</table>
CASTE, a social class whose burdens and privileges are hereditary. The word is from the Portuguese casta, race, and was applied by the Portuguese to the classes in India whose occupations, privileges and duties are hereditary. This term is sometimes applied to the hereditary classes in Europe; and we speak of the caste or the prerogatives and usurpations of a caste, to express particularly that peculiar constitution of society which makes distinction dependent on the accidents of birth or fortune. The division into castes, where it appears in its most typical form, comes to us from a period to which the light of history does not extend, hence its origin cannot be clearly traced; but it is highly probable that wherever it exists it was originally grounded on a difference of descent and in modes of living, and that the separate castes were originally separate races of people. This institution has been found among many nations. According to the accounts collected by Clavigero, some traces of it were apparent among the Peruvians and Mexicans; but it prevails principally in the East, where it has existed from the earliest times, and has become blended with the political condition of the people. The division into castes was entirely interwoven in the whole fabric of civil society, in ancient Egypt, in India and ancient Persia. In Egypt this division was supposed to have been perfected as a political institution in the flourishing period of the Pharaohs; and the lines of separation which had been drawn in earlier times by a difference of descent and different modes of living were then rendered still more distinct. The number of castes in that country is variously stated by Herodotus, Plato, Diodorus and Strabo. Recent evidence however has made the existence of a strict caste system in Egypt rather doubtful. The institution of caste is best known to us as it exists in Hindustan, where it is well known to have existed since perhaps 1,500 or 2,000 years before the Christian era. The great Indian castes are four in number, namely, the Brahmins or priestly class; the Kshatriyas or military class; the Vaisyas or mercantile class; and the Sudras or servile class. The division of castes in ancient Persia was essentially similar, as one would expect on the basis of the intimate relation between the religions of two countries. The three castes first named are regarded as being altogether of a higher character than the fourth, rejoicing in the peculiar religious distinction of being "twice-born" as contrasted with the "once-born" Sudras. This distinction is undoubtedly ethnical in its origin, being descendants of the Aryan invaders and conquerors of the country, while the once-born are the representatives of the conquered. Caste, however, is a much more complicated thing than would be supposed from this brief statement, since the principle of caste classification according to employment as well as to race has long prevailed, and from early times there has been an intricate mingling of castes. At present, marriage within the caste is general. However, the wife is allowed to be of a lower caste than the husband, provided the children revert to the lower or to an intermediate caste. The Brahmins are the sacerdotal caste, but, according to Sir W. W. Hunter ("The Indian Empire," 2d ed., 1893), "Even among the Brahmans, whose pride of race and continuity of tradition should render them the firmest ethnical unit among the Indian castes, classification by employment and by geographical situation, plays a very important part; and the Brahmans, so far from being a compact unit, are made up of several hundred castes, who cannot intermarry or eat food cooked by each other. . . . In many parts of India, Brahmins may be found earning their livelihood as porters, shepherds, cultivators, potters and fishermen, side by side with others who would rather starve, and see their wives and little ones die of hunger, than demean themselves to manual labor, or allow food prepared by a man of inferior caste to pass their lips." Altogether some 1,886 separate Brahmanical tribes have been enumerated, and the Kshatriyas or Rajputs now number 590 tribes in different parts of India. In many outlying provinces we see non-Aryan chiefs and warlike tribes turn into Aryan Rajputs before our eyes. Well-known legends have been handed down of large bodies of aliens being incorporated from time to time even into the Brahman caste. While there has been a tendency in the different provinces every separate employment to develop into a distinct caste, there are also instances of castes changing their employment and raising themselves in the social scale. Thus the Vaisyas, who were anciently that Aryan caste upon whom the tillage of the soil fell, have become the commercial and bankers of India, leaving to the Sudras and mixed
castes the labor of cultivation. "Each caste is to some extent a trade-guild, a mutual assurance society, and a religious sect. As a trade union it insists on the proper training of the youth of its craft, regulates the wages of its members, deals with trade delinquents, supplies courts of arbitration and promotes good fellowship by social gatherings. . . . The caste or guild exercises a surveillance over each of its servants, from the time of their enrollment until death. If a man behaves well he will rise to an honored place in his caste; and the desire for such local distinctions exercises an important influence in the life of a Hindu. But the caste has its punishments as well as its rewards. The fine usually takes the form of a compulsory feast to the male members of the caste. This is the ordinary means of purification or of making amends for breaches of the caste law. A person who has become an "out-caste," or lost his caste position and privileges, may generally recover them in this way. In southern India the castes are divided into two large classes, those of the right hand and those of the left hand. The suggestion has been made that this is a survival of Buddhism.

Bibliography.—Bhattacharya, Jogendra Nath, 'Hindu Castes and Sects' (1896); Buchanan, F. H. 'A Journey from Madras' (London 1807); Crooke, W., 'Things Indian' (London 1906); Geiger, 'Civilization of the Eastern Iranians' (tr. 1885); Hopkins, 'The Mutual Relations of the Four Castes according to Manavadharmasastram' (1881); Rhys Davids, I. W., 'Buddhist India' (London 1911); Risley, 'Census of India Report' (Chap. XI, Vol. I, Calcutta 1901); Senart, 'Les Castes dans l'Inde' (Paris 1890).

CASTEL VETRANO, vâ-trâ'nô, Sicily, town in the province and 27 miles southeast of Trapani, on a rocky hill. It lies in a fertile district, is regularly built, has several churches, grammar school with municipal museum of antiquities, many of whose objects were found at Selinus, in the vicinity. Grapevines, olives and rice are extensively cultivated. The white pine produced in the neighborhood is esteemed the best in Sicily. Articles of coral and alabaster manufactured here. Pop. 25,000.

CASTELLAR, kä-səl-lär' y RIPOLL, Emilio, Spanish orator and statesman: b. Cadiz, 8 Sept. 1832; d. Murcia, 25 May 1899. He was left an orphan when quite young and his early life was spent in boarding schools. At the Institute of Alicant (1845-48) he was distinguished for his ability to remember for his intellectual grasp and his oratorical powers. His knowledge of philosophy, history, literature and the Latin and Greek classics was very extensive, in fact, much more so than of law, which he went to Madrid to study in 1848. He obtained his degree in law in 1852 and that of doctor of literature the following year. On leaving the university Castellar entered political life as a member of the Progressive party and before the end of the year he had already become a member of that party. He was elected to the Cortes in 1855-56. He combined his oratorical gifts, and one of the shining lights of republican democracy. His youthful speeches were collected, published and spread broadcast by the ultra-Republicans, and the press of Madrid opened its arms to him. He accepted a position as editorial writer on El Tribuno, which he left some time later, when the latter went over to the monarchy. He joined the staff of the newspaper, which he also left when the latter became altogether radical. Finding La Discesa, whose staff he next joined as chief editorial writer, too timid in its advocacy of Republican principles, he founded La Democracia, dedicating it to the overthrow of the Bourbon and the house of Bourbon (1864-66). He took part with the Democrats against the Socialists. It was at this period that he wrote and published, in Ateneo, 'La historia de la civilizacion en los cinco primeros siglos del cristianismo' (1855-58). In the latter year he became professor of Spanish history in the Central University. This gave him an opportunity to preach from two great tribunals, the university and the press, his democratic ideas. He was finally deprived of his chair in the university on account of his radical republicanism. The substitute professors in the department of Spanish history at once resigned out of sympathy with Castellar; and this was followed by a revolutionary demonstration on a scale that had never been known down with considerable bloodshed (10 April 1865). But the revolutionary fire was still smouldering and very active plotting went on in secret. Castellar, arrested in 1866 for participating in revolutionary activity, was tried and condemned to be hanged; but he succeeded in escaping, in disguise, to France, where he continued his editorial, journalistic and literary work and wrote 'Semblanzas.' 'Un año en Paris,' 'Recuerdos de Italia,' 'Vida de Lord Byron' and 'Introducción al estudio de la historia.' He was one of the most active spirits among the revolutionary party in Paris, and on the triumph of the latter in 1868 he returned to Spain, resumed his chair in the university and was elected a member of the Cortes, where he became the leading advocate of republicanism and the most distinguished orator of the nation. On the establishment of the republic in 1873 Castellar became Minister of State. He was instrumental in the establishment of the military orders of Santiago, Calatrava, Alcántara, Montesa and San Juan de Jerusalem; and later on, those of Carlos III, Maria Luisa and Isabel la Católica. On 6 Sept. 1873 he was elected president of the executive, a position he held until the following January, when a counter revolution once more forced him into exile in France, where he continued actively his literary work. He finished his 'Historia del movimiento republicano en Europa' and the second part of 'Recuerdos de Italia,' 'La redención del esclavo' (poem) and 'El ocaso de la libertad.' Returning to Spain in 1876 he was elected to the Cortes, of which he remained an active and prominent figure for 17 years, always dreaming of the ultimate establishment of the Spanish republic by peaceful means. Thus his disenchanted revolutionary means to gain revolutionary ends helped the cause of the monarchy and of law and order, although he continued the leader of the opposition to his wonderful oratorical gifts, and one of the shining lights of republican democracy. His youthful speeches were collected, published and spread broadcast by the ultra-Republicans, and the press of Madrid opened its arms to him. He
CASTELEIN—CASTELLI

lican ideal in Spain, which his brilliant oratorical gifts, his writings and his ceaseless activity kept constantly before the people. He fought for universal suffrage and the abolition of slavery in Porto Rico; he defended the principle of religious liberty; advocated the election by ballot; abjured the calóndrins; and he was a powerful champion of universal military service. He strongly influenced the politics of his age in Spain; and this influence extended to all the Latin countries in Europe and America. His literary works, which are very voluminous, include, in addition to those already mentioned, the following: 'La reolución religiosa'; 'Perfiles de personajes y bocetos de ideas'; 'Estudios históricos sobre la Edad Media'; 'La fórmula del progreso'; 'Defensa de la fórmula del progreso'; 'La cuestión de Oriente'; 'Cuestiones políticas y sociales'; 'Cartas sobre política europea'; 'Recuerdos y esperanzas'; 'La rendición del esclavo'; 'La hermana de la caridad'; 'Historia de un corazón'; 'Discursos políticos y literarios'; 'Era Filippo Lippi'; 'Tragedias de la historia'; 'El suspiro del Moro'; 'Discurso de recepción en la Academia Española'; 'Discurso en la Coruña sobre literatura gallega'; 'Galería histórica de mujeres célebres.'

CASTELEIN, kás-të-lèn, Matthiis de, Dutch poet; b. Jamele (Oudenhout) 1485; d. 1549. He was the acknowledged lawyer and pattern of all the Dutch rhetoricians of his time in 'De Cruin van Rhetoriken' (1555). He composed many plays, but only two of them were published; one of these is the 'Story of Pyramus and Thisbe.' He wrote also a volume of 'Diversche Liedkens,' in melodious verse.

CASTELHAMARE, kás-të-lè-là-mà're, or CASTELHAMARE DI STABIA, Italy, a seaport town on the Gulf of Naples, 17 miles southeast of the city, at the beginning of the peninsula of Sorrento, and 10 miles northeast of that town. It extends for a mile along the shore at the base and on the slope of a spur of Monte Sant' Angelo (4,735 feet high), a mountain which commands a splendid prospect. It has fine sands, walks, sea baths and other attractions it is a favorite summer resort of the Neapolitans, as well as tourists, and has several good hotels, one of them formerly a royal residence. The harbor is protected by a mole and there is an arsenal with a dockyard. It contains a technical school, a theatre and a large royal arsenal. The principal imports are grain, coal and iron; the principal exports wine and fruit. The fisheries are important, and there are macaroni, soap, leather and cotton factories. The town owes its name to a castle built by the Emperor Frederick II in the 13th century. Castellamare occupies the site of the ancient Stabiae, overwhelmed, with Herculanum and Pompeii; by an eruption of Vesuvius, 79 A.D.; and it was here that the elder Pliny met his death by approaching too near the mountain while it was in a state of eruption. The modern town was afterward built from the ruins of Stabiae. Here in 1667, the French general, Macdonald, defeated the allied English and Neapolitan forces. Pop. about 33,000.

CASTELLAN, or CHÂTELAINE, properly the owner or commander of a castle. In Flanders and France the title went with the possession of certain districts, and in Normandy and Burgundy châtelains ranked next after bailiffs, with both civil and military authority. In Germany the châtelains were Imperial officers with military and civil jurisdiction in fortified places. Consistent Lucassen, 'Manuel des institutions françaises,' (Paris 1892).

CASTELLAN, kás-të-lèn', Esprit Victor Boniface, Count of, French marshal: b. Paris, 21 March 1788; d. Lyons, 16 Sept. 1862. He entered the army in 1804 and took part in most of Napoleon's campaigns. After the Restoration he became colonel of the Hussars of the Royal Guard. He fought in Spain (1823) and at the siege of Antwerp (1832), and as lieutenant-general commanded the Army of the Pyrenees. In the February revolution (1848) he lost his command, and in consequence went over to Louis Napoleon. In 1852 he became colonel at Lyons and in 1852 marshal and senator. His 'Memoirs,' published in 1896, though crude in style, are valuable for their mass of minute detail.

CASTELLANETTA, kás-të-là-nà-tà, Italy, city of Barì delle Puglie province, 24 miles northwest of Taranto. It is a thriving trade centre for local produce, olives, fruit, wool and cotton, and is a bishop's see with an interesting cathedral. Pop. 11,530.

CASTELLI, kás-të-lë', Benedetto, a pupil of Galileo: b. Brescia 1577; d. Rome 1644. He was a monk and became abbot of a Benedictine monastery of the congregation of Monte Cassino. He afterward became a professor of mathematics and taught success both at the University of Pisa and at the Collegio della Sapienza at Rome. Torricelli was his pupil. He distinguished himself in hydraulics and rendered important services to Urban VIII in his projects for the regulation of Italian rivers. He may be regarded as the founder of that branch of hydraulics which relates to the velocity of running water, though his fundamental principle, that the velocity is proportional to the height of the reservoir, is inaccurate, and was demonstrated to be so by Torricelli, who showed that the velocity is proportioned, not to the height, but to the square root of the height. In his investigations as to the measurement of time Castelli made use of the pendulum. His principal work, entitled 'Della Misura dell' acqua corrente,' published at Rome in 1628, was translated into French in 1664.

CASTELLI, Ignaz Franz, Austrian dramatist: b. Vienna, 6 May 1781; d. there, 5 Feb. 1862. He was educated for the law, but following his inclination for the drama, gained access to the orchestras of theatres as a player of the violin. His circumstances compelling him to look out for some means of support, he accepted various subordinate offices, but using his leisure in composing patriotic songs for the Austrian army, he was brought into favorable notice. His songs having given umbrage to Napoleon, he fled to Hungary. In 1815 he accompanied Count Cavriana as secretary to Paris, and afterward he served in the same capacity with Baron Münch von Bellinghausen in Upper Italy. Because of the success of his opera, 'Die Schweizerfamilie,' (music by
Weigl), he was appointed court poet at the Kärntnertor Theatre. In 1840 he retired with a pension and the office of state librarian. The author of many poems, popular songs and miscellaneous writings, he was at various times connected with the press of Vienna, but is best known by his voluminous productions for the stage. Of 100 plays adapted from the French, partly original, are attributed to him. He was a zealous collector of plays, handbills of the theatre and portraits of actors, covering the years from 1600-1862. The collections are now at Vienna in the Imperial Library. In 1848 more than 100,000 copies of his political pamphlets in favor of the Revolution found eager purchasers. His most popular drama was 'Die Waise und der Mörder.' His last publication was his 'Mémories de mes années' (4 vols., 1861-62).

CASTELLIÓ, käs-täl’i-ō, Sebastiánus, French theologian and humanist, translator of the Bible into pure and classic Latin; he was a native of Dauphiny: b. 1515; d. Basel 1563, in exile and in extreme poverty. His family name was Châtelion, which he latinized after the fashion of the time into Castellion. At the invitation of Calvin he settled at Geneva, where he became professor of the ancient classic literatures, but because of differences regarding questions of religious belief he was deposed from the professorship and banished from Geneva. His Latin version of the Bible retained little or nothing of the profoundly Hebrew character of the scriptural writings and was justly censured by Calvin and the Confessors. They thus defined it as "work of Satan," as he called it, made a Latin translation of the Bible himself, striving to retain the Oriental flavor of the original in every respect. Castellio also wrote a book in defense of the right to hold and publish views deemed by Church and state to be heretical; this, too, evoked a reply from Beza. Castellio wrote also a tractate on "Predestination Opposed to the Views of Calvin"; it was published after the author's death by Faustus Socinus in 1579.

CASTELLO, käs-täl’ō, Gabriele-Lanci- lotto, Sicilian antiquary, Prince of Torsu- zuza: b. Palermo 1727; d. 1794. He studied science and archaeology. He formed a splendid collection of the remains of antiquity found in Sicily. He bequeathed a large quantity of books, etc., to the public library of Palermo. At his death he was honorary member of the Royal Society and of the Academy at Paris. His important works are 'Storia d'Alesa, antica città di Sicilia' (Palermo 1753); 'Inscrizioni Palermitane' (1758); 'Sicilia populi poporum veteres numimi' (1781); 'Sicilia et adjacent veteres Inscriptiones' (1786).

CASTELLOBRANCO, Camillo, Portu- guese novelist and poet: b. Lisbon, 6 March 1825; d. 6 June 1892. He studied in Oporto and Coimbra with great irregularity and entered the career of letters. After a short journalistic career in Oporto and Lisbon he entered the Episcopal Seminary and took minor orders. His restless nature prevented his adherence to this course and he abandoned it to resume a feverish literary activity. Having lost his sight in one eye, he went insane, after which he committed suicide. He is the most popular of the modern romancers of Portugal, and at the same time the most national in tone, spirit and form. His novels are numerous, of which the most notable are 'O Romance de um Homem Rico' and the series, 'Novellas do Minho.' To, the romances he owes his reputation. His novels of manners created a new style of narrative, in which he describes with great nicety the social and domestic life of Portugal in the 19th century. In the domain of history, biography and literary criticism he is the author of 'Noites de Lamego'; 'Cousas levés e pesadas'; 'Cavar em ruínas'; 'Memorias do Bispo do Grão Para'; 'Lid Aze- hemia do Espírito.' His verses are mediocre. His collected works have been published by the Companhia Editora de Lisbon. Consult Frei- tas, 'Perfil de Camillo Castello Branco' (São Paulo 1889); Orsorio, Paula, 'Camillo, a sua vida, o seu genio, a sua obra' (Oporto 1908).

CASTELLÓN, käs-tel-lōn, Francisco, Nicaraguan revolutionist: b. about 1815; d. 2 Sept. 1855. He was the leader in a revolt at Leon in 1853, which was unsuccessful, and fled to Honduras, whence he returned in June of the next year. He was largely by his invitation that the filibustering expedition under William Walker (q.v.) went from the United States in 1854. See NICARAGUA, HISTORY.

CASTELLÓN DE LA PLANA, Spain, capital of the province of Castellón, 40 miles north-northeast of Valencia. It stands in a large and fertile plain, watered by the Mijares, from which an ample supply of water is brought into the town by an aqueduct supposed to have been constructed by the great Anton, who, in 1233, wrested Castellón from the Moors. It is well built and has considerable manufactures of sailcloth and woolen and hempen fabrics, ropes, porcelain, leather, cork, etc., and some trade in hemp, grain, and other products. The painters Ribalta, father and son, were born here. The original town occupied a hill north of the present site. Pop. of town 32,509; of province, 322,537.

CASTELNAU, kas-tel’nō, Edouard de Curières de, French general: b. Saint- Affrique 1851. He entered the Saint-Cyr military school in 1869, and in the following year, when the Franco-Prussian War broke out, he was given a commission. He served throughout the whole campaign and emerged with the rank of captain. During the Commune he took part in the street fighting. For over 40 years de Castelnau was one of that little band of French soldiers — Joffre, Gallieni, Foch, etc.— who devoted their entire strength to the problem of preparing the army against a repetition of the disasters of 1870-71. He rose through the successive grades, passed the Ecole de Guerre, was promoted general in 1906 and became chief of staff to General Joffre when the latter was designated (in 1913) as commander-in-chief in case of war. The two men had long worked to a joint and joint, and took all possible aspects of a future war. At the commencement of the European War de Castelnau was placed in command of the Army of Lorraine, charged with the defense of Nancy. His forces were drawn up across the front of Nancy to prevent the advance of the Crown Prince of Bavaria from turning the Allied front. The

CASTELNAU, Francis, Comte de, French traveler: b. London 1812; d. Melbourne, Victoria, 4 Feb. 1880. He traveled extensively in Canada, the United States and Mexico, and under the protection of the French government undertook an exploration of South America in 1843, accompanied by D'Osey, a botanist; Weddell, a botanist; and Deville, a taxidermist. After his return to France, in 1847, Count Castelnaudary 'Expédition dans les parties centrales de l'Amérique du Sud' (1850-51), a work in six volumes, of which one was by M. Weddell. Castelnaudary afterward traveled in Arabia, and was successively consul at Bahia, the Cape of Good Hope and Singapore, and at the time of his death was consul-general at Melbourne.

CASTELNAUDARY, kás-tél-nó-dá-ré, France, a town in the department of Aude, on a height above the Canal du Midi, 22 miles west-northwest of Carcassonne. It is built by the Visigoths on the site of a rich town which had been destroyed, and was named Castellum Novum Arianorum, from which its present name is corrupted. It rises in the form of an amphitheatre, and is nearly the capital of a district and strongly fortified. It was the scene of much barbarity by the inquisitors in 1237, was almost totally destroyed by Edward the Black Prince in 1355 and is famous for the battle fought beneath its walls in 1632 between the troops of Louis XIII and those of Gaston of Orleans, which resulted in favor of Louis chiefly in consequence of the inactivity of the Duke of Orleans. The Duke of Montmorency was wounded in this battle and taken prisoner, and afterward executed at Toulouse by order of the King, Louis XIII. It is indifferently built, has manufactures of coarse cloth, several distilleries and tanneries and one of the largest grain and flour markets in the south of France. It contains specimens of mediæval architecture, among them the church of Saint Michel (14th century). Pop. about 10,000.

CASTELNOVO, kás-tél-nó-vó, Leo di. See Pullè, LEOPILIO, COUNT.

CASTELNOVO, kás-tél-nó-vó, Enrico, Italian novelist: b. Florence 1839. His stories have attained great popularity; among them 'Prof. Romualdo' (1878); 'Twe Conventions' (1885). His 'Règles, France' and 'Fances' (1886). He is one of the acknowledged Italian masters of the "novel of the inner life" (romano intimo).

CASTELVECCHIO, Riccardo, rë-sär'dó kás-tel-vék'-ché-du. See Pullè, GIULIO, COUNT.

CASTER-KELLNER ELECTROLYTIC PROCESS. See Electrochemical Industries.

CASTI, kás'té, Giambattista, Italian poet: b. Montefiascone 1721; d. Paris, 7 Feb. 1803. He studied at Montefiascone, became professor there, was appointed a canon and made a journey to France. Receiving an invitation from the Prince of Rosenberg, who became acquainted with him in Florence, he went to Vienna and was presented to Joseph II, who knew how to appreciate the genius of the poet, and delighted in his conversation. Casti took advantage of every opportunity of visiting other courts and joined several embassies without office or title. Catherine II received him in the most flattering manner. He visited also the court of Berlin and several other German courts. After his return to Vienna, Prince Rosenberg, the director of the Imperial Theatre, caused him to be appointed poeta Cesareo on the death of Metastasio. After the death of Joseph II Casti requested his discharge and retired to Florence, where he spent the remainder of his life. In 1783 he went to Paris. His 'Novelle galante' were republished at Paris (1804), under the title 'Novelle di Giamb. Casti' in three volumes. They are 48 in number. Almost all are of a licentious character, but written in a lively, original and graceful style. The same may be said of his didactic satirical poem, 'Gli animali parlanti, poema epico di Giamb. Casti' (Milan 1802, 5 vols.). There are translations of it in French, German and English. Casti's 'Rime analoghi' are pleasing, and his comic operas, 'La grotta di Trofonio' and 'Il re Teodorico in Venezia,' etc., are full of wit and originality. His letters have been published in 'Miscellanea di storia italiana' (Vol. XII, Turin 1883). Consult Tommasio, N., 'Dizionario d'Estetica' (Vol. II, p. 75, Milan 1860); Foscolo, 'Opere' (Vol. IV, Florence, 1850-62).

CASTIGLIONE, kás-tél-yó'ná, Baldassare, Italian writer: b. Castatico, in the territory of Mauta, 1478; d. 8 Feb. 1529. He studied at Milan, and entered into the service of the Duke Ludovico Sforza, and afterward that of the Duke of Urbino, of whose elegant and splendid court he soon became an ornament. By him he was sent as an envoy to Henry VII of England, and afterward in the same capacity to Louis XII, at Milan. In 1513 Castiglione appeared as ambassador at the court of Leo X, where he became intimate with the most distinguished literati and artists. In 1521 he obtained for the new Duke of Urbino, Federigo, the command of the Papal troops, and in 1524 was employed by Pope Clement VII to conduct his negotiations with Charles V. When Rome was plundered by the Constable of Bourbon in 1527 he was accused of negligence and his health was undermined by chagrin. He refused to accept the rich bishopric of Avila, which was offered to him by the Emperor, until the Pope should be reconciled with Charles. Among his works, the 'Libro del Cortegiano' is the most celebrated. It teaches the art of succeeding at court. The best edition is by Cian (Florence 1894). His few Italian and Latin poems are elegant. His letters are valuable, and contribute to political and literary history. (See It. Cortegiano). Consult Cartwright, Julia, 'Baldas-
CASTIGLIONE—CASTILLON

care Castiglione: His Life and Times (New York 1908, trans. by Opycke, New York 1903).

CASTIGLIONE, Carlo Ottavio, Count, Italian scholar: b. Milan 1784; d. Genoa 10 April 1849. His magnum opus, published in 1828, is a work in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, however, he is best known by his edition of some fragments of the Meso-Greek version of the Bible by Ulphilas, which had been discovered in 1817 by Cardinal Mai among the palimpsests of the Ambrosian Library. His biography has been written by Biondelli (Milan 1856).

CASTIGLIONE, Giovanni Benedetto, Italian painter: b. Genoa 1616; d. Mantua 1670. He was a pupil of Paggi and Ferrari, studied at Rome, Florence, Parma and Venice, and formed his style on the best masters. He is particularly celebrated as a painter of animals, and in these subjects, as well as his other paintings, is remarkable for softness, elegance and beauty. Of his larger pieces, the most celebrated are the 'Creation of the Beasts,' 'Their Entrance with Noah into the Ark' and 'Jacob's Return with His Family and Servants, His Flocks and Herds' at Cassine, Bianco, Genoa, Dresden, Vienna. He also distinguished himself as an engraver, and from his skill in the production of light and shade has been called the second Rembrandt. In 1564 he became court painter to Duke Charles I of Mantua and in that city he lived until his death. Consult Bartsch, 'Le peintre-graveur' (Vol. XIX, p. 71); Hubert et Post, 'Dictionnaire des Graveurs.'

CASTIGLIONE DEL STIVIERE, stê-vâr'a, Italy, a small city in the province of Mantua, 22 miles northwest of Mantua. It is well built, surrounded by walls, defended by an ancient castle and contains a large square adorned with a central fountain, three churches and a town-hall. A well-attended annual fair is held in June. The city which obtained here a decisive victory over the Austrians on 5 Aug. 1796, which gave to Marshal Augereau his title of Duc de Castiglione. Its chief industry is silk spinning. Pop. 7,124.

CASTILE, New. See New CASTILE.

CASTILHO, kâs-tê'yô, Antonio Feliciano, Portuguese poet: b. Lisbon, 26 Jan. 1800; d. 18 June 1875. Though almost blind, he was educated by a brother and studied jurisprudence at Coimbra. His first poetical composition, 'Cartas de Eacho a Narciso' (1821), published while he was a student, won him great celebrity. He excelled in pastoral; and to this class belong his 'A primaveras' and 'Amor e melancholia.' He had a deep sympathy with nature and was a master of elegiac verse. In prose he wrote a treatise on Portuguese versification and 'Quadros historicos de Portugal' (Lisbon 1838; Rio de Janeiro 1847).

CASTILLA, kâs-tê'la, Ramon, Peruvian soldier and politician: b. Tarapaca, 30 Aug. 1796; d. there, 30 May 1867. He served in the Spanish cavalry until 1821, when General San Martin proclaimed Peruvian independence. Castilla, then a lieutenant, joined the liberating army, in which he distinguished himself. He was appointed prefect of his province. In 1830 he became brigadier-general of the army; and, after the treaty with the President of Bolivia, went to Chile. There, in 1837, he joined the Peruvians in their attack on Santa Cruz, the President of Bolivia. Gamarra was proclaimed President of Peru, with Castilla as Minister of War. In 1841 he was one of the leaders of the Bolivian invasion. He was elected President of Peru in 1845. At the expiration of his term of office, in 1851, he was succeeded by Gen. José Rufino Echenique, but usurped the power in 1855, and was, by a majority of 70,374 votes, re-elected to the presidency in August 1858. He introduced several important reforms, such as the abolition of slavery; and of the tribute paid by the Indians; the granting of universal suffrage; and the prohibition of the practice of all religions save the Roman Catholic. After being succeeded by San Roman in 1862, Castilla lived in retirement till his appointment to the presidency of the Senate in 1865. Consult Markham, 'History of Peru.'

CASTILLEJO, kâs-tê'yâ'ho, Cristóbal de, Spanish poet, the last representative of the ancient Spanish poetry: b. Ciudad Rodrigo about 1494; d. Vienna, 12 June 1556. He served first as page to King Fernando, younger brother of Charles V. He took orders and in 1525 became secretary to that prince. The ennobling of his family in 1532 was another mark of royal favor, followed by his appointment in 1536 to the benefice of Perdege in the bishopric of Passau. This he resigned in 1539 in order to accompany Mendoza, then ambassador to Venice. He opposed the introduction of Italian styles into the poetry of Spain, and justified his opposition by demonstrating in his own work the competence of the traditional styles of Spain for the expression of all moods and all sentiments. Of his comedies, none are extant. A number of his poems survive, first collected at Madrid 1573. They include love poems, poems of everyday life and religious and moral works. Some sonnets and madrigals are also to be found in the collection. Consult Adolfo de Castro, 'Biblioteca de autores españoles' (Vol. XXXII, Madrid 1854): Nicolay, C. L., 'Life and Works of de Castillejo' (Philadelphia 1910).

CASTILLIAN, The. See WASP, REINDEER, AVON and CASTILLIAN.

CASTILLOELASTICA, a lofty foresttree, belonging to the Bread-fruits (Ariliocarpaceae). Some specimens have near the ground a circumference of from 10 to 12 feet. The tree is native to southern Mexico and the Central American countries and supplies the Central American rubber of commerce. This rubber, instead of being molded, as is Para rubber, is made into sheets (hence called sheet-rubber) and hung up to dry. Castillo elastica has been found to be cultivable in India and Ceylon.

CASTILLON, kâs-tê-yôn, France, town in the department of Gironde, on the right bank of the Dordogne, 33 miles east by rail. Beneath its walls, on 17 July 1453, was fought the battle which terminated the Hundred Years' War, when the English met a signal defeat, their leader, Earl Talbot of Shrewsbury, and his son, being slain. Part of the bat-
CASTINE—CASTLE

tle is described in the fourth act of Shakespeare's 'King Henry VI, Part 1.' Pop. 3,300.

CASTINE, kás'-tén, Vincent, BARON DE, French soldier: b. Oleron 1650; d. 1722. He went to Canada in 1665, established a mercantile house at Penobscot (now the town and port of entry of Castine, Me.), in 1687, and married the daughter of the Penobscot chief. In 1690 he led Pemaquid, at the head of 200 Indians. He assisted in the defense of Fort Royal, in 1706, and was there wounded the following year. His son, who succeeded him in command of the Penobscots, was made prisoner and taken to Boston in 1721.

CASTING, the running of melted metal into a mold, so as to produce an object in metal having the shape of the mold. Iron-casting or iron-founding is carried on by three methods, the first called "open sand-casting," the second, "sand-casting between flasks," and the third, "foam-casting." The casting of small articles, in type, is done by machines. See COMPOSING MACHINES. See also FOUNDRY PRACTICE; and FOUNDRY AND FORGE TERMS.

CASTING AWAY OF MRS. LECKS AND MRS. ALESHINE, The, a humorous story by Frank R. Stockton, in which the two delightful old ladies who give their names to the narrative are constantly before the footlights. They set out for Japan, and on the way they are shipwrecked, but escape from the sinking vessel in a leaky boat which finally sinks under them. They make their way to a small coral island with their companion, Mr. Craig, where they take possession of the summer place of the Dusantes and make themselves at home. A missionary and his daughter are added to the party. The two old ladies decide that, since they have been wrecked into the place, everyone should pay for his board so much a week; and the money is put in a ginger jar. They also make up their mind that Mr. Craig should marry the missionary's daughter; and they accomplish their ends in their own way. The next spring they make their way to San Francisco, after the wedding; and from there they proceed to their home in the East, their sayings and doings on the way being fully as entertaining as those on the island. In a stage coach they meet with the Dusante party and Mr. Dusante attempts to return the "board money" left on the island; and the comedy of the ginger jar enlivens the rest of one of the characteristic of the Stockton stories.

CASTLE, Egerton, English novelist: b. 12 March 1838. He was educated at Paris, Glasgow and Cambridge universities. After a brief military career he turned to literature and journalism and has written: 'Schools and Masters of Fence' (1884); 'Scenes and Characters of the Light of Scarthey' (1895); 'The Jerningham Letters' (1896); 'The Pride of Jennyco' (1898); 'Desperate Remedies,' a play; 'The Bath Comedy' (1899); 'Marshfield the Observer' (1901); 'The House of Romance' (1902); 'The Rose of Usherwood' (1903); 'The Legend of the Rose' (1905); 'Flower o' the Orange' (1908); 'The Grit of Life' (1912); 'The Ways of Miss Barbara' (1914); 'The Hope of the House' (1915), etc. The greater number of his later novels have been written jointly with his wife, Agnes Castle.

CASTLE, Vernon, English actor and aviator: b. Norwich, England, 2 May 1887; d. Fort Worth, Tex., 15 Feb. 1918. Vernon Castle Blythe, to give him his real name, was educated for a civil engineer at Cambridge University. He made his professional début in 1907 with Lew Fields, as the Head Waiter in "The Girl Behind the Counter," at Herald Square, New York, and later played minor parts in other productions. But his outstanding talent was dancing and inventing new figures and steps. He opened a dancing school, which proved a most profitable venture, and after his marriage with Irene Foote of New Rochelle in 1911 devoted himself entirely to exhibition dancing and teaching the art. Castle took up aviation in 1915 and received his pilot's certificate from the Aero Club of America in February 1916, and a month later was attached to the British Royal Flying Corps in France. He served at the front for a year, making about 200 flights over the enemy lines. He was killed in an airplane accident while acting as instructor with the Canadian contingent of the flying corps, which had been transferred to Texas for winter training.

CASTLE, William Ernest, American zoologist: b. Alexandria, Ohio, 25 Oct. 1857. He studied at Denison and Harvard universities; became Latin instructor at Ottawa (Kan.) University from 1889 to 1892; in 1895-96 was instructor in vertebrate anatomy at the University of Wisconsin; and in 1896-97 instructor in biology at Knox College. After instructorship at Harvard University, he became there in 1908 professor of zoology. His numerous articles on embryology, animal morphology and heredity appeared in the Contributions from the Zoological Laboratory of Harvard and in the Publications of the Carnegie Institution of Washington. His published works include 'Heredity in Relation to Evolution and Animal Breeding' (1911); 'Heredity and Eugenics' (1912); 'Reversal of heredity and its Explanation,' with C. C. Little (1913).

CASTLE, a word derived from the Latin castellum, a diminutive of castrum, a fortress or stronghold. The word castellum was frequently applied by the Romans as a military term to denote a redoubt. The word has come to be used as the designation of those strongholds which, in feudal times, served at once as residences and as places of defense for the nobles, and which continued to exist until the invention of gunpowder changed the whole system of fortification. The royal residences among the Franks resembled in some points both the Roman villa and the Roman camp, and those of the Frankish nobles differed little from those of the kings except in point of simplicity. Strictly speaking, only the grand feudatories had the right to erect fortified castles, and then only after receiving the royal consent; but the grand feudatories very early began to take it upon themselves to grant the privilege of erecting castles to their vassals, and these again to those of a still lower grade. In the very large numbers of castles began to spring up at an early period in France, Germany, England and elsewhere.

The castles of the Norman Conquest in Eng-
CASTLE GARDEN

land were probably the first stone buildings erected there. The great square keep of Rochester Castle is probably of this period; it is about 70 feet square, with projecting corner turrets, and as it now stands is 100 feet high, but battlements have been altered and its original character lost. A heavy wall divides the huge structure into two nearly equal parts, and within this wall a well is arranged which communicates with all three stories; the outer walls are 12 feet thick at the base and the roadway is very persistent. Little is known of the ancient disposition of the minor buildings. There is no doubt that a high and battlemented wall enclosed a court or perhaps two courts, an inner and an outer bailey, as they are called; that the keep was enclosed by the inner wall, but always so near the wall that a postern could communicate with the outer moat, and that within the enclosing wall, often built up against its interior face, were stables and storerooms, and also lodgings for the garrison, which last, however, might be temporary structures. This wall was always surrounded by a deep and broad moat, which might be filled with water in low country, or, when dry, served merely to increase the effective height of the walls and to harassage the approach of the besiegers. There was always a chapel, but in Rochester Castle this is built against the southeast corner of the keep and opens from its principal floor. In an early castle the keep is the only strong place, as a vigorous attack would breach or scale the outer wall very soon.

The castles of the 12th and 13th centuries were far more elaborate, and their tendency was toward separate posts, each defensible by itself. Every tower could be shut up and defended, its little garrison resisting even after the neighboring works had been captured or rendered indefensible. This arrangement had the disadvantage that a very bold and sudden attack might capture the strongest parts of the castle, even the keep itself, before assistance could come to it. The typical castle of the 12th century is the famed Chateau Gaillard in Normandy, and of the 13th century the famous castle at Coucy, near Laon in northern France; and in the British Isles, Kidwelly in Wales, which remains in a perfectly traceable condition.

The perfect castle was not developed until the time when gunpowder was about to make it useless. Thus the Chateau of Pierrefonds, north of Paris, and near Compiègne, was built about 1400, and in this the faults of the earlier castles were avoided. The walls are everywhere of nearly equal height, the galleries of defense are continuous so that the soldiers of the garrison can watch the whole length of the walls, and these galleries are two or even three deep, allowing the defenders to throw a prodigious rain of projectiles upon any attacking party. These galleries, built of stone, replace the temporary wooden galleries, always put up on the walls of earlier castles when an attack was anticipated. It is to be noted that the attack and defense in medieval fortifications was vertical; the higher the wall the more formidable; it was supported by a falling hall of stone, or a timber or iron bar; while the projectiles from crossbows and military engines would certainly lose nothing, and the garrison in this way was removed far above the assailant, who must come close under the walls to attack. This attack, then, consisted, in the case of a well-defended place, chiefly in breaching or undermining the walls. Escalade was only possible where the garrison was weak or in poor condition or surprised.

Castles often had outer works, thus the barbican or barbacan is strictly a defense built outside of the principal gate and intended to keep the enemy away from it for a certain length of time. When a castle was near a river an outward wall would be built on the other bank, covering the bridge leading to the castle. When the site was high, with steep approaches, a covered way might be built to protect the whole of the path leading up to the castle, and the foot of this would have an outward or strong post capable of some defense.

The introduction of fire-arms and especially of cannon heavy enough to breach the walls compelled a change in the old castles, which were often ruined as consistent pieces of medieval fortification by having the guns placed down to accommodate artillery of defense. A round stone tower 200 feet high would be cut down to a kind of bastion 30 feet high, with a parapet and embrasures for cannon around its platform. Even in this work temporary, for it was soon found that the effect of artillery fire was irresistible by stone walls, and these were abandoned for the sloping rampart of earth introduced in the 16th century. See FORTIFICATION.

The term castle was applied to the sea-coast forts which defended our modern sea-ports previous to 1870, and of which some still remain. It was held that the stone wall, 8 or 10 feet thick, carefully built of granite blocks, with the embrasures covered by wrought iron plates and allowing of a great accumulation of guns within a small space, were proof against the attack of a fleet; and this because the fire from the decks of ships cannot be so exact as to produce a breach. It was assumed that the enemy would not be able to make a landing near with effective guns. Thus, at the entrance to Savannah, Fort Pulaski was a "sea-coast castle" of that type, but it was breached in a few hours by the rifled guns landed on Tybee Island.

In modern English nomenclature, a name compounded with castle (such as Castle Howard, Berkeley Castle and the like) is used for habitable buildings which may have been erected on the site or immediate grounds of an ancient building of defense or within its old walls; but this is a mere whim in the selection of an arbitrary name. On the other hand, Windsor Castle, the favorite residence of Queen Victoria, has retained much of its medieval defensive character, but the rooms inhabited by the royal family are of the reign of George IV, and the only part of the ancient work which remains in full use is the great chapel dedicated to Saint George, a famous and beautiful building completed in the time of Henry VII. See CASTLES, HISTORIC.

CASTLE GARDEN, the former immigrant depot at New York, at the mouth of Manhattan Island, in Battery Park. In the early days of the city the place was a small, fortified island a few feet from the mainland; later it became a public hall for assemblies and
concerts. Here Jenny Lind made her American début. Many years ago the island was incorporated with the general area of the Bat-
tery by filling the intervening space with earth and rock; new buildings were erected and the place was devoted to the purpose of landing steerage immigrants. In 1890 it ceased to be used as an immigrant depot and was turned over to work commissioners of the city of New York. The old fort is now used as a pub-
lic aquarium.

CASTLE OF OTRANTO, The. Horace Walpole's 'The Castle of Otranto,' published in 1764, owes its importance to the fact that it is the first example ofthe so-called Gothic romance, a type of fiction which, in the hands of writers like Mrs. Radcliffe, became highly popular in the late 18th century as a reaction against the sentimental and realistic novel of the school of Richardson, and prepared the way for the great exploitation of romantic melan-
choly in the historical novels of Sir Walter Scott. Intrinsically 'The Castle of Otranto' is interesting chiefly by virtue of its absurdity. The scene is a medieval castle, with frowning battlements, razor-sharp turrets, and intricate sub-
terranean cloisters; the theme, the mysteries which it harbors within its walls. The plot, involving a gloomy tyrant, a persecuted wife, a lonely young prince and two romantic girls, and employing the supernatural powerfully at every turn, is not worth rehearsing. A gigantic helmet comes crashing from heaven into the courtyard. An ancestral portrait steps forth from its frame and becomes a ghost. Walpole was a mere dilettante, trying what he could do to wring sensation out of a spurious medi-
evalism. He is entirely lacking in the delicate skill and the genuine historical sense of Scott. Yet the credit of originality cannot be denied him. He is the father of all those who cast reality to the winds and carry the reader deep into the heart of the romantic mystery. 'The Castle of Otranto' was reprinted with a memoir by Scott in 1823; a convenient edition is that in Cassell's National Library. Consult Beers, H. A., 'English Romanticism in the Eighteenth Century' (1898).

JAMES H. HANFORD.

CASTLE PEAK, in Mono County, Cal., one of the highest peaks of the Sierra Nevada, rising to 12,500 feet above the sea, in lat. 38° 10' N. and long. 119° 30' W. It is about 25 miles northwest of Mono Lake. The lower slopes are covered with forests.

CASTLE RAKKRENT. This story, written in 1800, was the first of Maria Edgeworth's novels and is still regarded by many as her masterpiece. It belongs to that series of novels dealing with Irish life, which elicited the praise of Sir Walter Scott and other contemporaries. The opportunity which Miss Edgeworth had of studying Irish conditions at first hand en-
abled her in these novels to draw a powerful and substantially accurate picture of contempor-
ary conditions in Ireland. The theme of 'Castle Rakkrent' is the coming of fortune and the final disaster of an honorable Irish family as the result of carelessness, improvidence, folly and absenteeism. The story, of only a few score pages, is told by a faithful old re-
tainer of the family, Thady Quirk, who lives through the successive reigns of Sir Patrick, who drank himself to death; of Sir Murtagh, the close-fisted, who wasted his substance in law-suits; of the dashing Sir Kit, an absentee landlord who married a Jewess whom he despised and confined for seven years in her chamber, and who met his death in a duel; and finally of Sir Condy, under whose easy ways the estate finally passed from the hands of the Rakkrents into those of creditors, par-
ticularly of Jason Quirk, the son of old Thady, who had bought the debts of the property. The story is told throughout in a vigorous phraseology and is full of local touches of a lively character. Leslie Stephens' article in the 'Dictionary of National Biography' and Helena Zimmern's 'Mary Edgeworth' in the 'Eminent Women Series' may be consulted.

WILLIAM T. BREWSTER.

CASTLEBAR, Ireland, the capital of County Mayo. It is on the Castlebar River, 11 miles northeast of Westport, has infantry and cavalry barracks and some linen manufac-
tures. In 1641 the Parliamentary forces that held the city were massacred after the capitulation by the infuriated besiegers; in 1798 Castlebar was held for a fortnight by the French general, Humbert; and in 1846 it suffered greatly from famine. Pop. 3,698.

CASTLEFORD, England, a thriving manufac-
turing town in the West Riding of York-
shire, on the Aire, here crossed by a bridge, 10 miles southeast from Leeds. The public buildings include the church of All Saints, several denominational chapels, schools, a market-hall, mechanics' institute, etc. There are numerous collieries in the neighborhood; and the town has extensive manufactures of glass bottles, earthenware and chemicals. Pop. 23,090.

CASTLEMAINE, Australia, a municipal town in the colony of Victoria, in the county of Talbot, at the junction of Barker and For-

rest creeks, 78 miles northwest of Melbourne on the Melbourne & Echuca Railroad. The town is pleasantly situated and well laid out, and the buildings, both public and private, are of a superior character. Castlemaine owes its importance to the mining industries carried on in its neighborhood, and it has a reputation as a resort for persons suffering from pulmonary complaints. Pop. 5,228, exclusive of aboriginals.

CASTLEMON, Harry. See FORBICK.

CHARLES AUSTIN.

CASTLEROAGH, käs'ēl-rä', Robert Stewart, Viscount, English statesman: b. 18 June 1769; d. 12 Aug. 1822. He was educated at Armatagh and at Saint John's College, Cam-
bridge. He entered the Irish Parliament in 1790, became Viscount Castlereagh in 1796, and was raised to the peerage in 1801 and 1803. He turned Tory in 1795 and next year became keeper of the privy seal, but he continued a steadfast supporter of Catholic emancipation. Still, he believed that emancipation with an independent Irish Parliament would mean simply a transferent of power to an entrenched oligarchy to a Catholic democracy; hence, as chief secretary from 1797, he bent his whole energies to forwarding Pitt's measure of union. Transferred by the union from Dublin to Westminster, he accepted office in the Addington ministry (1802), as president of the
CASTLEHEATH — CASTLES

board of control; but the true second era in his career was as War Minister under Pitt from July 1805 to January 1806, and again under Wellington from April 1807 to September 1809. His real greatness begins with March 1812, when, as Foreign Secretary under Lord Liverpool, he became the soul of the coalition against Napoleon, which, during the momentous campaigns of 1813-14, was kept together by him. He was on hand at the congresses of Chaillot and Vienna in 1814-15, at the Treaty of Paris in 1815, at the Congress of Aix-la-Chapelle in 1818. As the leader of the Liverpool government in the lower house, he carried the suspension of the Habeas Corpus Act in 1817. The "Six Acts" of 1819 made him extremely unpopular. The retirement of Canning from the ministry (1820) threw the whole weight of business on Castlereagh. By the death of his father in 1821 he became Marquis of Londonderry. He was preparing to start for a congress at Verona, when, in a fit of insanity, he committed suicide with a pen-knife at Foots Cray, his Kentish seat. Consult his "Memoirs and Correspondence" (12 vols. London 1848-53) and Hassall, Arthur, "Viscount Castlereagh" (ib. 1908).

CASTLEREAGH, Ireland, a market-town of Roscommon County; also a barony in the county of Down. The castle stands on the summit of a Danish rath and was once the seat of an O'Neil. It is now the property of the Marquis of Downshire. The barony gives the title of viscount to the Marquis of Londonderry.

CASTLES, Historic. Of castles and ruins of castles to be found to-day, perhaps the most interesting are those of Germany. These Burgen, whether of the feudal lords or of the Robber Knights, on account of their rugged situation, protected by mountain fastness, forests and rivers, were peculiarly adapted to the feudal period, and their remains stand as representative of the best of that time. And nowhere else has greater effort been made to preserve these relics of the Middle Ages, or to keep alive the history and romance with which they have been identified. The district having the greatest number of especial interest is that along the Rhine, from Coblenz to Bingen, where in the course of a five-hour trip by steamer 20 or more castles may be seen; however, below Coblenz are a few notable castles, for instance, near Königswinter stands above the mountainous terrace the ancient and famous castle of Drachenfels, or "dragon's rock" (so called in reference to the dragon slain by Siegfried). It was erected by Arnold, archbishop of Cologne, in 1147 and bestowed by him as a feil on the Cassins Monastery at Bonn in 1149. The keep is one of the rare examples of pure ashlar work in the district of the Rhine. From 1176 on the castle was in the hands of the Burggraves of Drachenfels, whose race became extinct in 1530. The red wine grown on the southwest slope is known as "Drakenhut" or dragon's blood. The castle of Neuss, seat of the archbishops of Cologne, on the Meuse and the Rhine, just opposite the city of Coblenz, was an ancient stronghold of the Electors of Treves (Coblentz). It played an important part in the Thirty Years' War; it was taken by the French in 1599 after a gal-

CASTLES

11

castles—and numerous turrets and jutting corners, loopholes and one entrance only, a door situated six feet above the moat and reached by a ladder. It was built on a ledge of rock in the middle of the Rhine by Louis the Bavarian for the purpose of exacting tolls from passing boatmen.

The Castle of Staheck (12th century), now the seat of Brunach, was formerly the residence of the Counts Palatine. Taken and retaken eight times during the Thirty Years’ War, it was finally destroyed by the French in 1689, but its picturesque ruins are of great interest to travelers. Near it are the ruins of the Castle of Nollich, 580 feet above the Rhine, the subject of many a legend. Near the village of Rheindiebach is the Castle of Fürstenburg, also in ruins. It was here that in 1292, when Adolph of Nassau was on his way to be crowned at Aix-la-Chapelle, the garrison of the castle detained his vessel for the purpose of levying toll. It was destroyed by the French in 1689. The massive tower of the Castle of Heimbach (13th century), near Niederheimbach, in the neighborhood of Niedern, and Sooneck (a.d. 1010), with its slender tower, are interesting, as well as the Falkenburg— stronghold of the “robber knights,” and for this reason destroyed in 1252 by the Rhine League, but later restored and again destroyed in 1699.

An example of a castle entirely surrounded by water is the Mouse Tower, near Bingen, in the middle of the river. It was built in the 13th century by Archbishop Siegfried as a toll-house. It fell into ruins, was restored in 1857, and is now used as a signal station. The Castle of Klop, at Bingen, stands upon the site of a former Roman fortification. It has been restored and is now the municipal seat of Bingen, and in it are preserved many of the antiquities of the Roman and Mediaeval periods. It was at this castle that Emperor Henry IV was seized by his treacherous son—afterward Henry V—on Christmas Day, 1105. Other castles of interest are Ehrenfels (ruined) and Rheinfels, the latter one of the oldest castles on the Rhine. In 1825 it was purchased by Prince Frederick of Prussia and has since been carefully restored, even to the interior furnishings. Its collection of medieval armor is notable.

The Schloss Saarbrücken is a splendid example of the feudal castle, having all the appurtenances of mediaeval times. Located on the river Saar, the castle was until 1793 the residence of the family of Nassau-Saarbrücken, when it was destroyed by the French. Later it was restored in part and was used as a nunnery. While it is strongly fortified, many of the buildings are devoted to residential purposes. Being situated upon a height, its natural location is defensive. Its walls, with their towers and upper corridor, portholes, etc., are built for repelling attack from any quarter, and within is sufficient space to accommodate a large number of retainers or a garrison, with living accommodations superior to the ordinary castle. The court is divided into two wards, in addition to the divided garden plot, the last a later development. The donjon is the towering structure at the upper corner, overlooking the valley and inaccessible from the outside. In addition the wall is plentifully supplied with watch and defensive towers. The lack of a moat is explained by the fact that the ground surrounding the castle and reached was littered with boulders. Another fine example of the mediaeval castle of the “robber knights” is Castell Wildenstein. Its location on a high cliff overlooking the Danube River is an ideal one for protection against sudden attack. Such locations were usual for the castles of thebooters of the Middle Ages. The stone tower in the centre was connected by bridges that could be lifted or destroyed with the two towers on the cliff, and in case of siege, the knight and vassals, taking refuge in the one on the isolated cliff, were able indefinitely to withstand attack.

Other notable German castles are those of Lower Bavaria planned and constructed by Ludwig II, the Mad King. They are the castles of Neu-Schwanstein, Hohen-Schwangau, Linderhof and Herrenschiemsee. The Neu-Schwanstein is modern, its construction being begun in 1869 on the site of the old castle, Vorder-Hohen-Schwangau, on a precipitous rock. Its style is Romanesque, and the greatest German architect, Mon Reinhold Riedel and Von Dollmann—are responsible for its completion. Its fittings, while modernized, are connected with the past, particularly in the mythological subjects known to us from Richard Wagner’s operas, and events in the history and life of Louis XIV, King Ludwig being particularly proud of both. Its tower rises to a height of 195 feet, from which there is to be had a splendid view of the Pöllat River with its gorge and waterfall and the surrounding country. Schloss Hohen-Schwangau (12th century), formerly called Schwanstein, was originally the seat of the house of Guelph; in 1191 it came into possession of the Hohenstaufen Dukes of Swabia, and in 1567 passed to the Dukes of Bavaria. Fallen into ruins, it was purchased in 1832 by King Max II of Bavaria, who restored it, decorating the interior with frescoes depicting German legends. Later, King Ludwig made additions. Schloss Linderhof, erected by King Ludwig II (1869-78) in the Rococo style, is notable for its unique furnishings and garden, particularly its grotto with a subterranean lake and swan-drawn boat, Moorish kiosk and the cascades. Schloss Herrenschiemsee (1879-85), near the ancient castle of Tell, was another of King Ludwig’s creations, and in it also the motive is Louis XIV and Wagner. The decorations are sumptuous and many of the halls are notable. The Gallery of Mirrors, 245 feet long, is lighted with 35 lustres and 2,500 candles. One of the most novel features, however, is its dining-hall with its table ascending and descending, so that no servant need be in the room.

Other notable German castles are Heidelberg, an interesting ruin with rich decorations, the statue of Charlemagne and other sovereigns in particular. Built in the 12th century, it has been added to and improved at various times since, and in it are the remains of the best examples of the different styles of architecture through which it passed. Destroyed by the French (1689), it has since remained a ruin, but perhaps one of the most picturesque to be found anywhere. The Heidelberg Tun, the castle cellar, is notable for its 800 hogsheads of wine, and its general mediaeval ap-
CASTLES

pearance. At Nuremberg are two famous castles—Burgrafsburg and Kaiserburg, both of the 11th century. The former is the oldest building in the town. Its only remains is the Pentagonal Tower, wherein are kept relics of the antiquity of the city and castle. Its most is still to be seen, as it was well, 33 feet deep. Kaiserburg, or the Imperial Castle, was formerly the residence of Frederick Barbarossa, who enlarged it. It has been added to from time to time, and is to-day in a state of splendid preservation, being greatly modernized during the last century. Its furnishings and decorations are magnificent, and at the same time representative of the age of the castle.

A famous castle in Alsace is the Hoh-Königsburg; it is built upon a ridge mentioned in a document of 774 as the "Stopenberch" (Staufenberg); was in the possession of the Hohenstaufen family about 1147 and was later held in fee by the Counts of Werz. In 1462 it was betrayed by the League of Rheno-Towns, but in 1479 it was rebuilt by the Counts of Thierstein. From 1533 to 1600 it was held in pledge by the Lords of Sickingen, from whom it passed successively into the hands of the Lords of Bolleter and the Counts Fugg- ger (1617). In the Thirty Years' War the castle was destroyed by the Swedes (1633). Toward the end of the 17th century it fell again into the hands of the Lords of Sickingen, who sold it in 1770. After various other changes of ownership it was acquired in 1863 by the town of Schlettstadt, which presented it to Emperor William II in 1889. The Emperor caused it to be rebuilt (1901-08) at the expense of Alsace and the German empire from the plans of Bodo Ebhardt, who restored it as far as possible to its appearance in the 15th century. Its walls and towers of red sandstone, towered above the dark-green chestnut wood, are strikingly picturesque.

Beyond Colmar (Alsace) above the village of Egisheim stands the castle of Hohen-Egisheim or Dreien-Egisheim, with its three towers, viz., the Wahlenburg and Wekmund of the 11th century and Dagsburg of the 12th century, together known as the "Drei-Exen." In Egisheim stands the "Pfalz" that is said to date back to the 8th century.

Near Strassburg is the ancient Imperial fortress Trifeis. It was founded as early as the 10th century, but the present scantly runs date from about the middle of the 12th century. Trifeis was not infrequently occupied by the German emperors. Its walls protected the unhappy Henry IV, when excommunicated by Pope Gregory VII in 1076 and deserted by his nobles. It was here that Richard Cour-Delion is said to have been confined for more than a year (1193-94) by the Emperor Henry VI, until his liberation was effected by the faithful Blondel. After the Thirty Years' War the castle fell to decay. The central tower, 33 feet in height, was an interesting chimney which recently been restored. In cleaning the castle-wall, the spring, cut in the rock, was discovered at a depth of 270 feet.

The Castle of Coburg (16th century) is a late-Gothic structure used as a fortress and later as an arsenal. At present it is a museum. Its collections of arms and armor, woodcuts (200,000), paintings relating to German history and natural history are notable. It was here that Martin Luther resided for a time (1530) and translated the Prophets and Psalms. In connection with Luther, the picturesque Castle of Wartburg (12th century) at Eisen- bach is of interest. This castle was the seat of German letters and art for many generations, and in early days it was the scene of contests in minstrelsy for all Germany. Here Luther sought asylum and found refuge when he translated the greater part of the Bible. At Munich is the Schloss, a large group of buildings (1663-1728). It is in reality a palace, with beautiful grounds, conservatories, cascades, etc., and its decorations are of the best of the rococo period. It is the residence of the king, and its fittings are in regal magnificence; as an instance, the curtains of the Bedchamber are of gold brocade valued at $400,000. Here also is the "Schatzkammer," or Treasure Chamber, containing the crown jewels and other priceless objects of historic interest.

At Würzburg is the old Castle of Marienberg (12th century), formerly the residence of the prince-bishops. It is a magnificent structure containing 285 apartments, besides its Echter-Tor (1666) and its alarm batteries, the only one of the architectural works of the 18th century construction to be found, an example of the baroque style from designs by Neumann. Its size is 550 by 290 feet, and it contains 312 rooms, a chapel and a theatre, all uniformly decorated in keeping with the general purpose of the structure. In connection with the palace is an orangery of great beauty. At Schwerin, the Palace (1845-57) has been built on the site of a 12th century castle of the Princes of Mecklenburg, parts of the original structure, as rebuilt in the 15th and 16th century, being incorporated into the present building. It is a magnificent structure with lofty towers, enclosing a pentagonal court. Of its rooms, the Waffenhalle, the Usasalle and Gothic Chamber are most noteworthy. The staircase is particularly remarkable. At Dresden there is a famous castle, the Royal Palace, founded in 1530, and enlarged early in the 18th century, with extensive alterations during recent years. Its Grünes Tor is the highest structure in Dresden (331 feet). The original staircase, towers at the four corners and the gallery over the gate (1549-51) still stand. The Palace is a veritable museum of the history of art, particularly of the art of Dresden, famous as the center of the porcellain industry, and the Green Vault, on the ground floor, contains one of the richest collections of the goldsmith's and other handicraft of the Renaissance and later periods.

In Berlin, the Schloss, or residence of the Kaiser, is representative of the medieval castle changed to a palace. The original Schloss was built by the Great Elector Frederick II (1443-51), was altered (1698-1716) and enlarged until to-day it is 650 feet in length by 380 in width. In the reign of Wilhelm II it became the residence of the sovereign. Its decorations and appointments are in keeping with the purpose for which it is used. It
CASTLES 13

represents the work of two of Germany's greatest architects, Schlüter and von Goethe. The western part is an imitation of the triumphal arch of Septimius Severus at Rome. Other royal residences at Berlin are the Palace of the Crown Prince, the Palace of Emperor Wilhelm I, the Palace of Prince Frederick Henry of Prussia, and the Palace of Prince Frederick Leopold, erected 1737, and the Palace of the Princesse, connected with that of the Crown Prince by an arch over Oberwall-Strasse.

At Potsdam, "the Versailles of Prussia," is the Palace of "Sans-Souci," erected by Knobelsdorff in 1745-47 for Frederick the Great. It is copied after the Palace of Versailles. It was here that Frederick the Great spent the greater part of his life, the rooms and objects connected with his history remaining as he left them. In addition, Frederick built a New Palace (1763-69), a magnificent building with 200 rooms, now the summer residence of the Kaiser.

Wherever one goes in Germany, he finds evidence of its ancient life in the castles that served their day, are now ruins or intact as fortifications or adapted to residential or museum and civic purposes. With few exceptions, the public is admitted at stated times to these relics of the past, sometimes free, but generally for a small fee used for their upkeep.

In France, feudalism took deep root, and everywhere is evidence of its existence in the castles or their ruins to be found in every city and hamlet. Even later, when kingcraft had subdued the barons, these castles became fortresses in the civil and religious wars that disturbed the country for three centuries, and later yet when the Crown of England was attempting to keep its hold on Normandy and France, and quarter was a thing unasked for.

As to their form, the castles of France were very similar to those of Germany, with the exception that, save in exceptional instances, the territory to be protected by them was without the natural fastnesses and barriers of the territory adjacent to the German castles. Architecturally they show more of the Roman and Byzantine influence. What is reputed to have been the greatest example of the mediaeval style is the Château of Conde, an old castle built by the Seigneurs of Coucy near Soissons. Guarding the castle and covering an area of more than 10,000 square yards, the donjon towered 210 feet above its walls, at the base being 34 feet thick. This castle was destroyed in 1916 by Germany in the European War. Second to it in France is the Castle of Vincennes, in the park of the same name, just outside the fortifications of Paris. Built originally in 1137 by Louis le Jeune, it was demolished by Philippe le Vieux in 1333, and the present foundations were laid. It was built in a rectangle, 1,200 by 672 feet, and flanked by nine square towers. It contained a donjon, a citadel and a prison, notable for the prisoners that it has held — Mazarin, Diderot, Mirabeau, Henri IV, Mazarin, Condé, Cardinal de Retz and others equally famous. In 1748, after the publication of Mirabeau's "Essai sur les lettres de cachet," it ceased to be a state prison, and fell into decay after the Revolution. In 1868 most of its masonry were torn down and the castle was turned into an arsenal. At present it is a fortification. The buttressed entrance tower and the donjon, repaired in part, still stand intact, the latter 115 feet high. The donjon is isolated from the rest of the castle wall, with which it is connected by drawbridges over a deep moat. It is in the middle of the court, has four towers, and stands four stories above ground, access from floor to floor being by spiral stairways in each of the towers. Its architecture is Gothic, the large central room (30 feet square) on each floor being vaulted, with a supporting column in the centre. Its walls are 17 feet in thickness.

Northwest of Paris, near Les Andelys, are the ruins of the Chateau Gaillard, built by Richard Cœur-de-Lion, and finished in one year. On a high cliff overlooking the Seine, it was erected to control the navigation of this river and to protect Normandy against the French monarchs. It was considered impregnable to military attack, but after a siege of six months by Philip Augustus starvation forced its defenders to capitulate. Lest it fall into the hands of a too powerful rival, Henri IV in 1603 destroyed it with several other castles belonging to Norman barons. For its total demolition, however, 16 years were required, and even to-day its ruins appear formidable from the Seine. It is famous from a painting made by Turner. At Dieppe stands the Tour de Jeanne d'Arc, the remaining relic of the citadel in which the Maid of Orleans was tried and condemned. It was erected by Philip Augustus in 1204. The tower in which Jeanne d'Arc was imprisoned was demolished in 1809. At Dieppe also are ruins of two other castles, one the "Castle," occupying a commanding position on a precipitous cliff overlooking the sea, erected in 1433 as a defense against the English. Sixty-four years later it, with the entire town, was destroyed by the bombardment of the English fleet. The other is the Castle of Arques, famous as the scene of victory of Henri IV over the League in 1589. The Castle of Gaillon, erected in 1500 and destroyed during the Revolution, stands in the town of the same name, its partly destroyed ruins now used as a prison. In its day it was considered as one of the finest in Normandy, its tower being more than 500 feet high. The excellence that the lofty façade has been removed and is now in the court of the Ecole des Beaux-Arts at Paris. This castle was erected by Pierre Fain, one of the greatest architects of the 15th century, for the Cardinal d'Amboise, Minister of Louis XI, and a patron of the Renaissance in France, and is of mixed Gothic and Renaissance style.

At Provins stands the ruin of an ancient castle whose erection dates back to the conquest of Gaul. It is known as the Château de César. While reputed to be of Roman origin, it has many evidences of origin in the Middle Ages. Its massive tower is square at the base, but as it rises it separates into four turrets, and the base at the height where they begin becomes octagonal. The towers are connected by flying buttresses. This donjon, as such it originally was, has two curious rooms or dungeons evidently used for the confinement of military and state prisoners. The structure now serves as the bell tower of the neighboring church of Saint Quentin, like a relic of the Middle Ages. Off the coast of Normandy
the Castle of Mont Saint Michel (q.v.) is a picturesque example of the medieval stronghold.Situated on a lofty rock and surrounded entirely by water at high tide, it was almost impregnable, except for the fact that it had no fresh water, which itself was responsible for its surrender by its defender, Henry, to his brothers, William the Conqueror and Robert, in the year 1091.

Around the city of Paris are many famous castles, some in ruins, but the greater number restored, or restored as residences, museums, or municipal and state buildings. To the east on the Marne is the Chateau Thierry; to the northeast the Chateau de Villers Cotterets, with gabled roof and towers, situated in the beautiful forest of the same name; the Chateau de Pierrefonds, a perfect example of the feudal stronghold, at one extremity of the Forest of Compiegne, while another is the Chateau de Compiegne, modern, now a museum; the Vieux Chateau at Chantilly, with its five towers and gate still standing. Near Nanteuil-le-Haudouin is the old ruin Nantouillet sur les Fosses, and in the forest of Ermenonville is the Chateau of the same name, Ermenonville; a square and a round tower with part of the wall remaining. To the northwest is the Chateau de Chantilly, a palace, and the Chateau de Mouchy. To the northwest is the Chateau de Gisors, a famous castle during the wars between France and Normandy, and near the city of Paris the Chateau or Palace of Saint Germain, residence of the kings of France. To the west, the Chateau d’Anet, the portal of which, due to its chaste design, is preserved in the court of the Ecole des Beaux-Arts at Paris; and the Donjon, the massive remains of a medieval castle at Houdan, near which, at Boutigny, is La Vieille Porte flodale, the gateway to another castle of the same age.

At Montfort is the Porte Bardou, a fragment of medieval fortification, and in the Forest of Rambouillet, southwest of Paris, is the donjon of the original Chateau de Rambouillet, with later additions, south of which is the Chateau de Maintenon, a palace, and further to the south, near Auneau, a single corner of an old castle known as Epaule de Gaillardon. Likewise, southwest of Paris is the Chateau de Versailles, now a state museum, the magnificent palace of French royalty, and the scene of many of the most notable events in French history, particularly the Revolution. (See article on Parks.) To the south of Versailles is the medieval Chateau de la Madeleine, with donjon and a few other parts intact. South of Paris is the Chateau and Tour de Monthéry, in ruins, and to the southeast, the famous chateau and Park of Fontainebleau, noted as the country residence of French royalty, and one of the showplaces of France to-day.

In Italy, with the exception of the northern part, the feudal system did not have the hold that it had in western Europe, and such castles as it possessed were rather of the paternal or family type, and the castles to be found differ likewise from those here described. Such seats as were depended on for protection were usually the palaces of former Roman governors, built with a view to guard against the depredations of the Goths, Huns, and Vandals from the north.

Spain in many ways is looked upon, particularly for romantic reasons, as the country of castles. *Castles in Spain* bring to the imagination feudalism and chivalry. Castle, one of the most important provinces, means *castle*, and throughout its whole extent are numberless ruins of Moorish and Gothic feudal fortifications. The Spanish castle differs appreciably from those of the northern countries, in that it was an appendage of the religious wars that were waged for centuries between Moor and Christian, and wherever a castle is found, there is a mosque, a minaret, or wall. The Arab word for castle—Alcazar or Alcazaba—is found throughout the Iberian Peninsula, often as the denomination of the most important of the Moorish remains. The Alhambra, in part, was a castle, and here the Califs of Granada fortified themselves and founded a civilization of which the remains, yet visible, are a credit to Oriental culture. At Cordoba is the Alcazar, a famous sight to-day, and at Gibraltar, in the year 725 A.D., the Moors had a castle, the remains of which are still to be seen. The Alcazar of Alfonso the Learned, at Segovia, is a striking example of the combination of Moorish and Gothic architecture, a structure butressed and turreted, with square donjon in the center, wall or mosque. The city of Burgos, Spain, takes its name from the word *Burg*, it being erected by the German son-in-law of Diego Porcillos, in the 9th century.

In the British Isles there are evidences of castles or rude fortifications dating from the days of the Roman conquest. It is, however, from the days of William the Conqueror that the castle as we know it took its rise, as this monarch, familiar with feudal and state fortifications on the Continent, found such of the greatest utility in maintaining Norman supremacy over the English barons. As to the architecture of British castles, they combined all styles used on the Continent with a purely English form that differentiates them from others. But the principles of fortification were the same.

On the eastern limits of the town of Dover there stands to-day the Castle, the modern fortifications standing on the site of the original Dover Castle, the "Key to England." The remains of the original, altered by the vicissitudes of time and civil and foreign wars, have been incorporated in the present fortress. Within sight of Castle, the nearest and most formidable foreign enemy, it was constructed on a hill 320 feet high, and was fitted to withstand long sieges, the necessity for which was frequently proved. At York, one of the most ancient cities in the kingdom, and the reputed birthplace of the Emperor Constantine, there are many relics of the Roman occupation of England, the most interesting being the Multangular Tower. This tower is 30 feet in diameter in the interior, and was originally of a 13-sided form, 10 of the 13 walls still remaining. Of the remains of the Middle Ages, the castle still stands, and within its walls are at present the law courts and jail. The donjon, known as Clifford's Tower, is intact. Of other remains of the feudal days are portions of the ancient walls, beyond which the city has extended. The gates, known as "bars," are an interesting feature found in many English
cities. They are usually towered and embattled, with port-holes, and locations on the streets that they cross are usually spoken of as below or above the bar. Other castles are found in the neighborhood of York, among them being Pontefract Castle, where Richard II was Landed, and Conisbrough Castle near Doncaster. At Durham is the ancient Norman Castle founded by William the Conqueror, and now in possession of the university. Near Newcastle-on-Tyne is Alnwick Castle (11th century), a fortified castle from the 14th century by the Percy family. Formerly an important border fortress, it is noted in England as being one of the finest examples of feudal dwellings in the kingdom, and with modern restorations it is in a perfect state of preservation. It covers five acres of ground. Malcolm, King of Scotland, and his son, Prince Edward, were killed here in 1094, and in 1174, while besieging the castle, William the Lion was taken prisoner. Near Alnwick Castle is the ruinous Lindisfarne — a monastery on a vast island nine miles away on the sea shore is the recently restored Bamburgh Castle, standing on a rock 150 feet high. It was a Saxon fortress, built in the 7th century. Near it is the ruined Castle of Holy Island. It was returned to by Sir Walter Scott in 'Marmion.'

At Rochester on the river Medway is the ruins of one of the finest castles in England. The walls and the donjon are in almost perfect condition. At the town of Newport is the ruins of Carisbrook Castle, the donjon of which is supposed to have been a Saxon stronghold. The tower, ivy covered, reaches high above the rest of the structure. The outer walls of the castle enclosed about 20 acres. The ancient well, 240 feet deep, is still in use. It was here that Charles I was a prisoner in 1647. At Kenilworth is a noted castle, made famous by Sir Walter Scott. The ruins are extensive and picturesque. It was the stronghold of Simon de Montfort, Earl of Leicestershire, and the insurgent barons during the reign of Henry III, and was likewise the abode of Robert Dudley, the favorite of Queen Elizabeth. Its donjon is known as Caesar's Tower, and is the most ancient portion of the castle. Its walls are four feet thick, and the remains of the banqueting hall, 86 by 45 feet, are still to be seen. Near the borough of Grantham is Belvoir Castle, the magnificent manor house of the Duke of Rutland, with one of the best collections of paintings in the kingdom, and furnishings of ducale splendor. At Rochester is the remains of a castle notable in English history, the keep still standing, 104 feet high. At Norwich is a castle architecturally known for its ornately designed arches. The castle in which Edward II was murdered is still seen at Berkeley, occupied by the descendants of the family that then possessed it.

Of all the castles in England none is better known than that of Windsor, typical in its magnificence of the feudal stronghold, and to-day the residence of the royal family. On a height overlooking the Thames, it commands a great stretch of territory. It has 13 towers, and within its walls are two rectangular wards, the lower and upper. The keep is in the centre. It has many sumptuously decorated and furnished halls and rooms, in keeping with its regal uses, and one octagon room, 38 feet in diameter. It is surrounded by a large park. Historically, however, no English castle is better known than the Tower of London. Erected on the site of a Roman fortress, the Tower as it exists to-day was originated by William the Conqueror (1078). At first a stronghold and palace, it was also a prison. It is at present a fortress, a museum, and depository of the Crown jewels. It overlooks the Thames, a moat being between the river and the castle. The most conspicuous part is the White Tower, the oldest part of the centre, having four entrances, the Iron, Water, Traitor's and Lion's Gates, the last the principal one. Other towers are the Bell Tower and Bloody Tower. The walls of the towers are from 13 to 15 feet in thickness, and are surmounted by turrets at the angles. The chapel is considered one of the finest examples of Norman architecture in the kingdom. In the inner ward are 12 smaller towers, all of which have been used as prisons, mostly for state prisoners, among whom were Queen Anne, Princess Elizabeth, Sir Walter Raleigh, Lord Dudley, Henry VI and the Earl of Warwick.

Wales, Ireland and Scotland, likewise, have their castles, resembling those of England, with the exception that they are for castles rather than feudal residences. Near Cardiff, Wales, are the remains of four famous castles —Caerphilly, Neath, Swansea and Oystermouth. Of these, Caerphilly in size and grandeur — judging from its ruins — is the greatest of all. In Ireland, the most famous to-day is Blarney Castle, near the city of Cork. It is now a picturesque ruin. It was erected in 1449 by Cormac McCarthy. Its chief feature is its embattled square tower. It is visited by thousands of tourists on account of its world-renowned *Blarney Stone,* a small stone on the highest point of its northern turret, which is supposed to give those that kiss it the power of fluent and witty speech. In Scotland, the best known is Edinburgh Castle, the immense fortress overlooking the city of Edinburgh. The fortress as it stands to-day is on the spot of an ancient castle erected before the first records of Scottish history. It has one entrance, across a drawbridge through a 100 foot space, in the old state prison. Within is a Norman chapel built by Queen Margaret (11th century), and restored in 1853. The castle was formerly a palace of the Scottish kings, but to-day is an object of antiquarian interest, aside from its military uses. Among the relics in its collections is "Mons Meg," one of the earliest examples of cannon, cannon such as were used to batter down the castles of the feudal barons. It is 13 feet long, 20 inches in diameter, and weighs five tons. It is formed of long strips of iron, held together by hoops. Of as much interest, but less known, is the Castle Dunle, the seat of Lord Lovat, perhaps the last example of a castle being used for feudal purposes. In 1740 medieval service was still required of the retainers of this eccentric Lord, who lived in one room, her Ladyship in another and the servants — of whom there were many —below in a covered court with straw for beds. Author of 'Modern City Planning and Maintenance.'

CASTLETON. England, a village in the County of Derby, 10 miles northeast of Buxton, situated at the bottom of a rugged eminence, on which stands the ancient castle called Peak Castle, erected by William Peveril, natural son of the Conqueror. The houses are chiefly of stone. It contains the parish church of Saint Edmund, a fine specimen of the early pointed style and the vestry of which contains a valuable library. The inhabitants are mostly employed in mining; but many derive a subsistence from the manufacture of ornamental articles from spar. The Castle of the Peak is celebrated in Scott's novel, 'Peveril of the Peak.' Pop. 581.

CASTLETOWN, Great Britain, a seaport and former capital of the Isle of Man, on Castletown Bay, 10 miles southwest of Douglas. Castle Rushen, now a prison, occupies the site of a Danish fortress of the 10th century, which was almost wholly demolished by Robert Bruce in 1313. The grounds of Rushen Abbey (11th century), near the station, are now market gardens. Near by is the small building where the House of Keys assembled for about 170 years. Castletown was the seat of government of the Isle of Man from the 6th to the middle of the 19th century. Brewing, tanning and lime-burning are carried on. Near Castletown is King William's College, an Elizabethan pile, rebuilt after the fire of 1844. Pop. 1,817.

CASTOR, or CASTOREUM, an odorous substance obtained from two glandular sacs connected with the sexual organs in both sexes of the beaver. In past years it was utilized for medical purposes, especially as a remedy in diseases of the uterus, and in the case of catalepsy, hysteria and other spasmodic diseases. What little now reaches market is used as an ingredient of perfumes, but most of it is kept by northern trappers as a scent for baiting their traps and known as backstone.

CASTOR OIL (Oleum ricini), the fixed oil expressed from the seeds of Ricinus communis, of the family Euphorbiaceae. The oil is obtained from the seeds by various processes. The seeds are sometimes boiled and the oil skimmed from the water, or the oil may be taken up by solvents, such as alcohol, ether, etc. In the large manufacturing pharmacy houses in the United States the seeds are first warmed slightly and then passed between rollers, or other forms of pressure apparatus. The oil is collected and decanted, or mixed with boiling water and purified. The average yield of high-grade oil is from 40 to 50 per cent in weight. Care must be exercised in the amount of heating of the seeds, else a very active and acrid turbid gum, which is present in the seed coat, is added to the oil. This tends to render the oil very Griping in its action. Unscrupulous manufacturers have been known to add small quantities of ricin to adulterated oil. Seconds, or sorts, are inferior qualities of oil. The best of the oil should be a clear, colorless, viscid oil, with a faint, mild odor, a bland and unpleasant taste. Its specific gravity should be 0.950—0.970 at 60° F. It should be soluble in equal parts of alcohol, in all proportions of absolute alcohol, or in glacial acetic acid, and tested to exclude other mixed oils; is soluble at 60° F. in three times its volume of a mixture of 19 parts of alcohol and one part of water. This test will detect an admixture of over 5 per cent of other oils. Castor oil contains at 15° F. The chemical structure shows castor oil to be composed almost entirely of ricinoleic acid, C₉H₈O. It also contains palmitin, stearin, myristin and an acid principle. This is broken down by saponification, and sets the active agent of the drug's action. Castor oil is a reliable cathartic. It empties the bowel completely, largely by its stimulating intestinal peristalsis, and is probably the best cathartic for children with overloaded intestines. In intestinal fermentation and putrefaction accompanied by diarrhoea, it is excellent. It causes a number of loose, not very watery movements, attended with mild griping. There is a tendency to constipation following its use; hence, it is not of service in habitual constipation. As it is extremely disagreeable for many, its taste may be disguised by orange peel, or best in some aromatic frothy or carbonated mixture, as in coffee, soda water, in capsule form. From a teaspoonful to a tablespoonful is the usual dose.

CASTOR-OIL PLANT, CASTOR-BEAN, or PALMA CHRISTI, a tropical herb (Ricinus communis) of the family Euphorbiaceae, a native of Africa and Asia, whence it has been distributed in warm countries throughout the world. In cool climates it is a half-hardy annual, but in frostless regions it is a perennial, often becoming a small tree. Its large palmate leaves, sometimes more than two feet in diameter, and its green or red stems, which in the central United States may attain a height of 12 feet, and in the tropics 30 or 40 feet, are very striking in flower borders and clumps of shrubbery. The unisexual flowers are borne in terminal racemes, and the female ones are succeeded by three-celled spiny capsules which explode when the seed is ripe, throwing the seed to a considerable distance. The seeds have long been employed for making castor oil, which is used for lubricating, for making sticky fly-paper and in medicine. About half the demand of the American market is met by the crops grown in Kansas, Missouri, Oklahoma and adjacent territory, but since the introduction of petroleum products the oil has a smaller use as a lubricant than formerly, and since the importation of various palm oils its use in soap-making has declined. It is also less popular as a medicine than it used to be. The crop is not considered a paying one. Castor-oil pomace (the oil cake after the oil has been extracted) is a highly valuable nitrogenous fertilizer.

CASTOR AND POLLUX (the latter called by the Greeks Polydeuces), the sons of Tyndareus, King of Lacedaemon, and Leda, or, according to some, of Zeus and Leda. The fable runs that Leda to whom the god came in the form of a swan brought forth two eggs, one of which contained Polydeuces and Helen, the other Castor and Clytemnestra. Pollux and Helen, being the offspring of Zeus, were immortal; but Castor and Clytemnestra were
begotten by Tyndareus, and mortal. Homer's account is that both Castor and Pollux were the sons of Tyndareus, and that Helen was the daughter of Zeus. The two brothers were inseparable companions, equally brave and spirited, and attached to each other with the four-horse chariots. Castor was particularly skilled in the art of breaking horses, and Pollux in boxing and wrestling. They were among the heroes of the Argonautic expedition, in which they acquired divine honors; for a terrible storm having arisen on the voyage, and all with loud voices calling on the gods to save them, there suddenly appeared over the heads of Castor and Pollux two star-like meteors, and the tempest subsided. From this time they were the patron deities of mariners, and received the name of Dioscuri ("sons of Zeus"); and from them the name of Castor and Pollux was given to the fires that are often seen on the masts of vessels in storms, and which are electrical phenomena. After their reinterment are on his right side, from the confinement in which Theseus had for some time held her. They were also among the heroes of the Calydonian hunt. They wooed the daughters of Lycippus, Phebe and Hilaera or Eleira, and carried them off and married them. Having become involved in a quarrel with Idas and Lynceus, the sons of Aphaeus, Castor killed Lynceus, and was slain by Idas. Pollux revenged his brother's death by killing Idas, but full of grief for the loss of Castor, he besought Zeus either to take away his life or grant that his brother might share his immortality. Zeus listened to his request, and Pollux and his brother alternately resided one day on earth and the other in the heavenly abodes of the gods. It is doubtful whether the ancients understood them as being together or separate in their alternate passage between the upper and lower worlds. The former opinion seems to be the older; the latter to have gained ground subsequently. Temples and altars were consecrated to them. In great perils, especially in battles, the ancients believed that they frequently appeared to mortals as two youths on white steeds, in shining garments, with meteors over their heads. They were also represented side by side, the two horses of Iris holding a horse by the rein, with spears in their hands and stars on their heads. Rome accorded them special homage because of their supposed assistance at the battle of Lake Regillus. In the heavens the Dioscuri appear as one of the 12 constellations of the zodiac, with the name of Gemini (the Twins). Consult Alberti, 'Le culte de Castor et Pollux en Italie' (1883); Paton, 'De Cultu Dioscurorum apud Graecos' (Bonn 1894).

CASTORIDEUS. See BEAVER.

CASTOROIDES, a gigantic, extinct, beaver-like rodent of the Pleistocene Epoch in North America. It was nearly as large as a black bear, and inhabited the cold, swamplike, evergreen forests of the north, its remains being found chiefly in peat-bogs along with bones of the mastodon.

CASTRICATION. The art of laying open and of placing the troops so that the different arms shall afford support to each other in the best manner. No definite rules can be laid down, but the proper exercise of the art of encamping is so to place the troops that they can quickly form line of battle on the position they are to occupy. In the presence of the enemy the troops bivouac in line of battle; if safety permits, the tents may be pitched immediately in rear of the line of stacks, the tents of the company officers in the rear of the com-
panies, the tents of the Field and Staff in rear of the centre of the line of company officers. When not in the presence of the enemy, each batal-
tion usually camps in column of divisions. The tents of each division are arranged in two lines facing each other; those of the right company face to the rear; those of the left company face to the front. The company officers' tents are arranged in line parallel to the flank of the column, facing the division-streets; the tent of the captain of the right company of each division is to the right (or left) of the line passing through the centre of the street, according as the officers are on the right (or left) flank of the column; his lieutenants are on his right (or left). The tent of the left company is on the left (or right) of the captain of the right company, the lieutenants of his company on his left (or right). The first sergeant's tent is on the flank of the company toward the officers' tents, the tent of the Field and Staff, when practicable, are in line parallel to those of the company officers, the colonel is opposite the centre of the column, lieutenant-colonel and major are on his right, the adjutant is on the left of the colonel. The other staff officers are on the left of the adjutant. The tents of the non-commissioned staff are in rear of the tents of the staff; they may be assigned to tents in the divisions.

The kitchens of the men are in line on the flank opposite the company officers; the sinks for the men are outside of the line of kitchens. The kitchens of the officers are in rear of their tents, the sinks for the officers are in rear of the line of tents of the Field and Staff. The positions of the color-line, guard-tents, supply store, officers' horses and baggage wagons are prescribed by the colonel. The width of the division-streets, and the streets in front of the company officers, varies with the nature of the ground and the strength of the battalion. When the companies are in line, the tents shall be formed according to the above principles, in column of companies, the tents of each company being in one line, or in two lines facing each other.

A battalion of cavalry being in line with the usual intervals, to encamp, the men dismount, and, without forming rank, unsaddle and place their arms and equipments in line 10 yards in front of the horses; the blanket is placed on the equipment, moist side up. The picket-line is stretched between posts about six feet high, or is stretched on the ground, the ends being firmly secured; the horses are tied to the picket-line by the halter at intervals of a yard; if the picket-line be on the ground, they may be fastened to it by a strap about two and a half feet long, the strap being provided with a collar which is buckled around the pattern of the left fore-foot. The tents of the men are pitched in line about 15 yards in front of the picket-line, the intervals between companies being left free; the tent of the left company is on the right; the arms and equipments are kept in the tents of the men. The kitchens of
the men are in line in front of their tents; the sinks in front of the line of kitchens. The tents of the company officers are in line about 30 yards in rear of their tents.

When artillery camp, the pieces and caissons are pitched at 14 feet interval. The harness of the team of each carriage is on a rack on the right, and close to the carriage, so that the Paulin can cover the harness. Horse equipments are kept on the racks or in the tents. The picket-line is 15 yards in rear of the caisson. It is stretched between posts about six feet high, the ends being firmly secured; the horses are tied to the picket-line by the halter at intervals of a yard. The men's tents are pitched in line about 30 yards in rear of the picket-line; the first sergeant's tent covers the carriages of the right section; the left guard-tent covers the carriages of the left section; the tents of each section are in the order of their pieces in park, and are closed on the centre, or to the right, so as to have a vacant space between two guard-tents and the tents of the left section. The men's kitchens are in line 10 yards in rear of the guard-tents, which may be faced to the right so that No. 1 can overlook the kitchen. The officers' tents are in line 30 yards in rear of the battery-tents; the captain's tent is on the right, center of that of the first sergeant. The officers' kitchens are 10 yards in rear of the officers' tents; the battery wagon covers the captain's tent; the forge covers the left guard-tent. The sinks are 30 yards in rear of the wagons; the officers' sink on the right, the men's sink on the left.

The preceding order may be modified if circumstances require it. The battery wagon and baggage wagons may be in line with the pieces, the interval between the battery wagon and nearest piece being 14 yards, that between the battery wagon and left baggage wagon about 30 yards; the guard-tents half-way between the battery wagon and baggage wagons, facing to the rear; the forage pine between the guard-tents and the baggage wagons, the forge in line with the caissons and covering the right baggage wagon, the men's kitchens in line with the caissons, and covering the left baggage wagon, the officers' tents on a line perpendicular to the men's tents, and on the prolongation of one of the baggage wagons; the officers' kitchen in rear of the officers' tents, and on the prolongation of the forge. In a horse battery, if but one picket-line be used, it may be turned equally to the front around the flanks of the park; the battery wagon, forge and baggage wagons may be divided equally and placed on the flanks of the men's tents, facing inward, and so as to be on the prolongation of the bent portions of the picket-line. The picket-line may also be in one straight line, in which case the baggage wagons should be equally divided upon lines to the rear of its extremities. The horses are sometimes picketed in two lines, in which case the second line is 14 yards in rear of the first, and the wagons are placed in line 30 yards in rear of the men's tents. See CAMP.

CASTRATION, the removal of the testicles or ovaries of animals. Castration is usually performed to limit reproduction, to change the character of the working animal, making him more docile and easier to train, or to improve the quality of meat for eating, as in capons. In human beings castration is a surgical procedure and is usually performed for the relief of some irreparable or malignant disease. Thus in tuberculosis and cancer of the testicles, and in malignant or painful disease of the ovaries, the operation is justifiable. There has been a large amount of needless removal of the ovaries in women. The after results are often more annoying than the original disease.

The change produced in men by emasculation is highly remarkable, giving rise to physical and psychological alterations resembling those of female type. The elasticity of the fibres and muscles is weakened, and the subcutaneous tissues become filled with a much larger quantity of fat; the growth of the beard is prevented; the upper part of the windpipe contracts considerably, and the castrate acquires the physiognomy and voice of a female. The most numerous class of castrates are those who are made such by the removal of the testicles. Another class are not deprived of the parts of generation, but have them ingeniously injured so as to leave them the faculty of copulating, but deprive them of the power of begetting. Juvenal mentions these as the particular favorites of the licentious Roman ladies. To the third class belong those who are entirely deprived of their genital members; they are used in preference, by the Turks, as keepers of their women. The castrates of all three classes are called eunuchs. Those of the third class, to distinguish them from the two others, are frequently termed entire eunuchs; the word eunuch is Greek, and signifies "guard" or "keeper of the bed." The castration of adults produces some change in the disposition, but little in the bodily constitution. According to the accounts of ancient historians, the Lydians, celebrated for effeminacy, castrated women. The latter are said to have used these beings as guards of their wives and daughters. With females the operation produces a completely opposite effect to that which it has on men. The character changes, a beard appears on the chin and upper lip, the breasts vanish, the voice becomes harsh, etc. Boerhaave and Pott relate mediæval instances of this kind. Among the evils which religious fanaticism has at all times produced, castration is conspicuous. The Emperors Constantine and Justinian were obliged to use their utmost power to oppose this religious frenzy, and could put a stop to it only by punishing it like murder. The Valerians, a religious sect whose minds had been distracted by the example of oxygen, not only considered this mutilation of themselves a duty which religion imposed on them, but believed themselves bound to perform the same, by fair means or foul, on all those who came into their power. In Italy the castration of boys, in order to form them for soprano singers, was in use for a long time. Clement XIV prohibited this abuse, which, notwithstanding, did not cease till comparatively recent times, and in some Italian towns was not only suffered but exercised with such shameful openness that the practitioners gave public notice of the lesson. In modern times severe laws were enacted against castration, and the custom is probably now extinct. Beings thus mutilated were common on the European stage. It is remarkable that so odious and unnatural an
CASTRÉN—CASTRO

operation should produce the fine effect on the tones of the singer, which all had to acknowledge notwithstanding the disagreeable effect of the association.

CASTRÉN, käs-trënn, Matthias Alexander, Finnish philologist: b. Tervola, 2 Dec. 1813; d. Helsingfors, 7 May 1852. While attending, as a young man, the University of Helsingfors he conceived the project of tracing out the various detached branches of the Finnish races and languages, and presenting their ethnological and philological phenomena in one general view. Following out this idea he undertook in 1838 a pedesrian excursion through Finnish Lapland, and another in 1840 through the district of Karelia, with the view of studying the primitive language of that country, and enabling himself to translate therefrom into Swedish the great Finnish epic of the 'Kalevala.' The chief work was not completed by him after his return. He soon, however, resumed his travels, and for several years continued to prosecute his researches among the nations of the Arctic regions, both in Europe and Asia. He died before he was able to add much more to his work—a martyr to the cause of science. Among his writings are his translation of the 'Kalevala'; 'Elementa Grammatices Syrææ'; 'Elementa Grammatices Tächeremissæ'; and 'De Affixis Personallbus Lingurarum Altecarum'; besides travels and other works published after his death. His works were edited in Swedish (in 5 vols., 1852–58) and were supplemented in 1870 by another volume containing a biography by J. V. Snellman. A German translation was published between 1853 and 1862, under the auspices of the Academy of Saint Petersburg, by Anton Schiefner. They include, besides the works enumerated, grammars of the Samoyed, Buryat, Tungus, Khotie languages.

CASTRÉS, käs-tré, a town of southwest France (ancient Castrium Albigensium), in the department of Tarn, 46 miles east of Toulouse, on the Agout, which divides it into two parts—Castres Proper, north side, and Villagoudon, south side of the river. The public buildings include the 'palais de ville,' formerly the episcopal palace, which contains a public library, and has a garden laid out on the plan of the Tuileries; cavalry barracks, etc. The manufactures consist of fine cloths, coarse cloth for the troops, blankets, bed-covers and other woolen goods, linen, glue and black soap. There are also bleaching-grounds, dyeworks, tanneries, paper-mills, forges, brass-foundries and tannery-ware works. Trade is also carried on in silk, cotton, liqueurs and confectionery. Castres has a commercial college and two seminaries. The town arose round an abbey of the Benedictines (which is said to have been founded in the 7th century), and was already in the 12th century a place of importance. During the religious wars of the 16th century, in which its inhabitants espoused the Protestant cause, Castres was the scene of many conflicts. Louis XIII, to whom the town surrendered in 1629, ordered its fortifications to be razed to the ground. Pop. 27,830.

CASTRÉS, käs-trë, Charles Eugène Gabriel de la Croix, Marquis or, French soldier: b. 27 Feb. 1722; d. Wolfenbüttel, 11 Jan. 1801. He entered the army, fought at Dettingen and in lower Alsace, became lieutenant of Languedoc and governor of Montpellier and Cette, and under Marshal Saxe commanded the army in Flanders, where he covered the sieges of Menin, Ypres and Courtray, and ended the campaign with the battle of Courtray. He afterward fought at Fontenoy, Raacoux and Laufen. During the Seven Years' War he added greatly to his fame, was made lieutenant-general and was dangerously wounded in the battle of Rossbach. In 1783 he was marshal of France, and emigrating in 1791 found an asylum with the Duke of Brunswick. He subsequently commanded the army of the French princes in Champagne. He signed the manifesto issued by Monsieur in 1793. In 1797 he formed, in conjunction with Saint Priest, the so-called cabinet of Louis XVIII, at Blankenburg.

CASTRO, käs-trö, Agustin, Mexican poet: b. Cordova, Vera Cruz, 24 Jan. 1729; d. Bologna, Italy, 1790. He became a Jesuit priest and a teacher of philosophy, and was a skilful translator of classical authors. Among his original works in poetry are 'Hernán Cortez' and 'Charts,' a guide for young poetic genius. His versions of Sappho, Euripides, Seneca, Milton and Fénelon have received high praise from scholars. See MEXICO, LITERATURE.

CASTRO, Cipriano, Venezuelan military leader: b. Capacho, Venezuela, near the frontier of Colombia, about 1855. His parents were Spanish mestizos of the peasant class. He attended school in Capacho. While still a very young man he took an active part in politics in Capacho, as a Liberal. His first military exploit consisted in scoring a moral success in the so-called 'Battle of Capacho' (1886) against Morales, the local representative of the Lopez government. He remained a leader of the Liberal party in his state until 1892. In that year began Crespo's rebellion against Andueza. Castro, supporting Andueza's cause, was victorious in the battle of 15 May 1892, in Tárira, defeating Morales who now was under Crespo's command. In Caracas, however, the insurgents triumphed. Crespo entered the capital 6 Oct. 1892. Castro remained in control of Táchira and Merida, but before the end of the year withdrew across the Colombian frontier and bought a farm near Cúcuta in the department of Santander. For the next six or seven years he was a farmer and cattle-raiser. Invited by Crespo to take office as head of the custom-house at Puerto Cabello, he declined this offer, but promised Crespo not to join his enemies or attack his government. Andrade was Crespo's successor. Castro went to Caracas and called on the new President, where, to his great surprise, he found he had no friends. Castro's partisans assert that he again refused the tender of an office under the government; according to another version he was
insulted, and left the Yellow House vowing vengeance. When he returned to his home some political friends and relations of Andrade's who lived in Cúcuta procured from the Colombian government an order for his arrest. For about two months he was in hiding; then he went to Bogotá. On 23 May 1899. His old followers in Táchira joining him, in three days he collected a force of 1,500. The first skirmish was in the country between San Cristóbal and Rubio. In Las Palmas, the commander of the government's frontier troops fell. At Zumbador about 2,000 men led by Morales were defeated. Castro laid siege to San Cristóbal, where Peñalosa was strongly entrenched. About 6,000 men under Hernandez were sent against him from Caracas. An indecisive engagement occurred. Then Castro left Hernandez in the rear, and marched toward the capital, defeating several government forces on the way. Andrade having fled the country, Castro entered the capital, opened the prison in which Andrade had been, and declared himself "jefe supremo"—neither President nor dictator but "supreme military leader." The Constituent Assembly made him provisional President of Venezuela, 30 May 1900, and on 20 Feb. 1902 he was elected President for the term of six years. Hernandez promptly revolted, and was put back into prison. Célestino Peruza was the next rebel; and after Peruza came Matos, who intrigued to gain the support of foreign governments. He resigned the presidency temporarily on 9 April 1906, but soon resumed it. Castro involved Venezuela in dangerous quarrels abroad; the most important being those with the European creditor nations in 1902-03, with the United States 1904-08, with Colombia and France in 1905. In all these difficulties Castro acted in a high-handed, unprincipled manner. He was re-elected unanimously for a full term in 1905, and proclaimed a general amnesty for all political prisoners. His difficulties with the United States arose over the confiscation of the properties of the New York and Bermúdez Asphalt Company. In 1907 Venezuela satisfied her obligations with Great Britain, Germany and Italy in accordance with the awards of The Hague Tribunal. In the same year Castro suppressed two rebellions with great cruelty, executing many of the leaders and those connected with their plots. Further trouble ensued with the United States over the claims of the New York and Bermúdez Asphalt Company. Castro held out but in December 1908 went to Europe to undergo surgical operation. A revolution broke out soon after which placed Vice-President Juan Vicente Gomez in the presidency. Castro's policy was reversed, and all claims amicably adjusted. Castro made several attempts to return to Venezuela, but was unsuccessful. He resided in Spain and France for several years and in 1916 came to the United States. See VENEZUELA.

CASTRO, Joao de, Portuguese navigator: b. Lisbon, 7 Feb. 1500; d. 6 June 1548. In 1538 he accompanied the viceroy Garcia de Nerinha, his uncle, to India, as commander of a vessel, and in 1540 was in the expedition that explored the Red Sea, of which he made charts and scientific descriptions. His profound knowledge of mathematics and languages made these works of great value. They were published under the title of 'Roteiro' (latest ed. by Corvo, Lisbon 1882). After his return he was made commander of a fleet to rid the European seas of pirates; was appointed governor of India in 1543, in which office he defeated the great army of the Moors, under Adel Khan, and completely subdued Malacca. In 1547 he was commissioned viceroy of India, but died shortly afterward. A statue was erected in his honor at Goa.

CASTRO, Jose Maria, Costa Rican statesman: b. San José, 1 Sept. 1818; d. 1907. He was educated at the University of Leon, Nicaragua, and held positions under the government of
CASTRO Y BELLVIS

Costa Rica. As minister under José María Alfonsó, he was instrumental in establishing the University at Santó Tomás. In 1846 he was Vice-President and in 1847 was elected President. Among his reforms were the founding of a normal school, girls' school, the creation of the office of "City Physician," local public charities bureaus; abolition of the death penalty for political adversaries; and the establishment of Costa Rica as an independent state. After Costa Rica withdrew from the Central American states, resigned the presidency, but held diplomatic positions. He received the official designation of "Founder of the Republic of Costa Rica." From 1866 to the rise of the Jimenez government (1868) he was again President.

CASTRO Y BELLVIS, bélvés, Guillén, Spanish poet and dramatist: b. Valencia 1569; d. Madrid, 28 July 1618. Next to Lope de Vega he is the greatest Spanish dramatic poet of his day. He lived at an age when Spanish drama was almost at its best; for the dramatic writers who followed him and Lope de Vega added practically nothing to the essentials of the drama, but enriched it with various literary adornments to it. Castro's work had a strong influence on his own and succeeding generations of dramatists and, in a secondary sense, on all Spanish literature. He was born of an old and noble family, and such comparatively slight information as survives relative to his life shows that he had always friends in high positions who were constantly interesting themselves in his welfare. He was successively captain of the mounted coast guard of Valencia, governor of Sefanó and occupant of other high positions under the government. From the Duke of Osuna he received a pension of 1,000 crowns; and the Count of Olivares secured for him a pension of like amount from the King. Through this same strong court influence he was created a knight of the Order of Saint James in 1623. All his friends, admirers and followers ranked him as at least the equal in dramatic talent to Lope de Vega.

The age in which Castro lived was one of encouragement of literature; and Valencia, the "romantic home of the Cid" was one of the two great literary centres of Spain. Literary societies and guilds formed a prominent part of the life of the city; and literary contests, lyrical, epic, dramatic and pastoral, formed a part of the order of the day. Castro took a prominent part in these literary contests and won many prizes and honors in competitions held by the State and the literary guilds. A very active theatre completed the incentive to literary and, more especially, dramatic life, to which Castro was irresistibly drawn. At the age of 20 he was already counted among the promising young poets of his day and he apparently counted among his friends the powerful and brilliant literary set of Valencia. He appears to have been much of a spendthrift and to have been cursed with an imperious and haughty temper which continually estranged from him friends of high estate: as a dramatist, his infirmities of temper seem to have increased and to have been the direct cause of the loss of many of the social and material advantages which he had enjoyed in his earlier life. It was maintained by his earlier biographers that he finally became reduced to such poverty that he was buried at the public expense. But his widow, which was signed a few days before his death, and which is still in existence, would seem to disprove this, as it disposed of considerable property. He undoubtedly had, to the end of his days, a certain income from his literary work which was in constant demand, especially in theatres and the Church, and must, therefore, have been well paid for. Moreover it is known that the habit of the Order of Santiago was conferred upon him in Madrid in 1623, only eight years before his death.

To Castro the historical drama in Spain owes much; and his influence in this literary field was strongly felt in France and England. Castro's 'Don Quixote' was imitated by Guérin de Bouscal and presented in Paris in 1635; Moreto found his model for 'In Sarraceni, don Diego' in 'El Narciso en su opinion'; Fletcher's 'Love's Care' is derived from 'Fuerza de la costumbre'; and Calderón's 'Magico prodigio' from 'El prodigio de los montes.' Even to-day some of the best-known Spanish dramas, 'Las mocedades del Cid,' slightly modified, is ever welcome on the Spanish stage; and it is looked upon in Spain as one of the great literary inheritances of the Spanish people. This play is avowedly the inspiration of Corneille's 'Le Cid.' From the purely dramatic point of view the 'Cid' of Castro is superior to that of Corneille, though the latter gains in simplicity what it loses in the picturesque effects of the Spanish original. Castro set a taste in Spanish drama which long prevailed, and which, to a certain extent, persists to-day. His characters reflect, especially in the 'Cid,' the chivalrous or romantic times in which they lived. His plot and characters are very animated and are dressed out in beauty of imagery and thought. Castro is, therefore, in a sense, the father of the drama of chivalry. His inventiveness and his management of plot are superior to that of any Spanish dramatist previous to his time. In all these respects Castro's 'Cid' is superior to Corneille's 'Cid.' The former and 'Las Hazañas del Cid' together, in a sense, form one dramatic work which has made the name of Castro known among all the literary nations of Europe. In France Castro was held in even higher esteem than in Spain; and to the popularity of his numerous dramas, some 40 in all, is due his literary influence on succeeding generations for both good and for bad. While he bequeathed to the drama a vividness, reality, force and action previously lacking in Spain, he also left it a tendency to licentiousness and disrespect for the laws and customs of conventionality; and he glorified the romantic age with its intrigues, its rule of force, its duels and other conflicts. Born in Valencia, the home of the Cid, he was deeply inspired by the legends and glorious traditions of his native city; and his patriotism frequently bursts out into ardent flame. With wonderful facility and an appearance of reality and truth, he re-creates chivalric customs and feudal manners; and the old sentiments of honor and patriotism are ever at his beck and call. But he is lavish in more titanic effects. The meet-
ing of infidel and Christian, the life of the Crusades and the shock of battle he handles with equal facility and familiarity.

When he turns to comedy, which he frequents, and that is well, Castro is at his best; his follies, vices and customs of his age. Life as he knows it he put on the stage. For the most part, the life of his day was not a good life; and Castro makes it no better than it actually was. Hence his plays have been condemned for their immorality and his detractors have lost sight of his vast and many-sided contributions to the stage, in their efforts to discredit him, which unfortunately were, for a time, only too successful. His dramatic work covers the whole wide dramatic field. His most noted historical dramas are: Las mocedades del Cid; La justicia en la piedad; Pagar en propia moneda; Alla van leyes do quieren reyes; La humanidad soberbia y el amor constante. To his romantic dramas belong: El Conde de Alarcos; El nacimiento de Montecinos; and El desengaño dicho; while to la casa y espada clas belong: El narciso en su opinion; La fuerza de la costumbre; and Los mal casados de Valencia. His dramas de costumbres y caracteres in which he displays criminal loves, intrigues and, in general, the follies of his day, and holds the mirror up to life in a masterly manner, include: El curioso impertinente; Don Quixote; La verdad averiguada y engañoso casamiento; El pretender con pobreza; En guerra se engañaron; and El perfecto caballero. His freedom in depicting society as he found it has placed his dramas on the taboo list in most Protestant countries. Mythology, too, met with skilful and sympathetic treatment at the hands of Castro in the drama Progne y Filomena. The semi-mystical, semi-religious drama he also handled better than his predecessors in El mejor esposo San Jose; Las maravillas de Babilonia; El prodigio de los montes y mario del cielo Santa Barbara; and La degollacion de San Juan Bautista. He has attempted heroic tragedy with considerable success in Dido y Eneas. Among his other dramatic pieces are: El Conde de Irlós; Los enemigos hermanos; Cuando se estima el honor; El vicio de los extremos; La fuerza de la sangre. The following works have also, with apparently good reason, been attributed to Castro: El caballero bobo; El dudoso en la venganza; Ingratitud por amor; El nito de su padre; Donde no esta su dueno esta su duelo; El enamorado mudo; Quien malas manos ha; Quien no se aventura; and La tragedia por los celos. He also wrote dramas in collaboration with other dramatists. In two of these, La manzana de la discordia, and El robo de Elena, he worked with Mira de Mesqua. In 1621 La primera parte de las comedias de don Guillén de Castro was published at Valencia; and the second part four years later, on the same plate. See Poem of the Cm. Consult Biblioteca de autores españoles Vol. XLIII (which contains seven of his plays); Ferster, W., Las mocedades del Cid (Bonn 1878); Merimé, E., Première partie des mocedades del Cid (Toulouse 1890); Rennew, H. A., Ingratitud por amor (Philadelphia 1899).

Editorial Staff of the Americana.

CASTRO-Del-Rio -- CASTUERA

CASTRO-Del-Rio, Spain, a town in the province of Cordoba, 16 miles southeast of Cordoba, on a slope above the Guadajoz. The more ancient portion is surrounded by a dilapidated wall, decorated with towers. One gate, which was defended by an Arab castle, now also ruinous. The modern portion is outside the walls, and extends along the foot of the hill on its north side. The most of the streets are wide and regular, lined with well-built houses and handsome public edifices. The church is large and handsome, and there are also several convents, two colleges, primary schools, hospitals and manufactories of linen, woolen and earthenware. There is a considerable trade in agricultural produce. Pop. about 12,000.

CASTRO-URDIALES, oor-de-a-las, Spain, seaport town, Santander province, on the Bay of Biscay, connecting by a branch line with the Bilbao-Santander Railway. An ancient town with a medieval site and part in church, it has grown rapidly since 1870, through the development of neighboring iron mines and increased railway facilities. In a recent year, exports of iron rose to 277,200 tons. Fishing and the canning of fish, especially sardines, in oil, is also a thriving industry. Pop. 14,200.

CASTROGIOVANNI, kǎ-strō jō-vǎnˈni, or CASTRO GIOVANNI (anc. Enna), a city of Sicily, in the district of Caltanissetta, on a plateau in the center of the island, 4,000 feet above the sea. The climate is healthful, the soil fertile and water abundant. The old feudal fortress of Enna is the chief edifice. It contains also a cathedral, founded in 1307, a public library, a museum, a technical institute and a castle built by Frederick II of Aragon. It was the fabled birthplace of Ceres, and the site of her most famous temple. About five miles distant is the lake of Pergusa, where Proserpine, according to the poets, was carried off by Pluto. During the first servile war the insurgent slaves made Enna their headquarters. It was captured by the Normans in the 9th and by the Normans in the 11th century. It has trade in sulphur and rock salt. Pop. 28,932.

CASTRUM DOLORIS, a Latin term signifying castle of grief, has a different meaning from catafalque (q.v.). The latter is used to denote an elevated tomb, containing the coffin of a distinguished person, together with the tapers around, ornaments, armorial bearings, inscriptions, etc. placed in the midst of a church or hall. The castrum doloris is the whole room in which the catafalque is elevated, with all the decorations. The sarcophagus, usually empty, is exposed for show upon an elevation covered with black cloth, under a canopy surrounded with candelabra. Upon the coffin is laid some mark of the rank of the deceased, as his epaulette or sword and, when the deceased is a sovereign or a member of a ruling family, princely insignia are placed upon surrounding seats. The French call the castrum doloris, chapelle ardente, sometimes also chambre ardente; but the latter has also a separate meaning.

CASTUERA, kǎ-soo-ərˈə, Spain, town in the province of Badajoz, near the right bank of the Guadaleja. Most of its streets are straight, clean and well paved. It has two
squares, lined with substantial houses; the principal one contains the town-hall, prisons and spacious modern parish church. The inhabitants are engaged in weaving, making earthenware, tiles, bricks, and stone. Trade is carried on in cattle, wool, wine, grain and oil. Pop. 6,322.

CASUARINA, käs-ú-rin'a, or BEEFWOOD, the single genus of the family Casuarinaceae, or cassowary-trees. There are about 30 species, natives chiefly of Australia. They are jointed leafless trees or shrubs, having their male one-stamened flowers in whorled catkins, and their fruits in indurated cones. Some of them produce timber called beefwood, from its color. C. quadriovialis is called the she-oak. C. equisetifolia is the best-known species, and is much cultivated in Florida and California, and in tropical regions generally.

CASUISTRY, the science or art of determining cases of conscience and the moral character of human acts; so called from casus conscientiae, a case of conscience. Wherever the question arises, Is such an act allowable by moral law? there is a case of conscience and matter of casuistry, as in deciding the question for himself, as everyone habitually does, everyone is a casuist. But in current usage a casuist is one who, skilled in the prescriptions of the divine moral law and its interpretation whether by lawyers, moralists or theologians, studies either suppositions or actual cases of conscience and judges whether a given act, or even a given thought is consistent with or in violation of moral law — for, unlike the civil lawyer or the ministers of civil law, the casuist must determine the moral character of thoughts no less, or rather more, than of acts. The professional casuist is inevitable in the system of the Catholic Church, where the minister of religion, in his capacity of confessoreus or confessor, must be the counsellor and director of penitents and resolve for them questions of guilt or innocence, questions touching the obligation to restitution, for example of goods, or reparation of damage to a neighbor's reputation by slander; granting or withholding absolution according to the merits. For the minister of the sacrament of penance acts under Jesus Christ's commission, whose sins he shall forgive, whose sins ye shall forgive; and he shall forgive, or retain; and to execute that commission the minister of the sacrament must decide for himself and the penitent the moral character of the acts. The science or art of casuistry has doubtless been carried to extraordinary lengths; but though the questions which it treats are such as touch individually and most intimately daily and hourly the many millions of souls who resort to the confessional, the works of writers on casuistry, though voluminous, would count as a scant armful compared with only one part of the works contained in a law library — those which record the decisions of the civil courts. It is true also and inevitable that casuistry like law lore is often employed as a means of escaping from legal penalty or of quieting the sense of guilt. As there are lawyers who for a fee will defend any cause however defenseless morally, even to the extent of working injustice — loss of property, loss of reputation to the party opposite — so there are casuists who by their overinclining to an indulgent interpretation of the divine moral law, release or cut the nerve of moral responsibility, administer an opiate to conscience.

Probabilism is the name given to the doctrine which declares to be lawful in foro conscientiae an act the moral correctness of which is affirmed by any moral theologian of weight (doctor gravis); or, as defined by Ligouri, a probable opinion is one which rests on a solid foundation (fundamento gravi) both of reason and of authority, so that it is able to move the assent (flectere assentum) of a prudent man, though with fear regarding the opposite. But a writer in a great encyclopedia, who regards probabilism as the most remarkable doctrine they (the casuists) promulgated — a doctrine which it is hard to believe that any one ever ventured to assert teaches that according to probabilism any opinion which has been expressed by a grave doctor may be looked upon as possessing a fair amount of moral right, and may, therefore, be safely followed, even though one's conscience may insist upon the opposite course: the last clause is gratuitous and has no warrant in the teachings of Catholic moralists, who unanimously hold that an act done in defiance of conscience, even if it be a plainly erroneous conscience, is a sin.

Viewed in the abstract, the rule of the probabilists is not an unreasonable one; it is acted upon daily by whoever, doubting his own judgment, asks counsel of others whom he regards as trustworthy advisers, even though they be not grave doctors (graves doctores). It is admitted that some of the probabilists, even the greatest of them, as Escobar, Suárez, Busebaum, did not always guard the doctrine against misconstruction, and gave occasion for views of moral obligation which were too lax: but the ecclesiastical censure has fallen upon such erroneous teachings, without discrediting for Catholic moralists the principle of probabilism. Let any other school of moral teaching set to itself the same task which confronts the moral theologian of the Catholic Church, that is, to define with precision the moral character of every act, every thought, every imagination that has relation to the moral law, and it will be seen whether probabilism must not have a place in its system.

CASUS BELLi, the material grounds which justify (or are alleged by one of the parties concerned to justify) a declaration of war (q.v.). The casus belli is not seldom a very trifling one, and does not necessarily indicate the real causa belii or cause of the war.

CASWELL, Richard, American lawyer: b. Maryland, 3 Aug 1729; d. Fayetteville, N. C., 20 Nov 1789. He removed to North Carolina in 1746; practised law and was a member of the colonial assembly (1756-70). He was a delegate to the Continental Congress 1774-75; was president of the Provincial Congress which framed the State constitution (1776), and 1st governor of the State 1775-79; re-elected 1784-87; comptroller-general of the State 1782-84; was also a delegate to the convention which framed the Federal constitution in 1787. He was major-general of the Newbern district in the Revolution.

CAT, a predatory animal of the family Felidae (q.v., for physical characteristics). All
feline animals are "cats" in the broader sense; but in the more restricted and common usage the term refers to the typical members of the genus Felis. The type is the wildcat (F. catus) of Europe and western Asia, but now extinct in Great Britain, and very rare except in the wilder forests of Germany, Austria and eastward. It is somewhat larger and of stouter build than the domestic cat; its body is yellowish gray, with a dark line along the back, and many darkish stripes on the sides and across the legs; its tail, of moderate length, is ringed and tipped with blackish; and the soles of the feet are black. It is a fierce animal, preying upon anything it is able to overcome, goes abroad chiefly at night, and makes its lair in hollow trees and crannies among rocks, and is almost untamable. This brief description of habits will answer for most of the other cats to be mentioned, varying with their diverse habitats; but some of the others have shown themselves far more amenable to domestication. It should be noted that the American wildcat is in some respects a very different one — the short-tailed lynx (q.v.).

Mivart enumerates in his monograph 36 species of these smaller cats, but some of them are probably mere varieties of others, and we can here mention only a few of the better known ones, larger descriptions of which may be found under their names. The most important one is the Egyptian or Caffre cat (F. libycus), the main source of our household pets, described in the article Cats, Domestic. Another important African species is the widely distributed serval (q.v.) whose fur is valuable. A reddish-brown species, called the golden-haired (F. rufus), and two or three others, little known, inhabited the West African forests.

Asia has many varieties of cats, some of which are of large size. Thus the spotted cat (F. tigris) of the interior of China has a body nearly three feet long; and nearly as big is the handsome, spotted and striped fishing cat (q.v.) of eastern India and the Malay Peninsula. Ours of note are the leopards and Asian lion (F. bengalensis), the common Indian jungle cat or chaus (q.v.); the little rusty-gray jungle cat (F. rufibundus), which is the smallest of its tribe; the Manul of northeastern Asia (F. manul); the ring-tailed or "raccoon" cat (F. prionailurus), which is uniformly brown in hue; the marbled cat (F. marmorata), richly ornamented with wavy, irregular lines and blotches of color, and the bay or golden cat (F. aurata) of northern India, Malaya and the East Indies. This last animal is of special interest as it is believed to be the parent stock of the Siamese domestic cat, which was formerly reserved for royalty alone. Its fur is pale golden-chestnut in color, becoming bay along the back; the throat and under parts are white, while the face is strikingly ornamented with stripes of black, white and orange.

America has several species of wildcats besides the large jaguar (q.v.) and the puma or cougar (q.v.); those of North America are more easily distinguished than those of Europe. But Central and South America have several typical felines. Of these the ocelot, the margay, the eyra and the jaguarondi, are described elsewhere under their names. A very distinctive and well-known species of the plains region south of Brazil is known as grass cat, pampas or grass cat (q.v.). See Cheeta, Felide, Lynx.

S., 'African Lion in Africa' (New York 1912) and Cassell's, the Royal and the Standard Natural Histories.

Ernest Ingersoll.

CAT, Domestic, The. The influence of the domestic cat upon American civilization has received less consideration than it deserves, for a great deal of the advance of agriculture as well as of the spreading out over the vast woodland and prairies has been made possible by this much abused and misunderstood animal. How much food cats have saved, how much property they have guarded from destruction, what plagues of vermin they have kept in check, from the time this country was far too poor to compute. But for their sleepless vigilance the large cities would quickly be overrun with rats and mice.

The government appropriates money every year for the maintenance of the post offices and other public buildings of the larger cities, in order to keep down the vermin that would gnaw holes in mail-sacks and destroy public records and other property. It is recognized in the national printing office of France, where vast quantities of paper are stored, and where an army of cats is retained to keep the mice in check. In Vienna it is regarded as a part of good municipal government to take care of the cats. The United States government has systematized its cat service in public institutions, and in Pittsburgh a certain strain has been bred to live in cold storage houses, and is developing characteristics peculiar to this kind of life. In warehouses, corn cribs, barns, mills and wherever grain or food is stored, cats must be kept. But to be effective, they must be taken care of, for well-fed cats are the best mousers.

Origin and History of the House Cat.— Formerly it was carelessly thought that our house cats were simply the progeny of tamed wildcats, but that theory was exploded when it was found that domestication had proceeded so far that all the members of the family were bred only in captivity; but anatomy denied the probability of this, and historical investigation showed that they came from another source. This source is the North-African *gloved* or "Caffre" cat (Felis libycus), which, w' as historical evidence, including innumerable mummies, shows, was domesticated by the Egyptians before the time of the oldest monuments of their civilization. Moreover, the characteristic specific markings of the caffre cat (still wild as well as tame in the Nile Valley) reappear unmistakably in our common house cats, in spite of the fact that interbreeding with other species, and various local races, has intervened. A well-marked variety of this cat was to be found anciently, and now, in Syria and eastward, known as the Mediterranean cat. Its "paws" are the "paws" of the wild cat of the Mediterranean Sea, and founding trading-posts on both its shores, where finally arose and spread the extensive civilizations of Greece and
of Rome on the north, and of Carthage on the south. With these colonists undoubtedly went their friendly and useful mousers. That they then were crossed somewhat with the native wild cat seems to be shown by the resemblance of the peculiar form we call "tabby" cats. This, in brief, is the history of the common European house cat, whence have come, by emigration, those of America and most of the civilized world.

In the remote and isolated East, however, exist races of domesticated cats of more local origin. Prof. G. Martorelli, of Milan, Italy, has made a special study of this whole subject; and he has concluded that the ordinary domestic cat of India has descended from the Indian desert cat (Felis ornata). From it, he says, are derived their common spotted breed, while the fulvous breed seen in India has been produced by a cross with the native jungle cat (Felis chaus). Both these have intermixed with the imported western cats in recent years. The Persian or "Angora" long-haired breeds may probably have come from Pallas' cat of central Asia; and the curious Siamese cat is regarded as a breed in itself. The tabbies have been mingled accidentally, or by the design of breeders, of these various species and races has produced the bewildering variety of forms now seen. Consult on this subject Ingersoll, 'Life of Mammals' (New York 1893, with bibliographical appendices).

American Interest in Cats.—American interest in the cat is often said to have originated within the last 20 years, that is, since the advent of exhibitions and the taking up of the cat-cult by the public. This impression is not borne out by facts, for we have exhibitors who have intimately studied cats, have bred and raised them, and have cared for them for over 60 years, and cat-shows were held in Maine between 1860 and 1870, even before the great exhibition instituted in London by the well-known animal painter, Harrison Weir, in the year 1871. But cat-shows in America were not known outside of Maine until one was held in the Madison Square Garden, New York, in 1895. From there it has gone on from Mr. Weir's first show up to the present time, so that the marking epochs in modern cat history may be dated from the Crystal Palace show in 1871, and the New York show in April 1895. From these shows has arisen what may be described as a cult, or in some ways an industry. Numbers of individuals, principally women, have taken up the cat as a partial means of livelihood, selling those they rear by exhibiting them to the public, the outcome of which has been the introduction of different colors, strains and families. Clubs have arisen for the care and maintenance of exhibitions; registers and stud-books have been started; and the importance of cats of known pedigree is duly recognized by our government as one of the many things to be considered and provided for in a tariff schedule.

The varieties or breeds recognized in shows are the Persian, Siamese, Abyssinian and odd-colored short-haired. The Persian and Angora may be said to be the long-haired cat, though distinctions were drawn in old days; but these were very indefinite, and at the present time we draw up rules and regulations for two large groups, the long-haired cats and the short-haired cats, and these are judged by points and classified by color distinctions. Angora is a small place, and comparatively few cats could have come from there, but many have come from other parts of Asia. Taking the long-haired division first, because commercially it is the most prominent, the judge requires that the cat shall be short in body with a short tail and short legs, the latter shorter in front than behind. The cat should be of the loin square and firm, the bones of the legs well developed and the frame sturdy. The head that corresponds with this formation and is required is a broad, round head with short, wide nose, eyes large and round and set well apart. The ears, a most important feature, should be as small as possible and placed on the side of the head, the base of the ear being narrow, not gaping wide open, with a tuft of hair at the apex. This standard is more or less based upon a general impression stemming from Asia. The colors most valuable and most approved are the light silvers, smokes, blues (or slate color) white, black, orange, cream and tortoise-shells; and the tabbies of different colors are also favored. To this tabby cat that has a light ground-color and is spotted, barred or striped with darker color, and the word "tabby" has no reference to the sex of the animal. The name "tabby" is derived from Atab, a street in Bagdad celebrated for its manufacture of watered or moiré silks, which in England were called "atobi" or "taffety." The most usual colors in tabby cats are yellow, marked with orange or red, making what are called orange tabbies: yellow brown, marked with black, making the brown tabbies: gray, marked with darker stripes, giving us the gray tabbies; and pale silver, marked with black or a sort of dark blue verging on black, from which we have the silver tabbies. The great feature required in tabby cats is that the ground-color should afford as distinct a contrast to the stripes, bars or spots as possible; the colors should be vivid and the marks very plain. There are spotted tabbies, and in these the spots must be round, clear and distinct; but we seldom see a good race at this. Most of these tawny varieties come from India, the home of the best spotted tabbies. The solid-colored cats are the whites, blues, blacks and smokes; although recently the silvers, creams and oranges have in a few instances almost attained perfection in being without marks or foreign color. The tortoise-shell cats are black, red and yellow; when accompanied by white, the patches are clearer and distinct; and this feature is what is aimed at. Tortoise-shell males are almost unknown, and orange females are very rare.

Points of Show Cats.—The eyes of a cat are an important feature, and should be large, round and pleasant in expression. Although color of eye is a great feature, many judges prefer large, well-placed, pleasant eyes to those that are more correct in color but badly placed, or are small and mean in expression, or give the cat a sour look. The color of eyes required may be briefly summed up as blue (as deep as blue short-sighted) for a white cat; emerald-green for a light silver or chinchilla, and then called; and yellow to orange, as deep as possible, for all other varieties. The color and beauty of the cat's eyes vary according to the state of health, the light and the time of day.
and judges have to be careful in this matter. The body-colors can be defined as white, as pure as possible; black, deep and glossy; blue or slate, sound and pure from root to tip of hair, showing no light shadings or light undercolor; smoke, a deep plum-color, silver undercoat; ruff and stomach; cream, light fawn or cream color, varying in tone. The hair marked, should be as rich and strong as possible. The tortoiseshells marked with clear distinct patches, clean-cut and free from each other. The fur of the long-haired cats should be fine, long, silky and glossy; wooliness is deprecated, but is more inclined to appear in certain colors, such as orange and cream; and blacks may have a rather coarser texture of coat if they make it up in color. But in whites, silvers, blues, smokes and in brown tabbies there can be no excuse found for anything but exquisite quality.

In the short-haired division we must consider our old fireside friend first, and coloration in this variety is much the same as in the long-hairs, though color and coat of these are more strikingly marked and more brilliant, as the colors are not clouded or mixed by the length of the hair. White cats with blue eyes are generally deaf, but not always. The short-haired cat is rather different in formation to the long-haired cat, the face is more angular, or rather the nose may come to a finer point, though its cheeks should be well developed. The eyes are differently placed yet should be full and large, the ears larger, closer together, more toward the top of the head, wider at the base and more pointed at the apex. The body should be moderately long, slender and elegant. The great thing to avoid in all cats is coarseness, and size alone is not a recommendation.

**Foreign Cats Exhibited.** —The Siamese is a distinct variety which comes from the palace of the King of Siam or from a few families of nobles. These cats are conceded to be the most intelligent and companionable of all cats, but having been much injured in the past and do not increase very fast. The climate of California suits the Siamese cat, and the variety is found there in fair numbers and doing well. The points valued in this cat are a rather small and flat head, a small and elegant body of a light fawn or biscuit color, with chocolate-colored legs, mask and tail. The more decided the contrast—that is, the lighter the body-color and the darker the points—the better. The Siamese are much appreciated as show-cats. Chocolate-colored cats of this variety are found and are valuable. The fur most approved is very fine and glossy, resembling beaver. The eyes are blue, the color as rich as possible.

The Manx cat makes a distinct species in our exhibitions, and is classed by itself. Besides the absence of tail, which is the distinguishing feature of this cat, a different formation of body is required; namely, that the fore legs should be short and the rump as abrupt as possible, making the hind legs longer than the fore legs, so that the cat seems to jump forward like a rabbit, and is sometimes called a rabbit cat. The head should be neat, round and rather glossy; body short and compact. The Manx cat may be of any of the recognized colors. There is a distinction between this variety and our other domestic cats. Gambier Bolton who studied the question and traveled to collect specimens for the British Zoological Society coincides with the naturalist Kemper, and recognizes a strong likeness in these cats to those of the islands in the East, the Malay Peninsula, Japan, China and lands contiguous. All the cats in those parts, even the Siamese, seem to have peculiar formations of the tail, whether cut short, forked, kinked or otherwise. These cats are smaller; there are differences in the call or language, ways and character, that have been observed by these students. The origin of the Manx cat is now attributed to the arrival of these cats on the Isle of Man from ships belonging to the Spanish Armada that were wrecked there. These cats were most probably previously brought from various parts of Europe, or so many others, and the blue-eyed whites have probably been bred from the long-haired cats. But as to color, color of eyes and classification, the rules specified for long-hairs fit the short-hairs except that the tabby cats are more distinctly marked and more brilliant, as the colors are not clouded or mixed by the length of the hair. White cats with blue eyes are generally deaf, but not always. The short-haired cat is rather different in formation to the long-haired cat, the face is more angular, or rather the nose may come to a finer point, though its cheeks should be well developed. The eyes are differently placed yet should be full and large, the ears larger, closer together, more toward the top of the head, wider at the base and more pointed at the apex. The body should be moderately long, slender and elegant. The great thing to avoid in all cats is coarseness, and size alone is not a recommendation.
which means black patches on the cheeks, a white blaze up the face, joining a broad, white belt which goes completely round the cat half way between the ears and tail.

Of the cats indigenous to the American continent, which might be suitable for domestication, few have been tried in a domestic way, and the species that inhabit this country are not many. I have seen the wildcat or gray lynx, at shows, behaving in the most exemplary manner. Having been brought up from infancy by children, and perfectly tame, it was more at ease in a large show-room, and not nearly as nervous as the ordinary feline. So that if it were not for the size of the creature, its possibilities as a domestic animal would be good; but unfortunately our time does not seem to be destined to take in hand or give us any fresh species of domesticated animals; what we have are handed down through the ages. In this particular we are not original, for we destroy more often than we create, and we seem to have no time for trying to subdue or lead into bondage any new varieties of mammals. In some quarters, however, the lion ranges over the whole of North and South America, but is too large for domestic purposes; yet it has never been aggressive against man, and, if history is to be thoroughly correct, it has never driven any settlers till driven to exile and filled with fear by man himself. The ocelot is one of our most beautiful varieties, and varies somewhat in color, with sometimes a gray body-color, but more often yellow. It is clearly marked with dark color in spots, bars and splittings, and is very handsome, but larger and more powerful than the domestic cat. These cats have been taken when young and reared; and although comparatively tame and sociable till about a year old, they then become savage and impossible and have to be caged or killed.

A very pretty cat that has been exhibited in America is the margay from Central and South America, where it inhabits the woods. This cat has been handled at aClion and found tame and with a passion for being caressed. The margay is light red or orange, beautifully and regularly spotted with small black spots, the ears small, round and pointing forward, with a gray or black backs, edged with black. It is a small cat, very handsome and refined, and if the effort could be made to obtain some of the species these cats would be a very valuable addition to our varieties and to our home circles. Geoffroy's cat is another small spotted cat, of which a few have been introduced into England, but it is too early to state what the future increase may be. The pampas cat is another feline not amenable to domestic life.

Asiatic Races.—As a rule our best white cats with blue eyes come from India and some of the best are brought from Tibet. In crossing the Himalaya Mountains with these cats carriers slit their noses to enable them to breathe with greater ease the rarified atmosphere of the highlands, and slit noses are much valued. As to cats coming from this place or that, such as Persia, Angora, etc., a good deal of proof is required before any particular claim can be accepted. The writer has failed to find any long-haired cats at Teheran, and Angora, as has been said, is but a small place. We probably obtained many of our long-haired cats from around the Persian Gulf, and from India, many of which come down from the same line as the Arab horse-traders. Cats vary in their adaptability to changes of climate, and no doubt to this factor we owe what we have and what breeds we can retain and perpetuate. The Siamese soon succumb to dampness, but the long-haired cats, in some cases, took to the climate of Maine early in the century, when brought from the East. They bred extensively, and increased and became an article of commerce to the large cities, long before these cities held shows. These cats went by the name of Angoras, and in fact the ordinary nomenclature of the country defines all long-haired cats as Angoras. The Maine cats were often carelessly bred, and when shows commenced and competition came they had to give way to the more finely bred English cats, but in other cases they held their own and the blood has been perpetuated. The Maine cats are found in all colors, and some are very big and strong, but these cats with short-haired cats, and a great deal of hybridizing has been done even in England. There is a Russian long-haired cat, but it has not gained much favor, being solitary in its habits, unsociable in character, coarse in body and fur and dingy in color. A few have been brought from Persia, but they had the faculty of attaching themselves more to other cats than to their owners. They are originally the same cat as the Asiatic—that is, the Persian or Angora; and the first long-haired cats must have been brought over by sailors and travelers from the East. All long-haired cats seem to have a common origin in Pallas' cat (Felis manul).

Another cat that has created a great deal of interest is the Maltese. This cat is hard to account for, but should be blue or slate in color and greatly resembles what in Great Britain is called the Russian or Archangel cat, specimens of which have often been brought from Russia; but lately quite an influx of blue cats has come from Iceland. Whether cold winters are calculated to develop blue cats I do not know, but it is sufficiently evident that northern climates have produced most cats of that color. Blue cats are not numerous in Great Britain, although they are becoming more so by introduction. Here in America we have plenty scattered all over the United States, but how they gained their name of Maltese the writer has been unable to discover, for there is no blue cat indigenous to the island of Malta. Probably the cats were brought there in early times from the same source whence the English now obtain theirs, and the color being peculiar, these cats were selected or by superior hardness, they may have selected themselves. However many people who are not cat exhibitors or who do not know much about cats scientifically keep their short-haired blue *Maltese* and are proud of them. The Chartreuse monks had blue long-haired cats many years ago.

Temperament and Intelligence.—Some writers have told us that long-haired cats are less affectionate than short-haired cats. This is a mistake, although long-haired cats, on the average, are more intense, more nervous,
more highly strung, more pugilistic and have more puck and daring than the short-haired cats. The cat has great intelligence; in fact, is one of the most intelligent of the domestic animals, and it is this fact that precludes the possibility of teaching the average cat tricks. For the cat sees through the manœuvre, and refuses to be made a fool of. In respect to memory they are phenomenal and far exceed the average dog in this quality. Their powers of conversation are well developed, accompanied by delicate inflections of the voice that need to be known to be understood. Dupont de Nemours says: "The cat has also the advantage of a language in which the same vowels as those pronounced by the dog exist, with six consonants in addition, m, n, g, h, v, and f." It requires study to get to know cats, and Rouvière, the actor, said that no one could really understand a cat unless he himself became one. A cat, of all the domestic animals, has retained the greatest part of its wild nature and traits, and the easiest way to get at a cat is by kindness and by trying to learn cat ways. At the contrary there are cats that would settle down anywhere, that have crossed and recrossed the Atlantic Ocean, and have lived quietly in any locality their owners chose. A cat is one of the finest mothers on earth.

Cat-fanciers' Associations.—The fortunes of the cat are now more or less regulated by clubs and associations, and there are homes, hospitals and refuges in many places and in many lands. The principal clubs are the National Cat Club founded in 1887, with headquarters in London; the Scottish Cat Club, founded in 1894; the Cat Club, London, founded in 1898; the Northern Counties Cat Club, the Silver and Smoke Persian Cat Society, the Siamese Club and the Orange, Cream, Fawn and Tortoise-shell, founded in 1900; the Black and White Club, the Blue Persian Society, the Chinchilla Cat Club, the Short-haired Cat Club, the Midland Counties Cat Club, the British Cat Club and the Manx Cat Club, founded in 1901. All the above are in Great Britain, but many have members in America. In the United States there are the Beresford Cat Club, founded in 1899, with headquarters in Chicago; the Atlantic Cat Club, with headquarters in New York; the New York Cat Club, the Louisville Cat Club, the Pacific Cat Club; the Orange and Cream Society, with headquarters in Chicago, the Washington, D. C., Cat Club, the Detroit Club, etc. All these have been founded since 1899; so we can see that the advances made of late years have been sudden and rapid; and they will no doubt continue to do so, as there are many of the principal cities and are yearly fixtures. Prices for cats increase; and whereas $25 was considered a good price a few years ago, some of the best have been recently sold for $500 each, and many at $75 and $100. The largest price of which we have record as having actually been paid in cash for a cat is $300, which was the price Lady Decies paid Mrs. Greenwood of Lord Southampton; although I expect to see this exceeded in time to come, for competition enhances values, and the best specimens and most perfect will bring high prices from those who want them. All this will tend to draw attention to the cat and better the race and its general conditions.

Cats have had their artists: the Egyptians, the Japanese, the Chinese, Salva tor Rosa, Gottfried Mind ("The Raphael of Cats"), Burbank (a master little known), Cornelius Wisscher, the Dutch artist, whose "Tom" cat has become typical, J. J. Grandville, Harrison Weir, Louis Wain, Madame Ronner and Adam.

Members of the English royal family breed and exhibit cats at the regular exhibits of the present day. The Duchess of Connaught, the sister-in-law of the late King, was the organizer of the National Cat Club, one of the associations which maintains a thoroughly reliable studbook for cats; the Queen mother, Alexandra herself, is active. Members of the Ladies' Kennel Club, and both Princess Christian and her daughter, Princess Victoria of Schleswig-Holstein, have taken many first prizes with their valuable feline pets.

A Few Hints to Breeders.—Do not try to keep too many; a good cat well reared will bring more money than 8 or 10 badly nurtured, undersized kittens. Cats are not gregarious, and when crowded together become diseased and mangy, and prematurely die. One litter of really good cats will yield more pleasure and profit to the owner than five or six litters of poor ones.

Liberty is necessary to the health alike of the present and of the coming generations, and these latter should never be out of our minds when mating.

Meat is the main diet of all the carnivora to which order domestic cats belong. The best diet for cats is composed largely of meat, for which their teeth are adapted. Without meat they will not long remain healthy. They vary in their tastes, and what is fancied by one is not always preferred by another. Fish they are fond of, but as a rule house cats should not be given much raw fish. Cats kept in confinement should have grass, vegetables and changes of diet provided for them. Grass is a necessity.

Epidemics that sweep through different countries and continents at stated periods decimate the cat family, and it is well to be prepared for such occasions by having none but the healthiest and best of animals. Distemper, the greatest of cat scourges, is best treated by nursing, care and cleanliness. Fleas convey embryonic worms which infect cats, and should be rigorously kept down. They breed in cracks in the floor, in bedding; and in the ground, and war waged upon their haunts will be work well laid out.

Do not use nauseating drugs for ailing cats, but choose the mildest remedies that will effect a cure. Do not be prejudiced against a course of treatment when we have heard of some who, on the supposition of a cure, will be no more effective. Cats, when ill, require sympathy as much as human beings, and more so than any other animal, in order to battle successfully with disease, for they have a tendency
to be very pessimistic and sorry for themselves, and to recover or fail quickly. They suffer mostly from distemper, worms, eczema, bronchitis, pneumonia and liver diseases, and occasionally from catarrh fever. They are acquainted with a good homeopathic physician, and have any idea of what ails your cat, consult him and abide by his advice.

Do not breed from your queens too young, although many good kittens have been raised from queens not a year old, if strong and healthy. Male cats will not mate as early in life as the queens, and are seldom of much use till a year old. Do not cross long-haired cats with short-haired cats, for you spoil the type of both. Siamese cats will breed with other cats, but the progeny are never good for the show-room; and the Siamese being a distinct breed, does not amalgamate with any of the other varieties. The Manx cat is better kept pure, or the type degenerates and the result is not satisfactory.

Remember, when trying to rear good cats, that what goes in at the mouth and the care bestowed upon the young and growing animals cover 50 or even 75 per cent of essential requirements. The best blood in the world will not bring prize-winners or nice pets if they are badly reared. The crucial period takes in the first six months; when the young cat is well grown, and at seven months of age is through teething, you will have an animal that may live 20 years or more. Healthy cats are more long-lived than dogs, and authentic records tell of not a few over 20 years of age, and of some even 30.

Kittens should not be taken away from their mothers before they are at least eight weeks old; and if three months old, it will be still better. Care should be exercised in the diet of kittens at an early age. Sudden changes or sudden chills will bring on gastritis. Milk, unless pure, is more dangerous than meat, which in a raw state may be given scraped or minced at a very early age. Milk is better when mixed with Robinson's prepared barley according to the directions on the box, unless you can obtain warm milk from a cow that has not been too long in the barn. The most common diet for highly bred kittens is cold skimmed milk of an uncertain age.

To destroy a cat, or put it out of its misery when too sick to recover, administer a few drops of chloral, place the cat, if possible, in a tight box, and when the cat is fast asleep drop into the box a sponge saturated with two or three ounces of chloroform.

Revised by Ernest Ingersoll.

CAT-BIRD, one of two kinds of birds. (1) In North America a familiar songster, (Galeocerops carolinensis), so-called because of its mewing call-note, which is strikingly similar to the plaint of a kitten in distress. This, however, is not its only note, its wild and melodious warbling in the morning and the evening being also typical of the musical thrush family to which it belongs. It is about nine inches long, and of a dark slate color, with a black cap, and a reddish patch under the tail. It is migratory only in the Northern States, spends its winters in the South, and frequents bushy pastures and gardens, being one of the few species which often visit the cultivated fields, and being rarely found far from the habitations of the farmer. It is of great service to the agriculturist in devouring wasps, grubs, worms and insects, which, with fruits and berries of all kinds, especially of sumach, green gum and poke, constitute its food. It has a brilliant and varied song, in which it seems to mimic the notes of other birds; when in a domestic state it will imitate strains of instrumental music. The nest, generally built in bramble thickets, is large, and constructed of twigs and briers mixed with leaves, weeds and grass, lined with dark fibrous roots arranged in a circular manner. Its eggs, from four to six in number, are of a greenish-blue color, without spots. Its attachment to its young is remarkable, and it will often feed and raise the young of other birds. It migrates during the night. It frequently attacks the common blacksnake, which, in the absence of the bird, rifles its nest.

(2) In Australia, one of thebower-birds (Eudynamus vivax), so named because of its cat-like call.

CAT-BOAT, a boat having one mast stepped just abaft the bow and carrying a sail laced to a boom and gaff, resembling a schooner's mainsail. In general catboats are very broad in beam, averaging 1:3. They are usually equipped with a center-board, which, with the extreme forward position of the mast, enables them to point high into the wind, and makes them remarkably quick in stays. They are principally employed as pleasure craft on the coasts and inland navigable waters of the United States, and are consequently of shallow draft.

CAT ISLAND, one of the Bahamas Islands, about 36 miles in length from north to south, and three to seven miles in its mean breadth. Pop. 3,000. This island was long identified with the Guamame or San Salvador. Columbus, the first portion of land belonging to the New World on which he landed, 12 Oct. 1492, an honor now conceded to Watling Island.

