According to the Fourth Gospel, Jesus summarized the relations of his work and teaching to the religion of Israel by saying: "The (Messianic) salvation is from the Jews." There is no fundamental doctrine of Christianity the germ of which are not found in Judaism. Christianity presupposes the ethical monotheism, the ethical monotheism, the value of the world and man and the ideals of rightousness which underlie the teaching of Israel's greatest religious teachers, the prophets. The New Testament uniformly regards the gospel as an unfolding, a development from the Jewish religion, and this view is amply justified by a critical study of both religions.

But are they, then, two different religions? Are they not merely two branches growing on the same stem? The differences appear by contrast. Christianity is the view of cards. In Israel Church and State were one. The state had no existence except in and through its religious constitution. Israel's great peculiarity was that it conceived itself to be a theocracy, a people whose real king was Jehovah. Now Christ, in his teaching, entirely disregarded this civic organization of the forces of religion. His teaching was wholly ethical and spiritual. He framed no constitution, enacted no laws; he did not even formally provide for an outward organization. Many Christians, indeed, hold that the creation of a closely compacted organization, a new kind of theocracy, was implicit in the principles of Jesus and was the legitimate and necessary outgrowth of his work; but however that may be, it cannot be shown that, in any direct way, he concerned himself with matters of outward organization and policy.

To the ritualistic system which was so prominent a feature of Judaism, Jesus only incidentally referred. As we have seen, he made a violent break with this system; it is a fair inference that he continued to attend upon the temple worship. But he laid no stress upon a ritual which had acquired increasing importance in the life of Judaism, and even depreciated it. Like the Old Testament prophets, he does not commend sacrifices, but teaches that the most commonplace moral duty is more important. The most sacred rite of all, the badge of Israel's separation from the rest of the world, circumcision, he never even mentions. From such considerations it is evident that the gospel of Jesus is no mere reproduction of Judaism.

There are many other differences kindred to those which have been mentioned or growing out of the growth of Judaism. Christianity is the view of its Founder, a legal religion. It is a dispensation of inner, not of outer, law. In this regard, its closest analogue in Hebraism is the teaching of the prophets. The New Testament writers see in the gospel the fulfillment of the prophecy that the new covenant should not be like the old; that the chief mark of the Messianic era should be that God would write his law on the heart. Hence Christianity finds its norm not in statutes, but in a personal life in which it beholds all its motives operative and all its thoughts illuminated.

The Relation of Christianity to Other Religions.—The principle which the Founder of Christianity announced when he said that he had not come to destroy but to fulfill was not applicable solely to Judaism. Jesus recognized goodness and truth under whatever form of religious practice it might be found. While it is true that he has a found in Jewish history a unique revelation of God and recognized in the Jewish Scriptures the product and record of that revelation, it is also true that he found a revealing and saving activity of God outside Judaism. He could see in the nobility and generosity of a heathen soldier a faith not matched in all Israel. He had other sheep who were not of the Jewish fold whom he would bring into the fold. In the opinion of many interpreters the judgment parable in Matthew xxvi is intended to describe the testing of the heathen, many of whom are accepted because they have shown the spirit of love and service; having done kindness to Jesus’ fellowmen, they are regarded as having done it unto him.

The New Testament writers have apprehended this conception of the relation of the gospel to other forms of religion. Paul declared that God had not left himself without a witness among any people; that he had made of one blood all nations of men; that the Greeks had been his people, and that there was a law of God written in the hearts of all men. The apostle recognized elements of truth in the crude beliefs and worship of the heathen. Despite their ignorance, he saw in their more than ordinary religiousness evidence of a sincere aspiration after God and in their devotions and moral judgments a proof of their native kinship to him.

These views obviously rest upon the conception that, in some real sense, revelation is universal. God’s eternal power and divinity are known to mankind, says Paul, because God has made these truths known to them. Other New Testament writers teach the same in other terms. In the Fourth Gospel Christ is identified with the Logos of Greek speculation. Accordingly in his preincarnate activity he is conceived as the medium of a universal revelation. Like an eternal sun he has been shining down into the world’s darkness and sin, enlightening the minds and hearts of all men, not only in the life of Israel of old, however blind this favored people may have been to his presence. Paul expresses allegorically the same thought when he says that the spiritual rock of which the Israelites drank in the wilderness was Christ. But this action of the pre-existent Christ was not exceptional. He was the light of men universally. "His writing is upon the wall, whether of the Indian fane, or of the porticoes of Greece." (J. H. Newman). From these various lessons it is seen in the New Testament writers esteem and regard the teaching and work of the Founder of the Christian religion as a clarification and completion of such truth. Christianity builds on the constitutional religiousness of man, upon his native and persistent sense of God, which it aims to enlighten and to quicken into a rational, moral faith.

The Doctrinal Contents of Christianity.—What has been said concerning the early history of Christianity, its monotheism and its constitution of God, may serve as a point of begin-
CHRISTIANITY

Its Ethical Character and Requirements.
—While, officially considered, Christianity has had the character of a doctrinal system, with its authorized theories and binding beliefs, practically its chief value and power have lain in its ethical teachings and influence. Theologians have placed great stress upon the various formulas and definitions which have been elaborated from time to time, but of these the vast mass of Christians have never had more than the vaguest knowledge. Dogmaticians have often held that Christianity was primarily a body of officially defined doctrines, but for most believers it has certainly not been such but rather a series of moral duties and requirements—a certain line of action or kind of life.

This view of Christianity is more germane to the teaching of Jesus than the dogmatic view. He promulgated no creed, elaborated no system, championed no set of formulas. His teaching was doctrinal in the sense that there underlay it certain conceptions. The doctrine thus included these three elements: (1) the coequal eternity of the three persons; (2) the subordination and derivation of the second and third from the first; and (3) the consequent oneness of the divine Nature in which all three persons are united. It would carry us beyond the purpose of this article to dwell upon the various arguments and analogies by which it was sought to illustrate the nature of this tri-unity in God, or to describe the varying types of theory which were elaborated in subsequent theological discussion. Those who desire to pursue the subject further can do so by the aid of such standard treatises as Neander’s or Milman’s History of the Church, or Fisher’s History of Christian Doctrine. The various forms of Trinitarian belief are sketched and discussed in Prof. L. L. Paine’s Evolution of Trinitarianism.

The orthodox doctrine of incarnation was that the Son, the second person of the Trinity, united himself with human nature—sometimes defined as impersonal, sometimes as personal. “Two whole, complete natures in one person” was the formula. In modern times these definitions have been modified or rejected by most of the liberal philosors. The Christian philosophy of the Trinity from that on which the definitions proceed.

Amidst the many diversities of opinion and theory the great common conviction of all Christians is that Jesus Christ is the supreme Revealer of God and the Saviour of men. The manner in which he effects their salvation has been variously explained and illustrated according to the conceptions entertained at different times of the ethical character of God. But whether Christ died as a sacrifice or as an expiation, or as a sacrifice and expiation, he paid a debt of honor to God or to have experienced a vicarious punishment for us, or to have safeguarded the divine government, or to have furnished a supreme example and incentive to goodness—in all these and other theories of atonement he is recognized as the Way to the Father.

These few statements respecting three great doctrinal topics may serve as illustrations of the historic theories which have been, in some cases, sanctioned by ecclesiastical authority, and, in others, favored almost equally binding by tradition and of the modern form by the application to them of modern historical and philosophical methods of investigation and thought.
the patriarch of Constantinople was the chief
dignitary. Out of the same controversies also
grew a number of sects and national churches
still substantially Christian, such as the Greek, Ethiopian,
and Armenian. Down to the Protestant Rehormation in the 16th century the two chief
forms of Christianity were the Oriental, now
represented by the Greek and Russian Churches,
and the Roman Catholic. In the West the
claims of the papacy were gradually increased
until the Pope rivaled in political power the
greatest European emperors. There was no
responding development in the East, where the
Church became more and more dependent upon
and subservient to the states with which it
was allied. The Eastern Church was dif-
f erenced from the Western by a more speculative
and less practical tendency, the favorite
themes in the theology of the former centering
in the doctrine of the Trinity, those of the latter
having more largely to do with sin and
salvation. Both developed an elaborate ceremo-
nial of which the mass is the central feature.

At the Reformation, or in consequence of its
results, the various divisions of Protestantism
arose. Some of these, for example, the
English Church, continued in alliance with the
state; others repudiated any such connection.
The Church of England retained the Episcopal
system and laid increasing stress upon its con-
tinuity in organization with the Church of
apostolic days. Most Protestant communions
rejected this order along with other features of
the Roman organization, and attached no
importance to the question of so-called tactual
sacraments. Among these the greatest variety
of belief and practice prevails.

It is quite impossible adequately to charac-
terize in a brief statement the various forms of
belief and life which the Churches and creeds
of Christendom illustrate. In general, it may
be said that the Roman type represents a highly
elaborated, authoritative system. The decrees
of popes and councils are binding, and, indeed,
within certain limits, infallible. There is a
highly developed and minutely defined system
of dogma and an elaborate ritual. Great stress
is laid upon the prescribed rites of the Church
and upon priestly mediation. Salvation is
mediated through the sacraments, which are
seven in number. In the English Church we
see an intermediate form. Its head is not the
Pope, but the king. In general, it highly
seems the decrees of the early councils and lays great
stress upon the (two) sacraments, but, in
practice, does not compel the unquestioning ac-
ceptance of the former, nor regard the latter
as essential to salvation. Many of the bodies,
such as Baptists, Congregationalists,
Methodists and Presbyterians, permit and ex-
cercise a larger liberty regarding traditional
beliefs and rites, some of them, as the two former,
having no general authoritative creed, others,
as the two latter, allowing considerable liberty
in the interpretation of their official articles of
belief. In general, it may be said that in
Protestantism the prevailing tendency of
thought is to regard Christianity as not being
a system which can be embodied in rules and
enforced by laws, but a religion whose
nature it is to attest itself to reason and con-
science by its moral appeal to the human mind
and heart.

The Essential and the Transient in Chris-
tianity.—What facts and truths constitute the
essence, the permanent substance of Chris-
tianity? That is a difficult question. Such
Christian thinkers would answer in the most
various ways. Certain it is that in its long
history Christianity has undergone many trans-
formations, been influenced by a great variety
of foreign forces and taken up into itself many
incongruous elements. In its most modern
form it blended with the Roman Imperial idea.
In its most elaborate developments of dogma it
wrought in close alliance with Greek philosophy.
Some of its doctrines have been examples of a
Christianized Platonism. Are these features of
historical Christianity essential to it?

The same question meets us if we go back
to the Church of the first age. The common
view has been that every idea which is found in
the New Testament is of the essence of Chris-
tianity; but this supposition is not without its
difficulties, and was probably never consistently
carried out in practice. Were the apocalyptic
expectations of the first Christian century valid
and essential — the universal belief in Christ's
second personal return to the world, the confident anticipation of Rome's early
destruction and the like? A close study of
eyeapatic Christian history reveals the fact that the
admixture of foreign elements with primitive
Christian teaching was not limited to the later
ages of the Church, the Christian doctrine had al-
ready undergone a considerable development
within the New Testament period. Greek ideas
and, especially, late Jewish theories and specula-
tions, must be taken into account in interpreting
apostolic and post-apostolic teaching and tradition.

If Christianity be regarded as a certain kind
of life — if it be conceived as the essential
member in the kingdom of God then we cannot say that any one particular form
of church organization is essential, or that
Christianity is formed within a purely human
organization. Except in some places it is truly said
arbitrary definition of it, it cannot be said that
of that divine grace is the special province or prac-
tice of one of them. Nor can any other rite, or prac-
tice concerning the sacraments, or of re-
uculative be essential. A vast range of
essential form, though often insisted upon as essential to salvation, can hardly be a constit
part of Christianity, since the vastly greater
part of the life of the Christian world is nothing of

Christ never emphasized organized ceremonies or dogmas. His great words of
love, righteousness, sonship to God are like.
He said that all ritual observances were trifling in comparison with Judgment,
and the love of God; that he who had writ
a brother might better leave his sacrifice and
and God and man was the substance of all laws,
mandments; and his life was the perma-
ent commentary on these sayings. That was that God was
obedient, trustful, and a son of God. His concern was to found and foster the kingdom
of God; that is, the reign of love among men.
For this end he labored, suffered and died, as
he taught that his followers must follow him
in this path of service and sacrifice. To live
kind of life he lived is the essence of Chris-
tianity. See CHRISTIAN CHURCH.

Religion' (4th ed., Bonn 1888); Dreyer,
CHRISTIANS OF SAINT THOMAS—CHRISTIE

The following works are by Roman Catholic authors: Chateaubriand, 'Le génie du christianisme' (5 vols., Paris 1802); Shahana, 'The Beginnings of Christianity' (1903); Devieriv, 'Christian Apologetics'; Meagher, 'Christ's Kingdom on Earth' (New York 1900); Cardinal James Gibbons, 'The Faith of Our Fathers' (Baltimore 1880 et seq.).

GEORGE BARKER STEVENS,
Late Professor of Systematic Theology, Yale University.

CHRISTIANS OF SAINT THOMAS, the name of a sect of Christians on the coast of Malabar. In southern India, to which region the apostle Saint Thomas is said (by a tradition that has little to justify it) to have carried the gospel. The facts of their history are not well made out. They originally belonged probably to a body of Christians who, in the year 495, united to form a separate and distinct Church in eastern Asia, and who were adherents of the doctrines taught by the heretic Nestorius. At an early date (7th century) the Persian Church had adopted the name of Christians of Saint Thomas, and the Christians of Malabar received bishops from Persia. Latterly the Christians of Saint Thomas gained the position of a military caste which locally had considerable power. When the Portuguese gained a position in Malabar these Christians were forced to join the Roman Catholic Church (1599). But in 1653 many of them renounced this union, and having in 1665 received a bishop sent by the patriarch of Antioch, they have since belonged to the Jacobite body of Eastern Christians. The Church is now under the jurisdiction of the Church of Eastern Christians. The Church is now under the jurisdiction of the Church of Eastern Christians. They allow the consecration of a married layman or deacon to the office of priest. They hold that the pictures except the cross. Their liturgy is similar to the Syrian, and the Syrian language is used in it. At present they are, under the British government, free from any ecclesiastical restraint, and form among themselves a kind of spiritual republic, in which the priests and elders administer justice, using excommunication as a means of punishment. Consult 'The Indian Empire,' by Sir W. W. Hunter.

CHRISTIANSAND, kristeân-sand, Norway, city in the southern part of the country, situated on a sandy promontory north of the Torrilds ELV, in the Bay of Christiansand. It was built by Christian IV in 1641; and has been the capital of its province or stift since 1684. It has several docks, a good harbor, much used for refuge, and a considerable trade in timber, pitch, stockfish (salted cod), fish-oil for curriers, salmon, mackerel and lobsters, the latter chiefly for the London market. Hides, copper and iron are also exported. Shipbuilding is a considerable industry. Christiansand has a cathedral and grammar-school, and is the residence of a bishop. The streets are wide, straight and regular; the houses are built of wood and detached, presenting altogether a remarkable colonial appearance. It has twice, once in 1800 and once in 1879, been burnt by fires. Its fortifications have become useless because of the fortress built at Flekkerø, five miles distant. Pop. 15,154.

CHRISTIANTED, krist'ënted, capital of the Danish West Indies, and chief town in the island of Santa Cruz, situated on the north-east shore. The harbour is small, being encumbered with many shoals, one of which stretches out nearly two miles seaward in a northeasterly direction. Pop. 6,000.

CHRISTIANSUND, Norway, seaport on the northwestern coast, capital of the bailiwick of Romsdal, 82 miles southwest of Trondhjem, on three islands, which enclose its beautiful land-locked harbor. Fresh water is scarce and must be brought to the islands in long aqueducts. The trade of the place is considerable, and the principal export is dried cod, chiefly for the Spanish and Italian markets. The town was founded in 1734 by Christian VI of Denmark, who gave it many privileges.

CHRISTIE, Anne, Canadian poet and novelist, b. London, England, 1837. She went to Canada in early life and settled on Amherst Island, near Kingston, Ontario. Later she removed to Ottawa. She wrote several short stories and poems for American, British and Canadian periodicals. She also wrote for the Magazine of Poetry and received high praise from distinguished critics for her verses dealing with the Riel rebellion. Her novels include 'Alice Grey' (1873); 'Edge Tools' (1880); 'Requested' (1886); 'Loved I not Honour More' (1889).

CHRISTIE, Richard Copley, English scholar, b. Lenton, Nottinghamshire, 22 July 1830; d. Ribe, 9 July 1903. He was educated at Oxford, studied law and practised his profession 1857-77. He was professor of political economy at Owens College, Manchester, 1854-66, and was chancellor of the diocese of Manchester 1872-94. After retiring from the profession he gave much time to bibliographical research, and besides contributing to the 'Die-
tionary of National Biography' he published 'Biennie Doit, the Martyr of the Renaissance' (1880); 'Old Church and School Libraries of Lancashire' (1885); 'Letters of Sir Thomas Coghill to Owen Collector'. He opened the 'Christie Library', opened in 1898, and at his death bequeathed his library of 75,000 volumes to the same institution. Consult The Athenæum, 19 Jan. 1901.

CHRISTIE, Sir William Henry Mahoney, English astronomer: b. Woolwich 1845. He was educated at King's College School, London, and at Trinity College, Cambridge. He became fellow of the latter in 1869 and in the following year was made chief assistant at the Greenwich Observatory. In 1880 he was secretary of the Royal Astronomical Society and in 1881 became Astronomer Royal, remaining in this relation until 1910. He has published numerous technical papers in scientific periodicals and the volume 'Manual of Elementary Astronomy' (1875). He was created K.C.B. in 1904.

CHRISTIE JOHNSTONE, a story by Charles Reade, published in 1855. The story, by turns pathetic and humorous, abounds in vivid and dramatic scenes of Scottish life by the sea.

CHRISTINA, kri-te'na, queen of Sweden: b. Stockholm, 9 Dec. 1626; d. Rome, 19 April 1689. She was a daughter of Gustavus Adolphus, and her education was conducted in a masculine manner. After the death of Gustavus in 1632 the States-General appointed guardians to the Queen Christina, then but six years old. These were the five highest officers of the Crown, who were entrusted at the same time with the administration of the kingdom. The education of Christina was continued according to the plan of Gustavus Adolphus. She learned the ancient languages, history, geography, politics, and renounced the pleasures of her age in order to devote herself entirely to study. In 1644 in her 18th year she took upon herself the government. A great talent for business, and great firmness of purpose, distinguished her first steps. She terminated the war with Denmark, obtained several provinces by the treaty concluded at Brömsebro in 1645. She then, contrary to the advice of Oxenstiern, who hoped to gain, by the continuance of the war, still greater advantages for Sweden, labored to re-establish peace in Germany, in order to be able to devote herself uninterruptedly to the sciences and the arts of peace. France, Spain, Holland and England sought her friendship. She promoted commerce by wise legislation, and patronized the learned and literary institutions. She declined to marry her cousin, Charles Gustavus, but induced the States-General in 1649 to designate him for her successor. In 1650 she caused herself to be crowned with great pomp, and with the title of king. From that time she neglected her ancient ministers, and listened to the advice of ambitious favorites. The public treasure was squandered with extravagant profusion. Distinctions were conferred upon the undeserving, and produced jealous murmurs, complaints and factions. In this state of confusion the Queen declared her intention of abdicating the crown. The old ministers remonstrated with so much energy that the Queen desisted from her resolution. She now grasped with more firmness the reins of government, and occupied herself again with study, bought paintings, medals, manuscript, books, maintained a correspondence with many learned men and invited several to her court. Descartes, Grotius, Salmiasi, Bœchard, Huef, Chevreau, Naudé, Vossius sent letters to Queen Christina. She appeared in Stockholm, and the Queen conversed familiarly with them on literary and philosophical subjects. But new troubles occurred; and Christina, who loved whatever was uncommon, resumed her determination to resign the crown.

In 1654 she assembled the States-General at Upsala, and in their presence laid aside the insignia of royalty to surrender them into the hands of Prince Charles Gustavus. She reserved to herself a certain income, entire independence and full power over her suite and household. A few days after she left Sweden, and went to Brussels, where she made a secret profession of the Roman Catholic religion, which she afterward publicly confirmed in Innsbruck. From there she went to Rome, which she entered on horseback in the costume of an Amazon, with great pomp. When the Pope Alexander VII confirmed her she adopted the surname of Alexandra. In 1656 she visited France, where her dress and manners produced an unfavorable impression, but her talents and knowledge were generally admired. She offered to mediate between France and Spain; but Mazarin declined the offer. While at Fontainebleau during this visit, abusing the right of extra-territoriality, she had Monaldeschi, her grand equerry and lover, executed before her eyes, as a faithless traitor. Mazarin succeeded in accelerating her departure from France under various pretenses. After the death of Charles Gustavus in 1660, the Queen made a visit to Sweden, under pretense of wishing to arrange her private affairs; but it was soon perceived that she had other views. As the Crown Prince was very young, she declared that in case of his death she should lay claim to the throne. This project was unfavorably received and she was compelled to sign a formal act of abdication. About this time she aspired to the Polish Crown, but the Poles took no notice of her wishes. Finally she returned to Rome, where she passed the remainder of her life in the cultivation of arts and sciences, giving way at times to fits of sensual indulgence. She was interred in the church of Saint Peter, and the Pope erected a monument to her with a long inscription. She had asked only for these few words: 'Christina annos LXXXIII. Consult Archenholts, 'Vie de Christine par elle-même' (Stockholm 1751); Bain, 'Christina, Queen of Sweden' (London 1890); Geyer, 'Geschichte Schwedens,' Vol. III (Hamburg 1836).

CHRISTINA, Maria, queen of Spain, daughter of Francis I, king of the Two Sicilies, and mother of Isabella II, the de-throned queen of Spain: b. Naples, 27 April 1806; d. Hâvre, 22 Aug. 1878. She was married to Ferdinand VII in 1829, and took an active part in the affairs of Spain from 1830 to 1854. As queen-regent she governed arbitrarily, and in 1834 she abdicated.

CHRISTISON, Sir Robert, Scottish physician and toxicologist: b. Edinburgh, 18 July 1797; d. 23 Jan. 1882. He graduated in medicine at Edinburgh University in 1819, and subsequently studied in London and Paris. He was appointed to the chair of medical juris-
CHRISTLIEB — CHRISTOLOGY

prudence in Edinburgh in 1822, shortly after his return to Scotland, and in 1832 was promoted to those of materia medica and clinical medicine, but resigned them in 1877 and 1855, respectively. He was twice president of the Royal College of Physicians, president of the Royal Society of Scotland and ordinary physician to the queen in Scotland. He was created a baronet in 1871. The most important of his published works is his 'Treatise on Poisons' (1829); he also wrote 'Granular Degeneration of the Kidneys' (1839); and a commentary on the 'Pharmacopoeia of Great Britain' (1842).

CHRISTLIEB, krist'leb, Theodor, German theologian: b. Bukenfeld, Württemberg, 7 March 1833; d. Bonn, 15 Aug. 1889. He studied at Tübingen, after which he taught for some time in France. In 1858 he began preaching in London, where his famous lectures on 'Modern Doubt and Christian Belief' were later published. After a stay of seven years in London, in 1865 he returned to Germany, and subsequently, in 1869, became professor of theology at Bonn. In 1873 he was sent to the United States as a delegate to the Evangelical Christian Alliance, then convened in New York, and delivered a lecture before that body on rationalism. Prominent among his publications are 'Leibniz und Lehre des Johannes Scotus Erigena' (1860); 'Modern Doubt and Christian Belief' (1874); 'Protestant Foreign Missions, Their Present State' (1880), etc.

CHRISTMAS, derived from the medieval Christes Masse, the Mass of Christ; the feast commemorates the birth of Jesus, as observed by the Christian Church annually on the 25th of December. It was, according to many authorities, not celebrated in the first centuries of the Christian Church, as the Christian usage in general was to celebrate the deaths of remarkable persons rather than their birth. The death of the martyr Stephen, and the massacre of the innocents at Bethlehem, had been already long celebrated, when, perhaps in opposition to the doctrine of the Manicheans respecting the birth of the Saviour, a feast was established in memory of this event in the 4th century. In the 5th century the Western Church ordered it to be celebrated forever on the day of the old Roman festival of the birth of Sol, as no certainty knowledge of the day of Christ's birth existed. Among the German and Celtic tribes the winter solstice was considered an important point of the year, and they held their chief festival of Yule to commemorate the return of the sun to the holy wheel; the Yule log and the wassail bowl are relics of pre-Christian times. In the East Christmas was celebrated on 6 January. As told in the Gospel of Saint Luke, Christ was born during the night, and therefore divine service was performed in the night of 24–25 December, from which circumstance Christmas is called in German Weihnachten, a contraction of the old German ze vil nahten, on the holy or consecrated nights. The feasts of the martyr Stephen and the evangelist Saint John were united with it, and a feast of three days' continuance was thus formed. In the ecclesiastical year this festival gives name to a period extending from the first Sunday of Advent to the feast of the Holy Trinity. In most Roman Catholic Church priests are allowed to celebrate three masses against the rule which prevails every other day in the year. In the Greek and Roman Catholic churches the manger, the holy family, etc., are sometimes represented at large and before them are sung the carols and manger songs which are musical features of Christmas-tide. Most Christian churches celebrate this great festival in some way, and practically the entire community in Christian countries, including Jews and non-churchgoing people nominally classed with Christian populations, join in its social observance. In the United States, England and other countries business is commonly suspended, although in Scotland this is only partially the case. The custom of making presents at Christmas is derived from ancient usage; but it has become consecrated by ages, and contributes greatly to make this festival an interesting event to families. (See Befana.) The sending of Christmas cards by way of friendly greeting and remembrance has grown up since about 1860. The Christmas-tree has been adopted from the Romans. It went from Germany to Great Britain, and is almost universal in the United States, where the customs of so many nationalities meet and gradually blend into common usage.

CHRISTMAS-BOX. See BOXING-DAY.

CHRISTMAS CAROL, a song in celebration of Christ's birth, sung especially at Christmas time. Such carols, as well as many of a more secular but always joyous nature, have been long popular among the people of many nations. In France they are known as noëls, and various good collections of them have been published from time to time. Consult Sandys, 'Christmas Carols, Ancient and Modern.'

CHRISTMAS GIFTS, Origins of. See Befana.

CHRISTMAS ISLAND, the name given to three oceanic islands, of which the most important is situated 200 miles southwest of Java. This island, which is supposed to have been originally a coral atoll, and to have been raised by volcanic forces, rises to the height of nearly 1,600 feet and is in shape an irregular quadrilateral nine miles long and about three miles wide. It was annexed by Great Britain in 1888, and a settlement has been formed on it for the purpose of developing beds of phosphate. The population in December 1914 was about 1,670, all employed in the phosphate industry.

CHRISTOLOGY, in the widest sense, includes whatsoever of theology bears upon the Christ; in a limited and technical sense, it is that branch of theology which treats of the nature, personality and activities of the Christ. In this technical sense, Christology may be conveniently treated according to the historical evolution of ideas Christological in: I. The Old Testament; II. The New Testament; III. The Early Church; IV. Modern Schools of Christology.

The viewpoint of this article is that of a like of Catholics and of Protestants, who have the traditional belief in the divinity of Christ. The names Catholic and Protestant have of set purpose been omitted, since the matter of belief is common. The essentials of the Christology of the Reformers have not been given; they are
the traditional and conservative ideas that run through the article. Anything distinctive of each form of Christian belief is left to the articles on the various religious denominations.

I. Christology of the Old Testament—The Word of God, and consequently derive religion from God's revelations to the human race, trace the idea of a Christ throughout many prophecies contained in the Old Testament.

Early Prophets.—Immediately after the fall of the human race in Adam, God promised a victory of that race over the enemy that caused its fall (Gen. iii, 14-15). In the divine promises made to Abraham, Isaac and Jacob, this victory was spoken of as salvation by their seed (Gen. xiii, 16; xv, 5; xxiii, 17-19; xxii, 17-18; xxx, 4; xxviii, 14). The saving seed of Jacob was designated as a Ruler in the patriarch's blessing of Judah:

"The sceptre shall not pass from Judah, Neither his seat between his feet, Till that he come whose cause is, And his be the obedience of the folk." (Gen. xlix, 10)

From Mosaic days, Israel looked forward to a salvation that should come through a King of the line of Jacob and of Judah (Num. xxiv, 17-19). To David (2 Sam. vii, 14-16; 1 Chron. xvii, 11-14), the interpretation of this revelation that is given in Hebrews i, 5.

The Christ of the Psalter.—In its present inspired content, the Psalter is the result of a gradual evolution. The Psalters of David, the Director, Asaph, etc., were finally collated and arranged in a lyric anthology that records Israel's religious thought from the time of David to that of Esdras. Three lyrics will sufficiently indicate the Christological ideas, whereof these inspired psalms afford abundant evidence. In Psalm 2, probably written in the time of David, the mention of the Christ, "the Anointed, the Messiah" (verse 2), whom previous Old Testament writings speak of as the saving King. Acts iv, 25-28 interprets the first two verses of this psalm as foreboding the coming of the Christ and the defeat of the power of the world to overthrow the Christ. The Christ of the Psalms is the Son of God, begotten in eternity: "Jahweh said to me: My Son art thou: I to-day begat thee" (verse 7). The divine name Jahweh, wrongly written Jehovah, means "He is"; and denotes the ever being of the Deity. Hebrews, in proving the divinity of Jesus, interprets this verse of natural divine sonship of the Christ (Heb. i, 5). In like manner, the Jews at the time of Jesus looked forward to the Christ, the King of Israel, as the Son of God. Witness the act of faith of Nathanael: "Rabbi, thou art the Son of God; thou art the King of Israel" (John i, 49). Witness the authoritative and judicial query of Caiaphas: "I adjure thee by the living God to tell us if thou be the Christ, the Son of God" (Matt. xxvi, 63). This expectation of the Jews infiltrated even into Samaritan religious life. The Samaritan woman said to Jesus: "I know that the Messiah who is called the Christ is coming" (John iv, 25).

In Psalm 45 (44):7-8, we find "Thy throne, O God, is forever and ever. . . Thy God, hath anointed thee." Hebrews i, 8-9 refers these words to the Christ as the natural Son of God, the first born of the Father and the object of adoration to the angels (Heb. i, 6). Hence, the Christ is here twice called the Son of God; and is throne, or reign, is said to be from eternity.

In Psalm 109 (110): 1. *Jahweh said to Adonai: Sit thou at my right hand." This passage is cited by the Christ to prove that he is Adonai, seated at the right hand of Jahweh (Matt. xxii, 44). But Adonai, "my Master," as a proper name, is used exclusively of the Deity, either alone or in such a phrase as Jahweh Adonai; indeed, in the stead of the ineffable name, Jahweh, the pious Jew read Adonai. It is clear, then, that in this lyric, Jahweh addresses the Christ as a different Person and yet identical in Godhead. Moreover, farther on Jahweh says to the Christ: "Before the day-star I begat thee" (verse 3). Hence the Christ of this psalm is the begotten of God, sharing the nature of his Father, different in personality; he is before the world comes into being; he sits at the right hand of the Father from all eternity.

The Sophia-Logos of the Sepulchral Books.—In Proverbs, Wisdom, and Ecclesiasticus, the Christ appears as the uncreated Sophia and Logos, the personified divine Wisdom and Word, a divine Person distinct from the first Person.

The Christ of the Early Prophets.—Isaiah who prophesied before the fall of Samaria (a.e. 722), will serve as a witness to the Christological ideas of the Prophets of the Assyrian period. All his inventive and foreboding in regard to the degeneracy and downfall of Israel are tempered by a Messianic hope that ever and anon looms large over against a stormy horizon. What though Samaria be on the point of falling? Fear not the Assyrian hordes.

"Say to the fluttering of heart: Be still, and know that I am God! Lo, with vengeance your God will come in quittance: Your God, he will come and save you!" (Is. xxxv. 4)

Manifold and multiform is the clear prophecy of Isaiah that the nature of the Christ will be that of a Jew and of a king. *Jahweh* (xl, 3). *Lo, Adonai Jahweh will come with might* (xl, 10). Saint Mark, witnessing to the Messianic expectation of his time, identifies Jahweh of this prophecy with the Christ (Matt. i, 3), that only Jahweh, but a new divine name is given by Isaiah to the Messiah: "His name will be called Emmanuel" (Is. vii, 14). This prophecy is said by Saint Matthew to be fulfilled in the divinity of Jesus the Christ: They shall call his name Emmanuel, which, being interpreted, is God with us (Matt. i, 23). Equally clear is the prophecy of the divinity of the Christ, when Isaiah says: "A child is born to us. . . . his name shall be called Wonderful, Counsellor, God the Strong One, the Father of the world to come, the Prince of Peace" (Is. ix, 6). The very same child, whose coming is to be the salvation of Israel, is called Emmanuel (vii, 14) and God the Strong One (ix, 6). The former name explains the latter. The Christ will be with Israel more intimately than Jahweh Shechinah, *Jahweh, He who teth with us.* By this more intimate presence and
CHRISTOLOGY

greater efficiency of Immanuel, is the Christ to be God the Strong One.

Though more efficacious than Jahweh of the old covenant, by the grace of might in Israel, the Christ will be "the Sprout of Jahuweh" (Is. iv, 2), the same in nature as the Father. "The Saviour sent by our God" (Is. iii, 10) will be "God our King" (Is. iii, 7).—yea, very God of very God, "Jahweh the God of Israel" (Is. iii, 12). The thought is the same, Hebrae, Jahweh, the hosts his name (Is. iv, 5).

The Christ of the later Prophets.—Among the prophets of the Babylonian period, Jeremiah stands out as a beacon of Messianic hope. While thundering against sin, before B.C. 586, he foretells the peace that is to be through the Christ. "Jahweh our Just One" (xxiii, 6; xxxiii, 16). Malachi (B.C. 459-445) says: "Behold I send my angel, and he shall prepare the way before my face, and presently the Lord, whom ye seek, and the angel of the testation, whom ye desire, shall come to his temple" (iii, 1). The Christ himself interprets "my angel" as his precursor, John the Baptist, who prepared the way before his public life (Matt. xi, 10). The revelation of Jesus was made in the words of Malachi. But the words of Malachi are uttered by Jahweh the great God of Israel. Hence, in this prophecy of Malachi, as elsewhere in the prophets, the type merges into the antitype, the God of the Old Testament becomes the God of the New, Jahweh and the Christ are one and the same divine person.

II. Christology of the New Testament.—Three fundamental facts are taught by the Christology of the New Testament: (1) The Divine Nature of Jesus Christ; (2) The Human Nature of Jesus Christ; (3) The Hypostatic Union of the Human with the Divine Nature in the Divine Person of Jesus Christ. The Divine Nature of Jesus Christ.—By the Christology of the Gospels and of Saint Paul, the divinity of Christ stands out in clear relief. The underlying, and at times overlapping, purpose of Matthew, Mark, Luke, John and Paul, is to establish the divinity of Jesus Christ. The evidence will be limited to two forms of this doctrine. First Jesus is the natural Son of God; secondly, he is very God. These two forms of the doctrine of the divinity of the Christ are deduced from documents, which are assumed to be authentic, historical and inspired. The origin of Mark from Q and another early document, the dependence of Luke upon Mark and an another source, of the sources of Matthew, the authenticity of the Pauline epistles, all these questions are waived in this statement of conservative Christology of the New Testament.

A. First, Jesus Christ is the Son of God. At Cesarea Philippi, during the third year of his ministry, Jesus asked the disciples: "Who do men say that the Son of Man is?" (Matt. xvi, 13). This name, Son of Man, was one of predilection to Jesus; it connoted his oneness with men. The disciples made answer that others said he was one of the prophets Christ pressed them: "But who do ye say that I am?" (ibid. 16). Peter, as spokesman, replied: "Thou art the Christ, the son of the living God" (ibid. 16). Peter meant more than they said that Jesus was one of the prophets. They meant that he was the adopted son of God. All the prophets were the adopted sons of God both by grace and by descent from Abraham. Without special divine revelation, Peter might have known that Jesus was the Son of God. The divine sonship that he ascribed to Jesus was known to him by special revelation, and not by acquired knowledge. Peter meant that Jesus was the natural Son of God. The Christ appeared of both the avowal and the source of information: "Blessed art thou, Simon son of John; for flesh and blood hath not revealed this to thee, but my Father who is in heaven" (ibid. 17). Jesus here admits that he is the natural Son of God; that God is his Father by a title greater than that whereby the prophets and other saintly leaders in Israel were adopted sons of God. That title is identity of divine nature. Friend and foe alike were allowed by Jesus to address him as the Son of God, and to show by adoration that they meant real and natural sonship, not a figurative and adoptive divine sonship consequent upon personal and racial sanctity. Men possessed by unclean spirits prostrated themselves in adoration before him, and the spirits of evil were forced to cry out: "Thou art the Son of God" (Mark iii, 12). His disciples, after the stilling of the storm at sea, adored him and said: "Indeed thou art the Son of God" (Matt. xiv, 33). The man born blind, whom Christ had cured at Jerusalem, was asked to make an act of faith in the divinity of the Wonderworker: "Dost thou believe in the Son of God? And after a brief instruction, he said: "I believe, Lord; and he adored him" (John ix, 36-37). The centurion on Calvary (Matt. xxvii, 54; Mark xv, 39), the evangelist Saint Mark (i, 1), the hypothetical witness of Satan (Matt. iv, 3) and of the enemies of Christ (Matt. xxiv, 40), all go to show that Jesus was called and esteemed the true Son of God. Never once did Jesus suggest that men should not give him the adoration due to God alone; never did he hint that men erred in making him more than the adopted son of God.

He could not have suggested such error. Adoration was his due. He claimed to be that which adoration implied, the Son of God; the natural Son of God. It was just before the end. Jesus had journeyed to Judea for the last time. He would continue his ministry thereabout for three months until the last Passover. Open and
CHRISTOLOGY

frank then were the teachings that had at times been given under the esoteric form of the parable. One day, during the celebration of the Feast of the Dedication of the Temple, Jesus was walking neath the portico of Solomon on the temple plot. His foes were on the watch. They wished to catch him in speech. So they gathered round about and said: "How long dost thou hold our souls in suspense? If thou be the Christ, tell us plainly." The answer of the Christ was typical. He put them off for a while; chided them for unbelief, for the rejection of the abundant testimony that his works bore of the truth of the Messianic claim. And then followed the clear and tremendous teaching: "I and the Father are one." The Jews understood at once. They took up stones to kill him. He asked why. He made them admit that they understood him aright. They replied: "We stone thee not for a good work, but for blasphemy; yea, for that thou, being a man, makest thyself God." Had they misunderstood, Jesus would have cleared himself of the charge; he would have denied all claim to true divine sonship, to identity of nature with God the Father. He made no such denial. He pressed the claim more fully home: "Do ye say of him whom the Father hath sanctified and sent into the world, Thou blasphemest, because I said, I am the Son of God? The Father is in me and I am in the Father" (John x, 22-38). A last incident worth special note is the judicial procedure before Caiaphas, who was de jure High Priest of the time. Jesus had hitherto held his peace, and made no reply to any false charges. But when Caiaphas solemnly queried in regard to the very fundamental issue of the Messianic mission, silence was broken. Caiaphas demanded: "If thou, by thy living, dost deny me, and be the Christ, son of God," (Matt. xxvi, 63). Simple and to the point is the answer: "I am," (Mark xiv, 62). Caiaphas understood. He rent his garments and accused Jesus of blasphemy. All joined in condemning him to death for the supposed blasphemy of claiming to be the natural Son of God. Jesus allowed them to understand his claim, and to put him to death thereafter. Had he not made claim to be the natural Son of God, he would have been other than fair and fair to correct the wrong impression.

B. Secondly, Jesus Christ is very God. Again and again New Testament Christology bears witness to this second form of the doctrine of the divine nature of the Christ, namely, that Jesus Christ is very God.

In the tradition of John, Jesus identifies himself absolutely with God: "He that seeth me, seeth the Father." (John xiv, 9). The very purpose of the Gospel of John is that ye may believe that Jesus is the Christ, the Son of God. (John xx, 26-27). The prologue is a grand summary of the fundamental facts of Christology: "In the beginning was the Logos, and the Logos was in relation to God the Father, and the Logos was God." (John i, 1).

From all eternity was the Logos, the Word. And the Logos of John is Jesus the Christ. For the Logos is he of whom the Baptist bears witness: "This is he of whom I said,—He who is come after me, is before me." (John i, 15). But he of whom the Baptist bears this witness is Jesus the Christ. (John i, 30). Therefore the Logos is Jesus the Christ. Hence the Christ was from all eternity.

Moreover, "the Logos was in relation to God the Father." This translation is correct. The words ὁ λόγος (with the article) mean, in Johannine Hellenistic, "God the Father." The preposition ἐν is the Platonic, as well as Aristotelian, way of expressing relation. New-Platonic ideas and forms had got a vogue in Alexandria. Alexandrian philosophy had been brought over the sea to Ephesus. It was the influence of this Alexandrian philosophy in Ephesus and elsewhere that John set himself to combat. Quite naturally, then, he adopted some of the expressions of the hostile school, and adapted them to his Christology. To stem the insinuating tide of Gnosticism, he clearly set it down that Jesus the Christ, the Logos of his Gospel, was from eternity, was in nature God, was in relation to God the Father from all eternity, and therefore a distinct divine Person. And to drive home by irresistible clearness of statement, the teaching of the divine nature of Jesus, John excluded some of the gnostic theory of the human coming into being, and apart from him came into being not one thing that is God (John i, 3). Jesus is the very God, who "in the beginning created heavens and earth" (Genesis i, 1). Similarly in his Epistles, John set down an absolute witness to the very Godhead of Jesus: "We know that the Son of God is come. And he hath given us understanding that we may know the true God, and may be in his Son. This is the true God and life eternal." (1 John v, 20). The Patristic interpretation down the centuries refers this to the Christ: "Jesus is the true God, and life eternal." 

Saint Paul is as absolute in his witness of the Deity of Jesus as are the evangelists. To the great Apostle, Jesus is the Christ, "who is over all things, God blessed for ever" (Romans ix, 5). The Christ is Jahweh of the Exodus: "And all drank the same spiritual drink; yea, they drank of the spiritual Rock that followed them, and the Rock was the Christ." (1 Corinthians x, 4). It was Jesus who some of the Israelites tempted; and they perished by serpents (ibid. x, 19). It was he, against whom "some of them murmured; and they were destroyed by the destroyer." (ibid. x, 10). In him dwelt the fulness of the Godhead bodily (Colossians ii, 9). Men should not go so low as to give to angels, that they see not, the adoration due only to the Christ (ibid. ii, 18). "For in him all things were created: and things were created by him and for him." (ibid. i, 6). "Although he was in the nature of God, yet did he not look upon equality with God as above all things to be clung to; but he emptied himself by taking the nature of a slave and by becoming like men. And having appeared among us in outward bearing as mere man, he still further humbled himself by submitting even to death,—even to death on a cross. And that is why God the Father raised him to the very highest place, and freely gave him the name which stands above all other names; so that the Name (at the Jahweh power of Jesus) every knee should bend in heavens, on earth and under the earth, and every tongue should confess that Jesus Christ is Jahweh in the glory of God the Father." (Philippians ii, 6-11).

The Human Nature of Jesus Christ.—The
CHRISTOLOGY

Gospel story of the birth, upbringing, public life, private life, suffering and death of Jesus would all be a lie, were he not a Man with human nature as such as ours. "For there is one God, and one Mediator between God and men, the Man Christ Jesus" (1 Timothy ii. 5). He is the 'seed of Abraham' (Galatians iii. 16), the son of David (Matt. i. 1), the fruit of the loins of Adam and of the seed of David according to the flesh (Romans i. 3).

To prove the human nature of the post-Resurrection Christ, Jesus even takes pains to enumerate the parts of his body: "See my hands and feet, that it is I myself; handle and see; for a spirit hath not flesh and bones as ye see me to have" (Luke xxiv. 39).

The Hypostatic Union of the Divine Nature with the Human in the Divine Person Jesus Christ. —New Testament Christology teaches not only that the Christ is true God and true Man—i.e., has divine and human nature—but that the two natures are physically united in one hypostasis or person, and that Person is divine. The very same Person, the Logos, the Christ, was in personal relation with God the Father from eternity (ibid. i, 2), created all things (ibid. i, 3), and was made flesh,—i.e., became Man in time (ibid. i, 14). The same divine Person, the Christ, "although he was in the nature of God, yet ... emptied himself by taking the nature of a slave and becoming like men. And having appeared among us in outward bearing as mere man" (Philippians ii, 6-7), he was "in every way tempted, exactly as we have been, yet without sinning" (Hebrews iv. 14). During the beginnings of the Church in Jerusalem, Saint Peter told the people, at the Gate of Solomon: "The Author of life ye have put to death, but God raised him from the dead" (Acts iii. 15). It is always one and the same Person, Jesus Christ, who is said to be God and Man, or is given predicates that denote divine and human nature.

III. Christology of the Early Church. —Of little import are the early heresies of Basili des, Marcion, Valentinus, the Manichæans and Apollinaris. They were combated by the Fathers of the time. First to attack effectively the conservative Christology of the early Church was Arius, who maintained that the Christ was not of one essence, nature or substance with God,—not a divine Person,—was at most a half-way between the human and the divine. This heresy was condemned by the declaration of the Church in the Council of Nicaea, A.D. 325, which defined the divinity of the single Person, Jesus Christ, and his twofold nature,—human and divine. Later Nestorius started a new form of heresy. He taught that, in Jesus, there were the human nature, and therefore a human person; and also a divine Person with a divine nature. This heresy was condemned by the Church, which in the Council of Ephesus, A.D. 431, defined the oneness and divinity of the single Person, the Christ; and the phrasis: 'anthropos Christos, theos Logos', Person, of the double nature, human and divine, of the Word made Flesh. Later another heresy took rise. By the anathema of Nicaea, the Church had made it impossible to teach, in the sense of Arius, that, in Jesus, there is no divine Person and no divine nature. In the Council of Ephesus the Church had condemned the opinion of Nestorius that, in Jesus, there were two persons and two natures. Was there room for more heresy? Yes, Eutyches saw a loophole. He taught that, in Jesus, there was only one Person, the divine, and only one nature. The followers of Eutyches, Monophysites, taught either an intermingling of the two natures of Christ into one; or some sort of a conversion of the human nature into the divine. The Council of Chalcedon, A.D. 451, launched an anathema against all Monophysites; and defined still more clearly that, in Jesus, there were two distinct natures, the divine and the human, physically united in one divine Person, and yet not merged into one nature.

What more? Since the two natures of Jesus were physically united in one divine Person, what handle for heresy remained? One handle more! Three of the Oriental patriarchs, Sergius of Constantinople, Cyrus of Alexandria and Athanasius of Antioch,—joined their patriarchal power in one last effort to destroy the great mystery of the Christian faith. They had to admit with Nicaea, Ephesus and Chalcedon that one divine Person, Jesus the Christ, had two natures, the divine and the human, physically united in one hypostasis or Person. But they rested the mystery of a perfect Man, who was not a human person. They withdrew from the perfection of the human nature of Jesus. They taught that, in Jesus, there was no human activity—that the activity of the human nature was merged into the activity of the divine; that, in Jesus, there was only the activity of the divine nature; that, in Jesus, there was only one person, one unity, and one will, and that one activity and one will were divine. Against this heresy, the Council of Constanti nople, A.D. 680, defined the perfection of the human nature of the Christ, his perfect human activity distinct from the divine, his perfect human activity distinct from the divine.
CHRISTOLOGY

One more effort was made by the Orient to detract from the perfection of the two natures in Christ. Photius, 9th century, admitted with the Council of Constantinople, the perfection of the human nature of Jesus; he detracted from the divine, and denied to the Son equality with the Father in the procession of the Holy Spirit. He was condemned. The Church taught the procession of Father and Son, the procession of the Holy Spirit from Father and Son as from one principle. A schism resulted. The tear was mended for a century and a half. Then, in the middle of the 11th century, under the Emperor Michael Cerularius, the party of Photius again gained power. Constantinople was wrenched from Rome. The Eastern Church was separated from the Western in its Christology.

H. R. Cortiet, 'History of the Church in Western Europe' (revised Batiffol), 'Primitive Catholicism' (1911); Barnes, 'The Early Church' (1913); Fortescue, 'The Lesser Eastern Churches' (1913), 'The Orthodox Eastern Church' (1911); Scott, 'The Beginnings of the Church' (1917); Fisher, 'The Beginnings of Christianity' (1916).

IV. Modern Schools of Christology.—Unitarians.—After the break between the Eastern and Western churches, there were no widespread, epoch-making Christological controversies for many centuries. The Reformers took over the three fundamental facts of traditional Christology; they taught the divinity and the humanity of the one divine Person, Jesus Christ. An exception was Lælius Socinus, who in a.d. 1544 was obliged to leave Italy for denying the divinity of Christ. From Socinianism came Unitarianism, which was first organized in Poland about a.d. 1563. Unitarians teach that Jesus is the highest of men, but profess a deism which excludes the doctrines of the Trinity and the divinity of Christ.

Modern theories of Christology are the outcome of two tendencies, which to-day divide German liberal Christologists. The first tendency is that of the Religionpsychologischemerkärlinge, the school that claims to interpret religion according to the findings of psychology; its chief resultant theories are the Ideal Christ, and the Christ of Experience. The second tendency is that of the Religiongeschichtlich-erkärlungslehre, the school that claims to interpret religion in terms of history; its chief resultant theories are the Christ of History and the Mythic Christ. Modern Christological theories at times show both tendencies,—for instance, the Christ of History now and then dovetails into the Christ of Experience; but it will make for clear exposition, if, according to his dominant tendency, the modern Christologist be classed under one of these four main groupings. All of these modern theories either explicitly deny the divinity of Christ, or deny a Godhead that departs from the definitions of the early councils of the Church.

The Ideal Christ.—During the 17th century, the Lutheran theologians strove by scholasticism to defend Lutheran Christology, and to explain the union of the two natures of Christ in one divine Person. Their attempts were an intellectualistic departure from Luther's voluntarism. In the 18th century, the revolt against this array of scholasticism on the side of Luther took place in the 18th century. The pioneer rebel was Kant (1724-1804). He was an anti-intellectualist. According to him, pure reason can reach, not the noumenon, the thing in itself, but the phainomenon, the thing in the content of consciousness; and hence pure reason cannot attain to the knowledge either of the human or the divine nature in Jesus. Hence faith is not an act of pure reason on the authority of God revealing. Faith is an act of the practical reason. Practical reason postulates, by a Kantian Ought, the acceptance of the Man-God; and this acceptance by the will is the Kantian act of faith in Christ (Consult Kant, 'Religion innerhalb der Grenzen der blossen Vernunft,' Chapter 4). Kant had set at naught things in themselves. They are, but we cannot get at them. Fichte (1762-1814) put aside even the Kantian noumenon, and substituted the use of them, since we cannot get at them? The only thing we know about them is that we know nothing about them. It is the I, the Self, that makes the world. The world is whatsoever self-consciousness makes of it. God and self-consciousness is the Moral Will, the will to act nobly, dutifully, steadfastly, divinely. The human nature of Jesus, being part of the world, in Fichte's Christology, is a limitation of the Absolute, the projection of Moral Will, the I, the Self, into time and space. The incarnation is the union of God and man by self-consciousness. The Deity of Christ is impersonal.

The Romantic School.—Fichte's explanation of the world of subject and object as the objectifying of Moral Will led to the Romantic School. This school was started by a group of young men, all born between 1765 and 1775, the two Schlegels, Tieck, Novalis, the philosopher Schelling, and the theologian Schopenhauer. The Romanticists substituted Emotion for the Moral Will of Fichte, as their impersonal Deity. The world of objects is what emotion makes it. Dream out your world; it is a dream of the inner life,—a projection of Emotion into time and space. In Christ, the Absolute first becomes a Godhead. Godhead is not that of a Person. Josiah Royce, late Alfred professor of natural religion, moral philosophy and civil polity, at Harvard, always retained the voluntarism of Schopenhauer.

Hugo Münsterberg late professor of Psychology in Harvard, was likewise voluntaristic in his philosophy. In seeking a substitute for Kant's noumenon—the useless thing-in-itself—he set down, as the ultimate category of objectivity, not Sein, not the being of the thing-in-itself; nor Müssen, not the must-be of a thing—a universal necessity consequent upon scientific consciousness; norollen, of the Freiburg school of critical transcendentalists, not the ought, of a thing upon Moral Will; but Wollen, an over-individual Will, reminiscent of the Wollen of Schopenhauer. Nietzsche's Absolute, Will Power, is also of the Romantic school. He deems Pontius Pilate to have been the nearest approach to Superman in the Gospel story.
Hegel (1770–1831), in his Absolute Idealism, is a monist. He identifies subject and object in unity and finds all reality in the Idea. God, Deity is not a Person, his Christ is an Idea. To explain the world, that seems to be outside the thinking subject, Schelling starts from the Absolute; Hegel starts from the Idea. The Absolute is the pure Idea in itself; Nature is the pure IdeaSubjunctive; Spirit is the IdeaMan, turning back on itself — the Idea as Soul, Society, God. The Christ is the supreme manifestation of the Idea. Among recent Neo-Hegelians are Bradley, the Cairds, Bishop D'ArCY of Down and Canon INGE.

The Christ of Experience.—While the subjectivism of Kant led up to the various forms of the impersonal Ideal Christ, which the foregoing pantheists substituted for a real, personal Christ, a rival school of Christology founded its views on the existing fact of the Christ and the Christian consciousness thereof. Schleiermacher (1768–1834) started by denying that religion is a philosophy or any science at all; it is not knowing, but feeling. Every religious experience is determined by or intuition of the world outside the self. Christ had such a new intuition. His divinity lies in a consciousness of mediatorship and Godhead. He had not eternal existence, did not rise from the dead; he is divine in the complete satisfaction he gives to the Christian conscience. Rothe (1799–1867) followed Schleiermacher in denying the identity of Christ with God the Father, and affirming a divinity that is founded on the consciousness that Jesus had of his mission, and upon the Christian consciousness of the worth of the Christ. Ritschl (1822–89) followed in the wake of Schleiermacher and Rothe; and steered by the beacon of Kant. At first a disciple of Bauer, in the search and research for a Christ of History, he in time wearied of the unconscionable arbitrariness with which his master carved out parts of the New Testament and recast the Gospels. So Ritschl harked back to the Kantian Ought. Since reason is incapable of attaining to the thing-in-itself, the Christ in himself does not matter. What matters the categorical imperative of practical reason in the realm of Christology. Religious knowledges is it is supposed, independent and direct value-judgments — in judgments, for instance, about the Christ, that are independent of scientific knowledge, and the direct dictate of practical reason. By the Kantian Ought, we are conscious that immortal joy is assured to us, and that the Christ is of value in bringing us to that end. No motives intervene to lead pure reason. The appropriation of the Christ-values is a direct and independent act of faith, or trust, of the will. Ritschl is numerous amongst Christological writers of to-day; such are Weinel, Widgery, Fairbairn, Roberts, Burton, Mathews, Macmillan, Armitage.

Somewhat akin to the Christology of Ritschl is that of the Pragmatists. James, Dewey, Schiller and others unite in making satisfactoriness their variable criterion of truth and goodness. James proposes a Deity that is impersonal, and an immortality of the soul — that is not personal. That is good, in matters religious, which works; and, in far fewer cases, satisfactorily. Logic ally the variable Christology of pragmatism is whatsoever works, gives satisfaction, in one's attitude toward the Christ.

The Christ of History.—While the Christ of psychology has appeared in many a Jesusform, the school of historical criticism in Christology has been at work. This school starts with the elimination of all elements of supernaturalism — miracles, prophecies, etc. The Virgin Birth and physical resurrection of Jesus are assumed to be impossible and unhistorical. A Christ of History is sought, who is not God, and yet satisfies, to explain the fact of Christianity. Strauss (1808–74) was the first to break up the Gospels into historical and mythical elements. The birth of the Baptist and of Jesus; the baptism, temptation and miracles of the Christ; the Last Supper and Resurrection—all these facts are relegated to the realm of mythology. They are myths invented to give a supernatural air to Christianity. Bauer (1792–1860) taught that Christianity was built upon faith in the Christ rather than upon the Person of Christ. Saint Paul, not Jesus, was the real founder of the Church. At first there were two parties, the Pauline and the Petrine. The Petrine party believed that Jesus was the Messiah, but clung to Judaism; from this party came the elements of the New Testament that give us a Christ of History. The Pauline party divorced Judaism, aimed at a universal faith, superadded the supernatural elements, was victorious over its Petrine rivals and founded Christianity with all the supernaturalism contained in Romans, 1 and 2 Corinthians and Galatians. Renan (1823–92) was free from the dogmatic violence of Strauss against supernatural religion, made no attempt to explain Christianity as the work of Paul, and presented to his readers a simple, loving, lovable, God-learning, deluded saint and fanatic, as the Christ of History. Drawing upon the ideas of Daniel and other Messianic writers of the Old Testament, Jesus became fascinated and inspired with the delusion that he was the Messiah. On this account he practised pious frauds to save the desire folk had of the miraculous; and was so misled by fanaticism as even to desire death. Among recent writers, Dr. Adolf Harnack, of Berlin University, while taking great pains to prove the genuineness of the Apostolic writings, deems them to be records of the evolution of the Christian conscience from the death of Christ to the close of the New Testament canon. His Christ of History is so stripped, not only of supernatural power, but even of natural ability, as not to measure up to the stature of Socrates and Aristotle. Wellhausen, of Göttingen, strips the Christ of History of even the noble sentiment which inculcates forgiveness of injuries. This fundamental element of Christianity, together with the parables wherein it is taught, are all said to belong to a time later than that of the Wellhausen Christ of History. Schmiedel, of Zürich, sifts the Gospel narrative down to nine passages, the famous pillar-passages, upon which he builds up his Christ of History. The historical worth of these nine passages is admitted as a start, because Schmiedel thinks that they rather degrade than exalt Jesus.

The Eschatological Christ.—The eschatological sayings of Jesus — i.e., the prophecies that have to do with the end of the world—
have led some to look upon the Christ of History as a fanatic, a dupe to his expectation that, before his death, the world would end in a cataclysmic upheaval and the establishment of the Messianic kingdom. He died a failure. The expectation was not fulfilled. His followers were up against the alternative of admitting that failure or of making him out to have been God. Either duped or duping, they preferred the latter alternative. Thus began the evolution of the Christian conscience which gave us Christianity in its present form. Such is the Christology of Johann Weiss, Schweitzer, Loisy, Tyrrell, Burkitt and Lake.

The Mythic Christ.— The radical and destructive reconstruction of the life of Jesus—inaugurated by Strauss, and maintained by Bossuet, Neumann and the above-mentioned critics—has left so little of fact to the critical Christ of History, that it is not surprising to find radicals throwing over the very existence of an historical Jesus. Jensen, of Marburg, seems to have been carrying on the work of Babylonian mythology. Other members of the Pan-Babylonian school, who class the Christ as a Babylonian Jesus-myth, are Jeremias, Drews, Gunkel and Kalthof. W. B. Smith, of Tulane University, New Orleans, holds that the Jesus-cult took its rise from a Judao-pagan source that is indicated by the two titles Jesus Christ.

Neither of these titles originally meant an earthly man; both certainly designated a deity. The latter seems to be chiefly Jewish; whereas the former is at least half foreign. Cf. Der vorschichtliche Jesus. (1911) p. xv.

WALTER DRUM, S.J.
Professor of Scripture, Woodstock College, Maryland.

CHRISTOPHE, krē-shöf, Henri, king of Haiti: b. Grenada, West Indies, 1767; d. 8 Oct. 1820. He was an African slave who received his freedom as a reward of faithful service. On the outbreak of the negro insurrection in San Domingo, 1801, he became one of its leaders, and attracted by his energy and ability the attention of Toussaint l'Ouverture, who conferred upon him a divisional military command. After the deposition of Toussaint Christophe served under his successor, Desalines, and waged a war of increasing ferocity against the French, who in 1803 were compelled to evacuate the island. In 1811 Christophe obtained undisputed possession of a portion of the island, and was proclaimed Henri I, king of Haiti. His reign was despotic and sanguinary.

CHRISTOPHER, Saint, a saint whose name and feast are celebrated, but whose history is little known. He is reported to have been a native of Syria or Cilicia, who was baptized by Saint Babylas, bishop of Antioch, and received the crown of martyrdom in Asia Minor about the middle of the 3d century. Relics of him are found in several places, principally in Spain. The Eastern Church celebrates his festival on 9 May; the Western on 25 July. His intercession was particularly sought in the time of the plague. Christopher literally means bearer of Christ. He is represented as a giant, bearing the child Jesus upon his shoulders over a stream, which refers to a legend of this saint.

CHRISTOPHER NORTH, pseudonym of John Wilson, the Scotch author (q.v.).

CHRISTOPHER'S, Saint (commonly called Saint Christopher), West Indies, an island of the Lesser Antilles or Leeward Islands, 100 miles northwest of Guadeloupe, discovered by Columbus in 1493; 23 miles in length, averaging about 5 miles in breadth and having an area of 65 square miles. It produces sugar, potatoes, tomatoes, coffee, cotton, plantains, as well as pineapples, bananas, custard-apples, cocoanuts and various other fruits. Mount Misery, the highest elevation, rises 4,100 feet. The flora and fauna are similar to those of the West Indies generally, among the latter being a species of small monkey. The climate is considered to be very healthful. This island is divided into nine parishes, Basseterre being the capital, with a population of 8,160. It was colonized by the English in 1623. Pop. of the island 26,283.

CHRISTOPULOS ATHANASIOS, Greek lyric poet: b. Kastoria, Macedonia, 1772; d. Wallachia, 29 Jan. 1847. He studied medicine and the sciences at Budapest, and finally settled at Hermannstadt in Transylvania. An epicurean in every sense of the word, and unconcerned for the fate of his art, he was only for the gratification of his appetites and celebrated sensual indulgences in his Erotika and Bacchika, or Love and Drinking Songs, which have been several times collected and printed under the title of Lyrika. Though partly modeled upon Anacreon and the songs of Piron, Desaugiers and other French authors, they display so much ease and simplicity, tenderness and grace, as to give their author a high place among the poets of his nation and entitle him to the name of the modern Anacreon.

CHRIST'S HOSPITAL (generally called the Blue-coat School, from the costume of the pupils), a school in London, founded by Edward VI, for supporting poor orphans. There used to be from 1,000 to 2,000 boys and girls at this establishment receiving instruction, board and clothing, the girls being comparatively few in number. The ages varied from 8 or 9 to 15 or 16, five of the best scholars being sent each year to Oxford and Cambridge. An entirely new scheme of management came into operation in 1891, according to which the preparatory school (established in 1683 at Hertford) has 120 pupils, the boarding-school for boys 700 and the girls' school 350; a day-school for 600
boys and another for 400 girls being also provided for. No Blue-coat boy ever wears a hat or cap winter and summer. They wear knee-breaches, yellow stockings and long blue coats with a leather belt. Entrance to the Hospital Schools is partly by nomination or presentation, partly by competition; and in regard to two-thirds of the scholars, fees ranging from five to 10s. may be charged if the parents or relatives are judged to be able to contribute to the child's education and maintenance. Numerous exhibitions and prizes still remain, including exhibitions to the universities. Situated in Newgate street, London, since the 16th century, Christ's Hospital was pulled down a few years ago and the institution removed to Horsham. The new general post-office now stands upon the old site. Camden, Stillingfleet, Coleridge, Charles Lamb and other distinguished men received their education at Christ's Hospital.

CHRIST'S THORN, a small thorny shrub of the order Rhamnacea, or buckthorn family. It is common in the southeast of Europe and Asia Minor, especially in Palestine. The fruit has a similar appearance to a head with a broad-rimmed hat. The spines are long and sharp, growing on slender vine-like branches which are easily plaited, the flowers rose-shaped. The plant derives its name from its being believed by many to be the plant from which the crown of thorns was made which was placed on the head of our Saviour. The fruit is called jujube.

CHRISTY, kris'ti, Charles, American minstrel: b. New York 1828; d. Kansas City, Mo., 13 Feb. 1897. He was an actor from boyhood, sung and acted in the minstrel shows, and as a singing minstrel he was in very high favor.

CHRISTY, Howard Chandler, American illustrator: b. Morgan County, Ohio, 10 Jan. 1873. He was educated in the public schools of Duncan's Falls, Ohio; went to New York in 1893, studied at the National Academy of Design and the Art Students' League under Chase. He first attracted attention with his illustrations of the Spanish-American War, published in Scribner's and Harper's magazines and in Collier's Weekly, gaining especial prominence with his 'Men of the Army and Navy' series and a portrait of Colonel Roosevelt. He is, however, best known for his charming illustrations of the works of such authors as the late Richard Harding Davis and has created a picturesque and romantic type of society women peculiarly his own. He prefers black and white, but has also worked with success in color.

CHRÖDEGANG, or GODEGRAND, Saint, bishop of Metz: b. about 700; d. Metz, 6 March 768. He was a native of Hosbania (Belgian Limburg) and a descendant of a distinguished family among the Ripuarian Franks. Pepin the Short, in 742, appointed him bishop of Metz; in 753 he conducted the Pope on a journey from Rome to Gaul; and in 764 brought from Rome the relics presented by the Popes and monasteries of Gaul. He was the author of the rule (Vita Canonica.)

CHROMATES. See Chromium.

CHROMATIC, in music, a succession of semitones, ascending or descending. The chromatic semitone is the interval between any given note and that same note raised by a sharp or lowered by a flat. The chromatic scale consists of 13 tones, the B scale tone and the 5 intermediate. It is believed by some that the term chromatic was adopted because the Greeks were in the habit of designating the intermediate tones by characters of various colors.

CHROMATIN, krô'ma-tin, a substance in the nucleus of a cell which is readily stained by certain reagents, such as carmine, hematoxylin and safranin, so as to be distinguished from the other substance called achromatin or linin. This chromatin is made up of minute spherical or rod-like particles called "chromosomes." The latter bodies in the course of cell-division are of equal size in the same cell and their number is the same in all the cells of all the tissues of the same species. The chromatin particles are of especial interest because they are supposed to be the bearers of hereditary characters and thus thought to form the physical basis of this unknown property of organic life. See Heredity.