CAT-OWL, any of several widely distributed large owls, so called because of their
feline habits and cat-like face; also, locally, the common little screech owl. The best known American cat-owl is the barred owl (Strix varia), one of the largest birds of its kind, living in the eastern United States, in length. It has no ear-tufts, and the general color is whitish, everywhere transversely barred with deep umber brown, except on the abdomen, where the stripes run lengthwise. It is a lover of the woods, where its coughing cry resounds and is heard but faintly, where it breathes in hollows or among the branches of trees. It is not migratory, and often nests very early in the spring. This owl has the reputation of being especially destructive of poultry, but in truth it lives mainly on mice, of which it devours vast numbers each season, and hence is the benefactor rather than the marauder of the farm. Consult Fisher, 'Hawks and Owls of the United States.'

CAT-SHARK, any of various members of the Scyllorhynchus group of true sharks, which are characterized by having two dorsal fins, the anterior of which is placed over or behind the ventral, and by having the tail not bent upward. Some of these are called also 'roussettes.'

CATABANGENES. See CATABANGENES.

CATACLYSM, in geology, a physical cataclysm of great extent, supposed to have occurred at different periods, and to have been the efficient cause of various phenomena observed in the surface configuration of localities. The belief in cataclysmic movements as geological agents has largely given place to that in the working of ordinary agencies over long periods of time.

CATACOMBS, subterranean caves or vaults used as burial-places. All nations have been accustomed to some outward manifestation of regard for the dead, such as funeral solemnities, the consecration of grounds for sepulture, the erection of monuments, etc. Some nations, as the Egyptians, constructed pyramids and labyrinths to contain the remains of the departed. Others, as the Phenicians and Greeks, hallowed the rocks for tombs, surrounding their towns with vast magazines, containing the bones of their fathers. Asia Minor, the coast of Africa and Cyrenaica, afford instances of these singular and gigantic works. The discovery of these monuments has always excited the curiosity of travelers and the attention of artists. The latter have applied themselves to learn from them the character of architecture and painting at different epochs; and though they have often found only coarse representations, or productions of art in its infancy or decline, they have occasionally met with types of perfection. Many monuments of this description have been preserved to our days, and still contain traces of the painting and architecture with which they were decorated. There are catacombs existing in Syria, Persia and among the most ancient Oriental nations. But the revolutions in these countries, and the changes which they have occasioned, have deprived us of the documents which would have given us exact information regarding them.

The description of the catacombs in Upper Egypt gives us an idea of those whose location is still unknown to us. They contain the history of the country, and the customs and manners of the people, painted or sculptured in many monuments of the most admirable preservation. The subterranean caves of these countries, like the pyramids of Egypt, have their origin in quarries. From the depths of the mountains which contain them, stone was taken, which served for the building of the neighboring towns, and also of the great edifices and pyramids which ornament the land. They are dug in a mountain situated in the neighborhood of the Nile, and furnished the Romans with materials for the construction of buildings in their colonial establishments. The excavations in these mountains are found throughout a space of 15 to 20 leagues, and form subterranean caverns which appear to be the work of art; but there is neither order nor symmetry in them. They contain vast and obscure apartments, low and irregular vaults, supported in different parts with piles and props by the workmen. Some holes of about six feet in length and two feet wide, give rise to the conjecture that they were destined for sepulchres. Cells of very small dimensions, formed in the hollows of these obscure caverns, prove them to have been the abode of recluse.

In Sicily and Asia Minor a prodigious number of grottoes and excavations have been discovered containing sepulchres. Some appear to have served as retreats to the victims of despotism. The greater part are the work of the waters which traverse the mountains of these regions, as for instance the great cave of Noto, which passes for one of the wonders of Sicily. This cave, the height, length and breadth of which are equal, has been formed by the Cassibil River, which runs at the bottom, and traverses it for the length of 100 fathoms. In the interior of this cave are a number of houses and tombs. At Gela, on the south coast, there are abodes for the living and sepulchres for the dead, cut in the rocks; at Agrigentum subterranean caves, labyrinths and tombs, arranged with great order and symmetry. There are also caverns in the environs of Syracuse which may be ranked with the principal of this description, from their extent and depth, the architecture of the monuments, and from some historical recollections attached to them. The catacombs in the tufo mountains of Capo di Monte, near Naples, consist of subterranean galleries, halls, rooms, basilicas and roundels, which extend to the distance of two Italian miles. Throughout there are seen niches for coffins (loculi) and bones. A description of them was given by Celano in 1643. They probably owe their origin to the quarries which afforded tufo for the walls of the cities Paleopolis and Neapolis, and afterward served as sepulchres for the Christian congregations.

The most numerous and extensive catacombs are those in the immediate neighborhood of Rome, at San Sebastiano, San Lorenzo, etc., the earliest of which of certain date belongs to the year 111 a.d. They are composed of interminable subterranean galleries, extending underneath the town itself as well as the neighboring country, and are said to contain not less than 6,000,000 tombs. The name of catacombs, according to Saint Gregory, was at first applied to designate exclusively the cave in which the bodies of Saint Peter and Saint
Paul were buried, and it was only at a later period that it came to be given to all the subterranean passages which were used as public burying-places. It is now regarded as certain that in times of persecution Christians frequently took refuge in the catacombs, in order to celebrate there in secret the ceremonies of their religion; but it is not less certain that the catacombs served also as places of burial to the early Christians, and that in spite of the efforts of the authorities for two centuries, and even down to our day, the catacombs were not for the most part abandoned quarries, but were excavated by the Christians themselves. It is found that originally the cemeteries of Rome were made up of separate tombs, which rich Christians constructed for themselves and their brethren, and which they held as private property under the protection of the law. But in course of time this was changed. At the end of the 2d century there existed a certain sort of property of individuals but of the Church. Such was that which Pope Zephyrinus (202–19) entrusted to the superintendence of Calixtus, and which took its name from that bishop. Successively constructed of human bones, there were already several such common burying-places belonging to the Christian congregations, and their number went on increasing till the time of Constantine, when the catacombs ceased to be used as burying-places. From the time of Constantine down to the 8th century they continued to be used as places of worship by the Christians, but during the siege of Rome by the Lombards they were in part destroyed, and soon became entirely inaccessible, so that they were forgotten. The first excavations in them were made by Antonio Bosio between 1560 and 1600. The results of these excavations were published in his 'Roma Sotterranea' (Rome 1632), which was translated into Latin by P. Aringhi (Rome 1657). Among the more modern works on the subject may be mentioned Rochette's 'Tableau des Catacombes de Rome' (Paris 1837); Perret's 'Les Catacombes de Rome' (Paris 1861–56); and La Roma Sotterranea Christiana, by D. Rott (Rome 1864–77), containing the results of very careful investigations made by the author, who is justly regarded as the foremost student, in fact, father of this branch of archeology.

The catacombs of Paris, situated on the left bank of the Seine, are almost equally celebrated. The name itself, which has been given to this labyrinth of caverns and galleries from its resemblance to the asylums and places of refuge of the persecuted Christians under Naples and Rome, informs us of the purpose to which it has been applied since 1786. These galleries were originally the quarries from which materials were excavated for constructing the edifices of the capital. The weight of the super-incumbent houses rendered it necessary to prop them; and when the cemeteries of the demolished churches and the burying-grounds were cleared in 1786, the government resolved to deposit the bones in these quarries, which were consecrated for that purpose. The first cemetery was the Cimetière des Innocents, and the bones from it were deposited beneath what is now Petit-Montrouge. The ossuary now extends much farther. The relics of 10 or more generations were here united in the repose of the grave. Many times as great as the living tide that rolls over this spot is its subterranean population. By the light of a taper and a prism it may descend about 70 feet to a world of silence, over which the Parisian police keep watch as strictly as over the world of noise and confusion above. He will then enter a gallery where only two can go abreast. A black streak on the stones of the overlying tombs, which, from the great number of by-passages, it would be difficult for the visitor to retrace without this aid or without guides.

Among the curiosities here is a plan of the harbor of Mahon, which an ingenious soldier faithfully copied from memory, in the material of the quarries. Entering the hall, one is ushered into the realms of death by the inscription which once stood over the entrance to the churchyard of Saint Sulpice: 'Hae ossa et sepulcrum sibi sequentium esse expectant' ('Beyond these bounds rest those awaiting the hope of bliss fulfilled'). Narrow passages between walls of skeletons; chambers in which monuments, altars, candelabra, constructed of human bones, skulls and thigh-bones, interspersed occasionally with inscriptions, not always the most happily selected, from ancient and modern authors, excite the gloomy impression which is always produced, even in the most light-minded, by the sight of the dissolution of the human frame. Weary of these horrible embellishments, the visitor enters a simple chapel, without bones, and containing an altar of granite. The inscription "D. M. III Septembris. MDCCXCI" recalls to memory the victims of the September massacres, whose remains are here united. On leaving these rooms, consecrated to death, where, however, the air is always preserved pure by means of air-holes, the visitor may pass to a geological cabinet, formed by Héricart de Thury, the director of the Carrières sous Paris. Specimens of the minerals furnished by the regions traversed, and a collection of diseased bones, in a contiguous hall, scientifically arranged, are the last curiosities which these excavations offer. 660 feet from the beginning to the east of the road to Orleans the visitor finally returns to the light of day. Strangers may visit the catacombs in company with the government officials at the periodical visits. An account of these subterranean passages is that which was published by M. Dunkel in 1885.

The Etruscan tombs were not, strictly speaking, catacombs, yet as subterranean places of sepulture they may appropriately be referred to. They were usually hewn out of cliffs on the sides of a hill and were variously arranged, sometimes tier above tier and sometimes on a level. There was a central chamber with smaller ones opening from it. In the latter there were stone benches to receive the bodies of the dead. See CATACOMBS, ROMAN.

CATACOMBS, Roman. The "Catacombs of Rome" is the name given to the underground cemeteries in which were laid to rest the Christians of the Eternal City during the first four centuries. The word itself seems to be a hybrid from the Greek 'kata' and the Latin 'lumen,' and signifies "next to the light." It first came into use at the end of the 3d century as a topographical term for a point of the
Appian Way. In the course of time it was applied to the adjoining cemetery of Saint Sebastian, and in the Middle Ages, when the other cemeteries were forgotten, it became a great cathedral for all the Christian burial-places at Rome. It was a word unknown, however, to the first followers of Christ, who called the sepulchres of the saints cemeteries, "places of sleep," owing to their faith in the Resurrection. There are some 32 of these larger early Christian cemeteries beyond the Aurelian wall, bordering the ancient Roman roads and encircling the city of the living with a silent city of the dead. The most important are the Catacombs of Priscilla on the Via Salaria, of Callixtus on the Via Appia, of Domitilla on the Ardeatina and the Ostianum on the Via Nomentana. In this Roma Sotteranea there are some 550 miles of underground corridors, honeycombing the soil of the city, in niches, called loculi, or loculi, which contained the bodies, were closed by a marble slab or a series of tiles, on which was frequently carved some inscription. To understand the origin of the Catacombs it is necessary to keep before our minds (1) the funeral customs and laws of Imperial Rome; (2) the early Christian mode of burial; and (3) the nature of the soil out of which sprung the famous seven hills. (1) The ancient Romans had a great reverence for their dead. Religion, locum unus quaque sua voluisse facti, dum mortuum infert in loco suo. Wherever a body rested became terra sancta, sacred soil, subject to the authority of the pagan pontiffs. Hence burials were forbidden inside the walls, and the law, "in columbiaeuit," forbidden the passage of the city from the first to the third milestonewith the mausoleum, whose richness was one of the glories of the Imperial City, as their ruins are one of the beauties of modern Rome. The pagan mausoleum consisted of three parts, the monument proper, the area or lot of ground and the underground vault in which the ashes were placed in dovecot niches, known as columbaria. These burial plots with their magnificent monuments were owned by burial societies as well as by families and were fully protected by the law. The Christians likewise, either singly or collectively, erected their mausolea along the highways beyond the walls, and this property, even in times of persecution, was safeguarded by the majesty of Roman law. Hence it often happened that while the law spilt the blood it spared the body of the Christian. The opinion sometime current that the bodies of the martyrs were buried by stealth, and that the pagan authorities were ignorant of the existence and extent of the Catacombs, is altogether unfounded. The Catacombs were registered under and recognized by the law. They enjoyed the privilege of sacrosanct soil. Indeed many of the bodies were interred in surface cemeteries as to-day. (2) The first faithful originated no special mode of burial. They generally followed the customs of the people among whom they lived. They adopted the Jewish practice of all burial in tombs or sepulchres. Roman method of cremation, on account of their belief in the resurrection of the flesh. The sepulchre hewn in the rock, where the body of Christ was laid, was the resting place too of the Christian body. This was first wrapped in a tunic or winding sheet previously coated with a preparation of plaster, was covered with perfumes and flowers and placed in one of the niches cut out of the subterranean crypt or along the corridor. In the case of the martyrs or wealthier converts the bodies were laid sometimes in a marble sarcophagus or in an arched grave hewn out of the rock, termed arcosolium, and called bisomus or trisomus, according to number of bones it contained. (3) The soil of the Roman Campagna is of volcanic origin and consists of three distinct sorts of tufa: (1) the lithoid tufa or peperino, a hard building stone; (2) the fine pozzolana sand used in making the Roman cement; (3) the granular tufa in raws one above the other like the shelves of a shop or the bunks of a vessel. The corridors average about three feet in width and six feet in height and were dug generally in three or four levels, ranging from 30 to 50 feet below the surface of the soil. The niches, called loculi, or loculi, which contained the bodies, were closed by a marble slab or a series of tiles, on which was frequently carved some inscription. To understand the origin of the Catacombs it is necessary to keep before our minds (1) the funeral customs and laws of Imperial Rome; (2) the early Christian mode of burial; and (3) the nature of the soil out of which sprung the famous seven hills. (1) The ancient Romans had a great reverence for their dead. Religion, locum unus quaque sua voluisse facti, dum mortuum infert in loco suo. Wherever a body rested became terra sancta, sacred soil, subject to the authority of the pagan pontiffs. Hence burials were forbidden inside the walls, and the law, "in columbiaeuit," forbidden the passage of the city from the first to the third milestonewith the mausoleum, whose richness was one of the glories of the Imperial City, as their ruins are one of the beauties of modern Rome. The pagan mausoleum consisted of three parts, the monument proper, the area or lot of ground and the underground vault in which the ashes were placed in dovecot niches, known as columbaria. These burial plots with their magnificent monuments were owned by burial societies as well as by families and were fully protected by the law. The Christians likewise, either singly or collectively, erected their mausolea along the highways beyond the walls, and this property, even in times of persecution, was safeguarded by the majesty of Roman law. Hence it often happened that while the law spilt the blood it spared the body of the Christian. The opinion sometime current that the bodies of the martyrs were buried by stealth, and that the pagan authorities were ignorant of the existence and extent of the Catacombs, is altogether unfounded. The Catacombs were registered under and recognized by the law. They enjoyed the privilege of sacrosanct soil. Indeed many of the bodies were interred in
ished in a number of instances. With the increasing number of the faithful were formed burial societies among the brethren, which, like the pagan societies, provided by the payment of dues for the care and decent burial of the deceased's members. They owned their own lots, had their own houses built above the ground, in which they met to celebrate their agape and funeral feasts. Hence there was nothing incongruous in the Christians assembling at the Catacombs on state occasions to keep the anniversary feasts of their martyrs. Similar celebrations were held by the pagans themselves, and there is a striking resemblance between the liturgy of these pagan funeral feasts and the language of the Roman martyrlogy. The inviolability of the cemeteries was undisturbed even in times of persecution, save by Valerian, in 258, and Diocletian, in 303. The part played by these burial societies in the Church is still in dispute. De Rossi has advanced the theory that the Church in the 3rd century owned its property as a burial society, as Ecclesia Fratrum or Ecclesia Cultorum Verbi. Duchesne, however, contends that even in period of persecution, the Church was recognized as a religious society in this capacity. The work of excavating was under the care of a distinct class, called fossores or diggers. They were regarded as an inferior sort of clergy, and many of the rude inscriptions were made by them.

The Constantine Period.—It has often been said that the victory of Constantine brought the Church from the Catacombs to the cathedral. The reverse is literally true. It was precisely in the era of peace that the Church betook itself to the Catacombs and that they attained their largest growth and grandeur. Everyone wished to be buried close to the martyrs of Christ. Quod multis cupiunt et rari accipiant, we read in an inscription of the year 381, of one who had obtained burial near the sepulchre of the saints. The crypts of the martyrs were changed into triumphal halls of fame. They were decorated with the choicest of marbles from the wealth of the Imperial City. New inscriptions and entrances cut into the old ones were joined together. Metrical hymns of praise were placed above the graves of the chief martyrs, especially by Pope Damasus. Lights were kept burning before their shrines, and thither the devout of the city were continually flocking to implore the intercession of the saints or to honor their memory. Even the great Constantine basilicas of St. Peter on the Vatican, St. Lawrence on the Labicane, St. Paul on the Ostian, St. Agnes on the Nomentana, and the Caesarean, were erected over the tombs of these Christian heroes. Toward the end of the 4th century the custom of burying in the surface cemeteries began to prevail, and after the sack of Rome by Alaric, in 410, interment in the Catacombs ceased altogether.

Period of Decline.—In the succeeding centuries they were chiefly centres of devotion and terms of pious pilgrimages from the North. The testimonies of these pilgrimages from England and Germany, which have been preserved, were veritable Ariadne-clues in the rediscovery of these buried labyrinths. For some time the Popes of Rome, notably Viglius (537-55), John III (561-74) and Honorius I (625-38) kept the shrines in a state of repair; but after the ravages wrought in the Catacombs by the invading Lombards, Paul I in 757 and Paschal I in 818 translated the relics of the martyrs to caves within the walls. Despoiled of the treasures which had attracted visitors, they rapidly fell into decay. With the exception of the Catacomb of St. Valentine on the Flaminian, and St. Sebastian on the Appian Way, the once existent tombs faded out of the minds of men in the Middle Ages.

Rediscovery and Research.—In 1587 some workmen, excavating on the Via Salaria, chanced upon a Catacomb corridor, rich in paintings and inscriptions. The interest aroused by this discovery has never since died out. Antonio Bosio (1576-1614), the Columbus of the Catacombs, devoted his life to their exploration. His Roma Sotteranea is the first classic on the Catacombs. The researches made by Baldetti and Battari as early as 1609, and that of Pascoli, in the 19th century were mainly in the interest of controversy. To the Jesuit, Father Marchi, belongs the glory of having inaugurated, in 1841, a strictly scientific study of these early monuments and memorials, and the still greater glory of being the master: of the work of excavating was under the care of a distinct class, called fossores or diggers. They were regarded as an inferior sort of clergy, and many of the rude inscriptions were made by them.

Paintings.—In regard to the many paintings found in the Catacombs, it may be said in general that the history of the decline of Classic is that of the beginning of Christian art. In fact nearly, all the examples extant of Roman paintings in the 2d, 3d and 4th centuries are in the Catacombs. They show us that the Church baptised the art as well as the language of the Graecoroman world. While the themes treated for the most part have a direct reference too the creed, they still illustrate a large part of the creed of the early Church. The Catacomb frescoes belong to three distinct periods. In the 1st and beginning of 2d century, there was properly speaking no Christian art. The methods and motifs of the pagan painter, such as abound at Pompeii, vines, garlands, flowers, fishes, fruits, birds, cupids, etc., appear likewise in the Catacombs. However even among these designs, those that were capable of symbolizing some Christian truth, cactus, date, and fish, predominate. In the 2d and 3d centuries, as the cemeteries pass from private to public control, a series of paintings distinctly Christian begin to appear. They are symbolical in meaning and similar in execution.

In the third epoch which corresponds to the time of peace, the pictures tend to become more and more realistic, until they are petrified in the 5th and following centuries in the rigid forms of Byzantine art.

The Biblical Cycle.—A remarkable parallel between the prayers of the Roman Breviary for the commendation of the soul in the hour of death and the Biblical Cycle of cemeterial paintings was first pointed out by Le Blant.
This correspondence is so exact as to leave little doubt that these paintings derive their inspiration from the funeral liturgies of the Church. The deliverance of Noah from the flood, of Isaac from the sacrificing hand of his father, of Daniel from the lions' den, of the three children from the fiery furnace, of Susannah from her false accusers, of Jonah from the whale, are the chief repeated themes, and they all correspond to the liturgical prayers for the dying. The raising of Lazarus completes the Biblical Cycle, and this scene is the gospel for the Requiem Mass. Of this series Jonah and Lazarus are most frequently depicted. The designs are evidently symbolic. A man standing in a chest serves to recall Noah and the ark; the story of Jonah is often told in three scenes; the casting from the ship, the vomiting forth from the dragon fish and the resting under the gourd. But not infrequently the last scene alone is portrayed. In the same spirit the raising of Lazarus is depicted by a man standing upright at the entrance of a tomb.

**Picturcs of the Saviour.**—There is no like-mindedness. Christ attempted, in the Catacombs. He is represented by the symbol of the fish and the hidden cross. The fish, in Greek, 

\[ \chi \varsigma \varsigma \varsigma \]  

formed the famous acrostic \( \chi \rho \iota \sigma \tau \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigma \varsigm
charistic bread and wine, which is himself. Saint Jerome would seem almost to speak of this scene: "No one is so rich as he who carries the body of Christ in a wicker basket and his blood in a cup of glass." (Ep. ch. xxxv ad Rust.). Another painting of the first half of the 2d century, by Vitiello, Wilpert (1894), in the archaic part of Frissella, the Capella Greca, seems to be a real representation of the Eucharistic action of the *Breaking of the Bread.* Seven persons, one of them a woman, are seated at a semi-circular table, on which are two plates with five loaves and two fishes. These, however, are evidently symbolical, for the priest at the head of the table is engaged in the very act of breaking the bread, and before him sits the Eucharistic chalice. This fresco is in a chapel, and seems to be an early representation of the Eucharistic sacrifice. The representations of the other Sacraments are rare and of doubtful interpretation. A general survey of these paintings leads to the conclusion that early Christianity saw nothing in religious representations hostile to the law of Moses; that the early Church had no repugnance to art, and that the art of the Catacombs is Roman and not of Oriental origin. Mgr. Joseph Vitiello has just published an accurate and complete edition of the 'Pictures of the Roman Catacombs' with German and Italian texts (Rome 1903).

Sculpture.—Christian sculpture barely existed before the 4th century. Catacomb conditions were not favorable to its growth. A fresco could easily be painted in the gloom of the grave, but carved marbles were both expensive and required light and space for execution. Moreover, the sarcophagi in the pagan shops were often covered with idolatrous scenes. Some of these have been found in the Catacombs with the pagan images effaced. With the era of peace, however, the faithful began to use sculptured sarcophagi, and a number of them are preserved in the Lateran Museum. As far as workmanship is concerned, they are of inferior merit, being executed at a time when art had greatly degenerated. Some of them are little less than carved cedars, containing the main mysteries of the Christian religion. They shed much light on the earlier paintings. The clear carving of the 4th and 5th centuries illumines the doubtful fresco of the 2d and 3d. In the sarcophagi, it is Peter striking the rock and Peter to whom Christ gives the law. Hence in the earlier paintings Moses typified Peter. Daniel among the lions on the sarcophagi is evidently Christ on the Cross. Hence we have a key to the early representations of this scene.

Statuary.—But few pieces of statuary have been found in the Catacombs. While idols were on all sides, the faithful seem to have held aloof from this branch of art. However several statues of the Good Shepherd were executed, and one of the 3d century preserved in the Lateran is a most beautiful representation of the subject. The sitting statue of Hippolytus of the first part of the 3d century, found in the cemetery of his name, is unique among early monuments. It contains inscriptions of his works and his computation of the Easter Cycle.

Gold Glasses.—The gold glasses of which many have been found in the Catacombs consist of a design made of gold leaf, enclosed between two pieces of glass, ordinarily at the bottom of the glass. The subjects treated in these glasses of the 3d and 4th centuries are of two classes. Some of them are genre pictures, ornamented with the portraits of a newly married couple of a family. The other are described with such toasts as "Drink! Live!" They were probably gifts for wedding and family feasts. Others used probably in the liturgical functions and perhaps as Eucharistic chalices were ornamented with the ordo of the day, as in some cases of paintings, but especially with the images of the Saints. Peter and Paul, Agnes and the Virgin Mary are the subjects most frequently represented. Eighty out of the 300 published by Garucci portray Saints Peter and Paul. The constancy of the types, their correspondence with tradition, and the medallion of the same characteristics found in Domitilla and attributed to the early part of the 2d century, indicate that these are portraits of the Princes of the Apostles.

Mosaics.—There are but few mosaics in the Catacombs, and most of these are of the age of peace. The mosaic is the distinctive Christian decoration of the basilica of the 5th and 6th centuries, as the fresco was of the Catacomb in the 3d and 4th.

Lamps.—The common clay lamp is the object most frequently found in the Catacombs. Most of them are in no respect different from those used by the pagans. However in the 3d and particularly in the 4th centuries, they were marked with the Christian emblems of the fish, the Constantine monogram, the Good Shepherd, the palm, etc. They illustrate the way the Christian faith entered into domestic life after the advice of the Apostle: "Whether you eat or drink—do all to the glory of God." (1 Cor. x, 31). The wine flagon and the wine cup, as well as the lamp and the loaf, were stamped with the sign of the cross in the 4th and 5th centuries. The few bronze lamps unearthed are of much more elaborate workmanship and symbolism.

Other Objects.—Rings, seals and coins adorned with the characteristic symbols of early Christian art have been found frequently in the excavations, as well as a number of miscellaneous objects, such as children's toys, combs, etc.

Inscriptions.—The numerous Catacomb inscriptions are of the greatest interest to the Christian scholar. The most precious of them have been arranged in the Lateran Museum by De Rossi. The bulk remains yet in the Catacombs and in the gallery of Christian inscriptions at the Vatican. They may be divided according to the method of execution into carved, painted and "graffiti" inscriptions, the latter being writings rudely scratched on the plaster or tufa; according to time, into the original epitaphs and later laudatory inscriptions; according to language, into Greek and Latin; according to content, into dogmatic and domestic. Many of the tombs are without any inscription whatsoever, and many more are distinguished but by a rude mark or some object pressed into the fresh plaster. As a rule the early epitaphs are the shortest, although brevity is a distinguishing trait of Catacomb epigraphy, in marked contrast to the lengthy pagan eulogies of the time. The name of the
departed, with a short prayer and some symbol as the fish, palm, anchor or Constantinian monogram, to which were sometimes added the date of burial and age, forms the ordinary inscription. "Gerontius, may you live in God," "Lucilla in peace," are characteristic epitaphs. The word "deposition" is peculiar to Christian epigraphy, implying that the body is consigned but for a time to the soil. The short prayers and symbols on the tombs are in general but a reproduction of the "Memento of the Dead in the Mass," "Sanctus," "Tunc requiescat in pace," "et pacis ut indulgas, depreamur," "Refreshment, light and peace grant to them, O Lord." This is the requiem chanted and carved in the Catacombs. Despite the fact that the inscriptions are sepulchral, they yet contain much matter of dogmatic and historic interest. They express belief in the unity and trinity of God, in the divinity of Christ, in the Holy Spirit, in the resurrection, and almost every article of the creed is carved on some monument. The list of formulas is the same in these tombs as in the basilicas, but the stones of the Catacombs are prayers for and to the dead. Both are sometimes found in one inscription, as this from Domitilla:

VIBAS
IN PACE ET PETE
PRO NOBIS.

"Gentianus,—pray for us because we know that thou art with Christ," we read in another. "Holy Martyrs, remember Mary," comes from Aquileia. "Sancta Mariae sancte reginae et Reginae pro nos." This last inscription from Calixtus is a fair sample of Catacomb Latinity. It is ornamented with a small box, containing the rolls of the law, the customary representation of the Bible in early Christian art.

Papal Crypt.—The inscriptions of the crypt where the Popes of Rome were interred in the 3d century are of peculiar interest.

ANTINOUS E. T. I. DABIANOS E. T. I. FP.

These inscriptions show that Greek was still the official language of the Church in the 3d century. The monogram Mr, martyr, was the official canonization of the Catacombs.

Damasene Inscriptions.—Pope Damasus (304–85), the first Christian archaeologist, embellished the tombs of the martyrs with a series of metrical inscriptions, carved on large slabs of marble by his secretary, Furius Dionysius Philocalus. The fragment of one of these is preserved in the ancient itineraries, and many of the original slabs have been discovered in the excavations of the last 50 years. The inscription of the papal crypt was found broken in 125 small pieces, which, when joined together, gave the entire text. Of all these inscriptions, but a fragment of the title at the tomb of Pope Cornelius remains in its primitive position, so thorough was the work of the devastating Lombard and destroying time. The tomb of Damasus himself, so long sought by the archaeologists, was discovered at the close of 1903 by Monsignor Wilpert. The work of excavating is still going on, but enough data have already been dug from the depths to make it certain that within 10 years the whole will go back to Christ much as they were at the hands of the Catacombs. Here he will find the mind of the Master in the might of the Martyr, and the love of the Saviour in the liberty of the slave. Here he will find Church and Sacrament, rite and ritual, creed and deed. Here he will come upon a society, Catholic in composition and in charity, Christian in faith and in hope, sleeping the sleep of peace and awaiting the resurrection of the flesh in X. The scientific study of the Catacombs has shown that the Christians were numbered in Rome by tens of thousands in the 3d century. "We are of yesterday yet we fill all that belongs to you; we leave you only your temples," the rhetoric of Tertullian is the reality of the Catacombs. The researches of De Rossi have shown, too, that the acts of the martyrs have much more historical value than the critical school of history was formerly inclined to give them. Further and fuller research will act as luminaria to dispel the darkness which controversy has gathered round the Catacombs. And when the treasures of Roma Sotterranea are all unearthed, should all other witnesses of the faith once delivered to the holy church be lost, the very stones of the Catacombs will cry out to the world the wisdom and grace of Christ.

Consult Lowrie, 'Monuments of the Early Church' (1901), which gives in an appendix the best Catacomb bibliography accessible to the'English reader.

WILLIAM TEMPLE, Formerly Professor of Philosophy, Saint Joseph's Seminary, Dunwoodie, N. Y.

CATACOUSTICS, kát-a-koos'tiks or -kows'tiks, the science which treats of reflected sounds, or that part of acoustics which considers the properties of echoes.

CATAFALQUE, kát-a-fálk, an ornamental structure, in the form of a scaffolding or stage, for temporary use at ceremonial funerals. It is placed the coffin containing a body lying in state, as in a church or other public edifice, and it is sometimes used as a hearse, or set, as the representation of a tomb, over a grave.

CATAĻÁ, Valetín, Cuban poet: b. Havana, 3 May 1829; d. Havana, 7 Sept. 1877. He studied medicine in Paris and practised his profession there and in Barcelona. Later he returned to Havana where he was appointed pharmacist in 1868. He had already given considerable attention to literature while in Europe; and almost immediately, on his arrival in Havana, he began to write for the Cuban press under the nom-de-plume of "Chaudío," and sometimes under his own name. The two principal journals to which his contributions were made were La Prensa and Cuba Literaria. He was a prolific writer and, like most newspaper men, careless of his literary offspring; so, much of his best work is still buried in the files of the Havana papers. Among his works which have been collected and issued in book form are "Higiene de los Literatos"; "Noches de insomnia"; and "La dalia negra del cementerio de Guanes." The "Noches" is a collection of poems, and "La dalia" a legend. Catalá's work displays considerable originality and command of language.

CATALAN, a native of Catalonia (q.v.) and certain other parts of northeastern Spain. For the language of Catalonia see CATALAN LANGUAGE AND LITERATURE.
CATALAN FURNACE—CATALAN LANGUAGE

CATALAN FURNACE, a blast furnace for reducing ores, extensively used in the north of Spain, particularly in the province of Catalonia. It consists of a four-sided cavity or hearth, which is always placed within a building and separated from the open fire by a thinner interior wall, which in part constitutes one side of the furnace. The blast-pipe comes through the wall and enters the fire through a twyer which slants downward. The bottom is formed of a refractory stone, which is renewable. The furnace has no chimney. The blast is produced by means of a fall of water, usually from 22 to 27 feet high, through a rectangular tube, into a rectangular cistern below, to whose upper part the blast-pipe is connected; the water escaping through a pipe below. This apparatus is exterior to the building, and is said to afford a continuous blast of great regularity; the air, when it passes into the furnace, is, however, impregnated with moisture.

CATALAN GRAND COMPANY, The, a name of a troop of adventurers raised by Roger of the 13th century. Roger first gave his services to Frederick, King of Sicily, in his war with Robert, Duke of Calabria, but when peace was concluded between the two princes, being at a loss how to maintain his soldiers, he proposed to lead them to the East to contend against the Turks, who were then desolating the Eastern empire. Andronicus, then Emperor of the East, gladly accepted the offered assistance of Roger, and submitted to all the conditions which he imposed. Roger set sail from Messina, Sicily, in 1303, with 26 vessels partly equipped at his own expense. The number of the troops embarked with him is said to have amounted to about 8,000 men of different nations, Sicilians, Catalans, Aragonese, etc. The Catalans, either because they were the most numerous or for some other reason, gave their name to the whole company. On his arrival at Constantinople Roger was received with great rejoicings, and was elevated to the dignity of grand duke. A conflict took place between the Greeks and the Catalans marked the first period of the stay of these adventurers in Constantinople. Andronicus hastened to get them to cross over into Asia. This they did in the spring of 1304, and in the same year they defeated the Turks completely. In 1305 he took Ancyra and forced the Turks to raise the siege of Philadelphia, but he was not so successful in his attempt to take Magnesia. After a long and ineffectual siege he recrossed into Europe in 1306, bringing along with him his Catalans, who left behind them everywhere traces of their plunder and violence. When they had reached Europe they took up their quarters at Gallipoli. But Andronicus, who was by this time very anxious to be rid of the company, now appealed to Roger with great coldness, and even obliged him to give up his title of grand duke in favor of Berengarius. The sudden departure of Berengarius, however, and the simultaneous return of the Turks into Asia Minor, compelled Andronicus again to appeal to Roger and his Catalans for assistance. Roger was raised to the dignity of Caesar to appease him for the slights that had been put on him. But this only caused him to be regarded with more jealousy by the Greeks, and especially by Michael, the son of Andronicus, who was associated with his father in the empire. The result was that before he could start once more for Asia he was assassinated (1306 or 1307). The Catalans now turned against their arms against the Byzantines, in order to avenge the death of their leader, and defeated them in several battles. They then passed into Greece and entered the service of the Duke of Athens, but so long afterward they turned again and defeated him in the battle of Cephissus (1311). They now became masters of Attica, where they maintained themselves for four years, when they were finally defeated by Philes near Byzantium (1315). Consult Gibbon, 'Decline and Fall' (Chap. LXII).

CATALAN LANGUAGE, one of the groups of the Romance tongues which has been considered politically in Spain as but a dialect of Spanish. It is, however, as distinctly different from Spanish and the other Romance languages as it is Portuguese. Catalan was long the language of an independent kingdom; and the influences under which it has been passed in Catalonia and the other districts where the ancient Catalan was spoken were quite distinct from those of the other countries of Roman conquest. And it is these influences which have made the Catalan tongue. Modern Catalan seems to be a mixture of the ancient language spoken on the west coast of Spain and the north of Italy on the coming of the Romans for the first time to the Iberian Peninsula, and the Latin of the lower class of Italy influenced in a literary way by classical Latin. But Catalan has come under other influences. The Phoenicians, even before the arrival of the Romans in Spain, carried on a trade of some considerable extent and importance with the west coast of Iberia, the people of which we are told, had attained to considerable civic organization and had important cities in many parts of their territory. It has been claimed for the people of this region, with some show of reason, that they were of the same origin as the Romans and that they spoke a Latin tongue, which differed, however, very widely from that of the Italian Peninsula, which was itself divided into widely different dialects. Others claim that the Catalonians were of Phoenician origin, or that the country had been populated from Carthage, and that therefore the original language of the east coast of the peninsula was Carthaginian. According to various other accounts of their origin, they came variously from Palestine, Greece, Britain, central Asia, or even Mongolia. Still others have claimed for them a Celtic origin common with that of the other Celtic inhabitants of various parts of Europe. Thus there is no certainty as to the origin of the ancient inhabitants of Catalonia. But that their language persisted throughout the Roman occupation of their country seems certain, during which period it continued to amalgamate with that of the Latin soldiers. If the ancient Catalan were really a Latin tongue which had undergone the formation of an analytic language, the rise of modern Catalan soon after the disappearance of the Roman power about the beginning of the 5th century would be easily explained. But
this ancient tongue would have to have been dialectically decidedly different from that of the Italian Peninsula.

Catalan is spoken in a part of France bordering upon Spain, in the greater part of the Pyrenees Orientales, Barcelona, Lérida Tar- ragona, Gerona, Valencia, Alicante, Castellón de la Plana, a part of Sardinia and the Balearic Islands. It has also had a strong influence on the pronunciation of the Spanish spoken throughout the Latin American countries, notably in Cuba and some parts of Central America. While Catalan was strongly influenced by Provençal in a literary way, the language of the people of Catalonia and adjacent territory resisted this foreign and unnatural influence. The result was somewhat curious. Catalan poetry, strongly influenced by the Provençal troubadour, reflected the Provençal mode of thought and form of verse, while Catalan prose at first was not looked upon as worthy the name of literature, is instinct with Catalan genius and racial feeling, idiom and point of view. This is one of the best proofs of the artificiality of the Provençal influence in Catalonia and of the unconsciousness of the Catalans that Catalan was nothing more than a variation of Provençal. Catalonia, owing to the fact that it came into contact, at such an early period in its history, with the Phœnicians, Carthaginians, Romans, British, Celts, Greeks and probably other races, and that it was later conquered or partially conquered by Romans, Carthaginians and Goths, assumed a mixed character. This was accentuated, in the first half of the 8th century, by the very considerable foreign population which had flowed into the country for commercial and other purposes. At this time the population of Catalonia was made up of the ancient native stock, Latins, Greeks, Arabians, Chaldeans, Hebrews, Celts, Valencians, Catalans and people from other parts of Spain. Business seems to have been carried on in the Catalanian country, or more properly speaking, where the Catalan tongue or some dialect thereof was spoken, that is, all along the coast from Spain, from the Pyrenees, into most of the island of Cyprus and over most of the adjacent islands. And it was undoubtedly during this protracted trading period that the Catalan language assumed more or less definite form. Certainly by the 9th century it had become a strong independent language spoken over all the country already indicated. It had discarded Latin grammar, if it had ever had it as a part of the tongue of the masses, and had assumed all the earmarks of a living, aggressive, popular language. There can be no doubt that Catalan is still spoken; for we find the writers of the later period of Provençal influence in Catalonia conforming to the popular and court usage of the age and writing poetry in Provençal and prose in Catalan. Moreover, when the Provençal influence was suddenly removed, after domination of considerable time, the native Catalan sprang up fresh and vigorous as the medium for prose and poetry. The people of Catalonia have ever shown strong individuality. When they first came into contact with Carthaginians, Greeks, Romans and other civilized races they were given to agriculture, commerce, industry and the sailing of the sea. So venturesome were they that they had coasted out through the Strait of Gibraltar and down the west coast of Africa before Cæsar had heard of them. This strength of character they showed in their stubborn retention of their native tongue long after the greater part of the rest of the Iberian Peninsula had adopted Latin. Cicero states that, in his day, which was some considerable time after the conquest, the Catalonians possessed and used a distinct language of their own. This is all the more strange since the other parts of Spain came much less into contact with the Romans than did all the east coast of the peninsula. We are also told that the Catalonians spoke different dialects in different parts of their own country. This is born out by the fact that even to-day there is a considerable variation in the Catalan speech throughout the country, even to-day.

One of the distinctive features of Catalan which distinguishes it from the other Hispanic tongues is its tendency to suppress many of the consonant and unaccented vowel endings so common in Spanish. Thus the Spanish hombre, man, becomes hom in Catalan; ciudadano, citizen, becomes ciudad; bueno, good, bo. There is also a tendency to other changes, but not seen in Spanish. Catalan had early become an analytical language and had thrown overboard all Latin verbal declensions and other forms peculiar to Latin grammar. Catalan has its own distinctive accent and rough throat sounds different from the other dialectic forms of Spanish. The Catalan speaks very fast, and this combined with his cutting of the Latin final vowel forms (except a) makes it difficult for even the Spaniard to understand him when he resists. In Catalan the absence of noun declensions is noticeable; and there is a tendency to strongly accentuate z between vowels; the Latin u is never modified as in French and the Provençal au becomes o.
Finally the b and v are kept distinct. Consult Baellot y Torres, 'Gramática de la lengua catalana'; Jueb de Pau y Roig, 'Recherches historiques sur la langue Catalane.'

John Hubert Cornyn, Editorial Staff of the Americas.

Catalan Literature, the literature of Catalonia and adjacent districts speaking the same form of the Romance tongues. It had its origin in the movement started by the troubadours who overran Catalonia, Valencia and Provence, and it attained its highest development in the 14th and 15th centuries. The literature of Catalonia and Valencia is, therefore, closely related to that of Provence, and the two may be said to be practically the same development of the Latin tongue subject to different influences. The former is naturally divided into three distinct periods, the first of which embraces the history of the Catalan literary movement from the first appearance of Provençal influence to the early part of the 13th century. Catalonia was closely united to the Latin-speaking people across the Pyrenees by custom, interests and customs; and the influence of Provence, which had early felt the literary movement, became supreme. But under Jaume I the Barcelona dynasty set itself to develop the national spirit of Catalonia with success. This first period of Catalan literature, therefore, was naturally Provençal in character. Troubadours were to be found all over Catalonia as they were first in Provence and later all over France and most of Spain. Up to the coming of this exotic influence there had been no native literature in Provence, unless it may have been popular songs which, if they ever existed, have altogether disappeared or become so mingled with the Provençal literature as to be undistinguishable. But though the Provençal forms dominated the Catalan literature during this first period there are signs that the Catalan spirit was beginning to assert itself. The form is Provençal, but much of the spirit of the literature is native in forms of expression, modes of thought and subject of poetic effort. Count Berenguer, toward the end of this Provençal period, thinks like a Catalan; and through his troubadour poetry marsh Catalan thought, characters and customs proclaiming the coming of a national literature. Yet his work is still Provençal. Other Catalan writers, toward the close of the 12th century, show the same influence. The rugged spirit of Catalonia had begun to assert itself over the more effeminate Provençal.

The Rise of Catalan.—About the beginning of the 13th century the Provençal influence begins to give way before the new Italian literary domination which was ultimately destined to sweep over all the Latin countries. Catalan literature, being in constant touch with it, soon came under the influence of the new Italian literature; and imitations of the Italian poets became the order of the day. Renascent Provençal worshipped at the shrines of Boccaccio, Dante and Petrarch, while still containing protest to the Laws of Love and the Romance of the Rose. In Catalonia and Valencia the floral games became an institution patronized alike by sovereigns, nobles and the many dabbers in literature who seem to have literally overrun the land. At these games poets contested for prizes and kings graciously and proudly awarded them. Among these contestants for poetical honors were many men bearing titles of nobility; for literature was fashionable in Catalonia and Valencia, where even the sovereigns themselves aspired for honors higher than their royal distinctions. Under the influence of the powerful personality of Jaume I, himself one of the most distinguished of the native writers of his age, the exotic Provençal gave way rapidly to the customs and beliefs of Spanish and Catalan; and under the king's patronage, encouragement and example the Catalan speech rose into a national language and created a national literature. One of the most noteworthy monuments of the 13th century is the 'Chronica o Comentari' of Jaume I, which is at once a biography of his life and a history of his kingdom for that period. It was the first work of true history to appear in Spain. About it there is a freedom, naturalness and sincerity, and at times a loftiness of style combined with simplicity of diction and thought, which mark it as a real work of art, throughout which the king's strong love of everything Catalan is constantly in evidence.

Under the protection of her sovereigns Catalonia produced poetry, history, moral philosophy and scientific works superior to any other literature in Spain at this time; and she may be said to have led the way for the brilliant Spanish drama which followed. Among the other very notable patrons of literature was Pedro III of Aragón, known as "the great," himself no mean poet and a noted writer on scientific subjects.

Catalan literature attained its highest development in the 14th and 15th centuries. During this period two names, Ramon Llull and Ausias March, stand prominently forth. Llull, who was born in 1235, was a voluminous writer of great talent who had a powerful influence upon the literature of his age. He seems to have covered almost every field of literary endeavor and to have done well nearly everything he attempted. He was a noted orator, naturalist, jurist, theologian and poet. His works cover almost the whole field of human knowledge. His hymns to the Virgin are sincere, tender and sweet. Devotion, love of country, and the triumphs of religion are his chief themes, as they were those of most of the Catalan writers of his day. Between Llull and March (who died in 1460) there is a long list of Catalan writers who have remained unknown to the outside world simply because they unfortunately wrote in a language which was destined through the fortune of conquest to be looked upon as a dialect. These include Ramón Vidal whose "La dreta maniera de trovar" (The Art of Poetry) had a powerful influence upon the most notable Catalan poets who followed him; Pedro de Aragón, Ramón de Muntaner, an excellent didactic poet, chronicler and historian; Bernat des Clos, a learned writer and historian of note who took for his special theme the counts of Barcelona; and Ambrós de Llúria, who writes as a soldier of what he saw during his long life, so as not to lose the memory of those wonderful feats with which the Catalans and the Aragonese astonished the world. His work is extensive, varied, regular and methodical; and he writes with authority, in his
capacity of chancellor to the eastern expedition of the army under Roger de Flor. His work bristles with customs, characters, battles, sieges, speeches and conversations of leaders and warriors; descriptions of cities, districts and people, all presented in an original and simply, through their expressiveness and exciting campaigns stand forth in relief. No such history had been written before in Spain. Among the other writers of this period were Llorens Mayol, Luis de Villarrasa, Arnaldo March, En Dalman Rocaletti, En Dalman Rocaletti, Andreu Faber, Jordi de Sent Jordi, Jaume March and Mossen Vallmayna, all of whom have left important literary remains. Faber translated the Divina Commedia in 1428, Sent Jordi wrote excellent sonnets, and Vallmayna, a poet of note, was an authority on troubadour poetry.

Alfonso V so stirred up the literary enthusiasm of his people that it became the fashion among his nobles to patronize literature. Leonardo des Sors, Jaume de Aulesia and Joan de Torreus Castell were all writers of huge importance in their day; and Marçó is specially worthy of note as a dramatist whose plays appeared toward the close of the 14th century and followed by their popularity, helped to inspire the noted Spanish drama which followed shortly afterward.

The Golden Age.—Between this latter period and that of the rise of Catalan as a literary language is a short and very active period which began about the middle of the 15th century and ended with its close. The bright peculiar light of this, the height of Catalan literary activity, was Auseas March, the greatest and most original of the Catalan poets. He was a follower of Petrarch; but no servile imitator. Filled with the troubadour spirit, he wrote tender love songs, moral didactic poems and sentimental sonnets full of true feeling and simplicity of diction. Cants d'amor and Cants de mort are his best and most original poems. He was very popular during the 16th century when his works passed through several editions and were translated into Spanish (1539). With him Catalan begins to die as a national literature, as Catalan individuality soon merged itself into that of the United Kingdom, and under Ferdinand and Isabel the Catholic. Yet Jaume Roig, who survived March 18 years, helped to keep alive Catalan traditions in his Libre de Consells of which many editions were published. A caustic satire on women by Roig is a brilliant and trustworthy picture of Valencia life and habits in the latter half of the 15th century. It is especially valuable from a historical point of view. Contrary to the popular belief, native poetry was not dead in the Catalan country; for as dialect literature it was alive at the beginning of the 18th century. But from 1714 it lay practically dormant for over a hundred years.

Catalan Renaissance may be said to have begun with the works of Verdaguer, Soler and Rubió between 1840 and 1850, though some little interest had been taken in the language by philologists and literary historians previous to this time. Carlos Arceba, a noted Spanish poet, wrote in his native Catalan, a fervid ode to his patron, Regent, in which he praised the past glories of Catalonia and lamented its neglected estate. This proved a powerful inspiration to native Catalans. It was extensively printed, recited and imitated, and brought vivid, patriotic imitators in its train who urged the study of the ancient Catalan literature; and, wonderful to relate, this artificial movement was immensely successful and it became the popular thing in Spain. From elsewhere it raised enthusiasm for the neglected and almost forgotten literature. Then came Sol y Padrés, young, energetic and enthusiastic, who, taking men's eyes from the past, set them on the future. His became the voice of the prophet proclaiming the renaissance of Catalan. Boralfull added to the movement aesthetic taste and good literary style; Villaraya, with his Canco, and Pascual Pérez, with his Sent Vicente Ferer, gave a new impetus and enthusiasm to the renaissance movement. After 1850 larrer and Lo Torreus Castell were all prominent in the patriotic note. In 1861 Mila added still more to the Catalan revival by the publication of his Trovadores en España, which painted, in glowing colors, the early literary history of Spain and Catalonia, a work which had done so much to encourage literature under the native kings. Teodoro Llorente and Vincente W. Queral added fervor, inspiration and correctness of style to the new movement and showed what Catalan was capable of producing in the way of modern literature.

Roberio y Renart revived the traditions of the ancient Catalan theatre in his very popular comic drama; and Federico Soler produced a series of musical parody comedies which were immensely popular; the first of these appearing in 1864, Vidal y Valenciano, in Tal farás tal trovarás revolutionized the Catalan drama, inspired numerous other writers of note, and established the popularity of the rising Catalan theatre. Damaso Calvert, Conrado Roure and Francisco Batlló added an aura of excellence to Catalan literature. Their works helped along the Catalan revival. Newspapers and journals in Catalan appeared in various cities and Catalan theatres and good actors sprang up all over the land. Among the later names of this movement the most noted are Ignacio Iglesias, Rusigiol and Angel Guimerà. Of these the latter is by far the greatest name in Catalan literature and his is the foremost name in modern Spanish drama, even though his plays have not been translated from Catalan into Spanish. Guimerà's name is synonymous with Catalan drama. He began exhibiting his plays when there was no theatre which would take them, for they had no commercial value; and he has lived to see Catalan drama in possession of the Teatro Principal of Barcelona, the largest playhouse in all Spain, and to rejoice over its possession of excellent theatres not only in Catalonia, but in all the principal cities of the land. Guimerà has been proclaimed, by the whole Spanish people, one of the greatest writers of our time, and found a new school of Spanish literature of which Catalan is nationally looked upon in Spain as a dialect.
CATALANANES—CATALEPSY

He is very emotional, imaginative, strong, fierce at times; a master of situations and all the tricks of the drama. He always goes straight to the heart of the situation and he has as strong a dramatic sense as Shakespeare and Hugo, his two great masters. His early plays were written in blank verse; but later he adopted a peculiarly vivid and exact prose in which redundancies and verbosity of all kinds were avoided. Rapidity of movement distinguishes all his work. Among his dramas, which are numerous, are 'Gala Plácida'; 'Mar y Cel'; 'L'Anima Morta'; 'Lo Fill del Rey'; 'Las Monjas de Sant Ayman'; 'En Pólora'; 'Terra Baixa' (translated into English under the title of 'Marta of the Lowlands'); 'Aygua que Corre'; 'Las Pecadoras'; 'Sol Solei'; 'Lo Cami del Sol'; 'Jesús de Nazareth'; and 'La Reyna Jove.' He has also written comedies of local customs, farces and distinctly romantic plays, poems and patriotic songs. He was the first to carry Catalán drama beyond the boundaries of Spain. His plays have been translated into more than a score of languages and the best of them have been played in nearly all the great capitals of Europe and America. 'Terra Baixa' was translated and made by Wallace Gillpatrick of New York, was presented on the metropolitan stage in 1903 and since then it has been periodically revived, has traveled across the continent several times and has been taken to England. 'Marta la Rosa' has also been translated into English.

JOHN HUBERT CORNYN,
Editorial Staff of The Americana.

CATALANANES, kä-tä-län-gäns', a Malay people of Mongoloid type, living in the flood plain of the Catalangan River (province of Isabela, Luzon, Philippines). They are clean and industrious, and dress like the Christian Malays. They worship two pairs of gods, and their ancestors. They are heathen and peaceable and speak the same language as the Irayás. Consult Sawyer, 'The Inhabitants of the Philippines' (1900).

CATALANI, kä-tä-lä'ni, Alfredo, Italian composer: b. Lucca, 19 July 1854; d. Milan, 7 Aug. 1893. He was graduated at the Paris Conservatory and settled in Milan, where he achieved fame with brilliant operas, especially 'Dejanice,' 'Lorely' and 'La Wally'.

CATALANANA, Angelica, Italian mezzo-soprano singer: b. Sinigaglia, most probably in 1782, although several other years are given; d. Paris, 13 June 1849. As early as her seventh year her magnificent voice had become the subject of general remark, but it was not till the age of 14 that she received her training in the higher departments of the musical art. At 16 she was compelled by family misfortunes to turn her talents to account, and made her first appearance on the stage at Venice. She afterward filled the grand soprano parts at the operas of Milan, Florence, Rome and Naples and in 1799 accepted an engagement at the opera of Lisbon, where she continued for five years. She then visited successively Madrid, Paris, London and the principal towns of Great Britain, in all of which her success and profits were immense. In 1814 she returned to Paris to take the management of the Italian opera there, but sustained thereby severe pecuniary losses from the injudicious investment of her funds, and the widow of de Valabréque, formerly a captain in the French army. On Napoleon's return in 1815 she was obliged to resign the direction of the opera, but resumed it again on the second restoration. In 1818 she again resigned the direction of the opera, and from that year till 1828 made repeated professional tours through the Continent and Great Britain. In 1830 she retired from public life to a villa in the neighborhood of Florence, and here she resided with her family and gave instruction to girls who manifested indications of local talent, one condition being required from them that they should adopt the name of Catalani. She was a woman of majestic appearance and her voice displayed a wonderful degree of purity, flexibility and compass. She rather astonished and overpowered an audience than touched or subdued their hearts by her marvelous execution. Consult Edwards, 'The Prima Donna' (Vol. I, London 1888); Ferris, 'Great Singers' (New York 1893); Needham, 'Queens of Song' (London 1863); Lahee, H. C., 'Famous Singers of To-Day and Yesterday' (Boston 1900).

CATALANUIN PLAIN, the ancient name for the wide plain around Châlons-sur-Marne, in France, famous as the field where Aetius, the Roman general, and Theodoric, King of the West Goths, gained a complete victory over Attila and the Huns, 491 A.D.

CÁTALDO, kä-täl'dó', SAINT, Italy, town in the province of Caltanissetta, five miles west-southwest of the town of Caltanissetta. The sulphur works in the environs produce annually about 1,875 long tons of sulphur.

CATALEPSY, a peculiar motor phenomenon, not a disease, that is found in a number of nervous disorders. It consists of a persistent muscular attitude of some part of the body, and may or may not be attended by unconsciousness. Thus a person may place the right arm or leg, or another may so place the limb, in a peculiar, or awkward, or in fact any position. This position is maintained by the patient for a very long time, usually a time much longer than a normal individual could maintain it. Almost any muscle group may be involved. The patients may squat on the floor, or stand on one leg for hours, or hold both arms in the air almost all day. There seems to be some form of muscle anesthesia and the position of the limb seems to be one maintained by the patient. This symptom is very frequent in cases of true hysteria (q.v.), and it is also found in a number of other affections that cluster about hysteria. Thus it is present in somnambulism, in hypnosis, in a peculiar mental state known as the highest grades of mania, and in porous melancholia,—all of which have much in common, being affections superimposed on the hysterical nervous organization, a type of make-up of a character, whose main features
are assuming a definite recognition by students of the functions of the nervous system. The normal functions of respiration, digestion and circulation continue. Prolonged cases demand forced feeding. Between attacks cold baths, tepid and various remedies are recommended. An emetic or a pinch of snuff may sometimes avert an attack. The disease still demands investigation, as its immediate cause is not known. Consult Janet, 'Mental State of Hystericals'; Raymond, 'Observations et Psychathénies'; Starr, 'Text-Book of Nervous Diseases.'

CATALONIA (Spanish Cataluña), formerly a semi-independent principality of Spain, then a part of the domains of the Crown of Aragon and now a captaincy-general of the Spanish Republic, which is composed of the four provinces, Gerona, Lérida, Barcelona and Tarragona, occupies the northeast corner of Spain. It is bounded on the east by the Mediterranean Sea, on the north by the Pyrenees, on the west by Aragon and on the south by Valencia. It covers an area of about 12,500 square miles of territory and has a population of about 2,000,000. The country, on the whole rugged, contains many fertile valleys watered by numerous streams and rivers, none of which are navigable. Along its coast of 240 miles are numerous harbors, the best of which are Barcelona, Tarragona, Mataró and Rosas. Of the rivers of the country, all of which flow into the Mediterranean, the Ebro alone is worthy of note, though most of the streams are famed in the traditions of the people and their rulers. In the regions of the interior, which are traversed by a spur of the Pyrenees running in a southern direction in a very broken formation, are many wooded hills and peaks from which much commercial wood is taken. But the non-wooded lands, wherever workable, are nearly all devoted to agriculture. The rugged hillsides, however, support many goats and sheep; but comparatively few cattle. Along the coast the ground is level, and the rains and, these make the low coast lands fertile. Though hot they are healthful except in the low and swampy parts, which are comparatively few. In the higher regions the climate passes from cool and temperate to quite cold, for the snow lies on the mountain summits nearly the whole year.

The people of Catalonia, owing to the fact that for centuries they have had to defend their language, customs and individuality, have become a nation. They had originally a clan system, the country being occupied by numerous independent tribes who never united except in case of common danger. Among these tribes who distinguished themselves during the Roman connection with Catalonia or later were the Ceretanos, Riusinos, Indigenes, Lacetanos, Laletanos, Suezetanos, Sedetanos, Costetanos, Aetanos, Ilgerentes, Ilcianos and Ausetetanos. These and the other tribes of Catalonia, notwithstanding their lack of political unity and nationality, were great traders and very active in all the occupations and pursuits of life. They were venturesome sailors and traded up and down the coast, along which they appear to have planted colonies before the coming of outsiders to their land. The first of these were the Phenicians who for a considerable space of time carried on trade relations with the east coast of Spain. The natives learned much from them, adopted their culture and became like them, they became still bolder sailors and are said to have sailed out through the Straits of Gibraltar and to have coasted down the west coast of Africa for a considerable distance. The Greeks followed the Phenicians, and, and were also received in a most friendly manner by the natives, who also increased their knowledge of civilization through their contact with the Greeks.

This prosperity and peace was broken up by the Carthaginians under Hamilcar, who hearing that Catalonia was rich in gold mines, landed a large force of trained soldiers on the coast with a view of conquest. A prolonged and desperate struggle followed; and several times the Carthaginians suffered defeat. Hannibal followed his father to Spain and had the same fierce struggle. Whenever the invaders were victorious they put the natives to the sword. It was during this struggle that Barcelona was founded on the coast as a fortress and place of refuge for people fleeing the interior. When war broke out between Rome and Carthage, C. Scipio seized the coast of Catalonia, and P. Cato, after a long and desperate struggle, finally reduced the country to slavery. The devastated land was redivided, policed by the Roman army and peace finally settled down upon it. In the course of time many of the natives rose to prominence throughout the conquered land and the Romans and the Catalans intermarried and formed a mestizo race which had already become a strong factor in the national life before the overthrow of Roman power. Flourishing towns and cities sprang up all over Catalonia. Over 600 of these are mentioned on the Roman tribute lists, which were kept at Tarragona, the capital of the province. Roman law was extended everywhere throughout Catalonia; and roads, temples, theatres, circuses, public baths and magnificent private residences and stately temples existed. In spite of the struggle and devastation that last Catalonia became another Italy and the favored province of the Romans. The Emperor Adrian gave a special constitution to Catalonia; and Rome looked upon the country as one of the storehouses of the empire.

But the invasion of the Goths and other barbarians once more arrested the prosperity of Catalonia; which finally, after another period of desperate struggle, became the head of a kingdom founded by Ataulf. In the time of Teodoro a popular insurrection against the harshness of the government of the native rulers started in Catalonia and spread rapidly over all Spain. Civil war lasted for over half a century and numerous Spanish generals sent to reduce Catalonia were themselves signally defeated. Shortly after peace had been restored the Arabs overran the coast; but they found the Catalans as hard to conquer as had the other invaders, for they were defeated several times, and signally to 7500 men, and were driven out with the help of Charles the Great. Catalonia was annexed to Aragon through the marriage of the heads of the two countries, and it was under French rule three different times between 1040.
and 1813. It fought gallantly and savagely in the wars against Napoleon and took part in the civil wars in Spain in 1820, 1823, 1827 and in the later Carlist troubles. In 1842 Barcelona was bombarded by the Spanish army; and during the struggle that preceded and followed this bombardment it several times defeated noted Spanish leaders. Barcelona is the great revolutionary centre of Spain to-day; and this is probably why the people cling so tenaciously to their自由 and independence.

**CATALPA,** ká-tál'pa, a genus of trees of the family Bignoniaceae, consisting of about 10 species in North America and Asia. They have large, entire or lobed leaves, large panicles of showy white, yellow or pink flowers, and fruit of long, slender, cylindrical pods. C. catalpa, the big tree, or Indian bean, is a native of the southern United States. C. speciosa, a similar species, the western catalpa, ranges from Illinois and Indiana to Louisiana and Mississippi. The wood of these two species is coarse-grained and soft, but very durable in the ground, consequently it is much valued for fence-posts and railroad ties. These species and some of the Asiatic ones are very widely used as shade trees.

**CATALYSIS, or CATALYTIC ACTION** (Gk. σαραδώ, to dissolve). Certain chemical reactions are very markedly accelerated in the presence of substances which emerge from the reaction unaltered. For example, cane sugar is inverted (changed into a mixture of dextrose and levulose) in the presence of acids with a very slight increase in the strength of the acid. This phenomenon is called catalysis, and the acid is said to be a catalyst. Water, which delays the reaction, is said to be a negative catalyst. Again, it is possible by the formation of an arc under water to obtain ultramicroscopic suspensions of many of the metals, such as gold, silver or platinum. These suspensions have the remarkable property of decomposing hydrogen peroxide very rapidly into water and oxygen, while they themselves remain unchanged. A similar action is shown by certain organic substances, the enzymes. In the case both of the enzymes and of the ultramicroscopic colloidal metallic suspensions, the catalytic action is immensely diminished by the presence of very slight quantities of certain poisonous substances such as hydrocyanic acid or hydrogen sulphide. Another interesting example of catalysis is the action of platinum—black or sulphur dioxide and oxygen, which unite in its presence to form sulphur trioxide. Water vapor often is the sole gaseous reactant; dry ammonia vapor and dry hydrochloric acid will not unite. This example illustrates the fact that catalytic agents accelerate both halves of a reversible reaction, for dry ammonium chloride can be vaporized without dissociating into ammonia and hydrochloric acid. Catalysis is an extremely common phenomenon in chemistry. Its nature is not well understood; it is agreed that in certain reactions which appear catalytic the catalyst enters into the reaction and is ultimately regenerated, but this explanation does not cover all the cases found.

In the case of platinum black, which acts as a catalyst in many reactions, Faraday considered that the action was due to the approximation of the molecules of absorbed gases. This case, however, has also been ascribed to the formation of intermediate products into which platinum enters. In general, most catalysis is a surface action, and is accelerated by fine subdivision of the catalyst because of the immense areas thus brought into play. Certain substances are known to catalyse themselves. See also Enzymes.

**CATAMARAN,** ká-tá-ma-rán, a sort of raft used in the East Indies, Brazil and elsewhere. Those of the island of Ceylon, Madras and other parts of the Indian coast are formed of three logs. The timber preferred for their construction is the 'pimp-wood or cherne-maram, the pine-varnish tree,' their length is from 20 to 25 feet and breadth 2½ to 3½ feet. The logs of which they are constructed are secured together by means of three spreaders and cross lashings through small holes. The centre log is much the largest and is pointed at the fore end. These floats are navigated with great skill by one or two men in a kneeling posture. They think nothing of passing through the surf which washes the beach at Madras, and at other parts of these coasts, when even the boats of the country could not venture out. Sometimes they are also propelled out to the shipping at anchor when boats of the best construction would be swamped. In the monsoons, when a sail can be got on them, a small out-rigger is placed at the end of two poles as a balance, with a bamboo mast and yard, and a mat of cotton-cloth sail. The name is applied also to the double boat in the United States. These have almost always proved very slow. However, some have been built for racing purposes which were satisfactory. In the United States navy the term "catamaran" is sometimes applied to the balsa or to a float used for the men who clean the ship's side along the water line.

**CATAMARCA,** ká-tá-mar'ká, Argentina, province, bounded north by Salta, east by Tucuman and Santiago del Estero, south by Cordoba and Rioja and west by Rioja and Chile; area, about 47,530 square miles. The surface is very mountainous in parts, except the southern, where it stretches out into a large plain. The loftiest and best known of the mountains is the Sierra de Aconquija, which stretches from south to north and attains in its culminating point near its southern extremity a height of more than 16,000 feet. The Santa Maria, flowing north to the Huachipas, is the only river of any importance, but as every valley has its
mountain stream, the whole province is well watered. Most of the smaller streams are dry in the summer, but overflow in the winter. There are also a number of salt lakes. The soil is fertile, producing large crops of maize, rice, and wheat and supporting large numbers of live stock, especially goats. The vine is also cultivated and yields wines and spirits which bear a high name in the surrounding countries. The principal exports are beants of burden, horned cattle and hides and goatskins, raw or tanned. The principal mineral is iron, but gold, silver and lead are also found. The capital is Catamarca. Pop. (1910) 110,317, chiefly of Indian extraction, with a considerable mixture of Spaniards.

CATAMARCA, Argentina, the capital of the province of Catamarca, situated on the Valle River, 82 miles northeast of Rioja and about 250 miles northwest of Cordoba. It is connected by rail with Rioja and all the chief towns of the republic. It is regularly and moderately well built and contains a fine town-hall, a Franciscan monastery, a national college and a normal school for women. There are considerable imports of European goods and the place is the centre of distribution for a flourishing district. Dried figs, wines, brandy and cotton are the principal articles of export, together with the curious form of embroidery for which the women are celebrated. It was founded in 1663. Pop. (1905) 8,000; (1916) 13,900.

CATAMOUNT, a short form of the phrase "mountain," is frequently found in the older books about America and still occasionally used as a name for the lynx of the eastern United States, and sometimes for the puma, or "panther," once common in New England. The term is so indefinite that it is well that it has fallen into disuse.

CATANDUANES, kā-tān-dwā'nez, Philippines, an island lying northeast of the province of Albay, Luzon; its length is 44 miles north and south; width, 29 miles at the southern end; area, 704 square miles. The mountain system consists of ranges that radiate from Mount Catiamong near the centre of the island; the rest of the surface is irregular, covered with low hills. The most important rivers are the Ocón and the Bató or Cabagao; there are also a number of smaller rivers, and the island is well watered. The soil is fertile, and rice, cotton, corn and hemp are raised; indigo and cocoanuts are exported. The natives find gold, both dust and nuggets, in the gravel beds of many of the rivers. The largest town is Birac (pop. 8,382). The island does not form a province of itself, but is a constituent part of the province of Albay, and is included in the military department of Luzon. Pop. 33,300.

CATANIA (ancient Catana), Italy, city of Sicily, in the province of Catania, on the borders of the valley of Noto, the sea of a bishop, the suffragan of Monreale, 47 miles south-southwest of Messina, 85 east-southeast of Palermo. It is situated on a gulf of the Mediterranean, at the foot of Mount Etna. This city has been repeatedly visited by violent earthquakes, and partially laid in ruins by lava issuing from the crater of Mount Etna. The most disastrous eruption was that of 1669, by which many of the antiquities of Catania were overwhelmed, and the worst earthquake was that of 1693 when 18,000 people were destroyed. Although again greatly injured by the earthquake of 1783, Catania is now reviving with great splendor and activity, and is considered as a metropolis than Palermo. The principal streets are wide and well paved with lava. Most of the edifices have an air of magnificence unknown in other parts of the island, and the town has a right to rank among the clearest cities of Europe. An obelisk of red granite, placed on the back of an antique elephant of touchstone, stands in the centre of the great square, which is formed by the town-hall, seminary and cathedral. The cathedral, a fine building, was founded in 1091 by Count Roger, but required to be mostly rebuilt after the earthquake of 1693. It is dedicated to Saint Agatha, the patroness of the city. The suppressed Benedictine monastery of Saint Nicholas, comprising a church (with splendid organ), library, museum and other extensive buildings, was long celebrated for wealth and splendor. The university, founded about 1445, has about 1,200 students, a school of pharmacy, a library of over 130,000 volumes and a collection of archives and curios. The ruins of the amphitheatre, which was more extensive than the Coliseum at Rome, are still to be seen, as also the remains of the theatre, baths, aqueducts, sepulchral chambers, hippodrome and several temples. The industries include the manufacture of silk, linen and cotton goods, and objects in lava, wood, marble and Sicilian amber, and the mining of sulphur. The harbor was formerly a good one, but by the eruption of 1669 its entrance was almost entirely choked up, and it is only in recent times that it has been improved, a considerable amount of money having been spent on it. The trade of Catania is of some importance, the principal export being sulphur, next to which come oranges and lemons, almonds and other fruits and wine. Cereals, textiles and other manufactures are the chief imports. The exports have an average annual value of about $5,000,000. A circular railway runs from Catania round the base of Mount Etna. The classic Catana was founded by Greeks from Chalcis about 729 B.C. and soon became prosperous. It was the Athenian headquarters in the war between Athens and Syracuse 432 B.C. It flourished under the Romans, by whom it was taken in 263 B.C. It was plundered by the Saracens and fortified by the Normans, and in 1169 A.D. almost destroyed by an earthquake. It was restored in 1232 and fortified by Frederick II, and again flourished for four centuries until the great earthquake and eruption of 1669, which nearly filled up the harbor. Pop. 211,699.

CATANZARO, kā-tān-zārō (ancient Catacium), Italy, city and capital of the southern province of the same name, on a height, eight miles from the Gulf of Squillace. It suffered severely from the great earthquake of 1783, but is still of some importance, defended by a citadel, and containing a cathedral and various other churches, an academy of sciences, one of the four great civil courts of the kingdom, a lyceum and three hospitals. The climate is pleasant in summer, many wealthy families reside here. The manufactures consist chiefly of silk and velvet,
and there is some trade in wheat, wine, oil, etc. Pop. 34,103.

CATAPHORESIS, kā-tā-fōr-ē'sis, a method of introducing remedies into the body by means of electricity. While certain substances can be made to penetrate the skin by means of electrical currents, the general cataphoric method has not found favor with conservative and careful observers.

CATAPHRACT, a group of fishes known also as "mailed-cheeked," characterized by having a bridge-like bone running from below the eye to the gill covers. The group includes the rock-fishes, scorpion-fishes, sculpins, sea-poachers, gurnards, lump-suckers and sea-snails. Most of these live in the sea, but there are several species of sculpins which dwell in fresh-water streams and lakes and are known as miller's thumbs. The names Loricati and Parioplitac are also applied to this group. Consult Jordan and Evermann, Fishes of North and Middle America.

CATAPLASM, poultice or plaster applied to sore parts to increase suppuration, relieve pain, stimulate the skin or some similar purpose. It may be composed of any moist and pulpy substance that will retain the water without dripping or soaking through thin muslin covering in which it is usually wrapped. Cataplasms are not official in the United States Pharmacopoeia. The linseed-meal poultice is the most easily made, and most satisfactory of all soothing applications. The meal is stirred gradually into a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistency, and in quantity sufficient to cover completely, to the thickness of three-quarters of an inch, the whole painful part. The pulp is then folded up in muslin or thin calico and applied as soon as the heat will permit it to be borne. The bread and milk, or even bread and water poultice, is also very good; as is also the oatmeal-porridge poultice, to which a little butter may be added with advantage. A spoonful or two of yeast may be added if there are foul discharges, or charcoal may be sprinkled on the surface of the poultice before it is applied. Poultices made of clay and glycerin have the great advantage over linseed or bread poultices in that they can be made aseptic. When considerable irritation of the skin in a short time is desirable, a mustard plaster or sinapis [sinapi, mustard] is used. The making of an effective poultice, however, is rather a delicate operation, since numerous little niceties must be considered and proper conditions observed before a desirable preparation is obtained.

CATAPULT, an engine of war, which had considerable vogue among the ancients. It somewhat resembled a crossbow, and was operated by means of a string or rope, suddenly freed from great tension, which gave a powerful impulse to an arrow placed in a groove. The arrow in this case is called a "calot," but in essential purpose and construction they were all alike. Thus, there were catapults fixed upon a scaffold with wheels, which were used for hurling huge stones in sieges; smaller machines that were readily portable were employed in field operations. A toy catapult was and still is used by boys at play for throwing stones or similar projectiles.

CATARACT. An opacity of the lens of the eye. See Eye.

CATARACTS (from Latin, cataracta, a "water-fall"), one of the names given to sudden descents in streams of water, the more general English term being fall or falls. A considerable declivity in the bed of a river produces rapids. When it shoals so as to precipice it forms a cataract. If it falls from steep to steep, in successive cataracts, it is often called a cascade. In rocky countries rivers abound in falls and rapids. In alluvial districts, falls, of course, are very rare. Rapids and cataracts are often a blessing to rugged countries, since they furnish the cheapest means of driving machines in manufactories, etc. In recent times water-falls have been utilized in the furnishing of electric power in addition to ordinary water power. Many counties are remarkable for their sublimity, the grandest known being Niagara Falls (q.v.), on the Niagara River, between Lakes Erie and Ontario. Some others of note are mentioned below.

The Montmorency River, which joins the Saint Lawrence a few miles below Quebec, forms a magnificent cataract, 250 feet high. The Missouri, in the upper part of its course, descends 357 feet in 16½ miles. There are four cataracts, one of 87, one of 19, one of 47 and one of 26 feet high. The Yosemte River in California forms a series of magnificent falls, with a total descent of 2,600 feet. The first of them is a plunge of 1,500 feet, and is followed, after a series of beautiful cascades, by a final plunge of about 400 feet. Fully 200 miles from the mouth of the Hamilton River in Labrador there is a magnificent series of cataracts known as the Grand Falls, the largest having a height of over 300 feet. In Colombia, South America, a great cataract, that of Tequendama, is formed by the Bogotá River. The river precipitates itself into a chasm, about 36 feet broad, to the depth of over 600 feet. On the Potaro River in British Guiana, the Kaieteur Fall, 740 feet high, and about 370 feet, is a splendid spectacle, and just below it is a second fall of 88 feet.

The most remarkable water-fall in Africa is one with which Dr. Livingstone's missionary travels first made us acquainted. This is a cataract on the Zambesi, called by the natives Mosioatunya (*smoke sounds here*), named by him Victoria Falls. The stream, about 1,860 yards broad, flowing over a bed of basaltic rock, is suddenly precipitated into a tremendous fissure, extending across the bed of the river from the right to the left bank, to the depth of about 370 feet. The breadth of this fissure or crack is only from 80 to 90 yards, and the pent-up waters, from which immense columns of vapor are continually ascending, are then hurried through a prolongation of the chasm to the left with furious violence. The so-called Cataracts of the Nile are not, properly speaking, cataracts. A more correct designation for them would be "rapids." The Stanley Falls on the Kongo comprise seven cataracts. On the Tugela River in Natal there are the Tugela Falls. On the Umgeni River,
in the same country, are the falls of the Great Umgeni (360 feet) and the Kar Kloof Falls (350). There seem to be no waterfalls of more note in Asia than those of the Cavery River.

One of the grandest falls in Europe is that of the Ruikenfoss ("smoking fall"), on the Maan River in Norway. The height of the cataract is 805 feet. In Sweden, on the Gotha River, a few miles below its outlet from Lake Vänern, are the celebrated falls of Trollhättan, which have a height of over 100 feet. The cascade of Gavarnie, in the Pyrenees, is reputed the loftiest in Europe, being over 1,300 feet high. Its volume of water, however, is so small that it is converted into spray before reaching the bottom of the fall. Another waterfall in the Pyrenees is that of Seculéjö, in the neighborhood of Bagneres-de-Luchon. It descends from the Lac d'Espingo, into the Lac de Seculéjö, or d'Oo, a singularly romantic mountain reservoir, from a height of 820 feet, and is the most copious of the Pyrenean waterfalls. The Swiss Alps likewise contain some falls of great sublimity. At Lauterbrunnen, in addition to numerous other cascades, is the renowned fall of the Staubbach, about 800 feet high, which, however, from its small volume of water, has none of the terrific adjuncts of a cataract, and resembles, in front, a beautiful lace veil suspended from the summit of the precipice. Near Martigny is the picturesque waterfall of the Sellesche or Pissevache, the final leap of the cascade being 128 feet. The falls of the Rhine at Schaffhausen are renowned over Europe. They are 300 feet broad and nearly 100 feet high. In Italy the falls of Terni, or the Cascate del Marmore on the Velino, have been immortalized by Lord Byron, and, though artificial, are justly regarded as among the finest and most picturesque in Europe. They consist of three falls, the aggregate height of which may be estimated at 550 feet. The falls of the Anio or Teverone, at Tivoli, are likewise very beautiful. They, too, are artificial, and have a fall of about 80 feet.

CATARMAN, kâ-têr-mân', Philippines, a town on the north coast of the island of Samar, situated on the Cataraman River, 55 miles northeast of Catbalogan. It has a good anchorage ground. In 1871 the town was destroyed by a volcano which burst forth in July from low land on the west side of the island, and in two months had thrown up a hill two-thirds of a mile long, one-third of a mile wide and about 450 feet high, destroying all vegetation for miles around. At the time of the visit of the Challenger, January 1875, the volcano had attained a height of 1,950 feet, and was still active, there being visible columns of smoke by day and series of small fires at its summit by night. Pop. 10,482.

CATARRH, ka-târ', a flow from a mucous membrane. It is a symptom purely, and not a disease, and any mucous membrane of the body may be affected by an acute or chronic inflammation, usually entitled an acute or chronic catarrh. A catarrh of the nasal mucous membrane, of the pharynx, larynx, stomach, intestines, rectum, bladder, vagina, etc. The word has general significance only, but it is much used by vendors of nostrums. See NOSE AND THROAT.

CATASAUQUA, Pa., a borough of Lehigh County, on the Philadelphia and Reading, the Central of New Jersey and the Lehigh Valley railroads, and on the Lehigh River, three miles north of Allentown; settled in 1805, chartered as a borough in 1833. Anthracite pig iron was made a commercial success here as early as 1839, and Catasauqua became a busy manufacturing centre, developing blast furnaces, foundry and machine shops, hardware factories, Silk mills, rubber goods, car wheels, etc. Pop. 5,250.

CATATORIA, a variety of schizophrenia— or dementia praecox, which latter is the most frequent of all mental disorders. The catalonic variety is the most severe and is usually marked by a greatly increased tendency toward excessive motor reactions, such as negativism, catalepsy, mannerisms and violent tempestuous outbursts, often extremely furious in their character. It is a form of the mental disorder which most frequently exhausts the patient and leads more often to tuberculosis.

These patients often will stand in one position, often an extremely strained one, for hours at a time, sometimes days, often weeks. Some cases are known, for instance, to lie rigid in bed like a corpse for six months or a year at a time, refusing to pay any attention to the external world. They urinate and defecate in bed and may have to be tube fed all this time. Others will make incessant stereotyped movements, walking backward and forward like animals in a cage, or go through certain occupational movements, sawing, hammering, etc., hour upon hour without interruption. They may stand in a rapt attitude all day long without so much as blinking. Sometimes they talk incessantly, saying the same thing over and over again. Others make wild rushes here and there in their rooms, beating their fists against the walls or a piece of furniture.

Careful study of these cases shows that the movements always have a certain symbolic significance for the individual. They are frequently made in response to hallucinatory voices or images and can usually be resolved to certain elementary instinctive desires of the individual, usually connected with sexual taboos of some kind.

The causes are not completely revealed. In some there are obvious endocrinopathic disturbances. Certain psychiatrists regard these latter as primary; others are disposed to view them as secondary to the disturbances in the emotional fields of activity. Thus these had the primary defect to lie in patients' incapacity to make social adjustments along the line of the love-life of mankind. This incapacity is revealed in the unconscious strivings which are greatly distorted in the behavior of the individual and hence are uninterpretable, so modified are the symbolic expressions of this internal conflict. The catatonic cases occasionally get well following an acute manic period, but when the disease is prolonged 5 to 10 years they usually make up a great mass of the chronic incurable lunatics of our hospitals for mental diseases. See DEMENTIA PRECOX. Consult Jelliffe and White, ' Diseases of the Nervous System' (2d ed., 1917).

SMITH ELY JELLIFFE.
Comparison of Victoria Falls (Africa), 400 feet high, with Niagara Falls, 168 feet high. The tower of the Singer Building (New York), 612 feet high, rises above the crest.
CATAWBA, or GREAT CATAWBA, RIVER. See WATEREE RIVER.

CATAWBA, a light, sparkling wine, of rich Muscatine flavor, produced in several parts of the United States. It is made from the Catawba grape, first found growing on the banks of Catawba River in the Carolinas. This wine is now in extensive use, and is generally superseding Rhenish and French sparkling wines, to which, in general character, it bears a resemblance.

CATAWASAS, derived from the Chocotaw, signifying "divided," a tribe of Indians formerly inhabiting Nauvosa and five other towns on the Catawba River, an attractive region in North and South Carolina. The tribe is now represented by about 100 half-breeds, some of whom speak the ancient language, on a small State reservation on Catawba River, in York County, S. C. In early colonial times they were a powerful tribe numbering about 6,000, including 1,500 warriors. Wars and degeneracy reduced their numbers until they declined in 1822. Peter Harris, the last pure-blooded Catawba, was a Revolutionary soldier. Longfellow's verse popularized Catawba wine, the grapes for which, found near the banks of the Catawba River in 1801, were named in 1828 by Major Adlum.

CATBALOGH, kät-tä-lôg, Philipines, capital of the province of Samar, situated on a small bay at the mouth of the Antigas River on the west coast. It is protected by a number of islands, Daram being the largest. The anchorage ground is not safe during monsoon weather; Paraan Island Bay, 10 miles west, is then the refuge for vessels. The town has a large trade in hemp and cocoaanut-oil with Manila, which is 388 miles northwest, and steamers from Manila call every two weeks. Pop. 7,738.

CATCH, a short piece of music peculiar to England, written generally in three or four parts. It is a sort of short canon, the second voice taking up the theme when the first has completed the first phrase, the third following the second in the same manner. These compositions are most frequently of a humorous and bacchanalian character and have been from Purcell's time very popular in England. There is a Catch Club in London which was founded in 1676.

CATCHPLY, any one of several plants of various genera. The name is perhaps most commonly applied to species of Silene, of the family Sileneae, since their calyces and stems exude a clammy, sticky substance which attracts flies and holds and kills those that alight. Certain species of Lychnis, a closely related genus, especially L. viscaria, are also popularly called by this name. Sometimes, too, the Venus flytrap is called Carolina catchfly. See Carnivorous Plants; Lychnis; Silene.

CATEAU, kät-o, Le, or CATEAU-CAMBRESIS, kät-o-kämbrē-zë. France; a town in the department of Nord, on the right bank of the Selle, 15 miles east-southeast of Cambrai. It was once fortified, though now open, and is famous for the treaty of its name signed here in 1559, by which Henry II of France gave up Strassburg and agreed to abandon all he had conquered from Spain on condition that that country would do the like with her French conquests. Altogether France lost 189 fortified towns by the treaty. Le Cateau has manufactures of cotton, wool, merinos, cambic shawls and a considerable trade in them and in wine, iron, coal and agricultural products in general. PoP. 10,500.

CATECHESIS, kät-ē-kē'sis, the science which teaches the proper method of instructing beginners in the principles of the Christian religion by question and answer, which is called the catechetical method. Hence catechist and catechize. The art of the catechist consists in being able to elicit and develop the ideas of the youthful mind. This part of religious science was first cultivated in modern times, and Rosenmüller, Daub, Winter, Heinrich, Müller, Schwartz, Palmer and others have particularly distinguished themselves by their writings upon it.

CATECHETICAL, kät-ē-kē't-ik-l, SCHOOLS, institutions for the elementary education of Christian teachers, of which there were many in the Eastern Church from the 2d to the 5th century. They were distinguished from catechumenal schools, which were attached to almost every church and which were intended only for the popular instruction of proselytes and children; whereas the catechetical schools were intended to communicate a scientific knowledge of Christianity. The first and most renowned was established about the middle of the 2d century, for the Egyptian Church at Alexandria, on the model of the famous schools of Grecian learning in that place. (See ALEXANDRIAN AGE.) Teachers like Pantaenus, Clement and Origen gave them splendor and secured their permanence. They combined instruction in rhetoric, oratory and music, in classical Grecian literature and the Eclectic philosophy, with the principal branches of theological study, exegesis, the doctrines of religion and the traditions of the Church; distinguished the popular religious belief from the Gnosis, or the thorough knowledge of religion; established Christian theology as a science and finally attacked the dreams of the Chiliasmists (believers in a millennium); but by blending Greek speculations and Gnostic phantasties with the doctrines of the Church, and by an eclectic interpretation of the Bible, they contributed to the introduction of heresies. The distinction of the Alexandrian Church by the Arian controversies proved the destruction of the catechetical schools in that place about the middle of the 4th century. The catechetical school at Antioch appears not to have been a permanent institution like the Alexandrian, but only to have been formed around distinguished teachers, when there happened to be any in the place. There were some distinguished teachers in Antioch about the year 200. We derive no certain information, however, of the theological teachers in that place, such as Lucian, Didorus of Tarsus and Theodore of Mopsuestia, until the latter part of the 4th century. These teachers were distinguished from the Alexandrian by more sober views of the Scripturé and by a bolder discussion of doctrines. The Nestorian and Eutychian controversies, in the 5th cent., drew all into the ruin of the schools at Antioch. Of a similar character were the schools instituted at Edessa.
in the 3d century and destroyed in 489, and the school afterward established at Nisibis, by the Nestorians, in its stead; both of which were in Mesopotamia. To these schools succeeded, at a later date, the cathedral and monastic schools, especially among the Western Christians, who, as late as the 6th century, made use of the heathen schools, and had never established catechetical schools even at Rome.

CATECHISM, a form of instruction by question and answer, especially in Christian doctrine by that method; and not the instruction only, but the book in which the questions and answers are contained. The catechetical school of Alexandria was an institution designed to instruct pagans in the doctrines of the Christian Church (2d century). Its founder, Pamphinos, was a Greek convert deeply learned in the Grecian philosophy and in the Hebrew Scriptures. Among his disciples was Titus Flavius Clemens, who became his successor as head of the school; and to Clemens (Clement of Alexandria) succeeded the illustrious Origen, who, at the early age of 18, was deemed worthy to be named to so responsible a post.

The catechetical instruction given by these masters of the Alexandrine school was conveyed rather in the form of lectures than in the question and answer. The more familiar instruction given to catechumens in the early Church was of the same nature, but more simple and elementary. In the latter half of the 4th century Saint Cyril, bishop of Jerusalem, composed 25 lectures, or in Greek katechesis, which were addressed to postulants for baptism (catechumens) and five to the neophytes after their baptism. These latter he called mystagogic catecheses, or instruction in the mysteries of Christianity. They are of a more popular character than the catechises of the Alexandrines and are believed to be the first example of a popular compendium of the Christian doctrines.

In the Roman Catholic Church the Catechism of the Council of Trent, or Roman Catechism or Catechismus ad Parochos (Catechism for Parish Priests) is addressed especially to pastors and others having care of souls, suggesting to them the manner of expounding Christian doctrine and of enforcing the precepts of Christian morality in their sermons from the pulpit and in conveying religious instruction to the young. It is also designed as a basis and model in composing short expositions of Christian doctrine for popular use among the laity. The Catechism of the Council of Trent was first published in 1566 in Latin and formed a considerable volume, 500 pages 8vo. A decree of the Council of Trent ordered all bishops to "take care to have the Catechism faithfully translated into the vernacular language and expounded to the people by all pastors." The translations were accordingly made into Italian, French, Spanish and German. The first English translation was not published till 1829. It is a large octavo, closely printed, of over 400 pages. The work possesses high authority, but not the highest; it does not rank with the translations of the Council or with the canons and decrees of councils or the dogmatic definitions of Popes.

All the principal divisions of Protestantism — the Anglican Church and its offshoots, the Lutheran and Calvinistic Churches, the Presbyterianists, Methodists and Baptists — have catechisms. Many of these Protestant catechisms, as the Church of England, the Calvinist of Geneva, the Westminster Larger and Shorter catechisms, the Catechism of the Church of England, possess in their several Churches an authority equal or comparable to that of their several creeds or confessions of faith.

CATECHU, an earthy or resin-like substance, used in dyeing and calico-printing, and in medicine as an astringent. It is obtained by boiling the leaves, wood and fruit of certain plants growing in India and other Eastern countries (notably the Acacia catechu) and concentrating the extract by evaporation until it will solidify. Catechu (known also in the trade as "cutch") consists mainly of catechu-tannic acid, which is soluble in cold water, and catechin, which is insoluble in cold water, but soluble in hot water. In medicine catechu is of service because of the tannin that it contains. It acts as an astringent and is serviceable in diarrhoea and dysentery. Catechu is also used in lozenges for afections of the mouth and throat.

CATECHUMEN, a person who is under instruction and probation preparatory to admission to membership in the Christian Church through baptism. On the day of Pentecost and in the early days of the Church's mission the converts to the religion of Jesus Christ were admitted through baptism to fellowship in thousands at a time, without any preliminary inquiry into their dispositions, and without any instruction in the articles of Christian belief or the new obligations contracted by admission into the Christian body. But when the first enthusiasm of conversion had cooled doubtless many were found who "walked no more" in the way of the apostles and went back to their pagan or their Jewish beliefs and practices, or worse, who after two changes of religion lapsed into open contempt of all religion and of all morality. To guard against the scandal of such apostates and to provide a system of preliminary, graduated instruction and probation for those who desired admission to the Christian communion. The candidates for admission to the Church, to the body of the faithful (believers, fidèles, pisto) were called catechumeni (persons under instruction) and even in this class there were three or even four separate grades. There was the first grade, that of those who, having expressed a desire for admission, were put under instruction privately by some officer of the Church; this class was not admitted at all to the assembly of the faithful. Those in the second grade, that of the acoumoeni, audientes, hearers, were admitted to the assembly for worship, but were required to withdraw after the reading of the stated prayers and the evangelic and apostolic books and the sermon or exhortation by the bishop. Those of the third grade, the gonyclomontes, genuflexentes, those "bending the knee," that is, who join in the prayers of the faithful, remained in the congregation till certain prayers in the liturgy were said and the bishop had pronounced his blessing. The fourth grade included all those who, having passed the first three, were to receive the rite.
of baptism and thereby to be admitted to full communion with the Church. The new day for the administration of that sacrament: these are the photaiomenoi, instructed, or competentes, or electi. The first two grades are not recognised as two by all Church historians.

Such a term of preliminary instruction and probation was imperatively necessary in the ages of persecution, to save the Christian body from the scandal of apostasy on the part of coverts who entered the Church either from unworthy inducements, as, for example, act as informers; or who entered without weighing the obligation they assumed to lead a holy life void of all offense, and who disgraced their Christian profession by their disorderly lives. The institution of the catechumenate persisted after the peace of the Church was proclaimed by the first Christian emperor, and indeed the need of it was greater now that the profession of the Christian religion seemed the gateway to honor and power in the state instead of to martyrdom. The importance of catechetical admission to the Church was great; and even the children of believers like converts from the pagan religion had to pass through the catechumenal grades. Out of this grew a great abuse and a great scandal. Men who sought admission to the Church for other reasons than a desire to lead a Christian life would enter themselves as catechumens, postulants, and would continue in that grade for an indefinite period not pleading themselves to observance of the law of Christ and the tests committed to the end of their life was at hand. Nor was it the converts from paganism alone who thus deferred baptism, as Constantine did, but the children of Christian parents often followed their example. Yet the motive for deferring baptism was not always a desire to evade the obligations of the Christian profession; in very many instances the delay was prompted by a conscientious scruple lest the baptized person falling from grace afterward should commit sin. This could never be condoned: among illustrious men who for a time acted on this scruple are numbered even doctors of the Church — Saints Ambrose, Gregory of Nazianzus, Augustine.

The ancient church edifices provided for the separation of the catechumens from the faithful that were in full communion. In the ancient church of Saint Clement in Rome, the body of the building is divided off by stone constructions into the presbyterium, chancel or sanctuary for the clergy at the eastern end, a middle compartment for the faithful in full communion — the galleries here being reserved for the women — and in the western end, or front, a much larger compartment of the nave for the catechumens.

CATEGORY (Gk. κατηγορία, an accusation), in logic and philosophy, one of the great natural divisions into which all conceivable objects fall. The ancients, following Aristotle, generally made 10 categories. Under the first all substances are comprised, and all accidents or attributes under the last nine, namely, quantity, quality, relation, time, place, situation and acquired nature. A somewhat similar arrangement is to be found in the works of the Hindu philosopher Kaúvá. This arrangement, however, is now obsolete. Descartes thought that all matter may be better considered under the seven divisions: spirit, matter, quantity, substance, figure, motion and rest. Plato admitted only five categories — substance, identity, diversity, motion and rest. The Stoics held four — subjects, qualities, independent modes, relative modes. Plotinus applied to the intelligible world the categories the One, motion, rest, identity and difference; to the world of sense the categories being, relation, quantity, quality and motion. Kant's list of categories is: 1. Categories of quantity: unity, plurality, universality. 2. Categories of quality: reality, limitation, negation. 3. Categories of relation: substantiability, causality, reciprocity. 4. Categories of modality: possibility, actuality, necessity. Kant considered that these categories corresponded to the different classes of judgment, but it was soon realized that the basis these give to the categories of the list is merely specific. In accordance with his custom of deducing matter of the most concrete nature by a priori method, he determined the number of notions categories which other philosophers would regard as grounded in experience. Mill substitutes for Aristotle's set of categories the classification of all things into feelings, minds, bodies and temporal or qualitative relations between feelings. In the philosophy at the present day, though there are certain writers and schools who make a considerable use of the process of classifying things in categories — Hume and Hartmann, for example — there is much less discussion of the categories than there used to be. This is due to the fact that we are coming to see that the taking of an inventory of the universe is one of the least of the tasks of metaphysics, which is rather concerned with the analysis of the relational structure of things. However, even in a view of the world which regards it as a relational structure, there are bound to be a number of summa genera, such as class, relation, proposition, etc. For a discussion of the category-system of a view of this type, see Symbolic. Consult the works of the various writers mentioned, and especially von Hartmann, E., 'Kategorienlehre' (1896).

NOVARAT. VIENNE, Ph.D.,
Editorial Staff of The Americana.

CATHEL, Franz, German artist: b. Berlin, 22 Feb. 1778; d. Rome, 19 Dec. 1856. His earliest efforts were wood cuts for illustration of books. He then painted in oil and water colors, and took up his abode in Rome in 1812. Overbeck, Schadow and Gommers gave him much encouragement, and he painted historical and genre pieces and landscapes, in which last named department of his art he was especially successful. He became a member of the Academy of Berlin (1800); and professor of the Royal Academy (1841). During a journey to Sicily, about the year 1818, he painted a large number of views of Mount Etna, and other prominent places on the island. He directed his fortune to be invested for the benefit of poor artists.

CATEGORICAL, the curve assumed by a perfectly flexible chain of small links supported at both ends and allowed to hang freely under the influence of gravitation between supports. This is the simple catenary. The geometrical cate-
nary supposes the curve of a perfectly flexible, inextensible and infinitely fine cord of infinitesimal weight hanging at rest between two points of suspension. The equation of the catenary is expressed thus: \( y = \frac{1}{2} h \left( \frac{x^2}{a^2} + \frac{1}{a^2} \right) \).

The cables of a suspension bridge hang in catenaries before any of the other parts of the bridge are attached. The effect of the weight of the roadway, etc., is to draw the cables into curves more nearly approaching the parabola.

**CATERPILLAR**, the larva of a moth or butterfly. The body is long and cylindrical, consisting, besides the head, of three thoracic and 10 abdominal segments, the last one forming the suranal plate. The three pairs of thoracic legs are solid, horny and jointed, while the supports of the abdominal segments, of which there may be five pairs, are soft and fleshy. Caterpillars are very voracious, the digestive canal being very large. The American silk-worm (*Telia polyphemus*), at the end of its life as a caterpillar, has eaten not less than 120 oaks or 10,000 square yards of a pound; its food, taken in 56 days, equals in weight 86,000 times the primary weight of the worm. The jaws of caterpillars are large, black, horny appendages, and are toothed on a cutting edge so as to pass through a leaf somewhat like a circular saw. The eyes are minute, simple eyeslets, three or four on each side of the head, and only useful, probably, in distinguishing day from night. The silk is spun through the tongue-like projection (spinneret) of the under lip. It is secreted in two long sacs within the body. The thread is drawn out by the two fore feet, which are three-jointed and end in a single claw. The legs on the hind body, sometimes called prop-legs, are fleshy, not jointed, and end in a crown of hooks which curve outward, enabling the caterpillar to firmly grasp the edge of the leaf or a twig of its food-plant. Most caterpillars are more or less hairy or spiny, rendering them, when especially so, disagreeable to birds; besides this, they are bright colored, so that birds readily recognize them and waste no time over them, but search for the common green smooth-bodied ones, which are, however, so difficult of detection by the birds that plenty are left to become moths or butterflies. Certain caterpillars, as the currant-worm, though smooth-bodied, are brightly spotted; these, however, often have a disagreeable taste. The bright colors are thus danger signals, hung out to warn the birds and other enemies. (See Larva.)

Consult authorities mentioned under Butterfly. Mort, Insect, especially Holland. "Butterfly Book" (New York 1898) and "Moth Book" (New York 1903); also Elliott and Soule, "Caterpillars and their Moths" (New York 1902; directions for breeding).

**CATFISH**, any of the fishes of the family *Siluride*. This large family is characterized by having the body naked or covered with bony plates, but without true scales. About the mouth there are two or more barbels, the longest of which are at the corners of the mouth. There is usually a row generally serrated, spine in front of the dorsal fin, and often another in front of each pectoral fin. These spines are likely to inflict considerable injury on the careless fisherman. There is what seems to be a poison-gland connected with the pectoral spine of some of the smaller species, and wounds are very painful. This is one of the most widely distributed families of fishes, and is especially abundant in South America and Africa. Most of them live in fresh waters. There are estimated to be about 1,000 species.

The catfish are sluggish in their movements, securing their prey rather by natation than by swiftness. They are bottom-feeders and indiscriminate, so that although, on account of their size and abundance, they constitute an important element in the fish food of the countries they inhabit, their flesh is not considered of high quality in taste. North and middle America contain 100 or more species, of which a third, perhaps, are to be found in the United States and Mexico. The majority are not of much importance, but some are of great local value. At the head of the commercial list stands the channel cat of the genus *Ictalurus*, which are found throughout the Mississippi Valley and Gulf States, and are caught in vast quantities not only for home use, but for export, as much as 2,000,000 pounds annually being dressed, packed in ice and shipped from Morgan City, La., the central mart of the Atchafalaya River fisheries, which are in operation from September to May. The method of capture is by "trot-lines" from a yard or two to a mile long. The catfish move with the season's temperature of the water, going down stream in winter and up in summer. At the season of the spring floods they are in the swamps and adjacent lands, and thousands are caught by the shorter "brush" lines. There is a regular collecting service of tugs. The Louisiana species most taken is the channel cat (*I. punctatus*), which loves sluggish waters. A more northerly species, ordinarily 20 to 25 pounds in weight, is the "blue" or "white" channel cat (*I. punctatus*), which thrives in the colder, swifter waters of the Tennessee, Cumberland and neighboring rivers, whose flesh is declared equal to that of the black bass. Both these have been acclimated in California. The largest of the American species is the great fork-tailed Mississippi cat (*I. lacustris*), which inhabits all the lakes and big rivers from the Saskatchewan and Great Lakes to Florida and Texas, and reaches a weight of 120 pounds or more. The so-called Potomac River cat (*A. catus*) is the one most familiar in the east, since it abounds from the Delaware River to Texas, but is most common in the waters of Chesapeake. Florida and southwest Texas. It is next in commercial value to the Great Lakes fish. It has a very wide head and large mouth, but seldom exceeds two feet in length. The smaller yellow cat (*A. natalis*) and other
species of this genus are numerous in the interior, but not of great importance. (See Bullhead.) The mud cat or goujon (Leptocephalus olivarus) is a slender pike-like fish with a very large, wide head and mouth, and thick skin, which lives in the sluggish rivers of the Southern States. It is sometimes five feet long and 100 pounds in weight, but is most repulsive in appearance; its flesh, however, is excellent, and is often sold, dressed, for that of the favorite western channel cat. Other genera and species go by such names as horned pouts, mud-cats, stone-cats, mad tom, etc., and will be found elsewhere described, as well as many foreign species of interest and value.

Consult, besides general works, Jordan and Evermann, 'Food and Game Fishes of America,' and the publications of the United States Fish Commission.

CATGUT is made from the intestines of different quadrupeds, particularly those of sheep, but never from those of the cat. The manufacture is chiefly carried on in Italy and France. The texture from which it is made is that which anatomists call the muscular coat, which is carefully separated from the peritoneal and mucous membranes. After a tedious process of steeping, scouring, fermenting, inflating, etc., the material is twisted, rubbed with horse-hair cords, fumigated with burning sulphur to improve its color and dried. Cords of different size and strength and delicacy are obtained from different domestic animals. The intestine is sometimes cut into uniform strips with an instrument made for the purpose. The strips are then dried, and when dry, and to get rid of the oily matter, the French make use of an alkaline liquid called eau de javelle. Catgut for stringed instruments, as violins and harps, is made principally in Rome and Naples. For the smallest violin strings three thicknesses are used; for the largest seven; and for the largest bass-viol strings 120. It is well known that the membranes of lean animals are tougher than those in a high-fed condition, and there can be no doubt that from this point of view domestic animals are superior to all others are produced. In Naples, whence the best treble strings, commonly called "Roman," are obtained, there are large manufactories of this article. Catgut is also used for surgical sutures and for bow-strings.

CATHA, a genus of plants belonging to the order Celastraceae, or staff-tree family. The species are mostly natives of Africa, forming small shrubs, sometimes -washed by spiny branches. Catha edulis is a native of Arabia, and from the leaves the Arabs make a beverage possessing properties analogous to those of tea or coffee. Under the name of kah or cafio, the leaves form a considerable article of commerce among the natives. Chewed, they produce wakefulness and hilarity of spirits.

CATHARINE, the name given to themselves by the adherents of numerous heretical sects, undoubtedly of Gnostic and Manichæan origin, which swarmed among western tombs, particularly in northern Italy and southern France in the 12th century. At that period society had much advanced in wealth and power, which brought their concomitant vices. There were many heretics present in the Church, and some of the clergy led scandalous lives. The numer-
CATHARINE—CATHARINE II

ning eloquence; whence she is the patroness of philosophers and learned schools. Having steadily rejected all offers of earthly marriage, she was taken in vision to heaven, where Christ plighted his troth to her with the ring. This subject has been a favorite one with many artists (as signifying the union of the redeemed soul with Christ); the Christ being usually represented as an infant. It has been suggested that the attributes of the unhistorical Saint Catharine seem to have been derived from those of the actual Hypatia, a heathen who suffered death at the hands of Christian fanatics. Saint Catharine's festival falls on 25 November. 2. SAINT CATHARINE OF SIENA, one of the most famous saints of Italy, was the daughter of a dyer in Siena, and was born there in 1347. While yet a child she practised extraordinary mortifications and devoted herself to perpetual virginity. She became a Dominican, and therefore afterwards a patron saint of the Dominicans. Her enthusiasm converted the most hardened sinners, and she was able to prevail upon Pope Gregory XI for the sake of the Church to return from Avignon to Rome. She was given, it was said, extraordinary power of fasting, and even as much as 20 to 30 days, were impressed upon her body. She wrote devotional pieces, letters and poems, an edition of which is Tomaso's (Florence 1860). Her festival falls on April 30. 3. SAINT CATHARINE OF BOLONIA (1413-61), festival 19 March, and SAINT CATHARINE OF SWEDEN (d. 1481; festival 22 March), are of less note.

CATHARINE, Saint, Order of, the name of two organizations of very different character: (1) The Knights of Saint Catharine on Mount Sinai, an ancient military order, instituted for the protection of the pilgrims who came to visit the tomb of Saint Catharine on this mountain. (2) An organization in Russia, constituting a distinction for ladies, and instituted by Catharine, wife of Peter the Great, in memory of his signal escape from the Turks in 1711.

CATHARINE I, Empress of Russia: b. Ringen, near Dorpat, Livonia, 15 April 1684; d. Saint Petersburg, 17 May 1727. The early history of this remarkable woman is uncertain. According to some accounts she was the daughter of a Swedish officer named Rabe, who died shortly after she was born; according to others her father was a Roman Catholic peasant. She at first bore the name of Martha and entered the service of a clergyman named Glück, at Marienburg, who caused her to be instructed in the Lutheran religion. Here she was married to a Swedish dragoon. But a few days after he was obliged to repair to the field, and the Russians, within a short period, took Marienburg in 1701. Martha fell into the hands of General Tcheremetieff, who relinquished her to Prinz Mentchikow. While in his possession she was seen by Peter the Great, who made her his mistress. She became a protégée to the Greek Church and Assumed the name of Catharine Alexiowna. In 1708 and 1709 she bore the Emperor the Princesses Anna and Elizabeth, the first of whom became the Duchess of Holstein by marriage and mother of Peter III. The second became Empress of Russia. In 1712 the Emperor publicly acknowledged Catharine as his wife. She was subsequently proclaimed Empress, and crowned in Moscow in 1724. Besides the daughters above named she bore the Emperor five more children, all of whom died early. The Princesses Anna and Elizabeth were declared illegitimate. Their mother seemed irreparably lost on the Pruth in 1711 Catharine endeavored to win over the grand vizier; and having succeeded, by bribing her confidant with her jewels, she disclosed her plan to the Emperor, who gave it his approbation, and was admitted the bread. She afterwards received many proofs of the gratitude of her husband. Peter even deemed her worthy of being his successor. But in the latter part of 1724 she fell under his displeasure. Her chamberlain, Moens, with whom she was suspected of being on too intimate terms, was beheaded on pretense that he had been bribed by the enemies of Russia. Mentchikow, who had always manifested much attachment to her, had now been in disgrace for some time and Peter had very frequent attacks of bodily pain, with intervals only marked by dreadful explosions of rage. These circumstances made Catharine's situation critical and her anticipations of the future must have been the more melancholy, as the birth, which had lightened her, released a change in the succession to her disadvantage. To prevent such an event she applied to Mentchikow; and by the prudence of Jaguschinski a reconciliation was effected with the Emperor. The Empress and the favorites were laboring to confirm their improving prospects when Peter the Great died, 28 Jan. 1725. Catharine, Mentchikow and Jaguschinski considered it necessary to keep the death of the Emperor a secret until, by judicious arrangements, they had secured the succession of the throne to the Empress. Theopanes, archbishop of Plescov, swore before the people and troops that Peter on his death-bed had declared Catharine alone worthy to succeed him in the government. She was then proclaimed Empress and co-ruler of all the Russians and the oath of allegiance to her was taken anew. At first the Cabinet pursued the plans of Peter, and, under Mentchikow's direction, the administration was conducted with considerable ability. But the influence of favorites was soon felt and great errors crept into the administration. Catharine died suddenly, her death being probably hastened by excess in the use of ardent spirits. Consult Lavisse and Rambaud, 'Histoire générale' (Vol. VII, Paris 1896), and Schuyler, 'Peter the Great' (New York 1884).

CATHARINE II, Empress of Russia: b. Stettin, 2 May 1729; d. Saint Petersburg, 17 Nov. 1796. She was a daughter of the Prince of Anhalt Zerbst and her name was originally Sophia Augusta. The Empress Elizabeth chose her for the wife of Peter, her nephew, whom she appointed her successor. The young Princess accompanied her mother to Russia, where she joined the Greek Church and adopted the name of Catharine Alexiowna, given to her by the Empress her mother, on the 19th of December 1745. It was not a happy one, but Catharine found relief in the improvement of her mind. She was endowed with uncommon strength of character; but the ardor of her temperament and the ill treatment of her husband led her into errors which had serious and disastrous influence on her whole political life. In January 1762 the Empress Elizabeth died and
Peter III ascended the throne. He lived in the greatest dissipation, and on such intimate terms with a lady of the court, named Elizabeth Woronoff, that it was generally thought that he would repudiate Catharine and marry his mistress. The Empress, therefore, was obliged to take measures for her personal security. At the same time Peter grew continually more and more unpopular with his subjects, which led to a conspiracy, at the head of which were the hetman, Count Rasumovsky, Czar Panin, the emperor's daughter Princess Daschhoff, a young officer of the guards, Gregory Orloff. All those who were dissatisfied, or who expected to gain by a change, joined this conspiracy. Panin and the greater part of the conspirators were actuated only by the desire to place the youthful Paul on the throne, under the guardianship of the Empress and a council of the empire. But this plan was changed through the influence of the Orloffs. The guards, under a promise of the Empress on her presenting herself to them at Peterhof on the morning of 9 July 1762; and Alexei Orloff prevailed on Teplow, afterward appointed senator, to read at the Kazan Church, instead of the proclamation of the conspirators in favor of the youthful Prince, one announcing the elevation of Catharine to the throne. Peter died a few days after in prison. The accusation against Catharine of having contributed to hasten this event is without foundation. The young, ambitious princess, neglected by her husband, whom she did not respect, remained passive on the occasion, yielded to circumstances which were, it is true, propitious to her, and consoled herself for an event which she could not remedy. She knew how to gain the affections of the people by flattering their vanity; showed great respect for their religion; caused herself to be crowned at Moscow with great pomp; devoted herself to the promotion of agriculture and commerce and the creation of a national force; improved the laws; and showed the greatest activity in the administration of the internal as well as the external affairs of Russia. A year after her ascension to the throne she forced the Courland, Pomerania, Saxony, and to recall Biron, who was extremely odious to the nobles. After the death of Augustus III, King of Poland, she was the means of Stanislaus Poniatowski's being crowned at Warsaw. But while she was forcing this king on the Poles, the number of the malcontents in her own empire increased, and several attempts against her life were made at Saint Petersburg and Moscow. The young Ivan was the person to whom the hopes of the conspirators were directed, but his death at the first session; and it was impossible for so many different nations to understand each other, or to be subject to the same laws. Catharine, who presided at the debates, and received from the assembly the title of mother of the country, soon dismissed the discordant legislators. About this time France formed a party in Poland against Russia; but these attempts only served to accelerate Catharine's plans. The war to which the Porte was instigated had the same result. The Turks were beaten. The Russian flag was victorious on the Greek seas; and on the banks of the Neva the plan was formed of re-establishing the republics of Sparta and Athens as a check to the Ottoman power. The advancement of Austrian troops into Poland inspired Catharine with the desire to aggrandize herself in this quarter. She therefore entered into an agreement for the division of the country with the courts of Berlin and Vienna in 1772, by which the governments of Polotzk and Mohiley fell to her share, and she ensured to herself exclusive influence in Poland by undertaking to guarantee the Polish constitution. At the same time she abandoned all her conquests, with the exception of Azoph, Taganrog and Kinburn, in the peace with the Porte, concluded at Kainardschi in 1774, but secured to herself the free navigation of the Black Sea, and stipulated for the independence of the Crimea. By this apparent independence the Crimea became, in fact, dependent on Catharine. This peace was as opportune as it was advantageous to Russia; for in the third year of the war Moscow and several other cities were desolated by the plague; and about the same time an adventurer named Pugatschew, assuming the name of Peter III, had excited a revolt in several provinces of eastern Russia, which was soon suppressed. At this time Potemkin exercised an unlimited influence over the Empress. In 1784 he succeeded in conquering the Crimea, to which he gave its ancient name of Tauris, and extended the confines of Russia to the Caucasus. Catharine upon this traversed the provinces which had revolted under Pugatschew, and navigated the Volga and Dnieper, taking greater interest in the expedition, as it was attended with some danger. She was desirous, likewise, of seeing Tauris. Potemkin induced the Empress to join him. A party was formed on the Volga; the Empress took place in 1787, into a triumphal march. Throughout a distance of nearly 1,000 leagues nothing but feasts and spectacles of various kinds were to be seen. Palaces were raised on barren heaths, to be inhabited for a day. Villages and towns were built in the wildernesses, where a short time before the Tartars had fed their herds. An immense population appeared at every step—the picture of affluence and prosperity. A hundred different nations paid homage to their sovereign. Catharine sat at a distance, towns and villages, of which only the outward walls existed. She was surrounded by a multitude of people, who were conveyed on during the night, to afford her the same spectacle the following day. Two sovereigns visited her on her journey—the King of Poland, Stanislaus Augustus, and the Emperor Joseph II. The latter renewed his promise, given at Saint Petersburg, to assist her in her projects against the Turks. The result was a new Turkish war, which by the Peace of Jassy (1792), ended not less favorable to Russia than the first. The power of Russia was also increased by the war with Sweden.
CATHARINE OF ARAGON—CATHARINE OF BRAGANZA

which terminated in 1790, and by the last two partitions of Poland and the incorporation of Courland. Catharine took no part in the war against France, though she broke yet all connexion with the French republic, actively assisted the emigrants, and entered into an alliance with England against France. She likewise made war against Persia, and, as some historians assure us, she in the representation of destroying the power of the English in Bengal, when a fit of apoplexy put an end to her life.

Catharine II has been equally censured and praised. With all the weakness of her sex, and with a love of pleasure carried to licentiousness, she combined the firmness and talent of a powerful sovereign. Two passions were predominant with her until her death, love and ambition. She was never without her favours, yet she never lost sight of her dignity. She was distinguished for activity, working with her ministers, writing letters to Voltaire and Diderot, and signing an order to attack the Turks, or to occupy Poland, in the same breath. She would despise us, and was particularly partial to the French. At Paris she had a literary agent (Baron Grimm). She several times invited Voltaire to her court, proposed to D'Alembert to finish the Encyclopedia at Saint Petersburg, and to undertake the education of the Grand Duke. Diderot visited her at her request, and she often allowed him the privilege of familiar conversation with her. By these means she gained the favor of the literati, who called her the greatest of rulers; and, in fact, she was not without claims to this title. She protected commerce, improved the laws, dug canals, founded towns, hospitals and colleges. Pallas and others travelled at her expense. She endeavored to put an end to the abuses which had crept into the administration of the different departments of government; but she began without being able to finish. Civilization advanced but slowly in Russia under her reign; and her anxiety to enlighten her subjects ceased when she began to entertain the idea that the French Revolution had been brought about by the progress of civilization. Laws, colonies, schools, manufactures, hospitals, canals, towns, fortifications, every thing was going on so rapidly that she was unfinished for want of means. Consult Bilbasoff, 'Geschichte Katharina II' (Berlin 1893); Bruckner, 'Katharina die Zweite' (ib. 1883); Bury, 'Catharine II' (New York 1900); Castara, 'Vie de Catharina II' (1796); Herzen, 'Memoires de l'Impératrice Catharina II' (1859); Tannenberg, 'Leben Catherinens II' (1797); Hützsch, 'Catharine II' in 'Cambridge Modern History' (Vol. VI, New York and London 1906); Lavisse and Rambaud, 'Histoire générale' (Vol. VII, Paris 1896); Wallensteini, 'The Romance of an Empress, and the Story of a Throne' (London 1895).

CATHARINE OF ARAGON, Queen of England, the youngest daughter of Ferdinand of Aragon and Isabella of Castile: b. Alcalá de Henares, Spain, 15 Dec. 1485; d. Kimbolton, Huntingdonshire, Dec. 1, 1536. In 1501 she was married to Arthur, Prince of Wales, son of Henry VII. Her husband dying about five months after, the King, unwilling to return her dowry, caused her to be contracted to his remaining son, Henry, and a dispensation was procured from the Pope for that purpose. In his 15th year the Prince made a public protest against the marriage; but at length yielding to the representations of the latter, he consented to ratify the contract, and on his accession to the throne in 1509 was crowned with her. The inequality of their ages and the capricious disposition of Henry were circumstances very adverse to the continuance of their union, and it seems surprising that Catharine should have acquired and retained an ascendency over the affections of the King for nearly 20 years. The want of male issue, however, proved a source of disquietude to him, and scruples, real or pretended, at length arose in his mind concerning the legality of their union, which were greatly enforced by a growing passion for Anne Boleyn, one of the Queen's maids of honor. He made application to Rome for a divorce from Catharine. But all that Henry could obtain at Rome was a promise to investigate the case. Catharine, meanwhile, conducted herself with gentleness and firmness, and could not in any way be induced to consent to an act which would disgrace and stain her with the imputation of incest. Being cited before the papal legates, Cardinals Wolsey and Campeggio, in 1529, she declared that she would not submit her cause to their judgment, but appealed to the court of Rome, by which declaration was declared contumacious. His failure to secure the sanction of the Pope to the divorce induced the King to decide the affair for himself; and the condemnation of his conduct based on a decree of the court of Rome provoked him to throw off his submission to it, and declare himself head of the English Church—an act of royal caprice and of great importance in English history. In 1532 he married Anne Boleyn; upon which Catharine, no longer considered Queen of England, retired to Ampthill in Bedfordshire. Cramer, now raised to the primacy, pronounced the sentence of divorce, notwithstanding which Catharine still persisted in maintaining her claims. Shortly before her death she wrote a letter to the King, recommending their daughter (afterward Queen Mary) to his protection, praying for the salvation of his soul, and assuring him of her forgiveness and unabated affection. The pathos of the letter is but frequently interspersed with tears from Henry. He had never presumed to call the virtues of his injured wife in question, and she certainly acted throughout with eminent dignity and consistency. Several devotional treatises have been attributed to Catharine which belong to Queen Katharine Parr.

CATHARINE OF BRAGANZA, brä-gan'sa, wife of Charles II, King of England,
and daughter of John IV, King of Portugal: b. Villa Viçosa, Portugal, 25 Nov. 1638; d. Portugal, 31 Dec. 1705. In 1662 she married Charles of the House of Habsburg, and all the neglect and mortification to which his dissolute conduct necessarily exposed her, and which became still more galling from her having no children; still she conducted herself with great equanimity, and after the death of Charles received much attention and respect. In 1693 she returned to Portugal, where, in 1704, she was made regent by her brother, Don Pedro, whose increasing infirmities rendered retirement necessary. In this situation Catharine showed considerable abilities, carrying on the war against Spain with great firmness and success. Consult Strickland, 'Lives of the Queens' (Vol. IV, London 1888); Jesse, 'Memoirs of the Court of England' (Vol. III, London 1876); Ranke, 'History of England. Principally in the Seventeenth Century' (Oxford 1875); Davidson, 'Catharine of Bragança' (London and New York 1908).

CATHARINE OF FRANCE. See Catharine of Valois.

CATHARINE HOWARD, Queen of England. See Howard, Catharine.

CATHARINE DE MEDICI, mà'di-ché, Queen of Henry II of France: b. Florence 1519; d. Blois, France, 5 Jan. 1589. She was the only daughter of Lorenzo de Medici, Duke of Urbino, and the niece of Pope Clement VII. Francis I consented that his son, Henry, should marry her only because he did not believe she ever would ascend the throne, and because he was in great want of money, with which Lorenzo could furnish him. The marriage was celebrated at Marseilles in 1533. She was the mother of four sons, of whom three became kings of France in her own lifetime. They were Francis II, 1559-60; Charles IX, 1560-74; and Henry III, 1574-89. Catharine was equally gifted with beauty and talents, and had cultivated her taste for the fine arts in Florence; but at the same time she imbued the perverted principles of politics then prevailing in Italy. Catharine's ambition was unbounded. She sacrificed France and her children to the passion for ruling; but she never aimed steadily at one great end, and had no pronounced views of policy. The situation in which she was placed, on her arrival at the French court, gave her great opportunity to perfect herself in the art of dissimulation. She flattered alike the Duchess d'Étampes, the mistress of the King, and Diana de Poitiers, the mistress of her own husband, though these two ladies hated each other. From her apparent indifference she might have been supposed inclined to shun the tumult of public affairs; but when the death of Henry II in 1559 made her mistress of herself, she plunged her children in a whirl of pleasures, partly to enervate them by dissipation, partly from a natural inclination toward prodigality; and in the midst of these extravagances cruel and bloody measures were executed, which made the whole court shudder. Her authority was limited under the reign of Francis II, her eldest son, who, in consequence of his marriage with the unfortunate Mary Stuart, was entirely devoted to the party of the Guises. Jealous of a power she did not exercise, Catharine then decided to favor the Protestants. If it had not been for her patronage, by which the ambition of the Huguenots was stimulated, the conflicting religious opinions in France never would have caused such lasting civil wars. Catharine felt herself embarrassed by this indulgence toward the innovators, when the death of Francis II placed the reins of government during the minority of Charles IX, in her hands. Wavering between the Guises on one side, who had put themselves at the head of the Roman Catholics, and Condé and Coligny on the other, who had become very powerful by the aid of the Protestants, she was constantly obliged to resort to intrigues, which failed to procure her as much power as she might easily have gained by openness of conduct. Despised by all parties, but consolled if she could deceive them; taking arms only to treat, and never treating without preparing the materials for a new civil war, she brought Charles IX, when he became of age, into a situation in which he must either make the royal authority subordinate to a powerful party, or cause part of his subjects to be massacred, in the hope, at best, of a dishonorable one of subduing faction. The massacre of Saint Bartholomew was her work. She induced the King to practise a dissimulation foreign to his character; and as often as he evinced a disposition to free himself from a dependence of which he was ashamed, she knew how to prevent him, by the fear and jealousy which she excited in him by favoring his brother Henry. After the death of Charles IX Catharine became again regent of the kingdom, and the return of Henry III, then king of Poland. She contributed to the many misfortunes of his reign by the measures which she had adopted previously to its commencement, and by the intrigues in which she was uninterruptedly engaged. At her death, France was in a state of complete dismemberment. The religious contests were in reality very indifferent to her. The consequences she was not able to conceive. She was ready to risk life for the gratification of her ambition. She was equally artful in uniting her adherents, and in promoting dissension among her adversaries. To those who directed her attention to the prodigal expenditure of the public treasure, she used to say, 'One must live.' Her example contributed greatly to promote the corruption of morals which prevailed in her time. Her manners, however, were elegant, and she took a lively interest in the sciences and arts. She procured valuable manuscripts from Greece and Italy, and caused the Tueleries and the Hôtel de Soissons to be built. In the provinces, also, several castles were erected by her order, distinguished for the beauty of their architecture, in an age when the principles of the art were still unknown in France. She had two daughters, Elizabeth, married to Philip II of Spain in 1559, and Margaret of Valois, married to Henry of Navarre, afterward Henry IV. Consult Alberi, 'Vita de Caterina de Medici' (Florence 1838); Balzac, 'Sur Cathérine de Medicis' (Paris 1864); Chéruel, 'Mémoire sur la Mort de Cathérine de Medicis' (id. 1858); Sisley, 'Cathérine de Medici et la French Reformation' (London 1905); 'The Later Years of Catharine de Medicis' (ib. 1906); Zeller, 'Cathérine de Medicis et les Protestants' (Paris 1889); La
FERRIÈRE, 'Lettres de Catherine de Medicis' (1680-91).

CATHERINE PARR. See PARR, CATHARINE.

CATHERINE PAULOVNA, Queen of Württemberg: b. 21 May 1788; d. 9 Jan. 1819. She was a daughter of Paul I, of Russia, and in 1809 married George, Duke of Holstein Oldenburg. After his death in 1812, she accompanied her brother, Alexander, on his campaigns in Germany and France (1813-14), to Paris, London and the Congress of Vienna (1815), assisting him by her talents and resolute spirit. The marriage of her younger sister to the Prince of Orange is said to have been effected by her influence. In 1816 she married William, Crown Prince of Württemberg, whose acquaintance she had made during her travels. During the famine of 1816 in that country she proved her benevolence by the formation of female associations and an agricultural society. She was active in promoting the education of the people.

CATHERINE OF VALOIS, vá'lwá. Queen of England, youngest child of Charles VI and Isabella of Bavaria: b. Paris, 27 Oct. 1401; d. 3 Jan. 1438. In 1420 she was married to Henry V of England, who was then declared successor to the crown of France. To this prince she bore Henry VI, crowned in his cradle king of both countries. After the death of Henry, in 1422, Catharine went into retirement and privately married Owen Theodore, or Tudor, a Welsh gentleman of small fortune, but descended from the ancient British princes. By this marriage she had two sons, the eldest of whom, Edmund, Earl of Richmond, by a marriage with Margaret Beaufort, of the legitimated branch of Lancaster, became father of Henry VII and founder of the house of Tudor. Consult Strickland, A. Lives of the Queens of England (Vol. III, London 1840); De Virville, 'Histoire de Charles VII' (Vol. I, pp. 143, 187, 189, 218 et seq).

CATHERINE-WHEEL, a window or compartment of a window of circular form, sometimes with radiating divisions or spokes, used in medieval building, called a rose or marigold window. It is a memorial of Saint Catharine's martyrdom. The term is also applied to a kind of firearm in the shape of a wheel, made to revolve automatically when lighted; a pin-wheel.

CATHARTIC, any remedy that will cause an increased discharge from the intestinal canal. For purposes of general description there are four classes of cathartics. These are mild cathartics, or laxatives; simple purges, drastic purges and hydrogogues. Catharsis is accomplished either by increasing the amount of water in the intestines or by stimulating the movements of the intestines—peristalsis. The laxatives are water, sugar, honey, fruits, stringy vegetables, coarse bread, cassia fistula, sulphur, figs, etc.; these act either by giving bulk, stimulation of peristalsis, or by adding water, all of the sugars attracting water from the intestinal wall. The simple purges act usually by stimulating peristalsis. These are castor oil, cascara sagrada, rhubarb, aloes, senna, iris, podophyllum, leptandra, calomel, etc. The drastic purges stimulate peristalsis, and many of them cause a flow of water into the intestine. The simple purges in large doses are drastic. Gamboge, jalap, colocynth, scammmony, eruc oil and elater are drastic. Another class of cathartics are saly, and by osmosis attract water into the intestines and stimulate the motor activity of the intestines; they thus act as hydragogues and are termed the saline cathartics. Those most commonly used are epsom salts, rockcette salts, magnesium oxide, citrate, sodium phosphate, tartrate and bitartrate. Most of the mineral waters belong to this class of cathartic. In former times cholagogues were described as cathartics that "soured" the liver secretions. It was well recognized that those drugs that stimulate peristalsis affect the gall bladder, causing it to empty itself more actively, and that the liver is unaffected. The only true hepatic stimulant that is now recognized is ox-gall. This is frequently employed as a good cheap cathartic. Cathartics are an evil above all description. It is almost safe to assert that the injurious use of the many patent cathartic pills on the market is responsible for more intestinal trouble than any other agent. They tend to be unduly occupied with their intestinal functions and work incalculable injury. See Constipation.

CATHARTIDÆ, the American vultures, a family of birds of the order Accipitres or Raptores, differing from the more eagle-like Old World vultures (Piiuride) in having the beak comparatively slender, straight and blunt, the complete absence of a septum between the nostrils, the much more largely naked head and neck, and the weak feet with elevated hallux and but slightly clawed toes. As a rule they are less predaceous birds, which feed exclusively on carrion or attack weakling animals. Five genera, each with but one or a few species, are found in America, more especially in the warmer parts. Among them are the carrion crow, the condor and the turkey buzzard (qq.v.).

CATHAY, káth-á', a name by which Marco Polo designated a part of Asia, probably North China.

CATHCART, Sir George, son of William Schaw Cathcart (q.v.): b. London, 12 May 1794; d. Inskerman Criese, 5 Nov. 1854. He entered the Life Guards in 1810, accompanied his father as attaché to Russia, and subsequently acted as aide-de-camp to the Duke of Wellington at Waterloo. He served in Nova Scotia and the West Indies, quelled the rebellion in Canada in 1837, and was appointed in 1852 governor at the Cape of Good Hope, where he showed ability in subduing the Kaffir insurrection. On the outbreak of the Crimean War great things were expected of him, but he fell as divisional commander at Inkerman. He was the author of 'Commentaries on the War in Russia and Germany in 1812 and 1813' (London 1850).

CATHCART, William Schaw, Earl of, English soldier and diplomatist: b. Petersham, England, 17 Sept. 1755; d. near Glasgow 16 June 1843. He studied at Dresden and Glasgow, then entered the army, and served with distinction first in the American war and afterward in the campaigns against the French

republic in Flanders and Germany. In 1801 he was made lieutenant-general, and in 1803 commander-in-chief for Ireland. In 1807 he was appointed commander of the land forces in the expedition against Copenhagen, and was elected a representative of his province on this occasion. In 1812 he proceeded to Russia as Minister-Plieniopotentia, joined the Emperor Alexander at the headquarters of the Russian army and accompanied him through the campaigns of 1813-14. He entered Paris with the Emperor and occupied a position in the Congress of Vienna. The same year he was created an earl. Subsequent to this he resided for several years at Saint Peters or as Ambassador to the Russian court.

CATHEDRAL. See CATHEDRALS AND CHURCHES.

CATHEDRAL, The, a poem by James Russell Lowell, published in Boston in 1869. The particular cathedral which suggested the thought of the poem is that of Chartres.

CATHEDRAL PEAK, a peak of the Sierra Nevada range, situated in the north-eastern part of Mariposa County, Cal., near lat. 37° 50' N. It is of granite formation and contains the source of the Merced River. It is 11,000 feet high.

CATHEDRAL OF SAINT JOHN THE DIVINE. See CATHEDRALS AND CHURCHES.

CATHEDRAL SCHOOLS. All of the schools of western Europe were derived from bishop's schools (q.v.). The manifold duties of the bishop, however, which often caused his absence from his diocese, forced the control of the school to devolve on those members of the chapter who were bound to stationary residence. In the process of time, the cathedral school developed into three or sometimes four schools: the theological school, the music or song school, the choristers' school, a combined grammar and song school, and the grammar school itself, which became the cathedral school par excellence. These institutions were the first public schools of the Middle Ages, and continued their high importance in England down to the 18th century. They were open to all students, and taught the classics in general, together with the rhetoric and logic of the scholastic trivium. The four principal dignitaries as the schools were organized at the end of the 11th century throughout Europe were the dean, precentor, chancellor and sacrist or treasurer (in order of rank, generally). The head of the school was generally a master of arts. When the monastic cathedrals at Canterbury, Rochester, Durham, Worcester, Norwich, Ely and Carlisle were abolished in 1540, and replaced by secular canons, a master and an usher were added to each new grammar school; provision was made for the admission of fee students; and exhibits planned, to take the best scholars to the universities. This last provision was soon canceled. The monastic cathedral schools meanwhile suffered through lack of funds and eventually became annexed to some other charitable enterprise of the cathedral or died out altogether. When in 1863 the great inquiry into the secondary schools was conducted for the purpose of revival, the old monastic schools were entirely overlooked and arrangements were made for the extensive assistance of the newer secular cathedral schools from the funds of the ecclesiastical commissioners. Westminster, throughout the 17th and 18th centuries, conducted the best and most famous of public schools; York had the chief school of the north; Durham has been the most uniformly successful; Canterbury, for many years decadent, has increased recently; Norwich, Hereford and Ely have been fairly successful as local schools; Bristol and Oxford have declined notably. See ALMONY SCHOOLS.

CATHEDRALS AND CHURCHES, the latter name derived from the Greek καθολικός, a "seat." Thus, "to speak ex cathedra," is to speak as from a seat of authority. A cathedral city is the seat of the bishop of the diocese and his throne is the cathedral church. From the early days of the Christian Church the bishop presided in the presbytery or assembly of priests. He was seated on a chair, a little higher than those of the others. The whole meeting of priests is called cathedra; and at a later period, when Christians were allowed to build churches, this name was applied to the episcopal churches. Besides the cathedral churches we find those distinguished as collegiate, collegiate-parochial or abbey, according to the classification of the Roman Catholic Church. The governing body of an English cathedral is called the dean and chapter. The cathedral is commonly, though not invariably, the most important church building, architecturally speaking, in the diocese. Its usual form is the Latin cross. From the comparatively simple outline of the early Christian basilica has been evolved the complex cathedral structure of the Middle Ages. In its outline a typical cathedral exhibits nave, extending east and west, transepts, north and south, choir, retro-choir, and, sometimes, lady chapel. A tower rises where the transepts cross the nave. Two towers usually flank the western front, which contains a large rose window. But it must be borne in mind that the outward and architectural style the cathedral is not necessarily superior to the other churches of a diocese. The dimensions of some of the abbey and parish churches are greater than those of some cathedrals. French cathedrals are distinguished by their great height, chevets, or apsidal east ends with a corona of chapels, elaborate and logical vaulting system, and, in the later Gothic styles, by extremely profuse adornment. The portals of French churches are generally lofty and imposing and richly sculptured, while the English cathedrals are much longer and lower than French ones. Their east ends are usually square and their portals small, and, in some examples, as at Wells, even insignificant.

Early Roman and Italian Edifices. The earliest churches were, known to be at the time of Constantine. They were of the form known as the basilica, consisting of three aisles (or, rarely, five) separated by columns. The middle aisle, which is the nave, was higher and broader than the others and always ended in a round apse, which bowed outward from the wall at the rear of the church. This type was much used in Italy. The church of Saint John Lateran in Rome is also called the "Ba-
Cathedrals and Churches

Silica of the Saviour. Over its chief portal is the inscription "Omnium urbis et orbis ecclesiarum mater et caput (mother and head of all the churches of Rome and the world). Saint John Lateran is the cathedral of the diocese of Rome. The Pope as Bishop of Rome performed episcopal functions there until 1870, since when a deputy has officiated in his stead. Valentine calls it "the venerable temple, the first that was raised to the true God of the Christians." It was built in the 4th century, but the interior has been entirely remodeled, and unfortunately by Borromini (q.v.). The façade is still later, for it was designed by Galilei in 1734; but this, with the effective deep shadows produced by the double porch gallery, deserves praise.

The great church of Saint Peter's at Rome is surpassed by no cathedral in splendor of design and equalled by none in magnitude. It marks the culmination of Renaissance church architecture. Its interior is 619 feet in length and 449 in width (along the transepts). The diameter of the cupola is 144 feet; the height from the ground to the top of the roof measures 470 feet. Saint Peter's is the largest church in the world. About the middle of the 15th century plans were discussed for a new building to replace the ancient structure that occupied the same site. The foundation stone was laid on 18 April 1506, for a building according to the designs by Bramante, an Umbrian, who, through his plans for the basilica of Saint Peter and the Vatican palace, became the most famous of Italian architects. Bramante's influence was greater than that of any of his predecessors. Subsequently assigned to the work were Raphael, Michelangelo, Barozzi, Giacomo della Porta, Maderna and Bernini — the last mentioned designed the colonnades.

The completed church was consecrated by Urban VIII on 18 Nov. 1626. Thus 120 years passed between the first planning and the dedication of the building, that period covering the reign of 20 popes; and, besides the seven architects mentioned, eight others succeeded one another in the construction of the edifice. The effect of the church itself, marred by Maderna's façade in the first part of the 17th century, is wonderfully enhanced by Bernini's colonnade, and that of the middle of the same century. The dome is its most striking feature.

Conspicuous examples of Italian Romanesque are the cathedral of Pisa, A.D. 1067-1118, with the Leaning Tower and the Baptistery; S. Miniaio at Florence; Genoa, 988-1199 and 1260; Pistoca, 1160—enlarged in the 13th century; and Monreale in Sicily. The Italian Gothic is exemplified very nobly by Milan Cathedral, 1386-1418, and the cathedral of Florence, 1290-1462 (though here we must note that the octagonal dome, 1385 feet in diameter, was added by Brunelleschi and belongs to the Renaissance period). Other fine Gothic Italian cathedrals are Siena, 1243; Arazzo, 1273; Orvieto, 1290; Lucca, 1350; and Como, 1390. Saint Mark's, Venice, 1053-1350, that wonder of Byzantine architecture is in the form of a Greek cross, of equal arms. The delicate sculpture in every part and "inexpressible color" Ruskin regarded as the characteristic in which he expressed it, "the effects of Saint Mark's depend."}

French Cathedrals and Churches.—The two most famous French cathedral churches are here briefly described. Pope Alexander III, being at the time a refugee in France, laid the first stone of Notre Dame, Paris, in 1163. The northern transept and portal were built in 1312 by Philip le Bel. Porte Rouge, on the north side, was erected in 1407 by the Duke of Burgundy, as a mausoleum, by the Duke of Orleans, as expiation of his crime. But not until about 1714 was the choir completed as it now stands. The building is in the form of a Latin cross, with an octagonal east end. Two towers of equal height (264 feet) embellish the western façade. The spires have never been constructed. The length of the building is about 390 feet; its width at transepts 144 feet. It was the scene of the coronation of Napoleon on 2 Dec. 1804, and the wedding of the youthful Francis II and Mary, Queen of Scots. The capacity of the building is about 22,000 persons.

Reims (or Rheims) Cathedral was proclaimed long ago by Charles VII in 1424, "The Noble Church, the glory of France, of the kingdom." The learned M. Demaison (see Bibliography) writes: "Among all our Gothic churches I should not dare to say that Reims ought to hold first place. It would be very puerile to desire to open thus a kind of argument and try to answer a question in respect to which every one has his preferences and personal tastes. But it is none the less true that in certain details the superiority of the cathedral at Reims can be asserted in a manner almost beyond dispute. Its lateral façades especially are of incomparable beauty. With infinite regret we must change the tenses of this distinguished writer's verbs from present to past. The barbarous invaders in the European War have utterly demolished the noble fane. The building had the form of the Latin cross and was 453 feet long. It contained a collection of 5,000 statues. In it the French kings were crowned down to the time of Charles X. First of that brilliant succession, Philip Augustus, in 1179, was crowned in the old cathedral which was destroyed by fire, 6 May 1210. On 6 May 1211, the first stone was laid for the new edifice. For two years about the middle of the 13th century. The façade with its twin towers (263 feet), its rose-window, 120 feet in circumference, and the doorways with 530 statues, was of majestic beauty.

The principal Gothic cathedrals of France, besides Notre Dame of Paris and Notre Dame of Reims, are Leon, A.D. 1113-1200; Chartres, 1194-1260; Amiens, 1220-28; Rouen, 1202-20; Coutances, 1254-74; Beauvais, with the most lofty choir in Europe, 1337-47; Bourges, 1190; Bayeux, with its 22 chapels. In addition there are (or were until the coming of the Germans), Chalon-sur-Marne, 1248; Soissons, 1175-1342 (demolished by the Germans); Meaux, 1179; Orleans, 13th century, reconstructed by Henry VII; Rennes, 1180-1389; Saint Brienne, finished 1248;
CATHEDRALS AND CHURCHES

Tours, 1170–1550; Angers, 12th century; Laval, 12th to 16th century; Le Mans, 11th to 13th century; Nantes, 1343–1840; Clémont-Perraud, 1248; Le Puy, 12th century; Verdun, 13th, 14th and 15th centuries; Saint-Dié, 14th and 15th centuries; Bellay, 1413; Saint Flour, 1396–1466; Limoges, 1273–1510; Tulle, 12th century; Sens, 1124–68; Moulins, 1465–1885; Nevers, 11th century (Romanesque); Troyes, 1208–1640; Lyons, 1107–1680; Auxerre, 13th century; Dijon, 1280; Grignoble, 11th, 12th, 13th, 14th centuries (Gothic and Romanesque); Saint Claude, 1340–1726; and Besançon, 11th and 15th centuries. Southern France boasts of Bordeaux, 13th and 14th centuries (Gothic); Agen, 12th and 13th centuries; Luçon, 13th and 17th centuries (various styles); Angoulême, 12th century (Romano-Byzantine); Périgueux, 1047 (Byzantine and Aquitaine); Poitiers, 1162–1379; Auch, 15th and 17th centuries; Bayonne, 1213; Tarbes, 12th and 14th centuries; Toulouse, 15th and 16th centuries; Carcassonne, 13th century; Albi, 1272–1512, one of the most original buildings in Europe; Cahors, Romano-Byzantine, Perpignan, begun in 1224; Rodez, 12th and 15th centuries; Avignon, 11th century; Nîmes, 11th century; Valence, 1095; Viviers, 14th and 15th centuries; Aix, 13th and 15th centuries; Fréjus, 11th–13th century; and the modern La Major, Marseilles, 1852–93.

Of French Romanesque, the most famous examples are the Abbaye-aux-Hommes (S. Etienne); Caen, commenced in 1066 by William the Conqueror, to expiate his fault in marrying his closely related Matilda; also, in the same place, the Abbaye-aux-Dames (La Trinité). The Classic movement in Paris produced the Madeleine (1764–1806), which combines Hellenic and Roman elements. It is an excellent reproduction of a Corinthian temple.

English, Scotch and Irish Cathedrals.—Of English church buildings the most interesting is Westminster Abbey, begun in 1050 by Edward the Confessor, who died soon after the choir was finished in 1065 and was buried there. Mr. Allen (see Bibliography) writes that "Edward was interred before the high altar eight days after the dedication. To be crowned beside that tomb lent additional sanctity to the rite of coronation; and every British sovereign, from William the Conqueror to George V has received the crown before its altar. Henry III, who rebuilt the church, palace and monastery at Westminster, chose his own burial-place on the north side of the stately shrine to which he had translated the body of the Confessor. There, in due time, lay his son Edward I and his Queen; there king after king was buried; there Chaucer was laid to rest, and there, nearly two centuries later, the poet's poet, Spenser,—and after him Ben Jonson, poet laureate of the Commonwealth—a cornet of Nelson's cry: "Westminster or victory!" epitomized the feeling and settled conviction of Englishmen that to be laid to sleep in ground sacred with the dust of kings, warriors, churchmen, statesmen and poets, was an honor of the highest sort. A Parliament met in Westminster's Chapter House, the cradle of Parliamentary government of the British empire. Edward III spoke of the Abbey as not only the monastery church of Westminster, but also as the "special chapel of our principal palace." Twice in its long history a bishop's throne has adorned its choir stalls; but to-day it is not a cathedral it is—Westminster Abbey. The nave is the loveliest in England and the transept contain some of the most beautiful work that can be found any-where. The south transept is the "Poets' Corner," a name given by Goldsmith. Chaucer's tomb is here. Henry VII's chapel is the most perfect example of its existence. The vault is beautiful with "fan-viner." Above the superbly carved stalls of the Knights of the Bath hang ancient banners. In this impressive and elaborate chapel the tombs of Queen Elizabeth and her victim, Mary, Queen of Scots, are side by side.

The famous 'Jerusalem Chamber' (see Shakespeare's 'Henry IV, Part II, Act V, Sc. IV) is on the right of the chief, or west, entrance. In this room the Assembly of Divines met in 1643, to frame the Westminster Cate-

ism.

Saint Paul's Cathedral, in London, replaces the first Saint Paul's which was destroyed in the great fire of 1666. The first stone of the present edifice was laid by Christopher Wren, who drew up a comprehensive scheme for the new streets and squares of London, but was permitted to exercise his great talent only upon this main building in his general plans. Sir Christopher's son laid the last stone, the highest slab on the top of the Lantern, 363 feet above the pavement, in 1710. The entire building was finished in 35 years under one architect, one master mason, and while one bishop, Dr. Henry Compton, occu-
pied the see. Compare what is said above about Saint Peter's. The plan of the building is the Latin cross surmounted by a dome 145 feet in diameter, and the latter combines characteristics of both Bramante's and Michelangelo's designs for the dome of Saint Peter's in Rome. The dome is the great feature of Saint Paul's and almost seems to typify London. The length of the building, east to west, is 500 feet; its width is 125 feet, except at the west end where two towers extend the width to 180 feet. The choir stalls, carved by Grinling Gibbons, are superb.

Saint Paul's is second only to Westminster Abbey in its number of monuments to the celebrated dead. Here lie Wellington, Nelson, Rodney, Gordon, Lord Cornwallis, Sir Joshua Reynolds, Lansdowne, Turner and the American painter, Benjamin West. Westminster Abbey is the church of the king; Saint Paul's is the church of the citizen. It has always been chosen as the scene for stirring commemora-
tions and thanksgivings ever since Queen Anne celebrated Marlborough's victories there. The streets around Saint Paul's bear such names as Amen Corner, Creed Lane, Canon Alley and Paternoster Row.

Canterbury Cathedral, founded soon after the Norman conquest, is 545 feet long and the greatest transept is 170 feet. It has three towers, the central one being 230 feet high. The crypt, which extends under the entire structure, is the finest in Europe Parlia-
ment met in Westminster's Chapter House, the cradle of Parliamentary government of the British empire. Edward III spoke of the Abbey as not only the monastery church of Westminster, but also as the "special chapel of our
CATHEDRALS AND CHURCHES

stayed the original choir (that of the Norman Church), the work of reconstruction was entrusted, in 1174, to the French architect, William of Sens, who naturally supplied a purely French contemporaneous design. As Canterbury was four centuries in building it contains specimens of all classes of Pointed Architecture. The tomb of Stephen Langton, first subscribing witness of the Magna Charta, is here. The bones of Thomas à Becket, who was murdered here in 1170, became a pilgrimage place of great celebrity and veneration.

Salisbury Cathedral, begun in 1220 and finished in 1258, is universally selected as the best embodiment of Early English design; and this for the good and sufficient reason that it has the excellent quality of unity, which bears the same relation to architecture that composition does to painting. The plan is a double cross; extreme length, 474 feet, and width along greater transept, 230 feet. The great east window is the finest specimen of its kind in England.

In Lincoln Cathedral was developed the first complete form of the Pointed Arch. Lincoln greatly resembles the Cathedral of Dijon, but is even finer. It was begun by Hugh of Burgundy, 1185, after an earthquake had destroyed the earlier building. The Lincoln east front is regarded as almost perfect in design. The main stylistic divisions at Lincoln are given as: First, Saint Hugh’s choir and east transept, 1180-95; second, nave and west front, 1205-50; third, presbytery or Angel choir, 1256-80; fourth, upper portions of towers, 14th century. Lincoln Cathedral has a length of 524 feet externally, and measurement inside gives 482 feet. Its central tower is 300 feet high.

Peterborough Cathedral has been called a monument of the latest English Romanesque style. The first part of this building to be erected was the apse, about 1120. A critic says: “nothing of the Romanesque architecture in England is quite so fine as that round apse at the east end of Peterborough. According to the same observer, “the interior of the church is even more impressive, relatively speaking, than the outside, and is probably the finest early interior in England.”

There is much English work and some Perpendicular in this cathedral. The west front with its three enormous doors is famous.

Ely is one of the long and comparatively narrow English cathedrals whose main structures, the nave and transepts, are Norman. Its length is 516 feet and its width 190 feet. The great west door is both Early English and Decorated and the Galilee Porch is one of the finest examples of Early English in existence. The Octagon, the work of Walsingham (13th century), is the gem of Ely. The choir-stalls are the finest Decorated stalls known. The choir-stalls and Perpendicular. The towers rise to 200 feet. The south transept (1216-41) and the north transept (1241-60) are Early English. For stateliness and magnificence the choir is unrivaled. The glass is magnificent and there is more ancient glass here than in any other building in the world.

Winchester, the largest cathedral in England, represents every style from pure Norman to early Renaissance. It has the most beautiful nave in England. The choir-stalls are magnificent. Alfred the Great was crowned here. It is pre-eminently a cathedral of royal associations.

Exeter is the best specimen of the Decorated style. The finest work of the 14th century is here. Its special features are the screen on the west front, lady chapel, bishop’s throne, east window and minstrels’ gallery with wonderful carvings.

Lichfield, Early English and Decorated, of the 13th and 14th centuries, is famed for its three lovely and delicate towers, west front and lady chapel.

Chichester, though small, is a treasure-house; for it contains every style without a break from the 11th to the 16th century. It is called an epitome of English architecture.

Gloucester is noted for the most beautiful choir in England with the magnificent east window, 72 feet high and 38 feet wide, the largest window in Europe. The central tower, cloisters and lady chapel are also famous. Gloucester offers splendid examples of the transition from the Decorated to the Perpendicular.

Wells is celebrated for the carvings of its capitals, its chain-gate, chapter-house, inverted arches in the nave, east end and singular west front. It was built in 1206-42.

Rochester has the finest of all Norman doorways in its west front. This cathedral was built in the 12th century.

Durham is the most picturesquely situated of all English cathedrals. Its Galilee chapel, choir of nine altars, Neville screen and Joseph’s window (a splendid example of Early Decorated tracery) are its features. Early Norman, Early English and Early Decorated are found here. The tombs of the “Venerable Bede” are here.

In Scotland there are, besides modern edifices, only two complete and entire cathedrals—those of Glasgow and Kirkwall. Consult Addis, M. E. L., “The Cathedrals and Abbeys of Presbyterian Scotland,” Philadelphia 1901.

In Dublin there are two cathedrals: Christ Church, built in 1038, restored and, in 1878, reopened; Saint Patrick’s, erected 1190 and restored between 1860 and 1865.

German Cathedrals and Churches.—Turning now to German cathedrals, we may mention as typical structures the enormous structure at Cologne and the new cathedral at Berlin. The former was begun in the middle of the 13th century and only in part finished by 1500, after which date work was discontinued, and not resumed until 1830. In 1863 it was thrown open to the public, and in 1880 it was finished. It is 511 feet long and 231 feet wide. The towers reach the height of 513 feet above the ground. The nave, although five feet narrower than that of the cathedral at Amiens, Consult Fergusson, J., “A History of Architecture in All Countries” (London 1874, Vol. I, p. 533 and Vol. II, p. 67); also Moore, C. H., “Development and Character of Gothic Architecture” (2d ed,
INTERIOR OF CATHEDRAL AT TOLEDO, SPAIN
New York 1906, p. 253]. The new cathedral at Berlin, dedicated in 1905, has its principal entrance for the people of that city and for the general public at the side; the traditional west-façade door or doors are reserved for "exits and entrances of the Imperial family, and for entrances not followed by exits—since this cathedral is intended to serve as an Imperial mausoleum. The architect, apparently striving after Italian Renaissance effects, has produced a mere "school chapel" are decreted. It is of historic interest as the crowning place of the Western Emperors. Lübeck Cathedral is a type of brick architecture peculiar to North Germany; the nave and transept are of this period, being founded in 1173. Examples of Gothic in Germany (besides Cologne Cathedral) are Strassburg Cathedral, 1240-1365, which has two western towers, though only one spire (which dates from 1429) of open work tracery; Ratisbon Cathedral, 1275-1334, the open spires of which were added in 1859-69; Ulm Cathedral, spacious and lofty, with fine choir stalls; Magdeburg, 1208-11; Halberstadt, 1250; Altenburg, 1255; Freiburg, 1270; Meissen, 1274; Osnabrück, 1318; Augsburg, 1332-1431; and Metz, 1330. Saint Elizabeth, Marburg, 1225-83, has the side aisles raised to the same height as the central aisle, a new type which Germans call the "Halle [Church]"—as is also Munich Cathedral; Saint Stephen, Vienna, 1300-1510, a splendidly impressive church in the heart of the city, with traceried vaults and windows of the original stained glass. The cathedral of Prague (1344-52) shows French influence.

Russian Ecclesiastical Edifices.—In Russia, the largest and most famous of Petrograd's churches is that of Saint Isaac of Dalmatia, which was erected 1819-58) in place of an earlier church, after plans by R. de Montferrand, and at an expense of about $2,000,000. Its plan is a Greek cross, and the extreme width is 315 feet. It is built of granite and marble. The central dome, which is gilded and is 87 feet in diameter, is crowned by a lantern more than 40 feet high. Above the floor the dome rises to the measured height of 269 feet (interior), and 334 feet (exterior) to the top of the cross on the lantern. The walls of the interior are lined with marble of many different kinds, and each of the chief entrances is ornamented with 16 monolith columns, 7 feet thick and 54 feet high, of red granite from Finland. In the cathedral of the Saints Peter and Paul is the mausoleum of the Russian Imperial family. It is a domed structure 210 feet in length and 98 feet wide. In Moscow, and near the centre of the Kremlin, which is in the very heart of the city, stands the cathedral of the Assumption, the church in which the Tsars are crowned, built by Fioravanetti of Bologna in 1475-79. Its form is rectangular and its dimensions moderate (length 125 feet and width 82 feet). Its central dome rises to a height of 138 feet, and there is a smaller dome at each of the corners. Archangel Cathedral in Moscow was, before the time of Peter the Great, the mausoleum of the Tsars; and near it is the building in which rulers of the same family are christened and married, the cathedral of the Annunciation. The Inner City contains one of the most revered ecclesiasties in Russia, that of the chapel of the Iberian Virgin. Saint Basil's, with its variety of domes and strange colors, is one of the most famous churches in Russia. The cathedrals at Moscow, Kiev, Novgorod, and elsewhere, have an eastern aspect, because of their bulbous-shaped domes and barbaric details. Prof. Banister Fletcher writes: "In Greece and Russia the Byzantine style has been the accepted treatment of the Greek Church up to the present day. In Greece, the buildings are smaller, but not necessarily executed, as the church of Daphni, near Athens, the well-known cathedral at Athens, etc. Saint Sophia at Constantinople, built by order of Justinian A.D. 532-37, is a masterpiece of Byzantine architecture; the minarets were added many years later.

Spanish and Portuguese Cathedrals.—Spanish Gothic cathedrals of special interest or beauty are Burgos Cathedral, dating from 1220; Toledo, 1227; Tarragona, 1235; Barcelona, 1298; and Seville, 1403-1520, the last-mentioned being the largest medieval cathedral in any country. Its tower, called the Giralda (upper part rebuilt in 1395; the lower built in 1195) is not Gothic but Spanish Saracenic. Others are Zamora, 1181; Leon, 1250; Valencia, 1262; Oviedo, 1388; Pamplona, 1397; Gerona, 1312; Salamanca, 1510-60; Segovia, 1525, and Valladolid, 1585. Also Spanish Saracenic is the great Mosque at Cordova (A.D. 786), some portions of which were destroyed by Charles V and described by Russell Sturgis as an "interpolated Christian cathedral church in the very heart of the great prayer-hall of the mosque." In Portugal the cathedral at Coimbra is a fine example.

Flemish, Dutch, Scandinavian and Swiss.—In the Netherlands, the famous ecclesiastical buildings are the cathedral of Saint Gudule of Brussels; Saint Martin at Ypres, begun in 1254; the cathedral of Antwerp with six aisles; the cathedral of Liége; Saint Sanveur, Bruges, 13th and 14th centuries; Saint Bavon, Gent, made a cathedral in 1559; Tournai (11th and 12th centuries); Saint Rombout, Malines (Mechlin), with its huge spire; the cathedral of Bois-le-Duc (1419) in Holland, and that of Utrecht (1251). Norway, Sweden, Denmark and Switzerland have been forms or received guidance for the construction of their most important buildings from other countries. Thus, the Cathedral of Upsala was built from the designs of Etienne de Bonneval of Paris. Switzerland has Lausanne and Bern (1421).

American Ecclesiastical Architecture.—
In the United States some churches show independent architecture while others are influenced by foreign styles.

The cornerstone of Saint Patrick’s Cathedral, New York, was laid 15 Aug. 1858, exactly six centuries to the year, after the completion of Salisbury Cathedral, England, and about six centuries after the laying of the cornerstone of Saint Patrick’s Cathedral in Dublin. The original plans of its architect, Mr. James Renwick, were drawn in 1853. The ground on which it stands (Fifth and Madison avenues, 50th and 51st streets) was bought in 1852 by the trustees of the cathedral for $59,500. The building admirably and quite frankly perpetuates the decorated and geometric style of Gothic architecture which prevailed in Europe from 1275 to 1400, examples of which are the cathedrals of Rheims and Amiens and the naves of York Minster, Exeter, and Worcester. Its plan is a Latin cross. The exterior dimensions are: Extreme length (with lady chapel), 396 feet; extreme breadth, 174 feet; towers at base, 32 feet; height of towers, 330 feet. The interior dimensions are: length, 370 feet; breadth of nave, 90 feet; choir, 130 feet; length of transept, 140 feet; central aisle, 48 feet wide and 112 feet high; side aisles, 24 feet wide and 54 feet high; chapels, 18 feet wide, 14 feet high and 12 feet deep. Above the granite base-course, the exterior is entirely of white marble. The lady chapel, which was finished in 1906, is of 13th century French Gothic design, by Mr. Charles T. Mathews. Its length is 56½ feet, its width 28 feet and its height 56 feet. The cost of the building was about $4,000,000. The ceremony of dedication took place 25 May 1879, somewhat less than 21 years after the laying of the cornerstone. Between the lady chapel and Madison avenue stand the archbishop’s house and the presbytery.

The cathedral church of Saint John the Divine, situated on Morningside Heights, in New York city, was begun in 1882. It has been under active construction since 1901. The design of Heins and LaFarge was adopted and the consecration of the church occurred 19 April 1911. The material of the walls is Mehogane granite; wrought work of exterior, Frontenac stone and Mehogane granite; wrought work of interior, Frontenac stone; columns of ase, Pemboke granite; pinnacles in choir and chapels, Sienna Cipollino, serpentine, Alps green, Belgian black, yellow Numidian, red Numidian, Hauteville, Skyros, Briche violaces and Grueby tile. The rose red bases of walls and piers are jasper. The total projected length of the building is given as 520 feet; the total projected breadth, across transepts, 290 feet; total projected height, to crown of dome, 254 feet; total projected height, to top of spire, 425 feet. Both *The American Architect* (Vol. XCIX, p. 146) and Mr. LaFarge (in *Scriven’s*) lay special stress on the octagon of Ely Cathedral when tracing to its source the idea carried out in Saint John’s of the arrangement proper to the modern and Protestant Church in which the preaching is as important as the liturgy. In simplest terms, this is to be essentially a modern cathedral; not a mere copy of any ancient one or a reproduction of an ancient type; and it

börrows suggestions not alone from Ely but also from Spanish churches, perhaps particularly that of Toro.* The *Architectural Record* reminds us that “the winning design was described, at the time of the competition, as a domical church in a Gothic shell.” Up to 1916 somewhat less than $4,000,000 had been spent for the choir, with its ambulatory and chapels, the arches of the crossing and the crypt.

Saint Thomas’s Church, New York, was founded in 1823. In 1867 the present site was acquired (Fifth avenue at 53d street); three years later the *old* Saint Thomas’s was dedicated, and for a third of a century its tower was a noted landmark on the avenue; moreover, the church was beloved on account of its magnificent altar, with LaFarge’s decorations, and for its organ. That earlier building was destroyed by fire 8 Aug. 1905; a competition for architects’ designs was held; the design by Messrs. Cram, Goodhue & Ferguson was selected. Adequate size was achieved (the nave is 43 feet wide and the vault rises 90 feet above the pavement), despite the limited area available, by the successful solution of the problem in ecclesiastical architecture. The building-stone employed for the exterior is the oolithic limestone of Bowling Green, Ky.; for the interior, soft yellow sandstone from South Carrollton in the same State. Guastavino tile was used for the vault. The cost of the new Saint Thomas’s was approximately $1,000,000. The interior is simple, though restful rather than severe, as to its main lines and proportions.

Other beautiful, or historically interesting churches in New York are Trinity; Grace; and Saint Paul’s Chapel (Colonial period and single example of original church architecture of that period remaining in the city), etc. Among the American cathedrals and churches outside of New York city are the Roman Catholic Cathedral at Baltimore, which dates from 1800; that of Saint Peter and Saint Paul at Philadelphia, a domical Renaissance structure (height of dome, 210 feet); the Immaculate in 1891, and the Immaculate in 1872; Saint Joseph’s Church, and the Cathedrals at Hartford, Saint Louis, Providence, Boston, Albany, Buffalo and Rochester.

Montreal, Canada, is fortunate in the possession of the Catholic Cathedral of Saint James on Dominion Square; the large church of Notre Dame, built 1824; and the Anglican Christ Church Cathedral (Early English architecture).

Finally, looking southward to Mexico and other New World countries, attention should be called to the powerfully designed and executed cathedral at Puebla before mentioning the enormous jumbled mass of the cathedral in the City of Mexico, which has Italian Renaissance and Oriental domes and Churrigueresque façades. In Peru the most noteworthy ecclesiastical buildings are the cathedral and the church of the Compañía in Cuzco and the cathedrals in Arequipa and Lima. The Brazilian capital possesses, in its not quite appreciated cathedral, a building of rather impressive dignity. The wide façade of the church at Buenos Aires does not harmonize with the genius of a country that sends the roots of its power every year deeper into the soil.
CATHELINÉAU—CATHOLIC APOSTOLIC CHURCH

Author of 'Famous Cathedrals.'

CATHELINÉAU, ká-te-le-nə', Jacques, French Vendean general: b. Pin-en-Mauge, Anjou, 5 Jan. 1759; d. 11 July 1793. On the breaking out of the French Revolution he was living quietly with his family, when an unforeseen event suddenly called him forth from obscurity. In March 1793, during the levy of the conscription which the National Assembly had decreed, the youth of the district of Saint Florent rose in insurrection, and put the officials and gens d'armes to flight. They then returned home, and were awaiting the terrible revenge of the Republicans, when news of the outbreak reached Cathelinéau. He instantly determined to put himself at the head of his countrymen. Causing the alarm-bell to be rung in different places, he was soon followed by almost all the men capable of bearing arms, surprised several Republican posts, carried off their cannon and now mustered several thousand strong. As he did not deem himself equal to the post of commander, he placed himself under Bonchamp and Ébée, but as soon as the victory of Saumur, 9 June 1793, was formally invested as commander-in-chief. On this he resolved to make a decisive attack on Nantes, and appeared before it with 80,000 men, still further increased by the Charette brought from lower Poitou. Notwithstanding these vast numbers, and the greatest display of undisciplined galantry, the attack was repulsed, and Cathelinéau died shortly after of the severe wounds which he had received. For his piety he was called the "Saint of Anjou." Consult La Porte, 'La légende de Cathelinéau' (Paris 1893); Muret, 'Vie populaire de Cathelinéau' (Paris 1845).

CATHERINE. See Catharine.

CATHERINE'S SAINT, or SANTA CATHARINA, an island close to the coast of Brazil, between lat. 27° and 28° S., and belonging to the province of Santa Catharina (q.v.). It is 30 miles long and 10 broad, and contains Desterro, the state capital. The surface is mountainous.

CATHERET, any tubular organ used to insert into a mucous canal or hollow organ. Thus, there are nasal catheters for the nose, eustachian catheters for the eustachian tubes, and urinary catheters for the bladder. This latter is the more frequently used. Materials used in making urinary catheters are silver, glass, rubber, woven linen and gum elastic. A stylet is generally used for putting the less flexible catheters in place. Catheters used for male patients are about 10 inches with a curve of two inches at the extremity in metal instruments. For females, five is the proper length, the metal instruments curving a half-inch. Great care should be exercised in its use, that it be kept clean, to avoid cystitis (q.v.).

CATHEMETRER, in physics, an instrument for the exact measurement of small vertical distances. In its usual form it consists of a horizontal telescope, mounted so as to slide upon a fixed, graduated, upright support or post. The telescope is raised or lowered until its cross-hairs coincide with one of the objects, whose difference in height is to be determined, and the position of the telescope upon the vertical, graduated post is noted by means of a vernier or micrometer. The telescope is then brought to the elevation of the second object in the same way, and the difference in the two readings gives the desired difference in height. A cathometer that is well designed and constructed is an instrument capable of giving very precise results when in the hands of a skilful observer. It is greatly used in accurate barometry, for determining the height of the barometric column above the mercury in the cistern.

CATHODE, the negative pole of any given portion of an electric circuit, such as a battery, an electrolytic cell, vacuum tube, a motor, etc.

CATHODE RAYS. See Ether; Electron; Molecular Theory; Radiation, etc.

CATHOLIC APOSTOLIC CHURCH. A body of Christians founded by Rev. Edward Irving, in London, England, in 1835, hence often called "Irvingites." Irving was pastor of a Scotch Presbyterian Church, but, changing his views, was dismissed. He held that the gifts bestowed upon the Apostolic Church—words of wisdom and prophecy, powers of healing and miracles, discerning of spirits and speaking in divers tongues and interpretation thereof—they were not meant exclusively for the apostles and their immediate successors, but are given to all who have the living faith. For this reason he ceased to be pastor of the Presbyterian Church, but his followers developed his ideas and completed the organization of the Catholic Apostolic Church, which has four classes of ministers: Apostles (the chief of all), prophets, evangelists and pastors, each comprising 12 members, when complete these 48 presiding over the 12 tribes of the general church. Each congregation has its "Angel," or bishop, with 24 priests, six of each class of the ministry; there are also elders and deacons for temporal affairs, and a corps of sub-deacons, acolytes, singers and doorkeepers. The service is highly ritualistic, with "High" and "Low" celebrations, vestments, candles, incense, holy oils, etc. The Church accepts the Apostolic and Athanasian creeds, and expects soon the second coming of the Lord. The denomination was established in the United States before 1851.

The New Apostolic Church arose in Europe as the result of a difference of view as to the number of apostles which should be present. The original body limits it to 12; the new branch holds that a larger number may be
CATHOLIC BENEVOLENT LEGION — CATHOLIC CHURCH

created. The latter has in the United States 13 churches, 19 ministers and 2,020 members; the former, 11 churches, 14 ministers and 2,907 members. These figures are those of the census of 1906. Consult Life of Edward Irving (of which there are several) and E. Miller’s ‘History and Doctrines of Irvingism’ (London, Eng., 1878).

CATHOLIC BENEVOLENT LEGION, a fraternal society for Roman Catholic laymen, designed to afford to the members facilities for intellectual improvement, social advancement and such other advantages as are offered by similar non-Catholic fraternities. It was organized in 1881 and incorporated under the laws of the State of New York with 11 charter members. Thirty years later the Society had 17,000 active members, and had paid to widows and orphans of 8,000 deceased members the sum of $21,000,000. The organization is incorporated under the style of the Supreme Council, Catholic Benevolent Legion, and to the Supreme Council final appeal is made on all matters of importance emanating from State or subordinate councils. Male Roman Catholics who are personally acceptable, of sound bodily health, and between the ages of 18 and 55, are also eligible for membership. There is a relief fund on behalf of sick and distressed members, and a benefit fund, out of which a sum not exceeding $5,000 is paid to the beneficiaries of deceased members, and a sum not exceeding $2,500 to a member who is permanently disabled. A subordinate council of the Catholic Benevolent Legion may be formed in any congregation or parish; a charter is granted by the Supreme Council to a group of 15 or even of 7 eligible persons who associate themselves with a view to enter the fraternity. The organization has the express approval of the Pontiff and of all the archbishops and bishops in whose jurisdictions councils of the fraternity have been formed.

CATHOLIC CHURCH, a phrase signifying universal Church, the whole body of true believers in Christ; but the term is commonly used in connection with the Western Church. Like most other words used in ecclesiology, the term Catholic was borrowed at first from the New Testament. It occurs in some editions of the Greek original — including that issued in connection with the last revision — in the titles prefixed to the Epistles of James, 1 and 2 Peter, 1 John and Jude, and is the word translated “general” in the King James Bible. The first to apply it to the Church was the Apostolic Father Ignatius. When he and his successors used it they meant to indicate that the Church of which they constituted a part comprised the main body of believers, and was designed, as it was entitled, to be universal. In this sense the Church was opposed to the sects and separate bodies of heretics who had separated themselves from it and were now outside its pale. When, in the 9th century, the separation between the Eastern and Western churches took place, the latter retained as one of its appellations the term “Catholic,” the Eastern Church being contented with the word “Orthodox.” It was thus used by the Russian Church in their politico-ecclesiastical manifestos. When the Protestant churches separated from their communion with Rome in the 16th century, those whom they had left naturally regarded them as outside the Catholic pale. They, on the other hand, declined to admit that this was the case, and the term “Catholic Church” is used in the English Liturgy apparently in the sense of all persons making a Christian profession.

CATHOLIC CHURCH, Roman. By this name is designated the large body of Christians, united in doctrine and worship under the supreme jurisdiction of the Pope, the bishop of Rome. (See PAPACY). The members of this communion are wont rather to speak of it as the “Catholic Church,” but admit the term “Roman” in the sense that “to be Roman is to be Catholic and to be Catholic is to be Roman.” They hold that their Church alone possesses in its fullness the system of truths, laws and practices for the worship of God which was instituted by Jesus Christ (q.v.). Hence a brief statement of Catholic teaching on the origin, nature and properties of the Church of Christ will enable us to understand why the Roman Catholic Church demands that a man submit to her authority as a teacher, divinely appointed to make known with absolute certainty the conditions of salvation.

From the Four Gospels, considered as trustworthy historical documents, we learn that Jesus Christ was certainly a divine messenger to all mankind, and that therefore all men are bound to receive His message with implicit submission. The doctrine which He teaches may be an enforcement of truths which man might have learned, however imperfectly, by the use of his natural powers, or may include new truths which his natural powers would never have discovered. As Christ did not remain on earth to teach all men in person, He chose a band of apostles, whom He commissioned to preach to all nations the truths He had taught them, promising His assistance unto the end of the world, and imposing upon all men, under penalty of losing their souls, the obligation of receiving His doctrine. The presence of the Holy Spirit was to preserve the Apostles’ “Romans or V. C.” and keep them perfectly united in their teaching.

Besides the gift of infallibility (q.v.), He conferred on them jurisdiction over all believers, the right to govern with threefold power, legislative, judicial and executive. Moreover, they were to sanctify men by certain religious rites, called sacraments (q.v.), and for this purpose received the gift of Holy Orders (q.v.). To Peter (see SAINT PETER), one of the Twelve Apostles, was granted a primacy, merely by the will of jurisdiction. On him was Christ’s Church to be built; he was to feed the entire flock, the lambs and the sheep. By thus organizing a body to teach, govern and sanctify men under the primacy of Saint Peter, Christ founded a religious society, supernatural in its object and means, and He chose for it the special name, the Church. (See CHURCH, AN ORGANIZATION OF CHRISTIANS). This society was tolast even until the day of judgment; its duty was to teach all men; whereas the Apostles appointed their successors and transmitted to them the authority received from Christ. As the primacy of Saint Peter was the first foundation, necessary to ensure the unity and stability of the Church, it too was to
last forever. The power he received was for him and his successors. There never should come a time when the doctrine of Christ would be lost through corruption.

Where we gather that there exists to-day a religious society, empowered to teach with certainty all the truths of Christianity, and that it is a visible body, united in its government and religious teachings. The members of this society claim, in the profession of the faith, to its sacred ministry by the reception of baptism (q.v.) and to its ecclesiastical rule by obedience. If all men are obliged to enter this society, it is evident that Christ provided some signs, notes or marks by which His Church can become known to all earnest inquirers, by which it can be distinguished from other associations. Christ intended that His Church should be known by Unity. It was to be one in faith, one in government, one in worship, and one in the charity uniting all its members. It was to be known by Holiness. The Church is holy in its Founder; in its aim to lead men to God; in its means of sanctification, in the heroic virtue of its members, and the permanence of miracles among them. It was to be Catholic; that is, conspicuously diffused everywhere. Finally it was to be Apostolic. The governing and teaching body is the continuation of the Apostolic body to which Christ gave His mission and with which He promised to remain until the end of time. Whoever is not in communion with the successor of Saint Peter cannot possess union with the Apostolic body. The obligation of becoming a member of the Church is often expressed in these words: "Out of the Church there is no salvation." They do not mean that all who die out of the visible communion are lost. God does not inflict punishment but for a wilful fault, and those who without fault cannot see their obligation of joining the Church are not to blame. If, however, anyone, knowing this obligation, refuses to comply with it, he puts himself out of the way of salvation. The same holds true for those who neglect to examine properly into a matter of doctrine.

Catholics hold that the marks of the true Church of Christ are found only in the Church in which the bishop of Rome holds the primacy. The bishops of this Church all over the world are the successors of the apostles, possessing the right to teach, to rule, and to sanctify. The gift of infallibility, that is, the right to declare that certain doctrines have been revealed by God is not personal to each bishop, but belongs only to the whole body of bishops, whether gathered in a general council or not. The consent of the universal Church according to Christ's promise is a sure criterion of revelation. To the bishop of Rome as the successor of Saint Peter belongs the primacy of jurisdiction over the whole Church, complete, supreme, ordinary, and immediate over each and all the churches of the world, over each and all the bishops and the faithful.

In this primacy is included the supreme authority of the Church, the prerogative of papal infallibility. By virtue of a special supernatural assistance of the Holy Spirit promised to Saint Peter and his successors, the Pope cannot err when, as supreme teacher of the universal Church, he defines a doctrine concerning faith or morals to be held by the whole body of the faithful. Only when these four conditions are fulfilled is the Pope infallible: First, he must speak not in his private capacity, not merely in his official capacity, but as supreme teacher. Secondly, the matter defined must concern faith or morals. Thirdly, the judgment must be delivered with the manifest intention of commanding intellec-tual assent. Fourthly, the definition must be given to the whole body of the faithful. It is clear that infallibility has absolutely no connection with the Pope's personal qualities and is entirely distinct from impeccability, or incapability of sinning. The extent of papal infallibility is the same as that of the Church's infallibility. It embraces all the truths that God has revealed as the object of faith, and extends to other truths and matters of faith without assurance of which it would be impossible or very difficult to preserve the deposit of revealed truth.

It follows from what we have hitherto said that whoever wishes to know Christ's doctrine must appeal to the living authority. The Church as teacher, claims that the bishops non-in-union with the Pope cannot alone tell us what doctrines were revealed. This knowledge is not acquired from new revelations, but with the assistance of the Holy Ghost from various sources, chief among which is the preaching of the Gospel, by which the doctrines of Christ are handed down as a sacred heritage from age to age. Thus, even if nothing had ever been written, we should have to-day, in corrupt and infallible, the means of preserving religious truths which Christ established, namely Tradition. However, it was natural that those who were commissioned to teach should also set down their teaching in writing. Hence we possess many documents and monuments from which we learn what the Church taught in past ages and what it now teaches; the truths revealed remain unchanged. Moreover, we learn from the Church that God Himself provided, by means of men, certain writings, containing revealed truth, and gave them to the Church for the instruction and direction of the faithful (See Bible). From it alone we learn what books have been so inspired and constitute Holy Scripture; the Church alone can authoritatively interpret these writings. Tradition, therefore, is prior to the Christian scripts both in time and in thought. It is wider in its scope, for it embraces Scripture as an instrument by which tradition is handed down and on the other hand contains matters which are not in Scripture. First and principally, tradition teaches us the authoritative character of Scripture itself. Even were all the copies of Scripture destroyed, the living voice would still proclaim the entire Christian teaching. Catholics yield to none in their esteem of Holy Writ, as the inspired word of God, but they do so esteem it because of what they learn concerning it from tradition. The chief sources from which this tradition is learned are the acts of councils, the writings of the Popes, of the Fathers of the Church, the sacred books, documents, pictures, liturgies, rites and pious customs, in a word, every way in which the Church is wont to profess her faith.

The Chief Doctrines of the Catholic Faith.—Catholics believe in one, true, living
CATHOLIC CHURCH

God, the Creator and Lord of heaven and earth and of all things visible and invisible, all things eternal, immense and incomprehensible; infinite in will and intellect and in all perfection, who, being one, singular, absolutely simple and unchangeable spiritual substance is to be regarded as distinct really and in essence from the world, infinitely happy in and from Himself and unapproachably exalted above all things that exist or can be conceived.

He knows all things in the most perfect manner, by one all-embracing act of His intellect, from eternity to eternity ever the same. He knows His own being, all things that are possible, past, present and future, and all things that are not and never have been nor will be, but which would be if some condition were fulfilled. He is all-wise, all-holy, all-just, true, faithful and bountiful. Moreover, in God as there is one divine nature, so there are three divine persons, Father, Son and Holy Ghost, really distinct from one another, perfectly equal to one another. Nevertheless there are not three Gods, but one God. The Father is unbegotten, the Son begotten of the Father, and the Holy Ghost proceeds from the Father and the Son. (See TRINITY, DOCTRINE OF THE).

This one true God of His goodness and by His omnipotent power, not in order to increase His happiness, not to acquire perfection, but to manifest it by the good which He imparts to His creatures, in accordance with His absolutely free decree, at once from the beginning of time framed out of nothing as to the whole of their substance, two kinds of creatures, spiritual and material, the angels and the world, and then man, in whom spirit and matter were united. God preserves and governs by His providence all things that He has created.

To the angels He gave sanctifying grace and with it the power to merit eternal happiness by free service. Many of them rebelled and were cast into everlasting fire, the rest were confirmed in grace and admitted to the beatific vision of God. God formed the body of the first man out of the slime of the earth. He created his soul immediately, as He creates the soul of every man; the soul is a spirit, endowed with intellect and free-will and immortal. All men are descended from Adam (q.v.) and Eve. Life is subsisting in two natures, were also raised to a supernatural state by the infusion of sanctifying grace into their souls, being made adopted children of God, destined to the enjoyment of the beatific vision. This is the principle of supernatural life, whereby man can produce works that merit a heavenly reward. Moreover, God bestowed on man other preternatural gifts: great powers of mind and infused knowledge, complete control of the passions, immortality and exemption from suffering and decay. This original justice our first parents lost by mortal sin, that is, by a grievous, wilful violation of God’s law; in consequence of Adam’s sin all of his descendants were deprived of those privileges, are conceived in original sin and cannot of themselves enter the kingdom of heaven.

To atone adequately for the grievous insult to God and to repair the evil done to mankind, the second person of the Trinity became man. Jesus is true God and true man, one Divine Person, coeternal with two natures, divine and human, not by the conversion of Divinity into flesh, but by the assumption of humanity unto God. He was born of the Virgin Mary, who was truly the Mother of God and remained a Virgin in conceiving and bearing a Son and ever after till the end of her life. By singular privilege of God through the merits of Christ, the Redeemer, the Blessed Virgin was preserved free from original sin (q.v.), that is, in the first moment of her conception, when her soul was created, it was endowed with sanctifying grace. By further privilege she was never guilty of any actual sin, mortal or venial. See MARY; IMMACULATE CONCEPTION.

Christ, the God-man, became our Redeemer, not by the mere effect of His preaching and example, but by His bloody death on the cross. He made Himself our mediator with His Father, offering atonement for the sins of all men. This satisfaction is not applied to those who have use of reason without their free employment of the means ordained by Christ. He merited for us the remission of sins, sanctifying grace and all other graces conferred on man. After His death, He rose again on the third day (Is. 55:3) and ascended to the Father at the right hand of the Father, whence He shall come with glory to judge the living and the dead, and of His kingdom there shall be no end. He founded a Church and confided to it the task of teaching His doctrines and administering to men’s souls the means of sanctification. This Church is the guardian and interpreter of revelation; for though the existence of God can be known with certainty by the light of reason, it is by revelation that the Church teaches and reveals many natural truths as well as all those that regard our supernatural life. This revelation is contained both in written books and in unwritten traditions. The books of the Old and New Testament, held by the Church to be sacred and canonical, were written by the inspiration of the Holy Ghost and have God as their author. In matters of faith and morals the true meaning of Scripture is that which is maintained by the Church. All interpretations at variance with the unanimous consent of the Fathers, when they speak as witnesses of tradition, are false and forbidden.

Whatever is presented to us by the Church as revealed truth must be accepted by the free assent of the intellect, not because of its intrinsic truth seen by the light of reason, but on the authority of God who has given the revelation, and who can neither be deceived nor deceive. This divine revelation has been made credible by external proofs, especially by miracles and prophecies; yet as faith is a supernatural virtue, the act of faith requires the assistance of divine grace, enlightening the intellect and strengthening the will and making our act supernatural. Without faith there is no justification, but as God wishes all men to be saved, all receive, either proximately or remotely, the grace to believe. Among revealed truths some are mysteries that cannot be demonstrated by human reason, but must be believed. The demonstration of this one point does not contradict revelation, hence any assertions of human science that are at variance with what the Church teaches to be revealed must be false.

As grace is necessary for the beginnings of faith, and even for the pious affection toward believing, so it is needed to make our good
works deserving of a supernatural reward. Grace is needed even for the just to avoid sin. Final perseverance is a special privilege of dying in the state of grace. Apart from a special revelation, no one can know that he will receive the remission of punishes, but grace will be sufficient to help him resist the besetting sin. It is possible to resist less urgent temptations and perform acts that have natural goodness; hence all works done before justification are not sins. According to Catholic doctrine, actual grace is a real influence exerted by the Holy Ghost upon the soul, but it does not destroy the free-will of man. A grace may be fully sufficient for a supernaturally good act, but if a man refuse to act with it, the grace will not be efficacious. God will not save us without our co-operation. See Grace of God.

Actual graces aid us to obtain habitual or sanctifying grace, that is, to be justified by the remission of original sin or of grievous actual sin. This sanctifying grace makes us like unto Christ, holy and supernaturally pleasing to God, and brings with it the infused virtues and the gifts of the Holy Ghost (q.v.). There are many grades of habitual grace; it may be increased by good works, and on the other hand may be diminished by sin. Only by His mercy offers man supernatural happiness and makes this offer known by the preaching of His Church, which he accompanies by an interior stirring grace. When a man co-operates with this grace, he believes the truth with absolute certainty and is moved by the thought of God’s love; he sees reasons to fear God’s justice and throws himself on God’s mercy, trusting in the merits of Christ; hence he conceives a love of God and a detestation of sin. Thus by the working of grace and the co-operation of man’s free will, the way is prepared for justification; and, provided that man puts no obstacle, the Holy Ghost works this justification by infusing charity into his soul, thereby destroying sin. Thus purified, he enters on a virtuous life, hoping by the merits of Christ to enter heaven, but he has no absolute certainty of his salvation.

In the process of justification, the first grace conferring a habit of grace or a supernatural virtue is necessary, but the grace of justification is due to natural acts. With the aid of grace both sinners and just can merit further actual grace, but only congenitally and not with any strict right in justice. The just, that is, those in a state of grace, can merit final perseverance concomitantly, and, because of God’s promises, can merit in justice the increase of habitual grace, eternal life and increase of glory. By mortal sin, all merit is lost. As a means of justification Christ has entrusted to His Church seven Sacraments (q.v.), or sensible rites, instituted by Him to effect in the soul the grace which they signify. When the necessary conditions are placed, the Sacrament works by its own efficacy and not through the place of the minister nor of the recipient. The Sacraments are Baptism, Confirmation, Holy Eucharist, Penance, Extreme Unction, Holy Orders and Matrimony. Baptism and Penance remit sin; the others cannot lawfully be applied to mortal sin. Baptism, Confirmation and Holy Orders can be received only once, because they imprint on the soul an ineffaceable mark, called the sacramental character. All the Sacraments, if properly received, give sanctifying grace or increase it, if already in the soul. Since the promulgation of the Gospel, justification cannot be obtained without Baptism of water, which blots out original sin and all actual sin. Infants who die without Baptism cannot enjoy the supernatural vision of God. In adults, when Baptism of water cannot be received, pardon of sin can be obtained by the baptism of desire, which consists in a perfect love of God and a sorrow for sin, including, at least implicitly, the desire of the Sacrament. Remission of sin is also granted to all who suffer martyrdom for Christ. Sins committed after Baptism are remitted by the Sacrament of Penance (q.v.), in which the sinner confesses with contrition all his mortal sins to the duly authorized priests of the Church, from whom he receives absolution. Sins are also remitted by perfect contrition, but the obligation of Divine Law requires that even then, if possible, they must be confessed. Penance pardons the guilt of sins confessed and repented of, infuses or increases sanctifying grace, remits eternal punishment, if it was due, secures actual graces to avoid sin in future, and may also remit, wholly or in part, the temporal punishment still to be undergone for sins the guilt of which has been pardoned. The whole punishment is not always remitted with the fault; for the remaining debt satisfaction is made to God by sufferings patiently borne or voluntarily inflicted. For this purpose also the Church has the power of granting indulgences which are not a remission of sin, much less a permission to commit sin, but the remission of the whole or part of the temporal punishment which may be due for sins, after the guilt has been pardoned. See Indulgence.

In the Holy Eucharist there is really and substantially present the Body and Blood, Soul and Divinity of our Lord Jesus Christ, under the appearances of bread and wine. By the words of the priest at the consecration, there is effected a conversion of the whole substance of the bread into the Body and of the whole substance of the wine into the Blood, which conversion is called transubstantiation (q.v.). By force of the words, the Body is under the species of bread and the Blood under the species of the wine, but in virtue of the natural connection and comcontitance by which the parts of Christ are linked together, He exists whole and entire under each species and every part of the species. In the Mass (q.v.) there is offered to God a true, proper and propitiatory sacrifice for the living and the dead. To offer up this sacrifice, Christ instituted a visible and external priesthood and the Sacrament of Holy Orders (q.v.); the minister of this Sacrament must be a bishop, who has received the fullness of the sacred ministry. The various orders constitute the Hierarchy. Priests cannot ordain or confirm. Other orders are the diaconate, subdiaconate and the minor orders (Acolyte, Exorcist, Lecturer and Ushers). Before the minor orders, the tonsure is conferred as a sign of enrolment among the clergy, who are separated from the rest of the faithful, called the laity. The right to exercise the sacred functions within appointed limits is called jurisdiction; it only includes the lawful performance of all functions and for the validity of some. The Roman pontiffs have, by Divine institution, universal jurisdiction. The other bishops have power to govern the
dioceses to which they have been assigned by the Pope.

Marriage between Christians was raised by Christ to the dignity of a sacrament. Its essence lies in the contract freely made between man and wife; the grace conferred is first an increase of sanctity, and, secondly, actual grace to fulfill the duties of the married state. The bond of Christian marriage after consummation is absolutely indissoluble; it is also exclusive, no man can have several wives, no woman several husbands, at the same time. Those who, with the aid of God's grace, fulfill the obligations of virginity or celibacy live in a state more holy and better than the state of matrimony. From the fact that Christian matrimony is a Sacrament, it follows that it has been entrusted to the Church and is subject to the laws of the Church, not to those of the State; hence the Church has the power of assigning conditions to the validity or lawfulness of the contract between those who have been baptized. See Marriage.

The means of sanctification are given to men to enable them to live and die in the state of grace. In the hour of death a soul is judged by Christ, and if in mortal sin, is condemned to hell to be punished by eternal torments, varying in intensity according to the degree of guilt. Those who die free from all sin, mortal and venial, and from all the temporal punishment for sin, are admitted at once to life everlasting, to perfect beatitude in the vision of God. The saints and angels in heaven offer up prayers for men, and it is good and useful to invoke their intercession that we may obtain favors from God through Jesus Christ, who is our sole Redeemer and Saviour. Catholics honor and worship the saints and angels, and especially the Blessed Virgin Mary, because God loves and honors them, and because of their own personal sanctity; not, however, with the supreme worship that belongs only to God. Because of their special connection with holy persons, honor is also given to relics of the saints, to images and paintings of Christ and His saints. If men die in venial sin, or temporal punishment be still due, their souls are detained in purgatory (q.v.) until expiation is made. In this state they can no longer merit for themselves, but can be assisted by the prayers and good works of the faithful and particularly by the holy sacrifice of the Mass. The Church has the power to apply indulgences for their relief. In addition to the particular judgment, immediately after death, there will be a general judgment at the end of the world. The body will rise from the grave reunited to the soul, will receive either happiness in heaven or punishment in hell.

The chief duties of Christian life are expressed in the Ten Commandments of God and the commandments of the Church. Many laws have been imposed by the Church on particular classes or for special purposes; all Catholics, however, are bound, under pain of mortal sin, to hear Mass and rest from servile work on Sundays and Holydays of obligation, to fast and to abstain from certain food on the days of mortification, to confess mortal sins at least once a year and to receive the Holy Eucharist during the Easter time.

A Catholic must believe all the truths God has revealed and teaches through His Church. Denial of one such would mean either the denial of God's veracity or of the Church's infallibility. But it is not necessary that he should know explicitly more than the principal truths; all the dogmas of the Church as a divine teacher, alone capable of declaring what truths are contained in the deposit of faith handed down from the apostles. The definition of a dogma by the Church brings no change in the law of faith; it is the law of faith as of faith is ever given up nor can any point be added which was not contained, at least implicitly, in the original teaching. However, the Church's infallibility is not limited merely to revealed doctrines; she can also speak infallibly on matters necessary to safeguard revealed teaching. Belief in such decisions is called ecclesiastical faith. Outside the domain of divine or ecclesiastical faith, there are many subjects of pious belief among Catholics. Some of these are held to be favored by the Holy See, others are recommended to the observance of the faithful as of faith, but they are not yet authoritatively proposed. Others depend on human testimony, and are accepted with that degree of certitude which the testimony warrants.

In the field of teaching truths and in the defense of faith from the charge of conflict with demonstrated truths of science and philosophy, the Church makes use of terms derived from the philosophy current among its subjects. Thus it has come about that the dogmas are expressed in the terms of scholastic philosophy and officially in the Latin language. As its doctrines can be taught in any language, so, too, the expression of them may be harmonized with whatever is found to be true in any system of philosophy.

In the worship, liturgies, discipline and practices of the Church, some regulations may be of divine origin, others are of ecclesiastical origin, and still others arise from the voluntary piety of individuals. Besides the ordinary obligations of Christian life, she invites those of her children who feel the call from God to bind themselves by vow to His service. The principal vows are those taken to observe the evangelical counsels of poverty, chastity and obedience, or their equivalent, and to remain in approved congregations or religious orders are called religious. (See Orders, Religious.) As a matter of discipline all those in Sacred Orders in the Latin portion of the Church are bound to observe celibacy. In the Greek portion, to-day, no priest can marry, but married men may receive Holy Orders, except episcopal consecration.

External Organization of the Church.—Supreme jurisdiction, as we have seen, resides in the Pope; the bishops are the rulers of dioceses, which are subdivided into parishes or missions under a parish priest or rector, assisted by curates. The dioceses are united into provinces, over each of which is an archbishop or metropolitan, the other bishops being called his suffragans. The archbishop convokes provincial synods, hears certain appeals from the episcopal court, watches over the observance of ecclesiastical law in some particulars, and, under certain circumstances, appoints an administrator of mortal sins at least once a year. The archiepiscopal See is to-day only an honorary rank. The Pope is represented in some countries by apostolic delegates, to whom are referred appeals from the lower courts and through whom the
Pope sends his communications. In some countries there are apostolic nuncios, who deal directly with the various governments that have their representatives at Rome.

The Pope is assisted immediately by the Sacred College of Cardinals and by the Sacred Congregations. The College of Cardinals, when complete, contains 70 members: 6 Cardinal Bishops of the Suburban Sees, 50 Cardinal Priests and 14 Cardinal Deacons. The Sacred Congregations, 21 in number, are committees of Cardinals to whom special affairs are entrusted. They were arranged, almost as at present, by Pope Sixtus V. The Cardinals alone cast votes for the final decisions, but they are assisted by secretaries and consultors. The Pope himself acts as prefect of some congregations (the Inquisition, the Apostolic Visitation and the Consistorial). A Cardinal presides over each of the others. The acts of all congregations are submitted to the Pope for his approval. These acts, when promulgated in a solemn manner as the acts of the Sovereign Pontiff himself, are subject to change; though not infallible, they must be received by the faithful with an internal assent, such as is due to religious authority and obeyed as laws of the Church. The instant congregations are: the Holy Roman Inquisition (the supreme tribunal to judge of heresy and crimes allied with heresy), the Consistorial (which selects the matters that are presented and sanctioned by the College of Cardinals assembled in the Papal Consistories), the Apostolic Visitations, Bishops and Regulars, and Council of De Propaganda Fide (which cares for missionary countries), Sacred Rites, the Index (which prohibits the reading of books condemned as contrary to faith or good morals), Indulgences and Relics, and the congregation of Studies.

The Church and Civil Authority.—The Church was established by Christ as a perfect, independent religious society. Its authority depends on God's ordinances alone; wherefore it has always denied any right on the part of the state to interfere in its internal affairs. In Catholic countries, the Church claims immunity for its officials from the authority of civil rulers. This immunity is often absolutely necessary for their just protection. Sometimes the Pope makes a Concordat with temporal rulers; that is, a treaty whereby, in consideration of certain promises of these rulers, the Pope abstains from urging certain of his rights. To exercise the prerogatives which we have described, the Pope, his Cardinals and other officials must be exempt from the jurisdiction of any civil tribunals. Practically this cannot be secured without the Temporal Power (q.v.).

Moreover, the Temporal Independence of the Sovereign Pontiff. It is not enough for the Pope to be free, he must be known to be free; suspicion of being under the influence of a sovereign would be fatal to his influence. This independence has possessed for more than 15 centuries; it was assured by the recognition of his sovereign authority in the states of the Church. Since the usurpation of these states by the Italian government, the Popes, Pius IX, Leo XIII and Pius X, have not been treated as civilized communities would treat a nation which possessed the freedom, security and independence demanded by his dignity, his rights and for the proper exercise of his authority; and (3) that the Holy See must insist on these facts and look forward to some efficient remedy for the injustice and indignity of present conditions. To deal rightly with Catholics of all nations, the Pope must be extra-national. As the seat of our general government, the District of Columbia, is independent of all the States, so the seat of the general government of the Church should be independent of all the countries of the earlier, and the present age.

History.—The history of the Roman Catholic Church may be divided into three great epochs: (1) Christian Antiquity, embracing the first seven centuries, during which Christian civilization was chiefly Greek and Roman. (2) The Middle Ages, from the 8th century to the 16th, characterized by the Church's action among the various peoples of north and central Europe, who were molded into organized nations by her influence. (3) The Modern Age, from the rise of Prot. Hilary, Ambrose, one day, during which the Germanic nations separated from the Church and attached themselves to various sects, and the Church has had to struggle against the modern, infidel spirit in science and government.

The first epoch contains two periods. First comes an era of persecution, during the struggle with paganism, which was terminated by the edict of Milan (313); then, an era of development in definitions of dogma against the attacks of heresy. The second epoch embraces four periods: I. The conversion of the barbarians. II. The development of the Western Empire and the Church's struggle to maintain her independence (800-1073). III. The supremacy of the Church maintained (1073-1300). IV. Attacks on the Church's supremacy, from Boniface VIII to Protestantism.

During the third epoch three periods may be distinguished: I. The period of religious warfare, ending with the Peace of Westphalia, 1648. II. From 1648 to the French Revolution, the era of established Churches. III. Dawn to the present day: Neo-paganism in science and life, the age of unrestrained freedom to accept or deny the truths of religion.

Even while the Church was undergoing cruel persecution, she was also developing her discipline and defending her doctrines against the pagans and heretics. From the first three centuries have come down to us the valuable works of Ignatius, Polycarp, Justin, Clement of Alexandria, Tertullian, Origen and many others. The mightier struggle with heresy, and her marvelous growth after she emerged from the catacombs, gave renown to Athanasius, Basil, the Gregories in the East and West, Chrysostom, the Cyrillics, Hilary, Ambrose, Jerome, Augustine, Leo and a host of other Christian writers, of whose works the modern world knows very little. The growth of monasticism is one of the glories of this age. Monks and nuns consecrated their lives to God's service by prayer and industry, thus preserving the ancient civilization from utter destruction by the barbarians, and preparing for the Church the means of converting these barbarians and transforming them into the Christian nations. The union which existed between Church and State gave rise to the Holy Roman Empire (q.v.) and to the great body of laws by which their
mutual relations were regulated. Frequent attempts were made later to subject the Church to the Empire. They were frustrated by the Popes, and especially by Gregory VII, after which comes the glorious period of vigorous life and eminent learning. Among the orders that were then founded we may mention the Carthusians, Cistercians, Franciscans, Dominicans and Servites, fruitful in numerous saints and scholars. The Church boasts of Saint Anselm, Peter Lombard, Robertus Magnus, Saint Thomas Aquinas, Saint Bonaventure, Duns Scotus, Saint Bernard and others. It was also the age of Crusades (q.v.) for the recovery of Palestine. The 14th and 15th centuries are noted for the revival of interest in pagan literature, the sad exile of the Popes at Avignon and frequent movements to effect a much-needed reformation of morals. In this work, many rejected the divine authority of the Church and were cast as heretics; they are generally regarded as forerunners of Martin Luther (q.v.), who succeeded in separating whole sections of Germany from the Church, and became the occasion for the counter reformation that was effected by men like Francis de Sales, Ignatius Loyola and Peter Canisius during the 16th century, and especially by the great work of the Council of Trent (1545-63). In this same period, millions of pagans were brought into the Church by the heroic labors of her missionaries, notably in South America, India, Ethiopia and Japan. England, under Henry VIII and Elizabeth, renounced the supremacy of the Pope, made a state religion of its own, and by the penal laws almost annihilated the Catholics. France remained Catholic, but, becoming infected with Jansenism and Gallicanism (q.v.), and later with atheism and socialism, brought about the utter disorganization of Continental society. In the reconstitution of the shattered nations, Napoleon (q.v.) thought to make the Papacy his tool, and thus ruin the Church; but he failed, and the 19th century witnessed the gradual revival of the Church in almost all European countries, and its stupendous growth in the United States and other English-speaking countries. Catholic emancipation in England (1829), the Tractarian movement (see TRACTARIANISM) in the Established Church, that resulted in so many converts to Rome, and the restoration of the Catholic hierarchy (1850), have given Catholics prominence in English life. In France, though the people are loyally Catholic, the government is engaged in controversy with the Church and in the attempt to control Catholic education. When the French garrison was withdrawn from Rome in 1870, the Papal states were abolished and the city of Rome was annexed and added to the Italian kingdom. For the past 34 years the Pope has never left the Vatican Palace. Shorn of their earthly kingdom, Pope Pius IX (q.v.) and Leo XIII (q.v.) witnessed the attempt of Bismarck (q.v.) in Germany, to subject the Catholic Church to the state; but they witnessed also the failure of the attempt and the repeal of almost all the iniquitous laws. Persecution served only to unite all Catholics and revealed to them the power of united action. In continental United States the Church has grown from 244,500 in 1820 to 17,416,303 in 1918. This great increase has been due mainly to immigration from Europe and Canada. Irish, Germans, French Canadians, Italians, Poles and Bohemians have come in large numbers. Meeting with no official opposition, the Church has prospered and is regarded even by many non-Catholics as a strong power for the preservation of the republic from the new social dangers that threaten the United States as well as the whole civilized world.

The activity of the Church in the mission field was almost destroyed by the wholesale massacres of the French Revolution. As soon as order had been established in Europe, the missions revived, and, especially since Gregory XVI, have spread to every land of the world. Dioceses are mapped out and bishops appointed as soon as the circumstances warrant. The reorganization of the Congregation De Propaganda Fide by Pius IX, with separate sections for the Latin and the Oriental Churches, has been of great advantage. College, institutes and special religious congregations have been founded in various cities of Europe for work in the foreign missions. The Association for the Propagation of the Faith is the largest of the societies among the laity for the collection of funds. Missions are also conducted with success in the Oriental Churches in communion with the Holy See. These Churches hold the same doctrines as the Latin Church, but have special rites, discipline and liturgical language. There are four chief groups: I. The Greek, subdivided into Greek proper, Melchite, Slav (which is Ruthenian and Bulgarian) and Russian. II. The Syrian, subdivided into Syrian proper, Syro-Chaldean (which also included the Malabar) and Maronite. III. The Coptic, which is Egyptian and Abyssinian or Ethiopian. IV. The Armenian. Pope Leo XIII was much interested in these eastern churches, and had the joy of receiving many converts into communion. For bibliography see article CATHOLIC CHURCH IN THE UNITED STATES.

JOHN J. WYNNE, S.J.

CATHOLIC CHURCH, Roman. Recent Growth and Statistics.—To-day the Catholic Church contains within its fold 294,583,000 souls, or about 48 per cent of the entire Christian population of the globe. It is found in all continents and among all nations but is strongest in southern countries and among the Latin and Celtic races in Italy, Spain, France, Austria, Ireland and South America. Its history during the 19th century discloses the remarkable fact that while it lost somewhat on its own ground, especially in France and Italy, these losses have been more than offset by the gains throughout the English-speaking world, especially in the United Kingdom, the United States and Australasia. In England the conversion of Newman, Manning and others was the beginning of a movement which brought and still brings thousands into the Catholic Church.

Pope Pius IX took official cognizance of the movement by re-establishing the Roman Catholic hierarchy in England in 1850. The growth of the Church in Holland led to a similar re-establishment of the hierarchy there in 1853. The Irish emigration to Scotland after 1847 led to a great increase in the number of Catholics in that country, where the Oxford movement also exerted considerable influence.
and in 1878, Leo XIII re-established the Catholic hierarchy there. Great and numerous, however, as were the gains in the Old World, they were greatly overshadowed by the vast growth and spread of the Church in the New and in the British dominions overseas. The Irish famine of 1846-47 caused thousands of Catholics from that country to migrate to the British colonies and to the United States and to these emigrants and their descendants are to be ascribed the flourishing condition of the Church to-day in Australia, New Zealand, Canada, South Africa, and the United States. The Church, in addition to the Irish immigrant, was reinforced also by immigration from Catholic Poland, and the Kulturkampf of the seventies in Germany caused great numbers of German Catholics to seek religious freedom in the Great Republic of the West. In later years Moravians, Copts, Ruthenians and Greeks have been added in ever increasing number to the Catholic forces in the United States. In Canada, the growth of the French-Canadian population, Irish immigration and the settlement of great numbers of the Catholic Gaels of Scotland have placed the Church of the Dominion in a flourishing condition. In Latin-America, the losses incurred during the breaking up of Spain's colonial empire and the establishment of new autonomies have been repaired. The Church is well organized in these countries and while it labors under annoying restrictions in some of the republics, it is in the main at liberty to proceed in its work of evangelization. Millions of aborigines have come within its fold and as of old its missionaries still labor on the outskirts of civilization.

We are thus face to face everywhere in the modern world with an organization stretching in unbroken succession back to the palmy days of heathen Rome; an organization which has outlived all the governments and dynasties of Europe, and is likely to see the end of the national groups as at present constituted. Its losses in the Old World and in the New; its vitality and energy are evidently unimpaired; in general culture and intelligence it is the equal, while in eloquency and reform work in our complex modern social life it surpasses, the Church over all other institutions, has a rich and remarkable history and still exercises a greater power over the masses of the people than any other body of Christians. The 294,583,000 Roman Catholics in the world are distributed as follows: Europe, 183,760,000; Asia, 5,500,000; Africa, 2,500,000; North America, 50,000,000; South America, 44,623,000; Oceania, 8,200,000. The estimated number in the chief countries of Europe in 1918 was: Austria, 26,000,000; Hungary, 13,000,000; Belgium, 7,000,000; Denmark, 2,921; France, 35,000,000; United Kingdom, 6,000,000; Greece, 35,000; Sweden, 2,237; Italy, 32,983,664; Netherlands, 2,053,021; Norway, 2,946; Portugal, 5,597,985; Russia, 11,467,994; Switzerland, 1,563,538; Spain, 20,928,986; Germany, 24,000,000. In Egypt are 706,000 Copts who are in union with the See of Rome.

In 1918 there were 24,922,062 Catholics under the United States flag. Of these, 17,416,303 were in the United States proper, 7,285,458 in the Canal Zone, Guam, American Samoa, Hawaii, Porto Rico and the Virgin Islands. There were 19,572 Catholic clergymen in the United States, of whom 14,318 were secular clergy and 5,254 were members of religious orders. There were 10,058 Catholic churches with resident priests, 5,105 mission churches, 85 seminaries with 6,201 students preparing for the priesthood, 112 homes for the aged, 210 colleges for boys, 685 academies for girls and 5,588 parochial schools. In the parochial schools were enrolled 1,497,949 children. The Catholic orphan asylums number 283, with 48,069 orphans. See CHRISTIAN CHURCH, DIVISIONS AND STATISTICS OF THE.

Editorial Staff of The Americana.

CATHOLIC CHURCH, Social Service in the. Definition.—Etymologically, the phrase social service comprises all activities for the benefit of social groups. In modern usage, however, it is restricted to works on behalf of the more needy and weaker sections of the population, and to benefits that are mainly physical, although it does include certain intellectual and moral kinds of activity. The present article will present the social service of the Catholic Church under the heads of charity and social reform.

Doctrinal Viewpoint.—A few words concerning the doctrinal attitude of the Church toward social service will help us to understand her practice. In the first place, the Church does not conceive her mission as primarily that of reforming society or improving the temporal condition of the individual. Her main and specific concern is with the individual's spiritual welfare. In old-fashioned terms, her function is to save souls by inducing men to avoid sin and live virtuous lives. In her eyes the temporal condition of the individual, whether it be of riches or poverty, of sickness or of health, of freedom or of bondage, is in itself comparatively unimportant. Even less is she concerned with the forms of social organization, with economics, or with politics. She knows that men have sinned against God faithfully and saved their souls in every kind of individual and social condition, and she holds that no temporal condition has value or importance except in so far as it conduces to union with God in this life and in the life to come.

This attitude is based on the words of Christ and on the Christian tradition. Throughout the Gospels the Founder of Christianity lays supreme emphasis upon the life of the spirit and the transcendent value of eternity. He neither attempted to found nor directed His followers to found a new social system. So little value did he attach to temporal goods that He counseled the seekers after perfection to give up their material possessions. "Seek ye first the Kingdom of God and His justice." "What doth it profit a man if he gain the whole world and suffer the loss of his soul?" If thou wiltst be perfect, go, sell what thou hast and follow me." All through her history the Church has maintained this same attitude and held to this comparative estimate of temporal and eternal values.

Nevertheless, the Church has always held that social service is among her ordinary functions. While maintaining that corporal works of mercy are not inept, since they may be more than they are the main business of the individual, she never allows either himself or
her children to forget that charitable assistance is frequently necessary to enable the individual to live righteously. In other words, the Church values social service not as an end but as a means. Since men cannot serve God and prepare themselves for eternity without a certain amount of physical, intellectual and moral goods, she does all that is within her power to assist them in these respects. It is in this sense that she interprets the second of the two Great Commandments, that of loving the neighbor as the self, as well as all the other injunctions of Christ concerning charity toward our fellow-men. These commands she imposes upon all her children and strives unceasingly to fulfill herself. And she believes that when social service is performed in this spirit, and from this motive, it will be more extensive and more efficacious than when it is undertaken on grounds of mere humanitarianism. She believes that the most effective basis of social service is to be found in the eternal values of God and the soul.

Charitable Activities.—The superiority of social service conceived as active love of the neighbor for the sake of God is clearly manifested by the popular charity in the Church. In the words of the rationalist writer Leopold von Ranke, "Christianity for the first time made charity a rudimentary virtue, giving it a leading place in the moral type, and in the exhortation of its teachers." ("History of European Morals," II, 9.) Some of the principal effects of this conception upon society may be summarized as follows:

In the most civilized countries of the ancient world the prevailing theory of social relations was that expressed by the Roman poet Lucan, "paucis vivit humanum genus" ("the human race lives for the few"). A very small minority possessed all wealth and power in society, and the great mass lived in misery. The individual as such was not accorded rights, dignity or sacredness; a large proportion of the population were slaves, whose sufferings make the condition of the negro slaves of the United States look like paradise; the lot of the great mass of the free persons was little better socially and economically than that of the slave population; and if the hunger of the poor was sometimes relieved by public gifts of corn, the motive was not pity nor brotherly love, but the fear of revolution. Within a few centuries the Christian teaching that all men are persons and therefore essentially equal, that all are brothers in Christ with the same eternal destiny, and that the possessors of superfluous goods are morally bound to distribute them among the needy,—led to the mitigation and substantial abolition of slavery in Christian countries, to the recognition of labor as something honorable instead of degrading, and to a marvelous variety of organizations and works for the relief of distress.

From the beginning the care of the poor was accepted as one of the primary duties of the Church. Every parish had a special organization and special funds for the discharge of this function. The possessions of the Church were called "the patrimony of the poor," and one of the four divisions of its revenues was definitely set aside for poor relief. In the second half of the Middle Ages the chief dispensers of all kinds of charity were the monasteries. Indeed, the main reproach brought against the social service of these institutions is that they were too generous. Certain religious communities owe their foundation to the desire to relieve certain special forms of distress. Thus the Brotherhood of the Holy Spirit, the Knights of Saint John and the Hospitals devoted their energies to the erection and care of hospitals, and the order of Saint Lazarus provided houses for the care of lepers. The Alexian Brothers were mainly concerned with the burial of the dead. The Trinitarians ransomed thousands upon thousands of captives. The Fratres Pontifices built roads and bridges, and in other ways strove to make traveling safe. The Franciscans preached and practiced a wholesome poverty and induced the rich to share their goods with the distressed. One of the most important functions of the craft and merchant guilds was to make adequate provision for the insurance and relief of their needy members.

The extent to which this care was carried may be judged from the fact that as early as the 6th century there was one in almost every city of the Roman empire; that the hospital of the Holy Spirit, founded by Pope Innocent III at the beginning of the 13th century, accommodated 1,500 patients; that in the later Middle Ages there was hardly an important town in Germany that did not have one or more of these institutions, while there were 20,000 of them in France. And it must be remembered that the medieval hospitals were not merely places for the treatment of the sick, but for the refuge and care of the homeless poor, the aged and orphans and widows.

One of the chief duties of the bishops has always been the care of orphans. They were provided for either in separate institutions or in connection with hospitals and monasteries. Owing in great measure to the zeal of Saint Vincent de Paul, orphanages became so general that 300 of them were to be found in France on the eve of the Revolution.

In the latter Middle Ages institutions known as "montes pietatis" were established by the thousand under the direction of the Church in Italy, France, Belgium and Germany. Their object was usually the loan of money at a low rate of interest, with other charge except for the cost of administration. In an age when borrowers were largely at the mercy of rapacious usurers, this was not the least important performance of social service.

The charitable activity and efficiency of the Church in the period of its greatest influence may be fairly summarized in the words of Prof. S. N. Patten: "It provided food and shelter for the workers, charity for the unfortunate, and relief from hospital illness and famine, which were but too common in the Middle Ages. When we note the number of the hospitals and infirmaries, the bounties of the monks, and the self-sacrifice of the nuns, we cannot doubt that the unfortunate of that time were at least as well provided for as they are at the present." ("The Development of English Thought," pp. 90, 91).

At the present time the relief of physical distress outside of institutions is carried on mainly by the parish churches and by charitable societies. In every Catholic city will be found a box near the entrance into which the faithful are requested to drop
their offerings for the poor. This money and all other funds that come into the hands of the pastor for the same purpose are administered for the benefit of the needy by him individually or through volunteer committees and associations. Through this method it is easily possible to reach every case of distress. While the number of such cases is somewhat too great for the available resources, the parish organization of relief is in itself admirably adapted to perform its task comprehensively and in detail.

Among the Catholic associations devoted to the relief of the poor, first in importance is the Society of Saint Vincent de Paul. Founded in Paris in 1833 by Frederic Ozanam and seven companions, it has extended throughout Europe and North and South America, and has branches in many parts of Asia, Africa and Australasia. Its main features are the personal activity of its members among the needy, the emphasis that it places upon improving the moral and religious as well as the material condition of those who are assisted, and the exceptionally small cost of administering physical relief. In proportion to its members and resources, it is one of the most efficient and economical social societies in existence. The Elizabethan associations of Germany are composed entirely of women. They have some 550 branches or conferences and give assistance to between 10,000 and 12,000 families annually. In one diocese of Germany, Cologne, there are 162 charitable societies with 3,000 members. A federation of all the Catholic charitable societies of Germany was organized in 1897 with a central bureau in Freiburg. It holds conferences, makes investigations, issues publications and co-operates with many non-Catholic and secular charitable movements. France has more than 4,000 Catholic charitable societies. In the United States the Queen's Daughters Society has branches in many States and cities, and a local women's charitable organization exists in probably the majority of urban parishes. Frequently the latter are federated into a league or guild which represents the entire city. In 1910 the National Catholic Guild of Charities was organized and held its first sessions in Washington. It meets biennially. At the meeting in September 1916, 500 delegates were registered, representing 78 cities and 28 States. The papers read at these meetings are generally of a high order, and evince a sustained endeavor to know and utilize all that is best in modern methods of charity.

A few brief indications will here be set down of the charitable work of the Church in institutions. Nothing like a complete account is attempted; only a statement of types. For the care and treatment of sick and defective there exists a great variety of hospitals and homes. The United States alone has more than 400 general hospitals under Catholic direction, whose patients in 1916 exceeded half a million, 5 institutions for the blind, 13 for deaf-mutes and 3 for feeble-minded persons. The principal institutions for the care of wayward and delinquent girls are conducted by the Sisters of the Good Shepherd, who have more than 250 establishments throughout the United States. Reformatorys for boys are managed by the diocesan clergy and by religious communities. As examples of these may be mentioned the Catholic Protectory of New York (1,500 inmates), Saint Mary's Industrial School of Baltimore (1,500 inmates) and Saint Mary's Training School of Chicago. Institutions for the helpless, such as orphanages, infirmaries, hospitals, nursing homes and homes for aged persons are found in the majority of dioceses. In 1916 the Catholic Church in the United States had 293 orphan asylums with more than 45,000 inmates, 106 homes for the aged, some 35 infant asylums and 30 homes for destitute young persons. In recent years the movement for the establishment of day nurseries, homes for workingmen and workingwomen and social settlements has been considerably accelerated among the Catholics of this country. Education, secular; religious and moral, is an important accompaniment of the physical care given in all Catholic institutions for young people.

Social Reform.—The modern Catholic movement for social and industrial reform originated with Baron Von Ketteler, bishop of Mainz from 1850 until his death in 1877. His first important work in this field consisted of six sermons, delivered in the cathedral of Mainz in 1848 on the Catholic doctrine of property and the duty of the Church to the poor society in existence. Aside from the thesis that the sociology of Saint Thomas Aquinas was sufficient to meet every social need of the 19th century, the most striking element of these discourses was the proposition that social questions were more important than political questions. Although we of to-day recognize this statement as a truism it had a strange sound in that year of political revolutions, 1848. "If we wish to know our age," said the speaker, "we must endeavor to fathom the social question. The man who understands that knows his age. The man who does not understand it finds the present and his future an enigma." In 1864 he wrote 'The Labor Question and Christianity,' which advocated labor associations and co-operative societies of production. In 1869 he proclaimed the necessity of increased wages, shorter hours and the prohibition of industrial labor in the case of women and children. A conference of the German Catholic guilds held at the same time endorsed his proposals for interesting the clergy in the condition of the working classes. In his last book, 'The Catholics in the German Empire,' he emphasized anew the duty of the state to promote the formation of workingmen's co-operative associations, to protect the workers, especially women and children, against unjust exploitation, and to enforce safety and sanitation in work places. These proposals were afterward embodied in the program of the Catholic party (the Cen-trum) in the Reichstag.

Next to Bishop Ketteler, the ablest leader of social reform among the German Catholics is probably Canon Hitler. He advocated a reorganization of industry on the basis of legaly recognized occupational associations, which would be open only to persons who had passed a technical examination, and humane regulation of hours, safety and sanitation, woman and child labor, and other conditions of employment. As a member of the Reichstag he has been an active proponent of many social reform measures. Father Kolping organized journeymen's clubs (Gesellenvereine) to provide lodging and other club facilities for
their members, and for mutual protection generally. When their founder died in 1865 they had a membership of 80,000.

The Catholic associations for co-operative production, advocated so strongly by Bishop Ketteler, never met with much success, owing to the difficulty of obtaining capital. Among the principal Catholic organizations that have become efficient are savings, credit and labor unions, associations of peasants for promoting the interests of their members as regards prices of products, seeds, fertilizer, loans and co-operative effort generally; and organizations of employers to provide for the workers' education, improved dwellings, lower rents, relief and savings agencies, limitation of working hours, hygienic conditions and Sunday rest, and to promote better relations between employers and employees. Indeed, one of the most remarkable features of the German Catholic social movement has been the number of wealthy men in its ranks. They provided a very important part of the initiative as well as the financial resources.

The greatest general force in promoting Catholic social action in Germany has been the popular congresses which have been held annually since 1848. As the years followed one another they gave more and more attention to the social question. Before long it was found that meetings held once a year were not sufficient, that an organization was needed which should be in action continuously. To meet the situation the Volksverein was founded in 1892 by Ludwig Windthorst, the great leader of the Centre party in the Reichstag. It formulated a constructive social program and set to work systematically to educate the German people in Catholic social principles. The organization contains a director for each state or diocese, a manager for each town or collection of villages and a promoter for every 20 to 50 Catholic families. The promoters number 20,000 and each of them comes into frequent personal contact with each of the families in his jurisdiction. In 1903 the Volksverein distributed 13,500,000 tracts and pamphlets and was able to extend its influence on social and economic subjects to 361 Catholic periodicals. It also conducts annual courses of study in economic and social subjects, and its representatives in the Reichstag have contributed effectively to the enactment of workmen's insurance and old age pension laws and other statutes for the protection of labor in both city and country.

The Austrian Catholic social movement was inaugurated by Baron Von Vogelsang and Prince Von Lichnowsky. Both were strong in their denunciation of unlimited competition. In their view the doctrines and practices of economic liberalism were giving to the weaker members of society, the wage earners, only the freedom to be exploited by the possessors of the power of wealth and capital. Hence they conceived the first and most urgent reform to be measures which would protect the workers against this abuse of economic liberty and industrial power. And they maintained that this protection would have to come from the state.

Through the influence of the Catholic party a law was passed in 1883 re-establishing the corporations or guilds for the protection of labor in the smaller industries. Among the functions of these organizations were the maintenance of systems of apprenticeship, trade education, conciliation and arbitration and mutual assistance.

In 1885 the Catholic social reformers assisted in passing a law limiting the hours of labor of women and children and declared in favor of a legal minimum wage. Thus the Austrian Catholics were the first in the world to advocate the establishment of minimum wages by law. They were among the first to realize and proclaim the necessity of protecting labor by international agreements.

The greatest figure in the work of Catholic social reform in France is the late Count Albert de Mun. In the early seventies he founded the "Catholic Workingmen's Circles" ("Œuvres des Cercles Catholiques"), which aimed at a restoration of the ancient guilds along lines suitable to modern conditions and under the direct approval and protection of the state. Underlying them are the doctrines that the policy of unrestricted competition and governmental non-intervention have reduced the masses of the population, especially in Germany, to a condition of intolerable insecurity. This must be remedied through adequate and compulsory workingmen's associations. In 1884 the French government enacted a law providing for the establishment of labor syndicates, but it did not give them sufficient power to attain the objects of the Catholic reformers. About the same time de Mun offered, in the Chamber of Deputies, a program of labor legislation which included Sunday rest, a working week of 58 hours, abolition of night work for women, the gradual suppression of female and child labor in industry and insurance against accidents, sickness, unemployment and old age. A little later his group of reformers advocated a legal minimum wage which would be sufficient for the decent maintenance of the workingman and his family.

A particular experiment in social service that has assumed considerable importance in France is the establishment of workingmen's gardens. These are cultivated by industrial workers in their spare hours and the profits go into their savings and endowments. These gardens furnished an important part of the livelihood of some 2,300 persons in the city of Fourmies alone, and of some 50,000 persons throughout France. The originator of the plan was the Abbé Grison of Fourmies.

Another form of social service strongly advocated by the Catholics of France is that limited measure of industrial democracy which finds its best illustration in the factory of Leon Harmel. For more than 25 years a "board of control," composed of representative male and female employees, has met regularly with the employer to discuss their common interests.

The Catholic social reformers of Belgium have been, as a body, less advanced than those of Germany, Austria or France. Several of them have been rather fearful of the intervention of the state in this field. Among the leading names identified with the movement are Bishop Doucet of Liége, the Abbé Potter, M. Perin and M. Brust. Before the war the Belgian Catholics had a powerful labor federation, co-operative societies and associations of employers. Among the principles of the "Belgian Democratic League" are the
inviolability of private property; a considerable modification of present property rights; the organization of guilds or trade corporations, with power to fix wages, hours and other conditions of employment and to provide social insurance and old age pensions; co-operative purchasing and credit associations both in urban industries and in agriculture; and mixed associations of employees and employers.

In Holland the Parlement took an important part in the establishment of boards composed of masters and workers which act as advisory bodies to the public authorities on matters affecting labor and which include agencies for the settlement of industrial disputes. In 1893 the Catholic Democratic League demanded the abolition of industrial work for married women, a family living wage for men, the prohibition of child labor, a weekly day of rest and insurance against accidents, and provisions for old age. In 1897 the Catholic representatives in the national legislature drew up a program which, in addition to the foregoing demands, contained the following: laws for the regulation of apprenticeship, for laborers’ dwellings and a shorter workday for men, women and children.

The founder of the Catholic social reform movement in Switzerland was Cardinal Mermilod, bishop of Hebron. In a sermon, delivered in 1836, he condemned the gross inequality of possessions that characterized the age and pleaded for an infusion of the principles of Christianity into the social and industrial situation. The most active and effective worker in the movement was Gaspar Decurtius. As member of the Swiss Parliament, one of his first acts was to oppose successfully the attempt to abolish the privilege of grazing on the common lands, which had been enjoyed for centuries by the poor peasants. Soon afterward he brought about the enactment of a law providing for the compensation of injured workmen. On this occasion he presented a report in which he advocates the legal establishment of a minimum wage which should be sufficient for the family to live decently and to live, but protect the worker against sickness, accidents and all other unfavorable contingencies of life. He was also one of the originators of the movement for international labor legislation, which finally developed into the International League for Labor Legislation. In 1887 the Swiss bishops unanimously resolved that the clergy should be instructed to take an active part in the formation of labor associations. One of the most remarkable and effective elements in the policy of these associations has been their co-operation with non-Catholic agencies for protective labor legislation.

In Italy the Catholic social reform movement began somewhat later than in the countries discussed in the foregoing pages. The principal figures connected with it are Padre Curci, Bishop Bonomelli, Cardinal Capecelatro and Signor Toniolo. Among the reforms demanded by the Catholic Congress in Rome in 1894 are the increase of small property ownership and a wider distribution of social credit, the re-establishment of workingmen’s guilds or corporations and a moderate degree of intervention by the state. In recent years a considerable number of practical works have been inaugurated by Catholics in more than one part of Italy. For example, Bergamo has 45 societies for mutual insurance, a diocesan labor union, co-operative bakeries, mills and other industries, a co-operative building association, a people’s bank and a wide distribution of social literature. The Federation of Catholic Rural Credit Banks embraces about 1,800 financial institutions of this type.

Social reform among the Catholics of Spain has likewise been somewhat belated. In some parts of the country unions of agricultural laborers and co-operative savings banks and pawnshops have existed for many years, but it is only since the beginning of the present century that the social movement became general.

The statements of the bishops point out the particular social works with which the clergy ought to co-operate, such as rural banks and labor associations.

The earliest and the greatest name in the Catholic social movement of England is Cardinal Manning. In his famous lecture on the ‘Rights and Dignity of Labor,’ in 1874, he denounced the policy of laissez faire and proclaimed the duty of the state to protect the rights of labor and to provide such industrial conditions as would assure the working classes decent family life. A few years later he declared in favor of an eight-hour day in the mining industry, Sunday rest, the limitation of profits and a legal minimum wage. His article in the Dublin Review, July 1891, defending, interpreting Pope Leo’s encyclical ‘On the Condition of Labor,’ is one of the best and most sympathetic expositions of that great document and did much to popularize it throughout the English-speaking world. Indeed, it is generally understood that the cardinal’s views were sought and utilized in the preparation of the encyclical. The greatest single act of Cardinal Manning was his sympathetic and successful mediation in the famous dockers’ strike in London in 1889. It is said that the Englishman of the 19th century was so generally revered and loved. Bishop Bagshawe of Nottingham and Mr. C. S. Devas were also important figures in the Catholic movement. The former took even a more advanced stand than Cardinal Manning in favor of the rights of labor, while the latter was an able author of works on political economy which were pioneers in their insistence upon ethical discussion as a necessary element in economic treatises.

For the last 10 years from the liability to seizure for debt, a living wage, profit sharing and copartnership, better credit facilities for small business men, the repression of speculation and usury, the re-establishment of the Catholic Church
CATHOLIC CHURCH AND SCIENCE

and the legislative proposals set forth by the Guild are well thought out, pertinent and progressive.

The agitation for the reformation of the labor and wage system of Ireland was particularly active during the last quarter of the 19th century was to a great extent led and supported by the bishops and priests. The names of Archbishops Walsh and Croke, Bishop Nulty and many others will be readily recalled in this connection. If the peasant farmers of the Green Isle have obtained a tolerably satisfactory settlement of the land question they owe it at least as much to these spiritual leaders as to any other agency.

What work has been done for Catholic social reform in the United States has been carried on mainly by individuals. The relatively favorable condition of the laboring classes in this country and the preoccupation of the working classes with the maintenance of civil and lay life and of the enormous task of building churches and schools have done much to postpone the organization of a social movement. Without doubt the most significant and far-reaching action of any individual Catholic in this field was performed by Cardinal Gibbons in 1888, when he obtained a revocation of the condemnation pronounced at Rome upon the Knights of Labor. In the memorial which he presented to the Roman authorities on this occasion he declared that labor organizations were necessary to protect the workers against the tyranny of omnipotent capitalism and that the Church ought to take the side of humanity and of justice for the toiling masses.

A few years ago the American Federation of Catholic Societies established a Social Service Commission for the study of social questions and the promotion of social reform. This organization has endorsed the principle of a living wage and progressive labor legislation generally. The Central Verein, which is a federation of the German Catholic societies of the country, is doing important work through its publications, its annual courses of social study and its efforts on behalf of social and labor legislation.

The supremely important event in Catholic social reform was the publication of the encyclical 'On the Condition of Labor' ('Rerum Novarum') by Pope Leo XIII, 15 May 1891. In this document the Pope restated the traditional Catholic principles on social and industrial questions and applied them specifically and authoritatively to the conditions of the present time. The opening paragraphs emphasize the gravity of the social question and the necessity of finding a solution, and include the statement that "a small number of rich men have been able to lay upon the teeming masses of the laboring poor a yoke little better than slavery."

The principal declaration and proposals of the encyclical may be thus summarized: Socialism is unjust because it would prove injurious to all classes, especially the workingmen; employees should render an honest day's work; employers should treat their workers not as chattels but as human beings and give them opportunity for religious and moral life, not taxing them with labor beyond their strength or unsuited to sex and age; the possessor of wealth may not use it as he pleases, but is morally bound to administer it for the benefit of the needy; the state is obliged to promote the welfare of all classes, but especially that of the wage earners, on account of their relative weakness, and should intervene whenever the general interest or any particular class is threatened with mischief which can in no other way be met or prevented; hence the state should enforce Sunday rest; limit the hours of labor; and restrain the employment of children in conformity with their physical and moral welfare; the laborer has a natural right to a decent livelihood, and he is made the victim of force and injustice when he is compelled to accept a wage that is insufficient for reasonable and frugal comfort; the state should also promote a wide distribution of property among the laboring masses and foster labor unions, employers' associations and organizations embracing both employers and employees. Finally, the Holy Father exhorts every minister of religion to bring to bear upon the social question "the full energy of his mind, and all his power of endurance."

Twelve years later Pope Pius X reaffirmed and supplemented the principles of the great encyclical of his predecessor in an 'Apostolic Letter to the Bishops of Italy.'

Inasmuch as the encyclical of Pope Leo was addressed to all the peoples of the world, its propositions and proposals were necessarily stated in general terms. Nevertheless, they were sufficiently specific to meet the needs of every modern society and country. Were they honestly and thoroughly put into practice, they would remove all the serious social and industrial evils of the time.

CATHOLIC CHURCH AND SCIENCE, The. The development of the history of science in recent years has completely revolutionized our knowledge of the cultivation of science in the older time and with it many long accepted notions as regards the relation of the Church and science. Little was known about the history of science a generation or so ago even by scientists themselves and it was assumed that there was very little cultivation of science in the centuries preceding our own. It was felt that there must have been some active factor to account for the absence of scientific curiosity which is so natural to man that it would surely manifest itself unless definitely suppressed. The Church came to be looked upon as that factor and certain incidents in history were pointed out as indicating that her constant and consistent policy had been to hamper science lest it should disturb faith. Many refused to consider this a stigma on the Church,
CATHOLIC CHURCH AND SCIENCE

because it was felt that some such attitude was absolutely necessary for the perpetuation of her sway over the minds of men. Science and faith being as they conceived incompatibile, the Jesuits had adopted the broad and unreserved stand of opposition, permitting only such scientific study as could not possibly be suppressed and encouraging only whatever could be directed into safe channels.

The recent development of the history of science has compelled another point of view entirely. The realization has been forced upon us that men have at all times been interested in science and concerned with its development. They have often followed it from different standpoints from those which now prevail, but they have seldom failed to be attracted by it or to make advance in it. The story of the medieval universities is particularly striking in this regard. It has been the custom to say that there was no scientific interest in the Middle Ages, but as a matter of fact the medieval universities were quite literally scientific. The Seven Liberal Arts as they were called, the trivium and quadrivium of the curriculum, astronomy, music and mathematics, logic, grammar, were studied in the majority of the schools of Europe, and from the scientific standpoint. Huxley (Inaugural Address, Aberdeen) said that the work of these old institutions of learning "however imperfect and faulty judged by modern lights it may have been, brought them face to face with all the leading aspects of the many sided mind of man." He even went so far as to add "I doubt if the curriculum of any modern university shows so clear and generous a comprehension of what is meant by culture as this old trivium and quadrivium does."

Geography.—This was the first of the sciences to develop and owes very large contributions to the early Christian missionaries who wandered far afield and wrote accounts of their travels. The Acts of the Apostles and Saint Paul's Epistles are valuable geographical documents. Saint Brendan's wanderings described by Dicuil the Irish geographer are further examples. Gerald the Welshman's writings are of geographic significance. A work containing missionary writings down the centuries are now considered geographically very valuable. The stories of Friar John of Carpini and Friar William of Rubruk (Rubruquis) doing their missionary work in the Far East in the 13th century and of the Jesuits and Franciscans in the East and in America during subsequent centuries supplied immense amounts of geographic knowledge. The Jesuit Relations recently republished in some 70 volumes are a typical example of such houses of scientific data. Other missionary letters particularly those of the Recollects are of similar value. The work of Abbé Huc and of Père Armand David in the 19th century show that this good work still goes on. Abbé Huc succeeded in finding his way through Tibet and into Lhasa, two generations ago, while Père David wandered far beyond the territories familiar to Europeans in China and sent home accounts and even specimens of literally hundreds of species of animals hitherto unknown to science. The policy of missionaries instead of being discouraged by the Church authorities was constantly encouraged. The typical demonstration of this is the favor enjoyed by Father Kircher, S.J., who coming to Rome just at the time of Galileo, continued for the next 30 years to be active in the accumulation of scientific information of all kinds so that he stood by the patronage of the popes a long series of well-known volumes which have now become bibliographic treasures. Above all he founded the Kircherianum, as it came to be called, a museum containing many scientific materials which had been sent him by the missionaries of his own order, the Jesuits, or having been presented to the popes by other missionary orders were transferred here for safe keeping. Father Kircher was the personal friend of a number of popes who encouraged in every way his scientific work and particularly the growth of his museum.

Astronomy.—The great foundation stone of modern astronomy was laid by Copernicus. He was a Pole, who studied in Italy for some 10 years and then spent the rest of his life quietly as the canon of the Cathedral of Frauenberg, where, after making careful observations, he worked out his theory of the universe. He had already begun to think about it while he was in study, but he determined that the Copernican theory was publicly taught in Rome long before Copernicus' great book was published. This work was dedicated with permission to Pope Paul III. Copernicus continued to be until the end of his life a staunch supporter of his friend and patron, Bishop Maurice Ferber of Ermeland, who kept his see loyal to Rome at a time when the secularization of the Teutonic Order and the falling away of many bishops all round him made his position as a faithful son of the Church noteworthy in the history of that time and place. When Galileo insisted on stating Copernicanism as an absolute scientific doctrine instead of a theory, Copernicus' book was placed on the index (though not unconditionally, for its author is spoken of as "a noble astrologer" when the word astrologer meant astronomer) but only until certain passages in which theories were stated as facts should be modified so as to make their theoretic significance clear.

Before Copernicus a number of distinguished clergymen had attracted attention by their astronomical teaching. Bishop Vergilius, the Irish missionary astronomer of the 8th century, taught that the earth was round and freed himself from the charge that his teaching was contrary to scriptures. Albertus Magnus insisted that there were antipodes, taught the rotundity of the earth and other supposedly modern astronomical doctrines yet was always in high favor, was made a bishop, and after his death canonized as a saint. In the 15th century Cardinal Nicholas of Cusa taught that "the earth is a star as the other stars in the heaven," and that it had a movement of its own and could not be the centre of the universe. Though deeply interested in science and teaching many new and startling doctrines for his time he was made Bishop of Brixen, then Papal Legate to Germany for the reform of abuses, and finally a Cardinal, being a close friend of several popes. The first epoch-making astronomer of modern times the priest who, in complete opposition to the Church, established a regular observatory at Nuremberg. He was summoned to Rome to direct the calculations for the correction of the
Catholic Church and Science

calendar. His invitation to Rome for this purpose was within 10 years of the time when Pope Calixtus III is said to have issued a Bull against the Copernican system. The suppression Bull had never been found. Toscanelli, who influenced Columbus so deeply was an intimate friend of Cardinal Nicholas of Cusa as well as of Regiomontanus and also of the famous Antoninus, Archbishop of Florence. Antoninus taught very emphatically that comets are celestial bodies like others in the heavens and had no effect on the physical or moral conditions of the world. Regiomontanus who was also a priest was a close friend of Toscanelli’s. The relations between the ecclesiastical authorities and Toscanelli are illustrated by the gnomon which he arranged in the dome of the cathedral at Florence, by the shadow of which it is said that he could determine midday within half a second. Cardinal Ximenes of Spain improved their accuracy by using a gnomon which he arranged in the dome of the cathedral at Seville, and here the meetings of the mathematicians and astronomers for the reform of the calendar were held. After this there was always a Roman Observatory directly under the patronage of the popes, either in the Vatican or the Roman College in charge of the Jesuits. When the Jesuits were suppressed or expelled by the Italian government the Vatican observatory was resumed as at the present time when it is under the charge of Father Hagan, S.J., who was for a time at the observatory at Georgetown University, D.C. The Jesuit astronomers, though the order was directly under the control of the Pope, taking a special vow of obedience to him, have done some excellent original work in astronomy. Nearly every important Jesuit College in the 17th and 18th centuries had an observatory, and secular students of astronomy made it a point to keep in touch with them. Professor Foster in The Journal of the German Astronomical Society (1890, page 60) said, “Among the members of the Society of Jesus in the past and in the present we find so many excellent astronomers and in general so many investigators of purest scientific devotion that it is of important interest to their colleagues in science to notice them.” The great names among them in astronomy are Father Clavius, to whom the Gregorian reform of the calendar is due; Father Scheiner, the authority on the sun and planets; Father Gemma, the authority on the moon, and Father Riccioli, who introduced the lunar nomenclature in use to-day. Three Jesuits, Fontaney, Noel and Richard, are mentioned by Humboldt in his Kosmos as early observers of double stars. In the modern time Father Secchi has been of deep influence on present day astronomy, and Fathers Perry, De Vico and Sidgreaves have done excellent work on government astronomical commissions.

The Church is supposed by many to have hampered the progress of astronomy, but that is all due to a misunderstanding of the Galileo case. Cardinal Newman once said that the Galileo case is the exception that proves the rule of beneficent patronage of science uniformly practised by the Church authorities. It is the one stock argument to the contrary. Prof. Auguste Comte, in his article on “The Motion of the Earth in the Encyclopaedia,” an authority not likely to be suspected of Catholic sympathies, has expressed exactly this same conclusion. “The Papal power,” he says, “must upon the whole have been moderately used in matters of philosophy, if we may judge by the great stress laid on this one case of Galileo. It is the standing proof that an authority which has lasted a thousand years was all the time occupied in checking the progress of thought! There are certainly one or two other instances, but those who make most of the outcry do not know them.” Professor Huxley, writing to St. George Mivart, 12 Nov. 1885, says that, after looking into the Galileo case while he was on the ground in Italy, he had been led by similar reasons to believe that Pope and the College of Cardinals had rather the best of it. In our own time M. Bertrand, the perpetual secretary of the French Academy of Sciences, declared that “the great lesson for those who erected in the minds of men the idea that violence was clearly to be read in Galileo’s story, and the scandal of his condemnation was brought about without any profound sorrow to Galileo himself; and his long life, considered as a whole, must be looked upon as the most serene and enviable in the history of science.”

As Father Secchi, S.J., pointed out: “None of the real proofs for the earth’s rotation upon its axis were known at the time of Galileo, nor were there direct conclusive arguments for the earth's moving around the sun.” Even Galileo himself confessed that he had no strict demonstration of his views. Lord Bacon refused to accept Copernicanism in Galileo’s time and science was so far from determining the question of the truth or falsity of either the Ptolemaic or the Copernican system, that shortly before 1633, the year of Galileo’s condemnation, a number of savants such as Fromond in Louvain, Morin in Paris, Berigaro in Pisa, Father Fontaney in Paris, and Scheiner in Rome wrote against Copernicanism. It was under these circumstances that Galileo was condemned for contumaciousness in teaching as positive science what was only theory, though he had given a solemn promise that he would not until further information was acquired. His punishment consisted in being placed in the custody of a Cardinal friend. He was never an hour in prison. His next custodian was another dear friend in Florence, and then Father Grimaldi, Father of the authority on the moon, and Father Riccioli, who introduced the lunar nomenclature in use to-day. Three Jesuits, Fontaney, Noel and Richard, are mentioned by Humboldt in his Kosmos as early observers of double stars. In the modern time Father Secchi has been of deep influence on present day astronomy, and Fathers Perry, De Vico and Sidgreaves have done excellent work on government astronomical commissions.

The Church is supposed by many to have hampered the progress of astronomy, but that is all due to a misunderstanding of the Galileo case. Cardinal Newman once said that the Galileo case is the exception that proves the rule of beneficent patronage of science uniformly practised by the Church authorities. It is the one stock argument to the contrary. Prof. Auguste Comte, in his article on "The Motion of the Earth in the Encyclopaedia," an authority not likely to be suspected of Catholic sympathies, has expressed exactly this same conclusion. "The Papal power," he says, "must upon the whole have been moderately used in matters of philosophy, if we may judge by the great stress laid on this one case of Galileo. It is the standing proof that an authority which has lasted a thousand years was all the time occupied in checking the progress of thought! There are certainly one or two other instances, but those who make most of the outcry do not know them." Professor Huxley, writing to St. George Mivart, 12 Nov. 1885, says that, after looking into the Galileo case while he was on the ground in Italy, he had been led by similar reasons to believe that Pope and the College of Cardinals had rather the best of it. In our own time M. Bertrand, the perpetual secretary of the French Academy of Sciences, declared that "the great lesson for those who erected in the minds of men the idea that violence was clearly to be read in Galileo's story, and the scandal of his condemnation was brought about without any profound sorrow to Galileo himself; and his long life, considered as a whole, must be looked upon as the most serene and enviable in the history of science."

As Father Secchi, S.J., pointed out: "None of the real proofs for the earth's rotation upon its axis were known at the time of Galileo, nor were there direct conclusive arguments for the earth's moving around the sun." Even Galileo himself confessed that he had no strict demonstration of his views. Lord Bacon refused to accept Copernicanism in Galileo's time and science was so far from determining the question of the truth or falsity of either the Ptolemaic or the Copernican system, that shortly before 1633, the year of Galileo's condemnation, a number of savants such as Fromond in Louvain, Morin in Paris, Berigaro in Pisa, Father Fontaney in Paris, and Scheiner in Rome wrote against Copernicanism. It was under these circumstances that Galileo was condemned for contumaciousness in teaching as positive science what was only theory, though he had given a solemn promise that he would not until further information was acquired. His punishment consisted in being placed in the custody of a Cardinal friend. He was never an hour in prison. His next custodian was another dear friend in Florence, and then Father Grimaldi, Father of the authority on the moon, and Father Riccioli, who introduced the lunar nomenclature in use to-day. Three Jesuits, Fontaney, Noel and Richard, are mentioned by Humboldt in his Kosmos as early observers of double stars. In the modern time Father Secchi has been of deep influence on present day astronomy, and Fathers Perry, De Vico and Sidgreaves have done excellent work on government astronomical commissions.

The Church is supposed by many to have hampered the progress of astronomy, but that is all due to a misunderstanding of the Galileo case. Cardinal Newman once said that the Galileo case is the exception that proves the rule of beneficent patronage of science uniformly practised by the Church authorities. It is the one stock argument to the contrary. Prof. Auguste Comte, in his article on "The Motion of the Earth in the Encyclopaedia," an authority not likely to be suspected of Catholic sympathies, has expressed exactly this same conclusion. "The Papal power," he says, "must upon the whole have been moderately used in matters of philosophy, if we may judge by the great stress laid on this one case of Galileo. It is the standing proof that an authority which has lasted a thousand years was all the time occupied in checking the progress of thought! There are certainly one or two other instances, but those who make most of the outcry do not know them." Professor Huxley, writing to St. George Mivart, 12 Nov. 1885, says that, after looking into the Galileo case while he was on the ground in Italy, he had been led by similar reasons to believe that Pope and the College of Cardinals had rather the best of it. In our own time M. Bertrand, the perpetual secretary of the French Academy of Sciences, declared that "the great lesson for those who erected in the minds of men the idea that violence was clearly to be read in Galileo's story, and the scandal of his condemnation was brought about without any profound sorrow to Galileo himself; and his long life, considered as a whole, must be looked upon as the most serene and enviable in the history of science."
Anatomy.—Anatomy after astronomy is the science often said to have been hampered in its development by the Church because of the prohibition of dissection. As with regard to it was not uncommon for the patient to be cut up and boiled for transportation to long distances for burial. This was an abuse that had crept in during the Crusades. The records of public dissection in Italy begin just after the issuance of that papal decree. Dissection was done at Rome at all times and a number of papal physicians are famous for discoveries made as the result of dissection. Bealdo Colombo, the discoverer of the circulation of the blood in the lungs, Caesalpinus the first to describe the circulation of the blood in the body, Eustachius after whom the tube was named, Varolius of the Pons Varoli in the brain, Malpighi, after whom more structures in the human body are named than any other and deservedly because he was their discoverer, and Lancisi, the great anatomical teacher, were all papal physicians. Fortunately for dissection purposes in Italy during the later Middle Ages and the Renaissance, directly under the influence of the Church. All the great artists of the Renaissance period made many dissections. Whenever anyone anywhere in Europe before the 19th century wanted to have special opportunities for anatomical study he went down to Italy. The case of Vesalius the Belgian who, unable to secure dissecting material in the early 16th century at Louvain or Paris, went down to Italy, where he wrote his great textbook of anatomy illustrated by dissections, which is still a classic exemplifies this very well. Stensen the Dane after having studied for a while in the Netherlands also went down to Italy to complete his studies and there became a Catholic and later a priest and even a bishop. In the meantime, however, he had been a professor of anatomy at Copenhagen. The prejudice against dissection is Puritanic and modern and reached its height in the Middle Ages. Every city in the United States, in the early 19th century, mobs attacked dissecting rooms, destroyed property and even put the lives of physicians and medical students in serious danger. It is only by recent legislation that English and American physicians have succeeded in securing the privilege of dissection and the material for that purpose as freely as they had it in Italy in the later Middle Ages.

Surgery.—President White suggested that the reason why surgery was neglected in the Middle Ages and the ignorant barber-surgeon the only resource of afflicted humanity suffering from surgical disease was that the Church had forbidden clergymen to practise surgery because it was not proper for them to shed blood, and as the only educated people of the time were clerics, hence surgery fell into the unworthy hands of the barber surgeons. Recent developments in the history of surgery contradict this idea completely. Really great surgery began at the University of Salerno before the end of the 12th century. The surgical textbooks of Roger and Roland and of the Four Masters were written down there and then surgical development continued in North Italy. These wonderful Italian surgeons of the later Middle Ages anticipated most of our modern surgery. We have their textbooks which were written in the Renaissance time and have now been reprinted in modern editions. They were operating on the skull for tumor and for abscess, on the thorax for pus and other fluids and on the abdomen for many conditions. They insisted on sewing up intestines when wounded or the patient would surely die. They used various devices, tubes of metal, of bone, and the trachea of animals to help them in these intestinal anastomosis operations and seem to have gotten very good results. They could not have done such extensive operations without anesthesia, but we know now that for two centuries all important operations were done under an anesthetic and we know the mode and means by which they produced anesthesia. Their death rate would have been very high without antisepsis, but they employed strong wine as a dressing, insisted on utter cleanliness and got union by first intention,—the very expression is medieval Latin and were proud of their 'pretty linear sutures.'

So far from there being any Church opposition to the development of surgery one of the greatest of these surgeons of the 13th century, Theodoric, who left an important textbook which has attracted a great deal of attention in our time, was actually a bishop. He deplored strongly the idea that the development of pus was necessary in the healing of wounds; he discusses fracture of the skull and of the vertebrae quite thoroughly, gives rather elaborate directions for intestinal anastomosis over a metal tube; insisted that abdominal wounds should be closed and not left open and deplored the use of the probe and of manipulations in fractures of the skull, in compound fractures or in wounds of the abdomen. Theodoric was made a special confessor (penitentiarius) by Pope Innocent IV and later was made a canon and then a bishop. He had a lucrative practice in surgery but left the money he made for charity. So far from surgery being neglected in the Middle Ages as neat the Middle Ages had important periods in its history. Among the great Italian surgeons are William of Salicet and Lanfranc, who afterward taught at Paris, and Guy de Chauliac who is usually spoken of as the Father of French surgery. Chauliac studied in Italy and became the papal physician of the popes at Avignon, where he wrote his 'Chirurgia Magna,' a great textbook in which many supposedly modern developments of surgery are anticipated. Chauliac was a cleric, probably a priest, a great personal friend of the Avignon popes, one of the most respected men of his own time and high in the estimation of modern historians of surgery. He declared that a surgeon who did not know anatomy was like a blind carpenter sawing wood. Chauliac told of his own studies in anatomy in Italy and his expressions demonstrate that there was not the slightest opposition to dissection or anatomical study by the ecclesiastics. The great Italian surgeons of the later Middle Ages worked out the laws for the proper administration of mercury, which is one of the greatest triumphs in the history of therapeutics.
CATHOLIC CHURCH AND SCIENCE

Chemistry. — Some historians have suggested that a Papal bull of the later Middle Ages forbade alchemy and therefore hampered the development of chemistry just as the similarly quoted Papal bull, which we have seen had no such import, forbade dissection and therefore prevented the proper evolution of anatomy. The bull as to chemistry referred to is one issued by Pope John XXII, and its text, as found in the text of the corresponding decree with regard to the cutting up of bodies, may be found in 'The Popes and Science' (Walsh, New York 1915). The *alchemies* that were forbidden under this technical term were operations for the supposed manufacture of gold and silver out of base metals. As pointed out by the Pope these were bringing about debasement of the coinage and so were very properly prohibited. The popes of the time issued bulls for the chartering of universities and the regulation of the curricula, and this being an international matter very naturally came within their purview. There is not the slightest evidence for any Church opposition to chemistry at this time or subsequently. There had been a good deal of interest in chemistry during the 13th century and Albertus Magnus and Roger Bacon made distinct contributions to the science under the name of alchemy, Raymond Lully wrote on it some 16 treatises, Arnold of Villanova gave special attention to it and the Hollanduses, father and son, continued it in the 14th century. Albertus Magnus was highly honored in his own time, was made a bishop and subsequently was canonized. That is his life was held up as a model of what a Christian should be. Roger Bacon is sometimes said to have been persecuted for his work in science and particularly in chemistry, but not by those who know his life. Bacon was placed under custardy — there is no evidence for imprisonment — because of the violation of disciplinary regulations within his own order, the Franciscans, but it was due to the request of a pope that his great works on science were written and Roger Bacon himself never withdrew from the Franciscans, but continued to be a member of the order until his death, well past 80 years of age.

There was abundant interest in chemistry in the 16th century, and it is curious how many of the men connected with it were ecclesiastics. Basil Valentine, the German Benedictine Monk, may be only a name for a group of men, but the writers were surely Benedictines. Paracelsus, the great chemical investigator for medical purposes of the 16th century, mentions that he was helped in his chemical studies by the Abbot Tricho of Spanheim; by Bishop Erhardt of Lavanthol; by Bishop Nicholas of Hippon; and by Bishop Matthew Schacht. In more modern times there has been no question of any opposition to chemistry, and pharmaceutical chemistry at least has had some magnificent contributions made to it by the drugs obtained from the Indians by missionaries. These include *cinchona*, which was for so long known as "Jesuits' bark"; *cascaray sagrada*, secured by the Franciscans from the Mexicans; *india* from the Indians; a number of valuable laxatives from the same source, *grindelia robusta* and other pharmacals.

Medicine. — It has been suggested that the Church was so much interested in cures by relics, prayers, masses, pilgrimages to holy places, and the like, that naturally her policy was to maintain the development of medical science. The historical contradiction of this suggestion is to be found in the list of papal physicians. The popes summoned to Rome to be their personal medical attendants and as a rule at the same time to teach in the Papal Medical School at Rome some of the most distinguished scientific physicians of medical history. No list of physicians connected by any bond in the history of medicine, not even that of the faculties of the older medical schools, can compare in personal prestige and scientific achievements with the roll of papal physicians. In the section of this article on anatomy a few of them are named, but there are literally dozens of others who have an enduring place in the history of medicine. Among them are Gregor Montpellier, a great reorganizer of hospitals; Richard, the Englishman, famous throughout Europe in his time; Taddeo Alderotti and Simon of Genoa, both well known in medical history; William of Brescia a good deal of interest in herpology; Hubert Bibliolus, in his time a great bibliophile and hygienist; Bartholomew of Pisa; Paulus Lovius; Braamavoda; Alfonso Ferri, the authority on gun-shot wounds; Manovelli; John of Aquila, referred to by his contemporaries as "a second Aesculapius"; Frigimelica, famous for his study of baths; Magri, who made the study of gun-shot wounds so clear; Cananus, the well-known dissector; Simon Pasqua, who wrote on the goat; Gymnasius, who was summoned on consultation to many of the princes of Italy; Malpighi; Cæsaldinus; Jacobus Bonaventura, the brothers Castellani; uncle and nephew Sylvester and Taddeus Collicola; Zacchias who wrote on medicolegal problems, and so on through many other names that have a place in the history of medicine.

The Church's attitude toward medicine is very well illustrated by the regulations for the maintenance of high standards in medical education which were enforced by papal bulls. According to the Pope or there was a preliminary study at the university, then four years at medicine and a year of practice with a physician before personal practice could be taken up. We have climbed back in many schools, but by no means in all, to this standard in the 20th century. In the mid-19th century we required only two terms of four months each, ungraded lectures, for the degree in medicine, and that was a license to practise in any State in the Union.

The Church's greatest contribution to medicine was the hospitals. Medieval hospitals were beautiful buildings, well planned, roomy, airy, with an abundance of water and well-organized nursing. Virchow has told the story of these old hospitals and their foundation. The main factor was "the papal enthusiasm." He adds: "Though hospitals had existed in the East it was reserved for the Roman Catholic Church to establish institutions for the care of those suffering from disease." Miss Loring, in "A Minor Doctrines in their 'History of Nursing' have emphasized the contrast between the sordid municipal and State institutions of the modern time with the beautiful gardens, roomy halls and springs of..."
CATHOLIC CHURCH AND SCIENCE

water of the old cloister hospitals of the Middle Ages, with the delight of their friendly interiors. It was these finely organized hospitals and the good nursing that made the astounding surgery of the later Middle Ages possible. The three things go together, good surgery, good nursing, good hospitals. The modern hospitals of our times are but a continuance of them. Virchow points out that in Germany every city of 5,000 inhabitants had its hospitals. They were at least as numerous in the Latin countries.

An old proverb ran “where there are three physicians there are two atheists.” This is not true so far as Catholic physicians are concerned and especially not as regards great scientific physicians. The illustrations will serve to show at the same time the relations of the Church and medicine in the last two centuries. Morgagni, the father of modern pathology* (Virchow), was a devout Catholic, one of whose sons became a Jesuit and all of his eight daughters nuns, with their father’s full approbation. Laenec, the greatest of clinical physiologists, was a convinced Catholic whose favorite devotion was the Rosary. Auenbrugger, the inventor of auscultation, Corrigan, of Corrigan’s disease, Schwann, the founder of the cell doctrine, Johannes Müller, the father of modern German medicine, Claude Bernard and Pasteur, were not merely nominal, but thoroughly practical, Catholics. The same thing can be said of such men here in America as Sir William Hingston of Montreal, Prof. Thomas Dwight, Parkman professor of anatomy at Harvard for 25 years, and Prof. A. C. Emmet, pioneer in American gynecology. Horto Storer, a leader in the organization of hospital nursing and the reform of hospitals, John B. Murphy, our greatest surgeon in this generation, and many others who might be mentioned.

Biology.—The biological sciences are usually supposed to have been the focus of the danger area for faith in modern times, and especially since the theory of evolution has gained ground the Church presumably had to take an attitude of opposition for the fear that the fact many of the epoch-making workers in biology have been devout ecclesiastics. Experimental and observational biology begins with Abbé Spallanzani (1729-99), whose work “Experiments” (1779) was one of the first to be made. The discoverer of the cell theory was Theodor Schwann, a Catholic from the Rhineland, who refused flattering offers of professorships in German universities because he wished to remain among his Catholic students in Belgium. Johannes Müller, the great German physiologist, to whom modern biology owes more than to any other, was a devout Catholic. So was Pasteur, the father of modern bacteriology. Claude Bernard, like many Frenchmen, neglected religion in mid-life, but for some years before his death was a faithfui Catholic. Mendel, the revolutionizer of modern biology in all that relates to heredity, was an Augustinian monk, who, in the midst of his scientific work, was made abbot of his monastery and died in the odor of sanctity. Father A. F. David, the missionary in China, probably described more hitherto unknown species of animals and plants than any other in the last generation.

One of the greatest of modern entomologists is Father Wasmann, S.J. In archeology Catholic churchmen have rendered brilliant service: Abbé Breuil and Father Oliver are the greatest living authorities on the cave man. The greatest name in Babylonian archeology is Père Scheil, the Dominican, who so promptly translated the Code of Hammurabi and has done so much else to put archeology in his debt. Far from the Church disdaining such scientific work by priests they are given opportunities for it, can readily command the aid of other ecclesiastics and, above all, are free from solicitude as to worldly cares while carrying it on. The hierarchy and the religious orders to which they belong take pains to show them how proud they are of their achievements, and they themselves, far from having their faith disturbed by their science, are usually known for their devotion to their religious duties. As it is now it has always been. At times there have been unfortunate misunderstandings. These occur also at the present time. They are entirely personal. They do not represent the policy of the Church. Occasionally it seems as though priestly art is being hampered in his work by religious superiors, but thorough knowledge of the case always shows other factors at work.

Physical Science.—The policy of the Church as to the physical sciences, apart from those mentioned, is clear from history. Many of the distinguished names in the scientific development of electricity from Father Diwisch, Franklin’s rival in bringing lightning from the clouds, and Father Becaria, who, through his Priestly influence, was elected Fellow of the Royal Society of England, and Abbé Nollet, famous for his series of experiments on the effects of electricity on animals and plants, were Catholic priests. A great many of the distinguished pioneers in electricity were faithful Catholics. To take only the names of the men after whom units in electricity are named we have Galvani, who asked to be buried in the Third Order of Saint Francis, to which he belonged; Volta and Ampère, both of them well known for their devotion to faith and practice; and Coulomb, a good French Catholic, and Ohm, who was teaching at a Jesuit school when he made his great discovery of the law of resistance. Meteorology, in the older time as well as now, and seismology in recent years, much of their development to the scientific stations established by the religious orders, especially the Jesuits in connection with their colleges in various parts of the world. These brought precious information from which laws were deduced. The Jesuits solved the secret of the heavy storms of the Philippines and the United States government recognized their work.

CATHOLIC CHURCH IN THE UNITED STATES

JAMES J. WALSH,
Author of "The Catholic Churchmen in Science", "The Popes and Sciences," etc.

CATHOLIC CHURCH IN THE UNITED STATES. The recent historical developments as to the Norsemen on the American Continent show that there was a bishop in Greenland and missions on the mainland before the end of the Middle Ages. Whether any of these were in territory now the United States is not sure, but the traditions of Norumbega (q.v.) favor it. The first definite date in United States Catholic History is that of the celebration of mass on Manhattan Island for the expedition of Verazano, who led French ships here in 1524. The Spanish settlement (1565) of Saint Augustine, Fla., was the first Catholic foundation in the country. The French settlement of Louisiana led to a distinct development of Catholicity in that region in the 17th century. The Indian missionaries, who in the same century came down from Canada into what is now Maine, New York, Michigan and Illinois, represented further developments of early Catholicity here. The Spanish missionaries on the Pacific Coast in the 18th century showed how much could be accomplished by such efforts among the Indians when unhampered by the exploitation of the whites. As the result of the Franciscan missions the Californian Indians, some of the lowest in the country, were in the course of a single generation lifted to a comparatively high level of civilization, living peacefully in their mission towns, occupying themselves with agriculture and domestic manufactures, but above all developing what amounted almost to genius in the arts and crafts and a love of architecture that are standing witnesses, now fortunately being carefully preserved, of the success of their Christian teachers to bring out all that was best in Indian nature.

In the 13 original colonies, Catholics were proscribed. Even in Maryland, founded by a Catholic and whose proprietor, Lord Baltimore, had at its foundation proclaimed for the first time in history the practice of religious freedom, prescriptive laws were passed after time and Catholics were deprived of most of the rights of citizens. In New York under King James II a Catholic governor of the colony, Thomas Dongan, granted a charter (1683) far more liberal than that enjoyed by any American colony up to that time, above all securing for everyone absolute freedom of worship; but after the fall of the Stuarts, Catholics in New York came under rather severe laws once more, so that as late as the middle of the 18th century John Ury, convicted of being a Catholic priest, though he was not, was put to death.

Pennsylvania was the only one of the colonies that tolerated freedom of worship for Catholics before the Revolution, for even Maryland under King James II, who granted a charter (1683) far more liberal than that enjoyed by any American colony up to that time, above all securing for everyone absolute freedom of worship; but after the fall of the Stuarts, Catholics in New York came under rather severe laws once more, so that as late as the middle of the 18th century John Ury, convicted of being a Catholic priest, though he was not, was put to death. Pennsylvania was the only one of the colonies that tolerated freedom of worship for Catholics before the Revolution, for even Maryland under King James II, who granted a charter (1683) far more liberal than that enjoyed by any American colony up to that time, above all securing for everyone absolute freedom of worship; but after the fall of the Stuarts, Catholics in New York came under rather severe laws once more, so that as late as the middle of the 18th century John Ury, convicted of being a Catholic priest, though he was not, was put to death.

The question of building a Catholic church in Philadelphia the project was for a time put off until there was a definite settlement of the dispute then pending, as to whether the land on which Philadelphia was built belonged to Maryland or Pennsylvania.

In spite of this intolerance of the colonists a great many of the Catholics fought bravely for the colonies in the Revolution, so that Washington particularly came to respect them thoroughly. Some, like General Moylan, became close friends, while the ardent patriotism of men like Commodore Barry heartened the Father of his Country at some of the darkest hours of the Revolution. Catholic toleration in Pennsylvania had its manifest good effect, a large proportion of the famous fighting Pennsylvanians Line,—"the Line of Ireland," as General Lee called it,—were Catholics. When Guy Fawkes' Day was to be celebrated in Boston with the burning of an effigy of the Pope, Washington wrote a letter, still extant, suggesting how unsuitable it was when Catholics were taking their parts whole heartedly with the colonists. One of the important signers of the Declaration of Independence was Charles Carroll, a Catholic, who, when someone remarked that there were so many Carroll's that the British would not know one it was, designated himself beyond all doubt by adding "of Carrollton." Even John Jay's bigotry, though it alienated Canada, did not lessen the patriotism of Catholics in the colonies. The alliance with His Most Catholic Majesty of France did much to break down intolerance toward Catholics and the further alliance with Catholic Spain helped the same good cause. Members of Congress from all over the country came to be on terms of intimacy with the French and Spanish Ministers who had Catholic chaplains with them and formal religious celebrations of successes in the Revolution were held in Saint Joseph's Church, Philadelphia, and attended by many prominent in the government of the country. All this helped to break down bigotry. The Chevalier de la Luzerne, the French Minister, who pledged his private fortune to the help of the colonists, was a further important factor in the lessening of prejudice. He won the friendship particularly of New England members of the Continental Congress and became a close personal friend of Governor Trumbull of Connecticut, the "Brother Jonathan," whose name became the popular symbol of our people until replaced by "Uncle Sam." Benedict Arnold's treason plot proposed besides the surrender of West Point a scheme to capture the French Minister on one of his visits to Connecticut. Among the excuses alleged by Arnold in extenuation of his treason was that the Quebec Act had granted freedom of worship to Catholics in Canada and the toleration of Catholicity which he saw growing in the Colonies endangered the Protestant religion. It has sometimes been said that the securing of toleration in this country was more of an accident than a definite purpose. Anglican and Puritan could not trust each other, so Catholics slipped in under the general religious liberty which had to be voted. As a matter of fact it seems clear now that the putting of the First Amendment, guaranteeing religious liberty, was not a little due to Washington's influence and was
carried because he wanted to safeguard the rights of the Catholics, whom he had learned to value highly for their heroic efforts for the country during the Revolution. In spite of this amendment, however, the laws of many States continued to bar Catholic citizens from their rights. Pennsylvania and Delaware were the only States whose laws did not need expunging in order to secure to Catholics the right to vote and be voted for. In 1784 Rhode Island removed from its constitution the clause disqualifying Roman Catholics from office. This was before the adoption of the Federal Constitution, but other States were slow to follow this example. In 1806 New York did so, but Massachusetts waited until 1821, Virginia until 1830, North Carolina until 1836, and New Jersey did not remove all disqualifications from Roman Catholics until 1844, while in 1876, fully 100 years after the adoption of the First Amendment to the Federal Constitution, New Hampshire still retained disqualifying laws, only repealed the following year. Shortly after the Revolution the first Catholic bishop in the United States was appointed independently of all foreign influence with John Carroll, a relative of the signer, as Prefect Apostolic, appointed 26 Nov. 1784. Until the Revolution the Catholics in the colonies had been under the jurisdiction of Bishop Chaloner, the Vicar Apostolic of London. His successor refused to exercise any jurisdiction. It was proposed at first that the Church should be under French ecclesiastical jurisdiction and Franklin as our Minister to France favored this for a time, but was brought to realize the danger there would be in such foreign influence. Rev. Dr. John Carroll's appointment followed his recognition of this.

In his letter of acceptance Rev. Dr. Carroll states that there were at this time in Maryland 15,800 Catholics; in Pennsylvania 7,000; in Virginia 200; in New York 1,500; a few in New England and some scattered along the Mississippi, formerly under the jurisdiction of the bishop of Quebec. He less than 30,000 Catholics in the whole country. The infant Church had some serious troubles, many of them due to what is known as the trustee system. Laymen in control of the funds thought it their proper right to use the funds in an episcopal action. The spirit of independence in the new country readily tempted to abuses in this matter and the first half century of Catholic history has many such disputes, which led to the loss by the Church of a number of Catholics, especially of the older families. In 1789, the year of the organization of the government, Dr. Carroll was made bishop, so that the State and the Catholic Church run parallel in their formal history. Bishop Carroll at once took up the project of a college, already discussed in 1786, and Georgetown College in the District of Columbia was founded in 1789. Bishop Carroll visited Boston and notes with pleasure how the spirit of tolerance is growing. It is wonderful to tell you how great civil rights have been done to me in this town where a few years ago the popish priest was thought to be the greatest monster in creation. Previous intolerance can be best understood from the fewness of the Catholic population in New England. When the first Catholic was established in 1750, the number of New Catholics was estimated at only 750, this figure including some 500 Catholic Indians in Maine.

In 1800 Rev. Dr. Matignon erected the first building for Catholic services in Boston worthy of the name of a church, "John Adams, President of the United States, and other Protestant gentlemen being generous contributors." In 1803 the Louisiana Purchase brought New Orleans into the United States, in which there had been a bishop since 1867, an increase in Catholic population. The religious liberty assured in the country soon brought large numbers of Catholics and led a great many back to the faith which either they or their fathers had abandoned because of religious intolerance and the difficulty of practising their religion. At Bishop Carroll's suggestion new bishoprics were created in 1808 in Boston, Philadelphia and Bardstown. He recommended that New York be left under the jurisdiction of Boston, but the Irish bishops succeeded in securing the appointment of Father Luke Concannon as bishop of New York. Bishop Concannon died before reaching this country. Dr. Egan was chosen bishop of Philadelphia, Dr. De Cheverus bishop of Boston, and Dr. Flaget of Bardstown. Baltimore then became an archbishopric. Archbishop Carroll died in December 1815 and was succeeded by Archbishop Neale, who established the Missions, the Visitation Convent at Georgetown, D.C., and restored the Society of Jesus, suppressed by the Pope in 1773, but now permitted to revive. Prince Gallitzin of Russia, who had become a priest, did splendid missionary work in western Pennsylvania in the early part of the 19th century, founding in 1799 the town of Loretto, still famous as a Catholic centre.

The American Church was particularly fortunate in the bishops who occupied these first sees. Archbishop Carroll was a valued and respected friend of the patriots who made the country. Bishop Louis de Cheverus, the first bishop of Boston, had been doing heroic missionary work throughout New England for more than a quarter of a century before he was made bishop. He was often consulted by the legislature of Massachusetts and accepted many invitations to explain Catholic doctrine, making use for this purpose even of Protestant churches. Speaking of him, William Ellery Channing said: "How even was his face against this proof of the Catholic religion to form good and great men?" Bishop Flaget, another Frenchman, the first bishop of Bardstown, was indefatigable in his missionary labors in the immense territory under his jurisdiction, now divided into 28 dioceses, five of them archdioceses. He won the respect and reverence of all who came in contact with him. The Bardstown bishopric was subsequently transferred to Louisville (1841). Bishop Rosati, an Italian, the first bishop of Saint Louis, was another one of these marvelous pioneer bishops whose missionary spirit could not be satisfied. In one year his converts numbered 300. Bishop Loras became the first bishop of Dubuque in 1837 with but one priest to help him, and yet he succeeded in accomplishing immense good and stamping his personality on all the future history of Dubuque. Another very successful French bishop was Joseph Cretin, the first bishop of Saint Paul. Some of the problems he had to meet were those from the fact that within a period of six years his flock grew from 1,000 to 60,000. Like
Bishop Loras of Dubuque he was very successful in promoting Catholic immigration and laying foundations for the future of his diocese. The bishops were of all nationalities and Frederick Baraga, a Slovenian from the west of Austria, was appointed the first bishop of Marquette in 1853 after having labored for 22 years as a mission among the Indians of Michigan. His writings are still recognized as of high authority on the languages of the American Indians.

The Church continued to grow rapidly, particularly in the South and West, and two new bishoprics were created in 1820 in Richmond and Charleston. Rev. John England of Irish birth, destined to be a great power in the American Church, was made bishop of Charleston. His writings are still a storehouse of information on Catholic subjects. The bishoprics of Cincinnati and Saint Louis were erected in 1821 and 1826. It was felt that the growth of the Church now demanded that the bishops and prominent ecclesiastics of the country should take to each other's bosoms for the better direction of the Holy Catholicity in America, and the first Provincial Council of Baltimore was held in 1829. The records show that at this time Catholics had increased more than 12 times in numbers in this country and that there were in 1830 a Catholic population here of nearly 400,000.

New bishoprics continued to be founded in the West and seas were erected at Dubuque in 1837, Chicago and Milwaukee in 1843, Oregon City 1846, Saint Paul and Santa Fé 1850 and San Francisco in 1855. Before the acquisition of California San Francisco had been part of the Mexican diocese of the two Californias erected in 1840. During the decade after 1840 Catholicity increased very rapidly in the United States because of European immigration. The famine in Ireland and political troubles of various kinds in other countries caused a great many immigrants to seek the protection of the United States and the Church had to make provision for a very large increase in its membership. To meet the new problem thus created the First Plenary Council of Baltimore assembled in 1852. At this time the Catholic population numbered about 2,000,000; there were 30 episcopal sees including the six archdioceses of Baltimore, New Orleans, New York, Cincinnati, Saint Louis and Oregon City. In New York and Boston particularly Catholics increased rapidly in numbers. At the end of the first quarter of the 19th century there were some 15,000 Catholics in the diocese of Boston, about half of whom were in the city, but they were beginning to crowd into all the growing towns of New England, Lowell, Newport, Fall River, Taunton, Providence, Hartford. New York grew even faster. At the end of the first decade of the 19th century Father Kohlman, S. J., found the parish of Saint Peter's in New York city to contain 14,000 Catholics. He purchased a site for a second church between Broadway and Bowery road, then on the outskirts, and with a capital of $100,000 New York became the cathedral. Father Kohlman who opened a school and was prominent in the intellectual life of the city was once summoned as a witness against prisoners accused of deep robbery and tried to tell what he had heard from them in confession. This he refused to do in a most solemn way in court and the presiding justice, De Witt Clinton, supported him, thus settling for America the question of the status of information for the future of his church.

De Witt Clinton, supported him, thus settling for America the question of the status of information for the future of his church. The second bishop of New York was John Connolly, consecrated in 1814. He was succeeded by John Dubois in 1826. At his arrival he estimated the Catholics in the city at 25,000 and the whole state at 50,000. To serve the spiritual needs of this immense number New York city had but six priests and there were but four in the rest of the State. Albany, Rochester and Buffalo though each containing hundreds of Catholics had no resident priests. Brooklyn had but the small chapel, a mission from New York, visited occasionally by a priest. Newark, Paterson and New Brunswick, all of them then in the New York diocese, were only building their small churches. Almost necessarily under such difficult conditions a great many Catholics lost their faith because of lack of opportunities to practise their religion and bring up their children in it. Some of the Western dioceses were of course in even worse straits. For the benefit of Kentucky and Tennessee all the country known in the Northwest Territory, embracing what is now the States of Illinois, Indiana, Michigan, Wisconsin and Ohio. There were small scattered Catholic communities in French at Kaskaskia, Kahokia, Prairie du Rocher in Illinois: Vincennes, Ind., along the Raisin River and in Detroit and Mackinaw, Mich., at Sandusky, Ohio, and Green Bay, Wis., though there were only three priests to tend to them all. Bishop Flaget within 10 years was able to report that he had in Kentucky alone 19 churches, 10 priests and 10,000 Catholics.

Some of the pioneer priests were remarkable men. One of these was Father Gabriel Richard, a Sulpician who did so much for Detroit and the neighborhood at the beginning of the 19th century. The Sulpicians, exiled from Paris by the Revolution, were of great help to infant Catholicity in America. They founded Saint Mary's Seminary in Baltimore (1792) which, after a very trying time at first, proved a wonderful nursery of priests for the American Church. In 1831 they founded Saint Charles College for clerical students though it was practically not opened until 1846. Father Richard was assigned to the missions in Illinois about 1795, transferred to Detroit in 1798. He opened a young ladies' academy in 1804 and a seminary for young men the same year. The girls were taught spinning and weaving as well as purely intellectual subjects. With Rev. John Monteith, pastor of the Protestant church of Detroit as president and Father Richard as vice-president, the "Catholicepistemiad or University of Michigan" was founded in 1817. In 1821 when the University of Michigan was incorporated Father Richard was made a trustee. He published the first Catholic paper in this country, The Michigan Essay or Impartial Observer. Before he was able to get the printing press over the mountains he had a public crier who went from town to town in the gavoon with news and certain advertisements at the church door on Sundays. In 1823 he was sent to Washington as territorial delegate, the only instance of a priest having a seat in Congress. When cholera appeared in 1832 he was a victim to the disease in his zeal for the sick. Judge Cooley declared he would have been a
man of mark in almost any community and at any time." One of the greatest of the Catholic prelates of the United States was John Hughes (1797-1864) who became bishop of New York in 1838 and the first archbishop of that see in 1850. A self-made man who worked his way through Mount Saint Mary's College, Emmitsburg, Md., as a gardener, he demonstrated a high quality of intellect in his controversy with Rev. John Breckenridge which made the American people realize for the first time how strong was the intellectual position of the Catholic Church. He showed his firm character during the troublous times of trusteeship in Philadelphia and then was made bishop of New York. He at once took up the correction of abuses that had crept into New York life to the detriment of the Church. It was due to his efforts that the Public School Society, a private corporation which controlled the funds and managed the common schools of New York, was dissolved, to the lasting benefit of popular education. Bishop Hughes then inaugurated a system of parochial schools which he had developed into the modern Catholic school system of New York. His controversy with "Kirwan" (Rev. Nicholas Murray) in 1850 probably did more than anything else to make Americans understand how utterly one-sided were the commonly accepted views of the Church in this country. The firm stand that Bishop Hughes took in New York prevented the rioting, destruction and bloodshed, which occurred as a consequence of Native Americanism in 1844 in Philadelphia, and of Know Nothingism 10 years later, in many parts of the country, from coming to a head in his diocese.

He was well known for his thorough-going devotion to the best interests of his adopted country, and was a personal friend of President Polk and of many men prominent in the political history of the time. During the Civil War he was appealed to by President Lincoln and Secretary of State Seward and was entrusted with a diplomatic mission of an informal character to Europe and particularly to France in order to neutralize the growing sentiment in favor of European intervention on the side of the South. In spite of failing health which had compelled him to ask for a coadjutor he accepted this mission at the personal solicitation of President Lincoln, had an interview with the Emperor Napoleon in December 1861 and then proceeded to Rome, where, during many months, he met prelates from European countries and corrected many false impressions with regard to the war between the States. The government at Washington felt that his visit to Europe had been of great importance in making the cause of the North better understood and an official intimation of this was conveyed to the Holy See direct from President Lincoln, suggesting that the Archbishop could only be properly rewarded by Rome, but his failing health put that out of the question. President Lincoln wrote a letter commending Archbishop Hughes' patriotism. The last letter which Archbishop Hughes wrote was a public address delivered shortly before his death to the Catholics of New York with regard to participation in the "draft riots," which caused so much disturbance to the city and country in July 1863. His address to the crowd had to be made sitting down because of his weakness and his voice could not be heard far, but his published words made it beyond all doubt that the Catholic Church condemned to its members their duties as citizens to fight for the conservation of the Union to which they owed so much.

Just before and after the middle of the 19th century the Catholic Church received great additions to its members by the immigration from Ireland, consequent upon the famine and intolerable conditions there, and from Germany because of political disturbances in connection with the revolutions of 1848. Undoubtedly the strongest American influence exerted over these newly-arrived Americans was that of the Church, and its effect was seen in the large numbers of Catholics of Irish and German descent who fought splendidly and so many of whom shed their blood in defense of the Union during the Civil War. There had been organized intolerance under the name of the Native American party, which led to the burning of the Ursuline Convent at Charlestown, Mass., in 1834, and the burning of the Ursuline Convent in Philadelphia (1844) as the result of riots in which a number of people were killed. In the fifties the Know Nothings, so called because of their answer to all questions about the organization as directed by its rules was "I know nothing," led to serious disturbances, including the killing of Catholics, the burning of churches and other outrages in some 10 States. The answer to this campaign of bigotry by the patriotism displayed in the Civil War was complete.

About the same time the Church began to make large gains by conversion from among the educated people of the country. There was an "Oxford Movement" in America as well as in England and many distinguished converts were made. Among these the best known was Orestes Brownson, well known as a writer on serious subjects, and Isaac Hec- ker (of Brook Farm), who gathered round him the group of men who founded the Paulist Congregation, New York, for the conversion of non-Catholics. There were a number of converts from among the Protestant clergy, the most distinguished of them being Rev. Dr. Levi Silliman Ives, the Protestant Episcopal bishop of North Carolina, Rev. Dr. Preston of New York, Rev. James Roosevelt Bayley of New Jersey, Rev. George Herbert Doane, the son and brother of Protestant Episcopal bishops of New Jersey and Albany, and somewhat later, Rev. Kent Stone, president of Kenyon and Hobart colleges, who afterward became Father Fidelis of the Passionists.

The best proof of the recognition by Church authorities that the Church in the United States should be absolutely American in character and in sympathy with the republican aims of this country is to be found in the fact that a number of these converts were advanced to the highest posts in the hierarchy. James Roosevelt Bayley became bishop of Newark and later archbishop of Baltimore and is said to have been offered the cardinalate and who was a strong supporter of Archbishop McCloskey of New York. Other converts who became bishops were Tyler of Hartford, Wadham of Ogdensburg and Wood of Philadelphia, who later became archbishop. Father Doane became vicar-general
and chancellor of the diocese of Newark and Father Preston became vicar-general of New York and both were made diocesan prelates of the Pope. Dr. Silliman Ives was founder and the first president of the "Catholic Protectors for Wayward Girls and Boys of New York" and was given as a layman distinguished opportunities for the accomplishment of great good. Many other distinguished converts were made, among them Dr. J. V. Huntington, brother of Daniel Huntington, the artist, who wrote a series of Catholic novels; George Parsons Lathrop and Charles Warren Stoddard, poets; Edward Lee Greene, the botanist, Rev. Daniel Hudson of the Ate Maria, Molly Elliott Seawell and Frank Spearman, novelists; Rose Hawthorne, the daughter of Nathaniel, who afterward became Mother Alphonsa of the Cancer Home; Mr. and Mrs. Bellamy Storer and such distinguished physicians as Drs. Van Buren, one of the leaders of the profession of New York city, Horner, professor of anatomy at the University of Pennsylvania, Dwight, Parkman professor of anatomy at Harvard University, and Thomas Addis Emmet, of international fame in his specialty of women's diseases, Horatio Storer, vice-president of the American Medical Association and well known for his contributions to American medical literature. The number of conversions grew each year after the middle of the 19th century, increasing particularly in recent years, until it is calculated that about 25,000 converts are received annually into the Church at the present time. Perhaps the best evidence that the archbishop appeals to thoroughly practical men as well as to those of spiritual and intellectual tendencies is to be found in the fact that altogether of men who reached the rank of brigadier or major-general in the Civil War, 46 became converts before their deaths.

The Catholic population of the United States had been growing very rapidly during the decades just before the war between the States. The newly made citizens faced their duty to their adopted country bravely and with few exceptions whole heartedly. Archbishop Hughes more than any other gave the keynote to patriotism for his fellow countrymen at the North. The archbishop of New York had long considered that slavery was a blot on this country and as a young man at college in lyrical mood he had invoked Columbia to "chase foul bondage from her Southern plain." In his controversy with Breckenridge he had pointed out the absurdity of paying a compliment to our "memorable Declaration of Independence," coupled with an allusion to slavery. He had taken firm ground against the radical abolitionists, however, pointing out that they had committed the very crime of attempting to overthrow the Constitution and government of the United States which they charged against the Southern Confederacy and urging moderation and conciliation on both sides. Once war was declared, however, there was no half-heartedness about his support of the Union.

Another of the distinguished prelates of the second half of the 19th century was Archbishop Martin John Spalding (1810-72), a descendant of a family that had been in this country for many generations. He became bishop of Louisville in 1850 and archbishop of Baltimore in 1864. The growth of the Church, and above all the number of conversions had attracted great public attention to his lectures in many parts of the country and by the breadth of his scholarly erudition succeeded in placing the Church's position properly before the minds of fair-minded Americans. He was the first to suggest the establishment of a Catholic University and to insist that intensive development of the intellectual life would add greatly to the Church's position. He came to be held in high esteem by prominent men of all classes and sects in the United States. When the Second Plenary Council of the Church in the United States met at Baltimore in 1866 under the primacy of Archbishop Spalding the Catholic population had doubled to nearly 4,000,000, and though the increase was very largely due to Irish immigration, the archbishop, traveling throughout the country that our new citizens were being trained to genuine Americanism under the influence of the Church whose hierarchy was deeply patriotic in its policies.

Two distinguished prelates who have been called "Fathers of the American Church" were the Kenricks — Irish by birth but thoroughly American in their influence on the Church. Francis Patrick Kenrick was a time bishop of Philadelphia (1830), and was transferred to the archbishopric of Philadelphia in 1851. He was honored by his fellow citizens of Philadelphia for his courageous zeal during an awful epidemic of cholera and for his tact during the native American riots when 40 persons were killed in the city. His brother, Peter Richard Kenrick, became archbishop of St. Louis in 1847 and lived to celebrate the golden jubilee of his consecration. His firm stand with regard to the Drake Test Law led to a decision by the United States Supreme Court which prevented threatened infringement of the constitutional guarantee of religious liberty.

In 1884 when the Third Plenary Council was held, under the primacy of Archbishop (now Cardinal) Gibbons, the Catholic population had actually doubled once more to 8,000,000. The new primates, Cardinal Gibbons, was destined to occupy a place of particular affection in the hearts of the American people and to be looked upon as a typical representative of all that was conservative in American life. His published opinions came to be looked upon as almost national maxims, always read with attention and considered with reverence. The Church continued to grow rapidly under the favoring influence of religious liberty and doubled once more in numbers by the beginning of the new century.

Religious education came very early to be recognized as an extremely important factor for the Church's growth in the United States and for the conservation of the spirit of Christianity. The Catholic hierarchy was firmly persuaded, as was Albert Schweitzer's word, that "it works grave mischief whenever intellectualization precedes moralization." The first Catholic college, that of Georgetown, was established in 1789, the very year of the organization of the
CATHOLIC CHURCH IN THE UNITED STATES

Union. Other colleges followed until now there are 22 universities, more than a dozen of them with over 1,000 students in attendance, some 200 colleges for boys, 100 institutions for 50,000 students in attendance, not including 102 ecclesiastical seminaries with some 7,000 students. Catholic higher education for women began with the establishment of the Visitation Academy, Georgetown, D. C., in 1799. Mrs. Seton's orphans graduated from the Sisters of the Visitation Academy, Emmittsburg, founded in 1809. The first institution for giving anything more than education in the ordinary branches to girls in New England was the Ursuline Academy in Charlestown, Mass., opened in 1834 and though mainly attended by the children of Protestant parents, burned down that year by a mob from Boston, at the risk of the lives of some of the pupils. There are now some 700 Sisters' academies with over 100,000 pupils in attendance. At the present day, at the times these have developed 39 colleges for women, some of them offering graduate as well as undergraduate instruction. The Sisters teach in the parochial schools, over 50,000 of them. Practically all the 1,500,000 pupils in the United States are Catholics and very faithful to their religion. They have 750 priests, more than 500 churches and 20 Catholic newspapers in their own language. The Bohemians have 250 priests and 100 churches. The Ruthenians, the term being applied to those who come from Austria, have become important in our population in Pennsylvania, New York, New Jersey and Ohio. They are practically all Uniates, that is, in union with Rome but not using the Latin rite. They have some handsome churches and 150 priests, some 64 being married. It has been decreed that there should be no addition to the married clergy in this country either by immigration or ordination. The Greek Catholic Union among the Ruthenians is a powerful organization with a membership of nearly 50,000. There is an order of Ruthenian Sisters of the Order of Saint Basil who take charge of parochial schools. The Church demonstrates the validity of her name of Catholic by gathering into the fold here all the foreign nationalities: Poles, Ruthenians, Syrians, and Armenians. All of these have priests of their own and follow their own rites, to which they were accustomed at home. New York as the port of entry for immigration caught numbers of all these peoples so that mass is now said in New York in seven different languages, according to a series of rites. All these peoples, except the Ruthenian Greeks, who are organized in one diocese, under a Ruthenian prelate, are under the jurisdiction of the ordinary ecclesiastical authorities in this country and of course of the Pope.

This large foreign immigration to America has introduced a series of new problems and elements into our political life. They are not very different from those which occurred as a consequence of German and Irish immigration at the middle of the 19th century. The Church was an important factor in the transformation of these European stocks into American citizens of sterling patriotism. Her ministrations under the direction of a hierarchy that has shown itself thoroughly American and free from any political bias that might hamper our free development, is accomplishing a similar transformation for the
Slavs and the Italians. President McKinley declared the influence of the Catholic Church in America is exceedingly precious for the future welfare of the country. The decided stand taken by the Church against all the forces of anarchy has meant much for preserving the balance of conservatism among these newly arrived peoples, so liable in the first flush of their enjoyment of liberty to go too far in what they expect of it.

Catholic societies organized to foster social aims, provide fraternal insurance and organize public opinion against abuses and immoralities of various kinds have become increasingly prominent in American life. The Holy Name Society, organized to discourage blasphemy, but doing social work of many kinds, counts a membership of a million. The temperance societies of the Church represent another million. The American Federation of Catholic Societies, organized to oppose immoral tendencies and intolerant legislation, has nearly 5,000,000 members affiliated. The Knights of Columbus, who came into prominence in 1861 as an instrument in their organization of social life for the soldiers in the cantonments here and behind the line in France, have a membership of 400,000 men definitely engaged by their fraternal pledges to patriotism and work for social purposes. Some 350 Catholic periodicals, most of them weeklies, are published in the United States. They include 46 German, 18 French, 15 Polish, 7 Bohemian, 5 Italian, two each Slovene, Dutch and Magyar and one each Spanish, Croatian and Indian publications.

In 1918 the Catholic population in the continental United States was estimated to be nearly 18,000,000, with the hierarchy consisting of three cardinals, 16 archbishops and 100 bishops. There are 28,000 priests, about 3,000 of whom are members of religious orders — Jesuits 1,200, Benedictine 750, Franciscans 700, Redemptorists 500, Vincentians 300, Dominicans 250 and many smaller orders. There are some 85,000 women in religious communities. The American occupation of the Philippines added a Catholic population of 7,000,000 with one archbishop, 11 bishops and 1,250 priests; Porto Rico another 1,000,000, with a bishop and 150 priests; Hawaii, 40,000, with a bishop and 50 priests; Guam, 1,000, with a priest; Samoa, 1,000, with 4 priests, and the Canal Zone about 4,000, with 4 priests.