CHROMATOPHORE, a pigment cell. The possibility of change of color in the chameleon, frogs, the squid, etc., is due to the presence of the cuts which are filled with pigment. These pigment-cells are called chromatophores, and under the stimulus of light may expand or contract. When expanded they are highly ramified and when contracted are roundish. The pigment differs in different individuals and in different parts of the body, being yellow, brown, black and at times even red or green. In the goby (a fish), the chromatophores, which are yellow or greenish-yellow when distended, become orange when contracted; while the orange or red ones, when 'shrunk, become brown or even black. In the same fish a still different kind of chromatophores are filled with iridescent crystals of marvelous delicacy, which in expansion become visible as spots of metallic sheen. It is on the distribution and different depth in the skin of the chromatophores that the pattern of markings of the skin of changeable animals depend. The common squid is very beautifully tinted, and under the microscope the chromatophores can be seen dilating and contracting, giving off a remarkable play of all the colors of the rainbow. The value of this power, which is under control, is that it gives the animal means of concealment by adapting its color to that of its surroundings.

CHROMATOPSIS, in pathology, signifies colored vision, or an abnormal state of the vision in which colors present themselves independently of the color sensations usually experienced. These sensations are unnatural and generally they are only temporary. They may be caused by drugs, medicines or some temporarily abnormal condition of the organ of sense or that of vision. Frequently objects appear tinted with certain colors, through which the original color may even appear dimly. See Color-Blindness.

CHROMATROPE, krô'ma-trôp, or CHROMOTROPE, -mô, a toy consisting of a disc painted with arcs of circles in brilliant colors in such a manner that when the disc is revolved centrifugal or centripetal, the lines of color seem to flow through it. The term is also applied to an attachment for a magic lan-
tern, by which, on the revolution of two painted discs of glass, kaleidoscopic effects are projected on the screen.

**CHROMATYPY**, a photographic picture in which the paper employed has been sensitized by some of the salts of chromium.

**CHROME GREEN**, the green oxide or sesquioxide of chromium, forming a green pigment used by painters. It is also employed by dyers and calico-printers as a mordant. A hydrated variety, Cr₂O₃·2H₂O, used for the same purposes, is known as **"Guignet's green"** or **"Aurmordan's green"**. This contains some phosphoric acid in addition. These are now used instead of the poisonous greens prepared from arsenic as a base. See **Chromium**.

**CHROME IRON ORE.** See **Chromite**;

**MINERAL PRODUCTION OF THE UNITED STATES.**

**CHROMIC ACID.** See **Chromium**.

**CHROMITE, or CHROMIC IRON**, the only important ore of the metal chromium and the source of all of the chromium salts. Chemically considered it is a chromate of ferrous oxide, FeO·Cr₂O₃, and it is usually classed by mineralogists among the oxides of the spinel group as a compound of iron protoxide, with chromium sesquioxide, having the formula FeO·Cr₂O₃. The metals are often in part replaced by magnesium, aluminum and ferric iron, as in the varieties magnochromite from Silesia and mitchellite from Webster, N. C. The composition of the mineral thus approaches the chromiferous variety of spinel, picotite. Chromite has a hardness of 5.5 and a specific gravity of 4.32 to 4.57. It is usually a granular, massive, black, opaque, metallic mineral, much resembling magnetite. It has, however, a dark-brown streak and is readily distinguished from all black minerals by fusing it with borax and salt of phosphorus, the bead thus obtained assuming an emerald-green color on cooling. It is further identified by its invariable occurrence in serpentine or olivine rocks. It is often disseminated in grains, or rarely in small octahedrons and tabular crystals. Upon the disintegration of the rock the grains are washed into the streams and adjoining bottom-lands. Prior to 1884 it was extensively mined near Baltimore, also at Texas, Pa., and in California, North Carolina and Wyoming.

The production of chromite in the United States experienced a notable expansion in 1916, in the output of 47,035 long tons — more than 15 times the previous record output of 3,260 tons, mined in 1915. This was due primarily to the unprecedented demand for chrome steel for war purposes, but also in large measure to the scarcity of ocean tonnage from Africa and Oceania, which countries had heretofore been dependent on as the chief sources of supply. However, in spite of this difficulty in transportation, the importation was 115,945 tons, a gain of 39,490 tons, or nearly 52 per cent.

The United States' production came principally from California, which yielded 92 per cent of the country's total, the remaining 8 per cent being nearly equally from Oregon, with small additions from Maryland and Wyoming. Chromite is found in deposits of serpentine, where the latter has been disintegrated by weather and erosion. The black grains and boulders of the chromite accumulate in the surface soil, and in concentrated masses, in connection with magnetite, in the black sands of the streams and beaches. In quality the California chromite ranges up to 48 per cent of chromic oxide, and the Oregon mineral up to 40 per cent.

The importations of chromic iron into the United States in 1916 were as follows: From Rhodesia, 61,850 tons; from New Caledonia (French Oceania), 33,936 tons; from Canada, 12,220 tons; and from Greece, 7,000 tons. For Asia Minor, formerly the United States with about 10,000 tons of chromite annually, but since Turkey entered the European war that source has been cut off.

Under the stimulus of the war demand Canada's output of chromite has been very largely increased, and her exports of the ore to the United States in 1916 exceeded those of 1914 by more than 2,300 per cent. Consult California State Mining Bureau 'Bulletin 38' (Sacramento 1906); Dolbear, S. H., *The Nature of Chromic Iron Deposits*, *Mining and Scientific Press*, 21 April 1917; United States Geological Survey, 'Mineral Resources of the United States, 1916' (Pt. 1).

**CHROMIUM** (Gr. χρώμα "color," in alusion to the colors exhibited by its compounds), a metallic element discovered in 1797 by Vauquelin, in the native chromate of lead, Siberia, and afterward found combined with iron. The metal itself has never been prepared in large quantities, but it can be obtained by the reduction of the oxide by carbon in the electric furnace. It is also obtained by heating the anhydrous sesquisulfide of chromium with zinc, potassium or sodium. In nature it occurs most abundantly as the mineral chromite (FeO·Cr₂O₃), which is often found as a segregation in ultrabasic rocks such as peridotite.

Most of the world's supply has come from New Caledonia, Rhodesia, Turkey and Greece. In the United States California leads, though there has been a small output from Wyoming and from Maryland. Chromium is extremely hard, of a grayish-white color and less fusible than platinum. Its chemical symbol is Cr, and its atomic weight is 52.1 if 0 = 16, and 51.7 if H = 1. Its specific gravity is from 6.5 to 6.8 and its specific heat is about 0.1, though the latter constant has not been determined with precision. Once separated from oxygen, it does not readily combine with it again. It oxidizes superificially, however, upon being heated in air, and it decomposes steam at a red heat.

Chromium forms four different oxides, whose formulae are respectively Cr₂O₃ (chromium monoxide); CrO₂ (chromium sesquioxide); Cr₂O₃ (chromo-chromic oxide); and Cr₂O₃ (chromium trioxide). Of these the first two act as bases, each yielding a series of salts with various acids. Those salts that are derived from the monoxide, Cr₂O₃, are called *chromous* compounds; while those that are derived from the sesquioxide, Cr₂O₃, are called *chromic* compounds. Chromium sulphate, Cr₂(SO₄)₃, forms a series of alums with the sulphates of potassium and ammonium, the element behaving in the respect like aluminium. (See **Alum**). Chromo-chromic oxide is not chemically active. Chromium trioxide, Cr₂O₃, dissolves in water with the formation of an acid, H₂CrO₃, which is called *chromic acid,*
and is of great interest to the chemist. Chromic acid forms a series of definite salts that are known as chromates. One of the best known of these is chromate of lead, \( \text{PbCrO}_4 \), which is used as a pigment under the name of "chrome yellow," and is formed by precipitating chromate of potassium by a soluble salt of lead. Potassium dichromate, \( \text{K}_2\text{Cr}_2\text{O}_7 \), is another extremely important salt of chromic acid; it is used as a depolarizer in electric batteries, as a bleaching and oxidizing agent and as a convenient starting-point in the manufacture of many of the chromium compounds. It possesses the peculiar property of rendering gelatine insoluble upon exposure to light, and for this reason it is used in various photographic processes.

Chromium is used to some extent in the manufacture of steel, as it is found that the addition of less than 1 per cent of chromium materially increases the strength, hardness and elasticity of the product.

In medicine chromic acid and potassium chromate are used. The acid is employed as a caustic; the chromate is now rarely employed because of its irritant properties.

Poisoning by chromium compounds is similar to that caused by other metallic poisons. The drinking of battery fluid is the usual mode. There is severe gastro-enteritis, nausea, vomiting of yellowish bloody matter, diarhoea, pain, colic, tenesmus, great prostration, muscular cramps, rapid and feeble pulse, bloody urine (perhaps suppression of this secretion), feeble and irregular breathing, with coma or convulsions preceding death. A fatal ending may occur in from 4 to 15 hours. At times this result may be delayed and symptoms referable to degenerative processes in the liver and kidneys appear. Treatment is by prompt and continued washing of the stomach. Bismuth subnitrate is indicated in the after treatment, which is symptomatic.

CHROMIUM, or CHROME STEEL. See CHROMITE; and CHROMIUM.

CHROMO-LITHOGRAPHY, a method of producing a colored or tinted lithographic picture by using various stones having different portions of the picture drawn upon them with inks of various colors and so arranged as to blend into a complete picture. Sometimes as many as 20 different colors are employed. It was invented by Alois Senefelder, of Prague, between 1796 and 1800. An outline drawing is first traced, and then transferred to the various stones, one for each color. The artist puts in the colors, with soap, of the tints required. Next the slab is put upon a press and carefully dampened with a sponge, after which the oil color is applied with a leather roller. The parts of the slab which contain no drawing, being wet, resist the ink, while the drawing itself, being oily, repels the water while retaining the color. In printing, the lighter shades are printed off first and the darkest last. See LITHOGRAPHY.

CHROMOSOME. The entire body of an animal or plant is built up of cells; each cell consists of proplasm and a nucleus and is usually surrounded by a cell wall; the nucleus consists of chromates. During the nuclear division the chromatin appears in the form of definite pieces called chromosomes.

This name, meaning color bodies, was given because the pieces stain intensely with certain dyes. The general appearance of chromatin in the resting nucleus is shown in Fig. 1A; Fig. 1B shows the chromatin after it has assumed the form of definite chromosomes during the division of the nucleus.

![Diagram](image1)

FIG. 1.—Two cells from the root tip of an onion. A, resting condition; B, early stage of division. A, proplasm; N, nucleus; C, chromosome.

Since 1880 investigations dealing with chromatin in the resting condition, but more particularly with nuclear division when the chromatin is obviously in the form of chromosomes, have increased in number and in the extreme minuteness of their details. For a diagrammatic outline of nuclear division and the behavior of the chromosomes during this process, see the article on CELL. In regard to the details of nuclear division, there have been two strongly defended theories, one of which may be called the linin-chromomere theory and the other the vacuolization theory. The first assumes that the chromatin is in the form of granules rather regularly arranged upon or embedded in a substratum called linin. The granules, or chromomers, divide and their division splits the linin thread, so that each chromosome produces two new chromosomes (Fig. 2).

![Diagram](image2)

FIG. 2.—Diagrammatic representation of a single chromosome according to the linin-chromomere theory. A, single chromosome consisting of a linin band, \( b \), and chromomeres, \( c \). B, the chromomeres have divided, C, the linin has split between the two pairs of chromomeres, so that two new chromosomes have been formed.

All the chromosomes of the nucleus divide simultaneously and are distributed so that each of the two new nuclei not only receives half of the chromatin of the preceding nucleus, but half of each chromosome. This theory is satisfying to the philosophical mind, but practically all botanists have come to the conclusion that it is not supported by the facts. Most botanists accept the vacuolization theory. According to this theory vacuoles appear in each chromosome and increase both in number and extent until the group of vacuolated chromosomes constitutes the familiar network of the resting nucleus. Thus, there is only one sub-
stance, the chromatin. The substance which in the other theory is called linin is only the more attenuated portion of the chromatin. As division begins the attenuated portions are withdrawn and the chromatin condenses until the solid chromatin thread appears. This thread splits longitudinally, by some mechanism not yet known; then the thread, already split, breaks up into pairs of chromosomes and one member of each pair goes to each of the new nuclei.

There are many reasons for believing that the chromosome maintains its identity from one cell generation to another throughout the whole life of the plant or animal. The number of chromosomes is practically constant for a given species; e.g., in vegetative tissues, the lily has 24, trillium 12, canna 6, the mole cricket 12 and man has 24. If the nucleus of an egg be removed and a single sperm introduced the nuclei of the resulting embryo have only half the normal number of chromosomes. If a normal egg be fertilized by two sperms, the resulting embryo shows one-third more chromosomes than the normal. If the two species with different chromosome numbers be crossed, the resulting embryo shows a number equal to the sum of the numbers found in the sperm and the egg. Some very competent investigators claim they can see the chromosomes outlined in the network of the resting nuclei. Still further evidence might be cited to prove that the chromosome is a permanent organ of the cell.

The number of chromosomes is doubled by the union of the sperm and the egg during fertilization. At some subsequent point in the life history, before sperms and eggs are formed again, there is a reduction in the number of chromosomes. The most generally accepted view is that the reduction is due to the fusion of chromosomes in pairs. The number becomes reduced during two peculiar successive divisions, called the reduction divisions (Fig. 3).

Most botanists and many zoologists believe that the chromosome is the storehouse of hereditary characters. The male and female at fertilization contribute not only equal amounts of chromatin but, in most cases, the same number of chromosomes; and this is the only equal contribution. In some cases, as in the fly, the male contributes nothing but a nucleus, which consists, essentially, of chromosomes. If the nucleus of an egg be removed and the sperm of another species be introduced the resulting embryo has only the characters of the sperm parent. Other evidence might be added. It has been established that the chromosomes are not all alike and that different chromosomes may have different functions. In insects, and in some other forms, it has been shown that one chromosome, differing in appearance from the rest, is concerned in the determination of sex (See PLANTS, SEX IN).

In mutation (q.v.) it has been proved that the chromosome content of the nuclei of the mutating form differs from that of the parent plant and it seems probable that some change in the chromatin was the cause of the mutation.

CHARLES J. CHAMBERLAIN, Professor of Morphology and Cytology, University of Chicago.

CHROMOSPHERE, the gaseous envelope which exists around the body of the sun, through which the light of the photosphere, an inner envelope of incandescent matter, passes. During total eclipses it is observed that a red-colored envelope surrounds the sun and shoots up to great distances from the surface. It seems to have been first recognized by Secchi; and the projecting portions of it are commonly described as 'red-colored protuberances' and 'red flames.' To this red envelope the name 'chromosphere' was given by Lockyer. The light from it is much fainter than that from the photosphere; and till 1868, when M. Janssen and Mr. Lockyer almost simultaneously pointed out a method of viewing it, it was never seen except during eclipses. See SUN.

The spectrum of the chromosphere was first observed in 1868 during the Indian total eclipse, and it was found to consist of a number of bright lines, and conspicuous among them those of hydrogen. The light of the chromosphere was thus proved to be due to masses of incandescent vapor or gas, hydrogen forming a large part of the whole.

Since the invention of the Janssen-Lockyer method of observing, as it is called, very remarkable advances have been made in our knowledge of solar physics, discoveries quite unthought-of having followed. The observations are made by means of a combined telescope and spectroscope. A spectroscope is substituted for the eyepiece of the telescope, the slit of the spectrope being placed at the principal focus of the object-glass of the telescope. The slit is capable of being moved in such a way that any particular band of the image formed in the object-glass of the telescope may be examined by the spectrope.
The spectroscope employed for the purpose of examining the chromosphere must have the greatest possible dispersive power, and requires for this purpose a long train of prisms.

As was mentioned above, the spectrum of the chromosphere consists of a series of bright lines. The breadth of a bright line of the spectrum is not sensibly increased by increasing the dispersive power of the spectroscope, but the contrary is the case with a continuous spectrum, which is extended by dispersion. Thus the latter becomes weakened, while the former maintain their brightness and become more easily visible in comparison with it. The slit of the spectroscope being arranged so as to take in a band, either tangential or radial, close to the edge of the image of the sun formed by the object-glass of the telescope, it is found that the bright lines of the chromosphere are perfectly visible, in spite of the light of the continuous spectrum proceeding from the inner portion of the disc. Further it has been found possible, by using a spectroscopic of the very highest dispersive power, and by employing the narrowest slit, to see that whole of one of the protuberances at once, and by this means to watch its motions and its changes. To understand this the reader must consult the article Spectroscope. He must recollect that a continuous spectrum consists of an enormous number of images of the slit, placed side by side, and in ordinary cases slightly overlapping each other. If we could employ an infinitely narrow slit we should have an infinite number of infinitely narrow images, and no overlapping whatever. But suppose a light to consist of only two or three colors, say light from a source capable only of giving the two bright lines C and F, that is, one in the red and another in the blue part of the spectrum. It is easy, even with a slit of sensible width, to keep the two from overlapping, and we shall see without any confusion the two bright lines or bands at different parts of the spectrum, darkness intervening. Now imagine a bright prominence starting up from the sun's surface, and let the spectroscopic be directed on its image in the telescope; there will be only portions of the slit illuminated by it, portions corresponding to the shape of the flame, and if the flames are small, there will be two images of the prominence at the points of the spectrum belonging to these colors.

It will readily be seen from the explanation just given that if the general background of the field has been made faint enough (by a high dispersion), it may be possible to open the slit so widely that the entire prominence may be seen in its true form, in either of the regions, C or F, of the spectrum. The images seen in this way are, however, formed only by light of one particular wave length: if the point of the spectrum selected is that upon which there falls a line due to hydrogen, then the image seen will be that arising only from the hydrogen prominence; whatever other elements there may be in the sun, with which we shall, in fact, see the exact form and distribution of that portion of the cloud which is composed of hydrogen alone.

A remarkable application of this principle is made in the so-called spectroheliograph, an instrument invented by the American astronomer, G. E. Hale, and first successfully employed by him in the year 1891. Here all light is screened from the field except that coming through the very narrow slit of the spectroscopic, this slit being sufficiently long to include the whole object observed, or even the entire sun's disc. By letting the sun's image sweep over the slit, every part is successively seen by the light of a single wave length, and thus we may view the distribution of the hydrogen solely, or of the calcium, or of the other elements upon or about the sun. Finally, by allowing the very narrow, moving image of the slit to fall upon a photographic plate, we may obtain a photograph of the sun from a single selected element which it contains, provided only that there emanate from this element a line of sufficient brightness for this purpose.

The glowing prominences sometimes extend to great heights above the sun's surface; though the usual depth of the chromosphere is but from 5,000 to 10,000 miles, material has been observed at times of great eruptive disturbance to extend to a distance of no less than 400,000 miles—far beyond the radius of the sun itself. While, generally speaking, all the elements of the sun are found in the lower regions of the chromosphere, it is only the lighter ones which attain these enormous altitudes in the eruptive prominences, and the opposite is true of the constitution of the great, comparatively quiescent chromospheric clouds which lie above the photosphere. Thus Jewell has found that in the high levels of the extremely abundant, helium, parhelium, magnesium, sodium and ytterbium, while at the low levels are chromium, iron, cobalt, nickel, manganese, yttrium, cadmium, zinc, carbon and vanadium. Several substances, notably calcium, give contradictory results, the average level being sometimes high and sometimes low; as only very minute quantities of some substances are required to produce spectral lines, however, the apparent discordance is not surprising.

From minute displacements of well-known lines in the spectrum (see Spectrum Analysis) motions are inferred of the incandescent bodies from which these lines are proceeding. On this principle motions of the fixed stars have been determined, and through the enormous velocity of Arcturus is approaching us at the rate of 10 miles per second, and Arcturus is approaching us at the rate of five miles per second. The principle applied to the results of the spectroscopic examination of the prominences of the chromosphere, as well as a direct observation of their apparent movement across the line of sight, shows that they are due to enormous outbursts of gases and vapors from the sun. These gases are sometimes projected outward or even tangentially with extraordinary velocities, rates of motion so high as 300 miles a second having been reported. In some cases the apparent motion of a single cloud may be a perspective effect due to the successive formation of many clouds over an extended area, yet it is quite certain that in many of the cases, these motions observed are real, and it is probable that they may be in part, at least, due to electrical action. But much is still to be learned, not only as to the true cause and movements of the eruptive prominences, but also in explanation of the clouds which are nearly quiescent for a
considerable length of time, though so near the enormously distributed region of the sun's photosphere.

Bibliography.—The most recent, semi-popular, but authoritative, work is 'The Sun,' by C. E. Abbott; it contains many references to more detailed or extended publications. A larger and very important recent work is 'Physik der Sonne,' by E. Pringsheim (Leipzig 1910). Numerous papers will be found in the 'Proceedings' of the Royal Society (London), the American Journal of Science and History, the Astronomische Nachrichten, and the Astronomical Journal of Chicago, and in practically all journals devoted to general astronomy and to astronomical spectroscopy.

CHROMOTYPE. See CHROMATYP.

CHRONIC (Gr. χρόνος; time*), a term applied to diseases which are of long duration, and mostly without fever. It is used in opposition to the term 'acute,*' which is applied both to a poignant pain and to a disease which is attended with violent symptoms, terminates in a few days and is attended with danger. On the other hand, a 'chronic' disease is slow in its progress and not so generally dangerous.

CHRONICLE, a history recounting in order of time all details and events which have happened in a country until the present day. The term is derived from the Greek χρόνος, a term which means time, and has been used to denote a collection of historical events. The first use of the term 'chronicle' was in the 12th century, and it was used to denote a collection of historical events that were recorded in a systematic manner.

A CHRONICLE is a record of events that have occurred in a particular place or time, often compiled by a chronicler. The term 'chronicle' can also refer to a type of book that contains a record of events, often compiled by a chronicler.

CHRONICLES, Books of. The books of Chronicles were originally one book in the Hebrew, which is also true of Ezra and Nehu-
miah. Further, it is now a generally accepted conclusion that these two books, Chronicles, and Ezra and Nehemiah, were written by the same author and were, when composed, a single work. The reasons for this conclusion are the following:

Ezra is the direct historical continuation of Chronicles. Further, two verses at the end of Chronicles are repeated at the beginning of Ezra, a fact which leads to the conclusion that the division was made. Also, the characteristics of both works are the same. These are particularly a fondness for genealogies and also for the treatment of religious matters, especially those things which pertain to the temple and the work of the priests and Levites. Again, both are marked by the same unusual late linguistic peculiarities.

In Chronicles the passage which apparently indicates the latest date is 1 Chron. iii, 19-24, where the sixth generation after Zemaboth in the line of David is mentioned, which would be about 350 B.C. The text of the passage is, however, somewhat doubtful; the Septuagint reading indicates the 11th generation. Nehemiah, however, gives a later date. The main prophet Jaddua, of the time of Alexander the Great, is mentioned, Nehemiah xii, 10ff.; 22ff. Further, the description of Darius as the Persian, Nehemiah xii, 22, would be unnecessary if the book was written before 537 B.C. Hence the evidence that the book was written after the Persian empire was in existence, and implies that at the time of the writer that empire belonged to the past. Hence the writer lived probably about 300 B.C., but possibly later than that.

i-ix contains the history of the Hebrews from Adam to Saul; x-xviii, the history of the death of Saul to the death of Solomon; 2 Chron. x-xliv, the history of Judah only, without Israel, to the end of the Babylonian captivity in 537. When this history is compared with the parallel accounts in the books of Samuel and Kings it shows many omissions and also many additions. The omission of the entire history of the northern kingdom, Israel, is especially notable. The whole of the material of 2 Sam. ix-xx, except the account of the wars with the Ammonites, is omitted. This is particularly significant because the omitted portion gives an account of the failings of David and the unfavorable side of his court and family life. The additions are concerned chiefly with the activity of the Levites and the prominence of the temple and ritual matters. An example of a long addition is 1 Chron. xxix, 2-xxxix, 30, of which only xxix, 23a, 27, is from a known source, i.e., from 1 Kings. The additions show an idealized view of the history, representing the P code as in force in the time of David.

It is evident that the sources used by the writer included some of the canonical books, principal the books of Samuel and Kings, with the Pentateuch and Joshua employed less extensively. The material from these canonical books is largely in the form of verbatim extracts, with omissions and additions, but not rearrangement. The author also refers to other sources under at least 15 titles, such as:

- The Book of the Kings of Israel and Judah, 2 Chron. xvi, 11;
- The Book of the Kings of Israel and Judah, 2 Chron. xxxvii, 7;
- The Midrash on the Book of the Kings, 2 Chron. xxxiv, 27, etc.

It is obvious that several of the titles refer to the same work, and that is possibly the case with all. The principal source used by the writer, then, aside from the canonical books, is a work covering the history of Israel and Judah; whether any other sources he used to which is uncertain. It is probable that the material from the extra-canonical or sources is rewritten. At any rate, the portions not drawn from the canonical books all have the same peculiar late style.

The historical value of the portions of Chronicles not derived from the canonical books is uncertain. Much of the material is distinctly improbable, some being quite out of harmony with the earlier material from the canonical books. On the other hand, it cannot be asserted that there is no historical element in this added material. The evidence is not sufficient to afford a positive judgment in every case. The religious standpoint of the book is that of the time of the writer, and he puts that standpoint into the earlier time. The historical value of the book is largely that of showing the religious standpoint of about 300 B.C.

CHRONICLES OF CLOVERNook, a story by Douglas Jerrold, published in 1846. Clovernook is a "hamlet wherein fancy has loitered away a truant hour"; and under the guidance of the "Hermit of Bellyfulle" the author explores Clovernook, and discourses of it. The book charms by its quiet humor, the grace of its fancy and the benevolence which characterizes even its satire.

CHRONICLES OF FROISSERT. See CHRONICLE.

CHRONICLES OF THE SCHÖNBERG-COTTA, sh'nberk kofta, FAMILY, a novel by Mrs. Elizabeth Charles, published in 1863. It is the story of a family during the period of the Reformation in Germany, as told chiefly by Friedrich and Else, the oldest children. The book is written with an effort after the archaic style, and has much of the simplicity and directness of the old chronicles. It is interesting and has proved a great favorite, though accurate scholarship finds fault with its history.

CHRONOGRAM, a device by which a date is given in Roman numerals by printing certain letters of an inscription larger than the others; as in a motto of a medal struck by Gustavus Adolphus in 1632: ChristVs DVX;
ergo trIVmphVs. The value of C and the other capitals equals 1632, MDCCXVII.

CHRONOGRAPH. See CHRONOSCOPE.

CHRONOLOGY, the science of dates, or of arranging events in order of time. Two steps in human progress were requisite for its existence: the invention of recording, or material records, or memory would not transmit exact sequences of events on any considerable scale; and the adoption of some recurrent astronomical period, neither too short nor too long, as a measure of time. The pictograph, developed into a system of writing, and the Peruvian quipu, or knotted cord, are the chief of the former. The fixing of the year by the Babylonian astronomers was the only feasible specimen of the latter; the month being too short for a measure of long periods and even the year becoming too formidable in numbers for the limited counting power of the ancients. Between the creation of these raw materials, however, and the construction of a simple and unifying applicable system for every country, thousands of years elapsed in which the chaos of unsystematic systems is still the difficulty and often the despair of antiquarians.

For a satisfactory chronology there is a third requisite—a fixed epoch to count from, no matter what: as in Babylonia the accession of Nabonassar; in Greece the hypothetical institution of the Olympic games; in Rome the imaginary foundation of the city; in Christendom the arbitrarily fixed birth of Christ; with the Mohammedans the Hegira of the Prophet, etc. But, obvious as this seems, it is in fact a very late device of civilization. Herodotus and Thucydides, in the most splendid intellectual age of Greece, wrote history without a date, or any apparent recognition that one was needed. The sequence of events was preserved; but that these need be related to an arbitrary point in the past is an artificial conception, created by the accumulation of practical inconveniences. These would seem to have differed in each country which independently invented it: the scientific and business ones in Assyria, historical in Greece, administrative in Rome. Others borrowed the system when its utility was manifest; but others set on a new foot, with a ruder scheme. Their science and business was alike undeveloped; their historical sense was satisfied with a few dramatic episodes, and even the order of events was heroically confounded; and when it became necessary to keep public records, their unit was a reign, or they dispensed with units altogether and dated by some notorious event. Thus the Babylonians dated their business and official tablets "the year he brought Nannar of Nippur into a house," "the year he overran Karkar," "the year he overran Karkar a second time," "the year divine Bur Sin became king," etc.; on exactly the same principle as a modern mother dates events in the year the second child had the measles. Dating by the year of a certain king's reign is a natural system, still preserved in English statutes: they are not the laws of 1663 or 1860, but "4th Car. II.," "24th Victoria," etc.

In Assyria, as early as the 14th century B.C., a system was begun of dating by "eponyms," or the names of the chief, in annual succession, with the chief events in the year; each new king's name being entered on his accession. Thus: "Edusur-sarabe governor of Gozan. Revolt in city of Ashur. In month Sivan sun was eclipsed." (These inserting entries). "Pan-asur-lamr governor of Arbel. Revolt in city of Gozan. Pestilence." In Rome, it was "in the consulate of certain persons; in Athens, "in the archonship of"; and so on. Occasionally, it is required that the list of functionaries is preserved for a long time, as in Assyria it was for centuries, it will furnish a perfect chronology provided one date can be fixed in the series. This has been done in several cases, and the chronology of some sections of ancient history has been accurately reconstructed over long periods. The most certain authentication is by some astronomical phenomenon whose date can be fixed by calculation; and several of these priceless data are casually mentioned by old records or historians. Thus, the mention by an Egyptian papyrus of a rising of Sirius, in connection with the overflow of the Nile, fixes the accession of Usertesen III., fifth king of the 12th dynasty, between 1876 and 1873 B.C.; the only or approximate date in history yet discovered, and by a happy chance, in a country the most empty of chronological data. (The Babylonian Naram-Sin's date as near 3750 B.C. is now quite discredited). The most useful of these phenomena recorded are eclipses of the sun, from the terror inspired by the darkening of the sky; fortunately for history, as the mention of them has furnished several invaluable dates. The Assyrian records, with the help of several centuries, has been fitted with accurate dates by the eclipse recorded in the first entry above, 763 B.C.; the same one is mentioned in the Bible (Amos viii, 9) as occurring in the reign of Jeroboam II. Even when we cannot be certain by itself which eclipse was meant, it is rare that other synchronisms do not fix the limit. Thus, an important date in the kingdom of Lydia is determined by an eclipse which was either 610 or 585 B.C. In other circumstances make the later date probable.

When positive evidences fail, the only method of research is by synchronism, or fixing the date of an event by its connection with some other event or person of known date. Fortunately, it is satisfied with a ruder scheme. In this, if less than could be wished; they mention international battles, captures, treaties, appeals, threats, correspondence, etc., where one date must apply to both. Noted examples of this are the biblical records as to relations of Palestine with Assyria, Egypt, Tyre, etc.; sometimes confusing events and dates, occasionally confounding persons, and needing correction from other sources, but still of extreme value. Another specimen is the Assyrian "synchronic history" of the relations between Assyria and Babylonia, a tablet of about 800 B.C. When we come down to classic times, these synchronisms are the very basis of historical work on those periods. There is also a synchronism of arts, products exchanged between countries, systems of writing, etc., and even to some extent of institutions; which, though demanding expert knowledge and careful judgment, is often of the first value. On this basis much of the Homeric and pre-Homeric history of Greece is taking shape, and echos of state, in China perhaps be related to Babylon.

The chronological sense of different races
presents extreme diversities; but it is fairly accurate to say that none of the older ones had any appreciable amount except the Babylonians, the Egyptians in them and their near neighbors, the Assyrians in it was early and remarkably developed. Their dated records (in the primitive fashion above) go back to the third millennium B.C. at least; the Assyrians' eponym canon antedates by many centuries any similar system elsewhere; and the Babylonians were much the first to adopt an epoch. On the other hand, their cofounders of the earliest civilization, the Egyptians, were utterly destitute of it; and the dates in their history back of the time of close contact with Babylonia, where synchronism can be utilized, are almost pure guesswork. Beyond 2000 B.C. the divergences of estimated Egyptian dates among the most authoritative scholars vary from 500 to 1,500 years, and even down to 1500 B.C. there is often 100 or 200 years' difference; and only the vaguest inferential proof is available. The Hindus, the Chinese, the Jews, the Greeks, were nearly as devoid of chronological instinct. The case of the great Greek historians has been seen, and there it may safely be left that their "forty years," for a generation or an indefinite long time is familiar and not conducive to accurate chronology.

The obscurity due to lack of dates in general was of course enhanced by the fact that each state counted from its own events or persons, so that in place of one problem, the historical antiquity has scores. The chief method — for many ages the only one — by which this Babel of chronologies and follies, the Assyrian unformity over large areas was political absorption and the disuse of provincial systems. Even when fixed epochs came to be adopted, though the continuity of history was assured, the international confusion was not lessened nor comparative chronology made easier, as each selected a different epoch; and the same remedy only was operative here. Nor, indeed, for some time did even the individual system become the accurate instrument of research it is now; for the succession was not at first of years, but of annual magistrates, as with the Assyrians, Athenians and Romans sometimes more vaguily of kings and priests. Moreover, with one dubious exception the date of the epoch was not the foundation of its adoption, but centuries back; and the dates affixed by the new systems to former events were often wildly fanciful, as was that of the very event which furnished the starting point. The first epoch ever used, so far as known, was the accession of Nabonassar of Babylonia 747 B.C.; it is generally believed to have been used from the beginning, but this is less probable now than formerly. The Roman era was the foundation of Rome, somewhere about 750 B.C. according to Roman historians; it is not known when it was first adopted, but probably not before the 2d century B.C. The Greek reckoning was from the alleged foundation of the Olympic games in 776 B.C., quite as apocryphal as the other; it was fixed that in them and their festivals, the Assyrian calendar of Sicily in the 3d century B.C. It furnishes a scientific one when the year of the Olympiad is mentioned, which is not always, so that a margin of three years is left. Note the curious fact that all this is uncertain for centuries or so of each other, though the last two are merely guesswork. It seems incredible that the year, apparently the most simple and obvious of natural units, was first suggested and used in 194 B.C. by Eratosthenes, the great Greek editor, mathematician, geographer and chronographer. Of course it had been employed for thousands of years as a unit within other units, such as reigns, but not alone in sequence from a fixed epoch. The Olympiad, however, for reasons given below, was to divide the middle of the 5th century. Even after the official adoption of the Christian era,—which, like its predecessors, antedated its use by centuries,—centuries elapsed still before it was employed to the exclusion of other systems. Many other methods of dating, local or ecclesiastical, flourished besides it, and made nearly as much labor necessary in modern as in ancient times to synchronize dates. An acquaintance with these is indispensable to the study of the chronicles, charters and other legal and Church documents of the Middle Ages.

Still another cause of the imperfection of early chronological methods was the difficulty found by the masses in grasping large numbers. Hence, it became the jeweled, to divide into cycles of a small number of years, and number by the years in a cycle. The Olympiad was a refined form of this. Our own system of reckoning by centuries is another, only by its decimal form it expresses both ideas at once. Instead of saying "the 3d year of the 20th century," as "the 3d year of the 40th Olympiad," we use a term of addition, and say "nineteen hundred(s) and three." The Chaldeans had their saros of 6,585 to 6,589 days, or 18 years; the Romans, their indiction of 15; and the Chinese and other Asiatic nations still use a cycle of 60. The European cycles, however, as the metonic of 19 years still used for computing Easter, were mostly used to regulate the calendar rather than to compute dates; but they are often extremely useful as an additional method of verifying these.

**Babylonian: Era of Nabonassar.** This prince seems for a very brief time to have thrown off the Assyrian yoke and restored Babylonian independence. It was almost immediately lost; but he succeeded in imposing a new dating system which convenience maintained, or else later gratitude looked back to him, under the glories of Nabopolassar and Nebuchadnezzar, as the pioneer of Neo-Babylonian greatness. At any rate, the era is fixed at 26 Feb. 747, from astronomical data collected in Chaldea by Callisthenes, a general of Alexander the Great. It is the basis of the once famous Canon of Kings, or Mathematical Canon, preserved in Ptolemy's works, and previous to the era of archaeology our one source of Mesopotamian history. The Alexandrian Greeks also used this era till the adoption of Julius Caesar's reformed calendar, 24 B.C. The Babylonian year was different in length from the Julian of 365 ¼ days, and the conversion of Nabonassar years into years B.C. is a matter of delicacy, necessitating a knowledge of the month and day, for even the Roman tables have been drawn up for this purpose.

**Olympiads.** It is now pretty generally admitted that the early lists of victors in the Olympic games are fictitious, and that the foundation of the games cannot be certainly fixed; but what is authentic knowledge beginning with the 6th century B.C.; but this is indifferent to the method
of calculation which assumes a beginning in 776 B.C. They were celebrated every fourth year in the month of July as the Olympic year, began sometimes with the full moon before and sometimes with the one after the solstice, to save trouble and perpetual recomputation it was reckoned as beginning the 1st of July. Hence, the Olympic years cannot be synchronized with ours. The ancient Romans usually followed as the 1st of the month to which the 1st of the month corresponded with the first half of the other, and the month must be known for accurate conversion. Therefore, in years before Christ, when the event happened between January and June, inclusive, subtract the number of the Olympic year from 776. Thus: the oligarchy of the Four Hundred was deposed in June, Oly. ci, 1: 4 × 91 + 1 = 365; 776 - 365 = 411 B.C. Socrates was executed in May, Oly. cxxi, 1: 4 × 94 + 1 = 377; 776 - 377 = 399 B.C. If it took place in the latter part of the year (as did the immense majority of the familiar incidents in Greek history—all the great battles, for physical reasons, the deaths of Pericles and Cleon, etc.), subtract the year before the Olympiads, 777. Thus, when the battle of Plataea was fought in September, Oly. cxxv, 2: 4 × 74 + 2 = 298; 777 - 298 = 479 B.C. If the year is after Christ, subtract the number of the Olympic year from 776 in the first case, from 777 in the second. The Olympiads was only used by historians; it is never found on coins or inscriptions. A new Olympiad was instituted by the Roman emperors, beginning with 131 A.D., and is used on some coins and inscriptions, but struck no deep root.

Macedonian Era, or Era of the Seleucids: also called by the Jews Era of Contracts, because their Syrian governors compelled them to use it in civil business, and styled by the writers of the books of Maccabees the Era of Kings. This epoch dates from the foundation of the Syro-Mesopotamian monarchy by Seleucus Nicator, Alexander's general; assumed to begin with his occupation of Babylon in 311 B.C., 12 years after Alexander's death. It was used not only in the Seleucid empire, but by the Greek states on the east coast of the Mediterranean generally; was followed by the Jews till the 15th century, and is said to be in use by some Arabs even yet. It was the great Eastern date for many centuries, and it is one of the most difficult to convert into terms of Christian years, from the astonishing variety in the beginnings of the year (which in different countries and among different sects varied from the vernal equinox to 28 October), and from the variation in length of year, some using the Egyptian year of 365 days, some, the Jewish of 365½. The usual computation is to place the beginning of 312 Seleucid on 1 September in the Julian year preceding the first of our era. Therefore, to reduce a Seleucid date to ours, subtract 311 years 11 months.

Era of Alexander. This is used by some Greek historians, dating from his death 325 B.C.

Era of Tyre. This begins 19 Oct. 126 B.C. To reduce it to our era, subtract it from 120 if A.C., subtract 125 from it if A.D. This date is used only on medals and in the acts of some councils.

Era of Rome. The date of the foundation of Rome, as related to the Olympic-epoch, is dit to be in the year 753 B.C. On this basis, according to Fabius Pictor at Oly. vii, 1, autumn (747 B.C.); by Polybius at Oly. vii, 2 (750); by M. Porcius Cato at Oly. vii, 1 (751); by Verrius Flaccus at Oly. vi, 4 (752); by Terentius Varro at Oly. vi, 5 (753). As a Roman writer followed which he chose, and sometimes varied from one to another. Livy generally follows Cato, sometimes Fabius Pictor, Cicero follows Varro, as does Pliny, in general; Dionysius of Halicarnasseus follows Cato. The modern writers usually follow Varro in the 1st century by Censorinus, who specifically says the festival of the Palilia in April was the anniversary of the foundation. The Romans had two kinds of year: one for business, public or private; and the consular year, which their annalists follow. The former began with the calends of January. The latter had no fixed time of beginning, but commenced with the installation of the consuls, which happened as chance and politics dictated; it is the one generally used by the Latin and Greek historians down to the 6th century A.D., however. But in the computations of the Roman era the year begins with 21 April. After Caesar's regulation of the calendar, the era commenced with 1 Jan. 45 B.C., and is commemorated by the birthday of the Roman poets, who thought the spring was the real beginning, as, of course, it is.

Cesarean Eras. Several attempts were made to establish time eras from actions of Caesar and Augustus, one of them very successful. The Cesarean Era of Antioch commemorated Caesar's victory at Pharsalia 48 B.C.; it was used by Evagrius in his 'Ecclesiastical History.' The Syrians and Greeks, however, placed its beginning 11 months apart. The Julius era began 1 Jan. 45 B.C., and commemorated the reformulation of the calendar by Caesar. The Era of Spain or of the Caesars commemorated the completion of the conquest of Spain by Augustus, and began 1 Jan. 40 B.C.; for many centuries it was the era of Spain and Portugal, and generally of the Roman provinces subdued by the Visigoths, not only in the Iberian Peninsula, but in southern France and in Africa. Several of the councils of Carthage, and that of Arles, also dated from this, though after the 9th century the practice of the Incarnation was usually joined with it. It was not disused in Castile till 1382, and in Portugal not altogether till 1422 or later. The calendar being Julian, all its dates are reduced to ours by merely subtracting 38. There was an Era of Actions, commemorating that battle, fought 3 Sept. 31 B.C. The Romans began it 1 Jan. 16 Julian (30 B.C.); the Egyptians, 29 August; the Eastern Greeks (who used it till the 9th century), 2 September. The latter called it the Era of Antioch (not the one mentioned later), and that city struck medals with it. There was also an Augustan Era, beginning 27 B.C., the year in which Augustus received that title.

Jewish Era. The Jews came under foreign reign before they had invented an epoch, or even developed periodic magistrates; and their annals, except for synchronisms, are nearly as haphazard as the Egyptian. Their first internal chronology is after the Macedonian era was forced on them by the Syrian Seleucid conquerors. For religious matters, however, were regulated by their own calendar, in which the civil and sabbatical year began (as now) about the autumnal equinox, the ecclesiastical and legal year about the spring equinox. The dates were dependent on computations of the time from the Creation (see paragraph below), but their dates do not depend on
it till modern times. After the Dispersion they were obliged to conform to the periods of other nations. This caused the Christians to adopt a cycle of 84 years (a transformed Greek cycle). The time of its beginning is not certain, one author placing it at 162, and another at 291 a.C. In 46 a.C. the Christians adopted it, and used it particularly by the Jews. But after this, the Jews in 360 a.C. substituted the metonic cycle of 19 years, which the latter still employ. Till the 15th century they continued to date from the Macedonian era; since then they have adopted a Creation era, which they date 3760 years 3 months a.C. Their dates cannot be reduced to ours without expert knowledge of their involved calendar.

Creation Eras.—To emphasize their separation from paganism, and avoid participation in pagan observances connected with the calendar, the Christians early began to reckon time from the supposed date of the creation of Adam according to the Jewish Scriptures. Aside from its resting only on the adding up of impossible and uncertain successes, it was further confused by there being three texts of equal authority to work from—Hebrew, Samaritan and Septuagint—all irreconcilably variant. One author collects 120 different computations of the true date; another says he has collected over 200; and 300 have been reckoned; and the estimates vary over 3,500 years, from 3,483 to 6,954 years before the Christian era. None of them have any scientific standing, but for two centuries the Christian world generally accepted as a working hypothesis Archbishop Usher's (1650) figure of 4004 a.C., which is still used in some Bible appendices and similar works. Several earlier ones, however, obtained considerable footing, and two of them are not yet disused. It is of course as useful as any other arbitrary point, like the Olympic Games or the foundation of Rome; and has the advantage of requiring only one continuous figure, in place of a break in the centre like the Christian era. It was generally considered the satisfaction of marking off the time after Christ's coming as the beginning of a new era, have caused the latter system to supplant it. Of the others, the chief are: (1) Era of Constantine, which was used by the Russians till the time of Peter the Great. This begins 5,508 years 4 months before the Christian era. The civil year begins 1 September; the Church year on the spring equinox or 1 April. To find the current year corresponding to a Constantinople year, if the event took place before 1 September, subtract 5,508 from the date; if after the year, subtract 5,509. (2) Era of Alexandria. This was adopted by the Christians of Alexandria on the computation of Julius Africanus, who reckoned 5,500 years from the creation of Adam to the birth of Christ, but placed the latter three years earlier than the current reckoning, so that our era would begin 5503 Alexandrian. After the accession of Diocletian, 284 a.C., the Jews dropped 10 years, both from the year since the Creation and since the Incarnation, making in fact two eras instead of one. To convert this era into our own, in the first eight months of the era, subtract 5,502 up to and including 5786 Alexandria; in the last four months, 5,503 and 5,493 respectively.

This era was used by the Coptic Church till the 15th century, and is still retained in the Abyssinian. (3) Era of Antioch. The Christians, early in the 4th century, adopted Julius Africanus' reckoning as above, but dropped 10 years from it as the Alexandrians had already done; placing the Incarnation, however, as in our own era, three years later than the Alexandrian. As regards the Creation, therefore, the two eras are seven years apart up to Diocletian's time, and then coincide; as regards the Incarnation, the Antioch is three years less before that time and seven years later after it. Dates in this system are reduced to ours, as in the reformed Alexandrian calendar above.

Era of Diocletian, Subsequently Named Era of Martyrs.—At the same time that the Alexandrians changed their Creation era as above, they established a new and shorter one from the accession of Diocletian, 29 August (first of the Egyptian year) 284. The second name given implies that an attempt was made to start it from 303, the date of Diocletian's edict of persecution, but it was unsuccessful, as indeed a mere perpetuation of a strife was likely to be. The era is still used by the Copts of Egypt and the Abyssinians. The change from the Egyptian to the Julian calendar, and the peculiar complications it has introduced into the conversion from that era to ours, are too intricate to detail here. To make the change, add to their date 283 years 240 days in common years; if the date is between 30 August and the end of the year in the one before leap year, add 283 years 241 days. But the Ethiopians do not reckon the years continuously from the beginning; at the end of each 532 years (that is, 28 × 19, or the solar and lunar cycles multiplied together) they begin again with 1.

The Christian Era.—It is not generally realized how modern this epoch is in general use. It was introduced into Italy 533 a.C. by Dionysius Exiguus ('the lean'), a Roman abbot; was not introduced into Gaul (France) till the 8th century and not in current use there till the 9th; and came into use in England only in the latter part of the 8th. In Latin countries the current scheme before that was the cycle of induction (below). Any uniform system in which its defects may be overlooked. That of having a double set of numbers, forward and back, is not serious. Perhaps the chief inconvenience in calculating backward is that of calling the year preceding the era 1 a.C. instead of 0; thereby making the leap years on the backward series fall on the odd years, 1, 5, etc., or else making 7 years between the first one previous and the first one after. Astronomers rectify this by calling the first year previous 0. (For the different dates on which the beginning of the year has been placed, see calenders). Dionysius fixed the birth of Christ in 754 of the Roman era, but he began the year 1 with the Annunciation, 25 March of the year preceding. In ecclesiastical and common usage it has begun at Christmas, Easter, 1 March, and other dates. In England from the 7th to the 13th century it was on Christmas; in the 12th the Annunciation began to be used as well, and from the 13th till 1752 remained paramount. The different beginnings of the year must be carefully taken into account in studying medieval history.

Vol. 6 — 41
Cycle of Indiction.—This was a period of 15 years, whose object has been already explained. It was generally used in the Western or Latin empire for several centuries before the Christian era became general. It began in the year 313, or was referred to that year as a start. There were three, differing only as to the beginning of the year: (1) The Constantinopolitan, beginning in September, which was a Greek year; generally used in the Eastern or Greek empire and sometimes in France. (2) The Imperial or Constantinian, attributed to Constantine the Great, called also the Cesararian. It began 24 September, and was used by old French and English chroniclers. (3) The Roman or Pontifical, beginning on Christmas or 1 January as custom varied; often used in papal bulls, and sometimes in old French writers. To find the number of any year in the Indiction, add 3 to the date (our era), divide by 15, and the remainder is the number. If the remainder is 0, the year is the fifteenth or last of the cycle.

Armenian Era.—This starts from the Council of 706, when St. Mesrob, as the act of condemnation of the acts of the Council of Chalcedon. The Armenian civil year is the Egyptian year of 365 days, out of all measure with others; their ecclesiastical year begins 11 August, and has the Julian calendar. They also use the Creation era of Constantine along with their own, dating documents with both on occasion. In business with Europeans they employ our era and our year. To convert their civil dates to our era, multiply the number of Armenian years by 365; add the number of days from 1 January to the given date; subtract 176; the remainder will be the number of days from 1 Jan. 553 to the given date; reduce this to Julian years, add 552, and this gives the date in the Julian year, old style. Add the requisite number in the Gregorian calendar if desired. In ecclesiastical reckonings, add 551 years 223 days. In leap years, if the date is between 1 March and 10 August, subtract one day from the above.

Mohammedan Era.—This commemorates the Hijra or Hegira (flight) of the Prophet from Mecca to Medina, 622 A.D. It does not, however, date from the flight, but from 68 days previous, 16 July, or as some have it, 15 July. The methods of computation are too complicated and uncertain to be given here: Mohammedan chronology is one of the most treacherous of subjects, and even experts disagree and go astray.

Persian or Gelalean Era.—This begins with the accession of Yazdegird III to the throne of Persia, 16 June 632. Till 1079 the Persian had the random Egyptian year, 365 days without intercalation; it was then reformed by Khayyam, the great poet and astronomer, under Malek Shah, to a degree almost as accurate as the Gregorian. There were seven successive leap years once in four years, but the eighth was deferred till the fifth year. The method is thus once universal in Persia, and is still followed by the Parsees of India. Owing to the days of error accumulated by the old year, the day of beginning is thrown back, so that the Persian year can be converted into ours by adding 631.

Indian Eras.—The philosophers divided the duration of the world into four yugas or ages, of which three are past, and the present corrupt one, the kali-yuga, is alone historical. It begins 3101 B.C. and includes several others in use. The Era of Visvarudra, from a Hindu Augustus who may or may not be historical, is reckoned from 57 B.C. This monarch is generally attributed to the 5th or 6th century if real, and the epoch is thought a sidereal one. The Era of Sivalahana is 78 A.D. This is used in southern India, and commemorates an equally dubious ruler. The Fusi era, used in revenue transactions all over India, is not uniform, but the most usual begins 590 A.D.; it seems to be a Mohamadan era corresponding roughly to the Hegira. The Bengali era is another of the sort, and is set at 631. There are also others which are used in different provinces. The 60-year cycle is employed, its date being variously set.

Chinese Chronology.—This rests on cycles of 60 years, the mathematical tribunal fixing their start at 2277 B.C. But since 163 B.C. the Chinese writers have used periods called Nien-hao, each beginning with the accession of some emperor, and named after him, as with English laws, and ending when he or some successor chooses to begin a new period. Tables of Nien-hao are therefore needed to identify the years.

CHRONOMETER (Gr. χρονóμετρον, *time* + μέτρον, *measure* = *time-measurer*), an instrument designed to measure time with great accuracy, and much used in scientific work, for the determination of longitude at sea, and in the regulation of clocks and watches by makers and repairers. The marine chronometer bears a strong superficial resemblance to a watch, except that it is larger and is mounted upon gimbals, so that the motion of the ship may affect it as little as possible. In its mechanism it differs from a watch chiefly in the design of its escapement and balance-wheel. The usual form of escapement, as invented by Le Roy about 1765 and greatly improved by Earnshaw and Arnold some 15 years later, is shown in Fig. 1. It is known as the "detached" or "de-tent" escapement. In the figure a spring detent is shown, the spring being at F. This type is the usual one for marine chronometers. For pocket chronometers the spring is omitted and the detent method is pivoted.

In the ordinary watch the balance-wheel is in connection with the train of wheels leading from the mainspring continuously, or nearly so; but in the chronometer it is free from these during the greater part of the time, so that its natural period of vibration is more nearly realized. A is the escape-wheel, which is in gear.
with the other wheels of the instrument and is prevented from free rotation by means of the locking-pallet, D. B is a disc (technically known as the "impulse-roller") secured to the same staff, or axis, as the balance-wheel. F is the "detent spring," which serves to return the light frame, C, and the locking-pallet, D, to the position they have in the illustration, after the detent has been tripped by the balance-wheel. A set screw, provided for preventing the locking-pallet, D, from being drawn too far into the escape-wheel, but this has been omitted in the illustration for the sake of greater clearness.

When the mechanism is in the state shown, the balance-spring should be free from strain; but the balance-wheel is moving with its maximum velocity in the direction (let it be supposed) of the arrow, so that in another instant the discharging-pallet, H, will trip the detent by momentarily withdrawing the locking-pallet, D. The escape-wheel is then again arrested by the locking-pallet, D; but as it does so it engages the impulse-pallet, C, and accelerates the balance-wheel. After the escape-wheel has been arrested by the locking-pallet, the balance-wheel continues its excursion until the energy of its motion has all been expended in winding up the balancespring. The balance-spring then preponderates, and the wheel returns to the opposite extreme of its swing without disturbing the locking-pallet, D; the discharging-pallet, H, merely raising the light gold spring, E, as it passes the detent. In most chronometers the balancespring is made in the form of a helix instead of a flat spiral.

The balance-wheel is also compensated for change of temperature, though this feature can hardly be said to constitute a point of difference between a chronometer and a watch, since practically all of the better grades of watches are similarly compensated. The effect of an increase of temperature upon the rate of a chronometer (or watch) is of a dual nature. If the instrument keeps correct time at one temperature, then, unless some mode of compensation is provided, it will lose time at all higher temperatures, because (1) the strength of the balance-spring is less at a higher temperature, and (2) the wheel itself is greater in diameter on account of its natural expansion, so that it has a greater moment of inertia, and hence responds more sluggishly to the action of the impulse. To counteract these effects as far as possible, certain weights are provided along the rim of the wheel and the wheel is so designed that as the temperature rises these weights are automatically thrown nearer to the axis of rotation. The moment of inertia of the wheel is thereby reduced, and the wheel is caused to respond to the weakened spring with precisely the same readiness as before. The essential parts of the balance-wheel of a marine chronometer are shown in Fig. 2. The rim is divided by transverse cuts into two equal, semi-circular segments, each of which is supported near one end; and it is built up of two concentric metal strips, of which the inner is steel, while the outer (which is twice as thick as the others) is brass. As the brass expands more than the steel, so that the rim-segments are deflected inward, and the weights, AA, are caused to approach the axis (or "staff") of the wheel. The two masses AA must always be opposite each other, in order that the balance may not be thrown out of poise; but they are slotted so that they may be slid along the rim. If a chronometer keeps correct time at one temperature, but loses at a higher temperature, the compensation is not sufficient, and the masses AA must be shifted toward the free ends of the rim-segments. If it gains at the higher temperature it is overcompensated, and the masses AA must be shifted toward the fixed ends of the rim-segments. In practice it is found to be impossible to adjust the masses so that the instrument shall be perfectly compensated at all temperatures. In fact, the theory of the balance shows that there are only two temperatures at which the chronometer can be expected to keep correct time, though these two may be selected arbitrarily, and the instrument adjusted accordingly. In marine chronometers the temperatures so selected are 45° and 80° F., and at intermediate temperatures the instrument will gain. Hartnup, the director of the Liverpool Observatory, concluded, as the result of experiments upon 1,000 chronometers, that the error in rate from imperfect compensation may amount to 1.5 seconds per 24 hours at temperatures 15° F. above or below either of the points at which the balance is standardized, when the balance-spring is of steel. With paladium springs the error is smaller. A more delicate adjustment has been devised, in the form of short arcs of steel attached to the shaft of the wheel at its ends. They are set parallel to the rim and a short distance from it, and at their free extremities carry an adjustable screw. Two are placed on the outside of the long ends of the cut rim, and these check the outward thrust of the rim under the influence of cold, thus automatically shortening the expanding arm. The two placed inside of the rim act in a similar way when the temperature is high, shortening the contracting arms.

The practical effort is to bring the extremes of temperature for which the chronometer is regu-
lated much closer together and nearer the centre of the scale to be covered, the temperatures above and below these points being taken care of automatically. When the balance has been compensated for temperature as accurately as possible, the moment of inertia of the wheel is adjusted so that the chronometer will keep correct time at the standard temperatures, by means of the slotted nuts BB. These turn upon screw-threads that are secured to the rim near the central arm, where their positions will not be sensibly affected by changes of temperature. If they are caused to approach the rim, the moment of inertia of the wheel is lessened, and the chronometer runs faster; and vice versa. The slots in BB are provided so that the nuts may grasp their screws spring-tight, and so avoid backlash. Consult Britten, F., J., 'Watch and Clockmakers' Handbook' (New York 1899); Fritts, C. E., 'The Watch Adjusters' Manual' (Philadelphia 1912).

Chronoscope, or Chronograph, an instrument contrived to measure the duration of certain short-lived luminous phenomena, such as the electric spark, of which the eye itself is incapable of forming an impression, and the persistence of impressions of light on the eye after the cause of sensation has ceased. The phenomenon is observed by reflection in a mirror, in such rapid motion that the image of the luminous object would appear to describe a circle supposing the luminosity to endure long enough. Should the phenomenon be instantaneous, the image will appear as a mere point; should it last for an appreciable time, the image will form an arc, greater or less, of the circle. The nature and operation of chronoscopes will be best understood by a few descriptions.

Navez-Leurs Chronoscope.—This is one of the most successful of all the pendulum instruments, where the value of the time is expressed in arc. It may be said to consist of two self-sustaining pendulums, the pendulum instrument and the disjuncteur. The pendulum instrument is an upright plate of vulcanite with a graduated arc, mounted on a stand, and supporting two pendulums, two electro-magnets, a pair of spotters, and the parts which the escapement system works. One of the pendulums is termed the chronometer pendulum and the other the register pendulum; and the magnets are so adjusted one behind each pendulum, that when magnetized by a current of electricity they will just sustain the bobs of their respective pendulums, into both of which a piece of soft iron is inserted. The disjuncteur consists of a small stand on which are two pieces of brass, each provided with a pressure-screw, a brass spring, fastened by another pressure-screw, and a cam to work the spring; the brass pieces have platinum points, separated from each other by a short interval, and the spring has also a platinum point below it, which when pressed down by the action of the cam connects the two other points; thus connecting, when requisite, the circuits through the apparatus. The electric currents are obtained by means of voltaic batteries, there being two circuits for an ordinary experiment, one passing through the magnet of the chronometer pendulum on the first screw, the other through the magnet of the register pendulum and the second screw; as both pass through the disjuncteur, the simultaneous disjunction of both circuits can be effected by turning the releasing spring, and so disconnecting the platinum points.

Challenger Chronoscope.—The principle of action of this instrument consists in registering by means of electric currents upon a recording surface traveling at a uniform and very high speed, the precise instant at which a projectile passes certain defined points in the bore of a fire-arm. It consists of two parts:—First, the mechanical arrangement for obtaining the necessary speed, and keeping that speed uniform; secondly, the electrical recording arrangement. The first part of the instrument consists of a series of thin metal discs, each 36 inches in circumference, fixed at intervals upon a horizontal shaft, which is driven at a high speed by a heavy descending weight through a train of gearing multiplying 625 times. If the requisite speed of rotation were got up by the action of the falling weight alone, a considerable waste of time would ensue; to obviate this inconvenience the required velocity can be obtained with great rapidity by means of the handle. The speed usually attained in this way is 1,000 inches per second, linear velocity, at the circumference of the revolving disc, so that each inch traveled at that speed represents the one one-thousandth part of a second; and as the inch is subdivided by the vernier into a thousand parts, a linear representation at the circumference is thus obtained of intervals of time as minute as the one one-millionth part of a second. As a small variation in speed would affect the relation between the several records obtained, the uniformity of rotation is ascertained on each occasion of experiment by three observations, one immediately before, one during and one immediately after the experiment, the mean of these observations being taken for the average speed. Some idea may be conveyed of the minute intervals of time which can be measured, from the fact that the distances between the parts of a 10-inch gun at which the time records have been obtained are in some instances only two and four-tenths inches, while the bore of the tube which the escapement mechanism system works is 5.5 inches—when fired with a full charge, is about the one-hundredth part of a second. By means of the time may be recorded which the projectile occupies, from the commencement of motion, in reaching different parts of the bore, and from these time records may be deduced the velocity with which the projectile is passing through the different parts of the bore, and the pressures in the gun which corresponds to these velocities.
tile reaches any point in its trajectory is by the application of electricity marked upon the cylinder beside the scale of time. The number of vibrations comprehended between any two consecutive marks is an exact measurement of the time elapsing between the instants at which the projectile occupied the corresponding positions in its trajectory. The measurement of time depends on the equality of duration of the vibrations made by the fork; the number of these vibrations in the unit of time is fixed by the construction of the fork. The principal parts of the machine are the cylinder vibrating fork, electro-magnets, the wheel-work, the electric interrupter, Kuhnkorff coil, pendulum and micrometer, and, while experimenting the galvanic batteries and targets. The cylinder has a double motion of rotation against the tuning fork on the inner side of the prong, making the fork its own interrupter when the electrical current is passed through it.

Hipp Chronoscope.—In this instrument a falling weight sets in motion a clock-work which is regulated by a rapidly vibrating spring. Electro-magnets make this clock-work engage and disengage a registering dial. The instrument reads in thousandths of a second.

Benson's chronograph is, in principle, a lever watch with double seconds hands, the one superimposed on the other. The outer end of the lowermost hand has a small cup filled with a black viscous fluid, with a minute hole at the bottom, while the corresponding end of the uppermost is bent down so as just to reach the hole. When in operation a string is pulled, and translation, given by means of a weight acting on a system of clock-work. The silvered face of the cylinder is covered with a thin coating of lamp-black, which is removed by the trace and spark, exposing the surface in strong contrast to the blackened parts. The vibrating fork stands immediately in front of the cylinder; on each side of it is an electro-magnet to originate, sustain and equalize the amplitude of the vibrations. The left branch of the fork is armed with a flexible quill-point, which, by an eccentric roller, can be made to touch the cylinder at pleasure, and thus make the traces upon it. The interrupter is the mechanism by which the current for the fork's electro-magnets is made and broken. In the Schulte Chronoscope at West Point the detached mercury interrupter has been replaced by a light metallic spring, which is pressed whereupon the bent end of the upper hand passes through the hole and makes a black mark on the dial, instantly rebounding. This chronograph, which is sometimes called a stop-watch or a split-second fly-back watch, registers to one-tenth of a second.

Very ingenious devices are employed for special kinds of work. Thus for registering the exact times of the "transit" of a moving star across several wires in the field of the telescope, a moving wire is sometimes kept accurately upon the star's image (either wholly by hand or partly driven by a small motor) and at the instant when the moving wire reaches the position of one of the fixed wires the current is automatically closed and the record made. In another device for the same purpose the clock each second uncovers a delicate photographic plate placed at the focus of the tele-
scope; the plate when developed thus shows a series of dots which are the positions of the star at successive seconds. The wires of the instrument are also photographed upon the same plate directly. In this form the plate itself becomes the astronomical chronograph. It should also be mentioned that in a very ingenious form of chronograph invented by G. W. Hough the closure of the key by the observer records upon a moving tape the exact time to one-hundredth of a second when the closure was made, the figures expressing the hours, minutes and seconds being directly printed upon the paper. This does away with the necessity for a later measurement of the chronographic record, for the figures can be readily read from it.

**CHROSPERMA**, krō-sper-ma, a monotypic genus of plants of the *Melanthaceae*, the bunch-flower family. The single species (*Mucaetoxytum*) is commonly known as hy-fox poison, so called from its deadly effect on flies and similar insects. It has a longish bulbous root, grass-like foliage and six-petaled white flowers borne in a terminal raceme, of which the lower flowers open first. It abounds in dry sheltered soil from Arkansas and Tennessee eastward along the seaboard of the United States, in some sections reaching high altitudes.

**CHRUDIM**, hrōo’děm, Austro-Hungary, town and capital of a circle of the same name of Bohemia, situated 74 miles by rail southeast of Prague on the river Chrudinka. It is a walled town and contains an old church and a Capuchin convent. Its principal industries are the making of sugar, liquors, meal, leather, shoes, cloth, and agricultural machinery; and the horse markets held here are the most important in the empire. Pop. 13,017.

**CHRYSLALIS OR THE ADVENTURES OF A GUINEA**, a satirical novel by Charles Johnstone, published in 1760. Chrysal, the spirit inhabiting a guinea, passes through many hands, from the prince's to the beggar's, and tells its own story, which is chiefly the adventures of those in whose possession it is for the time being.

**CHRYSLIS**, krīs’-a-lis, the pupa stage in butterflies, succeeding the caterpillar. During this time the insect eats no food, living upon the fat stored up by the larva. (See Pupa.) The chrysalides of butterflies differ from the pupa of moths in being often ornamented with brilliant golden spots which have given origin to the name "chrysalis" or "aurelia." Also the body is often strengthened or protected by tubercles situated on the head, back and sides.

They are either suspended head downward by the tail, or rest horizontally, with a thread passing around them to hold them securely. Many, if not most, chrysalides are protected from observation by their colors, which harmonize with the color of the object to which they are attached. Thus, the chrysalis of the milkweed butterfly (*Anostrarchus*) which is suspended among the pale-green leaves of the milkweed and does not hibernate, is of a pale-green tint; while those of *Papilio funus*, or of *Pieris*, are gray, and so spotted with light and dark marks as to harmonize with the neutral tints of the boards or fence to which they are attached. These colors and markings are apparently due to the effects of light and shade. These tints are determined at the period when the caterpillar is about to pupate, or become a chrysalis, when the integument is soft and moist. Poulton found, by subjecting the partly formed chrysalis to artificial surroundings of different colors, that the breeding boxes, when lined with black paper, produced dark chrysalides; when lined with white, light-colored, or green ones, or when lined with gilt, they produced chrysalides of a distinctly golden color, more completely so than occurs in nature.

Certain chrysalides have been found to exhibit negative phototropism (e.g.); that is, are directly sensitive to light. They will, while suspended by the tail, change their position if sunlight strikes them, and move so as to keep in the shade, from a pendant to a horizontal position, through an angle varying in different species of from 45 degrees to 70 degrees or even 90 degrees. Too much light, especially direct sunlight, seems to be injurious to them, and the movement is one of protection.