CATHOLIC COLLEGES IN EUROPE — CATHOLIC EDUCATION

CATHOLIC COPTS, those native Egyptian Christians, about 5,000 in number, who acknowledge the authority of the Pope. The word Copt is an adaptation of the Arabic Qibti or Quhî (a corruption of Aṣîyûn). See Copts.

CATHOLIC CREDITOR, in Scottish law, a creditor whose debt is secured by a lien or charge on more than one subject belonging to the debtor.

CATHOLIC EDUCATION IN THE UNITED STATES. Historical.—The first schools within the present limits of the United States were those founded by the Franciscans in Florida and New Mexico. Saint Augustine, Fla., had a classical school as early as 1665, and there were a number of schools in existence for the natives of New Mexico in the year 1629. Schools for the natives were likewise
established in Texas and California, with the foundation of the missions in those regions. Ursuline nuns from France established a parish school and academy in New Orleans in 1727; a few years after the foundation of the city. French schools, for both white and native children, were also opened at Saint Louis, Detroit and Milwaukee. The first Catholic parish in the West was St. Louis; it may be said that Catholic school work usually began in a place, whether it was a white or an Indian settlement, as soon as there was a sufficient Catholic population and organization to furnish support for the school. In the East, the Jesuits in Maryland had opened schools by the year 1650, and a college or "school for humanities," was established there in 1677. Later on, a boarding school was opened at Bohemia, on the eastern shore of Maryland; among the famous pupils at this institution were John Carroll and Leonard Neale, who subsequently became archbishops of Baltimore, and Charles Carroll of Carrollton, one of the signers of the Declaration of Independence. The order also opened a college founded in the year 1789. A more favorable opportunity for educational work was offered to the Jesuits in Pennsylvania, owing to the tolerant attitude of the Quakers, and, with the organization of the first Catholic parish in Philadelphia in 1730, the foundation of schools as a regular and permanent feature of parish work may be said to have begun. Philadelphia had a larger Catholic population than any other town in the country, and the system of schools that was started there found its way throughout Pennsylvania as new parishes were organized became a model to Catholics elsewhere. A new impulse was given to Catholic education by the American Revolution. Catholic immigrants came in increasing numbers, and learned priests, exiled by the French Revolution, arrived opportune to take up the work of organizing parishes, schools and colleges. In 1791 the Sulpicians founded Saint Mary's Seminary at Baltimore and the Convent of the Alleghenies were established in Kentucky. Father Gabriel Richard in Detroit and Michigan and Father Edward Fenwick, a Dominican, first bishops of Cincinnati and Bardstown, respectively, did much to establish Catholic educational work west of the Alleghenies. The former was a great organizer of educational work in the country. The American Catholic educational work west of the Alleghenies was accomplished in these three States had a very important influence in the development of Catholic education throughout the whole Middle West later on. During the period 1800-40 the progress of Catholic education, while slow, was steady and solid, and corresponded with the growth of the Church. Catholic textbooks began to appear, and, more important still, religious sisterhoods were organized to carry on the work of teaching in the schools. The first teaching sisters in the English-speaking States were the Poor Clares, who opened a school at Georgetown in 1801. This order soon discontinued educational work; but in 1812 an American branch of the Visitacion Order was founded at the same place by Bishop Neale. Mrs. Elizabeth A. Seton, under the direction of Father Dubourg, organized the Sisters of Charity at Emmitsburg in 1809; this community grew rapidly and furnished teachers to Catholic schools in all the States. Shortly afterward, three teaching communities were founded in Kentucky — the Sisters of Loretto, the Sisters of Charity of Nazareth and the Sisters of Saint Dominic. The close teaching communities rendered it possible for Catholics to carry on their schools and academies without aid from the state, and to extend the educational system to new centers of Catholic life as fast as these became organized. Among the religious orders engaged in this work of the Lazarists and Jesuits during this period deserves particular mention, the latter having laid the foundation of Saint Louis University in 1828. Another great forward movement in Catholic education originated in the tide of immigration that set in about the year 1840. Hundreds of thousands of Catholic Irish and Germans made their way to the Middle Western States and beyond. Zealous priests and bishops of the newly-created dioceses labored to erect everywhere not only churches but schools. After the failure of Bishop John Hughes of New York to secure for the Catholic schools of that city a share of the public educational funds, although his efforts were warmed at every turn by Governor Seward, it was more keenly realized by Catholics that it had become a matter of religious necessity for them to erect and maintain their own schools and that, as Bishop Hughes declared, "In this age and country the school is more necessary than the church." At the instance of the bishops many new teaching communities came from Europe, and their membership was rapidly augmented under the favorable conditions offered for religious and educational work. The result was that, while in the year 1840 there were only about 200 parish schools in the country, this number was multiplied several times over during the ensuing decade. Academies for girls were established by the Ladies of the Sacred Heart and other sisterhoods while the Christian Brothers took the lead in the field of secondary education for boys. Colleges and seminaries also sprang up. The Jesuits carried their work of higher education to all parts of the country by founding colleges and preparatory schools. A later phase of the immigration movement resulted in the establishment of schools for French-Americans, Poles, Italians, Bohemians and other nationalities. Of these, the Polish schools was the most important.

School Organization.— In accordance with the Church's organization, Catholic elementary education is framed along diocesan lines. Each diocese has its school system, with the bishop at its head. Bishops, however, are bound by the legislation of the Third Plenary Council of Baltimore, which prescribed a definite form of school organization for all the dioceses. General legislation has thus operated to give a certain measure of unity to parish-school work in the country over, while local needs and interests are left to be provided for by the diocesan authorities. Diocesan control over the schools is usually exercised through the diocesan school board, presided over by the bishop. The members are selected from the clergy of the diocese, in some places the laity are included. In the prevailing type of school organization the school board includes, as its executive officer, a diocesan superintendent of schools. The priest who is selected for this office is specially trained and devotes his time to the inspection of schools and
CATHOLIC EDUCATION IN THE UNITED STATES

to the study of the problems involved in their improvement, and his recommendations are embodied in an annual report submitted to the school board. As assistants to the superintendent there are in many dioceses community inspectors of schools. As a rule, there are many teaching orders engaged in any given diocese, and when each community appoints one of its members to inspect and study the work that is being done in its own schools in the diocese, the result is to give the superintendent a corps of zealous and efficient assistants through whose cooperation his recommendations may more easily be given practical effect. In the case of the individual parish school, the pastor is, of course, by right its head; but generally speaking beyond supervising the religious instruction and financial matters, he leaves the direction and control of the school to the superior of the Sisters or Brothers in charge. The actual principal of the school is therefore the immediate religious superior, and the teachers usually live in or near the school building, which is in close proximity to the parish church. About nine-tenths of the teachers in the parish schools are religious. Male teachers are less than one-fifteenth of the total number. Nearly 300 distinct communities are engaged in the work, including single independent houses as well as congregations. Of these, 11 are teaching brotherhoods. The curriculum of the parish school does not, as a rule, show any substantial difference from the curriculum of the neighboring public schools, except in the matter of religious instruction.

The training course for religious teachers embraces the postulate, the novitiate and the normal school. In the postulate are comprised the elements of a good common-school education and some high school work; during the novitiate—generally of one year—study is continued, but the chief aim is the religious formation of the candidate; in the normal school, proximate preparation is made for the work of teaching, the essential character and studies, while more advanced academic courses, sometimes leading to the college degree, are also taken up. Such is the training course that obtains in the more progressive communities; in many instances, however, this ideal program is not strictly carried out, owing to the demand for teachers. But the tendency is steadily toward higher standards. Much has been accomplished in this direction through the work of summer institutes and summer schools conducted especially for teachers by colleges and universities. Worthy of special mention in this connection is the Sisters' College, at the Catholic University of America, Washington, D. C. Many sisterhoods are now sending picked young teachers to this institution for college and university courses as well as normal-school training. Money for the support of the schools is obtained from three sources, tuition fees, the parish treasury and endowments. The amount derived from the last-named source is practically a negligible quantity, except in the case of a few favored schools. The tuition fee—the fee ranging from 50 cents to a dollar a month—was long the prevailing source of school revenue, but of late years it has been replaced to a great extent by more simple and direct means of support, the parish treasury, especially in

the cities and larger towns. Schools thus supported are called "free schools." In many places, in accordance with the practice in public schools, textbooks are also supplied free. The salaries of sisters engaged in parish school work probably average $25 per month, or $250 per year. Brothers who teach in the parish schools generally receive from $300 to $400 a year. Teachers in Catholic schools thus receive less than one-half the salary of public-school teachers of the same class, and in many parts of the country they receive barely one-third as much. Yet out of the slender salaries the religious teachers have not only to maintain themselves, but also to save something as a contribution to the support of the mother-house and its various establishments, such as the training schools, the infirmary, etc. Only by the practice of the strictest economy, joined to the most devoted personal self-sacrifice, are the members of religious communities enabled to accomplish these objects successfully. As light be inferred from the above data elementary education in Catholic schools costs less than one-half as much as elementary education in public schools. The actual cost per capita of Catholic elementary schooling throughout the country averages only from eight to nine dollars a year.

Alongside the parish-school system there have been developed secondary schools or high schools. These belong to several distinct types: the college preparatory school; the parish high school—an adjunct of a particular parish school; the diocesan high school, under the control of the bishop; and the independent high school, conducted by a religious order and more or less independent of diocesan control. There is a strong movement toward the more general establishment of diocesan high schools, since these form an integral part of the diocesan school system and thus contribute more effectively to the unification of Catholic educational work. Notable among institutions of this class, in character and influence, are the Boys' Central High School and the Girls' High School in Philadelphia.

An important agency in the changes that have been brought about in Catholic education in the direction of more perfect organization has been the Catholic Education association, which was organized in 1904, and includes three main departments—schools, colleges and seminaries.

School Enrolment.—In the year 1918 there were 5,488 Catholic elementary schools in the United States with an enrolment of 1,456,205 pupils, and with about 36,000 teachers. Elementary pupils in high schools and academies would make an addition of about 100,000 to this number. Investigation has shown that the total actual enrolment in Catholic schools is not quite one-half that which the Catholic population of the country should normally supply, the proportion being as 893 to 1,948. This means that about the same number of Catholic children go to the public schools as go to the parish schools. There are over 100 Catholic industrial schools; many girls' schools furnish instruction in the upper grades, in practical household subjects.

Included in the total school enrolment just given are 137 schools for colored children, with an enrolment direct or indirect of about one-fourth of these being in the archdiocese of New Or-
leans. A number of teaching communities devote themselves especially to this work, several of these being composed of colored Sisters. These nun schools are maintained by receipts from general church collections and gifts from generous individuals. There were also 72 schools for the education of Indians, with 5,674 pupils. Orphanages—not included in the above total—numbered 293, with 45,056 children. There are at least a dozen Catholic schools for the deaf and dumb, with an enrolment of approximately 1,000.

Colleges.—Catholic male colleges and universities in the year 1916 numbered 84, with an enrolment of 14,846 students of collegiate grade; of these 6,177 were pursuing professional courses, while 974 were registered in engineering courses. Colleges for girls had at least 1,000 collegiate students. The enrolment in Catholic colleges is increasing rapidly, the ratio of collegiate students in such institutions to every 1,000,000 persons of the Catholic population having increased from 511 in the year 1907 to 896 in the year 1916. The movement toward the development of universities has been accelerated by the progress of American higher education, which has affected many of the larger Catholic colleges. Thirty-nine institutions now have at least one professional department, while quite a number have several professional departments, in addition to post-graduate courses of study. Pre-eminent among Catholic institutions of higher education in the United States is the Catholic University of America, which is under the direction of the bishops, and which has a large post-graduate attendance and many affiliated institutions.

The college department of the Catholic Educational Association demands a requirement of 16 units for entrance to college and 128 hours as a minimum for graduation. Other requirements relating to the work and equipment of the college have been adopted, and at the Buffalo meeting of the Association, in 1917, a committee was appointed by the colleges to carry out the work of standardization and classification. Seventy-six institutions are conducted by the religious orders. Catholic colleges and universities are as a rule self-supporting; only a few are even partially endowed, with the exception of the Catholic University. Religious professors receive no salary, and the services they render being entirely gratuitous; hence the college, being free to a great extent from the heavy financial burden of professors' salaries, is able to devote the revenue derived from student fees to its general expenses. Lay professors are not excluded, but their number is relatively small, except in a few instances. There is, however, a tendency to increase the number of lay professors; many of the colleges are endeavoring to raise endowment funds, largely with this end in view, and considerable success has attended these efforts. At any of the large Catholic colleges, if salaried laymen were to replace the religious teachers and officials, the change would involve a range of $20,000 to $100,000 a year—which would represent a capital between one and two million dollars. The gratuitously rendered services of the religious professors at the Catholic college or university are therefore equivalent to an endowment fund, and in many instances its amount will compare favorably with the endowment of the better equipped non-Catholic institutions.

Seminaries.—Catholic seminaries in the United States are either diocesan or religious, the former being destined for the training of the secular or diocesan clergy, and the latter for the training of the clergy of the religious orders. Diocesan seminaries are usually conducted by secular priests under the direction of the Ordinary, while religious seminaries are in charge of members of the respective religious orders. The diocesan seminaries, although not nearly so numerous as the religious seminaries, have in the aggregate almost twice as many students as the latter; in the year 1915 there were 21 of the former with an enrolment of 2,232, and 46 of the latter with an enrolment of only 1,394. Of preparatory seminaries—these schools cover the ground of the classical course—there were the same year 11 diocesan institutions with an enrolment of 1,727 and 23 belonging to the religious orders with an enrolment of 1,734. Saint Mary's Seminary, Baltimore, in charge of the Sulpicians, is the oldest of the diocesan seminaries, and has over 300 students. The oldest religious seminary is the Jesuit institution at Woodstock, Md., with nearly 200 students. The specific aim of the seminary discipline is the thorough spiritual formation of the candidate for the priesthood. The entrance requirements for admission to the seminary, whether diocesan or religious, involve the completion of the classical course. The length of the curriculum of the diocesan seminary was fixed by the Third Plenary Council of Baltimore at six years, two to be devoted to the study of philosophy and four to the study of theology. Practically the same length of time was prescribed for the curriculum of religious seminaries by recent legislation at Rome. Lecture courses on pedagogy and social and political science have lately been introduced into a number of the seminaries. On the material side, great changes have been made in recent decades. The new Kenrick Seminary at Saint Louis, and the seminaries at New York, Boston, Philadelphia, Saint Paul and San Francisco, as well as the new religious establishments at the Catholic University, Washington, are models in the way of modern seminary buildings and equipment. In many other instances, where there has not been a complete reconstruction of the seminary plant, notable changes have been effected, including the erection of new buildings or the extension of old ones, improved sanitary and curative arrangements and additions to the library and its equipment. Similar improvements have been made in the case of the preparatory seminaries. As a rule, diocesan seminaries are dependent upon the parish collections for their support. See also Parish Schools.

**Statistical Summary (1918)**

| Catholic population of the United States | 17,416,303 |
| Parish schools | 4,488 |
| Parish school enrolment | 1,497,395 |
| High schools | 1,260 |
| High school enrolment | 74,531 |
| Colleges and universities (1916) | 84 |
| Collegiate enrolment | 14,846 |
| Seminaries | 1,734 |
| Seminary enrolment | 6,201 |

CATHOLIC EMANCIPATION ACT.

an act of the British Parliament passed in the 10th year of the reign of George IV, 13 April 1829, by which the Catholics of Ireland were relieved of civil disabilities still persisting there after the more odious and oppressive provisions of the penal laws enacted in 1691, in violation of the stipulations of the Treaty of Limerick, had been gradually done away. For 50 years after 1691 those laws were enforced vigorously; from 1782, the year of the end of emancipation, there was a gradual relaxation. The design of those penal laws was the extermination of the Catholic religion in the island and the administration of the government purely for the benefit of the Protestant interest and the English interest. A Catholic was not permitted to be a landowner, nor even to hold land on lease, save for a brief term; the son of a Catholic could, by making profession of the Protestant religion, come into possession of his father's property, allowing to his parents annuity; if a Catholic owned a horse, whatever its value, any Protestant might legally seize it on paying to the owner $25; no Catholic priest could lawfully exercise his ministry in Ireland save under severe restrictions, and monks and friars were regarded as felons and punished as such; no Catholic could be a barrister, nor a schoolmaster; Catholics were ineligible to the Parliament of Ireland, or even as electors; they were not permitted to be freemen of boroughs. When the act of union of the kingdom of Ireland with that of Great Britain was passed William Pitt gave solemn assurance to the Catholics of Ireland that the last of their disabilities would be forthwith removed, and bills to that effect were brought into Parliament; but Pitt, giving way before the insane bigotry of King George III, did not press the measure and went out of office. The Catholics continued to demand their emancipation and emancipation, and their appeals were heard in the British Parliament; but it was seen that the hope of redress of grievances was vain unless a show of force was made, or a popular agitation set on foot. Daniel O’Connell, already a highly successful counsellor-at-law, though not a barrister, owing to his disability as a Catholic, took the leadership of the Catholics of Ireland, and from 1824 till the act of emancipation was passed, Ireland was the scene of an unparalleled agitation, never equalled in any country till the agitation for the repeal of the union with Great Britain was set on foot immediately after the grant of Catholic emancipation. The British Cabinet was alarmed by the outburst of popular enthusiasm in Ireland. The House of Commons in 1825 passed a relief bill for Ireland, but the Lords rejected it. A second relief bill, two years later, failed in the House of Commons. But the following year, 1828, the House, although the Cabinet (Wellington’s) was adverse, passed that second bill. This made the Cabinet and even the King (George IV), pause, and it was confessed that really something must be done; but the agitation must cease. The reply of the Irish Catholics was to nominate O’Connell, despite his legal disability, for membership in the Parliament and to elect him triumphantly. He was a member of the Parliament-elect, but he would not take the oath whereby he must accept the King’s supremacy in religion. It was the King and the Cabinet that had to retreat now. The bill for Catholic emancipation was brought into the House of Commons on 5 March 1829, and passed the first reading by a majority of 188 in a House of 508 members; on the second reading the majority was 180, and on the final vote it was 178 in a House of 462. Even in the Lords the measure was passed by a good majority and the bill received the King’s assent. The rights and privileges accorded to the Catholics of Ireland by this act were: That they were not to be required to take the oath of supremacy; that they became admissible to all offices in corporations and to enjoyment of civil rights. But no Catholic could be regent or lord chancellor, either of Great Britain or of Ireland; and they were incapable of holding offices connected with the Established Church or the universities. In all other respects the Catholics were to stand on an equal footing with Protestants. In 1871 the Roman Catholic oath and the declaration concerning transubstantiation were abolished.

CATHOLIC EPISTLES, a group of seven letters in the New Testament which are addressed by apostles to the faithful in general, not to particular churches, as is that to the Philippians, that to the Ephesians, etc.; nor to individuals, as are the epistles of Paul to Timothy, Titus, etc. The Catholic or general epistles are those of James, 1 and 2 Peter, 1, 2 and 3 John, and the epistle of Jude. These same epistles are also styled Canonical, signifying, according to Calmet, that they contain excellent rules (canones) of faith and morals. Consult Gloag, 'Introduction to the Catholic Epistles' (Edinburgh 1887); Sanday, 'The Biblical Inspiration' (London 1890); and Bigg, C. A., 'Commentary on Saint Peter and Saint Jude' (Edinburgh 1902).

CATHOLIC INDIAN MISSIONS, Bureau of, an organization of the Roman Catholic Church, established in 1874 by the archbishop of Baltimore in behalf of the Catholic prelates having Indian missions within their respective dioceses, in order to represent before the government the interests of these prelates in all matters appertaining to Indian affairs. By decree of the Third Plenary Council of Baltimore it was recognized as an institution of the Church and placed under the charge of a commission of seven prelates. This committee was dissolved in 1894; and the bureau as then constituted was superseded by a new corporation. The chief work of the bureau is the establishment of schools among the Indian tribes and obtaining funds for their maintenance. The bureau publishes each year a report of the
CATHOLIC INDIAN MISSIONS OF THE UNITED STATES

director, and its past publications include "Annals of Catholic Indian Missions in America" (1828-81) and the Bureau of Catholic Indian Missions (1874-93). From time to time it circulates statistics concerning its work. See Indian, Catholic Education of The.

CATHOLIC INDIAN MISSIONS OF THE UNITED STATES (referring exclusively to actual missionary effort made within the present boundaries of the United States).

Early Period.—Although priests had visited the present territory of the United States previous to the advent into New Mexico of the Franciscan Friar Mark of Nice (1539), Catholic mission work properly dates from the expedition of Coronado the year following. Franciscan friars were the pioneers; it was chiefly they who evangelized the tribes of Florida, Texas, New Mexico, Arizona and Upper California. Their exceedingly long roll of missionaries, many of them martyrs, contains such illustrious names as John of Padilla, the prototype of the United States missions (New Mexico 1542), Francis Pareja (Florida 1612), who published several treaties in Timuquana, his "Doctrina Christiana" being the first work in any Indian language of this country to issue from the press; Ven. Anthony Margili of Jesus (Texas 1716); Junipero Serra (California 1769-84). The Dominicans gave to Florida Luis Cancer, the martyr (1549), Dominick of the Annunciation, Salazar and others (1559). The Jesuits were pre-eminent of the apostles of the North; their missions extending from Maine to the Mississippi River. They also announced the Gospel in many other portions of the country. Among their best-known missionaries were Martinez (Florida 1506); Rogel (South Carolina 1569); Kühn (Arizona 1687); the illustrious martyr Jogues (New York 1645); Chaumont and Dublon (New York 1654); Le Moyne (New York 1661); Allouez (Wisconsin 1670); Marquette (discoverer of the upper Mississippi 1673); Rale (Maine 1724); Duchesnion (Natchez 1729). Besides Franciscans and Jesuits, other priests engaged in the work, and Christianity was preached to the natives throughout the length and breadth of the land.

Results.—In many instances the missions flourished exceedingly; the Indians received a rudimentary education and were brought to a high state of civilization. In 1630 there were in New Mexico about 35,000 Christian Indians, living in 90 pueblos, each pueblo having its church, attended from 25 mission residences. In 1634 there were in Florida 35 Franciscans maintaining 44 missions, while the Christian Indians numbered between 25,000 and 30,000. In California the results were equally satisfactory. The fruits of the labors of the early missionaries may still be seen among the Indians of New Mexico, Arizona, California, Minnesota, Wisconsin, Michigan and Maine. The missionaries not only evangelized the Indians, but they have placed the whole world in their debt by their work of exploring and colonizing, and by their contributions to science. They wrote exhaustively on many topics, and, moreover, preserved to posterity the Indian languages by means of numerous lexicons, grammars and books of devotion and instruction.

The Missions Revived.—In the last century the tribes of the great Northwest were evangelized principally by the modern apostle of the Indians, Peter Lorett (1838-73) and his Jesuit co-laborers. The Jesuits, moreover, established missions among the tribes of Alaska. Other noted missionaries of the period were the Benedictine monks, who have met with marked success, especially in Minnesota and the Dakotas; Bishop Hennepin (Michigan 1830-68); Archbishop Blanchet (Oregon 1838-80); Bishop Marty, O.S.B. (Dakota 1876-94).

One of the results of President Grant's "Peace Policy" was the establishment, in 1874, at Washington, D. C., of the Bureau of Catholic Indian Missions to represent Catholic Indian interests at the seat of government, to superintend Catholic agencies and to obtain other agencies falling by the terms of the peace policy to the Catholic Church. In fulfillment of the peace policy, the bureau turned its attention to the establishing of schools and the aiding of missions, and since the withdrawal of government aid from Indian mission schools, it provides financial aid to such Catholic institutions. The history of the bureau since its inception is intimately bound up with that of the missions. It has established over 50 schools, which represent an investment of more than $1,000,000. The name most prominent in Catholic Indian mission work of the present day is that of Mother M. Katharine Dreixel, foundress of the Sisters of the Blessed Sacrament for Indians and Colored People, who has devoted her life and a very large fortune to mission work among the Indians and negroes.

Present Status.—The tribes wholly or partially Catholic are: Arickaree, Assinaboine, Abenaki, Blackfeet, Cœur d'Alene, Chippewa, Crow, Colville, Digger, Flathead, Gros Ventre, Huron, Kalapuya, Mohawk, Mandan, Menominee, Mission, Nez Percé, Osage, Ottawa, Potawatomi, Piegans, Passamaquoddy, Pueblo, Papago, Pima, Quapaw, Sioux, Saint Regis, Tinineh, Tulalip, Umatilla, Winnebago, Watachita and Yakima. Catholics are also to be found among the Arapahos, Chocataws, Cherokee, Chickasaws, Creeks, Comanches, Cayugas, Miamis, Northern Cheyennes, Otos, Oneidas, Poncas, Peorias, Stockbridges, Sauk and Foxes and Yumas. Most of these tribes are provided with missions, while a number of others live in the vicinity of missions and fall under Catholic influence. Consequently Catholic Indian mission work is carried on in Alaska, Arizona, California, Idaho, Kansas, Minnesota, Michigan, Maine, Montana, Mississippi, New Mexico, Nebrask, New York, North Dakota, Oregon, Oklahoma, South Dakota, Washington, Wisconsin, Wyoming. Elsewhere small remains of tribes are cared for by the parochial clergy. More than 150 priests, both secular and regular, aided by catechists (Indian and white), labor on the Indian missions. The total number of priests, teaching brothers, lay brothers, scholars, sisters and secular teachers engaged in Indian educational work is about 650. There are about 100 schools (teaching and boarding), with over 6,000 pupils; about 200 churches and chapels; and the value of church and school buildings is not less than $1,500,000. The mission records show annually about 3,500 baptisms, 600 Christian marriages, 1,200 Chris-
CATHOLIC KNIGHTS OF AMERICA

Catholic burials. Of a total Indian population of 291,014 about 100,000 are Catholics.

Rev. W. M. H. Ketcham, Director of the Bureau of Catholic Indian Missions, Washington, D. C.

CATHOLIC KNIGHTS OF AMERICA, a fraternal organization, founded in Nashville, Tenn., in 1877 and chartered under the laws of Kentucky in 1880. Its object primarily was mutual life insurance, but its scope was eventually extended to include the endeavor to unite all acceptable Catholic Knights of every profession, business and occupation; to give all possible moral and material aid in their power to members of the organization, by holding instructive and scientific lectures, by encouraging each other in business, and by assisting each other to obtain employment, and to establish and maintain a benefit fund for the benefit of the families of the members. The benefit fund is distributed according to well-established insurance rules. The age limits for admission are from 18 to 45. At first men only could become members; but since about 1901, women have been allowed admission on the same conditions as men, except the age limits for women are 18 to 40. The executive power is vested in the Supreme Council (National) with headquarters in St. Louis, Mo., the State councils and the officers of the local branches. In 1913 there were 560 branches in the United States, with a membership of 18,300 with a total insurance of $20,610,171. The organization had total assets of $1,168,541, including the reserve fund of $828,000. The claims paid in 1913 amounted to $540,662. Since its organization there has been paid to beneficiaries nearly $15,000,000; but the material aid has been slight compared with the spiritual, moral and intellectual benefit the organization has effected. This is the pioneer Roman Catholic fraternal organization in the United States.

CATHOLIC MAJESTY, a title given by Pope Alexander VI to the kings of Spain, in memory of the complete expulsion of the Moors from Spain in 1491 by Ferdinand of Aragon. But even before that time several Spanish kings are said to have borne this title.

CATHOLIC MISSIONARY UNION, The, an organization of the Roman Catholic Church established "to procure the services of clergymen and laymen at the Church to teach and preach as missionaries of their faith in the United States and in furtherance of religious opinions"; "to lease, take, hold and purchase places, buildings and lands for such teaching and preaching"; to provide for the maintenance of the workers; to publish and distribute books, pamphlets and other reading matter in connection with these efforts, and to aid archbishops, bishops and other Church authorities in the United States to establish and conduct missions within their jurisdictions. Its practical activity takes the form of the collection of funds to enable bishops of the various dioceses to reserve diocesan priests for missions to non-Catholics within their various jurisdictions and to maintain such missionaries in their work. The Apostolic Mission House, on the grounds of the Catholic University, Washington, D. C., is the training-school for diocesan missionaries.

CATHOLIC MUTUAL BENEFIT ASSOCIATION, The. This Association was organized in Niagara Falls, N. Y., July 1876 and was incorporated by the legislature of the State of New York in 1879. It does a fraternal life insurance business, furnishing protection to its members in amounts of $500 to $2,000. It has 64,000 members; 800 local branches throughout United States and Canada; has $82,000,000 insurance in force; and has disbursed over $31,000,000 to families of deceased members, over $1,500,000 being disbursed annually. Its assets amount to about $2,000,000. The qualifications for membership are that a man shall be a practical Catholic, physically sound, of the full age of 16 years and under the age of 50 years. The Corporation is known as the Supreme Council of the Catholic Mutual Benefit Association, and is composed of representatives from each Grand or State Council in addition to its own officers and holds its conventions triennially. Grand councils are composed of their own regular officers and one representative from each branch in their jurisdiction and meets triennially also. The reserve fund is surrounded by the safest and most reliable safeguards for its protection. The Association was one of the first to establish a reserve fund. It has adequate rates, and has complied with the laws of the State of New York, in which it is incorporated, and also with the laws of other States requiring solvency from an actuarial standpoint.

CATHOLIC PRESS OF AMERICA

The formative period of Catholic journalism was an era full of struggles and anxieties when unreasonable attacks were made upon the liberties of Catholics; for at that time the tenets of the Roman Catholic Church were very poorly understood and oftentimes misrepresented by those who were ignorant of her beliefs or who mistrusted her influence. As the forerunners of the Catholic newspaper were the Irish journals. Although these papers were not distinctly Catholic in purpose, their sympathetic tone toward those of the ancient faith merits for them a place in any description of Catholic journalism. In fact, more than a decade of American history had passed before any Catholic periodical, properly so called, was established. Hence, during this time the principal champions of Catholic doctrines and practices were the Irish papers. As citizens of the United States, the Irish editors frequently were forced to defend with vigor their civil and religious liberties against their enemies, through the kingly power of the press. For years they had fought against British tyranny in Ireland, and in struggle for freedom they engaged some of the brightest and most intelligent of Erin's sons, many of whom afterward came to America. The soul of this movement was the Society of the United Irishmen, founded in 1791. The purpose of this celebrated organization was to unite Catholics and Protestants into one body devoted to the
parliamentary reform of Ireland. The contributions of Emmet, Sampson, MacNevin and others to this patriotic and active land attracted universal attention. Matthew Carey, William Duane and others in America assisted the efforts of the parent society by their fearless advocacy of the doctrines of the United Irishmen, and that in the face of a Federalist opposition which was beginning to manifest itself at that time. The Federalist press used every species of attack against these Irish associations. The neutralization of existing prejudices and the creation of a more favorable public opinion were the chief causes which prompted the establishment of Irish journals in which the affairs of that nation might be truthfully stated. This need was met by the Irish Catholic weeklies published principally in the two great centers of population, New York and Philadelphia. With one or two exceptions the Irish newspapers, down to the year 1840, had an ephemeral and rather precarious existence. The Shamrock, or Clerical Chronicle, was first issued on 15 Dec. 1810. It suspended publication four times before it was finally discontinued. One of the most eventful years of this paper's career occurred when Rufus King, formerly Ambassador to England, was running for governor of New York. Thomas A. Emmet, on that occasion, came out openly in the press and attacked King with the overwhelming force of his clear and brilliant mind. In March 1816 a systematic opposition to King, headed by Emmet, swept through New York. As the editor of the Shamrock, Emmet smote this Caesar with their trenchant quills; they sealed the political fate of one who had been an enemy in their fight for civil and religious liberty. The power of Rufus King, the cunning and crafty adversary of the United Irishmen, was broken. It is true that he continued in public life until 1826, but he was no longer "the first man in the country." His attitude toward the Irish while at the Court of Saint James was exposed by speeches, letters and editorials. Even his correspondence was used against him with telling effect. He was defeated for the governorship of New York and in 1816 gave up the cherished ambition of his life, the hope of being the chief ruler of the nation. After the checkered career of the Shamrock, other papers began to appear in the great centers of population. The Globe and Emerald began publication in 1824 in New York and Philadelphia respectively. Then came the Truth Teller with its long and interesting history (pp. 53). In 1828 the Irish Shield and Monthly Miscellany made a bid for patronage. Its editor entered upon a suicidal policy of persistent attack on a paper already well established and accomplishing much good in Catholic circles, George Pepper became involved in a libel suit and left New York without a friend. He settled in Philadelphia, where he began the Irish Shield and Literary Pannorama. This was followed in 1832 by the Patriot and Shield, and finally the same year there appeared the Republican Shield and Literary Office. In 1835, a new paper, Truth Teller, called the Irish Advocate, was started. In its race for favor the new paper claimed not to enter as an antagonist, but as a fair and honorable competitor. Yet in the course of events it soon became apparent that its jealous editor betrayed at times in his conduct the same picaroon instincts for detraction and reviled the asperities of the infant terrible, the Irish Shield. Another ephemeral journal whose history is shrouded in obscurity was published in Charleston, S. C., in 1829. It was first known as the Irishman and Charleston Weekly Register, but it soon changed its name to the Irishman and Southern Democrat. The last Irish paper of this era, the Green Banner, started 3 Oct. 1835, was a creature of circumstance, and in 1837 on account of certain ecclesiastical difficulties its editor, Father Levis, was obliged to discontinue this otherwise ably-conducted journal. Certain other periodicals, national in their tendencies, were published during this period. Among these we must record the Michigan Essay and Impartial Observer, printed in 1809. This was the earliest effort in Catholic pioneer journalism. The little paper owes its origin to Father Gabriel Richard. This illustrious American missionary journeyed to Baltimore in 1808 and on that occasion purchased a printing press and a font of type. These he brought overland to Detroit, setting up his press at Spring Wells in the house of Jacques LaSalle. Many persons have claimed for this press the honor of being the first to be set up in the Northwest, but it is to be questioned whether it was the first in operation in Detroit itself, for there were proclamations issued to the people of this vicinity by Lieutenant-Governor Hamilton as early as the year 1777. The documents were dated at Detroit, though it was not until 1809 that press had been printed there. Strange to say, these were the only printed papers that were, over a long stretch of years, credited to Detroit as the place of issue. Some have concluded that the lieutenant-governor's proclamations were dated from Detroit but printed elsewhere. Another press was owned by Alexander and William Macomb, who received it from England in 1785, but there is no evidence that it was ever put in operation. The Michigan Essay was not, however, the first newspaper printed in the Northwest. Various papers were already being printed in the territory before the year 1800. Cincinnati and Chillicothe can boast of this means of enlightenment before 1809. In 1824 a Spanish periodical appeared in Philadelphia under the strange appellation, El Habanero. This magazine was not professedly Catholic, but since it contained articles on ecclesiastical subjects and was conducted by a Catholic priest, the Very Rev. Padre Don Felix Varela, the journal may with propriety be classed among the contributions to early Catholic periodical literature. Father Varela figured conspicuously for many years as a newspaper editor and controversialist. In 1829 he wrote also for a magazine called El Messagerso Semanal, conducted by Father Sanchez in Philadelphia. The first strictly religious journal established in this country in defense of Catholic doctrines was the United States Catholic Miscellany. It began on 5 June 1822. One may easily understand the need there was for this paper when one considers that Catholics in the newly founded diocese of Charleston were very few, and were scattered over the territory which now embraces the three States of North Carolina, South Carolina and Georgia. At the period of the American Revolution hardly a
CATHOLIC PRESS OF AMERICA

single Catholic lived in the whole extent of that country, and the people who inhabited this part of the United States were ignorant of Catholic doctrines and practices. Bishop England, the first editor of the *Miscellany*, was quick to recognize the needs of Catholics in America. Among other things, he saw the secular press so filled with absurdities and misrepresentations concerning Catholicism that he felt it was his duty to take up the pen to answer some of these attacks against his religion. The prelate was certain that if he could disarm the honest prejudices of the landed aristocracy in the Carolinas he could soon find his way into their esteem. Once the more independent classes of society were won over, he felt that little effort would be required to influence their less wealthy neighbors. Among the papers located in different parts of the United States which helped to defend the faith in these stormy times, one might mention the *Catholic Press*, of Hartford (1829), the *Jesuit and Catholic Sentinel* and its successors in Boston in 1829, the *New York Register* and *Catholic Diary* (1832), the *Shepherd and Farmer* of St. Louis (1837), the *Catholic Herald* of Philadelphia (1833), the *Catholic Journal* of Washington, D. C. (1833), the *Catholic Advocate* of Bardstown (1836), with its immediate precursor, the *Minerva*, and the *New York Catholic Register* (1839).

Besides these, there were four journals which were fortunate enough to survive the trials and vicissitudes of this exciting period, the *Catholic Telegraph* of Cincinnati (1831), *Der Wahrheitstreund* (1837), the *New York Freeman's Journal* (1840), and the *Pilot* of Boston (1837).

In drawing this brief outline of the pioneer efforts of Catholic journalists we must not fail to notice the deleterious influence exercised by journals relying in a great measure on Catholic patronage, but whose editors made religion the medium through which much harm was done to the Catholic cause in America. During the year 1822, when the Hogan schism was at its height, the journals of Philadelphia vied with one another in catering to the unpleasant strife. The following papers were frequently employed as organs by the schismatic Hoganistes: the *Democratic Press*, the *Aurora*, the *National Gazette*, the *American Sentinel* and *Merchants' Advertiser* and the *Columbian Observer*. Besides the virulent attacks on Catholics contained in the daily press, there were two weekly papers conducted by the Hoganistes, which defended the position of that party with all the ability of which they were capable. These journals were the *Apostolic Herald* and *Weekly Register* and the *Erin*. Of the former we know little, as there are but a few copies extant. It was the chief organ of the schismatics and was conducted by E. F. Crozet. The witches' cauldron in Macbeth was not filled with words of ambition than might be found in the *Catholic Herald*. So blasphemous was its tone toward Catholic matters generally that it must have even shocked the slumbering consciences of the stubborn Hoganistes. The *Erin* was brought into existence by Finotti's *Bibliografia* as "an angel's name with the devil's tongue." Like every other Irish journal which appeared before or after it, this paper claimed to be a defender of the liberties of Irishmen against persecution. Combating this formidable array of discordant and biased journals, the Catholics possessed one lone journal in Philadelphia which was gage for truth and justice. It appeared for the first time on Saturday, 22 Feb. 1823, but after a few issues ceased publication. The whole disposition of Catholic journalism during the first half of the 19th century seems to have been to promote the interests of so-called pure Catholics from the pathway of non-Catholics the groundless prejudices and prepossessions which had grown up into social barriers, due chiefly to the circulation of misrepresentations and calumnies by the enemies of Catholicism in Europe and America, and the supineness of the Catholic body at large in the face of these fabrications. Until the year 1840 the general policy of Catholic journalism was a defense of Catholicism by vigorous appeals to reason and dogmatic pronouncement and was more the subject of spirited controversy. Catholic doctrines during the epoch were very imperfectly understood by those outside of the Church. There was a predisposition on the part of all sectarian papers to depict in a most repulsive manner Catholic doctrines in every conceivable way. After the year 1840 there began among the non-Catholics of the land a formulation of better and clearer judgments, which result had been brought about largely by the successful conflicts carried on by Catholic journalists. The newspapers of this period give a contemporary view of the life and spirit of Catholicism in America. It will be impossible, within our space, to give any detailed information regarding the newspapers and magazines that have been founded since these pioneer days. At the present time there are being published 128 newspapers, 128 magazines, 30 quarterlies, 9 bi-weeklies, 9 bi-monthlies and 16 annuals. The State of New York leads in number of Catholic newspapers. The checkered careers of these papers only give us an idea of the trials and vicissitudes of editors elsewhere. In 1848 Thomas D'Arcy McGee started *The Nation* but the editor soon precipitated a controversy with Archbishop Hughes who withdrew his support from the paper and *The Nation* ceased after two years' existence. McGee's next venture, the *American Celt*, had a rather unsettled career. It was published first in Boston, then in Buffalo and finally in New York. It was here purchased by D. and J. Sadlier who gave it the name of *The Tablet*. Quite a galaxy of famous editors at one time or other enlivened the columns of this journal. Dr. J. V. Huntington, Bernard Doran Killian, Wm. Denman, Dr. O. A. Brownson, the editor J. A. Ogden, Lawrence Keough and D. P. Conyngham gave some of their best years in journalism to build up the prestige of this paper. During the course of the year 1859 the *New York Freeman's Journal*, conducted by James McMaster, gave an account of the Irishmen's trial before a constitutional court on account of the idiosyncrasies of its editor. This necessitated the establishment of the *Metropolitan Record* which continued until 1873. In the dying days of the *Metropolitan Record* there appeared in it a brilliant and aggressive and practical journalist, Patrick V. Hickey, who edited the *Catholic Review* until his death in 1889. At that time Dr. John Talbot Smith took up the work and gave to the journal those rare talents which have always
distinguished his writings. In 1886 the Catholic News was founded by Hermann Rider. During his career, the newspaper was under the leadership of Dr. Shea, who passed away in 1892. The Catholic Examiner was also under his editorship. The News is now under the editorial direction of Michael J. Madigan. The neighboring city of Brooklyn made several attempts in Catholic journalism, most of which have been short-lived. In 1882 the Catholic Union was begun. This was followed by the Leader in 1884. Of more recent origin is The Tablet which is now the diocesan organ. The Catholic Union and Times published in Buffalo has always been under strong editorial management. The Catholic Union was started in 1872 by Rev. Louis A. Lambert, a man of vigorous yet well-disciplined mind. The editorship later passed to Rev. Patrick Cronin who was a leader among the journals of the day. When the Tablet was not established, two other Catholic newspapers have also been established in other cities of New York State, principally in Albany and Syracuse. In Albany the earliest was the Catholic Pioneer in 1853. All succeeding ventures proved unsuccessful owing to a lack of support. In Syracuse during the second half of the 19th century, several attempts to maintain Catholic weeklies ended in failure. The Catholic Reflector, the Catholic Vindicator and the Catholic Sentinel, each had a feeble existence and ceased publication. The present Catholic Sun is published there. In Philadelphia the need of a Catholic newspaper was felt more urgently than elsewhere on account of the canker-worm of trusteeism. This led to the establishment of the Catholic Herald in 1833. Moreover the number of religious periodicals increased with such startling rapidity about the middle of the third decade of the 19th century that very few denominations were without a weekly journal in which they could advance and defend their respective views of doctrine and church government. Needless to say, controversies arose on all sides which became more bitter as time went on and these finally terminated in 1844 in bloodshed, arson, desecration and destruction of church property. In 1856 the Herald was consolidated with the Visitor, under the management of James McDonald, Charles S. Greene and Charles A. Reppier. It ceased publication about the end of the Civil War. Another Catholic Herald was started in 1872 and did not long endure. In 1866 the Catholic Standard was first published. After a series of trials, such as was the lot of all newspapers of this period, this paper was amalgamated with a rival The Times, started by Rev. Louis A. Lambert in 1892. The new combination known as the Standard and Times was brought about in 1895. To-day this is one of the most authoritative organs of Catholic opinion in America. The only other city in Pennsylvania which has contributed notably to Catholic journalism is Pittsburgh. The Pittsburgh Catholic was begun in 1844 by Bishop O'Connor. It has always been ably conducted and it is one of the few early journals to brave the storms of adversity and has grown strong in the defense of Catholicism and its ideals. The summary of early New England journalism is but a panorama of the revivals of religious thought. Long ago upon the centuries of Puritan ascendency in America, the descendants of the Pilgrim Fathers had little to be proud of in their treatment of Catholics. As time went on, a little more toleration was practised but Roman Catholics were long regarded as the objects of Puritan distrust and their religion considered "subversive of society." With the War of Independence, the condition of Catholics began to improve but in Boston the admonition of General Washington was required to calm the passions and the prejudices of its populace. For years there lingered within the confines of the Puritan heart mistrust and apprehension of the Catholic religion. After the framing of the constitution they threw all their prestige into the Federalist party and succeeded in electing John Adams. Hardly had he gained power than, listening to their promptings, the Congress passed the celebrated Alien and Sedition laws. These imprudent measures caused the horde of immigrants that had sought refuge in the ranks of their opponents, the Jeffersonian or Republican party. To crown their perfidy as a political organization, the Federalists in 1814, through the Hartford Convention, called a protest against the War of 1812 and recommended that, "naturalized foreigners should be debarred from membership in Congress and from all civil offices under the United States." Such in brief, forms, as it were, the historic background of Catholic journalism in New England.

Boston, being the chief metropolis of New England, presented a fair field for the Catholic journalist. As early as the year 1829 the Jesuit or Catholic Sentinel was established. This lasted under various names until 1836. During the course of seven years this journal had the following titles: The Catholic Intelligencer, the Jesuit, the Irish and Catholic Sentinel, Literary and Catholic Sentinel and the Boston Pilot. In 1837 it suspended publication and after some months Patrick Donahue summoned up sufficient courage to give Catholic journalism in New England another trial. The Pilot was the name given to the new journal. It was at first a national, rather than a religious paper. The Irish of Boston did not care for it as it contained news from Ireland. They helped to build up the circulation of the Pilot. In 1842 Thomas D'Arcy McGee, whose brilliant talents were but in their dawn, became the editor. Another editor of some note was Rev. Father Fennotti, who assumed charge in 1852, but his diary states that he had no great love for Patrick Donahue, the publisher. In 1870 the Pilot was fortunate in obtaining the services of one who has done more to elevate Catholic journalism from mediocrity than any one preceding him, John Boyle O'Reilly. His genius as a writer was recognized both by the religious and secular press and the influence, therefore, of the Pilot became nation-wide. Two editors that maintained the high standard set by O'Reilly were James J. Roche and Katherine Conway. Among the numerous other papers that soon followed the Pilot, we may mention the Catholic Observer (1847), edited by Orestes A. Brownson, the Republic in 1881, Sacred Heart Review (1888), Connecticut
Catholic in 1876 which afterward became the diocesan organ with the name of the Catholic Transcript. Another well-edited New England paper is the Providence Visitor. Scattered throughout the South various newspapers have from time to time been published, most of them being forced to suspend publication after a few years of precarious existence. The Catholic Mirror of Baltimore, started in 1849, had considerable influence before the Civil War, but after that time its prestige waned although the paper was issued until 1908. The Catholic Guardian of Louisville, begun in 1858 but lasted only four years. The Catholic Advocate of earlier days was revived in Louisville under the name of the Central Catholic Advocate. In 1896 it consolidated with the Midland Review but despite the combined circulation and the services of the versatile editor, Charles J. O'Malley, it died after four years. In New Orleans the Morning Star was conducted by Rev. Abram Ryan and James R. Farquhar with considerable ability. In Memphis the Southern Catholic (1874) continued and gave place to the Catholic Journal. At Saint Louis the Western Watchman (1865) has survived mainly through the personality of Rev. D. S. Phelan, who, like McMaster of the French Family, was one of the most active in Catholic journalism. In Ohio, the Catholic Universe established in 1874, and the Catholic Columbian (1875), as well as the Catholic Record of Toledo (1905), are still doing excellent service for Catholicism. The earliest venture of Catholic journalism in Illinois occurred in 1852 when the Western Tablet was started in Chicago. Several feeble efforts were without success until the New World was established in 1892, with Charles J. O'Malley as editor, reaching the acme of its greatness under his supervision. In 1895 the Western Catholic was started at Quincy, Ill., and is still being published. In recent years Indiana has established two newspapers, the Indiana Catholic, under the editorship of Rev. P. Mahony, and Our Sunday Visitor, published by Rev. Dr. Noll. This latter journal has done much in allaying persecution and in countering the influence of anti-Catholic journals. Its circulation is by far the largest of any Catholic journal in the United States. Our Sunday Visitor has a circulation of close to 2,000,000. The interests of the archdiocese of Detroit are looked after chiefly by the Michigan Catholic.

Within the last quarter of a century many journals have appeared in several States beyond the Mississippi. There are only two that antedate that period that are still being published: The San Francisco Monitor begun in 1852, and the Catholic Sentinel of Portland (1879). The following is a list of the journals that are still being published: The Intermountain Catholic (1899), Catholic Tribune of Dubuque (1899), True Voice (1903), Catholic Register of Kansas City (1899), San Francisco Leader (1892), Catholic Herald of Sacramento (1908), Tidings, of Los Angeles (1895).

The early efforts in journalism editing met with the same discouragements that the newspaper men experienced. The first quarterly review of any kind to be started in the United States (The American Review of History and Politics) — was edited by Robert Walsh, a Catholic, during the year 1811—12. In 1819 a magazine was begun, known as the Globe. This was the outgrowth of the Shamrock or Hibernian Chronicle. It is doubtful whether there are any numbers of it extant. The Metropolitian started in 1830 and was the first Catholic magazine, strictly so called. It was filled with bright gems of Catholic scholarship and had all the claims to immortality but one — patronage. Consequently the monthly was allowed to perish after a brief existence of only one year. Another magazine by the same name was started in 1853 but shared the same fate. A juvenile magazine was founded in 1835 in New York city, known as the Children's Catholic Magazine. Only one similar venture had preceded it, a weekly called the Expositor published in 1830 under the same auspices as the Jesuit in Boston. In the establishment of the Children's Catholic Magazine, the editor was but following the example of other denominations. It was observed that these journals had increased nearly tenfold in a ten year period, and these periodicals were being liberally patronized and most extensively circulated. Even the most mediocre could claim 5,000 patrons while some of the better class of children's magazines had already 20,000. The Children's Catholic Magazine had 13,000 subscribers. Due to poor management it lasted only two years and then suspended publication and was later revived under the name of the Young Catholic Magazine. In 1842 another monthly magazine was started in Baltimore called the Religious Cabinet. At the end of one year its name was changed to the United States Catholic Magazine. This review was discontinued in 1847. It had as its contributors some of the best Catholic thinkers of that time, both lay and clerical. Brownson's Quarterly Review was published in 1844, suspended in 1864, revived in 1873 and finally ceased in 1875. Dr. Orestes A. Brownson was a man of great erudition and a scholar of high reputation. He attracted many readers to his journal. Catholics and non-Catholics alike regarded him as the best philosophical thinker of his time in America. The Catholic World, a monthly magazine, was started in time by the present editor of the Paulist Fathers. This review is now regarded as one of the most conservative and authoritative Catholic journals in the United States. Its prestige has grown to such a degree that it is consulted by all religious denominations. Another review, Ave Maria, started just one year later, being founded by Father Sorin of the Congregation of the Holy Cross, Notre Dame, Ind. This magazine enjoys a very high literary reputation and has perhaps the widest circulation of any Catholic magazine in the United States. It has readers in every part of Christendom. Its staff of contributors are some of the best and most representative Catholic writers in Europe and America. In this same year The Messenger of the Sacred Heart was founded by the Jesuits. This was supplemented by another magazine more literary in character called The Messenger. In 1910 it was replaced by America, a progressive weekly that immediately became a leader in Catholic journalism and now enjoys a wide circulation. The American Catholic Quarterly Review.
began in 1876 and is another high class periodical occupying a place similar to Brownson's Quarterly, during the middle of the 19th century. It affords a medium whereby Catholic erudition as a scholarship and exposition is given. The following reviews are of more recent origin: Rosary Magazine (1891), Benziger's Magazine (1898), Extension Magazine (1907), Catholic Fortnightly Review, Saint Vincent de Paul Quarterly, and others. In the last 50 years many magazines with a more limited scope have been founded. Some have succeeded, others have failed. The Ecclesiastical Review and the Homiletic Monthly are two professional magazines for the clergy. Since 1911 the Catholic Educational Review has done excellent service in its particular field. Another publication that looks after the interests of primary and secondary education is the Catholic School Journal. Catholic history has been gathered through its columns and distributed to the American Catholic Historical Researches, Records of the American Catholic Historical Society of Philadelphia, Records and Studies of the United States Catholic Historical Society, and another quarterly called the Catholic Historical Review, published at the Catholic University of America. Another product of the scholarship of the same university is a new monthly periodical, the Catholic Charities Review. Among those that failed we may enumerate the De La Salle Monthly (1867), later changed to the Manhattan Monthly, the Young Crusader (1868), the Catholic Record of Philadelphia (1871), Central Magazine of Saint Louis (1872), Domineau's Magazine (1876), Catholic Reading Circle Review, Mosher's Magazine, The Dolphin, the New York Review (1905), and the Globe Review.

As we take a retrospect of the whole history of Catholic journalism we are confronted with the ever-recurring failures, due in large measure to a lack of patronage. From this observation we are led to inquire why Catholics have not more generously supported the Catholic newspaper. The reason is not far to seek, for the Catholic press is in a sense the people's press, the people's organ. There are elements necessary for the cultivation of enlightened expression on problems of the day. First, we must have a thinking people to create sound opinion. Secondly, we must have a means of disseminating it among others. There are leaders in all communities who must be moulders of the best thought. There are also master minds who must analyze it and separate the gold from the dross. With no man thinking or leading generations through their courses and die. One of the ideals, therefore, of Catholic journalism is: to develop the Catholic mind along correct principles. The Catholic press is needed to defend the right, to advance the truth, to maintain order, morality, intelligence and culture among the adherents of the Church. There is no reason in the world why this high moral and intellectual tone cannot be developed to its fullest in Catholic journalism. The production of genuine Catholic taste and genius is even more possible than in other departments. Spiritual indolence, mental inertia and indifference are the only obstacles to its success. It was the journalistic genius of John Boyle O'Reilly that made the Boston Pilot in his day the greatest Catholic newspaper in America. It was the classic style and polished diction of Bishop England that perplexed his most clever antagonists and compelled them at the end of their controversies with him to admire his pro- dor, his matchless courage, his firmness and gentleness of character. It was the persuasive- ness and mental acuteness in the writings of Archbishop Hughes that vanquished the yellow journalists of his time and overcame their shame and confusion. It was the keen and analytic mind of Orestes A. Brownson, the philosopher, that commanded the spontaneous respect of the intellectual leaders of his age. But the Catholic press, through the prestige of such thinkers as these, has even a broader aim. It would have its ethical influence extended to and absorbed by American journalism in general. History has taught that public morality is a condition to any national life. When a nation ceases to esteem and practise the virtues of truthfulness, honesty, integrity and justice, it does not desire to live. Our government requires a higher plane of public morality than does despotism or monarchy. It is within our means to make a serious effort to improve our press by formulating principles which regenerate and strengthen the body of ethical truth by the development of correct sentiments in the press. In this effort the thinking people of the Catholic Church, the most powerful numerically in the United States, can exercise a tremendous influence through the service of the Catholic newspaper as a directing force. Very many people get firm convictions by habitually reading a certain journal. Great then is the moral influence of the press for good or evil. Our modern life mirrors the journal more effectively than news columns reflect life. This is no place for an indictment of the daily press. It is sufficient to say that our metropolitan newspapers of to-day devote over half of their first page to scandals, suicides, divorce proceedings, robberies, murders and other abominable social barbarities. If this is evidence of the moral decadence of our democracy, then there is a clear duty for all of us. The failures we see on every side are due to the fact that few think of their vocation as being valuable chiefly as the means of mental and moral improvement. We would remind the journalist that his office is one of public trust. His moral mission in society is to instruct or direct the masses, but to accomplish this he must practise and pursue a sound moral policy. We ask for editors strong, upright men, whose very utterance is the touchstone of a moral mind.

Here, then, is our ideal. We know that in the past men like John Boyle O'Reilly, Bishop England, Archbishop Hughes and Orestes A. Brownson gave a stimulus and a prominence to Catholic journalism that reflected itself in a national way. They compelled recognition and respect from Horace Greeley, Henry Jarvis Raymond, James Gordon Bennett and a score of other prominent newspaper men. John Boyle O'Reilly perhaps did more to clear away prejudices than any other editor of his day. He must be regarded as the premier Catholic journalist of the 19th century.

Catholic journalism in our day demands that we must secure the best journalistic ability and pay well for it. If the Catholic press is to measure up to the ideal set, if it is to be a mighty power
for good, the co-operation of the laity is necessary. The past has demonstrated that without this generous assistance there can be no great standard of excellence, no great measure of success. It has been the privilege of the Catholic journals to have hindered its growth and development. This need no longer be so. Three Catholic universities, Notre Dame, Fordham and Marquette, have during the past decade established schools of journalism where young men may be trained in scientific, cultural, professional and ethical ways that will enable them to stand in the front rank of editorship. The Catholic laity must in the future respond to the leadership of the scholarly and experienced journalist. They must pay for this high moral and intellectual worth if Catholic journalism is to accomplish its mission.

P. J. Folk, C.S.C., Librarian, Notre Dame University.

CATHOLIC SEMINARIES. The name seminary is properly applied to the institutions where candidates for the diocesan priesthood in the Catholic Church receive their spiritual and intellectual training. Preparatory departments (Petite Seminaire) are sometimes found in the same building, but the term is generally applied in the United States to those institutions which admit only those applicants who have completed the collegiate course.

Saint Mary's Seminary, Baltimore, Md., was the first American Catholic seminary. It was founded at the request of Bishop Carroll, who succeeded from Father Emery in 1791. It is the alma mater of the Society of Saint Sulpice, which had been established in Paris by Father Olier in 1642 for the express purpose of training young men for the priesthood. For many years it was the only institution of its kind in the United States, and consequently it supplied to the ranks of the clergy the vast majority of native trained priests. At present there are about 250 seminarians at Saint Mary's. In 1805 it was raised by the Maryland legislature to the rank of a university.

In Saint Charles Theological Seminary, Overbrook, Pa., the aspirants to the priesthood for the archdiocese of Philadelphia are trained. In 1835 Bishop Kenrick placed five ecclesiastical students under the care of his brother, Rev. Peter Kenrick, in a little house on the corner of Fifth and Prune (now Locust street), Philadelphia. This was the humble beginning of the present most important seminary. The seminary department was begun in 1839 at Glen Ridge over which the present Bishop Shanahan of Harrisburg presided for nine years. This institution passed out of existence when, in 1871, the students were transferred to the number of seminarians that the procession of the present building at Overbrook, which had been erected by Bishop Wood. For the maintenance of this institution the Catholics of Philadelphia contribute annually about $35,000. There are approximately 100 seminarians at Overbrook, 15 professors and a library of 25,000 volumes.

Saint Joseph's Seminary, the theological seminary for the archdiocese of New York, is located at Valentine Hill, near Dunwoodie, a station on the Putnam division of the A. N. C. Railroad, and within the city limits of Yonkers. It was founded by the late Archbishop Corrigan and constructed at a cost of nearly $1,000,000. It was opened in September 1896 and was at first under the direction of Father Corrigan. The full course of study comprises six years, two of which are devoted to philosophy, the remaining four to theology. The faculty comprises 13 regular professors and a few instructors, and the students (who are not admitted until they have completed a classical college course) number about 161, nearly all from the archdiocese of New York. This institution has taken the place of the old provincial seminary of Saint Joseph, at Troy, N. Y.

Mount Saint Mary's Theological Seminary, Emmetsburg, Md., was founded in 1806 by Rev. Du Bois during the episcopate of Bishop Carroll of Baltimore, and in the following year 16 young aspirants to holy orders were brought hither from Pigeon Hill, Pa. In 1810 the college had 40 pupils, and as a more commodious building had been erected, the founder gave to Mrs. Seton the log house, which thus became the cradle of the great community of the Sisters of Charity in the United States. United to the seminary is the college department wherein regular classical and scientific studies are pursued. There are 18 regular professors, several assistant teachers and over 350 students.

Saint Paul Seminary, Groveland Park, Minn., together with the College of Saint Thomas, Merriam Park, was founded by Most Rev. John Ireland, the present archbishop of Saint Paul. They are the result of the generosity of J. J. Hill, late president of the Northern Pacific Railroad, are located within a few miles of the city, have maintained a high grade of scholarship from the beginning and are directly affiliated with the Catholic University in Washington. At present there are 131 students and 12 professors in the seminary proper; in the college 355 students and 17 professors.

Niagara University (formerly Seminary of Our Lady of Angels), founded by Rev. John Lynch of the Congregation of the Mission, a community organized by Saint Vincent de Paul in France in 1625. Father Lynch, who afterward became the first archbishop of Toronto, in 1856 opened an institution on the lake shore near Buffalo, but finding the place not quite suited for the purpose, he removed in 1857 to the present site on the New York bank
of the Niagara River, about four miles north of the great cataract. The university owns 300 acres; numbers about 200 students, 60 of whom are in the seminary, and has a faculty of 20. Its library contains 13,000 volumes. The grounds and buildings have a value of over $500,000. It was incorporated under the title of the College and Seminary of Our Lady of Angels by an act of the legislature of the State of New York in 1863, and in 1883 it was erected into a university with full powers and authority under the present title of Niagara University, by the regents of the State of New York.

Saint John’s Ecclesiastical Seminary for the Boston archdiocese, located at Brighton, a charming suburb, and now under direction of diocesan clergy, was placed by its founder, Archbishop Williams, under the direction of Sulpician Fathers, assisted here, as in Baltimore and New York, by professors taken from the ranks of the diocesan clergy. In the two departments, philosophical and theological, there are 12 professors and 100 students.

There are about 85 seminaries in the United States, wherein 4,000 diocesan students and members of religious communities are trained for the priesthood. In Europe two institutions are maintained by the American bishops for the training of American students, the American College in Rome, and another at Louvain.

CATHOLIC SUMMER SCHOOL OF AMERICA, a school for higher education established by the Roman Catholics at Plattsburg, N. Y., on Lake Champlain. It was organized in 1892, and met at various places before the present site was decided upon. In 1893 the regents of the University of the State of New York granted a charter by which this school became a legal corporation, and was classified in the system of public instruction devoted to university extension. By this charter certain advantages are accorded to students who wish to prepare for the regents’ or State examinations. The object of the school is to increase facilities for those who wish to pursue lines of study in various departments of knowledge. Opportunities for instruction are provided by faculty of great eminence. Courses are given in philosophy, anthropology, history, literature, ethics, science, pedagogy, sociology and religion. The school is beautifully located, and though not far from the principal summer hotel on Lake Champlain, has its own cottage accommodations, a club or casino for social reunions, its lecture halls and local book store. The place is an ideal summer resort and attracts many friends of education, both Roman Catholic and Protestant, during the school season.

Another summer school, the Columbian Catholic Summer School, assembled at Madison, Wis., in July 1898, with lecturers from Washington, D. C., and other centers of educational work. In 1901 it removed to Saint Paul, Minn., and adopted the name of the American Catholic Chahtaqua.

CATHOLIC TOTAL ABSTINENCE UNION OF AMERICA, a confederation of all the Catholic total abstinence organizations in this country. It believes that the virtue of temperance is a religious virtue, to be cultivated by religious methods. The membership, amounting in the year 1910 to nearly 100,000, includes women’s and juvenile organizations, as well as men’s societies. While the Union urges men to become total abstainers, it does not hold that drink is an evil in itself, or that the use of it is wrong, but that the use of it is for many the proximate occasion of sin; and that by such persons drink should be abandoned altogether. It does not assert that all good and virtue are in total abstinence, but it does hold that total abstinence is a powerful preventive of social disorder and sin. The office of the general secretary of the Union is in the house of the Paulist Fathers in New York. The Union publishes for circulation numerous pamphlets on the subject of total abstinence.

CATHOLIC UNIVERSITY OF AMERICA, The, an institution for higher education maintained by the Catholic Church in the United States and located at Washington, D. C. The need of a university in which instruction should be given and research conducted in all the departments of knowledge, under Catholic auspices, was recognized by the bishops assembled in the Second Plenary Council of Baltimore (1886); and the establishment of such an institution was recommended by the Third Plenary Council (1884). Pope Leo XIII in 1887 approved the project and granted the pontifical charter by the Apostolic Letter "Magni nobis gaudii" of 7 March 1889. The university was incorporated under the laws of the District of Columbia, and the city of Washington was selected as the site. The first endowment ($300,000) was contributed by Miss Mary Gwendoline Caldwell of Newport, R. I. The Rt. Rev. John J. Keane, then bishop of Richmond, Va., was designated as rector of the university. In November 1889, academic work was inaugurated in the School of the Sacred Sciences. The Schools of Philosophy and Social Science were opened in 1895 and their departments were subsequently reorganized in the Schools of Law, Philosophy, Letters and Sciences.

The "organic law" of the university is embodied in the constitution, which was approved by the Holy See in 1889. It provides that the bishops of the United States shall have plenary authority in all matters pertaining to organization, instruction or discipline. This authority is exercised by a board of trustees composed of bishops, priests and laymen, who may elect new members and fill vacancies in the board. The chancellor, as the representative of the Holy See, presides at the meetings of the trustees. Subject to the authority of the trustees, the immediate government of the university is placed in the hands of the rector, assisted by the academic senate. The ex officio members of the senate are the rector, the vice-rector, the general secretary, the deans of the faculties and the presidents of university colleges. In addition, each faculty elects two delegates to serve in the senate for two years.

The senate acting with the rector has competency in matters pertaining to the methods of instruction, the appointment of associate professors and examinations for degrees. It proposes to the board of trustees such measures as may seem advantageous for the development of the university and it recommends to
the chancellor successful candidates for degrees.

The work of each school is in charge of a faculty composed of professors appointed by the board of trustees. The school comprises various departments in which courses are given by professors, associate professors, instructors and residents. The faculty elects its officers—dean, vice-dean and secretary—and two delegates to the senate. It has a consultative voice in regard to the appointment or removal of professors, and, subject to the decision of the senate, draws up or revises courses of study, examines candidates for degrees and makes recommendations for the development of the school. The teaching staff for 1916–17 includes 32 priests and 47 laymen.

The revenues of the university are derived from endowments, donations for special purposes, tuition fees and annual collections taken up in each diocese of the United States. A detailed statement of the receipts and expenditure is published yearly in the rector's report. In 1911 there were 20 endowed chairs, 4 fellowships, 37 scholarships and 50 graduate scholarships, the last named being the foundation of the Knights of Columbus (1914). The terms of award of these endowments for the assistance of students are published in the 'Yearbook' of the university.

The student body includes clerics and laymen, the former representing the diocesan clergy and the religious orders. According to the registration lists for 1910–11, the university enrolled 564 students, 313 clerics, 435 laymen.

The courses offered by the School of the Sacred Sciences are for graduates only, i.e., for students who have completed both their collegiate studies and the usual course (five years) of the theological seminary. In other schools, some of the courses are for graduates only, but most of them are open to undergraduates, i.e., to students who have completed a four years' high school course. Students who apply for admission without a certificate of previous study must take an examination in accordance with the requirements of the college entrance examination board.

Grouped about the university are the houses of study of the religious orders: the Passionists; Fathers of the Holy Cross; Franciscans, Sulpicians, Dominicans, Brothers of Mary, Carmelites, Oblates and Missionaries of Divine Love. Each order maintains a college which is open only to members of the order, and in which courses of instruction are given with special reference to the needs of the students and their training as religious. For advanced courses these students attend the university. Other institutions affiliated with the university are the Saint Paul Seminary, Saint Paul, Minn.; the Institute of Scientific Study, New York city; Mount Saint Mary's Seminary of the West, Cincinnati, Ohio; and the Apostolic Mission House, Washington, D.C.

The Catholic Sisters College (50 students), established in 1911, receives only members of female religious communities who desire to prepare for the work of teaching. The courses of instruction are given by professors from the university and the requirements for degrees are the same as those prescribed for candidates within the university.

Catholic University of America, 1889–1916, by the university at Washington and since 1914 at Dubuque, Iowa. They are followed by members of the teaching communities and by lay teachers, the average attendance being 400.

In 1912 the university adopted a plan for the affiliation of the colleges and universities in the course of study in the affiliated institution must be approved by the university which also sets the examination. At present 10 colleges and 112 high schools are affiliated.

The publications that issue from the university are: The Catholic University Bulletin; The Catholic Educational Review; The Corpus Scriptorum Christianorum Orientalium; The Catholic Historical Review and The Catholic Charities Review.

Edward A. Pace, Professor of Philosophy, Catholic University of America.
CATHOLIC UNIVERSITY OF AMERICA

1 Cardinal Gibbons Memorial Hall

2 Graduate Hall
War of 1879-71 he was engaged in caring for wounded French soldiers at Coblenz. In 1872 he was expelled from Germany by law against the Jesuits, and was ordained to the priesthood in 1877. From 1879 to 1882 he was on the staff of *Simmen aus Maria-Loch*, and from 1882 to 1892, a professor of private ethics at the Jesuit scholasticate of Blyenbeck Exaten and Valkenburg, Holland. He wrote *Die englische Verfassung* (1881); *Die Aufgaben der Staatsgewalt und ihre Grenzen* (1882; 10th ed., 1915); *Die Sittenlehre des Darwinismus: eine Kritik der Ethik Herbert Spencer's* (1885); *Moralphilosophie* (2 vols., 1891; 5th ed., 1911); *Der Sozialismus* (1890; 10th ed., 1910); *Das Privatgrundseigentum und seine Gegner* (1892; 4th ed., 1909); *Philosophie moralis in usum scholarum* (1893; 10th ed., 1915); *Kirche und Volksschule* (1896); *Durch Athemsium zum Anarchismus* (1895; 2d ed., 1900); *Recht, Naturrecht und positives Recht* (1900; 1909); *Glauben und Wissen* (1901; 5th ed., 1911); *Die Grundbegriffe des Sozialismus* (1905); *Die Kreuzzüge* (1906; 3d ed., 1909); *Religion und Moral, oder gibt es eine Moral ohne Gott?* (1902; 2d ed., 1904); *Die katholische Weltanschauung* (4th ed., 1914), and contributions to periodicals.

CATILINE (LUCIUS SERGIUS CATILINA), Roman statesman: b. about 108 B.C.; d. Pistoia, 5 Jan. 62 B.C. Of patrician birth, but poor, he attracted himself to the cause of Sulla, who had some share in his success, and still more in his proscriptions. Murder, rapine and conflagration were the first deeds and pleasures of his youth. He appears to have served in the army with reputation. Sallust, who has written the history of his conspiracy, describes him as having a constitution that could support hunger, cold, fatigue and want of sleep, to almost any limit; with a spirit bold, cunning, fruitful in resources; lusty after the wealth of others, prodigal of his own; a man of fiery passions, but limited judgment. Such was his art, that, while poisoning the minds of the Roman youth, he gained the friendship and esteem of the severe Cato. Equally well qualified to deceive the good, to intimidate the weak and to infuse his own boldness into his associates, he evaded two accusations brought against him by Clodius for criminal intercourse with a vestal, and for monstrous extortions, of which he had been guilty while proconsul in Africa. A confederacy having been formed of many young men of rough birth and daring character, who saw no other means of extricating themselves from their enormous debts than by obtaining the highest offices of the state, Catiline was placed at their head. This eminence he owed chiefly to his connection with the old soldiers of Sulla, by means of whom he kept in awe the towns near Rome, and even Rome itself. At the same time he numbered among his adherents not only the worst and lowest of the populace, but also many of the patricians and men of consular rank, not a few of whom were encouraged by him to join in the plot. Pompey was pursuing the victories which Lucullus had prepared for him; and the latter was but a feeble supporter of the patriots in the Senate, who wished him, but in vain, to put him in the lead. Marcus, who had delivered Italy from the gladiator's sword, was striving after power and riches, and counte-

nanced the growing influence of Catiline as a means of his own aggrandizement. Caesar, who was laboring to revive the party of Marius, spared Catiline, and perhaps even encouraged him. Only two Romans remained determined to uphold their falling country—Cato and Cicero; the latter of whom is known to have possessed the qualifications necessary for the task. The conspirators were now planning the elevation of Catiline and one of his accomplices to the consulship, by which they hoped to obtain possession of the public treasures and the property of the citizens under various pretexts, and especially by means of proscription. Cicero had the courage to stand candidate for the consulship; neither insults nor threats, nor even riots and attempts to assassinate him, deterred him from his purpose; and being supported by the rich citizens, he gained his election, 65 B.C. All that the party of Catiline could accomplish was the election of Antonius, one of their accomplices, as colleague of Cicero. This failure, however, did not deprive Catiline of the hope of gaining the consulship the following year. For that purpose he revived the kind of terrorism by which he had laid the foundation of his power. Meanwhile, he had lost some of the most important members of his conspiracy. Antony had been prevailed upon or compelled by Cicero to remain neutral. Caesar and Crassus had resolved to do the same. Piso had been killed in Spain. Italy, however, was destitute of troops. The veterans of Sulla only waited the signal to take up arms. The signal was now given by Catiline. The centurion Manlius appeared among them, and formed a camp in Etruria. Cicero was on the watch; a fortunate accident disclosed to him the counsels of the conspirators. One of them, Curius, was on intimate terms with a woman of doubtful reputation, Fulvia by name, and had acquainted her with their plans. Through this woman Cicero learned that L. Vargunteus, a senator, and C. Cornelius, a knight, had undertaken to assassinate him at his house. On the day which they had fixed for the execution of their plan, they found the doors barred and guarded. Still Cicero delayed to make public the circumstances of a conspiracy, the progress and resources of which he wished first to ascertain. He contented himself with warning the citizens, in general terms, of the impending danger. But when the insurrection of Manlius was made known, he obtained from the Senate the decree, only promulgated on occasions of the utmost importance, that the consul should take care that the republic receive no detriment. It was exceedingly difficult to seize the person of one who had soldiers at his command both in and out of Rome; still more difficult would it be to prove his guilt before judges who were accomplices with him, or at least were willing to make use of his plans to serve their own interest. Cicero had to choose between two evils—a revolution within the city, or a civil war. He preferred the latter. Catiline had the boldness to do in the Senate what he was to be the enemy of the Roman state. Cicero then rose and delivered that bold oration against him, beginning, *Quis ad se tandem abutere, Catilina, patientia nostrae?* (*How long, then, Catilina, wilt thou abuse our patience?*) As he did not possess, he attempted a reply, but his
CATINAT.—CATINITE

words were instantly drowned by the cries of "Parricide!" and "Traitor!" which rose on all hands. Now fully conscious that his plans were discovered, he rushed from the assembly with threats and curses on his lips, and left Rome at dead of night. The chief conspirators who remained, Lentulus Sura, Cethegus and other infamous senators, engaged to head the insurrection in Rome as soon as Catiline appeared at the gates. According to Cicero and Sallust, it was the intention of the conspirators to set the city on fire, and massacre the inhabitants. Lentulus, Cethegus and the other conspirators, in the meanwhile, were carrying on their criminal plots. They applied to the ambassadors of the Allobroges to transfer the war to the frontier of Italy itself, or, revealed the plots, and their disclosures led to others still more important. The correspondence of the conspirators with their leader was intercepted. As the circumstances of the case did not allow of a minute observance of forms in the prosecution of the conspirators, the latter relating thereto were disregarded, as had been done in former instances of less pressing danger. Cesar spoke against immediate execution, but Cicero and Cato prevailed. Five of the conspirators were put to death. Catus Antonius was then appointed to march against Catiline, but on the pretext of ill health, gave the command to his lieutenant, Petreius. He succeeded in enclosing Catiline, who, seeing no way of escape, resolved to die sword in hand. His followers imitated his example. The battle was fought with bitter desperation. The insurgents all fell on the spot which their leader had assigned them, and Catiline at their head. Consult Sallust; 'Bellum Catilinarium'; Cicero, 'Orationes in Catilinam'; Rose, 'History of Catiline'; 'Nouvelles Annales', 1813; the biographies of Caesar and Cicero in Plutarch's 'Lives'; and Beesley, E. S., 'Catiline as a Party Leader' in Fortnightly Review (June 1865).

CATINAT, kā-tē-nā', Nicolas de, marshal of France: b. Paris 1637; d. Saint Gratien 1712. He quitted the profession of the law for that of arms, and attained the office of Louis XIV. at the storming of Lille in 1667, and was promoted. By a number of splendid deeds he gained the esteem and friendship of the great Condé, particularly by his conduct at the battle of Seneh. He was sent as lieutenant-general against the Duke of Savoy, gained the battles of Stafford, 18 Aug., 1690, and of Marsaglia, 4 Oct., 1693, occupied Savoy and part of Piedmont, and was made marshal in 1693. In the conquered countries his humanity and mildness often led him to spare the vanquished, contrary to the express commands of Louvois. In Flanders he displayed the same activity, and took Ath in 1697. In 1701 he received the command of the army of Italy against Prince Eugene; but was straitened by the orders of his court, and was destitute of money and provisions, while Eugene was allowed to act with full liberty. On 6 July he was defeated at Carpi. Equally unfortunate was the battle of Chiaro, where Villeroi had the chief command. In spite of his representations the French court would not believe the disasters in Savoy, and owing to the perjury of the Duke of Savoy, and Catinat was disgraced. From his unalterable calmness and consideration his soldiers called him 'le Père la Pensée.' Consult his 'Memoirs' (Paris 1819) and the biography by De Broglie (1902).

CATINEAU-LAROCHE, kā-tē-nō lā-rōsh, Pierre-Marie-Sebastien, French politician: b. Saint-Brieuc, 25 March 1772; d. 22 May 1828. He studied at Poitiers, and to escape the Revolution emigrated to San Domingo, where he published a journal, L'ami de la paix et de l'union. He was sentenced to death for the opinions which he advocated, but, by the timely assistance of the agents of the king of France, succeeded in escaping to Cape Hayten (then called Cape Français), where he alone of 17 of his countrymen was saved from the subsequent massacre in that city. He now visited the United States and England, and on his return to Paris, in 1797, prepared several dictionaries. His printing office having been destroyed by fire, the government employed him in various public capacities. In 1809 he was appointed secretary-general of the commission houses and sent to Austria; and in 1810 he was made inspector of Illyria. He was made head of the Library Administration Bureau and served as secretarygeneral of the department of Aisne, prefect; and sub-prefect of Saint-Quentin. Once more he visited the United States, and on his return in 1819, he was commissioned to go to Guiana, to study the climate and resources of that province. His notes on that country appeared in 1822. He became chief of the Bureau of Commerce and of the Colonies (1826) and commissioner-general of the interior (1828).

CATLETTSBURG, Ky., city and county-seat of Boyd County, on the Ohio and Big Sandy rivers at their confluence, and on the Chesapeake and Ohio Railroad. It has extensive lumber interests and has flour mills, machine shops, saw mills and wholesale grocery, hardware and shoe warehouses. Pop. 3,520.

CATLIN, George, American traveler and artist: b. Wilkesbarre, Pa., 26 June 1796; d. Jersey City, N. J., 23 Dec. 1872. After practicing as a lawyer for two years he set up at Philadelphia as a portrait painter, and in 1832 commenced special studies of the American Indians, residing many years among them both in North and South America. In 1840 he went to Europe, and subsequently introduced parties of American Indians to European courts. His finely illustrated works are 'Manners, Customs and Condition of the North American Indians' (1857); 'North American Portfolio' (1844); 'Eight Years Travel in Europe' (1848); 'Last Rambles Among the Indians,' etc. (1868). His 500 portraits from life of American Indians are now in the National Museum at Washington, D. C., constituting what is known as the 'Catlin Gallery.' About 400 sketches are in the possession of the American Museum of Natural History, New York city. Consult Miner, 'George Catlin, with an Annotated Bibliography of His Writings' (New York 1901); 'My Life Among the Indians' (ed. by M. G. Humphreys, 1893).

CATLINITE (named after Catlin q.v.), American traveler and artist) is a product of incinerated clay. It occurs in Pipestone County, Minn., as a layer about 18 inches thick in quartzite. It has been extensively manu-
factured by the Sioux Indians into pipes and various ornamental objects.

CATNIP, or CAT-MINT, a hardy perennial herb (Nepeta catonensis) of the family Menthaeae. It is a native of the Orient and Europe, and has become distributed in most temperate regions of the globe. It is very common in America in the neighborhood of dwellings. Cats are especially fond of it, rubbing themselves upon it and eating it with evident relish. Like other members of its family, it contains a fragrant volatile oil, for which it is sometimes used in cooking. It grows about two feet tall, bears heart-shaped, velvety, whitish-green leaves, and dense whorls of numerous small, purplish or rosy-white flowers. Catnip is sometimes planted in herbaceous borders to soften the taming, at the same time heightening the effect with its erect stems. In medicine, catnip tea enjoys great popularity with the laity. It is brewed hot and is very useful in attempts to avert "colds." The heat, volatile oil, and the accompanying care that the patient takes are all self-conservative.

CATO, kā′tō, Dionysius, the reputed author of the small collection of moral aphorisms known as "Catonis Disticha de Moribus ad Filium," Nothing is known of him; but the work, which is apparently in large part a genuine classic, had a high reputation in the Middle Ages.

CATO, Marcus Porcius, the censor, sur- named Piscus, also Sapiens ("the wise"), and Major ("the elder"), Roman statesman and general: b. near Tusculum 234 B.C.; d. 149 B.C. The modern village of Monte Porzio Catone near Tusculum perpetuates his memory. He inherited from his father, a plebeian, a small estate in the territory of the Sabines, which he cultivated with his own hands. He was a youth at the time of Hannibal's invasion of Italy, and served his first campaign, at the age of 17, under Fabius Maximus, when he besieged Capua. Five years after he fought under the same commander at the siege of Tarentum. After the capture of the city he became ac- quainted with the Pythagorean, Necharus, who initiated him into the sublime doctrines of his philosophy. And when he was already conversant. After the war was ended Cato returned to his farm. As he was versed in the laws, and a fluent speaker, he went at daybreak to the neighboring towns and acted as counselor and advocate to those who ap- plied to him. Valerius Flaccus, a noble and powerful Roman, who had an estate in the vicinity, observed the talents and virtue of the youth, conceived an affection for him and per- suaded him to remove to Rome, where he prom- ised to assist him with his influence and patronage. A few rich and high-born families then stood at the head of the republic. Cato was poor and unknown; but his eloquence, which some compared to that of Demosthenes, and the integrity and strength of his character, soon drew public attention to him. At the age of 30 he went as military tribune to Sicily. In the following year he was questor, at which period there began between him and Scipio a rivalry and hatred which lasted till death. Cato, who resented Scipio's extravagance and, and, although his rival was acquitted, this zeal in the cause of the public gave Cato a great influence over the people. Five years after, having been already ședile, he was chosen praetor, and obtained the province of Sardinia. His strict moderation, integrity, and love of justice, was more strongly displayed than in Rome. On this island he formed an acquaintance with the poet Ennius, of whom he learned Greek, and whom he took with him to Rome on his return. He was made consul 192 B.C., having his friend Valerius Flaccus for colleague. He was opposed with all his power to the abolition of the Opiate law, passed in the pressing times of the Second Punic War, forbidding the Roman women to wear more than half an ounce of gold, to dress in garments of various colors or to wear other ornamens; but he was obliged to yield to the eloquence of the tribune Valerius and still more potent female im- portunities. Soon after, he set out for Spain, which was in a state of rebellion. His first act was to send back to Rome the supplies provided for the army, declaring that the war ought to support the soldiers. He gained several victories with a newly-raised army, reduced the province to submission and returned to Italy, where the honor of a triumph was granted to him. He afterward put himself under the command of the Consul Manius Acilius, to fight against Antiochus, and to carry on the war in Thessaly. By a bold march he made himself master of the Callidromus, one of the highest peaks of the mountain pass of Thermopylae, and thus decided the issue of the battle. He brought the intelligence of this victory to Rome, 189 B.C. Five years after, in spite of a powerful faction opposed to him, he obtained the most honorable, and at the same time the most feared, of all the magistracies of Rome, the censorship. He had not canvassed for the office, but had only expressed his willingnesed to fill it. In compliance with his wishes Valerius Flaccus was chosen his colleague, as the only person qualified to assist him in correcting the public disorders, and restoring the ancient purity of morals. He fulfilled this trust with inflexible rigor; and though his measures brought him some obloquy and opposition, they met, in the end, with the highest applause; and when he was not resolved to erect a statue to him with an honorable inscription. He appears to have been quite indifferent to the honor; and when, before this, some one expressed his wonder that no statue had been erected to him, he was answered, "I would rather have it asked why no image has been erected to Cato than why one has." Still he was not void of self-complacency. "Is he a Cato, then?" he was accustomed to say, when he would excuse the errors of another. Cato's political life was a con- tinued warfare. He was continually accusing, and was himself accused with animosity, but was always acquitted. His last public com- mission was an embassy to Carthage to settle the dispute between the Carthaginians and King Massinissa. It is said that this journey was the original cause of the destruction of Carthage; for Cato was so astonished at the rapid recovery of the city from its losses, that he ever after found every speech of his with the well-known words, Primum esse delendam ("I am also of opinion that Carthage must be destroyed"). He died
a year after his return. Cato, who was so frugal of the public revenues, was not indifferent to riches. He was rigorously severe toward his slaves, and considered them quite in the light of property. He made every exertion to promote and improve agriculture. He was twice married, and had a son by each of his wives. His conduct as a husband and a father was equally exemplary. He composed a multitude of works, of which the only one extant is De Agri Cultura.1 This of which the loss is most to be regretted are his orations, which Cicero mentions in terms of the highest encomium, and his history of the origin of the Roman people, which is frequently quoted by the old historians. Fragments of his orations are to be found in Meyers, Oratorum Romanorum Fragmenta1 (Zürich 1842); and in Jordan's edition (Leipzig 1860); and Peter, Historicorum Romanorum Fragmenta1 (ib. 1870). Consult Sears, History of Oratory1 (Chicago 1896). See (for a translation of De Agri Cultura) beer, (for an English) Farmer, The Treasures of Cato and Varro: The Treatise of Cato and Varro done into English, by a Virginia Farmer1 (New York 1913).

CATO, Marcus Porcius, called (to distinguish him from the censor, his great-grandfather) Cato of Utica and Cato the Younger, Roman patriot: b. Rome 95 B.C.; d. Utica, North Africa 46 B.C. He was a friend of the Stoic Antipater of Tyre, and maintained throughout his life the principles of the Stoic philosophy. His first appearance in public was against the tribunes of the people, who wished to pull down a basilica erected by the censor, Cato, which was in their way. On this occasion he displayed that powerful eloquence which afterward rendered him so formidable, and won the cause. He served his first campaign as a volunteer in the war against Spartacus, and highly distinguished himself. He served as military tribune in Macedonia in 67 B.C. When his term expired he went to Asia, and brought back the Stoic Athenodorus with him to Rome. He was made questor in 65 B.C., and executed his difficult trust with the strictest integrity, while he had the spirit to prosecute the public officers for their acts of extortion and violence. His conduct gained him the admiration and love of the Romans, so that, on the last day of his questorship, he was escorted to his house by the whole assembly of the people. The fame of his virtue spread far and wide. In the games of Flora the dancing-girls were not allowed to lay aside their garments as long as Cato was present. The troubles of the state did not permit him to remain in seclusion. The example of Sulla in usurping supreme power was followed upon him, and he endeavored to unite himself to both and made use of the wealth of the one and the reputation of the other to attain his own objects. By keeping aloof from all parties Cato served the Commonwealth with sagacity and courage; but he injured the cause which he was trying to benefit by the inflexibility of his character. In 63 B.C. he was chosen tribune of the people. About this time the conspiracy of Catiline broke out. Cato supported Cicero, then consul, with all his power, first gave him publicly the name of "father of his country," and urged, in a fine speech preserved by Sallust, the rigorous punishment of the traitors. He suggested the proposition of Metellus Nepos to recall Pompey from Asia, and give him the command against Catiline, and very nearly lost his life in a riot excited against him on this account by his colleague and Cn. Piso. After the return of Pompey he frustrated many of his ambitious plans, and first predicted the consequences of his union with Crassus and Caesar. The triumvirate, in order to remove him to a distance, had him sent to Cyprus, of which he took possession on behalf of Rome (58-57). Compelled to obey, he executed his commission with so much address that he enriched the treasury with a larger sum than had ever been deposited in it by any private man. In the meantime he continued his efforts to prevent the triumvirate. Endeavoring to prevent the passage of the Tribonian law, for investing the triumvirs with extraordinary powers, he was drawn into tumults, and even personal conflict. Being made praetor in 54 B.C., he drew up an execution a law against bribery that displeased all parties. After the death of Crassus the civil commotions increased, and Cato, as the only means of preventing greater evils, proposed that Pompey should be regarded as consul, contrary to the constitution, which proposition was adopted. The year following, 53 B.C., Cato lost the consulship by refusing to employ bribery to procure a majority. In 49 B.C. the civil war broke out. Cato, then praetor in Sicily, on the arrival of Curio with three of Caesar's legions, departed for the camp of Pompey at Dyrrachium. He had always hoped to prevent the war by negotiation; and when it broke out he put on mourning in token of his grief. Pompey, having been victorious at Dyrrachium, left Cato behind to guard the military chest and magazine, while he pushed after his rival. For this reason Cato was not present at the battle of Pharsalia, after which he sailed with his troops to Cyrene, Africa. Here he learned that Pompey, after the death of Scipio Metellus, had gone to Juba, king of Mauritania, where Varus had collected a considerable force. Cato immediately set off to join him, and after undergoing every hardship reached Utica, where the two armies effected a junction 47 B.C. The soldiers wished him to be their general, but he gave this office to Scipio, and took command in Utica, while Scipio and Labienus marched out against Caesar. Cato had advised them to protract the war, but they ventured an engagement, in which they were defeated, and Afric, submitted to the victor. Cato had at first determined to defend himself to the last, with the senators in the place, but abandoned this plan, and despairing of the Commonwealth, and unwilling to live under the despotism of Caesar, resolved to die. On the evening before the day which he had fixed upon for executing his resolution, he took a tranquil meal, and discussed various philosophical subjects. He then retired to his chamber and read the Cato, and afterward, having made up his intentions, his friends had taken away his sword. He sent for it, and in spite of the tears and entreaties of his friends persisted in his
CATO—CATRAIL

Cato, the title of two noted 18th century plays: (1) A blank verse tragedy by Joseph Addison in five acts. It was first presented in 1713. The scene is laid in a hall of the governor's palace at Utica. The subject is Cato's last desperate struggle against Caesar, and his determination to die rather than survive his conqueror. Cato's countrywomen, his tyrant's friends, and his wife's appeals to his passion for liberty, all conspired to deter him from the decision that the Roman Senate had decreed for him. After the Whigs Marborough was a Cato, to the Tories he was a Caesar. Every poet of the time wrote verses in honor of 'Cato,' the best being Pope's prologue; and it was translated into French, German, and Italian. (2) A tragedy by Tancred Burman, 1827. The author has made a successful use of the historic accounts of Cato's relations with Caesar, and the details have more probability than those of Addison. He shows a decided superiority to Addison in making Caesar the principal figure next to Cato, and placing them constantly in contrast with each other.

CATO STREET CONSPIRACY, or THISTLEWOOD CONSPIRACY, in English history, a plot formed in 1820 to murder the Foreign Secretary, Lord Castlereagh and other Cabinet Ministers, and to form a provisional government. The leaders of the conspirators was Arthur Thistlewood. The plot was discovered and several of the conspirators captured, on 23 February, when they had assembled in a stable on Cato street and were preparing to carry out their intentions. Thistlewood, who escaped, was arrested the next day. After a trial in which they were defended by John Adolphus, Thistlewood and four others were executed, and five were transported.

CATOCALA, a genus of noctuid moths, represented by more than 100 species in North America, and many in the Old World. See UNDERSWING.

CATON, John Dean, American lawyer and author: b Monroe, N. Y., 1812; d 1895. From 1855 to 1864 he was chief justice of Illinois. He has traveled extensively in Europe, China and Japan and published 'A Summer in Norway' (1875); 'The Last of the Illinois and a Sketch of the Indians of the Northwest'; 'The Antelope and Deer of America' (1877).

CATOPTRICS, that branch of optics which explains the properties of incident and reflected light, and particularly that which is reflected from mirrors or polished surfaces. The whole doctrine of catoptrics rests on the principle that the angle of incidence is equal to the angle of reflection and in the same plane.

CATOPTROMANCY, a species of divination practised by the Greeks, in which a mirror was let down by a cord into a fountain in the temple of Ceres, in Achaea, into which persons looked. If the observer's face appeared in it sickly or ghastly the omen was considered unfavorable, and the sick person would not recover; but if, on the other hand, it appeared fresh and healthy, the omen was considered favorable. The superstition that seven years of bad luck will follow the breaking of a mirror or that if a young lady looked in the mirror by candle light on Halloween she would see the face of her lover are evidently survivals of this old form.

CATORCE, kə-tɔrˌsā, or ka-ťor'sa, Mexico, mining town of San Luis Potosi, which received its name, signifying 14, from a gang of robbers, formerly a constant menace to its inhabitants. It is situated in a barren district 7,870 feet above sea-level, in the north of San Luis Potosi by rail. The town lies at the foot of a mountain 10,000 feet high. It contains valuable silver mines discovered in 1773, now pretty well worked out. The ore is mixed with sulphur, and requires treatment by a high degree of heat. When the French invaded Mexico, a mint was started here, and worked until 1867. The amount coined was about $52,000,000. The population is variable, ranging from 10,000 to 18,000, according to the state of mining.

CATOSTOMIDE, a family of fishes of the order Plectospondyli (q.v.), or, in a more limited sense, of the Esoxgnathi. They have the first four vertebrae coalesced and partly converted into a chain of bones reaching from the swim-bladder to the internal ear; the lower pharyngeal bones elongated and falcate, and bearing a row of numerous comb-like teeth; the jaws toothless and formed in part by the maxillary bone; the mouth usually small with thick, protractile lips; the form more or less elongate, and rounded or slightly compressed; and the fins soft, rayed with no adipose (rayless) dorsal fin. An extensive family of fresh-water fishes, chiefly of North America, where 12 or 14 genera and more than 60 species occur; in addition to which a very few are found in eastern Asia. Although abundant almost everywhere in the United States, none of the species have more than a local value as food fishes. To the Catostomide belong the suckers, buffalo-fishes, horse-fishes, certain so-called mullets, etc. (qq.v.).

CATRAIL (also known as the Picts' Work or Picts' Work Ditch), the name applied to the remains of a large earthwork in Scotland, about 50 miles in length, which, beginning at Torwoodlee Hill, near the junction of the Gala Water with the Tweed, runs with a semi-circular sweep southward through the counties of Selkirk and Roxburgh to a point under Peel Fell, in the Cheviots. The earthwork consisted of a deep ditch, with a rampart on each side, and varied in breadth from 20 to 26 feet. Various causes have resulted in the destruction of the ramparts in many places. The origin of the Catrail has led to much
speculation, but is now supposed to have been a line of defense raised by the Britons against the invading Saxons.

CATS, käs, Jakob, Dutch poet: b. Brouwershaven, Zeeland, 10 Nov. 1377; d. Zorgvliet, near Capetown, 12 Sept. 1660. He studied at Leyden, Orleans and Paris. In 1627 and 1631 he was Ambassador to England, and in 1636 grand pensioner of Holland. His poetry is unimpressive and didactic, but has been extremely popular in the Dutch middle class by whom he is frequently affectionately alluded to as "Father Cats." A statue has been erected to him at his birthplace. His works consist of allegories, according to the taste of his times, poems on the different ages and situations of life, idyls, etc. Among the most noted are "Het Houwe-lyck" (Marriage) (1625); "Sinneen-Minnebeelden" (1618); "Trouwingh" (1637); "Maechden-plicht" (1618); "Selfstryst" (1620); "Spiegel van den ouden en neuen tydt" (1632); "Oude Facies Agustae" (1633). Consult Derudder, G., "Un poète néerlandais"; "Cats, sa vie et ses œuvres" (Hague 1899).

CATS’ EYE, the name given to several hard semi-transparent stones used as gems, which, when cut in a certain way show a line of light giving what is called a chatoyant effect. The Chatskill quartz is a chrysoberyl of a greenish color, found in Ceylon and Brazil. The line of light shown when the stone is cut en cabochon is due to the structure of the crystal, or to included impurities. The common cat's-eye, of little value, is a crystalline quartz sometimes containing fibres of asbestos, which, cut across the fibres, gives a chatoyant effect. It is found in Bavaria. Tiger-eye (q.v.) also shows the chatoyancy of the cat's-eye. Beautiful tourmaline cat's-eyes, rivaling the Oriental stones, have recently been found in California. Stones exhibiting the cat's-eye ray have been cut from various other minerals, including beryll, corundum, fibrous hornblende, bronzite and hypsithene.

CATSKILL, N.Y., village and county-seat of Greene County, 30 miles southeast of Albany, on the west side of the Hudson River and on the West Shore and the Catskill Mountain railroads, also connected with the New York Central by a ferry crossing the Hudson. It is connected by steamboat lines with New York and Albany. The village, frequented as a summer resort, though important rather as the point of departure for the more popular mountain resorts, has a courthouse, opera-house, free academy and public library. It manufactures woolens, hosiery, cut glass, bricks, etc., and is in a productive fruit-growing region. Catskill was settled about 1680 by Derrick Tenis Van Vechten. The village owns its waterworks. Pop. (1910) 5,296.

CATSKILL AQUEDUCT. See AQUEDUCTS.

CATSKILL GROUP, a name given to a great thickness of red, brown, green and gray conglomerates, sandstones and shales of which the Catskill Mountains are composed. Being well exposed by numerous cliffs and gorges, these deposits were carefully studied by the New York Geological Survey some 50 years ago. The rocks were believed to constitute a series, having a definite place in the classification of the Paleozoic rocks worked out by the Survey, and were given the name Catskill. Subsequent investigation has shown that the Catskill is not even to be called a group. It is simply a succession of shoal water deposits of Upper Devonian Age, that were laid down along one shore of an interior sea; while normal marine sediments, now represented by limestones, were being laid down elsewhere. Thus is happens that the Lower Catskill, of the Catskill Mountains, is represented elsewhere by limestones of the Hamilton stage, the Middle Catskill by the Portage and the Upper Catskill by the Chemung. In the Catskill Mountains the so-called Catskill series is 4,500 feet thick, and where thickest, at Mauch Chunk, Pa., it is 7,500 feet thick. Farther south the rocks thin out and disappear altogether in Virginia. Though having no standing as a rock group, the Catskill is of interest from its many resemblances to the Old Red Sandstone of England, made famous by Hugh Miller, and is of economic importance from containing some beds of excellent flags, quarried at numerous openings in Ulster, Greene and Delaware counties, N.Y., and sold as Hudson River bluestone. See DEVONIAN; OLD RED SANDSTONE.

CATSKILL MOUNTAINS, a group of moderate elevation, part of the Alleghany Plateau, lying to the west of the Hudson River and situated mainly in Greene and Ulster counties, N.Y. The system covers about 1,400 square miles. The geological formation is very old, the mountains consisting of the shales and sandstone of the Catskill group of the Devonian system. The group contains several summits between 3,000 and 4,000 feet above sealevel. Slide Mountain, 4,204 feet; Hunter Mountain, 4,025 feet, are the highest. The low lands along the creeks which drain the mountains and some uplands are cultivated. Many of the slopes form fine pastures; but the greater part is forested thickly with oak, ash, maple, beech, pine, hickory, etc. The pure atmosphere attracts summer visitors in large numbers, and the region is dotted with many hosteries. Railways give access to many parts of the region, and several points can be reached by boats. There are several pretty cascades in the gorges, known here by their Dutch name, coves. Within recent years part of the Catskill watershed is being utilized as a water supply source for New York city.

CATT, Carrie Lane Chapman, American suffrage reformer: b. Ripon, Wis. She was educated at the State Industrial College of Iowa and subsequently studied law. She was for three years principal of the High School at Mason City, Iowa, and in 1894 was married to Leo Chapman, editor of the Mason City Republican, who died some two years later. In 1891 she was married to G. W. Catt (q.v.). Since 1890 she has devoted herself to woman suffrage work, lecturing in every State, and also in most of the countries of Europe. In 1904 she was elected president of the International Woman Suffrage Alliance and still holds that office, and in 1915 elected president of the National American Woman Suffrage Association.

CATT, George William, American engineer: b. Davenport, Iowa, 9 March 1860; d.
1905. He was educated at the Iowa State College and subsequently studied engineering and law. He was chief engineer of the San Francisco Bridge Company, 1887–92; president and engineer of the New York Dredging Company, 1893–99; and president and engineer of the Atlantic Gulf & Pacific Company from 1899.

CATTARO, kát-tá-rō, Austria, a seaport in Dalmatia, at the foot of the Gulf of Cattaro, on the east side of the Adriatic, 38 miles southwest of Ragusa. It lies at the foot of steep limestone rocks, strongly fortified and surmounted by a castle, and is surrounded with walls. The buildings are in the Venetian style, and the streets are narrow, irregular and dark. It is the seat of a Roman Catholic bishop, and the cathedral is a well-built edifice. The harbor is spacious. The chief trade is with Montenegro. Once a Roman colony, it became part of the republic of Venice in 1420; passed to Austria in 1797; was conquered by Italy in 1805; restored to Austria 1814. Two earthquakes wrought considerable destruction in the town. Pop. about 6,000.

CATTLEGAT, or KATTEGAT, a gulf of the North Sea, between North Jutland to the west, Sweden to the east, and the Danish islands of Zealand, Funen, etc., to the south; and by joining the Skagerrak on the west and the Little and Great Belts and the Sound on the east, forming the middle link in the chain of waters connecting the Baltic with the North Sea. It is about 150 miles from north to south; its greatest breadth about 90. It is difficult of navigation, being not only shallow toward the shores, and irregular in depth, but obstructed by several sand-banks, and the adverse winds which often prevail here increase the danger. The Kattegat is noted for its herring-fishery. It contains the islands Samsø, Anholt, Læsøe and Hertsholm.

CATTELL, Henry Ware, American pathologist: b. Harrisburg, Pa., 7 Oct. 1852. After studies at Lafayette College and at the universities of Leipzig, Pennsylvania and Freiburg (Baden), he was appointed demonstrator of morbid anatomy at the University of Pennsylvania 1892–97, and director of the Ayer Chemical Laboratory in the Pennsylvania hospital. He was consulting pathologist to numerous Philadelphia hospitals and professional expert in several criminal cases. Besides editing the International Medical Magazine (1894–97); International Clinics (1900–03) and again after 1910; Medical Notes and Queries (after 1905); Lippincott's Medical Dictionary (1910; 3d ed., 1913), he translated Ziegler's 'Special Pathological Anatomy' (1899–97). His published works include 'Notes on Demonstrations in Morbid Anatomy' (1899–1901). 'Post Mortem Pathology' (1900; 3d ed., 1906); '666' (1910).

CATTELL, James McKeen, American psychologist: b. Easton, Pa., 25 May, 1860. He was graduated at Lafayette College in 1880, and studied at Leipzig, Paris, Geneva and Göttingen. He was assistant under Wundt at the University of Leipzig, professor of psychology in the University of Pennsylvania in 1888–91 and professor of experimental psychology in Columbia University 1891–96; from 1896 to 1902 head of the department of anthropology, and from 1902 to 1905 professor in the department of philosophy. He resigned in 1917. He is coeditor of the Psychological Review and Science, and The American Naturalist.

CATTENORLE, George, English water color painter: b. Dickleborough, near Dussitt, Norfolk, 8 Aug. 1800; d. Chelsea, 24 July 1868. Like Turner and William Hunt, he started in life as a topographical draughtsman, and was employed as a draughtsman on Britton's 'English Cathedrals' when only 16. He drew the designs for the illustrations of various annuals, the Waverley Novels, for an edition of Shakespeare, and for his brother's 'History of the Civil Wars.' In 1833 he was elected a member of the Society of Painters in Water Colors. He was a member also of the Academy at Amsterdam, and of the Belgian Society of Water Color Painters. He obtained a medal of the first class at the Paris Exhibition of 1855. In 1851 he resigned his membership of the English Society, and devoted himself to oil painting. Cattermole is one of the most important representatives of the Romantic movement in English art. Among the best known of his pictures are 'Hamilton of Bothwellhaugh about to Shoot the Regent Murray'; 'Luther at the Diet of Spires'; 'The Armorer's Tale'; 'A Terrible Secret,' etc.

CATTI, or CHATTI, one of the most renowned and valiant of ancient German tribes, inhabiting what is now Hesse, also part of Franconia and Westphalia. They carried on bloody wars with the Hermunduri and Cherusci. In the time of Caesar they dwelt in the Lahn, and opposed him with effect. Dueus defeated without reducing them. In the reign of Marcus Aurelius they made incursions into Germany and Thrace, but were afterward defeated by Didius Julianus. In 392 they made their last appearance in history. The English word cattle comes from the old French word cattel, which is derived from the Medieval Latin capite or capitae, meaning goods or property. The use of the English word cattle ordinarily refers to a group of animals related to the ox or cow, although on occasion it has been applied to any of the larger animals of economic value. The present Latin designation for cattle, bos taurus, was given by Linnaeus the Swedish naturalist, but as taurus means bull, this word is unsatisfactory if it is desired to refer to the female, the cow, or to the unsexed male, the steer. The English word ox is traced through several languages to the words uros, aurochs or aurochus, names given the prehistoric ox. This word ox (plural oxen) has been very widely used in reference
to cattle, though not entirely satisfactory in its application.

Existed in prehistoric times, and their remains have been extensively found in the more recent geological periods. Wild oxen were hunted in Great Britain and on the continent of Europe, and parts of skeletons have been found in which were embedded flint spear heads, and so on. The prehistoric ox, known as Bos taurus primigenius, varied in size in a marked degree, but as commonly found was much larger than the ox of the present day. A complete skeleton of what has been termed Bos taurus giganteus has been recovered from the English fen lands, and many parts of large skeletons may be seen in British museums.

There are to-day in England and Scotland a few scattered herds of what are known as wild cattle. These are on large estates where they are preserved and allowed to reproduce in a state of nature. These wild cattle are assumed to be lineal descendants of the prehistoric ox. They are white in color, but with dark red or black hairs upon the ears and above the muscle; have broad, heavy, upstanding horns, and are comparable in size with many of our domestic cattle. In a few instances wild females have been mated to domestic bulls, from which through several generations very excellent results have been obtained.

In a zoological way, cattle present certain features of special interest. They belong to the order of Ungulata or hoofed animals, which includes elephants, giraffes and camels. However, cattle belong to a sub-order of this group, having cloven feet, the horse belonging to another sub-order with a solid foot. The skeleton of the ox does not stand as high as that of the horse, and the bony processes of the spine form a line along most of the back that is nearly straight. The horns are essentially extensions of the corners of the skull, although there are breeds of cattle that normally have no horns. Cattle have no teeth at the end of the upper jaw; this part being covered with a tough membraneous pad, against which the incisor teeth at the point of the lower jaw press. In grazing the vegetation is caught between the teeth and pad, and is pulled rather than cut off. The ox has a compound stomach of four parts, an important feature of this animal, and in large animals has a capacity of as much as 60 gallons. When food is first swallowed, it goes into the large first stomach, the paunch, where it is softened and macerated, and overflows through a slit into the much smaller second stomach or honeycomb. From one or the other of these stomachs, by muscular contraction, the food is forced back to the mouth in small balls or "cuds," when rumination or "chewing the cud" takes place, which explains why cattle are generally known as ruminants. Rumination only takes place under conditions of quiet and rest, and not during grazing. After chewing the cud less than a minute, the food passes down into the second stomach the manyplies, from which it moves on into the small abomasum or true stomach.

In comparison with the stomach, the intestines in cattle are relatively small while with horses and donkeys the reverse is true.

Cattle are world wide in their distribution, and either exist wild in a state of nature, or are of the domesticated, improved races or breeds. Among the wild cattle of America and Europe, the buffalo of Asia and Africa, the yak of highlands of central Asia, the gaur of India, the bantin of Java, Siam, Burma and adjacent countries, etc. There are various forms of buffaloes ranging from animals of small size to those of large proportions, and these are especially abundant on the continent of Asia and contiguous islands. South America and Australia possess no native wild cattle. Domesticated cattle are best represented in the various breeds used for food or labor that are found in large numbers in all countries where herbage is easily grown.

In Asia and Africa is found a class of humped domesticated cattle, commonly known as the zebu, of which there are many breeds. These Indian or Brahman cattle, as they are often called, differ from our common domestic cattle in general bodily form, in possessing a more or less large hump over the shoulders, in shape of ears, depth of throat, curve and size of horns and form of long, shaggy hair. What are known as the common domesticated cattle of Europe and America differ in a marked degree in size, color and certain features of form. However, they are all essentially the same from an anatomical point of view, and belong to the same species. The variations referred to have been due to various factors, among which emphasis may be laid on environment, selection and the artificial breeding operations of man. In general the domestic cattle may now be divided into three classes or what are commonly known as types, viz., beef, dairy and dual purpose. Beef type cattle have short, thick necks; smooth shoulders; wide, prominent breasts; large heart girths; broad backs and loins; deep bodies; wide, level rumps; thick, meaty thighs and comparatively short legs. When in good condition, the body is smoothly covered with a thick layer of flesh indicative of great meat-producing capacity. Good examples of beef cattle have bodies resembling a parallelogram from side view, or square from the ends, having what is known as a "blocky form." Dairy type cattle are relatively thin of neck; somewhat prominent of shoulder; narrow of breast; deep yet lacking in thickness; narrow at the withers and gradually widening along the back to the hips; long of rib and deep of middle; long and wide of rump; and comparatively narrow behind in the thighs. The females are notable for large udders capable of great milk production. This type is lean and muscular, and good examples show what is termed the "triple wedge" form. (1) As viewed from one side, the body gradually widens in depth from front to rear. (2) Viewed from above the body gradually widens back to the hips. (3) Seen from in front the body widens in wedge form from the withers (just over the shoulder) downward. The beef type is notably broad and flat, just above the shoulders comparatively round and sharp. Superior beef cattle as a rule are small milk producers, while the contrary high class dairy cows are very inferior meat producers. Dual purpose, oftentimes termed general purpose, cattle, are fair producers of both meat and milk. They lack the thick,

6. Shorthorn
7. Jersey Bull
CATTLE

blocky form most desirable in the model beef animal, with less fullness over the shoulders and at the thighs. Dual purpose type cows should have good sized udders and show distinct evidence of milk-producing capacity. Our domestic cattle are not only divided into types but into many breeds that have originated under widely different surroundings. The influences of climate and food, as well as the breeding operations of man, have resulted in many breeds within these types, each of which is quite distinctive in character and usefulness. The measure of merit in our herds of cattle is absolutely dependent upon the meritorious character in the breeds themselves. The common herds cannot be improved without the use of sires from pure bred herds.

The following breeds, grouped according to type, are the more important ones to be found in North America.

BEEF TYPE.

Shorthorn cattle originated in northeastern England in the counties of York and Durham, where they first came into prominence under the guidance of the Dutch. The color may be all red, red and white, pure white or roan, the latter being a commingling of red and white hairs without forming solid color. Mature males of this breed commonly weigh from 1,800 to 2,200 pounds, although some bulls much exceed this. Mature cows commonly weigh from 1,400 to 1,500 pounds, though the latter figure is often exceeded. This is a horned breed, very domestic in temperament, and is noted for the production of suckling beef. It is the most widely distributed breed of cattle in the world, and is very popular in the United Kingdom, North and South America and Australia. Among the beef breeds the Shorthorn is noted for milk production and some families of the breed are especially famous in this regard.

Hereford cattle originated in Herefordshire, western England. It is a very old horned breed. The main body color is red, with white face; solid white markings usually occur about the ankles, the lower part of the belly, brisket and neck, top of neck, withers and brush of tail. Mature males often weigh 2,000 pounds, and females 1,500 pounds or more. Much heavier weights however are recorded. Hereford cattle are noted as grazers and rustlers, being unsurpassed for the range. They mature early and produce most excellent beef. The breed is largely restricted to Herefordshire in England, but is deservedly popular on the grazing lands of the United States, Argentina and Australia.

Aberdeen-Angus cattle, a black, hornless breed, originated in the counties of Aberdeen, Kincardine and Forfar in northeastern Scotland. Occasionally a red specimen occurs but these are not used for breeding purposes. Mature bulls of the breed weigh about 2,000 pounds, and females about 1,400 pounds. This is a famous beef breed, and in the British and American fat stock shows has long secured prize honors. The crossing of white Shorthorn bulls on Aberdeen-Angus cows has long been a custom in the English-Scotch border country, their union producing the famous blue-gray steers which yield the best of beef.

Aberdeen-Angus cattle are popular in Scotland, have a strong clientele in the United States west of the Mississippi and are regarded with favor in Australia.

Galloway cattle are black and hornless, and originated in Galloway district, southwest Scotland. It is a beef breed of medium size, mature bulls weighing about 1,000 pounds and cows 1,200 pounds to 1,400 pounds. This breed is especially adapted to grazing, and does not do its best under conditions of small farming and confinement. It cannot be regarded as a popular breed, and has a comparatively limited clientele. This is largely due to a nervous disposition and a tendency to fatten slowly, although Galloways make very superior beef. The four beef breeds referred to are the only ones of importance in America.

DAIRY BREEDS.

Jersey cattle originated on the Island of Jersey, one of the group of Channel Islands near the coast of France. There they have been bred pure for more than a century. The law of the island prohibits the introduction of any other breed. Jers are found in a variety of colors and various shades, such as yellow, red, brown, mulberry, silver, etc. White markings are not rare, though not popular. Bulls at maturity commonly weigh 1,250 to 1,400 pounds, and cows from 850 to 900 pounds, many animals, however, exceeding these weights. The most striking features in the Jersey are the color, the wedge form, the short, dished face, the prominent, beautiful eye, the fine bone, and deer-like character of the young calves. This breed is notably one for the better cows is about 7,500 pounds of milk a year, although the cow Passport 219742 has an official record of 19,695 pounds for a year. Jersey milk usually tests 4½ to 5 per cent fat, and is of very superior quality. Many Jerseys have produced 400 pounds of butterfat in a year, Sophie 19th of Hoof Farm 189748 having to her credit the great yield of 999.14 pounds. Jersey cattle are very popular in England, the United States and Canada.

Guernsey cattle are natives of the island of Guernsey, also one of the Channel Islands. Guernseys, like Jersey, prohibits the introduction of any other cattle, excepting for slaughter, and the cattle on Guernsey have been bred pure for many years. Guernseys are fawn of color, usually of a reddish shade, and frequently have white markings. The standard size for mature bulls is about 1,500 pounds and 1,850 pounds for the cows. In recent years these cattle have made remarkable improvements and many large records of milk and butterfat are credited to the breed. The better class of cows will average about 8,500 pounds per year of milk that is about 5 per cent fat. Nearly 5,000 cows have averaged 457 pounds of fat in a year, the largest record being 1,098 pounds produced by Murme Cowan 19597. Guernsey butter is noted for its yellow color. This breed is more especially known in England and the United States east of the Mississippi.

Ayrshire cattle originated in southwestern Scotland, with the county of Ayr as a centre. These cattle frequently have rather long, large, erect horns. The color of the hair is a com-
CATTLE

bination of red, brown and white markings, with white in most favor at the present time. A breed of dairy breed type, with a smooth body, and may be fattened to make very fair beef. At maturity standard weights will approximate 1,500 pounds or more for the bull and 1,100 pounds for the cow. A breed of the large class, when mature, will average about 9,500 pounds of milk, testing 33/4 to 35/4 per cent fat. Lily of Willowmoor 22268, a famous cow of the breed, produced 955.56 pounds of fat in a year. In their native land, the milk of these cattle is in much favor for making cheddar cheese. Ayrshires are little known outside of Scotland, the Scandinavian countries, the eastern United States and Canada.

Holstein-Friesian cattle originated in Holland, where they have been bred for centuries. This is a horned breed, and is black-and-white in color, in large markings. Present day popularity favors a preponderance of white. This is a large breed, and mature bulls weigh usually about 2,000 pounds, and cows 1,250 to 1,400 pounds. There is considerable variation in type within this breed, with good examples of both dairy, beef and dual purpose type. However, the most popular type is the dairy type, with some thickness of thighs and smoothness of fleshing. Holstein-Friesian cows surpass all others in milk production. They have large udders, but produce milk of quite ordinary quality, testing 3 to 33/4 per cent fat, under average conditions. The better cows of this breed will average about 15,000 pounds of milk in a year and 500 pounds of butter-fat. The cow Lütscke Vale Cornucopia 110505 produced 31,247 pounds of milk, while Duchess Skylark Ormsby produced 1,205 pounds of fat each within a year. Holstein-Friesian, or closely related Dutch breeds, are popular in Holland and much of northern Europe and are looked upon with much favor in the United States.

Dutch Belted cattle originated in Holland, where they have long been bred in a very small way. They are of a dairy type, and are black in color excepting for a white stripe which encircles the body between the hips and shoulders. These cattle have thus far made few records of interest, and they are little bred excepting as a fad for their peculiar markings.

Kerry cattle are of Irish origin. They are black in color and comparable with a small Jersey as to size. The Kerry is distinctly a dairy breed, that has been comparatively little improved, but the better cows produce 5,000 to 6,000 pounds of milk a year. This is a very hardy breed, and is but little known outside of Ireland, there being hardly a dozen herds in America.

Dexter cattle are also of Irish origin, and are perhaps an offshoot from the Kerry. This is the smallest breed of British origin, bulls at maturity often weighing 600 to 700 pounds and the cows about 500 pounds. These cattle may be all black or all red. They not only produce choice small carcases of beef, but some of the cows give comparatively large yields of milk, one English Dexter being credited with 12,000 pounds in a year. These cattle are little known outside of Ireland and England. In the United States there were not over 10 herds in 1917.

French Canadian cattle originated in the province of Quebec, Canada, perhaps 200 years ago. It is a breed of large size, comparable with a small type Jersey. But little has been done in improving this breed. French Canadian cows produce a fair amount of milk testing slightly above 4 per cent fat. These cattle are almost unknown outside of Canada.

Dual Purpose Cattle

Red Polled cattle are native to the counties of Norfolk and Suffolk in England. As indicated by the name, these are hornless, red cattle. Mature males ordinarily weigh 1,800 to 2,000 pounds, and cows from 1,250 to 1,500 pounds. This is a distinctly dual purpose breed, and is so advocated in America and England. A milk record of 5,000 to 6,000 pounds a year is quite common, though Jean DuLuth Beauty 31725 produced 20,281 pounds in a year. The milk is a good standard, testing about 3.75 per cent fat. Cattle of this breed incline to be somewhat nervous of temperament, in comparison with Shorthorns. Red Polled cattle are mostly found in eastern England and in the central United States.

Devon cattle originated in Devonshire, southwest England, being a very ancient breed. This is a horned, red breed. There are wide extremes in type with the Devon, but most breeders in the United States, located in the East, regard it as of a dual purpose type. At one time this was a very popular breed in America, but is now rarely seen. There are no official milk records for this breed in America. The better cows produce a fair yield of excellent milk.

Brown Swiss cattle are native to Switzerland, in the eastern section. This is classed as a dairy breed by the American Brown Swiss Cattle Association, but is really a dual purpose breed, and is so regarded in Switzerland. The color is usually dark brown, with mealy or creamy marking about the muzzle, the udder, inside the legs, and sometimes along the back bone. This is a large, horned breed, with rather coarse heavy bones; mature bulls weighing 1,800 to 2,000 pounds, and cows 1,300 to 1,400 pounds, with many exceeding these weights. Brown Swiss cows yield under fair conditions 5,000 to 6,000 pounds of milk a year, testing 33/4 per cent fat. The cow College Bravura 2d has a record of 19,461 pounds of milk. These cattle are comparatively little known in the United States.

Statistics of the Number and Distribution of Cattle

Statistics relative to the number and distribution of cattle in the world are of interest. According to the most recent census figures available, the following are the 10 leading cattle producing countries of the world:

The total value of the cattle of the United States as a whole is given at $1,499,524,000. In 1910, Wisconsin, New York, Illinois, and Minnesota each had over 1,000,000 dairy cows, New York leading with 1,500,000. At the present date, 1 Jan. 1917, Wisconsin leads in numbers of dairy cattle. The average value of milk cows in the United States on 1 Jan. 1916, according to United States Department of Agriculture statistics, was $53.90, and of other cattle, Chicago is the great cattle market of America. In 1917 there were received at the Union Stock Yards, Chicago, 3,209,427 head of cattle having a valuation of $322,256,581. During the past 50 years there has been a grand total of 106,423,953 head of cattle shipped into the Chicago yards, the largest receipts for one year being 3,571,796 head in 1892. The general tendency in the United States is to an increase in the number of dairy cattle, and a decrease in beef cattle. With increase in population and the development of large urban communities is associated increased demand for milk. The census shows that from 1900 to 1910 there was an increase of about 20 per cent in dairy cattle in the United States. The beef supply, however, has fallen off to a notable degree, in comparison with growth in population, so that we are now hardly producing enough beef for domestic use. For the 10 years up to 1915 inclusive we have the following interesting records of export and import trade on live cattle:

<table>

The economic factors are various factors explanatory of the decrease in beef production and our export trade. The area of free grazing lands west of the Missouri has largely diminished, many of the large private ranges have been divided and it has not been possible to produce cattle thereon as cheaply as in the past. In the central west, in the states of Colorado, New Mexico, and Texas, where beef cattle have been bred in great numbers, land values have increased to such an extent as to consider the cost of corn, many have discontinued feeding beef cattle, because of the loss involved, or small margin of profit. On the other hand, in the more thickly settled States, many farmers have changed from beef to dairy cattle, owing to the large demand for milk and the greater profit in its production in comparison with beef production. Experimental research in Europe and America, notably by Lawes and Gilbert of England and Trowbridge and Eckles of Missouri, show the dairy cow to be a much more economical converter of products of the field into human food, than is the beef-producing animal. From 100 pounds of digestible matter in the food eaten, according to Jordan, the cow producing 139 pounds of milk yields 18 pounds of edible solids, while the dressed carcass of the steer yields but 8.3 pounds marketable products, of which but 2.8 pounds are edible solids. These figures show about six times as much edible solids in the milk of the cow as in the carcass of the steer, the result in each case from equal amounts of digestible food. The feeding of cattle involves a wide range of ages, condition and purpose of the cattle fed, availability of feeding stuffs and relationship to markets. Extensive experiments, especially in Germany and America, have resulted in establishing feeding standards for cattle and other animals under certain conditions of weight and production. The evidence demonstrates that for 1,000 pounds live weight, or fraction thereof, there is required within limitations a specific amount of dry matter, digestible crude protein and total digestible nutrients, showing a certain nutritive ratio. Modern science has provided the stockman with standards of the composition of feeding stuffs, as well as feeding standards, whereby he may without difficulty feed his animals rations supplying the correct amounts of digestible food for their several needs. At the present day many stockmen make use of feeding standards as necessary guides to intelligent practice. Quoting the Wolff-Lehman standard, as given by Henry and Morrison in 'Feeds and Feeding,' we have the following illustrative standards for fattening cattle:

<table>

Special tables are prepared for dairy cows, in which certain amounts of nutrients are allowed for maintenance of the body functions to which is added required crude protein and total digestible nutrients for each pound of milk based on its percentage of fat.

A large variety of succulent feeds, hay or dry roughage, grain and meat, and the like, are suited to the needs of cattle. Beef calves as a rule nurse their dams six months or more, while calves from dairy cows are taken from their dams in two or three days, and are gradually changed from whole to skim milk, being fed the latter from three to four weeks of age up to eight months or so. Among the standard foods much in use for cattle in the United States besides pasturage are the following dry roughages: timothy, blue grass, red top, alfalfa,
red clover, corn fodder and stover. Of grains we have Indian corn and oats, with a wide variety of by-products from mills handling wheat, corn, barley, cotton and flax seeds. Silage, mainly from corn, is extensively used as a cattle feed, both in milk and beef production.

In making up standard rations, dairy cows are fed approximately two pounds of dry roughage or one pound of this and three pounds of silage daily, for each 100 pounds of live weight, with enough concentrates (grain or by-products) to adjust the entire ration to the feeding standard. Experimental results have shown that it is good practice to feed dairy cows daily about one pound of grain for each three to four pounds of milk produced, cows producing rich milk, as Jerseys or Guernseys, requiring the lesser amount. Fattening steers may be given daily about two and one-half pounds of dry roughage (or the equivalent in silage) and concentrates for each 100 pounds of live weight, the amount of concentrate ranging from one to one and three-fourths pounds for each 100 pounds live weight, based on the degree of fattening.

Extensive losses occur from disease among cattle, of which the more common are tuberculosis, contagious abortion, black leg and Texas fever. Based on figures reported, we have an annual loss in this country from disease, exposure, accident, etc., estimated at $177,750,000. The seven most important losses are as follows:

Inquiry was addressed to numerous agents of the United States Department of Agriculture as follows: "For every $100 worth of cattle in the county what would you consider the extent of yearly loss from all causes indicated above?" replies to which gave an average of $71.31 for the entire United States.

CATTLE

immunized before the ultrasensible germ reached the lung, its natural habitat. Though successful in immunizing and saving the inoculated herd this virtually spread the disease-germ—in the buildings, yards, pastures, manure, fodder, etc. of the animals operated on and the pest was kept alive for 59 years, until more thorough and radical measures were adopted.

Lung plague was imported from England into Brooklyn, N. Y. (1843), into New Jersey (1849), into Pennsylvania (1845), and into Holstein (1859). The New Jersey importer stamped it out by promptly killing the whole herd; the Massachusetts authorities cleared that State by killing all infected herds at a cost of $77,511.07 for indemnities. The Brooklyn outbreak persisted for 49 years, extending into New England, New York, New Jersey, Pennsylvania, Maryland, Delaware, District of Columbia, Indiana, Illinois and Wisconsin. In 1887, when the National Stock Yards, Chicago, became involved, and the whole continent was imminently threatened, a campaign for extinction was started. In March the plague-stricken Chicago and Cook County were cleared, and by 1882 the United States was once more free, though the last case was not reported till 1896. This outbreak failed to spread widely because the cattle traffic was practically all eastward to the large cities on the Atlantic seaboard, and this plague was finally carried west by a comparatively new but considerable traffic in thoroughbreds, and in several cases to replace losses in the Western herds. This but repeated the Old World experience that in countries breeding their native stock, as in Spain and Portugal, Norway, Scottish and Welsh Highlands, cattle remained long free from this and other plagues. The same is true of the Channel Islands. It strongly emphasizes the necessity of stopping the movement of all stock, and even men, in districts where a deadly pestilence prevails, of killing all infected herds (sick and well) and of thorough disinfection of the carcasses, manure, litter, fodder and articles of all kinds that can by any possibility carry infection. The writer found that sterilized exudate from the diseased lung, when injected under the skin, immunizes such animals against the disease. If prepared without possibility of survival of the living germ this is entirely safe and harmless, but the probable escape of the live germ, excepting in the most careful preparation, forbids its general use. In case of high class cattle and under skilful supervision it may be profitably used on an already infected herd, kept absolutely separate from others.

Foot and Mouth Disease.—This has been repeatedly introduced into the United States in cattle, sheep and swine, and by cowpox virus, and has secured a wide and threatening prevalence on different occasions. It is perhaps the most contagious of cattle diseases, and since other cloven-footed animals (sheep, goats and swine) are about equally susceptible with cattle, and other warm-blooded races and man are only slightly less so, it has at times caused much apprehension and dread; veterinarians have pronounced it dangerous and fatal, and government authorities have treated it as such. Exposed herds in cattle, other infected animals, herds and flocks are promptly slaughtered and the places disinfected. It is, however, one of the mildest and least fatal of cattle diseases, proving lethal only when the infection has been swallowed in the food (milk, water, soiled fodder, etc.) and has set up the diseased process on the alimentary canal (stomach, bowels). As usually occurring it shows itself in isolated blisters one-third to one inch in diameter on the mucous membrane of the muzzle, lips, cheek, tongue and throat, on the teats and between the hoofs (extending up in front and behind). Each blister shows but one undivided sac filled with a clear serum (a true cowpox of about Paris), each sac being separated by internal partitions into a number of separate sacs and must be prickled again and again to empty it. The disease has a period of incubation of from two to eight days in cold weather, followed by some dullness in appearance and rise of body heat, a pink color of the membrane of the mouth, heat and some tenderness of the teats and between the hoofs, and soon movements of the jaws, accumulations of white froth in masses around the lips and a dribbling of liquid saliva. A loud smacking usually follows caused by gaping, parting of the lips and separation of the tongue from the roof of the mouth. The simultaneous attack of the whole herd and the concentration of the lesions on the three points named form a striking picture. The implication of sheep, goats or swine in the same building, yard or road is equally striking. The rule is that when kept clean, fed soft, slopy food and treated with mild antiseptics, the patients improve rapidly and are well in 14 days, and after an attack they can be considered immune for a length of time. They may have a second attack a year later. As reassuring data it may be stated that in the United States, and in Great Britain it was the rarest thing to have a death occur. McMinn's cattle insurance statistics, covering long periods of prevalence of the plague, give not a single reference to a death. The writer's experience, having lived on a Scottish farm in his youth, was that feeding cattle, bought in the fall market, usually brought the infection with them, passed through the attack in the first fortnight and recovered without exception; and that the next spring crop of calves lived and thrived without any sign of the malady, even in cases of no previous outbreak. The infection became inert when dried for 24 hours at 88° F., but remained virulent for nine months when kept at 32° F. (Loeffler). It infected men who consumed butter and cheese from infected herds; others have eaten this without harm, but these were in infected districts and the experimenters were veterinarians with ample previous opportunity for exposure to the disease and consequent immunization. It should be added that the outbreak of 1870, imported in English cattle landed at Lewis (Quebec), which spread through Quebec, Ontario, New York and New England, showing its virulence by sparing no bovine in any herd it entered, and extending to swine, sheep and human beings as well on the farm, ran its usual Old World course of two weeks, then subsided for lack of susceptible subjects, and, on the coming of spring and the fresh crop of calves, it failed to attack any one of these. There had been no large outbreak of swine in quarantine; only the owners sealed the stock as usual in winter quarters, and this allowed time for the spontaneous death of the germ. Again, the New England outbreak of 1902 from
contaminated cowpox virus occurred, like the Quebec one, in the fall, and should have had an equal chance of dying out quickly but for the fact that it involved a number of large dairies supplying milk to Boston and other big cities and that it was officially subjected to compulsory slaughter, so that dairymen attempted to hide the existence of the malady as far as possible to prevent the ruin of their milk business, their chief or only source of livelihood. The animals were huddled in close, unsanitary quarters, too often along with concealed manure, and thus contracted secondary diseases from septic infection of the sores, which rendered the affection much more complex and injurious. The outbreak and these results lasted until May 1903, seven months after the Federal government took the matter in charge (or a year after the first circumstantial report of the existence of the pestilence in the State). This outbreak is in most marked and unhappy contrast with the experience of the simple disease in Scotland, Canada, New York and New England in 1870; also with a number of more restricted outbreaks in which none of the infected cattle were kept until they had passed through the disease and recovered.

Prevention, Exclusion.—For any disease like this, exclusively microbial, always requiring importation to start the first case in any outbreak, non-fatal, lasting but two weeks, with microbe easily sterilized, the cheapest and most efficient resort is still to exclude it absolutely from the country by preventing importation. All warm-blooded animals must be shut out because these can contract the disease under favorable circumstances and can harbor the microbe causing the affection and convey it to other susceptible animals. This would of necessity shut out not only warm-blooded animals, but also their products: hides, horns, hoofs, hair, wool, bristles, feathers, down, bones, meats, dried muscles, tendons, sausage cases, extracts of all kinds made from such animals, wet or dry, blood, manure, virus, bacterins, miscalled vaccines, real vaccine (cowpox variola) and all other products that could convey foot and mouth disease. It would also exclude immigrants, and especially stock men, and those with soiled clothes until these were sterilized by heat. This is confessedly a large order, but we have essentially cleared through these channels and are liable to suffer again and again while present methods continue. Which then is better: to make our own products at home, or to stamp out every few years a pestilence threatening all of our 90,000,000 head of cattle that can reach, and their yearly offspring, until the pest is thoroughly extirpated? An alternative would be to detain all such imported animals and animal products at the port of arrival, quarantining the former under the most rigid and inflexible rules for one month, or more if needed, under constant professional supervision; and sterilizing the latter by heat or by thorough disinfection before they were released. The mere exclusion of live imported cattle or their safe seclusion after arrival would be of little avail, or a loophole escapes. Birds, insects and even vermin would open the way for escape of infection. The efficacy of a perfect quarantine and disinfection was evidently recognized by the Federal officials, who, under the urgent protest of the owners of thoroughbreds then on exhibition in the Chicago International Cattle Show, retained the whole exhibit for a length of several days and then released them. But inconsistently enough a highly valued thoroughbred herd outside the city was ruthlessly slaughtered; and again, when the Chicago Stock Yards were closed, several days' grace were allowed so that stock unexpectedly caught there could be disposed of. As might be expected the disease made its way in several new directions in the interval.

A costly and irremediable result of the slaughter of some of the best stock in the country lay in the sudden removal of priceless cattle that it had cost lifetimes to secure and the rendering impossible of the birth of their equally priceless prospective issue. It was a deed that could in no way be claimed as wise foresight, loyal patriotism nor devotion to the interests of live stock improvement or national prosperity. Official reports of cattle killed and paid for (1902-03) in the New England invasion were $179,572.37. For that of 1908 referred to above the charges for cattle killed were $376,785.39. But these take no account the other losses to the stock owners, the interruptions, often permanent, of business connections and enterprises, the outlays made imperative to establish new lines of trade, the losses incidental to restocking (when the old stock could have been profitably retained) and the certain loss of all prospective issue of the stock needlessly killed. The officials have sought to excuse their actions by quotations of heavy losses in dairy cows kept day and night in close, offensive city stables, the empty stalls being promptly filled from city markets charged with infection, and again of others from Germany, where, in addition, every city maintained its Freibank for the sale of detective meat at a cheap rate, and through which there was inevitably a continuous distribution of infection.

Treatment consists in scrupulous cleanliness and dryness, with the use of healing lotions weak enough to be non-irritating — alum, borax, copperas, blue stone, annie blue, formalin, hypochlorite of lime (bleaching powder), or, better still and cheaper, the Carell-Dakin's combination of lime hypochlorite (30 per cent chlorine), 4½ ounces put in a bottle with 5 quarts water and shaken often for 6 hours; 2 ounces dried soda carbonate and 1½ ounces bicarbonate of soda in 5 quarts water put in a separate bottle, well shaken and set aside for 6 hours; add the two liquids together, shake well for some minutes; set aside for one-half hour; siphon off the surface water without disturbing the precipitate; filter through paper and use.

Immunity.—Viewed broadly, this consists in invulnerability of a living body to the attack of a microbe. Every race of animals shows a susceptibility to its own microbial enemies and insusceptibility to others, and where the latter is very pronounced the blood or other serums may often be used on the other susceptible races to induce some degree of immunity. But this is not an invariable result; one animal, with a strong vulnerability to a given microbial affection, when it has once passed through that disease and recovered, shows an equally potent acquired immunity...

heating of the saliva for half an hour to 212° F. in a suitable apparatus will insure sterilization so that, in the absence of all living germs, it can be used with full confidence of safety, and even in other diseases (spore-forming), and therefore liable to infect premises and soil, it is only necessary that the virus shall be subjected to repeated heatings with intervals of 12 to 24 hours to allow for the sprouting of the spores to form microbes, and a sterilized product is obtained.

A list of the more common contagious diseases is here given, indicating their adaptability or otherwise to the employment of autotherapy:

1. **Cattle pests too contagious and fatal to admit safe autotherapy:** Kinderpest, canine madness, chronic bovine dysentery (Johnes' disease).

   For these the cheapest, safest and most effective resort is to stop any movement whatever of animals of any kind within a very large area around the herds known to be infected, spreading the infected herds to other areas, burying the carcasses and products and to thoroughly disinfect the premises, pastures, etc.

2. **Cattle pests in which the germs are preserved in dead tissues of the living body, caseated or pus products, etc., to spread the affection later:** Anthrax, blackleg, tetanus (lockjaw). In these the cattle operated on are likely to prove immune, but susceptible animals coming on the lands later, by birth or from outside, are liable to suffer and start a new outbreak. Here autotherapy protects the animals on the ground, but efficiency demands quarantine, drainage (drying the land), and, for a length of time, seclusion of the area from other live stock.

3. **Cattle pests that are not self-limiting (self-immunizing).** Here the disease may show itself a second time in animals treated by autotherapy and may spread to other susceptible animals, the beginning of a fresh outbreak: Poll evil, fistulous withers, foot rot, chronic tuberculosis, deep-seated pus pockets having no sufficient dependent outlet, chronic intermittent bovine dysentery (Johnes' disease), cancer, acinomycosis, etc., which, like syphilis in man or glanders in the horse, may persist for months or years in the same animal and steadily infect others. The danger of such a disease is seldom clearly appreciated by the owner because the animal, after recovering, appears to suffer so little. But in such chronic cases the germ carrier has become largely immune or the deadly germ would have cut him off long before, and his individual invulnerability gives him a long opportunity to spread the germ he bears, and thus to become incomparably more destructive to other and more vulnerable subjects. By this means such splendidly beneficient enterprises as Pasteur's method of immunizing and saving the life of the already infected animal has, for lack of necessary accompanying precautions, apparently become the means of preserving and spreading the germ of this most deplorable affection to which man and beast are so generally susceptible. From 1868 to 1878, later mad dogs and hydrophobic men were alike unknown in central New York, while since the Pasteur laboratory was established mad dogs have been common throughout the country as they were earlier in New York city, and there has been no lack of human patients at the laboratory. The same is true of France, the country made famous by Pasteur's skill. The Pasteur laboratories have failed to exterminate mad dogs or to save people from their bites and canine and human victims have been plentiful in France, while in Great Britain, Australia and other nations, where effective muzzling of dogs is secured, mad dogs and candidates for hydrophobia treatment are alike unknown. It is for the objector to explain why. It is not for us to abolish at once the Pasteur laboratory, but to see that its patients are not allowed to leave the institution and mingle with the general community in completion of the series of injections of the living germ and while that microbe is still alive in their systems. It is equally essential that the strict muzzling of all dogs be enforced (not simply placed on the streets in books) until long after the last case of hydrophobia has been effectively disposed of.

In all such cases autotherapy by the sterilized virus is the rational and safe resort.

**Tick Fever (Southern Cattle Fever).**—In the splendid enterprise of extirpating this by dipping again and again, all cattle in the infected district (embracing whole States) are cleared. But as a means to this end the cattle of a district were driven at regular intervals to a place where the baths had been constructed, dropping there and on the roadsides the eggs of the liver fluke (Distoma hepaticum and lanceolatum), thereby infesting the land, the water and slugs and laying the foundation for a plague of flukes in the locality, a continuous infestation of the farm animals, a deterioration of values and ruinous losses in sheep especially, and only less so in cattle, pigs and other mammals. Similarly, the opportunity was given for stocking the land and water with germs of or-born animals, feed, tetanus and other plagues, the germs of which survive outside the body. See **Cattle-tick**.

**Tuberculosis.**—The most widely prevalent and intractable plague of animals, largely because it is often concealed, through lack of obvious symptoms, through the variety of organs attacked in different animals, so that the victims may appear to be in rugged health and yet continually spread the germ. Many of them can be easily traded off on an unsuspecting customer and will go on unsuspected in the new herd dealing their deadly gift all around, and especially to pigs, through feeding in common or in succession with cattle. In hidden cases germs are preserved in the hard fibrous tubercle, in the softened and caseated masses and even in partially calcified ones, and, finally, there is no effective legislation nor administration for its suppression. Tubercles appear in the throat, the lungs and their covering, on the inner side of the ribs and spine, in the heart and in the diaphragm of the digestive organs, stomach, liver, pancreas, peritoneum or in any gland or gland group throughout the body (superficial or deep), in bones or joints,
in the brain or its coverings—indeed, anywhere throughout the body. The majority in an infected herd may escape detection unless the tuberculin test is applied to all. The most signs of disease are to put a drop of tuberculin under the lower eyelid in each animal. If next day that eye is red, inflamed and watering while the other eye has escaped, there is good ground for suspicion and all animals showing this should be separated from others and either castrated or kept under observation. A drop of tuberculin should have a half-dram of tuberculin injected under the loose skin of the neck or side. The temperature of each animal taken just before the test to give a normal should be recorded and after eight hours the body temperature should be taken every hour for 12 hours. Any rise above the normal from 103.5° to 106° F. would condemn any subject that had also showed the congested eye. All such should be killed if the aim is to stamp out the disease. The cows and bulls should be disinfected with good, fresh bleaching powder, and other measures taken. After racks and drinking troughs. The remainder of the herd should be tested yearly or half yearly and reactors removed and killed. In case of thoroughbred reactors, valuable mainly for their high-priced calves, they may be kept in thoroughly secluded premises and well-fenced pastures, their calves should be taken from them as soon as born and brought up on the milk of sound cows (or on their dams', first thoroughly sterilized by boiling). Such calves should be kept rigidly apart from other animals, in disinfected premises and safely fenced pastures. They should be tested when one year old.

Protozoa are microscopic (or ultramicroscopic) animal parasites, as bacteria are minute vegetable parasites. Some diseases, above referred to, are caused by protozoa in the blood, lymph, tissues and liquids of the host, and others, especially the ultravisible, have been suspected of belonging to this class; blackhead in the turkey and the cluster masses of cells (Coccidia) on the skin and in internal organs of birds and mammals, amebae of the intestinal contents, piromas (piroplama) of Texas (causing no disease in the latter), theileriosis and Rhodesian East Coast tick fever. Suspected of being protozoa are the ultravisible germs of hydrophobia, hog cholera, foot and mouth disease, lung plague, rinderpest, cowpox, sheepox, contagious cerebro-spinal meningitis, chicken pest, contagious epizootia, etc. Some of these have been treated by weakened germs (unsterilized autotherapy), but where they are extremely fatal and controlled very uncertainly by the mitigated virus it is more rational, to employ the sterilized germ, blood and antitoxins, etc. (sterilized autotherapy), rather than to run the risks of mistaken diagnosis and the resulting introduction of an unknown disease.

A widespread family of pathogenic protozoa (Trypanosomes) have live cell-like, mobile bodies, with a delicate undulating membrane at one side running into a fine antenna at the tail. They are found mainly in the blood and animal fluids, but also in the tissues, and can live outside the body. They are found mostly in warm climates, but have been discovered in the North American winters when domiciled in a warm-blooded host, as in the case of the breeding paralysis of horses, which has assumed a place in our studs. This demands castration of both males and females when affected and remanding them to work service by themselves. A progressive anaemia is common to all forms of tripanosomiasis. They are largely carried from victim to victim by predatory flies. Hence they can be checked to a large extent by destruction of insects.

Larger Parasites. These are usually large enough for recognition without the microscope. Like the microbes they are amenable to control or extinction in a district or country, thereby exterminating the diseases which they respectively cause. Each parasite must, however, be dealt with on the basis of its own genus and life habits.