**CHRYSALEN**, k्रيث-sa-l'en, Friedrich, German music editor: b. Lübbechen, Mecklenburg-Schwerin, 1850; d. 1901. He studied philosophy at Rostock, but later devoted him-
CHrysanthemum — Chrysippus

CHrysanthemum, a genus of herbs of the family Asteraeae. The very numerous species are natives most of the cooler parts of the northern hemisphere, but some have become introduced and established in the southern hemisphere as weeds, having escaped from gardens. They are generally hardy, white or yellow-flowered, annual or perennial and easy cultivation. Except C. cinerariefolium and C. coccineum, the flowers of which are used to make insect powder (q.v.), the species have small economic use, though some, notably C. leucanthemum, the ox-eye daisy, is a troublesome weed upon badly managed land in the United States. C. segatum, the corn-marigold, and C. frutescens, the mariguerite, are cultivated for ornament, especially in Europe, where they are native.

But the most important species are C. indicum and C. morifolium. These are the parents of the popular autumn flowers known as "mums" and chrysanthemums, the varieties of which in Europe and America are numbered by thousands, and vary greatly in size, form and color. So great is the diversity that fanciers speak of the varieties as belonging to certain types, of which there are recognized: Single, double, large, small, few-flowered, many-flowered, anemone-flowered and various forms of the ray flowers, such as incurved, reflexed, etc. The size ranges from the "pompon," which may be less than an inch in diameter, to the "show," which may exceed eight inches in diameter. Thus, the range of form and color the varieties are almost scentless, or have some disagreeable odor. These varieties are mainly cultivated under glass, since they do not attain perfection in the open air. They are propagated almost wholly from cuttings, which are taken from the parent plant after it has flowered. The cuttings are grown in a cool greenhouse until spring, when the young plants, then in pots, are placed in partial shade for the summer and kept as stocky as possible. In autumn, they are forwarded until they blossom, after which they are destroyed, new cuttings having been taken.

For exhibition purposes the plants are watched and tended with the most minute attention, the supersilicious buds and stems being removed while still tiny. Sandy or clayey soil is found useful by various growers, but whatever its character it must be rich and rather porous. Attention to fertilization, watering and cultivation is essential. For outdoor culture the late summer is distinguished for its skill in debate. He was the principal opponent of the Epicureans, and is said to have written 700 different works, mostly of a dialectical character; but of these no complete work is extant. He died at a great age.

The literature dealing with this flower is voluminous, probably ranking next in extent to that dealing with the rose. Eighty-three books are listed by C. Harman Payne in the "Catalogue of the National Chrysanthemum Society" (1896), and many more have been published in recent years. Other references to literature are given under the title Chrysanthemum in Bailey's "Cyclopedia of American Horticulture," which should be consulted for descriptions of various species, types, etc., and for methods of propagation, cultivation and management. Consult also Scott, "The Show Chrysanthemum and Its Cultivation."
CHRYYSIS, a priestess of June who by falling asleep suffered the sacred fire to destroy the temple of her goddess, and was at last burned herself.

CHRYSOBALANZE, krís-ô-bá-lâ'ne, a plant family closely allied to the Rosaceae, of which it is sometimes considered a sub-order, comprising 12 genera, with 180 species, all trees or shrubs. Many of them, as the cocoa-plants, produce edible fruits. So do several species of West Africa, the seeds of which are sometimes substituted for or used to adulterate sweet almonds, which they resemble in taste and appearance. From the seeds of a member of the family growing in the Himalayas an oil is extracted.

CHRYSOBERYL, krísô-bër'âl (Gr. χρυσόβερυλλος, "golden beryl"), a native aluminate of glucineum (or beryllium), having the formula GlO.AlO₃, and crystallizing in the orthorhombic system. It is transparent or translucent, with a very vitreous lustre and a green or yellow color. The variety alexandrite (q.v.) is green by daylight and colombine-red by artificial light. The finer varieties are used as gems. It has a hardness of 8.5 and a specific gravity of from 3.5 to 3.84. Chrysoberyl occurs in Brazil, Brazil in Ceylon, in the Urals and in England; and in the United States it has been found in Maine, Connecticut and New York. See also CAT'S-EYE.

CHRYSOCCOLA, krís-ô-köl'â, a hydrated silicate of copper, having the formula CuSiO₄ + 2H₂O. It is cryptocrystalline and usually occurs in granular or earthy masses, or as incrustations, or not infrequently with botryoidal surface. When pure it is translucent and of sky-blue color, but when impure it is often opaque and dull green, brown or black. Its hardness varies with its composition, from 2 to 4, and its specific gravity from 2 to 2.2. Its lustre varies from vitreous and shining in the pure mineral to dull and earthy. It is found in copper mines in all parts of the world, especially in Cornwall, England, Australia and Arizona. The Chrysocolla of the ancients, meaning "green glue," was apparently a body used to facilitate soldering. The name is still applied to borax which is thus used. Malachite, the green carbonate of copper, was doubtless confused with chryscolla.

CHRYSOGENUM, krísô-ô-gên'əm, a monotypic genus of the natural order Compositae. It is found throughout the eastern seaboard of the United States, in dry soil, from southern Pennsylvania to Florida, blossoming in April and July. It is a perennial herb with large heads of tubular and radiate flowers.

CHRYSOLITE, krísô-lît (Gr. χρυσόλιθος, "bright yellow stone"), a native silicate of magnesium and iron, sometimes also containing titanium, nickel or tin. It occurs massive and granular, and also in orthorhombic crystals. It is transparent or translucent, and usually green or yellow in color, with a vitreous lustre. It has a specific gravity of from 2.37 to 3.57 (according to its composition), and a hardness of from 6.5 to 7. Chrysolite occurs in volcanic rocks; as in basalt and basaltic lavas, and it is also found in dolomite and in certain varieties of limestone. The finest crystals of the mineral come from Brazil and Egypt, and are known as "precious chrysolite." They are used to a certain extent as gems, and are sometimes confused with the emerald. Chrysolite readily passes by alteration into serpentine, and numerous large beds of the latter mineral are known to have originated in this manner. It is abundant in crystalline grains in some meteoric iron and stony meteorites. Peridot and olivine should not be confused with chrysolite.

CHRYSOLEORAS, krísô-ô-lô'râs, Manuel, Greek scholar: b. about 1535; d. Constance, Germany, 15 April 1415. He was the first who, in modern times, transplanted Greek literature into Italy. The Emperor John Palaeologus sent him in 1391 to Italy and England to ask for assistance against the Turks. Having thus become known in Italy he returned there about the year 1395, and was appointed professor of Greek literature at Florence, where he collected around him a great number of scholars of all ages and ranks, and excited universal enthusiasm as much by his dignity and the grace of his elocution as by the extent of his learning. From his school proceeded Leonardo Bruni, Poggio, Francis Philotheus, and other distinguished reviewers of classical studies. He afterward taught with equal success at Milan, Pavia and Venice, and lastly at Rome. Pope Gregory XII employed him in public affairs, and sent him with others to the Council of Constance, where he died in 1415. He should not be confounded with his nephew and companion in Italy, John Chrysoleras.

CHRYSOMELIDÆ, krísô-ô-mêlî'dë, an extensive family of small beetles which have a hemispherical or ovate form, small, sunken head, and antennae widely separated, and especially the typical genus Chrysomela, are very gaily colored,—blue, green, golden or a mixture of brilliant tints. The most elegant American species (C. scalaris) has the head, thorax and under side dark green, while the wing-covers are silvery white, ornamented with small green spots on the sides and a broad irregular stripe down the middle of the back; the legs and antennae are rust-red, and the wings rose-colored. These beetles inhabit trees, bushes and plants, feeding on the leaves. They include many species, as the potato-bug and the elm-leaf beetle, which do vast damage. Their eggs are laid on the leaves, and the grubs, which as a rule are protected by disagreeable odors and excretions, go into the ground to transform, and there spend their pupal life. The family is a very large one and is spread all over the world. See LEAF-BEETLES.

CHrysopANIC, krísô-ô-fân'îk, ACID, the yellow coloring matter of rhubarb. It can be obtained direct from rhubarb by exhausting with benzol and purifying the crude product. It crystallizes in fine yellow tablets. It is hardly soluble in water, but dissolves in ether, benzol, etc. With potash it gives a fine purple solution, and thus affords a delicate test for the presence of alkalis. It is also soluble, without decomposition, in strong sulphuric acid. Its acid properties are rather obscure.

CHRYSPHYLLUM, krísô-ô-fîl'îm, a genus of the sapodilla family (Sapoticaceae), consisting of trees with milky juice, alternate leaves with numerous transverse closely aggregated ribs, and golden hairs on the under surface. In the West Indies the fruit of C. cainito
CHRYSOPTES—CHRYSTOS TON

is esteemed a delicacy under the name of star
apple. It is fleshy, with several one-sided
seeds, or, by abortion, with one. Seeds not-
like.

CHRYSOPTES, kri-soptes (from the Greek
signifying "of a golden aspect"), a genus of
about 20 species of the natural order Compos-
ita, comprising nearly 30 species, natives of
North America and Mexico. Commonly known
as the golden aster.

CHRYSPRASE, kris-ô-prás, a variety of
chalcodon, colored apple-green by nickel oxide
and prized as a semi-precious stone. Silesia
and Siberia long furnished a small supply, but
later discoveries in California have made it
abundant and cheap. It also occurs in Oregon
and North Carolina.

CHRYSTOS TON, kris-ôs-ton, Dion (surnamed
Coccelanus). Greek orator: B. Frusa in
Bithynia about 99 a.d. He was first a Sophist,
then a Stoic, and rose to high repute as an
orator under Domitian. That tyrant, however,
took offense at his freedom of speech, and he
was obliged to save himself by flight. He was
afterward highly esteemed by Nero and Tra-
jan. Amongst his orations, however, there
were many that were not extant. They are written in an affected style, but not
withstanding form a valuable contribution to
our knowledge of ancient philosophy. They
appeared first in a collected form at Milan in
1478.

CHRYSTOS TON, John, Saint, archbishop
of Constantinople, greatest of the Greek Fathers
of the Church: B. Antioch, the capital of Syria,
about 347; d. near Comana, in Pontus, 14 Sept.
407. His cognomen, the golden-mouthed
(chryostomos), which was given to him after
his death, he owes to his extraordinarily rich,
fervid and persuasive eloquence. In his youth
he attended the school of Libanius, a celebrated
Pagan sophist, was his favorite disciple and
would have been his successor had he not
been won for the service of the Church by his
pious mother Anthusa. In accordance with the
general usage of that time, he did not receive
baptism till he had attained maturity, and then
he lived devoted in religious contemplation and
studies seclusion in a desert place for six
years. There the austerity he practised
undermined his strength, and being called back
to Antioch by the bishop, he was ordained
deacon in 381 and presbyter in 386. By his
zeal, his urbanity and his eloquence, he won
to the Church heretics, pagans and Jews in
great numbers; and his fame spreading to the
capital city of the Eastern empire, he was,
with the approval of the Emperor Arcadius,
chosen to be archbishop of Constantinoople in
387. Here he led such an episcopal life as
the life of a ascetic, eschewing the pomp and
luxury of his predecessors, and out of the
revenues of the see maintained numerous charities.
Meanwhile his homilies or pulpit discourses,
which are still extant, were even a stronger
attraction for the masses than the shows of the
amphitheatre. But he had many rivals, who
left no means untried to blacken his character,
his reputation for piety, zeal, disinterestedness
and for orthodoxy, and his life was according
ly full of trials and vicissitudes. His en-
forcement of the Church's laws regarding the
relations between ecclesiastics and the female
inmates of their households; his deposition
of bishops for simony and licentiousness; the
restrains he put upon the vagrant habits of the
monks, called forth a host of enemies, who
brought against him the charge of sympathiz-
ing with heretical monks of the Nubian desert
who had been excommunicated by their eclec-
tiasticai superior, Theophilus, patriarch of
Alexandria. Theophilus not only denied himself
to the malcontents of Constantinople, and he
called a synod of bishops to be held in the
imperial city to judge Chrysostom. But because
of the menacing attitude of the common peo-
ple, who were to a man loyal to their arch-
bishop, the synod had to be held in the neigh-
boring city of Chalcedon. To this synod
Chrysostom was four times summoned, to re-
ply to the charges that were to be made against
him, but he ignored the summons, and was
declared guilty of favoring the heresies of
Origen. By order of the Emperor Arcadius
he was exiled to Bithynia; but so great was the
commotion of the common people in Constantinoople when the
punishment was published, that the emperor,
alarmed, ordered his recall. The re-entry of
Chrysostom to the city was attended with all
the pomp of a Roman triumphal procession, and
he abated not jot of his zeal. For the remainder
of the evils of Church and state. His lan-
guage was, as it had ever been, sufficiently
emphatic, sufficiently plain-spoken, but his en-
emies put in circulation a spurious version of
the opening passage of his first discourse after
his return; he was reported by them to have
comenced his address with these words in
denunciation of the Empress Eudoxia: "Herods
is again furious; Herodias again dances;
she once more demands the head of John." The
report was false, but the fate of Chrysos-
tom was sealed. Barbarian troops were
brought into the city to overawe the commons
while another synod was in session in the city:
it confirmed the decree of the synod of Chalce-
don. By decree of the emperor, Chrysostom
was banished to Cucusus, beyond Mount
Taurus. The people of Constantinople, not to
be restrained by the garrison of Gothic merca-
enaries in the city, set fire to the cathedral and
the senate house on the day the decree was
published; and Chrysostom, though absent,
was a more formidable power than ever: his
correspondence with bishops, both in the East
and West, arrayed the whole Catholic Church
against Theophilus and the court of Arcadius.
Indignant at the contumacy of the exiled arch-
bishop, Arcadius ordered his transfer to a more
inhospitable region still, the desert of Pityos.
He died on the way thither in his 60th year.
His day in the calendar of the Greek Church
is 13 November; in thate of the Latin Church,
27 January. His last words are reported to
have been "God be in all things praised." His
works consist of homilies or discourses sug-
gested by or illustrating passages of Scripture;
commentaries on the sacred books; epistles,
etc. Consult Martin, 'Saint Jean Chry-
sostome, ses œuvres et son siècle'; Perthes,
'Life of Saint John Chrysostom and His
Biographers'; Tauscher, 'Life'; both in Ger-
am; and a biography by Aimé Puech, in
English.

GEORGE EDWIN RINES.
CHRYSOTILE: kris'-o-tile, a variety of the mineral serpentine, occurring in silky fibres that are flexible and easily separated. It is commonly greenish in color. Its specific gravity is about 2.22, which is sensibly less than that of ordinary serpentine. It occurs abundantly in Canada, where it is known as "bostonite" and "asbestos." See Asbestos.

CHRISTLER'S FARM. Battle of, the most discouraging American defeat, as Chickamauga was the most brilliant victory, of the War of 1812, was fought 11 Nov. 1813. The expedition prepared in the spring and fall of 1813 at Sackett's Harbor, on Lake Ontario, to descend the Saint Lawrence and capture Montreal, started 17 October under bad auspices. Aside from insufficient resources and the lateness of the season, the personnel was hopeless. The commander-in-chief alone would have ruined it. This was Maj.-Gen. James Wilkinson, termed by Sec."an unprincipled imbecile," a mere cunning jobber, of neither military talent, firmness nor even character to be respected, and despised by all the other officers. He had been appointed for the curious reason that his uncle, Gen. Orlando, was not thought safe in his hands. Furthermore, he was prostrated with lake fever, as was his second in command, Morgan Lewis. Boyd, the third, was so incompetent that Jacob Brown, the one able fighting professional, had threatened to leave the army rather than serve under him. Men cannot fight without leaders. The flotilla, battered by contrary winds, began the descent of the river 5 November. From this on, the British made progress slow and dangerous. Captain Mulcaster, an able and daring naval officer, with several gunboats, harassed the rear, and 800 regular infantry co-operated with him, pouring musketry and artillery fire on the expedition from the opposite bank whenever possible, besides the batteries at Prescott. Brown's and Macomb's brigades were landed on that side to clear the road; and 10 November the flotilla had reached the Long Sault, and anchored for the night at Christy's Farm on the Canadian side. The next morning Brown marched down beside the rapids with his brigade, and Boyd was ordered to take the rest of the troops, some 2,000, with six field pieces, and guard the rear. Brown reported all clear, and the fleet was about to run the rapids when Boyd reported that the enemy was advancing in order of battle. Wilkinson was sick in bed and could give no orders; so was Lewis; and Boyd was left to fight his own battle. He did it as a weak commander usually does, by detachments, which the British crushed in detail, though they had but 600 against 2,000. The battle lasted from about 2:30 to 4:30, when General Covington was killed and his brigade driven back in disorder. Then the whole American line gave way and retreated in haste. Wilkinson's report 102 killed and 2:7 wounded, and the British claim to 100 American killed. It is more likely to be true that Wilkinson's report of none. The British reported 22 killed, 148 wounded and 12 missing. The American troops hurriedly re-embarked; the next morning the flotilla ran the rapids to Coburg. Col. Brown, as a colleague, Wade Hampton, had ended operations for the season (see CHATEAUGAY), and at once went into winter quarters. Consult Henry Adams, 'History of the United States,' Vol. VII, Chap. 8.

CHU-HI', choo-be', Chinese scholar and philosopher: b. 1130; d. 1200. As a student of the Chinese classics, he became widely known through his interpretation of the doctrines of Confucius, and became one of the founders of the Chinese school of speculative philosophy. He had a large number of disciples among the scholars, and they, under his direction, compiled a history of China in 59 books, which is still a standard work.

CHU-KIANG, choo-ki-ang', or CANTON, RIVER, the "Pearl River" of the Chinese, is the lower part of the Pe-Kiang, and has a navigable channel of about 300 miles. Opposite Canton it is about one-fourth mile wide, and is crowded with shipping up to 1,000 tons burden; larger vessels must lie up at a point 15 miles below. About 40 miles below Canton it is called Boca Tigre, or The Bogue.

CHUAR, Piute Indian name given by Walcott to a thick group of strata of Algolian Age in the Grand Canyon of Arizona. The rocks are shales with interbedded sandstone and limestone, about 5,000 feet in all. They overlie the Unkar group and are unconformably overlain by sandstone at base of Tonto group.

CHUB, a name given to various species of fishes of the family Cyprinidae (q.v.), of which the river chub (Hybopsis kennicottii) and the creek chub (Semotilus atromaculatus) are the most important in the United States. The name is also sometimes applied to the roach (q.v.), and more rarely to certain marine fishes, as the rudder-fish. The river chub is abundant in rivers and creeks throughout the eastern United States, and may be known by its orange-colored fins and the tubercular head of the males in spring. It reaches a length of 10 to 12 inches, and is a favorite with the less ambitious anglers in certain regions. The creek chub, or horned dace, is even more widely distributed, and inhabits brooks rather than rivers. It resembles the roach, but has a black spot in front of the dorsal fin and does not exceed a foot in length. The large black chub (Acrosches salminius), of the Pacific Coast rivers, is known locally as cheslemouth, squaremouth and hardmouth. The English chub (Squalius cephalus) is a much larger fish, attaining a length of two feet and a weight of eight pounds, and lives in mountain brooks as well as in rivers. It is a game fish of considerable importance.

CHUB-MACKEREL, a fish (Scymnus colias), found in immense numbers in the Mediterranean Sea. It is the "Spanish mackerel" of England.

CHUBB, Percival, American educator: b. Devonport, England, 17 June 1860. He was educated at Stationers' School, London, and received training for the English Civil Service where he was employed for 10 years on the local government board. He has delivered lectures on literature at the Brooklyn Institute of Arts and Sciences; instructed in pedagogy at Pratt Institute. Mr. Chubb is a ll English department of the Manual Training High School, Brooklyn, and as principal of the high school department of the Ethical Culture School
of New York, where he also directed the English courses and produced pageants, festivals, etc. After acting in the capacity of leader of the Society for Ethical Culture at New York for a few years and as lecturer on New York University, he went to Saint Louis, where in 1911 he became leader of the Ethical Society. He edited Emerson's 'Selected Writings' (1888); Montaigne's 'Essays' (1891); Pope's 'Homer's Iliad' (with William Maxwell, 1898); Dryden's 'Palamon and Arcite' (1899); Browning's 'Poems'; 'Boy Life'; 'Readings from Howells' (1909); 'Select Writings of Lincoln' (1909); 'Travels at Home' and 'Readings from Mark Twain' (1910). He is also the author of 'The Teaching of English' (1902); 'Festivals and Plays in Schools and Elsewhere' (1912). From 1915-16 he was president of the Drama League of America.

CHUBB, Thomas, English controversialist: b. East Harndham, near Salisbury, 29 Sept. 1679; d. Salisbury, 8 Feb. 1747. He was a mechanic who employed his leisure in the acquisition of knowledge from the best English books which he could procure. In 1715 he published 'The Supper of the Father Asserted,' the perspicuity and argumcntative skill of which obtained for it much notice. Of course a production assailing the orthodox faith did not pass without reply, and a controversial warfare commenced which lasted as long as his life. Between 1725 and 1732 he offered to the world his thoughts on a variety of topics, moral and theological, in 34 tracts, collected in a 4to volume, of which book Pope in a letter to Gay speaks with great respect. Various publications followed: 'A Discourse Concerning Reason'; 'The True Gospel of Jesus Christ Asserted'; 'Inquiry into the Ground and Foundation of Religion,' etc. His publications were a good deal read in America.

CHUBB LOCK (so-called from the name of the inventor), one of the most intricate of the many-tumbler locks which were first made in England by Barron in 1774. The locks of Chubb have obtained their celebrity partly from their superior workmanship, having more tumblers than usual, with the addition of a lever called the "detector," which is so fixed that, while in the ordinary application of the key, it cannot fail to move if any one of the tumblers be lifted a little too high, as must be the case in any attempt at picking. The bolt becomes immovable fixed, and thus, while rendering all further attempts at picking useless, gives notice that such an attempt has been made on the next application of the proper key. To draw the bolt after it has been tampered with, it is necessary only to turn the key a little farther backward, as in the process of unlocking this pushes up a tooth at the end of the detector, restoring the lock to its original position, and the key is then free to turn in the ordinary way. These locks, which were patented as far back as 1818, maintained the reputation of being impregnable until the celebrated locksmith Hobbs, of the United States, in 1851 succeeded in picking the most intricate locks of English workmanship, such as 'Chubbs, Brahams and Cotterills.'

CHUBUT, choo-boot', Argentina, a territory in the northern part of Patagonia, so named from a river which drains a large part of the surface. Its area is about 90,000 square miles. It contains the capital, Rawson, which has a population of about 15,000. It was first settled in 1826 and was ceded to the United States in 1819. Since then it has been under the control of the government of Argentina. It is bounded on the north by the Province of Santa Cruz, on the east by the South Atlantic Ocean, on the south by the province of Chaco, and on the west by Bolivia. It is divided into three departments: the western department, which is the most fertile, and contains the capital; the eastern department, which is the least fertile; and the southern department, which is the most mountainous. The climate is mild and temperate, and the soil is well suited to the cultivation of wheat, corn, and other crops. The rivers are navigable, and the country is well watered. The population is about 300,000, and the chief occupations are agriculture, stock-raising, and fishing. The principal town is Rawson, which has a population of about 15,000.

CHUCK-WILL'S-WIDOW, a large, nocturnal bird (Antrostomus carolinensis) related to the whippoorwill, common in the Southern States of the Union. The name is an attempt to reproduce the note of the bird. It is fully 12 inches in length, and is one of the largest of American song-birds, and when uttering its call, opens its mouth enormously. The eggs are laid upon the ground, little or no attempt being made to form a nest. The bird is a voracious eater of insects, its large bristled mouth fitting it for catching flying objects.

CHUCKWALLA. See LIZARD.

CHUFA. See CYPERUS.

CHUGUWATER CREEK, Wyo., a railroad station in Platte County; it is also the name of the Red Beds, an extensive geological formation in Wyoming carrying valuable gypsum deposits.

CHUKOR, or CHICORE, a partridge (Caccobis chukor), the favorite game-bird of the foothills of the Himalayas.

CHUMBUL, a large river of Hindustan. It rises in Malwa, in the Vindhyas Mountains, about 50 miles south of Oojeein, flows north, enters Rajpoontana, through which it runs northeast, and falls into the Jumna about 90 miles southeast of Agra, after a course of over 650 miles.

CHUNAM, in India, a name given to a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for经费与betel (q.v.). It is also used for plaster, being mixed with fine sand by wetting, and sometimes with various other materials added. It makes a plaster of great durability, capable of being highly polished, and suitable for decorative work. Both fresh and fossil shells are used for making Chunam. Extensive beds of fossil shells employed for this purpose occur in the south of India, particularly in low, marshy places near the seacoast. The name is applied also to a weight for gold used in southern India.

CHUNAR-GHUR, chun-är'gér', India, town, fortress and invalid station in Hindustan, 17 miles southwest of Bhatinda. The fortress stands on a lofty rock rising abruptly from the river. Chunar was stormed by the British in 1764, and formally ceded to the East India Company in 1768. Pop. about 12,000.
CHUNG-KING, choong-k'ing, China, city in Szechwan, on the Yang-tze-Kiang, at its junction with the Kia-ling. It was declared open in 1890, and has become one of the most important commercial centres of western China. It is surrounded by a strong stone wall, about five miles in circumference, and pierced with nine gates. The climate is neither pleasant nor healthful. The vice-consul of the United States states that the trade of Chung-King in 1915, although less than in 1914, was more than in other years. The value of the trade of the port was as follows: Net foreign imports, $5,322,888; net native imports, $5,980,186; exports, $10,120,803; total, $21,423,877. The number of vessels entered and cleared at Chung-King during 1915 was given as follows: Chinese vessels of foreign type 120, tonnage 31,627; Chinese junk 1,905, tonnage 85,793. There was a rebellion of the natives here in 1896-98, which checked progress. A railroad to centre at Chung-King is projected, and the exploitation of valuable products awaits the realization of this plan, since in size and potential wealth Szechwan surpasses all other provinces. Pop. about 702,300.

CHUPRAH, chūp-rā', or CHAPRAH, India, a town in Bengal, on the Gogra, near its junction with the Ganges, 32 miles west-northwest of Patna. It is narrow but extends along the river for four miles. It has government courts and offices, government English schools, and is the station of a German Lutheran Mission; a Roman Catholic Mission was also started within recent years. In 1901 the population was 45,901, or nearly 12,000 less than in 1891, the decrease being mainly due to a plague outbreak and the attendant exodus shortly before the census. The plague has visited the town several times since; between November 1902 and February 1903 there were 2,138 deaths from the epidemic.

CHUQUISACA, choo-kē-sē'kā, Bolivia, department in the southeastern part of the country, bounded on the north by the department of Santa Cruz, on the east by Brazil, on the south by the department of Tarija and on the west by the departments of Oruro and Potosí. Its area is 28,417 square miles. The eastern portion is mostly level, the mountainous parts being in the west. There are large forests and grazing lands, and the soil, where cultivated, is found good for agriculture. Mineral deposits exist, the most valuable being silver, of which some is mined. Among the other productions are wheat, coffee, sugarcane and cacao. The capital of the department is Sucre (q.v.) which was formerly the capital of the republic also. The population is estimated at 230,000, embracing about 85,000 civilized and 8,000 uncivilized Indians.

CHURCH, Albert E., American mathematician and military officer; b. Salisbury, Conn., 1807; d. West Point, N. Y., 30 March 1829. He was educated at West Point and was professor of mathematics there 1834-78. His mathematical works include 'Elements of Differential and Integral Calculus' (1842); 'Elements of Analytical Geometry' (1851); 'Analytical Trigonometry' (1857); 'Elements of Descriptive Geometry' (1865).

CHURCH, Alfred John, English translator and author; b. London, 29 Jan. 1829; d. 1912. He was educated at Lincoln College, Oxford; was ordained in the English Church in 1853; professor of Latin in University College, London, 1880-88; and rector of Ashley, Gloucestershire, 1892-97. He published translations of Tacitus and Livy. His tales retold from the classics and American literature of the ancient empires of Greece and Rome won him wide popularity on both sides of the Atlantic. 'His Memories of Men and Books' was issued in 1908.

CHURCH, Sir Arthur Herbert, English chemist; b. London, 2 June 1834; d. 31 May 1915. He was educated at King's College, London, the Royal College of Chemistry and Lincoln College, Oxford. He was professor of chemistry in the Royal Agricultural College, Cirencester, 1863-79; and filled the same position in the Royal Academy of Arts from 1879 to 1911. He was the discoverer of the animal pigment known as turacin, and of churchite, a native cerium phosphate. He published 'Precious Stones' (1883); 'English Earthenware' (1884); 'The London Guild' (7th ed., 1894); 'Food' (16th thousand, 1901); 'Josiah Wedgwood' (1894); 'Color' (1887); 'Guide to Corinium Museum' (1910); Chemistry of Paints and Painting' (1901).

CHURCH, Benjamin, American soldier; b. Duxbury, Mass., March 1639; d. Little Compton, R. I., 17 Jan. 1718. He commanded forces with distinction in King Philip's war and in the famous battle of 1675 with the Narragansetts won renown. He captured and executed King Philip in 1676. 'Entertaining Passages Relating to King Philip's War,' was compiled from his notes by his son Thomas.

CHURCH, Benjamin, American physician; b. Massachusetts about 1710; d. 1776. He graduated at Harvard; became noted for his patriotic writings during the decade preceding the Revolutionary War, and was a leader in the 'Boston tea-party.' He secretly corresponded in cipher with the British, and, being detected, failed to exculpate himself. He was lost at sea while on a voyage to the West Indies.

CHURCH, Francis Parcellus, American editor; b. Rochester, N. Y., 11 Feb. 1839; d. New York city, 11 April 1906. He was the first publisher and editor of the Army and Navy Journal; afterward, with his brother, he established and edited the Galaxy Magazine. He was a leading editorial righter on the New York Sun, and till his death was a proprietor of the Army and Navy Journal.

CHURCH, Frederick Edwin, American landscape painter; b. Hartford, Conn., 4 May 1826; d. New York, 7 April 1900. His earliest productions were views of the Catskill Mountains, among which he resided, and a view of East Rock, near New Haven, which attracted very favorable notice. In 1855 he visited South America, and found in the magnificent scenery of that country materials for several of his most admired pictures. After his return he executed his 'View of Niagara Falls from the Canadian Shore,' regarded by many as the most successful presentation of the great cataract. Among his other works are 'The Heart of the Andes,' 'Cotopaxi,' 'Morning on the Cordilleras,' 'Under Niagara Falls' (1863), 'The Alps' (1869), 'The Alps: The 'bergs,' and 'Sunrise on Mount Desert Island.' After a visit to the Holy Land in 1868 he
painted 'Damascus' (1869); 'Jerusalem' (1870); 'The Parthenon' (1871).

CHURCH, Frederick Stuart, American artist: b. Grand Rapids, Mich., 1 Dec. 1842. He studied at the National Academy of Design, of which in 1885 he was elected a member. He was also an active painter as a realist and is well known as a painter of figures and animals. He has a sensitive and delicate feeling for color which he realizes more fully through his use of water color than in the medium of oil. Among his pictures are 'Weirdness'; 'Mad as March Hares'; and 'The Sea Princess,' in oil; 'Hard Times'; and 'The Phantoms,' in water colors. He exhibited 'St. Cecilia' in 1898 and in the National Academy of Design 1901, 'The Sea Serpent'; 'Companions' (1909); 'The Were Wolf? (1910); 'Summer' (1911); 'The Stowaway' and 'Refuge' (1912); 'Conquered' (1913).

CHURCH, George Earl, American soldier, engineer and explorer: b. New Bedford, Mass., 7 Dec. 1835. He was a member of the Scientific Expedition to the South Pacific in America in 1858; served in the Army of the Potomac 1862-65; and was a member of the epic journey of the New York Herald 1860-67. He made explorations in South America 1869-72; was United States commissioner to visit and report on Ecuador 1880; represented American Society of Civil Engineers at London Congress of Hygiene and Demography in 1891, and was president of the Geographical Society of the British Association in 1896. He is now residing in London where he is vice-president of the Royal Geographical Society.

CHURCH, Irving Porter, American civil engineer and educator: b. Ansonia, Conn., 22 July 1851. He was educated at Cornell University and has been professor of applied mechanics and hydraulics in the College of Civil Engineering there, from 1892. He has published 'Statics and Dynamics for Engineering Students' (1886); 'Mechanics of Materials' (1887); 'Hydraulics and Pneumatics' (1890); 'Mechanics of Engineering' in 1890; 'Notes and Examples in Mechanics' (1892); 'Diagrams of Flow of Water in Open Channels' (1902); 'Hydraulic Motors' (1905); 'Mechanics of Internal Work' (1910).

CHURCH, John Adams, American mining engineer: b. Rochester, N. Y., 5 April 1843; d. New York, 19 Feb. 1917. He was educated in New York city, completing his course in the School of Mines, Columbia University, in 1867. The two years immediately following his graduation were passed in European travel. From 1872 to 1873 he was acting professor of metalurgy and mineralogy at Columbia, at the same time editing the Engineering and Mining Journal. Several years later he was appointed a member of the United States Geographical and Geodetic Survey. Much of his work for the government was done in Nevada. He was assigned to make a detailed study of the Comstock lode, and at the completion of the work he started the scientific world by evoking the theory that the presence of heat at the bottoms of deep mines was the cause of the changes in the rock and not to the approach to the earth's fires. His report received recognition by Columbia University and the degree of doctor of philosophy was conferred on him. From Nevada Mr. Church went to Ohio State University as professor of mining and metalurgy. He entered the employ of the Chinese government in 1886, and for four years under Vice-Admiral Li Hung-chang he supervised the reopening of several famous silver mines in Mongolia. Mr. Church served on the Assay Commission under President Cleveland. He was the author of 'Mining Schools in the United States'; 'Notes of a Metallurgist in Europe' (1875); 'The Comstock Lode' (1880); 'Report on Artesian Wells in Arizona,' and other volumes of a technical character. He was a member of the American Institute of Mining Engineers and of the Century Club.

CHURCH, Richard William, English clergyman: b. Lisbon, 25 April 1815; d. Dover, 9 Dec. 1890. He took a first class at Oxford in 1836, and soon after was elected to a fellowship at Oriel. From 1852 to 1871 he held the rectory of Whateley, near Frome. In 1871 he became dean of St. Paul's Cathedral, London. In 1884 he became editor of the Church Re- views,' and thereby took rank almost at once as one of the most graceful and scholarly writers of the day. His university sermons 'Human Life and its Conditions' (1878); 'The Gifts of Civilization' (1890); and 'The Discipline of the Christian Character' (1885), are profound contributions to religious thought. Other works by him are 'Life of Anselm' (1843); 'Dante: an Essay' (1850); 'Spenser' (1879); 'Bacon' (1890); 'The Oxford Movement' (1891); 'Miscellaneous Essays'; 'Occasional Essays.' Consult his 'Life and Letters' (1895).

CHURCH, Samuel Harden, American writer: b. Caldwell County, Mo., 24 Jan. 1858. He is a railway official in Pittsburg, Pa., and has written 'Oliver Cromwell: a History' (1874); 'John Marmaduke' (1897); 'Corporation History of the Pennsylvania Lines West of Pittsburg' (1898-1900); 'Penruddock of the White Lambs' (1907); 'Short History of Pittsburg,' "The American Verdict on the Great War" (1915).

CHURCH, William Conant, American editor and author: b. Rochester, N. Y., 11 Aug. 1836; d. New York city, 23 May 1917. He was educated in the Boston Latin School. While still a youth he engaged with his father in editing and publishing the New York Chronicle. In 1860 he became publisher of the New York Sun and in 1861-62 was Washington correspondent of the New York Times. He resigned this position on his appointment as captain in the United States Volunteers in 1862. He served for one year, receiving brevets of major and lieutenant-colonel. In 1863, with his brother, F. P. Church, he established the Army and Navy Journal, and in 1866 founded the Galaxy Magazine, and conducted it until 1878 when it was purchased by the government. In 1812 President Arthur appointed him government inspector of the Northern Pacific Railroad. With George W. Wingate he established the National Rifle Association and was its first president. He took a very active part in public affairs. N. Y. State was one of the founders of the Metropolitan Museum of Art, and a life member and director of the New York Zoological Society. He pub-
lished 'Life of John Ericson' (1890); Life of Ulisses S. Grant' (1899).

CHURCH, a word derived from the Greek kyrιakes, dedicated to the Lord, the Scottish kirk and German Kirche being forms of the same word. In its widest sense the Church denotes the whole community of Christians, and was thus used by the New Testament writers. In more restricted significations it denotes a particular section of the Christian community differing in doctrinal matters from the remainder, as the Catholic Church, the Protestant Church, etc.; or to designate the recognized leading church of a nation or community as the Greek, Lutheran, Gallican, Anglican, Presbyterian, etc., Church. In another sense it signifies the building in which Christians assemble for the worship of God, and, referring the reader to the separate articles on the sects into which the community is divided, this may be a few remarks, historical and descriptive, on church as denoting the edifice appropriated to Christian worship. When in the time of Constantine the persecuted Christians emerged from their meeting-places in upper rooms and in the Roman catacombs by the imperial edict, no buildings could be found fitter for their purposes than the basilicas or royal public halls of Rome. The basilica (q.v.) was generally in the form of a parallelogram, with a semi-circular apse at one end, which was raised, being approached by a semi-circular range of steps. In the centre of this apse was the raised seat of the questor or other presiding magistrate; on each side, upon the steps, were places for the assessors, or those engaged on the business being transacted. In front of the apse was placed an altar, where sacrifice was performed before undertaking public business of any importance. The area of the building was divided by two rows of columns, the central division or nave being by far the broadest; over the two smaller divisions or aisles a gallery was often raised. In the small dark and Pagan temple there was neither room nor light enough to conduct Christian worship, but in such a building as above described the whole congregation of the faithful could meet and take part in the act of worship. The bishop naturally took the place of the questor, the priests that of the assessors. The altar (q.v.) on which the pious Pagan poured his libations at the commencement of important business served equally well for the celebration of Christian rites. (See Altars). When in course of time the separation between laity and clergy became complete, the apse was raised off and appropriated to the use of the clergy, then the raised part on which the altar stood was separated by pillars called calcilli, and not allowed to be profaned by the multitude. Another change was the introduction of a choir, or enclosed space in the centre of the nave, round three sides of which the faithful congregated to hear the gospel read from two pulpits built into its inclosure on either side, or to hear the services read or sung by the minor clergy, who occupied its precincts. As time and circumstances were introduced; on the erection of new buildings, the symbolic form of the cross was generally adopted as the most suitable for a Christian building; the arms of the cross (the transept) were raised off by rows of columns as the main building had been; at the point of intersection of the transept with the nave a tower was raised, which was at times surrounded by a small spire and two towers were placed at the angles of the entrance end of the edifice. Over the greater part of Europe the style which came to be usually adopted for ecclesiastical buildings was the pointed Gothic, as lending itself more readily to a more magnificent treatment than the graceful Greek with its columned portico and rounded tower. Circular churches, which were popular at an early date, have found little imitation. The structures which are among the most notable in point of size or historic interest are alluded to in the article on Cathedrals. The ordinary churches are generally long rectangular buildings, without transpents, and the tower is placed so as to form the principal entrance, or a one of the angles of that end of the church. During the latter half of the 19th century a taste for a superior style of building to that hitherto prevalent arose among all Christian bodies and resulted in the erection of many fine church edifices throughout the world. (See Architecture). Consult Brandon, 'Parish Churches' (London 1848); Braudot, 'Eglises de bourgs et villages' (Paris 1867); Everett, 'Historic Churches of America' (Boston 1884); Norton, 'Church Building in the Middle Ages' (New York 1880).

CHURCH, an Organization of Christians. As understood to-day there are two widely different opinions regarding the meaning of a church, and both claim the New Testament as authority: (1) that Jesus Christ established a definite Church with a code of laws pertaining to belief and government; (2) that he gave us only moral instruction and no definite laws of belief or discipline. Under (1) may be classed those who claim that Jesus Christ established only one Church, and that the churches mentioned by Paul and others of the early missionaries, as recorded in the New Testament, were all parts of the one Church. Still others hold that the Christian Churches of the New Testament were the whole congregation of the faithful, and that one Church is unorganized, but one faith. The Roman Catholic, Greek, Church of England and all Christian organizations with any generally recognized form of government, whether by presbyters or by the congregation, may be classed under (1). Under (2) will come all who hold that to observe the moral code as taught by Jesus Christ is all sufficient, hence this division need not be treated under the head Church. The Roman Catholic definition of Church is: "The congregation of all the faithful, who are baptized, profess the same doctrines, partake of the same sacraments, and are governed by their lawful pastors under one visible head on earth, the Bishop of Rome." This implies unity of faith, morals and government. The Greek definition is the same except they do not recognize as the visible head the bishop of Rome. The Church of England definition is: "A congregation of faithful men, in which the pure word of God is preached, and the sacraments be duly administered in all those things that are of necessity requisite to the same." In the further authorized explanation of this definition it is shown that the government is given to the bishops without any authoritative
head. The same definition is in general use by all other Christian churches, but in some of the government is vested in presbyters, elders or officers acting as elders; in others the government rests in the congregation or members of the church. See Church Government.

Under the names of the various Christian denominations may be found further information regarding particular doctrines and forms of government. See Christian Church; Christianity; Church and State.

CHURCH-ALE, formerly a church festival in England at which ale was drunk liberally; also the ale bowl at such a festival. To name is obviously compounded like bridal—bride-ale, scot-ale, clerk-ale, bid-ale, etc. The church-ales were usually held upon Whit Sunday, and two persons were chosen beforehand to preside over the feast, and divide out the victuals and drink voluntarily contributed by the parishioners. Sometimes the drink which had been brewed from malt gave by the parishioners was sold about Whit Sunday at the church. The ale was often used in the repair of the church and similar objects. The practice of holding church-ales with the corresponding games was denounced by the Puritans, and is not overlooked in Stubb's 'Anatomy of Abuses.'

CHURCH CALENDAR. A systematic method of arrangement of the feasts of the Christian Church has long been in use, and the record of the time of these feasts is called the Church Calendar. Many of the feasts of the Church occur on a fixed day of the month, as Christmas, 25 December; All Saints', 1 November; the Assumption of the Virgin, 15 August, and the feasts of the saints. The movable feasts are regulated by the feast of Easter Sunday. (For Easter see Calendar). The fiftieth day after Easter Sunday is Pentecost; the eighth day after Pentecost is Trinity Sunday, etc. The feasts, except those of Lent, are regulated by the feasts, the records of which are found in the calendar.

CHURCH DISCIPLINE, the practice of the Christian Church in dealing with such of its office-bearers and members as have by public scandal caused a breach in the communion of spiritual life. Its Scripture authority, resting on such passages as Matt. xvi, 19; xviii, 15 (et seq.), is further enforced in Paul's epistles and in the gospel and epistles of John. Discipline, in the ecclesiastical sense, means the laws which are intended to govern the subjects of the Church in their conduct, as distinct from dogmas or articles of faith, which affect their belief. These laws may be based upon the Scripture and tradition or they may be the outgrowth of the condition of the times.

CHURCH OF ENGLAND. See England, Church of.

CHURCH FATHERS (PATERE ECCLESIAS), teachers and writers of the ancient Church, who flourished after the time of the apostles and apostolic fathers (the immediate disciples of the apostles), from the 2d to the 6th century. This name is also sometimes given to the teachers and writers of the following centuries in the Church who begin with the 12th century. A large number of their writings have been preserved, and have been published by modern scholars. The fathers of the Church are divided into two chief classes—Latin and Greek. The most celebrated among the Greek fathers are Clement of Alexandria, Origen, Eusebius, Athanasius and Chrysostom. The most distinguished among the Latin fathers are Tertullian, Augustine, Ambrose and Jerome.

CHURCH GOVERNMENT. The system by which the affairs of the local church, or congregation, and of the denomination are directed. The main principles of church government are derived by various bodies of Christians from the New Testament. Roman Catholics and Episcopalians, Presbyterians and Reformed, Baptists and Congregationalists, whose polities are as different as possible, all believe that their respective systems of church government are derived from the Scriptures, particularly from the Gospels, the Acts of the Apostles and the Epistles. Apostolic succession is of fundamental importance to the Roman Catholic, the Greek Catholic, the Greek Orthodox, and the Episcopalian, and holds that since the time of Peter and Paul it has had an unbroken succession of the episcopal order. Churches using the presbyterian or congregational order hold that their respective systems are in harmony with the Scriptures and insist that they have a valid ministry. They do not accept the idea of apostolic succession, and do not believe that any particular system is of divine authority, but that churches of Christ are free to adopt their polities to circumstances and conditions, provided that the procedure be orderly.

There are three more or less distinct systems of polity, or church government, generally recognized, as the congregational, the presbyterian and the episcopal. There are, however, many modifications or variations of these systems. It is not always possible to determine what particular system a particular denomination employs. The Lutherans in the United States generally followed the congregational; some of them, however, contend that their system is presbyterial, while a few insist that it is really more nearly episcopal. In the Scandinavian countries the Lutheran is the state church and has bishops.

1. The congregational method regards the local church, or congregation, as having full control of its own affairs, and as not subject to legislative or executive direction by any denominational organization or even by the whole denomination itself. That is, the local church is a complete body in itself with inherent authority to conduct all the business appertaining to itself. The principles of fellowship and co-operation, however, come in to modify any tendency toward strict independency of the local church, which feels that it ought to be related to other churches of like faith and order, and recognizes that fellowship is concerned to know, when a new church is organized and seeks the recognition of other neighboring churches, what is its doctrines, principles and practices, and whether it calls a pastor, to be
assured of his standing and qualifications. Hence, associations, or conferences, of contiguous churches; and councils for recognition, ordination and installation, and hence, also, cooperation in the support of denominational missionary, educational and other boards, or societies. Congregationalists and Unitarians and the various Baptist bodies, with other denominations, accept the congregational system. Baptists and Congregationalists in the last half century have developed denominational conventions and councils for the supervision of general denominational activities.

2. The presbyterial system is government by presbyters, which is another word for elders. Presbyters (Milton said, "new presbyter is but old priest writ large") are elder ministers, or teaching elders, bishops or pastors, and there are also in each local church "ruled" elders, who are laymen, and with the pastor constitute the session or consistory. Control in each church is exercised through the session or consistory; then comes the presbytery or classis, composed of pastors and elders of the churches of a district; then the synod, consisting of representatives from presbyteries or classes, and then the General Synod or the General Assembly, the chief legislative and judicial authority of the denomination. All Presbyterian and Reformed churches use the presbyterial form of government, and, strictly speaking, that of the Methodists is more akin to the presbyterial than to the episcopal polity, although they have bishops. The Methodist bishop is a general overseer or superintendent, but has no legislative power and is subject, under a few constitutional restrictions, to the legislative, executive and judicial authority of the General Conference, the supreme governing body.

3. The episcopal system centres in the bishop. The Roman Catholic Church is governed by the Pope as bishop of Rome, which it calls the primal Christian see. He creates cardinals, archbishops and bishops, calls ecumenical councils, at long intervals, to advise him, but he is always the supreme head of the Church, "the vice-regent of Christ on earth." The Anglican Communion and the Eastern Orthodox Churches are also episcopally governed, though the state comes in to modify the system somewhat. The Protestant Episcopal Church of the United States has a triennial General Convention, composed of two houses, the house of bishops and the house of clerical and lay deputies, the latter elected by the diocesan conventions. This is the supreme legislative body of the Church. Concordance of both houses is necessary to the enactment of legislation. The Methodist Episcopal Church, a type of a number of bodies similarly organized, lodges supreme legislative and judicial power in the General Conference, a body composed of ministerial and lay delegates elected by the annual conferences and lay electoral conferences. The bishops preside over its sessions, but are not members of it, and have no part in its proceedings, except as presiding officers. Prior to 1872 this body consisted solely of ministers; since that date laymen have participated in the government of the Church. The patronage of the Church, the appointment of pastors, is vested by the constitution in the bishops.

The denominations provide judicial courts to determine the validity of ecclesiastical legislation and to try ministers and laymen accused of offenses against doctrine, discipline, and moral principles; and, recognizing the principle generally that ministers should not be condemned except by tribunals constituted of ministers, or of ministers and laymen.

Briefly, the following distinctions are characteristic of the different ecclesiastical polities: In the congregational form, no convention or council has power to legislate for the local churches or to make and enforce rules for their government. The local church is the fountain of ecclesiastical power. In the presbyterial form, the presbytery is the ecclesiastical unit, but with no power of legislation, which rests with the denomination in a representative general synod, or general assembly, consisting of representatives of the presbyteries. In the episcopal system, as represented by the Protestant Episcopal Church, supreme power belongs to the denomination, as in the presbyterial form, but bishops have co-ordinate power of legislation with the synod and lay deputies of the dioceses, while in the Roman Catholic Church, the bishop holds, in the person of the Pope, all power in his hands.

Author of 'Religious Forces in the United States.'

CHURCH HISTORY, the history of any church, but especially of the Christian Church. Church history naturally divides itself into four periods: From the advent of Christ to the time of Constantine; from Constantine to Mohammed, or by the arrangement of Mosheim and others, to Charlemagne; from Charlemagne to the Reformation; from the Reformation to the present time. This division of the subject is not always followed; some authors regard the great periods in Church history as: Foundation; Persecution; Extension; Reformation. See CHRISTIAN CHURCH, THE.

CHURCH OF THE NEW JERUSALEM, a body of Christians founded on the writings of Emanuel Swedenborg (q.v.), and often called "Swedenborders." Swedenborg was a public officer of Sweden who became intensely interested in religious matters and, retiring from office in 1747, devoted himself thereafter till his death in 1772, in London, to receiving and writing his revelations, as they are called. From his voluminous works are drawn the system of religion held by the New Church, his followers believing that he was a "divinely illuminated seer and revelator." He never preached a sermon and no societies were formed until after his death. Public services were first held in 1788, in London, and the first church of the order in America was organized in Baltimore, in 1792. The name is taken from the Revelation of John, who beheld the "New Jerusalem coming down from God out of heaven." The doctrines are set forth in Swedenborg's books and are based on his creed in the 'New Book of Worship.' A distinctive idea is that material things have correspondences in the spiritual world, and that the word of God has an outward and also an inward or spiritual meaning. He taught that the Trinity do not contemplate three persons, but distinctions in essence and existence, in love,
wisdom, power. Jesus is directly worshipped as God, in whom is the Father, the Son and the Holy Ghost. Christ is creator and redeemer, the word and the revelation. The Father is the divine parent, the Son the divine head, and the Holy Ghost is the divine proceeding in and for man. Thus the New Church reverses the usual trinitarian view of approach to God through Christ. As to Christ's second coming, Swedenborg held that it was the same as the divine proceeding in and for man, and that the New Church reverses the usual trinitarian view of approach to God through Christ. As to Christ's second coming, Swedenborg held that it was the same as the divine proceeding in and for man, and that the New Church reverses the usual trinitarian view of approach to God through Christ.

The New Church, means a new dispensation following the apostolic as the apostolic followed the Jewish, and embraces all who acknowledge these three essentials: (1) The divinity of our Lord; (2) the holiness of the Word; (3) the life of love; and unite with the New Church. The ritual is similar to that of the Anglican Church, except that it is all addressed to Christ as God, and not through Christ to another of the Trinity. Two sacraments are observed, baptism, through which angelic association is formed, and the Lord's Supper, in which the Lord is not present materially but really in the divine good and truth, which are his body and blood.

Societies of the New Church exist in England and many other foreign countries. There are two divisions of the body in the United States, one known as the General Convention, the other as the General Church.

1. The General Convention of the New Jerusalem in the United States was organized in 1817 and is composed of delegates from State and Territorial associations. The convention meets annually. There are general pastors who preside at the meetings, and ordained pastors and ministers. Local churches and associations have power to conduct their own affairs; the polity is a modified episcopacy.

2. The General Church of the New Jerusalem originated in the Academy of the New Church which was formed in 1876 for a stricter adherence to Swedenborg's revelations and for the development of the religious and social life of the Church. Twelve principles were enunciated, among which was the declaration that the government of the Church belongs to the priesthood of three degrees, the highest of which is bishop. The General Association of Pennsylvania supported the Academy and, finding itself out of harmony with the General Convention, organized anew in 1897 as the General Church of the New Jerusalem and elected a bishop. The General Church had in 1916,1,272 members, 22 churches and 38 ministers. Its publishing house is at Bryn Athyn, Pa. The General Convention had in the same year 8,500 members, 128 churches and 102 ministers. Its publishing house is at 3 West 39th street, New York. Consult Swedenborg's works; Dole's 'New Church—What? How? Why?' (New York 1905).

HENRY K. CARROLL,
Author of 'Religious Forces in the United States.'

CHURCH RATE, in England, a rate raised for the purpose of repairing and sustaining the established parish churches, churchyards and other ecclesiastical objects. It was made by the churchwardens with consent of the parishioners, who fixed the amount, but could not refuse it altogether, as in that event the churchwardens were empowered to levy a rate for necessary purposes. Church-rates originated in the quadrupled tithes laid on the principal fruits of the Scriptures was revealed to himself in 1757, and that universal judgment accompanied this advent in which the religious beliefs of mankind were overturned and recast. In other words, the New Church means a new dispensation following the apostolic as the apostolic followed the Jewish, and embraces all who acknowledge these three essentials: (1) The divinity of our Lord; (2) the holiness of the Word; (3) the life of love; and unite with the New Church. The ritual is similar to that of the Anglican Church, except that it is all addressed to Christ as God, and not through Christ to another of the Trinity. In other words, the New Church means a new dispensation following the apostolic as the apostolic followed the Jewish, and embraces all who acknowledge these three essentials: (1) The divinity of our Lord; (2) the holiness of the Word; (3) the life of love; and unite with the New Church. The ritual is similar to that of the Anglican Church, except that it is all addressed to Christ as God, and not through Christ to another of the Trinity. Two sacraments are observed, baptism, through which angelic association is formed, and the Lord's Supper, in which the Lord is not present materially but really in the divine good and truth, which are his body and blood.

1. The General Convention of the New Jerusalem in the United States was organized in 1817 and is composed of delegates from State and Territorial associations. The convention meets annually. There are general pastors who preside at the meetings, and ordained pastors and ministers. Local churches and associations have power to conduct their own affairs; the polity is a modified episcopacy.

2. The General Church of the New Jerusalem originated in the Academy of the New Church which was formed in 1876 for a stricter adherence to Swedenborg's revelations and for the development of the religious and social life of the Church. Twelve principles were enunciated, among which was the declaration that the government of the Church belongs to the priesthood of three degrees, the highest of which is bishop. The General Association of Pennsylvania supported the Academy and, finding itself out of harmony with the General Convention, organized anew in 1897 as the General Church of the New Jerusalem and elected a bishop. The General Church had in 1916,1,272 members, 22 churches and 38 ministers. Its publishing house is at Bryn Athyn, Pa. The General Convention had in the same year 8,500 members, 128 churches and 102 ministers. Its publishing house is at 3 West 39th street, New York. Consult Swedenborg's works; Dole's 'New Church—What? How? Why?' (New York 1905).

HENRY K. CARROLL,
Author of 'Religious Forces in the United States.'

CHURCH AND STATE. Between these two institutions, in modern times, there has rarely, if ever, existed perfect harmony. This struggle, so long protracted, bids fair, unless some astonishing upheaval occurs, to last for all time. It has been a bitter one. It has involved large interests and brought to the forefront momentous discussions. It has fomented uprisings of all kinds and originated a literature of vituperation without parallel outside of political strife. It has been the topic of political contention. There has been much confusion of issues, yet the lines of division are visible throughout. The question has its historical side and its doctrinal features. In contemporary events it is reduced, practically, to a battle between one important Church and not a few of the civil powers. In Italy the recognition of that Church has reached the irreducible minimum. France has at last snapped the only link which, since the days of the Directory, constituted after all but a semblance of union. Everywhere at present we find ourselves confronted with a state using its power against a Church, or a state Church, or Church and state going their own ways, very little mindful of each other. Summarized, the history of the contest is that before the coming of Christ there was no Church in the sense in which it has been presented by Christianity in its many forms. The religions of antiquity, with the exception of that of the Jews for the most part unsystematized beliefs and a ceremonial which was either identified with the state or was a mere function thereof, dependent in a large measure on civil rulers. This is found to be the case in the great religions of the ancient world; the religions of the Egyptians, of the Assyrians and Babylonians, of the Iranians, of the early Sassanitic Indians, of the Phoenicians and Carthaginians, of the Etruscans, and of the ancient Greeks and Romans (Rawlinson). The religion of the Jews, as is sufficiently well known to all educated persons, was the essential element in their theocratic form of government. While this lasted friction was hardly possible. In captivity the Jews, as religiousists, were more or less hampered by their conquerors. They were sometimes persecuted, sometimes unmolested. In general, a goodly amount of religious liberty was accorded them. The historic struggle for Church supremacy and independence began with Christianity. It met with opposition from the start. The antagonism germinated the day when Herod, his court and all Jerusalem were troubled, because wise men came from the East and asked where is He that is born King of the Jews. It became more
accentuated when Christ began to teach in public and more intensified when His disciples set out upon their missionary journeys. In d.
the aftermath of the 2d century the Roman 

Empire, which was the whole known world, was 
agitated, and for 200 years thereafter the Im 
perial state used all its powerful machinery to 
crush the Church out of existence. It is to be 
noticed that whereas the state pressed hardly 
against the Church, the reason put forward 

was the weal of the state. This has always 
been the war cry. Under Constantine the 
Church entered the arena of universal activity 
as a collaborator in the task of civilizing the 

peoples. Acknowledged as the spiritual ruler, 
it gradually acquired a local habitation and a 
name as a temporal potentate. It became a 
world power. This success was the beginning 
of all the many disasters of the Church. Some 

say this external grandeur was the cause, oth 
er that it was merely the occasion, of every 
calamity by which the Church has been visited. 
Emperors granted her immunities and promul 
gated laws in her favor. The wealth and posi 
tion which she acquired (whether according to 
the spirit of her founder or not, is still a problem for many) was a basis for her 
of independent action. From the preaching 

of Christianity at Rome, to the conversion of 
Christianized nations, the Church persecuted the Church and refused to recognize the divine authority it claimed to possess. From Constantine to 

Charlemagne the civil power, while giving legal recognition to the Church, interfered in its gov 

ernment. From Charlemagne to a period ap 
proximately that of the Reformation, Church and 
state were closely united and there was a gen 
erally acknowledged subordination of the civil to the spiritual authority. During this last divi 
sion of history the Church was in possession to a very marked degree of the prize which she has 
lost, though still fights for; that is, she was 
admitted to have an independent sphere of ac 
tion, a supremacy in all spiritual matters and 
an undisputed title to the territory which in one 
or other way she had acquired and enlarged. She has been accused of greed and tyranny in 
her management of her temporal rights. In 

every age many forewore their allegiance to her. 

Deserters from her camp counted peasants 

and princes. These either used or invoked the 

secular arm against her. The Arians and other 
dissenters did this. Modern nations were 
formed and the idea of individual independ 
ence became stronger and more general. The 

Eastern schism was open rebellion against the 
parent Church. The Orient went its own way 
through many vicissitudes and much bickering 
until it was finally absorbed by the state. In 

that large portion of Europe there was no longer 

conflict, for ecclesiastical rule was swallowed 
up in that state Church which Peter the Great 
established and which he denominated the 

Orthodox Church. The schism of 1721, or 

was the reaction of Russian love against things. His doctrines and his alliances with 

princes brought about rupture after rupture with the old Church (1530). The followers of 

Luther discarded all Roman authority whether 

in temporal or spiritual matters. The Roman 

Empire gradually split into fragments. Princes introduced the Church to their respective 
states. The opposition to Rome grew. The state 

ran like a tidal wave over Europe. The Brit 

ish Isles were drawn into the vortex. Henry 

VIII declared himself head of the English 

Church. In France Gallicanism propagated a 

spirit hostile to the Church. Voltaire and the 

Revolution abolished every vestige of papal 

authority. A reaction began with Napoleon, 

who aimed at subordinating the supreme ruler 
at Rome to himself and to his power. There 

was a protest on the part of the pontiff. He 

was thrown into prison. At last a concordat 

was agreed upon between the consul and him 

self. Barring the revolutionary changes, the 

attitude of France has remained the same. The 

concordat was more or less religiously adhered to until these later times, when the French 

government violated nearly all its agreements and 

recently annulled it, thus completely separ 
ating state from Church. The Chamber of 

Deputies passed the bill effecting the separation 

of Church and state in France. The people 

involved in the measure are destructive of all 
union between the two powers. The state 

neither recognizes nor salaries any form of 

worship. The exercise of worship is free un 
der certain restrictions. French citizens, eccle 

siastical as well as lay, are not all at one in 

their views regarding the nullification of the 

concordat. Some see in it a beginning of bet 

ter days for religion just as not a few Catholics, 

the world over, are against any kind of a union 

with any church. It is said that the French 

Church will never be reconciled with Rome but think that the Roman pontiff is much better circum 

stanced now that he has no temporal rule, for 

the welfare of the Church and its mission. 

They hold that the Church won spiritually dur 
ing the three first centuries—a period when 

the popes never dreamed of being civil so 

vereigns. Whether or not this view can be con 

sidered an orthodox Catholic view may be de 

cided by a reference to recent papal utterances 

on the matter. It would appear that since the 

Reformation the Church which maintains what it considers its prerogative in its relations to 

the state is that of Rome. Practically every 

other Church is a state one, or claims no rights as against civil government, and as a con 

sequence is ignored by secular constitutions, or is 

an instrument more or less passive, of the king 

doms or principalities or republics of which it is 

a territorial part, or is so limited numerically and has so small a voice in general affairs that 

its demands challenge neither notice, nor cen 

sure, nor opposition, on the part of the state. Thus the struggle which for so many centuries shook the world is narrowed down to an an 

agonism between governments and Rome. The 

old Roman Church power has dwindled down 

to a very small area, without kingdom or weap 

ons of death. But that is complete, as far as things go. As this Church holds views on the 

status of Church and state, as she still main 
tains the principles which for so short period 
directed national movements, her position de 

mands investigation. What is the basis of this claim? What is the base of that claim? To 

these two questions the Catholic Church has 
given an answer which goes back very far. The 

answer is found in all the papal documents in which the popes have touched on this sub-
CHURCH AND STATE

ject. The reply has been very diligently elabo-
rated by the great doctors and theologians and
has introduced into what may be termed, with-
out any implied reproach, Catholic Casuistry, a
series of discussions which contain minute of
argument concerning the state and the Church;
and this notice to compass. The following con-
densation will bring forward the very large out-
lines only. Civil power as well as ecclesiastical
authority are of divine origin. Both aim at the
welfare of humanity, the one in a higher, the
other in an inferior, degree. As both agencies
are necessary for the betterment of the race,
there must be union and not separation. Not
only is union demanded by the nature of the
common purpose, but subordination also, and in
that subordination the place of supremacy must
be ceded to the Church. Each power is distinct,
yet each is to help the other. The duty of the
state is to protect all the rights of every man,
to provide for all a quiet and regulated ex-
istence, and, where necessary, to co-operate with
the Church, whose divine character it is bound
to recognize in the leading of all men to salva-
tion. The Church has the right to require from
the secular ruler, as from the individual Catho-
lic, that he give due obedience to divine law and
act in conformity with her interpretation of its
precepts. The Church strengthens civil authority by imposing upon all
her subjects that state power is of divine right,
that secular governors are the anointed of the
Lord. According to this view, in many ages the
Pope was looked upon as the head of the im-
mense Christian family scattered throughout
the earth. He cited before his tribunal both sover-
eigns and subjects, composed quarrels, inflicted
spiritual penalties upon scandalous princes and
deprived of their dignities and rights those who
refused obstinately to change their line of con-
duct. The Pope was then regarded as the na-
tural head and father of Christendom. Kings
stood in need of the Church for things religious
and the Church was protected by the laws of
the state. If the warning voice of the Church
failed to deter the evil-doer, the sword of the
civil power was drawn in her behalf. The
Church was found to be the principal obstacle
that needed to be removed in order to put
under the jurisdiction of both powers. Each
power remains sovereign in its own sphere, each is confined within
limits perfectly defined and traced in conformity
with its nature and special purpose. There is
therefore a circumscribed sphere within which
each of them exercises its own action, jure
proprius, through its own right. Yet, as their
authority is wielded over the same subject, it
may happen that one and the same thing, though
from a different cause, may be under the judge-
ment and jurisdiction of both powers. This
position the Church bases on the fact that to
Saint Peter, according to her view of Scripture
and tradition, and to his successors, Jesus Christ
collided power of Christ, and
secondly, on the more exalted nature of her ap-
pointed head; thirdly, on the conduct of Christ
and the apostles who never asked leave from
civil rulers to evangelize and whose principle
(jure militari) was, 'Thy will be done in
earth as it is in heaven.' The Church declares that she pro-
claims the independence of secular power and
she herself cannot interfere so long as state ac-
tion does not infringe upon the laws of God and
the rights of the Church and the spiritual in-
terests and chief end of man are not endangered
by legislation. In case of conflict, that is to say,
when in mixed questions the two authorities
impose upon their subjects who are the same
persons contradictory obligations, the state
should yield to the Church. The facts have
confirmed the principles affirmed by the Church and are
the Catholic view of the relations which should
exist between both. This doctrine is her doc-
trine to-day. A stand so preeminent and so
unmistakable has not met with universal ap-
proval. Within the last 300 years it has been
denied in toto. The opponents say the founda-
tion on Scripture and tradition is insecure, that
such a relation as Rome calls for is inadmis-
sible, because the history of the past proves that
it was always controverted in theory and prac-
tice, that it led to the denationalization of peo-
plies, that it incited to the worst of crimes, that
it extinguished every spark of patriotism, that
it called for the universal empire of the Church,
that it spoke for greed and tyranny and self-
aggrandizement merely, that it crushed intelli-
gence and battered down all the props of indi-
vidual and collective freedom, that it fettered
thought and clipped the wings of science, that
it deflected nations onward, that it curbed its
press and that it was a benighted doctrine and
to be fought and execrated wherever it showed
its head. Statesmen have scoffed at it and ex-
pelled its votaries as they would drive out an-
archists and criminals of God. Laws in the most
enlightened countries have been made to prevent,
if not its existence, at least its logical effects.
The widespread theory held by the powers
of-day is either: no Church or absorption of
Church by state or the suberviency of the
Church to the state. It has assuredly gone
hard with the Church in many ages and under
many governments. No one upholding Chris-
tian doctrines could be a citizen has been the ex-
pressed opinion of multitudes of people in
many countries. The Catholic teaching on this
point has angered governments because of
two special questions, that of education and
that of divorce. In recent times the Church has
not been silent regarding the family and her
protests have irritated national self-interest, and
have also been confirmed by the approval of men outside
her pale. As the Pope is now an isolated indi-
vidual, stripped of all temporal power, the ques-
tion of Church and state has become purely
academic. It must not be lost sight of that,
though no civil ruler, his spiritual legislation ex-
tends over some 250,000,000 subjects, who are
more or less obedient to his commands, and
that therefore the states not only now but as
long as the papacy lasts will have to reckon with
his influence and cannot afford to consider him
as at any time a negligible quantity, and hence
the question of Church and state is one which,
concerning essential features, is not yet to be
considered beyond discussion or likely to be
closed. See FRANCE.

Professor of Ethics, New Rochelle College.
CHURCH AND STATE IN THE UNITED STATES

That an indispensable function of any government is the conservation of public morals, and that an indispensable method of achieving it is to enforce the public exercise of some religious forms, seemed axiomatic to most people in the 17th century. The tenet that religion is best promoted by leaving it to individual discretion was first evolved, naturally, by groups whose best hope was their own sect's establishment. These differing circumstances in the English colonies, with changes of views from experience and change of policy from gain or loss of power, resulted in four chief attitudes of the colonial governments toward religion: (1) The establishment of a specific Church, and the taxation of the entire community to support it; (2) restriction of suffrage to church members, without specifying the Church — *theocracy*; (3) requirement of some church form and steady parish service in communities, without establishment of a specific Church or disfranchising individuals; (4) entire religious liberty.

The first type is found in the chief Southern colonies and New England. Virginia came first, then Carolina before its division, then *Fundamental Constitutions* (see CAROLINA, ORIGINAL CONSTITUTION OF) merely shaping in this respect the provisions of Charles II's charter; lastly Maryland in 1691, after overthrowing the tolerant proprietary government. Each, from the nature of the case, established the Church of England. In New England the form of establishment was peculiar and quasi-casual; it was not statutory nor specific, but rested on local taxation to support a Church which, owing to circumstances, was at first always the Calvinistic Congregational Church. When other church bodies began to grow, this taxation was remitted to all who supported a church of their own; those who were not thus bona-fide contributing members to another Church paid their cost to the Congregational as before. The second type is limited exclusively by the early Massachusetts Bay and New Haven colonies. The former, 18 May 1631, when as yet there was no popular representation in the colony, enacted that no man should be admitted to this body of public but such as were members of some of the churches within the limits of the same. This restricted suffrage to one-fourth the adult males and was repealed 3 Aug. 1664. The latter, 4 June 1639, agreed that church members only shall be free burgesses, and they only shall choose among themselves magistrates and officers for public business. This, of course, persisted with the absorption of the New Haven into the Connecticut colony, in 1662. The third type has but one representative, New York, including the Jerseys. This was *the Duke's* (after James II) constitution and is nothing but the only ground for a less harsh judgment on him than prevails. The fourth type includes Rhode Island, the product of a quarrel with Massachusetts theology and politics, in which the papacy, if it found a foothold, was the only ground for a less harsh judgment on him than prevails. The fourth type includes Rhode Island, the product of a quarrel with Massachusetts theology and politics, in which the papacy, if it found a foothold, was the only ground for a less harsh judgment on him than prevails.

The Revolution swept away all vestiges of establishment. The Constitution of 1787 provided against a danger not likely to recur. Article VI enacts: *No religious test shall ever be required as a qualification to any public trust under the United States.* This, however, did not touch the real likelihood if bigoted sectarians should control the government; the State conventions held to ratify the Constitution, urged a clause to guard against slavery and religion; therefore the First Amendment begins: *Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.* Even this does not in the least debar individual States from doing it; but most of their constitutions decisively prevent that, not only by direct prohibition, but by enacting that no appropriation of public money shall be made to sectarian institutions. The stability of this provision, the impossibility of evading it, and its inexpressible public utility have been proved many times over in the past half century. In the early years of the Union, efforts were occasionally made to have the legislatures enact some test to confine the government to Christians, for fear of atheistic or of Jewish control; or to Protestantism or to Catholic supremacy; but the improbability of its need has prevented any approach to success. The only serious problem that has arisen on this point is due to Mormonism, where the claim to free exercise of their religion and its dictates is complicated by one of its ostensible revelations enjoining polygamy. In 1882 Congress prohibited polygamy under severe penalties; and the Supreme Court held this not in conflict with the constitutional provision above cited.

CHURCH STATES. The former dominions of the Popes or Roman Pontiffs in Italy. Prior to 1859, the Papal states covered a territory stretching across Mid-Italy from sea to sea and comprised an area of 17,218 square miles, with a population of 3,124,668. The states originated with the grant of Pepin, king of the Franks, in 754, who bestowed on Pope Stephen II some districts which the Lombards, against whom Stephen II solicited Pepin's assistance, had taken from the Exarchate of Ravenna. Charlemagne confirmed this grant in 774, and in return received the title of Roman Emperor from Leo III in 800. The wise policy of the Popes in conferring favors on the Normans in Lower Italy secured to them in these vassals staunch protectors of the holy see. The structure of the papal power was fully completed in 1075 under Gregory VII. The dominions of Matilda of Tuscany were added to the states of the Church by her request, and the Popes maintained possession of them against all the claims of the German emperors. The papacy, as a constitutional and religious power, held the key to the throne of France, from 1305 till 1376, to Avignon, which Clement VI bought of Joanna, queen of Naples and Countess of Provence, in 1348. As this change of residence was made, it was charged under the influence of the king of France, it never obtained the full assent of the
Romans and Germans, and anti-popes were sometimes elected by the opposing factions, and the Church of Rome. The Church of Rome in Italy suffered by their mutual hostilities. After 20 years of exile the Popes returned to Rome. Julius II added Bologna to the papal dominions in 1513 and Ancona in 1532. The Venetians were obliged to restore Ravenna. Ferrara was also recovered from Modena in 1598, and Urbino was bequeathed to the papal chair in 1626 by its last duke, Francis Maria, of the house of Rovera. The wise administration of Sixtus V restored internal order toward the end of the 16th century; but the extravagance and family partialities of some of his successors created fresh disorder. Subsequently Naples renounced her feudal obligations to the papal chair. After the successes of the French in Italy the Pope was forced at the Peace of Tolentino, 13 Feb. 1797, to cede Avignon to France, and Romagna, Bologna and Ferrara to the Cisalpine republic. An insurrection in Rome against the French, 28 Dec. 1797, caused the annexation of the states of the Church to the Roman republic. Pius VI died in France. The victories of the Russians and Austrians in Italy favored the election of Pope Pius VII. 14 March 1800, who, under the protection of Austrian troops, took possession of Rome. By the concordat concluded in 1801 with the First Consul of the French republic the Pope again lost a great part of his temporal domains. In 1807 France again declared war, and the provinces of Ancona, Urbino, Macerata and Camerino were added to the kingdom of Italy. The possessions of the Church beyond the Apennines were all that remained to the Pope. On 2 Feb. 1808, a French corps of 8,000 men entered Rome; the remainder of the papal states were added to France, and a pension of 2,000,000 francs settled on the Pope, whose ecclesiastical power was guaranteed by Napoleon. The decree of 17 May 1809 put an end for the time being to the ecclesiastical state. The Pope was held a prisoner in France until the events of 1814 again permitted him to take possession of his states. Pius VII was succeeded by Leo XII, who reigned from 1823 till 1829. He was succeeded by Pius VIII, who, in his turn, was succeeded by Pius IX in 1846. The first acts of this Pope were characterized by such a liberal spirit that diplomatic Europe was surprised. The events of 1848 caused the Pope to pause in his advanced policy, which so dissatisfied the extreme liberal party that they drove Pius IX from Rome, and the reins of government fell into the hands of Garibaldi, Mazzini and Avezzano (1849). Some few months afterward the French government, resolving to restore the papal authority, sent General Oudinot with an army against Rome. Defeated in their first attack on the city, the French began a siege in regular form, and in a month's time were masters of it. Pope Pius did not return to Rome, however, until the following year.

After the Austro-Italian War of 1859 the papal see was stripped of the greatest part of its territorial possessions. Embracing before that date an area of 17,218 square miles, with 3,341,000 inhabitants, it was then reduced to 4,891 square miles, and 692,106 inhabitants. Of the former legations and delegations into which it was subdivided only five remained, namely—Rome and the Comarca, Viterbo, Civita Vecchia, Velletri and Froshine. From 1859 to 1866 the papal government was sustained by the support of a French force, which was withdrawn in 1866 upon the king of Italy binding himself by treaty to respect the integrity of the Roman states. In 1867, however, revolutionists numbering 15,000, belonging to the Italian party of action, entered the papal territory, headed by Menotti Garibaldi. They made but little progress until the elder Garibaldi placed himself at their head. Napoleon III, at the earnest prayer of the Pope, sent an army to protect the city against the violence, of the revolutionists, who had now surrounded it. On 28 October the French entered Rome, and Garibaldi, beginning to perceive that he would be hemmed in by the regular Italian forces under Cialdini, thought of retreat. An advanced section of the papal troops came in contact with the Garibaldians (3 November) and were likely to have suffered severely had not two French battalions, armed with the Chassepot rifle, come speedily to their aid. Garibaldi, with 4,000 men, deserted the Italian territory, where they were disarmed. A strong force of French troops were left in occupation of Civita Vecchia after peace was restored and the Pope seemed as secure as ever. But the outbreak of the Franco-German War changed the aspect of affairs. The French army of occupation left Rome on 30 July 1870, and the Pope was at the mercy of his powerful neighbor, Victor Emmanuel, king of Italy, who, seizing the opportunity, marched upon Rome and took it by force of arms. In September the Italian troops occupied Rome. In October the states of the Church were incorporated with the kingdom of Italy, a plebiscite was held under hayonet-rule, the count of which resulted in 133,681 in favor of the Sardinian occupation and 1,807 against it. In the beginning of July 1871, Rome became the seat of the Italian government and the residence of the court. An Italian law of 13 May 1871 guaranteed, besides possession of the Vatican and Lateran palaces and the villa of Castel Gandolfo, an annual income to His Holiness and his successors forever of $694,000. This allowance whose arrears without interest in 1918 amounted to $30,900,000 remains unclaimed and unpaid.

CHURCH TEMPERANCE SOCIETY, a national organization of the Anglican Church in the United States. It was founded in New York in the year 1881, and its object is to promote temperance by means of high license. It seeks to influence state legislators and municipal authorities, and it has done most effective work in providing substitutes for the saloon. The organization in the United States follows, in a measure, the methods used by the Church of England Temperance Society.

CHURCH-WARDEN, one of two Episcopalian parochial officers chosen annually at the Easter vestries. In Anglican churches in the United States the wardens are usually elected by the parishes; in England the custom prevails of the rector appointing one warden and the parish the other. Their duties are to protect the building of the church and its appendages, to superintend the ceremonies of divine worship and the proper distribution of
Churches of God—ChurChill.

Alms, etc.; to form and execute parochial regulations and generally to act as the legal representatives of the parish. They usually attend to the secular affairs of the parish. The term "church-warden" is also given to a long-stemmed clay tobacco-pipe formerly much used in Great Britain. A famous* example of this class of pipes is located in the town of Broseley, in Shropshire.

Churches of God, a denomination of Baptist principles and Methodist organization, founded by Elder John Winebrenner in Pennsylvania, in 1830. Winebrenner was a minister of the German Reformed Church and was active in revival movements and changed his views so as to be out of harmony with his Church, with which his relations were severed in 1828. Continuing his revival work, he organized the fruits in societies, called simply Church of God, which in 1830 were formed into a denomination at Harrisburg, with the same name. The Church of God has annual conferences, called elderships, and a general conference, called general eldership. Since 1800 the denominational name has been Churches of God in North America. The doctrinal position of the denomination is evangelical, with a leaning toward Arminianism, rather than Calvinism. There is no written creed, the Bible being accepted as the only rule of faith and practice. Biblical designations are used wherever possible, as in the denominational title. Three ordinances are recognized—baptism by immersion, the Lord's Supper and foot-washing. In each local church there are deacons and elders, who, with the pastor, constitute the church council. Annual elderships, or conferences, are composed of pastors and laymen, and the general eldership of ministers and laymen elected by the annual elderships. It meets once in four years. The Churches of God, including many of German origin or descent, are active in Sunday-school, missionary, educational and young people's work. According to denominational statistics for 1916 there are upward of 28,000 members, with 434 ministers and 484 elders. Since 1906 there has been a falling off in the number of churches and ministers and an increase of about 4,000 members. The Church is strongest in the States of Pennsylvania, Ohio, Illinois and Indiana. It has a publishing house at Harrisburg, Pa., where its weekly organ, The Church Advocate, is issued. Consult Winebrenner's 'Brief Views of the Church of God' (1840).

Churches of the Living God, the general name applied to three small bodies of colored Christians. The first, called also Christian Workers for Friendship, was begun in 1889, by Rev. William Christian, in Arkansas. It consists of those who believe in the Baptist faith in the Methodist form of organization. Believers are baptized by immersion, the ceremony of foot-washing is observed and the Lord's Supper is celebrated with water and unleavened bread. The churches are generally called temples. The polity is presbyterian, legislative power being lodged in a national council and the executive officer of which is called "chief" or "bishop." The second branch, the Apostolic Church, differs only in calling its chief officer president, instead of chief or bishop. The third branch, the Church of Christ in God, separated from the older body partly for personal reasons and partly to lay more stress on education. The three bodies have together 68 churches, or temples, with 4,276 members, of whom 2,676 are in the first branch, 732 in the second and 846 in the third. There are 81 ministers in all.

CHURCHILL, Charles, English satirical poet: b. Westminster, February 1731; d. Boulogne, France, 4 Nov. 1764. He took orders in the Established Church, but reflected very little credit upon his clerical profession. He won his fame with 'The Rosciad,' a satire upon the actors of the time, in which only Garrick and some few popular actresses are praised. His capacity for ridicule was so great that 'The Ghost,' 'The Farewell,' 'The Conference,' 'The Author' and 'The Prophecy of Famine' proved exceedingly popular.

CHURCHILL, Randolph Henry Spencer, Lord, English statesman, 3d son of the 7th Duke of Marlborough; b. 13 Jan. 1810; d. London, 24 Jan. 1895. He was educated at Merton College, Oxford, and entered Parliament in 1874 as member for Woodstock. After the Conservative defeat in 1880, he formed what was half satirically known as the Fourth party, consisting usually of four members, who took up an attitude of uncompromising and even obstructive opposition to the measures of government, and one also of frank and brutal criticism of the "old gang," as Lord Randolph called the official opposition leaders. So well did he employ his powers of ready and extensive criticism, both in the House and in the country, that on the accession of the Conservatives to office in 1885 he became Secretary for India. His tenure of this office was rendered notable by the annexation of Upper Burma. On the defeat of Gladstone's Home Rule bill in 1886 and the return of the Unionist party to power Churchill became leader of the House of Commons and Chancellor of the Exchequer. In his leadership of the House he showed tact, judgment and resource; but on 23 December of the same year, owing to demands made by the ministers responsible for the army and navy for increased outlays, to which he was opposed, he caused a sensation by uncovering his private office. Subsequent events showed this to be an act of political suicide, for he never regained his old place in the party councils. A man of great natural abilities, and of boundless ambition, with marvelous political insight and debating and oratorical talent of a high order, he had at the same time the defects inseparable from an unstable nervous system. He married in 1874 Jennie Jerome, a daughter of Leonard Jerome, of New York. In July 1900 Lady Ran- dolph Churchill married George Cornwallis West. His elder son, Winston Leonard Spencer Churchill (q.v.), has inherited his father's political abilities.

CHURCHILL, William, American philologist: b. Brooklyn, 5 Oct. 1839. He was graduated at Yale in 1862 and 1866 and was made consul-general to Samoan, also judge of the Consular Court and receiver of the revenues of Samoa. In 1897 he was also made consul-general to Tonga. In 1902-15 he was a member of the editorial staff of the New York Sun. He edited the Malay-Poly-
nesian department of the ‘Standard Dictionary’ in 1912. He is a fellow of the Royal Anthropological Institute and of the American Philological Association. He has written ‘A Princess of Fiji’ (1892); ‘Polynesian Wanderings’ (1910); ‘Beach-la-Mar’ (1911); ‘Easter Island, Rapanui Speech and the Peopling of Southeast Polynesia’ (1912); ‘The Subanu’ with John Park Finley (1913) and many monographs on ethnological and philological topics.

CHURCHILL, Winston, American novelist: b. Saint Louis, Mo., 10 Sept. 1871. He was educated in the public schools of Saint Louis and at the United States Naval Academy, Annapolis. He was graduated from the latter institution in 1894. He received the honorary degree of A.M. from the academy in 1903. He was a member of the New Hampshire legislature, 1903-05, and was a candidate on the Progressive ticket for governor of New Hampshire in 1912, but failed of election. He has written several successful novels and many articles of interest for the magazines. His novels are ‘The Celebrity’ (1898); ‘Richard Carvel’ (1899); ‘The Crisis’ (1901); ‘The Crossing’ (1904); ‘Consistorial Chronicle’ (1906); ‘Modern Chronicles’ (1910); ‘The Inside of the Cup’ (1913); ‘A Far Country’ (1915); and ‘The Dwelling Place of Light’ (1917). As an historical novelist and as a novelist of contemporary life he has done substantial work. He writes carefully and the structure of his novels are evidence of this commendable characteristic, which distinguishes him from many gifted popular writers whose methods are more perfunctory.

CHURCHILL, Winaton Leonard Spencer, English statesman, soldier and author: b. 30 Nov. 1874, the elder son of the late Lord Randolph Churchill (3d son of the 7th Duke of Marlborough) and Jennie, daughter of Leonard Jerome, banker, of New York. He was educated at Harrow and Sandhurst Mili-
tary College, and joined the 4th Hussars in 1896, and in the same year (while on leave) he saw his first active service—with the Spaniards in Cuba. With the 31st Punjab Infantry he accompanied the Malakand Field Force on the Northwest Frontier of India in 1897, and in 1896 served with the Tirah Expeditionary Force under General Lockhart. When Kitchener started on the reconquest of the Egyptian Sudan in 1896, Churchill immediately joined the 21st Lancers and took part in the battle of Omdurman (Khartum). By the time he was 24 he had already been mentioned in dispatches and earned four military decorations. In 1899 he turned to politics and contested the Oldham division as a conservative. He failed, however, and when the Boer War (1899-1902) broke out he was appointed lieutenant in the South African Light Horse, at the same time acting as war correspondent for the London Morning Post. On 15 Nov. 1899, during the Natal campaign, he was riding in an armored train which was ambushed by the Pretoriana Durban Light Infantry, when they ran into an ambush and part of the train was derailed. Churchill led a little party of volunteers to clear the line in front of the engine, which they succeeded in disengaging, from there he and till the rails, it was sent on with its cab full of wounded, shells and bullets playing furiously around them. Churchill got away with the engine, but returned to share the fate of his comrades. All the Fire Support troops were the Boers and taken to Pretoria, whence Churchill and Captain Haldane escaped a month later, the former afterward taking part in some 20 battles and engagements. He returned to England in 1900, again contested Oldham in the general election, and this time successfully. He held the seat till the resignation of the Balfour Ministry in December 1905, when he turned over to the Liberal party, which then came into power with an overwhelming majority. The main ground for Churchill's defection was his uncompromising opposition to the Tariff Reform movement inaugurated by Chamberlain in 1903. Elected for Northwest Manchester, Churchill entered the Campbell-Bannerman ministry as Under-Secretary of State for the Colonies. During his first six years in Parlia-
ment he had frequently distinguished himself as a skilful debater and a brilliant—it somewhat reckless and impetuous—orator. In 1908 he was raised to Cabinet rank as President of the Board of Trade, a change which necessitated an appeal to his constituency. To the general surprise he was defeated, and had to seek election elsewhere. He was then elected for Dundee, which he still represents (1910). In 1910 he became Home Secretary, the most powerful official in England. During his 21 months' tenure at the Home Office Mr. Church-
Hill frequently encountered adverse criticism levied against his rather novel procedure in criminal affairs. He not only freely exercised the prerogative of his office in reducing sentences and issuing pardons, but endeavored to ameliorate the rigor of prison life by permitting occasional concerts and lectures to be held in penal establishments. The notorious "battle of Sidney Street," where some criminal was besieged in a London slum on 3 Jan. 1911 by artillery and police under the personal supervision of the Home Secretary, led to a series of attacks in the press and Parliament upon Mr. Churchill for alleged interfer-
ence. He proved, however, that he had not sent for the troops nor exceeded his authority. In October 1911 Mr. Churchill suc-
ceded Mr. McKenna as First Lord of the Admiralty, in which capacity he was destined to play an important part in the Great War. He kept the fleet in a high stage of efficiency notwithstanding the repeated offers to Germany for a "naval holiday," and was able to assemble, in July 1914, a formidable armada of 200 fighting ships, drawn up in eight lines, extending over 22 miles, and manned by 70,000 men. The occasion of this gathering was the annual royal review off Spithead, which in that year proved of unforeseen value, due to the intervention of Mr. Churchill and the then First Sea Lord, Prince Louis of Battenberg. The review ended on 20 July, three days before the Austrian ultimatum was launched. In normal times the vessels would have been dispersed to their respective stations and the reserves called out for the occasion would have been sent home. It has since become known that Mr. Churchill, entirely on his own responsibility, kept the fighting units together and at the critical mo-
ment Great Britain's naval strength was con-
centrated in the North Sea, ready for action.
After four years' absence from the Admiralty, Lord Fisher, the creator of the dreadnought, returned as First Sea Lord early in the war. When the Belgians were thrown back on Antwerp and the fall of the city seemed imminent, Mr. Churchill arrived on the scene (4 Oct. 1914) with 2,000 Royal Marines, followed next day by 6,000 more, in a desperate effort to save the city. Antwerp fell on the 10th, and Mr. Churchill did not escape criticism in consequence, though his justifiable attempt delayed the fall of the city for a few days. In May 1915 a Cabinet crisis arose through a quarrel between Mr. Churchill and Lord Fisher over the Dardanelles campaign. The first phase of the operations in that theatre had ended in disaster on 18 March. Lord Fisher resigned; Mr. Asquith reconstructed his Cabinet and Mr. Balfour succeeded Mr. Churchill as First Lord, the latter accepting the undistinguished office of chancellor of the duchy of Lancaster. Lord Fisher refused to reconsider his resignation unless Mr. Churchill were eliminated, and as that condition was not fulfilled, he disappeared. On 11 Nov. 1915 Mr. Churchill resigned his office and on the 15th he reviewed in Parliament the share he had taken in the matter of Cornol, Antwerp and the Dardanelles, asserting that Lord Fisher had never expressed disapproval of the moves of his Council. Two days later Mr. Churchill left for the front with the rank of major in the Grenadier Guards. In December 1916, on the accession of Mr. Lloyd George to the premiership, Mr. Churchill succeeded him as Minister of Munitions. The Report of the Dardanelles Commission (March 1917) revealed that he originally conceived the idea of the campaign as a means of defending Egypt. Among his numerous literary activities the chief are 'Lord Randolph Churchill' (2 vols., 1905); 'The War' (the Sudan campaign, 1899); 'The Story of the Malakand Field Force' (1898); 'London to Ladysmith via Pretoria' (1900); 'Ian Hamilton's March' (1900); 'Savrola' (a novel, 1900). See War, European.

HENRY F. KLEIN, Editorial Staff of The American.

CHURCHILL RIVER, a river of the Northwestern Territories of Canada, which arises in La Grosse Lake, forms or passes through various lakes or lake-like expansions, the largest being Big or Indian Lake, and enters Hudson Bay near Fort Churchill, after a northeasterly course of about 800 miles. It is called also Missinippi, English and Beaver. Except by means of frequent portage, it is not navigable.

CHURCHING OF WOMEN, a rite founded on the Mosaic injunction found in Levit. xii, 6-8, and as practised in some denominations, is now a giving of thanks for the birth of a child. The first mention of the subject as a usage in the Christian Church is found in the Bible in the Arabic Canon, but no prescribed form is given.

CHURL (Saxon ceorl) in modern usage, a rude, boorish person, but in Saxo Northland, the term denoted a common freeman. The rank of the churl, or ceorl, steadily declined until finally the only importance attaching between churl and serf was that the former might choose his own master. The better class of churls sometimes found their way into the class of thee, or thanes, corresponding to the knights of post-Conquest times, while the others became the villeins of the Norman feudal organization. 'Domesday Book' makes no mention of the word ceorl.

CHURN, a vessel in which cream is agitated to separate its butter globules in a solid mass from the fluid portions. The length of time usually occupied by this process, and the fatigue consequent upon working those machines by hand, have caused the ingenious to produce numerous modifications in form and size. Some may be worked by dogs in the way a squirrel-wheel is driven; others may be worked by horse-power; and in some cases steam is the motive power. The ordinary plunge-churn, with its cylindrical box, its straight rod projecting downward through the cover and attached below to the dasher, has been greatly improved by an arrangement by which the air is introduced into the cylinder at every stroke by a tube run right along the handle, with a valve which opens as the dasher rises and closes as it sinks. The air is thus dashed through the cream, separating it into innumerable small particles, and throwing it into a state of foam. A box form of churn, attached to a rod passing horizontally through the box, and driven by a winch, is frequently used. Less common kinds are those in which the whole body of the machine is set in motion, such as the rocking-churn and the barrel-churn. A churn on the centrifugal principle has been introduced into Sweden. Though the rapid completion of the process of butter-making is the principal end in view, it is a well-known fact that butter suffers seriously by too rapid a process. When butter forms in about 45 minutes it is sure to be good; when it appears sooner it is soft; when later, strong-tasted. See BUTTER; DAIRY.

CHURRIQUERESQUE, chūr'ri-ga-resk', the term used to describe that distinctively Spanish post-Renaissance style of architecture which corresponds to the combined Baroque and Rococo. It takes its name from José Churriguera who was "royal architect" in the reign of Carlos II and through his two sons and his pupils, the Quinones, dominated Spanish architecture in the second half of the 18th century. Its most striking and unrestrained development was in Mexico. See MEXICO—ARCHITECTURE.

CHURRUS, chūr'ūs, the resinous exudation of the leaves and flowers of Indian hemp, Cannabis indica. It is used by the natives of India as an intoxicating drug. According to Jaffar Shurreef, a man covers himself with a blanket and runs through a field of hemp early in the morning; the dew and gum of the plant naturally adhering to it are first scraped off and the blanket afterward washed and wrung. Both products are boiled together and an eluetsory formed. The smoking of five grains of it will produce intoxication.

CHURRUSCO, choo-roo-boos'ko, Battle of, one of the principal engagements of the Mexican War, took place at Churubusco (q.v.) was won in the early morning. Churubusco in the forenoon and early after-
noon, of that day; but they are quite distinct.

The main road to the City of

Mexico, via San Augustin and San Antonio,

an elevated paved causeway, converges with

that on the west from Contreras and Coyoacan

at Churubusco, a village six miles south of

the capital and a mile northeast of Coyoacan.

Just north of Churubusco one crosses a

little stream called Rio Churubusco, crossed

by the main road at a bridge fortified with

a bridge-head; there was a strong bastion

75 to 100 yards on a side, with embrasures

sweping the San Antonio road. Along

the sides were cornfields, maguey plantations,

hedges and thickets, and irrigating ditches

full of water. In the western part of the village,

southwest of the bridge-head, on the Coyoacan

road, was the Convent of San Pablo, a massive

building with walls so thick that field-pieces

could make no impression on them, defended

on two sides by strongly built bastions with

six or eight heavy guns, and the building it-

self an impregnable cover for musket-fire.

Almost it was a flooded moat, in front were

cornfields and thickets. The two points to

be carried were the convent and the bridge-head;

and since, after the rout at Contreras, this was

the last place where the Mexicans could make

a stand short of the City of Mexico, the resist-

ance was likely to be desperate. The wreckage

of Contreras was being pursued by Pillow and

Twiggss along the Coyoacan road; and Worth,

having turned the works at San Antonio on

the main road, had captured a considerable

body of the enemy, and was advancing along

the causeway. Santa Anna threw a battalion

into the convent, placed five guns and a heavy

body of troops at the bridge-head, and posted

several regiments along the north bank of the

stream. The first assault was made on the

convent. Bennet Riley's and Persifor F.

Smith's brigades, Dimick's and Taylor's bat-

teries, attacking it from the west and south,

were received with a storm of shot and shell

from the guns in embrasures and barbettes,

and as they struggled out of the cover they

were swept by the musket-fire from the build-

ing itself, with heavy loss. Seizing a line of

adobe buildings 60 yards from the convent,

they opened fire under that protection and

held it. Meantime Worth's division, with Pillow, Cadwalader,

Garland, Clarke and others, had charged

down the causeway, blocked for several hun-

dred yards with loaded wagons, and through

the fields to the bridge-head. Broken into

irregular fragments by the hedges and ditches,

they were twice repulsed with tremendous loss

by the plunging fire of the Mexican guns; but

Shields had moved north from Coyoacan and,

after a fierce combat, which nearly went awry

him, he was reinforced by Lee and Sumner,

carried the river line, and moved east against

the rear of the bridge. In danger of having

their retreat from the capital cut off, the

Mexicans lost nerve, and a third charge from

the Americans carried the head with a rush.

Thence they turned southwest against the

convent; the American artillery was still batter-

ing it on the other side; a sally from the

garrison was driven back and, as the fire

slackened, both divisions of the Americans

entered it from opposite sides at the same

time. The American forces in this battle

numbered a little over 7,300; the Mexican

numbers are uncertain, but probably about

25,000. The American losses at Contreras and

Churubusco together were 1,053, not over 100

at Contreras. The Mexican loss was 2,637

prisoners at both, and probably 2,000 at least

killed and wounded at Churubusco. Consult

Bancroft, H. H., 'History of Mexico' (1885);

Scott, General, 'Autobiography' (New York

1864); Wilcox, 'History of the Mexican

War' (1892).

CHUSAN, choo'san, ARCHIPELAGO, a

group of islands off the east coast of China, the

largest being the island of the same name, which

is about 21 miles long, and from 6 to 11 broad,

with a population of about 200,000. Its surface

is finely diversified by hill and dale. The rocks

are evidently volcanic; and the soil, often very

fertile, is under good cultivation, for the most

part by spade husbandry. On the same slope

may be seen, in different stages of their growth,

wheat, tea, sweet potatoes, cotton and tobacco.

There are several towns on the island; the capi-

tal is Ting-hae, a walled town of about two

miles in circumference. From its situation near

the mouths of the Yang-tse-kiang, which forms

the great channel of communication with the

heart of the empire, Chusan is considered as the

key of southern China, and was accordingly

taken possession of by the British on several

occasions during the first Chinese War. Notwith-

standing the great mortality among the British

troops during their occupation of the island,

the climate is still considered healthful.

CHUTIA NAQPUR, choo'te-a naq-poor'.

See CHOTA NAQPUR.

CHUTNEY, chú'tnī, a condiment com-
pounded of sweets and acids, much used in the

East Indies and thence introduced into England

and the United States. Ripe fruit, especially

mango and tamarinds, raisins, spices, herbs,

chillies or cayenne, lemon-juice, vinegar, etc.,

are the ordinary components, which are

pounded, well boiled together, and then bottled

for use. It is much eaten in India with curries,

stews, etc.

CHUZZLEWIT, Martin, the principal

character in Charles Dickens' novel of that

name, published 1843-44.

CHYLE, kīl, the liquid mixture of food-
stuffs taken up by the lacteals from the in-
testine in the course of digestion. It is not a

definite substance, its composition varying very

widely according to the character of the in-
gested food. See DIGESTION; LACETEALS;

CHYME.

CHYME, kīm, a pulpy mass into which

food in the stomach is resolved by the action

of the gastric juice and by the contraction of

the stomach. This mass is grayish in color and

the previous texture or nature of the aliment can

be no longer distinguished. It passes by the

pylorus into the intestinal canal, where it is

mixed with the pancreatic juice and the bile.

The thinner parts of it are absorbed by the

slender tubes termed "lacteals." The liquor

thus absorbed, which is called "chyle" (q.v.),

is of a white color; it passes through the glands

of the mesentery, then enters the thoracic duct

and is conveyed by it into the blood at the jun-

tion of the left jugular with the left subclavian

vein. Chyle is an opaque milky fluid, mild to
the taste. By standing for some time one part of it coagulates; another portion is coagulated by heat. The chyle, after mixing with the lymph conveyed by the absorbent vessels, is received into the blood, which has returned from the capillary vessels before this passes to the heart. All traces of it are very soon lost in the blood, as it mixes perfectly with that fluid. It is probable, however, that its nature is not immediately completely altered. The blood passing from the heart is conveyed to the lungs, where it circulates over a very extensive surface presented to the atmospheric air, with the intervention of a very thin membrane, which does not prevent their mutual action. During this circulation the blood loses a considerable quantity of carbon, part of which, it is probable, is derived from the imperfectly assimilated chyle, as this, originating in part from vegetable matter, must contain carbon in larger proportion than even the blood itself. See Digestion; Lymph; Nutrition.

CIALDINI, châ-dé-ni, Enrico, Italian soldier, statesman and diplomat; b. Castelvetro, Modena, 10 Aug. 1811; d. Leghorn, 8 Sept. 1892. For his share in the insurrection of 1831 he was forced to escape to France and in 1835 passing over to the Spanish service, he fought against the Carlists and was made colonel. When Charles Albert headed the Italian rising in 1848, he was employed by the Sardinian government to reduce the volunteers to discipline and fought at the head of his new regiment in the brief campaign in the Crimea. In the Crimea he commanded a division of the Sardinian contingent; and on his return was appointed aide-de-camp to the king. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi. In the war of 1859 the victory at Palestro was his chief exploit. In 1860 he defeated the papal army at Castelfidardo; in 1861 Gaeta and Messina yielded to him. Created Duke of Caeta, and for a few months governor of Naples, he had to act against Garibaldi in the second Sicilian expedition (1862). In 1864 he became a senator; and in the war of 1866 occupied Venice almost without a blow. In 1876 he was sent as Ambassador to Paris, but he retired in 1881 and received the post of one of the two generals of the army.

CIAMICIAN, châ-mish'yan, Giacomo, Italian chemist; b. Trieste, Austria-Hungary, 1857. He was educated at the University of Vienna. He became assistant at the Chemical Institute of Rome in 1880 and in 1887 was appointed professor of general chemistry at Padua. After 1889 he was professor of general chemistry at Bologna and in 1910 became a member of the Italian Senate. He published 'I problemi chimici del nuovo secolo' (1905); 'Organico e fisiologico chimica' (1908); 'Cooperazione delle scienze' (1911); 'Fotochimica nell'armonia' (1912).

CIAMPI, châ'-pè, Ignazio, Italian poet and historian; b. Rome 1824; d. 21 Jan. 1889. From 1874 till his death he was professor of modern history in the University of Rome. Among his poetical works are some imitations of the Russian poet Pushkin; an epic, 'Stella'; and 'Scritti di Voltaire.' He wrote several works on the history of literature, also biographies and histories of special periods. His principal work appeared posthumously: 'Modern History,' from 1492 to the Peace of Westphalia.

CIAMPI, Sebastiano, Italian scholar; b. Pistoia, 30 Oct. 1769; d. Florence, 14 Dec. 1847. Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; owing to some misunderstanding with his colleagues, he accepted in 1818 a professorship in Warsaw and returned to Italy in 1822, a prebend having been conferred on him in Poland, which enabled him to devote himself to literary studies at Florence. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages and of the history of Poland.

CIAMPOLI, châm-pôlê, Domenico, Italian novelist: b. Atessa in Abruzzi, 25 Aug. 1855. He became professor of the history of literature at the Lyceum of Ancona and later librarian of the Victor Emmanuel Institution at Rome. His stories and romances are to a great extent pictures of life among the peasantry and mountain folk of southern Italy, of which he may be mentioned 'La bebe abruzzese' (1877); and 'Cicuta' (1884). He has also written romances of a less local character; 'Diana'; 'The Unknown.' He has devoted special study to Slavic literature and published several volumes on that subject. He published also 'Nuovi studi letterari e bibliografici' (1889).

CIBAO, se-bà'ô, a mountain range in the central part of Santo Domingo; length about 20 miles. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Japan. Gold was found there in 1494, by Ojeda.

CIBBER, sib'ber, Caius Gabriel, Danish sculptor: b. Flensborg, Holstein, 1630; d. London 1700. He visited England during the protectorate of Cromwell and met with such encouragement as to induce him to settle there. He was employed to execute the bas-reliefs on the pedestal of the London Monument. The work, however, by which he is best known are his figures of Raving and Melancholy Madness, formerly erected above the gate of the old Bethlehem Hospital and now in the new hospital, Saint George's Fields. He was the father of Colley Cibber (q.v.).

CIBBER, Colley, English dramatist and actor: b. London, 6 Nov. 1671; d. there, 12 Dec. 1757. He was a son of C. G. Cibber (q.v.) and the sculptor's second wife, Jane Colley. He made his appearance at Drury Lane Theatre in 1699. In 1695 appeared his first comedy, 'Love's Last Shift,' which met with great success. In this piece he played the part of Novelty, a fashionable pop. This character is found in most of his pieces and in the representation of it he was likewise distinguished. His dramatic celebrity is founded chiefly on the 'Careless Husband,' which even obtained for him the title of his declared enemy, Pope. This piece, though without novelty in the characters and without invention in the plot, is a good picture of the manners and follies of the time. His comedy, the 'Non-juror,' is an imitation of Mohièr's 'Tartarous Poems to Helen,' the copy of it appearing in 1717 and was directed against the Jacobites. It was very successful, but drew upon him many enemies, whose number he in-
creased by his conduct as director of Drury Lane Theatre, from 1711. His appointment as poet-laureate in 1730 gave full play to the gallery of his enemies. Cibber had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him on every opportunity. Besides writing original works for the stage, he adapted a number of others. Shakespeare's Richard III being one of those that have passed through his hands. In 1750 he quitted the theatre and published the "Apology for the Life of Colley Cibber," written with spirit and candour and containing many entertaining anecdotes and judicious remarks.

CIBBER, Susannah Maria (Arne). English actress: b. London, February 1714; d. London, 30 Jan. 1766. She was the sister of the celebrated Thomas Arne (composer of the music of 'Rule Britannia'), who taught her music and introduced her in one of his operas at the Haymarket Theatre. She was so much of a favorite with Handel, that he composed pieces expressly adapted to her voice and also instructed her in singing them. In 1734 she married Theophilus Cibber (q.v.), but was soon after separated from him. She subsequently made her appearance in tragedy. Her beauty and her talents gained her universal admiration. Garrick is said to have exclaimed when informed that she was dead, 'Then tragedy has expired with her.' She is buried in Westminster Abbey.

CIBBER, Theophilus, English actor and dramatist: b. 26 Nov. 1703; d. October 1758. He was the son of Colley Cibber (q.v.). Among his plays are 'The Lover' (1730); 'Patie and Peggy' (1730); 'The Auction.' The 'Biography of English and Irish Poets,' which appeared under his name, was from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt.

CIBOL, sbôl, a perennial plant (Allium fistulosum) of the onion genus, a native of Siberia, with hollow stems larger than those of the chive. It was formerly cultivated in Great Britain for culinary use, but it has been superseded by more palatable species. See Onion.

CIBORIUM, si-bôr-î-um, the sacred vessel of silver or gold or silver-gilt and often incrusted with precious stones, in which the sacred host is reserved. Its liturgical name is pyx. In the language of architecture, ciborium is the name of the canopy which overhangs the high altar of a church.

CIBOTIUM, a genus of ferns of the family Cyatheaceae, natives of Mexico, Polynesia and China. C. barometza a Chinese species, gave rise to the wonderful stories concerning the Barometz or Sceythian lamb, which, according to the famous botanist Bauhin (1650), had wool, flesh and blood and a root, attached to the navel and bore a perfect resemblance to a lamb, but grew on a stalk about a yard high and thick. This form from the sides of all the herbage within reach, until from lack of food it died. Not until 1725 was it explained authoritatively that the Barometz was merely the large root of a fern, covered with yellow down, which had been placed in a museum in an inverted position in such a manner that it resembled in a vague way some quadruped.

CIBRARIO, chê-brâ’ryô, Luigi, Italian historian and politician: b. Turin, 23 Feb. 1882; d. Salo, 1 Oct. 1870. He studied law, entered the service of the state and soon distinguished himself by his historical investigations. In 1848, when Italy rose against the Austrians, Charles Albert appointed him commissioner at Venice and a senator of Savoia. In 1852 he was made Minister of Public Instruction and ultimately, in 1855, Minister of Foreign Affairs. In 1839 he published his 'Della Economia Politica del Medio Evo'; in 1840, his 'Storia della Monarchia di Savoia'; and in 1847, his 'Storia di Torino.' He published numerous other works on history, numismatics and miscellaneous subjects.

CICACOLE, sik-ô-kôl. See Chicacoles.

CICADA, si-kâ’dâ, a large insect of the order Hemiptera, sub-order Homoptera and family Cicadidae, known by its broad head, protruding eyes, sucking beak and ovipositor. The male cicada makes a shrill noise by means of a special apparatus at the base of the abdomen or hind-body. The males only possess this sound-organ. "Happy," said Xenarchus, "are the cicadas' sides, for they all have voiceless wives." The loud, piercing notes issue from a pair of structures or cavities on the under side of the body, which act somewhat as two kettle-drums or "timbals," each cavity being covered by a tense membrane which is rapidly vibrated by means of two special muscles within. The sound is variously modified by adjacent smaller disc-like sounding-boards, which increase and transmit the sound vibrations caused by the movement of the membrane. The sound is modified by the semi-circular discs, one on each side projecting from the metathorax over the "mirrors," cover-plates or sounding-boards, one on each side and which, when closed, deaden the sound, or, if open, allow it to escape in greater volume. This apparatus appears to be homologous with the "ears" of the locusts or common grasshoppers. Cicadæ have an incomplete metamorphosis, the young (nymphs) being like the parents, but without wings; they live attached by their beaks to the roots of trees, etc. The females deposit very long, slender, cylindrical eggs in gashes in twigs made by her saw-like ovipositor. From 400 to 600 eggs are laid, the process requiring about 45 minutes. The two commonest forms in the United States are the dogday harvest fly (C. tibicen) and the periodical cicada (C. septendecim). The former is the black-and-green harvest fly which appears in midsummer and gives out its shrill notes during the heat of the day from the tree tops. It matures in two years, but there being two broods, one appears every year. The 17-year cicada (wrongly called 17-year locust) is the longest-lived of any known insect, as the grub or nymph lives for over 16 years sucking the roots of forest trees, often several feet below the surface; in the late spring it finishes its metamorphosis and usually at the last of May or the beginning of June issues in enormous numbers from the ground. This appearance of a 17-year brood in a given area has been recorded as far back as 1633. At the present time each year has its brood or broods, each limited, as a rule, to a
CICATRIZATION—CICERO

well-defined district. Of such broods there are 30, occurring over a large area in the Atlantic and Central States. In southern New England a brood periodically appears near Fall River and on Martha's Vineyard, as well as in Connecticut. The oldest known appearance known in history was in the first week in June 1903, in the town of Coventry, near Tiogue reservoir. The southern limits are northern Georgia and the western limits are eastern Nebraska and Kansas. Besides this 17-year brood is a 13-year brood, which is more southern, the dividing line being about latitude 38°; this appears to be a temperate variety. The male is very short-lived and takes no food. The females live for several weeks and deposit their eggs about the middle of June in New York and West Virginia. The young hatch, dropping to the ground about six weeks after the eggs are laid; they then burrow into the soil and begin to pierce the rootlets of trees. The nymph molts about once a year or oftener, and Riley estimates the number of molts at from 25 to 30, while there are six stages of growth before the imago or winged state is assumed. Consult Riley, 'The Periodical Cicada' ('Bulletin 8 United States Department of Agriculture', 1893); Marlett, C. L., 'The Periodical Cicada' (ib. 14, Washington 1898); and Woodworth, 'Synopsis North American Cicadae' (in Psyche, Vol. V, Cambridge, Mass., 1888).

CICATRIZATION, the process of healing in the skin of an ulcer or a wound. Where a solution of continuity of the skin is made the blood is thrown out into the gap, the edges of the wound are gummy together by serum, and, sprouting from both sides of the wound, new connective tissue is formed. This new connective tissue gradually fills the wound with a white glistening mass, the cicatrix. The cicatrix and all that may be left of the wound is a white shiny strip of new connective tissue.

CICELY, Sweet, a plant of the United States belonging to the natural order Umbelifera, a perennial herb growing from fleshy, clustered, thickish roots. There are about 15 species in North America, western South America and eastern Asia, grouped into the genus Washingtonia, so named in honor of George Washington. Eleven of the 15 are natives of the western United States. They are related to chevill (q.v.) on one side and to Scandix on the other. The smoother sweet cicely (W. longiseta) grows in the woods of southern Canada, through Dakota, eastward to North Carolina, southward to Tennessee and Alabama and westward to Kansas, and on elevations to the height of 4,200 feet. The roots have a rich spicy taste and odor, resembling anise. The sweet cicely of England (Myrrhis odorata), although common about buildings, is an imported plant, probably from central Asia. It is fragrant and its odor is supposed to be particularly agreeable to bees, therefore hives are rubbed with the herb to attract them.

CICER, sī'sēr, a genus of the natural order Leguminosae, of the tribe Vicieae, of which the chick-pea (q.v.) is a representative.

CICERO, Marcus Tullius, Roman orator and statesman, and the greatest master of Latin prose style: b. 106 B.C.; killed at Formiae 43 B.C. Cicero was a native of Arpinum, the birthplace also of Marius. His father was a knight of good social position and the son was well educated in preparation for the bar and for public life. While still a young man he served a campaign under the elder Pompey. He first attained legal success as a lawyer in 80, and in the latter case was brought into direct collision with a favorite of Sulla, at that time perpetual dictator. It was perhaps in consequence of this that he withdrew for a time from public life. He had been a friend of Cicero and Asia Minor, occupying himself with the further study of oratory. In 75 he began his political career by serving as quaestor in Sicily, and in 70 he gave evidence of the closeness of his relation to that province by prosecuting Verres for maladministration as governor there. In 69 he was curule aedile and in 66 praetor urbanus, following the usual course of offices; in the latter year he made his first distinctively political speech in support of a proposal by the tribune Manlius to give to Pompey the command of the war against Mithridates. Though the distinction between parties was then less sharp than it is now, he had thus far been connected with the democratic party, but in the canvass for the consulship of 65 he had already two candidates in the field, Catiline and Antonius, while the Optimates had no candidate of special promise. As Catiline belonged to the radical wing of the democrats, the senatorial party, desiring his defeat, threw its influence in Cicero's favor. He was thus elected as a representative of the Optimates and continued to act with that party during the rest of his life. His constitutional instincts were further strengthened by the outbreak during his consulship (63) of the so-called conspiracy of Catiline, an attempt by the radicals under the leadership of this reckless noble to seize the government by violent means. This attempt Cicero put down with considerable vigor; Catiline was killed in battle and several of his associates were condemned to death by a vote of the Senate and executed under Cicero's orders. The execution, however, was of questionable legality, since it set aside the right of the accused to an appeal to the popular assembly, and once at once by members of the democratic party for his responsibility in the transaction. Upon the formation, in 60, of the coalition between Caesar, Pompey and Crassus called the First Triumvirate, by which the democrats came into control of the government, Cicero was banished from Rome and left Italy (April 58). The years preceding his exile had been years of great professional activity and some of the best of his speeches belong to this period, but he had not yet acquired the habit of literary production and the year of his absence was unfruitful except in letters. His return to Italy in 57 was the occasion of a great party demonstration and was to some degree a personal triumph, and he engaged himself at once in suits for the recovery of his property and in the party struggles with the Triumvirate. During this period he also took up again his early studies in rhetoric and wrote the 'De Oratore,' one of his most finished and authoritative works. He had not up to this time followed the usual custom of taking the proconsular governorship of a province, but in 52 he went to Gaul, though much against his will, he went as governor to Cilicia. He spent here exactly the year
required of him, from 31 July 51 to 30 July 50, but impatient as he was of the enforced absence from Rome his governorship was highly creditable to him; he showed, in particular, the most honest love of the public interest and the most strenuous effort to avoid even the customary exactations from the provincials. When he returned to Rome, he found all parties absorbed in the agitation which preceded the civil war. Early in 49 Caesar marched upon Rome and Pompey withdrew to Dyrrachium, and, during these months (the Cicero remained away from the city in great uncertainty as to his duty and his interests. Caesar asked of him only that he should remain neutral, and his own forebodings as to the outcome of the struggle inclined him toward this course, but his party connections, his constitutional prejudices and opinions and his lifelong respect for Pompey took him finally to the camp at Dyrrachium. After the victory of Caesar at Pharsalus in August 48, he returned to Italy and spent a year in Brundisium, awaiting Caesar's permission to go to Rome. From the summer of 47 to March 44 the domination of Caesar put an end to free discussion and action in the state and Cicero made only a few speeches, addressed to the Senate. He had been in terms of friendship, on behalf of persons desiring amnesty. But the enforced political inactivity he put to use in literature, and to this period belong almost all his greatest writings, the ripe fruits of a life of intellectual interests. In March 44 the assassination of Caesar aroused in Cicero, though he was not cognizant of the plot, a renewed hope that the Senate might recover control of the state. But for the first few months events turned against his party; popular feeling did not approve the death of Caesar, Antony was unexpectedly active and successful, and Cicero for a time thought of joining Brutus and Cassius in the East. As the confusion began to clear, however, and the old issue between constitutional government and the rule of a dictator took form, Cicero's indecision came to an end and he threw himself unreservedly into the contest of the Senate with Antony. The 14 Philippics, delivered between September 44 and March 43, are unmatched among his speeches. When the Senate (Augustus) were reconciled and formed with Lepidus the Second Triumvirate, Cicero's name was placed upon the list of the proscribed, and he was killed at his villa near Formiae, 7 Dec. 43.

The literary work of Cicero is in amount much greater than the extant work of any other Latin writer and in value is second only to the poems of Virgil. It consists of orations, rhetorical works, philosophical essays and collections of letters, and will be taken up in that order.

Of the orations we possess 57 in nearly complete form and the titles of some 50 more are known. The extant orations are about equally divided between speeches to the Senate or the people on public, military and personal topics. Cicero spoke by preference on the side of the defense in both civil and criminal trials, sometimes making a close legal argument, but not infrequently using also political and even literary devices to rekindle the moral argument. The public orations are to a considerable extent invective, especially the four orations against Catiline and the 14 Philippics against Antony, and these are at times bitter to a degree that modern taste would condemn, even in the most excited political struggles. But the wit, the fire, the humor and breadth, the easy handling of complex arguments and the grace and precision of stylistic form are such that no critic, either ancient or modern, has seriously questioned Cicero's supremacy in Roman oratory.

The rhetorical works deal chiefly with oratory; several are text-books on the theory and practice of public speaking. The section of Roman oratory and one is a discussion of the ideal in oratory. While Cicero did not attempt a wholly novel treatment of these subjects, there is in the works much of the ripe judgment of the practised speaker who was interested also in the theory of his life work, and they contain some of his most finished and delightful writing.

The philosophical works are constitutional and ethical essays in dialogue form. Cicero himself regarded them as useful exercises of making educated Romans better acquainted with Greek philosophy, especially of the Academy and Stoic schools, and made for them no claim to originality of thought. We possess also a collection of nearly 800 letters by Cicero, with nearly 100 more from his correspondents. They begin with the year 68 and with some breaks continue down to the year of his death. About half of them are addressed to his intimate friend T. Pomponius Atticus, the rest to various persons, including almost all the eminent men of his time. Some few of them are formal and guarded in expression, but the majority, especially those addressed to Atticus, are extremely intimate and confidential, written without thought of publication. They give a most interesting picture of the progress of events and changes of opinion during a critical period of Roman history, and they also reveal some of the weaknesses of Cicero's character and have furnished the material upon which the harsher judgments of his conduct have been founded.

The uncertainty of the judgment of posterity— to which appeal is often made as if it were always precise and infallible— was never better illustrated than in the history of Cicero. In regard to Cicero. During the earlier centuries after the Revival of Learning, when attention was fixed upon correct and elegant Latinity, the judgment which scholars formed in regard to Cicero's public career was mainly determined by their just admiration for his Latin style. And most scholars up to the beginning of the 19th century continued to occupy the uncritical position. But with the rise of historical science a revision of opinion was inevitable. This found expression in Drummann's history of Rome and later in Mommsen's history; in both of these writers, however, the extravagant and passionate discredit of Cicero was as marked as the earlier unquestioning worship had been. The influence of Mommsen's attack is still seen in popular and school histories, though scholars have long understood its inaccuracy. But though opinion varies within narrower limits, it still varies somewhat, for reasons which are to be found partly in the character of Cicero and partly in the nature of the constitutional and political questions that are connected with his career. Cicero was, as most orators are, a
CICERO — CICERO’S LETTERS

CICERO’S LETTERS. The letters, ‘Epistulae,’ of Cicero cover a period of 25 years, from 68 to 43 B.C., the year of the orator’s death, and embrace in four groups:

(1) ‘Epistulae ad Familiares,’ consisting of 16 books of letters to various friends, including an entire book of those addressed to his wife and children, and another book of those to his faithful freedman Tiro.

(2) ‘Epistulae ad Atticum,’ likewise consisting of 16 books, a witness to the life-long friendship and intimate relations subsisting between Cicero and Titus Pomponius Atticus.

(3) ‘Epistulae ad Quintum Fratrem,’ three books of letters to Cicero’s brother Quintus.

(4) ‘Epistulae ad Marcus Brutum,’ two books of letters to the Brutus who headed the conspiracy against Julius Caesar.

The contents of the letters are so various that it is difficult in brief compass to give any adequate conception of the range and quality. Many of them deal directly with the stirring political issues of Cicero’s own time, the strife of parties, the competition for office, the ambitious aspirations of Caesar, Pompey and Crassus in the First Triumvirate, the conflict between Caesar and Pompey and the chaotic conditions subsequent to Caesar’s assassination. Others have to do with the purely personal affairs of the writer, the publication of his works, the construction and furnishing of his wills or the gossip of the day. Several touch upon the domestic infelicities of Quintus Cicero and his wife, Pompeia, the sister of Atticus, in which Atticus naturally blamed Quintus, while Cicero blamed Pompeia.

Most of the letters are written in the more intimate style of the Roman sermo familiaris, contrasting strongly with the studied elegance of the formal style characteristic of Cicero’s other works. Equally marked is the unreserved frankness with which Cicero discusses the men and measures of his day. In the letters to Atticus in particular he practises as little reserve as if he were writing a diary for his own private edification. As a result, some of the unattractive features of Cicero’s personality are brought out in strong relief. In 52 B.C. we find him writing to Atticus that he contemplates the defense of the unsavory Catiline. “I am thinking,” he says, “of defending Catiline. We can have any jury we wish with the full consent of the prosecutor. If Cicero is acquitted, I hope it will make us better friends.” Thus he writes of the man whose true character he knew well, and whom only two years later he was branding in his speeches with all the vituperation at his command. On his way into exile and later when he broke out into the most disconsolate lamentations as to his hard lot, bewailing the sad fate of his wife and children and expressing regret that he had not committed suicide. Fifteen months later the exultation to which he gives utterance on his return to Italy and the capital is no less extravagant. In 52 B.C. he went to Cilicia in Asia Minor as provincial governor. He cannot dwell sufficiently upon the enthusiasm manifested at his arrival in the different towns through which he passed, and his journey. A trivial military success over some wild mountain tribes within his jurisdiction impels him to write home in loud praises of his achievement.
The four collections above enumerated contain 774 letters written by Cicero. As many more are believed on good grounds to have existed in antiquity and to have been lost. . . .

CICUTA, si-kū'ta, a genus of poisonous umbelliferous plants commonly known as water-hemlock or cowbane, the species natives of North America. The plants are a dangerous poison, said to be fatal to cattle that eat them. Persons are known to have died from eating the roots which are white and fleshy. The common hemlock, Conium maculatum, a poisonous umbellifer, has a stem from two to four feet high, hollow, striated and spotted with purple; leaves large, much divided and fed with juice; and with unilateral partial involucres, marks by which the common hemlock is readily distinguished from the water-hemlock, and from other plants of the Apiaceae. It is dangerous in Europe, and is extensively used in medicine, being given internally as a sedative, and applied externally to sores, ulcers, etc., in the form of a poultice or ointment. It may be the kowstos (hemlock) of the Greeks, which Socrates and others condemned to death were required to drink. The Latin cicuta was the true hemlock. See HEMLOCK.

CICUSBEO, če-chēs-bā'd, or CAVALIERE SERVENTE, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the cicisbeo, who even attended at her toilet, to receive her commands for the day. The custom is the more extraordinary, from the natural jealousy of the Italian, who seemed to change his character completely after marriage.

CICOGNARA, Leopoldo, Count DA, Italian antiquarian, diplomatist and writer on art subjects: b. Ferrara, 17 Nov. 1767; d. Venice, 5 March 1834. He studied at Modena and the Academy of San Luca, and was later appointed Ambassador to Turin, and councillor of state. In 1808 he became president of the Academy of Fine Arts in Venice. His most important work was a 'History of Sculpture from the Renaissance of that Art to the Present Century' (3 vols., 1813-18). He also wrote a 'Life of Canova' (1823).

CICONIA, si-kō'n'i-a, the genus of birds to which belongs the common stork, the type genus of the family Ciconiidae.

CICONIFORMES, an order of Aves (birds), composed of the sub-orders Megapodidae (the megapodes or bird cassowaries), Ciconiidae (storks, ibises and spoonbills); and Phaenicopidae (flamingoes). All are aquatic or mainly so. See ORNITHOLOGY.
des, a new Moslem sect from northern Africa, drove Alfonso in battle, and caused him to withdraw his protection from Valencia, and the governor of the city appealed to Saragossa for help. The Cid was sent to the aid of the city in command of an expedition which proved successful, and he established himself in Valencia territory. As the recognized protector of the lawful king, in reality, the suzerain of Valencia, he received a generous tribute; but it is clear that he had already resolved, when opportunity offered, to secure the city for himself. Meanwhile he skillfully held off, now by force, now by ruse, all other competitors, Christian and Moslem alike; including among these King Alfonso, whose territories he once wasted with fire and sword. As head of an independent army, he made successful forays in all directions; despoiling, levying tribute, garrisoning strongholds and strengthening his position in every way, and in 1094 finally became master of Valencia itself. He successfully held the city till 1099, when his troops, he had sent against the Almoravides were utterly routed, few escaping, and he already enfeebled in health, died, it is said, of grief and shame. His widow held Valencia for two years longer. He left two daughters, one of whom married the Count of Barcelona, and the other the Infante of Navarre.

The Cid very soon became the favorite hero of popular songs. It is probable that these songs were at first short stories in rude metrical form; and that they were the sources of the epic poems. The earliest of the epic poems is 'Poema del Cid' or 'Cantar de mio Cid,' 'The Poem of My Cid,' based upon history, but with a large amount of legendary matter. Its date is probably about 1200. It is one of the best of mediaeval folk epics, its characters being drawn with clearness and simplicity. Another poem of about the same date, 'The Legend or Chronicle of the Youth of Rodrigo,' is of inferior merit, though not without fine passages. Two centuries and more after these poems were with the 'Romances' or 'Ballads of the Cid.' The earliest of these do not in their present form form an atedate 1500. These ballads are derived from all sources, but chiefly from the Cid legend, which is here treated in a lyric and popular tone.

These ballads make Jimena (or Ximena) Gomez the wife of the Cid and tell the legendary story of her father (Don Gomez), insulting the Cid's father, of the Cid's revenge by killing Don Gomez, of Jimena's pursuit of the Cid demanding justice of King Ferdinand and the final reconciliation through marriage. De Castro, in his drama, 'The Youth of the Cid,' drew his material from the ballads, but added love and the conflict between affection and the claims of honor in the mind of both Jimena and Alfonso, to the verse. His drama, 'The Cid' (see Cin, The) upon that of Castro, using the same plot and the same struggle between love and duty on the part of the hero and heroine, Corneille condensed De Castro's 'The Cid,' gave it dramatic unity, and added greater dignity and majesty to the verse. His drama, when first put on the stage in France (1636), met with immediate success. Of the very first poem on El Cid, there are translations by A. M. Huntinton (1901); J. H. Freer (1874); J. Ormsby (1899). Consult Huber, 'Geschichte des Cid' (Bremer 1829); Southey, 'Chronicle of the Cid' (London 1838); Alfonso Mendez Doral, 'Cantar de mio Cid: texto, gramatica y vocabulario' (3 vols., Madrid 1908-11); ib., 'El Romancero espanol' (1910).
a critic of expensive thought its subject ill-chosen, its irregularity unpardonable, its action clumsy, its prosody bad. Cardinal Richelieu was jealous for he had literary loyales; the Academicians professed alarm. Cornelle found it prudent to withdraw for three years from Paris to Rouen. But the play was popular from the first. Boileau found that "all Paris has for Rodrigue the eyes of Chimène" and, though this tragi-comedy lacks ethical depth and tragic force, it is still most acted of Cornelle's dramas.

"Le Cid" is best edited with English notes by C. Searles (Boston 1912); translated by Mongan (New York 1896). Consult Gaste, 'La Querelle du Cid' (Paris 1878) and Searles, C., 'Les Sentiments de l'Academie Francaise sur Le Cid' (Minneapolis 1916).

BENJAMIN W. WELLS.

CIDER, the pressed fermented juice of apples; a beverage, the quality of which depends principally on the following particulars:—kind of fruit, condition of the fruit when ground, manner of grinding and pressing, method of producing fermentation, and precautions to be taken against its excess.

The chief characteristics of a good cider apple are a red skin, yellow and often tough and fibrous pulp, astrignency, dryness, and ripeness at the cider-making season. The only artificial criterion for ascertaining the quality of an apple for cider is the specific gravity of its must, unfermented juice; or the weight compared with that of water. This indicates with very considerable accuracy the strength of the future cider. Its weight and consequent value are supposed to be increased in the ratio of the increase of saccharine matter. The strongest and most highly flavored cider which has been obtained from the apple was produced from fruit growing on a shallow loam, on a limestone basis. All the writers on the subject seem to agree that calcareous earth should form a component part of the soil of a cider orchard. A dry and somewhat loose soil is preferred.

Condition of the Fruit.—Fruit should be used when it has attained full maturity, and before it begins to decay. Each kind of apple should be manufactured separately, or at least those kinds only should be mixed which ripen about the same time. The longer the fruit remains on the tree without decay or being injured by frost the better, for not only is the perfect maturity of the juice an important consideration, but the colder the weather, short of actual frost, the more quiet and equable will be the fermentation. When gathered the apples should be carefully stored in some shady, cool room, and finally in barrels to undergo a further ripening, and acquire more saccharine matter while losing a considerable quantity of watery juice.

Grinding, etc.—This operation should be deferred till December, if possible. It is absolutely essential that the weather should be cold, even slightly frosty, to counteract the tendency to rapid fermentation. The apples should be reduced by the mill as nearly as possible to a uniform mass, in which the rind and seeds are scarcely discernible, the pomace should be exposed to the air. It has been ascertained that, by exposing the reduced pulp to the operation of the atmosphere for a few hours, the specific gravity of the juice increases from 1.064 to 1.078. For fine cider the fruit should be ground and pressed imperfectly, and the pulp then exposed 24 hours to the air, being spread and once or twice turned, to facilitate the absorption of oxygen; it should be then ground again, and the expressed juice added to it before it is again pressed. The best method of grinding the apples is to employ cylindrical rollers placed so near each other as to crush them. They are fed from a hopper above them, from which the apples pass between a pair of fluted or toothed cylinders, by which they are torn and partially crushed before reaching the more perfectly crushing apparatus below. The mass is then powerfully pressed, and the cider is run into casks.

Fermentation.—The vinous fermentation commences and terminates at different periods, according to the condition and quality of the fruit and the state of the weather. The best thing whereby to judge the proper moment to draw the liquor from the scum and sediment is the brightness of the liquid which appears after the discharge of fixed air has ceased and a thick crust has collected on the surface. The clear liquid should then be drawn from the scum into another cask. If it remains bright and quiet, nothing more need be done to it till the succeeding spring; but if a scum collects on the surface it must immediately be racked off again, as this would produce bad effects if suffered to sink. A. ong the precautions used to prevent excessive fermentation is stunning, which is fuming the cask with burning sulphur. This is done by burning a rag impregnated with sulphur in the cask in which the liquid is to be decanted, after it has been partly filled, and routing it so as to incorporate the liquid with the gas. By distillation, a strongly fermented cider called cider brandy or applejack is produced, containing a larger percentage of alcohol. A species of vinegar is also made from cider. See VINEGAR.

CIENFUEGOS, thē-ën′foo-a-gōs, Nicasio Alvarez de, Spanish poet: b. Madrid, 14 Dec. 1764; d. Orthez, France, July 1809. He studied at Salamanca at the time when the modern school of Spanish poetry was founded there by Cadalso and Meler. He dedicated himself to this school, and in 1798 laid the foundation of his literary fame by the publication of a collection of poems. Shortly after he became editor of the government newspapers, La Gaceta and El Mercurio, and was appointed to the Department of Foreign Affairs. He was in possession of this office when the war of independence broke out. Madrid was occupied by the French and Cienfuegos, having both offended Murat by an article in La Gaceta and taken part in the insurrection of May 1808, was brought to trial and condemned to death. At the intercession of some influential friends the sentence was commuted to banishment to France. His tragedy, 'Pitaco,' had procured his admission to the Spanish Academy. He also wrote the tragedy of 'Idomeneo,' and the comedy of the 'Magnanimous Sisters.' His tragedies are considered his best works. His dramas were collected and published at Barcelona 1836. Consult 'Plaideurs' (in Biblioteca de Autores Españoles, Vol. LXVII); Piñeyro, 'Cienfuegos' (in Bulletin Hispanique, Vol. XI, Bordeaux 1909).
CIFUEGOS, Cuba, city in the province of Santa Clara, on the south side of the island. Its harbor, which is one of the finest in the West Indies, was visited by Columbus on his first voyage, and was surveyed by Ocampo in 1508. The town was settled by refugees from Santo Domingo in 1819. Here the revolutionist Narciso Lopez planned to make his first demonstration on 4 July 1847. (See also CUBA.) In recent years its commercial progress has been rapid, and it is now the second seaport of Cuba. Some of the sugar estates in the neighborhood are very large, and conducted on the most approved modern plan; in fact, Cienfuegos is considered one of the sugar trade centers of the Caribbean coast. It is a city of attractive, well-shaded streets, and substantially built houses. One of its plazas is the largest in Cuba. Among the principal buildings are the governor's house, market, railroad station and military and government hospitals. Water from the aqueduct is supplied to 42 per cent of the dwellings; from wells, to 47 per cent; from cisterns, to 7 per cent. There are social clubs, a theatre, etc. The city is lighted by gas and electricity. The climate from May to November cannot be highly commended, the air having an excess of moisture, and the temperature ranging from 75° to 98° F. The winter months, however, are very agreeable, winds from the north prevailing, and the temperature ranging from 60° to 78° F. during the day, with cooler nights. Cienfuegos is connected by rail with Sagua la Grande, on the opposite coast; with Santa Clara, the western terminus of the Cuba Company's main line to Santiago; with Havana, etc. By steamer it is in regular communication with New York, as well as with ports of the southern coast of Cuba from Santiago to Batabano. The census taken during the first American intervention showed: number of inhabitants engaged in trade and transportation, 3,065; in agriculture, fisheries and mining, 901; in personal service, 4,004; in manufactures and mechanical industries, 3,221; in professional service, 294; without gainful occupation, 18,553; total school attendance 3,832; number of persons able to read, 18,052, 60 per cent—a higher percentage in the west being found among Cuban citizens than in the east. (See CIGAR.)