Vegetable Parasites.—The cryptograms (nonflowering) are allied to bacteria but larger, often quite visible to the naked eye. Fungi attacking the skin, hair, hair-bulbs and follicles are common in cattle, especially about the head and neck, showing as circular patches with loosening and dropping hair, leaving bare patches (ringworm). Microscopic examination shows fine filaments and spores, and the bare patches enlarge by extension around the edges. These are unsightly, but not deadly, and can usually be checked by pulling out or shaving the hair and applying tincture of iodine or an alcoholic solution of bluestone, repeating this daily. Another filamentous fungus of a snowy whiteness (Fusarium) attacking the skin of domestic animals (including cattle) is overcome by sulphur or coal tar ointment. Thrush of calves' mouths with formation of a filamentous, curd-like accretion, as in children, is to be treated by boric acid or chloride of potash (powder or solution). The aspergillus of the air passages in mammals (including cattle) causing wheezy cough and breathing, fever and general disorder and an eruption on the bronchia, lungs, pleura, etc., at first as if sprinkled with water, but later with nodules and caseous masses filled with filaments and spores, and death as in acute tuberculosis, is to be met with antiseptics such as fumes of sulphur and alcohol burning in a close room till it causes cough, and repeated two or three times. The dilution of bichromate of soda may be injected into the windpipe. The walls of the building should be cleaned and thickly coated with a watery solution of bleaching powder.

Animal Parasites.—Two-winged flies (Diptera), larva in wounds: The most prevalent and persistent enemies are the common house flies and near allies, which are not blood suckers. Without perforating stylet they suck off the scurf-skin so as to leave raw surfaces and make spreading sores. The horn fly is a familiar example of this. The maggot-like larva, like those of the blood suckers, live in almost any decaying organic matter (animal or vegetable) that attracts by its fetid odor. Suppurating wounds and sores attract them and the ravenous larva adds in depth and width. These are particularly destructive in sheep infested with intestinal worms and scouring, so that the liquid discharges maturing the wool make a special protection and feeding ground for the maggot. The blood suckers are, however, the most thriving by drawing the blood through the stylet; they often transfer the most dangerous diseases, an
evil that is not unknown in the case of the flies
that suck only. Bottles pass their larval stage
mostly subcutaneously in cattle in spring (in
fall and winter they are usually near the gullet,
being apparently licked in from the skin by the
barbed tongue and swallowed). When numer-
ous they do much damage to health and hide,
the loss rising to $15 a head. These grubs
should be squeezed out and crushed in early
spring to head off the next year’s crop.
Mosquitoes and Small Black Flies deserve
mention. Their bite is venomous and they may
besides implant in the wound the germ of
another disease from the blood of the last
victim. It is common to cover drinking water
by a film of kerosene to destroy their larvae
(wrigglers).
Flies are common enemies and carry disease.
Some carry larvae of tapeworms to their next
victims; others infections. The tropical bur-
rowing in the Sow bug, through the skin, forming a
hatching nest and suppurating sore. The eggs,
larvae and pupae hide in furniture, clothing and
even on filthy skin where they can find decaying
organic matter for sustenance. Keep buildings
scrupulously clean, boil clothing and use freely
insecticides. Laurel oil, tar water and even
sticky paper to catch the offender in his
leaps. Lice are among the most widespread
and health-destroying pests. Cattle harbor two
cultures, blood suckers and biters. Blood suckers
prefer parts covered with long hair and best
out of the way of the tongue (head, neck,
back, tail). Itching leads to persistent rub-
ing, and hairless patches indicate the inva-
sion-areas. The safest remedies are weak tar
or tobacco water, decoction of hellebore or
stavesacre and naphthalin, though the latter
will taint the milk. A special dressing is due
in eight days to destroy the new crop hatched
from the nits in the interval. Ticks and Mites
are eight-legged insects (larva has but six
legs), and form large classes, always injurious
when attacking in numbers, which they do on
the skin or in internal cavities. They develop
through four successive stages: eggs, larva
(hexapod), nymph (octopod) and mature.
The larva attacks the mammal and lives on it
until it is mature. Some ticks, like the
deadly venim and instil it into the victim.
All produce some irritation and swelling where
they bite. But they do most harm by trans-
ferring deadly infections and infestments from
animal to animal, as in Texas fever, which
long prevented the success of cattle industries
in the South and created one of the most
deadly epizootics when taken North. This last
tick is now being exterminated in State after
State through with imperfect pre-
cautions to prevent diffusion of other diseases,
like anthrax, black leg, flukes, etc.
Mites like ticks can carry infection, though
in its absence they usually deprecate health,
condition and value by irritation. The harvest
mite of a vivid red color, and an European one
of a brilliant crimson, produce great irrita-
tion for several days, or continuously if the
victim goes daily through vegetation. Pro-
tection is sought by indoor life, by solutions of
tobacco or hellebore or by sulphur.
Speaking of the parasite that has the victims due to
any one of various Acari, the burrowing ones
(Sarcopites from Sarx flesh) boring into the
skin or sweat-glands, and the others living on
the surface, under scurf, scales or scabs.
(Psoroptes Psora itch and Symbiotics live to-
gether). The mange acari are very prolific,
reaching 7,500,000 from a single pair in six
generations, 60 days. They can be treated by
sulphur or hellebore ointments, naphthalin,
potassium sulphide or by simple oil injection
—the oil being applied to the right and left
sides of the body on alternate days. Tape-
worms are flat worms consisting of a
succession of segments the first of which bears
the small head with four suckers on the cor-
ners, and a proboscis in some species bearing
hooks for attachment to the mucous mem-
brane. Each segment is bisexual, and when
mature is a mere bag of eggs. The embryos
hatched out, each bores its way into the tissues
of its new host, forming the bladder worm or
soxcel, and the next host devours the soxcel
which then grows into the mature tapeworm.
If it fails to enter a suitable host it perishes.
But the two hosts usually live in numbers close
together, and as each feeds on the products
of the other, it follows that the worms multiply
so as to cause most deadly plagues in flocks and
herds. Cattle harbors: Diphyllobothrium, a small
inflat worm, the following tapeworms: the serrated tapeworm, unarmored, 8 to 15 inches long and \( \frac{1}{2} \) inch broad; the broad tapeworm, unarmored, 12 to 18 feet
long, segments showing a waving posterior
border; the white tapeworm, 18 inches to 7
feet long, 10 to 12 mm. broad, unarmord; in
tissues, the narrow-necked tapeworm (diving
bladder worm) which becomes the mature
Tania Margrata in the dog; the Ceznurus
Cerebralis (rather rare) in the brain which
passes into the Tania Ceznurus in the dog and
the Echinococcus Cyst which is the Tania
Echinococcus in the dog. Echinococcus being
a well-known disease in man, to the ox belongs
the odium of forming a link in the chain of its
survival. Treatment: after a few days’ fast give
powdered male shieldfern or area nut, \( \frac{1}{2} \) to 1
oz., to the host of the mature tapeworm with
an active purgative (Epsom salts 1 to 2 lbs.).
Liver Flukes (Distoma Hepaticum), \( \frac{1}{2} \) to
1 inch long, and Lancoolatum, \( \frac{1}{2} \) inch long, are
flat, leaf-shaped parasites found in the gall
ducts of (carnivorous) and the latter of man, near ponds, swamps and wet
lands, where there are fresh water snails
that harbor the undeveloped fluke as a sporocyst.
The successive stages of development in the fluke are: (1) The egg in the dropings
of the host; (2) the embryo, a flat organism,
like a microscopic fluke in fresh water; (3)
The Sporocyst in a fresh water snail; (4)
The Redia again floating free in water; (5)
In summer often Daughter Redia; (6) In autumn,
Cercaria encysted on stems of water plants;
(7) These grasses being eaten by mammals the
flukes are set free by gastric digestion and
pass into the first intestine, and thence into
the gall ducts to form the mature flukes. It
seems as if the risk of such a long chain of
changes would arrest the increase or even
annihilate the fluke, but in wet soils with abun-
dance of fresh water snails, and heavy stocking
with sheep, cattle or swine, the parasite pros-
per and multiplies, and the fluke plague is
constantly in cattle and swine. The vic-
tims lose condition, become anemic and weak,
dropsical in lower parts of the body and inter-
ally and die. Prevention is not to be sought
by withdrawing all stock from the land when the products of the soil are so precious. Thorough drainage is the true alternative and until the field is dried or turned to dry pasture the slough may be confined to dry areas or indoors, by the disuse of all fresh water supplies, the charging with sea salt of all retained drinking sources, the adoption of silos and well-salted ensilage, or well-salted dry food when ensilage is not in use and the liberal salting of all retained pastures (as far as possible without stopping their growth). These are the fundamental precautions needed. The 30,000 eggs deposited at one laying of the fluke constitute a terrible risk if any loopholes are left. Every precaution must be taken to see that no fluke-infested animal can escape to spread the pest on wet lands as yet free from its curse. A census of fluke carriers may be kept and the factors regulating on traffic (except for immediate slaughter on the premises) unless first cleared of the parasite. Even the gathering of live stock for sale, market or for some other sanitary object, though called under government control or demand of evil doers or rendered possible. Frogs and toads have been cultivated in the waters of Hawaii, and carp in the Columbia River, to combat successfully the snails and slugs that form such an important link in preserving this parasite.

Other flukes found in the first stomach and intestines of cattle have rarely proved especially injurious. It is different with the Bilharzia Crassa which produces white, albuminous urine in man, and is charged with causing Epizootic Hematura in cattle. The giant-fluke of lungs and liver of sheep and cattle encysts itself, causing dark red nodules. Fatal results are common when they are numerous. Prevent and treat as for other flukes.

Round Worms.—These are cylindrical, have true digestive organs and the sexes in two separate individuals. Some produce live young, some through eggs laid, some like Trichina pass their immature life in one host, which being eaten by another goes on to maturity in the latter; others pass through both stages in the same host; some again pass immature life in water outside the mammalian host. Cattle harbor from 15 to 20 species of round worms, a number of which spend their entire life in one host and leave their progeny in the same for the next generation. Some therefore must be treated with verminuges given to the host, others may have their career cut short by removing the intermediate host that harbors the immature parasite, or the water which harbors the adult. Great factories flourish on medicine intended to destroy the mature worm in its mammal host, which is too often but a closure of the spigot to let the vessel gush at the bung-hole. Worms resemble contagious diseases in this, that they must be destroyed both outside and inside the host wherever found. Much depends on where in the body the worm makes its habitat. If in the solid tissues or even in the blood, it is less effectively reached by medicine if it is not a paralyzing agent (non-poisonous to the host) are often the most promising agents, and even in the case of worms living free in the bowels, the multiple stomach of cattle and other ruminants endangers the dilution and weakening of the drug to an extent that is not met with in the small simple stomach of horse, man and other non-ruminating animals. All round worms living in the alimentary tract have digestive and absorption of the foodstuffs by their movements and the consequent irritation, as well as by consuming of nutriment needed by the host. The bloodsuckers irritate still more by the many punctures and undermine the health by the amount of blood extracted. Some even secrete poisons that destroy the blood functions, or even break down blood globules and with them health and vigor. The eggs of many worms fall with the excretions and live in the soil or in water for a year, so that on pastures they are liable to continuous increase, unless all hosts of that worm are excluded for years, or, better, unless ploughed up and put under cultivated crops for years. Among round worms that may be named a hairworm inhabiting the eye and the serous cavity of the abdomen; the encysted trichina in muscles (rare in cattle); a hairworm in beautiful zigzag lines in the mucous membrane of the gut; and many embryo worms in the blood. Among those living in the bowels: one whipworm in the blind gut; one Ascaris (like an earthworm) in the small intestine; five strongles (round) large and small, in the bowels (very irritating) and one hookworm (very injurious) in the air passages, 2 strongles giving rise to husky paroxysmal cough and much loss of condition, with expectoration containing worms: in or near the urinary organs the giant strongle (very harmful).

Intestinal Worms are liable to cause irregular bowel motions, costive or loose, unwholesome skin and a fur around the anus from dried-up mucus. The worms can often be seen in the droppings. As prevention change herd in pasture (horses or swine for cattle), change of water if from a running stream with herd above; feed liberally of salt, give a course of finely powdered copperas, areca nut, naphthalin, quassia water, wormseed or other vermifuge. For hookworms give thymol and be careful to prevent the embryos entering through the skin from the infested soil.

Non-contagious and Constitutional Diseases.—These are not self-propagating nor pestilential and thus make less appeal to the public. They are due mainly to generally operating causes — climatic, dietetic, chemical mechanical, electrical, pluvial or otherwise unhygienic. They are to be prevented by subjecting each individual in sound health to the conditions that guard against these functions so as to maintain a normal equilibrium. This would include good air, ample but well-balanced diet, regular exercise, never to extreme exhaustion, the avoidance of all chemical poisons whether originating inside or outside the body, and of all mechanical injuries that would in any way impair bodily functions. Yet there may at any time occur a combination of contagious or parasitic disease on the one hand and a sporadic disease on the other, so as to demand a cord vaporizer in cases of the two. A bodily impairment or debility resulting from a contagion or a parasite may make a subject more susceptible to the injurious action of cold and heat, humidity or dryness, electric action or impure air, than would other-
wise have been the case, and on the other side an injury due to cold or heat, etc., may unbalance the functions and system so that a microbe may meet with less resistance when it attacks the enfeebled body. Thus it is often needful especially to guard a patient suffering from a sporadic disease from the danger of infection and the victim of a plague from any disorder due to defective hygiene or care. It becomes desirable to employ autotherapy in the complex malady, along with the standard treatment for the specific affection present.

Inflammation is a vascular and nutrition reaction of any tissue to an irritant, and shows a contraction followed by a distension of the capillary vessels, an increased and somewhat depraved action of the tissue cells and an exudation into the affected and adjacent structures, or even into an internal cavity, of a liquid (lymph) and even blood, also a deranged nervous control. It may kill it or may result in tissue changes of many kinds—death of cells, either by necrosis or pyknosis, formation of pus or pus (abscess) and various degenerations.

Fever is a reaction, marked by an increase of body temperature, derangement of the nervous heat-producing centres, and of secretions generally, scanty, bright-colored urine of increased density, costiveness, dry skin, etc. It attends on all acute extensive inflammations, rises and falls with them, and leads to many derangements and degenerations.

Treatment of Fever and Inflammation.—Up to a given point a general system of treatment can be laid down. The profound changes in the blood, the excess of fibrin and its increasing coagulability, increase of white cells, enzymes and other poisons produced in the inflammatory and febrile processes, from the fermentations in the torpid bowels and elsewhere, and from the altered products and suspended secretions of glands, especially of the kidneys and skin, and from the generally altered functions of the body cells, even from the blood and system at large. If the already-formed poisons have given rise to diarrhea this may be omitted or given in smaller doses, until the bowels and system have become more normal. With the bowels cleared, saltwater may usefully employed (½ oz. twice a day) to lower heart action, increase the discharge from the kidneys and eliminate from the blood much injurious morbid product. Short of this the free use of water to drink will do much to activate both kidneys and skin, lowering body heat, and expelling and diluting the poisons. When body heat remains very high (103° F. and +) aspirin (2-4 drams in ball) increases kidney secretion and especially useful in rheumatism, acetanilid (1-2 drams) or acetanilid (2-4 drams) may be given. A simple course is to give pure cool air and water, clothing if chilly, and even damp compresses covering the affected region or even the whole trunk. The skin of the affected part is hot, soft, and even tender; kidney or other part becomes nervously susceptible and even tender, and the applica-

tion of warmth relaxes and soothes the deep-seated, inflamed part. The effect is still better if a damp compress is applied, warm if the animal is cold, but cold if the surface is burning hot; it should be well wrung out as not to drip, and at once covered, closely at all points, by a dry blanket or bandage sufficiently thick to prevent too sudden evaporation of the water and chilling of the skin. It must be a mode of applying warmth and thereby soothing. The good effect may be secured in other ways—by active friction to the skin, by rubbing actively with stimulating, essential oils, by an electric pad or by detaining the blood for an hour in the skin and then setting it free again. This was formerly effected by cupping. Chase most of the air out of the inverted cup by heating it with a taper; withdrawing the taper, suddenly apply the mouth of the empty cup on the skin over the affected part, and hold it there until it cools, increasing the partial vacuum, drawing the skin up into the cup, and the blood into the skin. If blood forms, an area corresponding to the size of the organ affected, and allow them to stay on for an hour. Then they can be taken off by separating the cup from the skin at one side and admitting air, when the blood will resume its original flow and pass out into the system. By enveloping an extended area of skin or a whole limb in a rigid, close-fitting cover and exhausting the air is essentially the same in principle. Both alike avail of the autotherapy method, for the blood coming with a ready-prepared charge of toxins and defensive products from a microbial, inflammatory and febrile source is held for a time semi-stagnant in direct contact with healthy, active body cells until even more fully charged with the defensive materials evolved from these under the most appropriate stimulus and is then sent back to carry out its recuperative work in the system at large. Similarly, blistering unconsciously availed of this source of defense and often with excellent results. In diseases of bones and joints even the hot iron judiciously applied will often work wonders.

Softening of Bones (rickets), seen in calves of cows kept on soils rich in organic matter, but deficient in hard, cold, exposed areas and on damp farmyards is essentially due to a fault of diet and nutrition and must be met by a richer ration, especially by change to land having an abundance of lime and other phosphates and salts. Tonics are usually necessary as well.

Rheumatism, attacking bones, joints and other fibrous structures, also claims cold, wet and exposure as an immediate cause, but may be traced as well to an excess of acid in the system or in the food, to a defect of nutrition or overfeeding with deranged digestion and local injuries. Warm, dry buildings, dry soil, sunny pastures and more careful feeding are demanded. As a direct anti-rheumatic, salicylic acid or salicylate of soda in full doses daily is desirable, particularly in the part affected with a liniment of oil of turpentine and salicylate of soda.

White Cell Blood, with or without Enlarged Lymph Glands (Leukemia; Lymphadenoma).—In this the affected lymph nodes or lymph cells in the blood, in the marrow of cancellated bones, the spleen and the liver, and,
CATTLE FEEDING—CATTLE-TICK

still more marked, by the presence of abnormally large white cells with pale nuclei. Bone marrow and lymph and other glands are the great producers of white cells, and these are liable to be enlarged in one form of the disease (Lymphadenoma), showing nodular swellings around the throat, in front of the shoulder and stifle and back of the latter. The cattle lose condition and run steadily down. Other conditions (notoriously hookworms) leading to enlargements of such glands may cause Leukemia. Bitters (quassia, gentian, quinine) with iron and arsenic of soda solution will often have a good effect.

Progressive Pernicious Anemia.—This is seen in cattle on muddy or otherwise defective soils, confined indoors or out in poor pastures, and preferably from three-fourths to one year old. No visible microbe has been clearly demonstrated. Subject loses condition rapidly even though liberally fed, has a dull yellow tinge of the eyelids or of white ears, pulse 70 to 80 and a hissing (anaemic) murmur with the first sounds of the heart. Blood globules are often modified or deformed. Temperature may be normal or subnormal. Blood spots may show on the eye before death, in two or three weeks. May advance more quickly after calving. Mortality 50 per cent. Treat as in leukemia.

JAMES LAW, Emeritus Professor of Veterinary Science, Cornell University.

CATTLE FEEDING. See Nutrition of Farm Animals.

CATTLE-PLAGUE, any plague by which large numbers of cattle are destroyed. Such plagues have existed at intervals, more or less, in all countries and in all ages. Among the severest visitations in centuries preceding the 19th may be mentioned a great plague which arose in Hungary in 1711, whence it spread to other countries, destroying in the next three years about 1,500,000 head of cattle. A second visitation, which affected England and the west of Europe between 1745 and 1750 caused the death of 2,000,000 cattle. See also Black Death.

Several of the diseases of cattle are due to insects, including that called "pleuro-pneumonia" or "Texas cattle fever," which is caused by a blood-inhabiting sporozoan that is carried by ticks from an infected animal to a healthy one, communicating the disease. Cattle bred in the Southern States have become practically immune, but the disease affects and kills northern cattle. The natural limit of the tick concerned (Boophilus annulatus) nearly coincides with Mason & Dixon's line, and Federal laws prohibit the shipping north of any cattle from south of this line, except between 15 November and 15 February. Other species of this same genus of ticks transmit similar cattle diseases in various parts of the world, especially the well-known "lumpy-jaw," a most virulent and incurable affection. Experiments have been time and again ineffectually tried to find a cure for this, though large governmental encouragement has been offered. A rigid examination of cattle is made by government inspectors at all receiving and shipping ports. See Cattle, Diseases of.

CATTLE-TICK, or TEXAS-FEVER TICK, an arachnid (Boophilus annulatus) related to the mites, and prevalent in the western and southwestern States. It is a reddish, tortuous, flattened or swollen creature from a quarter to half an inch in length. The cattle-tick lays a great many eggs, nearly oval, dark-brown, coated with a hard secretion, the process of egg-laying lasting for several days or a week. The young tick, on hatching, is whitish, afterward turning brown; it has three pairs of legs. After molting it becomes a nymph, when the fourth pair of legs is added. During the nymph stage the reproductive organs develop. After another molt it becomes sexually mature. It completes its development from the larva to the adult on cattle. After this second molt the couple pair, and the male grows but little. The female, voraciously feeding on the blood of her host, grows to a gigantic size, her body swelling and becoming gorged with blood and eggs. The males can be easily detected by their smaller size, and by the extension of the shield over the entire back. Ticks live upon the blood of their host. The females, as they increase in size, store away quantities of the ingested food in an immense convoluted chamber or appendage of the stomach. In summer only three or four days after the final molt are necessary for the ticks to become large. When fully gorged, and the eggs fertilized, the female loosens her hold in the skin of her host, and falls to the ground, where she lays her eggs, after which her body contracts, shrivels up and then dies. The young ticks get access to cattle by climbing bushes, whence they reach out and attach themselves to passing animals.

It has been proved that ticks, by sucking the blood of cattle infested with the Texas fever germ, which is a sporozoan (Apicystis bigeminum), may communicate the disease (bovine malaria) to healthy cattle, just as the sporozoan blood-parasite of yellow fever, malaria, is communicated by a mosquito (Anopheles). In dealing with ticks it should be remembered that it breasthes by spiracles, or minute holes in the sides of the body. By the use of oil, or any greasy substance, those openings may be covered, thus asphyxiating the creature. The ticks may thus be killed by dipping or spraying the cattle with cotton-seed oil. Cattle should be kept away from wooded or bushy pastures. Rotation of pasture is also used by stock farmers, so that the tick may die of starvation. The United States Department of Agriculture has conducted the work of eradicating the cattle tick from the southern States in cooperation with the States affected. A total area of 275,782 square miles had been made free of this pest up to 1 July 1915.

There are one or two species closely allied to the Texas cattle-tick, and named Boophilus australis; they are regarded by experts as either distinct varieties or species from B. annulatus. They transmit the cattle-fever in the countries above named. Another sub-species or variety, the blue tick (B. decoloratus) in South Africa transmits the same disease in that region.
CATTELEYA—CATULLUS

The Lone Star tick (Amblyomma unipuncta) is, next to the cattle-tick, to be held responsible for the transmission of the Texas fever. It may be recognized by the simple bright red spot on the back.

**CATTLEYA**, a genus of orchids, including about 40 species, natives of tropical America. The species are the showiest of all orchids and are among the best known. Under this name, botanical writers commonly group the orchids, but in reality the genus is widely grown by florists. In their native haunts they are epiphytic upon the trunks of trees. Innumerable hybrids and horticultural forms have been produced by plant breeders.

**CATTY**, the name given by foreigners to the Chinese kin or pound and used also in the Malayan parts of the Straits Settlements, Java, British North Borneo, etc., it is approximately one and a third pounds. The Siamese catty is equal to 2.675 pounds. In Burma, it equals one and a ninth pounds.

**CUTABANGANES**, ká-toó-bán-gáns', or **CATABANGENES**, warlike tribes settled in the mountains of Guimayangan, in the province of Tayábas (Luzon, Philippines). Nothing is known about their origin or habits, whether they be pure Malay or Negrito-Malay. They are probably Remontados mixed with Negrito blood and gone wild.

**CUTABIG, ká-toó-bíg'**, Philippines, a small town in the island of Samar, 48 miles north of Catbalogan. The place is garrisoned by United States troops, who, in June 1900, withstood an attack by 600 insurgents. This episode was a stirring incident of the war. It exports abacá fabrics to Manila. Pop. 9,565.

**CATULLUS**, Gaius Valerius, Roman poet: b. Verona 87 or 84 B.C.; d. probably 54 B.C. He is deemed by some to be Rome's greatest lyric poet, by others to be second only to Horace. His family seems to have had social standing and at least moderate means; for his father often entertained Julius Caesar, and the poet apparently never had to earn his living. While still a youth he could go to Rome and there complete an excellent education. It was in the expensive metropolis, too, that he chiefly resided, although his native town and his villa at Sirmio on the Lago di Garda, and another not far from fashionable Tivoli, would from time to time claim his presence. His one trip abroad may have been a financial venture, but it was perhaps mainly to visit the storied cities of the East that he joined the staff of Memmius, who governed Bithynia in 57-56 B.C. The provincials proved too poor a visa to an up-scrupulous official, much less to one of his suite, and Catullus vented his spleen in lampoons that contrast strikingly with the elegies of the other great contemporary poet, Lucretius, who revered Memmius as his patron. Catullus' trip did, however, allow a visit to the grave in the Tract of his only brother. His expressions of inconsolable grief are among the most affecting in Latin literature. In lively contrast are two inimitable poems that voice his joy at returning home. The year's absence had at least quenched the last embers of his passion for Lesbia, who had been for some years the curse and inspiring object of his life. According to the generally accepted theory, Lesbia is his pseudonym for perhaps the most remarkable woman of the day, Clodia, the sister of Publius Clodius Pulcher. She was at least 7, and perhaps 11, years older than Catullus, and in 61 A.C., when he fell in love with her, was the wife of Metellus Celer, a consul-elect. Apparently even Cicero did not wholly escape the fascination of this beautiful though utterly dissolute queen of the Roman *fast set.* The course of the poet's liaison may be traced in a series of poems that expose his inmost feelings with a power and vividness that critics deem almost unequaled. To the period of difficult courtship belong madly passionate lyrics and the dainty *sparrow-songs.* Next a lovers' quarrel and reconciliation engage our sympathies. Soon, however, the poet's faith in Lesbia's fidelity wanes, and with it all purer love, although his passion grows only the wilder and more intense. The poems in which he assails successive rivals, beginning with the brilliant but disreputable Catlus Rufus, are marvels of invective. It is only after his return from Bithynia that Catullus seems fully to appreciate the hopeless infamy of his former mistress, when he sends a scathing reply apparently to a profiter of reconciliation. While it is this cycle of love poems that has immortalized Catullus, he wrote admirably on other subjects. In spite of a life of pleasure, he had energy to study thoroughly the early Greek lyric poets, and especially the technical achievements of the Alexandrine school, which began now to have great influence upon Latin poetry. Although some direct translations from the Greek also attest his interest in these models, Catullus remained peculiarly independent. No matter how far his studies may show the results of his studies, they were primarily an outlet for feelings that compelled utterance, and not, like Horace's odes, a purely intellectual performance. He is less original in some of his long poems. The longest is an epitaphium, in Alexandrine style, upon the wedding of Peleus and Thetis, introducing also the story of Theseus and Ariadne. While Catullus' work in mythological epic no doubt made that of later writers, including Virgil, easier, his daring of his time has remained unique. On the other hand, his epitaphia are the forerunners of others in Latin literature, as also of the marriage poems of Spenser, Jonson and Herrick. Horace also often appears in his odes the older poet's debtor, though in artisitic form his superior. In epigram Martial is ready to concede the palm to Catullus as well as Marsus, though himself the acknowledged master of that form. Furthermore, in the leading elegiac writers, Tibullus, Propertius and Ovid, there are great obligations to Catullus and often read his praises. He enjoyed, too, the admiration of contemporary writers, and not alone those of
his own school of poetry, like Calvus and Cnua; for the historian Nepos seems to have started him auspiciously in his literary career. To him belongs the final edition of his poems. Other famous Romans that receive kindly mention are Asinius Pollio, Hortensius, Cicero’s great rival in oratory, and Cicero himself. Caesar, however, is attacked with a fresh animosity, as if the language is shocking. But in judging Catullus’ obscenities, his liaison with Clodia, and other even less creditable relations, moderns are charitable in proportion to their knowledge of the standards of that age. Even the severest are won to sympathy, if not affection, by happier glimpses of the poet’s character. In an age of insincerity every word of his rings perfectly true. His gentle side appears in his verses on babies, flowers and the beauties of nature, in his affection for his brother and his friends, and even in the better aspects of his, and for Clodia, besides the English poets already named, Prior, Gray, Byron, Landor and Tennyson have shown especial admiration of Catullus. Among numerous excellent editions of the poet, the translations by O’Malia (Oxford, Blackie Press 1904) may be named; also the editions of Bährrens (Leipzig 1885); Merrill (Boston 1893); and Friedhich (Leipzig 1908). Besides the commentary by Ellis (second edition 1889), the English reader has the poetical translations of Theodore Martin (1881), those in prose by Francis W. Cornish (Cambridge University Press 1912), and, perhaps, best of all, Hugh Macnaghthin’s ‘The Story of Catullus.’

WALTON BROOKS MCDANIEL, 
Professor of Latin, University of Pennsylvania.

CATULUS, the name of several distinguished Romans. 1. GAIUS LATIATIUS CATULUS, the admiral whose fleet defeated the Carthaginians near the Xegates Insulae off the Sicilian coast in 241 B.C., thus closing the First Punic War. 2. QUINTIUS LATIATIUS CATULUS, Roman general, historian and poet; b. about 152 B.C.; d. 87 B.C. He was consul in 102 B.C. with Gaius Marius, and in the following year was proconsul. During his proconsulship he, with Marius, defeated the Cimbri near Verceilae, the modern Vercelli, in northern Italy. As one of the aristocratic party and a partisan of Sulla, he was proscribed by Marius. With the exception of two epigrams nothing of his work has survived. 3. QUINTIUS LATIATIUS CATULUS, son of the preceding, consul in 78 B.C., censor in 65. He quelled the revolutionary uprising of M. Emilius Lepidus, his colleague in the consulship (78), who had tried to overthrow Sulla’s constitution, and assisted Cicero in the prosecution of Catiline.

CAUCA, kow-kə, Colombia, one of the nine departments of the republic, bounded on the northwest by Panamá; on the north by the Caribbean Sea; on the east by the departments of Bolivar, Antioquia, Tolima and Cundinamarca, and the republics of Venezuela and Brazil; on the south by Brazil and Ecuador; on the west by the Pacific Ocean. The territory of Caquetá and the districts of Huila, Inzá and Páez are included in this department. The eastern part of Cauca is watered by the Amazon and some of the affluents of that river; the Guaviare and the Casiquiare flow into the Orinoco; the Atroto empties into the Gulf of Urabá; while a dozen smaller rivers flow into the Pacific. On both the Caribbean and Pacific coasts there are several oil refineries. Its original area was 31,388 square miles, but in 1903 was reduced to 20,403 square miles. The centre of population and cultivation is along the Cauca River Valley, where corn, sugar cane, cacao, tobacco, etc., are grown with success. The mineral wealth, especially gold and silver is extensive. The forests, which cover a large section of the department, yield large quantities of rubber and cinchona. Pop., including aborigines (1912), 211,756. The capital is Popayan, with a population of 18,724.

CAUCASIA, that division of European Russia lying in the extreme southeastern part of the empire (38°-46° 30′ N.), between the Black and Caspian seas, and bounded on the south by Asiatic Turkey and Persia and on the north by the provinces of the Don Cossacks and Astrakhan. It covers an area of 180,843 square miles and is divided into two separate divisions by the Caucasian Mountains, on the north by Cis-Caucasia, on the south Trans-Caucasia. The physical aspect is diversified and present an irregular succession of mountains and valleys, table-lands and plains, making description extremely difficult. The central section of the country is one vast mountain-top, 700 miles in length and covering an area of over 12,000 square miles. From the range of mountains the plains of Cis-Caucasia on the north gently slope, ending in the Steppes, a low, marshy country; throughout Trans-Caucaasia on the south are chains of mountains running parallel to the central range. The Kuma and Terek rivers, flowing into the Caspian Sea, and the Kuban River, flowing into the Black Sea, drain the northern section, while the southern part is drained by the Kur and the Aras, its affluent, emptying into the Caspian, and the Rion, leading to the Black Sea. The much smaller Rion flows into the Black Sea. The water system of Caucasus belongs wholly to the Black and Caspian seas. Lakes are found only in Trans-Caucasia. The chief of them is the Gotchka, or Sevanga, situated in Erivan. Agriculture is the most productive occupation of the settled inhabitants of the southern section, the principal crops being wheat and other cereals, cotton, and tobacco. In Cis-Caucasia cattle-breeding is the principal industry and wheat, rye and other grains give large returns in the irrigated districts; while in the mountainous regions mining is carried on to a great extent, the mineral deposits being very rich, copper, silver, iron and manganese ores, cobalt, sulphur, quicksilver, naphtha and rock salt the most important. The region is especially rich in oil, the production of petroleum being very extensive and second only to that of the United States. Coal, of inferior quality, is extracted. About 30,000,000 gallons of wine are produced yearly. Rugs, wooden goods and harness are also made. The exports and imports are rapidly growing, the exports, valued at $30,000,000, being about six times the value of imports. The transportation facilities are far from adequate. In many parts the pack horse is still used for transporting freight. The northern of the two chief lines of railway extends along the Caspian coast from Baku to Petrovsk; thence inland and north into the
province of the Don Cossacks to its terminations at the Sea of Azov. A branch connects the main line with Novorosiysk on the Black Sea. The mountainous ridges between Baku, on the Caspian, with Batum and Poti, on the Black Sea. For higher education there are about 200 schools accommodating 27,000 pupils. There are 5,443 primary schools with 90,000 pupils under the Ministry of Education and about 2,000 secondary and 1,308 modern schools with 36,000 pupils under Cossack supervision, besides numerous religious schools. The majority of the people attend the Greek Orthodox Church, but there are large numbers of Nonconformists, Gregorians, Lamists, Mohammedans, Buddhists, etc. The territory is governed by a general governor, acting for the emperor, and the local zemstvos administer the economic affairs of their respective districts. Caucasia is divided into 11 separate governments: on the north are Terek, Kuban and Stavropol; on the south are Tiflis, Kars, Kutais, Erivan, Daghestan, Black Sea, Yelizavetpol and Baku. Prior to 1770 historical information is vague, but by the end of the 18th century Russia had acquired Cis-Causasia, and by 1829 the whole territory was nominally under Russian dominion. Not until 1865, however, could it be said that Russian power was firmly consolidated. The Russo-Turkish War of 1877-78 resulted in the annexation of a considerable portion of Turkish Armenia. In 1895 Caucasus was the scene of violent disturbances, racial and revolutionary. The inhabitants are mainly Russian Armenians, Tartars and Georgians, about 68 dialects being spoken. Pop. (1911) 12,037,200. Consult Keane, ‘Man: Past and Present’ (1899); Ripley, ‘Races of Europe’ (New York 1899); Erckert, ‘Der Kaukasus und seine Völker’ (Leipzig 1887); Freshfield, ‘The Exploration of the Caucasus’ (London 1902); Wirath, ‘Kaukasische Zusammenhänge’ (Leipzig 1907).

CAUCASIAN, kò-há'šan, RACE, a term introduced into ethnology by Blumenbach, in whose classification of mankind it was applied to one of the five great races into which all the different nations of the world were divided. Blumenbach believed this to be the original race from which the others were derived and gave it the epithet of Caucasian because he believed, probably erroneously, that its most typical form — which was also that of man in his highest physical perfection — was to be met with among the mountaineers of Caucasus. The Caucasian race comprises the most highly civilized nations of the world, including most of the inhabitants of Europe (the Turks, Hungarians and Finns being excluded); the Hindus, Persians, Arabs, Hebrews and the ancient Phoenicians of Asia; and a large proportion of the inhabitants of northern Africa. See ETHNOLOGY.

CAUCASUS MOUNTAINS, a lofty and rugged range of mountains forming one of the natural barriers between Europe and Asia. It extends in a northwest and southeast direction from near the strait of Kerch on the Black Sea to near Baku on the Aspheron Peninsula projecting into the Caspian Sea. The distance between these points in a straight line is 700 miles, but following the main ridge of the mountains about 940 miles. The range varies in width from 60 to 130 miles and may be divided into three parts. The western portion, extending from the Strait of Kerch and the Sea of Azov to the peak of Elbruz, consists of a series of narrow ridges, the peaks of which are abrupt; and the southern slope of the main ridge has in places almost vertical walls 2,000 to 3,000 feet high. There are few passes through this great barrier, and these are difficult. The snow line is at about 9,000 feet.

The highest peaks of the Caucasus are in the central part, from Elbruz to the Adai-Khokh. Here, as to the westward, is a series of parallel ridges, the higher summits all snow-clad, with deep longitudinal valleys; some of the highest peaks, Elbruz and Kazbek, are on spurs more or less isolated from the main range. In this central portion of the Caucasus, as yet incompletely mapped, there are said to be fully 20 summits higher than Mont Blanc, the highest peaks being Elbruz, 18,470 feet; Dykh-tau, 17,889 feet; and Janghitud, 16,564 feet; and Kazbek, 16,546 feet. The snow line is at about 11,500 feet, and the total number of glaciers of the first class is fully 175, while rounded rock surfaces and boulders in the valleys show that glaciation was much more extensive at no very distant time. East of Kazbek the range narrows and is narrowest south of Vladikarkaz, where it is crossed by the Russian military road to Georgia. This road runs over the Kobi Pass and through the great Davial Gorge, one of the greatest mountain chasms in the world. The eastern part of the Caucasus, from Kazbek to the Caspian, is of much more complicated structure; the range widening and including a high plateau crossed by subordinate ranges having an east-northeast and west-southwest direction, though what may be termed the main axis continues its southeast course.

The plains of Caucasia north of the mountains are underlaid by Tertiary and Quaternary strata. The foothills of the Caucasus and the plateau of the eastern Caucasus show rocks of Cretaceous and Jurassic age, and nearer the main axis of the range are Paleozoic formations. The main axis shows schists and gneisses with granite and syenite. Trachyte and similar rocks occur, and some of the peaks, Kazbek, are probably in part of volcanic origin.

The scenery of the Caucasus is wild and gloomy rather than beautiful. The lower slopes are thickly wooded, but there is not the combination of dark forests, beautiful lakes and graceful snow-crowned summits that makes some ranges — for instance the Selkirks in British Columbia — so attractive to the mountain-climber.

The mineral wealth of the Caucasus is very great; in fact, in this respect the range is one of the most noteworthy in the world, but owing in part to the very rugged topography much of this wealth is still undeveloped. Among the valuable resources may be named the coal fields near O-Semchiri and at Kuban and Kutais, the copper mines of Tiflis and Elizabetpol and the silver ores of Terek and Kutais. More important are the manganese mines near Kutais, whence some 500,000 tons of ore are exported.
annually to various European countries and the United States. Most important of all are the oil wells of the Asperhorn Peninsula, the most remarkable in the world, whence some $12,000,000 worth of petroleum, benzine, etc., are shipped to foreign countries every year. Consult Bodenstedt, 'The People of the Caucasus'; Deniker, 'Races of Man'; Keane, 'Man, Past and Present'; Ripley, 'Races of Europe.'

CAUCHY, kō’shē, Augustin Louis, French mathematician: b. Paris, 21 Aug. 1789; d. Seca1, 23 May 1857. Entering the polytechnic school in 1805, he distinguished himself by the solution of difficult problems. In 1816 he won the grand prix of the Institute by his paper on 'Wave-propagation.' He qualified as a civil engineer, but selected science for his chief work, owing to health conditions. His political bias barred him from the higher college positions which were his due. He was created a baron by Charles X in 1848, he became professor of mathematical astronomy until his death, at the Sorbonne. His political-religious writings attest both his faith in the legitimacy of kingship and in the Catholic religion, one of his characteristic works in this line being the poem 'Charles V en Espagne' (1834). He contributed to almost every branch of mathematics which he perfected by his discoveries, notably residual and imaginary calculus. Among his numerous works are 'Cours d'analyse' (Paris 1821); 'Leçons sur les applications du calcul infinitésimal à la géométrie' (2 vols., 1826-28); 'Exercices de mathématiques' (1826-28); 'Sur l'application du calcul de résidus' (1827); 'Leçons sur le calcul différentiel' (1829); 'Mémoire sur la dispersion de la lumière' (1839); 'Exercices d'analyse et de physique mathématique' (3 vols., 1839). The Academy of Sciences published 'Les œuvres complètes d'Augustin Cauchy' (27 vols., Paris 1882-1901). Consult Terquem, 'Analyse des travaux de Cauchy' (Paris 1857); Valson, C. A., 'Le Baron Augustin Cauchy: sa vie et ses travaux' (Paris 1888).

CAUCUS (shō for eaucus club), a political party gathering for nominations or conference on party policy, as distinguished from a merely hortatory one. It may be a town or ward meeting, to nominate local candidates or delegates to higher nominating conventions (the latter sort are also called 'primaries'); or a party conference of members of Congress or a legislature, to decide on members or confirmations to office. Originally, a secret gathering on the model of the Caucus Club of Boston, whose leading business was the making of 'slates' for local offices, it incidentally came to be the molding of a policy of local autonomy in opposition to British influence. The etymology of the name is pure guesswork. The usual derivation from 'caulkers' (sc. club), or an imaginary 'caulk-house,' is most improbable. More probably, the worth of pe is that from Lat. ecur, Gr. &kappa, a cup, as originally a convivial society, most secret societies of that day having classical names or initials; the words, however, are not classical, but mediæval, and are so less likely to have come under their notice. Possibly, however, it might be that it is merely a derivative common jargon. Most probable of all is the adoption of an Algonkin word, kaw-kaw-wus, to consult: —if the word is real: cf. 'pow-wow.' At all events, the club and the elements of the system originated in Boston during the 18th century. Samuel Adams' father was accredited as a founder and eminent member; his son became immortal, and to which he owed his first election to the legislature. The preparation and distribution of ballots before the election was one of its chief instrumentalities. The first mention of the original club is in John Adams' diary, February 1763: the officers are 'regularly chosen there before they are chosen in the town,' and intimates that the distribution of business favors as a quod pro quo was not absent, which might be assumed.

The system rapidly grew; indeed, in some form it is part of the inevitable machinery of majority rule, which in constitutional countries has supplanted the primitive decision of battle by merely counting the opposing hosts, it being assumed as a basis that the larger could outfight the smaller. But for common action of that majority there must be some method of determining its will before the elections, as to both measures and men; and all countries with any measure of popular control have some shaping and testing mechanism. In England it has been formally established since 1880, by the so-called 'Birmingham system'; but in the higher lines of policy, even before that, the two great political clubs of London, the Carlton and the Reform, Conservative and Liberal, discharged many of the functions of informal caucuses. Nevertheless, the power of the caucus is greatly affected by local and national circumstances. In England and most Continental countries, it is restrained by the still powerful aristocratic system, which forms a counterpoise and provides natural leaders; in France, by the centralized government system. In no other country has it the same authoritative power as in the United States. Early in our history it became universal. Said Adams in 1814: 'We have Congressional caucuses, State caucuses, county caucuses, city caucuses, district caucuses, town caucuses, parish caucuses, and Sunday-school caucuses at the church doors.' This is primarily due to the entire legal equality of all classes; that absence of prescriptive privileges furnishing a shelter for minorities and independent action, which is considered the chief glory or the chief danger of democracy, according to the point of view. The gradations of the American political system into national, State, district and municipal powers have produced a corresponding hierarchy of caucuses, each sending delegates to the next higher caucus or convention, and constituting a 'machine' of great efficiency and formidableness.

But it has been made at once practically irresistible, and largely worthless for its ostensible purpose of determining the general sentiment of the party, by the 'spoils system,' which throws the organization and management of the caucuses into the hands of those who can give their whole time to political work, because paid for this service (in reality though not in name) out of the public treasury. Thus managed, the caucus in the larger places does not necessarily represent the views of the majority; and very often the leading object is to prevent the majority from meddling with the machine. In theory, the caucus was a voluntary association of the members of a voluntary association, to
deliberate as to its policy and agents, all are fair and hoist his decisions, and have no right to "bolt" afterward; otherwise there is an end of all common action. It is of course to the interest of the managers to cultivate this theory, and the military similes of "campaigns" and "forces" and "deserters" and "closing up ranks," etc., and to stigmatize all individual courses as equivalent to treachery and insubordination; and no matter how spurious this technical majority may be, or by what methods a real minority may have attained a seeming majority, a "regular" nomination will always have enormous weight. In part, it is true, this is because the vast majority have no common wish or purpose, and are destitute of constructive political ideas; and any pronouncement of the constituted party authorities is really their will, which is simply to obtain such a mandate. Hence, "regularity" is the test of merit; and this willingness to accord to the show what belongs to the substance is the almost invincible bulwark of political corruption.

This has generated in the last few years a host of efforts, public and private, to break down the monopoly of the caucus and substitute a real and direct control of nominations by the party; control of policy cannot thus be shifted, but corruption is the work of men, not of measures. It cannot be said that any of these movements as yet are very successful or promising, largely owing to the consideration just mentioned, that the initial possession of political ideas is a condition precedent to expressing them. One scheme is to have nominations made by direct popular vote instead of by primaries; but this simply shifts the function of the caucus one stage back, to decide on the votes for nomination instead of the votes for offices. More elaborate, and in some directions more efficient, are the legislative provisions made in several States for taking the primary caucuses themselves under the control of the law, as elections have always been. In this case, all persons who wish to vote in a party caucus must register themselves as members of that party. The effects of these measures have been a singular mixture of good and evil, and probably reflect in this regard the motives of the enactment. On one hand, factitious leaders can no longer swamp a caucus with a rabble of purchased voters from the lowest element of the other party. In theory a check list was always used; but as it had no legal validity, it was scouted whenever a majority, real or spurious, was interested in evading it. The check list under the law cannot be so treated. On the other hand, an obvious effect of the law, probably not absent from the minds of the framers, is to extinguish as a party force the independent or "mugwump" element of both parties, who try to reform their own party by a leverage obtained from the other; and are therefore excluded from either, as they cannot keep changing registration. If this was a motive, the Nemesis has been a fit punishment. The party managers in various places are greatly disappointed and alarmed to find that only a fraction even of their normal and calculable voting strength will register at all, and therefore they are nominating in the dark, without knowing what the party sentiment is. When they honestly wish to ascertain the party feeling they have great difficulty in doing it. The dislike to sporting a registered, public and unchangeable party label is not confined to the more intellectual independents, but is strong in the general mass; and the attendance at primaries is a much less sure guide than of old to what the party will support at the polls. The future future of the caucus cannot be forecast; but there is little evidence thus far of a loosening of its hold.

**Congressional Caucuses for President and Vice-President.**—These grew out of the Electoral system (see for instance a singular and paradoxical phenomenon) at the same time that the old theories of an educated official class and professional trained office-holders gave place to the inrush of the untrained democracy and rotation in office. It is no mere coincidence that the last Congressional caucus was held to nominate a candidate in the last election that returned a President of the old school. The masses were taking everything into their own hands; Jackson and popular nominations came in together, though there was no link when the people acted through the State legislatures. The theory of the electoral system was that the electors, themselves the chosen sages of the people, should make free choice of the best men in the country for the chief executive offices; but from the first their choice was pointed out in advance. While Washington lived and would take office, no other candidate for President was possible; and for his first Vice-President, John Adams was the choice of New England, and the other States had either their "favorite sons" or no special wish. In 1792 the same circumstances controlled; though New York's favorite, George Clinton, won the support of several southern States. The electors deferred to the notorious public feeling; but their action was nominally independent. In 1796 this was still true of the Federalists, who made a combination of North and South on Adams and Pinckney; it was substantially true of the Republicans, for Jefferson was the undisputed leader, and while the Republican members of Congress informally agreed to support Burr, there was no set ticket for the electors to support at party peril. But in 1800 both parties held regular but secret caucuses and adopted nominees who voted solidly and even stupidly, with results still memorable. The Federalists voted that Adams and Pinckney should be supported alike. The point of this was that up to that date, there was no distinct candidate for President and Vice-President, the one who received the largest electoral vote being President and the next one Vice-President. Adams was certain to receive no Republican votes, but if all the Northern Federalists voted for Pinckney, he as a popular Southerner would probably receive some southern votes; so Jefferson was elected President over Adams, whom the Federalists hated but did not wish to bolt. Thus they would defeat him by appearing to keep strict party faith. The Republicans on their part had managers in various places greatly disappointed and alarmed to find that only a fraction even of their normal and calculable voting strength will register at all, and therefore they are nominating in the dark, without knowing what the party sentiment is. When they honestly wish to ascertain
This actually happened in the case of Jefferson and Burr, and the struggle was only settled after 36 votes. The results were the adoption of the 12th amendment to the constitution, regulating presidential elections and compelling electoral votes to state which candidate they would support, the impeachment of Burr by the House, and the trial of Burr in the Senate. The trial lasted a month, and during this period, the issue of the election was decided in the House by a vote of 13 for Jefferson and 14 for Burr. Jefferson was thus elected President, and Burr was convicted and sentenced to imprisonment for perjury.

In 1824 several State legislatures passed resolutions forbidding the State representation in Congress to attend a caucus if one were called. But the Crawford party, who wished to give his nomination the prestige of a national backing, and especially to see about a fourth of the members attended, and nominated him and Albert Gallatin. It can hardly have gained him much support, however, and a paralytic stroke finished whatever chance he might have had. In the next (1828) campaign, the tickets dictated by the party representation in Congress, they instantly became, as they have ever since remained, nullities. The second occasion was on 29 Feb. 1804, when the Republicans (in open, not secret caucus) renominated Jefferson; they dropped Burr for George Clinton (New York still keeping the place), by 67 votes to 20 for Hugh H. Breckinridge of Pennsylvania, and some scattering. The Federalists held no ostensible caucus; but naming Pickering, Georgia for Vice-President, the governor of New York, and with that prestige nominate him for President, the plan must obviously have been agreed on in what served the purpose of caucuses. Burr’s killing of Hamilton spoiled this scheme, however; they nominated Pickering and Rutledge. In Virginia legislature had split into Madison and Clinton factions, the former much the stronger; nominated separate sets of electors and carried the quarrel into Congress, where Monroe’s party issued a manifesto protesting against both Madison and Congressional caucuses. The Federalists held none, and renominated their previous candidates. On 18 May 1812 the Republican or Democratic party held its fourth caucus, and renominated Madison on his express agreement to declare war against Great Britain; also nominating Pickering and Rutledge. This time they appointed a national committee to see that the nomination was respected. The New York Democrats, however, were very restive under the “Virginia dynasty” and the “secretary of state dynasty”; and their members of the legislature held a caucus, nominated George Clinton and protested against the Congressional caucus as always nominating a Virginia candidate. A secret caucus or convention of Federalists was held in New York in September, adopted the Clinton nomination and nominated Jared Ingersoll for Vice-President. On 29 March 1816 the Democrats, now practically the only existing party, held the last caucus which accomplished anything. Henry Clay and another member introduced resolutions that the caucus nominations be abolished, but were voted down; and Monroe was nominated, by no great margin, over William H. Crawford of Georgia. Daniel D. Tompkins of New York was nominated for Vice-President. In 1820 a caucus was summoned, but only about 50 members responded, and they took no action. The general feeling was now strong against the system, as there was but one party, and a nomination by Congressional caucus was equivalent to allowing Congress to appoint the President and Vice-President. In 1824 several State legislatures passed resolutions forbidding the State representation in Congress to attend a caucus if one were called. But the Crawford party, who wished to give his nomination the prestige of a national backing, and especially to see about a fourth of the members attended, and nominated him and Albert Gallatin. It can hardly have gained him much support, however, and a paralytic stroke finished whatever chance he might have had. In the next (1828) campaign, the tickets dictated by the party representation in Congress, they instantly became, as they have ever since remained, nullities. The second occasion was on 29 Feb. 1804, when the Republicans (in open, not secret caucus) renominated Jefferson; they dropped Burr for George Clinton (New York still keeping the place), by 67 votes to 20 for Hugh H. Breckinridge of Pennsylvania, and some scattering. The Federalists held no ostensible caucus; but naming Pickering, Georgia for Vice-President, the governor of New York, and with that prestige nominate him for President, the plan must obviously have been agreed on in what served the purpose of caucuses. The general feeling was now strong against the system, as there was but one party, and a nomination by Congressional caucus was equivalent to allowing Congress to appoint the President and Vice-President.
face of the earth or underground, as in *Lycopodium*.

**CAUDINE FORKS**, a pass of southern Italy, in the form of two lofty fork-shaped defiles, in the Apennines (now called the valley of *Aterna*), by which a Roman army was en- ticed by the Samnites, 321 B.C., and being hemmed in was forced to surrender.

**CAULDL'S CURTAIN LECTURES**, Mrs., a series of humorous sketches, by Douglas Jerrold (q.v.).

**CAUER**, kow'ër, Emil, German sculptor: b. Dresden, 29 Nov. 1800; d. Kreuznach, 4 Aug. 1867. He studied in Berlin under Rauch and at Munich under Haller; in 1825 he went to Bonn where he was instructor in art at the university; in 1832 he was appointed drawing master at the gymnasia at Kreuznach. His fame rests on his invention of the so-called "Cauer- sche Masse," a superior substitute for plaster. Among his best works are "Sickening;" "Charles V;" "Melanchthon;" and the representations of Red Ridinghood and other fairy tale characters. He also restored the antiquites in the museum at Dresden.

**CAUER, Karl**, German sculptor: b. Bonn, 14 Feb. 1828; d. Kreuznach, 17 April 1885. He studied with his father, Emil Cauer (q.v.), and with Wolff in Berlin; he also visited London several times in order to study the Parthenon friezes. Among his works are the Schiller monument at Mannheim, "The Witch" and a number of portrait busts. In his later life he became interested in the question of coloring sculptures, and made a number of experiments in that line. He also designed the tomb of President Garfield at Cleveland.

**CAUER, Robert**, a younger brother of Karl Cauer (q.v.): b. Dresden 1831; d. 1893. He studied at Düsseldorf, and then with his father at Kreuznach and then at Rome. He made hundreds of little statuettes, charming in execution, the motifs of which are taken from romantic or classic tales and poems, such as "The Sleeping Beauty," "Hermann and Dorothea," "Puss in Boots," "Paul and Virginia." He and his brother Karl were commissioned by the Prussian Ministry of Public Instruction to superintend the reproduction in plaster casts of the principal structures of Italy. EMIL THE YOUNGER, HUGO, LUDWIG AND ROBERT THE YOUNGER, sons of Karl Cauer, and STANISLAS, son of ROBERT THE ELDER are all sculptors.

**CAUGHNAWAGA, kō-nä-wā'ga**, Canada, town in the province of Quebec, situated on the Saint Lawrence River at the head of the Lachine Rapids, 10 miles west of Montreal. It is an Indian town and was established by the Jesuit missionaries in 1676 as a colony for the Indians who were converted to Christianity. The converts were Iroquois, mostly Mohawks, and remained loyal to the French during their quarrels with other Indians and the English. In the Lower Canada insurrection of 1838 Caughnawaga was the first place to be attacked by British troops, who were repulsed by the Indians and a number of them taken prisoner. There were 2,240 Indians in the reservation in 1911.

**CAUL**, a membrane enclosing the viscera, such as the peritoneum or part of it, or the pericardium; also the amnionic membrane that surrounds all fetal structures and sometimes becomes caught by the head of a child at birth. Many superstitions have been connected in the past with caul. The child that happened to be born with one was esteemed particularly fortu- nate; and the possession of it afterward, however obtained, was highly prized, as of a charm of great virtue. The superstition is thought to have come from the East. With the French, être né coiffé was an ancient proverb, indicative of the good fortune of the individual. The alchemists ascribed magical virtues to it; and, according to Grose, the health of the person born with it could, in after life, be judged of by its condition, whether dry and crisp, or relaxed and flaccid. Medicinal virtues were imputed to it by the ignorant, as well as the property of preserving the owner of it from drowning. It has been bought and sold occasionally at a high price, and it has been known to give as much as $150 for a single caul. Consult Brand, 'Popular Antiquities' (London 1870); 'Notes and Queries' (Vol. VII, London 1849 et seq.); Jones, 'Credulities, Past and Present' (London 1898).

**CAULINCOURT, kō-lin-kōr, Armand (är-mān) Augustin Louis de, DUKE OF VICENZA, French statesman: b. Caulincourt (Aisne), 9 Dec. 1772; d. Paris, 19 Feb. 1827. He early distinguished himself as an officer, was made a general of division in 1805 and shortly after created Duke of Vicenza. In 1807 he received the appointment of Ambassador to Saint Petersburg. There he tried to maintain the alliance of Tilsit, and was successful un- til, in 1811, hostilities broke out between France and Russia, and he resigned his post. Faithful to the last to Napoleon, he was made Minister for Foreign Affairs in 1813, and during the Hundred Days resumed the office, receiving a peerage of France, of which he was deprived after the Restoration. He was then among those proscribed but his name was erased from the list on the intervention of the Russian emperor.

**CAULIFLOWER**, a member (Brassica oleracea var. botrytis) of the cabbage tribe, derived from the same original species as cabbage (q.v.), from which it differs in having a more or less compact head of metamorphosed flowers and adjacent parts instead of a bud-like head of densely packed leaves. Broccoli is a late hardy form of cauliflower not widely grown in America. Cauliflower is more delicately flavored than cabbage, like which it may be cultivated and prepared for the table. In its cultivation, however, it seems to be more difficult to bring to perfection unless conditions, especially moisture and temperature, are just right. The essentials of its cultivation are highly fertile soil well drained, but well supplied with moisture, a moist climate or season, and shelter from the direct rays of the sun, as on a northern slope, or reduction of the intensity of the sun's heat by planting either very early so as to mature in spring, or late so as to mature after mid-autumn. The heads produced in mid-summer are generally small in both size and quality. When the heads begin to develop, the leaves are tied above them so as to keep out foreign materials, but mainly to make the heads whiter and more attractive.
to the purchaser. In preparing for the table the finer heads are usually served with a cream sauce, and in the porridge the heads are used without the parsnips; in this latter case, the seed of cauliflower is very expensive because of the difficulty of maintaining its high quality. Formerly the seed was imported from Denmark and Germany, but Washington and British Columbia have been gaining ground in this respect. In the production of cauliflower, cabbage and other related seeds.

Cauliflower suffers from the same enemies that attack cabbage. Consult Bailey, L. H., 'Standard Cyclopedia of American Horticulture' (New York, 1914); Allen, 'Cabbages, Cauliflower, etc.'

CAULKING, CALKING, or CAUKING, the act of rendering the seams of a ship watertight by driving oakum, cotton or the like, between the planks in the ship's decks or sides, in order to prevent the entrance of water. Alternate oakum is driven hard into the seams, and it is covered with hot melted pitch, to keep the water from rotting it.

CAULOPTERIS, a genus of fossil tree ferns found in the coal-measures. The outer surface is characterized by four or more longitudinally rows of oval or roundish impressions or foliar scars. Each scar contains a linear cicatrix concentrically disposed either in horsehoe form, with the ends curved inward, or a complete ellipse, the upper portion of which surrounds a transverse trace somewhat like an inverted U. The inner scars mark the exit of the vascular bands of the petioles. Caulopteris is distantly related to the Marathaceae. It is characteristic of the Carboniferous.

CAURA, kow'ra, a river of Venezuela, tributary to the Orinoco which rises in the southern part of Venezuela on the northern slopes of the Sierra Pacaraima, and flows north-northwest through the department of Bolivar. It is over 400 miles long. On both sides stretches the territory of Caura (22,485 square miles), with immense forests of valuable woods.

CAUS, kô, or CAULX, Salomon de, French engineer: b. Dieppe 1576; d. Paris, 6 June 1630. He was in the service of the Prince of Wales in 1612, and of the Elector Palatine, at Heidelberg, 1614-20, but by 1623 returned to France, and became engineer and architect to the King. At Frankfort, in 1615, appeared his 'Causes of Kinetic Energy,' a work in which is described an apparatus for forcing up water by a steam fountain, differing only in one detail from that of Della Porta. There is no reason to suppose that the apparatus ever was constructed, but on the strength of the description, Arago has claimed for De Caus the invention of the steam-engine.

CAUSE, that which brings about any change in the state, condition, circumstances, etc., of things; that which produces an effect. In philosophy, that by which something known as the effect is produced and without which it could not have been produced. To give a satisfactory notion of all the senses in which this word has been used it would be necessary to review all the teachings of metaphysics from the time of Aristotle downward. The various positions of the conflicting philosophers can here be only very briefly indicated. Aristotle states causes to be of four kinds: efficient, formal, material and final. The efficient is the force or agency by which a result or effect is produced; the formal is the instrument by which it is produced; the material, the substance from which it is produced; the final, the purpose or end for which it is produced. A scientific cause demands the recognition of all the essential conditions, any one of which being absent the effect could not take place; it finds the origin of the notion of cause in sensation. Assuming that bodies have the property of modifying each other, it is only necessary to observe them to perceive and be driven to admit the principle of causality. Hume declares the power which we attribute to one object over another to be a chimera; such a power does not exist, or if it does we can have no idea of it. What we call cause and effect is merely two phenomena always following in the same order and which we have fallen into the habit of associating in our minds in such a way that on perceiving the first we inevitably expect the second. According to Leibnitz there is no existence, however humble, but is a force, that is, a real cause. The notion of force is a base even of the notion of existence; all that which is has a certain virtuality, a certain causative power. The human soul, like all the other limited forces in this world, is but a monad isolated in itself, but yet in whose inner being the whole creation is reflected, and whose movements have been from the beginning co-ordinated by Divine Wisdom with the harmonious movement of the universe. Kant's doctrine is that the notion of cause and the principle of causality certainly exist in our minds; but they are only simple forms of our understanding, or the entire subjective, albeit inevitable, conditions of thought. We are compelled by a law or a form pre-existing in our intellect to dispose all the objects our imagination represents, or all the phenomena our experience can discover, according to the relation of cause and effect; but we do not know if anything really exists, independent of our intellect, which resembles a cause, a force or effective power. Against the doctrines of the intuitionalists it has been urged that the mere statement that the mind possesses a belief in causation proves nothing; some men believe in it, others do not, and uniformity is necessary to the establishment of a universal belief. Nay, more, the mere universality of a belief is no conclusive proof of its correctness, as put in the words of the late John Stuart Mill—4 A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief amounted to an irresistible necessity, there would be no use in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow that mankind were under a permanent necessity of believing what might possibly not be true; just as they were under a temporary necessity,—quite as irresistible while it lasted,—of believing that the heavens moved and the earth stood still. The things which it has been supposed that nobody could help believing are innumerable, but no two generations would give the same catalogue of them. The theological question of a First Cause is debated on the ground that matter of itself is inert, that spirit is active, that in order of existence one spirit or active force must be
the first and uncaused cause. This is based on the common fallacy which demands a first term for every series, even though series without first terms are common and consistent.

The notion of cause used to be counted among the primary concepts of natural science, but there is a notable tendency nowadays to cut loose from a causal term, and to render the function of science one of description rather than one of causal explanation. This is not merely a desideratum or a program, but represents the attitude really taken by modern scientists in their work. A causal explanation of an occurrence $X$ consists in a statement of certain events, $A, B, C,$ etc., which, if present, will always evoke $X$ as a temporal consequent. This causal explanation of $X,$ then, involves the statement of a law according to which $X$ occurs, but not every descriptive law lends itself to expression in causal terms. In the first place, a causal law in the strict sense involves a definite, irreversible, temporal order between its events; it connects; in the second place, the antecedents, $A, B,$ etc., are definite events, which either are there or are not there. Now, the laws which have been most fruitful in the expression of scientific data and the stimulating of scientific research have usually been quantitative correlations, in which the correlated terms have not necessarily stood in a unidirectional temporal relation to one another, or indeed in any temporal relation whatever. The law of gravitation says that the acceleration of a body of mass $m$ with respect to a body of mass $m'$ at a distance $d$ from it, if the bodies start from rest and are acted on by no external forces, will vary as $\frac{m}{d^2}$. Here the acceleration, $m'$, and $d$ are all contemporaneous, and are all more-or-less facts, not yes-or-no facts. As far as the physicist is concerned, it is utterly meaningless to say that the cause of the attraction resides in the mass $m$, or the mass $m'$, or in anything else whatever. In spite of these facts, the unfortunate tradition which finds its typical exponent in Mill still makes many a metaphysician lapse into causal language in his treatment of natural science.

In law, a cause is a right of suit or action; it is something for which suit may be brought by one person against another; it includes the right of action. In practice, a cause of action comes into existence when there is such a state of facts or circumstances as will enable a person or party having certain relations with particular persons or property to commence a suit.

CAUSE CÉLÈBRE, koz sâl'brô, from the French signifying 'celebrated case,' a term generally applied to any criminal or civil case of special legal importance or interest, national or international. Of such are celebrated trials for political crimes, for treason, of judicial errors, of impostors, poisoners, assassins, murderers, etc. Among causes célèbres of modern days may be cited the Dreyfus case 1896-1903, the Steinheil 1912, the Caillaux 1914, in Paris; the Sickles-Key case 1859-60, the Stokes-Piske case 1872, the Thaw 1896-14, the Becker-Rosenthal case 1913, the B. Ch., an English murder case in Russia 1912-13, and in England the Tichborne case 1871, when an impostor laid claim to an ancient title and rich estates. A French ritual murder case in which Voltaire championed the cause of the victim was that of Calas broken on the wheel in 1762. The bibliography of French causes célèbres is voluminous. Consult Gayot de Pitaval, ‘Les Causes célèbres’ (3d ed., 22 vols., Amsterdam 1772-88).

CAUSERIES DU LUNDI, or MONDAY-CHATS, was the title given by Sainte-Beuve to the articles which he contributed every Monday for nearly 20 years, beginning with 1849, to the daily newspapers Le Constitutionnel and (after 1852) Le Monteur. Their 13 volumes, together with the three volumes of the Premiers Lundis and the 13 volumes of the Nouveaux Lundis, which are not to be separated from them, form an unmatched series of critical studies, of which literature is the central but by no means exclusive interest, and present a gallery of portraits of authors, philosophers, statesmen and savants, artists and actresses, great wits and charming and beautiful women, are painted with a wonderfully animating and revealing touch. The range and variety of the subjects is altogether surprising. Few figures of significance in French life and letters of the last three centuries fail to find a place in the collection. Nor was Sainte-Beuve's view confined to his own country. He was widely read in foreign literatures, particularly English. His curiosity was insatiable and his mind singularly mobile and insinuating. For such a mind criticism had to be something quite different from what it had traditionally been,—a classifying and judging of literary compositions according to some definite, accepted canon of taste. Its task was primarily to understand a work and a person in the light of their intention rather than to measure them by some conventional standard. Literary works were viewed but as a partial expression of individualities, to be fully comprehended only when illumined by the light thrown upon them by complete knowledge of their author's life, times, family, friends, surroundings, circumstances and character. The preliminary reading that went with each of these articles was prodigious. The critic could neglect nothing that could add to his knowledge of the man or woman whose work he was assessing. Sainte-Beuve did not, however, abandon standards of judgment himself up, like Taine, to explaining literature in terms of race, environment and moment. He maintained, with increasing insistence as he grew older, the tradition of a cultivated and disciplined taste. He furthermore added to his rare qualities of intelligence and discrimination the command of an entirely adequate style, of great delicacy, brilliancy and charm, so that the 'Causeries' delight us no less than they instruct. Taken all in all they constitute, with the companion series of 'Portraits,' as imposing a body of criticism as any literature can show, and justify the almost unanimous endorsement of Matthew Arnold's estimate of their author as 'the finest critical spirit of our time.' Of English translations of some of the Causeries, that by W. D. Matthew, 'Sainte-Beuve's or Monday-Chat Essays of 1879' (London 1879) is the best. It makes especially essays dealing with great French writers, while that of A. J. Butler, 'Select Essays of Sainte-Beuve' (London), confines
itself to those of interest to students of English letters.

Arthur G. Canfield,
Professor of Romance Languages, University of Michigan.

CAUSTIC, in medicine, any agent which causes a destruction of the parts by local application. Caustics act by withdrawing water from the skin, by coagulation of the albumen or by other chemical change. Thus caustic soda and caustic potash act by the abstraction of water. They further act on fats, saponifying them, and are particularly serviceable as caustics if penetration is desirable. Sulphuric acid acts in much the same way, but it is very difficult to control its caustic action. Others of the acids are used as caustics, nitric, glacial acetic, tri-chlor-acetic, etc. Many mineral salts, silver nitrate, zinc sulphate, zinc chloride, copper sulphate, arsenic, etc., are valuable caustics. The most reliable caustic is the actual caustery using a dull red flame. Caustics are used to stimulate the growth of granulating wounds, to remove warts, condylomata, etc., to cleanse ulcers, remove cancerous growths, to prevent poisoning by dog-bites, etc.

In mathematics, the curve to which rays of light are tangent after reflection from a surface or refraction by a lens. Opticians endeavor so to shape their mirrors and lenses as to make the caustic two intersecting straight lines. When this is achieved, the spherical aberration disappears. Caustic curves may often be seen on the bottom of a cup, produced by reflection from the curved wall of the cup. See also LIGHT.

CAUSTIC AND SODA, Electrolytic Production of. See ELECTROCHEMICAL INDUSTRIES.

CAUTERETS, kö-tê-rà, a watering-place of southwest France, in the department of Hautes-Pyrénées, 3,250 feet above sea-level, in the valley of the Lavedan, 42 miles southwest of Pau. The stationary population of the place is only about 1,550, but it is annually swollen in summer by some 50,000 visitors, for whose accommodation numerous sumptuous hotels and bathing establishments have been built. It is a good centre and guide-station for ascenders of the Pyrenees. The sulphurous springs, 24 in number, and varying in temperature from 75° to 137° F., are the most abundant in the Pyrenees, and have been known from Roman times; though their modern reputation dates from the 16th century, when Margaret, sister of Francis I, held her literary court and wrote much of her 'Heptameron' at Cauterets.

CAUTERY. See CAUSTIC.

CAUTIN, kow'ten, Chile, a province divided into the departments of Temuco and Imperial. It is bounded by the Pacific on the west, Argentina on the east, Malbeca and Valdivia on the north, and south, respectively. It has an area of 5,832 square miles, and a population of 161,000. The city of Temuco (pop. 11,000) is the capital. Principal towns are Nueva, Imperial, Lautaro and the port of Carahue. There is a regular line of steamers between Carahue and Valparaiso. In the province are numerous lakes, one of which, Villarica, with a surface of 100 square miles, lies at the base of a volcano of the same name. The Central Railway connects the capital with other cities of the republic. The soil of the province is fertile. Wheat, fruit and lumber are produced.

CAUTIN, a river in Chile; flows west through a province named after it, and empties into the Pacific Ocean. Its length is about 200 miles.

CAUTIONARY, a term used in Scotch law and signifying the promise or contract of one, not for himself, but for another. A simple cautioner is one who binds himself conjointly with the debtor or principal for the greater security of the creditor. The creditor may proceed against the principal debtor and cautioner, or against either of them. The cautioner may, however, stipulate on the document constituting the cautionary obligation that the creditor shall take legal measures against the debtor or principal. Cautioners are frequently taken bound, conjointly and severally, or as full debtors, with the principal, in which case both parties are liable for the whole debt. It follows, from the nature of the obligation, that a cautioner who has paid the debt is entitled to action against the principal for relief. All cautionary obligations must be in writing, and have the signature of the cautioner attached; the conditions of contract must be clearly stated, which must be strictly observed, otherwise the cautioner is freed.

CAUTIONARY TOWNS, four towns in Holland, Briel, Flushing, Rammakens and Walleren, so named because they were given to Queen Elizabeth in 1585 as security for their repaying her for assistance in their struggle with Spain. They were surrendered to the Dutch Republic by James I in 1616, although only a portion of the sum advanced was refunded. Consult Cheyne, 'A History of England' (Vol. I, pp. 195, 212, 243).

CAUVERY, kö-ver-, CAVERY, or KÁVERI, a river of Hindustan, to the waters of which Mysore and the Carnatic owe much of their agricultural wealth. It rises from several head streams in Coorg and Mysore, near the coast of Malabar, flows southeast through Mysore and the Madras Presidency, and after a winding course of about 470 miles falls into the Bay of Bengal by numerous mouths, the largest being the Coleroon. Where it separates Mysore from Coimbatore the Cavery forms an island called Sivasamudram, near which are two magnificent cataracts, each about 200 feet high, and more or less broken into cascades according to the volume of water. In connection with this river and its tributaries important canals and dams have been constructed for purposes of irrigation, with the effect of rendering the country on either side highly productive. The Cavery is filled by the rains in May and July, but is not navigable except by small boats. The irrigation system of its delta, dating from the 2d century, is the most ancient in India.

CAVA, kā'vea, DEI TIRRENI, Italy, city in the southern province of Salerno, situated in the valley of Fennara, three miles northwest of Salerno. It is the seat of a bishop, suffragan to the Pope, and contains a cathedral, three other churches, a convent, a house of refuge, a hospital and a seminary. Silk, cotton and
CAVAGNAL—CAVAILLÉ-COLL

linen are manufactured here, and in the numerous small villages that surround the town. The district is extremely unproductive, but the inhabitants have become wealthy by their industry and commerce. About one mile from Cava is the magnificent Benedictine convent of the Trinity founded, in 1025, by Saint Alferius over the cavern he had occupied, which formerly contained an excellent library, now transferred to Naples. This convent is now national property and contains a lyceum and boarding-school. It is a resort for Neapolitans in summer and for foreigners in spring and autumn. Pop. (1911) 23,817.

CAVAGNAL, Marquis de. See Vaudreuil de Cavaigny, Pierre François de Riguais, Marquis de.

CAVAIGNAC, Kā-vā-nyäk', Eléonore-Louis Godefroy, French journalist and politician, son of Jean Baptiste Cavaignac (q.v.). He opposed Louis Philippe, and was one of the founders of the Société des Amis du Peuple and of the Société des Droits de l'Homme, (1832), of which he was president in 1843. He took an active part in the various uprisings of the time, and in 1835 escaped to England. Returning to Paris in 1841, he became one of the editors of la Réforme, an opposition newspaper. An excellent statue by Rude is dedicated to him at Montmarte.

CAVAIGNAC, Jacques Marie Eugène Godefroy, French politician, son of Louis Eugène Cavaignac (q.v.): b. 22 May 1853; d. Saint-Claud, department of the Sarthe, 25 Sept. 1896. He studied at the Lycée Charlemagne, Lycée Louis le Grand, École Polytechnique and École des Ponts et Chaussées, interrupting his studies long enough to serve in the Franco-Prussian War. In 1872 he was elected to the Chamber of Deputies, and in 1885 was appointed under-secretary of state. In the Panama revelations of 1892 he bore a conspicuous part. On the organization of the Bourgeois Cabinet, 30 Oct. 1895, he was appointed Minister of War. In August 1896, he added to the exiles over the Dreyfus prosecution by forcing Lieutenant-Colonel Henry to confess to a forgery of certain letters bearing on the Dreyfus case, and the accused officer committed suicide within a few hours. In the following month Cavaignac resigned his office. He was author of "La formation de l'Empire contemporain" (1897-98).

CAVAIGNAC, Jean Baptiste, French revolutionist: b. Gourdon 1762; d. Brussels, 24 March 1829. He became an advocate at the Parliament of Toulouse; and in the National Convention acted as deputy from the department of Lot. He rose to be one of the leaders of the Mountain (Extreme Republicans), and, on his various dictatorial missions to the armies of the Republic, displayed the greatest energy, tact and incorruptibility. He was a member of the Council of Five Hundred; and afterward became a councillor of state in Murat's kingdom of Naples. During the Hundred Days he acted as prefect of the Somme. He was banished as a regicide, at the second Restoration.

CAVAIGNAC, Louis Eugène, French general: b. Paris, 15 Oct. 1802; d. 28 Oct. 1857. His father, Jean Baptiste Cavaignac (q.v.), was a furious revolutionist, and member of the Council of Five Hundred. Young Cavaignac entered the École Polytechnique in 1820, and afterward the military school at Saint-Cyr; and in 1824 joined the 2nd regiment of engineers. He served in the campaign in the Morea, and in 1829 was appointed captain. Being at Arras on the outbreak of the revolution of 1830 he was the first officer in his regiment to declare for the new order of things. In 1832 he was sent to Africa, where he remained for several years, and greatly distinguished himself in defending the French settlement against the Arabs and by his judicious organization of military hospitals, barracks and works of defense. In 1844 he received the appointment of brigadier-general, with the government of the province of Oran in Algeria. Cavaignac was in Africa when the revolution of February 1848 took place. In March of that year he was created by the provisional government general of division and governor of Algeria. Shortly afterward the office of Minister of War was offered to him, but declined. On 23 April he was chosen representative of the department of Lot in the National Assembly, and proceeding to Paris to take his seat arrived there just after the capital was then in a state of great excitement from an attempt on the assembly by the Red Republicans two days before. Cavaignac was offered again the portfolio of the Minister of War, and this time accepted it. The measures which he adopted to guard against the crisis which was evidently approaching were prompt and decisive. In a few days an army of nearly 30,000 men was assembled in and around Paris, and this precaution was speedily justified by the events which followed. On 23 June, at 11 o'clock a.m., the terrible Communist insurrection burst forth, and for three days Paris presented the most dreadful scene of tumult and bloodshed which had been witnessed there since the massacre of Saint Bartholomew. About 15,000 persons perished, and property was destroyed to the value of upward of $1,000,000. By the energy of General Cavaignac, aided by the loyalty of the army and the national guard, the insurrection was suppressed on 26 June. On that day the government delegated the entire executive power to Cavaignac as dictator, who resigned it again into its hands on the 29th, and received it anew on the same day, with an acknowledgment by the legislative body of the service rendered by him to his country. Notwithstanding these he was defeated in the elections for the presidency in the month of December following, and Louis Napoleon was preferred to the office. On 20 December he resigned his dictatorship. After the coup d'état of 2 Dec. 1851, he was arrested and conveyed to the fortress of Ham, but was liberated after about a month's detention. In 1852 and in 1857 he was elected member for Paris of the legislative body, but on both occasions was incapacitated from taking his seat by refusing to take the oath of allegiance to the Emperor. The last years of his life were spent at his country-seat in the department of Sarthe. Consult Montfort, "Biographie du général Cavaignac" (1848); Deschamps, "Vie de Cavaignac" (1870).

CAVAILLÉ-COLL, kā-vi-yäkol', Aristide, French organ builder: b. Montpellier, 2
CAVAILLON, ká-vá-yoń (ancient Cabel-lio), France, a town of southeast France, in the department of Vaucluse, 20 miles southeast of Avignon by rail. It is an ancient place, and has a cathedral dating from the 12th century. The surrounding districts is one vast garden, producing excellent fruit, especially melons and peaches. A considerable trade is carried on in silk, olive-oil, fruit, early vegetables and wool. The industries comprise straw hats, edge-books, tanning, the preserving of fruits and vegetables, etc. The Romans had an important colony here, and erected many edifices, of which almost the only remains are some tombs and the fragment of a triphyll arch. It was an episcopal city as early as the 5th century. (P. 94, 9416).

CAVALCANTI, ká-val-kán'te, Guido, poet: b. probably in Florence about 1252; d. there, 28 or 29 Aug. 1300. He was the friend of Dante, in whose judgment he excelled all in lyric verse (Purg. xi, 97); and like him a zealous Ghibelline, then the dissensions of the Guelfs and Ghibellines disturbed the public peace of Florence the citizens banished the chiefs of both parties. The Ghibellines were exiled to Sarzana. On account of the unhealthful air of that place they were permitted to return; but Cavalcanti had contracted a disease of which he died at Florence. In his youth he made a pilgrimage to Saint Jago de Compostella in Galicia. Returning home through France he fell in love at Toulouse with a young lady by the name of Maria, whom he married; in his verses which we possess are addressed. They are remarkable, considering the period at which they were written, for their beautiful style. His 'Canzone d'Amor' have gained him the most fame. The learned Egidio Colonna and some others have made commentaries on it. Various editions of his works have appeared, those of Arfone (Florence 1881); of Ercole (Leghorn 1885); of Rivalta (Bologna 1902), and of E. C. Lancisi (1917). Translations have been made by Ezra Pound (Boston 1912) by Fletcher (in Modern Philology 1910). Consult Ercole, 'Guido Cavalcanti e le sue Rime' (1885); Fletcher, J. B., 'The Religion of Beauty in Women' (New York 1911).

CAVALCASELLE, ká-vál-ká-sél'/le, Giovannii Batlto, Italian art historian: b. Legnano, 22 Jan. 1820; d. Rome, November 1897. He studied painting at the Academy of Venice and at Munich. He was active in the revolution of 1848 and was forced to escape to England. He became the literary executor of J. A. Crowe (q. v.), with whom he produced the epoch-making 'History of Painting in Italy' (1864-71), the most complete work on the subject; 'Early Flemish Painters' (1857-72); 'Life of Titian' (1871); 'Raphael' (1883).

CAVALIER, ká-vá-lér, Jean, French soldier, chief leader of the Camisards in the district of the Cevennes. b. Ribaute, near Anduze, 1681; d. Chelsea, England, 17 May 1740. He was at Geneva when the severe measures of Louis XIV against the fanatical Camisards induced him to return home. Several insurrections had already broken out, but he soon so distinguished himself by his courage and success, that, though only at the age of 24, he became the acknowledged head of the insurgents. Notwithstanding their gallantry they were obliged to carry on the war on such unequal terms that the impossibility of success became apparent, and Cavalier entered into a capitulation with Marshal Villars, by which he obtained a pension of 1,200 livres, a colonel's commission and permission to raise a regiment of his own for the King's service. He was summoned, however, to Versailles, and, finding himself looked upon with suspicion, made his escape and soon after visited England. In the Spanish War, being supported by the English and Dutch, he commanded a regiment raised by himself and par, consisting of refugee Camisards, and distinguished himself greatly at the battle of Almanza in 1707, where he was severely wounded. He was afterward pensioned by the British government, appointed governor of Jersey and made a major-general.

CAVALIER, (1) a horse-soldier; an armed horseman; a knight; the name given to the supporters of King Charles I, during the great Civil War in England, from their gay dress and demeanor, as contrasted with the austerity of the Parliamentary party, who were styled Roundheads, from the mode in which the more puritanical of that body wore their hair closely cropped. (2) In fortifications, a kind of interior bastion, several feet more elevated than the principal bastion of the fortress in which it is formed. The use of the cavalier is two-fold: It serves to direct the works from the fire of an enemy or an adjacent height, or to command the trenches of the besiegers. Cavaliers are sometimes constructed in the gorges, or on the middle of the curtain, and their form is semi-circular; but when they are within the bastion they are now built with straight faces and flanks parallel to those of the work in which they are placed. French cavaliers are works raised by besiegers on the glacis of a fortress for the purpose of enabling them to direct a fire of musketry into the covered way.

CAVALIER POETS, a term properly applied to the group of lyricists among the followers of Charles I and of his exiled son, from the first actual warfare with the Commonwealth until the Restoration. The term is also applied more broadly to other poets of the time such as Herrick (q. v.) or Donn (q. v.) who wrote in the same style; but the distinction of the manner is due to those loyalists who were pre-eminent court gentlemen and fighters for the King. In literary tradition the Cavalier poets took their descent from Wyatt and Surrey, Sidney
CAVALIERE SERVENTE

and Raleigh, and those other cultured and well-traveled *makers* of the Tudor and Elizabethan courts, who naturalized the Provencal lyric and integrated it into a more English soil. This influence, of course, had been strong in Chaucer's time, but only with this later group did lyric poetry as an accomplishment become well established among the gentlemen around the English sovereign, and take on a native manner, true expression of the historical moment.

The early Elizabethan court poets, even in their narrowest imitations of the French sonneteers, had some of the largeness of the age in their manner; they spoke consciously to an audience. At the end of the reign the Renaissance wealth of scholarship and culture had spread throughout the nation, in a wide circle from the court. What remained the peculiar inheritance of the courtly poet was undergoing a refinement such as the novel shows in the second part of *Euphues,* in which the story is taken into the drawing-room, where the feminine influence is dominant, imposing in a modern way the exquisiteness which is the end of all courts of love. By a similar transition the courtly poet, letting go the larger subjects and the public manner, made the quality of their verse the very qualities of graceful society—the personal compliment; the brief saliets that general conversation demands; the quick turns in which grace and wit count; that method of society verse which restrains beneath an even manner all feeling that is too personal or too deep. The presence of the ladies is felt—not of one woman alone; as in the garden scene in the second part of *Euphues,* the lover must find ways to woo his lady under the very eyes of her teasing comrades.

This development of the court poetry was occasioned, no doubt, by the natural growth of culture and the perfecting of manners in English society, as well as at the court. Some impression, however, was made upon the court by the change from Elizabeth's manlike rule to the gentle influence of Charles's refined Queen. The influence of Henrietta Maria, however, was not altogether desirable. Refining though it was, it took the direction of effeminacy, and in the preciouse fashion which is fostered, of insincere pedantry. William Harbington (1605-54) in his *Castara* (1634) illustrates the over-refinement of theme to which the graceful court verse at this moment might have seemed doomed.

The personality of Charles, however, which enlisted the loyalty of the courtiers, his tragic end, and the exile of his family and his followers, gave back to the courtly verse the vitality it was losing, and in addition some new characteristics, which distinguished it as Cavalier poetry. Loyalty to Charles and to his son, unlike loyalty to Elizabeth, was personal more than patriotic; it served to revive therefore some of the most ideal conditions of chivalry. Charles became not so much the sovereign of a country as the head of an order of knights; his exiled son became their leader under all skies. The sufferings that were the cost of their loyalty, their sense of a lost cause and the long tradition of proud breeding that would bear all with outward lightness, made the pathos and the grace of the best Cavalier poets. The Elizabethan aesthetics of manner never quite returned, though the Marquis of Montrose (1612-50) echoed it nobly in his lines on the death of Charles I, and in those on his own execution; but in general the lighter gracefulness continued and found a new expression in the most famous lyric, 'My dear and only love.'

In singleness and loftiness of devotion, in the actual sacrifice of his life for the cause, and in the natural, incidental place of literature in his career, Montrose is perhaps the ideal Cavalier poet.

Richard Lovelace (1618-58), author of the best known Cavalier lyric, 'Tell me not, sweet, I am unkind,' and of the only less perfect 'To Althea, From Prison,' illustrates in his life, as does Montrose, the tragedy that often underlay this graceful verse, but the tragedy is here one of sentiment. He impoverished himself to give his fortune to the King. On returning from the wars abroad, he was imprisoned, and his 'Lucasta,' Lucy Sacheverell, believing on him dead, married some one else. Lovelace died, worn out by suffering and poverty.

A similarly typical fate was that of Sir John Suckling (1609-42), who spent his fortune for the King, became an exile, and died abroad. He wrote the model of later criticism in light verse; his fame, however, is founded on his Cavalier poems. In his life and in his writing he is neither so noble nor so pathetic as Montrose and Lovelace; he is a roisterer at his heart, as can clearly be seen even in the exquisite 'Ballad upon a Wedding.' But he is master of the reckless tone that finally characterized the school, the tone that had been caught so finely by George Wither (1588-1667)—who strangely enough lived to be a Roundhead—in his 'Shall I, wasting in despair?' In such lines as 'Out upon it, I have loved three whole days together,' Suckling turns the bravado note into a pretty compliment; in his best lyric, the song from 'Aglaura'—"Why so pale and wan, fond lover?"—he carries it to its logical conclusion of recklessness.

Among the numerous poets who wrote in the Cavalier manner, though not under strict Cavalier conditions, besides Herrick and Donne, already noticed, should be mentioned Edmund Waller, for his two perfect lyrics of compliment, 'On a Girdle,' and 'Go, lovely rose.' But far more important is Thomas Carew (1598-1639?), probably the most gifted minor poet of the time, with the exception of Donne. Born into a good family, enjoyed an excellent education and, it seems, led a reckless life. In his verse the Cavalier compliment is most elaborate and most noble, as in the incomparable 'Ask me no more.' The same poet, in the epigrams and in the epistles to Lady Mary Villers, where he is indeed more the scholar than the Cavalier. 'Give me more love or more disdain,' and 'He that loves a rosy cheek,' are other familiar examples of his felicity. He had in full measure the rhetorical grace of the true Cavalier, the secret of splendid openings and cadences—an unacademic art that began not in literary imitation but in courtly conversation, in the fine compliment paid to beauty that need not be abashed by praise.

JOHN ERSKING

Adjunct Professor of English, Columbia University.

CAVALIERI—CAVALLERIA RUSTICANA

CAVALIERI, or CAVALLERI, Francesco Bonaventura, Italian mathematician: b. Milan 1598; d. Bologna, 3 Dec. 1647. He studied mathematics at Pisa under B. Castelli, a disciple of Galileo, and taught as professor in Bologna, and was author of several mathematical works, the most prominent of which was entitled ‘Geometria Indivisibilium Continuum Nova Quadraturae Ratione Promota.' Having expressed in this work some original ideas concerning the abstruse sciences, the Italians claim him to be the inventor of the infinitesimal calculus (q.v.). It is indeed true that his method of indivisibles enabled him to attain certain results which were not reached by the integral calculus, but Cavaleri made the false step of regarding a plane figure as the sum of a finite number of narrow rectangular strips and a solid figure as the sum of a finite number of cylindrical laminae, instead of considering the figures in question as limits of such sums.

CAVALLA. See Kingfish.

CAVALLERIA RUSTICANA ("Rustic Chivalry"). The title of a famous short sketch of how an "affair of honor" was settled in a man’s place in Sicily by Giuseppe Verga. The story first appeared in 1880 in a collection of tales entitled "Vita dei campi" ("Life in the Fields") and subsequently when the stories were reprinted gave its name to the collection. The direct way the story is told, without any elaboration, leaving to the imagination precisely what is necessary, makes the tragedy a model of this kind of realistic writing, a kind, which has given Verga a very high rank among modern Italian writers. Turiddu, a young farm hand, returns from military duty to find that his sweetheart, Lola, during his absence has given her hand to a well-to-do villager, Alfo. To revenge himself Turiddu wins the affection of a young girl, Santa, living directly opposite Lola, and then endeavors to make the latter jealous. He succeeds, and as a result of his treachery with his life in a duel with Alfo. Such are the bare facts. The way they are presented in rapid succession leading up to the tragedy is realism of the highest order. Moreover, the local color of the story as given by Verga, in a style that is peculiarly Italian and which characterizes thoroughly everything that is presented in the tragedy: Turiddu’s uniform and red cap with the tassel worn by the Bersaglieri that strangely agitate the young girls and attract the small boys; his reproach in Sicilian dialect to Lola, just before her marriage; the ostentation of the latter after her marriage, of her jewels and ornaments at the balcony of her house in order to proclaim her wealth; the courtship of Turiddu and Santa, broken by Lola’s jealousy, and the resulting consequences, that is the challenge of Alfo to Turiddu; the binding of the promise to fight the duel by embracing and by Turiddu’s biting Alfo’s ear; the duel at sunrise in the Indian fig field, where Alfo, wounded, stoops down, picks up a handful of dust, throws it into his opponent’s eyes, thus blinding Turiddu, making it possible for Alfo to wreak his revenge by dispatching the betrayer of his honor. In 1884 Verga dramatized ‘CAVALLERIA RUSTICANA' as an one-act play containing nine scenes. Several minor characters appear and Santa is called Santuzza. The whole action takes place Easter morning in the village piazza, where the wine shop of Turiddu’s mother, Nunzia, is seen and the village church. Although Verga’s dramatized version is effective, the drama is hardly the equal of the novella, the charm of which in no small degree lies in the merely suggested background. Undoubtedly much of the celebrity of ‘CAVALLERIA RUSTICANA' is due to Pietro Mascagni’s opera of the same name, the libretto for which was written by Targioni-Tozetti and Guido Menasci, shortly before 1890. Although the original version of the story is followed quite closely, several lyrical scenes are introduced serving as texts for arias and choruses, which, as admirable as they are in their way, by reason of their development, rather detract from the original dramatic effect. A readily available text of ‘CAVALLERIA RUSTICANA,' with English notes and commentary, by Professors Wilkins and Altrocchi of Chicago University, will be found in a collection: ‘Italian Short Stories' (Boston 1912). An English translation by Alma Stretell appeared in England in ‘CAVALLERIA RUSTICANA and ‘Sicilian Life' (London 1893), and in this country by Nathan Haskell Dole, in a volume entitled ‘Under the Shadow of Etna' (Boston 1896).

JAMES GEDDES, JR.
Professor of Romance Languages, Boston University.

CAVALLERIA RUSTICANA, grand opera in one act by Pietro Mascagni (libretto by Targioni-Tozetti and Menasci), founded on a tale by Verga, first produced at Rome, 17 May 1890. Awarded the prize in a competition for one-act operas offered by the publisher Soranzo, ‘CAVALLERIA RUSTICANA' launched its composer into world-wide prominence and founded a school of well-defined proportions. All Italy went wild over the work and Mascagni was hailed as the legitimate successor of Verdi. Everywhere the opera created a furore. In New York two managers vied with each other to be the first in the field, with the result that two productions were given in New York on 1 Oct. 1891 and the question of priority rights had to be settled by the courts. In the meantime, both Philadelphia and Chicago had heard it. The compressed emotional appeal of the work swept critical judgment off its feet. The hot-blooded passion of the story was raised to a higher power by the music, turbulent, theatrical, but persuasive. The vein tapped by the composer was not all precious metal and it paled out suddenly; but while it lasted, the rewards were rich. The Intermezzo alone, an eloquent advance agent of the opera, must have been the composer’s pockets. The Siciliana sung by Turridu, Santuzza’s romance, the Drinking Song and Lola’s aria are all melodious and easily remembered. The orchestration is often crude and blatant, but not unsuited as a vehicle for the "veristic" and melodramatic musical expression. Operatic annals contain few such sensational and meteoric careers as that of ‘CAVALLERIA RUSTICANA,' with the fortunes of which its composer’s fame hangs by a thread. Emilia Calvé’s impersonation of Santuzza is one of the outstanding histrionic
features of modern operatic history. For the outline of the story see Cavalleria Rusticana.
Lewis M. Isaacs.

Cavalli, ká-väl't'é, Pietro Francesco, Italian composer; b. Crema about 1600; d. Venice, 14 Jan. 1676. The name by which he is known was assumed by him in honor of his patron, Federigo Cavalli, podestà of Crema. His real name was Pietro Francesco Caletti Biondo. He studied under Monteverde whose style he continued. In 1655, he became organist at San Marco, and in 1668, Maestro di capella, or "chapelmaster," which office he held for the rest of his life. He is best remembered for his work in dramatic operas. He introduced solos, freer rhythm and widened the scope of dramatic possibilities. In all of this he was the direct forerunner of Scarlatti who developed opera along these lines. In spite of obvious crudities of style and weakness of harmony, Cavalli's 42 operas are still noteworthy productions. Among his numerous works may be mentioned Le Nozze di Tetide e di Peleo (1639); 'Il Giason' (1649); L'Artamisia (1656). In 1656, a collection of his church music was printed at Venice.

Cavallo, Tiberius, Italian physician and inventor; b. Naples, March 1749; d. London December 1809. He early removed to England, where he published, in 1775, a notice of 'Extraordinary Electricity Observed at Islington. He invented several ingenious instruments for electrical and chemical experiments. His apparatus for measuring the force and quantity of electricity is remarkably delicate and accurate. In 1779 he was admitted to the Royal Society. His study of the influence of air and light on plant development was brilliantly original, and paved the way for valuable discoveries in organic life. He wrote 'Medical Electricity' (1780); 'A Treatise on the Nature and Properties of Air, etc.' (1781); 'Complete Treatise on Electricity' (1786); 'Treatise on Magnetism in Theory and Practice' (1787); 'Elements of Natural and Experimental Philosophy' (1803), and other scientific works.

Cavally, one of the popular names of the horse-mackeral, Carangus hippos, called also horse-crévallé and jack. It belongs to the family Carangidae (q.v.), and is distinguished by the black spots on the operculum and the pectoral fin.

Cavallotti, ká-väl'-ót'é, Felice, Italian statesman and poet; b. Milan, 6 Nov. 1842; d. Rome, 6 March 1898. He fought under Garibaldi and gained celebrity; was a political journalist. Elected to the Italian Parliament (1868), he opposed Crispi and became an extreme Republican, opposing the monarchy with great vigor. He was repeatedly sentenced to imprisonment. He fought 32 duels and was finally killed. The most noted of his trade-dies are 'Agnes de Gonzaga'; and 'Alebriades' (1874). He also published volumes of lyric verse, his best work being 'The Canto of Canticles.'

Cavally, term used to designate soldiers trained to fight mounted and sometimes employed on foot. The decisive power and value of cavalry lie in its mobility and in opposing infantry. On foot, the cavalry of to-day can attack positions with the same resolution and determination as can infantry. They use the same weapon—the rifle—and the rifleman of to-day is the rifleman on horseback who can quickly convert himself into a rifleman on foot, ready to receive and repel the mounted charge of cavalry. There are enormous possibilities for the horseman of the future armed with the rifle, with a great extension of modern battle lines modified by the development of mounted infantry ready to throw itself on the rear or flanks of the distant enemy. The cavalry action of the future can be conceived by a comparison of the cavalry of the Civil War, the Boer War and the European War with that of Wagram and Waterloo.

Cavalry as a distinct military organization dates back prior to the Trojan War. Xenophon relates that in the first Messenian War, 743 B.C., Lycurgus formed his cavalry in divisions. In the war 371 B.C. Epaminondas had a cavalry force of 5,000 men, and we know their cavalry contributed greatly to the victories of Philip and Alexander of Macedon. It had an important part in the battle of the Granicus, 334 B.C.; and at the battle of Issus, 333 B.C., Alexander, who led the Macedonian cavalry of 7,000 men, dashed into a gap of the Persian army, and by this brilliant feat utterly routed the enemy. The Roman cavalry was very inferior to that of Hamilcar and Hannibal and most of the victories of these two generals were won by cavalry over the splendid infantry of the Romans. Publius Scipio's defeat at the Ticinus, 218 B.C., was due to the superiority of the Carthaginian horse; and the bitter experience at the Trebia and the battle of Canne, 216 B.C., taught the Romans the value of cavalry, by which Scipio finally defeated Hannibal at Zama, 202 B.C. Vegetius states that the Roman cavalry was organized into 10 troops or squadrons, forming a regiment of 726 horses, generally attached to some special legion. It is a singular fact that saddles were not in use until the time of Constantine, and stirrups were introduced by the Franks in the 5th century. During the Middle Ages cavalry may be said to have constituted the efficient arm of battle. This was owing to the unwillingness of the nobility in all countries of western Europe to entrust any military power to the serfs; the upper classes went into battle mounted, and both riders and horses had heavy defensive armor. The feudal cavalry consisted of mail-clad knights with their men-at-arms. Their weapons were lances, battle-axes and swords. The infantry was looked down upon during the Middle Ages, being composed principally of serfs and such as had not the means to keep a horse; but with the invention of gunpowder, the introduction of muskets and the use of field artillery a complete change took place; the infantry gradually rose in reputation, and the number of this class of troops was augmented. It seems that light cavalry did not exist as a distinct body, with general officers and a staff, before the time of Louis XII. Molucc, however, mentions a general of 12,000 light horse in the time of that monarch; and we hear of Henry II. in 1502, taking a troop of 3,000 cavalry in his expedition to Germany. In 1554 Marshal De Brissac formed a corps of mounted infantry, called Dragonis,
CAVALRY

trained to fight either on horseback or on foot. Maurice of Nassau, who saw the importance of giving more mobility to this arm, was the first to organize cavalry regiments, each regiment being composed of three companies of five ranks, and numbering about 1,000 horses. Gustavus Adolphus was a great cavalry general, and used his cuirassiers and dragons to good advantage. His tactics were much admired, and were adopted by many European nations. The French, especially, distinguished themselves after his death in the employment of cavalry. Turenne, Condé, Montecuculi and Marlborough were considered excellent cavalry leaders. Cromwell was indebted to his abilities as a cavalry officer for the victories of Marston Moor and Naseby. Defensive armor for cavalry had been abolished in his time, and the cavalry troops were taught to use the carbine. Charges of cavalry were seldom made in battle except by cavalry in the Russian Saxen and many improvements in this arm, and used guns in connection with cavalry at the battle of Fontenoy, although regular horse-artillery was not introduced till 1762. It was not until the war with the United States began that the full importance of cavalry was developed; he saw the necessity of training these troops to use swords instead of firearms, and endeavored to make them perfect riders. No firing whatever was allowed in the battle during the first charge; he claimed that the only two things required to beat the enemy were to charge him with the greatest possible speed and force, and then outflank him. The brilliant victories he obtained from the adoption of these tactics under the able leadership of Ney and Lannes have probably never been excelled. At the battle of Hohenfriedberg the Prussian cavalry of 10 squadrons broke 21 battalions, routed the entire left wing of the Austrian infantry and captured 66 standards, 5 guns and 4,000 prisoners. Frederick had learned to appreciate the true principles of mounted warfare through long experience and the occasional disasters which he had met in the first and second Silesian wars; and it was due to the efficient reorganization of the cavalry and the Prussian cavalry that he was able to win the battles of Rossbach, Stieglau, Kesselsdorf, Leuthen and others. One of the first improvements made in the French army by Napoleon was the reorganization of the cavalry. He increased the cuirassiers from one regiment to 12, and reintroduced the use of the lance and defensive armor. Some of his splendid victories were due to this force, especially at Marengo and Austerlitz; and it was owing to the loss of the French cavalry that the battle of Waterloo was lost at the battle of Waterloo was lost. Austerlitz and Lützen the war would then have been brought to an end.

In modern warfare it may be mentioned that cavalry was conspicuous at the battle of Solferino; but in 1866, the first great European war since Waterloo, neither the Austrian nor the Prussian cavalry was of any importance, although the manner in which the Austrian cavalry covered the retreat of their army at the battle of Königgrätz was a noble example of courage and devotion. In the Franco-Prus-
advantage of every spot favorable to its action, and, by short and energetic charges, force the enemy to move with circumspection. So long as infantry maintains its position firmly, particularly if the unfavorable to the movements of cavalry, the chances are against a successful attack by the latter. Cavalry should therefore either wait patiently until a way is prepared for its action, by a fire of artillerie on the enemy's infantry; or until the infantry has become crippled and exhausted by being kept in action for some time; or else, watching its opportunity, make a charge whilst the infantry is in motion, so as to surprise it before it can form to receive the attack.

Cavalry should direct its charge on that point of the enemy's infantry where it will itself be exposed to the least column of fire. If the infantry is in line, the charge should be made on one of its flanks; if in square, on one of its columns, or to the square, and whilst it several squares are formed, so as to afford mutual support by their fire, selecting the squares on the flanks as most vulnerable, from their position.

The formation usually recommended for charging against columns is that of three squadrons in exact double distance; the leading squadron being followed by the others, either directly in its rear, or else the squadrons may be formed in echelon, successively overlapping each other by about the front of a platoon. The angle of the square is charged by each squadron in succession, if the charge of the one preceding it fails; the repulsed squadrons each wheeling to the right or left on retiring, to leave the way clear for its successor. A fourth squadron in column follows those in line, to surround the square and make prisoners if it should be broken by the charge. To draw the fire of the infantry before charging, a few skilful flankers may be thrown forward to open a fire on the square. Stratagem may also be tried, by moving along the front of the infantry, and then charging, if it is tempted to throw away its fire.

In attacks against artillery, the detachment of cavalry should be divided into three bodies; one-third being charged with carrying the guns, one-half to attack the supports of the battery and the remaining fourth acting as a reserve, to cover the parties in advance from an offensive movement against their flanks or rear. The party to secure the guns make their attack in dispersed order, and endeavor to gain the flanks of the battery. When the battery has a fair sweep over the ground along which they must advance, they should, by manoeuvring and false attacks, draw the enemy's position, and draw their fire before making their charge.

So far as concerns actual duties, heavy cavalry charge the enemy's cavalry and infantry, attack the guns and cover a retreat: while the light cavalry make reconnaissances, cause delays and disorganize the enemy's outposts, supply pickets, scour the country for forage, and the commissariat, pursue the enemy and try to screen the movements of the infantry by their rapid manoeuvres on the front and rear of it, and attempts to outflank its columns. At the battle of Balaklava the heavy cavalry charge was within the reasonable duties of the troops, but that of the light cavalry was not; the former succeeded, the latter failed. Cavalry cannot wait to receive an attack like infantry; they must either pursue or retreat; and on this account it has been said, Rest is incompatible with cavalry. The infantry and artillery more frequently win the victory by their support than by their attack; for doing this, capture prisoners and trophies, pursue the flying enemy, rapidly succor a menaced point and cover the retreat of infantry and artillery, if retreat be necessary.

If we study the nature of modern cavalry action, it is clearly seen that no one particular formation can be rigidly insisted upon for the mounted charge against cavalry. The development of long range firearms, their rapidity of fire and great accuracy, has made it possible for cavalry having time to dismount and form up to repel the attack of horsemen as effectually as can unshaken infantry. By dismounting and using the rifle on foot the cavalry will be able to decimate the attacking force and knock it out before it reaches its objective. Dismounted action in future wars will be the rule, mounted attack the exception.

The battle attacks of the cavalry of the First Empire were simplicity itself. Placed close to the front it was composed in successive lines of regiments or brigades, with the light cavalry in front, behind them the dragoons and in rear of all the cuirassiers. The lines thus placed behind the other formed une colonne serrée. It attacked in successive lines of regiments or brigades at varying intervals, according to the course of events. After the charge or the mêlée the rally was to the flanks, where column was rapidly formed in order, if necessary, to advance again by passing through the intervals of the supporting lines. There was little occasion for manoeuvre, owing to the proximity of the cavalry to the front, but all movements were executed at the trot, the gallop only being sounded for the last 100 or 150 yards. Practically the only manoeuvre attempted was to take ground to the right or left and form again to the front; the success of the charge was due to the irresistible onset of the successive lines and the skill in the mêlée that being charged with the swordsmen the whole constituting a moral factor of the first importance and value.

The question is asked: Why, cavalry having attained such super-excellence under Napoleon, has it come to pass that in none of the succeeding wars from 1815 to 1870 is there any trace of the same emploi intensif? The same thing had already been noticed before in the Prussian cavalry of Frederick; in both cavalries there was a period of uniform success; in both of them when the zenith of the perfection of the organization were simple, the distribution supply and elastic, the commanders young and brilliant and the employment of the arm was the actual embodiment of the offensive spirit. Either cavalry attained its apogee, followed by a period of decadence; each in turn was content to rest upon its past fame, to rely merely upon tradition, until reverses and disaster led each in succession to examine into and correct the causes which had resulted in its overthrow. It is found in the long years of peace men fall back upon mere formula, trust to theory rather than to practice, consult schoolmen rather than leaders; that during peace time the natural tendency is to place undue reliance
upon regulations, form and *diletantisme tactique*, while overlooking the factors of energy and overpowering moral force which, through all material changes in armament, must ever remain among the keenest weapons of cavalry.

After the war of 1870 it was generally believed that cavalry was no longer a weapon for the battle, that all that could be asked of it were certain vaguely defined duties of reconnaissance; it was then recognized that opposing cavalries must meet and fight, and by both German and French experience with it was established that the first duty of cavalry is to defeat the cavalry of the opponent, while many efforts were made to formulate a doctrine of profitable employment. This heroic age, when it seemed that cavalry should be employed again in masses and by shock, was followed by the Russo-Turkish, the South African and the Manchurian campaigns, where such methods were impracticable, and a reaction set in in favor of the employment of smaller units and of fire action.

The Franco-Prussian War put emphasis upon the reconnaissance duties of cavalry, because the German cavalry took advantage of the fact that the French cavalry mostly was kept concentrated and was not permitted to spread out far in front of the German armies for reconnaissance purposes; also because both cavalries disdained to fight on foot and, therefore, contented themselves with waiting for opportunities to make mounted attacks. These opportunities came but seldom, and in the majority of cases furnished examples of the failure of the mounted attack rather than the reverse.

Cavalry officers in all countries have felt for years that undue emphasis was being put on the reconnaissance duties of cavalry, and that cavalry should not consider itself an obsolete fighting arm merely because it cannot habitually use the sabre, any more than infantry should rule itself off the battlefield because it cannot habitually use the bayonet. These cavalry officers have welcomed the possibility of the aeroplane taking over the duties of reconnaissance from the cavalry, as that means the end of that weapon between small bodies, which have been split up into small bodies, and the return to its use in large bodies under cavalry leaders. In other words, its use would be on a much larger scale but in the same manner in which Sheridan in the closing days of the Civil War cut off and destroyed Ewell, Lee’s rear guard, and afterward stopped Lee until the infantry could arrive.

In the great European War cavalry was indispensable and variously employed as cavalry screen; in reconnaissance; in patrol duty; in protecting flanks of armies; in filing gaps between armies; in acting as advance and rear guards; in pursuing the enemy as independent cavalry; escorting large bodies of infantry and machine guns moving in automobiles; seizing and holding important positions until the infantry could come up; holding long stretches of trenches; and acting as a mobile reserve in rear of the trenches. As a result of experience, in World War II the British drill book the rifle was declared “the principal weapon of cavalry.” But later when a new drill book was issued in 1907, the policy changed, and the *arme blanche* was declared to be the cavalry’s main reliance. The Boer War was the greatest demonstration of the value of the mounted rifleman the world has ever seen. It confirmed the experience of the American Civil War. But the lessons it taught Europe went unheeded and in 1914 the French, Austrian and Italian cavalry were armed with a carbine of little or no value, while in none of these armies was the cavalry properly or sufficiently trained in marksmanship or in dismounted action, and as a result, great masses of cavalry were obliged to stand helpless, useless and impotent spectators of fierce battles, whereas had they been trained to use the rifle, they could have moved with the speed of horsemen and fought with determination of infantry.

Cavalry played a significant role on both sides in the Allied retreat and the German advance to the Marne. During the battle of the Marne, the German cavalry held the gap in the German line between von Kluck’s flank guard north of Meaux and his main force on the right flank of the German line. When the Allies were endeavoring to extend their line to Antwerp, and the Germans were trying to reach the Belgian coast, the cavalry of both sides played an extra important part in the region of Lille and Ypres in fact, the part of all the early engagements in this region were fought by cavalry. See AMMUNITION; ARTILLERY; INFANTRY.

EDWARD S. FARROW,
Consulting Civil and Military Engineer.

CAVAN, Ireland, a county in the province of Ulster, having Fermanagh and Monaghan on the north, Leitrim on the west, Longford and Westmeath on the south and Louth on the east; area, 746 square miles. In the northwestern part is a range of hills called the Ballymageeragh Mountains, but the remaining surface, which is undulating and irregular, is pervaded by bog and interspersed with many fine lakes. The chief rivers are the Erne, the Woodford, the Blackwater and the Annalee, and the chief lakes Lough Ramor, Lough Sheelin, Lough Gowna, Lough Oughter and Upper Lough Erne. Mineral springs are numerous. Much of the soil of this county is cold, spongy and inclined to be stony. The chief crops are oats, the chief green crop potatoes. Wheat is little cultivated; flax is raised to some extent, and the high lands are good for grazing. Linen-bleaching and the distilling of whisky.
are the chief industries. The principal towns
are Cavan, Cootchill and Belturbet. There are
some interesting architectural remains. The
county returns two members to Parliament.
Pop. (1911) 74,271, of which 81.4 per cent is
Roman Catholic.

CAVAN, Ireland, town, capital and chief
business centre of the above county, 57 miles
northwest of Dublin. It has an endowed school
founded by Charles I, and a Roman Catholic
college, and has some trade in linen. Pop.
(1911) 2,961.

CAVANILLES, kâ-vâ-nil'â-ye's, Antonio
José, Spanish clergyman and botanist; b.
Valencia 1745; d. Madrid 1804. In 1777 he
went to Paris and remained there 12 years,
occupied with the study of several
sciences, but chiefly with botany. In 1783-85
he wrote his great botanical work 'Tabulae
Iconum et Descriptiones Plantarum, quae
ant sponte in Hispania crescent aut in Hortis
hancuatorum' (1791, 4 vols., folio, with copper
engravings). After his return to Spain he
wrote 'Icones et Descriptiones Plantarum, quæ
aut sponte in Hispania crescent aut in Hortis
hancuatorum' (1791-95, 4 vols., folio, with copper
engravings). In pursuance of a commission
from the King, Cavanilles traveled in Valencia,
and collected the materials for his 'Observaciones
sobre la Historia Natural, Geografía,
Agricultura, Población, etc., del Reino de Va-
lencia' (1795-97, 2 vols., folio, with copper
engravings from the drawings of the author).
The work was published at the expense of the King,
and intended as the first part of a similar work
to embrace the whole of Spain. Thurnberg has
named a family of plants Cavanillia. His
nephew ANTONIO CAVANILLES (1805-64) was a
distinguished advocate and the author of a
history of Spain (Madrid 1869-64).

CAVATINA, käv-ä-tê'na, in music, a short
operatic air without a return or second part,
maintaining the same tempo throughout, some-
times relieved with recitative, but now extended
to the aria generally, especially if the character
of expression is tender, hopeful or joyous.
In this elegant and gracefully melodic class of
composition the Italians naturally eclipse all
other musicians; yet the Il mio Tesoro of
Mozart will bear comparison with the finest
cavatina ever written.

CAVE, or CAVERN, an opening produced
by nature in the solid crust of the earth. Caves
are principally met with in limestone and gypsum
as a result of the solvent action of ordinary
circulating underground water. Less often they
occur in sandstone, and in volcanic rocks (ba-
salt, lava, etc.). The formation of the caves
depends partly upon the nature of the substance
in which they exist; but it is frequently altered
by external causes. Out of some caverns rivers
take their course; others again admit rivers, or
may be said to swallow them for a space.
There are many and various causes for the
formation of caves. Those in limestone and gypsum are unquestionably the results of the
dissolving power of water; in fact the almost
perfectly uniform direction, the gentle and
equally gradual nature of those caves, appear to be
the effect of the long continuance of water in
them, the action of which has widened the ex-
cisting crevices. In trachyte and lava, caves
appear to have been produced by the effects of
gas. The caves of gypsum often contain foul
air; the caves of limestone are commonly
marked by various figures of stalactites, pro-
duced by the deposit of the lime dissolved in the
water. Many of these contain occasional rem-
nants of bones of animals, such as hyænas,
elephants and bears. See CAVE-DWELLERS.

Many caves are remarkable only on account
of their great size, or sublime from the awful
gloom which pervades them, and the echoes
which roll like thunder through their vaulted
passages. Some are of great depth, as that of
Fredrikshall, Norway, calculated to be several
thousand feet in depth. One of the grandest
natural caverns known is Fingal's Cave (q.v.)
in Staffa, one of the Western Islands of Scot-
land. Its sides are formed of ranges of basaltic
columns, which are almost as regular as hewn
stone. The grotto of Antiparos, on the island
of the same name, in the Grecian Archipelago,
is celebrated for its magnificence. The Cavern
adorned with stalactites, many of them of 20 feet
long, and hung with festoons of various forms
and brilliant appearance. In some parts im-
mense columns descend to the floor; others
present the appearance of trees and brooks
turned to marble. The Peak district, England,
is a celebrated curiosity of this kind. It is nearly half a mile in length; and, at
its lowest part, 600 feet below the surface.
Other famous stalactitic caves are the Luray
Cavern (q.v.), Page Country, Va.; one near Ma-
tanzas, Cuba; one near Adelsberg, Carniola;
the Wyandotte Cave (q.v.), Crawford County,
Ind.; and Madison's Cave, in Rockingham
County, Va. The caves of Kirkdale, in Eng-
land, and Gailenreuth, in Germany, are remark-
able for the quantities of bones of the elephant,
rhinoceros and hyæna found in them. In the
rock of Gibraltar there are a number of stalacti-
tic caverns, of which the principal is Saint
Michael's Cave, many feet above the sea. Other
celebrated caves in America are Weyer's Cave,
in Augusta County, Va., extending 800 yards,
but extremely irregular; the Colossal Cavern,
Ky. (q.v.), discovered in 1895, and the Mam-
omoth Cave (q.v.) in Edmondson County, Ky.,
which encloses an extent of the cave in sub-
terranean windings. One of its chambers,
called the Temple, covers a space of nearly five
acres, and is surmounted by a dome of solid
rock 120 feet in height. The Cumberland
Mountains, in Tennessee, contain some curious
caverns, in one of which, at a depth of 400 feet,
a stream was found with a current sufficiently
powerful to turn a mill. Another cave in the
same State is named Big Bone Cave, from the
bones of the mastodon which have there been
discovered. In the Cumberland Mountains, near
the northwestern extremity of Georgia, is
Nickojax Cave, 50 feet high and 100 feet wide,
which has been explored to the distance of three
miles. A stream of considerable size, which is
interrupted by a fall, runs through it. The
Ozark region of Missouri is noted for its
numerous caves, among which Onondaga cavern
is perhaps the best known. Caves are some-
times found which exhale poisonous vapors.
The most remarkable known is the Grotto del
Cane, a cave near Naples, Italy. In the control
of Hawaii there are many caves formed by the
lava from volcanoes. In the volcanic country
near Rome there are many natural cavities of
great extent and coolness, which are sometimes
resorted to as a refuge from the heat. In South America is the cavern of Guacharo, which is said to extend for leagues. For information concerning human and animal remains in caves, see CAVE-DWELLERS and consult works of reference to. See also section on work of ground water, in article on GEOLOGY.

CAVE ANIMALS. The animal life of caverns falls into three categories: 1. Animals, mostly extinct, that made their dens or left their bones in caves, and in life were members of the next group. 2. Animals that temporarily, but habitually, resort to caves for refuge, or sleep, or as breeding-places. 3. Animals, degenerate, confined to an underground life throughout their whole existence. None of these classes include those making small caves for themselves, the burrowers; or which, like the mole and many insects, dwell in the soil or, (Hymenoptera, the pikes and several sea-birds, spiders, etc.), seek safe homes among the interstices of loose rocks.

Prehistoric Cave Beasts.—The first group will require little space, as it consists of such extinct cave bears, cave lions, cave leopard, cave hyaena, cave wolf and some smaller ones that have been given these names because their bones and portraits have been found abundantly in the floors or on the walls of caverns in Europe and Africa. Indications trusted by geologists and archaeologists combine to show that these animals lived there in the latter part, at least, of the third Inter-glacial Epoch, and on through the fourth and last glacial advance, when, although central Europe was free from an ice-cap, an almost Arctic climate prevailed, with much rain. This is what is known as the Reindeer Period, when humanity was represented by the Neanderthal race (see STONE AGE). The weaker part of the fauna disappeared, but those hardy carnivores, finding food still plentiful, gradually adapted themselves by increased hairiness to the cold climate; but apparently they resorted far more than previously to the shelter of caves. None of those mentioned above is regarded as anything but a vigourous variety (spelaus) of the lion, leopard, wolf, spotted hyaena, etc., except the cave bear (Ursus spelaeus). This beast was the most thoroughly speleman of all its habits, and occupied caves before men began to do so. It was not much if any larger than the ordinary brown bear of to-day, and its claws were shorter and feeble. *Hence it would appear,* says Osborn, *that the Neanderthals had driven out from the caves a type of bear less formidable than the existing species, but the contest is a serious one to men armed with the small weapons of the Mousterian period.* Probably fire and smoke were the most effective means. These bears were numerous, for game was abundant. A single cavern in western France has yielded remains of more than 800 skeletons; and from these bones and from prehistoric drawings it is possible to know this animal perfectly. With the close of the last period of partial glaciation, and the return in the early Pleistocene of the milder climate that still continues, these and the other cave-haunting beasts disappeared, largely, no doubt, killed off by the better-armed Neolithic hunters. The great bear left no descendants, for the modern European brown bear traces its lineage to an older and smaller species, the Etruscan bear, whose bones also are occasionally exhumed from cave-floors.

Caves in North America present different conditions from those of Europe. Those that have yielded animal remains, such as the Fort Kennedy and Frankstown "caves" in Pennsylvania, and the Concord Fissure in Arkansas, are hardly caverns,* says Scott, *in the ordinary sense of the word, but rather narrow fissures, into which bones and carcasses were washed by floods.* They contain a great variety of mid-Pleistocene species, at least half of which are extinct. Big Bone Lick Cave, in Kentucky, is more truly a cave, and has furnished palæontology with an immense supply of bones of recent time, including several ancient species, such as mastodons, mammoths and the ground-sloth, Megalonyx, and with certain traces of human presence. Caves in northern California are also rich in animal remains, illustrating the transition from the Pleistocene to the Recent faunas. Brazilian caverns have yielded much also; and a cavern near Last Hope Inlet, Patagonia, is noteworthy for the finding in it of the bones, and large pieces of the skin, of a great extinct sloth (Megatherium) with the hair still on.

Temporary Tenants of Caves.—In modern times, as anciently, bears and other carnivores use caves as sleeping-places when it is convenient, but they are exclusively resorted to by a few kinds of creatures that may properly be called cave-tenants. The most characteristic of these probably are certain bats, especially such insect-eating kinds as the leaf-nosed, the horseshoe and the true bats of the family Vesper-tilionide. Caves frequented by bats usually harbor enormous colonies, and one who enters and disturbs them will find himself in the midst of a whirring multitude that it taxes the powers of description to portray. Some caves long occupied contain vast deposits of the richest possible guano, and this has been extensively utilized in some places as a fertilizer. Such artificial caverns as the deserted tombs of Egypt are filled with bats, one species of which is popularly called tomb-bat, and abounds in the interior of the Great Pyramids. Birds of two sorts are cave-tenants. The most singular, probably, is the large guacharo, or oil-bird, of the family Steatornithidae, classified between the nightjars and the owls, and inhabiting northern South America and the island of Trinidad. It inhabits both sea-side and mountain caverns, going forth only at dusk to get its food, which is mainly fruit. *Visitors to the breeding-caves,* says Evans (*'Birds,' 1900) *are suddenly surrounded by a circling crowd of oil-birds uttering loud croaking or rasping cries. . . . The numerous nests . . . are flat, circular masses of a clay-like substance placed on ledges or in holes.* Great numbers of these birds are killed by torch-light for the sake of the oil obtained from them, which is excellent for illumination or for cooking purposes. The other birds choosing sea-caves as a breeding-place are swifts of the genus Colloca, whose nests are placed in the depths of caves on the coasts of Ceylon, and eastward and southward to northern Australia. Not one known of the many species is that which produces the edible nest of which the Chinese are so fond. Huge numbers of these swifts breed
in company in dark caves, where they are associated with bats; but the bats go outside at night and the swifts by day. Such caves contain an assemblage of animals of different classes which are blind, and in most cases eyeless. This fauna is evidently of great antiquity, since it exists most plentifully in caves, such as those of the limestone district of the South-Alleghanian region, and in southern Europe, which regions are south of the region of the Pleistocene glaciation. Within such caves, formed by the action of water (see CAVE), are rivers, sinkholes and deep wells, all perfectly dark, inhabited by carnivorous amphibiems, fish, crayfish and other crustaceans, and by many kinds of insects and spiders. No vegetation exists save a few scattered molds and fungi, and all the animals are carnivorous, preying on each other.

Mammoth Cave in Kentucky contains about 75 species of these blind creatures, to which 40 or 50 more may be added from other southern caves; while several hundred kinds have been described from European caverns.

The most striking and interesting form in Mammoth Cave is the blind-fish (Amblyopsis spelaea). It is about four inches long, colorless and blind, the eyes being vestigial. This fish seeks the dark and shuns the light, being much disturbed by a lighted match or bright sunlight, or even by a ray of light. In well-lit adult specimens there is no external indication of an eye; but in young ones, before reaching a length of two inches, the eyes can be distinctly seen, owing to their pigmentation, which is lost in the adult. The optic nerve can be traced in examples under an inch in length. This will apply to the eyes of other blind fishes and blind insects, crustacea, etc. While the sense of sight is lost, that of touch in the blind-fish, as in most other cave animals, is exalted. Amblyopsis is provided with tactile papillae, arranged in ridges on the front and sides of the head. They are said to show extreme timidity and caution in their movements.

A still higher type of vertebrate, two species of salamanders, have become adapted to cave life, losing their eyesight by disuse. The species of the genus Spelurus frequent damp, dark situations and the entrances to caves. An allied form (Typhlotriton spelaeus) is distinctly a cavernicolous as distinguished from a twilight species, and has never been found outside of caves. Its eyes show early stages of degeneration. It inhabits caves in southwestern Missouri, and occurs under rocks in and out of water. Still another salamander, whose eyes are the most degenerate known among amphibians, is the Typhlohomolge rathbuni. It lives in subterranean streams, tapped by an artisan and also a surface well, near San Marcos, Tex., and in one of the caves near that town. Its remarkably long and slender legs are too weak to support its body above the water.

The lower animals tell the same story of degeneration, total or partial atrophy of the eye, together with loss of color, and, in a more striking way, the compensation for the loss of vision by a great increase in length of the antennae and other appendages, or by the growth of long, slender tactile bristles.

The blind crayfish (Orconectes pelliculatus) is a common cave form. It differs from its out-of-door allies in being blind, deaf, slender-bodied and colorless. Other blind or eyeless crustaceans are various kinds of amphipods and isopods, both aquatic and terrestrial, of which species the Atalorhynchus pelagicus, and form the food-supply of the blind crayfish.

The eyeless beetles of caves (Anosphilum) have no vestige of eye or of optic nerves, while their bodies and appendages are slender. They grope their way about by means of very long tactile bristles. Other beetles, such as Adelops, which have retained vestiges of the outer eye; some spiders comprising an eyeless species, and others with eyes varying in size, some much reduced, spin little webs on the walls of the chambers. Among the harvestmen some (Phalangid) have extraordinarily long legs; while the Camptodex (q.v.), a wingless insect of the Mammoth and other caves of the United States and Europe, differs from the outdoor form in its antennae and abdominal appendages, being greatly exaggerated. The Limnophila are also mites, myriapods, primitive wingless insects (Podurana), a few flies, worms and infusorians.

Origin and History.—The blind fauna of caves, according to Packard, is composed of the descendants of individuals which have been carried by various means into the subterranean passages, have become adapted to life in perpetual darkness, becoming isolated, and thus, as long as they are subjected to their peculiar environment, breed true to their species, and show no tendency to relapse to their originally eye-condition. The absence of the stimulus of light causes the eyes, through disuse, to undergo reduction and atrophy. With this goes, in certain forms, the loss of the optic ganglia and optic nerves.

or where soft layers of sandstone or volcanic debris alternate with harder layers (see CAVES), and are usually dry, well-ventilated, of a fairly even temperature throughout the year, and often contain streams of running water. They are, therefore, suitable enough for human habitation, and often are really attractive. It is not surprising, then, that from the earliest times caves have been adopted as human residences and storehouses, and that they continue to be so utilized in various parts of the Old World. In the Western hemisphere this practice has never been followed, the occasional exceptions here and there being negligible. The reason is that the civilization of both North and South America is an important one. The early immigrants were men and women used to building houses, and finding in the New World plenty of room and materials for house building had no need of, and felt no call to, cave-life; nor have they been driven to it by fear.

The people of the Old World, from the Mediterranean to the China Sea, on the other hand, inherited the practice from remote antiquity, and maintained it under the pressure of circumstances partly common, partly peculiar to their poverty, danger from incessant wars and robber raids, until now in many places residence in artificial or modified caves is a matter of economy, or choice, or both. This is particularly true of southwestern Europe, and especially of France, where great areas of limestone, sandstone, and volcanic breccia underlie the soil. Through these the rivers, especially in the valleys of the Loire, Dordogne and Garonne, have cut deep channels with precipitous sides. Here scores of natural caves have been human habitations from prehistoric times onward—some even yet furnishing human homes. Baring-Gould pictures a well-known example that has been explored by antiquarians:

"At the bottom of all the deposits [constituting its floor-layers] were discovered the remains of the very earliest inhabitants, with their hearths about which they sat in nudity and split bones to extract the marrow, trimmed flints with the marks of cutting and cutting bear teeth; then potsherds, formed by hand long after the invention of the wheel; higher up were the arms and utensils of the Bronze Age, and the weights of nets. Above these came the remains of the Iron Age, and wheel-turned crocks. A still higher stratum surrendered a weight of a scale stamped with an effigy of the crusading King, Saint Louis (1226-70), and finally franks bearing the profile of... Leopold [of Belgium]."

Such a record of almost continuous occupation might be multiplied by hundreds; and in many cases such ancient resorts have been enlarged and improved. The same is true of northern Africa and northern Asia.

We have to do more especially with artificial caves dug out by men for occupation in one or another way. Thousands of habitations, stables and workshops were cut in the hillsides of Nottinghamshire and Staffordshire, in England, which in, within a few years, the local health authorities cleared them out. Holy Austin's rock in Shropshire, a mass of red sandstone, is honeycombed with habitations, whose neatly framed windows and doors are cut through the rock wall left for a front, and which even now are greatly liked by their tenants.

The vast expanse of chalk that underlies southern England, Flanders and northern France is easily worked, yet firm enough not to fall in, or crack away, when ordinary precautions are taken by the miner, and one might almost say that wherever it is exposed in river cuttings living rooms have been dug into the cliffs. Often these are so numerous and deep that an underground village exists. Thus near Montaigue, in the department of Loir et Cher, about 150 miles south of Paris, is the little city of Trôo, at the base of a cliff of chalk. "The whole height," a recent visitor writes, "is like a sponge, perforated with passages giving access to halls, some of which are circular, and into stone chambers; and most of the homes are wholly or in part underground. The caves that are inhabited are staged one above another, some reached by stairs that are little better than ladders, and the subterranean passages running from them form a labyrinth within the bowels of the hill, and run in superposed storeys... The town... is partly built at the foot of the bluff, but very few houses have vaulted chambers, store places, or stables. The café looks ordinary enough, but enter, and you find yourself in a dungeon."

The valley of the Loir, a northern tributary of the Loire at Angers, abounds in such rock villages, and they occur in many other places in France, Spain and northern Italy. In the department of Maine et Loire, whole villages are underground. A man may utilize valuable hillside ground for a vineyard, by building walls to retain level terraces. He quarries the necessary stones from the hill and fences his property. Then for his own dwelling he cuts out chambers in the sides of his quarry, leaving a thin front wall with windows and doorways, and bores a chimney up to the surface. Near Loudon the dry most of a mediaeval castle, cut into the rock, is alive with people inhabiting tenements dug into its sides. It is true that in most cases the families living in such quarters are poor and mean—sometimes degraded; but a great many are the homes of families of honest, working folks; are decently furnished, and ornamented outwardly by hedge gardens, hanging vines and neatly curtained windows; or regular house fronts may be erected before the caves, as is well known to tourists of the "chateau country" about Tours.

Caves, natural and artificial, have been and are still valued elsewhere in the Eastern world. Villages like those described above exist in some parts of Italy, in Sicily, in Egypt and especially in Syria. Southeast of Damascus, and not far from Palmyra, is Edrei, the capital of the Amoritishe King Og, ruler of Bashan, which was captured by the Israelites in the course of their conquest of Canaan. It was an underground city cut out of solid rock, which was explored some years ago by Wetstein, who was astonished at its extent. After threading a long, downward entrance-passage he found himself in a broad street, with dwellings on each side of comfortable height, and windows."
like three others which I afterward saw, now closed from above. Soon after we came to a market place, where for a long distance on both sides of the broad street, were numerous shops in the walls, exactly in the style of the shops seen in Syrian cities. After a while we turned into a side street where a great hall, whose roof was supported by four pillars, attracted my attention. The roof, a ceiling, was formed of a single slab of jasper, perfectly smooth and of immense size. In this region, too, lies Petra, hidden in a gorge of savage grandeur, and often visited by tourists. It also is an excavated city, where temples with their colonnades and façades are let into the red cliff, superimposed one above another. From the earliest recorded times the inhabitants of the district were ‘Horim,’ that is to say Troglodytes, whose first rude grotoes, shapeless caverns hollowed out of the hillside, have been transformed to architectural galleries decorated with statues and bas-reliefs.

Many other most curious examples of the present occupation of cave-dwellings in the hands of man might be cited, especially where banks and steep hillsides of the stiff earth called loess have been tunneled into, and are occupied by hundreds of dwelling places in which families now live in health and contentment.

Vast numbers of caverns, with evidences of former domestic occupation, are to be seen also in the mountains about the headwaters of the Yangtse Kiang (Blue River) in southwestern China. They are now left empty, or used occasionally by hermits or travelers. But in Kan-Su and Shen-Si precisely similar caverns are excavated in the hillside, and even to-day they are favorite dwellings of the people. Africa is not in general a cavernous region, because of its geology; but in south central Africa, the Bushmen found dwelling to a considerable extent under ground. Dornan (Trans. S. African Philos. Soc. 1909) writing of such inhabited caves in Basutoland says they were the rallying points of the various clans; and Stow reports that those inhabited by the head chiefs were adorned by paintings of totemic animals and the like.

Caves as Refuges.—Caverns and underground retreats, natural and artificial, ancient and modern, have always been resorted to as hiding places, not only by individuals fleeing from persecution, or avoiding legal punishment, or for criminal concealment (as by smugglers and robbers), but by great companies of people with their goods, in times of war or other social disasters. The early history of the Jews as given in the Bible has frequent references to this resort, as when Ahab persecuted the prophets and Obadiah hid them by fifties in a cave; and as when Joshua defeated the Amorites and their five kings hid themselves in the cave at Makkedah. The same sort of thing has occurred wherever men fought in a cavernous region from the beginning of humanity to the battles in northern France in 1915, when regimental secrets were concealed in subterranean chambers north of the Aisne. Nowhere was the value of such means of safety to a harassed population better illustrated than in the civil wars that have raged in southwestern China and in the tribal conflicts and blood-feuds of Afghanistan.

The Roman armies were constantly baffled by this method of escape in conquering the Armenians and Arabs in Asia Minor, or Gauls of France and the Franks of Stain Germany. When the Saracens invaded France from Spain in the 8th century, they found that the inhabitants, profiting by experience, had constructed underground retreats inaccessible to them, and by this means, almost alone, was the country saved from utter depopulation. Scarcely a century passed for several hundred years that this dreadful experience was not repeated at the hands of the Normmen (9th century); at the hands of English conquerors (12th century); at the hands of the Pope of Rome in the persecution of the Albigenses (14th century) and at the hands of local robber barons all the time.

It did not take long for the defenseless peasantry and townsmen to learn that their natural caves were not capacious enough to house the people, and they began to construct great subterranean halls, usually beneath their farms and villages, but often high in the faces of cliffs, so difficult of access that one man could defend the lairs by which they were reached. Hundreds of such underground, labyrinthine, caves of refuge, are known in southern and central France, and have been surveyed and described by French antiquaries, each large enough to contain the people of the neighborhood, with much property and provisions for a siege. Lacoste, in his ‘History of Query,’ remarks that in Lower Query the inhabitants dug souterrains with a labor that, only love of life could prompt. Three of vast extent have been discovered at Fontanes, Mondoumerc, and Olmie. The vastest and most remarkable for its extent and the labor devoted to it is at Olmie. The chambers are scooped out of a very hard sandstone. In some of them are little wells or reservoirs that were filled with water as a precaution against thirst. The entrance to such a hiding place was carefully concealed in a cellar, or under a movable stone in a church floor, or in a thicket; and all the excavated material was widely scattered so as not to betray the place.

It was the duty of every feudal seigneur to protect his vassals in return for their fealty and service; and every old castle in southern Europe, built in feudal times, almost always in some high and preferably isolated situation, stands on rock drilled through and through with galleries and chambers. «On the alarm being given, in the words of Baring-Gould, "of the approach of an army marching through the land . . . or the hovering of a band of brigands over the spot, within a few hours all this underground world was filled with plows, looms, bedding, garments, household stuff of every description, and rang with the bleating of sheep and the lowing of oxen, the neighing of horses, and the whimpering of women and children." This writer gives a list of 49 places in the department of Vienne alone, where such grottoes have been discovered, as well as castles, and we believe his statement that they number thousands in France alone. Where the entrance was not within the walls of a castle, defenses were arranged against assault. The entrance was very narrow, steeply inclined, provided with concealed pitfalls, and defended
by interior doors and by side-galleries from which entering assailants might be speared or otherwise attacked. Nevertheless horrible tales remain in history of large numbers of persons who have been speared or suffocated by smoke in these caves, or walled up by their enemies and left to starve.

Such souterrains abound in the northwest of France, also, where the most dreadful wars and oppression have swept the land again and again. Not only under villages, but beneath the scattered woodlands, the chalk was (and is) riddled with chambers and passages like an ant's nest. Victor Hugo has given, in his 'Quatre-vingt Treize,' a vivid picture of this state of things in Brittany at the time of the dreadful peasant uprising called La Vendée (1793–96). "The gloomy Breton forests," he tells us, were servants and accomplices in the rebellion. The subsoil of every forest was a sort of sponge, and water trickled in all directions by a secret highway of mines, cells and galleries. The underground belligerents lurking in these hovels under trap-doors were kept perfectly informed of what was going on, and would spring up under the feet, or just below the heels of their ambushed foes. Hugo asserts that in Isle-et-Villeaine, in the forest of Perret, not a human trace was to be found, yet there were collected 6,000 men under Focard. In the forest of Meulac, in Morbihan, not a soul was to be seen, yet it held 5,000 men. No wonder Napoleon's recruiting-sergeants could find few young men to impress, in the latter years of his campaigns—they had all run to their holes like scared rabbits.

The same arrangements for safety from massacre and robbery were made farther north; and we are assured by a recent historian that it may safely be said that there is scarcely a village between Arras and Amiens and between Roëy and the sea, betwixt the courses of the Somme and Authie, that was not provided with these underground refuges." One wonders how large a part they have played in the great war that began there in 1914. It is evident that the "dugouts" and other subterranean defenses had a place in the campaigns that followed were not as novel devices as the surprised Western world considered them.

Caves as Places of Religious Worship.—Whether or not the prehistoric peoples, the cave-men, degraded their cabins with religious intent, or whether anything in the way of worship was connected with them, is a matter on which archaeologists are undecided. Primitive man was a worshipper of nature, in the sense that he was a reciprocator to the powerful unseen agencies that he believed filled the universe. Supreme among the natural manifestations was the sun, and, as opposed to its brightness, the powers of evil worked in and were represented by darkness. Hence caves, unlighted, deep and mysterious, were logically regarded as abodes of malignant spirits, and perhaps as opening to the dark and horrid underworld. "The Zulus," says Taylor, "can show the holes where one can descend by a cord into the underworld of the dead, an idea well-known in the legends of Avernus, and which has lasted on to our own day in Saint Patrick's Purgatory in Lough Daroy [Ireland]." Such holes might call for propitiatory offerings, but would not become temples of uplifting worship. In various parts of the world, however, grottoes were used for the disposal of the dead, and in Egypt this became a cult of tremendous influence on the people, who, as they advanced, constructed elaborate, rock-cut tombs. Their growing belief in the immortality of the soul—nowhere more thoroughly realized—led to ceremonial of remembrance and ancestor-worship that developed into a philosophy that led to the erection of temples, and some of these temples were carved out of solid rock, with an ornate, architectural entrance (see Egypt). The same sequence of religious philosophy seems to have occurred in the valley of the Euphrates as in that of the Nile. The form of their ancient temples verifies the tradition of the Chaldees that they were evolved from tombs.

The wonderful cave temples of India, especially those of Elephant Island, near Bombay, are well known, or may be studied in the elaborate book 'Caves-temple of India,' by Ferguson and Burgess. Those of Elephant are Hindu (Sivastic), but more than 500 excavations made in ancient times by Buddhists for the purposes of worship and meditation are found in northwest India. Buddhist temples in caves, many of them still visited on holy days by priests and devotees, abound in southwestern China—a fact little known even to the Chinese themselves; most of them are natural grottoes, more or less modified for their purpose, and not all can be regarded as Buddhist. The latest explorer of them is Vicomte D'Ollone, who speaks as follows of them, as seen in the mountains near the head of the Blue River (Yangtze) in his book 'In Forbidden China': "Sometimes a population of statues slumbers and dreams in the mystery of these caverns, and the visitor experiences a feeling of religious awe as the torchlight shows their forms emerging from the shadow, like the very spirits of the earth."

A new and different impulse toward the utilization of natural caves, and the construction of underground places of worship was given by the advent of Christianity and the consequent persecution of its earliest adherents by the Romans, who regarded the sect not only as heretical but as politically dangerous. The faithful victims of this persecution were therefore compelled to seek everywhere secret places for their meetings. Their doctrine of the resurrection of the body, which was new in Rome, required that attention be paid to its proper bestowal after death, and this led, as long before it had done in Egypt, to elaborate tombs. Hence those sacred rock-cut tombs still revered in Palestine; and hence also the vast catacombs (q.v.) in the suburbs of Rome and of many other Italian cities. Within these catacombs were not only funeral chapels but regular churches. The system of hermitage, which became so prevalent in the early centuries of our era throughout North Africa and Asia Minor, sanctified many caves and semi-grottoes once inhabited by anchorites, and led to regular worship in them. Says Dean Stanley: 'Sinai and Palestine' (London, 1865): 'The moment that the religion of Palestine fell into the hands of Europeans it is hardly too much to say that as far as sacred traditions are concerned it became a religion of caves.'
Wherever a sacred association had to be fixed, a cave was immediately selected or found as its home. In Europe the veneration of the martyrs became in the Middle Ages the leading principle of Christian worship; and in many places the earth or rock about their tombs was removed until the sarcophagus was exposed, and the ashes of the saint, wholly or partially subterranean, was built about it. The crypts of ancient churches owe their origin to this custom, and many old cathedrals and churches in Europe rest on such sites.

All these influences resulted in the hewing of early and medieval churches out of the massif of cliffs and hillsides. Egypt has several rock-hewn temples of this kind; and they occur in Palestine, Crete, Spain, France, England, and elsewhere. How elaborate many of them are may be illustrated by a single example that of Saint Emilion, in the valley of the Dordogne River, France, where, in the middle of the 8th century, a hermit named Emilian lived in a small cave, still to be seen. He became celebrated as a teacher, and finally a monastery and gradually a town grew up in the valley below. Beside the town rises an abrupt mass of rock, hollowed out into a stately church. Its ground-plan measures 120 by 60 feet. The front contains a vestibule, 21 feet high, with doors and windows pierced in the face of the rock. The three lower windows are of the flamboyant order, the upper three (clearstory) are round; the principal doorway through the rock-wall is richly sculptured. The body of the church stands parallel with the face of the cliff, and is 95 feet long and 60 feet high. It consists of a nave and side-aisles, all excavated out of the living rock, the pillars left square, the ceiling accurately vaulted, and the whole dimly lighted by the vestibule windows. The pillars are plain, and without capitals, but quaint large figures are carved on the walls and at the rear of the choir.

Coincident with these mediæval churches several famous monasteries began as cave-hermitages, and were enlarged into series of halls and cells cut out of solid rock. These were in some cases occupied for hundreds of years, supplemented by, or giving place to, buildings erected near them. Examples of such cave-monasteries of old times are to be found even in England.

Bibliography.—The most complete summary of information relating to modern cave-dwellers is to be found in Baring-Gould’s ‘Cliff-Castles and Cave-Dwellings of Europe’ (Philadelphia 1911); for local particulars elsewhere, consult geographical treatises, such as the ‘Universal Geography’ of Reclus; books by explorers and travelers; the publications of archaeological institutes; scientific periodicals, and local histories—mostly in foreign languages.