CIESZKOWSKI, Tszé-shó-kévské, August, Count, Polish philosopher and economist; b. Sucha, Podlachia, 1814; d. 1894. He was educated at the University of Berlin, was one of the founders of the Biblioteka Warsawska, and in 1848 settled in Pozen. For many years he served as deputy in the Prussian Chamber of Deputies. He tried but in vain to establish a university in Pozen and in 1872 was made a member of the Cracow Academy. He combated the pantheism of Hegel and developed his own concepts of God, the immortality of the soul and the divinity of Christ. His best-known works are 'Prolegomena zur Historiosophie' (1838); 'Gott und Palingenesie' (1842); 'De la paire et de l'aristocratie moderne' (1844); 'Du crédit et de la circulation' (1847); 'Ojecz-Naszy' (1848) and 'O drogach ducha' (1859).

CIZZA, the'-sha, Spain, in the province of Murcia, on the west bank of the city of Murcia, on an eminence near the right bank of the river Segura. It has a large church and ancient tower, manufactures of linen and hempen fabrics, and a trade in corn, wine, oil and silk. Pop. 14,393.

CIGAR (of uncertain etymology; it cannot be connected with any West Indian speech, and the customary derivation from Sp. cigarra, cicada, in allusion to a similarity of outline is generally denied by scholars; Sp. cigarr, also incorrectly spelled segarr), a short compact roll of tobacco leaf for smoking. This form was borrowed by the Spanish invaders from the Indians of Cuba. When the Spaniards found that tobacco would grow elsewhere, they transplanted it to their possessions in the Philippines and to other localities. The Manila chero is a common form in which tobacco is smoked in the Far East. This chero is a roll cut off squarely at both ends and is shorter than American cigars. Rolling tobacco is generally practised in Virginia and the Carolinas for a long time after the settlement of those sections by the English, for there the Indians invariably smoked their tobacco in pipes, but finally the convenience and portability of the Rolls possessed made their use quite common some years before the Declaration of Independence of the American colonies. In Cuba, Mexico and Central America and, in fact, in all Spanish-speaking countries, the use of a pipe to this day is a rarity, the inevitable cigarette or cigarette ("little cigar") being found constantly in use.

The moist climate, the character of the soil and the peculiar conservative qualities of the air make Cuba the true home of the perfect cigar. There are but half a dozen valleys, mostly in the western end of the island, in the province of Pinar del Rio, where the finest cigar tobacco is grown and cured, the most important being the Vuelta Abajo district. In this section the soil is of volcanic origin, it is the color of chocolate, and of great depth. The fields are carefully and scientifically fertilized from year to year to preserve the proper proportion of chemical ingredients necessary to produce the finest tobacco. It is only said that the making of a cigar begins with the cultivation of the tobacco leaf. The flavor of the cigar depends essentially upon the harvesting of the leaf at exactly the proper moment. The finest quality of tobacco may be reduced to an inferior grade by gathering it while the juices are too green. Having been gathered, the Cuban tobacco leaves are hung in curing-houses, where they remain for seven weeks, during which time the color changes from the rich green of the growing plant to the peculiar shade of brown known by the specific variety under consideration. Having safely passed this stage, the tobacco is "sweated" in piles for a day or two, and is then baled and placed in a storage warehouse where it undergoes a fermentation process. It remains in this storage for from one to two years, according to the grade of cigars in which it is to be used—the longer the storage, the finer the smoking qualities. Havana tobacco thus prepared is of an even dark brown color, without spots or stains. The finest quality brings as
The excellence of the Havana cigar does not depend wholly on the quality of the tobacco, but is due in part to the skill of the roller. Tobacco leaves vary so widely in texture and in what blending of leaf will yield the choicest flavor. Perhaps the next best grade of cigar tobacco comes from Porto Rico. The removal of the duty on manufactured cigars from that island in 1903 flooded the United States with cigars from there, many of them very inferior. In order to avoid paying the high duties on Cuban-made cigars, the device was early tried of bringing the tobacco over to the small island of Key West, a part of the State of Florida, separated from Cuba by only an 80-mile-wide strait. It was thought that the climatic conditions there would be so similar to those of Cuba that an equally fine cigar could be made there, while the importation of the tobacco in bulk cut down the duties very materially. The *Key West* cigar is much cheaper than the one made in Cuba, but the flavor, for some reason, is inferior. The manufacturers even brought cigar-makers from Cuba to Key West, so that at one point in the process the product might be the same as the original, but it is generally disdained by experts of the Department of Agriculture that in Ohio and Texas are certain areas which possess a soil so similar to that of the celebrated Vuelta Abajo district of Cuba that it is possible to raise tobacco there that will equal the Cuban. Samples of the leaf grown there and submitted to dealers in New York and Philadelphia, who were not told where it came from, proved to be so similar to that of Cuba that it was pronounced pure Havana leaf of the best quality. The pioneer in the manufacture of Key West cigars was Gen. J. H. Gregory, who gained his military title in the first war for Cuban independence, and was familiar with the internal resources of Cuba.

The cigar is made up usually of two parts: the filler and the wrapper. In some makes there is also an intermediate strip placed around the filler, known as the binder. In the cigars made in Cuba (so-called Havana cigars), the filler and wrapper are of the same tobacco. In the cigars made in the United States, the filler is generally of one kind of tobacco, and the wrapper of another. About one-sixth of the tobacco used in cigar making in the United States is imported. The imported filler tobacco comes chiefly from Cuba, Porto Rico, Mexico, Brazil and the Philippines, and the wrapper tobacco from the Dutch East Indies and Cuba. The best tobacco for wrappers is grown in Sumatra. Connecticut wrappers are also much used, being strong and tough. The best cigars made within the limits of the United States are undoubtedly those manufactured in Key West, of Cuban tobacco with a Connecticut wrapper. Those with Virginia, Carolina, Pennsylvania and other tobaccos as the filler, with the Connecticut wrapper, are of inferior quality, but sell in large quantities, because of their cheapness. Tobacco for the "little cigars," cheroots and all cheaper brands is grown in Wisconsin, Connecticut, New York, Pennsylvania, Ohio and Florida.

Tobacco comes to the cigar manufacture in bundles, or bales, that suitable for wrappers being in separate packages. When the leaf is received the bales are opened, and the leaf spread out and sprayed with water. It is then piled for some hours until it has become moist throughout and pliant. It is then graded, and placed in bins for further curing of from one to six weeks. Tobacco leaves are highly flexible, and readily takes up odors from the air. If these are foul, the effect on the tobacco will utterly ruin the cigars made from it. The best temperature in which to keep the tobacco leaf is 65° F., and the moisture content of the air should be about 70 per cent. As it becomes *ripe*, it is taken to the cigar-makers. The operative spreads the filler leaf on his bench, with a small quantity of the wrapper beside him. He rolls the filler into the proper shape and firmness, then deftly cuts a portion of leaf to form a wrapper, winds the wrapper about the filler and secures the ends with paste. This is the standard method. Some popular grades are made by machinery, but hand-made cigars are generally considered the best. The cigars are passed up critically by a foreman who rejects those not up to the standard of the factory. The passed cigars are placed in large cedar bins for seasoning. Finally they are sorted according to color and packed into boxes. In general there are six distinct color grades: (1) Claro or Clara, a very light brown; (2) Colorado Clara, light brown; (3) Colorado, medium brown; (4) Colorado Maduro, dark brown; and (5) Maduro, very dark, almost black. As a fact, however, in large factories up to 32 shades of brown are recognized. The color, while usually considered an indication of the strength of the cigar, has in reality nothing to do with it, the wrapper giving no perceptible flavor to the cigar, constituting but about two per cent of it. And actually the flavor depends mostly upon the age at which the leaf was cut, and the time and skill bestowed upon its curing. The dark tobacco is the more likely to be ripe, and therefore superior in quality, and likely to be much milder than the very light cigars. In 1914 there were 16,754 manufacturers of cigars and 381 manufacturers of cigarettes operating in the United States. The total output for that year was 16,869,520,463 — an increase in the year of 1,298,722,016. In 1917 the output was 8,266,770,593 cigars, an increase of 876,587,423 over the previous year and the largest output on record. In the same year 35,377,751 pounds of snuff were manufactured and 443,763,206 pounds of smoking and chewing tobacco. The average quantity of unstemmed tobacco required to make 1,000 of the cigars weighing more than three pounds was 21.45 pounds. The average quantity used to make 1,000 little cigars was 6.46 pounds; the average for cigarettes was 3.68 pounds. The total quantity of leaf tobacco used in making the 1914 output was 157,967,457 pounds for cigars, and 62,209,366 pounds for cigarettes — a total of 220,176,823 pounds. In that year the United States imported 7,863,130 pounds of wrapper tobacco (valued at $9,992,276) and 49,543,392 pounds of other leaf tobacco (valued at $24,779,771). Of the latter, a considerable amount was used by cigarette-makers — the figures for cigar tobacco are not given. The Department of Commerce. Of the wrapper tobacco, 7,688,514 pounds was "Sumatra" leaf, from the Dutch East Indies, and 117,315 pounds Cuban leaf. Of the other leaf tobacco, Cuba supplied 25,601,021 pounds.
CIGARETTE — CIMABUE

(valed at $14,504,856). Turkey, 21,141,402 pounds (valued at $9,014,612), and Porto Rico, 6,395,528 pounds (valued at $2,805,534). The influence of the European War upon the tobacco imports of the United States may be seen by comparing the following figures for the fiscal year ended 30 June 1916 with those of the calendar year 1914 given above. Of wrapper tobacco there was imported in the year ended 30 June 1916, 5,070,308 pounds, valued at $7,246,933. Of this, 4,963,961 pounds came from the Dutch East Indies. Of other leaf tobacco there were imported 42,943,027 pounds, valued at $17,372,120. Of this, 23,920,899 pounds came from Cuba, and 6,705,823 pounds from Porto Rico. The usual importation of Turkish tobacco was entirely lacking.

The importation of cigars was: from the Philippines, 1,081,840 pounds, valued at $1,369,836 (in 1914, 798,746 pounds, valued at $1,238,306); all others, 564,116 pounds, valued at $3,373,042 (in 1914, 552,251 pounds, valued at $3,223,590). In addition Porto Rico supplied 156,996,000 cigars and cheroots, valued at $8,524,208. Of cigarettes, there were imported $2,780,000, valued at $72,325 (in 1914, 40,777 pounds, valued at $63,219). Of cigars exported there were 1,394 pounds, valued at $24,439; of cigarettes, 2,612,389 pounds, valued at $4,325,513.

Further details, including the culture and preparation of tobacco-leaf, see Tobacco. Consult also Brennan, W. A., 'Tobacco Leaves' (Menasha, Wis., 1915).

CIGARETTE. See Cigar.

CIGNANI, chen-ya'en', Carlo, Italian painter: b. Bologna, 15 May 1628; d. Forlì, 6 Sept. 1791. He was a pupil of Albano. He knew how to compose, like the Carracci, and to distribute his figures in such a way that his paintings appear larger than they really are. His finest fresco paintings are at Saint Michael in Boscó, at Bologna, in ovals supported by angels, and in the salon of the Farnese Palace, where he represented Francis I of France touching for the king's evil. In his painting of the Saint John, Forlì, he has imitated the beautiful Michael of Guido in the cupola at Ravenna, and other fine conceptions of this painter; but in other pieces he made Correggio his model. He does not so often introduce foreshortenings as the Lombards; and in his outlines and drapery he possesses a finish peculiar to himself. His pencil is powerful, and his coloring lively. Clement XI conferred on him several marks of distinction. His paintings have been engraven by various artists.

CIGNAROLI, chen-ya-ral'e, Giovanni Bettino, Italian painter: b. Salò, near Verona, 1706; d. Verona, 1 Dec. 1770. He worked in the cathedrals of Pisa, Bergamo, Mantua, and in the churches of his native city and of Ferrara. He educated a numerous school at Verona, and received several invitations to visit foreign courts, which he invariably declined. In style he resembled Carlo Maratti, but formed himself on the works of Guido and Coreggio. He was a man of literary culture, and wrote with discrimination and taste on various subjects.

CILIA, sil-l'a (Latin, *eyelashes*), small, generally microscopic, hair-like organs or appendages, averaging from inch in length, found on the surface of the tissues of most animals, and in some vegetable organisms (as algae), chiefly on tissues which in contact with water, or which produce fluid secretions. They are constantly in a state of active movement, and communicate to the fluid with which they are in contact a corresponding motion. This is called vibratile or ciliary motion. In most of the lower aquatic animals the movements of the organ function is aided by means of the vibratile cilia; many animalcules move by a similar mechanism; and in the highest classes of animals cilia have a share in the performance of some important functions.

CILIATA, sil-l'a-ta, a group of Protozoa, and to which belong most of the Infusoria (q.v.). The body is covered with cilia, and it is either free or stalked and attached to submerged plants, etc. The group comprises the most specialized Protozoa, including the trumpet-animalcule (Stentor), and the Vorticellae (Vorticella and Epistylis). In these one-celled animals there is for the first time in the animal kingdom, as we ascend from the simplest organisms, a permanent aperture (cytosome) corresponding to the mouth of higher animals, and an esophagus (cytopharynx), and the undigested or waste portions of the food are cast out at a fixed point or opening (cytopye), usually not detected when not used.

There also in the Stentor, etc., a definite spiral muscle, while netting bodies (trichocyst), like minute rods, in rare cases occur, and are supposed to be defensive in their nature. The ciliate infusoria reproduce by fission, budding and also by conjugation, mingling in the origin of spores or embryos. Certain forms are parasitic; thus the skin disease called eczema has been attributed to the presence of parasitic vorticella, and a flattened oval free form occurs in the large intestines of men ill with diarrhoea.

CILICIA, sī-lis't-ə, in ancient geography the maritime country between Pamphylia on the west and Syria on the east, lying athwart the Taurus Mountain range along the extreme northeastern area of the Mediterranean Sea. The inhabitants of the coasts were formidable as pirates, and even disturbed the Ægean and Ionian seas. The inhabitants of the interior portion lived in part a nomadic life; those in the east were devoted to agriculture. Its capital city was Tarsus. Alexander made Cilicia a Macedonian province after which many Greeks settled there. Later Cilicia, passing to the Syrians. Pompey subdued its piratical inhabitants. The mountainous parts were left in the hands of the native princes; the rest, in 67-66 a.c., was constituted a Roman province, of which Cilicia was proconsular in 55 B.C. It is now a part of the Turkısh vilayet of Adana.

CIMABUE, chĕ-mă-bo'ə, Giovanni, Italian artist: b. Florence 1240; d. there about 1302. Two Greek artists, who were invited to Florence by the Senate to paint a chapel in the church of Santa Maria Novella, were his first masters. Although they taught him the pencil awkwardly, they however taught him, according to ancient tradition, the proportions which the Greek artists had observed in their imitations of the human figure. Attentive to their instructions, Cimabue studied principally the fine antique statues. He was the first to point out to succeeding painters the elements
CIMBRI, kim'bri, a tribe which inhabited Jutland (the Chersonesus Cimbrica), whence they sallied, together with the Teutones, and became among the most formidable of the enemies of Rome. In the year 114 B.C., when the Romans were already masters of a part of the eastern Alps, in the present Carniola, Istria, etc., and had established themselves in Dalmatia and Illyria, along the coast, immense bodies of barbarians suddenly made their appearance, who overcame the consul Papirius Carbo in the country now called Slovenia, but instead of entering Italy they proceeded to the north, and soon after, jointly with the Tigurians, entered the territory of the Allobroges. The Romans sent two armies, commanded by the consuls L. Cassius and M. Aurelius Scaurus, to oppose them, but both were defeated — the former by the Tigurians, the latter by the Cimbri. Even after this success the victors did not enter Italy, but overran Gaul with three bodies, consisting of Teutones, Cimbri and Ambrones. Two new armies, with which the consuls C. Marlius and the proconsul Q. Servilius Cæpio hastened to oppose them, were likewise defeated beyond the Rhodanus. The Romans lost, according to Actius, 80,000 men. While Rome placed her last hope in Marius, the barbarians overran the other western countries of Europe. Gaul suffered severely, but the Iberians and Belgians repulsed the invaders. Upon this they resolved to descend into Italy. The Teutones and Ambrones were to enter on the western side of the Alps, the Cimbri and Tigurians on the east. After Marius had waited the approach of the first during three entire years, and had accustomed his troops to their appearance, he routed them completely (102 B.C.) in two days — on the first day the Ambrones, on the second the Teutones — at Aix in Provence. The Cimbri, on the other hand, who had driven back the consul Catulus on the Adige, and had spread themselves along the Po, demanded land of the Romans, but were totally routed by Marius at Vercellii 101 B.C. About a century after this the Cimbri sent (from the Cimbrian Chersonesus) an embassy to the Roman emperor Augustus, to offer him presents and to ask pardon for what they had previously done against the Romans. The nationality of the Cimbri is a disputed point. Similarity of name led the ancients to identify them with the Cimmerians, but this view is no longer held. Some authorities believe them to have been of Germanic, others of Celtic race. Their name certainly has a great resemblance to that of the Celtic Kymri; and their armor and customs, according to Plutarch and Strabo, were very different from those of the Germans. All these circumstances, y Schmitz, in SAYS 'Dictionary of Greek and Roman Geography,' render it in the highest degree probable that the Cimbri were a Celtic or Gallic and not a Germanic nation.

CIMBRIAN PANIC. The Roman panic after the annihilation of five armies by the Cimbrians 105 B.C. This panic rose to its climax after the terrible defeat of Cæpio, the consul, in Gallia Narbonensis.

CIMEX LECTULARIUS, s'mêks léckt-loor-é-us. See Bedbug.

CIMICIFUGA, si-mi-sîl'-u-ga, from the Latin "to drive away," so named because cer-
CIMMERIAN—CINCINNATI

tain species are used to drive away bugs and other insects. The plant is a genus of the crow-foot family, comprising about 20 species, native to North America, Asia and Europe. The best known American species, because of their medicinal properties, are the bugbane (Cimicifuga americana) (q.v.) and the black snakeroot or black cohosh (C. racemosa), supposed to be an antidote for the venom of serpents.

In medicine cimicifuga is used largely by the eclectics as a digestant, cardiac tonic and uterine stimulant. Its active principles have never been thoroughly determined and little is known of its physiological action as determined by exact pharmacological experiment.

CIMMERIAN, si-mēr-ē-ān, BOSPORUS, an ancient name for the Strait of Kaffa.

CIMMERIANS, a tribe half-mythical, half-historical, described first in the Odyssey as dwelling beyond the ocean-stream, in thickest gloom, visited by Helios. Hence the term, "Cimmerian gloom." From Herodotus we learn that they originally inhabited the country between the Bosphoros and the Tanais, but expelled by the Scythians, they traveled along the shores of the Euxine, passed through Colchis and over the Hylas, and entered Asia to the west of that river. Against this it is urged that the route by the Euxine would be impassable for a nomadic people, the Caucasus running down to the very shores of that sea. The sum of our certain knowledge respecting these people is, that they seem to have been the chief occupants of the Tauric Chersonesus (the Crimea), where they had a large city, near which were fortifications enclosing the isthmus by an earthen wall.

CIMOLIAN, si-mōl-ē-ān, EARTH, or CIMOLITE, si-mōl-ē-it or kim-bō-lit (from Kimolos, one of the Cyclades, in the Ægean Sea, where it is still to be found), a hydrated silicate of aluminum, apparently formed by the decomposition of augite. It is of a light color, compact and somewhat spongy. Water soon splits it up; when ground with water it forms a thick cream. In classical times it was used as a soap for cleaning delicate fabrics, and by the bathkeepers. It is mentioned by Aristophanes in this connection. It is used in the island as a detergent.

CIMON, ki-mōn, Athenian general and statesman: b. about 502 B.C.; d. Citium, Cyprus, 449 B.C. He was a son of the great Miltiades. He fought against the Persians in the battle of Salamis 480 B.C., and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke. The return of Aristides to Athens soon after left Cimon at the head of the whole naval force of Greece. He conquered the pirate island of Scyros, subdued all the cities on the coast of Asia Minor, pursued the Persian fleet up the Euphrates, destroyed more than 200 of their ships, and then, having landed, on the same day entirely defeated their army 469 B.C. He employed the spoil of Scyros, and the revenues from the embellishment of Athens, and in 463 reduced the revolted Thasians; but the popular leaders, beginning to fear his power, charged him on his return with having been corrupted by the king of Macedon. The charge was dropped, but when Cimon's policy of friendship to the Lacedaemonians ended in the latter inflicting the troops sent by Athens to their aid, his opponents secured his banishment. He retired into Bactria, and his request to be allowed to fight with the Athenians against the Lacedaemonians in 457 at Tanagra was refused. Eventually Cimon was recalled at the instance of Pericles to conclude a peace with Lacedaemon. He died while besieging Citium in Cyprus. His 'Life' was written by Cornelius Nepos.

CINAPUSEN, sē-nā-pōō-sān, or CINA-
PURAN ISLANDS, a cluster of 10 islands of the Tawi group, Sulu Archipelago, lying south-west of the island of Sulu; area, 13 square miles. The islands are covered with tropical vegetation, and are mostly resorted to for fishing by natives of neighboring islands. Tabawan, the largest of the cluster, is, however, thickly populated; the inhabitants carry on a considerable pearl fishery. They were for a long time notorious pirates, but since the destruction of their settlements by a Spanish fleet, have been harmless and inoffensive. The islands now belong to the United States and are a part of the military department of Mindanao.

CINCHONA, sin-kō'nā, BARK, the bark of several species of Cinchona, a genus of trees and shrubs of the family Rubiaceae. The following are the most important: Cinchona flava cortex, yellow cinchona bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flake cinnamon-colored pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from C. calisaya, which grows in the peculiar cloudy regions of the Andes. C. pallida cortex, pale cinchona bark, from C. officinalis. It occurs always in quills covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchincine. To hundred grains of the bark yield about one grain of alkaloid. C. succirubra, a native of Peru, appears to thrive in India. The bark occurs in flattened rough-fibrous, dark-brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than one and one-half grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion and tincture. The pale bark is contained in tincture cinchona composta and in mixtura ferri aromatic. The cinchona barks contain, besides the alkaloids, certain acids having astrignent properties, and are valuable as tonics in cases of great debility. Cinchona barks rich in quinine generally contain much tannin, and their solutions are precipitated by sodium sulphate. See QUININE.

CINCINNATI, Ohio, city and county-seat of Hamilton County, in the extreme southwest of the State, one of the great commercial and manufacturing cities of the Union, 10th in nominal rank and 7th or 8th in fact. It is situated on the north bank of the Ohio River, almost exactly half way from its origin at Pittsburgh to its mouth at Cairo, Ill., about 465 miles by water from each, and 315 miles by rail from the former and 360 miles from the
CINCINNATI

latter, and is a terminal of every trunk line of railroad in the Middle West, being the main terminal of the Cincinnati Southern, Cincinnati, Hamilton and Dayton, Ohio River, and Ohio and a number of others. It is 138 miles by water from Louisville and 1,631 miles from New Orleans against 114 miles and 1,210 miles respectively by rail; 764 miles by rail from New York and the public lots.

Topography.—Cincinnati occupies the northern half of a circular amphitheatre of hills about two and a half miles in diameter bisected east and west by the Ohio River—which here makes a great southward sweep. The southern half is bisected north and south by the Licking River with its Kentucky suburbs, respectable cities themselves. The northern semi-circle rises from the river in two great terraces sloping northward to a third level at the summit, originally quite distinct, now much confused by grading. The lower platform is a bluff about 65 feet above low water, the second 50 to 100 feet higher. The crest hills, 15 to 300 feet higher yet, are about 475 feet east and west, from Smale, Queen City, Mt. Adams, Mount Adams, Mount Lookout, Mount Auburn, Fairview Heights, etc.—giving a noble prospect of river and country. Three of these hills can be reached by inclined plane cable railways, used in the main for lifting of electrical cars. These rails are cut by ravines, the heavy original woods having been replaced by miles of the finest residence streets in America, parked with shrubbery, lawns and flower gardens. On the western side of the city from north to south runs Mill Creek, the remains of a once huge glacial stream whose gently sloping valley, one-half mile or more wide, forms an easy path into the heart of the city and was an indispensable factor in determining its position. Highways, canals and railroads come through it and the city's growth has pushed much farther up this valley than in other directions. The railroad stockyards are on its eastern slope. Cincinnati extends for about 30 miles along the river from a washout of about 15 miles to an irregular block north from it. The total area thus far in the city limits is 72 square miles, much more being legitimately a part of it. Cincinnati owns a strip of land 100 feet wide and 335 miles long directly south to Chattaroy, Tenn., upon which is built the city-owned Cincinnati Southern Railroad.

Municipal Conditions.—The site of the city is a glacial moraine of gravel and boulders cut through by the Ohio River. There is therefore little bottom land and there has been from the first none of the malaria which was long such a scourge and reproach to Western settlements; and this with the moderate climate averaging about 75 degrees in summer and 30 or 40 in winter and a rainfall of about 20 inches the slopes into the Ohio and away from the city has given it excellent sanitary conditions. Its death rate fell from 21 per 1,000 in 1890, to 15.6 per 1,000 in 1915. The city owns its waterworks and 712 miles of mains. In recent years the city's waterworks at a cost of $12,000,000, including a complete magnificent filtration plant which furnishes the city with 282,000,000 gallons of pure water daily. This water is so pure that it is used for hospital purposes except where distilled water is distinctly specified. Cincinnat

nati has 906 miles of streets and alleys (608 miles improved); and 463.6 miles of sewers. It owns property worth $126,000,000, and has an assessed property of $70,000,000.

Interior, Suburbs, etc.—The bottom level below the bluffs, along the river seat, is the site of the river shipping business, and has the usual fringe of low quarters. It is paved and there is a broad public landing fronted by floating docks, wharf boats, etc. Above are the wholesale and then the retail business streets with great extent and variety of fine business architecture and girt around with electric roads of which there are some 227 miles within the city limits. The principal lines converge at or near Fountain Square and connect with a ring of suburbs within and without the city limits, unsurpassed in America. To the north are Clifton, Avondale, Mount Auburn, Vernonville, College Hill, Winton Place, Linwood, Elmwood, Hartwell, Lockland, Glendale, Norwood, Oakley, Walnut Hills, Mount Lookout, etc. Across the river, over which are three bridges the electric lines run are numerous cities and towns, including Lebanon to Ludlow and Milldale to the west of the Licking, and Newport, Bellevue, Dayton and Fort Thomas to the east. These are in the State of Kentucky, but are included in Cincinnati's metropolitan district. The river is crossed by five bridges, each more than half a mile long, one exclusively for railway traffic, two for highway and two for both. The truss-bridge of the Cincinnati Southern to Ludlow costing $3,346,975, is one of the longest spans in the world; there are also the cantilever designed by John A. Roebling completed at a cost of $1,800,000; and two wrought iron bridges to Newport, one of them used by the Louisville and Nashville Railroad.

The original town was laid out as a checkerboard, with streets four rods wide, the conventional form of the artificial American town; but the irregular surface and individual tastes have given them greater variety since, and no city has a finer field for picturesque architecture. A local freestone and limestone are much used in building as well as brick and steel framing. The most notable public buildings besides churches noted below are the government building (post-office, custom-house, etc.), of brick and iron with freestone facing, 180 feet by 50 feet, costing $700,000; the new county courthouse, costing $2,500,000, erected in 1916; the Cincinnati General Hospital, a group of 29 buildings, costing $4,000,000; the magnificent Music Hall, the gift of Reuben R. Springer and others; the Romanesque public library, costing $675,000; the Masonic Temple (Byzantine); The Odd Fellows' Temple; the Y. M. C. A. building, the Art Museum, the Queen City Club, Bell Telephone building, the Union Central Life building, the tallest since building outside of New York city, and a number of skyscrapers of from 15 to 20 stories, one of which, the Ingalls building, was the first tall concrete structure in the world. Of public monuments, the most artistic is the Tyler Davidson Fountain, with a surrounding filigree, costing $200,000; the sculpture between Vine and Walnut on Fountain square, the centre of most of the street car lines. It was presented to the city by Henry Probasco in 1871, having been cast at the Royal Foundry at Munich at a cost of $250,000. The equestrian statue of President William Henry Harrison

Business Interests.—The position of Cincinnati as a midway point on the great central channel of commerce, and in the most fertile section of the world, added to its location on a platform above the floods which washed away its rivals, was the origin of its greatness; but that river traffic has greatly declined since the advent of railroads. Even so, however, it is invaluable for the transportation of bulky freight—coal, ore, iron, lumber, salt, etc.—to manufactories and the distribution of its products to the Ohio and Mississippi ports as far as New Orleans, up the Ohio to Pittsburgh, to the Big Sandy, Cumberland, Tennessee and Green, Red, White, Arkansas, Yazoo, etc., covering 1,200 miles of the Ohio, 850 of the Mississippi, and 2,000 of tributaries. About 100 vessels a year register for this inland commerce, with a tonnage of some 8,000; but there is a much greater commerce than this indicates, as one towboat will push many barges in front of it, a method peculiar to Western rivers. The government improvements, dredging and lighting the channel, have given it an almost insatiable demand. The immense railroad business has already been referred to. Seventeen roads enter Cincinnati; the passengers of most of them come into the Central Union Depot at Central avenue and Third street; but a few, of which the Pennsylvania is chief, have separate buildings. The Cincinnati Southern road, 338 miles long, was built and is still owned by the city, and is operated by the Southern Railway Company, under lease. The business interests of the community revolve around the Cincinnati Chamber of Commerce, an organization of business and professional men, totaling 4,000, which conducts by means of a large income a thoroughly departmentalized organization, the principal departments of which are devoted to conventions and publicity, weighing and inspection, statistics, grain and hay, exchange, produce exchange, civic and industrial work, traffic, merchandising and foreign trade.

The trade and manufacturing interests of the city are large and important. It has many national banks, clearings aggregating $2,030,181,819 in 1917. It has also a large number of State and private banks, building and loan associations, many strong trust companies and savings and loan associations. The packing of meats, especially pork, has been long and is still one of the leading branches of commerce, the city packing more than one-half of the produce of the State. Cincinnati holds the first position in the country in the manufacture and sale, both domestic and foreign, of machine and machinery. The number of industrial establishments is about 4,000, with a capital of about $212,500,000, and 100,000 workmen, and occupying real estate valued at $100,000,000, with an annual factory output of nearly $300,000,000. According to the last census the greatest single branch is iron work, including pig, castings, foundry and machine shop products and architectural iron work; men's clothing, slaughtering and packing of meats, distilled liquors, factory made and homemade wines, and fruit and nut products. The material, tobacco products and malt liquors. Other great products are leather and leather goods, furniture, lumber, timber and woodworking products; coffee and spices, roasted and ground; saddles and harness; pickles and preserves; undertakers' goods;
CINCINNATI

Fountain Square: Tyler-Davidson Fountain
University of Cincinnati Buildings
musical instruments; soap and candles; electrical supplies; flour and grit; plumbers' supplies; patent medicines; and society regalia, containing items for 10 day ele. Cincinnati heads the United States. Other products number hundreds, many curious and interesting, notably those of the Rookwood Pottery.

Educational Institutions, Libraries, Newspapers, etc.—Cincinnati has a thorough system of public instruction, with 59 day elementary, 6 public high schools and about 1,725 teachers; besides private academies and secondary schools including 51 Catholic parochial schools. For higher education the chief is the University of Cincinnati, the only municipal university in the United States, operated as part of the public school system, expanded from the old McMicken University, the capstone of the system of public instruction, with affiliated medical, and dental and law departments, and in connection the famous observatory now located on Mount Lookout — one of the earliest in the United States, with a 16-inch refractor and a new meridian circle, and with a notable record in the investigation of double stars. University buildings are on a 30-acre space set off by the city in Burnet Woods Park. The Ohio Mechanics' Institute, one of the most important educational forces in the city, has a large, thoroughly equipped building and library, and maintains both daily and night schools, attended by hundreds, in which regular classical, literary and scientific instruction and courses of lectures are given. There are also medical and surgical schools, besides training schools for nurses in the hospitals; two other dental colleges; a night law school; several business colleges and schools of expression; Lane Theological Seminary at Walnut Hills (1832) famous for Lyman Beecher and Calvin E. Stowe, and for its slavery dissensions, two Roman Catholic colleges, Saint Francis Xavier (1840) and Saint Joseph's (1873); five Catholic seminaries for the education of priests and six Catholic female academies and seminaries, leading to others, the Hebrew Union College (Reformed Jewish) for educating rabbis, in the United States; the Art Museum and Art School founded by Cincinnati ladies on the model of South Kensington, London, with two large buildings and several hundred students, and a valuable collection of works of art. The Cincinnati Society of Natural History has a museum of valuable and interesting relics open to the public. Of the libraries, the chief is the free Public Library, handsomely housed on Vine street (with over 400,000 volumes and pamphlets) and 23 branches and 26 stations. There are 16 others, subscription and institutional, of which the chief are the Young Men's Mercantile, the Law Library, that of the Mechanics' Institute, the library of Saint Xavier's College, Lloyd Library and Museum, the University Library, and the Historical and Scientific Society. Cincinnati collection in existence of original manuscripts, pamphlets and bound volumes pertaining to the history of Cincinnati and the State of Ohio, and ranks among the first institutions of the kind in the country. The city supports some 20 daily newspapers — English, German and Italian; over 80 weeklies, English and German; over 100 monthlies and quarterlies, besides a number of special publications.

Churches and Charities—Cincinnati has about 270 church bodies in 56 Roman Catholic (besides 5 convents), 219 Protestant of various denominations, 12 Jewish synagogues and 38 unclassified, including Christian Science, Spiritualist, etc. The city is the seat of a Roman Catholic archbishop and a Protestant bishop, with cathedrals of both. The finest church building in Cincinnati is the cathedral of Saint Peter in pure Greek style, 180 feet by 60 and 90, with a spire 224 feet high, and its priceless altar-piece Murillo's original "St. Peter Delivered." Other prominent churches are the First Presbyterian, with a tower and spire 285 feet high, the loftiest in the West; the Second Presbyterian; Saint Francis Xavier and the Saint Francis de Sales (Roman Catholic), Christ's and Saint Paul's Protestant Episcopal and Saint Paul's Methodist Episcopal, the Ninth Street Baptist, Unitarian, New Thought Temple and the church of the New Jerusalem (Swedenborgian). There are 61 benevolent associations in the city covering every class and grade of alleviable human misfortune, and an infirmary, a workhouse, with workshops and workrooms. Prominent among 17 hospitals, public and private, are the Cincinnati General, Jewish, Good Samaritan, Longview Insane Asylum, Bethesda, Ohio Hospital for Women and Children, the Presbyterian, Elizabeth Gamble, Deaconess Home, Christ, and the Branch Hospital (the first tuberculosis hospital established in America for the scientific treatment of tubercuicular subjects). There are also numerous homes for the aged and infirm, for orphans, for incurables and the friendless, non-sectarian and denominational, all splendidly equipped, and a fresh air fund and farm.

Government, Finances, etc.—The government is a modified federal form, there is a four-year mayor, who appoints directors of public service and safety, a legislative council of one from each ward with four elected at large and a board of education elected by the people. The city debt is about $55,000,000, but $27,000,000 of this is for the Cincinnati Southern Railroad which returns $1,000,000 per year rental. The tax rate is $13.40 per thousand dollars. The yearly disbursements are about $14,457,725, of which over $2,500,000 is for schools.

Population.—In 1800, 750; (1810) 2,540; (1820) 9,642; (1830) 24,831; (1840) 42,338; (1850) 115,435; (1860) 161,044; (1870) 216,239; (1880) 253,139; (1890) 296,908; (1900) 325,902; (1910) 363,591; (1914) 402,000. The census bureau estimate for 1915 was 406,706. This is inaccurate, however, without supplemental figures based on the population of the city with nearly one-third of its business population residing across the river in another State, as well as several populous suburbs in other towns to the north, Newport, Bellevue and Dayton, Ky., east of the Licking, Covington and Ludlow, west of it, Millcreek, Columbia and Delhi and Norwood on the north adding about 200,000 to the population above stated. About 79 per cent of Cincinnati people are native white Americans, a greater proportion than any other large city in the United States. The foreign-born population is 15.6 per cent of the total. Male aliens over 21 years of age form only 2.6 per cent of the population. Negro
population is but 5.4 per cent of the total; 78 per cent of the foreign-born population is made up of Russians, Italians, and Hungarians. 10.3 per cent of the foreign-born population is made up of Russians, Italians, and Hungarians.

History.—The site of Cincinnati at the time it first came under the eye of the white man was surrounded with "works," monuments of a prehistoric race. Traces of many of these "works" are still abroad in the neighborhood, which is a centre of the so-called "Mound Builders." It was in pursuing one of these bands of "Horse Thieves" that Benjamin Stites first noticed the fertility of the section and its desirability for settlement. As a result of his efforts came the Miami Purchase. Symmes, with other members of Congress who had been interested in Stites, in 1787 began negotiations with the government for the land lying between the Miami and the Licking River. This purchase covered 90,000 acres, some 600,000 ares, which he ultimately received about half. Early in 1788 he sold 740 acres opposite the mouth of the Licking to Matthias Benman and others, with whom he visited the spot later and selected it as the site for a city, to be called Losantiville, a combination of Latin and French, meaning "Town opposite the mouth of the Licking." After some shifting of ownership a firm consisting of Israel Ludlow, a surveyor, and two others took possession 28 Dec. 1788, and Ludlow laid out a village with the present Central avenue and Broadway, about three-quarters of a mile apart, for east and west boundaries, and Seventh street, about as far from the river, for northern, blazing the street lines on the trees. Ten or four log cabins were built, and the flooding out of several Ohio River town sites about this time left Cincinnati the chief survivor. The building of Fort Washington by the government in the summer of 1789, just east of Broadway, still further confirmed its primacy, for the Indian was a terrible menace until long after. In January 1790 Gen. Arthur St. Clair, newly-appointed governor of Northwest Territory, arrived, laid out Hamilton County (named after Alexander Hamilton), and made its seat the new town, whose name he changed to Cincinnati (Symmes who professes to have suggested the change, was tenacious for Cincinnati), after the famous society of Revolutionary officers, of which he was a member. By the end of 1790 it had some 40 log houses. The defeats of Harmar (1790) and St. Clair (1791) nearly caused its abandonment in a panic, but the importance of the fort kept the settlement alive. In 1792 as many as 354 lots had been sold. In 1793 the Ohio school (pay) opened with 30 scholars, perhaps some of this language was "common form." Also as settlers were compelled by law to take their loaded guns to church for protection against Indians, it was not until 1793 that the church was built. In 1793, the Sentinel of the Northwest Territory, the first newspaper published north of the Ohio, appeared, and a year later the first through mail to Pittsburgh was started in a canoe, and a packet line of keel boats to Pittsburgh was organized. Wayne's crushing defeat of the savages at Fallen Timbers, bringing peace to the frontier, was in one sense disastrous to Fort Washington, as settlers swarmed all over Ohio, and it ceased to be the one centre. This defeat, however, assured the permanency of Cincinnati, which increased slowly but surely until in 1800 its population was 750, a growth of 50 per cent since 1795. In December 1801 the seat of territorial government was removed to Chillicothe, Ohio, but its 12 years of improvement and postal service as the valley post making it a depot for supplies, and its frontier position, had given it a safe start. In 1802 Cincinnati was incorporated as a town. A well-known picture of the town also dates from this year, as it had 600 inhabitants. The Ladies' School was started, indicating a superior grade of population, and from February to May 1802 over 4,400 barrels of flour were exported, showing its development as a distributing port. The first bank, that of the Miami Exporting Company, was started in 1803. In 1805 the town had 900 people and 172 buildings. But immigration set in much more strongly a year later, and the names show an extraordinary intellectual calibre, in the settlers it was attracting. In 1810 it had 2,300 inhabitants, and was the largest town in the State, the centre of immigration to Ohio, and with a great commerce along the river, and was contemplating a university. The first book descriptive of the place appeared this year written by the celebrated Dr. Drake. In October 1811 the steamboat New Orleans passed the town on her first trip from Pittsburgh to Louisville. A stone steam mill 110 feet high of nine stories and with foundation walls 10 feet thick dates from 1812. In 1814 Lancaster Academy, afterward Cincinnati College, was founded. In 1819 the town received a city charter, having according to the first directory, published this year, 9,873 inhabitants, mostly from the Northern and Middle States, but also many foreigners, so that it was "not uncommon to hear three or four languages spoken in the streets." Another little book descriptive of the city published in 1826 was republished in England and translated into German, circulated on the Continent and attracted a large number of immigrants, especially Germans, who by 1840 numbered one-fourth of the population. But its great development came with the opening of the Miami Canal, the most important single influence in the history and success of the city, for it was broken in 1825 at Middletown, and which was completed to Cincinnati in 1827. This not only developed commerce but furnished great water power for manufacturing. The first railroad, the Little Miami, was finished in 1835, and the new one in 1856, but it was not completed until 1846, the first steam, not until 1843. Even before this the growth was very rapid, nearly trebling 1820-30,
CINCINNATI

and doubling 1830-40, but the next decade showed the tremendous leap from 46,000 to 115,000. From 1840 the immense immigration of German led the city to make it for years the typical German city. The Germans took great interest in grape culture and the city for some years was a great wine market. It was the great German population that caused the first Saengerfest of the North American Saengerbund to be held here in 1849, a great stimulus to the musical activity of the city since so famed in the musical world. Several times the city was fearfully ravaged by the cholera, beginning with 1832-34; in 1849 and 1850 over 9,000 souls, nearly 8 per cent of the entire population, perished of it. Yellow fever came in 1878. Floods have also risen over its platform several times and laid the lower section under water; those of 1832 (the year of flood, fire, pestilence and famine), of 1883, 1884, having been especially high and destructive. In 1838 the new and beautiful steamer Moselle exploded in front of the landing with a loss of almost 140 lives, one of the worst ships which hit the city. Two years later the city was the centre of the log cabin campaign, which sent a favorite son, William Henry Harrison, to the White House. At a later time Haynes, whose previous active life had been spent in this city, occupied the presidential position, and Salmon P. Chase, another famous Cincinnatian, was chief justice of the United States. A continuous excitement of the city was its fury over the race question as of late, the chief movement. The vast Northern interest in Southern trade was everywhere a powerful restraining influence on this; but Cincinnati, on the border, and with its daily bread dependent on this trade, besides having a considerable percentage of its people of Southern birth and detesting the movement on general principles, felt menaced with entire industrial ruin, if the agitation were not put down by force. Lane Seminary was threatened with fire, and its faculty with lynching, if the students were not prohibited from discussing slavery; and in 1836 and 1841 James G. Birney's philanthropist press was wrecked by the mob. But anti negro riots were frequent and arose upon the slightest provocation. The later aggravated by the fact that Cincinnati, being a border city, was a chief station on the underground railroad; one Quaker citizen boasted of aiding 3,000 fugitive slaves to escape, and in all several times that number must have been smuggled across. Here, too, were tried the celebrated fugitive slave cases, the Rosetta and Margaret Garner cases. In 1856 Buchanan was nominated for the presidency; later nominees of Cincinnati conventions were Gleeley, in 1872, Hayes, in 1876, and Hancock, in 1890. When the war broke out, however, it became a strong Union city, and its record is noble. In 1862 the fear of an assault by the Confederates, Kirby Smith, caused the city to be put under martial law for a while; a somewhat similar act at the time of the John Morgan raid. Another war incident was the Vallandingham case. Cincinnati sent its citizen, George B. McClellan, to command the armies of the North. The decade prior to the war had not been one of great prosperity, but in spite of the war trade with the South, the city leaped forward with the resumption of peace. The desire to renew the relations with its old business associates induced it to enter upon the construction of the Cincinnati Southern Railway to Chattanooga, which was built by the city itself, an extremely instance of municipal ownership. The celebrated Bible case in 1869 resulted in the abolition of religious instruction from the public schools and gave national fame to war that included such lawyers as those who argued the case. In 1869 began a series of annexations, which in a few years increased the city's area from 7 square miles (3 miles when incorporated in 1819) to 24 square miles. Annexations in 1895 and 1903-04, 1912-13-14 and 1915 brought the area to 72 square miles. The most notorious event in its later history is the Cincinnati Riot of 28-31 March 1884. As usual in modern times, the law had protected the criminal against the community till the criminal law was felt to be a farce; some murderers had received absurdly light sentences, and the patience of the lower orders gave way; they attempted to break into the jail and lynch the prisoners; foiled in the courthouse, and burned it, as well as its records and other buildings adjoining; the State militia had to be called in, and in the fray that ensued 45 persons were killed and 145 wounded. In 1888 the centenary of the settlement of the State and city was celebrated by a Centennial Exposition of the Ohio Valley, the culmination of a series of industrial expositions that had attracted the attention of the country and given a director-general to the Centennial at Philadelphia in 1876.

THOMAS QUINLAN,
Cincinnati Chamber of Commerce.

CINCINNATI, Society of the (as having left the plow, like Cincinnati, for their country's service, and returning to it when the need was over), a memorial society, organized by the officers of the American Revolutionary army, 13 May 1783, just before their final dispersion, from the camp on the Hudson near Fishkill. The first meeting was in the Verplanck House, Steuben's headquarters. A society was organized for each State, besides the general society of which Washington was elected president. Membership was confined to officers of the Continental army who had served with honor three years, or been honorably discharged for disability, whether or foreign, and to their direct male descendants in order of birth, through females in default of males, and then to collateral if judged acceptable to the Society. Partly as including several European nobles (Lafayette, Stouven, etc.), this was considered the beginning of an aristo-
CRITIC ORDER ON EUROPEAN MODELS, OBNOXIOUS TO POPULAR LIBERTIES. OF COURSE IT COULD ONLY BECOME SUCH BY AVOWEMENT RECOGNITION, BUT THE PRINCIPLE OF HEREDITY IS PER SE UN-AMERICAN. WITH MORE SHOW OF REASON, IT WAS REGARDED AS A MILITARY CONSPIRACY TO APPROPRIATE ALL THE OFFICES UNDER THE NEW GOVERNMENT; A SIGN THAT THE OFFICERS DID NOT INTEND TO BE CINCIUMATUSES IF THEY COULD HELP IT. IT WAS REGARDED BY HIGH AND LOW AS A GRAVE PUBLIC DANGER; AND ALL THE REVOLUTIONARY CHIEFS WHO HAD NOT BEEN IN THE ARMY, AND WERE INELEGIBLE, FRANKLIN, ADAMS, JEFFERSON, ETC.—DISTRUSTED ITS POSSIBILITIES IF NOT ITS MOTIVES. THE LEGISLATURES OF MASSACHUSETTS, RHODE ISLAND AND PENNSYLVANIA ADOPTED RESOLUTIONS CENSURING IT AS DANGEROUS TO THE LIBERTY AND SAFETY OF THE COUNTRY; THE GOVERNOR OF SOUTH CAROLINA DENOUNCED IT IN HIS MESSAGE TO THE LEGISLATURE; AND THE IRISH CHIEF JUSTICE OF THE SAME STATE, EDANUS BURKE, WROTE A PAMPHLET, SIGNED "CAESIUS," PROVING THAT IT WOULD SUBVERT EVERYTHING GAINED BY THE REVOLUTION. THIS PAMPHLET WAS TRANSLATED INTO FRENCH, AND USED BY MIRABEAU TWENTY YEARS LATER. AT THE FIRST GENERAL MEETING, 7 MAY 1784, WASHINGTON PERSUADED THEM, IN VIEW OF THIS PUBLIC EXCITEMENT, TO ABOLISH THIS HEREDITARY FEATURE. THIS, HOWEVER, DID NOT WHOLLY CONSOLIDATE POPULAR FEELING; AND IN 1789 THE TAMMANY SOCIETY WAS FOUNDED IN NEW YORK IN AVOWED OPPOSITION, AS A BODY WHERE TRUE EQUALITY SHOULD GOVERN AND PRIVATE ADVANTAGE SHOULD NOT PREVAIL OVER DISINTERESTED PUBLIC SPIRIT.

IN 1787 WASHINGTON WAS ELECTED PRESIDENT-GENERAL, AND RE-ELECTED TILL HIS DEATH; AND HAMILTON SUCCEEDED HIM. MOST OF THE STATE SOCIETIES SOON DIED, AND THE GENERAL SOCIETY LANQUISHED. WHEN LAFAYETTE VISITED THIS COUNTRY IN 1824 HE WAS THE ONLY SURVIVING MAJOR-GENERAL. THE OLD HERO'S REAPPAREANCE GALVANIZED IT INTO NEW LIFE FOR A SHORT TIME, BUT IT SANK OUT OF SIGHT AGAIN, AND FOR MANY YEARS WAS VIRTUALLY DEAD, ITS CHIEF FUNCTION BEING AN ANNUAL DINNER IN NEW YORK. EVEN A NOMINAL ORGANIZATION WAS RETAINED ONLY IN THREE OR FOUR STATES. THE LAST SURVIVOR OF THE ORIGINAL ASSOCIATION WAS ROBERT BURNET OF NEW YORK, WHO DIED IN 1854. IN 1893 THE GENERAL SOCIETY BEGAN A SUCCESSFUL EFFORT TO INDUCE THE STATES TO REVIVE OR RE-FORM THEIR BRANCHES, AND CONNECTICUT FIRST (1874) AND CALIFORNIA LAST (1902) FILL UP THE ROLL OF THE 13. SOME OF THEM ISSUE PUBLICATIONS.

THE PRESIDENT-GENERAIS OF THE SOCIETY HAVE BEEN GEORGE WASHINGTON, ALEXANDER HAMILTON, CHARLES COTESWORTH PINCKNEY, THOMAS PINCKNEY, AARON OGDEN, MORGAN LEWIS, WILLIAM POPTHAM, H. A. E. DASH, HAMILTON FISH, WILLIAM WAYNE AND WINSLOW WARREN.

THE EMBLEM OF THE SOCIETY, ADOPTED AT THE OUTSET, WAS A BALD EAGLE SUSPENDED BY A DARK-BLUE RIBBON WITH WHITE BORDERS, SYMBOLIZING THE UNITY OF THE NATIONS. ON THE EAGLE'S BREAST IS CINCIUMATUS RECEIVING A SWORD AND OTHER MILITARY INSIGNIA FROM THE SENATE; IN THE BACKGROUND, HIS WIFE STANDS AT THE DOOR OF THEIR COTTAGE, WITH THE PLOW AND OTHER AGRICULTURAL IMPLEMENTS NEAR; ROUND THE WHOLE ARE THE WORDS "CAESARIS DEMID" ("HE LEFT ALL TO SERVE THE COMMONWEALTH"). ON THE REVERSE, FAME IS CROWNING CINCIUMATUS WITH A WREATH, INSCRIBED "VIRTUTIS PRIMUM; IN THE BACKGROUND IS A SEAPORT CITY WITH GATES OPENED AND VESSELS ENTERING; BELOW ARE JOINTED HANDS SUPPORTING A HEART INSCRIBED "ESTO PE-

PETUA ("BE THOU PERPETUAL"). THE LIVING HEREDITY MEMBERS NUMBER ABOUT 980.

CINCINNATI ANTICLINE. IN THE PERIOD OF DISTURBANCE WHICH MARKED THE CLOSE OF ORDOVICIAN TIME IN NORTH AMERICA, THE LIMESTONES DEPOSITED DURING THE TRENTON EPOCH IN
the interior sea that covered most of what is now the Mississippi Valley were forced up, on a line running through southern Ohio, Kentucky and Tennessee, in a low, broad arch. This arch is called the Cincinnati Anticline. It has been of much economic importance from its having contained great reservoirs of petroleum and natural gas, the latter now approaching exhaustion. See Ordovician System; Trenton Stage.

CINCINNATI ZOOLOGICAL GARDENS, located in Cincinnati, Ohio, by Mr. Andrew Erkenbrecher, were opened to the public 18 Sept. 1875. There existed in the city a society of acclimatization, and it was at a meeting of this body, 30 June 1873, that the matter of instituting a zoological park was first agitated, followed by the formation of an influential stock company. The gardens embrace 60 acres of ground diversified with valleys and undulating plains, covered with verdure and tree growth, about three miles from Fountain Square, the city centre, in a group of picturesque hills in a charming suburb. The collection of animals averages over 500 mammals, 1,200 birds and 125 reptiles, including fine specimens of lion, buffalo, polar bear, giraffe, zebu, elephant, python and alligator. The condition of the collection, the attractive buildings, the fine structures of pleasing designs erected in iron and stone, the exceptional beauty and taste of the landscape gardening, the general arrangement of the grounds, the care displayed and success achieved with the animals and birds, rank this institution as second to none. Under good management it has become a self-sustaining as well as an excellent paying proposition without any detriment to its valuable educational advantages.

CINCIINNATUS, Lucius Quinctius, a patrician belonging to the earliest period of the Roman republic: b. about 519 B.C. The legend which makes him the beau-ideal of the virtuous Roman is as follows: The Romans of his day were weakened by dissensions between the patricians and plebeians; the warlike Equians, after making harassing incursions into their territory, succeeded at last in surrounding the Roman army under the consul Minucius in the wooded grounds of Mount Algidus. In despair the Roman soldiers went to Cincinnatus, offering him the dictatorship. The messengers found him at the plow. Reluctantly he accepted the office. He succeeded in rescuing the army from its perilous position, and marched to Rome laden with the spoils of victory. He then returned to his farm, whence he was again called, at the age of 80, to resume the dictatorship, to oppose the machinations of Spurius Mælius, and prevent a civil war between the upper and lower classes, which he succeeded in doing.

CINEMATOGRAPH, kën'ë-mät'o-gräf (Gr. kinein, *movement*; from kinein, to move*), an ingenious instrument introduced about 1885 by two brothers Lumière of Lyons, and founded on the same principle as Edison's kinetoscope— the persistence of vision. The characteristic part of the instrument is a sensitive plate or film or band about an inch and a quarter broad and from 50 feet long upwards, and which is exposed in a cinematograph camera. In this instrument the bands pass from the drum on which it is wound around a series of compensating drums into position behind the camera lens. This lens is equipped with a shutter which opens 16 times in one second, remaining open usually about one one-hundredth of a second, although this time must be much regulated for quick movement like that of a trotting horse. During the time when the shutter is closed the film is pulled forward three-fourths of an inch, presenting a new surface for the succeeding exposure. The entire mechanism is worked by turning a crank-handle at the uniform rate of two turns per second. After exposure the film is developed by the tank method and wound for drying upon a large drum. In order to produce positives from these negatives a second sensitive film is exposed beneath it in a suitable apparatus and duly developed. If desired the positive may be conventionally colored by hand; the pictures are too small to be colored in detail. The cinematograph proper is a projecting lantern arranged to show the film pictures in rapid succession enlarged upon a screen. Besides the customary combination of the brilliant light and lenses which constitute a projecting lantern, the cinematograph is characterized by a delicately adjusted apparatus for advancing the film picture by picture in jerky fashion past the aperture behind the lenses at the rate of 16 per second, and a shutter which opens when the film is stationary and closes while it is moved onward. The periods while the shutter is closed are so brief that the eye fails to note it, the previous picture persisting upon the retina of the eye until the next picture appears on the screen. Upon the skill with which this delicate mechanism is regulated depends the steadiness, or freedom from flicker, of the view on the screen. Unfortunately the lenses which condense or concentrate the light used for projecting also condense the heat rays, and the film being of celluloid is quickly ignited if the winding reels pause when the shutter is open. Four or five seconds exposure to the concentrated rays is enough to start a conflagration, often with the most serious consequences. Recently several effective automatic fire prevention devices have been introduced and the newer cinematographs have this very necessary protection.

The moving mechanism for the film is operated generally by hand, as with the cinematograph camera, but in some machines a small electric motor is attached. However, the hand mechanism is much to be preferred if an expert operator is to be had, as he can gauge the speed by the actual effect on the screen and thus compensate for any deviations in the speed with which the original film was made.

The average length of the commercial exhibition cinematograph film is from 600 to 1,000 feet, requiring from 10 to 16 minutes for its presentation on the screen. Some extended subjects occupy three reels, or 3,000 feet, and require 50 minutes for a presentation. It is necessary to the smooth production of the motion picture on the screen that the individual pictures appear at the rate of 16 per second. It is not necessary, however, that the negative should have been taken at the same rate. For instance, very interesting pictures showing the growth and blossoming of a plant have been produced by making the exposures at intervals longer or shorter—an hour, or even a day between. The film thus obtained in a
CINERARIA — CINNAMON

period stretching over months is shown in a
few minutes on the screen, and the actual mo-
tion of the pictures as it grows is witnessed by
the audience. This latitude in the time within
which a film may be exposed affords oppor-
tunity for the production of marvel or trick
pictures, the camera being stopped while changes
are made and started again to make such
record as is desired. The continuous exhibi-
tion of the film presents the illusion that the
picture presented was also a continuous event.

and Operate Moving Pictures' (New York
1916); Talbot, F. A., 'Practical Cinem-
atography' (London 1913).

CINERARIA, a genus of plants of the
family Asteraceae, comprised of about 25 spe-
cies, natives of South Africa. The plants com-
monly in cultivation under this name were for-
merly placed in the genus Cineraria but are
now generally referred to the vast genus Senecio. The cultivated
species have been derived from Senecio cneorum, native of the
Canary Islands. They have large hairy leaves and dense clusters of heads of white, blue,
pink and reddish flowers. They are exten-
sively grown by florists as pot-plants, and by
careful breeding a large number of varieties
have been obtained.

CINERARY URNS, urns in which the
ashes of the dead were deposited after the body
was burned. Many Greek and Roman urns are in a high style of art, and are formed of bronze,
marble, glass or pottery ware. See BURIAL.

CINGALESE. See SINGHALESE.

CINNA, sin'a, Lucius Cornelius, Roman
patrician, associate of Marius and leader of
the popular party, during the absence of Sulla in the
East. In 86 B.C. he was elected consul along with Octavius, and in violation of his
oath to Sulla he attempted to overpower the Senate and to procure the recall of Marius and his
supporters from banishment. In the contest
which ensued he was defeated by his colleague
and driven from the city. His office thus be-
came vacant, and the Senate appointed another
consul in his stead. He soon returned, how-
ever, along with Marius, and laid siege to
Rome. The Senate was forced to capitulate;
but while the voters of the people were being taken
for the repeal of the sentence against
Marius he broke into the city, massacred the
friends of Sulla and allowed his partisans to
commit frightful excesses. He was consul for the
next three years; but Sulla, having brought the
Mithridatic War to a close, resolved (84
B.C.) to return to Italy to inflict condign punish-
ment on his enemies. Cinna prepared to resist
him by force of arms, but was prematurely slain by a mutiny among his own troops.

CINNABAR, sin'nah-bar, red sulphide of
mercury, HgS. The native cinnabar occurs in
earthly, granular and massive forms, and also
in crystals belonging to the rhombohedral sys-
tem. It is red, not infrequently with a brown-
ish or leaden cast. Its hardness is from 2 to
2.5, and its specific gravity from 8 to 8.2.
Artificial cinnabar, formed by subliming a mix-
ture of sulphur and mercury, is brighter in
color than the native mineral, probably on ac-
count of its purity. Cinnabar is used in commerce as "vermilion." Cinnabar is the prin-
cipal ore of mercury, and large deposits of it
occur at Almaden, Spain, at Idris in Carniola,
at New Almaden, Cal., and in certain parts of
China and Japan. When it is roasted the sul-
phur burns away and metallic mercury distils
off and is condensed in earthenware vessels.
For a discussion of various ancient references
to cinnabar, consult English and Mining

CINNAMIC, sin'a-mik, ACID, an acid
which exists in the free state in the balsams
of Tolou and Peru, in liquid storax and in gum
benzoin. It occurs in two forms, slender
needle-like crystals, and large transparent
prisms, melting at 270° F. When oil of cinnam-
on is exposed to the air it absorbs oxygen
and deposits crystals of cinnamic acid, which
are colorless and readily soluble in alcohol, ether
and boiling water, but sparingly soluble in cold
water. It is not of any importance in the arts
and is chiefly interesting as being the acid
responsible for the characteristic odor of Tolu. This is the aldehyde of cinnamic acid and is repre-
sented by the formula C\text{H}_3\text{CO}_2\text{H}.
Though isomeric with oil of cassia it has a slightly different
flavor, and is much more expensive. Both of
these oils are employed in medicine as aromatic
stimulants, but chiefly as pleasant adjuncts to
disguise the taste of nauseous drugs. From a
chemical point of view, the cinnamic acid and
oil of cinnamomum are related to benzoic acid and
oil of bitter almonds. Oxidizing agents con-
vert it first into benzaldehyde and then into
benzoic acid. It unites with hydrogen to form
hydrocinnamic acid.

Cinnamomum is one of the active prin-
ciples in many of the balsams and enjoys an
excellent reputation in the treatment of tuber-
culosis and chronic ulcerative processes. It is
a marked stimulant to the skin and mucous
membranes and has been very widely used in
the form of an emulsion for the treatment of
tuberculosis of the joints. It is prepared in
quantity by keeping one part of benzaldehyde,
one part of acetyl chloride and three parts of
sodium acetate at a temperature of 320° F. for
24 hours.

CINNAMOMUM, a tropical genus of
plants of the laurel family, natives of Asia and
the Pacific islands. The genus numbers up-
ward of 50 species, all possessing aromatic
volatile oils that make them valuable articles
of commerce. Cinnamon proper is the prepared
bark of C. zeylanicum; culwian bark comes from the C. culwian, and cassia bark from C.
cassia. The best known American relative, al-
though not of the same genus, is sassafras.
See CASSIA; CINNAMON; LAUREL.

CINNAMON, the bark of the under
branches of a species of laurel (Cinnamomum
zeylanicum), which is chiefly found in Ceylon,
but grows also in Malabar and other parts of
the East Indies. The tree attains a height of 20
or 30 feet. Its leaves are oval, the flowers are
of a pale yellow color and the fruit is shaped
somewhat like an acorn. There are two prin-
cipal seasons of the year in which the Ceylonese
bark the cinnamon-trees. The first of these
commences in April, and the last in November;
the former being the cipher is the great crop is obtained. In this set are the branches of three years of growth are cut down, and the outside parts of the bark is scraped away. The twigs are then peeled up lengthwise and a knife and the bark is gradually loosened till it can be entirely taken off. It is then cut into slices and on being exposed to the sun curls up in drying. The smaller pieces, or "quilts," as they are called, are inserted into the larger ones, and these are afterward tied into bundles. Cinnamon is examined and arranged according to its quality by persons who, for this purpose, are obliged to taste and chew it. This is a very troublesome and disagreeable office, for few persons being able to hold out more than two or three days successively. After this examination, the bundles are made up to a length of about four feet and a weight of about 88 pounds each. From the roots of the trees numerous offsets shoot up. These, when they have attained the height of about 10 feet, are cut down and barked, being then about the thickness of a common walking-stick. The cinnamon which they yield is much finer than any other. In Ceylon, the cinnamon-trees are said to be so common as to be used for fuel and other domestic purposes. The smell of cinnamon, particularly of the thinnest pieces, is delightfully fragrant, and its taste pungent and aromatic, with considerable sweetness and astringency. It infuses in boiling water in a covered vessel it gives out much of its grateful flavor and forms an agreeable liquid. An oil is extracted from cinnamon, which is heavier than water. This is prepared in Ceylon, and almost wholly from the small and broken pieces. It is made, however, in such small quantities that the oil of cassia is generally substituted for it; indeed, the cassia bark is often substituted for cinnamon, to which it has some resemblance, although its qualities it is much weaker. The leaves, the fruit and the root of the cinnamon plant all yield oil of considerable value. That from the fruit is highly fragrant, of thick consistency, and in Ceylon was formerly made into candles for the sole use of the king. The oil of cinnamon consists mainly of cinnamic aldehyde, C₆H₅CHO, which, when pure, is colorless. By exposure to the air it absorbs oxygen and is converted into cinnamic acid (q.v.). Various forms of cinnamon have been used for many years in medicine as flavoring agents and as carminatives. As cinnamon is rich in volatile oils, the action of the drug resembles the action of the oil of cinnamon, which is closely allied to other volatile oils (q.v.). The active principle in the oil is an aldehyde of cinnamic acid, and its antiseptic and anti spasmodic action is due in large part to the cinnamic aldehyde.

CINNAMON FERN, a fern, Osmunda cinnamomea, so called from the cinnamon color of the sporangia. The plant has been known to reach the height of 11½ feet. It is frequent in boggy places from Florida and Mexico north to Minnesota and Newfoundland, and occurs also in Asia and Brazil. See OSMUNDA.

CINNAMON OIL, an essential oil distilled from the bark of the Cinnamomum Zeylanicum, the Ceylon cinnamon tree. The yield is from one-half to 1 per cent. It is of a bright yellow color, which gradually darkens. It consists chiefly of cinnamic aldehyde, normally from 70 to 77 per cent, with from 4 to 8 per cent of eugenol. When pure it has a specific gravity of 1.020 to 1.035. It is often adulterated, however, by an oil obtained by distilling the leaves with bark from the root. The chief constituent of this oil is eugenol, which gives its specific flavor to the oil of cloves. When exposed to the air cinnamon absorbs oxygen and forms a resin and cinnamic acid.

CINNAMON-STONE, or ESSONITE, a variety of grossularite garnet, usually of a beautiful cinnamon-brown, yellowish or brownish-red color. It is a silicate of aluminum and calcium. Its name essonite is derived from the Greek *essen*, inferior, and refers to its hardness, 7, which is inferior to that of the true byacinth, which it often resembles. It occurs in isometric crystals, usually in rhombic dodecahedrons. Cinnamon-stone from Ceylon is the finest known, and has long been cut out. Other colored specimens are found at Piedmont, Italy, Phippsburg, Me., and in Quebec, Canada.

CINO DA PISTOLA, ché'ño da pës-tö'yä, Italian jurist consultant and poet: b. Pistoia 1270; d. there, 24 Dec. 1336. He ranks among the best of the early Italian poets, and resembles Petrarch more than any of the other predecessors of his poet. His poems were first published at Rome in 1558 by Pili. They afterward appeared at Venice increased by a second volume, which, however, was not considered genuine. The most complete edition is that of Ciampi (1812). He published a commentary on the first nine books of the "Codex Justinianus" in 1314.

CINC-MARS, sän-mär, Henri Coiffier de Ruzé, MARQUIS DE, French courtier: b. 1620; d. Lyons, 12 Sept. 1642. At the age of 18 he was present at court at Cardinal de Richelieu and soon obtained the favor of Louis XIII, to whom he became master of the horse. Chafing at the restraint under which Richelieu held him and ambitious of political power, he framed a conspiracy to overthrow the cardinal, of which the King himself and his brother, Duke of Orléans, were members. But Louis was weak and fickle, Gaston perfidious and Richelieu not the man to be put down by a youth just turned 20. Cinc-Mars was delivered up to the cardinal and beheaded at Lyons with his friend, the councillor de Thou. Consult Basserie, 'La conjuration de Cinc-Mars' (Paris 1896); Bazin, A. de R., 'Histoire de France sous Louis XIII' (Paris 1846).

CIN-MARS. 'Cinc-Mars,' by Alfred de Vigny, is one of the most popular French historic novels. Published in 1829, it showed unmistakable traces of the influence of Sir Walter Scott and was an immediate success. The novel deals with that important and interesting period of French history which culminated in the sway of Cardinal Richelieu, the king’s father, in the 1630s. It is Richelieu, more than the favorite of the king, Cinc-Mars, who is the central figure of the story. The author does not keep very strictly to the historic facts and misrepresents to a great extent the characters which he portrays. For de Vigny’s symbol of ambition, while de Thou, the devoted follower of Cinc-Mars, is the type of the friend. Even the minor characters of the book
are treated according to the preconceived idea of the author. The novel is thus a curious mixture of history and fiction. But in spite of the falseness of the historic treatment there is much in the novel which explains and in a way justifies its wide popularity. There was a great revival of interest in the past at the time the book was written, and no other period, perhaps, was so full of dramatic incidents and gaps such opportunities for character study as that of the administration of Richelieu. Again, the lyric note of the novel is admirable. The picture in the opening chapter of beautiful and peaceful Touraine, where the author himself was born and which he knew well and loved, together with passages of similar charm and beauty, such as the description of the chateau of Chambord, are veritable poetic gems — and, after all, was not Alfred de Vigny primarily a poet? The reader will gladly overlook the historical inaccuracies, which were intentional, and will forgive the rather poor psychology of the characters for the sake of the spirited and entertaining story and the passages of exquisite description.

RAYMOND WEEKS,
Professor of Romance Languages and Literatures, Columbia University.

CINQUE PACE, sink pās, a kind of grave, stately dance, in which the steps were regulated by the number 5.

CINQUE PORTS, seven ports of England, on the coasts of Kent and Sussex — Dover, Sandwich, Hastings, Hythe, Romney, Winchelsea and Rye. They were originally only five, the two latter having been declared ports subsequent to the first institution; hence the name cinque, five. The precise designation of these seven localities is *The Cinque Ports and the Two Ancient Towns,* the last named being Winchelsea and Rye. They were granted special privileges by the later Saxon and earlier Norman kings, on condition of providing a certain number of ships during war, there being no permanent English navy previous to the reign of Henry VII. The ports are, collectively, in the jurisdiction of a lord warden, whose salary is £3,000 a year, and is little more than a sinecure. Consult Burrows, *The Cinque Ports* (in *Historic Towns Series*).

CINQUECENTO, ching-kwē-chên'tō, in Italian, 500, an abbreviation for *mille cinquecento,* or 1,500. The term is used to designate the art styles of the 16th century, or such as were developed about, or after, 1500. In like manner the terms trecento and quattrocento denote art of the 14th and 15th centuries. The Cinquecento is the period of the highest perfection of the arts of the Revival or Renaissance.

CINQUEFOIL, sink-foil. (1) In botany, a species of the genus *Potentilla* of the Rose family, closely allied to the strawberry. There are about 300 species, chiefly natives of the temperate regions of the northern hemisphere, 175 of them occurring in North America, scattered throughout the continent. In northern New England the shrubbery cinquefoil (*Dasiphora fruticosa*) is a troublesome weed. The names of the genus is from Latin *pœtens* (powerful), from the supposed powerful medicinal virtues of some of the species.

(2) In heraldry, a mark of ornament in the Gothic style, consisting of foliated divisions, often seen in circular windows. In heraldry, it means a five-petalled *corolle* borne without an explanation and in a way, justifies its wide popularity. There was a great revival of interest in the past at the time the book was written, and no other period, perhaps, was so full of dramatic incidents and gaps such opportunities for character study as that of the administration of Richelieu. Again, the lyric note of the novel is admirable. The picture in the opening chapter of beautiful and peaceful Touraine, where the author himself was born and which he knew well and loved, together with passages of similar charm and beauty, such as the description of the chateau of Chambord, are veritable poetic gems — and, after all, was not Alfred de Vigny primarily a poet? The reader will gladly overlook the historical inaccuracies, which were intentional, and will forgive the rather poor psychology of the characters for the sake of the spirited and entertaining story and the passages of exquisite description.

RAYMOND WEEKS,
Professor of Romance Languages and Literatures, Columbia University.

CINTRA, sēn'tra, Portugal, a town in the province Estremadura, 15 miles northwest of Lisbon, on the slope of the Sierra de Cintra. The country around is extremely beautiful, and the climate mild and agreeable. On these accounts it is much resorted to by the wealthier inhabitants of Lisbon, who have here their quintas or country houses. Cintra is celebrated for the convention entered into there in 1808, by which the French, after their defeat at Vimeira, were not only permitted to leave Portugal, but were conveyed to France with their arms, artillery and property. Pop. 4,946.

CIOTAT, syō-tā, La, France, a seaport department of Bouches-du-Rhône on the Mediterranean, 15 miles southeast of Marseilles. It has a safe and commodious harbor and carries, on a considerable trade in the productions of the district. The yards and workshops of the Messageries Maritimes Companies employ about 3,000 hands. The town, surrounded by its old ramparts, consists of well-built houses and spacious, well-paved streets. The surrounding district yields wine, oil, oranges, etc. Pop. 9,975.

CIPHER, a kind of monogram, in which the initials of a person or persons are intertwined with each other.

CIPHER DISPATCHES. See Cipher Writing.

CIPHER WRITING, a method of sending important intelligence in a manner so effectually disguised that only those for whom the communication is intended can understand the meaning of what is written. In comparatively recent years diplomats, statesmen and military or naval commanders were the principal persons compelled by circumstances to keep their affairs or their intended movements shrouded in secrecy. So long as there was not regular postal service important letters were sent by courier, and thus the weightiest secrets were often at the mercy of any one inclined to be dishonest. Before the spread of education, and at a time when few possessed a knowledge of any other language than their own, to indite a letter or dispatch in a foreign tongue was usually ample protection against a surreptitious prying into its contents. But this safeguard has broken down, and it became necessary for all who did not want their correspondence known to interested parties to contrive some means of communicating with the pen that would defy scrutiny.

Hence there came into extensive use the art of writing in cipher, called also cryptography from the Greek words *kryptē,* "secret," and *γραφή,* to write. Under this were included all private alphabets or systems of characters for the safe transmission of secrets. A popular cipher for ordinary purposes is found by using the alphabet in an inverted order, taking Z for A, Y for B, X for C and so on. When it is desired to write a cryptogram and not print it, such other characters may be used as are mutually agreed upon by correspondents, or the alphabet may be transposed in
other ways. A figured cipher is one in which the letters of the alphabet are numbered and these numbers compose the cryptogram. To enable deciphering, however, the particular series of numbers chosen shall be known only to those who use the cipher. Another plan consists in choosing a certain book—a dictionary appears to have been the favorite—and by a simple division of the number of the page, of the column and of the line, sentences were constructed, the key to which was extremely difficult of discovery by one not in the secret.

As the number of different dictionaries was necessarily limited, however, the mystery could usually be solved by any one willing to devote time and patience to hunting up the particular one adopted. Various other books have been similarly used, such as spelling books, and even the Bible; but these systems are cumbersome, and were all more or less open to detection. From a few rules, as for instance, that in English $e$ is the letter which most frequently occurs, and $the$ the most common word, the whole might generally be deduced. The task of detecting ciphers is rendered much more difficult when false characters, which are not to be counted, have been interspersed throughout the cipher. A curious explanation of the process of unraveling a cipher is given in Poe's story of the 'Gold Bug.' Still, with devices such as these, more or less ingenious, the world was fast to be content until the advent of telegraphy. Immediately a new want made itself felt. If the mail was slow, it afforded privacy, but the contents of a telegraphic message are of necessity known to others besides the sender and the receiver. So the minister, the banker and the merchant soon began to send cipher despatches. It was quickly discovered, however, that existing methods of cipher writing were unadapted to telegraphy; the costliness of the new invention necessitated brevity; and thus it was not long before there went whirling over the wire messages of 10 words that, properly deciphered, included from 30 to 50. Cryptography became a recognized calling, requiring thought, labor and inventive skill. A great proportion of commercial messages—orders to buy and sell and the like—are similar in their terms, and hence it is that a single word representing three or four words in frequent use is the plan on which our present cable ciphers are based, whereby there is annually a large saving in expense. Then, too, as trade increased and competition became fierce, every firm wanted or needed its own cipher system, distinct from any other. Hence there is a vast number of ciphers in use in every great commercial centre such as New York or London. There are firms which specialize in the preparation of ciphers or "cable codes" containing from 30 to many thousands of words. The International Office of the Telegraph Administrations in Bern, Switzerland, published an "Official Vocabulary for Telegraphs in Preconcerted Language" (1899–1901). In 1903, however, it was internationally decided that, after July 1, 1904, all combinations of letters that do not exceed 10 words in any case ciphers, *provided that it is pronounceable, or that it is taken from the following languages: English, French, German, Dutch, Spanish, Portuguese or Latin.* This concession widened enormously the scope of admissible words and huge, complicated codes sprang into existence. From the volume issued by the Simplex Code, for instance, it is claimed that 100,000,000 communication ciphers can be devised. The *Simplex Cryptograph* (Providence, R. I., 1902) is a small book, giving over 50,000 numbered cipher words with a "key" to each one. In this, e.g., the number 33,438 can be expressed by the word *post,* and 50,551 by the word *vary.*

The cipher codes of the State Department at Washington and those of other governments are frequently changed. The special code is entrusted to the personal custody of diplomatic officials embarking on a mission, who retain possession of it and destroy it if their lives are endangered. The imprisonment of the United States Minister Conger, in Peking, in 1900, caused the cipher to figure conspicuously in international relations. China objected to the transmission of cipher dispatches, but subsequently withdrew her objection. She was accused of having obtained surreptitious possession of a copy of the United States cipher code.

For private individuals desiring to communicate in cipher by letters through the post it is easier to devise a code of 26 letters or signs representing the alphabet. To avoid unauthorized deciphering of the message, it is advisable not to separate the words into their natural groups of letters; thus instead of arranging the signs or letters representing, say, "Come and see me," place them in this fashion: com eand se eme. Instead of having a certain sign or letter invariably represent the same letter, it is safer to adopt an arbitrary sentence of 26 letters and place them under the 26 letters of the alphabet. Such a code can easily be carried in the memory. The following example of such a cipher, taken from a book published in London, will explain: "Hush Money, by Charles H. Ross, Esq." By placing these letters under the alphabet we get H=A; U=B; S=C; H=D; M=E, and so on. Hence, Oba ya h sych. oayara rr loucys syra, Och shark rihimu h anamaneah emhdyr ans, could only be deciphered by the receiver as Par in a wild. unknown to public view. From youth to age a reverend friend grew.

Another method, absolutely undecipherable by any outsider, is to adopt a method of numbering somewhat as follows: Ignore all vowels, $h$, $y$ and $w$, or invent separate signs for them, using these only where absolutely necessary; then replace the consonants with figures like this: $L=1$; $N=2$; $M=3$; $R=4$; $F$ and $V=5$; $P$ and $B=6$; $T$, $TH$ and $D=7$; $SH$ and $CH=8$; $K$ and $C$ (hard) $=9$; $S$, $Z$ and $C$ (soft) $=0$. From this can be made 9327853744=KMNDFCHM T.M RR: *Come and fetch me to-morrow." This system is specially adapted for writing numbers by words: Ignoring vowels, $h$, $y$ and $w$, Kansas=2020; Smith=037; London=1272; California=91542; 127=1andd; 894=sugar. The same code can also be used to commit a number of figures to memory: If it is desirable to remember the number 746,527,682; this gives, in code, the letters DRPPNDSHN. By inserting vowels between these consonants, the sentence can be made, *Drop off and push on." By mentally repeating the sentence each consonantal sound suggests a figure, hence 746,
527,682. By using figures for letters and vice-versa, the telephone number "Central 3277" would read: 02741. Mandate. The consorts must be used phonetically, as in stenography, the "envelope as "Xs." The introduction of an occasional "dummy word," i.e., one not to be reckoned, will serve further to baffles attempts at elucidation. An interesting account of how the cipher dispatches in the Tilden electoral canvass of 1876 were deciphered by New York journalists is given in *The Tribune*, 21 Nov. 1878 (Extra No. 44).

**CIPHERS**, signs for numbers (see Notation). They are either borrowed signs, as letters, with which the Greeks and several tribes of the north of Europe designate their numbers; or peculiar characters, as the modern or so-called Arabic ones, though the Arabs do not use them, and never did. The ciphers, such as they are at present, 1, 2, 3, 4, 5, 6, 7, 8, 9 and 0, did not attain their present character till a pretty late period. We received them through the Arabians from Hindustan. It seems probable that the Egyptians were acquainted with the present system of ciphers, at least in its principles. As early as the 9th century ciphers were used, though seldom, in France. Not until the 11th century did their use become common in Europe.

**CIPPPUS**, sip'ūs, a low column generally rectangular and sculptured, and often bearing an inscription, used by the Romans for various purposes. Cippi served as sepulchral monuments, as milestones and boundaries, and in some cases to receive the inscribed decrees of the Senate. They were frequently or usually adorned with rams' heads supporting festoons of flowers, figures of sphinxes and various mythological subjects. Those serving as tombstones bore the epitaph of the deceased, including his name, the date of his birth, death, etc.

**CIPRIANI**, ché-prë-ā'ne, Giambattista, Italian painter and engraver: b. Pistoia 1732; d. London 1785. He was one of the first fellows of the Royal Academy. His drawing is correct, his heads have grace and loveliness, his coloring is harmonious and the general impression of his composition good. Many fine engravings of Barozzi are from the designs of Cipriani.

**CIRCARS**, sér-kärz', The Five Northern, an ancient division of the Madras presidency, on the east coast of Hindustan. The northern Circars were formerly Chicacole, Rajahmundry, Ellore, Kondapilly and Guntur, with Masulipatam as the chief town, but the districts that now correspond most nearly with them are those of Ganjam, Vizagapatam, Godavari, Kistna and Guntur. They were among the earliest of the territorial possessions of the East India Company, which acquired four of them in 1765 from Mogul Shah Allum, who bestowed them on the company as a free gift. The fifth, Guntur, came into possession of Great Britain in 1788. Consult history in *The Imperial Gazetteer of India* (Vol. X, Oxford 1908).

**CIRCASSIA**, sér-kâsh'-i-a, a region in the southeast of European Russia, lying chiefly on the north slope of the Caucasus, partly also on the Caspian Sea. It forms part of the government of the Caucasus, including a great portion of the territory of the Kuban and the districts of Sukhumi and Tichernomore, but is not itself an official division; and, indeed, the name is now much less seldom heard than formerly, since the country has been entirely incorporated with the rest of the Caucasian as "Xs." Russia has no longer a separate political existence. The whole region is mountainous, and is composed of the northern masses or western offshoots of the great chain of the Caucasus, the culminating heights of which are those of Mount Elbruz. The mountains are intersected everywhere with precipitous ravines, in the deepest hollows of which flow rock-impeded streams that occasionally become raging torrents. The chief rivers are tributaries of the Kuban and the Terek, the first of which bounds the territory on the northeast and east sides, while the Terek skirts the Circassian limits on the southeast side. Circassia is a beautiful though rugged country. The sides of the mountains are often clothed with thick forests. Its climate is temperate, its inhabitants are healthy and long-lived. There are few manufactures and little trade; but the valuable oil deposits are now being worked.

When Russia took possession of this region the exodus of the inhabitants left comparatively few Circassians proper, and those who remained have now to a large extent lost their national peculiarities. The people call themselves Adighe; the Tartar word *Tschertkess* being a slanderous name applied to them as "robbers." The Circassians were divided into several tribes, having three distinct languages or more. Each tribe included five ranks of men, namely, princes or chiefs (*pschat*); nobles (*vork*); middle class (*tlofokl or tokau*); serfs or retainers of the nobles, and slaves—the latter being prisoners taken in war or the descendants of such. All classes except the slaves were united into fraternities for mutual support; and this union formed the real groundwork of the government of the country, which was altogether peculiar, being patriarchal in nature, with a great amount of freedom. Hereditary feud, once prevalent, was latterly almost extinguished, and pecuniary compensation, including a mulet upon manslayers for the benefit of the deceased's family was substituted. Crimes of all degrees, and civil causes, were judged either in general or local councils; and petty offenses by district judges and assessors.

The religion of the country was chiefly Moslem; but in many cases it formed a jumble of Christian, Jewish and heathen traditions and ceremonies. In no case was it very strict; although most of the chief Mohammedan feasts and fasts were pretty well observed. The morals of the people were good. Great crimes were rare; and such as have their sources in poverty with one class and avarice in the other were not common, for property was little coveted, and money was scarcely known. The commerce of presents was universal; few or none were very rich, and there were no miserably poor at all. There was no tenure of land in Circassia except what immediate possession, for the purpose of cultivation, gives.

Agriculture is still in a rude state, but the produce of the earth is considerable and exceeds local wants. The forests yield great quantities of fine wood, including oak and all our own best species of timber trees,
with (in the southern regions) boxwood, etc. The chief grain is millet; but barley, oats and a little wheat are also raised. There are great numbers of goats, sheep and oxen.

The Circassians, male and female, are a well-formed and handsome race. The males are highly prized as warriors by the Russians, and the females as mistresses by the Turks, a position generally envied by the women themselves. The men are among the finest equestrians in the world, and their horses, though small, are of good stock, hardy and intelligent.

The early history of the Circassians is obscure. They have no annals; but their minstrels, in their martial and genealogical strains, preserve traditional accounts of the deeds and lineage of their dead heroes and existing tribes. Between the 10th and 13th centuries this country formed a portion of the empire of Georgia, and it is said the Georgian queen Tamar subjugated and for a time Christianized them. During the Middle Ages the Genoese had several trading stations on the coast, of which some memorials yet exist. In 1424 the Circassians were an independent people and at war with the Tartars of the Crimea, etc., to whose khans, however, it is understood some were occasionally tributary. In 1555 the Muscovite tsar, Ivan Vasilyevitch, came to their aid against the Tartars and married a Circassian princess. But the stay of the Russian forces was short, and after their withdrawal the belligerents kept up a struggle with varying results till 1705, when the Tartars were finally defeated in a decisive battle. Shortly after the territorial encroachments of Russia on the Caucasian regions began. From that time she advanced by steps slow and stealthy and in 1781 obtained a frontier line on the right bank of the Kuban, the left bank of which formed the national limit of Circassia. In 1784 the Turks founded Anapa, near the northeast corner of the Black Sea, as a place of trade for their commerce and that of the Circassians; this was the only territorial settlement they as yet attempted near the country and the place was a mere factory. In 1807 the Russians took Anapa from the Turks; but in terms of the Treaty of Bucharest, in 1812, it was restored. In 1829 it was once more attempted by the Russians to be finally ceded to them by the Treaty of Adrianople, along with the whole of Circassia — as they interpreted the words of that cunningly ambiguous document; the fact being that an inch of the territory of Circassia proper had ever been in the possession of either Turks or Russians. Many of the Circassians were indeed Mussulmans and all such recognized the padisha (sultan) as their spiritual head, but nothing more. As the "hated Muscovites" (fana Moscow) insisted Ivan proceeded to act upon the threat and cession, a struggle commenced which was continued over a long series of years. The spirit of resistance to Russia became stronger than ever; and a bold leader, Schamy, who united in his person the imputed sanctity of the hierarch with the daring courage and prudent conduct of a great warrior, with his heroic band beat off or baffled the whole disciplined forces that Russia was able to send against him. But at length the protracted resistance of the people, especially the women's, sustained for 35 years — terminated in the triumph of the more powerful of the foes and the Circassians with their leader surrendered. Large numbers of them, as many it is said as 500,000, were deported into the Turkish provinces in 1864 and were settled in Asia Minor and in Bulgaria and Serbia. A considerable portion of their former country was thus ruthlessly almost denuded of inhabitants.

CIRCE, sèr'sè, in classical mythology, a sorceress on the island of Æaea. Ulysses in his wanderings landed on her island, and sent out Eurylochus with a party to explore the country. They arrived at the palace of Circe, who gave them food and wine, and with her magic wand changed them into swine. Eurylochus only, by cautiously abstaining from the magical potion, escaped the transformation, and informed Ulysses of the event. He immediately proceeded into the country to free his companions. On the way Hermes (Mercury) met and advised him. Following the advice of Hermes he then ran upon her with his drawn sword, threatening her with death, and compelled her to bind herself by an oath to do him no injury and deliver his companions. Ulysses then remained with her a whole year. Before his departure she told him that in order to secure a safe return to his country he must visit the infernal regions and ask advice of Tiresias. This he did, and again visited Circe on his way back. The story is told in the Odyssey.

CIRCINUS, sèr'shús ("the Pair of Compasses"), one of the 14 southern constellations added to the heavens by Lacaille in connection with his work at the Cape of Good Hope in 1751-52. It is surrounded by Apus, Musca, Centaurus, Lupus, Norma and Triangulum Australe.

CIRCLE, in geometry, a plane figure contained by one line, which is called the circumference and is such that all straight lines drawn from a certain point (the centre*) within the figure to the circumference are equal to one another. According to this definition of Euclid, which is remarkable for its perspicuity and precision, the circle is the space enclosed while the circumference is the line that bounds it. The circumference is, however, frequently called the circle. Still no confusion ever arises from this usage.

The properties of the circle are investigated in books on geometry and trigonometry. Properly the curve belongs to the class of conic sections and is a curve of the second order.

The Cartesian equation of a circle with centre at the origin and radius $R$ is $x^2 + y^2 = R^2$. Its polar equation is $r = R$. The general Cartesian equation of a circle is $x^2 + y^2 + ax + by + c = 0$; the general polar equation is $r = a + b \sin (\theta + \phi)$. From the standpoint of projective geometry, a circle is any conic passing through a certain pair of imaginary points at infinity, known as the circular points.

The celebrated problem of "squaring the circle" has given rise to extraordinary geometrical labors, and even if there are to be found, as in the case of the problem of perpetual motion, those who profess to have solved it.

The question is to construct by rules and compass a square whose area shall be equal to the area of a circle. It is not possible to do so. This was only shown within the last 36 years.
handed direction or in a left-handed direction (whence the names), extinction is again obtained. Quartz is named right-handed quartz or left-handed quartz according to the direction in which the analyzer must be turned. The difference between right-handed and left-handed quartz is due to the fact that the right-handed circular component travels faster in the former and slower in the latter. The amount of the angle through which it must be turned depends on the thickness of the plate of quartz.

If, instead of using homogeneous light, we have been supposing, plane-polarized white light is employed, it is found that the different rays are differently deviated. The effect of the more refrangible rays is greater than that of the less refrangible, and the plane of polarization of the blue rays will thus be turned through a greater angle than that of the red rays. I will be perceived from this that having arranged the polarizer and analyzer, and inserted a plate of quartz, as described above, on rotating the analyzer in the direction, right-handed or left-handed, that corresponds to the nature of the plate of quartz, we shall not arrive at a position of total extinction, but we shall see a most beautiful play of colors changing in order from red to yellow, then to orange, green and blue. These phenomena are among the most beautiful and most striking of all the marvelous phenomena of light.

It has been remarked above that certain organic liquids and solutions have this rotatory power. Among these may be mentioned turpentine and the essential oil of anise as instances of left-handed rotatory substances, of lemon and oil of caraway and solutions of sugar, as right-handed rotatory substances, and solutions of tartaric acid as showing both rotations, as explained below. This fact is taken advantage of in Soleil's saccharometer, an instrument for determining the value of cane sugar in a liquid.

We have spoken above of the right-handed and left-handed properties of quartz; a discovery of Huyghen leads us here to the very threshold of the molecular structure of crystals. We may yet hope for discoveries in this direction. On comparing crystals of quartz that give us right-handed and left-handed polarization, it is found that a very remarkable property connects their forms. The crystals that give right-handed and left-handed polarization are of an unsymmetrical construction, such that either viewed in a looking-glass gives an image of the same form as the other. Pasteur, examining the crystals of the two varieties of tartaric acid whose solutions have opposite rotational powers, but whose chemical properties are very nearly the same, showed that the same law holds for them; and, having crystallized what is known as neutral tartaric acid, was able, by picking out the crystals by hand, to separate it into equal portions of levorotatory acid and dextrorotatory acid. But we must refer the reader to the special articles on the chemistry of this substance.

One of Faraday's most brilliant discoveries was the rotatory power of glass under the action of a powerful magnet. The reader is referred for an account of it to the article POLARIZATION OF LIGHT.

CIRCUMFERENCE — CIRCUMSTANTIAL EVIDENCE

seventh year; the Christian Abyssinians in the sixth, seventh or eighth year; while some of the African tribes that practise the rite follow the Jewish rule; others, again, performing the ceremony between the 30th and 40th day. Among such a rule valueless where custom already decreed it, or because he attached only a physiological and not a religious importance to the ceremony. It is, however, now recognized as a religious obligation just as strongly as if it had been ordained by the founder of Islam. Circumcision among Mohammedans may be practised seven days after birth, but it is customary to postpone the ceremony to some time between the 7th and 12th year.

Christianity recognizes no religious significance in the rite, substituting for it, according to Saint Paul (Rom. ii, 25-29) "circumcision of the heart." The Church, however, celebrates as a festival the first of January, as being the day of the circumcision of its founder.

Circumcision of proselytes, in Jewish or Mohammedan faith is insisted on by the orthodox, and previous circumcision for surgical reasons is not accepted as sufficient compliance with the requirements of religion. Among some reformed Jews, however, the circumcision of adults has lately been abandoned. Among many savage tribes the rite is undergone at the age of puberty and is perhaps in such instances more of a sociological than a religious ceremony, being akin to other mystic rites which mark the entrance of the young into full tribal fellowship.

The circumcision of women is effected by the removal of a portion or the whole of the clitoris. It is perhaps practised more in Arabia than elsewhere, but has never prevailed among Jews. The inner significance of circumcision is psychological. It is a purely symbolic rite, the origin of which is lost for the conscious life of the individual. It has no intrinsic medical value whatever, save where some mal-development is present. The motive of cleanliness is solen to a rationalization to endeavor to explain its deeper psychological significance as a type of racial identification and an index of the father's fixation fantasy in the unconscious. The operation is sometimes attended with grave consequences, hence should be done by surgeons only.

CIRCUMFERENCE, or PERIPHERY, the curve which encloses a circular, elliptic or other plane area. In figures bounded by straight lines, as the triangle, square and polygon, the term perimeter is employed to designate the sum of all the bounding lines taken together. The length of the circumference depends partly on the nature of the curve; thus, that of the circle of radius \( r \) and diameter \( d = 2\pi r = \pi d \), where \( \pi = 3.141592 \ldots \) and that of the ellipse

\[
2\pi a \left[ 1 - \left( \frac{1}{2} \right)^{2} - \left( \frac{3}{2} \right)^{2} - \ldots \right] = 2\pi a \left[ 1 - \left( \frac{1}{2^{2}} \right) - \left( \frac{3^{2}}{2^{4}} \right) - \left( \frac{5^{2}}{2^{6}} \right) - \ldots \right],
\]

where \( a \) is the semi-axis major, and \( \epsilon \) the eccentricity. See Circle, etc.

CIRCUMFLEX, in grammar, one of the three accents, formed by the union of the other two, thus, \( \tilde{\}} \). It originally denoted a rising and falling of the tone in the pronunciation of the syllable. In Greek it is used in certain cases to indicate the long vowel of the last syllable of the penult. In Latin the mark is \( \tilde{A} \). It is not used in English, and in French is usually a sign of the elision of a letter, often the letter \( s \), and therefore indicates a prolonged sound.

CIRCUMMUTATION, the continuous motion of every growing part of a plant, in which it describes irregular elliptical or oval figures. The apex of the stem, for instance, after pointing in one direction, moves round till it points in the opposite direction and so on continuously. The term circummutation was first used by Darwin.

CIRCUMPOLAR STARS, stars near the Pole that appear to move around it, and perform their circles without falling below the horizon. A star whose polar distance is less than the latitude of a place in the same hemisphere will never set at that place. If the place is in the other hemisphere it will never rise. They are constantly used by astronomers for the construction of their meridian work for determining latitude of a place or the azimuth of a line. The pole-star Polaris or Alpha Ursae Minoris, usually known as the North Star, is the most used for that purpose.

CIRCUMSTANTIAL EVIDENCE, evidence which tends to prove a particular fact by the proof of other facts from which it is concluded that the particular fact must have happened. It is the natural and reasonable inference resulting from facts which have been established.

If A is on trial for the murder of B, and a witness testifies that he saw A shoot B, and a few minutes later B died, that would be direct evidence; whereas if the witness testified that B had been shot and the bullet found in the body of B was of a particular make only used by A and that A was in the neighborhood at the time of the shooting, the jury might infer that A was guilty; but if A could prove that his pistol had been stolen from him shortly before the shooting and he had not recovered it at the time of the shooting, it would be a complete defense and the verdict would depend on the credibility of the witnesses.

Circumstantial evidence is of two kinds: that from which a certain conclusion necessarily follows and that from which a certain conclusion is only probable or likely. If the body of a man is found with a bloody right hand impression on a part of his body where it is impossible for him to put his right hand, the presumption is that some one was present at or since the time the person was hurt; but if that is all of the evidence, it is impossible to tell whether the bloody impression was made by the person at the time of the assault, or by some one after the assault had been committed. In civil cases the jury may decide according to the weight of the evidence; but to convict a person of a crime the evidence must be such as to leave no reasonable doubt as to his guilt. See Criminal Law.
CIRCUMVALLATION, a fortification consisting of a parapet of earth and a trench, constructed by a besieging army around its camp, was guarded against attempts to relieve the place besieged.

CIRCUS, a word which has come down to us from the Latin without change, meaning "circle" and used by the Romans to indicate the place in each city where chariot races, gladiatorial contests and feats of skill were held. The circus building in Roman times was without a roof, rectangular in shape, except that one short side formed a half-circle; on both sides and on the semi-circular ends were the seats of the spectators, rising gradually one above another, like steps. The largest of these buildings in Rome was the Circus Maximus, 1,875 feet long and 625 feet wide and capable, according to Pliny, of containing 260,000 spectators. At present but few vestiges remain, but the circus of Maxentius is in a better state of preservation. Grown great through commerce and its life to the people, the Romans of 2,500 years ago (and for 10 centuries later) encouraged all forms of pleasure which would develop to its highest pitch the fighting instinct in their soldiery. Among the circus games were chariot races, a favorite sport of the Romans; athletic contests; the Trojan games, contests on horseback; and combats with wild beasts in which beasts fought beasts, or beasts with men (either criminals or volunteer). The prizes given to the victors were often valuable and the honors great. In the decadence of Rome came a decline of the circus and it was frequently debased by revolting spectacles, in which Christians or others temporarily hated by the government were given over to wild beasts or crucified. Julius Caesar dug ditches around the circus and filled them with water. This served the double purpose of protecting the spectators from the sudden swerving of a chariot or spring of a tiger and of making possible the novelty of feats of skill on the water. Most of the vessels then were propelled entirely by banks of oars and Caesar held rowing-races, swimming-races, etc. Most of our grotesque picnic-games, like swimming in a barrel or running in a sack, are relics of these circus initiations to please his restive and turbulent people. There was no charge to see these entertainments, as a rule, the circus being used as a pacifier by the emperor.

America has taken the lead in the reproduction of the Circus Maximus. This is probably because the American people are of a similar strenuous, contest-loving, restless disposition. It was his acute perception of this disposition in his countrymen that led Phineas Taylor Barnum (q.v.,), a Connecticut Yankee, to devote his life to entertaining his countrymen by giving them a real circus. The magnitude of the Barnum & Bailey circus and menagerie can scarcely be described. It is usually formed by making three immense rings, three different performances being given simultaneously. The capital invested in this and other circuses in America is enormous, being estimated at over $100,000,000.

Since about 1890 there has developed a peculiar American form of circus which is worthy of mention. This is a reproduction in the ring of the habits and customs of the "cowboy" and pioneer of our own western plains. The exhibit-
CIRQUE—CISALPINE REPUBLIC

30 miles east of Philippopolis. It is situated in a fertile, fruit-producing region and is noted for its mineral springs. Pop. about 12,000.

CIRQUE, sérk, a broad amphitheatre-like valley cut into steep cliffs and sometimes called a glacial bowl. It is usually the gathering ground for the snow and névé that form the glacier. Cirques usually have steep rock walls and are often occupied by small lakes. They constitute a striking feature of mountain landscapes in glaciated regions. As the bergschrund crevasse is formed at the head of the glacier, where the ice pulls away from the rocky walls, these walls are exposed to frost work, which loosens large blocks of rock. Each winter, with the accumulation of new snows, these loosened blocks freeze into the glacier and are dragged down the valley. Thus the valley head grows larger and larger, until a typical cirque is formed. See BERGSCHRUND.

CIRRHOSIS, kír-ó'sís, a process of chronic, inflammatory reaction in an organ, due to some form of constant irritation. It is characterized by the excessive production of connective tissue in the part, which increase of connective tissue gradually invades the blood-vessels of the organ and slowly encroaches upon its essential glandular tissues. This connective tissue proliferation is probably a result of a lack of balance of autonomic and sympathetic nerve stimuli. Cirrhosis may occur in almost any portion of the body, but it is characteristically present in only a few organs which are rich in functioning parenchyma, such as the kidney, liver, spleen, pancreas and brain. In each of these organs it produces very definite forms of change with clearly defined clinical course and history, according to the functioning organ. Thus in the kidneys, cirrhosis constitutes one of the forms of Bright's disease or chronic nephritis (q.v.). Cirrhosis of the liver results in a well-defined form of liver-disease, or chronic cirrhotic hepatitis (q.v.). Cirrhosis of the spleen and cirrhosis of the pancreas also occur, and there is a well-known form of cirrhosis of the brain associated with degeneration. (See SENILE DEMEN'TIA.) These different forms of cirrhosis will be discussed under their separate headings.

CIRRIPEDIA, an order of entomostracan crustaceans (crustaceans), sometimes ranked as a sub-class, always fixed in the adult stage, but with free-swimming larvae having three pairs of appendages (nauplius) like other Crustacea. The typical barnacles have the body enclosed in a reduplication of the skin which secretes a calcareous shell, on which account they were classed with the Mollusca until the discovery of their free-swimming larvae led to a closer investigation of their structure. Owing to adaptation to a sedentary life segmentation of the body has become obscure, and the six pairs of jointed biramous appendages are mere fringed scoops for creating currents in the water. The eyes and other sense organs have likewise degenerated, and most species are hermaphroditic. The barnacles are exclusively marine, and a greater variety. Four sub-orders are distinguished: (1) Thoracica, including the typical, free-living, shelled barnacles of which the sessile forms (Balanidae, Coronulidae, etc.) are well known as rock and ship barnacles in which the animal is protected by a conical shell formed of several pieces, with a multivalve conical movable lid, leaving an opening through which several pairs of long, many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The young have oval bodies, with a single eye, a pair of antennae, with three pairs of legs. After swimming about for some time it attaches itself by its antennae to some object, and now a strange backward metamorphosis begins. The body becomes enclosed by two valves, the stalk by which it is anchored grows larger, the feet become more numerous and eventually the barnacle shape is attained. The goose-barnacle (Lepas) is not sessile, but is flat and triangular, and attached to floating bits of wood or seaweed by a long, large, soft stalk. (2) Abdominalia, parasitic barnacles, in which the sexes are separate and very unequal in size. In this group is presented the remarkable phenomenon of dwarfed complemental males discovered by Darwin. The females live in burrows in the shells of mollusks and other barnacles, while the males are minute, lack mouth, digestive canal and appendages, and live in several together, permanently attached to the female. (3) The Apoda, whose body is maggot-shaped, are hermaphroditic and parasitic in other barnacles. (4) Rhizocephala: This group presents perhaps the most extreme cases of degeneration, through parasitism, known among animals. Sacculina, which attaches itself to the abdomen of the crab, is little more than a bag of genital organs which draws its nourishment from the tissues of its host by means of branching root-like processes which penetrate to every part of its body. Consult Darwin, 'Monograph of Cirripedia.'

CIRRUS. See CLOUD.

CIRRUS, in botany, the tendril by means of which certain plants climb, usually a modified leaf or the prolongation of a midrib.

CIRSIUM, a genus of plants belonging to the family Asteraceae, generally known as thistles, common in most temperate regions. Many of them are troublesome weeds, though said to possess medical properties which make them useful in fevers. Among the more common of them are C. arvense (corn-thistle, way-thistle or creeping-thistle), which has strong fleshy roots extending underground, and is difficult of extirpation; and C. viscosii (sea-thistle), which, both from its size and rough feeding, is a great robber of the soil, but being only a biennial is more easily managed.

CIRTA, sir'tá, a city of northern Africa, the capital of the Numidian prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony. It was much injured by the troops of Masenius in 310 a.d., but was restored by Constantine and named Constantina. The modern Constantine occupies its site.

CISALPINE REPUBLIC, Italy, a former state in the northern part. After the battle of Lodi, May 1796, General Bonaparte proceeded to organize two states parihare two, the South of the Po, the Cisalpine Republic, and one on the north, the Transpadane. These two were on 9 July 1797 united into one under the title of the Cisalpine Republic, which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona and Rovigo, the duchy of Modena, the
principalties of Massa and Carrara, and the three legations of Bologna, Ferrara and the Romagna. The republic had an area of more than 16,000 square miles, and a population of 3,300,000. The seat of the government or Di-
rectory was Milan. The army consisted of
20,000 French troops, paid by the republic. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but restored by Bonaparte after the vic-
tory of Marengo, and some modifications of constitutions were made and the area was in-
creased. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its
president. In 1805 the republic sent a deputa-
tion to Napoleon with authority to give him
the title of king of Italy. The territory was
known as the kingdom of Italy until 1814. In
1815 it became a part of Austria. It is now
a part of the Italian kingdom.

CISCO, sis'kô, a local name, probably from the Indian language, applied to several species of fishes of the family Salmonidae (q.v.) and closely allied to the whitefishes (q.v.), with which they are sometimes placed in the genus Coregonus, or separated under the name Argyrossoma. They are distinguished from the true whitefishes by having the lower margin of the premaxillary bone horizontal in-
stead of vertical, and by the larger mouth.
Nine or 10 species have been described from
North America, most of them belonging to the
waters of particular lakes or lake systems. The
most important is *A. artedi*, which is found
in the Great Lakes and adjoining regions, being
represented in the small lakes of Indiana and
Wisconsin by a slightly modified race. Under
the name of lake herring it is the object of an
extensive fishery on the lakes, second in value
only to that of the true whitefish. It is a voracious fish, swimming in large schools,
frequenting deep waters during most of the
year, but spawning in the shallows during the
winter. The other species inhabit various lakes
and the river systems of Alaska, etc. Similar
species also occur in Europe and Asia.

CISLETHANIA, sis-li-thâ'né-a, a river on
the boundary line between Austria and Hungary.

CISNEROS-BETANCOURT, thes'-nâ'râs be-tân-kor', Salvador, Cuban patriot; b. Puerto
Príncipe 1832. He was a descendant of one of
the best families of Spanish nobility and
possessed the hereditary title of Marqués of
Santa Lucia. During the revolution of 1868–78
he was president of the Cuban House of Represen-
tatives and during a part of the time Presi-
dent of the Cuban Republic. In 1895 he was
re-elected President of the new Cuban Republic.
His niece, Evangelina Cosio Cisneros, was im-
pressed by the Spaniards for aiding the insur-
geants during the insurrection in 1896–97, and
made a sensational escape, coming to the United
States, where she became a protégé of Mrs. Gen.
John A. Logan. His daughter tendered her
services to the United States as an army nurse
during the war with Spain in 1898.

CISPADANE, sis-pâ'dan, REPUBLIC, an Italian state established by Napoleon in
1799 after the battle of Lodi. It comprised
Bologna, Modena, Ferrara and Reggio. In
1797 it was united with the Cisalpine Republic
(q.v.).

CISPLATINE, sis plâ'tin, REPUBLIC (Lat. cis, on this side, and Sp. Plata, name of
the river on the boundary between Uruguay and Argen-
tina). The republic of Uruguay was
called by this name from 1828 to 1831. Previous
to becoming an independent state it had be-
longed to Brazil and was called Cisplatine
province.

CISRHENISH, REPUBLIC, or CIS-
RHENIAN REPUBLIC, several towns on the Rhine, particularly Cologne, Aix-la-Chapelle
and Bonn, at the time when some republics
were created, declared themselves independent,
under French protection and took the title of
Cisrhenis Republic in September 1797. But at
the peace of Campo-Formio (17 Oct. 1797), the
left bank of the Rhine, including the Cisrhenis
Republic, was ceded to France by a secret article
and the confederation bearing this name is in
consequence hardly known.

CISSAMPELOS, a tropical genus of climb-
ing shrubs of the natural order Menispermacae,
whose growth is similar to that of an ivy vine.
The plant is of great commercial value because
of its medicinal qualities, especially the velv-
etable of Brazil (Cissampelos pareira), the root
of which supplies the spurious pareira brava,
abuta root, used in medicine as a tonic. Other
species growing in nearly all tropical countries
are used for emetics and cathartics and an East
Indian species (C. obtusa) yields an intoxicat-
ing spirit.

CISSEY, sé'sâ, Ernest Louis Octave Cour-
et, French general; b. Paris 1811; d. there
1882. He was educated at the military school
of Saint Cyr and having served with distinction
in Algeria and the Crimea, he was promoted
general of a division in 1863. He fought in the
Franco-Prussian War and against the Com-
mune of 1871. He was elected to the National
Assembly in February 1871 and was Minister of
War from 1871 to 1873 and in 1874–76. He
was elected life senator in 1875.

CISSOID, a curve in geometry, the locus of
the vertex of a parabola rolling upon an
equal parabola. If pairs of equal ordinates be
drawn to the diameter of a circle, and through
one extremity of this diameter a line be drawn
through the circumference of which one of the
ordinates is let fall a line be drawn, the locus
of the intersection of this line and the equal
ordinate is known as the cissoid. This curve
was discovered by Diocles while he was seek-
ing the solution of the celebrated problem of
the duplication of the cube.

CIST, Henry Martyn, American soldier: b.
Cincinnati, Ohio, 20 Feb. 1839; d. Rome, Italy,
17 Dec. 1902. He graduated at Belmont College
1858 and began the study of law, but enlisted
as a private in the Sixth Ohio Regiment in
1861, attaining, before his resignation in 1864,
the brevet rank of brigadier-general. He was
post-adjutant of Camp Chase during the im-
prisonment of the Confederates captured at
Fort Donelson, assistant adjutant-general of
the Army of the Cumberland and later on the
staff of Generals Rosecrans and Thomas. After
the war he practiced law in Cincinnati, was twice
mayor of College Hill, originated the project
that resulted in the conversion of the Chicka-
mauga battlefield into a national park and was
a contributor of military articles to the maga-
CIST—CITHÆRON

zines. He wrote 'The Army of the Cumberland' (1882); and collaborated with Donn Piatt in a 'Life of General George H. Thomas.'

CIST, a place of interment of an early or prehistoric period, consisting of a rectangular stone cist or enclosure formed of rows of stones set upright and covered by similar flat stones. Such cists are found in barrows or mounds, enclosing bones. In rocky districts cists were sometimes hewn in the rock itself. See BURIAL; BURYING PLACES.

CISTACEÆ, sis'ta-se-é. See CISTUS.

CISTERCIANS, sis-ter'shè-ans, a monastery founded in 1098 by Saint Robert of Molesme, a Benedictine monk of Cluny (q.v.) at Cistercium, near Dijon in France. After a year Robert of Molesme was succeeded as abbot by the monk Alberic and he in turn by Saint Stephen Harding, an Englishman who ruled the order during 25 years, while great worth was added and who is regarded as its second founder and lawgiver: his day in the Church calendar is 17 April. The Cistercian order in his time grew to be the most considerable monastic order in the Church and to him in great measure is due the founding of the four greatest Cistercian monasteries of France, next after Citeaux, namely, La Ferté, Pontigny, Clairvaux and Morimond. By the middle of the 12th century Citeaux had affiliated with it 500 abbeys and priories, and early in the 13th their number was 1,500, of which very many were convents or priories of Cistercian nuns. For 200 years the austere rule of Saint Benedict as reinforced by Saint Stephen Harding was maintained throughout the order: there was the chanting of matins and lauds at midnight throughout the year in the abbey or priory church; there was an annual fast on a slender meal from 14 September to Easter; there was abstinence at all times (cases of sickness excepted) from all animal food, save that very rarely milk was allowed. The austerity of the Cistercian rule extended even to the churches of the order: simplicity was sought in everything; there was no display of ornamentation, either of the edifice or of the vestments, or of the vessels; the copes and chasubles employed in the church services were of white linen instead of silk or cloth of gold; the chalices and the pyxes, instead of being of gold incrusted with precious stones, were of plain silver. But the Church schisms and the wars and civil commotions of the 14th century led to the plundering of the abbies and priories, and the monastic discipline was greatly relaxed, so that on the one hand it became necessary for the see of Rome to sanction in some respects the rules laid down by the rule of St. Benedict. On the other hand there arose zealous upholders of the ancient rules who brought back the primitive observance in all its rigor. Among the most notable of these revivers of the ancient rule was the abbot De Rancé of the monastery of La Trappe (q.v.) in the 17th century. At the dissolution of the English monasteries by Henry VIII there were in England and Wales 115 Cistercian houses, of which 25 were for nuns. In the period of the French Revolution most of the Cistercian houses were not only not exempt from the effects of the laws but were suppressed. In the United States there are three Cistercian abbeys, La Trappe at Gethsemane, Ky.; New Melleray, near Dubuque, Iowa, and Our Lady of the Valley, Cumberland, R. I. The most noted English Cistercians' houses were the abbeys of Furness, Fountains, Rievaulx, Tintern, Kirkstall and Woburn. The only English Cistercian abbey is situated at Mount Saint Bernard, not far from Leicester. Consult Januaschek, 'Origines Cistercienses' (1877); Guignard, 'Monuments primitifs de la règle Cistercienne' (1877); Sharpe, 'Architecture of the Cistercians' (1874); Lefroy, 'The Ancient and Abbeys of Yorkshire' (1889); Eulart, 'Origines de l'Architecture Gothique en Italie' (1893).

CISTERN, a tank for holding water. Cisterns differ from wells in that they do not get their water from natural sources, such as springs, but through channels made by the hand of man. In hot countries, where the supply of water is not regular, or where rain water is used, cisterns are necessary for storing up water for future use. They are also largely used for the supply of locomotive boilers at railroad stations. Cistern water used for drinking is usually filtered.

CISTUS, the typical genus of the rock rose family (Cistaceae), a family having four genera, and about 160 species, of which two at most are found outside the northern hemisphere. The American representatives of the family belong to the genera Helianthemum, H. sonia and Lechea, most of the species being pestiferous plants, such as the froest-weed or Canadian rock rose (H. canadense), poverty-grass (H. sonia ericeroides) and the pin-weeds (Lechea). Cistus does not grow wild in America, but some species are cultivated in greenhouses and the warmer regions for the beauty of their large, wild, rose-like flowers, which are often of two colors. This genus, which is a native of Europe, is generally a beautiful evergreen flowering shrub, ornamental in gardens or shrubberies. Gum ladanum is obtained from C. creticus and C. ladaniferus. This gum was formerly used as an external stimulant in plasters, but is now almost obsolete in medical practice.

CITADEL (from the Italian citadella, a diminutive of città, city; signifying little city), in fortification, a kind of fort, consisting of four, five or six sides, with bastions, commonly joined to towns, and sometimes erected on commanding eminences within them, it is distinguished from a castle by having bastions.

CITATION, a summons or official notice given to a person to appear in a court as a party to a cause. A writ issued out of a court of competent jurisdiction, commanding a person therein named to appear on a day named and do something therein mentioned, or show cause why he should not. In cases in which a citation issues it is generally the writ commencing the action, the same as a summons in trespass, or a bill in equity. The citation is used by courts having control over the estates of the dead. In law, the naming of an authority, as a legal textbook, or a State or Federal report.

CITHÆRON, si-thè-ròn, or ELATEA, a range of mountains in Greece, which stretches northwest, separating Boeotia from Megaris and Attica. The loftiest summit rises 4,620 feet above the sea, and is the subject of the fables and classical allusions. On its northern slope stood the city of Platea, the circuit of whose walls may still be traced. Its modern name, Elatea, from elaté, a fir, is derived from
the pine forests which are abundant on its sides and summit.

CITHARA, sīthā'ro, a guitar-like musical instrument, said to have been invented by Apollo. The strings, usually five or six in number, were strung with a plectrum, or picked with the fingers. It was the forerunner of the banjo, guitar, zither and similar instruments. See LYRE.

CITIES, American, Government of. Earlier Development.—In its earlier stages the American municipal system was based upon that of England, the charters of the colonial boroughs, among them New York, Albany, Philadelphia, Richmond and Trenton, following closely the English model. After the Revolution great changes were made, involving the introduction of the double-chambered council and the increase of the mayor's powers. In due course the choice of the mayor was taken from the council and given to the voters, thus making this office a separate and independent branch of the municipal government. This step was followed by vesting in the mayor's hands important powers of appointment, by the establishment of administrative boards to assist the mayor in the exercise of his functions and by greatly increased interference with city affairs on the part of the State legislature.

Relation of City and State.—The basis of American government is the municipal charter, over which the State legislature, in the absence of constitutional provisions to the contrary, has complete control. This has been completely established by judicial decisions. In many States, however, the constitution prescribes the conditions under which city charters shall be granted or amended by the legislature. In 12 States these established a system of municipal home rule under which each city acquired the right to draft its own charter and to adopt it by a majority vote of its own citizens. (See Home Rule, Municipal.) In some other States the legislature is forbidden to charter any city by special laws, being required to deal with all cities, or with all cities within designated classes, by means of a general enactment or municipal code. In a few States, notably in New York and Massachusetts, the legislature has enacted optional charter laws, allowing each city, with certain exceptions, to decide for itself by popular vote which of several types of charter it will adopt.

In any case the charter outlines the political organization of the city, defines the way in which the various officials shall be chosen, their relations to each other and the powers which they may exercise. American city charters are sometimes elaborate documents, setting forth in great detail the functions and responsibilities of many officials.

Administrative Officials.—(a) The Mayor. — In many cities of the United States the chief administrative official is the mayor, who is elected by popular vote for a term of from one to four years. Very few cities retain the one-year term. As a rule any qualified voter is eligible, but in some cities there are additional qualifications as to age and length of residence in the city. The nomination of candidates is usually by party convention or by a primary election; the election is by secret ballot, and the suffrage is that prescribed by State law for State elections. Mayors are paid salaries which vary according to the size of the city, and in the large municipalities demands almost the whole of the incumbent's time. As a rule a mayor who has served a term is eligible for re-election, but to this there are a few exceptions. The powers of the mayor may be grouped under four heads, (1) the power to initiate municipal legislation; (2) the veto power; (3) the appointing power; and (4) powers in relation to local finance.

The power to initiate legislation arises from the mayor's right to send messages or communications to the city council upon any official matter. Except in a few cities the mayor is not the presiding officer and indeed does not usually appear before the council in person. But he may at any time address the councillors as a body by sending a written communication to be read by the clerk. These communications, after being read to the council, are referred to one of its committees and the matter to which the communication relates is in due course brought back to the council. If the committee makes a recommendation thereon. In this way the mayor may and often does exert an important influence upon the council's legislative work.

In the second place the mayor possesses in most cities (except those which have adopted the commission plan or some similar form of government) the right to veto any ordinance or resolution of the council which does not meet with his approval. All such ordinances and resolutions must be sent to the mayor for his signature. If he approves an ordinance or resolution, he signs it; if not, he may return it to the council without his signature, accompanied by his reasons, within a designated period of time, usually five days. If within this period he neither signs nor returns the ordinance or resolution it becomes effective without any further action on his part.

But the mayor's veto of the council's action is not necessarily final. After hearing the mayor's reasons the council takes a vote of its members upon the question of sustaining or overriding the mayor's decision. If the prescribed majority of the councillors vote to override the mayor, the measure goes into effect notwithstanding the mayor's veto. This prescribed requirement is decided for itself by the members of the council; but in a few cities it is fixed at three-fourths or three-fifths.

Mayors have used their veto powers freely, much more so than the chief executives of the nation and the States. The passing of measures over the mayoral veto is also quite common. Much difference of opinion exists as to whether the executive veto, in municipal government, has justified its existence.

Then there is the mayor's appointing power, which is perhaps the most important among his various prerogatives. With the exception of the few administrative officials who are elected by the people, or chosen by the council, the chief positions in the city's service are filled by the appointees of the mayor. In cities under the commission form of government this power is exercised by the commission as a whole, but in most of those which retain the mayor-and-council system the executive appointing power is of great importance. Not that the mayor has an untrammelled hand in making appoint—
ments; in many cases his selection do not become effective until confirmed by the city council, or by the upper branch of it where there are two branches. In those cities which have established civil service rules for appointments the mayor's selections, except for headships of the administrative departments, must be made from the lists of eligibles submitted by the civil service board. In large cities (especially in cities under the commission or the city-manager plan of local government) the mayor's appointing powers are of great importance and place large amounts of patronage in his hands.

Thirdly, the mayor has important powers of initiative in financial matters. In some cities he is responsible for the preparation of the municipal budget. In many he awards all the important contracts for public work. He also takes the first step in any exercise of the city's borrowing power. These, moreover, do not exhaust the list. He has many functions of a miscellaneous character. In fine, the office of mayor in the larger American cities carries a greater amount of power and responsibility than any other city official. This is particularly true of such departments as education, public health and finance. So far as these fields of administration are concerned the municipal officials are to a varying extent merely the local agents of the State in carrying out its general policy. Some powers and functions, in the second place, are set forth in the provisions of the city charter. Almost invariably the charter prescribes the authority and duties of the mayor, his relations with the city council and to the various administrative officials and boards. As for the latter, the charter may, and in most cases does, define their general duties or it may leave these things to be determined by ordinance. That is the third method of assigning functions. The ordinance by a series of ordinances may outline the way in which the various administrative departments shall be organized, the work which each shall perform and the powers which each shall exercise. With the growth of administrative problems in extent and difficulty, this has become the preferable method. The ordinances have greater flexibility than the charter; they can be more quickly and more easily amended. Reorganizations of departments, changes in the powers and functions of officials, many details of duty have to be changed from time to time as new administrative problems arise or as old problems assume a different form. All this can be most satisfactorily handled by the ordinance-making power, that is, by the city council with the assent of the mayor.

As for the actual duties of the chief administrative officials and boards, these are broadly connoted by the titles which they bear. The city clerk has charge of the municipal records; in a word, he is the secretary of the municipal corporation. The city treasurer has the custody of the public funds, receives the income and pays the warrants which are presented to him for payment in proper form. The comptroller authorizes the payment of bills against the city after he has satisfied himself that appropriations are available to cover them, and that the expenditures which they represent have been legally incurred. The auditor checks up all items of revenue and disbursement. The corporation counsel, or city attorney, or city solicitor, as he is variously named in different cities, is the chief law officer of the municipality. He gives advice and opinions on legal matters when so requested by the mayor or by the city council, and represents the city in all cases to which the municipal corporation is a party before the courts. The police commissioner, fire commissioner, superintendent of parks and cemeteries, the police commissioner, fire commissioner, superintendent of parks and cemeteries, the
assessors, overseers of the poor, and so on. From city to city the exact powers of these and many other officials differ somewhat in extent but in a general way they follow much the same lines.

The Subordinate Service.—Below the officials at the head of departments come the rank and file of the municipal employees, ranging from the deputy-heads, through the chiefs of divisions and bureaus, the inspectors and foremen down to the ordinary laborers. Ordinarily the heads of departments, either of their own authority or with the approval of the mayor, appoint all of these. But in some cities, though not in the majority, these selections are governed by the civil service regulations and by the same rules the employees are protected against capricious removal. The gradations and pay of the different ranks are fixed by ordinance (usually by the budget or appropriation ordinance) or in some cases by the provisions of the State laws.

In Great Exaggeration.—In most parts of the Union the intervention of the State in city affairs is frequent and of far-reaching importance. A dozen or more States have by constitutional provisions forbidden any interference in matters of local concern and have guaranteed to the cities the right to determine all such matters freely for themselves. Even here, however, the line between matters of general interest affecting the whole State and those of purely local concern are hard to draw. As a result there is still, even in these home rule States, a considerable amount of interference with affairs which primarily concern individual cities alone. In the States which have not as yet recognized the principle of municipal home rule, the hand of the central authority is extremely active in local matters. Scarcely a legislative session passes but many new statutes regulating even the minutiae of municipal administration are enacted. And these statutory provisions often relate to such purely local matters as the pay of city laborers, their hours of work, their holidays, the paving of specific streets, the rates to be charged for water, and the way in which city officials shall keep their records. By this practice the legislature has in many cases virtually taken away from the citizens their power to control and regulate their own purely local affairs. This authority has been in large degree usurped by the State and is exercised through channels of legislation. Herein the situation differs widely from that which exists in the various European countries. In them there is state supervision of municipal government and in some respects it is a stricter supervision than that exerted anywhere in the United States. But it is exercised through administrative and not through legislative channels. The provincial president in Germany, the prefect in France and the local government board in England are all administrative agents of the central government; they deal with all city alike and deal with each city on its individual merits. That is obviously a different and far more satisfactory policy than one which deals with cities by acts of legislatures enacted by men who know little about the local problems in each city. So far as municipal affairs is concerned that is the chief difference between American and European practice. See City Manager; Executive; Commission Government; Cabinet and Cabinet Government; Boards, Municipal; Appointment to Office; Budget System, American.

William Bennett Munro
Professor of Municipal Government, Harvard University.

CITIES, European, Government of.—The chief features of city government in the various countries of Europe are (1) a uniform system of charter powers and organization applying to all the cities in each State; (2) a plan of close supervision of city affairs and city finances, by the central authorities; (3) the continual supremacy of the city council in the direction of municipal policy; (4) the election of the municipal executive by the city council, not by the people; and (5) the placing of experts in charge of all important branches of the city's administrative work.

1. England.—The English city, or borough as it is usually called, is governed under the general provisions of the Municipal Corporations Consolidation Act of 1882 (45-46 Victoria, c. 50), and amending acts. All English cities, with the exception of London, have substantially the same general powers. Their chief organ of government is the borough council, a body which varies in size and is composed of two classes of members. First, there are councillors who are elected by the wards of the city, one or more from each ward, for a three-year term. The suffrage in council elections extends to all owners and occupiers of ratepaying property. Women are permitted, in certain cases, to vote at these elections though not in parliamentary elections. In the second place, there are the aldermen, who are chosen by the councillors either from among themselves or from outside, and who serve for a six-year term. In many cases virtually taken away from the citizens their power to control and regulate their own purely local affairs. This authority has been in large degree usurped by the State and is exercised through channels of legislation. Herein the situation differs widely from that which exists in the various European countries. In them there is state supervision of municipal government and in some respects it is a stricter supervision than that exerted anywhere in the United States. But it is exercised through administrative and not through legislative channels. The provincial president in Germany, the prefect in France and the local government board in England are all administrative agents of the central government; they deal with all cities alike and deal with each city on its individual merits. That is obviously a different and far more satisfactory policy than one which deals with cities by acts of legislatures enacted by men who know little about the local problems in each city. So far as municipal affairs is concerned that is the chief difference between American and European practice.
men of good qualifications are usually appointed to municipal posts and they are not removed without proper cause. The council also enacts the municipal by-laws, determines the rate of local taxes and makes all the appropriations. Its action is also necessary for borrowing upon the city's credit. In some of these matters, however, its action is subject to the approval of a central authority known as the local government board.

Through its standing committees the council also manages the various city departments, such as police, fire, water supply, sanitation, highways and public health. It does not have charge of poor relief, which is entrusted to a special authority, the board of poor law guardians. The routine work of departmental administration is given to the permanent offices, but the standing committee for each department is the intermediate, and the council is the ultimate authority in all matters of administrative policy.

London is in a class apart. The City of London, which is only a small area in the heart of the metropolis, retains its ancient and intricate system of government by a lord mayor, a court of aldermen, a court of common council, a court of common hall, sheriffs and chancellor. The rest area of London government is the administrative county of London, created in 1888, and since governed by the London county council of 137 members. This body has charge of main thoroughfares, fire protection, main drainage and other matters of general importance. Within the administrative county there are 28 subsidiary borough governments exercising limited jurisdiction. The police administration of metropolitan London, which includes a much larger area than the county, is under the direct control of a metropolitan police commissioner appointed by the Crown and who is, in turn, under the supervision of the Home Secretary.

2. The German Empire.—Each of the states of the German Empire has its own municipal system although they do not differ widely one from another. That of Prussia, which is larger than all the other states put together, has its basis in the Prussian City Code of 1853 and is a model of which there have been a great many. In Prussia the dominant local authority is the city council (Stadtagsversammlung), the members of which are elected for six-year terms by the voters of electoral districts in each city. The suffrage is arranged on what is known as the "three-class system," by which all the voters are grouped into three classes according to the amount of their annual tax payments. Each class of voters in each district elects one councilor. The number of voters in each class differs widely.

The city council, in turn, chooses the members of the city's administrative board (Stadtrat or Magistrat), each for a 12-year term, and these officials have charge of the various city departments. As a body, the administrative board prepares all business for consideration by the council at its meetings and is entrusted with the duty of carrying the council's resolutions into effect. The subordinate officials are appointed by this board, but under strict regulations by the general law.

The bürgermeister, who is titular head of the city government, is chosen by the council subject to royal approval. Invariably an official of long administrative experience is selected for the post. The bürgermeister has the general oversight of administration, but he has no veto or appointing power, no patronage and no such administrative discretion as is vested in the American mayor.

In the exercise of their respective powers the German city authorities are subject to rigid supervision at the hands of the higher authorities, particularly those of the province in which the municipality is located.

3. France.—Except as regards Paris the system of local government is uniform throughout the French republic. All municipalities, large and small, with the single exception of the capital, are ranked as communes and governed under the terms of the Municipal Code of 1884. In each commune there is a local council, the members of which are elected by manhood suffrage for four-year terms. This council chooses from among its own members a mayor and one or more assistants—mayors or adjutants—for four-year terms. These officials, however, retain their membership in the council and continue to sit there, the mayor as presiding officer.

The general direction of municipal policy rests with the council, which maintains various standing committees. But the supervision exercised by the national government through the prefects is very strict. The municipal budget, for example, must have this official's approval. The mayor and his assistants have numerous important powers both as agents of the central government and as chief administrative officers of the municipality. The mayor has important powers of appointment; he is in control of the local police and he frames the annual budget, presenting it to the council for adoption. As agent of the central government he is responsible for the local enforcement of the national laws and decrees, for the administration of the system of universal military service as regards his commune, for the enrolment of voters, for the reportation of births, marriages and deaths, and for the proper working of the educational and poor-relief systems. Many of these functions are devolved upon the adjutants or upon the secretary of the commune.

Paris, which virtually forms the department of the Seine, is governed by two prefects, the prefect of the Seine and the prefect of police, both appointed by the President of the republic, and by a municipal council of 80 members elected by popular vote, one from each of the 80 electoral districts into which the city is divided. The term is four years. The council powers, apart from matters of finance, are not extensive. The city, however, is divided into 20 wards or arrondissements, each with a mayor who is appointed by the national government and who acts as a deputy-prefect. The whole system is one of rigid centralization.

4. Italy.—The Italian municipal system is based upon the Municipal Law of 1889 and its amendments. Each city has a municipal council of from 15 to 80 members elected for the four-year terms, one-fifth retiring annually. The right to vote is given only to those who pass an educational test and who pay a small amount in taxes. The administrative work is done by the council to a small standing committee or Junta, which it selects from within
its own membership. It also selects from among its own members a Syndic, or mayor, who is the chief administrative official of the city and head of the Junta. As in France the provincial authorities exercise close supervision over municipal affairs.

5. Austria.—The Austrian system of city government resembles that of Prussia, but with some important differences. The city council is elected by the citizens under a system by which the voters are grouped according to their annual tax payments into four classes. The administrative magistrates are selected by the council from among its own members and so is the burgomaster. The latter holds office for six years only but is sometimes re-elected. His selection is not valid until confirmed by the emperor, but this confirmation is rarely refused.

6. Other European Countries.—Of the other countries of continental Europe, Spain and Belgium have systems of local government which in their general outlines resemble that of France. In Spain each city ranks as a community; the organs of government are a city council (ayuntamiento), the members of which are selected for a four-year term by the voters, and all male Spaniards above the age of 24 have the right to vote at local elections. The council elects one of its own members to serve as mayor (alcade); but in the largest cities the right to appoint the mayor belongs to the national government. In Belgium the French system of city government has been almost literally followed, except that the mayor or burgomaster is chosen for a 10-year term. Plural voting and proportional representation have also been adopted. French influence is also apparent in the municipal system of Holland. There is an elective council, a board of adjoints (wethouders) elected by the council from among its own members, and a mayor or burgomaster appointed by the Crown for a six-year term.

CITIES, Water Supply of. See Water Supply.

CITIES OF THE PLAIN, Sodom and Gomorrah, chief of the five cities which were destroyed by fire from heaven, and their sites overwhelmed by the waters of the Dead Sea.