Ernest Ingersoll.

CAVE MEN, are literally men who have occupied, or do occupy, caves as residences. In popular use the term most often refers to the aborigines of the west, when primitive men dwelt in the shelter of overhanging rocks and cavern roofs, because they had not yet learned how to build houses. This is the fact in a certain early stage of primitive culture; and it will be found treated in its proper historic place in the article Stone Age. For the human occupation of caves for residence and various other purposes within historic times see Cave Dwellers.

CAVE-Temple, a cave used as a temple; but the name is especially applied to temples excavated in the solid rock, wholly or partially subterranean, was built about it. The crypts of ancient churches owe their origin to this custom, and many old cathedrals and churches in Europe rest on such sites.

In a law notice served on a public officer or court to refrain from doing a certain act without first giving notice to the caveator, as the person is termed who enters the caveat. Perhaps the best known use of the caveat in the United States is its entry by an inventor in the Patent Office for the purpose of establishing his claim to priority of invention, by enjoining its officers from issuing letters patent for any invention interfering with or infringing the rights claimed by the caveator without first giving him notice of the application for such letters patent. The terms of the caveat must set forth the claims of the inventor and the details of his invention with sufficient particularity to enable the officials of the Patent Office to determine whether a subsequent application for letters patent for letters falls within the claims of the first inventor. If such is the case the caveator is entitled to notice of such interfering application, and the new applicant’s claim to letters is suspended for three months, during which period the caveator must complete his specifications and file his own application for letters patent. If no interfering application is filed, the caveator’s rights remain valid for one year, and may be renewed at the end of that term, for one year more, on payment of a second fee. The law providing for the filing of caveats was repealed by Congress in 1910. Other uses of the caveat are to prohibit (without notice to the caveator) the admission of a will to probate, the enrolment of a decree in chancery, the grant of letters testamentary to an executor, the issuing of a commission de lunatico inquirendo, etc. On the filing of such a caveat and due notice being served thereunder, a hearing is had before a competent tribunal for the determination of the rights in the matter. (See PATENTS.) H. H. 'Rules of United States Patent Office'; Merwin, 'Patentability of Inventions' (Boston 1883); Luby, 'Patent Office Practice' (Kalamazoo 1897).

CAVEAT, käv'ët, EMPTOR (Lat. 'let the buyer beware'), a rule of law that warns the purchaser to take care and examine properly before he buys it. In sales of real estate the purchaser’s right to relief depends on the covenants in the deed in the absence of fraud on the part of the vendor. In 1 Serg. & R. 42, the rule is stated as follows:

"The rule of caveat emptor strictly applies to the purchase of lands, and the consideration-money cannot be recovered back after a deed executed, unless in case of fraud, where some covenant inserted in the deed has been broken. The purchaser has in his power to protect himself by proper covenants, and there is no reason why the law should provide to him a remedy, where he himself has been wholly inattentive and negligent in this particular."

In sales of personal property the purchaser buys at his own risk, in the absence of an express warranty by the seller, or when the law does not imply a warranty from the circumstances of the sale or the nature of the thing
sold, and when the seller was not guilty of a fraudulent misrepresentation or concealment. The purchaser must examine the quality of the goods bought and rely upon his own judgment. Generally, if the article purchased is defective, and an examination, such as a reasonable and prudent man would make, would enable him to see the defect, it is not a fraud on the part of the seller not to call his attention to it.

At common law in the city of London, the law of market overt applied to all stores where articles in that particular line were sold. The purchaser got a good title, but as to the quality the purchaser must examine and judge for himself.

CAVEDONE, kā-vē-dōnā, Jacopo, Italian painter: b. Sassuolo, in the duchy of Modena, 1577; d. Bologna 1660. He was a pupil of Annibale Carracci. His best works are the 'Saint Alo,' for the church of the Mendicanti at Bologna, the 'Adoration of the Magi,' the 'Four Doctors,' and the 'Last Supper,' which are now in the Bolognese Academy. Out of Italy he is frequently mistaken for Annibale Carracci. He became an assistant to Guido Reni in Rome. In his declining years he fell into great debt and died in extreme poverty.

CAVELLI, Edith, English nurse: m. Norfolk 1872; executed in Brussels during the German occupation of Belgium on 12 Oct. 1915. She was the daughter of a clergyman; entered London Hospital for training as nurse, 1896; invited to Belgium in 1900 by Dr. Depage, a distinguished medical man who had established a training school for nurses in a suburb of Brussels, and desired to modernize the nursing system of the country. Belgian nurses up to that time had been recruited chiefly from the ranks of nuns and domestic servants—the former attending mainly to Catholics and the latter to non-Catholic patients. Miss Cavell accepted the invitation and threw herself whole-heartedly into the task. In 1906 she became head of the institution, founded with the purpose of training a large army of nurses for the whole of Belgium. At the outbreak of the European War in 1914, she was in England on a visit, but returned at once to Belgium and converted her institute into a hospital for wounded soldiers. Dr. Depage was called into military service and placed in charge of another Belgian hospital, while Miss Cavell continued her work in Brussels. During the German occupation of the city—from 20 Aug. 1914—she was permitted to remain in control of the hospital. For the first year of the war she nursed without discrimination Belgians, French, British and Germans. During this time, with the aid of friends in Brussels, she was instrumental in conveying many of the wounded Allied soldiers—upon their recovery—across the frontier into Holland, whence they were able to rejoin their armies. She also assisted Belgians of military age to escape capture by the Germans. Her activities were discovered by the German authorities through the agency of a Belgian traitor (who was found murdered in the street nearly three years later), and on 5 Aug. 1915 she was arrested and lodged in the military prison of Saint Gilles. She was kept in solitary confinement for three weeks before the fact of her arrest became known. At the request of the British government the American Minister at Brussels, Mr. Brand Whitlock, took up the case and addressed an inquiry (31 Aug. 1915) to Baron von der Lancken, the chief of the political department of the German military government in Belgium. No reply being forthcoming for 10 days, Mr. Whitlock wrote on the matter (12 September) that Miss Cavell's defense was in the hands of a Belgian advocate, and that no interview could be permitted. The legal adviser to the American legation, M. de Leval, then endeavored to communicate with the prisoner and her alleged advocates, but in vain. On 4 October he was informed that the trial would be held on the 7th—nine weeks after the arrest. The defense was kept in the dark as regards documentary evidence in possession of the prosecution. By frankly admitting the charge brought against her, Miss Cavell had given the prosecution evidence that would otherwise have been unobtainable. According to the German Military Code the offense was treason and punishable by death. The trial ended on the following day (8 October) and judgment was reserved. The officials of the American legation made the most strenuous efforts to obtain information regarding Miss Cavell's fate; at 6.20 p.m. on the 11th, Mr. Hugh Gibson, the secretary, was officially informed that the decision had not yet been given. At 8 p.m. M. de Leval heard by accident that sentence of death had been passed at 5 p.m., and that Miss Cavell was to be shot at 7 in the following morning. Mr. Brand Whitlock was ill in bed at the time, but he wrote a personal letter to von Bissing, the military governor, while Mr. Gibson, M. de Leval and the Spanish Ambassador formed a deputation of appeal for mercy or at least postponement of sentence. They were dismissed about midnight and two hours later Edith Cavell fearlessly faced the firing squad. During an interview with a British chaplain she remarked, "I have seen death so often that it is not strange or fearful to me." Consult Gibson, H., 'A Journal from our Legation in Belgium' (New York 1917).

HENRI F. KLEIN.

CAVEN, William, Canadian educator: b. Kirkcud, Wigtownshire, Scotland, 26 Dec. 1830; d. Toronto, 1 Dec. 1904. In 1847 he emigrated with his parents to Canada, where they settled in Dumfries township, near Galt. After teaching school, he entered at 17 the theological seminary of the United Presbyterian Church at London, Ontario, was licensed to preach in 1852 and held a charge at Saint Mary's until 1866, when he was called to the chair of Old and New Testament Literature in Knox College, Toronto. In 1873 he succeeded Dr. Willis as principal of the college, and held that office until his death. He was largely instrumental in raising the funds for the new building. Mr. Caven contributed greatly toward the union, happily finally completed in 1875, of the various Presbyterian bodies of Canada, in which year he was moderator of the united church, and again in 1892. By his wise foresight, statesman-like grasp of affairs and moderate and healing counsels, he rendered service of inestimable value in the consolidation and upbuilding of the Presbyterian Church in Canada. From
1900 to 1904 he was president of the Pan-Presbyterian Alliance.

CAVENDISH, käv'en-dish or kān'dish, Frederick Charles, Lord, second son of the 7th Duke of Devonshire, English statesman: b. Eastbourne, 30 Nov. 1836; d. 6 May 1892. He was graduated from Cambridge in 1858, was private secretary to Lord Granville from 1859 to 1864. He sat in Parliament as Liberal member for the north division of the West Riding of Yorkshire from 1865 till the spring of 1862 and after serving as private secretary to Gladstone and acting as financial secretary (1880-82), he succeeded Mr. Forster as chief secretary for Ireland. He accompanied Earl Spencer to Dublin, and on the evening of 6 May, he and Mr. Burkt, an unpopular subordinate, were stabbed to death in the Phoenix Park. Eight months later, 20 'Irish Invincibles' were tried for the murder, and, Carey and two others having turned Queen's evidence, five of the rest were hanged, three sentenced to penal servitude for life and the remaining nine to various terms of imprisonment. Carey himself disappeared; but in July news came from the Cape that he had been shot dead by an Irishman named O'Donnell on board an American ship. O'Donnell was taken back to London and hanged.

CAVENDISH, George, English biographer: b. about 1500; d. about 1561. He became Wolsey's gentleman-usher at least as early as 1527. He remained in close attendance upon his great master till the latter's death, 28 Nov. 1530, after which he retired to his family at Glemsford, in Suffolk, where he lived quietly with his wife, a niece of Sir Thomas More, till the close of his own life. His affection for the great cardinal was most devoted, and his 'Life of Cardinal Wolsey' is one of the most interesting short biographies in the English language. It was written in 1557 and published in an unsatisfactory state in 1641, but it was not until 1905 that it appeared in polished form.

CAVENDISH, Henry, English chemist: b. Nice, Italy, 10 Oct. 1731; d. London, 10 March 1810. He was a grandson of the 2d Duke of Devonshire, and after his education at Peterhouse College, Cambridge, devoted himself exclusively to scientific research. He lived a quiet retirement, having no interests besides his scientific studies. He never married, and left a fortune of £1,175,000. He was rather eccentric, and had a hesitation in his speech. His first researches dealt with arsenic, and in 1765 he made some notable investigations concerning heats of liquefaction and vaporization which were not published until considerably later. He discovered the peculiar properties of hydrogen, and the qualities by which it is distinguished from atmospheric air. To him we owe the important discovery of the composition of water. Scheele had already observed that, when oxygen is mixed with double the quantity of hydrogen, this mixture burns with an explosion without any visible residuum. Cavendish repeated this experiment with the accuracy for which he was distinguished. He confined both the gases in dry earthen vessels, to prevent the escape of the product of their combustion, and found that this residuum was water, the weight of which was equal to the sum of the weights of the two gases. Lavoisier confirmed this conclusion in later times. Cavendish also obtained the anhydride of nitrous acid from nitrogen and oxygen by the electric spark.

Cavendish determined the constant \( K \) in the law of gravitation \( F = \frac{Gmm}{r^3} \), where \( m \) and \( m' \) are the masses of two bodies, \( d \) the distance between them and \( f \) the measure of their mutual gravitational attraction, and was thus able to determine the mean density of the earth. He found it to be 544 times as great as the density of water—a conclusion which differs but little from that obtained by Maskelyne in another way. The apparatus used consisted of two large fixed masses of lead and two smaller masses of silver, fixed to a frame by a wire at its middle. It was devised by the Rev. John Mitchell. Cavendish was a member of the Royal Society of London, and in 1803 was made one of the eight foreign members of the National Institute in France. His writings consisted of three parts of the 'Philosophical Transactions,' from 1766 to 1792. They are distinguished by acuteness and accuracy. Consult 'The Electrical Researches of Henry Cavendish,' edited by J. Clerk-Maxwell (Cambridge 1879); Wilson, 'Life of Cavendish' (London 1846).

CAVENDISH, Margaret, Duchess of Newcastle, English writer: b. Essex 1624 (?); d. London 1674. She became a maid of honor to Queen Henrietta Maria (1643-45). She married William Cavendish, afterward Duke of Newcastle (1645), and lived abroad with him until the Restoration. She was buried in Westminster Abbey. She wrote 'Philosophical Fancies'; a collection of poems, 'The Pastime and Recreation of the Queen of Faiiries'; 'Philosophical Letter' (1654); an 'Autobiography'; and a 'Memoir' of her husband. Selections of her works have been edited by Lower (in Smith's 'Library of Old Authors,' (London 1872); by Jenkins (London 1872); by C. H. Firth (London 1886). Consult Goss, E., 'Seventeenth Century Studies' (1893).

CAVENDISH, Sir Thomas, English navigator: b. Trimley Saint Martin, Suffolk, about 1555; d. at sea off Ascension Island 1592. Having consumed his property by his early extravagances, he collected three small vessels for the purpose of making a predatory voyage to the Spanish colonies. He sailed from Plymouth in 1586, took and destroyed many vessels, ravaged the coasts of Chile, Peru and New Spain and returned by the Cape of Good Hope, having circumnavigated the globe in two years and 49 days, the shortest period in which it had been done. For this exploit he was knighted by the Queen. In 1591 he set sail on a similar expedition, in which his principal success was the capture of the town of Santos, in Brazil. Accounts of his voyages are to be found in Hakluyt.

CAVENDISH, William, Duke of Newcastle, English general: b. 1592; d. 25 Dec. 1676. James I made him knight of the Bath in 1610 and in 1620 raised him to the peerage as Viscount Mansfield. In 1628 he became Earl of Newcastle by Charles 1 and later became the tutor of Charles' son, afterwards Charles II. On the approach of hostilities between the
Crown and Parliament he embraced the royal cause, and was invested with a commission constituting him general of all His Majesty's forces raised north of the Trent, with very ample powers. Through great exertions, and the expenditure of large sums from his private fortune, he levied a considerable army, with which, for some time, he maintained the King's cause in the north. In military matters he depended chiefly on his principal officers, it is said, but the numerous successes obtained by him render this unlikely. In 1634 he obtained a complete victory over Lord Fairfax on Adwalton Moor, and recovered all Yorkshire except Hull; but next year on the arrival of the Scottish army and its junction with the Parliamentary forces, threw himself into York. Having been relieved by Prince Rupert, he was present at the battle of Marston Moor next day, after which he left the kingdom. His term of exile was chiefly spent in Antwerp, where he was for a long time so straitened in circumstances that he had on occasion to pawn his wife's jewels. He returned after an absence of 18 years, and was rewarded for his services and sufferings with the dignity of Duke of Newcastle. His works include 'La methode et revelion de lever de dresser les chevaux' (Antwerp 1657), 'A New Method and Extraordinary Invention to Dress Horses and Work Them According to Nature' (1667); some comedies of no merit, and several worthless poems. Consult 'Life of the Duke of Newcastle' by Margaret Lucas, his second wife (London 1886). Pepys ridicules this work in his 'Diary.'

CAVENISH, William, English statesman: b. 25 Jan. 1640; d. 18 Aug. 1707. He was the son of William, 3d Earl of Devonshire, and the brother of the Duke of Devonshire. In 1667 began that opposition to the arbitrary measures of the ministers of Charles II which caused him to be regarded as one of the most determined friends of the liberties of his country. Intimately connected with Lord Russell, he joined him in his efforts for the security of free government and the Protestant religion. In 1684 he succeeded to his father's title. He took an active part in promoting the revolution, and was one of the first who declared for the Prince of Orange.

CAVENISH, tobacco which has been softened and pressed into quadrangular cakes and often sweetened with syrup and molasses, for chewing, so called after Thomas Cavendish, the Elizabethan circumnavigator. It is also called negro-head.

CAVENISH EXPERIMENT. See GRAVITATION.

CAVERYPAUk, India, a town of Hindustan, in the North Arcot division of Madras Presidency, 57 miles west-southwest of Madras. It is mainly built; and the adjoining fort, at one time a place of some strength, is now in ruins. A victory was gained here by the British under Clive over the French and their allies in 1752. Near the town is an immense artificial pond, eight miles long by three miles broad, by means of which a large tract of country is irrigated. It is perhaps the finest work of the kind in South India. Pop. 7,000.

CAVIANA, ká-ve-a'ná, Brazil, an island 35 miles long and 20 miles wide. It lies in the north mouth of the Amazon, under the equator; is level, fertile and well stocked with cattle. The small town of Roberdello is on its southeastern side and is almost exactly under the equator.

CAVIARE, or CAVIAR, ká-ví-ár', a table delicacy prepared from the roe of the sturgeon, especially in Russia. This is made in great quantities in Astrakhan, where the fish are caught in great numbers. Lately the industry has been extended in the western part of the United States. The process is as follows: The ovaries are first removed from the fish and beaten to loosen the eggs, which are then separated from the muscular tissues by being pressed through a sieve and washed in vinegar. Salt is rubbed in by hand, and the roe is put into a cloth and pressed to remove the liquor, after which it is packed in small kegs for market. The quality of the result depends on the care taken in clearing and drying it. The best is prepared by granulating the roe in linen sacks, which are laid in the brine and then hung up to dry in the sun.

CAVITE, ká-vé'tá, Philippines, province in the southwestern part of the island of Luzon, bounded on the north and northeast by Manila Bay, on the north and northeast by the province of Manila, and on the south by Batangas; area, 510 square miles, with the dependent islands, 610 square miles. In the south and southwest the province is mountainous; in the northwest there is a gradual elevation, forming a fertile plateau. The chief products are coffee, sugar, fruits and rice (in the lowland regions). In the towns of the interior, hemp and cotton cloth and sugar are manufactured; in the coast towns the chief industries are salt manufacture and fishing. There is export trade in all these products. There is communication with Manila by water and good roads throughout the province, connecting the coast with the interior. The occupation of Cavite by United States troops was the first event of importance in the Philippines after the naval battle in Manila Bay, 1 May 1898. The government of the province was established under the provincial government act of 6 Feb. 1901; and later several of the dependent islands were added to the territory in Luzon. Pop. 134,799.

CAVITE, Philippines, town and capital of the province of Cavite, on the eastern shore of Manila Bay. A tongue of land about one and a quarter miles long, projecting due east, separates waters of Cañacao Bay on the north and Bacooc Bay, inner harbor of Cavite, on the south. On this projection are situated fortifications and arsenal. During the Spanish administration Cavite was one of the principal strongholds in the archipelago; and since the Spanish-American War has been made even stronger. The town is walled, and all the buildings are of stone; it has a parochial church, two convents and a hospital. It has also several manufacturing industries, and is well equipped for building and repairing vessels. The Spanish fleet had the islands of Cavite when attacked by Admiral Dewey on 1 May 1898. The town is the naval headquarters of the United States in the Philippines. Pop. 4,494.
CAVO RELIEVO, Հայրենսայ արարեցի (եվր.՝ Հայրենսայ, արարեցի) Հայաստանի պատմական տարածքում գտնվող եղբայրական տարածք:

CAVO RELIEVO, ká-vó-ré-lý-vó, Sculpture in; called also COELANAGLYPHIC and CONCAVO-CONVEX SCULPTURE, a system of relief in which the figures do not rise above the general surface of the material on which the carving is done. It may be looked upon as sculpture in relief, of which the background has not been cleared away in the usual manner. Again, it may be considered as sculpture of which the bounding line has been marked by a groove, generally wedge-shaped, which is carried up to the slope of one side being left as the boundary of the pattern or design, while the other slope disappears in the general rounding of the figures. This sculpture, in architectural art, is almost confined to the Egyptian buildings of times before the Roman domination; but in minor decorative arts the Orientals do beautiful work in this way.

CAVOUR, ká-voor, Camillo Benso, Count di, Italian statesman: b. Turin, 10 Aug. 1810; d. 28 Mar. 1861, the son of the Marchese Benso di Cavour and his mother was the daughter of Count de Sellon of Geneva. He was educated in the military academy at Turin, where he graduated in 1836 with highest standing in his class. He had shown special aptitude in mathematics, a love for history and great facility for languages. After completing his studies he made a journey to England, where he acquainted himself with the principles and working of the constitution. Finding military life uncongenial, he resigned his commission in 1831, and assumed the management of his father's estates at Leri (Piedmont), which he made one of the model agricultural properties of the country. In 1842 he returned to Turin, where shortly afterward he published in the 'Bibliothèque Universelle' of Geneva his 'Considerations on the Present State and Future Prospects of Ireland,' which were subsequently translated into English. With Count Balbo and others he established in 1847 the journal of the 'Risorgimento,' which he devoted to the same cause of reform, independence and national unity. It was not, however, till after the battle of Novara that he entered that political arena in which his name since become so famous. He became a member of the Sardinian Chamber of Deputies in 1849, and the following year succeeded Santa Rosa as Minister of Commerce and Agriculture. In this office he set himself strenuously to promote the internal prosperity of the country by the establishment of railways and an improved system of postal communications. A new organization was given to the military and naval forces; and the monasteries were, with certain exceptions, suppressed.

His aggressive national policy made Cavour very prominent and, in November 1852 he became Premier, Minister of Finance and President of the Council and, not long afterward, gave a signal proof of his statesmanship by the part which he took in cementing an alliance with Great Britain and France, and more especially by the strong pressure exerted against the aggressions of Russia. The prestige thus gained to the arms of Sardinia was no less important than that acquired by her liberal and reforming policy in civil matters. The attitude, however, thus taken by Sardinia could not fail to prove extremely offensive to the neighboring power of Austria to whose arbitrary and repressive measures the government of Victor Emmanuel displayed itself as a standing reproof, and whose supremacy in Italy was eminently jeopardized by the aspirations of Sardinia. A collision, therefore, was inevitable, resulting in the campaign of 1859. This had been foreseen by Cavour who had made a secret agreement with the French Emperor Napoleon whom France was to continue the aid of Italy in case of need (July 1858). The immediate connection formed at that time with France, who lent her powerful assistance in the prosecution of the war, was mainly due to the agency of Cavour, who was accused, on this occasion, of having purchased the assistance of Louis Napoleon by unduly countenancing his ambitious projects. Napoleon secretly signed a treaty of peace with Austria thus deserting Italy before the close of the war; and Cavour, broken-hearted, retired to private life; but he was recalled to the head of the government in 1860. On 11 Oct. 1860 he secured the passage of a bill by the Piedmontese Parliament authorizing the government to incorporate in one union, such provinces of southern Italy as should express their desire therefor by a plebiscite. This had united all Italy, except Venetia and Rome, in 1861.

The marriage of Victor Emmanuel's daughter, the Princess Clotilde, with Prince Napoleon, was consummated in the early part of 1859, and the conclusion of the same year witnessed the cession of Nice and Savoy to France. In bringing about both of these results Cavour took a leading part. In 1860 Garibaldi's expedition to Sicily took place; but toward this and the subsequent movements of the Italian liberator, Count Cavour manifested an apparent coldness, which diminished somewhat his estimation in the minds of the more zealous Italian patriots. Consult Romilly, 'Reminiscences of the Life of Cavour' (1863); Dicey, 'Cavour: a Memoir'; Bianchi, 'La politique de Cavour' (1885); 'Lives' by Massari (1873); Marzorati (1877); Martiniengo-Cesar-escio (1897); Thayer, 'The Life and Times of Cavour' (Cambridge 1911); Ormsby-Gore, 'Cavour and the Making of Modern Italy' (New York 1914).

CAVY, ká-ví, a small rodent of the family Caviidae, related to the paca and agouti, and characterized by its stout build, short legs, small ears, pink eyes, and total absence of a tail. Cavies feed upon roots and vegetable fare, and are widely distributed throughout the plains and unforested highlands of South America. The only domesticated and familiar species is the much modified guinea-pig (Cavia porcellus), which is about eight inches long, and owing to its harmlessness is much kept as a pet by children. The largest species of cavy (Dolichotis patagonica), wrongly called "agouti," is scantily distributed throughout the plains of Argentina. It is rusty red in color, and about the size of a hare, standing on terrier-like legs. The "thieves" power against Russia.

Cutler's cavy (C. cutleri), are common in the Plata Valley and are uniformly colored with grayish-brown or black. Other species are found in Brazil and Bolivia. Cavies of several species were abundant in the Miocene and Pleistocene.
periods in South America, as is shown by numerous free-s; these extinct forms differed little from the modern cavius. Cavies live in burrows of their own digging, and breed twice a year, the number of young varying with the climate. The young are brought forth in a very advanced state of development. Their eyes are open and they are capable of running by the side of their mother in a few hours time. In less than a fortnight they are quite able to care for themselves. Consult Hudson, 'Naturalist in La Plata'; and Lydekker, 'Royal Natural History.'

CAWDOR, kō’dar, Scotland, village in Nairnshire, five and one-half miles southwest of Nairn. Cawdor Castle, near by, the seat of the Earl of Cawdor, was founded in 1454, but is one of the three places which tradition has assigned as the scene of King Duncan's murder by Macbeth in 1040. A series of papers from the charter-room at Cawdor was edited (1859) by Cosmos Innes under the title of 'The Book of the Thanes of Cawdor.' Pop. 847.

CAWDOR, Thane of, in Shakespeare's 'Macbeth,' a character who does not appear upon stage. On account of his alliance with the Northerners he is condemned to death by Duncan, who calls him 'that most disloyal traitor.' His title is given to Macbeth, in accordance with the prophecy of the witches. In describing his death it is thought that Shakespeare had reference to the execution of the Earl of Essex.

CAWEIN, kaw’én, Madison Julius, American poet; b. Louisville, Ky., 23 March 1865; d. Louisville, Ky., 8 Dec. 1914. His verse is often exceedingly musical and displays great command of metres. Its defects are over-ornamentation, and a too profuse employment of adjectives, but the note which he strikes is distinctive and pleasing. He is at his best in his purely Kentuckian poems. His works include 'Bloom of the Berry' (1887); 'The Triumph of Spring' (1888); 'Accident of Gain' (1889); 'Lyrics and Idyls' (1890); 'Days and Dreams' (1891); 'Moods and Memories' (1892); 'Intimations of the Beautiful' (1894); 'Poems of Nature and Love' (1895); 'Red Leaves and Rose' (1895); 'Undertones' (1895); 'The Garden of Dreams' (1896); 'Shapes and Shadows' (1896); 'Idyllic Monologues' (1896); 'Myth and Romance' (1899); 'One Day and Another' (1901); 'Weeds by the Wall' (1902); 'A Voice on the Wind' (1902); 'Kentucky Poems,' with introduction by Edmund Gosse (1902); 'The Vale of Temple' (1905); 'Nature-Notes and Impressions' (5 vols., 1907); 'An Ode in Commemoration of the Founding of the Massachusetts Bay Colony' (1908); 'New Poems' (1909); 'The Giant and the Star' (1909); 'The Shadow Garden and Other Plays' (1910); 'Poems,' with foreword by William Dean Howells (1911); 'The Republic' (1913); 'Minions of the Moon' (1913); 'The Poet and Nature and the Morning Road' (1914); 'The Cup of Comus' (1915).

CAWNPORE, kōn-pór, or CAWNPUR, kōn-poor', India, capital city of the district of the same name, in the Northwest Provinces, on the right bank of the Ganges, which is here about a mile wide, 130 miles northwest from Allahabad. It is a modern town with nothing specially noteworthy about it as regards site or buildings. There are several churches, a theatre, various military and other offices, high school, club, etc. It manufactures leather and cotton goods, has a large trade and is an important railway centre. In 1857 the native regiments stationed here mutinied and marched off, placing themselves under the command of the Rajah of Bithur, the notorious Nana Sahib. General Wheeler, the commander of the European forces, defended his position for some days with great gallantry, but, pressed by famine and loss of men, was at length induced to surrender to the rebels on condition of his party being allowed to quit the place unimpaired. This was agreed to; but after the European troops, with the women and children, had been embarked in boats on the Ganges, they were treacherously fired on by the rebels; many were killed, and the remainder conveyed back to the city, where the men were massacred and the women and children placed in confinement. The approach of General Havelock to Cawnpore aroused the brutal instincts of the Nana, and he ordered his prisoners to be slaughtered, and their bodies to be thrown into a well. The following day he was obliged, by the victorious progress of Havelock, to retreat to Bithur. A memorial has since been erected over the well in the form of an angel with palm branches, and fine public gardens, covering a acre, now surround the spot. Pop. 178,557. Consult Trevelyan, 'Cawnpore' (London 1865).

CAXAMARCA. See CAJAMARCA.

CAXIAS, kā-shē’aς, the name of two places in Brazil: (1) A town in the state of Maranhão, on the navigable Itapicuru, 190 miles from its mouth, with an active trade in cotton,attle and rice, the river being navigable. It is the birthplace of the poet, Luis Gonçalvez Dias. Pop. 10,000. (2) An Italian agricultural colony in the Brazilian state of Rio Grande do Sul, founded in 1875. Pop. 13,680.

CAXTON, William, first English printer; b. Kent about 1422; d. London, 14 July 1476. In 1438 he was bound apprentice to Robert Place, printer in London, and soon after his master's death (1441) he went to Bruges, where, in 1446, he went into business on his own account. About 1463 he was appointed 'governor' at Bruges for the English merchants settled in the Low Countries, a post in which he continued for some years. About 1471 Caxton entered the service of Margaret, Duchess of Burgundy, sister of Edward IV. He had already begun a translation of the popular romance entitled 'Le recueil des histoires de Troye,' and this he finished at Cologne in 1471. In order to meet the demand for the book he learned the art of printing, probably at Cologne, and his 'Recuyell of the Historie of Troye,' the first English printed book, appeared about 1474. Caxton is supposed, from the press of Colard Mansion at Bruges. His 'Game and Playe of the Chessse,' also a translation from the French, was probably a production of the same press in 1475, and is the second English book printed. Leaving Bruges in 1476, returned to England, and in 1477 had a press at Westminster Abbey, where he printed the 'Diccts and Sayings of the Phi-
losophers,' the first typographical work executed in England. Caxton continued to exercise his art for about 14 years, during which time he produced nearly 80 works, many of them translated by himself from the French, and one of them — 'Reynard the Fox' — from the Dutch. He was patronized by Edward IV, Richard III and Henry VII; and he was on intimate terms with Earl Rivers, the Earl of Worcester and others of the nobility, the two noblemen named having even translated works for his press. He was buried in the church of Saint Margaret's Westminster. Besides the books already mentioned, Caxton printed Chaucer's 'Canterbury Tales'; 'Troylus and Creside'; 'Book of Fame,' and translation of Boethius; Gower's 'Confessio Amantis'; works by Lydgate; Malory's 'King Arthur'; 'The Golden Legend'; 'The Fables of Æsop', etc. His books have no title pages, but are frequently provided with prefaces and colophons. His type are in the Gothic character, and copied so closely from the handwriting of his time that many of his books have been mistaken for manuscript. In some no punctuation is used; in others the full point and comma only; commas are represented by a long or short upright line. Copies of some of his books now bring extraordinary prices when sold. The standard 'Life of Caxton' is that by W. Blades (1861-63). Consult also Knight, 'The Old Printer and the Modern Press' (London 1861). Blades, 'A Catalogue of Books Printed by or Ascribed to William Caxton' (London 1865); 'Biography and Typography of Caxton' (London 1882); 'Cambridge History of English Literature' (Cambridge and New York 1907-13, in Vol. II); and the publications of the Caxton Club.

CAXTONS, The, a novel by Edward Bulwer, Lord Lytton, published in 1850 (3 vols., octavo). 'The Caxtons' was not only instantly popular in England, but 35,000 copies were sold in America within three years after its publication. Before he had finished it Edward Bulwer written with so light a touch and so gentle a humor, and this novel has been called the most brilliant and attractive of his productions. His gentle satire of certain phases of political life was founded, doubtless, on actual experience.

CAYAMBE-URCU, ká-yám-bá-oor'koo, or CAYAMBE, a volcanic peak of the Colombian Andes, lying directly under the equator in Ecuador. It rises in the shape of a beautiful and regular cone to a height of 19,187 feet. Its top is crowned with perpetual snow, and its geographical position and great elevation render it one of the most remarkable mountains of the world.

CAYENNE, ká-yên' or kl-ên', French Guiana, a city and capital of the colony, situated in lat. 5° 59' N., long. 59° 20' W. Six French expeditions were sent out to Cayenne and other parts of Guiana between 1604 and 1652. The Dutch occupied it in 1654, but were obliged to surrender possession to a new French expedition. After the Treaty of Breda in 1667 the Dutch, to prevent further occupation of the country by the French, and were attacked there by the French in 1676. The French settlement was permanently established at the beginning of the 18th century. It was until within recent years a French penal settlement. The climate of the capital, which is built on an island east of the mouth of the Cayenne River, is rendered exceedingly unhealthy by the low and swampy character of a part of the neighboring coast. The harbor is shallow, and the products of the country — gold, sugar, molasses, rum, coffee, hides, spices, cocoa, etc. — are shipped in considerable quantities each year. Pop. (1911) 13,527. See GUIANA.

CAYENNE PEPPER. See CAPSICUM.

CAYES, ká, Lee. See AUS CAYES.

CAYEY, ki-a', P. R., town 35 miles south of San Juan, 2,300 feet above sea-level. It is a favorite summer resort owing to its cool climate and excellent sanitation. It contains old barracks dating from the Spanish colonial period, a hospital, church and schools. Tobacco growing and allied industries, including the manufacture of cigars, are its principal industries. The climate of tobacco grown in the neighborhood is the best in Porto Rico. Pop. 5,000.

CAYLEY, ká'il, Arthur, English mathematician: b. Richmond, Surrey, 16 Aug. 1821; d. London, 26 Jan. 1895. He received his early education at Blackheath and King's College, London, passing subsequently to Trinity College, Cambridge. Called to the bar in 1849, he practised for some years as a conveyancer, but in 1863 was appointed first Sadlerian professor of pure mathematics at Cambridge. Trinity College in 1875 accorded him the rare honor of electing him a foundation fellow. He received many distinctions from universities and learned societies both at home and abroad, and in 1883 he presided over the meeting of the British Association at Southport. He seldom identified himself with movements outside his own immediate work, but took a prominent part in the agitation for the higher education of women, which resulted in the foundation of Newnham College. As a mathematician he was characterized by the wide scope and originality of his work. His chief memoirs deal with differential equations, elliptic functions and determinants. He discovered the higher curve named for him, and the principal proposition of matrices known as Cayley's Theorem. His 'Elementary Treatise on Elliptic Functions' appeared in 1876, and 'Single and Double Theta Functions' in 1882. After his death in 1889, a collected edition of his papers began to be issued, extending over 13 volumes. Numerous memoirs were published in the Cambridge Mathematical Journal. In 1882 he lectured in Johns Hopkins University, Baltimore.

CAYLUS, ká-lús, Anne Claude Philippe de TUBIÈRES, COUNT OF, French archaeologist: b. Paris, 31 Oct. 1692; d. there, 5 Sept. 1765. He was a son of the Marquise de Caylus (q.v.), and after having served in the army during the war of the Spanish succession, he left the service in 1715; accompanied Bonac on his embassy to Constantinople the following year, and visited Greece, Troy, Ephesus, Byzantium and Adrianople. In 1717 he returned to Paris, and began the arrangement of his extensive collections. He wrote a book on Egyptian, Etruscan, Roman and Gallic antiquities, with numerous plates. He was a member of the Academy of Painting and of the Academy of Inscriptions, and divided his labors between them. He made a chemical examina-
tion of the ancient method of encaustic painting, investigated the mode of painting on marble, the art of hardening copper, the mode by which the Egyptians raised great weights, the mummies, painting on wax and many other subjects. His love of elegance and estedness were united in his character, with occasional traits of dogmatism. He has left numerous works, tales as well as antiquarian researches. Among the latter is his 'Recueil d'anécèdes égyptiennes' (1752-57, 7 vols). Caylus was also an industrious and skilful engraver, and produced a collection of more than 200 engravings, after drawings in the royal cabinet, and a great number of heads, after the first masters. On this subject he wrote 'Nouveaux sujets de peinture et de sculpture' (1755) and 'Tableaux tirés de l'Illade, de l'Odysée et de l'Énéide' (1757). His stories were collected under the title of 'Œuvres banales complètes' (Amsterdam 1787). A number of these were translated into English under the title 'Oriental Tales' in Gueulette's 'Chinese Tales' (1817). Consult Rocheblave, 'Essai sur le comte de Caylus' (Paris 1889); Nisard's ed. of the 'Correspondance du comte de Caylus avec le père Paccardi' (1877); *Notice* of Uzanne in his 'Facéties' (1879).

CAYLUS, Marthe Marguerite de Villette, MARQUISE DE, French writer of memoirs: b. Poitou 1673; d. Paris (?), 15 April 1729. Originally of the Protestant family of D'Aubigné, she was converted to the Roman Catholic faith by her aunt, Madame Maintenon. Long an ornament of the brilliant court of Louis XIV, she passed her declining years in dictating 'My Recollections,' in which a valuable insight into the life of Louis XIV is afforded, through the medium of a singularly happy style. The work was edited first by Voltaire (1770) and by Racine (1881). Racine addressed the prologue to his tragedy of 'Esther' to her.

CAYMAN, kä-män, or CAIMAN, kä'ae-män, any of the five species of alligators inhabiting the fresh waters of Central and South America. The caimans are distinguished from other alligators in having an armor of overlapping bony scutes protecting the belly, as well as an armor of bony plates on the back. The black caiman (Caiman niger) of tropical South America east of the Andes is the largest species, reaching a length of 13 feet. In some of the rivers of South America caimans are found in vast numbers and are said to be extremely voracious. Their habits are the same as those of the common alligator (q.v.). See JACARÉ.

CAYMAN ISLANDS, a group of three islands in the Caribbean Sea attached to Jamaica. The Caymans, which is 17 miles long and 4 to 7 miles broad. Pop. 1911, 4,128. Its capital is Georgetown; pop. 1911, 1,446. (2) LITTLE CAYMAN, 9 miles long and 1½ miles broad; pop. 1911, 136. (3) CAYMAN BRAC, 10 miles long and 1½ miles broad; pop. 1911, 1,300. Education in the islands is backward, the annual expenditure being very small. They export green turtle, turtle shell, hides, cattle, ponies, cocoanuts. The climate is very healthful. A large proportion of the area is forested. The administration is administered by a commissioner and 14 justices of the peace appointed by the governor of Jamaica.

CAYUGA, kä-yoo'gä, LAKE, a lake in the State of New York, on the boundary of Cayuga and Seneca counties, and extending south into Tompkins County. 43 miles long and from 1 to 3½ miles wide. It is 381 feet above tidewater. It empties into Lake Ontario through the Cayuga and Seneca and Oswego rivers. At the north end the lake is shallow, but in other places it reaches a depth of 400 feet. It is navigable for 30 miles. It is much frequented by pleasure parties. The city of Ithaca stands at the extremity of the lake. Aurora is situated near the middle of the shore and Cayuga near the north end. It is connected by a canal with Seneca Lake.

CAYUGAS (*swamp-dwellers,* possibly in reference to their cranberry swamps) a tribe of North American Indians, forming the smallest of the original Five Nations of the Iroquois, and according to Onondaga tradition, the last to join the confederacy; whence it was called 'The Youngest Brother.' The tribe was not inferior in energy and original genius, however; several of the chiefs were noted for their superior ability, as Karistagea, or Steeltrap; and Tahgahjute, or 'Logan,' the son of one of its sachems. The latter will be ever remembered, not only for the pathetic speech attributed to him, but for his high personal qualities. Nor were the Cayugas inferior in fighting prowess; in one of their Virginia campaigns they seem to have destroyed the tribe of Tuteloes, and incorporated with their own tribe the remnant who were not slain. They were friendly to the whites, however, and bore a good reputation. They were located along the Cayuga Lake in central New York, and in the valley of its outlet, the Seneca River. At the outbreak of the Revolution, they joined the Mohawks and Senecas in alliance with the British against the Americans, and shared in the devastation of the property of the patriots during Sullivan's campaign; the most of them settled in Canada with the other Iroquois, 200 remaining in New York, apparently around Niagara. In 1789 they made their first formal cession of territory to the whites, confirming it by a treaty at Fort Stanwix in 1790; in 1795, by a treaty at Cayuga Bridge, they ceded their great reserve in the lake basin and the river valley, retaining only one of four miles square. For these releases they received large money annuities, which they used largely for liquor. In 1806 all the remainder left the reservation and emigrated westward or northward; some joining their brethren in Canada, some going to Sandusky, Ohio, others settling among the Senecas near Buffalo. There are at present about 1,300 in all, the bulk of them at the Six Nations on Grand River, Ontario, some with the Oneidas in Wisconsin, about 170 with the Senecas in New York State and others with the Senecas in Indian Territory.

CAYUSE, kä-yeooz', CAULOUX, or WILLEPTOOG, a tribe of North American Indians who formerly inhabited the region between the Des Chutes River and the Blue Mountains, Oregon, and also parts of Washington, south of the Yakima River. In 1847, their number was greatly depleted by a smallpox epidemic. This resulted in the death of superior of the Wáalthú' missionaries who were thought by the Indians to have introduced the disease. They now number some 300, mostly of impure
extraction, from intermarriage with other races. Their language, which is of Waiatl-puan stock, is spoken by a very few of their number. The pony of the northwest United States takes its name from these Indians, who were doubtless responsible for its introduction among the tribes of that section.

CAYVAN, Georgia. American actress: b. Bath, Me., 1858; d. 19 Nov. 1906. She went on the stage early in life and won note as Dolly Dutton in 'Hazel Kirke.' She was afterward with A. M. Palmer and Daniel Frohman. She became leading lady of the Lyceum Theatre Stock Company in 1897, retiring from the stage soon afterward. Consult Clapp and Edgett, 'Players of the Present' (Dunlap Society, New York 1899); and Edmunds, 'Famous American Actors of To-Day' (edited by McKay and Wingen. New York 1896).

CAYZER, Sir Charles William (Charles Whitworth Wynne), English shipowner and poet: b. Bombay, 19 July 1869. He was educated at Rugby and Christ Church, Oxford, where he received the degree of M.A. He became partner in the firm of Cazyer, Irvine and Company, and director of the Clan Line Steamers. He retired in 1911. He has published 'Ad Astra' (1900), a very extensively advertised volume; 'Songs and Lyrics' (1900); 'King David' (1902); 'Undine' (1908); 'By the Way of the Gate' (1911); 'Donna Marina' (1905).

CAZAL, Manoel Ayres de, kā-zāl', Portuguese historian: b. 1754; d. about 1821. He was for a long period prior at Crato, Goiás, Brazil, devoting himself to historical and geographical research, publishing in 1817 'Corografia Brasileira, ou relação históricog-geográfica do reino do Brasil' (2 vols, Rio de Janeiro 1817; 2d ed., 1845). It was prepared under the auspices of King John VI, and it is distinguished for its exactitude, and is the first circumstantial report on the interior provinces of South America. The name of the author appears on the title page as Um Presbytero secular de grão Priorado de Crato. The work earned him the title of 'Father of Brazilian Geography' Consult Pereira da Silva, 'Plurinco Brasileiro' (1847).

CAZALES, kā-zāl'is, Jacques Antoine Marie de, French politician: b. Grenade, Haute-Garonne, France, 1 Feb. 1758; d. Engalim, Gers, France, 24 Nov. 1805. The son of a counsellor of the Toulouse Parliament, he served for some time in Jarnac's regiment of dragoons. Being chosen in 1789 a deputy of the noblesse to the States-General, he became one of the most able and eloquent opponents of the Revolution, but was treated with ingratitude by the Royalists, although he had labored and suffered much in their cause, and barely escaped being put to death. Having traveled abroad during the reign of terror, he returned to France in 1803. Napoleon conferred on him, although he had refused to enter his service, the cross of the Legion of Honor. His 'Discours et opinions' and his 'Défense de Louis XVI' were published in 1821. Consult Chateaubriand's introduction to his 'Discours'; and Aulard, 'Les Orateurs de la Constituante' (2d ed., 1905).

CAZALLA DE LA SIERRA, kā-thâl'lyâ, Spain, a town in the province of Seville, and

53 miles by rail northeast of the city of Seville, on a declivity of the Sierra Morena. Its streets are clean, paved and well arranged; and it has two squares, in the principal of which are the ancient church and town-hall. The mountains in the vicinity are rich in minerals. Pop. 8,044.

CAZEMBE, kā-zēm'b, KAZEMBE, or CAZEMBE'S DOMINION. A region formerly constituting a large and well-ordered negro state lying south and southwest of Lake Tanganyika, and taking its name from the title of the sovereign. The country forms a kind of basin, bounded on the east by a plateau which rises to the height of from 3,000 to 4,000 feet; on the west, also, it is bounded by a series of heights. On the south it has the lofty watershed which separates its streams from those of the Zambesi river system. Its principal stream is the Chambesi, which flows westward into Lake Bangweolo, then northward, under the name of the Luapula, into Lake Moero. The ruler, or muata, used to be feared as a great magician; he had over 600 wives, and maintained a well-armed body of troopers. Speaking at one time, it is said, 20,000. His dominions were divided into districts, each of which had a governor of its own. These governors and other men of rank formed a body of privileged nobility; all the rest of the inhabitants, farmers, artisans, etc., were looked upon as slaves of the ruler. The population consisted of a ruling race, the Campolos, who had invaded and conquered the country, and the Missiras, the original inhabitants. It was only the Campolos that received official posts, and the Campololo language was the one spoken at court. The people were industrious agriculturists, growing crops of mandioc, maize, sorghum, etc. They manufactured coarse cloths, cords, nets, lines, etc., from cotton and the fibres of certain plants; made weapons and implements of iron; also earthenware, wooden vessels, etc. Cazembe was visited by Lacerda in 1799, and by other Portuguese explorers in 1831. Dr. Livingstone, in 1867, stayed 40 days at the capital, which he found to consist of a number of huts dotted over a large area, and having probably not more than a thousand inhabitants. The Cazembe at this time was a usurper, whose cruelties had done much to depopulate the country, and it was doubtful if he could bring a handful of warriors into the field. The British half of the country is now included in Rhodesia, and Cazembe is its chief town. Consult 'The Lands of the Cazembe' published by the Royal Geographical Society (1873).

CAZIN, kā-zîn', Jean Charles, French artist: b. Samer, Pas-de-Calais, 1841; d. 1901. He studied under Le Coq de Boisbaudran. In 1868 he was appointed director of the Ecole des Beaux Arts and conservator of the museum at Tours. He went to England in 1871 where he devoted himself to designing ceramics for the Fulham pottery. It was not until 1876 that he exhibited pictures. At this time his 'Le Chantier' appeared, which was generously received. Next came the 'Fuite en Egypte' (1877); 'Le voyage de Toyhe' (1878); 'Le départ'; 'L'Art', for which he was muchly mentioned. By far the best of his works is the 'Agar et Ismaël', in which he proved himself a master of the landscape-religious picture. For 'La Terre,' an Adam and Eve
theme, he obtained a medal of the first class. Other works are 'Souvenir de fête'; 'Poste de secours'; 'Judith' (1883); and 'La Journée faite,' in which he departs from the religious theme to portray a scene of contemporary reality. He is well known as a landscape painter. His figures are always subservient to the scene. But he has a power of idealization which gives to truth the most delicate air of poetry, a tender melancholy and sentiment. A wistful, hushed, sympathetic note pervades his works. He attempted to revive the art of encaustic painting. He became a member of the Legion of Honor. He also completed the decorations on the Puvis de Chavannes in the Pantheon (1898). Consult his biography by Bénédite (Paris 1901); and Marcel, 'La Peinture française au XIXe siècle' (Paris 1905).

CAZORLA, ká-thór'rā, Spain, a town in Andalusia and 41 miles east of the city of Jaen. It rises 1,050 feet on the slopes of the Sierra de Cazorla, and is well built, though much less important and populous than in the time of the Moors, during whose wars it held an important position. It has two castles, both in good preservation. The Sierra de Cazorla is a wooded, ridge round which winds the upper course of the Guadalquivir. Pop. 7,936.

CAZOT, ká-zō, Théodore Joseph Jacques, French politician: b. Alais, 11 Feb. 1821; d. 1912. In 1848 he was active as a Republican in his home department; in 1870 he was appointed general secretary in the ministry of the interior; in 1871 elected to the National Assembly; and in 1875 was made life senator. From 1879-82 he was Minister of Justice and was interested in bringing about a reform in the appointment of judges, but retired without passing the law he desired. In this capacity he was also active in the persecution of the Jesuits and other unauthorized assemblies. In 1883 he was president of the Court of Cassation, resigning in 1884 on account of being implicated in fraudulent dealings.

CAYOTTE, ká-zō, Jacques, French poet: b. Dijon 1720; d. 25 Sept. 1792. His masterpieces are 'Olivier' (1762), a poem of chivalry after the manner of Ariosto; and 'The Devil in Love' (1772), a tale of wonder, still a popular favorite. He had extraordinary skill in versifying, as shown by his addition of a seventh canto to Voltaire's 'Civil War of Geneva' with such perfect imitation of Voltaire's style and manner as to deceive all Paris. He joined the 'Illuminati' about 1775. For his opposition to the Revolution as a Royalist he was guillotined in the Prise of Toulon, Consult De Nerval, 'Illuminés' (Paris 1852).

CAZWINI, kāz-wē'nē, Zacharia Ben Mohammed, Arabian naturalist: b. Cazwin, Persia, 1212; d. 7 April 1283. He was descended from a family of lawyers, who derived their origin from Anas Ben Malek, a companion to portray a scene of contemporary reality. He is well known as a landscape painter. His figures are always subservient to the scene. But he has a power of idealization which gives to truth the most delicate air of poetry, a tender melancholy and sentiment. A wistful, hushed, sympathetic note pervades his works. He attempted to revive the art of encaustic painting. He became a member of the Legion of Honor. He also completed the decorations on the Puvis de Chavannes in the Pantheon (1898). Consult his biography by Bénédite (Paris 1901); and Marcel, 'La Peinture française au XIXe siècle' (Paris 1905).

CAZORLA—CEARÁ

important work is on natural history—'The Wonders of Nature and the Peculiarities of Creation'—of which Ideler, professor in the University of Berlin, published the chapter on the 'Constellations of the Arabsians,' and of which there are fragments in Bohchart's 'Heizozikon,' in Ouseley's 'Oriental Collections,' and in Wahl's, Jahn's and De Sacy's 'Arabian Chrestomathies.' It was the object of Cazwini, like Pliny, to describe the wonders of nature. His work contains a comprehensive view of all that had been written before him, but in so grand and original a manner that it is of higher value than most of the original works which treat of the same subjects. There is an abridged translation of it in the Persian.

CEAN-BERMUDEZ, thā-an' bēr-moo'-dēth, Juan Agustín, Spanish art historian and painter: b. Gijon, Asturias, 17 Sept. 1749; d. Madrid, 3 Dec. 1829. He devoted himself early to the study of the fine arts, into which he was initiated by Raphael Mengs. After holding a public office at Madrid, he retired to Seville, where he founded an academy of fine arts, and occupied himself with the study of their history. He was elected a member of the royal academies of history and the arts, and published several valuable works connected with his favorite pursuits. His most important book, entitled 'Sumario de las anti-guadas romanas que hayan España,' appeared posthumously in 1832. He published also 'Diccionario histórico de los más ilustres profesores de las bellas artes en España' (1800); 'Descripción artística de Sevilla' (1804); 'Díalogos sobre el arte de la pintura' (1819); 'Noticias de los arquitectos y arquitectura de España' (1829).

CEANOTHUS, a genus of shrubs and small trees of the natural order Rosaceae. There are about 35 species, mostly natives of the Pacific Coast region of North America. They are characterized by serrate or entire simple leaves; small, perfect, white, purplish or blue flowers in showy clusters, which are often panicked; and three-celled drupeaceous fruits, which, on drying, separate into three stones. Many of the species and their hybrids are popular ornamental shrubs, especially in mild regions, their free-blooming habit rendering them specially useful as lawn and hedge, and as specimen, C. americanus, C. occanus and C. fendleri, and some of their hybrids, are hardy in the north, but usually the hybrids must either be protected from frost or stored over winter in a plant-pit or frost-proof cellar. They succeed almost any soil, but do best in light, well-drained loams, especially when exposed to the sun. Propagation is easily effected by seeds, cuttings or layers. C. americanus known as New Jersey tea is the red-rose is common from Canada to the Gulf States. Its leaves are said to be used as a substitute for tea, a use to which they are reported to have been put during the American Revolutionary War.

In medicine ceanothus has not been used to any great extent. Its roots contain from 6 to 10 per cent of tannin, and have been used in domestic medicine as astringents. Owing to the close resemblance of the roots, ceanothus has been used as an adulterant for rhatany.

CEARÁ, sā-ā-rā', Brazil, a state bounded on the north and east by the Atlantic Ocean and the state of Rio Grande do Norte, on the
south by Parahyba and Pernambuco and on the west by Piauhy and Maranhão. Its area is 40,250 square miles, and its population 880,696. The principal town and capital of the state is Fortaleza (q.v.), which is regarded as one of the most beautiful cities of Brazil. A railroad connects Fortaleza with Baturité. The coast regions are sandy and unproductive, the centre is occupied by an elevated plateau, sparsely watered and fit only for pasture. The climate is hot and dry. The principal exports of Ceará are: rubber, cotton, hides, mules, preserved fruits and hammocks. Coffee, sugar, wine of the cashew nut, oranges and wax are also produced. The estimated value of all the exports is about $5,000,000 annually, in which amount the United States shares to the extent of nearly one-third. Ceará is divided into 27 comarcas, or counties. The most fertile and populous district is the upper Jaguaripe. Consult Fontenelle, 'The State of Ceará' (1893).

CEARÁ-MIRIM, a city in Brazil, state of Rio Grande do Norte. It is situated on the Ceará-Mirim River and has important manufactures. Pop. 18,000.

CEBALLOS, thâ-bâ'il'yôs, José, Mexican soldier: b. Durango, 15 March 1830; d. 1893. In 1869 he had command of a regiment in the province of Yucatan; while here a portion of his soldiers revolted, but he suppressed the insurrection in three days; he also executed without authority several private citizens who were implicated in the revolt. In 1870 he was made brigadier-general and given command in the western states, where he had charge of the campaign against the bandit chief, Losada. When Lerdo de Tejada became President of Mexico, Ceballos was put in command of the force sent to depose Camerana, the governor of Jalisco. After a severe struggle between the state and government forces, Caballos was successful and became governor, a position which he held till 1876. At that time Tejada was deposed by Diaz; Ceballos joined with Iglesias, but was forced to leave Mexico for a time. He went first to California, then to Guatemala, where he was appointed director of a military school. Though at first plotting a revolution against Diaz he suddenly turned to his support, returned to Mexico, was restored to his rank and made governor of the Federal district. He was a bitter enemy of the press, which he frequently antagonized, and in 1885—86 had a number of students and journalists arrested and imprisoned.

CEBES, of Thebes, Greek philosopher, a disciple and friend of Socrates and of Philo- laeus. He is the reputed author of three dialogues in the Socratic style—the Phry- nichus, the Hebdomie and the Pinax, or 'votive tablet,' a philosophical dialogue representing allegorically the temptations of this life and teaching that true learning can alone make for happiness. In spite of its pure Attic, and its truly Socratic tendency, modern critics now assign the work to the 2d century A.D. It was extremely popular in the Middle Ages, a sort of 'Pilgrim's Progress,' indeed; was translated into all the languages of Europe, as well as Arabic, which latter version, made possible in the 9th century, is our sole record of the close of the dialogue. Modern editions are those of Drosihn (1871); Kraus (1882); Parsons (1887); and Frâchter (Marburg 1893).

CEBIDÆ, sê-bë'-dë, a family of American monkeys, including the howler, saki, sapajou, spider-monkey (q.v.), etc. See also Monkey.

CEBU, thâ-boô' or sé-boô', Philippines, an island lying between Negros and Bohol, north of Mindanao. Its length, from northeast and southwest is 139 miles; width, about 20 miles; area, 1,668 square miles. It has a mountain system consisting of a chain running the length of the island, nearer the east than the west coast. The mountains are not over 2,200 feet high, but their ascent is steep and it is difficult to cross them. There are six passes, the best being the southernmost, from Sibonga to Dumanjug, over which United States army officers constructed a temporary wagon road in the summer of 1900. The chief products are rice, tobacco, sugar and coffee. There are manufactures of hemp and piña cloth, sugar-sacks, cocoanut, wine, sugar, salt and cheese. In 1827 coal was discovered in Cebu, the first found in the Philippines. It is of good grade, adapted to general use. The trade of the town is extensive. Besides the mountain passes there are two main highways, one on the east coast, and one on the west coast, while the port of Cebu has communication with Manila and the islands of the Visayan group. Cebu was first occupied by United States troops in February 1899. Operations against the insurgents resulted in driving them from their position, and capturing a large quantity of material of war. This island, with a few dependent islands, forms the province of Cebu, in which civil government was created under the provincial government act of 1901. At that time several of the cities had organized their municipal governments according to the code of the Philippine commission. Though the province was restored to military government for a time, in 1901 the government was permanently resumed in January 1902. The entire province has about 660,000 inhabitants; the island about 600,000; the capital about 60,000.

CEBU, Philippines, capital of Cebu prov-ince, situated on the east coast of the island of Cebu. The streets are wide and regularly laid out. There is a cathedral in the oldars, and it has also several other churches and an episcopal palace. Cebu is an important port with an extensive trade, being the chief commercial centre of the Visayan group. It is the oldest Spanish settlement in the Philippines. In the "Rizal," a building in front of the Santo Niño Church, is the cross which it is said was planted near the town by Magellan when he took possession of the island. An old fort built by the Spaniards stands within the limits of the town. Pop. about 60,000.

CECCHI, Giambattista, jâm-mà-rë's chë-chë, Italian dramatist: b. Florence, 14 March 1518; d. there, 28 Oct. 1587. He was a lawyer who devoted his leisure hours to writing. He was the rival of Bibbiena, Machiavelli and Ariosto in portraiture of character and in liveliness of dialogue. Of his plays, 95 in number, but few have been printed. These are mainly imitations of Plautus and Terence; the best of them are
CECCO D'ASCOLI — CECILIA

'La Dote'; 'Il Servigiale'; 'La Stava'; 'La Moglie.' He wrote also religious dramas; among them 'L'Esaltazione della Croce' (1580).

CECCO D'ASCOLI, chék'kó dás'kó-lé, properly Francesco degli Stabili, Italian poet; b. Ascoli about 1527; d. Florence, 16 Sept. 1577; a distinguished student of astrology and of demonology. For the expression and defense of certain erroneous opinions he was burned at the stake. His heretical or impious doctrines are contained in a poem, unfinished but of encyclopedic compass; 'Bitumene,' or the Devil. He lived to complete four books. The subject of the first book was astronomy with meteorology; of the second, stellar influence with physiognomy; of the third, minerals; of the fourth, sundry problems, moral and physical. Consult Baddely, W. S. C., 'Charles III also Cecco d'Ascoli, Poet, Astrologer, Physicist' (London 1894).

CECH, tschék, Sva'topulk, Czech writer: b. Ostredek, 21 Feb. 1846. He was editor in succession of several journals, and at the same time practised law. He received his education at winning some celebrity as a writer of stories and short poems, he made a bold flight in 1872 with 'Dreams,' in which he shows great epic power. Besides this he has written several other poems, as 'The Adria,' 'The Storm,' 'Songs of Morning.' He is the most popular of Czech poets. As a novelist he excels in lively wit and rich humor. Among his works of prose fiction may be named: 'Stories Arabeque and Humoresque;' and the amusing 'Candidate for Immortality.' He has written also 'Memories from the Orient' (1885), as well as later volumes. Consult Sumar, J., 'S. Ceche Leben und Werke' (1898).

CECIDOMYIA, sès-i-dō-mi'ya, a genus of two-winged flies, of the family Cecidomyiidae, a group of gnats which cause galls (q.v.). The Hessian fly (see Wheat, Insect Pests) belongs to the group.

CECIL, Evelyn, English politician: b. 1865. He is the eldest son of Lord Eustace Cecil, who is the second surviving son of the 2d Marquess of Salisbury. He acted as private secretary for several years to Lord Salisbury when he was Prime Minister. Since 1900 he has been Unionist member for Aston Manor, and has served with distinction on various parliamentary committees. He is secretary-general of the Order of Saint John of Jerusalem, and was sworn a Privy councillor in 1917, a rank bearing the designation of 'Right Honorable.'

CECIL, Lord Hugh (Richard Heathcote), English politician: b. 1869. He is the fifth son of the 3d Marquess of Salisbury, and brother of Lord Robert (q.v.). Educated at Eton and Oxford, he acted as private secretary to his father and became a prominent figure in the House of Commons as Conservative member for Greenwich, 1895-1905, first as a supporter of Mr. Balfour's Education Act 1908, later as one of the leaders of the Unionist Free Traders in opposition to Mr. Chamberlain's Tariff Reform policy. He was defeated in the Greenwich election 1906, but was returned unopposed for Oxford University in 1910. Like his brother an ardent High Churchman, he is one of the few speakers who can venture on the expression of personal religious feelings before a political audience. During the European War he joined the Royal Flying Corps, and in 1916 was included in the Commission of Inquiry on the Mesopotamia Campaign.

CECIL, Robert, Earl of Salisbury, English statesman, second son of William Cecil, Lord Burleigh (q.v.): b. about 1563; d. Marlborough, Wiltshire, 24 May 1612. Having received the honor of knighthood he went to France as assistant of what was left of the English Ambassador. On the death of Sir Francis Walsingham he succeeded him as principal secretary, and continued to be a confidential Minister of Queen Elizabeth to the end of her reign. He gained the enmity of Lord Essex who publicly declared him traitor. Cecil was exonerated, however, and his position remains secure. Having secretly supported the interests of James I previous to his accession to the crown he was continued in office under the new sovereign and raised to the peerage. In 1603 he was created a baron, in 1606 Viscount Cranbourn and in 1605 Earl of Salisbury. In 1608 he was made Lord High Treasurer, an office which he held till his death.

CECIL, Lord Robert (Edgar Algeron), English lawyer and politician, third son of the 3d Marquess of Salisbury: b. 1864. Educated at Eton and Oxford, he was called to the bar in 1887 and became a Queen's Counsel in 1900. A prominent member of the Conservative (Unionist) party, he had a large parliamentary bar practice before he entered the House of Commons in 1906 to represent East Marylebone. He resigned in 1910 as a protest against the Tariff Reform movement in his party. He stood for Blackburn as a Free Trader, but was defeated; in a by-election he was returned for Hitchin in 1911. Deeply versed in ecclesiastical law, he was appointed, in March 1915, to the office of Official Principal and Judge and Chancellor of the Consistory Court of York and Vicar-General in Spirituals of the Archibishop of York.* On the formation of the Coalition Cabinet in May 1915 he became Parliamentary Under-Secretary for Foreign Affairs, and, in addition, Minister of Blockade for the duration of the war (February 1916).

CECIL, William, Lord Burleigh. See Burleigh.

CECILIA, Saint, Christian virgin and martyr; her day in the Roman calendar is 22 November. Her story as recounted in the 'Breviari Romana,' represents her as a Roman lady of noble birth, a Christian from childhood, and from her early years vowed to virginity. Yet her parents gave her in marriage to a young noble, Valerianus, whom Cecilia persuaded not only to respect her vow, but also to become a Christian; and he, converted, induced also his brother, Tiburtius, and their intimate friend, Maximus, to enter Christ's fold; shortly after these three suffered martyrdom together. Cecilia now, in anticipation of the same fate or the same crown, distributed her possessions among the poor, and this becoming known to the prefect of Rome, he ordered her to be taken to his own mansion and there burned to death in the bath (in balnea). But the virgin, exposed to the flames for a day and a night, was found
unhurt; and after the axe of the headsman had also failed to sever her head from her body, at last the double breath of virginity and martyrdom; this was in the reign of Alexander Severus and in the pontificate of Urban I, about the year 230. Her festival is celebrated on 22 November. Urban erected a church in her house which was called by her name. The church of Saint Cecilia is still one of the most notable churches of Rome, having been again and again repaired or reconstructed. In this account of Saint Cecilia nothing is said of the musical accomplishments of the virgin, but legend makes much of them; hence, Saint Cecilia is the patron saint of music and musicians, and musical societies are very commonly called by her name: Dryden’s fine ode, ‘Alexander’s Feast: a Song for Saint Cecilia’s Day’ is an imperishable monument of the Cecilian legend in English literature. Consult Gueranger, ‘Sainte Cécile et la société romaine’ (Paris 1873). Another Saint Cecilia was born in Africa and suffered martyrdom by starvation under Diocletian. The Roman Catholic Church celebrates her festival on 11 November to enable the faithful to remember that it is probable that the true Cecrops was a hero of the Pelasgian race.

CECROPS, sekrōps, according to Greek tradition, the founder of Athens, and the first king of Attica. He was said to have been an autochthon (sprung from the soil) and was sometimes represented as half man, half dragon. He taught the savage inhabitants religion and morals, made them acquainted with the advantages of social life, and laid the foundation of the future city of Athens, which after him was originally called Cecrops. According to later legend, he was responsible for the formation of a confederacy of 12 cities, the introduction of marriage, burial of the dead, writing and other arts. He is also said to have introduced the art of shipbuilding. He died after a reign of 50 years. By the later Greeks he was represented as having led a colony to Attica from Sais in Egypt about 1400 or 1500 B.C., but the best modern critics do not look upon this event nor on the life of Cecrops at all as historical. There is no doubt that Egypt did have a certain influence on the development of civilization in Greece, but how great this influence was, or in what manner exercised, history does not furnish sufficient data to establish. It is probable that the true Cecrops was a hero of the Pelasgian race.

CEDAR, various cone-bearing evergreen trees and their wood; also several non-coniferous trees. The most widely known are probably the cedar of Lebanon (Cedrus libani), the deodar, or gha tree, of India (C. deodara), and the African or Mount Atlas cedar (C. atlantica). These are large ornamental evergreen trees with wide-spreading branches, which give them a form distinct from most other cone-bearing trees. They are sometimes planted in southern California and the Gulf States, and the last-mentioned species even as far north as Philadelphia, where it can stand the winter in sheltered situations. They are readily propagated by seeds, and thrive in well-drained, loamy soil. From ancient times their odoriferous, light-red wood has been used for fine furniture and interior house-finish. The white gum of the cedar of Lebanon, which oozes from the trunk and branches, was formerly employed in embalming, but the forests of this tree have become so much reduced that the gum, nor the oil made from it are in commerce. The other species are mostly abundant, the deodar in India and the Atlas cedar in northern Africa. Their timber is widely used for fine cabinet work.

The red cedar (Juniperus virginiana) is a well-known very variable tree found from Canada to Florida, and westward to the Great Plains. It attains a height of about 80 feet; has a conical more or less spreading head with upright limbs; evergreen, spiny, pointed leaves and bluish globular fruits covered with bloom. The wood is largely used for fence-posts, lead pencils, etc. The white cedar (Chamaecyparis thyoides) is also a well-known American tree found in wet ground from New Hampshire to Florida. It attains a height of 70 to 80 feet; has erect spreading branches, thin and flat pendulous twigs, fragrant green leaves, and tiny bluish-purple cones covered with bloom. The trees are highly ornamental, and, being hardy, are generally favorites in the North. The wood is especially useful in moist places. The name white cedar is often applied to the arbor
vita \textit{(Thuja occidentalis)}. The yellow cedar \textit{(Chamaecyparis nootkatensis)}, a common tree on the Pacific coast from Oregon to Alaska, is valued, in cabinet work and interior house-finishing, for its light-yellow wood, which takes a high polish. Like its relative mentioned above, it is often planted for ornament. In its home it often exceeds 100 feet in height. The best known non-coniferous trees that are sometimes called cedar are probably \textit{Cedrela odorata} (see Cedar, Barbadoes) and \textit{Cedrela toona}, the Australian cedar. See \textit{Toona; Juniper}.

CEDAR, Barbadoes, SPANISH CEDAR, or MEXICAN CEDAR, a tall tree (\textit{Cedrela odorata}) of the natural order Cerealea. It is a native of the West Indies, where its wood is highly valued for making certain kinds of furniture, cigar-boxes, canoes and shingles. It is also exported for the manufacture of lead pencils. It often attains a height exceeding 75 feet and a great girth. It bears pineate leaves 10 to 20 inches long; pendulous terminal panicles of inconspicuous white flowers, followed by small fruits about half an inch in diameter, containing numerous flat-winged seeds. The bark, leaves and fruits smell like asafoetida, but the wood is pleasantly fragrant. The tree is often planted for its ornamental qualities, especially along avenues. It thrives in southern California and in the Gulf States. Several of its relatives, especially \textit{C. sinensis}, which is hardy as far north as Philadelphia, are also similarly used. See \textit{Toona}.

CEDAR-APPLES, fungous outgrowths upon the under side of cedar trees. They are caused by some species of the parasitic fungus, gymnosporangium, one of the rusts. At the first they appear like warts upon the smaller branches and twigs, becoming chocolate color or brown as autumn advances, and remaining attached and unchallenged until spring, when they enlarge into horn-shaped, jelly-like masses that resemble sponge. At this time they produce their abundant spores which, as the masses become dry, are blown away by the wind and, clinging on apple trees, produce rust on the foliage and other green parts. They will not germinate upon cedar or juniper, but require an alternate host, the apple, to complete their life cycle. For methods of control see \textit{Apple; Fungi}.

CEDAR-BIRD, the common American wax-wing (\textit{Amplexus cedrorum}), a bird found throughout North America, breeding from the latitude of Kentucky northward. In most localities it is only partially migratory. It is a beautiful bird of delicate unobtrusive colors, generally ash-brown with a purple tint on the head, the front of which, like the throat, is black. The tail-feathers are tipped with yellow, and the secondaries have red tips. The head is gracefully crested. The cedar-birds spend most of the time in flocks, which wander according to the supply of food and are noteworthy for the uniformity with which all members alight or rise together. The food consists chiefly of berries when these are to be had, on which account they have received the name of cherry-birds in some sections. Nesting takes place late, when the summer is well advanced, and the rather bulky structure is usually placed in an apple or other orchard tree. The eggs are four to six in number, pale blue and thickly speckled.

CEDAR CREEK, a stream in Shenandoah County, Va., flowing into the north fork of the Shenandoah River.

CEDAR CREEK, Battle of. After the battle of Fisher's Hill, 22 Sept. 1864, General Sheridan followed Early as far as Harrisonburg; his cavalry going as far as Port Republic, Staunton and Waynesboro. He ran into the difficulty of supplying his army so far from its base, and of other operations by which two corps of infantry and a cavalry division of his army were to be sent to the Army of the Potomac, he holding only the lower valley of the Shenandoah, Sheridan, after ordering the destruction of all mills, barns, grain, forage and provisions of all kinds, began to withdraw down the valley on 5 October, and on the 8th recrossed Tom's Brook. His rear had been so persistently followed and harried by the Confederate cavalry divisions of Rosser and Lomax that he ordered Torbert, his cavalry commander, to whip the Confederate cavalry or get whipped. On the morning of the 9th Torbert fell upon Rosser and Lomax, in what is called two-hours' contest routed them, pursuing many miles and capturing over 300 prisoners, 11 guns and 40 wagons. Sheridan then resumed his march, and on the 10th halted on the north bank of Cedar Creek. Wright's 6th corps continued its march to Front Royal, on the way to Washington, where it remained two days, and then marched toward Ashby's Gap, but was recalled to Cedar Creek, where it arrived on the 14th. Early had been reinforced by Kershaw's division and about 600 cavalry, increasing his force to about 18,000 men, and under Lee's order to detain the Union troops in the valley he had followed Sheridan, arriving at Fisher's Hill, six miles from Cedar Creek, on the 15th. On the night of the 15th Sheridan left for Washington to consult with Stanton and Halleck, leaving Gen. H. G. Wright in command of the army. Sheridan's cavalry accompanied him to Front Royal, from which point he intended to push it through Chester Gap to the Virginia Central Railroad at Charlottesville and then on the east of the Blue Ridge, but upon erroneous information that Longstreet was moving to join Early, the raid was abandoned and Torbert moved the cavalry back to Cedar Creek. On the night of the 18th Emory's 19th corps was on the west side of the valley turnpike, on elevated ground overlooking Cedar Creek. Wright's 6th corps in reserve to the right and rear of the 19th, separated from it by Meadow Brook. Merritt's cavalry division was on the right of the infantry, and Custer's division one and one-half miles beyond Merritt's, watching the crossings of Cedar Creek and the roads on the right. Crooks' 8th corps was on the east side of the pike, one of its two divisions (Thorburn's) on a rounded, entrenched hill, one-fourth of a mile in advance of the other, near the junction of the creek and river, and both somewhat in advance of the 19th corps on the right. Two cavalry brigades of Powell's division were far to the left, near Fauquier, and one at Buckton, Stuyvesant's beyond Crooks' left. The Union army numbered about 31,000 men. Reconnaissances were sent out daily from the flanks to see what Early was
doing, and that of the 18th reported that the in-
dents, a large part of them, had retreated from
Fisher's Hill. He had not retreated, but had
matured a plan of attack. A reconnaissance by
General Gordon had disclosed the fact that the
left of the Union line was lightly picketed, with
but a small cavalry force on the north fork of
the Shenandoah, and that it was practicable to
move infantry secretly by night across the
creek, which was easily fordable, and through
the woods to within less than half a mile of Crooks' left and rear. This plan Early adopted, assigning for the movement the divisions of
Gordon, Ramseur and Pegram and Payne's
cavalry brigade, all under command of Gordon.
Early, with the divisions of Kershaw and
Wharton and all his artillery, was to co-operate
in the effort to crush the Union left and centre.
Two brigades of cavalry were to demonstrate
on the Union right, and Lomax's cavalry, mov-
ing from Front Royal, was to strike the valley
pike in the Union rear. The movement began
after dark of the 18th. Gordon led his column
across the north fork of the Shenandoah, down
its right bank, and again crossing below the
mouth of Cedar Creek, reached his assigned
position before daylight. Early led Kershaw
across Cedar Creek, midway between its mouth
and the pike, and at the first flush of dawn,
covered by the fog, captured or drove in the picket line and rushed over the
entrenchments held by Thoburn's division, at
a point where they were not manned, surprised
the camp, soon swept everything out of it, and
captured seven guns, which were turned
upon the fugitives. Kershaw then ad-
vanced on R. B. Hayes' division and Kitch-
ing's brigade, and at the same time Gordon
charged out of the woods directly upon Hayes'
left and rear, the combined attacks breaking
his division and Kitching's brigade, and uncov-
ering the left of the 19th corps, which was now
assailed by Kershaw and Gordon, while at
the same time Wharton's division, moving swiftly
down the pike, followed by 40 pieces of arti-
lillery, attacked in front, and the greatest part of
the 6th corps, abandoning 11 guns, was swept
from the field. Wright, who had foreseen at
the beginning of the attack that his position
was untenable, and a change of front necessary, now
ordered the 6th corps, under General Ricketts,
who was moving with two divisions to support
the left, to fall back to some tenable position;
and the 19th corps was ordered to rally on the
right of the 6th. The Confederates followed
up their advantage, taking many prisoners, but
were checked by the 6th corps, Wharton being
badly repulsed. Early still pressed matters; it
was now 9 o'clock, and Wright, losing six
guns of his own corps, withdrew to a more
favorable position one and a half miles north
and west of Middletown, where he was joined
by the cavalry brigade from Buckton and by
Trojan's division. His right, which had been
ordered from the right to left of the in-
fantry line; while the division commanders of
the 6th and 19th corps were told the enemy
would be attacked about 12, noon, as soon as an
ample resupply of ammunition could be
obtained. Meanwhile Sheridan, who had arrived
at Winchester on the afternoon of the 18th, was
hastening to the front, meeting on the way a
stream of fugitives, whom he ordered to turn
back, as he intended to reoccupy the old camp
that night. He arrived on the field a little
after 11 o'clock, during a lull. At 3 o'clock
Wright had reunited the divisions of the 6th
corps, which had been fighting by themselves
during the morning, and after the 19th corps
had been rallied and placed in line, also parts of
the 8th corps, the only part of the army
seriously engaged being a division of the 6th
corps and the cavalry, tenaciously holding the
valley pike, the key-point of the battle. Wright's
disposition of the infantry was approved, and
the only change made in the line was to send
Custer's cavalry back to the right of the in-
antry. About 1 o'clock Early pushed forward
his entire line, but was quickly repulsed, and
then busied himself in collecting his stragglers,
who were plundering the captured camps, get-
ting his prisoners and captured guns and
wagons back to Fisher's Hill, and throwing up a
defensive line beyond the reach of the Union
artillery. At 4 o'clock Sheridan saw a move-
ment of Early's, which he thought indicated an
attack, and led up Bear Hunt and the 19th
corps on the right, the 6th on the left, with the
8th following in reserve, Custer's cavalry on
the right, and Merritt's on the left of the infant-
try. The movement developed into a left half-
wheel, and after a very severe and obstinate
fight, during which parts of the Union line
were repulsed, again to go forward, was suc-
cessful; the Confederate line was broken near
its left, other parts of the line gave way, and
soon the entire army fled in panic and disorder
from the field and across Cedar Creek, Sheri-
dan's infantry following as far as the creek, the
cavalry continuing the pursuit three miles be-
yond and until after dark, capturing guns,
wagons, ambulances and prisoners. Early, with
but few of his men, rested at night in his en-
trenchments at Fisher's Hill, and at 3 o'clock
next morning retreated to New Market, fol-
lowed by Sheridan's cavalry as far as Wood-
stock. The 24 guns captured by Early were
retaken, and he left in Sheridan's hands 23 of
his own. The Union loss was 644 killed, 3,430
wounded and 1,591 missing; of the latter
1,429 were sent as prisoners to Richmond. The
Confederate loss was 320 killed, 1,540 wounded
and 1,050 missing. Early's offensive movement
suspended for a time the transfer of any part
of Sheridan's army to the Army of the Poto-
mac; his defeat ended efforts on the part of the
Confederates to invade the North by way of the
Shenandoah Valley. Consult 'Official Rec-
ords' (Vol. XLIII); Ford, 'Shenandoah Val-
ley in 1864'; The Century Company's 'Battles
and Leaders of the Civil War' (Vol. IV); Sheri-
dan, 'Personal Memoirs'; Keifer, 'Slavery and
Four Years of War' (Vol. II).
CEB A. CARMAN.

CECER FALLS, Iowa, city in Black Hawk
County, situated on Cedar River and on the
Burlington, C. R. & I. R. R.; the main line of
the Central and the Chicago & G. W. railroads, 85
miles northeast of Des Moines. It is actively en-
gaged in manufacturing, having flour, oatmeal,
paper, harvester, gate, wagon, pump, broom
and other factories. The Iowa State Teachers'
College is, who h a a a a at
tendance of 3,200. The city owns its water-
works and electric-lighting plant, and maintains
a Carnegie library, good schools, a hospital,
two parks and has shown marked growth in recent years. It was settled in 1845, incorporated as a village in 1853 and received its civic charter in 1865 providing for a mayor elected every two years and a city council. Pop. (1900) 5,012; (1910) 6,012; (1916) civic estimate, not including college students 7,000.

CEDAR KEYS, Fla., seaport in Levy County, on the Gulf of Mexico, 118 miles southeast of Tallahassee. It takes its name from the keys surrounding the harbor. There is a light- house on one of the keys, with a fixed white light, varied by a white flash every minute. The town has several saw-mills, most of which cut red cedar wood for pencils, which is a leading export. It has a considerable trade also in pine, sponges, palmetto fibre, lumber, fish and oysters. Pop. (1910) 864.

CEDAR LAKE, lake of Canada, in Manitoba, an expansion of the river Saskatchewan, receiving the waters of this large stream to pour them over the Grand Rapids into Lake Winnipeg. Cedar Lake is nearly 30 miles long, and 1 mile wide. It is about 250 square miles. Its depth of water is sufficient for the largest craft, except on the northwest, where the quantity of alluvium brought down by the Saskatchewan is rapidly filling it up. Both the mainland and the islands are well wooded with balsam, spruce, birch, poplar, tamarack, Bank- sian pine and cedar, the last growing on the shores of the lake, particularly the northwest, and giving it its name.

CEDAR MOUNTAIN, CEDAR RUN, or SLAUGHTER’S MOUNTAIN, Battle of. On 8 Aug. 1862, Crawford’s brigade of Banks’ corps marched from Culpeper Court-house, eight miles to Cedar Run, to support Bayard’s cavalry brigade, which was being driven back by Stonewall Jackson, who, with the three divisions of C. S. Winder, Ewell and A. P. Hill, in all nearly 24,000 men, was advancing from Gordonsville to seize Culpeper. On the 9th Banks’ entire corps, at Little Washington, was ordered to follow Crawford, and Sigel was ordered to march his corps from Sperryville to the same point. Crawford joined Crawford at Cedar Run about noon and took position on elevated ground just beyond it, covering the road to Culpeper. Crawford’s brigade and six companies of the 3d Wisconsin, of Gordon’s, on the right of the road, being partially hid in woods. Gordon’s brigade was held in reserve on the hither side of the stream. Across the road on Crawford’s left was Geary’s brigade; Prince’s brigade was on Geary’s left, and Greene’s small brigade to the left of Prince and somewhat removed. Seven batteries of artillery were distributed on the plateau slightly in advance of the infantry. Banks had about 8,000 men. Jackson crossed the Rapidan on the 8th, and about noon of the 9th drove back Bayard’s cavalry, and following, came under fire of the Union artillery and prepared for battle. Early’s brigade was ordered to advance, keeping to the right and close to the Culpeper road, while Ewell led his two other brigades further to the right along the slope of Cedar Mountain. Early advanced until he came under heavy artillery fire, when he halted under cover of a small hill and C. S. Winder’s division and three batteries came up on his left, Campbell’s brigade on the extreme left, then Talliaferro’s, with Winder’s brigade in reserve. While placing his batteries on and near the road Winder was mortally wounded by a piece of shell. It was now 5 o’clock, and Banks gave the order to advance and attack. The three brigades of Crawford, Geary and Prince threw out skirmishers, drove in those of the Confederates, and the main line advancing became severely engaged. Early’s right held its own against Prince, but on the Union right Crawford, advancing with great impetuosity, attacked and drove Prince’s brigade; then swung to the left, fell upon and (with the assistance of Geary) routed Talliaferro and shook Early’s left. It was going hard with Early when Hill’s division came up and, forming on his right and left, restored the fight, checked Crawford’s further success, drove him and Geary back, and held Prince in check. Then the 10th Maine, of Crawford’s brigade, which had been held in reserve, went forward on the extreme right, and in less than 10 minutes was compelled to retreat with loss of nearly one-half its men. At the same time a battalion of Pennsylvania cavalry charged down the road and was instantly driven back in disorder. Gordon’s brigade came on the field as the 10th Maine was going out. In its advance it moved a little to the right of where the 10th Maine had been, and was met by the brigades of Branch, Archer and Winder, with such a withering front and flank fire that it was badly cut up and parts of it driven off, again to rally and go forward; but, under cover of the woods, Pender’s brigade gained its right and rear, poured in a volley and drove it from the field. The artillery had now been withdrawn and the Confederates advanced. Prince’s brigade fell back, leaving Prince and many of the men prisoners, and Greene, on the extreme left, who had not been seriously engaged, but had held Ewell’s two brigades in check, was withdrawn. Night had now fallen, but Jackson, desiring to enter Culpeper before morning, gave his brigades the order to advance, and when one and one-half miles from the field was checked by Banks’ rallied troops and Rickett’s division, which had come up near Culpeper, followed later by Sigel. General Pope also had assumed command. The Union loss was 1,759 killed and wounded and 594 missing. The Confederate loss was 1,338 killed and wounded and 31 missing. Pope and Jackson confronted each other on the 10th and 11th, but on the night of the 11th Jackson retreated, abandoning many of his wounded, recrossed the Rapidan and marched to the vicinity of Gordonsville. Consult ‘Official Records’ (Vol. XII); Ropes, ‘The Army Under Pope’; Gordon, ‘Army of Virginia’; Allan, ‘Army of Virginia in 1862’; The Century Company’s ‘Battles and Leaders of the Civil War’ (Vol. II).

E. A. CARMAN.

CEDAR MOUNTAINS, a mountain range in Cape Colony extending nearly along the meridian of 19° E., for about 25 miles southward, beginning with lat. 32° S., and rising at some places to a height of 5,300 feet, and separating the valley of the Olifante River on the west from the Doorn on the east. Cedar trees of gigantic size formerly covered these mountains, and still do so to a considerable ex-
tent. The mountains contain many Bosjesman caves. The highest summit is Snoeuwkop, about 6,300 feet.

CEDAR RAPIDS, Iowa, city in Linn County, on the Cedar River, and the Chicago & N.W., Chicago, R. I. & P., Chicago, M. & Saint P. and Illinois C. railroads, 219 miles west of Chicago and 310 miles north of Saint Louis. It is an important railroad and manufacturing centre, and has valuable waterpower. The city is built on terraced hills on both sides of the river which is here crossed by several bridges. The streets are paved with brick and asphalt, and it has large and well-planned parks and excellent sewer, water, trolley, gas and electric-lighting systems. Cedar Rapids is the centre for a rich agricultural region and has an extensive wholesale trade. The city contains about 192 manufacturing establishments; capital, $6,500,000; persons employed, 6,500; wages, $4,500,000; value of products, $47,000,000. The factories do not include the American Cereal Company, whose mills employ 800 persons and have a daily capacity of 5,000 barrels. The Chicago, Rock Island & Pacific Railway shops employ nearly 1,000 men. Other industries are pork-packing, and the manufacture of flour, lumber, pumps, windmills, starch, furniture, agricultural implements, dairy, creamery and egg supplies, wagons and carriages, planing-mill products and confectionery. The United States census of manufactures for 1914 recorded 170 industrial establishments of factory grade, employing 5,669 persons, of whom 4,394 were wage earners, receiving yearly $2,727,000 in wages. The capital invested aggregated $20,281,000, and the year’s output was valued at $34,989,000; of this, $9,041,000 was the value added by manufacture. There are three national and seven other banks; and daily, weekly and monthly newspapers. Cedar Rapids is the seat of Coe College (Presbyterian), has excellent public and private schools, a business college and public and Masonic libraries. It has many handsome private residences and churches, hospitals, a post office and Federal court building, Masonic Temple, auditorium and fine business and railway buildings. The first settlement at the rapids of the river was in 1855. The city was incorporated in 1856, and the charter revised in 1898. The mayor and city council are elected for two years. Pop. 40,690.

CEDAR, or RED CEDAR, RIVER, a river rising in the southern part of Minnesota and flowing southeast through the eastern part of Iowa to Muscatine County, where it turns southwest and empties into the Iowa River at Columbus Junction, after a course of about 350 miles. The chief cities along its course are Waterloo, Vinton and Cedar Rapids.

CEDARTOWN, Ga., city and county-seat of Polk County, 60 miles north by west of Atlanta, on the Central of Georgia, the Louisville and Nashville and the Seaboard Air Line railroads. The city has important lumbering and mining industries. It has central and post-office in the district and there are valuable mineral deposits. The industrial establishments comprise a box factory, planing mills, knitting mills, iron furnaces and foundries, oil mills, fertilizer works, railroad repair shops and marble works. The city owns the electric lighting and water-works. Pop. 3,551.

CEDILLA, sè-dilla’, a mark used under the letter c in French and Portuguese when the c stands before a, o or u, to indicate that it is to be pronounced like the English s, not like k, as is usual before these letters. A c with the cedilla under it is written ç.

CEDREL A, séd-ré-la’, a genus of large timber trees, natives of the tropics of both hemispheres, bearing reddish-brown wood, which is now usually included in Meliaceae. The species have evergreen, equally pinnate leaves, and small bell-shaped white flowers. C. odorata of Honduras and the West Indies yields bastard cedar. C. australis is a valuable Australian timber tree. C. toona, a native of Bengal, furnishes timber much like mahogany. The bark is very astringent, and has been found valuable in fevers, dysentery, etc. The flowers are used for producing a red dye. The bark of C. febrifuga is used against the intermittent fevers of Java.

CEDRELACEAE, séd-ré-lá-se, the mahogany family, a natural order of dicotyledonous plants, nearly allied to, if really separate from, the Meliaceae. They are trees with alternate pinnate leaves and a woody capsular fruit. Different species yield mahogany, satinwood, etc. The typical genus is Cedrela.

CEPA LO, chà-fà-loo’, Italy, seaport city of Palermo province, Sicily, on the north coast, 40 miles east-southeast of Palermo. The town is named from the headland which rises 1,200 feet above it bearing on its summit ruins of an ancient Sikel town. Cefalu is a bishop’s see and its buildings include a fine cathedral and several other churches. The harbor is small, capable of accommodating only a few vessels. Sea-fishing is actively engaged in and profitable marble quarrying is carried on. Pop. 13,300.

CEHEGIN, thà-á-hèn’, Spain, town in the province of Murcia and 39 miles west-northwest of the city of Murcia, four miles east of Caravaca, on a declivity facing the south. It has numerous spacious streets, and two squares, lined with substantial houses and neat public buildings, comprising a parish church, convents, chapels, town- and court-houses, a prison, hospital, theatre, cemetery and several schools. The manufactures include paper, cloth, soap, pottery, brandy, wine and oil. There is also trade in grain, oil, wine, fruits, wool, hemp, silk, wax, and cotton. Pop. 13,315.

CEILING, the interior overhead surface of an apartment usually formed of a lining of some kind affixed to the under side of joists supporting the floor above, or to rafters; the horizontal or curved surface of an interior opposite the floor. The word seems to have been suggested by the use of arched coverings for churches, and even for rooms, which predated in the Middle Ages, and were not unknown to the ancients. In Egyptian temples the undersides of the flat stone roofs were ornamented with blue paint and yellow stars and other hatched patterns of the heavens. The ceilings of Babylonia and Assyria were often gilded and stuccoed. Greek roofings were decorated inside with ornaments. Arched ceilings among the Romans were known by the name camere or camera, the Greek origin of
which seems to furnish an argument in favor of the view that the arch was known to the latter people. The camera was formed by semi-

circular beams of wood, at small distances from each other, over which was placed a coating

of bark, paper, or even clay. The lens of the camera were frequently lined with plates of
glass, when they were termed vitreæ. But the ceilings most common among the Romans were flat, the beams, as in modern times, having been at first vain and afterwards covered with

planks and plaster. Sometimes hollow spaces or panels were left between the planks, which were frequently covered with gold and ivory, or paintings. The arched ceilings of the Romans were commonly of brick or concrete covered with stucco, and were of three kinds: barrel vaults, groin vaults, and domes. The Roman ceilings were always elaborately decor-

ated with stucco or paintings, as seen in those of the Pompeian baths. After the decline of Roman art, with its inventions of glass, developed new and wonder-

ful types, using curved roofing and mosaics which were wonderfully designed. Good examples are the Saint Mark's in Venice, and the churches at

Salonica and Constantinople. Mohammedan art developed a similar form. In the West, in the Middle Ages, the ceiling design took the form of bare rafters, which was later replaced by vaulting of stone and flat wooden ceilings.

In England, the simpler forms prevailed; while in France, the multiple rib vault and the elabo-

rate fan vault developed. The wooden ceilings were decorated in the hammer-beam types of English churches and halls, which lasted until the 17th century. During the Renaissance, Italy used three types of ceiling, the smooth vault, the same with penetrations, having a flat central field and curves; and the flat paneled ceiling of wood or plaster, of which the most magni-

cent example is that in the Doge's palace at Venice, highly decorated with paintings by Titian, Tintoretto and Veronese. In England, at Cokeshill, Berkshire, a ceiling by Inigo Jones (1620) is a type which became predominant for a century: deeply sunk panels with medallions round and bands enriched with foliage, fruit, etc., in bold relief. The present type generally used is the one developed by Robert Adam. Modern ceilings are generally flat and are of plaster or wood. When the ceiling is divided into deep panels it is said to be coffered.

CELAKOVSKY, châ-la-kâv'skâ, Frant-

tisek Ladislav, Bohemian poet and philologist:
b. Strakonitz, 7 March 1799; d. Prague, 5 Aug.

1852. He was destined for the pulpit, but from passion for art, he abandoned that profes-

sion, and engaged in 1821 as instructor in a nobleman's family. In 1828 he became asso-

ciate editor of the Quarterly Review for the Catholic Clergy, published by the consistorium at Prague, and in 1834 editor of the Bohemian Gazette, and of the Bee, a literary journal. He also commenced a series of lectures on the Czechic-language and literature, at the University of Prague. He lost both his situation as editor and that at the university, in consequence of his opposition to the Emperor Nicholas. The Bohemian Society for the Propagation of Science elected him a member in 1840. In 1842 he accepted a professorship of the Slavic lan-

guage and literature, recently established by the

King of Prussia for the benefit of his Polish subjects, at the University of Breslau. After

the events of 1848, the Austrian government, which now sought for support from the Czech nationality, offered him a professorship at the University of Prague. Of his numerous works, the following are most remarkable: 'Poems' (1822); 'Slavic National Songs' (1822-27); Lithuanian National Songs' (1827); a metrical translation of Walter Scott's 'Loch Lomond and the Lake' (1828); a translation of Augustine's 'De Civitate Dei' (1829-32); 'Echo of Russian National Songs' (1829); 'Echo of Czech Na-

tional Songs' (1840). One of his latest works was the 'Popular Philosophy by the Slavic Na-

tions in their Proverbs' (Prague 1851). After 1835 Celakovsky was engaged in a comparative study of all the Slavic dialects, the fruit of which is given in part in his additions to Jung-

mann's Czech dictionary. As a poet he is distin-

guished by the grace and naïveté of his popular songs.

CELAKOVSKY, Ladislav, Austrian bot-

anist, son of the preceding: b. Prague 1834;
d. there 1902. He was educated at Prague, where in 1860, he was appointed custodian of the botanical department of the Bohemian Museum. In 1862 he became professor of botany at the Czech University of Prague. His works are numerous and valuable. They include 'Pro-

dromus der Flora von Böhmen' (1867-81); 'Über die morphologische Bedeutung der Samen-

knospen' (1874); 'Vergleichende Darstellung der Placenten in den Fruchtknoten der Phan-

erogamen' (1876); 'Die Gymnospermen' (1890); 'Das Reduktionsgesetz der Blüten' (1895).

CELANDINE, sêl'ân-din (Chelidonium), a genus of herbs of the family Papaveraceae. The few species are natives of Europe, where they are widely distributed, and whence they have spread to other parts of the world. One species is common in some of the older parts of the United States, having escaped from gardens. Common celandine (C. majus), which is most frequently seen, is an ill-smelling bi-

ennial or perennial plant with brittle hairy stems, pinnate leaves, small umbels and slender two-valved pods. The plant has long been popular in old-fashioned gardens. It is easily grown from seed and produces abundant flowers all through summer. All parts contain an acrid yellow juice, for which the plant has been sometimes used in medicine, though it is now used practically only by the Eclectics. It is a drastic purgative, but its action is very irregular and difficult to control, and hence it has not been introduced into regular medicine.

CELANO, châ-lâ'nô, Tommaso da, one of the reputed authors of the Latin hymn 'Dies Irae': b. Celano, in the Abruzzi, toward the end of the 12th or about the beginning of the 13th century; d. Italy after 1250. He was one of the most devoted adherents of Saint Francis of Assisi, and after the establishment of an order of Minorite friars on the Rhine, was appointed custos (keeper) of the Rhine districts. In 1230 he returned to Italy. He wrote a life of Saint Francis and several hymns. His claim to the authorship of the 'Dies Irae' seems now fairly
well established, but is still disputed in favor of Matthäus Aquasparta (d. 1303), Cardinal Frangipani (d. 1294), and even Saint Bernard, Gregory the Great and others. His name is first mentioned in connection with the poem toward the close of the 14th century. See Dira I.e.

CELASTRACEAE, sel-ás-tra-se-é, a family of polygelatious dicotyledons, consisting of shrubs and small trees, natives of southern Europe, Asia, America, Australia, etc., most of them of no great importance. They have generally acid properties. The chief genera are Celastrus and Euonymus.

CELAYA, sə-lā'yə, Mexico, town in the state of Guanajuato, on the Rio Grande de San lago, about 150 miles northwest of the city of Mexico. It has several fine plazas, handsome churches, among which is that of Our Lady of Carmen, a magnificent structure, and manufactures of cotton and woolen cloths, soap, candles, saddlery and other articles. The burning of its bull-ring, on Easter Sunday, 1888, caused considerable loss of life. Near it are thermal springs. Celaya was founded in 1570 and in 1655 was raised to the dignity of a city by Philip IV. It was sacked by the revolutionists in 1810. Pop. about 25,500.

CELEBES, səl'e-bəs or səl'e-bəz, Dutch East Indies, one of the larger islands of the Indian Archipelago, between Borneo on the west and the Moluccas on the east, extending from lat. 1° 45' N. to 5° 45' S., and from long. 118° 45' to 125° 17' E. and remarkable for the singularity of its shape. It consists mainly of four large peninsulas stretching to the east and south, and separated by three deep gulfs. This singular conformation gives it a shore line of 3,500 miles. The total area of the island is a little over 71,000 square miles.

Celebes is high and mountainous chiefly in the centre and the north, where there are several active volcanoes. Mount Bonthain, which is in the southern part of the island, is over 10,000 feet high. The absence of extensive deltas, and the intervention of broad grassy plains between the forests, distinguish it from the other larger islands of the Indian Archipelago. All that is most majestic and lovely in these are concentrated in this island. It abounds in the most picturesque and varied scenery, and the most beautiful and magnificent tropical vegetation. Though cut by the equator, and wholly within the torrid zone, Celebes is considered remarkably healthful, the natives often enjoying a vigorous old age, and Europeans living longer than anywhere else in the East. Its extreme heats are tempered by the sea-breezes, by monthly rains, and by the north winds that prevail for part of the year. The east monsoon lasts from May to November, and the west during the remaining months. The soil generally consists of a bed of vegetable mold from 150 to 200 feet thick on decomposing basalt. Gold is found in all the valleys of the north peninsula, which is often convulsed by earthquakes and abounds in sulphur. Copper of good quality occurs at various points, and in Macassar tin also, as pure as that of Banka. Diamonds are sometimes found almost at the surface of the ground, and precious stones are carried down in the sand of the torrents. The island is entirely destitute of the large carnivorous animals and pachyderms. None of the cat kind are seen in its forests; nor has it the elephant, the rhinoceros or the tapir. Deer and wild hogs abound, together with the babirussa and herds of antelopes. Porcupines are unknown in the Sunda Islands, here first occur, and there is a black tailless baboon or ape. Among domesticated animals are found small but vigorous horses, buffaloes, goats, sheep and pigs. Trepang and turtle are caught in abundance. Among the trees are oak, teak, cedar, upas, bamboo, etc.; among plants requiring more careful cultivation, the coffee-tree, indigo, cacao, sugar cane, manioc root and tobacco.

The maritime districts of Celebes are inhabited by Malays; the peninsula of Macassar by Bugis and Macassars. Mandharis dwell in the west of the island, and the mountainous regions in the interior are inhabited by Alurese. In the harbors also there are many Chinese and Oorang Badjus or Oorang Laut, a mixed race party of Malay and partly of Battak origin, who live in their boats, and roam over the whole archipelago, gaining their livelihood by fishing. The natives are subject to several petty rulers, more or less dependent on them, and the capital is the town of Macassar (pop. 26,000), in the southwest of the island, in the bazaar of which are sold all the products of the neighboring islands as well as of Celebes itself. Among these are bamboo canes, sandal-wood, cajeput oil, nutmegs, rice, coffee, pearls, birds'-nests, trepang, birds of paradise, etc. The trade in trepang is very important, Macassar being the chief staple place for this article of commerce. The chief harbor of the north is that of Kema, on the east coast of Minahassa. The coffee of Menado is excellent, and is even preferred to the best Javanese coffee. The harvest of cocoanuts is considerable. Imports and exports average about $13,000,000. A European controller superintends the cultivation of the coffee-tree in his own district, advises the village chieftains, acts as the protector of the natives and negotiates between them and the Dutch government.

The language and literature of Celebes differ essentially from those of the countries to the west. The letters of its alphabet are in form as unlike the Javanese as the latter are unlike the Arabic or Roman. The three great languages of the island, not reckoning the dialects of the savage tribes, are those of the Bugis, the Macassars and of Mandhar. The modern Bugis is the most cultivated and copious; the Macassar is simpler and its literature more scanty; both are distinguished for a soft and vocal pronunciation. The Bugis have a considerable body of literature. The more civilized inhabitants profess Mohammedanism; but previous to the introduction of that faith the Hindus had brought their religion to the island.

The island of Celebes was first visited by the Portuguese in 1512. In 1607 the Dutch entered into commercial relations with Macassar, and gradually acquired and extended control until, early in the 19th century, they made their supremacy complete. There was a serious revolutionary outbreak in 1905-06. The population is estimated at 2,000,000, of which about 1,400 are Europeans. Consult Lahme, 'L'Ile de Celebes' (1879); Wallace, 'The Malay Archi-
CELERES—CELESTIAL SPHERE

CELERES, a body of horsemen traditionally said to have been introduced by Romulus, and to have numbered 300, consisting of citizens rich enough to furnish a horse. They are also described as subdivided into three centuries, under the name of Rannes, Titienses and Lanzites. The number of the centuries of the Celeres is said to have been raised to six by Tarquinius Priscus, this being the origin of the equites or knights, who in after times formed a separate class of citizens.

CELERIAC, sê-lêr'i-ak, a plant, Apium graveolens rapaceum, of the parsley family, and a horticultural variety of celery. It is highly prized as a vegetable in Europe but is little grown in America. Unlike celery, the plant has a very thick, fleshy root; this is used in flavoring stews or it may be boiled like cauliflower as a salad. An extract obtained from the root is said to have medicinal properties.

CELERY, a biennial or annual herb (Apium graveolens) of the family Apiaceae. It is a native of Europe, Asia and Africa, in the older civilized parts of which it was cultivated prior to the Christian era. In nature the plants are commonly found in moist ground, where they attain a height of from 6 to 15 inches. They have numerous leaf stalks, odd-pinnate leaves and branching, leafy flower stalks two to three feet tall, bearing many small umbels of small white flowers which give place to small seeds (fruits). Cultivated celery does not differ in general characteristics from the wild plant, but by cultivation its leaf stalks (the part desired for the table) have been made more solid, less stringy and more agreeably flavored. In many instances, too, they have been lengthened or increased in number and made to form more compact plants. Celery is usually blanched and eaten raw with salt, or cooked as a cooked vegetable, and its leaves, roots or ground seeds are frequently used for flavoring. Celery is largely grown in Europe, but little in America. It does not require blanching, but is usually cultivated like onions.

Celery is usually started in unheated beds and the young plants set out in the field when a few inches tall, after being transplanted once or sometimes twice. The soil best suited to the plant is a loamy soil, well manured, well supplied with moisture, but well drained. As the plant is a gross feeder abundant manure must be given. Celery will, however, do well in any moist, rich garden soil. In one method of growing, the plants are set about six inches apart in rows spaced from three to four feet, and the ground is kept loose and free from weeds by frequent cultivation, the plants being gradually covered with earth, or "earthed up," as they approach edible size, or they may be blanched by shading them with boards, straw, etc. In another method they are set closer together in the rows, which are rarely more than 12 inches apart. The size of the variety is a governing factor in the matter of distances; some varieties grow only 12 to 15 inches tall, others more than two and a half feet. In this "new celery culture" no earthing-up is necessary, as the plants blanch themselves. Summer celery is blanched quickly by the former method; autumn and winter celery slowly. Indeed, the process is frequently continued in the winter storing quarters, which usually consist of specially constructed houses or cellars, the floors of which are covered with a few inches of earth, in which the roots obtain some food and water.

Celery is frequently attacked by parasitic diseases, but most of its insect enemies are controlled by parasites and rarely become troublesome enough to demand special attention. The chief fungous parasites are scald or rust (Cercospora api) which appears upon the leaves as yellow or gray blotches which enlarge and gradually destroy the whole leaf. It is more frequent on plants grown in dry soils. Leaf-blight (Septoria petroselini api) appears on the leaves and stems as watery spots which become dotted with black spots. These parasites may be controlled by spraying with a standard fungicide (q.v.). Several other parasites are occasionally troublesome, but they can usually be similarly controlled.

In the United States the celery industry developed enormously during the closing quarter of the 19th century. From being restricted to the individual gardens and fields of market gardeners who grew it as one of their ordinary crops, it has in many localities become a specialized business, with machinery adapted to its particular needs. And from demanding only part of the time of the market gardener it now occupies the attention of hundreds of men in certain districts. In Michigan, California, Florida and New York there are thousands of acres devoted to this crop, and from some of these districts hundreds of carloads of celery (even trainloads from California) are sent to Chicago, Saint Louis, Kansas City, New York, Boston, Philadelphia and other large distributing centres. Instead of having celery as a delicacy for a few weeks during autumn and winter, American tables are supplied throughout the year with this vegetable, which has risen to the rank of a necessity, a development due mainly to improvements in the management of the crop, but partly to improved transportation and storage methods.

In medicine celery enjoys a certain popular reputation by reason of the apiole which it contains. This has an action similar to that of many of the volatile oils, but in addition it dilates the blood vessels, particularly of the pelvic viscera, and is, therefore, useful in disorders of menstruation, in chronic constipation and disordered intestinal states in general. It is also diaphoretic and diuretic.

Consult Greiner, 'Celery for Profit'; Van Bochove, 'Kalamazoo Celery'; Hollister, 'Livingston's Celery Book'; Durst and Bailey, 'Notes Upon Celery'; Cornell University Agricultural Experiment Station Bulletin 132; Bailey, 'Cyclopedia of American Horticulture.'

CELESTIAL EMPIRE, The, a popular name for the former Chinese Empire, taken from the Chinese appellation for the country, "Tien Chao" (Heavenly Dynasty). Hence the name "Celestials," applied to the Chinese.

CELESTIAL SPHERE, the sky background on which all celestial objects appear projected. It is supposed to be of indefinite
CELESTINA—CELESTINE

radius, with the observer at the centre. It is crossed by systems of imaginary circles which serve as positions for the coordinates of spherical co-ordinates. See CO-ORDINATES.

CELESTINA, The. 'The Celesitina,' or 'Tragicke Comedy of Calisto and Melibea,' one of the parent sources of modern realism, was the work of Fernando de Rojas, sometime mayor of Salamanca, whose title to the authorship recent Spanish scholarship has established to the exclusion of other claimants. Originally appearing at Burgos in 1499 (?), the 21 acts of this loose drama, or dialogue novel, provide a singularly vivid and realistic picture of the night life of a Spanish city of the Renaissance, whose more unsavory features are conveyed with a touch that is absolutely modern in its directness. The story, however, of the amours of Calisto and Melibea, as promoted by the activities of the bawd Celestina, is less hopeful because of the blight of long passages of scholastic dialectic and of pseudo-classical erudition which rest heavily upon it.

'The Celestina' was the point of departure of the Spanish picareseque or rogue novel, which in turn became a dominant factor in the development of the English novel. The life of the novel is often strangely suggestive in detail of that of the roisterers of Shakespeare's 'Henry IV,' but the tone of the work is wholly satirical and sardonic. It was translated without delay throughout Europe, and has been continuously influential in Spanish letters, where the naturalistic reforms of Galdós in the drama recall its procedure.

A verse interlude based upon the first four acts was published in English in 1530. The standard translation is by James Mate (1631); reprinted with an introduction in the 'Tudor Translations' (1894).

JOHN GARRETT UNDERHILL.

CELESTINE I, Saint, a Pope memorable in the annals of the Church as having convoked the General Council of Ephesus, 431; as having given to Palladius and Patricius mission to the Irish and the Caledonians, and as having checked the progress of Pelagianism and Novatianism. Of his birth or his age there is no record, but he died in 431 and his day in the Roman calendar (that is, the day of his death) is 7 April; he occupied the see of Peter about eight years and a half. Celestine was represented in the Ephesian Council by his legates, and at his instance the council condemned the heresy of Nestorius and of his letters to bishops of various churches both in the East and the West, communicating to them the council's decrees, four are extant, namely: those to the African bishops and to the bishops of Ilyria, of Thessalonica and of Narbonne.

CELESTINE II, Pope (GUIDO DI CASTELLO) : b. Tiferno, Tuscany; d. Rome, March 1144. He had studied under Abelard, and succeeded Innocent II in 1143. It was this pontiff who granted absolution to Louis VII of France and removed the interdict which for three years was laid upon that country.

CELESTINE III, Pope (GIACINNO ORSINI) : b. about 1106; d. Rome, 8 Jan. 1198. He succeeded Clement III, under whose influence, and succeeding Clement, over 80 years of age, and reigned till 1198. He crowned the Emperor Henry VI of Germany in 1191, but afterward excommunicated both Henry and Leopold, Duke of Austria, on a charge of infidelity. He died at the castle of Richard Cœur de Lion. In 1192 he confirmed the statutes of the Teutonic Order of Knights.

CELESTINE IV, Pope (Goffredo Castiglione) : b. Milan; d. 10 Nov. 1241. When a monk at Hautecombe in Savoy he wrote a history of Scotland. He was elected Pope in 1241, but died only five days after his election. It is said, of poison before the ceremony of consecration was performed.

CELESTINE V, a Saint, a Pope celebrated as the one occupant of the papal see who, his title undisputed and no demand made for his retirement, voluntarily and of his own motion abdicated the pontificate. He was a Neapolitan, born in 1215, and while a lad entered the order of Benedictines. From the first he practised the greatest austerities, and at the age of 24 years, for the sake of freedom in the pursuit of religious perfection, he quit the monastery and adopted the solitary or cenobitical life in a cave of Mount Morone, whence his surname, Peter di Morone. After five years spent in this solitude he, with two companion hermits, migrated to a similar cave in the Monte di Maella in Bruttium. Here discipies flocked to him in scores, and to these he gave a rule of life and thus laid the foundation of a new monastic order which later received papal approval; after the death of the founder the order assumed the title of Celestines. When Peter di Morone was, as superior-general, governing 36 communities of the new order comprising 600 monks, he was elected Pope, 7 July 1294. He protested vigorously against this unexpected promotion, but at last was prevailed upon to assume the burden of the papacy. As Pope he promulgated two decrees, one re-enforcing the rule which requires that the cardinal electors of a Pope shall be strictly secluded in the conclave; and the other that a Pope may lawfully and validly lay down his office. At the end of five months and eight days he acted on this definition and abdicated, out of a desire, as he publicly declared, "for humility, for a purer life, for a stainless conscience, and in view of his lack of physical strength, his ignorance, the perverseness of the people, and his longing for the tranquillity of his former life." All eminently strong and good and honorable reasons, and worthy of the sincerely religious soul that was moved by them. His successor in the papacy, Boniface VIII, doubtless fearing lest the honest hermit should repent of his abdication and resume the papal title, made him a prisoner and confined him in a strong castle where he died, after languishing 10 months, 19 May 1296. He was canonized 1313. Some commentators of Dante ('Inferno,' iii, 60) think that Celestine is the damned soul, who to base fear Yielding, abjured his high estate (Cary's trans.), or as the verse is rendered by Longfellow — The shade of him Who made through cowardice the great refusal. But as has been well remarked, 'Dante knew better than to consign a man to eternal pain for having given up the Pope. Celestine V's day in the Roman calendar is 19 May, but he is there styled not simply Saint Celest-
tine, but Saint Peter Celestine (Petrus Celestini) of the Roman Catholic Church, a branch of the great Benedictine order. It was founded by Pietro di Morone, afterward Pope Celestine V (q.v.). To Pietro di Morone, who was leading an eremitical life in a wilderness, so many men reported for spiritual guidance that he was induced to form them into a religious community under a rule drawn up by himself. The institution was approved by Pope Urban IV in 1264, 10 years after it had been founded, but not as an independent order, for it was made a branch of the Benedictines, under a rule based on the rule of that order. They wore a white garment with a black hood and scapular and lived a purely contemplative life. The mother house of the institute was on Monte Majella in the Abruzzi, and 30 years after it was affiliated to the Benedictine order its primacy was acknowledged by 36 establishments having 600 members. The founder now relinquished the office of superior-general and resumed his former eremitical life. After Pietro was made Pope Celestine, the order, till then known as Hermits of Saint Damianus and popularly as Moronites, took the name of Celestines. The order spread throughout Italy and beyond the Alps to France, Germany and Flanders; so strong was its French branch early in the 15th century that it obtained for itself from the Popes bulls that made it in a measure independent of the superior-general. But in the 17th century the order was already in process of rapid decay, and in the 18th many of its establishments were dissolved by papal decree, and many more by the secular powers. The order is now extinct.

CELESTITE, a native form of strontium sulphate, SrSO₄, crystallizing in the orthorhombic system, and also occurring in fibrous and radiated forms. The crystals resemble those of barite, and are usually tabular or prismatic. They have a hardness of from 3 to 3.5, and a specific gravity of 3.96. Celestite is commonly white with a vitreous lustre, but it also occurs as a bluish white, with a pronounced bluish tinge, from which circumstance it received its name. When found in quantity it is a useful source of strontium. Fine crystals of it occur in the limestone about Lake Erie. Other important localities are in Sicily, Hungary, England, Canada, West Virginia and California. Varieties containing large amounts of calcium or of barium are called calciocelestite and barytocelestite respectively; and the mineral itself is often called celestine.

CELIBACY, the state of being unmarried; especially the voluntary single life undertaken by religious devotees and by some clerical orders, as those of the Roman Catholic Church. Paul (1 Cor. vii) recommends virginity, without condemning matrimony. The Roman Catholic Church respects matrimonial chastity, but eschews it as a rule for clerics.

From the time of the apostles it became a custom in the Church for bishops, priests and deacons to renounce matrimony at their consecration, and to devote themselves entirely to the duties of the office. One point only was disputed, whether clergymen were to be merely prohibited from marrying, or whether even those who were married before their consecration should be required to separate themselves from their wives. At the Council of Nice several bishops proposed that the bishops, priests and deacons who had received the holy consecration should be directed by an express ordinance to give up their wives. But Paphnutius, bishop of Upper Thebes, contended that cohabitation with a wife was a state of chastity. It was sufficient, he said, according to the ancient traditions of the Church, that men in sacred orders should not be permitted to marry; but he who had been married before his consecration ought not to be separated from his lawful wife. As it became the general opinion that a clergyman could not marry, it soon became the general practice to refuse consecration to married men. By this means uniformity was effected. As for the bishops, it soon became a matter beyond dispute. When monachism had become firmly established, and the monks were regarded with veneration on account of their vow of perpetual chastity, public opinion exacted from the secular clergy the same observance of celibacy. Epiphanius assures us that by the ecclesiastical laws celibacy was commanded, and that wherever this command was neglected it was a corruption of the Church. The Council of Elvira (305) commanded all bishops, presbyters, deacons and subdeacons to abstain from their wives, under penalty of exclusion from the clergy. In the Western Church celibacy was rigorously required. Pope Siricius, at the end of the 4th century, forbade the clergy to marry, or to cohabit with their wives if already married. At the same time the monks received consecration, which increased the conformity between them and the secular clergy still further, and indirectly obliged the latter to observe celibacy. The Emperor Justinian declared all children of clergymen illegitimate, and incapable of any hereditary succession or inheritance. The Council of Tours, in 567, issued a decree against married monks and nuns, declaring that they should be publicly excommunicated, and their marriage formally dissolved. Seculars, deacons and subdeacons, who were found to dwell with their wives, were interdicted from the exercise of spiritual functions for the course of a year. In Spain, where many priests were required to conform to the requirements of the Church, the bishops were ordered to enforce celibacy upon their abbots, deacons, etc., once a year in their sermons. As in other points of discipline, in this also the Greek Church dissented from the Roman. The (Trullan) Council of Constantinople, in 691, in its 13th canon, declares: *We hereby forbid anyone to refuse the consecration of a priest or deacon on account of his being married, and cohabitating with his wife after he has requested consecration. We will by no means be unjust to marriage, nor separate what God has united. *Celibacy is indeed required of the bishops and monks, but priests and deacons, if married before ordination, are allowed to continue in this state. The Russian Church modified the ancient Greek canons by permitting priests and deacons to marry after ordination. The Roman Catholic Church, then, has retained celibacy as an old apostolic tradition, to which she has added the rule not to conse-
crate married men unless the wife enter a religious order. As no one has a right to demand to be consecrated a priest, the Roman Church has, by this addition, violated no one’s right. Her position, therefore, is expressed by sayings like: ‘The married clergy is best suited to her work, she admits to her ministry only those who voluntarily engage to lead a celibate life, and as long as she finds a sufficient number of such candidates she refuses to help them in the employment of others. While, however, the Church persevered in commanding celibacy, she had to struggle with the opposition of those who among the clergy represented corruption. A reformer appeared in Gregory VII, who in order to reform the discipline of the Church was obliged to encounter simony and licentiousness in some of the clergy. The former he checked by opposing the Emperor’s right of investiture, and he enforced the laws of celibacy by new regulations. In the Council of 1074, at Rome, he ordered all married clergymen and all laymen who should confess to them, hear mass of them or be present at any divine service performed by them, should be excommunicated. This met with much opposition, but in spite of that, Gregory succeeded, as he was by the most ancient and most undoubted canons. After Gregory’s death the Church continued in the same course. Still the question of celibacy has continued down to recent times to be the subject of fresh agitations and contests. All through the first half of the 19th century there were periodical attacks upon this rule of the Church, in which almost every Catholic country of Europe was represented. These movements have occurred alike within the communion of the Church and among its secular and political bodies. They have usually been inspired by concern for the welfare of the Church and for the character and perpetuity of its priesthood, but no result has thereby been gained in any alteration of the ecclesiastical discipline.

The rule of celibacy has been more strictly observed in the Roman Catholic Church since the Reformation than it was before. The far greater number of the Catholic clergy have continued to respect it. Among the reasons sometimes urged against requiring celibacy in the clergy is the scarcity of men willing to devote themselves to a profession which calls for such strict self-denial. This, however, is said to be not true in point of fact, since statistics show a marked increase in the number of candidates for the priesthood at the present time. Among the United Greeks, Ruthenians, Copts, Maronites and other Oriental rites in communion with Rome, the discipline is that bishops cannot, after consecration, either marry again or cohabit with the wife married before ordination. Priests and deacons may keep the wives taken before ordination, but must abstain from marital intercourse for some time before officiating at the altar. Priests and deacons cannot marry after ordination. Converts from schism already in orders are allowed to keep the wives taken before ordination. Celibacy is purely a disciplinary law, and has no doctrinal bearing whatever. Dispensations from celibacy have been granted in exceptional cases, notably that of John Casimir, who had been elected King of Poland, and was released from celibacy in order to preserve the succession in 1648.

**CELINA**

Ohio, city and county-seat of Mercer County, 25 miles southwest of Lima, on the Lake Erie and Western, the Cincinnati Northern and the C. N. and D. railroads. It has manufactories of furniture, acids, liquors, a creamery and two banks. The value of its taxable property is placed at $4,983,720. It has two public and one parochial school and a Carnegie library. Pop. 4,000.

**CELL.** The cell is the unit of life. The name was given by Robert Hooke, an English architect, who discovered the cellular structure of plants while examining charcoal and cork. In such objects all living contents have disappeared; so the name, cell, was applied to the honeycomb-like chambers. During the last half of the 17th century, Robert Hooke and Nehemiah Grew published extensive researches upon the cellular structure of plants; while the Italian physician, Malpighi, and Leeuwenhoek, a Dutchman, published similar investigations upon animals. The entire 18th century, with Linnaeus as the dominant figure, was so devoted to the classification of plants that scarcely any microscopic work was done. The prevailing small size of cells, together with the imperfections of the early microscopes, made investigations difficult. Most cells are too small to be seen by the naked eye. Some cells are not more than one micron (one-thousandth of a millimeter, or one-twenty-five-thousandth of an inch) in diameter. The cells which the earlier observers described were generally 10 microns or more in diameter. In plants, a cell 100 microns in diameter is very large. The intermodal cells of Chara, the Stonewort which grows in ponds, sometimes reach a length of three or four inches. The eggs of birds, before fertilization, are unicellular. They are the largest cells known. The egg, when it is laid, contains an embryo and so is already a multicellular structure.

The beginning of the 19th century saw a vigorous resumption of microscopic investigation, coupled with great improvements in the microscope. In 1838 Schleiden announced his theory that the entire plant consists of cells. This theory, now an undisputed fact, is called the Cell Theory. In the next year, Schwann declared that the entire body of even the most complex animal was built up of cells. While the Cell Theory was soon recognized as a fact, the development of tissues and organs from cells, and the growth, differentiation and multiplication of cells furnished subjects for research during the rest of the century. Many fundamental problems along these lines still remain unsolved, but the improved microscopes, together with improved methods, gave better views of the cell contents and it was soon recognized that the cell is the fundamental element in the cell wall.

The principal contents are the protoplasm and the nucleus. The nucleus was discovered and named by Robert Brown in 1831; the term, protoplasm, was first used by Purkinji in 1840.
to designate the entire body of young embryos. In 1846, von Mohl applied the term to the living contents of the cell, so that it is synonymous with the term, protoplasm, as we use it to-day. Most writers now restrict the term still further, applying it to the living contents of the cell, exclusive of the nucleus.

In all cells both animals and plants, with the barely possible exception of bacteria, have both nucleus and cytoplasm; but many cells, both in animals and plants, lack the cell wall.

Besides the nucleus and cytoplasm there are other cell contents which may or may not be present. In the early nineties many believed that the centrosome was a constant and essential organ of the cell. This organ attains its highest development in animals, particularly during the formation of the polar bodies; but it must now be admitted that in many animal cells no centrosomes can be demonstrated. In plants, there are genuine centrosomes in many of the algae and fungi; some investigators still claim to have demonstrated centrosomes in the liverworts, mosses and ferns; but all now admit that there are no centrosomes in the flowering plants. However, in the liverworts, mosses, ferns, Cycads and Ginkgo, during the formation of sperms, a centrosome-like body, called the blepharoplast, is very conspicuous. It is probably a genuine centrosome. In most Gymnosperms even this blepharoplast has disappeared and there is no trace of it in the Angiosperms. Plant cells may contain plastids, starch, chlorophyll and other pigments, oil, crystals, mucilage, resin, etc. These, however, are of only secondary importance, as they are formed under the influence of the living protoplasm. Animal cells contain an equally great variety of substances.

Cells of the wood and the bast are easily recognized as plant cells, while muscle and nerve cells are just as characteristically animal; but the similarity of the cells of animals and plants, especially in their younger stages, is so great that it easily leads to speculation. In both, the mass of protoplasm and the nucleus are the essential features. In its ultimate structure, the protoplasm of animals and plants seems to be essentially identical, although the characteristic vacuoles of plants are inconspicuous or lacking in animals and some of the products of protoplasm are different in the two kingdoms. The nuclei of animals and plants are so identical that in multitudes of cases, even an expert could not say whether a given nucleus belongs to an animal or to a plant. In a sense it has a nuclear membrane, nucleus, a nucleolus and chromatin. In both, during division, the chromatin breaks up into a definite number of pieces, called chromatin of the resting nucleus (A) forms a more or less continuous thread, called the spirem (B); the spirem segments into a definite number of pieces called chromosomes (C), the number being constant for any given species. Each chromosome splits longitudinally into two pieces, forming two new chromosomes (D). The new groups of chromosomes separate (E) and form two new nuclei, while a new cell wall develops between them (F). This whole process of division, formerly called karyokinesis, is now more generally called mitosis. Preceding the formation of eggs and sperms, there are two peculiar divisions, called the reduction divisions, which reduce the number of chromosomes to one-half the number characterizing the vegetative nuclei. This reduction of chromosomes is found in all animals and plants which have reached the level of sexuality. The fusion of the egg and sperm at fertilization restores the number. In both animals and plants, it is becoming recognized that the chromosomes are the physical basis of heredity.

The lowest animals and plants are unicellular and, since animals are either immediately or ultimately dependent upon plants, it follows that unicellular plants were the first forms of life. The single cell performs all the functions, ingestion, digestion, assimilation, excretion, respiration, reproduction, etc. The diversity of form attained by these unicellular organisms is amazing.

The first step in the evolution of the plant body was attained when, after the division of a cell, the two resulting cells failed to separate. Continued division of this sort results in the formation of a filament, either simple or branched, but still consisting of a single row of cells. The next step is attained when divisions take place in two directions, so that, instead of a filament, a flat plate, one cell in thickness, is built up. In the filaments and in such thin plates there is little or no differentiation among the vegetative cells, except that
some may be more or less modified as holdfasts to attach the plant to a substratum; but in both there may be considerable differentiation of reproductive cells. When divisions occur in three directions, more or less massive bodies are built up and the division of labor is accompanied by extreme differentiation among the various cells. Even in rather small bodies, the outer layer of cells is likely to be modified as a protective layer. If the body is so large that the inner cells are at a considerable distance from the surface, some cells will be modified for conduction. In large bodies, some cells will be modified to give support and, finally, in complex organisms, the various functions will be performed by the cells which have become modified in various ways. It is interesting to note that these cells which become so variously modified in their later development are, in their early stages, very much alike; e.g., in the lily the cells which are to form the epidermis, the digestive, assimilating, conducting and even reproductive tissues, are strikingly similar. What causes cells which appear to be exactly alike, when first formed, to develop along different lines, so that some become elongated while others remain short;

cells are formed by division. These regions are called "growing points," a very inaccurate name, since they are dividing regions, the growth taking place after division has been completed. There are two principal methods of building up a body: in one, there is a dominant apical cell from which segments are cut off, the repeated division of which gives rise to the whole body; in the other, there is a group of embryonic cells (meristem), all of which divide, there being no single, dominant cell. The first type, with the single apical cell, is found in many algae, all liverworts and mosses and the ferns; the second type is found in lycopsids and all the flowering plants.

Beyond the dividing region, cells grow and differentiate. Cells which are to form the conducting system elongate and secondary thickenings of their walls produce the spirals, rings, nets, pits and various markings, all of which are formed by material deposited on the inner surface of the original wall. The young cell wall consists of cellulose and most thick-walled cells do not get beyond this condition; but thick walls become impregnated with various substances, the most common of which is lignin, the substance which gives rigidity to all woody tissues. The characteristics of cork and bast are due to suberin; the rigidity of the stems of wheat and oats is due to silica; and there are various other constituents of adult cell walls.

The duration of the life of a cell is various. Some cells live only a few hours, some a few days, some live for a season and others live for years. A big tree, thousands of years old, consists almost entirely of dead cells, the life of the individual cell being comparatively brief, perhaps only a few years. The spores of the water fern, Marsilia, have germinated after resting for 50 years. Many seeds retain their power of germination for 20 or 30 years, some for 100 years and a few may germinate after 150 years. Tales of the germination of seeds from ancient Egyptian burial places are entirely without foundation. Seeds of corn, wheat and oats live only a few years. Since there is no cell division during the dormant period of the seed, the individual cell lives throughout this period, however long the period may be.

In Darwin's time, the great problems of biology were studied in the gross; but during the last quarter of the century there was an increasing tendency to study, both in plants and animals, the individual cell as the unit of structure and behavior. At present, the great problems of structure, development, physiology, evolution and heredity are becoming recog-
nized as cell problems and the increasing attention now devoted to cell studies promises to answer some of the most difficult questions of biology. (See PLANTS, ANATOMY OF; BALEPHAROPLAST; CYTOLOGY; HYBRIDITY; PLANTS, MORPHOLOGICAL EVOLUTION OF; PLANTS, RECAPITULATION IN; PLANTS, SEX IN; PLANTS, VASCULAR ANATOMY OF.) Consult Hertwig, O., 'The Cell'; Wilson, E. B., 'The Cell in Development and Inheritance.'

Professor of Morphology and CytoLOGY, University of Chicago.

CELL, a small chamber; the dwelling of a hermit; a lesser or subordinate religious house dependent upon a greater, by which it was erected, and under whose government it remained. The apartments or private dormitories of monks and nuns are also called cells. In early Christian usage, the word was also applied to a chapel erected over a tomb.

CELL, in mechanics. See Peaucellier Cell.

CELL, Electrical. See Battery.

CELLA, the windowless hall or central apse of a Greek or Greco-Roman temple. This was often divided into two chambers of unequal size; the naos, in which was the statue of the deity for whose worship the temple was built, and the thesauros or treasury. The cela was formerly supposed to have been roofless, or partially roofless, but later scholars believe it to have been lighted only through the doors or by artificial light. In the larger temples the roof was internally supported by the rows of columns in the cela, frequently in two superposed ranges.

CELLAMARE, thl-,yal-, y-m-ârâ', Antonio Giudice, Prince of, Spanish Ambassador: b. Naples 1675; d. Seville, 16 May 1733. He was educated at the court of Charles II of Spain, and took a prominent part in the Spanish side in the War of Succession. In 1707 he was taken prisoner by the Imperialists, and detained five years in Milan. On obtaining his liberty he returned to Spain, and in 1715 was appointed Ambassador Extraordinary at the French court. Here, having entered into Alberoni's scheme, he became head of a conspiracy for supplanting the regent, Philip of Orleans, and appointing Philip V regent of Spain and France. The plot was discovered and Cellamare was marched off under a guard to the Spanish frontiers. He was afterward made captain-general of Old Castle and held the office at his death. A romance of Vatout, entitled 'Conspiracy of Cellamare,' gives an account of the conspiracy with tolerable accuracy. Consult Martens, 'Causes célèbres du droit des gens' (2d ed., Leipzig 1861).

CELLAR-SNAIL, a species of land-snail (q.v.) (Zonites cellarius). It has been introduced from Europe and has become common in cellars, hot-hobs and gardens of the seaport towns along the Atlantic coast. The shell is small, much flattened, thin, and has a large umbilicus.

CELLE, or ZELLE, tsâl'lâ', Germany, town of Hanover province, Prussia, on the Aller River, here navigable; 24 miles by rail northeast of Hanover. Among its notable buildings are the ducale palace of the 15th century, the churches, the 16th century Rathaus and the museum of mediaeval antiquities. Celle is the seat of the Supreme Court of Hanover, and maintains an agricultural and forestry high school, a gymnasium, two libraries, collections of books, and other public institutions. The principal manufactures of the town are printers' ink, woolen yarn, tobacco, cigars, stearin, soap, and a busy export trade is carried on in honey, wax, wool and lumber. The annual horse races are noted. Pop. 13,300.

CELLINI, Benvenuto, chê-le-nê', bân-vâ-noo' -to, Italian sculptor of the Renaissance, engraver and goldsmith: b. Florence, 1 Nov. 1500; d. there, 25 Feb. 1571. It was his father's desire that his son become a musician. For this reason he spent his boyhood practising the flute, but when he became 15 years of age he was apprenticed to a goldsmith named Marcone. His hot temper soon manifested itself and led to a quarrel with some young men who had attacked his brother. He fled and wandered through Siena, Bologna and Pisa, supporting himself by plying his trade. At this period in the Renaissance the goldsmith's art was by no means a degrading profession and Benvenuto distinguished himself in it. In 1518 he returned to Florence and studied the works of Michelangelo, whom he always considered his beloved master and whose works influenced him profoundly. His reputation secured for him an invitation from Torrigiana to visit England and enter the service of Henry VIII. But having little liking for the English and less for his companion, he refused to undertake the journey. After a quarrel with his father he set out for Rome, where he remained for two years, diligently pursuing his trade. A brutal quarrel, in which he killed his enemy, caused him to leave Rome. He returned in 1523 and his extraordinary abilities secured for him the patronage of Pope Clement VII. Here he was employed in the making of various jewels, ornaments and services of plate. He served also in the Papal band. When Rome was besieged in 1527, Cellini took part in the protection of the Papal palace. His account of the siege reveals his own vanity and boastfulness. He tells us that he himself shot the Constable of Bourbon and wounded the Prince of Orange. When peace was declared Cellini paid a hasty visit to Florence and assassinated the murderer of his brother. Later with a curious domestic fidelity he took upon himself the support of his sister and her children. To escape vengeance at the hands of the friends of the murdered man, Cellini took refuge in the house of the Duke of Civita di Penna and received the Pope's pardon. Free again, it was not long before a passionate quarrel with a personal enemy resulted in another murder, for which he was again pardoned. He spent the next four years at Rome, engaged in constant quarrels; and having suffered seriously from a constitutional disorder, he departed for France. He passed through Switzerland, stopping at Zürich, Geneva and Lyons and came eventually to Paris. He returned shortly afterward to Rome, was arrested by Paul III and thrown into prison on the charge of having stolen the Pope's gold, but really because of the enmity of the bastard son of the Pope. He escaped with the greatest difficulty, breaking a leg in the attempt, and came
to the house of Cardinal Carnaro, who protected him for a time, but finally gave him back to his enemy, the Pope in exchange for a bishopric. Cellini was then thrown into a dungeon, where he underwent those remarkable spiritual excesses of devotion in which his enthusiastic nature found consolation and outlet. On solicitation from Francis I, he was freed and entered the service of that monarch, and was permitted to go to France; immediately forgot his spiritual awakening and once more turned to his pleasure-loving existence. Francis made him a present of a castle which Cellini had to conquer by force of arms. His life in France was characterized by the same restlessness and passion. It was filled with law-suits, intrigues, violent outbursts of all sorts, which arose from a lack of ease of manner at court and his violent temper. From these embroilments he always extricated himself with Machiavellian disregard of all except private gain. He executed many minor works for Francis, among them a nymph in bronze, a long-limbed, lifeless figure without meaning—a snuff-box ornament. His genius enlarged to a gigantic size. In a fit of passion he forsook Paris and returned to Florence and the mean-minded patronage of Cosimo di Medici. The remainder of his life was spent here, in constant quarrels with his rival Bandinelli and the Duke's steward.

In 1558 Cellini received the tonsure of the first ecclesiastical orders, which he renounced two years later and married. He died at the age of 70, leaving three legitimate children.

The great achievement of the last Florentine period was his statue Perseus, a bronze representing a beautiful and perfectly molded, but entirely expressionless youth, carrying the head of Medusa. In the niches of its base are small figures of gods, which in their absolute perfection of detail are unequalled anywhere; and a relief of Perseus Rescuing Andromeda, the original of which is now in the Bargello. The statue was completed in 1554 and was unveiled in the Loggia dei Lauzi at Florence, where it now stands. He enjoyed lavish praise for this marvelously overwrought masterpiece. Other important statues are the colossal bust of Duke Cosimo I (1545-48); the bronze bust of Bindo Aldoviti (1506, Gardner collection, Boston); and the life-size Crucifixion, intended for his own tomb. His work as a goldsmith won for Cellini the name of the greatest goldsmith that the Renaissance produced. Unfortunately few of these works survive. Among the most notable that have come down to us are the saltcellar of Francis I (now in the museum at Vienna). It is embossed in gold and enamel, and ornamented with figures of Neptune and Cybele in high relief. Many very beautiful works in the museums of modern collectors have been ascribed to him—among them two cups in the J. P. Morgan collection and the Alman collections. The gold cobe button of Clement VII, set with precious stones, including the second largest diamond in the world; the medals representing Hercules and the Nemean Lion, Atlas Supporting the Sphere in chased gold, and medals of the year 1550. These works of Cellini are among the remnants of his exquisite workmanship.

His fame rests largely on his autobiography, a brilliant work, teeming with his loves and hates and the kaleidoscopic adventures of his restless career. Cellini is chiefly interesting not only as an artist, but also as a mirror of his times. He reflects an Italy, brilliant, superstitious, cruel and sensual. His contemporaries accepted his arrogance, his disregard of the value of human life, his selfishness and vindictiveness as the rightful attributes of a great man. Law was a matter then for private justification. Religion belonged to the ascetic, or was appealed to when human agency failed. In his works we see the technique and so devoid of spiritual and moral inspiration, one sees Rome's worship of mere physical perfection, her love of luxury and her loss of soul. The autobiography, written in his old age, gives intimate and vivid touches of the political history of the time and the personalities who throng its pages.

In addition he wrote a treatise on the art of the goldsmith and on sculpture (1568), of which a modern edition was published by Milanesi (Florence 1857). His works were published at Florence in 1843. See Cellini's Autobiography.

Bibliography—The best Italian edition of his Autobiography is by Bacci (Florence 1900); English translation by Symonds (London 1890); by Cust (2 vols.), rendered a very admirable translation into German. The classic monograph is by Plon (Paris 1882-84); others are by Fogolari, in Les grandes artistes (1900); Torelli (1903); De Ricci (Paris 1904); De Ricci (Paris 1903); Guillermier (Paris 1908); Hehn (Paris 1887); Friedländer (Berlin 1880-82). Consult also Symonds, The Renaissance in Italy (Vol. III, 1885); Leader Scott, Sculpture, Renaissance and Modern (1886).

Cellini's Autobiography. English readers are fortunate in that the translation by John Addington Symonds has made the Autobiography of Benvenuto Cellini (1500-71) a piece of English literature. The translation is prefaced by an admirable critical introduction, to which the student is referred for all questions of text and historical setting. We learn that the best has been valued by such a mind as Goethe's, who translated it into German; by Horace Walpole, who found it "more amusing than any novel," and by Auguste Comte, who placed it upon his list of necessary works. In the opening sentences Cellini states his opinion "that all men . . . who have done anything of excellence . . . ought, if they are persons of truth and honesty, to describe their life with their own hand." He stands before us painted in vivid colors, the typical artist-soldier of the Renaissance, vain and violent, industrious and energetic, sensitive to beauty if not to goodness, often the bully and braggart, but always the exquisite and indefatigable artist. One is interested to note the contrast between his character and his art. The latter, in such pieces as remain to us, appears florid, elaborated, sophisticated; while the former, in its grim lines, seems to be the exact reverse. A terrible man! someone termed him, and Cellini records the phrase with pleasure, "I am among the remnants of his exquisite workmanship."

His fame rests largely on his autobiography, a brilliant work, teeming with his loves and hates and the kaleidoscopic adventures of his restless career. Cellini is chiefly interesting not only as an artist, but also as a mirror of
CELLITES—CELLULOSE

successful, we rejoice in his triumph. We
dwell with him in the violent Italy of his day,
following the jests of his rowdy supper-parties,
his brawls, duels and escaped his journeys into
France. He is modern with those kings, Popes
and dukes who roused him to such impatience.
His careless amours, his candid vices, his fears
and superstitions, his illnesses and recoveries,
his injuries and revenges, are all told with the
quaintness through which Martin, 'Is is lies in
his incessant grumbling at his bad luck; in his
rough and savage humor, his quarrels with
Vasari and Bandinelli, his hearty admiration
for Michelangelo. Great persons pass across
his pages—Don Cosimo di Medici, Lorenaino,
Francis I of France. What turbulent vigor in
the episode of the bronze Perseus, or in that
of his return to find his family dead in plague-
stricken Florence! Such incidents as those of
the necromancer raising devils in the Coliseum,
or of the mad castellan, who fancied himself a
bat, are unforgetable etchings; while the effect
of the whole book is to revive for us a period
in the world's history which has incalculable
interest for the dissimilar world of to-day.

ANNA ROBSON: BURR.

CELLITES, or ALEXIAN BROTHERS,
a religious order, so called from their patron
saint Alexius, and from cella, tomb, from the
fact that their life often leads to an early grave.
The brotherhood arose in Mechin about 1300
to check the ravages of the "black death," and
soon spread through Germain, Brabant and
Flanders. At first the Cellites were merely a
pious society, intended to harbor the poor and
indigent free of charge, to serve the sick and
bury the dead. In 1469 they were organized
as a religious Order, and, favored by the Popes,
they established houses in many parts of
Europe. In the United States, they have a
hospital in each of the following cities: Chi-
ago (founded in 1861); Saint Louis (1869);
Oshkosh, Wis. (1880), and Elizabeth, N. J.
(1893). They have also asylums and hospitals
in England, Germany, and Belgium likewise.
Consult Steele, 'Monasteries and Religious Houses
of Great Britain and Ireland' (London 1903,
1910-13); and 'A Brief History of the Alexian
Brothers' (Chicago).

CELLULOID, an artificial substance in-
vented in its modern form by the brothers
Hyatt of Newark, N. J., in 1869 (U. S. Letters
Patent No. 88,634) extensively used as a sub-
stitute for ivory, bone, hard rubber, coral, etc.,
having a close resemblance to these substances
in hardness, elasticity and finish. It is com-
pounded of the lower nitrates of cellulose, gel-
atinized in a solution of camphor in methyl or
ethyl alcohol. The nitrates of cellulose are
usually prepared by subjecting tissue paper

to the action of a bath of mixed nitric and sul-
phuric acid for twenty minutes, and then
heating to a temperature of at least 30° C. The
resulting substance is dried by blotting or by
the use of alcohol, and incor-
porated by heat or mixture with alcohol, cam-
phor and any pigments or fillers that may be
used. The double mass of the resulting is
worked into form by various means, and these
seasoned by being kept from one to six weeks
at 30° C. to evaporate the alcohol. Urea is
often added as a stabilizer, and various sorts
of dyes or pigments may be used. Celluloid
is plastic at 75°. It is very inflammable. It is
used for films for cameras and moving pictures,
but on account of its excessive inflammability
is coming to be replaced by preparations of
the acetic-acid ester of xylite instead. Celluloids
for lacquering on metal are prepared
from various pyroxylon preparations and pig-
ments. Consult Bockman, 'Celluloid' (London
1907); Ertel, 'Die Celluloid Industrie' (1909);
Lehner, 'Imitationen' (Vienna and Leipzig
1907); Martin, 'Les Celluloides' (Marseille
and Marseille, Chemistry—Organic' (New York
1913); Masselon, Roberts, Ellard, 'Lecelluloid'
(Paris 1910; translated 1912); Worden, 'Nitrocellu-
lose Industry' (London 1911).