CITIES OF REFUGE, according to the law of Moses six out of the 48 cities which the Israelites were directed to give to the tribe of Levi, in the division of the land of Canaan among their tribes, were to be set apart as cities of refuge for the manslayer or accidental homicide. The right of avenging murder belonged to the next-of-kin of the murdered man; but the slayer fleeing to one of these cities, three of which were to be on either side of Jordan, the avenger of blood was forbidden to touch him till the day before the congregation in judgment, when, if he were found to have acted without premeditation or malice, he had a residence appointed him in the city of refuge until the death of the high priest, and was then permitted to return to his inheritance. If the slayer violate, this regulation by leaving the city of refuge before the death of the high priest, the avenger of blood might kill him with impunity. The six cities of refuge appointed in accordance with this law were Kedesh, Shechem and Hebron on the west side of Jordan; and Bezer, Ramoth-Gilead and Golan on the east. This law of refuge seems to have been favored by the Levites, to whom it gave a measure of political influence, much in the same way as the privilege of sanctuary did to the monks, abbots and other dignitaries of the Roman Catholic Church; it was consequently interpreted by them in the most liberal way. Maimonides says that all the 48 cities of the Levites had the right of refuge, although only the six were obliged to receive and lodge the slayer gratuitously.

CITIZEN, originally, a member of the body of freemen entitled to share in the government of a civil, or city-state of the ancient type; as the Roman state gradually broadened into the entire ancient world, the citizenship was extended piecemeal for political reasons, till Justinian made it coextensive with personal freedom, and the attribute of all residents of the empire except slaves. With the growth of the miscellaneous modern community, where the flux of population, permanent and temporary, is going on, and the mass of people share in the government to a varying extent, the question of its limitations and the privileges it confers have become acute, and that of its legal definition has furnished one of the grounds of a civil war. The definition varies in different countries. In monarchies it is commonly used only of a resident's relation to his municipality, the term "subject" expressing the relation to the state; in republics generally it means a regular member of the community, subject to its ordinances, obligated to its support and defense, and entitled to its protection. In the United States, a complication is introduced by the Federal structure of the government, there being a citizenship of each distinguished from that of the other. The questions arising in this country are therefore: (1) What constitutes citizenship; (2) What rights it confers; (3) How it is acquired; (4) How it can be lost; (5) What are the respective obligations to State and Nation?

1. A citizen has been legally defined as "one who owes to the government allegiance, service, and money by way of taxation, to whom the government in turn grants and guarantees liberty of person and of conscience, right of acquiring and possessing property, suit and defense, security in person, estate, and reputation." In a word, the citizen is one whose lot is cast in with his society, for all social purposes according to his status and means, to fight or pay unless he is a dependent member of a group which fights, pays, etc. This includes women, children, defectives and criminals; and excludes alien residents (see, however, section 3), and Indians living in tribal relations, who are "dependent subjects." It should be added, however, that for jurisdictional purposes resident aliens are regarded as citizens. Commercial and business legislation "citizen" is equivalent to "resident."

2. Citizenship implies civil but not necessarily political rights. The former are alike for all, and are the primary obligation of a government to secure to its citizens; political rights
are endlessly varied and within the discretion of the government. The right of direct share in government is everywhere withheld from minors, women, and the insane; and could be so again. It was on this distinction that the minority in the Dred Scott case based their dissenting opinion that a slave's lack of political rights did not prevent his being a citizen with a right to sue in the courts; and the government by the Fourteenth Amendment ratified this view, and definitely dissociated civil from political rights.

3. Citizenship may be acquired by birth, every child born on the soil or within the jurisdiction of the United States—of resident aliens, except of foreign official representatives, whose residences are assumed to be part of their country's territory,—or of citizen parents traveling abroad, or of its officials resident abroad, before or after his or her naturalization; or by succession to a parent's or husband's rights,—the wife of an alien becomes a citizen by his naturalization, or after his death before naturalization if he had previously declared his intention of becoming so; and the children inherit similar rights.

4. It may be lost by formal renunciation, but the abandonment will not be presumed without it, even from a lifetime of residence abroad; but the government, with most civilized governments at present, recognizes full right to change allegiance at will. This was one of the issues in the War of 1812, Great Britain firmly refusing to recognize it; and it was not till 1870 that that country formally admitted that right.

5. Dual allegiance. The nature of the obligations is different: any one may be a citizen of the United States, yet not of any particular State, but not vice-versa; and as the citizenship of the nation is the more universal, so it is the more necessary. The two would come into conflict except through an act of secession, which must be fought out, so that the question is academic, as short of that the whole matter would involve a case in the Supreme Court, pending which the question would be in abeyance; but in case of forcible resistance of a State to a decree of the nation, the citizen's first allegiance is to the latter. Further than this, however, the national government cannot go beyond the scope of its reserved powers; and a State can go very far in the direction of abolishing even the civil rights of its citizens under the shelter of this flexible permission. It should be noted that the right of citizenship is totally unconnected in essence with the right of suffrage or the elective franchise. The former is an elemental right of all born among, or who have cast in their lot with, a civil society; the right to the protection of its laws and its strength, to a share in its benefits and its charities. The latter, a right to share in the governmental management of a society, is the more question of the best machinery of management, and dependent on the fitness or power of individuals or classes to help guide that machinery. The unfit or weak are just as much citizens as the fit or the strong, by natural right; women and minors, defectives and criminals, have the fullest right to claim the protection of the laws, by themselves or their guardians. The suffrage is only a substitute for a battle, assuming that the larger body could outfight the smaller; and admission to it lies in the discretion of the fighting body. (See Alien; Citizenship in the United States; Naturalization.)

Citizen, The. A comedy by Arthur Murphy, performed 2 July 1761, at the Drury Lane Theatre, and printed in 1763. It is founded in part on Destouches' 'Fausse Agnès.'

Citizen of the World, the signature of Oliver Goldsmith's Letters from a Chinese Philosopher residing in London, to his friends in the East. The work was published in 1762.

Citizen's Industrial Association of America, The. A national federation of local employers' associations, citizens' alliances and State and national organizations representative of business interests, organized as the culminating step in the movement for the organization of employers in 1903. Nearly all the large cities, and scores of the smaller ones, during the months following the antracite strike of 1902, became the centres of considerable agitation on the labor question, and from 400 to 500 local associations sprang into existence for the purpose of combating what was termed the lawless aggressions of organized labor. The membership of some of these associations was confined to employers, while others, which adopted the general name of alliances, admitted professional men, and even employees, into their ranks. In cities like Chicago, Saint Paul, Omaha, Kansas City, Saint Louis, Detroit, Cincinnati, Louisville and New York, employers' associations were founded, and in 1896 it was drawn out all over Colorado and many other parts of the West, as well, also, in the smaller towns of the Central States, the alliance was the most popular form of organization. In response to a call issued by a number of the prominent leaders in the employers' movement, a convention was held in Chicago, 29-30 Oct. 1903, which was attended by nearly 300 delegates, who came from all parts of the United States and Canada, cities as far apart as San Francisco, New Orleans, Montreal and Minneapolis being represented. The name of the Citizens' Industrial Association was considered as being inclusive in meaning of both employers' associations and citizens' alliances, and was selected by the convention for the new organization. The purposes, as set forth in the constitution adopted, were those of law enforcement, the maintenance of individual liberty, the securing of industrial peace and the perpetuation of free competitive conditions in industry. The organization stood for the open shop and no restriction of output. It was confined to that of educational propaganda, and it maintained a publication bureau for this purpose. It did not interfere in any respect with the internal government of its constituent associa-
CITIZENSHIP AND EDUCATION

The idea that schools and colleges should train for citizenship is one that in a measure depends upon a theory of the state. If the individual exists for the state, then there is no doubt but that the system of education must train the individual in all ways that serve the best interests of that state, and that the individual must be forced to follow it. On the other hand, if the state exists for the benefit of the individual, then it is less clear to the average mind that the individual should be forced to receive an education that he does not wish to take, or that his own freedom of action mentally or physically should be interfered with. Between these two extremes there exists a third theory that as the state came into existence to serve the best interests of those in it, the individuals who form it should be willing to do everything in their power to conform to those rules and regulations which will make the state their most effective agent for the purposes for which it grew up. If the state is to be more effective by virtue of having the individual intelligent, then he must get an education; if the state is to be more efficient because the individuals are healthy and strong, then the citizen must take care of his health and train his body. In a democracy the majority of the people determine what is best along these lines and the minority has to abide by the decision. In an autocracy it is those in power who do so determine and the individual education conforms as long as the few have the force necessary to compel obedience.

The idea that the individual should be trained or educated along certain lines because of the best interest of the state is not new, though its strength has varied much throughout history, and among peoples even at the same period of history. The Spartans among the Greeks represented the extreme view of the theory that the individual existed for the state, and their educational system was devised along those lines. On the other hand the Athenians represented the via media, or the third theory as presented above, and their educational system was worked out accordingly. The Romans tended strongly to the Spartan ideals and regarded the Athenians as unpractical and visionary. After the barbarians had overrun the Roman Empire and the idea of the participation of the citizen in the active work of the state had died out during the Middle Ages, when feudalism held sway, education except for the purposes of the Church, was generally non-existent.

In a way the Church took the place of the state, and the theory that the individual clergyman existed for the good of the Church was perpetuated.

It was only during the philosophical theorizing of the 18th century that the idea of giving the individual an education because of his interest to the state began to be revived. The democrats of the French Revolution soon realized that the individual's education as an education, were a dangerous element and would soon lead the ship of state on the rocks of anarchy and thus back into the control of a despot. It was for this reason that Danton in one of the best of his speeches declared: "After bread, education is the first need of the people." It was thus that democracy was fundamentally responsible during the whole course of the 19th century for the demand that the people be educated for the sake of the safety of the state. An ignorant electorate meant eventually the destruction of a democratic state.

It was from a different point of view that the educational reformers of Pestalozzi and Froebel approached the question. They were, quite naturally, because of the nature of their civil and economic environments, more impressed with the idea of the importance of education as a means for the economic and social betterment of the individual rather than as a means for preserving the state. It is now to be observed, however, that the two go hand in hand, for the well-to-do citizen is a good citizen. The education which has brought him economic prosperity and social recognition also tends to make him interested in the preservation of the state.

It remained particularly for the fathers of the American republic like Washington, Jefferson and Madison to lay stress on the idea that the safety of the republic lay in the education of the people. In 1786 Jefferson wrote to Washington: "It is an axiom in my mind that our liberty can never be safe but in the hands of the people themselves, and that none of the people with a certain degree of instruction. This is the business of the state to effect and on a general plan." Washington in his message to Congress in 1790 wrote: "Knowledge is in every country the surest basis of public happiness. In one in which the measures of the government receive their impression so immediately as in ours, from the sense of the community, it is proportionately essential. Whether this will be best promoted by affording aid to seminaries of learning already established, by the institution of a national university, or by any other expedients, will be well worthy a place in the deliberations of the Legislature. Madison wrote: "A popular government without was devised along the lines of acquiring it, is but a prologue to a farce or a tragedy, or perhaps both. "The best service that can be rendered to a country, next to giving it liberty, is in diffusing the mental improvement and in the preservation and enjoyment of that blessing."

These three men set by their words the standards which not only the United States but all democracies had to follow for the sake of self-preservation. Though progress along such lines was slow in the first half of the 19th century, in the latter half, the state has entered
For all of these purposes the curricula, not only of public schools but of private schools, must answer. In them must appear the necessary courses and the properly trained interfer with the liberty of the individual.

Once grant, however, that the state for its best good has the right to take steps along educational lines which serve for its preservation and that it is not beyond its power to do what may go. In a democracy perhaps little harm will come from such a doctrine, for the people are in the end the determining factors of the length to which interference with the individual is to go. In an autocratic government, however, the dangers of such a doctrine have become only too obvious. Under the leadership of an unscrupulous sovereign and military clique, the educational system of the state is devised to make good soldiers who are to do the will of the rulers. Under such a system, unlike conditions existing in a democracy, the people can exercise no restraining hand and the citizens are debauched morally and mentally so that they conduct themselves like obedient slaves. Trained under such a system they do not have any minds of their own, but are shaped to do the bidding of a tyrant.

The first attempt to give to the people an absolutely uniform education over a vast area was connected with religion. The Church and state combined in the Middle Ages to compel every citizen to receive uniform religious doctrine not only in one state, but all over Europe. The salvation of the state was thought to depend on religious uniformity. As James I of England said: "No bishop or preacher of the church may be changed in the province, for it is the way of the Pope and of his Popery to divide the people and they that be divided are dangerous to the commonwealth." It is clear that the security of the state was deemed to rest on a religious instruction which all must receive. He who refused it put himself outside the pale and was to be regarded both as a heretic and an anarchist—a fit candidate for the stake or the block.

The states of the world have gradually dropped the idea that the safety of the state is bound up with religious education, but in its place the theory of the safety of the state has dictated the institution of a system for the instruction of youth, not only mentally, as was originally intended by Washington, Jefferson and Madison, but physically, morally, vocationally and in an infinite variety of subordinate ways. The justification for such instruction in a democracy is not hard to find. If it is to the best interest of the state that its people should be trained mentally, it is also necessary that they be trained physically. Citizens that are weak physically are a menace to the state. The state has the right to step in and say that its citizens shall not be permitted to become physical weaklings. For this purpose it can interfere with the individual to see that he gets the proper physical culture, that he lives hygienically, that he is vaccinated, that he conforms to good physical health laws and subjects himself to good food regulations. The same also holds true for moral education. Morally debased people are a danger to the state and therefore the state may step in to give moral instruction. Citizens who are poorly prepared to earn their own living are also a menace to the state and on the same ground, here as elsewhere, it may for its own safety's sake see to it that the citizens are properly trained to follow vocations that will prevent them from becoming dependents.

Such, briefly stated, is the somewhat common theory of citizenship and its relation to education. How far the state will go along these lines only the future can reveal. It will go in a democracy as far as the people wish to, subject to constitutional limitations, but even the latter may be broadened, if the people see fit. In an autocratic state there are no limits except those found in a revolutionary overturn of the state by the people who feel that the state is going too far.

At the present time (1918) the most progressive states are insisting that their minor citizens must learn reading, writing and arithmetic and are compelling them to attend school to do so. From that minimum of the literary and mathematical, various states have added other subjects which the pupils must study: hygiene and physiology, history and civics, geography and natural science, music and drawing, trades and vocations, physical culture and religion and morals. In order that the minor may not escape such education he is forced to attend school up to a certain age and no one is allowed to give employment to him before that time. Even if he then goes to work, he is, by the law of certain states, forced to attend for a time certain continuation or evening schools to make himself better prepared for citizenship—political, social and industrial.

The present tendency of states is to increase the age limits for compulsory education, to add more subjects that must be taken for the sake of good citizenship and even to force adults to make up their deficiencies. In the United States trades and vocations have been recent additions, and physical culture and military drill are making great strides. Subjects present in European schools for generations, but still generally absent in the schools of the United States, are those of religion and morals. A campaign to introduce the latter without the former as essential to good citizenship and the safety of the state is being carried on.

James Sullivan,
New York State Historian.

CITIZENSHIP IN THE UNITED STATES. All persons who are within the territorial jurisdiction of a state owe an allegiance to it according to the maxim protectio trahit subjectionem et subjecto protectionem, and the existence of this fealty thus imposed is shown in the fact that, according to the public
CITIZENSHIP IN THE UNITED STATES

law of all modern constitutionally developed states, even aliens may be held guilty of treason, if, within its territory, they plot or commit acts against the welfare and existence of the local sovereign. In a narrower sense of the word, however, only those persons are termed citizens or subjects of a state who owe to the state allegiance and on that account may be and may be cast off only with the consent of the state concerned.

Viewed from the standpoint of international law, the citizen body of a state consists of all the persons from whom the state claims this primary and permanent allegiance. These persons, sometimes termed nationals, constitute, so far as other states are concerned, one homogeneous body. They are all equally entitled to the protection of their own government wherever they may be.

When, however, we regard the civitas or body-politic of the state from the domestic or constitutional point of view, it is found that its members may be divided into as many different classes as it has many different public and private rights, as may be deemed just and expedient by those who fix the public policy of the particular state in question.

All civilized states make a distinction between natural or native born, and naturalized citizens. The native-born citizen is one who has this status imposed upon him by reason of the nationality of his parents or parent, or the locality in which he is born; the naturalized citizen is one who, originally in allegiance to one state, is granted citizenship in another state.

Every sovereign state determines for itself the circumstances which shall be recognized as creating natural or native-born citizenship, as well as the conditions under which an alien may be admitted to membership in its citizen body. Many states adopt as their general principle the jus sanguinis, according to which the children take the citizenship of the father or, if illegitimate, of the mother. Other states accept the rule of jus soli, according to which a person becomes a citizen of the state within whose territorial limits he is born. This latter rule is constitutionally obligatory upon the United States, the Fourteenth Amendment to the Federal Constitution providing that "all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside." This rule, though thus explicitly stated only in 1868, was declaratory of the rule which had been previously applied. The qualifying clause "and subject to the jurisdiction thereof" was inserted to cover the cases of children of foreign representatives or other persons entitled to extraterritorial rights while in the United States. So absolutely, otherwise, has this rule of jus soli been declared to be, that children born in the United States of Chinese or Japanese parents are American citizens even though their fathers and mothers are aliens who, under statute law, cannot maintain naturalization.

The rule of jus sanguinis, however, also finds some application in the United States for the constitutional mandate does not operate negatively to the effect that only those persons shall be deemed natural citizens who are born within the jurisdiction of the United States. Thus children born to American parents while abroad are deemed natural citizens if, during minority, they return to the United States with the intention of residing there permanently. The conditions under which aliens may become naturalized American citizens are fixed by acts of Congress and have varied from time to time. They are now mainly determined by the laws approved 25 June 1910 and 30 June 1914. These statutes extend the rights of naturalization only to white persons or to those of African nativity or descent. Thus, among others, the Chinese and Japanese do not come within their provisions. The naturalization of Chinese is, indeed, expressly prohibited by a law enacted in 1882.

In order to be naturalized, the alien, being 18 years of age or over, must first file a declaration of bona-fide intention of acquiring American citizenship and to renounce forever all allegiance and fidelity to any foreign prince or state; and then, not less than two years after, file his petition, signed in his own handwriting, verified by two credible witnesses, who are themselves citizens of the United States, that he has resided in the United States continuously for at least five years immediately preceding the date of his petition, and that at least one year in the State or Territory in which he seeks naturalization. Besides various facts of date and place of birth, date and place of arrival in the United States, name and country of nativity of his wife, names and dates of birth of his children, if any, the petitioner must show that he is not a disbeliever in or opposed to organized government, that he does not practise or believe in polygamy and that he can speak the English language.

Aliens of 21 years of age or more who have been honorably discharged from the armies of the United States, whether regular or volunteer, or who have served five consecutive years in the United States navy or one enlistment in the marine corps, may be admitted to citizenship without having previously made a declaration of intention.

Naturalization is a judicial act and may be granted by the Federal District Courts, or by any court of record in any State or Territory which has a seal and clerk and a jurisdiction in law and equity without limit as to the amount in controversy.

Naturalization is granted to aliens without reference to any permission to expatriate themselves which they may or may not have received from the state of their original allegiance. Thus when the right of expatriation is not recognized by the original state, a double citizenship is created. Dual citizenship also arises when the same person is claimed by two states, the one by reason of the citizenship of his parents, the other by reason of birth within the territorial jurisdiction.

It has been declared by the United States courts that the naturalization of a father operates as a naturalization of his minor children if they are dwelling within the United States. In the same case (Boyd v. Nebraska) it was held that the declaration by a father of
CITIZENSHIP IN THE UNITED STATES

an intention to seek citizenship gives to his minor children, who reach their majority before his naturalization is completed, an inchoate citizenship which, however, they may, upon coming of age, repudiate. In the constitution it is provided that only native-born citizens are eligible for election as President or Vice-President of the United States. By statute it is declared that, except for this disqualification, naturalized citizens have the same rights, privileges and protection that are enjoyed by native-born citizens. In fact, however, in those states which do not recognize a full right upon the part of their citizens to expatriate themselves, the United States is not able to extend to the citizens of those states who have become naturalized American citizens that full degree of protection which it is able to assert and effect with regard to its own native-born citizens.

Citizenship may be lost as it may be acquired in various ways. Everywhere women lose their citizenship by marriage to aliens. By a recent act of Congress women may, however, resume their American citizenship upon termination of the marital relation through the death of the husband or separation from him.

Returning to the United States and residing therein or, if continuing to reside abroad, by making a declaration before an American diplomatic or consular representative of their intention to resume their American nationality. In some countries the loss of citizenship is lost by the acceptance of office or service under a foreign government but according to the law of the United States this results only in case the acceptance of office involves the taking of an oath of allegiance to the foreign government. By Act, 5 Oct. 1917, however, it was declared that American citizens who, since 1 Aug. 1914, had sworn allegiance to a foreign State which was at war with a State with which the United States is at war, in order to enlist in the armed forces of that foreign State, and was honorably discharged therefrom, may resume American citizenship.

In others, it is lost by the acceptance of a decoration from a foreign government, by desertion from the militia or naval service or by judicial condemnation for certain crimes; but American law does not provide for the loss of citizenship through any of these acts. Again, according to the law of various European states, citizenship may be lost by long residence abroad even if not followed by naturalization in a foreign state, but according to American law and practice long and continued residence abroad has no other result than to create a presumption of intention to abandon American nationality,—a presumption which may be overcome by the presentation of evidence to the contrary. Thus Secretary of State Evarts in 1879 stated that "a citizen of the United States may be absent from this country for an indefinite period for purposes of business, education or pleasure and so long as he does no act, or assumes no obligation inconsistent with his native or acquired citizenship in this country, he is not held under our laws to have forfeited any of his rights as a citizen of the United States." It was in accordance with this principle that the United States government in 1904 assumed the protection of an American citizen named Perdicaris, who had been kidnapped by a Moroccan bandit, this notwithstanding the fact that Perdicaris had lived abroad for 34 years. Likewise according to American law and practice loss of citizenship in the case of naturalized persons results ordinarily not from long residence abroad but from naturalization by a foreign government. In the case of naturalized citizens, however, the presumption from residence abroad of intention to abandon American nationality is much greater than that of the Act of Congress of 2 March 1907, it is declared that "when any naturalized citizen shall have resided for two years in the state of his origin, or five years in any other foreign state, it shall be presumed that he has ceased to be an American citizen—provided, however, that such presumption may be overcome on the presentation of satisfactory evidence to a diplomatic or consular officer of the United States."

Leaving now the distinction between native-born and naturalized citizens we come to consider a fundamental constitutional distinction which, in the United States, is made between Federal and State citizenship. This is a distinction arising out of the separation of the United States into the several States and the relation of these States to the Federal government. All persons, not aliens, who reside within one of the States of the Union have a double citizenship; they are citizens of the State in which they reside and are also citizens of the United States.

There was for many years an uncertainty whether, as a constitutional proposition, State citizenship was primary and the basis upon which Federal citizenship rested, or vice-versa. The result of the Civil War fixed in fact, and the adoption of the 14th Amendment established in law, the priority and supremacy of Federal citizenship. However, the distinction between the rights and obligations attaching to these two citizenships has been in no wise destroyed. This was made plain by the Supreme Court in the famous Slaughter House cases, in which it was held that the provision of the 14th Amendment that "no State shall make or enforce any law which shall abridge the privileges and immunities of citizens of the United States," has reference only to privileges and immunities which are peculiar to national citizenship, as, for example, the right to use the mails, to resort to the Federal courts, to go to the seat of Federal government, to receive protection while abroad, etc.

Another constitutional classification of citizens of the United States which has become especially important since the Spanish-American War is that between the citizens of the States of the Union and of the territories which are regarded as having been "incorporated in the United States," and those persons who are natives of those annexed territorial possessions, such as the Philippine Islands, who, while citizens of the United States in the international and broader sense of the term, are nevertheless not deemed to be citizens of the United States in a narrower constitutional sense, and therefore are not entitled to certain special rights which are regarded as flowing from the more special and privileged status.

*The Hawaiian Islands have the status of an "incorporated territory of the United States." By the act of 2 March 1917 the inhabitants of Porto Rico were declared by Congress to be citizens of the United States.
Another constitutional class of citizens which deserves mention embraces the Indians. Although under its sovereignty and jurisdiction, the United States for many years, saw fit to regard the Indians, or at least those who maintained tribal relations, as constituting bodies-political independent of the States of the Union, and separate from, though dependent upon, the United States, yet with these tribes the United States entered into treaties with respect to the rights which their members should enjoy and the control to which they should submit. For some time now, however, this quasi-international attitude has been abandoned, and the principle put into full operation that the Indians in all their private and public rights are absolutely subject to such statutory control as Congress may see fit to provide. The Indians have never been treated, however, in any full constitutional sense as citizens although they owe full allegiance to the State. As nationals they are, when abroad, entitled to the protection of the United States, and when desiring to leave the limits of the United States they can obtain from the Department of State a passport which parlates that formally it is not designated as, a passport. In all cases, whether living within those restricted areas known as reservations or not, whether maintaining tribal relations or not, Indians remain subject to the direct control of the Federal government. And it has been held that the Indian does not and cannot become a citizen of the United States simply by leaving his tribe, abandoning his reservation and taking up his residence and leading a civilized life within a State. On the other hand, it is within the power of Congress at will to impose citizenship upon such Indians as it pleases. This refusal to permit an Indian by his own will to obtain citizenship, and the imposition upon him of such a character without his consent, are illustrations of the principle that citizenship is not a right which inheres in the individual, but a status created by the sovereign will of the State.

The rights which aliens may enjoy within the United States are dependent upon the general principles of international law and comity and upon the provision of such treaties as the United States may have entered into with the native states of the aliens concerned. It is thus possible that aliens within a State of the Union may be entitled to rights and privileges which that State itself may be unwilling to recognize, and this too with reference to matters which, so far as American citizens are concerned, lie wholly within the legislative discretion of the State. A formal treaty may constitutionally go in fixing the rights of aliens within the States has been a matter of considerable controversy; and thus, both as a matter of law and as a matter of policy, there have arisen such problems as those connected with the right of Japanese, resident in California, to take title to and hold real estate, and to attend the public schools of the State.

With reference generally to citizens and noncitizens, that is, citizens and resident aliens, it is to be observed that throughout the civilized world there is an increasing tendency to make the distinction of little significance within the field of private rights, and within several of the States of the American Union even the right of suffrage has been extended to those aliens who have become domiciled and have declared their intention of becoming citizens, that is, as it is called, in the "first papers." See ALIENS; ALLEGIANCE; NATIONALITY; NATURALIZATION; NATURALIZATION LAWS; SUFFRAGE.

W. W. WILLOUGHBY,
Professor of Political Science, Johns Hopkins University.

CITRANGE, a hybrid between the common orange and the hardy trifoliolate orange, Poncirus trifoliata. This hybrid was first produced in 1905, and several varieties are now grown in the southern United States. The trees are very resistant to cold, being able to withstand temperatures as low as 15° or 10° F. without injury. The fruits are similar to those of the common orange, 1 to 4 inches in diameter. They are not grown commercially, but are planted for home use in regions of the South too cold for growing the common orange.

CITRIC ACID (C\(_6\)H\(_8\)O\(_7\)H\(_2\)O), a very widely distributed acid, present in most common fruit of the citrus family, especially the sweet oranges, lemons, citrons, cherries and many others. It is also a constituent of the sap of many plants. It was first separated and distinguished by Scheele in 1784. It is generally prepared from the dark treacle-like concentrated lemon juice imported from Sicily, Bergamot juice from Calabria or lime juice from Montserrat and Dominica. The process consists of filtering and neutralizing with chalk and quicklime, by which citrate of calcium is precipitated. This, by decomposition with a slight excess of sulphuric acid, gives the acid, which is then purified by repeated crystallization. The theoretical yield is from 51 to 64 ounces of commercial citric acid per gallon of juice, but this is seldom reached in practice. Several improvements have of late been introduced, both in preparing the crude lemon juice for exportation and in the subsequent purification and crystallization of the acid. As found in commerce citric acid is sometimes adulterated with tartaric acid which is distinctly observable by the brown coloration in the presence of potassium dichromate. Citric acid is white when pure; it crystallizes in two forms, one belonging to the triclinic system is the common form, and in it the acid contains one molecule of water, as indicated in the formula given above. The other form contains half the quantity of water. The ordinary crystals effloresce in the air in a warm room. Citric acid has a pleasant sour taste. It dissolves very readily in water and is soluble in alcohol, but insoluble in ether. When heated it undergoes decomposition and yields acetic, itaconic and citraconic acids, along with other products. It is acted on by nitric and sulphuric acids and by other reagents, yielding a variety of decompositions and derivatives.

Citric acid combines with the metals, forming citrates. They are crystalline salts and many of them are soluble in water. Crude citric acid is largely employed by the calico-printer as a resist and as a discharge.

Citric acid and the citrates are used in medicine as cooling drinks, as antidotes to alkalis and for the purpose of rendering the urine alkaline, thus overcoming abnormal acidity. Cit-
rates of magnesium are used as laxatives and cathartics.

CITRON, a tree (Citrus medica) related to the lemon, with a large lemon-like fruit having a thick peel and a small amount of very acid pulp. It is grown chiefly in the Mediterranean regions and large amounts of the fruit are preserved in brine and shipped to the United States, where the peel is candied and used for confectionery and culinary purposes. The trees are grown to a small extent in southern California. The name citron is also applied to a small variety of the watermelon which is used for preserving.

CITRON- MELON. See Watermelon.

CITRONELLA OIL, an oil obtained from a kind of grass (Andropogon nardus), cultivated at Singapore and in Ceylon. It is used for scenting soaps. Other species of the same genus and some other allied genera also yield essential oils.

CITRONELLE, sit-rô-nil', Ala., a village in Coffee County, where on 4 May 1865 the last Confederate army east of the Mississippi surrendered to the Federal troops under General Canby.

CITRONWOOD, or CITRUS-WOOD, the most costly furniture wood of Roman antiquity, usually regarded as derived from Biotis (Thuja) orientalis, or possibly from Callitris quadrivalvis, allied coniferous trees, both popularly known as Arbor vitae (Oriental and African). Cicero is said to have paid an enormous sum for a table of this wood.

CITTA VECCHIA, chè-tä věk'kë-a, a fortified city of Malta, formerly the capital, near the centre and almost on the highest point of the island, seven miles southwest of Valetta, which became the capital in 1570. Pop. 7,500.

CITTADELLA, chè-tä-de'lä, Italy, city in province of Padua, compartimento of Venetia, 30 mile northwest of Venice. It contains beautiful churches and botanical gardens. Its modern industries are the manufacture of paper, cotton, woolen goods and linen. It was founded in 1220, as a protection against Treviso, and has still retained its walls, tower and moat. Pop. 11,332.

CITY (Latin civitas). The Greeks and Romans distinguished a city from a town, or mere assemblage of people living together under municipal laws, as an independent community or state possessing sovereign authority, and including any portion of the surrounding territory the inhabitants of which possessed the rights of citizenship, but excluding conquered or dependent territories. Thus, Athens, Rome, and Carthage were all both towns and cities in different senses. In Europe the word city came to have two meanings, the one civil, the other ecclesiastical. The civil meaning corresponded with the Roman sense, in which the great Italian republics and the German free cities during the period of their independence corresponded with it. The fluctuations in time of such cities must necessarily have caused the word to lose the sense of territorial independence, and this change would be promoted by the rise of rivals to them in other respects having no such claim, so that in modern times a city has come to signify merely a town holding from extent of population, favorable situation or other causes, a leading place in the community in which it is situated. The ecclesiastical sense of the term city is a town with an archbishop or bishop. This seems to be the historical use of the term in England, and still possesses some authority there, but in general use it has been superseded by the wider one. In our historical retrospect we take the term in its least restricted sense.

The origin of cities belongs to the earliest period of history. According to Moses, Cain was the first founder of a city, and Nimrod built three, among which Babylon was the most important. The Jewish tradition is that Shem erected the first city after the deluge. At the commencement of society the form of government was patriarchal. The ruler was the head of the family or clan. Relationship, the innate wish of men to live in society, and more perhaps than both these causes, the necessity of providing means of defense against more powerful clans, brought together separate families to one spot. The fertility of the East also afforded facilities for pasture to and the rambling life of nomads and to form permanent settlements. These settlers began to barter with those tribes who continued to wander with their herds from place to place. This prosperity sprung up. These were then surrounded with walls to prevent the inroads of the wandering tribes. The bond of connection between their inhabitants thus became closer, and their organization more complete. As by degrees the chiefs of these states went away, the citizens began to elect the most able or most popular men for magistrates, without respect to birth or descent. Thus political institutions began to assume a systematic character.

The earliest form of government succeeding the patriarchal state was probably monarchical. In this the religious, paternal and political authority remained rudely mingled. When conquest extended the limits of these early kingdoms the authority of the king was weakened, his connection with the different parts of his dominions became imperfect and the progress of civilization was promoted almost solely by the growth of the cities. These gave rise to the division of labor, the refinements of social intercourse, the development of arts caused by the conflicting interests of many people living close together, the idea of equality of rights, the diminution of awe for a distant monarch, the growth of patriotism springing from the sense of advantages enjoyed and the exertion necessary to maintain them. These were the salutary consequences of the establishment of cities.

Under the mild sky of Asia, Africa, Greece and Italy cities were built first, and in the greatest number. The Phenicians and Egyptians particularly distinguished themselves by the erection of cities, which soon attained a high degree of wealth, and consequently of civilization. The Egyptians considered their city of Thebes older than any of the Greek cities; and Pliny says that Cecropia, said to have been erected in Attica by Cecrops, 1582 B.C., and afterward called "Athens," was the oldest city of Greece. Heeren justly remarks that the rise of cities was the true source of the republicanism of antiquity. This is particularly true of Greece. In fact cities
are, by their very nature, a democratic tendency. Some confederations of cities existed in the ancient world; for instance, the Phcenician, consisting of the cities of Tyre, Sidon, etc., and the Achaean league, formed by the most important cities of Greece, in order to strengthen themselves against the power of Macedonia. Under Alexander and his successor, the Romans began to establish colonial cities in Germany, having done the same long before in Gaul, Spain, Africa, etc. In Switzerland they first erected cities about 70 a.d., which, however, were mostly laid waste by 703, and subsequently rebuilt under the government of the Franks (496 a.d.). The Germans, accustomed to a wild, rambling life, did not show any disposition to live in cities until Charlemagne labored to collect them together in settled abodes from his desire to civilize them. Henry I distinguished himself particularly in this way, and on this account has been called by some "Henry the City-builder" (der Stadtbauer). He gave the cities great privileges, in order to induce the subjects to live in them, and thus laid the foundation of that power which at a future period contributed most to break down the feudal system. In many cities Imperial castles were erected to protect the inhabitants, and in the larger ones the devices and even the cruelties exercised by the feudal lords upon their peasants, or by the wandering knights and robbers, drove many people into the cities. The attacks of the neighboring lords gave firmness to the union, and compelled them to cultivate their resources. Commerce and the various arts and trades were soon cultivated within their walls, and their wealth and respectability increased. They soon became sensible of the want of a better system of laws and political administration than prevailed around them, and the principle of equal rights and laws was quickly developed.

One of the most important remnants, if not the most important, of the great fabric of ancient civilization, was the cities of Italy. In spite of their bloody contests with each other and the vices of an oligarchical government, Europe is mainly indebted to them for the civilization of the commercial spirit, together with the toleration and love of liberty, which, under the most unfavorable circumstances, it tends to foster, and for that ardor in the cultivation of arts, science and literature, which has always distinguished the best periods of Italian history, and from which the general revival of learning in Europe, called the Renaissance, took its rise. Under the reign of Conrad III (1138-52) the cities of Lombardy, and particularly Milan, which stood at their head, had acquired a high degree of wealth and power, and had formed themselves into a confederation. The struggles between the emperors and these cities for the possession of the most important portions of the history of the German empire and of Italy. Frederick I in vain demolished the powerful city of Milan. It was soon rebuilt, and the cities of Lombardy, in alliance with the Pope, obliged the Emperor Louis Told to whom they should be assigned. At the same time Cracow was declared an independent city, with a republican form of government.

Cities, as we have seen, naturally develop the democratic principle, and on this and several other accounts are to be considered among the
firmest supports of liberty. Well-organized municipal institutions, in which the government is in the hands of the citizens, afford continual homage to the spirit of freedom throughout a country.

In the United States a city is an incorporated municipality, usually governed by a mayor, aldermen and common council. In many of the States, especially the Eastern, the number required for legal municipal incorporation is 10,000. In several of the Western States a much smaller number is required. A village or town of 10,000 or more inhabitants is not obliged to become a city, and in several cases places of 20,000 and 30,000 have preferred for local reasons to remain under village government. In the United States cities are generally the outgrowth of villages; one village expands into a town with a population sufficient to assume the duties of a city; but in several instances, villages near each other have united to form a city, and sometimes cities nearby have united in one municipality.

The 10 largest cities in the world are London, New York, Paris, Tokyo, Chicago, Berlin, Victoria, Peking, Philadelphia, and Moscow. The cityward movement is common to all civilized countries. Not only the great industrial nations — the United States, Great Britain and Germany — but new countries holding vast unoccupied territories, such as Canada, Australia and New Zealand, have all felt the influence of the tidal movement that has set in toward urban centres. The explanation is plain and simple. The improvement in transportation facilities, the inclusion of one farm task after another — weaving, toolmaking, soapmaking, slaughtering — in the scope of the urban factory; the improvement of farm methods and farm machinery, making it possible to do the work still left to the farm with fewer hands; the encouragement given to the city as contrasted with the country, with tariff favors; the increasing array of financial and commercial middlemen required as communities become less self-sufficient and more dependent on world-wide exchanges, rendered the shifting inevitable. This migration to the cities has been accompanied by great congestion at the centre: in the East Side of New York 600,000 persons are huddled together on 1,250 acres; but within recent years there has been a movement in many large cities of factories and residences to the suburbs, when the problem becomes one of transportation from the business centre to the outlying residential districts. The most striking example of a city centre entirely given up to business interests is seen in the historic city of London, which during the day throbs with busy life, and in the night time becomes a city of caretakers.

In 1790 but 3.14 per cent of the inhabitants of the United States lived in cities; New York now contains a larger population than the States of the Union held at the beginning of the 19th century. In 1800 4 per cent were town dwellers; the proportions in 1830 and 1860 were 6.7 and 16.1 respectively. In 1890 the population living in urban places of 2,500 or more was 35.1 of the whole; in 1900, 40.5, in 1910, 46.1. In New York, New Jersey, Pennsylvania, Maryland, Illinois, Ohio, Colorado, California, Washington, and in all New England States with the exception of Vermont, the urban population predominates; New York, Chicago and Philadelphia contain about an eighth of the entire population of the United States.

The census of 1910 showed that 96.7 per cent of the inhabitants of Rhode Island lived in communities of 2,500 and over, 92.8 in Massachusetts, 78.8 in New York and 69.7 in Connecticut. The percentages for the South Atlantic States were 25.4 (19.5 in 1900), for the West Central States 22.3 (15.1 in 1900), and for the East South Central 18.7 (12.7 in 1900). The ratio of increase for the last decade was highest in cities of from 50,000 to 250,000, being 42 per cent. The rate of increase for the entire urban population was 38.5 per cent, as against 11.1 for the rural. A disquieting feature in the last returns is the fall of the birthrate in rural districts.

In England and Wales in 1851, 50.08 per cent of the population lived in towns; in 1911 the percentage was 78 per cent. In 1816 but 2 per cent of the population in Germany resided in cities of over 100,000 inhabitants. In 1910, 54.3 per cent were living in communities of 2,000 or over; the number living in cities of over 100,000 increased by 50 per cent in the last decade. In 1870, 68 per cent of the people were engaged in agriculture; in 1907-1908, 28 per cent. In France, Belgium and Holland the proportion of town dwellers is about 40 per cent. In Australia about one-third of the population is urban. In the decade from 1900-11 the rural population of Canada fell from 63 to 55 per cent of the whole. Even in the Western provinces, where millions of acres of virgin soil were opened for cultivation, the urban population showed a much greater relative increase than did the rural, and came near to the rural in absolute number, while in every one of the Eastern provinces with the exception of Quebec, the country population showed a decline.

Much has been said and written upon the immorality of large cities, and it cannot be denied that they have vices peculiar to themselves; but it must be considered, on the other hand, that they are free from many of those of petty towns, and even of rural districts. The association of men in masses, when due surveillance is exercised, has an influence distinctly favorable to the maintenance of social order, the impartial administration of justice, and, above all, the suppression of all petty and local tyrannies, and the maintenance of individual liberties. It is by the influence of cities alone that a sufficient organization for the support of education and the means of enlightenment is obtained, even though that organization often fails to penetrate the entire mass of the cities themselves. It is to them that many of the facilities for progress in art and science are due. It is in them that public opinion is formed, and so organized as to act upon the administration, and, even independently of direct representation, upon the legislation of a country; and although the individual freedom enjoyed in great cities may often tend to license, its general influence in an otherwise healthy community is highly beneficial to the moral tone of the whole. It must, however, be admitted that the democratic spirit in cities is so easily carried too far, that an excessive growth of large towns might become dangerous to the state. CITY APPROPRIATIONS—CITY COUNCILS

Government; Commission Form of Government.

CITY APPROPRIATIONS. See Appropriations, American System of; Budgets, American.

CITY OF BROTHERLY LOVE (Gr. *philadelphía, philadelphia, philos, philos*, dear, and *adelphos, adelphos*, brother). William Penn gave the English rendering of the two words as the name, Philadelphia, to a city in Pennsylvania. The common rendering into English of the name of the city is *City of Brotherly Love*.

CITY BUDGETS. See Budgets, American; Appropriations, American System of.

CITY OF CHURCHES, a name given to Brooklyn, N. Y., because of the large number of churches (350 in 1917) in proportion to the population, estimated 1 July 1916 at 1,928,432. The name was also given to Mexico City by Humboldt, where there were at the time 360 churches to 400,000 inhabitants.

CITY COUNCILS, American. Organization.—City councils in the United States are usually of the single-chamber type although many cities, including a few of the larger ones, have councils with the bicameral or double-chamber organization. In colonial times the single chamber prevailed in all the charted boroughs, but after the Revolution the double-chamber was introduced, largely through the application to city government of the so-called Pennsylvania plan, by which the State legislatures were the State legislature. Following their example the cities provided themselves with two local legislative bodies, commonly known as the board of aldermen and the common council, respectively. But in the course of time there came a reaction against the cumbersome system and it was in many communities abandoned. Eventually it will disappear altogether. No American city which has changed from the double to the single-chamber plan has ever retraced its steps in this regard.

The Councillors.—The number of members in American city councils varies greatly. Some small communities have only seven or nine councillors; more commonly the number is 15 or 21; in a few of the largest cities it rises much higher. In St. Louis 79; in New York the city's single legislative chamber (known as the board of aldermen) has 79 members; in Philadelphia the total membership of the two chambers is 132. But the drift has been everywhere in the direction of reduced membership. By charter amendments in recent years the number of councillors has been reduced in Boston to 9, in Saint Louis to 13 and Cleveland to 26.

Councillors are elected by popular vote; their term of service varies from one to four years in different cities; they are usually paid a stated salary per annum. As a general rule any voter is eligible to be a candidate for election; but in a few cities there are additional qualifications as to age or length of residence in the city.

There are three methods of electing members of city councils, namely, election by wards, election by the city at large and election by a combination of these two plans. In the smaller cities election at large is common. Both plans have their defects; the ward system too often results in the election of mediocre men, while under the scheme of election at large the entire slate of the dominant political party is frequently chosen and the minority party is left without representation entirely. The effort has been made to lessen these objections by a combination of the two plans, providing for the choice of some councillors by wards and others by the voters of the city as a whole.

The council elections are almost everywhere contested upon a partisan basis. From time to time non-partisan organizations put forward their candidates but rarely with continued success. Nominations are made by party conventions, or more commonly, by some form of primary, closed or open (see PRIMARY). The election is everywhere by secret ballot and ordinarily a plurality of the votes actually cast is sufficient to elect. In a few cities, however, the preferential form of ballot is used (see PREFERENTIAL VOTING). In most cities there are strict regulations for the prevention of fraud and corrupt practices at council elections and in some of them the maximum amount that may be spent by candidates or educate campaign expenses, is rigidly fixed by law.

City Council Procedure. — Each city council adopts its own rules of procedure, but these rules do not differ widely throughout the cities of the United States. Some of the meetings of the council are provided for, these meetings being held once a week in the larger municipalities, once a fortnight or even once a month in the smaller. In a few cities the mayor presides at these meetings, but for the most part the council chooses from its own membership a chairman or president to serve for one year. Meetings are almost invariably open to the public; the council records are kept by the city clerk or by a clerk of the council, and in the larger cities these are usually issued in printed form. Each city council has its own order of business and its own standing rules as to how business shall be disposed of; but these rules may usually be suspended by a two-thirds vote.

Council Committees. — As city councils have a considerable variety of business to deal with it is customary to maintain several standing committees. In large cities there may be 20 or more of these committees. Their selection is one of the first things to be done after a new council has been elected. In most cities the work of arranging the membership of these various committees is in the hands of the pre-
CITY COUNCILS

siding officer who makes his slate after consulting with the councillors and announces it when completed. In a few cases, however, the work is done by the council itself through the medium of a committee on which each member is designated as chairman and presides at the committee's meetings.

In the usual course of events all business coming to the city council for consideration is first referred to the appropriate committee. The standing committees on such fields of local administration as streets, public health, water supply, police, fire protection, parks, finance and so forth, each receive the matters which seem to come within their respective jurisdictions. At meetings of the committees these things are considered; public hearings are held if the importance of the matters in hand so warrant and in due course the committee reports to the council the recommendations upon each item that has been referred to it. The council may or may not adopt these recommendations but the committee's reports usually carry considerable weight. On the other hand the recommendations of the special committees are set aside frequently and this practice has greatly impaired the efficiency of the work done by the councils. So much business comes before the council that the members as a whole cannot study every question thoroughly. This work, if it is to be done at all, must be performed by committees. But the frequency with which the results of a committee's investigation are cast aside by the whole council has led to many abuses and forms one of the chief reasons for the growing demand that councils be reduced in size so that committees may be abolished altogether.

Powers of the Council.—(a) Legislative.

City councils are primarily legislative bodies; they frame and enact the local ordinances subject to the mayor's veto power where that power exists as it does in most cities. Through this ordinance-making power they exercise entire or partial jurisdiction over a great variety of matters of which only the most important can be described here. First of all come powers in the way of local taxation. In most cities the council determines the local tax rate although it does not, as a rule, have any discretion as to the amount of property that may be taxed nor the type of tax that may be imposed. These things are regulated by State law. But the rate of annual taxes depends upon the amounts of money appropriated for municipal expenditures, and these appropriations must in all cases be passed by the council before they become available. The estimates of necessary appropriations for each year may be transmitted to the council by the mayor, as in Boston; in a few cities, notably in New York, they are prepared under the supervision of an administrative body known as the board of estimate and apportionment; in some cities, as for example, in Chicago, they are arranged by a committee of the city council itself. But, however prepared, the estimates must be submitted to the council to be finally acted upon. If the estimate is segregated, the council acts upon it by item. Appropriations must be submitted to the specific limitations imposed by State law, however, there are certain general restrictions which apply to all ordinances. Ordinances to be valid must be reasonable; they must not
city manager plan of government

make unfair discriminations, and they must not be unwarrantably in restraint of trade. Whatever the council’s powers they must be exercised within the limits set by their general rules.

(b) Administrative powers. City councils are not administrative bodies, and strictly speaking they should possess no administrative functions. Nevertheless they do in most cities possess powers of this sort and in some of them powers of importance. Some administrative appointments are still made by city councils; the city clerk, for example, is frequently so selected. In various cities the council’s concurrence is necessary before appointments made by the mayor become valid. Its consent, moreover, is sometimes required for the award of contracts, for the acquisition of land when needed for parks or public buildings, and for changes in the organization of city departments or in the salaries of municipal officials. Usually it may investigate any branch of the city administration. And even in the absence of actual jurisdiction over administrative matters the council’s control of the city’s purse-strings necessarily gives it at least a substantial influence in this field.

Conclusion.—American city councils have been shorn of many powers but they still retain others of high importance. The tendency during the last half century has been to strengthen the executive branch of municipal government at the expense of the city legislature. In different cities this tendency has had varying degrees of strength; accordingly in no two cities of the land have city councils exactly the same jurisdiction. In some they retain much more than in others. See Cities, American, Government of; Commission Form of Government; Municipal Government.

William Bennett Munro, Professor of Municipal Government, Harvard University.

City of David, Bethlehem (modern Beit-Lahm, house of bread), supposed to be the birthplace of David, the place where his descendants had to go for the enrolment, when the census was taken by order of the Roman emperor. Jerusalem is sometimes called the ‘City of David’ because he captured it from the Jebusites and made it the capital of his kingdom.

City of Destruction, The. In Bunyan’s ‘Pilgrim’s Progress’ Christian begins his journey at this city and journeys to the Celestial city. The place of beginning represents the world with its temptations, and the place of ending, Heaven with its joys.

City Districts. See District.

City of Dreadful Night, The. This well-known poem by James Thomson was first published in The National Review in 1748. The initial, ‘V,’ for Bysson Vanolis, Thomson’s non-de Plume. The work is the most remarkable example in English literature of the unrestrained expression of intense and overpowering gloom. It has appropriately been called a ‘litany of pessimism.’ The author writes

‘Because a cold rage seize one at whiles
To show the bitter, old and wrinkled countenance,
Striped naked of all vesture that beguiles,
False dreams, false hopes, false masks and modes of youth.’

His words are addressed not to the happy, not to ‘those pious spirits with a God above them,’ not to oppressed workers who seek for a heaven upon earth, but to desolate and Fate-smitten sufferers like himself who see no ray of hope. ‘The City’ is life,—sombre, desolate, a hell on earth. It is empty, save for wreaths who move to and fro in the gloom like spectres, speaking as with one voice the message of despondency and woe. In a succession of vague incidents, which give forward movement to the meditation, the poet encounters one after another of these shadowy figures. He hears a sort of atheistical sermon preached from the dark pulpit of a cathedral to a vast congregation of ‘spectral wanderers of unholy night,’ counseling despair and suicide. The poem closes with a memorable description of Dürer’s ‘Melancholia,’ whom Thomson makes the presiding goddess of his doleful city.

False as the note of unrelieved pessimism may sound to healthy ears, there is in Thomson’s poem an unescapable appeal, due partly to the author’s compelling power of imagination, partly to the cadences of verse and partly to the very intensity of his mood. The atmosphere of gloomy mystery and the deep intonations of language in ‘The City’ are said to owe something to the poetry of Poe; it is true also that it is compounded of many simples.’ Yet Thomson’s poem remains not only highly original but unique. Thomson’s poems were published in collected form by Reeves and Turner in 1860; for comment consult Walker, ‘The Literature of the Victorian Era,’ and Steedman, ‘Victorian Poets.’

James H. Hanford.

City of God, The, a noted work by Saint Augustine. This, the most important of all the saint’s writings, was begun in 413, three years after the capture and pillage of Rome by the Visigoths under Alaric. The pagan had endeavored to show that this calamity was the natural consequence of the spread of the Christian religion, and the main purpose of Augustine is to refute them. The work was finished about 426. See De Civitate Dei.

City of a Hundred Towers, a name given to Pavia, Italy, from the many towers and steeples which first greet the traveler.

City of Magnificent Distances, The, a name given to Washington, D. C. When the city was planned, the last of the 18th century, the long and broad streets, with here and there small parks, almost all of which were out long distances in broad fields, caused this name to be given to it in derision. Now its citizens are proud of the title.

City Manager Plan of Government. As outlined in the charter of Dayton, Ohio, the council, or city managers of municipal government shall consist of a commission of five citizens, who shall be elected at large, . . . shall constitute the governing body with power as hereinafter provided to pass ordinances, adopt regulations, and appoint a chief
administrative officer to be known as the "City Manager,"... who shall be administrative head of the municipal government and shall be responsible for the efficient administration of all departments. He shall be appointed without regard to his political beliefs and may or may not be a resident of the city of Dayton when appointed. He shall hold office at the will of the commission and shall be subject to recall as herein provided. The powers and duties of the city manager shall be: (a) To see that the laws and ordinances are enforced; (b) to appoint and, except as herein provided, remove all directors of departments and all subordinate officers and employees in the departments in both the classified and unclassified service; all appointments to be upon merit and fitness alone, and in the classified service all appointments and removals to be subject to the civil service provisions of this charter; (c) to exercise control over all departments and divisions created... by the commission; (d) to attend all meetings of the commission with the right to take part in the discussion but having no vote; (e) to recommend to the commission for adoption such measures as he may deem necessary or expedient; (f) to keep the commission fully advised as to the financial condition and needs of the city; and (g) to perform such other duties as may be prescribed by this charter or be required of him by ordinance or resolution of the commission. The city manager may without notice cause the affairs of any department or the conduct of any officer or employee to be examined. Any person or persons appointed by the city manager [in this position] shall have the same power to compel the attendance of witnesses and the production of books and papers and other evidence, and to cause witnesses to be punished for contempt, as is conferred upon the commission by this charter.9

Such in brief are the powers and duties of the city manager, the minor details differing only slightly in the various cities operating under such government. Under commission government one responsible body supercedes the two and the number of elective officers is reduced; the responsibility for the administration of the various city services is fixed; and certain checks in the way of public control are provided. But in two respects the original plan of commission government fails to meet all requirements. In the first place the elective officers are called upon to execute what only the professionally experienced are competent to perform; and in the second place commission government fails to co-ordinate the work of administration by subordinating it to one central responsible authority. These defects are remedied by the city manager plan, since the manager is chosen because of expert qualifications and in turn appoints his subordinates on the basis of the same qualifications. Being appointed and subject to removal by him, under proper limitations, the department heads are responsible to him in every particular and hence he can use that compulsion which is frequently necessary to secure successful co-operation. On the other hand, none of the legal and political characteristics of commission government are interfered with or altered by the city manager — the commission retains its legislative function, its advisory capacity and its power to formulate broad-minded policies and wise plans, the execution being left to the expert. Toulin said the "unspoken qualifications, undoubtedly the chiefest in the make-up of a man in such a position are, first, absolute, unswerving adherence to his own view that efficiency, and hence results for the city, is the paramount thing; second, administrative experience in business; third, the maintenance of engineering works and the necessary technical education; and third, the ability to lead through tact as well as knowledge." When the commission selects the city manager, it has power to fix his salary and to secure the fact that the man the city finances will justify. Sometimes the salary of a city manager seems large but it is justified if the recipient save the city the excess and more by his economy of administration, without impairment of results.

The advantages claimed for the city manager plan are: (1) It creates a single-headed administrative establishment instead of several separate administrative establishments; (2) it permits expertness in administration at the head, where it is most needed; (3) it permits comparative permanence in office of city executive, whereas the terms of elective executives are rarely long, this permanence tending to eliminate amateur and transient executives and enabling the consummation of far-sighted policies extending over many years; (4) it permits the city manager to migrate from city to city, and thus as he need not be a resident of the city at the time of his appointment, an experienced man may be summoned at increased salary from a similar post in another city; (5) while giving a single-headed administration, it abolishes the one-man power of the old mayor-and-council plan, and, as the manager is subject to instant correction or even discharge by the commission, the city need not suffer from his personal whims or prejudices, whereas, on the other hand, the combined judgment of the whole commission safely submerges and averages the individual whims or prejudices of the various members of the commission, etc.

In 1908 the city of Staunton, Va., initiated the city manager plan in the United States by adopting an ordinance providing for a "general manager" who should assume all executive duties save those reserved to the finance, ordinance, school and auditing committees and be responsible to the elected governing body of the city; the mayor and council were retained because under the Virginia constitution the city could not change its government to the commission form. Hence the innovation created no widespread interest, but in 1912 the city of Sumter, S. C., directed attention to the plan by adopting a commission form of government and advertising widely throughout the country for applicants for the position of city manager. In 1911 the Board of Trade of Lockport, N. Y., secured the introduction in the New York legislature of a bill authorizing commission government with a city manager for cities of the third class in that State, but the bill failed to pass. Nevertheless the interest manifested in the city manager plan has resulted in its adoption in many cities in the United States and also the passage of general State-wide laws by Massachusetts, New York, Virginia, Ohio and Iowa, permitting all or certain classes of cities to adopt the plan. A list follows of the
number of cities operating wholly or in part under the city manager plan, and of some of the more important of these cities with the year in which the plan became effective.

Arkansas. 2. — Bentonville, 1915; Hot Springs, 1917.
Arizona. 3. — Phoenix, 1914; Tucson, 1915.
California. 10. — Balderfield, 1915; San Diego, 1915; San José, 1916; Santa Barbara, 1918.
Colorado. 2. — Durango, 1915.

Wisconsin. 1. — Horicon, 1914.

City of Oaks, a name given to Raleigh, N. C., from the size and beauty of some of the oak trees which adorn its streets.

City of Palaces, a name applied to Calcutta, India, from the numerous palace-like edifices.

City of the Plague, the name of a poem written by John Wilson (Christopher North), published in 1816. It is said to have been founded on the 'Journal of the Plague in London,' by Defoe.

City Planning. Due to the congestion of certain portions of cities, and their piece-meal development, without regard to order, with slums and inaccessible suburbs, greater attention is now being paid to the development of the science of city planning, for the purpose of balancing the different elements which constitute a municipality, and to give a greater degree of comfort and pleasure to its inhabitants. City planning is not alone a matter of engineering and architecture, but vitally concerned with the social, ethical and physical condition of the citizens. It means more light, purer air and more healthful and less expensive living quarters. City planning provides safer and more direct means of transportation, prevents traffic accidents and saves time. Conveniently located parks, places for recreation, public baths and gymnasiums, with access to woodlands and athletic fields, gives greater opportunity for physical development. The proper location of municipal markets affords cheap and wholesome supplies of food. These factors, together with the convenient location of schools, libraries, churches and other structures of a public nature, all unite to elevate the life of the citizens. A greater sense of civic responsibility is instilled in the citizens, their comfort and means of enjoyment are increased and the morale of the entire community is raised while the movement, as we know it, is recent, the concept of city planning is of the greatest antiquity. The remains of the earliest communal abodes of man, however primitive, show a certain definite arrangement. With the development of races, villages became towns, and towns, cities, continually on a larger scale; and it is undoubtedly true that the higher the degree of civilization of a people, the greater will be the size of its cities. The civilization of the Romans was largely expressed in the grandeur of the city of Rome, and the glories of ancient peoples were generally shown in their cities.

In the art of city planning, genius has occasionally arisen — among the early masters being Merian and Canaletto, the former developing the general plan of the city, while the latter excelled in the planning of its internal arrangements. Sir Christopher Wren, in 1666, after the great fire of London had the genius to present a plan for the reconstruction of the city that would have made it the most beautiful in the world, but he was ahead of his time, and London was permitted to grow up into the disordered mass of streets and lanes that makes it such a puzzle to the stranger. L'Enfant,
however, who planned the city of Washington, D. C., admittedly the most beautiful city in America and one of the most beautiful in the world, was not an architect, although he had the support of the founders of the republic and an unencumbered site upon which to build. Most city planners have had to reorganize existing cities. Equally fortunate was Breslau, where Humbold, with the help of the citizens, was given a free hand, and a plan was developed in which conceptions of order, convenience, variety and grandeur were not subjected to interference by questions of expense. Great avenues were cut through labyrinths of streets, and foul and congested districts were replaced by parks and spacious squares. The plan of the city of Buffalo is notable among American cities. Joseph Ellicott, an agent of the Holland Land Company, laid out the city in 1801-02. He is known as the "Father of Buffalo," and the city owes him a debt of gratitude for a well-conceived and well-executed plan, the fruit of his genius and foresight. Joseph Ellicott was a younger brother of Andrew Ellicott, the first land surveyor of the United States, who completed the city of Washington on the designs of the great French planner, L'Enfant. After him the art of city planning in America seems to have died, for, with the exception of Washington and Buffalo, American cities have been almost wholly built at haphazard.

The early masters, however, did not impart their theory, leaving instead only their accomplished work as examples. Modern or practical city planning is, therefore, a new art, of German origin, based upon principles, theories and practice reduced to a scientific basis. The originators and modern masters are Reinhard Bau- meister, the originator of the science of city planning, and Camille Sitte, the creator of the aesthetic principles governing the same, while, of practical city builders, Joseph Stübben is the greatest.

The results obtained by German city planners in applying scientific methods in the development of their cities have been studied by officials of other countries, with the consequence that within the past decade numerous cities in France, England, United States, Canada and Australia have organized city planning commissions, whose plan is to co-operate with the city authorities in many States of the Union laws which are in force to this effect; for instance, all third class cities (above 50,000 population) in the State of Pennsylvania must have city planning commissions, must retain a city planning expert and provide ways and means for the betterment and enlargement of their cities. The jurisdiction of these commissions covers also the territory within three miles of the city limit. Already more than 200 cities of the United States have adopted more or less comprehensive systems of city planning, and the number is constantly increasing.

Principles of City Planning.—The German city building movement produced great, practical city planners, who have left no municipal facts of their activities, as a result of the United Society of German Architects and Engineers in 1874 formulated a set of fundamental principles governing their activities. Some of the basic principles of enlarging a city, considered from the technical, the economic and the administrative points of view, are:

(1) The scope of city planning consists principally in fixing the base lines of all traffic movements and transit facilities, viz.: Streets, street cars, railroads and canals, which must be treated liberally and systematically. (2) The street net should contain the main streets, with the existing streets taken duly into consideration; the auxiliary streets which are fixed by local conditions; and in place of others subordinate streets, treated in accordance with the necessities of the immediate future, or having their development placed in the hands of interested property owners. (3) The grouping of the parts of the city should be effected in accordance with their location and individual characteristics, subject to such modification as may be demanded by sanitary considerations and the exigencies of commerce and industry. (4) The duty of the building department is to determine the rights and privileges of tenant and neighbor and house owner. Such rights and privileges are related to fire protection, freedom from interference, health, and safety of buildings; and all aesthetic considerations must be secondary. (5) It is evident that expropriation and appropriation be facilitated by legal measures, and of still more importance is the creation of a law providing for the regulation of new or reconstructed blocks to be built upon. (6) The city should be reimbursed by property holders directly benefited by improvements by funds advanced by the city for such purposes, and it is advisable to have the amount stipulated before the work is begun and a normal cost per front foot fixed. (7) The activities of interested property owners and associations, in regard to the improvement of certain sections, should be subject to municipal supervision. (8) Land upon which it is imperative to make improvements should only be built upon under reservations for its subsequent use by the city. The property owner whose land has been marked out for street improvements should be entitled to demand expropriation with compensation, in the event of delay in making the improvements. The installation of sewer connections to new buildings must be at the expense of the property holder, but the city should be obligated to install a complete system upon the guarantee of a sufficient number of property owners of abutting property.

In his work 'Stadtentwürfe in technischer, baupolizeilicher und wirtschaftlicher Beziehung' (1876), Baumeister says: "In the city of the future, there will be three principal divisions: a business section as a core, an industrial district, including possibly a wholesale and a residential district. It is, therefore, important that all large cities of the future, from the outset, should keep these principles in view. It must be recognized that the development of a city is confined to these three divisions and that they are interdependent in their development, though for the necessities of an immediate future, piecemeal progress may be made with subordinate projects. To each basic division belong main streets, railroads and drain- age canals, together with the concentration of industrial districts and the selection of places for public buildings and promenades. The immediate object is not to complete the planning at once, but to gain control of the ground that will be needed. In a good street net, dis-
CITY PLANNING

Division must be made between the main streets and the auxiliary streets. There must not only be variety in the city as a whole, but also in its various districts. Symmetry in grouping of buildings, picturesque perspective of streets and plazas, well chosen points of observation, and attractive successions of buildings constitute the individual elements of a satisfactory architectural impression. The straight stretches of the arterial highways of the city should be gradually transformed, as the suburbs are reached, into forms more characteristic of rural life, with curves and arches. Additional time will be consumed in traversing such streets, the life of the city has been left behind, and the enjoyment of the countryside have been reached. The further such avenues extend the more rural in character should they become.

The Civic Centre.—The heart of the city's design is the civic centre. It gives to the city its vital individuality, and imparts a sense of unity and cohesion that cannot be secured in any city, no matter how, with a suitable civic centre no longer gives the impression of being an accidental conglomeration of buildings; it becomes an organized whole and gains a new dignity and a new meaning. These centres, as a rule, are located in the heart of the city and have ready access from all parts of the city and surrounding suburban districts. Several main arteries of traffic radiate from the civic centre, making it also the centre of the city's street plan, the keystone in the arch of its design. Such a centre can hardly be too great in area, and, however expensive this may prove as an initial outlay, it will be of the greatest ultimate benefit. To make it easily accessible to all parts of the city, new avenues and streets have been cut through to afford the proper approach.

The buildings to be included within the civic centre are the city hall, courthouse, hall of records, post-office and Federal court, custom-house, administrative buildings for the various departments, and certain buildings of a commercial character, either in the civic centre or adjacent thereto and contributing to its general effect, such as a chamber of commerce, banks and life insurance buildings. The leading principle of the design is that one of the buildings dominates the rest. This one is usually the city hall or courthouse. The other buildings are in character and style related to the dominant building, but not of such size or outline as to detract from its importance, as it should be, in an artistic sense, protective of the others. Another important principle of the civic centre is balance, the buildings being so proportioned and placed with reference to each other that their masses and outlines produce a pleasing effect. The design of a civic centre is an artistic problem of great magnitude. It is a painting, with the city and the sky as a background, a sculpture in masses, and it should have strength, feeling, completeness, balance and splendor. The art of the civic architect is one in which the artist finds opportunity for expression not attainable in any other art. Probably the best example in the world of a civic centre is to be found in Washington. Originally built after the plans of L'Enfant, improvements have been continually added, in particular, in accordance with the report of the Senate (1902) regarding the construction of public buildings. Philadelphia, Seattle and Chicago, as well as many other American cities, have planned and built civic centres on the most approved plan.

Main Streets.—The proper expansion of a city depends upon the arrangements of the main streets conforming to the topography, what is known as the great ground plan. Most American cities have rectangular block systems, with long straight streets. Few have diagonal and circumferential streets, often found in European cities. Very excellent examples of great ground plans are those of the cities, Karlsruhe and Mannheim, Germany. The principles given in this system of streets have been adopted in many European and American cities. For instance, the horsehoe effect, according to the plan of Mannheim, has been adopted in the remodeling of Chicago and St. Louis, while the radiating street system of Karlsruhe is being followed in the new capital of India, New Delhi. This radiating street plan has been found in Washington, D. C., and Buffalo, N. Y.