CELLULOSE, a chemical substance
closely allied to starch, which occurs in all
plants, where its compounds form essential
constituents of the walls of the cells. It is
especially prominent in young plants, and with
age it becomes more or less completely con-
verted into lignin and other analogous prod-
ucts. Cellulose can be readily digested and
absorbed by herbivorous animals, but to a slight
extent by man. Cotton fibres are com-
posed almost entirely of cellulose, and such
other substances as they do contain are readily
removed by treatment with alkalis, alcohol,
ether, etc. Wood and all textiles of plant
origin are mostly compounds of cellulose. Cellulose has
the chemical formula (C6H10O5), and is there-
fore a carbohydrate. In some respects, it is
widely different from starch, but in others it
resembles starch very closely. It may be said
in general that the chemistry of all the sub-
stances that are intimately related to the
starches, gums and sugars is still very imper-
fectly known. Cellulose is specially remark-
able for its insolubility and its chemical stabil-
ity. It may be decomposed and caused to enter
into combination with other bodies, but the
only solvent known, which will dissolve it
without destroying its chemical identity, is an
ammoniacal solution of cupric oxide. From
its solution in this menstruum, cellulose may be
again precipitated in apparently unchanged
chemical form, though in a physically amor-
phous condition. Unglazed paper (which is
nearly pure cellulose) is converted, by the
action of strong sulphuric acid, into a parch-
ment-like substance that is known as vegetable
cream: O. The cellulose is converted into nitrates, the
higher ones of which are commercially known
as gum-cotton (q.v.). Collodion (q.v.) is a
solution of the lower nitrates in a mixture of
ether and alcohol. Celluloid (q.v.) is a mixture of
the lower nitrocelluloses with camphor.
Acetates of cellulose are formed by treatment
with acetyl chloride, and are often used as
substitutes for celluloid, being less inflammable,
non-porous and as insulating films. Formaldehyde is also used in this way. Xanthogenates of cellulose are used
in the production of certain forms of artificial
silk, leather and wood. Alkalis react with

cellulose, causing it to contract (see MERCERIZED
Corrosion). By the action of strong acid cellulose is partially converted into glu-
cose, and various other reactions are also
known with sulphuric acid according to the
conditions under which the experiment is made.
When strongly heated out of contact with the
air cellulose is destroyed, with the formation
of acetic acid, methyl alcohol and many other products. These transformations occur in the distillation of wood in the manufacture of wood alcohol. (See Alcohol.) It is probable that true cellulose occurs only in plants; but a substance that is closely analogous to it, and which is believed by some authorities to be identical with it, is found in the tissues of ascidia.

Cellulose as prepared from corn pith has been used to a considerable extent in ships of war, to prevent the entrance of water through shot-holes. For this purpose it is disposed within the steel hull along the water line, in the form of a belt some three feet in thickness. For several years a packing of cocoa fibre was used in this way, but corn pith is now preferred, because as soon as the water reaches it the pith swells and automatically closes the shot-hole. Consult Bersch, 'Cellulose' (Philadelphia 1904); Cross and Bevan, 'Cellulose' (London 1907); Researches on Cellulose (ib. 1901, 1906), 1911; C. W. Wall, 'Winepulp and Its Uses' (ib. 1911); WORDEN, 'Nitrocellulose Industry' (ib. 1911); SCHWALBE, 'Die Chemie der Cellulose' (Berlin 1911).

CELMA, a Thessalian woman, who, with her husband, Celmus, was changed into adamant for denying the immortality of Jupiter.

CELMAN, Miguel Juarez. See Juarez, Celmam.

CELSIUS, stl'sius, the name of a Swedish family, several members of which attained celebrity in science and literature: 1. MAGNUS CELSIUS: b. in the old province of Helsingland 1621; d. 1679. He became professor of mathematics in the University of Upsala and published two works on the antiquities of his native province and was the discoverer of the Helsing runes. Besides mathematics and archeology, he cultivated poetry with some success, and was so skilled in practical mechanics that he himself made all the scientific instruments he required in his astronomical observations, etc. 2. His son, NILS CELSIUS: b. 1658; d. 1724; also filled the mathematical chair in Upsala University. 3. OLAF CELSIUS, another son of Magnus: b. 1670; d. 1736. He early became famous as an earnest student of the oriental languages and of botany. He was successively appointed to the chairs of Greek, Oriental languages and theology, and filled the office of provost of the cathedral at Upsala. He devoted a good deal of attention to the study of runology and was among the first to recognize the genius of LINNEUS, whom he liberally patronized. In 1745-47 he published his voluminous work, 'Hierobotanicum,' a description of all the plants mentioned in the Bible, 4. ANDERS CELSIUS, son of Nils Celsius, and the most distinguished of the family; b. 27 Nov. 1701; d. 1744. After being appointed professor of astronomy at the University of Upsala, he traveled in Germany, England, France and Italy. At his instigation the observatory at Upsala was built, and he became its first director. In 1736 he took part in the famous expedition that was undertaken by Maupertuis, Clairaut, Camus and others for the purpose of measuring a degree of the meridian. For his share in this expedition he received a pension from the French king. He is best known at the present day as the constructor of the Centigrade thermometer. He urged the adoption of the Gregorian calendar. He published 'De observationibus pro figura Telluris' (1738). 5. OLAF CELSIUS the younger, son of the Orientalist and naturalist, and cousin of the preceding: b. 1716; d. 1794. He became bishop of Lund, and devoted himself to historical and juridical studies. His principal historical works are 'Ecclesiastical History of the Kingdom of Sweden'; 'The History of Gustavus 1'; 'History of Erik XIV.'

CELSIUS SCALE, the Centigrade thermometric scale. The name is from that of the inventor, Anders Celsius, who about 1741 attempted the precise graduation of thermometers. He took the melting-point of ice at 0°; and the boiling-point of water, under standard atmospheric pressure, as 100°. See THERMOMETER.

CELSUS, pagan philosopher, an antagonist of the Christian religion in the 2d century. He is believed to have been the same Celsius, friend of Lucian, to whom Plutarch, and Stobaeus, and Scaliger, and Scal. D. W., and other later writers, borrowed their historical sketch of the life of the noted impostor and pseudo-thaumaturgus Alexander of Abonotichus, entitled 'Pseudomantis.' No work of Celsius has come down to us in its integrity or in its original form, but his 'True Discourse' is in substance preserved for us in the eight books of Origen's computation of the arguments brought by Celsius against the truth of the religion of Christ. It was written at Rome in the latter part of the 2d century. Origen quotes textually long passages from the 'True Discourse' in his work 'Against Celsius.' From these passages it is seen that Celsius had accurate knowledge of the religious creed and practices, both of the Jews and Christians, and he skilfully puts in the mouth of a Jew his criticism of the life of Jesus as told in the Gospels. Celsius himself appears to have been an epicurean and a scoff'er at the supernatural, while his Jew is a firm believer in miracle, but for all that he cannot accept the Gospel stories. He rejects the doctrine of the Incarnation of God, and reports a scandalous story of an amour which he offers as a substitute for the evangelists' narrative; and the fact Origen quotes the passage, became mingling this shocking and tendentious suggestion (as it must have been regarded by him) is evidence that the Christian polemist is dealing fairly with his antagonist. According to Celsius, Jesus once visited Egypt and there learned the art of the jugglers; in his own country he easily won reputation as a wonder-worker, even a god. By his jugglery he might have made the multitude present at his immolation by John in Jordan believe that they heard a voice from heaven. If he was God, he would have made a better choice of apostles: why did he choose Judas? The story of the resurrection is self-contradictory. His death by crucifixion is undisputed and was a fact of public notoriety; if he rose from the dead, why did he not make the fact equally notorious and public? With such objections Celsius attacks the Christian faith in the first half of his work; in the second half he speaks in the person of a Grecian philosopher. Whatever is true and good in the Christian system exists already in the schools of philosophy; therefore, let the Christians abandon their narrow sectarianism and separatism and combine with all good and wise men in upholding the principles of good
government. Celsus then advances philosophical arguments against the credibility of the Christian mysteries, in particular the Incarnation. God cannot assume a mortal body either in reality or in appearance only: not really, for that would be contrary to his nature; not in appearance, for that would be a fraud. But the idea of an incarnation of God is absurd: what could be gained by an incarnation? Certainly no advantage for God; but neither for men: do men know God better for seeing him in bodies, or for that would we a fraud. But to conform outwardly to the state religion. Consult Pelagaud, 'Etude sur Celse'; Moeller, W., 'History of the Christian Church' (Vol. I, pp. 159ff); Harnack A., 'Expansion of Christianity' (Vol. I, p. 159ff); Froude, J. A., 'Short Stories' (No. 4).

CELSUS, Aurelius, or AULUS CORNELIUS, Latin writer on medicine who lived probably, under the reigns of Augustus and Tiberius. He has been called the Roman Hippocrates, because he imitated the Greek physician, and introduced the Hippocratic system into Rome. He also wrote on rhetoric, the art of war and agriculture. He is, however, best known as a medical writer. His style is elegant, and, though concise, is very perspicacious. His work on medicine is an inexhaustible source from which other authors have drawn materials. Eighty editions of his eight books 'De Medicina' have appeared; the first at Florence (1478). There is an English translation by Grieve (1756, 3d ed., Edinburgh 1837), and an edition, Latin and English, by Lee (1831). The edition by Védrennes (Paris 1876) contains a French translation. The standard text is that of Daremberg (Leipzig 1859).

Celtiberi, a people of ancient Spain, supposed to have arisen from a union of the aborigines, the Iberians, and their Celtic invaders. Various limits have been assigned to their country, which included probably all the north of Spain as far south as the sources of the Guadalquivir. They were divided into four tribes and were of the bravest and best of all the peoples of the peninsula. They excelled equally in cavalry and infantry. Hannibal subdued the Celtiberi, and they afterward passed under the Roman yoke. They revolted in 181 B.C., and were subdued by Tiberius Gracchus 179 B.C. Two struggles for independence followed, called respectively the first Celtiberian Numantine, and the second Celtiberian or Sertorian, wars, in the latter of which they were totally vanquished and after 72 B.C. do not again appear in history.

Celtic Church, kët'ëlk, the name applied to the Christian Church in Great Britain and Ireland before the mission of Augustine (597) and which for some time thereafter maintained its independence by the side of the new and growing Christian Church of Gaul. The origin of the Christian Church remains in obscurity. There are sufficient records, however, to prove that throughout the 4th century there was a well-organized Church in Britain which stood in constant touch with the rest of the Church, particularly in Gaul, and considered itself an active part of that body. In the 4th century, there are records of bishops, but for a hundred years after the mission of Germanus (429) nothing is heard of the Church in Britain. The Anglo-Saxon conquest drove the Britains to the mountains of the West, where, in the 6th century, Christianity again became prominent. There were several minor differences between the Roman forms. The date of Easter, according to the former, followed the Eastern calendar; and there were also divergences in the methods of administering baptism. The coming of Saint Augustine in 597 introduced the Roman form of Christianity which gradually gained precedence over and absorbed the Celtic. In 777 its ascendency was complete in Britain and South Wales. Still the Celtic Church continued farther north until 1172 when Queen Margaret introduced complete reforms.

In Ireland, there is much controversy concerning the foundation of the Church, which indicates that Christianity was brought from Britain to Ireland as the natural result of the close intercourse between those countries. The establishment of the Church itself seems to have been an outcome of the first mighty wave of monasticism which swept from Egypt over Gaul and Britain and carried a number of half-Romanized Christians to Ireland. The first important figure in the history of the Church in Ireland is Saint Patrick (q.v.), who converted the island and was most active in preaching and founding churches. In the region now known as Scotland, Ninian, Saint Columba and their fellow apostles established institutions which were monastic and missionary in nature. From Iona (q.v.) as a centre, the movement soon embraced all of Northumbria. The Celtic Church there was finally fused with the Roman in 604; and the Scottish and Irish churches lost their individual character in the same year, from which time their histories are identical with the Roman Church. See CELTS.

Celtic Languages. The Celtic languages are the most westerly representatives of the Indo-European (better called, as more clearly indicating their origin, or Indo-Celtic) family of languages, all of which descend from a common origin, with a general system of sounds, roots, and construction; they
have been spoken by different branches of the Celtic peoples (q.v.) from prehistoric times to the present day. The Celtic languages are more closely related to the so-called centum, or western, group (Italic, Greek, Germanic) than to the autum group (Armenian, Albanian, Balto-Slavic, Indian, Persian). This classification may be ignored, however, as may the one which, though correct in a purely linguistic sense, divides the Celtic languages into a K group (Goidelic and Brythonic) and a Q group (Gaulish and Brythonic), because this criterion, besides attaching overmuch importance to a single fact of consonantism, collocates two languages, one of which (Gaulish) is practically unknown, and separates two others (Goidelic and Brythonic), both of which are well known and possess many features in common. The most notable characteristics which set off the Celtic languages from the other members of the Indo-Celtic family are: (1) The fall of initial and intrusive th (i.e., English, Old Irish, other). This change, which is common to both branches of Celtic, took place before 1000 a.c. and before the Goidelic Celts separated from the Brythonic Celts and the invasion of Britain; (2) the change already referred to (viz. of qu to k and qu to l) which took place before the Goidelic invasion and the invasion: cf. Old Irish cóisc, Old Welsh pimpl, *five*; (3) the change of Indo-Celtic *t* to Celtic *th*: cf. Lat. velur, Old Irish *fhr*, *true*; (4) the change of vocalic *r* and *l* to *ri* and *li*: cf. Gk. sapio, Old Irish *cride*, *heart*.

Within the Indo-Celtic family Celtic is most closely related to the Italic dialects (including Latin), so much so as to form an Italo-Celtic linguistic unity, because of their having, inter alia, similar deponents and passives in -re, a b future and other tense formations in common, the suffix -io- to form abstract nouns, the genitive singular of masculine and neuter os-stems in ő, and many words closely related etymologically. These two branches are therefore more closely related linguistically than, for example, the two classical languages, Latin and Greek, and must have been spoken by a people who remained united and shared the same development for a long time after they had parted from the rest. The outstanding characteristics of Celtic (beside an extreme irregularity of verbal forms and the order of words in the sentence) are (1) the variability of initial and medial consonants. Though traces of similar initial mutation are found in the most various branches of the Indo-Celtic family, it is only in Celtic that the principle developed and became a regular system. The phenomenon is to be explained by the fact that here more than in any other language closely related words are grouped into a unity which dominates the entire mechanism of the language, without with the same after-effects of vowels and consonants, which largely take the place of inflection, there would be no such thing as syntax in Celtic. Unschooled Irishmen, Welshmen and Bretons operate these initial mutations to express often a very delicate shade of meaning with the same assurance as their ancestors 1,500 years ago. It is most convenient to classify the Celtic languages geographically as (1) Continental (or ancient) Celtic and (2) Insular (or mediæval and modern) Celtic. By Continental Celtic is meant the Gaulish spoken, e.g., in Gaul in Caesar's time, in Spain and northern Italy. All we have left of it are a few inscriptions, some in the North Etruscan alphabet of the 2d century B.C., some in the Greek alphabet or in the Latin alphabet of Roman Imperial times, many of men and places in classical texts and on coins, and glosses of foreign writers. But no Gaulish literature, not even a fragment of a written text, has been preserved. From the material at hand it is improbable that Celtic speech was pretty uniform in the vast territory over which the Celts held sway. Celtic survived in Gaul alongside Latin, and also among the Galatian Celts in Asia Minor, at least until the fall of the Roman empire. It was quite forgotten by the 6th century and has left only a few traces in the Romance and Germanic languages. Consequently the Celtic idiom spoken in the Armorican Peninsula (Brittany) is not a survival of the Gaulish nor, in spite of its geographical position, does it belong to Continental Celtic, but is the language carried thither by Britons who had been driven from their homes in Cornwall by the Saxons in the 5th, 6th and 7th centuries.

Each branch of the Insular Celtic comprises three languages: (1) Goidelic (called Gaelic by all its speakers) comprises (a) Irish or Irish Gaelic; (b) Gaelic or Scotch Gaelic, sometimes improperly called Erse, i.e., *Irish*. This dialect was brought over to Scotland since the end of the 5th century by the Scotti, i.e., *the Irish of Ireland* who gave their name to the north of Britain; and (c) Manx. Linguistically these are really nothing more than dialects of one language. Until the end of the 18th century, though spoken Irish and Gaelic had diverged to a considerable extent, there was a common literary language among them. Of all the Celtic languages Irish is by far the most important and may be regarded as the classic because of its wealth of forms and abundance of material. The transition from Old to Modern Irish is very gradual. Old Irish is the language of the period from c. A.D. 750 to c. 1100. Most of the Old Irish material has been several times published, but most completely and conveniently by Stokes and Strachan in their Theaurus Paleohibernicus, or Middle Irish (sometimes divided into Early Middle Irish and Late Middle Irish) extends roughly from 1100 to 1500. It is the language in which the great collections of religious and profane Irish literature have come down to us, and is distinguished from Old Irish chiefly by the weakening of vowels in unaccented syllables and the reduction of flexional forms. So far the language is not the popular language but rather that of literature and remarkably uniform, in spite of the division of the country into many chieftainships, and the division of great varieties in orthography. With the beginning of the modern period (from c. 1500 to the present day) dialectic differences become more pronounced and it is now customary to name the Irish dialects after the great divisions of the country: Conmacht, Munster, Leinster, Ulster, with many subdivisions. Sister language to Irish is the Scottish Gaelic with two main (northern and southern) and many sub-dialects. Southern Scottish Gaelic is the more Irish, better preserved the inflections and
is the form used in literature. The oldest document, 'The Book of Deer,' dates from the 11th or 12th century. Modern Gaelic has far more borrowed words than Irish, chiefly from English and Norse. Manx occupies a middle place between Irish and Scotch Gaelic. Its most noticeable feature is its peculiarity and firmness of phonetic spelling, using the signs and sounds of the English alphabet.

II. Were it not for a common vocabulary and syntax, the Brythonic group of Celtic would have been separated, at least since the Christian era in Britain, by an unbridgeable gulf from the Goidelic. This cleavage is observable from the earliest monuments and is chiefly due to the following factors: (1) The different treatment of Indo-Celtic \( p \) which at a very early period became \( ph \) in Brythonic but which in Goidelic was for a long time preserved and then, even in the oldest Irish, changed to \( k \) (written \( c \)). Gaulish agrees in making this change with Brythonic and Irish but now, like the Celtic, it may be, to that extent at least, regarded as a prehistoric type. E.g., Gaulish \( p e m e \), “five,” Old Welsh \( pemc \), Breton \( pemp \), Old Irish \( c c i c \); Old Irish, \( mac \), Welsh \( map \), “son.” (2) The different treatment of \( c \) and \( g \) in Goidelic (with dialectical exceptions) and on the first syllable but in Brythonic on the penult. This is one of the principal reasons for the profound differences which separate the declensional and conjunctural systems in these two groups of languages. (3) Contact with the Romans, as a result of which many more Latin words were introduced into Britain than Ireland and the language of the former became much more simplified and “civilized” in its grammatical structure than that of the latter which remained native, wild, unspoiled and, for that reason, more interesting. Unlike the speakers of Gaelic the speakers of Brythonic have no common name for their languages. Of this group Welsh (native Cymric) is the most important. Spoken Welsh is commonly divided into four dialects, in the northwest, the northeast, the southeast and the southwest of the Principality, but with relatively slight differences. Old Welsh extended as far as the end of the 16th century, but the Welsh language became synchronous with Middle Irish. Cornish (native Brethonic) is, since the end of the 18th century, a dead language. With Breton it forms a close group over against the Welsh. Of Breton (native Bretonk), sometimes called Armorican Breton, there are four main dialects: Leonard (spoken in Finistère and the most literary dialect), Trégorros, Cornouailles and Ynmetal, the most distinctive.

Celtic, once spoken almost over the length and breadth of Europe, no longer survives in the extreme northwest where it is subordinate to the English and the French and exists as it were by the sufferance of those two languages over which it once was mistress. Of the languages of Europe, Irish, farthest to the west, forms a pendant to the Greek, farthest to the east. Moreover these have the following in common, namely, that they have both fallen low from the place they once held as the cultural languages of Europe and that they are the only languages in which archaic and modern rich literatures independent of foreign literatures. The five surviving Celtic languages are spoken in the southwest, west and northwest of Ireland, in the Hebrides, parts of the Scottish Highlands, in some fishers' huts in the Isle of Man, in most parts of Wales and in lower Brittany. Including the Celtic speakers in Australasia, Canada, the United States and other lands to which the Celts came as colonists, the Celtic languages are spoken by approximately 3,500,000 souls, of whom perhaps 1,000,000 are monoglots. Of these over 1,250,000 speak Breton; nearly 1,000,000, or about half the population, Welsh with 250,000 monoglots; nearly 750,000, of whom about 28,000 speak nothing else, Irish; about 250,000, with about 25,000 monoglots, Scottish Gael, and about 4,500, Manx. The most marked falling off in the use of any Celtic tongue is to be seen in the case of Irish which only about 60 years ago was spoken by more than 3,000,000 persons, of whom 1,000,000 spoke only Irish. The Celtic languages are more flourishing now and receive more official and academic recognition than at any time in their long history. Of all the countries which are at present engaged in the work of the Celtic revival, Ireland is probably the only one in which the movement embraces the whole of the national life. In Wales the situation of the national language (largely due to the Methodist revival) is still far and away beyond that of the other Celtic countries, but for that very reason, perhaps, conscious progressive effort is less strenuous than in Ireland. The Pan-Celtic Union was organized a score of years ago to make known to the world the desire of the Celts to preserve their nationality and to develop the treasures of language, literature, art and music which they have inherited from their ancestors.

CELTIC LITERATURES

JOSEPH DUNN, Professor of Celtic Languages and Literatures, Catholic University of America.

CELTIC LITERATURES. We have no information as to the literature of the Gauls, if they ever had one, which is not likely, since writing was forbidden to the Druids, who were the repositories of lore and learning among the ancient Celts on the continent of Europe. If they had a national alphabet, it must have resembled the runic characters employed in north European countries. In Caesar's time the Greek alphabet was used to some extent amongst them.

Among the insular Celts the oldest sources of the native language are Irish inscriptions which were cut in stone or on bronze. The most ancient inscriptions are those cut horizontally or slantingly cut, and dots below and above a line made of the edge of an upright stone pillar. Of course this cumbersome method of writing was not used for literary purposes but merely to commemorate the name of the dead. There is no doubt that the various Insular countries, as elsewhere, the native tradition was originally and for ages only oral. The very earliest literature of Ireland, which dates from the period of the conversion of the country in the 4th century, is in Latin. The national literature, in Gaelic, first appears in the 8th century at the time of the foundation of the great schools and the activities of the Irish missionaries and scholars on the continent.

I. Irish Literature.—The Gaelic literature of Ireland is vast in extent and rich in quality, and in many respects it is one of the most fascinating literatures of Europe. Yet in spite of its interest and value and of the fact that it is the oldest existing literary language of any of the peoples living to the north of the Alps, such has been the neglect with which it has been treated that even to this day no satisfactory history of it has been written. Though the quantity of this literature that has been published is enormous, it is only a fragment in comparison with what still lies hidden in manuscript. There are thousands of unpublished Irish manuscripts of all kinds ranging from the 11th to the early 19th century, containing material much more ancient, and perhaps as many more have perished. These manuscripts have to be collated and the vast material edited and explained and questions of age and source settled, before anything like a complete history of Celtic literature can be written. The oldest monuments of Celtic, next to some scanty remains of Gaulish and the ogham inscriptions, are thousands of Irish glosses which date from the 8th and 9th centuries. These glosses are found between the lines or on the margins of several Latin manuscripts which are kept, for the most part, in continental libraries at Würzburg, Karlsruhe, Milan and Turin. Texts and glosses show a profound theological and grammatical training and wide reading on the part of the scribes, not only in biblical and patristic literature but also in the classics of pagan antiquity. This gloss material is of scarcely any literary value, however, and is valuable only for the history of theology and the structure of Celtic grammar. In no country did Christianity penetrate more profoundly than in the Island of Saints, and on no literature did it leave a deeper impression than on Irish. The oldest texts in the language are religious, such as the glosses to the Psalms of St. Paul and to the Psalms, already referred to, a homily and a tractate on the Mass. Only a few of the hymns in honor of the saints of Ireland have been published. Some of these works are translations or imitations of Latin texts but most of them are genuinely Irish and include popular lives, passions and miracles of saints, pious stories and anecdotes, prophecies, prayers, homilies, hymns called litica, corset or defense, and omo, orologies; in short, religious compositions of the most varied kind and of the greatest value for the history of hagiology and liturgiology and of western Christianity in general. The apocalyptic visions are a peculiar Irish product, although some of them, consist of lines horizontally cut, and dots below and above a line made of the edge of an upright stone pillar. Of course this cumbersome method of writing was not used for literary purposes but merely to commemorate the name of the dead. There is no doubt that the various Insular countries, as elsewhere, the native tradition was originally and for ages only oral. The very earliest literature of Ireland, which dates from the period of the conversion of the country in the 4th century, is in Latin. The national literature, in Gaelic, first appears in the 8th century at the time of the foundation of the great schools and the activities of the Irish missionaries and scholars on the continent.
the ecclesiastical calendar. The most important is known as the Féilire of Oengus. In modern times the best known religious compositions are the moral essays, 'The Three Shafts of Death' and 'The Key Shield of the Mass,' by the 17th century priest-historian, Geoffrey Keating, whose works are regarded as the model of modern Irish literature. Prior to the invention of printing early Christian Ireland, most of whom were religious, were also interested in preserving the secular literature of their country. It is to them that we owe the compilation of the great collections known as Leabhar na hUidhre, 'The Book of the Dun Cow,' dating from the 11th century, the Book of Leinster, dating from the 12th, the Yellow Book of Lecan, from the 15th, the Leabhar Breac or 'Speckled Book,' from the 14th, the Book of Ballymote, and other manuscripts of miscellaneous contents which, though some of them are as late as the 18th century, contain material which can be traced back without a break to the 8th or 9th century. The early non-religious literature of Ireland was preserved in Ireland for over a thousand years by historians or poets called swid, whom the kings and chieftains of Ireland supported at their courts to sing their exploits, write their annals and preserve the legal tradition. They followed a regular plan of education and were organized into classes, each rank enjoying certain privileges and monopolizing a certain number and variety of stories. Their chief, the ullahm, was supposed to know 250 prime tales and 100 of secondary importance.

Foremost among the tales are the epics, which for richness and originality have no equal in western Europe. Though many of them have been published, some 300 or 400, belonging to the greater or smaller cycles, still remain unedited and untranslated. They are in prose interspersed with verse and show an extraordinary perfection in the art of narration. The Irish literati arranged them under several heads, probably as an aid to memory. The subjects are such as wars, sieges, expeditions, battles, border forays, cattle-rafts, tales of heroes, great feasting and eloipements. Here it will be more convenient to group them broadly according to some time chronologically into three great cycles. The oldest and the one we know least perfectly is the Mythological Cycle, which consists chiefly of accounts of the migrations of the races or tribes who successively peopled Ireland. How far we have here merely a euhemerizing of the old Celtic pantheon and how much, if any, is based on historical events, it would be impossible to say, for only a part of it has been preserved. To this group belong some wonderful tales of rebirth, among which the story of Bran, the son of Bel, is the most famous. The best known of the three cycles is the Heroic, called also the Cycle of Ulster, or of the Red Branch. The tales belonging to it bring into view the warriors of Ulster and have at bottom the rivalry and conflict between that Province and the rest of Ireland, especially Connacht. Though the saga element is predominant here, the background is unquestionably historical. The events narrated are supposed to have taken place at about the beginning of the Christian era. The subjects are most often of tragic interest and many of the smaller tales served as introductions to the grandest and most epic composition of them all, the Cattle Raid of Coole. The outstanding characteristics of style in the Irish epic tales are movement, life, relief and realistic description. The Fenian or Ossianic Cycle points to the south of Ireland as the place of its origin. It deals with Finn MacCumhaill, his son Ossian (Ossian), and the other chieftains of the Fianna (Fenians), half soldiers, half hunters, who seem to have flourished in the 2d and 3d centuries of our era. While the two cycles previously spoken of have been handed down almost entirely in prose, the Fenian Cycle is in verse and the poems and ballads of which it is composed are on the greatest variety of subjects and almost without number. Some of these are unmistakably imitated from stories belonging to the earlier groups, and, while many of them contain nothing historical but a few proper names, there can be no doubt of the existence of their principal characters. The most extensive text, and at the same time one of the principal sources of Ossianic poetry, is the Colloquy of the Aednand Cogad Conaithi, from which cycle are a large number of romantic tales which are even now alive in Gaelic Ireland and Scotland. To the comparatively smaller saga-groups belong the lombrambha or 'Sea-voyages,' a literary genre as well as a contact with the Celts. These voyages were undertaken by pious pilgrims who, in search of the Land of Promise or of nothing more than a place of retirement and prayer, trusted themselves in a frail bark on the ocean to the will of God. They seem to have taken place in the 6th and 7th centuries when the Irish missionary spirit was most fervent. The most famous examples are the Voyage of Saint Brendan and the Voyage of Mael Duin. There are many other interesting tales of adventure in early Irish literature. Most of them are of native origin; for others the Irish story tellers got their characters and scenes from Greece, Norway and the Orient. Classical and medieaval literatures also had their influence, and the imitations which the Irish made of them, such as the versions of the Odyssey, the taking of Troy, Theseus and the Minotaur, Philip and Alexander, the loves of Dido and Aeneas, show what foreign books were made in monastic Ireland. On the other hand, from the days of the literature of the Celts have come the influences which have revolutionized European art. For the Arthurian romances, the Tristan and Grail sagas and the germ of the Divina Commedia, the world is indebted, and in the last analysis to Irish imagination. In Ireland, as in all Celtic countries, is to be found the oldest vernacular prose and poetry and the most developed folklore in western Europe. Much of this has been published, but it represents only a small part of the great body of tradition. The earliest annals of Ireland have not been preserved. That they existed is proved by later citations. The oldest extant are the Annals of Tigernach (died 1089), of Innisfallen, of Leinster, of Boyle, of Ulster, of Connaught, of Loch Cé, the 'Chronicon Scotorum,' and those of the Four Masters; in all, they range from the 11th to the 17th century. There are many smaller annals and works on genealogy, geography, topography, and in many cases, the learned compilations of Geoffrey Keating in his 'History of Ireland' (1629). The in-
terpretation of Irish law was originally in the hands of the *fidl*, later on of the brehons or "judges." This law is strictly native and extremely interesting. The principal treatises are made up chiefly of texts read and decisions rendered in the Irish law schools. Most of the manuscripts on the subject date from the 16th century, but according to tradition the texts go back to the 4th and 5th centuries. The largest and most important collection is known as the *Senchus Mór,* which deals with all possible personal relations. There are also treatises and compilations of all kinds, on medicine, pharmacy and astronomy, but especially on Latin and Irish grammar and Irish metrics, both of which were favorite studies with the ancient Irish. Valuable native glossaries, such as Cormac’s of the 9th century, O'Mulconry’s and O'Davoren’s, have been preserved; they consist of words which had become archaic in the time of the compiler and which he explains in more modern Irish.

I. Welsh poetry is very largely on topographical, geographical, historical and chronological subjects and of little poetic value. It is the production of the learned court poets in their official capacity as historiographers, whose business it was to praise a king or family or character. The deal in the rest of interest only for history proper and for the history of the Irish language. Of late years, however, attention has been directed to the genuine old Irish lyric poetry. This is of very high quality and shows, among other things, that in the literature of the Irish, much earlier than in the literature of any other people, the love of nature found expression. From the 17th and 18th centuries, the flourishing period of Munster poetry, to the present day, though hundreds of poems are irretrievably lost, the production has been so great that out of those poems alone could be written a history of modern Ireland.

II. Scottish Gaelic Literature.—The attention of the world was first called to the literature of the Gaels by the publication, in 1760, of some fragments of Gaelic poems, purporting to be genuine Gaelic ballads, by the ingenious Scottish Highlanders, James Macpherson. His *Fingal,* which appeared in 1762, had an enormous success in the 18th and 19th centuries in France and Germany. Manuscripts containing Scottish literature are neither so old nor so numerous as the Irish and are generally posterior to the 16th century. The oldest is the Book of Deer, a gospel-book of the 9th century in Latin but containing half a dozen words in Scottish Gaelic of the 11th or 12th century. The Gaelic literature of Scotland is almost exclusively in verse. The prose, of which much less is known, belongs chiefly to religious literature, which has been extensively cultivated since the Reformation. The first printed Gaelic book was the translation, in 1567, by Bishop Carswell of John Knox’s *Prayer Book.* There are many fine collections of hymns from modern times; the most celebrated of the religious poets was Dugald Buchanan, who was born in 1710. The oldest and most precious collection of poems is known as the Book of the Dean of Lismore (James Macgregor) and is now kept in the Advocates’ Library, Edinburgh. It was compiled at the time of the transition from Irish to Scotch Gaelic, and contains some 30 Osissian poems. The subjects treated are about the same as are found in Ireland, which is to be expected, since the literature of Scotland, in its earlier stages, drew its inspiration and themes from the motherland. In fact, the early poetry of the two countries is so closely intertwined that distinction is scarcely possible. Compositions of the Scottish tales deal with the older, or Ulster, cycle. Most of them deal with the deeds of Finn and his companions, and it is this so-called Osissian cycle which has taken on a new life in the Highlands. Much of this ballad material, though appearing only in later texts, can be traced back to the 12th century or earlier. But it is not so much in compositions whose subjects were derived from the epic legends common to Ireland and Scotland that the great richness of Scottish Gaelic literature consists, as in ballads which sing of events in the history of the country or were inspired by the observation of nature. Only the most eminent of the surprisingly great number of poets and poetesses who flourished from the time of the *Leabhar na Peinne* (1650-1720) to that of our contemporary, Mary Macpherson, poets of whom any country might well be proud, can be mentioned here. Alexander Macdonald and Duncan Bàn Macintyre, both of the 18th century, are the most pleasing and may be called national poets of Scotland. To the same century belong Robert Mackay (Rob Donn), distinguished as a satirist, and William Ross, at his best as a poet of nature, James MacGregor and Ewan MacLachlan. In addition to the work of the known poets, there are great collections, such as the *Leabhar na Gleann,* and the *Leabhar na Peinne,* and anthologies and periodicals containing an immense quantity of anonymous verse and one of the richest literatures of folklore, popular sayings and proverbs in Europe.

III. Manx Literature.—Almost all the Manx texts which have been printed are of a religious character, namely, the Bible, finished in 1775, the Book of Common Prayer, with the Psalms (1610), and Bishop Wilson’s sermons (1783). But the Isle of Man had a share in the earliest legends which take the place of history in Ireland. Some of the figures of the Ulster saga are found in Manx tales, and it is likely that the *Maa Rorr,* that is, the great writers of that island, were Manxmen themselves. The most original feature of their literature, however, is the carols or carvels which are still sung on Christmas Eve in the churches at the service called in Manx *Oiel lorry,* "Mary’s Eve." Only a small part of these have been published. There is, besides, a fair amount of folklore, some of which consists of tales belonging to the Gaelic stem and, in 1796, Th. Christian translated into Manx a part of Milton’s *Paradise Lost.*

IV. Welsh Literature.—Welsh literature is neither so old, so original, nor so varied as Irish. It has nothing to compare with the Irish epic tales, and the oldest form of Cymric speech consists only of glosses to Latin works in the 9th and 10th centuries. Nor has it any such yvellum codices as those mentioned under Irish literature. The oldest and most important manuscripts are the Black Book of Carmarthen, a collection of poetry belonging to the end of the 12th century; the Book of Aneirin, of the middle of the 12th century; the *Mabinogion;* Taliesin, of the end of the same century; the White Book of Rhydderch, and the Red Book
of Hergest, both of the 14th century. The Mynfrian Archytology of Wales, published in 1801, is an enormous, though uncritically edited, collection of old poetry, and other anthologies have appeared since and down to the beginning of the 18th century. The oldest literary pieces are poems ascribed to Aneirin, the author of the heroic poem, the 'Gododdin,' to Taliesin, called 'The ear of the bard,' and other anonymous works. Hên, 'the aged,' author of elegies, all of them bards who, according to tradition, lived in the 5th century. Some poems are even ascribed to Myrrthi (the celebrated enchanter Merlin), but, even though the language of these poets is dark and obscure, it cannot belong to that period. The oldest literary prose texts were not composed before the 12th century. The ancient laws of Wales, codified by King Hwel Dda, 'Howel the Good,' who lived in the first half of the 10th century, are unaffected by foreign influences and are of importance both for the science of law and because they show the life, manners and social conditions of the insular Britons in the early Middle Ages. The others are the 14th century law books from the 11th to the 14th centuries, containing the laws arranged according to three divisions of the country. All the Welsh epic romances are in prose, as in Irish, but without the interpolation of verse passages. The oldest and most famous are known as the 'Mabinogion,' by which is meant a collection of tales, marvelous or romantic and of divers nature and origin. The redaction, as we have it, cannot be earlier than the end of the 12th century, and the Red Book and the Green Book, in which the tales are preserved, date from the 14th, but the legends which compose them certainly record traditions that were in circulation ages before. The word 'Mabinogion' is the plural both of 'Mabonog,' a disciple or aspirant bard, and of 'Mabonogi,' meaning the state, condition or training of a 'Mabonog' or his literary stock-in-trade. The 'Mabinogion' differ greatly in character and in age. Of the 12 tales which are comprised in the collection, only four are 'The Four Branches,' slightly called 'Mabinogion.' Some of them deal with persons and events of a very remote antiquity; others belong to the age of chivalry. However, Welsh literature may be related to Irish, it shows a common origin with it, but the relations between these two bodies of romantic fiction have not yet been satisfactorily determined. The oldest historical writings in Wales are in Latin, but there are chronicles in Welsh, called 'Bruts,' after Brutus, the eponymous hero of the Britons, and genealogies. Medicine was a favorite study in old Wales, and some fragments of recipes for curing ailments and precepts of hygiene as well as some tracts on physics and natural history have been preserved. The early Welsh bards were greatly given to abstractions and fine-spun distinctions, and their thoughts were further hampered by the complicated verse of the professional schools. The theme of their poetry was mostly heroic and religious, but the 19th century works have the Triads, in which personages and deeds of the past are forced into groups of three. They cover a wide range of subjects — history, bardism, theology, ethics and jurisprudence — and the majority are 15th century productions, though some go back to the 12th. Although of doubtful historical value, they are none the less precious as showing the manner in which the scholars of the time codified and handed down their learning.

As in Ireland, the Welsh bards were attached to the houses of the chiefs and formed a guild apart from the rest of the community. Some of them in later days were forced to become wandering minstrels. The works of the bastard poet and his pupils became so numerous and so important that complaints are found against them in royal decrees from the 13th to the 16th century. Their flourishing period was in the 14th century and their most distinguished representative was Davyd ab Gwilym, a contemporary of Chaucer and in some respects the greatest poet of the entire Middle Ages. Davyd died in 1368. He sang of many subjects but as a poet of love and of nature he is unsurpassed by any Provencal troubadour or German minnesinger. Early in the 15th century the deeds of the celebrated Owen Glendower became the subject of patriotic songs, and Iolo Goch, who ranks next to Davyd ab Gwilym as a poet, in the early part of the 16th century, sang of his countrymen in their wars with the English. Among the hundreds of poets of modern times who have made notable the Welsh renaissance which has lasted to our own times, the most eminent was Goronwy Owen, who, born on the island of Anglesey in 1723, found a grave in America. The religious literature in Welsh is enormous and constantly growing. It began with lives, genealogies and legends of saints and was continued with the translation of the Bible by Bishop William Morgan, in 1588, and by the modern religious movement. There are Welsh versions of 'Paradise Lost' and of 'The Divine Comedy.' The masterpiece of modern Welsh prose is undoubtedly Ellis Wynne's satire on the follies of the world, namely 'Gweledigaethu yr Bardd Cwsy,' i.e., 'Visions of the Bard Sleep.' The Welsh are celebrated for their songs and no occasion is without them. The most curious are the penillion, short, epigrammatic poems on every conceivable subject. They have been collected by hundreds. More is printed in Welsh, in books, papers and magazines, than in all the other Celtic languages together.

V. Cornish Literature.— Though there are reasons to believe that Cornwall was influenced to some extent by the Welsh literary movement in the early Middle Ages, the earliest extant literary fragments, dating from the 14th-16th centuries and almost exclusively of religious contents, show a closer relationship to the literature of Brittany than to that of the Welsh. Apart from some old forms of the language which have a linguistic value, Cornwall's contribution to the literature of the Celts is of the slightest and consists chiefly of mystery plays. One of these is a trilogy on the Creation of the World, the Passion and the Resurrection. These Mysteries show little originality and are clearly modelled closely on Latin sources. The 'Life and Death of Saint Meriadek,' which was first performed in 1585, is more interesting but not of much higher literary value. The Lord's Prayer, the Creed, the Ten Commandments, some chapters of the Bible and a few proverbs and maxims are all else that survives of Cornish.

VI. Breton Literature.— Nor have the earliest literary monuments, such as they were,
of the Armoricain Bretons been preserved. There is an abundance of gloss material, which is our best source of information on the earliest form of Brythonic speech, but for literary remains, for a connected Breton text, we have to wait until the beginning of the Middle Breton period at the end of the 15th century. This early literature, too, is almost exclusively religious and consists of such works as a translation of the ‘Hours,’ the ‘Death of Our Lady,’ and the ‘Life of Man,’ all of them belonging to the 6th century. In Brittany, more than in other Celtic lands, the theatre has met with popular favor and the Bretons still have a peculiar fondness for dramatic composition and performances. Upwards of 150 Breton mystery plays are known to exist, of which about 25 have been published. The oldest is the Life of Saint Nonn, mother of Saint David. The Great Mystery of Jesus, of the Passion and Resurrection was published in 1530. The authors of these pieces were, for the most part, priests or members of ecclesiastical students, though, in some cases even uneducated artisans and small farmers were the playwrights. The Mysteries were mostly adaptations from the French and betray their foreign source also by the large amount of French words with which they are interspersed. Most of the subjects are taken from the Bible, lives of saints and pious legends, though a few belong to the romantic cycle and to such beliefs, for example, as the Purgatory of Saint Patrick. Though they show little art and little originality, they are interesting and valuable under several aspects, as for their local color and their picture of the life of the period and as one of the last manifestations of the mediæval Mystery. In the course of the preceding and present centuries, efforts have been made, and with considerable success, to revive and modernize the Breton theatre, and to provide it with subjects of a moral, historical and humorous character. In this field, the Vanalais poet, J. Le Bayon, is the most distinguished. But much more interest are the ballads, songs and folklore. We owe the beginning of attention to these subjects to the Vicomte Th. H. de la Villermarqué (1815–95), who, in 1859, published his collection O Mael (1859), in the case of Macpherson’s ‘Ossian,’ enjoyed great success in Europe and gave rise to a protracted and heated discussion. The searching criticism to which the ‘Barzaz’ were subjected has proved that they were largely due both as to matter and to form, to the author himself. Nevertheless, just as in Scotland in the similar case, these poems gave the start for a serious study of the popular Breton ballads. The most fruitful endeavors in that direction were made by P. M. Luezé (1821–95) who, in 1868, published the ‘Gwerzion,’ short ballads or complaints or village tales in verse, of a very dramatic quality and usually of tragic interest, and, in 1890 and following, with the aid of Jeannel Le Braz, the ‘Sonions,’ sailors, soldiers, scholars’ and women’s songs of love, marriage and satire. The popular literature in Brittany is of extraordinary wealth and every effort has been made to preserve it, with the result that a great deal has been published as well as given to the lips of the speakers or, to a larger extent, retold in French. It consists mostly of legends of saints, of death, of the sea and of pardoùs, and is all of the greatest interest to folklorists. The contemporary poets, from Brizeux, who died in 1858, to Jaffrenou, still living, to mention only the best known names, form a brilliant galaxy whose poems are to be found in separate editions, collections and reviews.

Celtic Peoples

Hecateus of Miletus and Herodotus (5th century B.C.) are the earliest authors to mention the Celts, and they speak of them in connection with the Danube. The Greeks and the Phrygians got their information at second or third hand from merchants and sailors and their notions on the subject were very hazy. According to Euphorbus (4th century B.C.), of the four peoples who inhabited the extremities of the world, the Celts lived in the west. There are many moot points in the earliest history of this great race, which may be accounted for partly by the vague and indiscriminate use of the names by which the Celts and the peoples identified or assimilated with them in western and northern Europe were known to the ancients; e.g., Hyperboreans, Keltoi, Celtae, Celtici, Cimbri, Keltoi, Taetari, Galataei, Galli, Gallo, Celto-Ligyes, Celtiberians, Celtilyrians, Celt-Thracians and Celta-Scoticns, the exact determination of which may never be possible to decide. It is probable that the name Celt (the meaning of which is unknown; the one most often given is "high, noble") was originally only that of a tribe or fraction—and that not the largest of the Celtic branch of the Aryan family. The name was never used by the Celts at any time when speaking of themselves. By some authors the Celts were identified with the Germans. There is anthropological reason for believing that, even at the time when they first appear in history, the Celts were a mixed race and included not only other branches of the Aryan family but even non-Aryans as well, the autochthonous inhabitants, Ligurians and Iberians, of the countries to which the Celts came as a superior people, imposing their language and customs upon them. More than 150 Celtic tribes are known to us by name, due, in part, to numerous migrations. The question: Were the Celts and Gauls ethnically one people? Let it suffice merely to answer, in the affirmative; but other questions in Celtic ethnology are still debated, though archaeology, linguistics and craniometry have been brought to bear upon them. The view that there was on the Continent an older group of Celts who preserved the Indo-European sound qu (the so-called qu group) and were followed by a conquering group, who changed that sound to p (the so-called p group) is now almost generally discarded. Though we have little written language of the ancient Belgae, it is sufficient to class it with that of the Celts and perhaps to identify the Galates and the Belgae. Anyhow it is clear that Taetari and Keltoi are two distinct words and that neither of them has anything to do with the modern names Goeldelic and Gael. Though antiquity seems to be almost, if not entirely, unanimous in representing the Celts as tall and blond, there is reason to believe that they were two so-called Celtic races, clearly distinct, in ancient Gaul. There, as elsewhere in what is or was Celtic speaking territory, we find short and dark, and tall and fair, longheads and broadheads among them. Hence the Celtic as an ethnic term is a vague appellation and, as is well known, who speak or spoke Celtic do not or did not necessarily belong to the same race. It must have taken many hundreds of years for the Celts to spread all over Europe and their language with them, and they must have mingled with many races. Yet, while we cannot speak strictly of a Celtic race ethnologically, we can speak of a Celtic race philologically and culturally, a race which has preserved and transmitted, as a bond of union, a common speech, mentality, institutions, religion and from the days of their origin to the present day. For practical purposes it is well to keep to the traditional division of the Celts, and to speak of the Celts as a generic term for all the branches of this once powerful and widespread race; to call Gauls those who occupied Cisalpine and Transalpine Gaul, and Galates those who established a small state in Asia Minor. Some would place the ancestral home of the Celts, about 1,000 years before Christ, in northern Gaul and central Europe; others, in northwest Germany, the Danish islands and the Netherlands, near the Elbe and the German Ocean; others, near the Caspian Sea and in southern Russia. The best received opinion, however, is that they have been southern Germany, between the upper courses of the Rhine, the Main and the Danube. From this comparatively restricted focus they spread out like a fan in all directions but chiefly toward the fertile fields of the peoples more favorably situated to the south and west of them. As early as the 9th century B.C., some of them crossed the Channel and settled in what is now Great Britain, and others, in Ireland, perhaps in the 6th century. Probably in the 7th century B.C. or earlier they crossed the Rhine and firmly established themselves in Gaul. A century later they crossed the western Pyrenees, reached Spain and occupied most of the Iberian Peninsula. Their domination there lasted until the end of the 3rd century with the conquest by the Carthaginians. About 300 years B.C. they entered southeastern Gaul. At the end of the 5th or beginning of the 4th century B.C. other detachments invaded northern Italy and Bohemia, the valley of the Danube. They had previously invaded northern Italy in the 6th century and...
later they founded a settlement on a large scale north and south of the Po, and broke up the power of the Etruscans. This region afterward became the home of an important literary culture, where Virgil, Catullus, the two Plinys and Livy were born. This exploit of the Celts is the best known to history and archaeology. In 390 B.C., in except the Capitol. Their fame spread rapidly and made a great impression on the imagination of the Greeks and Romans and for a long time the Celtic peril kept Europe in terror. At the other extremity of Europe they are found as mercenaries in the service of foreign princes, fighting in Greece, Africa and Egypt. Alexander the Great had dealings and made alliance with them. Celtic bands from Thrace and Macedonia in 279 B.C. pillaged Delphi, crossed the Euxine Sea and founded an independent state in Phrygia and Cappadocia, the kingdom of Galatia. To the descendants of these Asiatic Celts it was that Saint Paul addressed his Epistle to the Galatians.

The Celtic empire, called Celtia by the Romans, was at its greatest extent for some centuries before 300 B.C., and stretched from Ireland to Asia Minor. With their warlike colonies the Celts had ploughed a deep furrow over much of ancient western Europe, the valleys of the Danube, Rhine, Po, Seine, Rhone, Loire, Thames and Douro; the Danube continued to remain a Celtic river until its basin was absorbed in the Roman empire. They have left imperishable traces of their wanderings on the topography of Europe. Wherever there is a place the second term of whose name is derived from dunum (a fortified place), e.g., Carrodunum (Krapplitz on the Oder) and Noviodunum (Isaktscha in Rumania), ritum (a ford), magus (a field), briga (a hill), for example, it marks a Celtic settlement and such places are found over a wide belt as far north as Westphalia and as far east as the Dobrudja and southern Russia. The Celts were known to the Germans as Volcae, the name of a Celtic tribe on the upper Danube, and it is by this name, Germanized to Walah, that the Germans afterward knew the successors of the Celts, viz., the Romans and the Romance speaking peoples of the Empire. Of the Empire, Walachia, Walloons, Welsh, Wales, etc. The Celts succumbed to the Carthaginians, the Roman legions and Teutonic tribes. For 250 years, but especially during the 1st century B.C., the Romans fought them in northern Italy and it took 350 years to Romanize them. But, as a result of Roman conquest and Germanic invasion, the continental Celts were absorbed and lost to history. In modern times they have almost succumbed to the inroads of the Danes, the Normans and the Saxons— they had never formed a political unity under one supreme authority. The nearest they approached to it was under King Ambicatus and their nearest approach to a confederation was during the heroic defense, in the year 90 B.C., under Vercingetorix, before the fortress of Alesia. But if they had no strongly centralized power, they possessed a linguistic unity over against Greek, Latin and German speech and to a certain extent a moral, cultural and religious unity. There is good probability that scattered documents would lead us to believe. It is a misfortune that their civilization was cut off before it had time to mature. Archeology and Celtic literature have shown that the Celts possessed a civilization intellectually, industrially and socially considerably higher than that of their German neighbors across the Rhine, and that their influence spread even over regions into which the arms of the Celts never penetrated. In archeology can the La Tene period, or Late Celtic, a comparatively high stage of civilization which extended from about 400 B.C. to A.D. 50, arose in southern Germany along the Rhine in the centre of what was specifically Celtic territory. In certain respects the insular Celts (in Britain and Ireland), even at the time when Christianity was introduced among them, were at a more primitive stage of civilization than the kinsmen in Gaul in the time of Julius Caesar. As for the character of the ancient Celts, we must remember that almost all our information on the subject comes from the writings of their enemies. These all agree, however, in emphasizing their love of fighting, daring and adventure; their contempt of death; their devotion, and fierceness, withal; their vanity, self-consciousness, imagination, loquacity and religion; and in this characteristic they are corroborated by what we know from the ancient literature of the Celts and from the lives of the Celtic peoples of our own times.

Joseph Dunn,
Professor of Celtic Languages and Literatures,
Catholic University of America.

CELTIC RENAISSANCE is the name given to that comprehensive intellectual awakening, which manifested itself in a remarkable revival of interest, displayed during the latter part of the 19th and the beginning of the 20th century and continued up to the present, in the languages, the literatures, the earlier history, the ethnological groupings, and the ancient religions, laws, customs, modes of life, ways of thought, and amusements of the native inhabitants of Ireland, the Highlands of Scotland, Wales, Brittany, Cornwall, and the Isle of Man. Included under the general heading is that greater than the scattered documents would lead us to believe. It is a misfortune that their civilization was
ing with essentially Irish themes, on which, as a distinguishing designation, the specific title Irish Literature has been conferred. This part of the general movement is so important and so well and widely known that to it, exclusively, the title of Celtic Renaissance is sometimes given in error. To as-sign a precise cause or an exact date as the beginning of the Celtic Renaissance is difficult, if not impossible, for many causes and many dates, each inherently probable, might be named; but perhaps it may be here tentatively suggested that the publication, in 1853, of J. C. Zeuss's Grammatica Celtica, based on the Old Irish glosses which he rediscovered on the Continent, is an all-important philological fact. It is true that at no time, for several hundred years, were the cultivation and the study of some at least of the Celtic languages and literatures entirely neglected, and many Irish, Welsh, Scottish and European scholars consecrated themselves to such pursuits. The mention, in this connection, of Francis O'Molloy, Eibhlin Also, Logmadoc, H. B. MacPherson, Valance, Bouchier, Potts, Picard, John O'Donovan, Eugene O'Curry and Whitley Stokes—to name no others—will be sufficient indication of what is meant. But Zeuss's epoch-making work which established definitively, for the first time, that the Celtic group of languages belongs to the great Indo-European family, and was fortunate enough to have its conclusions accepted, gave an unprecedented stimulus to the examination of those languages in both their earlier and their later developments. On the literary side, Ernest Renan, in 1856, interpreted the Celtic spirit in his La Poésie des races celtiques, and Matthew Arnold's Oxford lectures, published as The Study of Celtic Literature in the Cornhill Magazine in 1867, insisted on the benefit to be derived from knowing the Celt and things Celtic more thoroughly. Thenceforward French, German and Italian savants, as well as enthusiastic scholars in Ireland, England, Wales, Scotland and America, gave increasing attention to the linguistic peculiarities of the various Celtic languages and dialects, and, almost as a necessary consequence, busied themselves in deciphering, editing and translating the many manuscripts in which the literature turned up, to a large extent buried away. Now, some of that literature was so wealthy, so noble, and so diversified, that soon its influence began to filter down from the desk of the scholar to the easy chair of the ordinary reader, and the movement, while remaining scientific in the hands of the trained linguist, took on, from another point of view, a decidedly popular tone. While old-established societies continued their work along traditional lines, but with increased vigor, new ones were formed, and periodical publications were issued, for the purpose of disseminating a wider knowledge of the subject, and of still further developing its popular scope. In Ireland, the Society for the Preservation of the Irish Language was formed in 1880, by the Gaelic Union, and this in turn, in 1893, by the Gaelic League. An organ for the necessary propaganda, namely, Irisleabhar na Gaedhilge (The Gaelic Journal), was started in 1882, and this was in due course supplemented by the official publications of the Gaelic League. Other Dublin publications, printed mostly in English but also partly in Irish, like The United Irishman, The Feis and The Leader, gave hearty support, and even political daily papers found it to their advantage to print a column or two in Irish. The Feis, or festival of Irish story-telling, poetry, song and recitation, as well as of Irish music, dances and games, was employed throughout the country as a further instrument for the revival of the old Gaelic spirit. Since 1898, the Oireachtas (assembly), held every year in Dublin, has been the culmination of those festivals. See Gaelic League.

In Scotland, the movement also took its rise with the scholars and men of letters, and gradually percolated downward. The Gaelic Society of Inverness, founded in 1871, whose valuable Transactions have now reached over 30 volumes, offered, in 1875, bonuses to teachers who would agree to teach Gaelic in the Highland schools, and more recently it succeeded in having instruction in that language officially recognized and sanctioned by the Scottish Education Department. Another Highland society for the preservation and cultivation of the native speech is An Comunn Gaidhealach (The Gaelic Society), founded in 1891, which holds a yearly assembly, called the Mod, somewhat along the lines of the Welsh Eisteddfod or the Irish Oireachtas.

There is also a vigorous press propaganda in Scotland. The Celtic Review, dealing more particularly with Iris and Scottish Gaelic, made its appearance in 1903. Two periodicals, Guth na Bhadna (The Voice of the Year), a quarterly started in 1904, and An Deo-Greine (The Sunbeam), first published in 1905, devote a considerable portion of their space to Gaelic. In 1908, a weekly newspaper, Alba, printed entirely in Gaelic, was founded. A fortnightly paper, also wholly in Gaelic, An Mac-talla (The Echo), was published in Prince Edward Island up to 1905. Side by side with this scholastic and popular activity in Gaelic, a Scottish Celtic revival was conducted in English in the quarterly magazine, the Evergreen, published in 1895 and 1896 at Edinburgh. Among its contributors were Patrick Geddes, S. R. Crockett, Sir George Douglas, Gabriel Seton, Sir Noel Paton, Ricardo Stephens, and Fionn Macleod. The various books written by "Fionn Macleod," who has long since been identified with the poet William Sharp, are among the most distinctive literary products of the Renaissance in Scotland, for they show in a pronounced degree many of the traits of Celtic art.

With some 250,000 speakers of Gaelic, the teaching of the subject in the schools, the fostering care of the various societies, and an enthusiastic campaign in the press, the preservation of the native speech of the Highlands seems assured. The Isle of Man did not escape the general movement. This little island, traditionally regarded as the former kingdom of the Gaelic god Manannan, has about 4,500 speakers of Manx, the total population of about 55,000. It is a dominion of the Crown of England, but enjoys self-government to a very large extent. It has its own Parliament, known as the Tynwald Court, consisting of the Council, or upper branch, and the House of Keys, or lower branch. The decrees of this
Parliament, when approved by the representative of the Crown, are supreme. They are promulgated in old Manx, as well as in English, before the people on the sacred Tynwald Hill. Not only do representatives of the island attend the various Celtic gatherings of other countries, but there is also a society for the preservation of the Manx language, services in Manx are held in some of the churches, columns in Manx appear in the papers, classes in Manx are conducted at Douglas and there is a Manx section at the annual Guild Festival. The one formerly Celtic section in which the Celtic Renaissance might be expected to find no responsive echo was the English county of Cornwall. Its native language was supposed to have finally died out so far back as the last quarter of the 18th century, and its inhabitants seemed completely absorbed in the English nationality. It had, however, Celtic traditions and even some remains of a Celtic literature, and one or two actual speakers of Cornish, not introduced by the industrious Fewkes, was in 1899 and at the Pan-Celtic Congress held in Dublin in 1901. In 1902 there was established the Cowethas Kelto-Kernwak (Society of Cornish Celts), whose object, in addition to saving from destruction the megalithic monuments of the country, the feudal ruins, the old crosses, the ancient chapels and the legendary wells, was to restore the Cornish language and to revive the popular Cornish open-air dramas and bardic solemnities. It seems a gigantic, almost impossible, undertaking; but, as Charles Le Goffic says, in this connection: "There is such a power of recovery in the Celtic races that, among them, the wildest dream of to-day often becomes the established fact of to-morrow."

In Wales, there was far less need for a linguistic or literary revival than elsewhere, for Welsh nationality remained of a pronounced type, and from early in the 18th century the Welsh language, owing to its constant use by the Methodist preachers, had had a wide vogue both as a spoken and a written medium. The society known as the Cymdeithas y Gymru (the Welshman's Association) and the Cyflogiau Gwyddon (The Association of Knowledge) and Cymdeithas Gymraeg (Cymric Review), date, respectively, from 1770 and 1793. In 1792 there was established in London an important society, the Cymdeithas y Cymreigddion, which engaged in a search for Welsh manuscripts, and published, in 1801-07, the result of its labors under the title of 'Mwyvrian Archæology.' Through the exertions of the prime movers in this society, the Eisteddfod, or National Assembly, whose origin is lost in the mists of antiquity, but which can with some certainty be traced back to 1135, was revived in 1819, under the direction of the Gorsedd, and has been held every year since without intermission. In Wales, therefore, the seed of the Celtic Renaissance fell on fertile soil and grew apace. Willing workers were not wanting, and, by 1895, no fewer than 57 periodicals in the Welsh language were making a regular appearance. In addition, many newspapers published in the principality and in the north-o'least publish columns in Welsh. Nearly a million persons, out of an approximate population of 2,000,000 (2,030,271, according to the census of 1911), are speakers of Welsh. Welsh is used in the pulpit and taught in the schools, and chairs of Welsh have been founded at the colleges of Aberystwyth, Cardiff and Bangor and in the University of Wales.

In Brittany, at the beginning of the 19th century, the native language had sunk almost to the level of a patois. It was restored to some literary dignity primarily by Legonidec, who had fled to Great Britain as a political refugee and spent there many years. He had, however, to be convinced and done for Wales, determined to try to do as much for his own country. His Grammaire celtico-bretonne appeared at Paris in 1807, and his Dictionnaire breton-français in 1821. People of standing and position became interested, and the teaching of Breton was introduced into a number of schools. The native language, however, fell under the ban of the Second Empire, and the Association bretonne, which was founded in 1844, was dissolved in 1859, and was not re-established until 1895, when the Revue Celtique was started by Gaidoz, and in a few years chairs of Celtic were endowed in various French centres, and were given to scholars like Gaidoz himself, D'Arbois de Jubainville, and others. The megalithic monuments fighting the teaching of the Breton language in the state schools of Brittany remained, as it still remains, in force. To combat the danger that, while higher Celtic studies flourished, the Breton language might perish in its native home, the Association bretonne appointed, in 1895, a permanent committee for its preservation. The efforts of this committee were seconded by the Union régionalistes bretonne, founded at Morlaix in 1896, whose object is not only to preserve the Breton speech but also to reconstitute the Breton life in all its forms. In pursuance of its policy, the Union régionalistes held, in 1899, a meeting similar to the Welsh Eisteddfod, the Irish Oireachtas, and the Scottish Mod, and these festivals took place annually thereafter. The result of all these endeavors is that Breton is now taught in the schools not controlled by the state; that several periodicals, some partly, some wholly, in Breton, are published; and that there are still some million and a quarter of people who use Breton as their native tongue.

The Celtic Renaissance was not confined to Europe. It spread wherever the ubiquitous Celt had made for himself a home: to Canada, to the United States of America, to Australasia, to far away India and Ceylon, to Argentina, even to Patagonia. Not to speak of the departments of Celtic which have been established at Harvard, Yale, Columbia, Johns Hopkins and Chicago, nor of the chair of Celtic founded at the Catholic University of America in Washington, sermons, etc., in Welsh and in Gaelic are preached in different parts of the United States and Australia and journals published in these languages in those and other countries, while encouraging their readers to loyalty to the land in which they live, serve also to recall to their minds the homes which they or their forefathers left, and to put before them, as a stimulus, the varied achievements of the great race from which they are sprung.

CELTIS—CEMENT

The manufacture of hydraulic lime, though carried on to a considerable extent in France, has never been established in this country, probably owing to the abundance of excellent cement-rock in New York, Pennsylvania and other States. Hydraulic lime is light and bulky compared with the other cements. It requires from one to two days to set and hardens slowly, but some grades resist the continued action of sea water even better than Portland cement.

Natural-rock Cement.—This material, also known as common cement, hydraulic cement, Rosendale cement and quick-setting cement, is manufactured in considerable quantities in some parts of the United States. It is made also in France, but the German and English output has been insignificant for some years. In the United States the material used is limestone, often containing over 25 per cent of clay, and the limestone is generally dolomitic, that is, contains carbonate of magnesia. In Europe magnesian limestones are seldom used. The cement rock is quarried, broken and burnt in continuous kilns, much as limestone is in the manufacture of ordinary lime. The burnt rock is a mass of partly vitrified clinker not affected by water. It is ground in mills of several types. Formerly all plants used millstones, and the light yellowish or brownish powder, fine enough to pass a 50-mesh screen, is sent to market in barrels containing about 300 pounds, or in sacks. When mixed with water this cement sets in a few minutes and hardens gradually. It is cheap and when mixed with one part of sand by weight is used for masonry or concrete and for cistern and reservoir linings. It has not the great tensile strength of Portland cement, hardens slower and more imperfectly.

The composition of Rosendale cement rock and natural hydraulic cement is as follows:

The chief centre of the industry in this country is the Rosendale district of Ulster County, N. Y., where the rock quarried is a limestone of the lower Helderberg series. It is also made in Pennsylvania, the Louisville region of Kentucky and Indiana, at several points in Illinois and around Milwaukee, Wis. The natural or Rosendale cement industry has weakened since 1903, and the production is now comparatively small.

Production.—The total production of Portland cement in the United States in the year 1916 was 91,521,198 barrels, valued at $100,947,881, an increase over the 1915 figures by 6.5 per cent in amount, and 36.6 per cent in.
value. The shipments from the mills for the year, however, were 3,031,098 barrels more than the production — from the reserve stock left over from the previous year. The price obtained by the mills varied from 94 cents per barrel in eastern Pennsylvania to $1.64 per barrel in Ohio. These figures do not include the barrel or bag in which the cement is marketed. The production was pretty well distributed over the entire country, but the output in the so-called Lehigh district, comprising eastern Pennsylvania and western New Jersey, was notably larger in proportion, amounting to nearly 30 per cent of the whole. The reserve for another year’s supply left at the mills at the close of 1916 amounted to 8,360,478 barrels.

Of natural cement and puzzolan cement the production in the United States in 1916 amounted to 842,137 barrels, valued at $430,874 — an average of 51.2 cents per barrel. Only one puzzolan plant (at Birmingham, Ala.) was active during the year.

Consumption — The total consumption of cement in the United States is arrived at by adding the shipments from the mills to the imports for the year, and subtracting the exports. On this basis the 1916 consumption appears to be 91,900,156 barrels — 7,621,288 barrels (about 9 per cent) more than in 1915. The highest per capita consumption for the year was that of Iowa, 1.77 barrels. Following this were Michigan with an average of 1.58 barrels and California with 1.51 barrels. In 17 of the States the consumption exceeded one barrel per capita, due in large part to extensive construction of public works in those States. See CONCRETE; LIMESTONE; MINERAL PRODUCTION OF THE UNITED STATES; PORTLAND CEMENT.

CEMENTATION PROCESS. See ARMOR PLATE; IRON AND STEEL; STEEL MANUFACTURE.

CEMETERY, a place of sepulture. See BURYING PLACES.

CEMETERY LAWS, official regulations governing graveyards where the dead bodies of human beings are buried; their management and the care of the avenues, walks, grounds, tombstones and sculptures, used for general or ornamental purposes. Two classes of cemeteries are recognized in law: the public cemetery, used by a community, neighborhood or church, and as much a public place as a courthouse or a market; and the private cemetery, used only by a family, or a small portion of a community. Statutes in California and Montana define that where six or more human bodies are buried at one place, such place is a cemetery. Cemeteries are controlled by police authority in so far as the private interests in rights of burial relate to public welfare. The establishment or suspension of cemeteries, the regulations for their use, are provided for by legislation. Ordinarily, cemetery corporations are not supposed to be organized for pecuniary profit, but rather for public than for private purposes; jurisdictions, however, differ on these points; ethical custom inclines to the latter view. Provisions in corporate charters do not permit the use of a corporation by the public interest; conversely, a corporation cannot be deprived of its charter rights by arbitrary interference of police power. Further burials in a cemetery as dangerous to public health may be prohibited; to prohibit burials as detrimental to neighboring real estate values is considered an unreasonable and oppressive exercise of police power. Cemetery lots are subject to the rules of sale and purchase made by the corporation or municipality owning them. Municipalities and corporations usually formulate reasonable rules for the care, adornment and management of lots and cemetery grounds, and heavy penalties are incurred by willful desecration or unlawful interference with the vested rights of owners. To avoid the possibility of the sale of cemeteries for non-payment of taxes, State legislatures usually exempt them from taxation. Similarly, a grave, vault or burial lot, in which bodies are interred cannot be seized for debt, nor can an owner raise a mortgage or loan on it, this being contrary to public policy. See also BURIAL; BURYING PLACES; CREMATION; DEAD; DISPOSAL OF THE; FUNERAL RITES; MACK, W., and HALE, W. B., eds., 'Corpus Jurs' (Vol. XI, pp. 49-69, New York 1917).

CENCí, chêñ'chê, Beatrice, Italian lady, the cause of the extermination of the noble family of Cencí. Muratori, in his 'Annals' (Vol. X, part 1, 136), relates the story as follows: Francesco Cencí, a noble and wealthy Roman, after his second marriage behaved toward the children of his first marriage in the most shocking manner, procured the assassination of two of his sons, on their return from Spain, by banditti, seduced and debauched his youngest daughter Beatrice, a maiden of singular beauty. She discovered this shocking crime to her relatives, and even sought to obtain protection from Pope Clement VIII. It appears, however, that this was not granted; for, when the guilty father continued his former treatment with aggravated wickedness, she joined with her brother Giacomo, and hired two assassins, who put the monster to death as he slept. The guilty parties were discovered, confessed the murder on the rack and were condemned by the Pope to be torn to pieces by horses. In vain the father begged and implored himself to obtain a mitigation of their punishment by a lively representation of the depravity of the deceased, 9 Sept. 1598. According to other accounts, Beatrice and her relatives appear to have had little or no share in the murder of the old Cencí; but a tissue of villainy and baseness gained belief in the false testimony of two banditti against the Cenci family. So much is certain, that, 11 Sept. 1599, Beatrice Cenci and her stepmother were executed with a sort of guillotine called mannaia. Giacomo was killed with a club; the younger brother was pardoned on account of his youth; but the estates of the family, to which belonged the Villa Borgese, were confiscated, and in 1635 presented by the reigning Pope, Paul V, of the house of Borghese, to his stepson, Raffaello di Borghese. In the Barberini Palace at Rome, travelers are shown an excellent painting, said to be by Guido Reni, as the portrait of the unfortunate Parricide; but this is now controverted, and recent investigations tend to show a popular version of the whole story is far from the true one. Shelley has made the Cenci the subject of a drama. Consult Bertolotti, 'Fran-
CENCI.—CENOBITES 191

cesco Cenci e la sua famiglia' (1877); Muratori, 'Annali d'Italia' (Milan 1744-49).

CENCI, The. Shelley's poetic tragedy 'The Cenci' was his first attempt to write 'the multitude' and for the stage. Though following the model of Elizabethan tragedy, and containing echoes from Shakespeare, mainly from Lear, 'Macbeth' and 'Othello,' it is yet a work of individual genius. While it may be uncritical to assert that 'The Cenci' is 'the greatest English tragedy since Shakespeare,' it is safe to say that no tragic poet since Webster has equalled this play in sombre power. The plot is founded on an old manuscript account of the crime, trial and execution of Beatrice, a daughter of the great Roman family of the Cenci, at the close of the 16th century. This particular account, one of many such that appeared within the century following the event, is utterly misleading in its picture of Cenci as a monstrous, unnatural monster and of his daughter as an angel of light; but Shelley accepted it as authentic, and followed it closely, except that he adds the banquet scene in the first act. His interest was increased by the surprise of finding Beatrice, once attributed to Guido, then in the Colonna, now in the Barberini, Palace. The play was produced in London in 1821, with a second edition in 1822. Though received with comparative favor by the public, it was rejected by the London theatre manager on account of the nature of its subject, and was unsuccessful when acted for the first and only time under the auspices of the Shelley Society in 1886. Shelley, who was an almost infallible critic of his own poetry, said, 'It is a work of art; not colored by my feelings nor obscured by my metaphysics.' And, indeed, 'The Cenci,' intrinsically great, is no less than astonishing as the production of the poet of 'Prometheus Unbound.' Except for this evidence, no one could have credited Shelley with such knowledge of human character and such power to represent it.

Owing to the difficulty of presenting the incidents of the story on the stage, the action of 'The Cenci' is weak. The fifth act, however, is the finest thing that Shelley ever wrote, but certainly compares favorably in all essentials of tragedy with anything outside of Shakespeare. The characterization is on the whole firm and convincing; though Orsino, whose crafty wickedness is contrasted with the utter innocence of Cenci, seems hardly consistent. The vacillating Giacomo and the irresolute Lucrezia throw into high relief the unwavering will of Beatrice, who grows in nobility until at the close she fills the action with her purity and strength, a tragic heroine claiming kinship with the greatest of her kind— with Antigone, Electra, Julie, Constance, and Webster's Duchess. The diction is simple and concrete; the style, highly dramatic and appropriate. Except the description of the chasm in the third act, not a passage, scarcely even a line, but contributes directly to the action or characterization. The effect of the play is that of unrealized gloom. 'In it culminates that fascination of horror in Shelley which gives to his strict solitude of anachorites a sense of beauty and love, though it is less omnipresent in his poetry' (Woodberry). The 'Cenci' has been edited for the 'Belles Lettres Series' by Professor Woodberry. Mrs. Shelley's notes and Shelley's preface to the play are given in the Centenary edition. See result pages 126-29 of Symonds 'Shelley' ('English Men of Letters'); Crawford, F. Marion, 'The True Story of a Misunderstood Tragedy: with New Documents' (Century Magazine, Vol. LXXV, No. 3, pp. 449-66).

MARION TUCKER.

CENEDA, chá-n'ádá. See VITTORIA.

CENES, sé-né, Mont, a mountain belonging to the Graian Alps, between Savoy and Piedmont, 11,755 feet high. It is famous for the winding road nearly 40 miles in length constructed in 1803-10 by Napoleon I, which leads over it from France to Italy, and for an immense railway tunnel, which required nearly 14 years' labor. It superseded a grip railway which was constructed over the mountain by Mr. Feli, an English engineer, in 1864-68. The tunnel does not actually pass through the mountain, but through the Col de Fréjus, about 15 miles to the southwest. The Mont Cenis Pass is 6,765 feet above the level of the sea, whereas the elevation of the entrance to the tunnel on the side of Savoy is only 3,801 feet, and that on the side of Piedmont 4,246 feet. The total length of the tunnel is 42,145 feet, or nearly eight miles. For the sake of the drainage the bottom of the tunnel has a culminating point about the middle, and falls southward 128 feet, and northward 473 feet. The breadth of the tunnel at the base is about 25 feet, at the widest part about 26 feet, and the height at the Modane end is 24 feet 7 inches; at the other end about a foot higher. The determination of the exact direction and height of the tunnel occupied a full year, and the work of piercing the tunnel was carried out with so much precision that the borers who had begun simultaneously from both ends met exactly. The tunnel is laid out for two lines of railway. The roof and walls are lined with masonry to the thickness of two feet seven inches, and where the ground is not very firm it is underarched. The boring was at first carried on by hand labor, and one-eighth of the total length of the tunnel was finished in this way, but the rest was constructed by machines specially devised for the purpose. Each boring machine had 18 borers, by which holes about three feet in depth were wrought in the rock. For the blasting of every yard of the tunnel 97 borings on an average had to be made, and above 100 pounds of gunpowder were employed. The total cost of the tunnel amounted to $14,475,000, which was borne partly by the French and Italian governments and partly by the Northern Railway Company of Italy. The first mine of the tunnel on the Italian side was exploded by Victor Emmanuel at the end of August 1857; on Christmas Day, 1870, the workmen met in the middle of the tunnel; and on 17 Sept. 1871, the tunnel was officially opened. See TUNNELS.

CENOBITES (Gr. Κοινωνία, common, βοις life), monks living in community with others, under a common rule instead of seeking the strict solitude of anchorites. The ascetics of the first ages, who dwelt in the deserts together, were usually called by this name, the place in which they lived being called a cenobium.
Some writers refer the institution of these communities to the times of the apostles, others to Saint Anthony (q.v.).

**CENOGENESIS.** While many animals during post-embryonic growth pass through a series of stages which are similar to the ancestral forms of such types (palingenesis), in certain species development is direct. The different stages of growth or metamorphosis are crowded back to the embryo stage, or abbreviated, and the animals hatch or are born in the shape of their parents. This is called ceno- genesis. Thus certain frogs, as a tree-toad of Guadeloupe, W. I., where there are no marshes, do not pass through a tadpole stage, but hatch without tails, and with legs, and otherwise resemble their parents. The same is the case with certain shrimps and crabs, and is partly the case with the lobster. In all such instances the direct development is apparently due to a difference in the environment, or other conditions of life, especially in certain crustacea, to a change from salt to fresh water.

**CENOTAPH,** sēnō-tāf, a monument erected in honor of a deceased person, but not containing his body, as is implied from the derivation (Gr. κενός empty, and τάφος a tomb). They were often erected by the ancients, who believed that when the body was not buried the soul could not be admitted into the abode of the blessed. Consult Virgil, *Æneid* (3, 304); Xenophon, *Anabasis* (6, 4, 9). In Suetonius, *Claudius* (Bk. 1), such a tomb is called *tumulus honorarius*.

**CENOZOIC,** sē-nō-zō'ik, ERA, the last of the great divisions commonly used in classifying geological time, and therefore including the present. As it is the last, its records are much more complete than those of the Mesozoic, but while more complete they are, perhaps, more perplexing. Of the older eras — as, for instance, the Palæozoic — much of the record left in the rocks has been obliterated, and thus only the traces of the greater changes in the distribution of land or water and of variations of climate have come down to us. Thus, while much is lost, the broader grouping of facts is easier. In the Cenozoic era there has been a great mass of evidence to sift and correlate, that geologists differ greatly as to how the record of the rocks shall be translated.

Generally speaking, the rocks of the Cenozoic Era are less compacted than those of the Mesozoic, being very often beds of loose sand or clay. They usually lie horizontal, though sometimes overturned in a great mountain range. Any particular series is seldom of wide extent, and different series tell widely different stories of climatic conditions. Thus, probably no series in the Cenozoic in North America is comparable with the coal-bearing formations of the Cretaceous.

As to the climate of the Cenozoic, it was at first remarkably mild and even. Spitzbergen and Greenland having as mild a climate as that of Ohio to-day. Gradually the climate became colder, resulting in the great continental glacier of the Ice Age. At a comparatively very recent date these glaciers receded, and the climate of the earth became substantially what it is to-day.

Cenozoic life is, on the whole, well differentiated from Mesozoic, particularly by the great development of mammals and, probably well along in its last half (reckoning by actual time), by the advent of man. As mammals have developed, so reptiles have declined, and to-day only snakes, crocodiles, lizards, and turtles represent the class; the great ichthyosaurs, plesiosaurs, dinosaurs and pterosaurs have disappeared away by the end of the Cretaceous. In fact, as the Mesozoic was the era of reptiles, so is the Cenozoic the era of mammals. Among invertebrates many curious Mesozoic types have disappeared, but of the genera in existence early in the Cenozoic most still exist. This also is true of Cenozoic plant life.

As has been noted, geologists differ in their divisions and subdivisions of Cenozoic time. American geologists generally make two great divisions, Tertiary and Quaternary.

The era is marked off from the Mesozoic, which precedes it, by the great disturbance which formed the Rocky Mountains. Throughout, the continent of North America was largely out of water, with a few minor exceptions. The Atlantic and Gulf Coasts and the Great Plains underwent several successive submergences and emergences. The present site of the Coast Range was largely submerged till mid-Tertiary time, when a pronounced period of folding formed the Coast Ranges. The Alps and Himalayas were probably also elevated at the same time. A period of submergence occurred in the north-east, at the close of the Glacial Period, in late Quaternary, which drowned Lake Ontario and Lake Champlain, separating New England as an island. (See also Geology; Geologic Period; Tertiary). Consult Dana, *Manual of Geology*; Geikie, *Text-book of Geology*; Le Conte, *Elements of Geology*.

**CENSER,** a vessel in which incense is burned. Censers were employed by the Jewish priests for presenting incense to the Lord in the sanctuary. Josephus tells us that King Solomon made 20,000 gold censers for the temple of Jerusalem to offer perfumes in, and 50,000 others to carry fire in. Censers or thuribles are used in some modern churches, especially in the Roman Catholic Church at mass, vespers and on other occasions. They are suspended by chains, by which they are swung about in the hand to spread the incense in all directions. They are usually made of brass or copper, sometimes of silver or gold. Of their precise shape before the 12th century there is little record. The earliest ones are richly decorated, set with jewels and sometimes made in the form of small churches. They were also often made in two hollow halves shaped like a ball. The upper half varies very much in form. The lower half holds the charcoal and the incense, while the upper half is perforated with holes to allow the smoke to escape.

**CENSORS,** sen'sorz. In ancient Rome, originally two magistrates whose chief duty it was to keep the register of property, on which all political rights were based; the community being graded by amount of income from estates. Being thus arbiters of the political and social position of every freeman, they speedily became the most important officials in the state except the occasional dictators. The supreme judicial functions, and the control of morals (*regimen morum*), fashion and speech, which
we associate with censorship, flowed naturally from this. The essence of their duty being to fix the status of each citizen, they took cognizance of everything which bore upon it; and became arbiters of the ancient laws and customary observances which are the cement of early communities. Not only could they expel a senator from the Senate and take his horse from a knight or even reduce him to the rank of a slave; they could punish for notorious evil living, by being found in slack tillage, celibacy, demeaning occupations, extravagance or any other conduct thought prejudicial to the common weal. There was an appeal to the popular assembly, however, and they had to state their charges publicly. The censors also filled vacancies in the Senate and appointed its chief, originally at will, later according to a prescribed list. They also administered the state finances, which included the regulation of the tributum or property tax; of the vectigalia, such as the tithes paid for public lands, salt works, mines, customs, etc., which were usually leased out to speculators for 10 years, and any publication which might be dangerous to the public order, under römerischen Censor [Halle 1912], and the article "Censor" in Smith, 'A Dictionary of Greek and Roman Antiquities' (3d ed., London 1890).

The term, legendarily five years at the outset, was a year and a half in historical times, and re-election was forbidden; originally patri- cians alone were eligible, but by fully historical times the plebeians had gained one censorship and occasionally secured both. The Emperors assumed censorship power under the title "prefects of morals." The 13th man, who bore it was the brother of Constantine the Great.

In American history, the title was given to two sets of State officers in imitation of the Roman office. The 1776 constitution of Pennsyl- vania provided that the people should elect a council of censors once in seven years, two for each city and county, to investigate the acts of the governmental departments, inquire whether or not the constitution had been violated, etc. This curious article was dropped in the 1780 constitution. In 1790, Vermont a similar article had a far longer life, surviving until a comparatively recent time. That State in 1777 proclaimed its independence and drew up a constitution. One article, following the example of Pennsylvania, provided that on the last Wednesday of March in 1785, and the same day every seventh year thereafter, the people should choose a council of 13 censors, who should examine whether the constitution had been preserved inviolate; whether the legislature had performed its duty as a guardian of the people, or had exceeded its powers; whether the taxes had been justly laid and collected, and how the public moneys had been expended; and whether the laws had been duly executed. They were also empowered, if they thought a change in the constitution was needed, to call a convention to meet within two years thereafter, giving notice of the proposed change at least six months before the meeting. This council was chosen by the people, it was the creator; but the censorship seems to have worked fairly well for nearly a century.

CENSORSHIP OF THE PRESS, a regulation subjecting books, pamphlets, and newspapers to the examination of certain civil, military or ecclesiastical officers, who are empowered to authorize or forbid their publication. Such a regulation was suggested by Plato, and an informal censorship existed in the times of Greece and Rome. After the Roman Catholic Church acquired a share in the civil power it induced the state to condemn heretical books. Throughout the Middle Ages it sanctioned the principle that books objected to by its authorities should be suppressed. The invention of printing and the increasing number of books called forth new and stricter prescrip- tions of censorship, and copies of books printed in 1479 and 1480 are accompanied with solemn approbations and attestations in their favor. Finally, in 1515, the Council of the Lateran, assembled at Rome, decreed that in future no books should be printed in any town or diocese unless they were previously inspected and carefully examined by the bishop of the diocese or his deputy, or by the inquisitor of the diocese or his deputy, or if at Rome, by the Pope's vicar and the master of the sacred palace. Every work which was approved was to be countersigned by the hand of the censor, and any publication which was not so countersigned was to be burned and its author or editor excommunicated. See INDEX LIBRORUM PROHIBIT- RUM.

In countries where the Reformation prevailed, the censorship was not abolished. Licensers of books were appointed in England, who were for the most part bishops. A general system of censorship was established by a decree of the Star Chamber, dated 11 July 1637, which was later confirmed by an act of Parliament. It was against this act that John Milton wrote his great plea for freedom of the press, the "Areopagitica," but the censorship was not abolished until 1693.

Censorship of the press existed under the old French monarchy. It was abolished at the Revolution, but revived under Napoleon I and again under Napoleon III. Except in Russia and Germany, where it is still in force, systematic censorship of the press may be said scarcely longer to be maintained in European Christian countries. In the Philippines, there has never been such a censorship, although there are laws against publications of a scandalous character; there are various State laws against libel and a government censorship.

In times of war strict censorship of the press is exercised to prevent the publication of information that might be useful to the enemy. The operations of the British Press Bureau during the great European War were the subject of much bitter criticism and frequent debate. It was stated that Sir Edward Cook and Sir Frank Swettenham were joint directors of the Press Bureau for which, however, the Home Secretary was responsible. It was further explained that the actual censorship was supervised by the military and naval authorities and that the Press Bureau was only responsible for permitting publication. The most spectacular act of censorship undertaken by the military authorities and confirmed by the Home Secre- taries was the suspension of the London Globe from 6 Nov. to 22 Nov. 1914.

CENSURE, in canon law, a spiritual penalty whereby a contumacious offender is denied the use of certain spiritual goods. It has three degrees, excommunication, suspension and in-
terdict. By excommunication the offender is cut off from association with the faithful whether in spiritual things or in secular; by suspension a minister of the Church, a cleric, is deprived of the right to exercise the functions of his station; by interdict the services and ministrations of the Church are denied to an offender—the sacraments and the right to Christian burial. An interdict may affect places as well as persons; may be laid on a church edifice or a burial place. Censures are the penalties prescribed in the Church's law for definite offenses, and some censures fall upon the offender, ipso facto or ex ipso-jure, without need of a judgment being pronounced by Church authorities. Such a censure is said to be lata sententia, that is, providing for its own carrying out; but most censures are ferenda sententia, requiring that the sentence be pronounced by some proper authority, as the bishop of a diocese or his deputy. And ablation from some censures lata sententia is reserved to the Supreme Pontiff, while ablation of other censures can be given by bishops, or other pastors, either in the ordinary course of their jurisdiction or in virtue of special faculties granted to them. A censurate, or a censure release; from which is reserved strictly to the Supreme Pontiff himself, is the censure of excommunication incurred by whoever violently assaults a cleric or a member of a religious order (can. 1371, 1372, 1375, 1391, 1392); but an exception is made of the case where the offender is in danger of death.

CENSUS. The utility to a government of knowing the extent of its resources in men and property is so obvious that some means of ascertaining it were probably employed early in history; but there is no record of it on the Egyptian or Assyrian inscriptions, and the Chinese accounts are dubious. The first we have reliable mention of is that of the Jews by David, including the males of 20 and over and the cattle; and the hatred and suspicion aroused by it are witnessed by the belief that God punished the whole people for the impurity. This apparently irrational feeling was universal in early times, has always been so in the East and is by no means unknown elsewhere and later; its prevalence in 18th century America, and even later in England, however, is probably due to misunderstood Bible teaching. The real reason was, that the early census had for an object not statistics, but taxation and conscription; and it was not to the advantage either of officials or people that the government should have too minute a knowledge of what could be exported from them. Poverty and sparseness of population were too convenient excuses for not paying taxes or not remitting them to the capital. In the West, however, when constitutional government replaced autocracy, the census became a necessity for ascertaining political rights and contributions; as in the Solonian constitution of Attica, where society was divided into four classes, with privileges graded according to income from landed estates. In Rome, whence the notion of "censura" ("assessment") comes, it was much the same; and as the enumerations were valued merely for the ratings deduced from them, not from any idea that statistics by themselves were of any value, they were discarded as soon as their use had passed, to the irremediable impoverishment of history. These censures were taken at long and irregular periods, sometimes nearly half a century elapsing. But as the empire grew and the provinces increased, the officials found the same need of a thorough detail of their temporary estates, to know whether their sub-farmers were cheating them, that a capitalist does of his business; and each took a census (by his own province on his own account, whose inquiries were not always as minute and exhaustive as those of the latest United States special census report on agriculture.

The medieval censures were of the roughest and far apart, and made only by a few enlightened rulers. Charlemagne attempted one for his dominion; and the Domesday Book of William the Conqueror in 1181 is familiar. This was a register of estates, with the heads responsible for feudal duties, their slaves and cattle—a census of the primitive type for the primitive objects.

The modern census, as a statistical review for its own sake, has a treble origin, in Sweden, England and the United States. In 1686 the Swedish parish clerk, who had charge of a record of births, marriages and deaths, accessions and removals of inhabitants, unusual happenings, etc. Of course registration, which is a record of changes, is not a census, which is a statement of condition at a certain time; but with a given basis it can be turned into one. By request of the Swedish Academy of Sciences, in 1746, the clergy were directed to compile statistics of population, etc., for a quarter-century past; but these were kept rigidly confidential till 1762. At their publication Dr. Richard Price, the founder of scientific life-insurance calculation, based his first insurance tables on them. At first annual, then triennial, since 1775 they have been published once in five years. Meanwhile, in England, the London bills of mortality, first begun after the plague of 1592, had been recorded weekly since 1603, the year of James I's accession; and in the last half of the 17th century Sir William Petty, the noted political economist, used them for very valuable and stimulating works on the extent and growth of population, human secundity, effects of social and political causes, etc. Others took up the subject and made computations. In 1791 Sir John Sinclair undertook the most herculean statistical task ever attempted, perhaps, by a single man—to compile a census of the population, agriculture, trade and industries of the entire kingdom, by inquiries sent to the clergy of the Established Church. He sent out schedules of 160 interrogatories, received over 900 replies, and in 1798 published 21 volumes of results. His work, and his exhortations made weighty by his work, induced Parliament in 1800 to establish a census office; the first census was taken the next spring, and decennial censuses have been maintained ever since. That of 1851, like the American of 1850, was a long step in advance. The Russian census had begun earlier, but on the most antiquated model, for military purposes, and therefore with no count of females. There were a few partial censuses from 1700 on. In 1718 Peter the Great ordered all landed proprietors to give in an account of their slaves; and the same year organized a body of
CENSUS

Canvassers to visit all the provinces and make returns to him of peasants, mechanics, domestics and people without occupation. In 1722 a case ordered a census taken every 20 years thereafter, and in 1762, another taking place in 1796. In 1802 a central bureau was organized and a census taken; and they have been taken in 1812, 1815 and 1834, decennially 1850-80, then in 1886 and 1897. France began taking them after the Revolution, Prussia in 1825 and Russia in 1850, and in both countries military conscription, organized a bureau in 1828; Belgium established one immediately after winning her independence in 1833, and it has been perfected by the genius of Quetelet and other eminent statisticians and furnished most valuable contributions to science. Our own census was entirely independent of all these in origin.

The United States Census.—For the various guesses at colonial population and the methods of arriving at them, see United States (Population). It may be mentioned here as germane to this subject that when Governor Hunter of New York in 1712 attempted to take a census, the biblical prejudice before mentioned compelled him to hide his name. The New Jersey government a few years later wished to do so, it did not dare begin. An accurate determination, however, became vital early in the independent life of the country. To apportion equally the burdens of the Revolutionary War, the Congress of the Confederation agreed to defray the charges out of a common treasury, to be supplied by the States in proportion to the value of all the land in each; and to requisition the quotas of land forces according to the quotas of white inhabitants. Under the constitution of 1787 the question of number became exiguous, as direct taxes and representatives in Congress were apportioned according to the number of free inhabitants in each State (including bound servants and excluding Indians not taxed) and three-fifths of all others. Censuses, therefore, became part of the ordinary running machinery of the government; and the first one was taken in 1790. Nine months were required for 1820, for the fourth census, and was extended the next year, as regularly for many a decade thereafter. The scope of inquiries simply included families: the name of the head alone being set down, with the number of others included, and slaves as a property item, the sex and color of free persons, the number of free white males of 16 and upward, number of free white females, and of all other free persons. The enumeration was committed to the marshals of the judicial districts of the United States (16 in all), who were to employ assistants as needed. No form of schedule was provided, each enumerator using any sheets or blank book he chose. This continued till 1830. There was no central bureau to receive or supervise returns, which were put together by the marshals and transmitted to the President. A penalty of $200 was imposed for false returns or delay beyond a certain time; and the same on individuals for giving false information or refusing any. The returns in the North were collected by hand; in the South by counties only. Two copies of the enumeration of each district were to be posted in some public place therein. The cost of this census was $44,377.28. The result, as usual, pricked many local bubbles; and as the country was not used to this, there was not only general disappointment but distrust of the census, and the United States officials carefully explained to foreigners that the returns were very defective. This is the case.

The second census, that of 1800, was specifically entrusted to the Department of State. There was no change in methods, except that the Secretary was to instruct the marshals as to schedules and instructions. The only changes in scope were to classify the ages of free white males rather more minutely, extend the classification to females and insert the name of county, city or town where the family resided. Memorials by Thomas Jefferson and Timothy Dwight, under the names of learned societies, wisely suggesting that Congress utilize the occasion by having the census include statistics of mortality, nativity and industries, were ignored; but took root in later censuses. There were 19 districts and the cost was $66,109.04.

The third census, that of 1810, improved somewhat on the loose methods of the two former. The enumerators now had to be residents of their districts, which could not be more than one county or city. There were seven onerous towns, and must be plainly marked off by natural or political boundaries; and they must make personal inquiries at each dwelling-house or of the head of each family in their district. In Territories the secretary, or if there was none, the governor, replaced the marshal. Attested copies of the returns must be filed with the Secretary of State. An attempt at a manufacturing census was made, and the Secretary of the Treasury was empowered to give instructions for it. But the time was too short; the inquiries were too many and injudiciously framed; the manufactories in a district were generally so few that the returns would disclose their private business, and there was no penalty for refusal to answer; and the returns were scattering and valueless for volume, though they had some value as indicating variety and distribution of industries. There were 26 districts and Territories, and the cost was $178,444.

The fourth census, for 1820, for the first time introduced the valuable feature (suggested by Jefferson and Dwight) of distinguishing between natives and foreigners, naturalized or otherwise. It also discriminated the free colored and the slaves by sex and age, and the free whites between 16 and 18. It replaced the manufacturing interrogatories to 14, of much the same scope as now, and a digest was ordered made and printed. This department was a failure as before, however. There were 31 districts and the total cost was $298,525.99.

The time of taking the fifth census, that of 1830, was changed on John Quincy Adams' suggestion to 1 June, as it has ever since remained. A very significant provision in the act was to prevent the marshals from blackmailing their subordinates, by exacting either bribes in advance or part of their pay later. Printed schedules were sent out, of uniform size, 18x15. The industrial statistics were dropped altogether. But inclusion was made of the deaf and dumb—white, free, blind—classified by age but not by sex, and of the blind, not classified at all. Ages were also very minutely classified. There were 36 districts and Territories, and the cost was $378,543.13.
The sixth census, that of 1840, was in one respect the beginning of a new era; in most others, the close of an old one. It first attempted to give statistics to the rudest of the intractable and idiotic, at public and private charge; educational — scholars in colleges, academies and public schools, illiterates over 20, etc.; besides Revolutionary pensioners, an item wholly aside. Indeed, statistics were the very name of the game. The enumerator had to deal with every class of society, and much matter collected. In a word, it was the first systematic and connected attempt to make the census a general body of usable statistics in the larger sense, a comparative survey of the life and changes of the country. But the effort is all that can be praised; its execution was a national scandal. The errors were so teeming and so monstrous that various bodies sent protests to Congress against its publication, and urged that it be either corrected, or if that were not possible, entirely disowned. This result was due partly to inadequate pay and ignorant enumerators, but partly also to the dislike in many sections to the new questions as "inquisitorial" and offensive. The old dislike to government was growing to warrant a prominent paper in becoming its spokesman, insinuating that the census was a "precursor to direct taxes," and that it was unworthy of "the dignity and the high functions of the Federal government to pursue such petty investigations." There were 39 districts, and the cost of the census was $833,370.95. It was published in three volumes.

All these censuses had a common defect which robbed them of ultimate statistical value: They lacked uniformity in method, and to a large extent could not furnish comparisons or accurate deductions. The enumeration extended over long periods, many months at a time; the results were not summarized by counties, nor uniformly by cities or towns; the classification of ages of colored people was on a different basis from that of whites, etc.

The seventh census, that of 1850, begins a new era. The blunders of the last one, and the public disgust and indignation, had aroused great discussion as to proper methods; and on 3 March 1849, the same act which created the Department of the Interior also created a census board, consisting of the Secretary of State, the Attorney-General and the Postmaster-General, to be a ten-year census schedule including above 100 inquiries. They framed plans which were adopted by Congress 23 May 1850. These schedules comprised: (1) Free inhabitants; (2) Slaves; (3) Mortality; (4) Products of agriculture; (5) Manufactures; (6) Social statistics. But the great advantage which it made was in scheduling individuals instead of families, thereby making full statistical comparison for the first time possible. The name, age, sex, color and place of birth of each person, free or slave, were now set down. Improvements in method were also made. The enumerators' districts were to be not exceeding 20,000, if feasible, on the basis of the last census; the returns were not to be compiled by the marshals, but at a central office in Washington created within the Department of the Interior. Its head or "superintending clerk" was Joseph C. G. Kennedy of Pennsylvania; the latter part of the compilation was done under the charge of James D. B. De Bow of Louisiana. There were 45 districts, and the work cost $1,423,350.75.

The eighth census, that of 1860, was on much the same lines. Mr. Kennedy was superintendent. Fortunately, the enumeration was finished before the war broke out. The principal change in schedules was to classify females as well as males by occupation. In the census of 1850, slaves and slaveholders were classified by States and Territories for 1850 and 1860. There were 64 marshals and secretaries. Cost, $1,969,376.99.

The ninth census, that of 1870, was taken under changed conditions, some of which interfered with its completeness and accuracy. The mass of enfranchised negroes in the South could no longer be counted on plantations by one authority, and were too ignorant to answer questions for themselves; and the Reconstruction conditions greatly impeded work. A new system had been carefully drawn up by Garfield, after consultation with Francis A. Walker, Edward Jarvis and other eminent statisticians, which would have made partial amendments; but it was not passed in the Senate. Unformed, however, the basis of the next census. General Walker, then chief of the bureau of statistics in the Treasury Department, was made superintendent, and his ability did much to redeem the defective system. The term "slaves" had of course to be dropped and the number of male citizens of the United States to be substituted. To satisfy the 15th Amendment, a schedule was introduced of the number of such citizens whose rights to vote was denied or abridged except for crime, etc.; but it was valueless. The month of births and marriages within the year was added. In "colored," Chinese and Indians were discriminated from negroes. In "illiterates," those unable to read were distinguished from those unable to write. In nativities, the place of parents' birth was added for the first time giving the number of native citizens of foreign parentage. A statement of public debts, State, municipal, etc., was included. Many changes were also made for clearness, or to remove objectionable inquiries. The enumerators were put under civil-service reform rules.

A strong effort was made to have an inter-decennial census taken in 1875, but it was not successful, though Garfield himself was elected in two annual messages. But for that of 1880, the system desired for 1870 was passed, under Garfield's presidency, completely revolutionizing the census methods. The changes may be summarized as follows: (1) The superintendent of the census and his chief enumerators, instead of being mere clerks of the Secretary of the Interior, became officials directly appointed by the President and confirmed by the Senate. (2) The marshals — court officers appointed for duties unconnected with census work and often conflicting with it — were replaced by supervisors of the census, not to exceed 150 in all, and each State or Territory to have at least one. The entire number were appointed by the New York State had 11. Their distant enumerators were subject to veto by the census office. (3) The enumerators' districts were reduced to an estimated maximum of 4,000 instead of 20,000, these subdivisions being also subject to the disallowance of the census office. This increased the number of enumerators from...
about 6,400 in 1870 to 31,265 in 1880; and enabled not only a swifter completion of work, but much closer local and personal knowledge on the part of enumerators, as each must be a resident of his district. (4) The time of enumeration was reduced to one month, or two weeks in the southern states. (5) Defective returns by the previous census; making results more nearly simultaneous. (5) Compensation was more closely adjusted to work. (6) Industrial statistics for 279 cities and large towns, and for the country, in the statistics of selected industries, were withdrawn from the regular enumerators and given to certain special agents, who need not be residents. The enormous advantage of this scarcely needs exposition. Not only did it allow the employment of able experts, but manufacturers will often give information to distant strangers, to be filed far off, which they would not put in the hands of local residents. In this census also a large use was made of "prior schedules," left with parties before they were enumerated, which had been introduced in 1870 but little employed. This census was by far the best, speediest and most helpful of all to that date and marked another era. The scope was also extended. For the first time in the statistics of diseases, crime and pauperism were thoroughly and properly classified; those of the factory system, of churches, museums, taxation, insurance, etc., entirely new, with better ones of schools and colleges, collected independently, were of great utility; and many improvements were made on other schedules. General Walker was the head of this census also and the author of most of its advances. Its cost was $790,978.40.

The 11th census, that of 1890, was in general taken by the same methods as the 10th. Ten chiefs of division were appointed, 175 supervisors and 47,975 enumerators. The superintendent was Robert P. Porter. The most important additional were: (1) All surviving soldiers, sailors and marines of the Civil War and their widows. (2) Classification of colored persons according to amount of white blood, from full-blooded negroes up to octo- roons. (3) Indebtedness of private corporations and (4) All Indians in different tribes, with Indian and English names of each, age, occupation, and whether paying taxes or not. (5) Census of Alaska. (6) Unincorporated express companies. An attempt was made to collect statistics of chronic disease; but the inquiries were too delicate to entrust to local residents to expect people to communicate to such, and the statistics gathered were of no value, besides exciting much public ill-will. Special agents were employed for 1,942 manufacturing centres, in place of 229 in 1880. Special attention was paid to nativity, to fecundity of native and foreign-born mothers, the expectation of life of children of native and foreign-born parents, naturalization and ability to read and speak English. Prior schedules were extensively used. Electric tabulation was employed, not alone greatly increasing both speed and accuracy, but enabling various statistical compilations to be made which were otherwise impracticable. It filled 25 volumes, and cost $11,047,713.

For the 12th census, that of 1900, preparations had been mooted before the 10th was well under way; and the question of a permanent census bureau, strongly urged over half a century since by the able statistician De Bow, was brought up, and its merits set forth in a valuable and exhaustive report by Superintendent Porter. On 1 July 1902 the Bureau of Census became a permanent office in the Department of the Interior. A year later, it was reorganized by the newly-created Department of Commerce and Labor, and since 4 March 1913 it has been under the Department of Commerce. The superintendent of the census is entitled the director of the census. The President appoints him, must also appoint an assistant director, who must be an expert statistician; and the director is to appoint five known and tried statisticians as chiefs of divisions, a geographer, a chief clerk and a disbursing clerk. The first director under this bill was William R. Merriam; assistant director, Frederick H. Wines; chiefs of divisions, William C. Hunt, population; William A. King, vital statistics; S. N. D. North, manufactures; Le Grand Fowers, agriculture; Walter B. Atchison, methods and results; geographer, Henry Gannett. The law creating this bureau, however, greatly limited its scope. The inquiries were restricted to the four heads of population, mortality, agriculture and manufactures. The last was added in 1890. E. Dana Durand, of California, was appointed director 26 May 1909, to succeed S. N. D. North, resigned. Work began 15 April 1910, with a staff of 70,000 enumerators and 330 supervisors. More than 90 persons took the examinations for the position of enumerators. These examinations were local and those recommended were again examined in Washington. Great improvements had been made in tabulating machinery, 300 of which turned out work faster and cheaper than in 1900. An elaborate card system was employed. A card was prepared for each person enumerated. These were run through the machines and the facts readily compiled in various combinations. Congress appropriated $12,000,000,000 for expenses of the census, to which an additional appropriation of $25,000,000 had to be added.

The methods of presenting the results of the 13th census were in some respects, a radical departure from former practice. The most important change was in the Abstract. Formerly the Abstract had been included in a small octavo volume, issued after the publication of the complete reports, and contained no text discussions and very few percentages, averages or comparative statistics. The Abstract for the 13th census is a quarto volume of 569 pages, presenting the résumé of the principal statistics, extensive text discussions in terms familiar to all, analysis of data and many diagrams and maps, thus visualizing the main facts concretely. And instead of being issued after the complete reports it was published first, thus creating a wider popular interest in the results than had ever been aroused before. The enumerators employed on the 13th census, for population and agriculture, numbered 70,286, more than the combined populations of New York and Philadelphia in 1790; an organization not far inferior to the regular army in numbers. The gathering of statistics on manufacturing, mines and quarries and another 1,087 special agents were employed. At one time the clerks and officials employed in
the Washington office in compiling and tabulating the schedules numbered 3,738.

Aside from the taking of the main census, the Bureau of Census carries on many other important investigations, which require periods of from seven or eight years to two weeks. Chief of these are the decennial census of wealth, debt and taxation, showing the total assessed valuation of property subject to taxation; the census of various religious bodies; the census of dependent, defective and delinquent classes, covering the inmates of benevolent institutions, insane asylums, penal institutions, etc.; and the annual collection of mortality statistics, to which it is expected soon to add the gathering of vital statistics. By the act of 1916 the director has an office of 569 employees, including a chief clerk, four chief statisticians, a geographer, eight chiefs of division, the rest being special agents and assistants.

State Censuses.—A number of States have constitutional requirements that a State census shall be taken once in 5 or in 10 years, or between two national censuses; but only a few pay any attention to the matter or attain results of much more than promise. Massachusetts, New York and Michigan thus far are the only States which have done good work in this line. The Massachusetts censuses from 1855 on, and the Michigan of 1874 and 1884, are notably good. On 3 March 1879 an act of Congress provided that any State which will take an inter-decennial census in all respects equal to that of the United States, and file a copy with the Secretary of the Interior, shall receive from the national government 50 per cent of the amount paid to supervisors and enumerators, plus 50 per cent of the gain per cent in population between the two fast preceding national censuses. Even this lure, however, has not thus far increased the interest of the States in their statistics. Consult ‘Report of the Director of the Census’ (in Report of Department of Commerce, 1915); ‘Story of the Census: 1790–1915,’ issued by the Bureau of the Census.

CENT, a United States coin and money of account, the 1-100 of a dollar. The convenience of decimal computation has caused in various countries the division of the monetary unit into hundredths, with names derived from Latin centum or its adjectives; as the French franc into centimes, the Dutch guilder into cents, the Italian lira into centesimi, the Spanish-American dollar into centavos, etc. Jefferson regularly used ‘cent’ to mean the hundredth of any unit of measurement; but in its first suggestion for our coinage it meant 100. The inconvenience of the English system being felt, Congress in 1781 instructed Robert Morris to devise a system of national coinage; and he proposed a unit of 100 grains of silver (or 1-1440 of a Spanish dollar, familiar in the colonies), of which 100 were to make a cent (about 7c of ours), 500 a quint (34.7c.), and 10,000 a mark ($6.94). Jefferson proposed instead the dollar as the unit, the smallest coin to be of copper and 1-200 of it (that is, the old English farthing or half-cent); this was adopted 6 July, 1785. But on 8 Aug. 1786, an act was passed, still modeled by Jefferson, to coin a cent, of which 100 were to weigh 21/2 pounds avoirdupois (157.5 grains each), and be equal to a dollar, and a half-cent proportionate. This was the first use of the name in our coinage, and doubtless represents Jefferson's 'hundredth.' The 'cents' prior to this have not that name on them, and are really English halfpence. The difficulty of displacing a popular name is shown by that of 'penny,' which still clings tenaciously though absurdly to our cent, only half its value. Congress in 1787 established a mint in New York. New brass and copper coins were coined there the 'Fugio' or 'Franklin' device, familiar to collectors. But from 1785 to 1788 several States coined copper 'cents' on their own account. Vermont (not yet admitted) began in June 1785; Connecticut in October 1785; Massachusetts late in 1786 (real cents and half-cents); New York, 1786; New Jersey, 1786 (coppers 15 to the shilling). Under the constitution the first coinage act was passed 2 April 1792, and raised the weight of the cent to 264 grains; but on 14 Jan. 1793, it was reduced to 208 and on 26 Jan. 1796 to 168, the half-cent always being proportional. The first coinage under the new act was in 1793. This old-fashioned 'copper' remained unchanged except in pattern till 1857, and its forms from 1793 to 1857 are perfectly uniform. Massachusetts and New York, on the other hand, at that time, no longer attached a chain or link around the word 'cent': (2) 1793, wreath in place of chain; (3) 1793–96, liberty cap on pike over left shoulder of 'Liberty'; (4) 1796–1807, 'Liberty' with draped bust; (5) 1808–15, filleted head with 13 stars; (6) 1816–39, plain coronet with coiled hair; (7) 1839–57, same with braided hair. No cents were coined in 1815 or 1835. Those of 1799, 1793 and 1804 are very rare, as are also the copper cent of 1856 and the half-cents of 1793, 1831, 1840 to 1848 and 1852. On 3 March 1851, a 3-cent piece was authorized, of 12½ grains, 75 per cent silver, 25 copper, legal tender to 30 cents; on 3 March 1853, it was raised to .900 fine, but reduced to 11.52 grains, 3/50 of the half-dollar. On 21 Feb. 1857, the half-cent was abolished and the old cent made legal tender on 6 March 1861, a 3-cent piece was authorized, ¾ copper and ¾ nickel, 30 grains, legal tender to 60 cents; but the ones and twos were made legal tender to only four cents. On 16 May 1866 a 5-cent piece (the "nickel") was authorized, same material as the 3,7710 grains, legal tender to $1. On 12 Feb. 1873, all cents and their multiples were discarded except the 1, 3 and 5, as above, each to be legal tender to 25 cents; and on 26 Sept. 1890, the 3-cent piece was discarded. See NUMISMATICS.

CENT, a name given under the old Germanic constitution to a small portion of territory. Each province or district was subdivided into so many cents and was placed under the special jurisdiction of an overseer or centenarius. The name corresponds with hundred as in English territorial division.

CENT-GARDÈS, sâŋ-gár'd, Les (Fr., "The Hundred Guardsmen"), a body-guard acting in the service of the French king during several centuries. See GUARDS.
CENT JOURS, sên-zhoor, Les (Fr., "The Hundred Days"), the second period of the reign of Napoleon I, so called because it lasted precisely 100 days, from 20 March 1815, when he returned to Paris, to 28 June of the same year, when the second restoration was established.

CENT NOUVELLES NOUVELLES, sân-nô-yô-vêl, a collection of facetious tales, first published at Paris in 1486. They were told at the table of the Dauphin, afterward Louis XI in the castle of Genappe during his exile. Their arrangement in their present form has been attributed to the Count of Croi, to Louis himself and to Antoine de La Salle. The latter, however, seems to have been the editor. The work is a curious example of a kind of literature distinctively French, and which, since its revival by Voltaire in the last century, has always been successfully cultivated: the literature that considers elegant mockery and perfection of form adequate compensation for lack of morality and lofty ideals. The historical importance of the collection arises from its giving details regarding the manners and customs of the 15th century that can be found nowhere else. They were first printed by Vérand (undated) from a manuscript of the year 1485. The "Nouvelles" also show us that the Middle Ages are past, for among the narrators obscure and untitled men, probably domestics of the Duke of Burgundy, figure side by side with some of the greatest names in French history. They were edited in Paris in 1850 by Thomas Wright.

CENTAUREA, sên-tô-re-a, commonly called Bachelor's-Button, Corn-Flower, Dusty-Miller or Knapweed, a genus of annual or perennial herbs of the family Asteraceae. There are about 500 much confused species, mostly natives of western Asia and the Mediterranean region. A few are found in the western hemisphere, but only one, C. americana, is native in the United States. This species, popularly called basket-flower, is a very attractive hardy annual with rose-colored flowers. Many of the species are widely used in ornamental gardening. The following are among the most popular garden sorts: C. cyanus, the blue-bottle or corn-flower, common in European grain fields and frequently found wild in America. Its blue flowers yield a blue dye, C. cineraria, the dusty-miller, has white-hairy leaves, and when grown as an edging plant—its most popular use—it is not allowed to flower. C. moschata, sweet sultan, is widely grown for its large, fragrant flower-heads. C. montana, mountain blue, which originally had blue flowers, has developed various other tints under cultivation. All the species are easily grown from seed and thrive in any good garden soil.

CENTAURS, sên-tôrs, in Greek mythology, a fabulous race dwelling in Thessaly, on Mount Pelion. According to one of many fables, they sprang from the union of Xeron and a cloud. They were typical of wild savagery, except in the case of Pholus and Chiron. They are said to have been half horse and half man, and the fable is explained by the surprise of the Greeks on meeting with the wild horsemen of the northern tribes. Mythology relates the combats of the Centaurs with Hercules, Theseus and Pirithous. The latter, at the head of the Lapithae, another Thessalian nation, their hereditary enemies, entirely defeated the Centaurs, killed many and slew Pelion. The Centaurs Nessus, Chiron and others are famous in fable. See Chiron; Dejanira; Hercules.

CENTAURUS, sên-tô-rûz, or THE CENTAUR, a southern constellation, only a small part of which rises in our latitude. Two stars of the first magnitude are catalogued in the portion which does not appear above our horizon. This is one of the 48 ancient constellations formed by Ptolemy, who first discovered the likeness of a centaur in it. On the celestial maps of the Arabs it is represented by a bear mounted on horseback. The principal star in this constellation a Centauri, has been found to have a larger parallax than any other fixed star. The researches of Gill and Elkin made at the Cape of Good Hope Observatory in 1881–83 make the distance of this constellation 4.3 light years ("light year" meaning the distance traversed by light in one year).

CENTAURY, a genus of plants (Centaurium) of the family Gentianaceae, of about 30 widely distributed species, mostly natives of western Asia and Europe, of which two are of distinct ornamental merit. One of these (C. nemorium) is from California; the other (C. massonii) from the Azores. They are hardy little annuals with rose-colored flowers, and are frequently planted in rockeries, in the soil of which the seed may be sown in early spring. Some of the related species have been used to a small extent in domestic medicine, but rarely in regular medical practice. American centaury (Sobanthia angularis), of the same family, is widely distributed in rich soil and sunny situations from Ontario to the Gulf States. It is often cultivated for its cymes of fragrant showy white or rose-colored flowers. Like the above, it has been used to a small extent in domestic medicine for simple ailments.

CENTAVO, sên-tô-vo, a Chilean coin equivalent to the cent.

CENTENARY, the commemoration of any event, as the birth of a great man, or the founding of a city or institution, which occurred 100 years before.

CENTENNIAL EXHIBITION, a World's Fair held in Philadelphia, Pa., from 10 May 1876 to 10 November of the same year. To celebrate the 100th anniversary of American independence, an association of Philadelphians in 1870 proposed an international exhibition of arts, manufactures and agricultural products, to be held in the city where independence was declared. Congress passed an act 3 March 1871, authorizing the exhibition and also appointed a commission of one member and an alternate from each State and Territory, nominated by the governors, to report on dates of opening and closing, plans for buildings, method of receiving and classifying articles, custom-house regulations. The commission was organized 4 March 1872, with Joseph R. Hawley of Connecticut as president; and on 12 May chose as director-general of the exhibition Alfred T. Goshorn. On 1 June Congress appointed a centennial board of finance, to raise funds for the
exhibition. This board was to solicit subscription to $10,000,000 of stock, and the corporators and subscribers were to erect 25 directors, who should apply the funds on the plans of the committee. Actual subscriptions, Pennsylvania gave $1,749,468. The city of Philadelphia added $1,500,000; the State of Pennsylvania $1,000,000 more. Then Congress appropriated $1,500,000, besides $500,000, for a government building. Fairmount Park was selected as the site of the buildings. The country, with the objects of the exhibition. The buildings of the exhibition proper consisted of all the building (for manufactured products, mines and metallurgy, the public works of all nations, and a prospectus of science and education), built of iron and glass with masonry foundations, 70 feet high, 1,880 x 464 feet, with central transept of 416 feet and two end transepts of 216; Machinery Hall, 1,402 x 300, of wood and glass on masonry foundations, occupying with an annex nearly 13 acres; Agricultural Hall, 820 x 540, of wood and glass; Horticultural Hall, built by the city of Philadelphia, a permanent structure of iron and glass in Moorish 12th-century style; Memorial Hall, intended as a permanent art gallery, of granite, glass and iron, in Renaissance style, 363 x 210 and 59 feet high, with a central tower 150 feet high, surmounted by a colossal statue; the United States Government Building, 504 x 306; the Women's Pavilion, an acre in extent, not only for the convenience of women, but for the collection and exhibition of their work; the Shoe and Leather Building and the Carriage Building, besides annexes. Moreover, 26 States erected buildings of their own, costing over $400,000, and a number of foreign countries, out of 49 which took part in the proceedings by invitation, erected their own buildings. There were over 200 separate buildings in all. The admission fee was 50 cents; 7,250,620 paid it in full, 753,654 paid a special 25-cent rate, and 1,906,692 went in free, making 9,910,966 admissions in all.

By the system of awards adopted the exhibitors—to the number of over 50,000—were divided into 36 groups, and these subdivided again and again into small sections. Each of these was assigned to a special jury of awards, who had to make a statement in writing of the special merits they found in the articles which they esteemed best, and the uses for which each was best fitted, and to sign their names to the award; thus left no room for carelessness or irresponsibility, and gave the maker the benefit of names of known weight. These judges numbered 233, of whom 118 were foreign and 115 Americans; included many of the ablest and most famous men of science and the professions and other great experts in the Western World; and the awards have been a source of just pride. Awards, consisting of a medal and diploma, were granted to 13,104 exhibitors, 7,802 of whom were foreign.

The exhibition was a most important landmark in the industrial history of the country, and other countries. Not only did it make later ones possible and successful here, but it diffused innovations, broke down stolid self-conceit and immeasurably advanced the knowledge of all the nations which took part in it. For instance, the Bell telephone was first exhibited there, and gained immediate celebrity from Sir William Thomson's enthusiastic praise; and the American bicycle manufacture sprang from Colonel Pope's inspection of English cycles there. It showed European countries with new clearness the marvels of American machinery-making, especially the immense development of mechanism with interchangeable parts, from watches to steam boilers and artillery. It made the first collection ever attempted of women's work on a large scale. It first made the beauty and grace of Japanese decoration and patterns popularly known. It shed new light on art principles in general. It illuminated educational systems with light from foreign sources. No public or private money was ever better invested than that devoted to creating and profiting by this collection. The official account of the exhibition was published in nine volumes by the government in 1880.

CENTENNIAL STATE, a popular name given to the State of Colorado on account of its admission to the Union in 1876, the 100th year of American independence.

CENTENO, Diego, dê-ê-ê-gô thân-tâ'nô, Spanish soldier: b. Ciudad-Rodrigo, Spain, about 1504; d. La Plata, upper Peru, 1549. Going to South America he accompanied Alvarado to Peru and soon became famous as a skilful fighter. He gained control of a part of the country by slaying the tyrant Almandras. In 1544 he took the part of the viceroy against Gonzalo Pizarro, but was defeated by Carbajal. His army was utterly routed and he himself was forced to flee. The Royalist cause aroused him and he collected an army at Charcas, but again suffered defeat by Pizarro and Carbajal. In the following year he assisted in the downfall of Pizarro and was appointed governor of Rio de la Plata, which office he held but a short time.

CENTER. See CENTRE.

CENTERVILLE, Iowa, city in Appanoose County, on the Rock Island, the Chicago, Burlington & Quincy and the Iowa Central railroads, 70 miles south of Des Moines. The town was settled in 1832 and was incorporated as a city in 1846. The city has a park, a public hospital and a public library. Coal, gypsum and limestone underlie the vicinity and large quantities are shipped. The exportation of live stock is an important industry, and there are railway shops and manufactures of lumber, flour, iron, skins, crushed rock, etc. Pop. 6,938.

CENTIMETER-GRAMME-SECOND SYSTEM. See Units.
CENTIPEDE, or CENTIPED, one of those myriapods (Chilopoda) with long, many-jointed, flattened bodies, each segment bearing only a single pair of appendages, which take the form of legs behind the head. The mouth parts consist of a pair of mandibles, consist of two pairs of maxillae, those of each pair being fused together in the middle. The first pair of legs are fused at their base, and form the poison-lancs, the poison-gland being situated in them, and the poison being ejected through an orifice at the end of the leg. The single ovipod and corresponding male duct open at the end of the body in the penultimate segment. The centipedes (Scolopendra) are mostly confined to the tropics, a small species extending as far north as New Jersey. Those of the West Indies and the tropics in general are eight to nine inches in length, one species, however, attaining the length of 18 inches. Their bite is dangerous, quite as much so as the sting of the scorpion. They are ferocious when attacked or seized, biting energetically. In the Northern States the centipedes are represented by the species of Lithobius (L. americanus), which are wrongly called earwigs, and live under stones, under the bark of fallen trees, etc. They predate on insects and worms. They have been observed to attack earthworms, grappling with them for several hours and, after killing them, sucking their blood. Very long, slender forms are Geophilus and its allies. The body is composed of from 19 to nearly 200 segments, each bearing a pair of legs. They are eyeless, and live buried in the sand, coming to the surface under stones.

The centipedes are hatched with numerous segments, and corresponding legs. Wood states that the female of a centipede (Scolopocryptops sexspinosa) guards her young by lying on her side, and then coiling her body, passes them along by a quick action of her feet, thus arranging them satisfactorily to herself. He also describes the manner of molting in this species.

The chilopods are more nearly related to the insects than are the millipedes. They are a less ancient group. No true Chilopoda are known from rocks older than the Middle Eocene period, species of Gertrgia, Scolopendra, Lithobius and Geophilus, having been detected in amber and the gypsum beds of Aix, Provence, France, of Oligocene age. (See Chilopoda.) Consult Latzel, 'Die Myriapoden der Oesterreichisch-Ungarischen Monarchie' (Wien 1880); Korschelt and Heider, 'Lehrbuch der vergleichenden Entwicklungsgeschichte der wirbellosen Thiere' (Jena 1891); Sinclair, articles on Myriapods, 'Cambridge Natural History' (Vol. V, London 1893); Zittel, 'Handbuch der Palaeontologie' (I Abth., II Bd., Leipzig 1881); Wood, 'The Myriapoda of North America' ('Transactions, Amer. Phil. Soc., Philadelphia 1865'.

CENTLIRE, sánt-îfr, Susanna Freeman, English actress and dramatist; b. Ireland about 1697; d. London, 1 Dec. 1723. When very young she married a nephew of Sir Stephen Fox. Becoming a widow within a year she took for a second husband an officer of the army of the name of Carrol, who was killed and she was left in debt. This event in her singular career reduced her to considerable distress, and led her to attempt dramatic composition. Her first production was a tragedy entitled the 'Perjured Husband,' performed in 1700. This was followed by several comedies, chiefly translations from the French, which exhibited the vivacity that distinguishes her literary character, and met with some temporary success. She also tried the stage as an actress on the provincial boards, and by means attracted the attention of her third and last husband, Mr. Centlivre, Queen Anne's head cook, whom she married in 1706. She kept the stage for the stage, and produced several more comedies. Some of these remain stock pieces, of which number are 'The Busy Body'; 'The Wonder'; and 'A Bold Stroke for a Wife.' They are diverting from the variety of incident and the liveliness of the characters, but want the accompaniments of adequate language and forcible delineation. They partook of the license of the age. Mrs. Centlivre enjoyed the friendship of Steele, Farquhar, Rowe and other wits of the day. Having, however, offended Pope, she obtained a place in the Dunciad, but is introduced by no means characteristically. An edition of her works with a biography appended appeared in 1872.

CENTNER, a German weight, in common use on the continent of Europe, which is nearly the equivalent of the British hundredweight. It formerly varied in the different German states, but since the introduction of the metric system of weights and measures into the German empire, 1 Jan. 1872, the value of the centner has been fixed at 50 kilograms, or 100 German pounds, equivalent to 110½ pounds avoirdupois. In Austria it is equal to 110¾ pounds, and in Sweden to 112.06 pounds.

CENTO, chên-to, Italy, city, 13 miles north of Bologna, on the eastern bank of the canal of Cento and near the river Reno. It is surrounded by a rampart and ditch and contains several churches, convents and a cathedral. The celebrated painter, G. F. Barberi, commonly called Guercino, was born here about 1590. A statue of him stands in the Piazza Governativo. The gates of the ancient town have been preserved. It has a hemp and rice market. Pop. 23,907.

CENTO, sên-to (Latin, 'patchwork'), originally a cloak made of patches; hence, as Lessing observes, the dress of Harlequin is called in Apuleius mimi centulus. The term has been transferred to such poems as have been formed out of verses taken from other poems. It was a particular art to combine passages of different authors on different subjects in this manner so as to form a regular whole. Thus there were in early times Virgilian centos (centones virgiliani), in which most of the verses were taken from Virgil; for instance the 'Cento Nuptialis' of Ausonius, and centos from the verses of Homer (Homeric cento). It was a favorite pastime in the Middle Ages. Consult Delepiere, 'Tableau de la litterature du cento' (London 1874-75).

CENTRAL AFRICA PROTECTO- RATE. See NYASALAND PROTECTO- RATE.

CENTRAL AMERICA. Though on the map Central America appears to be a mere isthmus extending in a southeasterly direction from Mexico to Colombia, between the Caribbean Sea and the Pacific Ocean, it is in fact structurally much more nearly related to the
West Indies, including the Gulf of Mexico and the Caribbean Sea, and to the northern coast of South America, than to the main bodies of the two continents. It has a distinct geologic formation at right angles to those of Java and South America. Probably in the Tertiary Period Central America and the Antilles together formed a great island or archipelago lying between North and South America. (Consult Robert T. Hill's 'Cuba and Porto Rico,' etc.). Guatemala, Honduras, Salvador, Nicaragua and Costa Rica, five republics, are characterized in the treaty of peace signed at Corinto, Nicaragua, 20 Jan. 1902, as "the Central American family." The Isthmus of Panama, at the commencement of its history under the Spanish régime, was associated not less intimately with the settlements in the region north and west of it than with those of South America; British Honduras (Belize) also, a colony lying between Guatemala and the Caribbean Sea, has been connected about equally with the history of the Central American states and with that of Yucatan. The mountains described as extending directly at right angles to the coasts of Honduras and the Cordilleras of Nicaragua are part of a great Antillean system. East and west mountain ranges of this type occur in the Isthmus of Panama, Costa Rica and the eastern parts of Nicaragua, Honduras, Guatemala and the adjoining provinces of Mexico, also along the Colombian and Venezuelan coast of South America, and in Cuba, Haiti and the other islands of the Greater Antilles. Two submarine ridges stretching across the Caribbean Sea, between Honduras and the Sierra Maestra range in Cuba, and from Cape Gracias a Dios to Jamaica, are regarded as being genetically a part of the same system. The great banks of the western Caribbean Sea were at one time projections of land probably connecting Central America with Jamaica and possibly Cuba. Therefore Florida, the Bahamas, the Antilles and at least the eastern part of Central America, totally severed from North and South America, together formed either one great island, or more probably, a group of several large islands, with volcanic chains on the east and west, and with characteristic rocks, calcareous and igneous, which have weathered into soils of unsurpassed fertility. A Central American group of volcanoes, with active craters crossing the western ends of the Antillean folds, occurs on the Pacific side of the republics, from Costa Rica to Guatemala. The central and eastern region is well watered, with comparatively low mountains, very rich soil, and a good climate, except the Caribbean coast which, from Trujillo downward, including the Mosquito territory, is hot and insalubrious. Lack of communication and means of transportation has led to the abandonment of the intermediate lands, the most attractive and extensive part of the country, nearly or quite beyond the influence of the volcanic area. The easily approachable volcanic strip (in Nicaragua, for example, between the lakes and the Pacific) has been preferred hitherto as a place of residence. To the north are the principal cities; and in the centre of population, seeing nothing of the naturally richer and better districts, receives the impression that this is the most volcanic region of the globe. The largest volcanoes are, for example in the north, the Acatenango,

14,000 feet elevation, in Guatemala; and in the south, for example, the Izalco and Turaebal, of 12,000 feet, in Costa Rica. In Nicaragua the highest, El Viejo, is only 5,800 feet above sea-level. In Guatemala we find the volcanoes, Fuego, Cerro Quemado and El Chato; in Salvador, Ilopango and San Salvador. Earthquake shocks in the republics last mentioned, and also in Costa Rica, have been, as a rule, very severe, while those of Nicaragua are comparatively mild and extend over limited areas. The recorded seismic disturbances that have affected the whole country are those of 1538, 1648, 1651, 1844 and 1865. Central Nicaragua, east of the lakes, Nicaragua and Managua (the largest bodies of fresh water in Central America), is regarded as nearly immune from such disturbances. Nicaragua's centre of volcanic activity is a ridge, the Sierra de los Morabios, between the Costiguita (whose outburst on 2 Jan. 1835 was considered the grandest on record before the eruption of Krakato in 1883), and the Momotombo. In this ridge are 10 vents, two of which, the Telica and Momotombo, are active and none can be presumed South American are part of a great Antillean system. East and west mountain ranges of this type occur in the Isthmus of Panama, Costa Rica and the eastern parts of Nicaragua, Honduras, Guatemala and the adjoining provinces of Mexico, also along the Colombian and Venezuelan coast of South America, and in Cuba, Haiti and the other islands of the Greater Antilles. Two submarine ridges stretching across the Caribbean Sea, between Honduras and the Sierra Maestra range in Cuba, and from Cape Gracias a Dios to Jamaica, are regarded as being genetically a part of the same system. The great banks of the western Caribbean Sea were at one time projections of land probably connecting Central America with Jamaica and possibly Cuba. Therefore Florida, the Bahamas, the Antilles and at least the eastern part of Central America, totally severed from North and South America, together formed either one great island, or more probably, a group of several large islands, with volcanic chains on the east and west, and with characteristic rocks, calcareous and igneous, which have weathered into soils of unsurpassed fertility. A Central American group of volcanoes, with active craters crossing the western ends of the Antillean folds, occurs on the Pacific side of the republics, from Costa Rica to Guatemala. The central and eastern region is well watered, with comparatively low mountains, very rich soil, and a good climate, except the Caribbean coast which, from Trujillo downward, including the Mosquito territory, is hot and insalubrious. Lack of communication and means of transportation has led to the abandonment of the intermediate lands, the most attractive and extensive part of the country, nearly or quite beyond the influence of the volcanic area. The easily approachable volcanic strip (in Nicaragua, for example, between the lakes and the Pacific) has been preferred hitherto as a place of residence. To the north are the principal cities; and in the centre of population, seeing nothing of the naturally richer and better districts, receives the impression that this is the most volcanic region of the globe. The largest volcanoes are, for example in the north, the Acatenango,

14,000 feet elevation, in Guatemala; and in the south, for example, the Izalco and Turaebal, of 12,000 feet, in Costa Rica. In Nicaragua the highest, El Viejo, is only 5,800 feet above sea-level. In Guatemala we find the volcanoes, Fuego, Cerro Quemado and El Chato; in Salvador, Ilopango and San Salvador. Earthquake shocks in the republics last mentioned, and also in Costa Rica, have been, as a rule, very severe, while those of Nicaragua are comparatively mild and extend over limited areas. The recorded seismic disturbances that have affected the whole country are those of 1538, 1648, 1651, 1844 and 1865. Nicaragua's centre of volcanic activity is a ridge, the Sierra de los Morabios, between the Costiguita (whose outburst on 2 Jan. 1835 was considered the grandest on record before the eruption of Krakato in 1883), and the Momotombo. In this ridge are 10 vents, two of which, the Telica and Momotombo, are active and none can be presumed South American are part of a great Antillean system. East and west mountain ranges of this type occur in the Isthmus of Panama, Costa Rica and the eastern parts of Nicaragua, Honduras, Guatemala and the adjoining provinces of Mexico, also along the Colombian and Venezuelan coast of South America, and in Cuba, Haiti and the other islands of the Greater Antilles. Two submarine ridges stretching across the Caribbean Sea, between Honduras and the Sierra Maestra range in Cuba, and from Cape Gracias a Dios to Jamaica, are regarded as being genetically a part of the same system. The great banks of the western Caribbean Sea were at one time projections of land probably connecting Central America with Jamaica and possibly Cuba. Therefore Florida, the Bahamas, the Antilles and at least the eastern part of Central America, totally severed from North and South America, together formed either one great island, or more probably, a group of several large islands, with volcanic chains on the east and west, and with characteristic rocks, calcareous and igneous, which have weathered into soils of unsurpassed fertility. A Central American group of volcanoes, with active craters crossing the western ends of the Antillean folds, occurs on the Pacific side of the republics, from Costa Rica to Guatemala. The central and eastern region is well watered, with comparatively low mountains, very rich soil, and a good climate, except the Caribbean coast which, from Trujillo downward, including the Mosquito territory, is hot and insalubrious. Lack of communication and means of transportation has led to the abandonment of the intermediate lands, the most attractive and extensive part of the country, nearly or quite beyond the influence of the volcanic area. The easily approachable volcanic strip (in Nicaragua, for example, between the lakes and the Pacific) has been preferred hitherto as a place of residence. To the north are the principal cities; and in the centre of population, seeing nothing of the naturally richer and better districts, receives the impression that this is the most volcanic region of the globe. The largest volcanoes are, for example in the north, the Acatenango,
central Chagres) River and Colon—at Porto Bello from 2 to 9 November, and at other points within a few miles for three weeks and five days. Thus during more than a month the greater discoverer hovered voluntarily about the spot where the strait he dreamed of was to be cut four centuries later. And when he thought to return by the way he had come, abandoning the search, stress of weather held his vessels back, so that it was not until 6 Jan. 1503, that they anchored in a little river just west of Colon. He wished to plant a colony on the coast between Veragua and Cerebaro, but, hostilities breaking out between the Spaniards and the natives, the former were obliged to abandon their attempt, and once more Columbus passed the place of the future canal, clinging to the shore before setting a straight course for Jamaica.

In 1506 Juan Diaz de Solis and Vicente Pinzón sailed along the coast of Honduras westward, exploring the Gulf of Honduras, in search of a passage by water to the Far East—Spanish Seamen now had before the Spanish King, Ferdinand, authorized Alfonso de Ojeda and Diego de Nicuesa to colonize and govern, in his name, the northern coast of South and Central America. The river Darien or Atrato was made the dividing line between their dominion. The eastern or South American portion was called Nueva Andalucía, and of this Ojeda was made governor; the western division was named "Golden Castle," Cartilla del Oro, and the command given to Nicuesa. The latter secured the larger number of followers; the former, however, attracted to his standard Martin de Encisco, afterward governor, Balboa, discoverer of the Southern Sea, and Francisco Pizarro, conqueror of Peru. The forces of both governors suffered extreme hardships. Nicuesa's capital was at Nombre de Dios, Ojeda's at San Sebastian—so named because the Indians afflicted them as that saint was tortured. Ojeda returned to Española, where he died, Encisco, Balboa and Pizarro removed the capital of Nicuesa, which existed probably about the beginning of the Christian Era, was inspected by Alvarado in 1522, and conquered with a small force of Spaniards and native allies before two years had passed. In 1533 an unsuccessful attempt to colonize Veragua was made in the interest of the descendants of Columbus (on whom the titles, "Duke of Veragua," etc., had been conferred), and a still more calamitous enterprise was that of Diego Gutierrez, a citizen of Madrid who led an expedition to Costa Rica north of Veragua in 1540. Francis Drake, English privateersman, attacked Nombre de Dios in 1572. Again, in 1595, Drake (now Sir Francis, knighted for his feat of sailing round the world), Sir John Hawkins and others attacked Nombre de Dios; but an English force of 750 men sent to attack Panamá was defeated by the Spaniards when half-way across the isthmus. Drake, dying on 28 Jan. 1596, was buried off Porto Bello. The Spaniards in that part of America. On 25 Sept. 1513, Balboa discovered the Southern Sea, and four days later took possession of it, with all its lands and ports and islands in the name of the King and Queen of Spain. Before news of this discovery reached the Spanish court, a successor to Balboa had been appointed in the person of Pedrarias Dávila. In 1517 Balboa was falsely charged with treason, and executed. Pedrarias Dávila, being superseded in command, went to the south coast and founded the city of Panamá (that is, the old Panamá, six miles from the present city), 15 Aug. 1519.

A voyage into the unknown northwest from Panamá was made in 1522 by Gil González, who explored the Dute and Nicoya gulfs indenting the Costa Rica's southern coast. Thence toward 50 leagues he went, to the domain of a chief whose name was Nicaragua, and who dwelt near the principal lake of that region. González learned that this lake, though lying near the Southern Sea, had an outlet to the Caribbean. In his narrative he says that the discovery is important, inasmuch as only "two or three leagues of very level road separate the two seas." The expedition returned to Panamá in 1523, after baptizing thousands of natives and securing 112,000 pesos of gold. On 15 Sept. 1521, Panamá was made a city with royal privileges; the episcopal see was transferred to it; from this base expeditions were sent out toward Peru and into the northwest. Pedrarias, in 1524, dispatched Francisco Hernández de Córdoba with Hernando de Soto and other captains to Lake Nicaragua. Gil González, continuing his discoveries in Honduras and Nicaragua, came into collision with De Soto; and only a little later one of the captains of Hernán Cortés, the Spanish conqueror of Mexico, appeared as a claimant for the territory of Honduras. In the latter part of October 1524 Cortés set out from Mexico, marching to Honduras with an army of about 100 horsemen, 40 archers and arquebusiers and 3,000 native warriors and servants. After making himself governor of the country, he returned in triumph to the City of Mexico. Pedrarias went to Nicaragua about the same time. There were rival Spanish governors even then in Nicaragua and Honduras. Guatemala and Salvador were overrun by Pedro de Alvarado, second in command to Cortés. The former country, in which a great empire had existed probably about the beginning of the Christian Era, was inspected by Alvarado in 1522, and conquered with a small force of Spaniards and native allies before two years had passed. In 1533 an unsuccessful attempt to colonize Veragua was made in the interest of the descendants of Columbus (on whom the titles, "Duke of Veragua," etc., had been conferred), and a still more calamitous enterprise was that of Diego Gutierrez, a citizen of Madrid who led an expedition to Costa Rica north of Veragua in 1540. Francis Drake, English privateersman, attacked Nombre de Dios in 1572. Again, in 1595, Drake (now Sir Francis, knighted for his feat of sailing round the world), Sir John Hawkins and others attacked Nombre de Dios; but an English force of 750 men sent to attack Panamá was defeated by the Spaniards when half-way across the isthmus. Drake, dying on 28 Jan. 1596, was buried off Porto Bello. The Spaniards in that part of America. On 25 Sept. 1513, Balboa discovered the Southern Sea, and four days later took possession of it, with all its lands and ports and islands in the name of the King and Queen of Spain. Before news of this discovery reached the Spanish court, a successor to Balboa had been appointed in the person of Pedrarias Dávila. In 1517 Balboa was falsely charged with treason, and executed. Pedrarias Dávila, being superseded in command, went to the south coast and founded the city of Panamá (that is, the old Panamá, six miles from the present city), 15 Aug. 1519.

A voyage into the unknown northwest from Panamá was made in 1522 by Gil González, who explored the Dute and Nicoya gulfs indenting the Costa Rica's southern coast. Thence toward 50 leagues he went, to the domain of a chief whose name was Nicaragua, and who dwelt near the principal lake of that region. González learned that this lake, though lying near the Southern Sea, had an outlet to the Caribbean. In his narrative he says that the
exposed to attack. That was the beginning of the present city of Panamá. Granada, in Nicaragua, was sacked by French and English pirates in 1686. A number of influential Scotchmen, chief of whom was William Paterson, the founder of the Bank of England, were authorized by the Scottish Parliament in 1695 to found colonies in savage lands. They afterward obtained letters patent from William III of England. Paterson chose Darien, believing the control of the traffic of the isthmus to be essential to the prosperity of England; it certainly was not, as is incorrectly and commonly stated, merely anxious to make money for his company, and reckless of consequences to the colonists. (Consult Bannister's "Life"; Rodriguez's "Expedition of Cuba," etc.). The largest and most costly expedition that had yet been fitted out for colonization in America sailed from Leith, 26 July 1698, and founded "New Saint Andrew." Subsequently recruits were sent out to them; but the project came to a sudden end. Many lives and several millions of money had been lost, when the survivors were starved into surrender by the Spaniards. A British squadron commanded by Adm. Edward Vernon (21 Nov. 1739), took Porto Bello, but not Darien. Meanwhile English settlements of a very peculiar character had been begun in Mosquitia and at Belize. The Missikto tribe, called by the Spanish and English "Sambos" or "Mosquitos," a hybrid people, descendants of fugitive slaves, "Cimarrones," and natives, ruled by an hereditary king, dwelt on the eastern coast of Honduras and Nicaragua in the 17th century. Unoccupied by the Spanish, this coast was frequented by buccaneers, who made Cape Gracias a Dios, on the dividing line between the colonies just mentioned, their rendezvous. Small settlements of English adventurers existed in this region. By the Treaty of Madrid (1670) certain rights were conceded to Great Britain, and the British claim was asserted (1744) by sending troops and building forts; but it was withdrawn (1786) when an agreement was reached as to the cession by Spain of the territory on the north coast of the Gulf of Honduras. The ex-freebooters of Belize, reduced by other adventurers, were able to exploit the rich forests and hold their own, or more, in the contest for the possession of this territory waged at intervals between the authorities at Yucatan and the wood-cutters (regarded as Ancepiers) from 1733 until the end of the 18th century. The Treaty of Versailles (1783) defined the limits of Belize; but these were more precisely stated in the treaty signed at London, 14 July 1786. The boundaries were subsequently extended by encroachments of the wood-cutters. Thus England, retaining the region now known as the colony of British Honduras, abandoned possession of the Mosquito coast, though her claim to exercise a certain degree of influence in the latter territory (from which the Spaniards were expelled) was not expressly and absolutely surrendered until the middle of the 19th century. Before that determination, several reverses were suffered in Nicaragua. An English force was repulsed at Fort San Carlos in 1769. A few years later the design to plunder the Spanish provinces of Central America, and, at the same time, to capture a route for an interoceanic canal, by taking possession of Lake Nicaragua and the cities of Granada and Leon (Consult Bancroft's "Central America"), proved infeasible. An English force of about 1,800 men, including a party of marines under Horatio Nelson, was forced by the deadly fevers to abandon the attempt.