The area occupied by streets varies, ordinarily from 30 to 40 per cent of the total area of the city. The streets of Washington, which are unusually wide and imposing, occupy 44 per cent of the city's total area. By the Prussian law of 1875, enacted to regulate the streets of Berlin, it was prescribed that the main streets should be 95 feet or more in width; secondary thoroughfares from 65 to 95 feet; and local streets from 40 to 65 feet. Another standard, for secondary German cities, such as Düsseldorf, Cologne, Frankfurt, etc., is: Main thoroughfares, 85 to 120 feet; secondary thoroughfares, 50 to 80 feet; and local streets, 30 to 40 feet.

In London, the Royal Commission on London Traffic, in its report of 1905, stated: "The chief difficulty that stands in the way of improving the means of locomotion in London is the narrowness of the streets, and the fact that they were not originally laid out on any general plan." In accordance therewith it was recommended that the following be observed: Main avenues, 140 feet; first class arterial streets, 100 feet; second class arterial streets, 80 feet; third class 60 feet, and 40 feet; fourth class 40 to 50 feet, the width in each case to include the footways on either side, and no street to be less than 40 feet.

The widths of the more prominent avenues in European cities are as follows: Avenue des Champs-Élysées, Paris, 230 feet; Reeperbahn, Hamburg, 210; Unter den Linden, Berlin, 190; Ring-Strasse, Vienna, 185; Belle-Alliance Strasse, Berlin, 160; Andrássy, Budapest, 145; Avenue Henri Martin, Paris, 130; Whitehall, London, 120-145; Victoria Embankment, London, 120; Potsdamer and Friedrich Wilhelm Strasse, Berlin, 110; Princess and George Streets, Edinburgh, 100; Avenue de l'Opéra and Paris Boulevards, Paris, 98; Holborn Viaduct, London, 90; Regent Street Quadrant, London, 80; New York, 30; London, 75; and Queen Victoria Street, London, 70.

One of the main objects in modern city planning is to secure streets of definite length, properly terminated, or curved or otherwise changed as to direction, avoiding the principle of having them of the same width throughout.
1 Approach to Williamsburg Bridge, New York City
2 Civic Center Project for the City of Seattle
The eye should rest at easy distances upon columns, arches, statues, fountains, façades or other visible objects, and the locality of unity will thus be gained. Without a terminal, a vista is meaningless. What, for example, would the Avenue de l’Opéra be without the closure of the Grand Opera House; Rue Royale, without the Madeleine; Avenue Victoria, without the Hotel de Ville; the Vienna Burgring, without the Parliament building; Reichsratstrasse, without the Votiv Kirche; and Unter den Linden, without the Brandenburg Tor.

In undertakings of breaking new streets, foreign cities have not hesitated at expense. Paris it is estimated has spent $265,000,000 on its reconstruction. London in new streets has spent $100,000,000, and the new commission has under way expenditures that will increase this by $125,000,000. That expenditures for the betterment of traffic conditions are justified is shown by a calculation made with reference to the improvement in a portion of Saint Louis, the one street of 130 feet, a short stretch of three blocks. It is estimated that the saving in time to those using the cut-off would amount to $500,000 in a year. The calculation is on the following basis: The savings would amount to 10 minutes per day for every person traveling over the road. In a year this would amount to 100 hours per person, which at 20 cents per hour means a saving of $20 per year, or for a traffic of 25,000 per day, or one-twentieth of the city’s population — the aggregate of $500,000 per annum.

Civic Embellishment.—Unless the streets of a city are properly embellished, kept free from nuisances, and given proper attention in every detail, the city will fail in realizing its full advantages, however well it may be planned. Such embellishments comprise, among other features, boulevards, esplanades, bridge and park approaches, water gates, quays, plazas, squares, bay fronts, terraces, monuments, statuary, fountains, trees, grass plots, artistically designed electrici, trolley poles and other like structures and details. The combination of such features makes up the individual worth of the streets, and for this point carelessness, neglect or inaccuracy in the treatment of small structures or other objects is likely to destroy the whole effect and spoil what has been accomplished at the cost of much time, skill, labor and expense.

Of the more important features of civil embellishment are the boulevards, esplanades and plazas, with the liberal provision of grass plots, shrubbery and trees on the streets. Among the trees that are useful for city purposes are the following: Norway Maple, Sugar Maple, Scotch and American Elms, Cottonwood, Horse Chestnut, Red, White and Pine Oaks, Ash, Catalpa, Linden, Kentucky Coffee Tree, Thornless Honey Locust, Lombardy Poplar, Evergreen Pines and Building Regulation.—In human cities the height of buildings is subject to very strict regulations. In Berlin, the height permitted is from 18 to 24 metres, or from 59 to 79 feet. The minimum height to which buildings are limited varies in different cities: in Hamburg, in Bremen and in Kiel it is 15 metres (49 feet); in Munich 12 metres (39½ feet); and in Kiel and Cologne, 11 metres (36 feet), this
being the minimum on the narrowest streets. It is greater, however, in the wider streets. It is only the height of buildings regulated in German cities, but also the maximum and minimum number of stories, which depends on the zone in which the building is situated. In Berlin and Hamburg, the greater number of buildings must be either four or five stories in height. The duchy of Baden, the number of stories runs from three to five, in the suburbs and outlying districts, three being the maximum, and in the business districts the maximum being five. In Munich, Cologne, Düsseldorf, Halle and Breslau, all buildings must be at least two stories in height, but in Bremen, one-story buildings may be erected. In Baden, houses in the country are not permitted to be over two stories in height.

Many American cities have taken up the question of the regulation of the maximum height of buildings, and the following are excerpts from several of their regulations: Baltimore, Md.: No building more than 175 feet, except that towers, spires or belfries in fireproof building may exceed to a greater height. Boston, Mass.: No ordinance, but building regulations provide the following: City divided into districts. District A, buildings of fireproof construction may be erected to a height of 125 feet; in another district, to a height of 100 feet; in a third, to 80 feet; but the buildings in these latter districts are not of the same construction as in District A. Buffalo, N. Y.: Outside the fire limits of the city of Buffalo, it shall be lawful to erect frame buildings not exceeding 50 feet in height from the sidewalk to the highest point of roof. Cleveland, Ohio: No building or other structure hereafter erected except a church spire, shot tower, water tower or smokestack, shall be of a height exceeding 2½ times the width of the widest street upon which the building faces, but no building shall be over 200 feet high. Denver, Colo.: No building or structure to exceed 12 stories except spires, towers, smokestacks, etc. All buildings or structures more than 125 feet high to be absolutely fireproof. Los Angeles, Cal.: Fire district, one story only, and not over 16 feet high. Class A. All buildings upheld by masonry or reinforced concrete or framework of steel or iron. Fireproof or skeleton construction. No building over 150 feet high, allowing 30 feet for mansard roof—nothing more than seven stories. Class B. Masonry or masonry and steel, and iron and steel buildings, supporting iron or steel masonry. No over 100 feet high, nor more than eight stories. Class C. Masonry or reinforced concrete walls, floors not wholly carried by steel columns and girders or reinforced concrete and masonry—85 feet high, not more than six stories, exclusive of basements. Class D. All buildings not included in A, B and C, not more than 50 feet high, nor more than four stories. Louisville, Ky.: No nonfireproof building or structure outside the fire limits shall exceed 70 feet in height, but this shall not apply to spires of churches or similar buildings outside of the fire limits which may be of wood to a height of 125 above the curb level. Portland, Ore.: Class I (Absolutely fireproof), 12 stories, or 160 feet. Class II (Fireproof, short span), 12 stories, or 160 feet. Class III (Fireproof, long span), 10 stories, or 140 feet. Class IV (Semi-fireproof), 6 stories, or 85 feet. Class V (Mill construction), 6 stories, or 85 feet. Class VI (Addition or extension), 4 stories, or 60 feet. Class VII (Frame construction), 3 stories, or 42 feet. Providence, R. I.: No ordinance. Building regulations provide: No nonfireproof building or structure hereafter should exceed 120 feet in height. Fireproof building (ordinary) or structure hereafter erected shall exceed 120 feet in height, except that structures or appendages may be built upon roofs of said buildings not exceeding 20 feet in height, provided that said structure or appendage shall be built of incombustible material throughout. Every building hereafter erected or altered to be used as a theatre or public station which exceeds 3 stories or more than 40 feet in height, shall be built fireproof (absolute) except as hereafter specified. Rochester, N. Y.: No ordinance. Height regulated to conform to size and strength of foundations and construction of walls. San Francisco, Cal.: Fireproof buildings, 102 feet; semi-fireproof, 80 feet; ordinary, 64 feet. The regulation of the height of buildings is only one of the numerous rules made and enforced abroad. Among the important ones are those affecting the ratio of the area of the building to that of the lot, the separation of buildings, classes of buildings, classes of area between buildings, minimum number of rooms in an apartment, window area, height of ceilings and cubic air content of sleeping-rooms. Representative figures are selected, which, though in many cases not applicable to American cities, will give a good idea of the regulations. The area of the lot which may be built over in cities in the grand duchy of Baden, the regulations of which are regarded as being well worked out, varies according to the zone, from three-quarters to four-fifths of the total area. In the outlying districts, these figures are reversed, it being permissible to build only over one-quarter to one-fifth of the total area of the lot. In other cities the regulations vary, but are all on the same basis, a difference being made according to the zone.

The regulations abroad as regards the classes of buildings that may be used as workingmen's homes require the apartment used by the family to contain a living-room, a sleeping-room and a kitchen. The living-room is required to be of a certain size. In Wiesbaden, this is 75 square feet; throughout Baden, 107 square feet; in Karlsruhe, 130 square feet; in Mannheim, 160 square feet; at the minimum. In the last named city, the kitchen must not be less than 130 square feet in area. There are in addition requirements as to the total area of the rooms, which in Düsseldorf, Magdeburg and throughout Saxony must not be less than 220 square feet. The height of the rooms is generally placed at not less than two and a half metres, or 8.2 feet, while the window area must be from one-twelfth to one-sixth of the area of the floor, an average being one-fourth. The minimum cubic air content of the rooms is also fixed by regulation at from 250 to 700 cubic feet, being in Baden 350 cubic feet. Block and Zone Systems.—The regulations as to space not built upon are sometimes based on the number of families occupying a
building. In Altona, 160 square feet per family must be left open in the main portions of the city, while in the suburbs, 1,100 square feet per family are prescribed. Among other rules are those in reference to light, there being provisions to the effect that certain windows of buildings shall receive light at angles of from 30 to 60 degrees over the walls of others, but these regulations are of a somewhat complicated nature and are not easily applied. In London, the right to "ancient light" has had the effect of causing theatres to be built practically underground, so that the highest priced seats are in the gallery near the street level, and the pit is far below.

In buildings in Germany in which the upper floor is 36 feet above the street, two stairways are usually required, though in exceptional instances one is permitted. Every portion of the floor must be within 98 feet of a stairway. All stairways must extend to the roof, or, if the main stairway does not go to the roof, an auxiliary stairway at least two and one-half feet wide must be provided to go to the roof. In many buildings the stairs are in a stairway house, that is to say, alcoves or lean-tos at the side of the building, of a fireproof construction. The shape of the stair halls is regulated and under some circumstances no corner is allowed. The regulations in different cities vary to some extent. In some buildings of more than two floors above the street, the floor must have two staircases, irrespective of their floor area. The main stairways must not be less than three and three-fourths feet in width, while the stairs to the roof and basement must be three feet wide.

One of the difficult problems in connection with the design of buildings in congested or closely built up blocks is to provide light and air for the rear rooms. To obtain a suitable circulation of air is even more troublesome than to secure light. A method adopted with great success for securing the direct circulation of air in blocks is to leave openings at the ends of the blocks. The houses face all four sides of the block, but there are four openings at the rear of the houses on the ends of the block. Blocks of this kind are to be found in cities in England, Holland and in some German cities, notably Bremen. In some blocks the houses only face the sides of the block. The breeze is free to sweep the entire length, there being no houses at the ends. Such blocks are required by ordinance in the cities of Mannheim and Posen in Germany.

A large number of American cities have alleys bordered by dwellings, such, for example, as the city of Allentown, Pa. There the alleys have the form of a capital "H," the two vertical bars of the "H" joining the main thoroughfares. A new block plan was adopted in 1916 (see the illustration). The plan to eliminate all interior buildings and, instead of the middle bar of the "H" in the alley system, to have two narrow alleys, spaced 40 to 50 feet apart, was adopted, thus making an interior plot of this width and about 100 feet in length, the interior being enclosed and used as a playground for the children residing in the block and provided with simple playground equipment.

Following the practice in Europe, American cities, such as New York, Washington, Baltimore, Los Angeles, Seattle and Boston have adopted zone or districting systems for dividing the city according to the purposes for which the different sections are best adapted or are already used. This establishment of the zone system is of as much importance in the older cities as in those under development. The number of zones depends largely on the activities of the city and on the extent to which the citizens are willing to submit. Those of European cities are much more numerous than would be practicable in America. For example, Karlsruhe, a city of 150,000 inhabitants, has as many as 16 different zones, while American cities have ordinarily adopted from four to six
zones for their purposes. The following is a workable basis for the extension of the system in the ordinary American city: (1) Residential district, (a) light traffic, no stores; (b) medium traffic, stores; (2) Business district, (a) medium traffic; (b) heavy traffic; (3) Industrial districts, employees per establishment; (b) over 100 employees per establishment; (4) Tenement district, stores and heavy traffic; (5) Warehousing district, heavy traffic. Other articles on city planning will be found under "Land Use" and "Recreation Centres.

**FRANK KOESTER.**

Author of "Modern City Planning and Maintenance."

---

**CITY OF THE PROPHET,** a name given to Medina, in Hedjaz, Arabia, the second holy city of the Mohammedans, the place where Mohammed took refuge, in 622, from Mecca, and the city where he died.

**CITY OF THE STRAITS,** often applied to Detroit, Mich., from its position. It is situated on that part of Detroit River between Lake Saint Clair and Lake Erie.

**CITY OF THE SUN,** a name given to Baalbec, an ancient city of Syria, built on the ruins of the Greek city, Heliopolis, "The Sun City."

**CITY OF VICTORY,** a translation of the Arabic name for Cairo, the capital of Egypt.

**CITY OF THE VIOLET CROWN,** the name applied to Athens.

**CITY WATER SUPPLY.** See Water Supply.

**CIUDAD BOLIVAR,** the capital of the state of Bolivar, on the Orinoco, about 240 miles from the sea, with governor's residence, a college, a cathedral and a considerable trade, steamers and sailing-vessels ascending to the town. Exports: coffee, gold, cotton, indigo, tobacco, cattle, rubber, hides, sugar, asphalt, etc. Imports: manufactured goods, wines, flour, etc. Ciudad Bolivar was founded in 1764. It was first called San Tomás de la Nueva Guayana, but was long known as Angostura ("the narrow") because of its situation at a narrow part of the river. In 1819 the Congress met here, which, under Simon Bolivar, formed the republic of Colombia out of the Spanish states of New Granada and Venezuela. Since then the city has been known as Ciudad Bolivar ("Bolivar's city") Pop. 11,686.

**CIUDAD DE CURA,** dà koo'-râ, or CURA. Venezuela, in the state of Guzman Blanco, 35 miles southwest of the city of Caracas, about
20 miles east of Lake Valencia. It is an 18th century city, but many of its new buildings are modern in style and beautiful in architecture. The streets are broad, many small parks adorn the city and the playgrounds are justly proud of their library. Pop. 12,600.

CIUDAD PORFIRIO DIAZ, pó-rfîr-ô déâth, Mexico, town in the state of Coahuila, on the Rio Grande, opposite Eagle Pass, Tex., on the Mexican International Railroad, and the Mexican terminal of the international bridge across the Rio Grande. It has a custom-house, army post, large cattle markets and but poor buildings for the storage of fruits or grains. It is situated in an agricultural region, and its trade with the United States consists chiefly in exporting grain, fruit and cattle and in importing manufactured articles. Coal beds near are of value and may cause the establishing of manufactories. It was founded in 1849. Pop. 5,200.

CIUDAD REAL, the name of a province of Spain, occupying the southern part of New Andalusia and of its capital. The area of the province is 7,620 square miles. The surface in general is bare looking, immense plains stretching from the mountains of Toledo to the Sierra Morena. The mountains of Ciudad Real abound in minerals: iron, silver, copper, lead, antimony, cinnabar and coal; also in quarries of marble, jasper, quartzite, granite, etc. Medicinal and mineral springs, both hot and cold, are abundant. The climate is dry, and in the heat of summer very oppressive. The plains and valleys are productive in the vicinity of the rivers; in favorable seasons good crops of cereals are obtained. Cattle, sheep and mules are reared. Woolen, linen and other fabrics, hardware, earthenware, esparto, etc., are manufactured; brandy, wine and oil of good quality are made. Metals, manufactured goods, brandy, wine and oil, horses, mules and cattle are exported. The city of Ciudad Real is situated on a low plain near the Guadiana, 100 miles south of Madrid. The walls are in many parts in ruins. The principal edifices are the church of Santa Maria del Prado, consisting only of a single nave, but so grand and lofty that no other in Spain, except the cathedral of Seville, can compare with it. There is also an excellent institute, with a good botanical and garden. The manufactures and the trade are of little importance—the former of woolen and linen cloths, the latter of grain, wheat, wine, etc. Pop. about 15,000. Pop. of the province about 321,580.

CIUDAD RODRIGO, rôd-rî-go, Spain, fortified town in Leon, on the river Agueda, eight miles east of the Portuguese frontier. There is a castle dating from the 13th century. The cathedral was begun in 1190 and contains many interesting features. Ciudad Rodrigo was a place of considerable importance in early Spanish history as a frontier fortress. It was taken by the English in 1706, during the war of the Spanish Succession, and recovered by the Spanish in 1717. The fortress was surrendered to the French under Ney, 10 July, 1810, but was not taken until 25 days; and 19 Jan. 1812 it was taken by storm by the British under Wellington, after a siege of 11 days. The Cortes bestowed on Wellington the title of Duke of Ciudad Rodrigo. Pop. about 9,000.

CIUDAD VICTORIA, vík-tôr-î-a, Mexico, capital of the state of Tamaulipas, on the main line of the railroad which runs from Tampico to Monterey, about 100 miles from the coast. It is in a sugar and fruit-growing region, but the sugar only is exported. It is an episcopal see and the residence of a consular agent of the United States. The city was founded about 1750 under the name of Santa Maria del Refugio de Aguayo, and the name now in use is its present name adopted. Pop. about 11,000.

CIVETS, a family of small carnivorous mammals, the Viverridae, related to both the hyenas and the cats. Their alliance to the former appears when the fossil history of the family is traced back to the early Tertiary, where the ancestry of both converges. The comparatively coarse hair and erect mane possessed by some species, and dentition, are still hyena-like; while the slender, elongated form, long tail and especially the fact that the claws are semi-retractile, exhibit the inborn likeness to the cats. The civets vary from two to three feet in length, and most of the species are strongly marked in black and white stripes and spots, sometimes prettily disposed. They are distributed throughout the warmer parts of the Old World, abounding in Africa and the Malayan Islands, but are absent from the Australian region. The family is divisible into two groups, one of which includes the typical civets; the African genets, one species of which also inhabits Spain and Portugal; the Iriusang and other Oriental spotted forms and the parasuches. The second group includes the mungoos and other ichneumons, suricates and the like. These various forms will be found described elsewhere under their separate names.

Civets feed upon smaller mammals, birds' eggs, lizards and snakes, and are considered beneficial because of their appetite for crocodile eggs, which they devour in great quantities along the Nile. They are characterized by, and chiefly valued for, an odorous, fatty substance, contained in a pouch connected with the sexual organs, in both sexes. This substance is used for compounding perfumes, and is ready for use after it has been drained, washed and dried. It is called "civet" in Castile, and Castellane averts to it as a "something baser than tar, the very uncleanly flux of a cat." A dram is obtained at a time from each animal, from which it is taken at intervals of a few days. Many thousand ounces are annually imported into London. Pure civet is valued at about $10 an ounce. The American "civet-cat" is the cacomistle (q.v.), which is not a true civet, but nearly related to the raccoons.

CIVIC CROWN, among the Romans, the highest military reward assigned to him who had preserved the life of a citizen in battle. It bore the inscription Q. Q. Q. 5, 4, 3. The word is *for saving a citizen,* and was made of oak leaves. He who was rescued offered it, at the command of his leader, to his preserver, whom he was bound to honor afterward as a father. Under the emperors it was bestowed only by them. The person who received the crown wore it in the theatre, and sat next the senators. When he came in all the assembly rose up as a mark of respect. The Senate granted to Augustus, as a particular mark of honor, that a civic crown should be placed on the pediment
of his house, between two wreaths of laurel, as a sign that he was the constant preserver of his fellow-citizens and the conqueror of his enemies. Similar honors were also granted to the Emperor Claudius.

CIVICS AND CIVICS TEACHING.

Civics is now a term broadly applied to the activities of the citizen in his relationship to the state and the society. When it first came into use it was generally interpreted to mean the relationship of the citizen to the state and supplanted the earlier expression "civil government.

Along its broader definition it now includes a wide variety of forms. Thus we have its use as:

1. Civics, sometimes modified by the word political, and interpreted to mean a study of governmental machinery.
2. Civics, including the first definition and adding thereto the idea of the duties of the individual to the state.
3. Community civics, emphasizing strongly the idea of the relation of the citizen to the immediate environment in which he is living, and ultimately the state and the nation, with the many obligations which they entail — political, social, industrial, and moral or ethical.
4. Social civics, stressing the duties of the citizen to society and social betterment, with emphasis on social agencies, but little attention to governmental machinery.
5. Industrial civics, emphasizing the relation of the citizen to industries.
6. Moral or ethical civics, pertaining to citizens' activities with relation to the moral or ethical standards of himself and his fellows.

Each one of these many conceptions or subdivisions of civics has grown out of the original conception of civics as civil government. It was not until after the middle of the 19th century that the idea of teaching civil government in the schools or colleges took any root at all. Previous to that time it was felt that the ordinary citizen would derive his knowledge of government by actual participation in it when he reached the voting age. This was always an ineffectual method of instruction, but its defects were only forcibly made clear when immigrants began to swarm into the United States in the middle and latter half of the century. Teachers' organizations and judicial officers soon detected the danger of allowing such people and their children to remain in ignorance and began a campaign for the introduction of the study into the schools.

The colleges gave them no encouragement or assistance, for it was at a time when literary education had strongest hold on those higher institutions and the utilitarian was rigidly excluded. The agitation, therefore, met with but little success. Schoolmen in general evinced little interest in it, and it was only in the early eighties that the Constitution of the United States began to be put into the backs of history textbooks of the elementary schools and the pupils were given some instruction in government.

Progress in the subject, however, was slow until an impetus was given from above. The colleges had shown themselves singularly obdurate to the study of political science within their own walls, and it was only in the middle of the late eighties that the subject began to make headway there. Once that men and women connected with higher institutions began to take an interest in the subject, the way for the introduction of the study of government in the lower schools was made easy.

The whole curriculum of secondary education was made the subject of a study by a Committee of 10 of the National Education Association from 1890 to 1893. A sub-committee was given the subjects of history, civil government and political economy to deal with. This met at Madison, Wis., in December 1892, and was known as the Madison Conference. It made the following remarks and recommendations:

"Civil government is pursued at present in very few grammar schools, certainly in not more than one-sixth of those which have come under our observation. It is, however, rather a frequent subject in high schools, about one-third offering some sort of instruction in it. In actual teaching it seems little associated with history; it is usually simply a textbook study during a part of one year; and very few of the teachers seem to be familiar with the subject.

"Resolved, that to American history be added the elements of civil government."

"That American history and civil government be taught in the last year of the elementary school and in the last year of the high school."

In 1895 the Committee of 15 of the same Association, which considered the subject of elementary education, recommended: "The study of the outlines of the Constitution, for 10 or 15 weeks in the final year of the elementary school."

In 1897 the Committee on Rural Schools recommended that "some work in civics should be taken up with children between the ages of 9 and 13 years, and that for those between 11 and 13 duties to the native land, treating under this title the organization and principles of our form of government (civics) should be taught. As a preparation the teacher should carefully read some systematic treatises on ethics and civics."

In 1899 a Committee of Seven of the American Historical Association recommended the study of government in the course in American history in the last year of the high school course. In 1910 a Committee of Eight of the same Association, especially appointed to consider history in the elementary schools, made clear that elementary civics should permeate the entire life of the school and recommended a course of study for it through grades five, six, seven and eight, to be taught in connection with history.

The subject had by this time become thoroughly established in the colleges and secondary schools. In the colleges the courses in government had been introduced gradually through the eighties and nineties, usually, however, under the control of the professors of history, and sometimes even denominated as history courses. The separation of courses in distinctly history and distinctly government courses took place rapidly in the colleges, but in the secondary schools the combination lingered.

In 1908 a Committee of Five of the American Political Science Association and Committee on Civics of the New England History Teachers' Association strongly recommended a course in civics for high schools which should be separated from the history course, and in 1911 a Committee of Five of the American Historical Association made recommendations to the same effect.
Organizations outside of academic circles began campaigns for the more effective teaching of civics. Among the most prominent of these was the National Municipal League, which in 1901 began a series of reports on college work in government and in 1905 published a syllabus for elementary and secondary schools.

Following the activities of this organization the Bureau of Education at Washington appointed an agent in civic education and a special committee issued a report in 1915, urging the teaching of civics in elementary and secondary schools along somewhat new lines. This report urged that emphasis be placed on "Community Civics." "The aim of community civics is to help the child to know his community . . . what it does for him and how it does it; what the community has a right to expect from him, and how he may fulfil his obligation; meanwhile cultivating in him the essential qualities and habits of good citizenship."

Meanwhile the American Political Science Association appointed as part of its Seven at work, and in 1916 it published the most complete survey to date covering instruction in civics or government in elementary schools, junior high schools, high schools, colleges and universities. It summarizes all activities up to the present and makes constructive recommendations.

In spite of the commendable activities of these various bodies progress in the matter of getting thorough courses in civics introduced into the rural schools, elementary schools and high schools has been slow and yet the progress when considered over half a century has been very great.

The entrance of the United States into the war in 1917 awakened the public to the fact that there has been great neglect in putting into operation the recommendations so urgently pushed by the associations mentioned above, and now (1918) there is evident in many parts of the country a desire to do that which has been so long neglected. The greatest difficulty encountered has been the lack of teachers properly prepared to teach the subject. Women, who form the overwhelming proportion of the teaching force, have, probably from the fact of their exclusion from past activities of their local government, failed to evince any active interest in the subject. Such teaching as has been given has been of a purely formal kind from a textbook. At the time of the earliest introduction of the subject, instruction usually consisted of reading or studying the Federal Constitution and sometimes even committing it to memory. The very nature of its introduction in the form of an appendix to a history of the United States scarcely permitted of any other kind of method and even the proponents of its introduction seemingly had no conception that it could be taught in any other fashion.

Gradually separate textbooks were published, but these at first consisted of commentaries on the clauses of the Federal Constitution. The State and local government was entirely neglected. Even when these subjects were added, as they gradually came to be, instruction was of the most formal and uninteresting kind.

Any other kind of teaching demanded of the teachers was impossible to have for the reason that they did not know the subject except from a text. The better prepared teachers began to teach the subject of government as it was actually carried on and the demand for that kind of instruction kept growing. This was difficult to get because civics, of all subjects, was one which demanded for its successful teaching a thorough preparation and the habit on the part of the teacher of keeping abreast with the news of the day.

The confusion of counsels in the ranks of its protagonists kept even the best prepared teachers from doing effective work. Those who had recommended that civics be taught as a part of history played into the hands of school officials who were only too glad to tack it on to another subject, so as to avoid taking away time from other subjects in the school curricula.

In such a position the teaching of the subject usually became nothing more than a study of constitutional history and such knowledge of actual government as was obtained by the pupil could only be had by rote before an examination. Even with the best of prepared teachers the subject under such circumstances inevitably became one of the study of machinery rather than of the functions of government.

It was largely to remedy such a condition of affairs that the study of community civics was introduced. Through this medium the pupil was to look about him, find out for himself what the government was doing for him and through that means approach the study of the agency of machinery of governmental activity. This method of study led to the consideration of municipal activities first and then quite naturally to the work of the State and Federal governments.

This brought to the subject an interest on the part of pupils that they had never before had. They visited local governmental agencies, executive, legislative, judicial; witnessed the numerous industrial, charitable, educational and social activities of their local government; kept note and scrap books; took a keen interest in current events on which they were quizzed; had debates on political issues; subscribed and read the daily newspapers and weekly or monthly periodicals; attended talks by public officials; took part in mock conventions and so on.

Actual experience showed that many of these methods could not be carried out in all centres and in others they were pushed to extremes. The sordid nature of a police court in a large city was not the best introduction to judicial institutions, and moreover political officers soon got tired of having a veritable mob of school children of all ages swarming over their buildings and offices. While only a few teachers were doing it, it was well enough, but when it became a daily or weekly, or even monthly, practice, for many it became distasteful.

There has been, therefore, a reaction from the extremes of this method of teaching by its advocates, but as a method of instruction it has aroused interest. The time consumed and its interference with the work of other teachers were not the least objections.

The time given in class to the subject in elementary schools where it is best taught is
combined with language study, geography and history, in the first four grades, while in the fifth and sixth grades 20 minutes a week are given to separate study of it; in the seventh grade 40 minutes and in the eighth grade 60. In the best high schools five periods a week, of 45 minutes for 20 weeks or three periods a week for 40 weeks are given to the subject. Sometimes it is taught parallel with the United States history and at others it follows.

The methods of instruction in colleges and schools have been undergoing great improvement in recent years though civics is far from being generally well taught in the schools. The improvement has generally come in those schools where the object of the teacher has been to get away from the dry résumé of officers and official duties to a study of functions. These have been studied by the use of current newspapers and periodicals, public documents and official notices, visits to legislative assemblies and courts, and in the employment of a great variety of means to interest the pupil in the living organization of governmental functions.

In many schools the classes and whole school have been organized into "School Cities" or "Schlobi States" and the pupils given a share in the government of the school. All of these methods along with many others have served to vitalize the study of the subject and to make for a good training in citizenship.

B., 'Status of Instruction in Municipal Government in Colleges and Universities' ('Proceedings of the National Municipal League,' 1908).

JAMES SULLIVAN
New York State Historian.

CIVIDALE, chè-ve-dà'la, Italy (the ancient Forum Julii), town of Venetia, in a basin of the Julian Alps, eight miles east-northeast of Udine near the Austrian border. It consists of the town proper, surrounded by walls and ditches, and of fine suburbs; and has among its edifices a large cathedral of the 15th century, with three Gothic portals, a curious baptismal font and several fine paintings; a museum of antiquities, and a record office with some very ancient characters. The neighborhood abounds in interesting antiquities. The Natisone, which flows through the city, is crossed by a 15th century bridge. The modernized city has a military training college, and silk, cotton and linen factories. Pop. 10,031.

CIVIL ACTION, an action brought in the civil courts for the recovery or protection of private or civil rights, or damages for their breach. They are divided into two classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.

CIVIL CORPORATIONS. See Corporations.

CIVIL DAMAGE ACTS, legislative acts passed in several of the States, giving to husbands, wives, children, parents, guardians, employers and others who have sustained injury in person or property or means of support, by an intoxicated person in consequence of such intoxication, the right of action against the person who sold or gave away the liquor which caused such intoxication. Such acts have been held to be constitutional. In some cases the right of action has been extended to the owner of the premises where such intoxicating liquor has been obtained.

CIVIL DEATH, a legal term applied to a person who on account of some crime, has been convicted and sentenced to life imprisonment, thereby losing all his civil rights, and is considered in law, dead. In some jurisdictions a person convicted of murder and sentenced to life imprisonment is considered dead.

CIVIL ENGINEERING. In order to understand clearly what constitutes civil engineering, it will be desirable to consider briefly the steps by which the different branches of the engineering profession have developed and have become differentiated from one another. The profession of engineering in some form is as old as the human race, for some form of building, some utilization of the materials and forces of nature, has always been necessary in order that man might protect himself against the elements and sustain himself in the conflict with nature. Up to about the middle of the 18th century there were but two recognized branches of the profession, the civil and the military. (See Engineering, Military). The former included all those branches of the constructive art not directly connected with military operations and the construction of fortifications; while military engineering concerned itself with the applications of science and the utilization of materials in the art of war. But during the last third of the 18th century there came a remarkable series of mechanical inventions, such as the spinning jenny by Hargreaves, the spinning frame by Arkwright, the mule by Crompton, the power loom by Cartwright, the modern steam engine by Watt and the puddling process for making wrought iron by Cort and others. These were followed in the first third of the 19th century by the development of the steam locomotive by Stephenson and of the steamboat by Robert Fulton. These discoveries led to the inauguration of the age of steam transportation by rail and by sea. The era of railroads began, for all practical purposes, with the victory of the *Rocket* in the competition at Rainhill in 1829. Improvements rapidly followed in the various fields of manufacturing and in methods of producing iron and steel.

The Field of Civil Engineering.—The Institution of Civil Engineers of Great Britain was established in 1818, and its first president, Thomas Telford, described civil engineering as a medium of bringing classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.
canals, river navigation and docks, for internal intercourse and exchange; in the construction of ports, harbors, mole systems, lighthouses; and in the art of navigation by artificial power for purposes of commerce, and in the construction and adaptation of machinery, and in the drainage of cities and towns. But the improvements and inventions above referred to, soon led to the differentiation of several branches from the parent stem of civil engineering, which up to that time had included all branches of the constructive art, excepting those for military purposes. The *construction and adaptation of machinery,* referred to by Telford, soon became a field by itself, which is known as mechanical engineering (q.v.) and which is distinguished from civil engineering by the essential characteristic that it deals with machinery. The rapid development in the manufacture of iron and in the production of the various metals from their ores soon led to the differentiation of metallurgical and mining engineering (q.v.). Architecture, which up to the 18th century had been considered a branch of the arts and sciences, became a profession by itself. Thus, until about the middle of the 19th century, the branches of the engineering profession were civil engineering, mechanical engineering and metallurgical and mining engineering. The last half of the 19th century, however, has probably witnessed a greater advance in the utilization and application of the sources of power in nature for the use and convenience of man than had occurred in all the previous centuries, and various other branches of the engineering profession have become specialties. For instance, within the last quarter of a century the perfecting of the electric motor and the other great discoveries in electrical science first led to the development of electrical engineering (q.v.) as a distinct profession, while later the increasing importance of the applications of chemistry in manufacturing has produced the chemical engineer, a combination of chemist and mechanical engineer, and the advance in sanitary science and the discoveries with reference to the nature, causes and prevention of disease have resulted in the development of sanitary engineering (q.v.) as a branch quite extensive enough to constitute a profession by itself, investment, it is still considered a branch of civil engineering.

The term civil engineering has, therefore, two distinct meanings. In the widest and oldest sense it includes all non-military branches of the engineering profession as it did a hundred years ago; but in its narrower, and at the present day more correct, sense, it includes those branches of the profession which are left after the separation from the main stem of mechanical engineering, electrical engineering and metallurgical and mining engineering. But even in this restricted sense, what is properly included under the title of civil engineering remains undoubtedly the widest in scope of the four great branches of the engineering professions; and no one who is practising it as a career must become a specialist in some one or in several narrower fields. These fields may be enumerated as follows:

1. The construction of railroads, now one of the largest fields both in number of men engaged and in magnitude. The work of the civil engineer comprises the location and construction of the railroad, with all its various structures, such as bridges and buildings, and also the maintenance of the road. The motive power is the field of the locomotive engineer and is a branch of mechanical engineering.

2. The construction of street and interurban railways, a branch of civil engineering which touches on the field of electrical engineering and may even be properly considered to belong to that field rather than to civil engineering, inasmuch as all street and interurban railways are at the present time operated by electricity. The construction of the track and structures, however, aside from the motive power and its applications, is properly a branch of civil engineering.

3. The construction of highways and of city streets and pavements. This has always been an important field of engineering, for the highways of a country, as Macaulay remarked, are a good index of its civilization; but with the advent of the modern automobile, the construction and maintenance of highways and of city streets have become of greater importance. In the application of various materials and bituminous products for the road surface, this branch of engineering touches on the field of chemistry.

4. The improvement of rivers and harbors, the construction of canals, of lighthouses and other works necessary for carrying on maritime trade and commerce. These four fields constitute the field of transportation engineering.

5. Structural engineering, which comprises the construction of bridges, aqueducts, steel frames for buildings, retaining walls, and indeed all fixed structures with their foundations. This great field of engineering finds its application in all of the other fields, for structures are requisite in all of them.

6. Hydraulic engineering, which includes the development of water powers and the construction of dams and power plants up to the point at which the mechanical engineer is called upon to supply the motors.

7. Irrigation engineering which concerns itself with utilization of waters in agriculture, the diversion of water from streams and its application to the land, with the construction of structures and appliances necessary for the purpose.

8. Surveying which is necessary in the laying out of works of all kinds in the field, but which constitutes a branch by itself known as land surveying when applied to the object of measuring and subdividing land, and which is known as topographical surveying when the object is to represent upon a map the surface configuration of the land, and which, further, when extended to the survey of very large areas in which the curvature of the earth must be taken into account, leads to the intricate and interesting problems of geodesy, or the measurement of the earth, and touches upon the field of terrestrial physics.

9. A great variety of problems due essentially to the congregating together of people in cities and the necessity for conserving and protecting the public health. This includes works of water supply, sewerage, the disposal of wastes, the drainage of lands and of buildings, and the heating of buildings. The latter field has recently become the
specialty of the heating and ventilating engineer. The last group of subjects, involving the preservation of the health of communities, has within recent years become the special field of the new profession of sanitary engineering (q.v.).

The above enumeration will make clear the vast extent of the field of what is still properly termed civil engineering, and will make it evident that this field touches at many points the other engineering professions and that the various specialties themselves are in some cases closely related and yet divergent. In the construction and operation of steam railroads and electric railways, the work of the civil engineer comes in many ways into relation with that of the mechanical and with that of the electrical engineer. The same is true in the development of water powers, the construction of pumping stations for waterworks and the design of canal and harbor works and docks with the necessary operating machinery. In problems involving the construction of the foundations and steel frames for high buildings, the civil engineer comes into intimate relations with the architect, with whom he must collaborate. The work of the sanitary engineer also comes in many ways into relation with others. Sociological and legal problems of great importance and difficulty.

Training and Education.—We may next inquire as to the qualities which fit a man for success in this profession. In the first place, it is evident that the ideal civil engineer must be a scientific man and at the same time a business man. He must have a thorough knowledge of the laws of nature, the fundamental principles of mathematics and mechanics and the materials of construction, for his work consists in applying those laws, principles and materials so as to make them of use in the world's business. He must be essentially a man of action. The engineer takes the discoveries of the scientist in his laboratory or the bookworm in his study, and makes them available for the use and convenience of man. His dominant quality must be practical common sense, combined with habits of care and accuracy, and with the courage and training which will enable him to meet any problems and problems of success. His mistakes may be very costly and his opportunities for effecting economies by skilful design and construction are very great.

It is often assumed that in order to be a successful engineer a man must be a fine mathematician. As a matter of fact, while the engineer should be thoroughly familiar with the fundamental principles of mathematics up to and including the calculus, he seldom uses any but the simplest applications. In geometry, and especially in trigonometry, he must be thoroughly at home; but the essential characteristic of his knowledge of these subjects is his ability to use them and his perception of their value as tools, rather than his power to indulge in elaborate mathematical refinements. The engineer must know how to use mathematics, but he must possess in addition other mental qualifications which are of far greater consequence; for mathematics is in its essential character a tool, and the good mathematician is apt to lack the qualities of action, the quick decision, the acute judgment, the ingenuity in meeting and overcoming obstacles and the natural grasp and insight leading him to see the physical possibilities of a situation, which must distinguish the successful engineer. On the other hand, the engineer should have a liking for mathematics, and a quick and instinctive grasp of its principles and methods, together with the insight which will enable him to see how they are to be made of use and to use them properly when the time comes.

The training of the engineer must be mainly a training in science, and such a training tends to develop the quality of honesty. The only aim of the true scientific investigator is to arrive at the truth concerning the phenomena he is studying. Such a training, if combined with business ability, makes the very best administrators, and, whether for this reason or not, engineers are being more and more sought after to fill administrative positions, especially in connection with corporations in which engineering is concerned. On the other hand, the early practice and administration of the engineer are often of a character which fails to produce polished manners or a good address and appearance, the lack of which is sometimes a great handicap.

There have been, and are, two ways of preparing for the practice of this profession. The first is to begin by getting a thorough technical training in a good engineering school, in the principles underlying the profession. The second is to begin as an apprentice or student in an engineering office, gaining experience and studying at the same time. A man may become a good civil engineer by either method. Which method is the better will depend upon the man. If he can take a college course and not become demoralized by the opportunities for slack work, the lack of responsibility and the rather low standards; if he can maintain his sense of perspective and avoid intellectual arrogance; if he can really master thoroughly the things which he studies and not simply learn to repeat by rote, he will find a college education to be the best and quickest preparation for the engineering profession. He will find there offered the opportunity to learn many things which are impossible in practice, the opportunity to become acquainted with engineering literature, to gain habits of study and breadth of view, and the adaptability of mind to enable him to select the best way of solving a new problem. But many young men have not the opportunity to go to college, and many also learn better when, from day to day in their actual work, they see the necessity for learning; others would become indifferent or lazy in a college atmosphere. For such men the second method may be adopted, and if they take advantage of the many opportunities now offered for self-culture, such as evening courses, correspondence schools, industrial and manual training schools, etc., it is possible for them ultimately to become just as good engineers as by the first method. The Franklin Institute in Boston, for instance, offers evening courses in most branches of engineering, including not only civil engineering but mechanical engineering and electrical engineering, in abstract sciences and the arts are carried as far into the subject as in some of the large engineering schools. Similar op-
opportunities are offered in the Wentworth Institute of Boston, the Mechanics Institute and the Cooper Union in New York, the Pratt Institute, Brooklyn, and other schools where instruction of high quality is offered and taken advantage of by many young men who are working and earning their living during the day time.

The young man, however, who aims to become a civil engineer should endeavor to secure a broad training and a wide outlook, not directed entirely to technical subjects, but covering also those subjects of a general nature which are necessary for every thoroughly trained man. The engineer of the past has too generally been considered a mere builder, and he has not, as a rule, been given the position to which his responsibilities and his achievements legitimately entitle him; but the engineer of the future should aim to take a position in society and business as a cultivated and highly trained man, on a level with men in any of the other professions.

A thorough education can now be obtained at many schools in this country. Many educators would advise a young man to take first a college course and to supplement it by a course in a professional school. Another plan which has its advantages is to lay out a course longer than the usual college course, in one institution, directed from the beginning toward the end in view, some general subjects and some professional subjects being studied in each year, with an increasing proportion of the latter toward the end of the course. The latter plan has the advantage that the student is working always toward a definite end, provided he is able to decide at the beginning what general line of work he desires to pursue. Some of the technical schools of the United States have provided courses of five years or more, in which the student may gain a technical training and a liberal training at the same time. If a young man is unable to decide upon a profession at the beginning of his course, whether he goes to college first or not, he should at least decide within broad limits, in order that he may arrange his studies so as to avoid unnecessary waste of time when he finds himself able to make a definite choice.

The University of Cincinnati, with the cooperation of a number of establishments or firms which employ young engineers, has adopted the novel system of having its students alternate between the school and some practical employment, spending a certain period exclusively in each place. In this way the student is made to see the use of what he is learning and to realize that the entire value of what is learned depends upon the ability to use it, which is frequently lost sight of or not perceived at all in the usual college or technical school. This experiment is a most interesting one as a method of training engineers.

It is not, at the present time, necessary to go abroad in order to obtain a technical training in engineering. Our American schools now offer as good or better preparation for the practice of the profession in America than can be obtained elsewhere, being well equipped and teaching American methods. Twenty years ago this could not be said, but at present our technical schools are as good as any in the world. Fortunately, also, many of them offer scholarships or other aids to needy but capable young men, so that the lack of money need not prevent a persevering man from gaining a technical education.

The Civil Engineer.—The opportunities presented to a young man graduating from one of our engineering schools, or prepared by self-training or at one of the evening schools referred to, will be many and varied. All professions are overcrowded in the sense that there are men in them who cannot find employment, and this is true in civil engineering. Yet there are few professions which offer so many opportunities to properly qualified men, so that, properly speaking, it is very far from overcrowded. The young civil engineer will, moreover, find open to him many purely business positions for which his training has fitted him. The range of the engineering professions is continually widening, one direction in which they are rapidly extending being that of administration. Within the past 60 years nearly the entire railway system of the country has been built, most of our factories started and our works of sewerage and water supply constructed. The construction of these works has required the services of most of our engineers, while the opportunities of profitable employment here have attracted many members of the profession from foreign shores. The civil engineer of the past has thus been mainly a constructor; but the civil engineer of the future will be more and more of an administrator as well. And while the construction of railroads will not proceed as rapidly in the future as it has in the past there are certain directions in which construction will still proceed with great activity. For instance, although the great era of railroad construction may be said to be substantially ended, there is still much work to be done in building branch lines, in double tracking existing lines, in reducing grades and curves, eliminating grade crossings and making other local improvements, often on a large scale. Moreover, the construction of urban and interurban electric lines, the building of subways and tunnels for rapid transit in cities and the improvement of steam railroad terminals, is proceeding at a rapid rate and will require the expenditure of many millions of dollars. The rapid growth of urban populations and the advances in sanitary science have recently given a great impetus to the construction of works for supplying pure water and for disposing of the sewage and other wastes without injury to the public health. Enormous projects requiring the services of hundreds of engineers, for 5 or 10 years are sometimes necessary for supplying one of our great cities with water which has sometimes to be brought hundreds of miles. But in addition to works of construction, which in the past have utilized the greater part of the energy of the profession, it is becoming more and more recognized that the man with a good technical training, if he have also a talent for organization and executive ability, and if he be possessed of that greatest of all gifts for the engineer, the keen instinct for the best type of man to direct the work of our great industrial corporations, many of which are dependent for their success upon sound engineering judgment. Some of our large railroad corporations have within comparatively
few years instituted the practice of choosing their higher officers from their engineering companies instead of from either branches of the service. Not a few railroad presidents began their careers as civil engineers, and the number of such men will increase in the future.

With respect to financial remuneration, the civil engineer ranks as an advantage considered, with the members of some professions, in the fact that his services are in demand at the outset at a fair salary, while the young doctor or lawyer is not able to meet his expenses for some years. The ultimate financial possibilities presented to the engineer may not be as great as in the professions referred to, but the rewards are still sufficient to tempt even the most ambitious men, while there are few inconspicuous engineers. The engineer will be appreciated more and more as time goes on. The profession is a growing one, with great possibilities, and few careers offer greater inducements or a surer or truer success to the energetic and capable young man, for we live in a mechanical age, and the work that the XII Tables who can "direct the great sources of power in nature to the use and convenience of man" must continually increase in importance.

George F. Swain,
Harvard University and the Massachusetts Institute of Technology.

CIVIL LAW, The. 1. Introduction.—
The term Civil Law (Jus Civilis) is commonly and popularly used in several distinct senses. Thus we distinguish it on the one hand from the Jus Gentium and on the other hand from the Jus Naturale. Again our municipal law is called the civil law, and further we distinguish between civil and criminal law on the one hand and civil and canon law on the other. But it is here used as referring to the whole body of Roman law (the Corpus Juris Civilis), having its proper origin contemporaneously with the genesis of the Roman state and coming down in ordinary generation, from century to century, with each regal period, the republic and the empire to the codification of Justinian and Napoleon.

When we speak thus of the Civil Law we mean the whole system of usages and rules of private law adopted by the Roman people the ordinary jus privatum as opposed to their jus publicum (including criminal and sacred law). The Corpus Juris Civilis as left by Justinian was the result of a gradual modification and enlargement of the code of the XII Tables under three great influences—the Jurists, the Pratrors and Legislation. The institutional definition of the jus civilis as the peculiar law of Rome, in contrast with the jus naturale and the jus gentium is a mere philosophical flourish; by late writers jus civilis was confined to the responsa prudentium alone; what the Roman jurists had chiefly before their minds when they used the expression was the old law of the XII Tables, as contrasted generally with the newer development of the jus honorarium (Hunter, "Roman law," 264).

Thus the Roman law presents two aspects, each perhaps equally deserving the attention of the student of jurisprudence. From one point of view it furnishes the sound and scientific basis of the greater part of the modern law of all civilized mankind, and has long proved an inexhaustible storehouse of legal principles. On the other hand, it forms a connecting link between the institutions of ancient Rome and the complex organizations of modern society. In its ancient records it takes us back to the very inception of civil jurisdiction, and tracing it down for more than 2,500 years from the Romans and Servius Tullius, we see it constitute a legal development not matched in the history of the law of any other people. The oldest fragments of the Roman law that have come down to us are ascribed to the period of the kings, but these are essentially traditional and practically insignificant, and we take the XII Tables as the first solid ground in the history of the Civil Law.

2. The Law of the XII Tables.— About the year 450 B.C. a commission from Rome visited Greece for the purpose of collecting information necessary to draw up a written code of laws. This fact suggests a foreign or Greek extraction for at least a part of the oldest body of Roman law, although it must of course be conceded that the Romans readily obtained much law of indigenous growth. Three centuries had intervened between the founding of the city and the promulgation of the law of the XII Tables. During this period a certain body of local, customary law had inevitably developed, some part of which must have incorporated into this first written code. Until the time of Diocletian (245-313 A.D.) professional lawyers, strictly so called, were not known in Rome. The business of practising law, so to speak, had been up to that time regarded as a public office, which each citizen might be called upon to undertake; but about that time there began to grow up in Rome a class of men among the patricians who made it their business to know the law. Pomponius in his history of the Roman law, written about the middle of the 2d century A.D., informs us that the custody of the XII Tables, the exclusive knowledge of the forms of procedure and the right of interpreting the law belonged originally to the College of Pontiffs, a patrician order, at the head of which was an officer known as the Pontifex Maximus, from which office, it may be remarked in passing, indirectly and by a strange and circuitous devotion has come down to the College of Priests of the Roman Catholic Church. Only a small part of the language of the substantive law of the XII Tables has been transmitted to our time. Some learned attempts have been made to patch out the substance of each table, but it is by no means certain that the exact fragments of any part of the XII Tables have come down to us in their precise original form and expression. The language has probably been essentially modified by the subsequent Latin usage and by repeated transcription; and the fragments have had to be picked out and pieced together from numerous references in the later literature, as for example from Cicero, Dionysius and Gaius; so that, as matter of fact, what passes for the substance of the XII Tables is probably largely a speculative patchwork, and its significance certainly more or less misleading.

3. The Jurists and the Pratrors.—
The jurists, a professional class of jurists or legal writers dating from the century before Christ, were given by Augustus an authority and standing which they had not there-
tolfere possessed, and from his time much weight is to be attached to the opinions and writings of the more eminent of them. In 426 A.D. Valentinian enacted a law, commonly called "the Law of Citation," providing that the writings of only five jurists,—Papinian, Paul, Gaius, Ulpian and Modestinus, should be quoted as authorities. If a majority of these held one opinion, that was to bind the judge; if they were equally divided, the opinion of Papinian was to be adopted. The great bulk of Roman law as it has come down to us, and all that is most valuable in it, is due to the jurists and the praetors. The praetor stood in Roman law midway between the jurists and the legislatures. At first there was but a single praetor, but later a praetor-urbanus and a praetor-peregrinus (when the empire extended beyond Italy), the number being increased to 18, dividing the jurisdiction among them generally either along the line suggested by their names or territorially. The praetor exercised a qualified or limited legislative power. His right to alter the law was conceded, but it was not unlimited. It was the source of the chancellor, the keeper of the conscience of the Roman people, or the person who was to determine in what cases the strict law was to give way to natural justice (naturalis aquisit).

4. Legislation.—To give an adequate account of Roman legislation would be to write the constitutional history of Rome, something quite beside the purpose of this article. It is important, however, to state that during the republic the popular assembly was the foundation of legislation. During the earlier part of the empire the function of the popular assembly was gradually usurped by the Senate, acting more and more as the mere mouthpiece of the emperor. Finally even this form was dropped, and all enactments were made directly by the emperor. During the republic three assemblies of the Roman people existed,—the Comitia Curia, a patrician body, the Comitia Centuriata, composed both of plebeians and patricians—the franchise being on the basis of a proper qualification—and the Comitia Tributa, which was based on a local division of the people of the city—the vote being given territorially, as if by arrondissements, counties or wards. The decisions fell in three ways,—(1) by direct legislation (edicta, constitutiones); (2) by judgments in their absence (decreta); and (3) by epistola or rescripta, giving instruction on questions of law in answer to applications from the judges.

5. Codification.—The earliest collection of law in Rome was the Jus Papirianum of the regal period (temp. Tarquinius Superbus), and it was not until 304 B.C. that the full knowledge of the law was wrested from the patricians. The constitutions of the emperors were collected at different times and constituted the first codes. The oldest collection in the form of a code is the Codex Gregorius et Hermogenianus, which covers a period of 200 years from Hadrian to Constantine. Of fragments of it remain. Next we have the Codex Theodosianus, made about the year 435 A.D. The Theodosian Code has small pretensions to scientific classification, but it runs to 16 books and has sovereign sway. It is enshrined by the later codices. The reign of Justinian (527-66 A.D.) marks the culminating period of Roman law. In collaboration with Tribonian, he prepared, or caused to be prepared, a complete codification of the whole body of the law, first appointing a commission of 10 members to draw up a code along the general lines of the Theodosian Code. This is called the Codex Vetus, which was speedily superseded by a later edition and has been entirely lost. Next, about the year 530 A.D., Justinian created a commission of 16 members to collaborate with Tribonian in a codification of the vast accumulation of law that had grown up under the hands of the jurists and the praetors. The commission had to deal with the works of 39 jurists, consisting of 2,000 books and 3,000,000 verses. This matter was finally sifted and reduced to 50 divisions or books, and constitutes what we know as the Digest and the Pandects. For the purpose of providing an elementary or preparatory textbook of the law, a commission was further constituted by Justinian which prepared the Institutes of Justinian, which are in some sort a little more than a revision or a new code in the conscience of the Roman people, or the person who was to determine in what cases the strict law was to give way to natural justice (naturalis aquisit).
all quarters and reviving a vivid interest in the civil law.

About 1135, or a little earlier, the code of Justinian was translated into French, and by the 13th century many French translations had been made of the Digest, the Institutes and the Code. By the 12th century ecclesiastical councils had begun to forbid ecclesiastics to study the secular law (Rheims 1131; the Lateran 1139; Tours 1162). This ecclesiastical inhibition served somewhat to check the study of the civil law at Paris — then as now the chief university town of Europe — and was favorable to the continued predominance of Bologna as the seat and centre of civil law study, to the growth of the Montpellier School and to the establishment of new schools, the chief of which were at Toulouse and at Orleans. All these great schools in France — except Paris — and the numerous schools that sprung up in the succeeding centuries, taught the civil law on the basis of the Justinian text. After the spread of the scientific study of Justinian's works from Bologna to Montpellier and other parts of Italy, Justinian's Digest became the standard work, and the 13th and 14th centuries gradually replaced the ante-Justinian, as being the more perfect form of the Roman law. In 1250 France was still divided under two laws; in the south (pays de droit écrit) the Roman law obtained, modified by local customs; in the north (pays de coutumes) local customs prevailed, slightly modified by Roman law, which, however, was taught in the northern schools and left numerous traces in the legal works of the period. A Dutch school of jurists arose toward the end of the 16th century at the University of Leyden. So, too, in Germany some progress was made in the study of the Justinian law. Like the jurists of other countries, those of Germany were impressed by the superiority of the Roman law to their native law, both in form and substance, and their admiration induced them by degrees to put it forward in practice. The influence of the Bologna revival extended into Spain, where a crude codification was effected as early as 1263, called the Partidas, which was adopted throughout the kingdom until about the reign of Alonzo XI in 1348. The Roman law worked its way into Scotland by way of France. From the close alliance that so long subsisted with Scotland, there is a strong illustration of the Roman civil law had become well known by the English Canonists. Henry of Bracton was the first really scientific commentator on the law of England, and the greater and more important part of his work is little more than a transcript of the Roman law. He shows everywhere close familiarity with the Corpus Juris. The Novels are not quoted, but the Institutes are referred to, and there are many quotations from the Digest and the Code, while a very large number of passages are incorporated bodily into the text itself and into the tissue of the author's commentary without any statement as to their source. From Bracton and Glanvill to Polock & Maitland, the predominating influence of the Roman law in English jurisprudence is abundantly evident. "The English system of equity and the ecclesiastical law have been formed more or less extensively on the Roman law or on the Roman law through the Canon law." (Mackenzie, 'Studies in Roman Law', 40).

Both in England and in Germany the influence of the Roman law was resisted and its predominance looked upon with disfavor, but it nevertheless made its way pari passu with advancing civilization in each country, becoming in fact and effect the substantial corpus juris of the one country directly and of the other indirectly. Many causes combined to open the way both in Germany and in England for the practical application of Roman law. Among them, especially in England, were the impulse given by the best writers on the law of Scotland, such as Stair, Bankton, Erskine and Bell, were able civilians; and though they have not produced separate treatises on the subject, their works abound with admirable illustrations of the Roman law, evincing great learning and research, and a familiar acquaintance with the writings of the continental jurists. (Mackenzie, 'Studies in Roman Law', 40-41).

The influence of Roman law on the English common law has been very differently estimated by different writers. Mr. Stubbs stands at one pole of the controversy. He shut, saying, "England has inherited no portion of the Roman legislation except in the form of scientific or professional axioms, introduced at a late period, and through the ecclesiastical or scholastic or international university studies. Her common law is, to a far greater extent than is commonly recognized, based on usages anterior to the influx of feudality,—that is on strictly primitive custom." (Stubbs, 'Const. Hist. of England', 1, 10, § 8). This is perfectly insular and manifestly untrue. The other and sounder view as here taken is presented in Reeves' 'History of the English Law,' following Guizot and Mackintosh, and more recently an equally enlightened view has been taken by Pollock & Maitland in their 'History of English Law.' The 16th and 17th centuries gradually replaced the ante-Justinian, as being the more perfect form of the Roman law. In 1250 France was still divided under two laws; in the south (pays de droit écrit) the Roman law obtained, modified by local customs; in the north (pays de coutumes) local customs prevailed, slightly modified by Roman law, which, however, was taught in the northern schools and left numerous traces in the legal works of the period. A Dutch school of jurists arose toward the end of the 16th century at the University of Leyden. So, too, in Germany some progress was made in the study of the Justinian law. Like the jurists of other countries, those of Germany were impressed by the superiority of the Roman law to their native law, both in form and substance, and their admiration induced them by degrees to put it forward in practice. The influence of the Bologna revival extended into Spain, where a crude codification was effected as early as 1263, called the Partidas, which was adopted throughout the kingdom until about the reign of Alonzo XI in 1348. The Roman law worked its way into Scotland by way of France. From the close alliance that so long subsisted with Scotland, there is a strong illustration of the Roman civil law had become well known by the English Canonists. Henry of Bracton was the first really scientific commentator on the law of England, and the greater and more important part of his work is little more than a transcript of the Roman law. He shows everywhere close familiarity with the Corpus Juris. The Novels are not quoted, but the Institutes are referred to, and there are many quotations from the Digest and the Code, while a very large number of passages are incorporated bodily into the text itself and into the tissue of the author's commentary without any statement as to their source. From Bracton and Glanvill to Polock & Maitland, the predominating influence of the Roman law in English jurisprudence is abundantly evident. "The English system of equity and the ecclesiastical law have been formed more or less extensively on the Roman law or on the Roman law through the Canon law." (Mackenzie, 'Studies in Roman Law', 40).
fore versed in the Roman law. Above all, however, was the necessity of supplying the defects of the common law. The growth of trade, the increase of intercourse and the greater importance of movable property; for the common law had expended its best energies in the completion of the legal constitution of the feudal system, and had showed no tendency toward creating an original commercial law. To these causes must also be added the scientific superiority of the foreign law, with its completeness, over the domestic law, with its want of theoretical development. Even at an earlier period it is not improbable that the Roman law had been used as an assistant and complementary authority in the Curia Regis, upon which court it was incumbent to instruct the inferior judges in regard to the law in doubtful and omitted cases. A legal principle enunciated by that court had authority beyond the particular case in which it was laid down, and became, by means of its actual use, part of the jus non scriptum, consuetudinarium. As Roman legal matter obtained recognition, the more the better sources of the Roman law were not at all received as having a legislative authority, Bracton properly included the former among the leges et consuetudines Angliae. (Prof. Dr. Güterbock, 'Henricus de Bracton,' etc., translated by Brinton Coxe, 60-62).

7. Code Napoleon.—Some steps were taken during the reign of Louis XIV looking to a codification of the French law. Little, however, was accomplished, and the French people owe to the constructive genius of Napoleon the present scheme of codification, which was undertaken during the consulates at his dictation, and finally completed, one code at a time, shortly after the end of his reign. The Civil Code, which was the first, was enacted and became the law of the land 21 March 1804. It was prepared by a council of jurists assigned by the First Consul to the work; but he himself took great personal interest in it, attending many of the sessions of the Commission and contributing much by his acute suggestions to the form and content of the law. With some fitness he is reported to have said, "I shall go down to posterity with the Code in my hand." This code, called at first the Code Napoleon, but now the Code Civil, has to do with the law of obligations, of persons, of personal status and of property. It contains 2,281 sections, many of them of only a line or two in length, and is comprised in a volume of less than 350 pages. The whole body of law in France at present, substantive and adjective, civil and criminal, is comprised in eight codes, as follows: Le Code Civil; Le Code de Procédure Civile; Le Code de Commerce, Le Code Pénal; Le Code d'Instruction Criminelle; Le Code Forestier; Les Codes de Justice Militaire. The scope and purpose of each of these codes is generally and sufficiently disclosed by its title. This codification is supplemented by the Lois Usuelles. The sources of the codified law of France are: (a) the practice of the Consuls of the Directory, between 17 June 1799 and 15 March 1803, as were thought by the codifiers to be of becoming merit to the growth of trade; (d) such general laws as have been enacted since 21 March 1804. The Roman law constitutes the foundation and groundwork of the structure, the other constituent elements indicated being merely subordinate or ancillary.

The Extent of the Civil Law Throughout the World.—The civil law in its modernized form and substantially as enacted in the Code Napoleon has, within a century past, become the law of more than three-quarters of civilized mankind. To be more exact, it is the law not only of France and of all her colonies, but also of Italy, Greece, Switzerland and all the minor countries of southeastern Europe, of Spain and Portugal, Belgium, Holland and her colonies, of Austria-Hungary, Germany, Norway and Sweden, Denmark, Russia, Mexico, together with all the countries of Central and South America—all of the western hemisphere from the Texas border to Cape Horn—of Scotland and the Philipines this country, the West Indies, and the English colonies of Egypt, of all the other civilized parts of Africa and of a majority of the more important British colonies, to wit: Quebec, Ceylon, British Guinea and other English possessions in Africa, and Australasia. It is also working its way into Turkey and her dependencies. The German Empire in 1900 adopted for the empire the Prussian Code, which is a Germanized version of the Code Napoleon; and Japan, as part and parcel of her scheme of civilization, has within recent years enacted a code of law on French lines, following closely even its minor details, thus writing the law of Rome—the Codes of Justinian and of Napoleon—into the jurisprudence of the remote islands of the sea.

9. Resemblance Between the Civil Law and American Law.—Aside from matters of procedure and minor detail, the actual differences between the living Civil Law as it exists throughout the world and the English common law, as refined and modified in its various forms and now administered here, are not great, certainly not greater than we should reasonably expect, having regard to the controlling influence—conscious and unconscious—of the Civil Law, upon the growth and development of the common law in England, and upon the fact that many English judges, notably Mansfield and Holt, and several of the chancellors for the past 200 years at least, have professedly drawn copiously from the great reservoir of Roman jurisprudence, whenever occasions have arisen for modifying or extending common-law principles or for applying them to new conditions of fact and circumstance. The so-called common law of England, certainly from the 11th century, is, in reality largely the Custom of Normandy and the Custom of Paris, as imported at the Conquest in 1066 A.D. Its scientific terminology and its exact language even in its present form are essentially French. Chief Justice Holt nearly 200 years ago said: "Inasmuch as the Custom of Normandy and the Custom of Paris are doubtless raised out of the ruins of the civil law, as all governments are sprung out of the Roman empire, it must be owned that the principles of our law are borrowed from the civil law, and, therefore, grounded upon the same reason in many things." (12 Mod.
from it, but many millions of our people live and must continue to live under it. It is a curious fact that the Custom of Paris was in force in Michigan and Wisconsin down to the year 1810, when it was formally abolished, in Michigan at the behest of a detective (18 Wis. 158; 8 Mich. 25). All the French colonies established in the 17th and early part of the 18th century in North America were governed by the Custom of Paris, which still remains in Quebec the basis of the codified law of that province. By a royal ordinance the laws, edicts and ordinances of France and the Custom of Paris were extended to Louisiana, and that system of law thus introduced prevailed there until 1763, when France ceded the country to Spain. That introduced the Spanish law into Louisiana, and there it was, however, only another form of the Civil Law. In 1808 a Code Civil was adopted by the Territory of Orleans based to a considerable extent on the Code Napoleon, and, as revised in 1825 and subsequently, constitutes the present Louisiana Code. We probably owe to the study of Blackstone's Commentaries much of the unreasoning prejudice which has hitherto existed to some extent in this country against the study of the Civil Law. Blackstone began to be read by law students in America about 140 years ago, and from then to now has been for the most part the initial textbook for all lawyers and law schools. He writes bitterly in his first lecture about the Civil Law. But it is manifest that he wrote without knowledge and under the influence of a set of political prejudices and with a bias and prepossession with which we in the United States may well have little sympathy. Abstractly, there is no more reason why Americans should entertain a prejudice against the Civil Law than against the law of gravitation, and there are cogent reasons, practical as well as scientific, why we should—now at least when it has become a matter of real personal concern to so considerable a part of our people—give serious attention to modern Civil Law.

10. The Importance of the Civil Law in America—The present practical importance of the Civil Law to us consists in the fact that about one-seventh of the present population of the United States and its dependencies—or, to put it in figures, more than 13,000,000 of our population—live under the Civil Law, and are governed in their personal and property rights by some form of it. Thus Louisiana, with a population of 1,700,000, Porto Rico, with a population of 1,150,000, the Hawaiian Islands, with a population of 190,000, the Philippine Islands, with a population of 8,000,000, and Cuba (if indeed it may be included), with a population of 2,050,000, are governed by the Civil Law. Not only, therefore, must our judges and lawyers acquire familiarity with it and facilitate working in it, but our commercial and trading classes are finding it constantly of more and more consequence to them in their business. Not only is much of our law derived