Except Belize, Mosquitia, and large tracts in which the Indians remained nearly undisturbed, Spain now held the land, but no longer had energy or opportunity to develop its natural resources. The natives, more docile and serviceable than in other parts of America, seldom increased the difficulties of the situation by uprisings; there was, however, little incentive to accumulate property in a land menaced constantly for a hundred years by English, Dutch and French pirates. The several divisions of an apathetic population were easily drawn together for administrative purposes. The captain-general of Guatemala, by the middle of the 18th century, had 124,000 inhabitants, but after the loss of its provinces of Costa Rica, Honduras, Nicaragua and Salvador, beside others now within Mexican boundaries. Revolt against Spain was the form in which the spirit of the people, awakened from its slumber, was manifested in the country itself. Unfortunately armed revolt has ever since been too closely identified with progress in the popular conception. The first weak blow for Central American freedom was struck in San Salvador, 5 Nov. 1811. A sequel to this attempt (in Leon, Nicaragua, 13 Dec. 1811) duplicated this Salvadoran effort, in result as in motive. A third failure was recorded when the Colombian insurgents (1820) fitted out a combined sea and land expedition to operate against the towns of Omoa and Trujillo. The Isthmus of Panama cast in its lot with South America, rather than with Central America, by voluntary annexation to the republic of Colombia on 28 Nov. 1821. For its subsequent history see COLOMBIA and PANAMA. The declaration of independence of the city of Guatemala, 15 Sept. 1821, was little more than an echo of the triumphant cry of other Spanish-American colonies in revolt. It was followed (5 Jan. 1822), by a decree of the junta of the provincias united, removed the boundary to Mexico. Salvador refusing to join in this surrender, a war with Guatemala ensued. Before 18 months had passed the Central American provinces resolved to form a union and constitute a single nation. On 1 July 1823 a national constituent assembly expressed this purpose, the name chosen for the nation being Provincias Unidas del Centro de América. Though laggards in the race to win freedom, the Central Americans were prompt in bestowing it. The laws of 31 Dec. 1823, and 17 and 24 April 1824, emancipated their slaves and declared that slaves of other countries on coming to Central America should be freed. When dissentions and civil war broke up their confederacy, they had at least taken one step forward, in abolishing slavery. The intermediate decrees of 1823, 1824, and 1826, were followed by the proclamations of 31 Dec. 1826, 1827, and 1828, which proclaimed the union and determined the form in which it was to be carried into effect.
Great Britain, the latter upholding the claim of the Mosquito King to all the territory lying between Cape Gracias a Dios and the mouth of the San Juan River, and sending (January 1848) two warships to occupy the port of San Juan. Nicaragua yielded provisionally to superior force. At this point the intervention of the United States was felt; and soon afterward the Clayton-Bulwer Treaty, concluded at Washington 19 April 1850, between the United States and Great Britain, provided that neither power should occupy, occupy, possess the territory by a treaty or otherwise exercise dominion over any portion of Central American territory (except Belize), or make use of a protectorate in any form. This treaty guarantees Central American independence and encourages the maintenance of English influence, which was considered beneficial within certain limits. By the Zedelon-Wyke Treaty of 28 Jan. 1860, England ceded to Nicaragua absolutely the protectorate over the Mosquito coast. While the diplomacy of the governmen of the United States was in the main considerate and helpful at this time, the conduct of some of her citizens left much to be desired. San Juan del Norte, or Greytown, was bombarded by the United States slop-of-war Cyone, and burned by the doctrine of a landing party from that vessel on 13 July 1854 (see Walker, William). Renewal of the efforts to achieve Central American unity was due, in a measure, to President Barrios of Guatemala (1873-85). For the further development of this design; the attempt (1895-98) to unite Honduras, Nicaragua and Salvador; the treaty of 20 Jan. 1902, and events of the years 1885 to 1916, see the separate articles on each of the five Central American republics. All the Central American countries sent delegates to a conference held in Washington, D.C., 14 Nov. to 20 Dec. 1907. As a result of their deliberations eight conventions were signed, in relation to a general treaty of peace and amity, the establishment of a Central American Court of Justice, of an international bureau, of a pedagogical institute also international in design, etc. The Central American Court of Justice was opened at Cartago, Costa Rica, 26 May 1908 in the presence of representatives from five Central American nations of the United States and of Mexico. This international court is now established at San Jose, Costa Rica. On 20 Jan. 1909 a meeting at Tegucigalpa, Honduras, was attended by delegates of the five nations, and an agreement was framed to secure the unification of the monetary systems, customs duties, weights and measures, fiscal laws and consular service. This was the year of the Zelaya episode (see NICARAGUA—HISTORY). Other happenings served to concentrate attention upon Nicaragua, which during the latter part of the summer and the entire autumn of 1912 was in a state of revolution which imperiled the lives and property of foreigners and so led to intervention by the United States. In January 1914 another conference took place, which carried even further the recommendations of the conference of 1909 and added plans for agreements as to international highways, postal and telegraphic regulations, and coasting trade, as well as for the establishment of a Central American institute and a central mission of foreign relations. Although no united action had, up to Febru-
a constitution on the model of that of the United States and borrowed the code of Louisiana.

Central American commissioners presented their credentials at Washington 10 Sept 1823. In 1824, Secretary Adams instructed Thomas N. Mann to visit Guatemala to obtain statistics and political information; and in 1825 the American government recognized the Federation of Central America, which in the same year was also recognized by Great Britain and the Netherlands. The first American diplomatic agent to the Federation, John Williams, was commissioned on 29 Dec. 1825; and the last American representative to the Federation, appointed in 1841, left his post in March 1842. The last Federation representative at Washington took his leave 16 March 1828.

On 5 Dec. 1825, the United States negotiated with the Federation a treaty of commerce which expired by its own limitations in 1837 and was never renewed. In April 1825, the American government received from Canas, the representative of the Federation, a proposal of co-operation in promoting the opening of a canal through Nicaragua, and, in 1826, through the influence of Mr. Williams, the Central American government contracted with A. H. Palmer of New York for the construction of the canal; but failure of plans caused Central America to open negotiations with a Holland company, whose plans failed by the political disturbances in an attempt in 1828 to separate of Belgium from Holland in 1830.

As a result of rebellions, the Federation was partially ended by 1833. It was practically dissolved by 1839 by the legislative decree of 1838 granting each member of the Union the privilege of unrestrained action in the most important matters, and completely dissolved by 1847.

After the complete dissolution of the Federation American diplomatic representatives to the separate republics were first sent to Guatemala in 1844, to Salvador in 1849, to Nicaragua in 1851, to Costa Rica in 1852 and to Honduras in 1853. Diplomatic representatives of the separate Central American states were received at Washington from Nicaragua in 1849, from Costa Rica in 1851, from Salvador in 1851, from Salvador in 1853 and from Honduras in 1854. A commercial treaty was negotiated with Costa Rica in 1851. A similar treaty, negotiated with Nicaragua in 1849 and at subsequent sessions, did not become operative.

Active American diplomatic efforts in Central America really began with the military occupation of California and the resulting Colombia treaty of 1846 which was ratified in June 1848. The motive which attracted the American government to exercise a larger influence over the region was associated with the problem of the establishment and proper control of a new route to California. It was also connected with the development of canal plans by Louis Napoleon between 1844 and 1848, and the consequent competition in Central America, especially the occupation of the Nicaraguan port of San Juan (Greytown) which precipitated the intervention of American diplomacy and the negotiation of the 1850 Clayton-Fulwarth Treaty (q.v.) which guaranteed the independence and integrity of Central American territory and prepared the way for the extinguishment of any British claim of sovereignty or protectorate over the Mosquito Indians along the coast of Nicaragua—a claim which was finally terminated by the English treaty negotiated by Wyke with Nicaragua in January 1860. On questions connected with these negotiations Central America requested and welcomed the support of the United States.

Boundary questions between Central American states furnished an opportunity for England to assert her earlier territorial claim. In 1852 Webster, acting under friendly mediation of the American government, submitted propositions for adjustment of such questions between Costa Rica and Nicaragua; but they were rejected by Nicaragua. In 1853, Marcy, anxious to prevent European intermeddling in Central American affairs (and especially English encroachments in Honduras), encouraged the re-establishment of the Central Federation, but he was not ready to pledge the American government to expel the British from the Bay Islands. After 1853, American diplomatic relations in Central America were affected by the constant apprehension of European influence inimical to American interests, and by a series of irritating events beginning with the bombardment and burning of Greytown by Americans in 1854 as a punishment for an alleged insult to the American Minister to Nicaragua.

Relations were complicated by Walker's bold despatchation with the political factions in Nicaragua, culminating in his conquest of Nicaragua and his election to the presidency of the country. By his expeditions, and by the filibuster diplomacy with which he vainly sought to gain recognition at Washington, he caused Nicaragua to present to the American government a series of claims for damages and created an ill feeling of all the Latin American representatives which culminated in the draft of the proposed treaty of alliance against the supposed designs of the United States.

The most important result of the Walker episode was the closure of the transit, causing a diversion of traffic which perhaps changed the destiny of Nicaragua.

In this period, in 1856, the American government adopted a more aggressive American policy in regard to control of transit and canal routes.

During the Civil War, the Central American people, seeing that the causes which produced filibustering were passing away by the results of Union victories, and fearing the designs of all Europe (and especially of France) against American states, became more friendly to the government at Washington and anxiously hoped for the restoration of the Union. Soon after the fall of Vicksburg and the failure of Lee at Gettysburg, some advocated annexation to the United States. Others relying on the American government as natural protector of American republics requested alliance or aid. To them was opposed the principle that the most effective aid to American republics was the moral influence resulting from the integrity of the American Union and the stability of republican institutions.

The considerate policy of Secretary Seward during the Civil War period in forbearing to press claims of American citizens against the
government of Nicaragua—claims which had long been a source of diplomatic irritation—unfortunately caused Nicaragua to regard the claims as abandoned and to refuse to negotiate a claims convention in 1871, although she agreed to a treaty of amity, commerce and navigation in 1867. The claims long remained a source of diplomatic discussion at intervals and were never settled.

Until the beginning of the 20th century the chief interest and attention of the United States in Central America, aside from the maintenance of the Monroe Doctrine, was centered in the possibility of constructing a trans-isthmian canal across Nicaragua. With the idea that the Nicaraguan route was more practical than the Panama route, an American canal company was organized in 1889—nominally to build a canal across Nicaragua, but really to induce the American government to take the responsibility in the enterprise. Until 1903, a violent controversy ensued between the advocates of constructing a canal via the Nicaragua route the American government negotiated for the withdrawal of the Clayton-Bulwer Treaty which was finally terminated by the Hay-Pauncefote Treaty of December 1901. Soon thereafter, however, a decision was made in favor of the Panama route, disappointing the hopes of Nicaragua.

In recent years, earlier American interests and influence in Central America have been modified and expanded by new American expansions in world commerce and larger American participation in world politics. By 1917 the United States dominated the Central American market and invested in Central America more capital than any other country, and was thus more closely related to the country by economic bonds.

The American government, with a policy of forbearance and national unsightfulness, too long allowed Central America to suffer from divisions, irresponsible leadership, revolution and bankruptcy. True, it sometimes lent its good offices to prevent interstate conflicts, illustrated in 1888 by President Cleveland’s arbitration of a long pending boundary dispute between Costa Rica and Nicaragua. With the hope of preventing revolution, Nicaragua urged a closer union and co-operation, recommending a return to the earlier policy of federation. In 1874 it began a series of friendly efforts to encourage the establishment of a strong and settled union, but practically abandoned its diplomatic efforts in that direction after the fourdarkers of Blaine in 1881.

In 1896, the last attempt to restore the early Federal union was made by the Presidents of Honduras, Nicaragua and Salvador, who (in accord with a treaty of 1895) formed, for the exercise of their external sovereignty, a single loose political organization with the title "Greater Republic of Central America" which was promptly recognized by the American government by the reception of a minister, but which never had the responsibility of each of the separate republics toward the United States remained wholly unaffected. Again the hope of the formation of a permanent federation was disappointed. In 1898, as a result of revolutionary movements—an insurrectional movement in Salvador—the provisional executive council of the Greater Republic announced the dissolution of the union by mutual consent.

In 1906 President Roosevelt with the cooperation of President Diaz, in order to terminate a war acted as mediator in a dispute of Guatemala with Salvador and Honduras. This was in accord with the treaty of peace which received the assent of all the five republics except that of President Zelaya of Nicaragua, and directly recognized the obligation of the United States to mediate and intervene in Central American affairs. In February 1899, the American government failed in a friendly mediation to prevent Zelaya from making war against Honduras, but was able to prevent the spread of the conflict to Salvador and Guatemala. In August 1907, by strenuous diplomatic representations, it averted war between Nicaragua and Salvador.

At Washington, in 1907, through negotiations encouraged and stimulated by the United States on the initiative of President Roosevelt, the diplomatic representatives of the separate republics held a Central American Peace Conference to find a basis of agreement on political, commercial and financial relations. The chief results were a series of palliative measures: the establishment of a Central American International Bureau as a bureau of information (a miniature of the Pan-American Union); the foundation of a Central American Court of Justice (five members) in Costa Rica, for the arbitration of questions of an international character affecting the relations of the five republics; and a provision for later Central American annual conferences to discuss political and economic questions of community interest.

The American government, after the decision which greeted the first decision of the new Central American court, concluded that a court without means of enforcing its decisions was of no value—and reluctantly, but logically, concluded that American intervention was necessary to prevent depredations by the Zelaya government in Central America. In 1909, after the execution of two Americans in Nicaragua, it intervened directly, compelled Zelaya to flee and entered into a treaty agreement (negotiated by Secretary Knox) to act as a receiver for the government in the rehabilitation of its finances. In the summer of 1912 it landed troops at the request of the Nicaraguan government to protect American lives and property and preserve free communication with the legation, and operated the national railway under the protection of American soldiers. It also negotiated a treaty, later approved by the Wilson administration, securing for its services in rehabilitating the finances sole rights to the construction of a canal across Nicaragua and to a coaling station in the Gulf of Fonseca. In August 1914 the Nicaraguan government was kept in power only by the presence of American troops landed at Bluefield.

The treaty, finally ratified by the American Senate in February 1916, containing substantial aid for the support of legally constituted good government in Nicaragua, was opposed by Costa Rica, who complained that it violated her rights. It was also opposed elsewhere in Central America on the ground that it would prove an obstacle to Central American unity. The governments of Salvador and Honduras joined in
the protest, Costa Rica brought suit against Nicaragua in the Central American Court of Justice at Cartago (Costa Rica). The court (in 1916) decided that Nicaragua acted illegally in occupying part of the territory without consulting Costa Rica, and in threatening the neutrality of Honduras by permitting a United States naval base to be established on the Gulf of Fonseca; but Nicaragua refused to be bound by the decision.

CENTRAL BANKS OF ISSUE. See banks and Banking—World’s Systems (Article 3).

CENTRAL CITY. Colo., city and county-seat of Gilpin County, situated on the Union Pacific Railway, 40 miles northwest of Denver and 20 miles southwest of Boulder. It lies in a gold-mining district of the Rocky Mountains and its industries are chiefly connected with the development of the mines, which have been worked for about half a century. The first discovery of gold in paying quantities in the State occurred in 1860. The city was settled in 1859 and was incorporated in 1864. The city is administered by a mayor, elected biennially, and a city council. There are municipal waterworks. Pop. 1,782.

CENTRAL CITY, Ky., city in Muhlenberg County, on the Illinois Central, the Louisville and Nashville and the Kentucky and Indiana railroads, 35 miles northwest of Bowling Green. It is the centre of the bituminous coal region of western Kentucky and its coal-mining interests are extensive. It has a public library, a railroad station, and a waterworks. The city has a large number of manufacturing establishments, with an aggregate capital of $1,389,000, including cotton, woolen, silk, haircloth, glass, machinery and leather factories. The river supplies excellent power. There are several churches, newspapers and both national and savings banks. It owns the water supply of the city, and owns the pipe system by which the water is supplied. The town, formerly included in that of Lincoln, was incorporated in 1895. Under its present charter, the mayor and city council are elected biennially, the latter being a bicameral assembly. The executive, with the consent of the aldermen, nominates police officers, and the school committee is chosen by popular election; all other officers are chosen by the council. Pop. 22,784.

CENTRAL FORCES. See Mechanics.

CENTRAL OF GEORGIA RAILWAY COMPANY, a corporation which owns or operates in Georgia 3,404.47 miles, in Alabama 579.55 and in Tennessee 4,07, a total of 1,924.90 miles of main track. The northern terminus is Chattanooga; the western Birmingham and Montgomery; the southern Jacksonville, Fla., and the eastern Savannah. The following lines constitute the system:

- Owned—Under first, consolidated and general and refunding mortgages: Savannah to Atlanta, Ga.; Gordon to Milledgeville, Ga.; 311.34 miles.
- Owned—Under divisional, consolidated and general and refunding mortgages: Dover to Brewton, Ga.; Milledgeville to Covington, Ga.; Macon Junction to Athens, Ga.; Columbus, Ga., to Andalusia, Ala.; Carrollton, Ga., to Belt Junction, Chattanooga, Tenn.; Chickamauga to Durham, Ga.; Lyerla, Ga., to Dewey, Ala.; Greenville to Raymond, Ga.; 167 Mile Post to Margaret, Ala.; 579.22 miles.
- Owned—Under consolidated and general and refunding mortgages: Savannah to Tybee, Ga.; Barnesville to Thomaston, Ga.; Griffin to Carrollton, Ga.; Meldrim to Lyons, Ga., 58.09 miles, leased to Georgia and Alabama Railway Company; Covington to Porterdale, Ga.; American to Columbus, Ga.; Columbus to Greenville, Ga.; Columbus, Ga., to Birmingham, Ala.; Opelika to Roanoke, Ala.; Montgomery to Faufaula, Ala.; Fuafula to Ozark, Ala.; Henry Allen to 1.67 Mile Post, Upper Cahaba branch: 541.83 miles. Pop. 2,364.36 miles.
- Leased—Augusta and Savannah Railroad, Southwestern Railroad, Chattahoochee and Gulf Railroad: 477.52 miles.
- Trackage rights, 14.18 miles. Total miles operated, 1,924.90.

Funded Debt.—The funded debt of the company on 30 June 1915 was $37,032,350.

Earnings.—The general income account for the year ended 30 June 1915 was as follows:

- Total operating revenues: $12,108,184
- Total operating expenses: 8,973,511
- Net operating revenues: $3,134,673

- Taxes: $576,544
- Uncollectible revenues: 10,496
- Operating income: $2,547,633
- Other income: 1,355,998
- Total income: $3,903,631
- Total charges: 2,101,636
- Surplus after charges: $1,202,005
- Dividends: 1,150,000
- Balance: $52,005
Equipment and Traffic.—Central of Georgia Railway Company owns 336 locomotives, 273 passenger cars, 10 freight cars and 389 service cars, and requires the services of more than 10,000 employees. The company transports annually about 4,500,000 passengers and 5,000,000 tons of freight.

History.—The company was incorporated under its present name with a capital of $5,000,000, 17 Oct. 1895. Through the purchase of its entire outstanding capital stock the Illinois Central Railroad Company acquired control in June 1909. On 17 June 1912 the charter of the Central of Georgia Railway Company was amended so as to permit the issue of $15,000,000 (preferred) additional stock. The railroad was originally incorporated 20 Dec. 1833, as The Central Railroad and Canal Company of Georgia, with capital of $1,500,000. In 1835 the corporate name was changed to The Central Railroad and Banking Company of Georgia. The first train passed over the whole line from Savannah to Macon (190 miles) on 13 Oct. 1843; the Macon depot was opened for regular traffic on 1 Nov. 1843, and trains were regularly operated over the whole line daily thereafter, Sundays excepted. Earnings from carrying passengers and freights are reported as early as August, September and October. Profits of $25,581,723, an average of $13,588 per mile. The lines listed above and completing the system were built afterward and incorporated by purchase or lease. The Central Railroad and Banking Company of Georgia was leased to Georgia Pacific Railway Company 1 June 1891, and passed into receivers' hands 4 March 1892. Deed of special master to Samuel Thomas and Thomas F. Ryan is dated 17 Oct. 1895, and confirmatory deed from the receivers to Central of Georgia Railway Company is dated 11 Dec. 1896. As already stated above, the company has since come under the control of the Illinois Central Railroad Company.

CENTRAL INDIA STATES, the official British term for a collection of states in Hindustan, consisting of five groups or agencies, namely, Bundelkhand, Bhagelkhand, Gwalior, Rewa and Malwa, covering an area of 121,845 square miles, under the ultimate charge of the governor-general's agent at Indore. The largest individual states are Gwalior, Indore, Bhopal and Rewa; total pop. 15,699,800.

CENTRAL PARK, the most noted park in New York city, extends from 59th street to 110th street between Fifth avenue and Eighth avenue. In 1856, the year of its purchase by the city, the land now constituting Central Park was occupied by shanties, bone-boiling establishments, piggeries and pools of offensive stagnant water, which rendered the neighborhood anything but park-like. The first full year's report of the men who were given the work of turning this ground into a park contains the following description of its condition:

"It was already a straggling suburban, when purchased by the city, and a suburb more filthy, sinister and disgusting than can hardly be imagined. A considerable number of its inhabitants were engaged in occupations which are nuisances in the eyes of the law and forbidden to be carried on so near the city. They were accordingly followed at night in wretched hovels half hidden among the rocks. During the autumn of 1857, 300 dwellings were removed or demolished by the commissioners, together with several factories and numerous 'swill milk and bog-feeding establishments.' Ten thousand loads of stone were also taken off the land and used to build a rough enclosing wall."

This description helps one to appreciate the vast amount of work and artistic planning which has been necessary to bring the park to its present state of beauty and attractiveness, and it is interesting to see how fully the prophecy of a park commissioner, who wrote in 1868, has been fulfilled:

"But we who are in the middle of life," he says, "can never know all its beauty. That is reserved for those for whom we have planted these shrubs and trees, and spread these level lawns. These trees will arch over many happy generations, and the bird born will enjoy the sweet green of the grass; and it will ever habitually serve to keep the memory of its founders green."

The central site was finally selected despite its uncompromising topography in preference to the one first proposed at 66th street on the East River — the Jones' Wood site — because it was central and spacious. It was also thought that the great expense of turning it into building lots — the extensive filling of low, swampy ground and blasting away of ledges — would enable the city to purchase the land at a low figure. Including a number of acres of water surface, comprising the two reservoirs belonging to the water department, the cost was about $7,500 an acre. The total acreage, including the subsequent extension to 110th street, was 843, and the price paid $6,348,959.90.

The special committee appointed by the board of aldermen to select the most desirable park site pronounced emphatically in favor of "the Central Park," stating their opinion that it could be made to compare favorably with the most celebrated public grounds of the chief cities of Europe, not excepting Hyde Park of London, the Champs Elysees of Paris, the Prater of Vienna, the CASCINE of Florence, the Corso of Rome, the Prado of Madrid, or even on the American continent, with the spacious plazas of Havana or the lovely botanical gardens of Rio de Janeiro."

It was freely predicted by the opponents of the park that it would prove a white elephant on the hands of the city; that it could never be made into a decent-looking park and was an unnecessary extravagance which the city did not need and could not afford.

The largest settlement of the park seems to have been along the Eighth avenue side. Mount Saint Vincent was included within the park borders, situated just west of Fifth avenue at 105th street, on the old Boston post road, which ran diagonally through the park. The land and buildings forming the State arsenal were subsequently purchased by the city and added to the park in 1867, the price paid being $275,000. Owing to the lack of funds no work was done in improving the land until 1857. In
April of this year the legislature authorized the issuance of bonds and in the following June, a tentative beginning was made on the park. Preliminary surveys had been carried out by Egbert L. Viele, the first engineer to the commissioners, but they soon decided that it would be desirable to offer a series of prizes to outside architects for designs for the formal laying out of the land. In 1857 such an announcement was made and on 1 April 1858 30 designs were submitted. That of Messrs. Olmsted & Vaux was chosen and they were awarded the first premium of $2,000. In 1857 Mr. Olmsted had been appointed superintendent to the board; George E. Waring, agricultural engineer; Samuel I. Gustin, nurseryman, and several other landscape offices had been created and filled. In 1858 Mr. Olmsted was promoted to architect-in-chief at a salary of $2,500 a year and the other offices abolished or subordinated to his. The work of putting the successful design into execution was begun by Mr. Olmsted, Calvert Vaux and J. W. Mould in June 1858. The original plan has been pretty closely adhered to, during the 60 odd years of the park’s existence, although there have been times when strong efforts were made to alter it, and even to remodel some of the previous work. In 1871, when the Central Park commissioners were legislated out of office and a board of public parks for the whole city instituted, such an attempt was made, one of its features being an extensive thinning of the trees.

Until 1871 the history of the park was an uneventful one. Most of the commissioners had served on the board since its first year, and, except for family squabbles over the details of management and construction, the improvements were carried on without interruption practically in the entire charge of Mr. Olmsted. The difficulties which began to interfere with the efficiency of the department after its political organization in 1871 are indicated by the following extract from a pamphlet by Mr. Olmsted, who was subsequently made a commissioner and president of the board, shortly prior to his dismissal:

"As superintendent of the park," he says, "I once received in six days more than 7,000 letters of advice as to appointments, nearly all from men in office." Delegations from various political parties came to find out "what share of his patronage they could expect," and in order to make him as little trouble as possible in its parceling out "they took the liberty to suggest that there could be no more convenient way than that you should send us our due quota of tickets, if you please, sir, in this form, leaving us to fill in the name." Here a pack of printed tickets was produced, which proved to be blank appointments, bearing the signature of Mr. Tweed. "That," continued the spokesman of the delegation, "was the way we arranged it last year, and we don't think there can be anything better."

There seems to have been some misconception, during the early years of the park, as to its real purpose, and considerable jealousy of its influence. In April 1884, for instance, one of the regiments of the first division of the National Guard, despite the vehement opposition of the park keepers, marched through one of the gates and proceeded to drill upon the green. Another regiment subsequently attempted to do the same thing.

An interesting report for 1863 is the announcement that 14 European sparrows, *moineaux* of France,* were let loose in the park in the spring of that year. This original 14, apparently the pilgrim fathers of the present local settlement, must now be represented by several million.

The paving of Fifth avenue up to the park was completed in 1863. Previous to this, especially in wet weather, the approaches had been extremely bad, and the completion of the Fifth avenue paving led to an immediate increase in the use of the park for driving. In its early days guards were stationed at each of the park gates, and a part of their duty was to count the number of persons passing in. In 1861 the result of the count was 1,863,263 pedestrians, 73,547 equestrians and 456,849 carriages, the total number of visitors being estimated at 2,404,659.

*For the purpose of ascertaining the nature of the existing vegetation,* says the first annual report (1857-58), *a botanical survey of the park has been made. First, to learn how far it can be made available in the projected improvements and to ascertain what plants will prove most nourishing if transplanted to this ground, and second to discover what alterations the soil will require in order to admit of an increased variety.*

This report details about 70 species of trees, shrubs and vines. Among the trees were included maples, beech, dogwood, chestnut, catalpa, red birch, persimmon, ash, locust, black walnut, red cedar, sweet gum, sycamore, poplar, American aspen, oak and elm. All told there were about 150,000 trees and shrubs. Regarding the present vegetation there seems to be no available data, no continuous record of the planting having been kept nor any detailed botanical study of it made during recent years. The soil of the park was never good in quality, nor abundant enough to support the vegetation of a park. For this reason the public had to be excluded from the meadows and lawns, as a single day’s trampling of the grass nearly destroyed it. In 1903 a systematic renovation of the soil was undertaken and continued until nearly the whole planted area was covered with loam, carried from Long Island, at an expense of upward of $2,000,000.

Over $30,000,000 have been spent in bringing the park to its present condition. It is 2½ miles long, half a mile wide and covers 843 acres, of which 183 are in lakes and reservoirs and 408 in forest containing over half a million trees and shrubs. There are 31 miles of walks, 10½ miles of roads and 5½ miles of bridle paths. Twenty gates bearing fanciful titles such as Artists, Scholars, Hunters, Strangers, Students, etc., give admittance to the park. Adding greatly to its attractions are zoological and botanical gardens, conservatories, fountains, free tennis courts, a field for baseball and other games, the tree-lined mall with its fine statues of world-wide celebrities and numerous other monuments, notably the Egyptian obelisk and the Maine monument, gracing different points.

**CENTRAL PROVINCES AND BERÄR.**

India, a chief commissionership created in 1861,
embracing the former province of Nagpur, the two territories of Sagar and Nerudda and other territories added since, the present designation dating from 1903. It is bounded by the Central Indian Agency and Chota-Nagpur on the north, Orissa on the east, Madras on the southeast and Hyderabad and Bombay on the southwest and west. Its total area is 99,823 square miles, of which the portion under direct British administration contains 82,057 square miles. The surface is in general composed of numerous hilly ranges amid which the chief, the Satpura Range, enters from the west, runs in an easterly direction and has numerous offshoots. It is traversed by the Nerudda, Wardha, Wainangona and Mahanadi rivers, all of which are navigable for some distance except during the dry season. The climate is hot and dry and there is a good average rainfall, but the soil absorbs the moisture so quickly that irrigation becomes necessary in cultivation. Of the total area only about one-fourth is cultivated, while the remainder is either unfit for cultivation or is covered with jungle and forest. The cultivated portion consists of rice fields, wheat and other foods, grains, oilseeds and cotton. Coal and iron are found; the manufacturing industries are very limited, and a very small portion of iron articles and cotton goods. The Indian Midland, Bengal and Great Indian Peninsula railways traverse the Central Provinces. The administration is vested in a chief commissioner, who is assisted by a number of commissioners in charge of special departments. The British possessions are divided into four divisions of Nagpur, Jabalpur, Narbada and Chhateesgarh, each in charge of a commissioner. The tributary states are 15 in number. In 1902 the government of India took Berar on lease in perpetuity at a rental of $850,000 annually to the Nizam of Hyderabad, incorporated the Hyderabad contingent in the Indian army, and in the next year annexed Berar to the Central Provinces under a resident commissioner. Education is aided partly by the government and is partly private. The population of the British divisions in 1911 was 10,859,146, and the tributary native states had 3,057,162. Of the total, 82 per cent. is Hindu, 16 per cent. Mussulman and the remainder consists of Christians and Mohammedans. The chief town and seat of the chief commissioner is Nagpur.

CENTRAL RAILROAD OF NEW JERSEY. The, a system operated in New Jersey, New York and Pennsylvania by the Central Railroad Company of New Jersey and controlled by the Reading Company which owns over 52.9 per cent of the capital stock. The company was formed 22 Feb. 1849 for the consolidation of the Elizabeth and Somerville Railroad, the Newark and Somerville Railroad Company, and the Somerville and Eastern Railroad Company, and has since absorbed the Newark and New York Railroad Company, the Perth Amboy and Elizabeth Railroad Company, the Constable Hook Railroad Company, the Manufacturers Railroad Company, the Railroad Branch Railroad Company, the High Bridge Railroad Company, the Longwood Valley Railroad Company and the Lake Hopatcong Railroad Company. In 1915 the company owned, leased and controlled 680.65 miles, operated by the line and the rest of 156.63 miles; proprietary lines, which had been practically absorbed, to 227.23 miles; leased lines to 211.24 miles; a jointly leased line to 42.41 miles, and trackage rights 43.14 miles. The lines owned had 156.63 miles of first track, 96.16 miles of second track, 30.36 miles of third track, the same amount of fourth track, 418.93 miles of side track, total 732.47 miles of track, of which 730.96 miles were steel rails of 70 to 135 lps. per yard, and 2.49 miles iron rails of 50 to 70 lps., the gauge being 4 feet 8½ inches. The proprietary roads had 227.23 miles of first track, 12.14 miles of second track, 94.97 miles of side track, total 334.34 miles of track, of which 327.30 miles were steel rails and 7.04 miles iron. The leased roads since the merger of 4 March 1905 have 211.24 miles of first track, 102.88 miles of second track, 10.63 miles of third track, 229.19 of side track, total 552.96 miles of track, of which 550.42 miles are steel and 2.54 miles iron rails. The jointly leased road had 42.41 miles of first track, 40.73 miles of second track, 43.21 miles of side track, total 126.35 miles of track, of which 126.35 miles were steel rails. The roads with trackage rights had 43.14 miles of first track, 9.66 miles of second track, 30 miles side track, total 53.10 miles of track, all of steel rails. Grand total, 1,799.22 miles of track operated, of which 1,107 miles were of iron and 692 miles of steel. The rolling stock consisted of 523 locomotives, 517 passenger coaches, 108 combination cars, 95 baggage, mail, dining and express cars, 23,917 freight cars of all kinds and 649 service cars. The marine equipment consisted of 3 steamboats, 10 ferryboats, 11 tugboats, 31 car floats and 93 lighters and barges.

The lines owned were: Jersey City to Philadelphia, N. J., 72.30 miles; Communipaw to Newark, N. J., 6.22 miles; Brills to Passaic River, N. J., 1.68 miles; East 22d street, Bayonne, to Constable's Hook, N. J., 1.95 miles; Elizabethport to Perth Amboy, N. J., 12.13 miles; Elizabethtown to Brills, N. J., 5.51 miles; Elizabeth to Elizabeth Docks, N. J., 2.72 miles; Somerville to Flemington, N. J., 15.78 miles; High Bridge to Wharton, N. J., 25.17 miles; German Valley to Chester, N. J., 4.51 miles; Hopatcong Junction to Nolan's Point, N. J., 5.56 miles; besides two spurs to factories; total 156.63 miles. The principal proprietary roads were: Cumberland and Maurice River, N. J., 50 miles; Narrowsburg, N. Y., an extension, 22.43 miles; Frechold and Atlantic Highlands Railroad, 22.75 miles; Navesink Railroad, 4.66 miles; New Jersey Southern Railroad, 73.62 miles; Sound Shore Railroad, 6.17 miles; Toms River Railroad, 7.57 miles; Toms River and Barnegat Railroad, 14.71 miles; Vineland Railroad, 46.82 miles; total with various smaller branches, 227.23 miles. The leased lines include: the Lehigh and Susquehanna Railroad, 105.32 miles; the South Bingham Valley Railroad, 16.69 miles; Ogden Mine Railroad, 9.86 miles; Trescock Railroad, 7.59 miles; Dover and Rockaway Railroad, 5.12 miles; Wilkes-Barre and Scranton Railroad, 4.27 miles; Hibernia Mine Railroad, 4.20 miles. It leases jointly with the Pennsylvania Railroad Company the New York and Long Branch Railroad, 38.04 miles, and with the Philadelphia and Reading Railroad the Allentown Terminal Railroad, 3.27 miles, and has trackage rights on the Union Coal Railroad — Union Junction to Minooka Dam, 10.45 miles, and on the Philadelphia and Reading Railroad — Tamanend to Silver Brook, Pa., 5.40 miles.
Greenwood Junction to Tamaqua, 1.04 miles; Greenwood Junction to Koska William, 9.47 miles. The rentals of the leased lines in 1915 were: Allentown Terminal Railroad, $13,500; Dover and Rockaway Railroad, $11,600; Hibernia Mine Railroad, $5,600; Lehighton and Sunogahanna Railroad, $2,210,229.99; Ogden Mine Railroad, $23,000; Wilkes Barre and Scranton Railroad, $56,606.48; miscellaneous, $284,253.93; total of rentals, $2,615,560.40. The gross earnings for the fiscal year ended 30 June 1915 amounted to $28,742,255.78, the operating expenses to $18,951,306.70, leaving a balance of net earnings, $9,790,949.08, with $2,170,614.97 non-operating income; this made a total of $11,961,564.05. In 1915 the operating revenue decreased $908,836.50 to 1.74 per cent. The average revenue tonnage per train per mile was 56.7, an increase of 11.0 tons, while the average distance each ton was carried was 71.51 miles, a decrease of 1.29. The total payments, interest on funded debt and guarantees, miscellaneous interest, rentals of leased lines and taxes amounted to $6,649,386.47, leaving a surplus of $5,312,177.58, of which $3,292,416 was paid in dividends to stockholders and $2,019,761 was added to capital stock. The net increase of net capital of the company was $2,221,416. The net income of $9,790,949.08 was increased $2,170,614.97 to a total of $11,961,564.05.

The revenue from transportation sources in 1915 was as follows: Merchandise traffic, $12,649,148.92, an increase of $429,046.16 over 1914; anthracite traffic, $8,712,472.28, a decrease of $661,484.65; passenger traffic, $5,887,220.85, a decrease of $369,168.84; and mail traffic, $480,306.02, a decrease of $47,846.24; and miscellaneous traffic, $1,413,107.93, an increase of $140,580.47.

Of the $30,000,000 authorized capital stock of the company there was outstanding in 1910 $27,436,800. The total funded indebtedness of the company at the close of the fiscal year ended 30 June 1915 amounted to $45,667,000 as against $46,271,000 at the end of the preceding year, a decrease of $610,000.

CENTRAL UNIVERSITY, popularly known as Central College, a coeducational institution at Pella, Iowa, organized in 1853, under the auspices of the Baptist Church and transferred in June 1916 to the Reformed Church in America. The university reported during the transition year of 1916: Professors and instructors, 17; students, 161; volumes in the library, 8,000; grounds, buildings and equipment valued at $110,000; budget for the year 1916-17, $18,000. An endowment of $200,000 has recently been raised, and it is confidently expected that the college will have a large increase of students under the new administration.

CENTRAL UNIVERSITY OF KENTUCKY, a men only institution at Danville, Ky., under the auspices of the Presbyterian Church. It was given its present organization in June 1901, by the consolidation of the Centre College of Danville (founded 1822) and the Central University of Richmond (founded 1874). Number of instructors reported, 50; number of students, 400; volumes in the library, 30,000; total value of property, $1,500,000.

CENTRAL VERMONT RAILWAY COMPANY. This company was chartered in 1895, and authorized by Act No. 159 of the Laws of the State of Vermont, and was formed for the purpose of acquiring title to, owning and operating the railroads of the Central Vermont Railroad Company, in pursuance of a plan for the reorganization of that company issued 29 Sept. 1898. The property was sold under foreclosure 21 March 1899, and the Central Vermont Railway Company came into possession 1 May 1899.

Funded Debt.—The funded debt consists of first mortgage 4 per cent 20-year gold bonds due 1 May 1920, interest payable February, May, August and November. These bonds are authorized by the mortgage of $12,000,000, but there are only $11,750,000 issued — $250,000 being reserved in the hands of the trustee to be issued for betterments and improvements under proper restrictions. The bonds are secured on the entire property and assets of the company. Also Montreal and Province Line $200,000 first mortgage 4 per cent 50-year gold bonds, due 1 Oct. 1950, interest payable semi-annually in April and October. The mortgage is a first lien on the Montreal and Province Line Railroad, 40.6 miles in length, extending from Saint Lambert to Farnham, Quebec, 32 miles, and Marlieville, Quebec, to Saint Césaire, Quebec, 8.6 miles. The Central Vermont Railway Company owns the entire capital stock of the Montreal and Province Line Railway Company.

Car Trust Notes.—Under date of 1 Aug. 1906, $200,000 in notes were issued in favor of the Royal Trust Company, in part payment for four 10-wheel passenger locomotives and 10 Richmond compound freight locomotives. These notes, 200 in number, for $1,000 each, are payable in 10 consecutive annual installments on the 1st day of August of each year. These notes bear interest at the rate of 4 1/4 per cent per annum, payable quarterly on the 1st days of November, February, May and August of each year. Under date of 1 April 1907, $270,000 in notes were issued in favor of the National Trust Company, in part payment for 500 flat cars. These notes, 250 in number, for $1,000 each, are payable in 20 semi-annual installments on the 1st days of April and October of each year. The amount so payable on the 1st day of April is $13,000 — and on the 1st day of October, $14,000. These notes bear interest at the rate of 4 1/2 per cent per annum, payable semi-annually on the 1st days of April and October of each year. Under date of 25 Feb. 1912, $980,000 in notes were issued in favor of Messrs. Blair & Company, in part payment for two standard baggage and express cars, six standard first-class coaches, two standard first-class parlor cars, one standard first-class diner, 1,000 box cars, four Pacific type locomotives, three switching locomotives and 200 steel coal cars. These notes, 980 in number, for $1,000 each, are payable in 20 semi-annual installments on the 1st days of February and August of each year. These notes bear interest at the rate of 5 per cent per annum, payable semi-annually on the 1st days of August and February of each year.

Mileage.—The company owns and operates the following lines: Between Windsor, Vt., and Saint Johns, Quebec, 177.5 miles; between Bethel, Vt., and Bethel Quarries, 5.4 miles; between Montpelier Junction and Williamstown, Vt., 14.9 miles; between Essex Junction and Burlington, Vt., 8 miles; between Essex Junction and Cambridge Junction, Vt., 26 miles.
miles; between Saint Albans and Richford, Vt., 28 miles; between Swanton Junction, Vt., and Rose Hill, Putnam County, N. Y., 33 miles; between S. S. and C. Junction, Quebec, and Waterloo, Quebec, 40.8 miles; between Saint Lambert, Quebec, and Freilingsburg, Quebec, 50 miles; and between Marievalle, Quebec, and Saint Cesaire, Quebec, 8.6 miles; a total of 376.9 miles; by the Central Northern Railway Company leases the New London Northern Railroad, extending from New London, Conn., to Brattleboro, Vt., 121 miles; from Montville, Conn., to Palmerstown, Conn., 2.5 miles; also the West River Railroad, extending from Brattleboro, Vt., to South Londonderry, Vt., 36 miles, a total of 159.5 miles, at an annual rental of $216,552.50, payable monthly.

Equipment.—On 30 June 1915 the rolling stock consisted of the following: Locomotives — passenger 29, freight 60 and switching 5, a total of 97; passenger cars — coaches 61, cafe-parlor 2, parlor 2, dining 1, combination passenger and baggage 12, baggage, mail and express 31 and milk 2, a total of 111; freight cars — 200 ft. 8, 215 and flat 655, a total of 3,001; work cars — tender 18, wreck 21, snowplow 8, construction 84, cabooses 45, scraper 14, official and pay 2, store 1, a total of 193; a grand total of 3,402.

The road and equipment up to 30 June 1915 represented an outlay of $16,778,945.96.

Traffic, Earnings, etc.—For the year ending 30 June 1915 there were 3,651,234 tons of freight carried or 292,602,872 tons carried one mile, showing a gross earning of $2,822,596.40 or $2.50 per ton of freight. The average net gross of $1.990,865, an average of $5.250 per passenger mile. The passenger receipts include the mail and express receipts for the year. The total railway operating revenue amounted to $4,210,411.07 and the railway operating expenses to $3,300,268.05.

CENTRAL WESLEYAN COLLEGE, a coeducational institution in Warrenton, Mo., organized in 1864, under the auspices of the local Methodist Episcopal Church; reported at the close of the year 1915: Professors and instructors, 25; students, 359; volumes in the library, 10,000; grounds and buildings valued at $173,000; productive funds, $248,213.27; income, $25,000.

CENTRALIA, Ill., city in Marion County, on the Illinois Central, Southern, Chicago, B. & Q. and the Illinois Southern railroads, 60 miles east of Saint Louis and 252 miles southwest of Chicago. It is situated in the famous fruit-belt of southern Illinois and carries on an extensive fruit trade. The Illinois Central machine shops, employing 800 men, are located here; there are two coal mines, employing 700 men, an envelope factory with 200 employees, a shoe-heel factory with 150 employees, and the city carries on many minor industries, such as the manufacture of flour, butternuts, shoes, and a large fresh fish, iron and steel, etc. The United States census of manufactures of 1914 recorded 30 industrial establishments of factory grade, employing 309 persons, of whom 237 were wage earners, receiving annually $123,000 in wages. The capital invested was $661,200, and the net annual production was valued at $768,000: of this, $325,000 was the value added by manufacture. There are three banks capitalized at $230,000. Religious services between 1,000 members elected every two years. The city owns the waterworks. Pop. (1910) 9,680; (1914) 11,000.

CENTRALIA, Wash., city in Lewis County, on the Northern Pacific Railroad, midway between Seattle and Portland. The sources of the city are derived from the lumber industry from coal and fire clay deposits, from farm and dairy products and canned goods. The city owns its electric lighting plant, its waterworks, has a Carnegie library, two banks, schools and many handsome church edifices. Centralia was first settled in 1857 by James Cochran, became a borough in 1873, a city in 1890 and has adopted the commission form of government, whereas the Federalists, or States Rights party, favored autonomy of the states. To the keen rivalry of these political parties may be attributed the state of civil war and revolution which for so long a time prevailed in Mexico. See MEXICO—History.

CENTRALIZATION, the placing in the hands of a central government jurisdiction over matters which might be under the management of local authorities. The term is used to denote the increase of power of a central authority already established, or the closer union under a central power of a federation of partially independent states. The adoption of the constitution of the United States was centralization in the latter sense. The question of centralization in the first sense has been an important one in United States history, being the point of dispute between the first two political parties, and being a frequent subject of discussion at all times. The question as applied to the United States is whether to interpret the constitution liberally, and give the national government power in doubtful cases; or whether to put a close construction on the constitution and give the States the benefit of the doubt.

CENTRARCHIDE, sén-trahrk'ky-de, a family of fresh-water percoid fishes, confined to North America. The body is generally short, deep and compressed, with an equal curvature above and below, and covered with rather large, strong ctenoid scales. The mouth is terminal, variable in size, with the premaxillary protractile, and numerous fins, including those of its bounding bones. Both dorsal and anal fins are long, with 6 to 13 strong, sharp spines in the anterior part of the former, and 3 to 8 in the latter. All are active, pugnacious, carnivorous fishes, many of which build nests. They are important game and food fishes of small or moderate size, of which about 12 genera and
30 species are known, almost all of which are confined to the Mississippi Valley and the eastern United States, where they are almost the most characteristic fishes. The most important are the grass bass, black bass, rock bass, warmouth and sunfish (qq.v.).

CENTRE-BOARD, a contrivance used in a yacht or shallow, keelless or flat-bottomed vessel, to counteract the tendency to make way and to enable the craft to stand up under press of sail. It consists generally of a quadrangular wooden or iron plate which is bolted or hinged by its lower forward corner into a trunk or casing which fits, water-tight, over a fore-and-aft slot in the vessel's bottom, about midway of her length. When running before the wind or in shallow waters the centre-board is hauled up inside the trunk. When on a wind, or with the wind abeam, the centre-board is lowered, presenting a broad surface to the water on the same principle as a leeboard. The term centre-board is essentially American; elsewhere the contrivance is known as a sliding-keel. See Yachts and Yachting; Speed.

CENTRE OF BUOYANCY. The centre of buoyancy of a floating body is that point within its boundaries corresponding to the centre of gravity of the volume of water or other fluid which is displaced. It is customary to regard buoyancy as a force acting upward and opposed to gravity. This is not in accordance with fact, for all the phenomena of floating in water, air or other fluids are due entirely to the attraction of gravity—which acts constantly downward. (See HYDROSTATICS.) When a body floats in water it sinks into the water and toward the centre of the earth only to the extent where the earth's attraction for the body and its attraction for the volume of displaced water are equal at that level. And as the weight of a body is the measure of the earth's attraction for it we say a floating body displaces its own weight of water. A floating body will therefore sink into water only to a point where the water beneath it is attracted toward the earth's centre more forcibly than is the floating body. The same phenomena may be observed in the case of a balloon. The balloon filled with a gas that is lighter than air at the sea-level will rise to a position where the earth's attraction for the balloon and its attraction for the volume of air displaced by the balloon are exactly equal. The centre of buoyancy of the balloon is the centre of gravity of the body of air displaced by the balloon.

When the centre of gravity of a floating body is below its centre of buoyancy (equivalent to its point of support—see EQUILIBRIUM), the body will float in stable equilibrium. When the centre of gravity is above the centre of buoyancy the equilibrium is unstable, and the body is liable to roll over in the water into such a position that its centre of gravity is below its centre of buoyancy. The same observations hold good as to bodies floating in air. A body which will float in water at 50° H. P. in mercury which would probably be in unstable equilibrium in mercury, the volume of mercury displaced having a much higher centre of gravity than the displaced water, and therefore lifting the centre of gravity of the floating body far above its centre of buoyancy.

CENTRE OF GRAVITY, or CENTRE OF INERTIA, a point in a body, or in a system of bodies, which the law of mechanics is usually and preferably called the "centre of mass." It is that point such that the vector sum (or integral) of the moments of the particles of the body with respect to it is zero. That is, if suspended by the centre of mass or gravity the system will be in equilibrium in any position. See Mass; Mechanics.

CENTRE OF INERTIA. See Centre of Gravity.

CENTRE OF OSCILLATION, or CENTRE OF PERCUSSION, that point of a pendulum at which its entire mass may be considered as concentrated, for the purpose of determining its time of oscillation. The pendulum may be suspended by an axis parallel to its original axis and passing through the centre of oscillation without altering its period.

CENTRE OF POPULATION, the centre of gravity of the population of a country, each individual being assumed to have the same weight. The centre of population in the United States has moved in a westward direction during the last 110 years along the parallel of 39° lat., in 1910 reaching the city of Bloomington, Ind. The following table shows the centre of population by decades since 1790:

CENTRE OF PRESSURE. See Hydrostatic Press.

CENTRING, or CENTERING, the framing of timber by which the arch of a bridge or other arched structure is supported during its erection.

CENTRIFUGAL FORCE, a phrase popularly used to express the tendency manifested by a body revolving about a centre to fly away.

CENTRIFUGAL MACHINES, machines used for various purposes, in which centrifugal force produced by rapid revolution is utilized. Such a machine may be used for drying clothes or other goods, the articles being placed inside a hollow cylinder made of wire-gauze or with numerous perforations in its circumference, which, being driven at a high speed, the moisture is caused to fly off by centrifugal action. Sugar is now often separated from the molasses by a centrifugal machine, the product being commonly known by the trade name of "centrifugal sugar." The cylinder in which the sugar is contained is placed within a larger cylinder in which the molasses is received. Liquids, such as beer, can also be clarified and cleared of foreign substances by means of centrifugal action, the extraneous matters being made to collect at the circumference of the
vessel through the high rate of speed at which it is driven, while the clear liquid can be drawn off by an outlet at the centre. Cream is now commonly separated from milk in large dairies by the same method. See BUTTER.

CENTRIPETAL FORCE, that force operating on a body moving in a curve which tends to draw the body to the centre of the curve. A moving body tends to move in a straight line. It may be deflected from its course into another straight line by some other impulse. If it is held continually to a curved path, it is under the influence of a centripetal force. A common illustration is the movement of the earth in its orbit. The inertia of the earth's motion tends to send it flying off into space in a straight line, tangent to the curve of its orbit. The attraction of the sun is the centripetal force which overcomes its inertia so far as to hold it steadily to the curve of its path around the sun. If the earth's forward motion were suddenly checked, the sun's centripetal attraction would draw it straight to the sun's centre. See DYNAMICS; ENERGY, CONSERVATION OF.

CENTROCLINAL FOLD. See FOLD.

CENTROSOME. The centrosome was long thought to be a permanent organ of all animal and plant cells. It is an extremely small body, usually less than 1/25000 of an inch in diameter, and is almost always surrounded by a system of radiating threads. It was first described by the zoologist Flemming in 1875, but was named and brought into prominence by another zoologist, Boveri, in 1888. Three years later a French botanist claimed to have found centrosomes in the lily. The general appearance and behavior of the centrosome in animal cells may be illustrated by the first division of an egg (Fig. 1).

An examination of the figure will indicate that the centrosome plays an essential role in the division of the nucleus, since it gives rise to the spindle which moves the chromosomes to their place in the new nuclei. On account of this function, it was claimed that the centrosome must necessarily be present in all cells. However, it proved impossible to demonstrate a centrosome in some resting cells, like muscle cells, and so it was concluded that, in some cases, the centrosome might not be a permanent organ, but, rather, that it must be formed anew at each successive cell division. In the early nineties this view was quite generally accepted. While a centrosome was described and figured in great detail in the lily and various botanists began to find centrosomes in various groups of plants, other botanists could not demonstrate it even in the lily. In 1906 a vigorous investigation by several botanists of different nationalities, but chiefly American, working under the direction of Strasburger at Bonn practically solved the centrosome problem in plants. A centrosome behaving as in animal cells was found in two of the algae and two of the fungi (Figs. 2 and 3).

On the other hand, it was definitely established that in the scouring Rush, Equisetum, no centrosomes are present during nuclear and cell division. It was also demonstrated that no centrosomes are present in the Gymnosperms and Angiosperms. In all these plants the spindle is formed in another way, no centro-

![Fig. 1. First division of an egg in which segmentation is complete. A, fertilized egg with nucleus and two centrosomes. B, the two centrosomes have moved apart, radiations have formed about them and a "spindle" has developed between them. C, the wall of the nucleus is breaking down and fibres of the spindle are becoming attached to the chromosomes. D, the spindle is fully formed and the chromosomes have been drawn by it into an equatorial position. E, the chromosomes have divided and are being drawn to the two poles of the cell by the spindle. Each centrosome has divided. F, the first two cells of the embryo have been formed, each with two centrosomes ready to repeat the process at the next division.]

![Fig. 2. Fig. 3. Nucleus; the web becomes drawn into many poles, which are gradually drawn together into]
two opposite groups, so that the familiar bipolar spindle is established (Fig. 4).

In ordinary vegetative divisions, the spindle first appears as a pair of dome-shaped prominences, or caps, at opposite poles of the nucleus. No centrosome is concerned. Since that time many centrosomes have been demonstrated in various algae and fungi; but in plants

![Diagram of a spindle without centrosomes](image)

**Fig. 4.** Development of a spindle, without centrosomes, in the pollen mother cells of the lily. A, the well of fibres surrounding the nucleus. B, the formation of many poles, the "multipolar spindle." C, the numerous poles collecting into two groups. D, the completed bipolar spindle.

higher than these no centrosomes have been proved, except as the centrosome may appear as the blepharoplast (q.v.) during spermatogenesis. Consult Wilson, E. B., "The Cell in Development and Inheritance"; also various articles in *Jahrbücher für wissenschaftliche Botanik* (1896 and 1897).

CHARLES J. CHAMBERLAIN,
Professor of Morphology and Cytology, University of Chicago.

**CENTUMVIRI**, judges of ancient Rome, three from each tribe, who determined ordinary causes. The extent of their jurisdiction is uncertain. Hollweg would confine it to civil cases; it seems probable that at first handled questions relating to quiritarian ownership, which determined the status of the citizens. During the Empire there were 180 such judges, the presiding officers being the decemviri. The Basilica Julia was the meeting-place of these sessions.

**CENTURIES OF MAGDEBURG**, a history of the early Christian Church, so called because it was divided into centuries, each of the 13 volumes covering a hundred years, and was first written at Magdeburg. Matthias Flacius formed the plan of it in 1552, but the last volume did not appear until 1574. It is the first comprehensive work of the Protestants on Church history; its main purpose was to prove agreement of Lutheran doctrine with that of primitive Christians, and the difference between the latter and that of the Roman Catholics.

**CENTURION**, a Roman army officer who commanded a century, or body of 100 men. The rank of a centurion corresponded very nearly to that of a captain in modern armies. There were 60 centurions in each legion, a junior and a senior for each of the 30 maniples; the senior of the first maniple of the first cohort was the chief centurion, or primipilus, of the legion, and on him often devolved the actual charge of the entire group. See LAUSAN.

**CENTURIPA**, chēn'tūō-rē'pā, Sicily, a town in the province of Catania, situated on a height above the valley of the Simeto, 28 miles northwest of Catania. It is situated in a district yielding soda, sulphur and marble. The ancient city (Centuripa), considerable ruins of which exist, was at one time among the important cities of Sicily. Emperor Frederick II destroyed Centuripe after removing the inhabitants to his new town of Agosta in 1233. It was rebuilt in 1548. Pop. 13,111.

**CENTURY**, in chronology, a period of 100 years. Modern chronology of Christian nations centres at the birth of Christ, and the centuries are numbered according to their order either before or after the event, for example, the 20th century A.D., the 4th century B.C.

In Roman times, (1) a division of 100 men in the army, corresponding to the modern company, 60 of which formed a legion; (2) a division of the six classes of the people, introduced by Servius Tullius, for the purposes of taxation and voting.

**CENTURY-PLANT**, a popular name of the *Agave americana*, or American aloe. See AGAVE.

**CEORL**, chēr. See CHURL.

**CEOS, sé'ōs, or KEA, kā'ā** (sometimes called by the Italianized name Ol Zeus or Toia), an island in the group of the Cyclades, in the Aegean Sea, 13 miles off the coast of Attica. It is 13 miles long, 8 broad and 39 square miles in area. The central and culminating point is Mount Ilias, 1,963 feet high. It is fairly fertile, raising fruit, wine, honey and valonia. In ancient times Ceos was noted as the birthplace of the poets Simonides and Bacchylides, and the physician Erasistratus, and the Cean laws were famous for their excellence. The capital is Ceos.

**CEPHAELIS, séf-ë-lës**, a genus of plants belonging to the order *Kuwiaea*, natives of tropical America. The roots of *Ipecacua* furnish the commercial drug of that name. See IPECAC.

**CEPHALASPIAS, séf-ä-lä'splis**, a genus of ostracodermis (q.v.) of the Devonian Period, characterized by a semi-circular or semi-oval head-shield, with spines at the angles. It has a curious superficial resemblance to the head-shields of certain trilobites.

**CEPHALIZATION**, the tendency exhibited in many different phyla of animals toward the specialization of the region about the mouth into a distinctive head, and the concentration there of nervous and sensory organs. In the chordates we find a clear development starting from the undifferentiated oral region of *Amphioxus* without any very special differentiation of its central nervous system and sense organs of the most generalized sort. The cyclostomes
and fishes form the next stage, in which there is a definite, though small, brain, and the more important of the special senses (those of smell, sight, hearing, equilibrium) are centralized in the head, which acquires a special skeleton, the skull, and a definite head region. Industrial vertebrates, in which all the special senses become located in the head, the lateral-line sense and dermal chemical sense being lost. The increasing size and complexity of the brain is one of the outstanding features of vertebrate evolution. In the arthropods, the gradual transition from the chaetopod worms, which are probably not far removed from the primitive arthropod, to the well-defined head of the crayfish or insect, with its specialized eyes, antennae, jaws and ganglia, is a tendency toward cephalization that is associated with the fact that the head is often the first part to take shape in the embryo; however, this fact, as exemplified by the trochocephalic larva of the aneids, may indicate that the basic segmented forms is the true representative of the entire body of their ancestors, and that the formation of the segmented body may be the reminiscence of an ancestral multiplication by budding.

CEPHALOCLE. Hernia of the brain is either congenital or an acquired (accidental) condition. The former is rare, 1 case in 10,000; the latter, by reason of the World War, with its enormous number of gunshot wounds of the head, is very common. Following operation upon the skull, decompression for tumors, or for gun-shot wounds, the brain tends to protrude through the bone opening and forms a soft mass beneath the skin of the scalp. There may be no symptoms. When the defect lies in the motor regions epileptic convulsions are the most frequent effects noted.

CEPHALOCHORDA, a group of Chordata (q.v.) represented by the lancelet or Amblystomus (q.v.). Other names for the group are Leptocardia, and Acrania. The Cephalochorda are fish-like in shape and have a notochord extending the length of the body, beginning in the head; hence the name Cephalochorda. The notochord is situated between the nervous system and the digestive canal. The central nervous system lies entirely on one side of the digestive canal, while numerous gills extend from the pharynx to the exterior.

CEPHALODONIA, séf-a-lö'n-a, or KEPHALLENIA, an island of Greece, the largest of the Ionian Islands, north-west of the Morea, at the entrance of the Gulf of Patras, about 31 miles in length and from 5 to 12 miles in breadth; area, about 266 square miles; between lat. 38° and 38° 31' N. and long. 20° 21' and 20° 23' E. The coastline is very irregular and deeply marked with indentations, and the surface is rugged and mountainous, rising in Monte Negro, the ancient Ænos, to a height of 5,380 feet. There is a marked deficiency of water on the island. The principal towns are Argoestoli, the capital, and Lixuri. The chief exports are currants, oil and grain; wine, cheese, etc. are also exported. The manufactures are inconsiderable, consisting of some cottons, carpets of various kinds, and goat-skin and goose-pottery, and distilleries of liqueurs. The island is subject to frequent earthquakes. One of the most destructive was that of the year 1867. The greater part of the population are of the Greek Church; the others belong to the Catholic Church. By Homer the island was called Same or Samos, though he speaks of the inhabitants as Cephalenes. The island adhered to Athens during the Peloponnesian War. In 1829 it came under the Roman dominion and after the division of the empire it became subject to the Byzantines. In the 12th century it was taken by the Normans, and afterward fell successively into the hands of the Venetians and Turks, and then again into the hands of the French, who retained possession of it until 1797, when the French seized it. From 1815 it belonged to the republic of the United Ionian Islands, and in 1864 was united with the other islands to the kingdom of Greece. With Ithaca and a few other adjacent islands it forms a nomos or province of the kingdom of Greece. Pop. of nomos 83,363; of the island about 72,000.

CEPHALOPODA, a class of mollusks represented by the squid, cuttle-fish, octopus, nautilus, argonauts, etc. In these mollusks the head-lobes bears arms or lobes, as the animal has no "foot" or creeping-disc like the other cephalopods, though its homologue is found in the siphon and tentacles. They have an unpaired muscular mantle, which forms the walls or outside, so that as in the squids, where there is no outer shell, the body is naked. The nervous system is much concentrated, for not only are the cerebral ganglia, pedal and visceral ganglia in the head, but also the ears and osphradia, or olfactory organs. The large complicated brain, thus composed of the three primary pairs of ganglia with some accessory ones, are enclosed in a cephalic carilage which suggests a comparison with the cartilaginous skull of the lamprey and sharks. In the body behind are the sympathetic and stellate ganglia. The eyes as a rule are highly developed, with a retina, choroid, iris, cornea, vitreous body and lens. The gills are well developed, either as one or two pairs situated within the mantle-cavity. The water is forced from the mantle-cavity, which is open behind the head, through the siphon. There are two kinds of heart; one heart consists of two or four (nautilus) auricles receiving the blood from the gills, and a median ventricle from which arise the anterior and posterior aortae. There is also, at the base of each gill, a branchial heart, which receives the blood from the vena cava and pumps it into the gill. These branchial hearts are not known to exist in other mollusks, and no other mollusks possess an ink-sac. The armature of the mouth, however, as in gastropods, consists of two long jaws, enormous in most cephalopods, and an odontophore with its lingual ribbon for cutting flesh, etc. In many forms one of the arms of the wall is peculiarly modified for sexual purposes—the so-called hectocotylized arm. The egg in developing undergo a superficial or discoidal development; and the young undergo no metamorphosis. The cephalopods is either chambered, as in orthoceratites, nautiloids and ammonoids, or, as in argonauts, forms a simple deep basin; in all the Dibranchiata it is at least partly internal. In the squids and cuttlefish it takes the form of an internal pen or "bone." The cephalopods are divided into two orders, according to the number of their gills:
Order 1. Tetrabranchiata.—This group, in which the gills are four in number, is represented by the nautilus, the sole living representative of a number of fossil forms, such as Cephalopoda, Goniatites and Ammonites. Nautilus pompilius and Nautilus umbilicatus are the only survivors of about 1,500 extinct species of the order. See Nautilus.

Order 2. Dibranchiata.—The diaphragmata are so called from possessing but two gills, while the tetrabranchiates had, as in Nautilus, numerous unarmed tentacles; these are now represented by 10 (Decapoda) or 8 (Octopoda) arms, provided with numerous suckers. To the 10-armed forms belong Spirula, a diminutive cuttle with an internal coiled shell. The shells of Spirula peronii are rarely thrown ashore on Nantucket; it lives upon the high seas. The extinct Belemnites had, like the recent Moroteuthis, a straight conical shell, the *thunderbolite* fossil. Allied to Loligo and Ommastrephes are gigantic cuttle-fishes which live in mid-ocean, but whose remains have been found at sea or cast ashore on Newfoundland and the Danish coast. Their jaws also occur in the stomachs of sperm whales.

Fossil Cephalopoda.—The greater proportion of cephalopod mollusks are fossil. They began to exist in the Cambrian period, and, as nautiloids and ammonoids, flourished in great perfection in Palaeozoic and Mesozoic eras, the ammonites (q.v.) of the Jurassic and Cretaceous beds numbering about 5,000 species. For bibliography see Mollusca.

CEPHALULA, séf-á-loo-á, the name applied by Packard to the stage of the embryos of mollusks and of worms immediately succeeding the gasula (also the trochosphere) when the larva is still a surface-swimmer and the head is beginning to be formed. Consult Packard, 'Life-Histories of Animals,' p. 94.

CEPHALUS, séf-á-lús, the son of Creusa; according to some the son of Deion, King of Phocis, and of Diomede. He was the husband of Procris, or Procne. Shortly after his marriage Eos (Aurora) carried off the beautiful youth while he was hunting on Mount Hymettus. He refused the love of the goddess, who induced him to put the virtue of his wife to a trial which it could not withstand. Procris, in return, tempted him likewise, and he yielded also. Learning their mutual weakness, they became reconciled. But Procris subsequently became jealous of her husband, and concealed herself in a wood to watch him. He mistook her among the leaves for a wild animal, and killed her with a javelin.

CEPHAS, séf-as, a surname given by Christ to Simon. In the Greek it is πέρας ("a rock"), in Latin Petrus, and in English Peter.

CEPHIUS, séf-us, a king of Ethiopia and husband of Cassiopeia; his name was given to a constellation of stars in the northern hemisphere, surrounded by Cassiopeia, Ursa Major, Draco and Cygnus. See Cassiopeia.

CEPHISSUS, the name of three rivers of Greece. (1) A river which waters the Athenian plain. It rises on the west slope of Mount Parnes and flows past Athens on the west into the Saronic Gulf near Phaleron. (2) A river of Attica emptying into the Gulf of Eleusis. (3) A river flowing through eastern Phocis and northern Boeotia and emptying into Lake Copais (Topolias).

CERACCHI, chà-rá-ké, Giuseppe, Corsican sculptor: b. on the island of Corsica, 4 July 1751, or, according to others, about 1760; d. Paris, 29 Jan. 1801. In 1798 he was appointed to establishing the republic of Rome, of which he was among the warmest partisans. On the re-establishment of the papal authority he was obliged to leave Rome, and went to Paris, where he was employed in making, for a bust of the First Consul. Nevertheless, he joined the young French artists whom he had known at Rome, and whose ardent republican opinions coincided with his own, in a conspiracy against Bonaparte, in whom he saw only the oppressor of his country. On 9 Nov. 1800 he was arrested at the opera, with Arena, Damerville and Topino Lebrun. Before the tribunal he answered only in monosyllables to the questions put to him. He was sentenced to death, together with his accomplices, and ascended the scaffold with great firmness. The death of this disciple, and almost rival, of Canova, was a great loss to sculpture.

CERAM, sé-rám', CEIRAM, or ZERAM, called by the natives Zeram or Serang, an island of the Moluccas, the second of the group in size, lying west of New Guinea, between long. 127° 55' and 130° 50' E. and lat. 2° 45' and 3° 40' S., in the Indian Archipelago; area, about 7,000 square miles. Its interior is traversed by mountain ranges from 6,000 to 8,000 feet high, and culminating in Noosahel, which is 9,600 feet. The vegetation is luxuriant and gigantic, some of the sago palms growing 100 feet high. Sago forms the chief food of the inhabitants and is an article of trade. The inhabitants of the coast are of Malay origin, and have extensive fisheries. The interior is supplied by Alfoories or Alfuros, long known for their barbarous custom of using human skulls for public and private ornament, and the still more barbarous atrocity of committing murder in order to procure them. They have become more civilized, and many of their rajahs have adopted the European dress and manners. They are divided into various independent tribes. Christianity has been introduced into several villages on the south coast, but not with any great success, though it is said that in some of the villages a considerable number of those professing Christianity can now read and write. At Amahai is the only good harbor, although Sawai on the north is frequented by whalers. The island belongs to the Dutch, who have established several stations there under the charge of an official residing at Wahai on the north coast. The country is governed by native chiefs under Dutch supervision. Pop. estimated at 100,000.

CERAMBICIDAE, sé-rám-bis-id, a family of beetles of great extent, readily known by their very long antennae, which give its members the name of longicornis. The family already numbers some 12,000 or 13,000 species, though probably not over half of the existing forms are known. It comprises some of the largest of the beetles, as well as the most destructive insects of the sub-order. They are readily recognized by their oblong, often cylindrical, bodies, the remarkably long, filiform, usually recurved antennae and the powerful in-
CERAMICS

The species of the American genus Oncideres are called girdlers, because the parent beetle, after laying an egg in a small branch, gir-dles this round with a deep incision, so that the portion containing the larva sooner or later falls to the ground. The growth of a longicorn larva frequently takes more than a year, and under certain circumstances it may be enormously prolonged. Monohamnus confusor has been known to issue from wooden furniture which was 15 years old. Individuals of another longicorn have issued from the wood of a table and even 28 years after the falling of the tree from which it was made. Watson has related a case from which it appears probable that the life of a longicorn beetle dwelling in household furniture extended over at least 43 years. It is generally assumed that the prolongation of life in these cases is due to the beetle resting quiescent long after it has completed the metamorphosis; but more probably it is the larval life that is prolonged; the larva continuing to feed, but gaining little or no nourishment from the dry wood in these unnatural conditions. A large number of longicorns stridulate loudly by rubbing a ridge inside the pronotum on a striate surface at the base of the scutellum. A few produce noise by rubbing the hind femora against the edges of the elytra, somewhat after the fashion of grasshoppers; and some possess highly developed stridulating surfaces on the hind and middle coxae.

CERAMICS. The fictile art; the art of the potter. The word ceramics is derived from the Greek keramos, the potter's clay. It is often spelled keramics following the Greek spelling direct, instead of taking the word from the French ceramique. The subject ceramics can be primarily divided into two basic divisions: (1) the technique; (2) the product. The essential features of the technique are the selection and preparation of the clay; the manipulation of a lump of the clay into its desired form: by hand unaided (as done by primitive peoples), by throwing on the potter's wheel, by molding soft clay in a form or mold. And, lastly, the baking of the clay in its acquired form either in the sun or in an oven. Formerly, the entire product of the potter was included in the term "pottery." Among experts, recently, it has become usual to include in the ceramicistic term the excavations of art pottery and "porcelain." In this system of the connoisseur's and collector's nomenclature the term "pottery" includes all classes of earthenware and stoneware. By this method we bring the different earthenware products, terra cotta, majolica, faience, Delft, etc., together with stoneware under one generic class—pottery. Additional refinements to the crude primitive fictile ware are glaze and decoration.

Technical Terms. The term used for the above processes in production may be here concisely defined as follows: Paste (French pâte) is the material of which the fictile ware is constructed; it is often termed body. The bare body baked is termed biscuit. Glaze is the glassy covering given to the inner or outer surface of the ware. Paste or body may be either "hard" or "soft," the former term indicating that it is not easily scratched with a steel point, and the term soft implies that the metal point, or a file, easily abrades the surface. Glaze may be either translucent or opaque. The former is a kind of glass (silicate of soda or potash), usually, or is produced by throwing table salt (chloride of sodium) into the hot oven when it creates a chemical action on the surface of the incandescent clay, producing "salt glaze." The addition of oxide of lead to the silicate of soda or potash produces a more brilliant and easier fusible, but softer, glaze (plumbiferous or lead glaze). By adding oxide of tin to the translucent glaze material, it becomes white (opaque (stanniferous glaze)). Earthenware has a porous body which is permeated by liquids; this defect may be corrected by glazing or by dipping into a fine liquid clay, termed slip or engobe, and then baked. By adding certain metallic oxides (as coloring matter) ground with fusible glasses a colored glaze or pigment is produced. When rendered opaque with tin oxide, this vitrifiable composition is termed enamel, and is used as a glaze or as a medium for painted decoration on the surface of the ware in the oven. When a glaze, through faulty firing or defective composition, cracks into numerous parts divided by crevices it is termed crazed. When the same effect is caused intentionally, the term crackle is used. Crazed glaze is liable to keep peeling off, and at time, also to increase the number of fissures. Crackle is a permanent effect and considered decorative. Ware decorated with enamel coating is called faience, or, quite commonly, majolica. The latter term, however, correctly belongs to the enamel art ware, derived from old Arabic and Moorish methods, made in Italy. (See Majolica.) Some small, delicate low relief decoration is done by dry- ing liquid clay in a mold or form, or by stamping; when well set it is applied by hand to the body of the ware, and is known as sprigging.

History. Proof of the great antiquity of the potter's art is found in the fact that fine, gracefully formed fictile ware was produced in Egypt before the potter's wheel was known, some pieces being made by hand. The excavations at Nineveh brought to light wall-tiles having polychrome enamel coating. Cyprus was a connecting link between Egypt and East Asia, and we, accordingly, find Cypriote clay vessels of grayish yellow with brown paintings, some with Egyptian tenden-
cies, others of Grecian or East Asiatic styles. Excavating the hill of Hisarlik (ancient Troy), Schliemann and others discovered the pottery vessels of a cultured people. Best known of ancient i l l e wares are the beautifully formed and decorated Greek vases (long called erroneously Etruscan) of terra cotta coated with thin black polished glaze. The Arretine ware, made from the red earth of Sestri, was highly prized by the Romans. In the East, clever ceramic work was done by the ancient Chaldeans, Assyrians and Persians, as their lovely hand-painted enamel tiles testify. But in the Far East the Chinese had arrived very early at a quite advanced stage of perfection of the ceramic art. The earliest pieces we know of date from the Han period (206 B.C.—220 A.D.) with early earthenware celadon (see Chinese ceramics) attempting imitation of their beloved jade stone, advancing to the discovery of stoneware, then porcelain (porcellain) in the early Ming dynasty (middle 14th century A.D.). The wide range of discovery and invention in ceramics of the ancient Chinese is clearer to modern connoisseurs by Western connoisseurs, with their lovely crackle, flambe (transmutation), self-colors and numerous other glaze effects; their delicate egg-shell ware, much admired blue-and-white, Kang-Hsi polychrome, highly decorative motifs of symbolism and mythology; which latter ware represents the bulk of the pieces in our private collections and museum exhibits. These attractive wares of the royal Chin-te-chen ovens have been actively bid for by the wealthy Westerners and the opening up of railroads in republican China has brought to light great quantities of ancient ceramic pieces of great beauty that were reposing many centuries in graves. Their presence in the markets has revolutionized the aim of the wealthy collectors, and ancient celadon is having its mysterious solved.

The Japanese declare they received their first knowledge of art pottery from the Koreans, but Western experts place their earliest glazed pieces not earlier than the 12th century A.D. and state that Kato Shirozaemon, in the 13th century, brought (after six years' study in China) over ceramic refinement to a factory at Seto. The connoisseurs at Nippon, with their exquisite egg-shell ware and the opening up of railroads in the country, have come to appreciate their own achievements and show little respect for the cold white glitter of porcelain. They produced none till that of the 16th century by Shonzui. The Japanese egg-shell china excels, some claim, even the Chinese, in thinness, transparency and brilliance; their drawing and color work are perfection. Peculiar to this nation are the painting in lacquer on porcelain, the cloisonne enamel china decoration. Greatly admired of European collectors is their ivory-glaze Satsuma faience.

Little wonder is it that India and Persia took to imitating the styles of Chinese decoration. For Europe, once seeing the ware, quickly acquired its "Chinese taste" craze. From Rouen soon followed imitation in immense quantities of Chinese and Japanese porcelain ware were brought into Europe by the Dutch and the East India trading companies' ships. These wares at first had genuine Chinese art in their decoration as well as Chinese form; but soon the traders had European ideas grafted on to made-toorder pieces and the truly Oriental style became obscured in a hybrid, preserved form.

Somewhere between the 9th and 12th centuries the Persians learned to make lustre decoration (mezza majolica) and we get here the so-called "Rhodes-Persian faience," Osmani-Turkish. From Arabia came the knowledge of enameling clay vessels into Continental Europe, an art known in the East from very early times, as is proved by her ancient polychrome hand-painted tiles for walls and ceilings in her mosques. We find these same tiles and enameled vases, etc., in opalescent metallic lustre in the true Arabian decoration, in Spain, in the old Hispano-Moresque buildings. And it was, probably, from these same conquering Moors that Italy obtained (through the island of Majorca) this tin enamel polychrome decoration process (see Majolica), which from the 15th century became a greatly popular lustre art in Italy. In the 15th century, Faenza, Pesaro, Gubbio, Urbino, Castel Durante, had majolica ovens. In this early Renaissance period the Della Robbia, with its own workshop, made their earthenware busts enveloped in tin-glaze (the so-called terra inverciata), Luca della Robbia claiming the discovery of using tin-glaze enamel to cover his stucco. In the 16th century we have Gubbio, with its great master Andrea di Georgio, as centre of Italian majolica manufacture, with its own lustre; and the clever artist Orazio Fontana was working on this ware in Urbino. The madre-perla lustre belongs to this time. The sgraffito decoration belongs to this period with its enameled scratched through to the body and finished in colored glaze.

In Germany glazed earthenware developed with its own tiles (Kachel) and Cologne (about 1530), then Nuremberg, produced its falsely termed "Hirschvogel" jug with their reliefs and colored glaze, to disappear in the 17th century. Next we find Germany producing smooth painted surface enamels and (end of 16th century) their white and light grey stoneware (Steinzeug) made in Cologne, then Siegburg, Frechen, Raeren, Grenzburg, etc., with its quaint applied relief decoration, and odd forms, such as "ring" vases, etc. This ware was long known as grès de Flandre. Verre Eglomise, aulant at the gallery of chemist and practice of the ceramist, after many disastrous failures, produced an enamel decoration (see Palissy) of brilliance and achieved fame through its naturalistic animal and plant representations in relief on plates, etc. In the middle of the 16th century arose the deservedly noted Henri Deux ware of Saint Porchaire with its intricate, yet artistic, strapwork inlays of brown clay on yellowish body, and its sgraffito, majolica and other reliefs. At the end of the 17th century Nevers started making true French faience, soon arriving at an extended palette, of glaze colors to cover the porous body with polychrome decoration. Rouen soon followed, assisted by their many artisans. (See Rouen). Early in the 18th century Moustiers made such faience, and we find large faience factories at Bordeaux, Paris, Sinceny, Strasbourg, Marseilles, Niderviller, Lille, etc. Talavera and Alcora in Spain produced this ware; Germany in Nuremberg.
Hoechst, Frankenthal, etc. But already in 1680 Delft, Holland, had 30 potteries producing opaque enamel glazed tiles, and was soon shipping abroad large quantities of ware imitating the Chinese blue-and-white decorated wares that was becoming so popular. See Delft.

England in the 17th century was making no ficile wares worth comment. Her upper classes were using imported Delft and German stoneware (termed "Cologne ware") and some truly artistic delicately executed stoneware, and, by 1753, 1691, the two brothers Elers, from Holland, started making very fine salt-glazed stoneware in Staffordshire. It was of the finest texture body and perfect execution with sprigged (stamped) decoration. Eler's path cast Astbury, Thomas Wedgwood, Ralph Shaw (1733). A white Derbyshire clay produced "Crouch ware" till 1720. Bristol, Vauxhall and Lambeth also made salt-glaze stoneware, and Burslem (Staffordshire), by 1750, had 60 small factories, and exports to Holland and Germany were large. Enamel polychrome decoration and gilding was done on some of this stoneware. By 1780 cream-colored earthenware had taken the place of stoneware and came into use over the entire civilized world, the industry propagated by Warburtons, Wedgwoods, Turners, Mayer and other Staffordshire potters. Thomas Whieldon, between 1740 and 1780, produced clever vari-colored pastes (agate, tortoiseshell, etc.) and novel forms. Josiah Spode (Whieldon's apprentice) and his son became noted for their "black basalt," cream color, transfer-print decoration, jasper and other wares. Josiah Wedgwood and his contemporaries, John Turner, Henry Penton, the Birch brothers, produced their wares till 1784, when the middle of the 18th century brought the earthenware product of the Staffordshire potters to a stage of fine art. Wedgwood's most famous ware was the beautiful jasper (of his own invention) in vases, plaques, medallions, etc., displaying the lovely reliefs of Flaxman and other artists. Other bodies were "pearl" ware, Queen's ware, basalts, encaustic (imitating Greek terra cotta) emanating from Wedgwood's factory, "Etruria." Liverpool turned out its tin enamel "(Delft) ware," and, by 1753, Sadler and Green had established the reputation of their transfer-print decoration process, and the "Herculaneum" factory made prolific quantities of artistic stoneware. Leeds was noted for its cream colored ware; Swinton produced "bran china" with its "Rockingham" glaze. Other well-known earthenware potteries were at Newcastle, Sunderland, Bristol (see Bristol), Derby (see Derby), Swansea, Mortlake, Caughley (Salopian ware) with its "wil- low" stamps.

Chinese porcelain ware was still a costly luxury, and, while Delft proved a less expensive, clever substitute, the European ambition was to produce its own true porcelain. Lacking the requisite earths imitations they attained large proportions in faience (enamel) ware made in the factories of Strassburg, Frankenthal, Nuremberg, Hoechst, in Genoa, Bilicci, and Capo di Monte, in Italy; Roerstrand and Marieberg, in Sweden; Lyons, Niderviller, Lüneville, Lille, Saint Cloud, Sceaux, Marseilles, in France.

European Porcelain.—The ever increasing shipments of porcelain from China at ever declining cost in the 18th century brought failure to the European faïenceries. The Oriental competition forced further researches for true porcelain earths. Florence, in the 16th century, had for a few years produced soft (artificial) porcelain. Saint Cloud, by the 17th century, was making an artificial porcelain, and rival factories started up at Mennecy, Chantilly and Vincennes, in France. The latter plant was moved, in 1756, to Sèvres, where Louis XV took it over and supervised it. It produced work of the highest style of the art in a lovely mellow body of artificial porcelain. In 1768 kaolin earth was discovered in France and by 1772 was producing its noted delicate soft porcelain. See Sèvres; Porcelain, etc.

But Boettger, in Germany (1708), discovered the true porcelain earth first, and a factory was established at Meissen (near Dresden), soon to be shipping its wares through Europe. (See Dresden). In spite of the Meissen workers being kept in military seclusion, the secret of hard porcelain manufacture leaked out, and we find porcelain factories opened in: Vienna (1718); Càpo di Monte (1742); Saint Petersburg (1745); Hoechst (1746); Fuerstenberg (1746); Berlin (1750); Frankenthal (1751); Nymphenburg (1758); Ludwigsburg (1758); Copenhagen (1756); Madrid (1760), known as Buen Retiro. In England porcelain was first made, in 1730, at Bow; it was artificial body, largely glass and ground Chinese porcelain (some American clay). William Duesbury purchased the factory in 1776, when it was removed to Derby. (See Bow). Chelsea made soft porcelain from 1745, or earlier. William Duesbury purchased the works in 1770 and ran it till 1784, when the middle of the 18th century brought the earthenware product of the Staffordshire potters to a stage of fine art. Wedgwood's most famous ware was the beautiful jasper (of his own invention) in vases, plaques, medallions, etc., displaying the lovely reliefs of Flaxman and other artists. England's first production of hard (true) porcelain was started through the discovery of kaolin (about 1758) by William Cookworthy of Plymouth. In 1764, it was purchased (1770) by Richard Champion, of Bristol, and soon moved to the latter city. (See Plymouth.) Bristol porcelain, likewise, was a financial failure and Champion sold out the factory (1781) to a New Hall pottery.

Modern Ceramics.—Bone porcelain (called also “standard” porcelain) became a regulation factory paste composition, used by all English factories, when (1800) Josiah Spode’s son started the use of the simple mixture of bone-ash, china stone and china clay. The ease gained and the low price of production of bone porcelain runned all competition against it, and it remains standard to this day. Royal Worcester and Crown Derby wares are still leaders in Great Britain in art products. The Wedgwood factory (Etruria) continues its output of jasper and other fancy wares. Other leading potteries of this and last century are those of Minton’s (see Minton’s), and of Copelands and Doultons stoneware potteries. Italy produces many imitations of the old pieces. Sévres continued producing the finest art work in soft porcelain, until (under Brongniart) about 1800, she turned to making hard paste body. In the last century Sévres worked out a cameo style of relief (pâte sur pâte) which Solon did master work on, till 1870, when he continued the delicate method at Minton’s. In France Theodore Deck and Taxil Dot became renowned creative ceramic artists. Sévres revived (in 1850) faience making alongside of her superb porcelain ware. (See Sévres.) French modern faience, in its perfect technique and beautiful painted decoration, takes a place in the plastic arts alongside the finest porcelain. Limoges grew to become a leading porcelain centre in the last century; the great American factory of Havilands is there. Berlin enlarged her ceramic palette and has done rich relief work in colored plant life and figures. The Berlin “transparencies” in delicate porcelain relief became famous; her dipped then fired lace produces clever effects. The pottery was removed to Charlottenburg in 1870. Seger’s research into Oriental processes produced a flambe and a sang de boeuf glaze of great beauty. See Chinese Ceramics.

Clement W. Coume.

CERARGYRITE, native chloride of silver, AgCl. It crystallizes in the isometric system. It has a specific gravity of 5.35, with a grayish color and a resinous lustre. Upon exposure to light its color changes to a violet-brown. It occurs in Mexico, in western South America, in Norway and in the Ural Mountains. In the United States it is found in Idaho, Utah, Colorado, Nevada and Arizona. When found in quantity it is valuable as an ore of silver.

CERASTES, a genus of African vipers, remarkable for their fatal venom, and for two little horns formed by the scales above the eyes. Hence they have received the name of horned vipers. The tail is very distinct from the body. C. cernutus is the horned viper or asp of northern Africa, a species known to the ancients. There are several other species.

CERASUS, a genus of trees, the cherries, of the order Rosaceae, now always regarded as a section of the genus Prunus, distinguished from the other sections by the smooth, bloomless fruit and unilocular nervation and other characters. See Cherry.

CERATES, certain official preparations of the United States Pharmacopoeia. They are unctuous substances, consisting of oil or petrolatum mixed with wax, spermaceti or resin, to which various medicines may be added. In consistency they are harder than ointments and softer than plasters, and should be capable of being spread at ordinary temperatures on cloth, and should not melt at the temperature of the human body.

CERATODUS, sê-ra-tô’-dús, an extinct genus of fishes belonging to the Dipnoi (q.v.) or lung-fishes. Its nearest extant relative is Neoceratodus, the barramunda or native salmon of the Australian rivers, measuring from three to six feet in length. This fish can breathe air, and can consequently live in water too foul for other fishes, but cannot live on land.

CERATOSA, certain sponges in which the skeleton or solid support is horny. Another name is Ceratophyllum. The skeleton consists of spongina, which differs chemically from the substance of true horn (keratin). The spongina is deposited in long fibres by peculiar cells (spongoblasts). The fibres interlace, branch and unite into the supporting framework of the sponge. Examples of the horny or fibrous sponges are the bath-sponges, such as Euphyton officinalis, varieties of which occur in the Mediterranean and about the West Indies, Florida, etc. See Sponge.

CERATOSAURUS, sê-ra-tô’sôr’-ús, a carnivorous dinosaur (see Dinosauroidea) resembling Allosaurus (q.v.), but of smaller size and with small horns over the eyes and on the nasal bones. It is found in the Como formation of Wyoming (Upper Jurassic Period).

CEREAUNIAHN, sê-ré-a’-nîn, MOUNTAINS, in classical geography: (1) A mountain range in the southeastern part of the Caucasus Mountains, the exact position of which is not known; (2) a chain of mountains in Greece, extending to the Adriatic and forming the peninsula Acroceranum (q.v.). The mountains themselves are also called Acroceraunia, and are now known as Khimara.
CEREOGRAPH, from the Greek ker-
unos, thunder and lightning, and graphem, to
write, an instrument for the automatic recording of
the number, time, and duration of flashes during thunderstorms. The instrument is made in several forms, but all are modifications of the recording apparatus of the wire-
less telegraph, suggested by the fact that it was a wireless telegraph instrument which au-
tomatically recorded the first thunderstorm record
(in 1898). As with the wireless, the vibrations are
transmitted by the Hertzian waves, caught by an antenna, and conveyed to a coherer and thence to the recording apparatus. The
instrument may be arranged for long distance observations, up to 600 miles. The ceremu-
graph has been combined with the barograph so that the records of both instruments appear on
the same chart. The name of the instrument was given to it by Father Odenbach of the Saint Ignatius College Meteorological Ob-
servatory, and his investigations appear in the
annual reports of that institution for the years
1902, 1903, 1906 and 1907. Consult also the United States Weather Bureau's 'Monthly Review'
for 1906, p. 273.

CERBERUS, σέρβερος, in Greek myths, a
three-headed dog, with snakes for hair. Hesiod
describes him as 50-headed, and states him to have been the offspring of Echidna by Typhon, the most terrible of the giants that attempted
from storm heaven; but later writers give him
only three heads and a tail or mane of ser-
pents. At his bark hell trembled, and when
loosed from his hundred chains, even the Furies could not tame him. He watched the
entrance of Tartarus, or the regions of the
dead, and fawned on those who entered, but
seized and devoured those who attempted to return. He was subdued by Hercules (Her-
cules).

CERCARIA, σέρκαρια, the larva of the
fluke-worm and other trematode parasites. The
body is tadpole-like in shape, with an inferior and posterior suckers, a mouth and pharynx,
and a forked intestine. The Cercariae are de-
veloped in the body of the parent-nurse (redia).
Escaping from the redia, the cercaria, swim-
mountainous bays, or ponds, forces its way into
the body of some snail, which forms its
first host. Then, losing the tail, it becomes encysted, attached to blades of grass or her-
bage. The transference of the larvae fluke to
its final host, the sheep, is effected if the latter
swallows the grass on which the cercaria hasecome encysted. The young fluke then escapes from the cyst, and forces its way up the bile-
ducts to the liver, in which it rapidly grows, and developing reproductive organs, attains the
adult conditions. See TREMATODA.

CERCIS, σέρκης, a genus of plants of the
order Leguminosae. C. canadensis, redbud, or
Judas-tree, is a small ornamental tree, often
cultivated, but growing wild from New York
south to Florida and west to Minnesota, Kansas
and Louisiana. C. silicicrustus, a native of the
southwestern United States and of several countries in
Asia, is a handsome, low tree with a spreading head. The leaves are remarkable for their un-
usual shape; they are of a pale, bluish-green color on the upper side, and sea-green on the under.

The flowers, which have an agreeable acid taste, are often mixed in salads, and
the flower-buds are pickled. The genus re-
ceived the name of the Judas-tree from the tradi-
tion that it was upon a specimen of it, near Jerusalem, that Judas hurled himself

CERCOPITHECIDAE, σέρκοπιθεταϊδαι, a family of primates, including all the Old
World monkeys, except the anthropoid apes.
The various groups and species may be found
described under their names. See also MONKEY.

CERCYON, a famous robber, killed by
Theseks.

CERDIC, kerdik, founder of the West Saxon
kingdom: d. 534. He was a Saxon earldorman who invaded England in 495, and after gradu-
ally fighting his way and extending his con-
quists, established the kingdom of Wessex about
519. He won a great battle at Charford in
519, but suffered a severe defeat from the Brit-
tons in 520 at Mount Badon, or Badbury, in
Dorsetshire. In 530 he conquered the Isle of
Wight. At his death his kingdom extended
over the present counties of Berkshire, Wilt-
shire, Dorsetshire (and Hampshire), and the
Isle of Wight. All the sovereigns of England, except Canute, Hardicanute, the two
Harolds and William the Conqueror are said to
be descended from Cerdic. Consult Bede, 'Histoeia ecclesiastica gentis' (bk. 5; ed. C.
Plummer, Oxford 1890); Gent, E., 'Origines Celticarum' (London 1883); Green, J. R., 'The

CERDONIANS, an ancient sect, whose be-
 lief, half philosophical, half religious, was a con-
fused mixture of Christian dogmas with Orien-
tal dualism and Gnostic ideas. Their founder, Cerdo, was a Syrian, who came to Rome about
the year 139 under the pontificate of Hyginus.
He maintained the existence of the Zoroastrian two principles, one of absolute good and the
other of absolute evil. The latter, according
to him, was the creator of the world and the
God and lawgiver of the Jews. The former
was the creator of Jesus Christ, whose inca-
ration, sufferings and death were only sensible
appearances, and not vital facts. Because they believed the human body the work of the evil
Deity, the Cerdonians prohibited the eating of
flesh, marriage and wine, and considered the
ascetic life the highest spiritual life. His dis-
ciples became confounded with those of Mar-
cion, who some years later propagated similar opinions.

CÉRÉ, sā-rē, Jean Nicolas, French botan-
nist: b. Isle of France 1737; d. there, 2 May
1810. Under the direction of the French gov-
ernment he greatly extended the culture of spices in the Isle of France (now Mauritius),
when that island was a French dependency.
The Agricultural Society of Paris published his
essay on the culture of rice and awarded him a
medal; and Napoleon confirmed him in his position as director of the botanical garden of the
Isle of France, and conferred on him a
pension of $120. A tree of the spicery has been
called after him, Cerea.

CERE, sērē, the naked skin or fleshy sheath
that covers the base of the upper mandible in
some birds, through which it is supposed that
a tactile sense is exercised.

CERALIA, sā-rē-ālē-ā (from Ceres, the
goddess of the fields and of fruits), signified
the productions of agriculture, also the festivals.
of Ceres, celebrated at Rome. The time at which they were celebrated is not known. According to Homer it was the 12th of April; according to others the 7th of the same month.

CEREALS, a term derived from Ceres, the goddess of corn. Though sometimes extended to leguminous plants, as beans, lentils, etc., and to buckwheat, it is more usually and properly confined to the Gramineae, as wheat, barley, rye, oats, which are used as food. In agriculture they are usually considered as exhausting crops, partly on account of their trailing roots; their mode of nutrition, which is effected more by the roots than by the leaves; their slender stems, which allow weeds to grow up and rob the soil; and from the necessity of allowing them to attain full maturity before they are reaped. Accordingly it is considered one of the rules of good husbandry not to take two cereal or white crops in succession, but to make them alternate with root crops, which, growing in rows at some distance apart from each other, have the additional advantage of allowing weeds to be destroyed by means of repeated hoeing. See Barley; Buckwheat; Grasses in the United States; Corn, Indian; Millet; Oats; Rice; Rye; Sorghum; Wheat.

CERECELLUM, sēr'-ē-bēl'um ("the little brain"), that portion of the brain situated behind and beneath the cerebrum. It is connected with the main brain mass by means of two feet or stems, the cerebellar peduncles, and is separated from the main brain mass in the cranial cavity by a thick layer of connective tissue, the tentorium cerebi. It is also connected with thepons by a pair of middle peduncles, and with the medulla oblongata by the inferior peduncles. It thus forms a very integral portion of the brain mass. In general the form of the cerebellum in human beings is a flattened ovoid measuring from 8 to 10 centimeters from side to side, five centimeters from before backward, and five centimeters vertically. Its average weight is about 140 grams, which is one-eighth of the weight of the whole cerebrospinal axis. It is larger and heavier in the male than in the female, and is relatively larger in the adult than in the child. Like the brain, it is divided up into a number of lobes, of which three are most prominent, the middle portion or vermis, and the two lateral lobes. The minute structure of the cerebellum is somewhat similar to that of the cerebrum, but there are certainly very marked differences, particularly in the development of a layer of very characteristic cells, the Purkinje cells. The interior of the cerebellum contains masses of gray matter, or nuclei. These are the dentate nucleus, the nucleus emboliformis, nucleus globosus and the nucleus fastigii in the vermis. Through the inferior, middle and superior peduncles fibers pass to and from the cerebrum, pons, medulla and spinal cord, thus bringing the cerebellum into organic union with the rest of the nervous system. The functions of the cerebellum are not yet completely worked out, but it is certain that the cerebellum has a number of important functions, chief among which are those: locomotion and the act of balancing, i.e., the orientation of the body in space. It is termed by Sherrington the chief head ganglion for the proprioceptors, or those organs which give rise to the sense of position of the head and eyes. The chief symptoms of cerebellar disease, either from maldevelopment or new growths, are: Cerebellar ataxia, a peculiar drunken-like gait; nystagmus (q.v.), adiadochokinesis, vertigo, hypotonus, asynergia, muscular asthenia, forced movements of the head and eyes, peculiar speech dysarthrias and occasionally cerebellar fits. Consult Jelliffe and White, 'Diseases of the Nervous System' (2d ed., 1917). See Brain.

CEREBRAL HÆMORRHAGE. See Brain, Diseases of.

CEREBRATION, an old term, much used in the early physiology, designating an automatic reflex series of brain actions taking place below the threshold of consciousness (q.v.).

CEREBRIN, C₉H₆N₄O₆, a name that has been applied, at different times and by different chemists, to various substances that are obtainable from the brain and other parts of the nervous system by extraction with alcohol. It is now usually applied to a nitrogenous powder that is obtained by heating ox-brain with baryta, washing, drying, and finally extracting with alcohol. The cholesterin that is also present in the product so obtained may be removed by the action of ether, in which cerebrin is insoluble. Cerebrin does not combine with acids or bases, but by prolonged boiling with dilute acids it is converted into a monosaccharide galactose and the nitrogenous substance known as sphingosin that can reduce Fehling's solution.

CEREBROSPINAL, pertaining to the brain and spinal cord together, looked on as forming one nerve mass.

CEREBROSPINAL FLUID. See Brain.

CEREBROSPINAL MENINGITIS. See Meningitis.

CEREBRUM. See Brain.

CEREMONIAL. See Court Ceremonial.

CEREMONIAL. See Court Ceremonial.

CEREMONIAL, the book used in the Catholic Church containing the ceremonies and rites for all general religious functions. The term is restricted to the Ceremoniale Episcoporum (of the bishops) and the Ceremoniale Romanum, special ceremonies and prayers being found in other books, such as Breviary, the Missal, etc. (q.v.).

CEREOPSIS, sē-rō-ōp'sis, the pigeon-goose, an Australian genus of the Anatidae or duck family, and the subfamily Anserinae, or geese. It has a small and extensively membranous bill and notably long legs, bare above the suffrago. They are so named from the remarkable size of their cere. There is but one species C. nova hollandiae which has been made the type of a subfamily ceroopsina.

CERES, sēr'ēz, the name given by the Romans to the Greek goddess of agriculture. Demeter, when her worship was introduced into Rome. The origin of the name cannot be explained with certainty. It is not Latin; but some think it was Etruscan, among which people, according to Livy, the women were the senators, or the mob. Others think that Ceres may be the same as the Greek Cora, or Free (that is,
“maiden”), another name for Persephone, the daughter of Demeter, with whom Demeter herself was often confounded. The worship of Demeter, or Ceres, was introduced into Rome from Sicily at the beginning of the 5th century B.C., and the first temple to her was vowed by the dictator, A. Postumius Albinus, 496 B.C. Her worship soon acquired a considerable degree of political importance. She was the goddess of the earth in its capacity of bringing forth fruits and grain. Her festival was the Cerialia. She is always represented as fully draped, with ears of corn and poppies in her hands and on her head a corn-measure. They sacrificed pigs and cows to her. As usual when the Romans introduced the worship of a foreign divinity into their own city, they adopted all the legends connected with that divinity, adapting them to their own mythology. Thus she was made the daughter of Saturn and Ops, and sister of Juno, Pluto, Neptune, Jupi ter, and Vesta. Her daughter was Proserpine (q.v.). See DEMETER.

CERES, the name of the first asteroid discovered between the orbits of Mars and Jupiter. It was discovered by Piazzi, 1 Jan. 1801. Having observed it at Palermo, in Sicily, he called it Ceres, after the Roman goddess of that island. Under favorable circumstances it has been seen by the naked eye as a star of the seventh magnitude, but more generally it looks like one of the eighth magnitude; some observers call it a light reddish and perceive a haze about the planet. Its diameter is about 500 miles.

CEREAUS, sērē-us, a genus of plants of the family Cactaceae, remarkable for their singularity of form and the beauty of the flowers. C. giganteus, the cactus, or saguaro of the Mexicans, is perhaps the largest and most striking of the genus. It rises to the height of 50 or 60 feet, and looks more like a candelabrum than a tree of the normal type. It occurs in Arizona and northwestern Mexico. Other notable species are C. renii, the long gray bristles of which give it the appearance of the head of an old gray-haired man. C. grandiflorus is the night-flowering cactus, but there are others which also flower at night. C. species is the creosote bush, commonly found in greenhouses, is a native of Mexico. C. flagelliformis, a creeper, is not frequently met with in gardens. The members of the genus are generally useful as cardiac agents and antipyretics. The fruits of many species are used for food.

CERIGNOLA, châ-rên-yô-la, Italy, town in the province of Foggia, and 24 miles southeast from the city of Foggia. It has a college, several convents and a hospital. The inhabitants manufacture linen; and the district produces large quantities of almonds, oil and cotton. In 1503 the Spaniards under Gonzales, Duke of Cordova, here defeated the French, when the Duc de Nemours, who commanded the latter, was slain. Pop. 38,180.

CERIGO, châ-rêgô (ancient CYTHEREA), Greece, an island in the Mediterranean, situated on the southern coast of the Morea by a narrow strait. It formerly belonged to the Ionian Republic of the Seven Islands, but in 1864 became part of the province of Arcadia, Greece; area, about 106 square miles. It is rather rocky and mountainous. Grain, wine, olives and other fruits are raised. Sheep and goats constitute the chief live stock. The people are of Greek origin, and are all of the Greek Church. At an early period a Phoenician colony was founded here. Later it was successively under the control of Argos, Sparta and Athens, and finally fell into the hands of the Romans. After submitting to Venice and then to Turkey, in 1718, it was once more assigned to Venice. It was ceded to France in 1807; two years later it was occupied by the English; after 1815 it shared the fate of the Ionian Islands. It was anciently sacred to Aphrodite (Venus) who was also called Cytherea. Pop. 13,110.

CERITHUS, one of the first heresiarchs who, according to Saint Irenaeus in his work, ‘Against Heresies,’ was contemporary with the evangelist Saint John; but Tertullian and Epiphanius refer him to the time of Hadrian. In Irenaeus’ work, as also in the ‘Philosophumena,’ attributed variously to Origen and Hippolytus, bishop of Ostia, Cerithus is represented as an alumnus of the pagan philosophical schools of Alexandria; but he broached his heretical doctrines in Asia Minor, and there had a numerous following. The universe, he taught, is not the work of the First God, but was created by some angelic power far inferior to the supreme power. Jesus he held to be the son of Joseph and Mary, born as other men are born, but excelling all in righteousness, wisdom and understanding. Cerithus taught also that upon Jesus, after his baptism of John, descended the Christos from the power which is supreme over all, in the form of a dove, and that then Jesus proclaimed the unknown Father and wrought miracles; but that at the end of the passion the Christos flew away out of Jesus, and Jesus suffered, but that the Christos remained impassible, being the spirit (or breath) of God. Angels play a conspicuous part in the system of Cerithus. Thus it was an angel, he says, that gave the law to Moses; and the Yahve of Israel was an angel. Cerithus and his followers entertained a special animosity against Saint Paul and Saint John, and the heresiarch is credited with writing an apocalyptic book attack the person of Saint John. He is said to have been a believer in the millennial reign of the Christ upon the earth. Modern critics consider Cerithus a Gnostic who, in common with the Jewish Ebionites, held the belief that the Christ was a thing apart, which was with Jesus only during his life and left him at death.

CERITE, sê-rît, a mineral occurring only at Riddarhyttan, in Sweden, and containing the rare element cerium, and others of the cerium group. Its formula is not certainly known, but the mineral may be described as a mixture of the metals of the cerium group, combined with small quantities of calcium and iron. It is mostly massive or granular, but crystals belonging to the orthorhombic system are sometimes found. Cerite has a hardness of about 5.5, and a specific gravity of about 4.9. It has a peculiar and characteristic color, intermediate between clove-brown and cherry red shading off to a gray.

CERIUM, sêrî-ûm, a metallic element the oxide of which was discovered and recognized
as a new substance in 1803 by Klaproth, and, independently, by Berzelius and Hisinger. It was named for the minor planet Ceres, which was also discovered at about the same time. The principal source of cerium is the mineral monazite (q.v.), which is a silicate of cerium and certain other allied elements. Cerium forms a basic nitrate that is insoluble in water, and this fact affords a ready means of separating the metal from the other elements with which it is almost invariably associated. Metallic cerium may be obtained by electrolysis of the anhydrous chloride, or by melting the anhydrous chloride with metallic sodium. Thus prepared, cerium is a steel-gray metal, ductile and malleable, and melting at a temperature probably not far from the melting point of silver. Its chemical symbol is Ce, and its atomic weight is 139.1 if \( \frac{H}{F} = 1 \). It has a specific gravity of from 6.6 to 6.75, and a specific heat of about 0.448. It does not change in dry air, but in moist air it oxidizes superficially. It decomposes in cold water slowly, and in hot water quickly. Two oxides of the metal certainly exist, one having the formula \( \text{CeO}_2 \) and the other the formula \( \text{Ce}_2\text{O}_3 \). Three other oxides have also been described, with the formule \( \text{Ce}_2\text{O}_4 \), \( \text{Ce}_2\text{O}_3 \), and \( \text{Ce}_4\text{O}_7 \), of these the first probably exists, but the other two still need confirmation. Oxide of cerium is also used in the manufacture of the better grades of incandescent gas mantles. A fabric of cotton is woven of the desired form and this is impregnated by repeated dipping in a solution of the nitrates of cerium and thorium. On ignition the cotton burns away, and the nitrates are converted into oxides, which give the intense luminosity desired. A mixture of 99 per cent of thorium oxide to 1 of cerium oxide gives the best results.

In medicine the insoluble salts of cerium are used, cerium oxalate alone being official. It resembles the insoluble bismuth compounds in its action, being a sedative to mucus membranes, and it is much used as an antemetic, particularly in the nausea of pregnancy. The soluble salts of cerium are poison, their action being similar to the soluble salts of bismuth.

CERNUSCHI, Enrico, chér-noos'kē, Italian economist: b. Milan, Italy, 1821; d. Mentone, 12 May 1896. He was graduated at Pavia in 1842, fought for liberty in the insurrection of 1848 and was obliged to flee from Italy, owing to political proscription. He acquired a large fortune in Paris as a banker, but owing to the hostility of the communists left France in 1871 and traveled extensively in Egypt, China, Japan, England, and the United States, visiting the last named in 1877. He brought back valuable ethnological and art collections which he bequeathed to the city of Paris. They now form the Musée Cernuschi, opened in 1898. He was an ardent himealist, and published 'Mécanique de l'échange' (1865); 'Ilusions des sociétés co-operatives' (1886); 'Discours' (1871); 'Silver Vindicat' (1876); 'Le bâ-métallisme à quize et demi' (1881); 'Amphitheatres' (1886), etc.

CERO, se'ē, a large, edible fish (Scromber-morus regale) of the western Atlantic, and similar to the Spanish mackerel. Another species (S. caballa), also called 'sierra' or 'king-cero' is found in the southern Atlantic, and reaches double the weight of the former, often attaining 100 pounds.

CERQUOZZI, chär-kwo'tzē, Michelangelo, Roman painter: b. Rome 1602; d. 1660. He received the surname delle battaglie (battle-painter), and at a later period that of delle bambocciate, because, in imitation of Pietro Longhi, he painted luscious scenes taken from life, such as that to be seen at fairs and markets, and among the lazzaroni. Among his best works are the 'Insurrezione di Massaniello in Naples' (Palazzo Spada, Rome); 'St. John the Baptist Preaching'; three Roman folk scenes (Galleria Nazionale, Rome) and two battle scenes (Dresden Gallery). Nearly all of the principal museums of Europe possess representative works by him.

CERRUTTI, chér-rētē, Luigi, Italian poet and rhetorician: b. Modena, 1 Nov. 1738; d. Pavia, 5 March 1808. The purity and elegance of his diction made him, at an early age, the most distinguished professor of rhetoric and oratory in Italy. His 'Poems and Select Prose,' collected into a posthumous volume, were instantly successful, and have retained their rank ever since.

CERRO BLANCO, the highest mountain in New Mexico; summit, 14,269 feet.

CERRO-GORDO, thêr-ro gör'dō, or sēr' rō górdō ("Big Hill"), a famous mountain pass in Mexico, the scene on 18 April 1847, of one of the sharpest battles of the Mexican War. After the capture of Vera Cruz on the coast, General Scott moved northwest toward the city of Mexico, along the National road. Some 50 miles from Vera Cruz this leaves the steam ing lowlands and climbs a steep rocky plateau, an eastern spur of the great mountain range, sharpened with ravines and thick with chaparral, and pierced by the defile of the little Rio del Plan. To this defile the road after crossing it and leaving it by a loop to the north among the mountains, returns at a ravine separating a sharp rocky ridge called Atlaya from a conical eminence termed Telegraph Hill. Of this again is the small hamlet called Cerro Gordo, which gives its name to the pass. On 9 April Santa Anna began fortifying Telegraph Hill, and from the 12th pushed on the work with all his force; accumulating about 12,000 men, the bulk at Cerro Gordo, but neglecting to occupy Atlaya. On the 11th, Scott's vanguard under Twiggs and Harney came up to Rio del Plan at the foot of the plateau, where the road crosses the river, drove away a few Mexican lancers, established a camp and began reconnaissances. Santa Anna, in place of attacking the scattered detachments, confined in his strong position, and the lowland fevers which must force the Americans to fight him, and waited. By the 17th most of Scott's forces had come up; and he pushed Twiggs forward within easy striking distance. The latter, finding Atlaya undefended, occupied it just as a Mexican detachment advanced to do so, routed them and chased them in headlong flight half way up Telegraph Hill. The whole American army, about 8,500, being now at hand, Scott issued orders for a general advance next day. Santa Anna's line extended from Telegraph Hill to a road at the ravine, and eastward for a mile along the heights overlooking
the National road, which ends in a precipitous rocky bluff 100 feet high; then back over three ridges terminating in rocky knolls, to the river dehle. In front of the batteries and infantry, the chaparral had been cut down and piled into an abatis for several hundred feet. The Americans, on the other hand, planted powerful batteries on Atalaya, and enfiladed the Mexican right with a howitzer across the river. Scott's plan was simple, but brilliantly effective, though the impassable ground made it fall short of the full intention. Since the Mexicans expected the chief attack on their right, he resolved to make only a feint there and assuming that they expected him to move forward along the road resolved not to do so. In the meantime he ordered the roads cleared around the hills to the north in order that by making a circuit to the National road in the rear of the Mexicans he might cut off their retreat. On the morning of the 18th Pillow assailed the right; the artillery on Atalaya rained shot and shell with terrific effect on Telegraph Hill, the road batteries, Santa Anna's camp, and even his reserves, and the howitzer over the river added its discharge. Twiggs, Shields and Worth, with Riley, then moved along the circuit till on the south flank of Telegraph Hill, at first out of sight, then in full range of the Mexican fire. Santa Anna detached part of the forces on Telegraph Hill to drive them back; then Harney from Atalaya swept over the crest and down the side, up Telegraph Hill till within 200 feet of the batteries and below their range. There he reformed and in one final charge utterly routed the Mexicans, at the same time turning the forces on the hill against the main body of Mexicans at Cerro Gordo. The entire right, its retreat cut off, threw down its arms and surrendered. The main body broke up in a panic, as the fugitives from Telegraph Hill rushed among them and the guns from that quarter cut them down, and fled wildly down the craggy slopes and to the de- file, and westward along the road. The Mexicans lost 1,000 or 1,200 in killed and wounded; about 3,000 prisoners, including 5 generals, and 299 other officers; 45 guns and 3,500 small arms. The Americans lost 63 killed and 319 wounded. The victory laid open the road nearly to the Mexican capital. Consult Bancroft, 'History of Mexico' (Vol. V, San Francisco, 1885); Wright, 'General Scott' (New York 1894); and Wilcox, C. M., 'History of the Mexican War' (Washington 1892).

CERRO LARGO, sér'ró lárg'gô, a department in the northeast of Uruguay, well watered, with large savannas and forests. Area, 5,729 square miles. Capital, Cerro Largo or Melo. The inhabitants are chiefly engaged in cattle-raising. Pop. 36,000.

CERRO DE PASCO, sér'ró dā pāskô, Peru, capital of the department of Junín, at the northern extremity of the plateau of Bourbon, 14,275 feet above the level of the sea at the north end of Lake Chinchayocha. The town came into existence in 1630, in consequence of the discovery of veins of silver there by a Spanish missionary. The town is crooked, and the houses small and without windows or balconies. The inhabitants are a mixture of all races and nations, who make their living by the produce of the mines. From October to July hail-storms, mists and snow-falls make the place almost intolerable, and in summer with the exception of a few clear days the climate is little better. On account of the extreme rarity of the air the difference in temperature in the sun and in the shade is great. Cerro de Pasco still contains the most productive mines in all Peru, although they no longer yield the almost fabulous wealth that the Spaniards are said to have derived from them. Many of the shafts leading down to the veins of silver are in the town itself, and have their openings either in little huts or in the dwellings of the owners of the mines. According to the greater or smaller depth of the diggings they are called minas or corries. The silver is found partly pure, and partly in ores containing from 25 to 80 per cent of the precious metal. Pop. (very variable) about 14,000.

CERROS, or CEDROS, ISLAND, an island belonging to Mexico, in the Pacific Ocean, off the west coast of Lower California, where it forms a part of the western boundary of San Sebastián Viscaino Bay. It lies between lat. 28° 5' and 28° 35' N. The climate is dry. It is for the most part mountainous and barren, but is thence possessed of mineral wealth. Area, 12 square miles.

CERTALDO, Italy, town of Tuscany, partly on a conical height, and partly on a flat along the right bank of the Elsa, 15 miles southwest from Florence. It is the birthplace, was long the home and now contains the ashes of Boccaccio. His house is still standing, and in one of its rooms are collected numerous relics of the author of the 'Decameron,' and a large fresco painting of him by Benvenuti of Florence. Pop. 10,439.

CERTIFICATE OF INCORPORATION. See CORPORATIONS, LEGAL.

CERTIFICATION OF TEACHERS. See SCHOOL SUPERVISION; also TEACHERS, PROFESSIONAL TRAINING OF. For foreign systems see the subhead Education, under the articles on the various countries.

CERTIORARI, sér-shé-ó-rär'i, in law, a writ issuing from a superior court to call up the record of a proceeding in an inferior court, or before a body or officer exercising judicial power, that it may be tried or reviewed in the superior court. This writ is usually obtained on complaint of a party that he has not received justice, or that he cannot have an impartial trial in the inferior court or body. It is now to a great extent superseded by the appeal.

CERULEUM, a blue pigment, consisting of stannate of protoxide of cobalt mixed with stannic acid and sulphate of lime.

CERULLI, chē-rool'ē, Vincenzo, Italian astronomer: b. Teramo, Italy, 20 April 1859. He was educated at the Sapienza, Rome, and at the University of Berlin. For some time he was astronomer of the Gregorian University, Rome. In 1892 he founded the Collurania Observatory at Teramo of which he has since remained director. He discovered the planet (704) Interamnia, and rediscovered the Faye comet in 1910. He is corresponding member of the Lincei Academy, the Pontaniana Academy, Naples, the Turin Academy of Sciences and of
the Italian Astronomical Society. He is the author of two works on Mars; three volumes of publications of the Collurania Observatory and is a contributor to *Astronomische Nachrichten*, 'Mémoire Spéctroscopiste Italiani,' and 'Astronomia e scienza affinit.'

**CERUMINOUS GLANDS**

The glands of the ear which secrete the cerumen or wax which lubricates the passage to the tympanum and prevents the entrance of foreign matter.

**CERUSITE**

The native lead carbonate, PbCO₃. It is common in orthonthic crystals, very frequently stellately twinned. It also abounds in massive, earthy and stalactite forms. It is very brittle, has a hardness of 3 to 3.5 and the high specific gravity of 6.5. It is usually translucent and of an adamantine or pearly lustre. Its color is white or gray, though green and yellow tints are not uncommon. It is one of the most abundant and valuable ores of lead, and often carries silver. It is formed from galena by the action of solutions of calcium bicarbonate. Among its many important localities are Broken Hill in New South Wales, Ems in Germany and Phoenixville, Pa.

**CERUTTI, châ-oo'ë, Giuseppe Antonio Gioschino, French Jesuit theologian: b. Turin, 13 June 1738; d. Paris, February 1792.** He was one of the most eminent professors in the Jesuit College at Lyons and his 'Apologie générale de l'institut et de la doctrine des Jesuites' attracted much attention. He had already published two discourses upon the means of preventing duels, and on the reasons why modern republics have not reached the splendid perfection they might have obtained. The last received the prize of the Academy of Dijon. He was at Paris when the Revolution broke out in 1789. Abandoning his former principles he became one of the most zealous supporters of the new order of things. He was intimately connected with Mirabeau, and labored much for him. He also published two with others a paper called 'La Fousille Villageoise' for the purpose of keeping villagers informed of the news of the day, and several pamphlets, among which was a 'Mémoire sur la nécessité des contributions patriotiques.' In 1791 he was a member of the legislative assembly. Some time after he delivered, in the church of Saint Eustache, a funeral discourse upon Mirabeau. The city of Paris called a street after his name. His collected works were published in 1793 (3 vols.);

**CERVALCES**

An extinct, moose-like deer, complete skeletons of which have been found in Pleistocene marls in New Jersey, and which probably survived until the advent of human hunters. Its antler is less broadly palmate than those of the existing moose, but have great trumpet-shaped plates on the lower prongs; the legs are very long, and the feet spread like those of a caribou, suggesting that it traveled in a snowy region, and indicating a much colder Quaternary climate in New Jersey than at present. The neck is too short to enable the animal to reach the ground without kneeling, and it is inferred that it was altogether a browser, although it has not the long prehensile muzzle of the elk or moose. It is, indeed, an intermediate form between stag and moose. Consult Osborn, 'Age of Mammals' (New York 1910).

**CERVANTES, Philippines, capital of the province of Lepanto, situated near the centre of the province in the northwestern part of the island of Luzon, three miles from Cayán, the former capital. It is on a road connecting it with Benguet, and is 78 miles from Dagupan, which is the nearest point on the railroad. Pop. 14,000.**

**CERVANTES SAAVEDRA, thär-van'tës så-ä-vä-drä, Miguel de, Spanish poet and novelist, one of the great writers of modern times: b. Alcalá de Henares, 9 Oct. 1547; d. Madrid, 23 April 1616. His parents removed to Madrid when he was about seven years old. Their limited means made it desirable that he should fix on some professional study, but he followed his irresistible inclination to poetry, which his teacher, Juan Lopez, encouraged. Elegies, ballads, sonnets and a pastoral, 'Filena,' were the first productions of his genius. Poverty compelled him to quit his country at the age of 22, to seek maintenance elsewhere; he went to Italy, where he became page to the Cardinal Giulio Acquaviva, in Rome. In 1570 he served under the papal commander, Marco Antonio Colonna, in the war against the Turks and African corsairs, with distinguished courage. In the battle of Lepanto, in 1571, he lost his left hand. After this he joined the troops at Naples, in the service of the Spanish king. In 1575, while returning to his country, he was taken by the corsair Arnaud Mami, and sold in Algiers as a slave. He remained in slavery for seven years, but servitude, far from subduing his mind, served to strengthen his faculties. Vincent de los Rios and M. F. Navarrete, his chief biographers, relate the bold but unsuccessful plans which he formed to obtain his freedom. In 1580 his friends and relations at length ransomed him. At the beginning of the following year he arrived in Spain, and from this time lived in seclusion, entirely devoted to the muses. It was natural to expect something uncommon from a man who, with inexhaustible invention, great richness of imagination, keen wit, and a happy humor, united a mature, penetrating and clear intellect, and great knowledge of real life and mankind in general. But it rarely happens that expectation is so much surpassed as was the case with Cervantes. He began his new poetical career with the pastoral novel 'Galatea' (1585), in which he celebrated his mistress. Soon after the publication of this he married. Being thus obliged to look out for more lucrative labor he employed his poetical genius for the stage; and in the course of 10 years furnished about 30 dramas, among which his tragedy called 'Numancia' is particularly valued. He was not so successful in another kind of drama particularly favored by the Spaniards, a tangled mixture of intrigues and adventures; and this was doubtless, and indicating a much colder Quaternary climate in New Jersey than at present. The neck is too short to enable the animal to reach the ground without kneeling, and it is inferred that it was altogether a browser, although it has not the long prehensile muzzle of the elk or moose. It is, indeed, an intermediate form between stag and moose. Consult Osborn, 'Age of Mammals' (New York 1910).
He did not appear again as an author till 1605, when he produced the first portion of that work which is immediately imputed to him. — Don Quixote.  Cervantes had in view by his work to reform the taste and opinions of his countrymen. He wished to ridicule that adventurous heroism with all its evil consequences, the source of which was the innumerable novels on chivalry. The beginning of the story was at first coldly received, but soon met with the greatest applause, in which a later period the whole of Europe joined. Cervantes' true poetical genius was nowhere so powerfully displayed as in his 'Don Quixote,' which, not-withstanding its prosaic purpose and its satirical aim, is full of genuine poetry. While it struggles against the prevailing false romance of the time, it displays the most truly romantic spirit. The extraordinary good fortune of the work did not extend to the author. All his attempts to better his condition were unsuccessful, and he lived contented with his genius and his poverty, and a modest though proud estimation of his merits. After an interval of some years, he again appeared before the public in 1613, with 'Twelve Novels' (which must be placed by the side of Boccaccio's), and in 1614 his 'Journey to Parnassus' — an attempt to improve the taste of his nation. In 1615 he published eight new dramas, with intermezzi, which, however, were indifferently received. Envy and ill-will, in the meantime, assailed him, and endeavored to deprive the neglected author of his literary fame; for which the delay of the publication of 'Don Quixote' afforded the pretext. An unknown writer published, under the name of Alonso Fernandez de Avellaneda, a continuation of this work, full of abuse of Cervantes. He felt the malice of the act painfully, but revenged himself in a noble manner by producing the continuation of his 'Don Quixote' (1615), the last of his works which appeared during his lifetime; for his novel 'Persiles and Sigismunda' was published after his death. He found a faithful friend in the Count of Lemos, but poverty, his constant companion through life, remained true to him till his last moments. He died on the same day as Shakespeare, in Madrid, where he had resided during the last years of his life, and the tercentenary anniversary of his death was celebrated in many European and American literary centres, contemporaneously with the Shakespearean tercentenary celebration in 1916. He was buried without any ceremony, and not even a common tombstone marks the spot where he rests. In addition to his celebrity as an author, he left the reputation of a man of a firm and noble character, clear-sighted to his own faults and those of others. (See Don Quixote; Exemplary Novels.) Among the best early editions of 'Don Quixote' are the one published at Madrid by Joaquin Ibarra in 1780, considered a masterpiece of typograph; that of Pellicer (Madrid 1798), and that of Clementin, with an excellent commentary (Madrid 1833-39). Many of his works are translated; 'Don Quixote' into all the languages of Europe. Among early English translations may be mentioned those of Motteux (1719); Jarvis (1742); and Smollett (1755). A more recent notable translation is that of Ormsby, J. (1885), containing life of the author, notes, bibliography, etc., republished with critical introduction by Fitzmaurice-Kelly, J. (Glasgow 1901).

Cervantes, or Antimony Ocher, is native antimony tetroxide, SbO₃. It usually occurs in crusty stibnite and other antimony ores. It has a pale yellow color and greasy lustre.

Cervera y Topete, Pascual, thár-bárra è tó-pá-tá, Spanish naval officer; b. province of Jerez, 18 Feb. 1833; d. Puerto Real, Spain, 3 April 1909. He was of noble birth on his mother's side. He was graduated at the Naval Academy of San Fernando; entered on active service in 1851; served against Morocco and was made first lieutenant in 1859; captain in 1868; and admiral subsequently. He was a prominent factor in the 10-years' war in Cuba, when he succeeded in blockading the ports and preventing the landing of filibusters; was sent to London as a representative of Spain to take part with other nations in a conference bearing on naval questions of international importance; and commanded the fleet sent against the American squadron operating in Cuban waters after the declaration of war in 1898. He was present at the battle in the inner harbor of Santiago de Cuba, and when, on 3 July, he attempted to escape, under imperative orders from his superiors, his entire fleet was destroyed by the squadron under the official command of Rear-Admiral Sampson and the actual command (in the temporary absence of that officer) of Rear-Admiral Schley. Admiral Cervera and his surviving officers were sent to Annapolis, Md., as prisoners of war, and soon afterward were released and allowed to return to Spain. He was a man of cultured and genial manners, of a kindly disposition and was a gallant officer and received many official courtesies at the hands of his captors. Consult 'Spanish American War,' (trans. from the Spanish, Washington 1899) and Cervera y Topete, 'Views Regarding the Spanish Navy in the Late War' (Washington 1898); Alger, R. A., 'The Spanish American War.'

Cervidæ, sér-vl-de, the deer family, a group of ruminant ungulates, including, besides the typical deer, the reindeer, the musk-deer and others. The most notable pecu-
naric of the entire group is the presence, in the males, or 'bucks,' of branched appendages to the skull, called antlers. These are, however, lacking in certain species, which, despite this fact, are very evidently closely related to the antlered deer. Only among the reindeer do the females have antlers. The antlered animals shed these ornaments annually and develop new ones. (For growth and reproduction of these, see Antlers.) Other peculiarities of the family are anatomical; the most noticeable is the absence (except in Moschus) of a gall-bladder, and the presence in all of two lachrymal ducts, one visible outside the eye in the 'tear-bag' (Crumen). The subfamily Cervina, with several genera and about 60 species, embraces the typical deer; the subfamily Moschus includes only the musk-deer (q.v.), separated because it is hornless, retains the gall-bladder and has no crumen. The musk-deer is confined to the Himalayan region. Otherwise deer occur in all parts of the world except Australia and Africa. Indications of kinship to his race occur in the
CERVIN, sér-vări, Mont (German, Matterhorn; Italian, Monte Svinio), a mountain, Switzerland, Pennine Alps, on the southern frontiers of canton Valais, about six miles west-southwest of Zermatt, from which road a leads to the Col Saint Théodule, a pass over the mountain into Piedmont. It is one of the most magnificent objects in nature, being an almost inaccessible peak of rock starting up from an immense glacier, to a height scarcely 1,000 feet lower than that of Mont Blanc. The glacier, which differs from the lower glaciers in not being included between bold walls, but occupying a vast and desolate table-land, is nearly 10,000 feet above sea-level. The height of the peak is 14,837 feet. It is composed of folded slate or gneiss. The peak was first ascended by a party of four English travelers and three guides in July 1865, but three of the party and a guide perished in the descent. (Consult Whymer's Scrambles Among the Alps 1). On the summit of the pass, 11,096 feet, are the remains of a rude fortification, supposed to have been erected two or three centuries ago, to prevent incursions from the Valais. The Little Matterhorn, or Petit Mont Cervin, reaches a height of 12,750 feet in the same group of mountains and is easily reached from the Théodule Pass.

CERVOLLE, sér-vo-lē, or CERVOLE, Armande de, French bandit chief, surnamed "The Wolf Priest". He was taken prisoner with King John at the battle of Poitiers in 1356, and after being ransomed, plundered the south of France with a band of troopers (routriers), and exacted tribute from Innocent VI at Avignon. He served for a time under the Dauphin, pillaged Burgundy, Champagne, Alsace and Lorraine; was made chamberlain to Charles V in 1365; and was murdered in 1366.

CESALPINO, chá-zal-pré'nō, or CÉSALPIN, Andrea, Italian botanist and physiologist. b. Arezzo, Tuscany, 1519; d. Rome, 23 Feb. 1603. He studied and taught medicine and botany at the University of Pisa, and was physician to Pope Clement VIII. He was the author of a valuable work 'On Plants,' in which he classified plants by their parts of fructification. To this work Linnaeus, Jussieu and other subsequent authors were greatly indebted for their ideas of botanical classification. In his 'Peripatetic Investigations' he propounded the theory of the circulation of the blood, afterward adopted and demonstrated by Harvey.

CÉSAR BIROTTEAU, bi-rō'tā (1837), is perhaps the most notable of a noteworthy group of scenes in Balzac's 'Human Comedy,' dealing with business venture and the chicanery of unscrupulous finance, with the cumulative entanglements of debt and the legal snare of usurious oppression. In this novel these are viewed from the point of view of a prosperous tradesman, with chivalrous standards of commercial honor, whom success in his own field betrays into intrigue. Later in the novel where he falls among thieves, men whom he thought he had special reason to trust. It is, Balzac says in his preface, "the obverse of a medal whose reverse is La Maison Nucingen," which deeds, however, less genially, with the same theme from the side of the exploiters of men of too credulous probity. César, a brother of Balzac's memorably unfortunate Curé de Tours, had prospered as a manufacturing perfumer during the consolatse and the empire, though his relations to militant royalists had brought him a wound in connection with the conspiracy of Vendémiaire, 1795, which seemed to give him a title to the aid of royalist sympathizers after the Restoration. One of these was the very unscrupulous and successful Baron Nucingen. Du Tillet, once Birotteau's head-clerk and a betrayer of both his domestic and his mercantile confidence, but now a financial shark and confidante of Nucingen for his baser needs, interests Birotteau still to the moment when his ambition reaches full bloom in a nomination as chevalier of the Legion of Honor, in a speculation and in imprudent expenditure by which his wealth becomes theirs and he a bankrupt debtor. By heroic exertion, four years' persistent labor and scrupulous economy, aided by Popinot, another type of industrial honor, who was later to marry Birotteau's worthy and charming daughter Césarine, the debtor discharges his liabilities to the last farthing, dying from the relaxing of the strain immediately after his solemn rehabilitation and the restoration of his commercial honor and coveted decoration by the courts. The story is less to be commended as a whole than for its portrayals of character, especially of the two druggists, the generous and loyal Popinot and the smug materialist Matifat, of the gentleman-scouturel Du Tillet and the ingeniously gracious Césarine, and most of all for its minute pictures, drawn in part from Balzac's own frequent memories, of the mental and moral tortures of César in his cumulating commercial embarrassments. There are four English translations.

BENJAMIN W. WELLS.

CESARESCO, Countess Martinengo. See MARTINENGO-CESALESCO, COUNTESS.

CESARI, chá-zā-rē, Giuseppe (sometimes called IL CAVALIERE D'ARPINO), Italian painter: b. Arpino about 1568; d. Rome, 3 July 1640. His first commission came from Gregory XIII who appointed him one of the group who were employed in the decoration of the Vatican. Among them was Poussin, whose association profoundly influenced the younger artist. Five popes honored him in style; he was one of the later 'Mannerists.' Among his best works are the frescoes of the Olgistì Chapel in Santa Prassede (1591); the huge 'Ascension' at Saint John Lateran; frescoes in the Borghese chapel and the capitol. A number of his smaller pictures may be found in the various European galleries.
Pope Clement VIII created him Cavaliere di Cristo. His works in fresco and oil — display lively color and great energy — and are preserved in the church of S.Giovanni and S. Anna. He devoted himself to the belles-lettres, and was soon chosen professor of rhetoric in the seminary in which he was educated. He translated three tragedies of Voltaire, — "Sémiramis," "La Mort de César" and "Maratona." In 1762 he went to Venice, where he translated Ossian into Italian, and was, in 1768, appointed professor of the Greek and Hebrew languages in the University of Padua. Here he published his translation of Demosthenes and of Homer, and his course of Greek literature. After the establishment of the republican government, in 1797, he was appointed by the existing authorities to write an "Essay on Studies." In this he made suggestions for the improvement of education. In 1802 he published his poem "Ode on Providence," in praise of his benefactor, Napoleon, who made him the same year knight of the Iron Crown. In spite of his advanced age he subsequently occupied himself with an edition of all his works; but his death prevented the completion of this enterprise. The edition of his works that had been begun during his life was completed by his friend Giuseppe Barbieri (1805-13). Consult Bersezio, Vittoria, "Il regno di Vittorio Emanuele" (Turin 1878-81); and the memoir in the edition by Barbieri.

CESENA, chä-zä'na, Italy, city in the province of Forlì, central Italy, on the right bank of the Savio, 52 miles southeast of Bologna. Among its buildings are a library founded in 1452 by Domenico Malatesta Novello, which possesses 4,000 precious manuscripts; a Capuchin church containing one of the best of Guercino's paintings, a lyceum, gymnasium, technical school, seminary and a noble cathedral. Productive sulphur mines are in the neighborhood; and the region has been noted ever since Roman times for the excellence of its wine. Hemp, vegetables and silk form considerable items of trade. Cesena was the birthplace of Popes Pius VI and VII. There is a colossal statue of the pope in the handsome city hall. In 1357, under Maria Oreladilla, it made a famous defense against Albormoz; but in 1377 it was barbarously pillaged by Robert of Genf. Later it was taken by Cesare Borgia and became part of the papal dominions. On 30 March 1815, Murat gained a victory at this place over the Austrians. Pop. (1911) 46,445.

CESIUM. See CÉSIIUM.

CÉSNOVA, chä'-no'lä, Luigi Palma di, American archaeologist: b. Piedmont, Italy, 29 June 1832; d. New York, 22 Nov. 1904. He was educated at the Royal Military Academy and served in the Sardinian army during the war in Italy also in the Crimean War. He came to the United States in 1860, serving in the Civil War, and attaining the rank of brigadier-general. He was United States consul at Cyprus (1865-77), where he made extensive archaeological excavations. In 1878 he became a trustee and director of the Metropolitan Museum of Art, in New York, a post he held till his death. In 1897 he was awarded a Congressional medal of honor for conspicuous military service. Columbia University conferred on him the degree of LL.D. in 1880. He published "Cyrus: Its Cities, Tombs and Temples," and many monographs on art topics.

CÉSPEDES, thé's-pä-dës, Pablo de, Spanish painter, sculptor, architect and poet: b. Cordova 1538; d. there, 28 Nov. 1586. He entered the University of Alcalá de Henares, where he distinguished himself by his proficiency in the classics and Oriental languages. He also assiduously cultivated his genius for the fine arts. Having at last made these his principal pursuit, he proceeded to Rome, studied under Zuccaro and Michelangelo, and soon became renowned both for his frescoes and sculptures. In 1577 he obtained a prebend in the cathedral of Cordova, and from that time resided alternately in his native town and in Seville. His best pictures are in Cordova, Seville, Madrid and several towns of Andalusia; and are admired particularly for elegance and loftiness of design, complete knowledge of anatomy, the skillful employment of light and shade, warmth of coloring, accuracy of expression and spirituality of composition. One of his most celebrated pictures is a "Lord's Supper," in Cordova Cathedral. He was the head of the Andalusian school of painting, and numbered among his pupils some painters of distinction. The portrait by himself hangs in the old Spanish gallery at the Louvre. Consult Pacheco, "Arte de la Pintura" (Seville 1649); Tobino, "Pablo de Céspedes" (Madrid 1860); Viardot, L., "Histoire des peintures."

CÉSPEDES Y BORGES, bär' gäs, Carlos Manuel de, Cuban insurgent: b. Bayamo, 18 April 1819; d. 22 March 1874. He studied at the University of Havana, and later at Barcelona, Spain. Implicated in Prím's conspiracy, he was banished from Spain (1843), and returned to Cuba to practise law. As leader of the revolt of 1868, he was chosen by the insurgents president of the newly-proclaimed republic. He was killed in a skirmish with the Spaniards.

CÉSART, cäs-sär, Louis Alexandre de, French engineer: b. Paris 1719; d. 1806. He early entered the military service, and distinguished himself in the campaigns of 1743-46, during which he was present at the battles of Fontenoy and Rocoux. Bad health having obliged him to obtain his discharge, he entered the École des Ponts et Chaussées, where he displayed so much genius and industry that in 1751 he was appointed general engineer of Tours. In 1775 he was removed to Rouen, and in 1781 proposed his plans for the construction of the harbor and works of Cherbourg. These have immortalized his name. He died while engaged in preparing a description of his most important labors. The work was published under the title of "Description des Travaux Hydrauliques de l. A. C. Louis Alexandre de Césarit."

CÉSIO BONORUM, sësh'ô bô-nô'rüm ("surrender of goods"), a process by which, according to the law of Scotland, a debtor against whom a warrant of imprisonment was issued, after being charged to pay his debt, was entitled to be free from imprisonment, if innocent of fraud, on surrendering his whole estate to his creditors. This procedure avoided infamy, and
the debtor could not be deprived of the bare necessities of life. Since the abolition of im-
property for debt a debtor may be compelled
to make cestio bonorum at the instance of a
creditor. Any property accumulated after this
surrender is liable to attachment so long as the
debt is not wholly paid off.

CESTIUS, the name of a plebeian gens at
Rome, of which two memorials have been pre-
served, one of them a bridge connecting
islands in the river with the right bank of that
river, and the other a monumental pyramid
standing at the gate San Paolo, partly within
and partly without the walls of Aurelian. This
pyramid stands upon a base of travertine. It
is 125 feet high, and at the base 95 feet broad.
It is built of bricks, encased in blocks of mar-
bule. In its interior there is a sepulchral vault
20 feet long, 13 feet broad and 14 feet high.
The walls of this vault were formerly decorated
with paintings, but these are now faded, and
only a few traces of them are still discernible.
They were copied in bronze by Falconieri 1661.
Two marble pillars which formerly supported
the statue of the person whom the monument
commemorates stand in front of the pyramid.
From the inscriptions which have been upon it, it has
been inferred that the Cestius who caused this
magnificent monument to be erected was a
Roman knight of that name who lived in the
time of Cicero, and who, having enriched him-
self in Asia Minor, left part of his wealth for
the purpose of perpetuating his memory in this
way.

CESTODA, or tapeworms, a class of the
phylum Plathelmintes. Elongate ribbon-
like usually jointed body with a scolex bearing
suckers, hooks and other organs of attachment.
The segments or proglottids contain complete
sets of reproductive organs and after separa-
tion from the chain may lead an independent
existence for some time. No trace of an ali-
mentary system has been found and the nervous
system is highly degenerate. The reproductive
system is richly differentiated and produces
large numbers of minute eggs which yield char-
acteristic minute six-hooked embryos that de-
velop in another host into bladderworms
(cysticerci). After transfer to the first
(primary) host the cisticercus grows into a
chain.

Cestodes are parasitic in the various types
of vertebrates only, though some bladderworm
stages occur in worms, crustacea and insects
of various sorts. In the rare monozoic cestodes
(Cestodaria) the simple body contains only a
single set of sex organs; in the polyzooic cestodes
there are many such sets corresponding usu-
ally to the numerous segments. The latter group
contains five orders, Pseudophyllida, Tetra-
phyllida, Diphylida, Trypanorhynch and Cy-
cophyllida. The fish tapeworm of man falls
in the first order and all others from the human
host in the last.

CESTRACION, sēs-trā'sēn, a genus of
primitive sharks, also known as Heterodontus,
of which the best known species is the Port
Jackson shark of Australia (C. philippi). Four
species are known, varying in length from four
to five feet. They feed mainly on various kinds
of mollusks. The family Cestracionidae, though
now represented by a single genus of four
species, was very abundant in the earlier geo-
logical periods.

CESTUI, sēs'-twi, CESTUY, in law, that
person: common in the phrases cestui que trust,
or person holding equitable title to an estate;
cestui que use, or person in whose behalf an-
other holds the fee of lands or tenements;
cestui que vie, or person whose death terminates
an estate. A cestui que trust is not only the
equitable, never the legal title to an estate.
The terms cestui que trust and cestui que use
are almost identical in meaning, the former
being more modern. As life estates are still
common in Great Britain and the United States,
the term cestui que vie is of considerable im-
portance in the law of real property. An
estate may be granted to one for his own life,
for the life of another or for the lives of
several others.

CESTUS, or CÆSTUS, the boxing-glove
of the Grecian and Roman pugilists. It con-
sisted of a girdle of raw hide or leather
fastened to the hand and reaching to the
wrist. It was afterward enlarged so as to reach
up to the elbow, and loaded with metal to in-
crease the weight of the blow. The combat
with the ordinary unloaded cestus was not
more dangerous than a common modern box-
ing-match. Theocritus (Idyll, xxii) and Virgil
(Aeneid, v. 362) describe one of these combats.

CETACEA, sē-tā'sē-ā, an order of mam-
mals whose structure is so modified as to render
them fit for an aquatic life. The whalebone
whales, the toothed whales, as the porpoise,
narwhal, etc. and the extinct zeuglodon, rep-
resent the leading divisions of the group.
The body is fish-like in form, the head passing grad-
ually into the trunk which tapers posteriorly
and ends in a bilobate caudal fin which is placed
horizontally, not as in the fish vertically. The
posterior limbs are wanting, and the anterior
are converted into broad paddles or flippers,
consisting of a continuous sheath of the thick
integument, within which are present repre-
sentatives of all the bones usually found in
the fore limb of mammals, but they are not mov-
ably articulated, so that the paddle moves like
a solid oar. The fish-like aspect is further in-
creased by the presence of a dorsal fin; but
this is a simple fold of integument, and does not
contain, as in fishes, any bony spines. The verte-
brae of the neck, seven in number, are
united more or less to each other, so that in
some they form a single solid piece. The right
whale and its allies have no teeth in the adult
state, their place being taken by the triangular
plates of baleen or whalebone which are de-
veloped on transverse ridges of the palate. The
frayed edges of these plates slope obliquely
downward and outward from the middle of the
roof of the mouth, so that when the mouth is
shut there is a triangular space in the middle,
the floor of which is formed by the enormous
tongue. The water taken into the mouth is sifted by the frayed edges of the plates; it is driven out sideways between the plates and the tongue backward to the gullet any animals that have been caught in the fringes. But the fetal whales possess minute teeth, which are very soon lost. The porpoises, etc., when they possess teeth in one or both jaws, have them numerous and conical in form; they have no milk predecessors. The stomach is divided into several chambers, but these are not, as in ruminants, connected directly with the gullet; they are rather appendages of the pyloric portion of the organ.

The arrangement of the respiratory and circulatory systems, which enable the Cetacea to remain for some time under water, are interesting. The nostrils open directly upward on the top of the head, and are closed by valvular folds of integument which are under the control of the animal. When the animal comes to the surface to breathe it expels the air violently, and the vapor it contains becomes condensed into a cloud; if the expiration commences before the mouth of the spout or blow-hole is above the surface, a little water may be blown up like spray but no water from the mouth is thus discharged, for the soft palate firmly embraces during life the upper end of the larynx, so that the gullet is divided into two narrow passages, while the lungs have a continuous passage to the exterior. The blood vessels, especially those of the thorax and spinal canal, break up into extensive plexuses or networks, in which the oxygenated blood is delayed, and thus the animal is enabled to remain under water, the necessity for changing the air in the lungs being diminished.

Fossil Cetacea.—Bones of cetaceans, mostly allied to the living species, are found in the marine sediments of the Tertiary and Quaternary ages, and are occasionally dredged up from deep-sea deposits. The hard and heavy earbones are especially apt to be preserved as fossils. The zeuglodons and squalodonts of the Eocene epoch represent a peculiar primitive group of cetaceans with two-rooted teeth. Very little is known of the evolution of this order of mammals. The Tertiary deposits of Patagonia are supposed to be rich in material bearing the extinct family of the Cetacea.

Classification of Cetacea.—The sub-orders of cetacea are as follows:
1. Mystacoceti, baleen-bearing whales. Its families are: Balanopteridae,rorquals, and other great whalebone whales; Bolamia, right whales and kogias.
2. Odontoceti, of which the families are: Physetneridae, sperm-whales (Physetera), and beaked whales (Ziphius); Delphinidae, dolphins, porpoises, white whales, killers and the like; Phocoenidae, river dolphins; and the extinct Squalodontidae.
3. Archoceti, containing the extinct family Zeuglodontidae. The most recent and important work on this order is Beddard's 'Book of Whales' (London 1900). See Whale, and the names of the various groups and species of cetaceans.

CETEYAWO, set-i-tw'i-yo, Kaffir chief or king, son of Panda, King of the Zulus. See ZULULAND.

CETHEGUS, Gaius Cornelius, Roman statesman, one of the associates of Catiline. He was put to death in prison by order of the Senate, at the instigation of Cicero, 68 B.C.

CETHEGUS, Marcus Cornelius, Roman official who flourished in the 3rd century B.C. He became curule edile, 213 B.C.; censor, 208; consul, 204. In 203, he was appointed proconsul of northern Italy, and was successful in driving back the armies of Mago, brother of Hannibal. He was well known for his oratorical ability. Indeed, Cicero, quoting Ennius, refers to him as "suadae medulla, the narrow of persuasiveness."

CETENJE. See CETTINE.

CETIOSAURUS, sét-i-ó-sár'ús, a genus of amphibious dinosaurs (see DINOSAURS), of which fragmentary remains have been found in the Lower Cretaceous (Wealden) of Europe. From the fragments of the skeletons which have been discovered, a fair idea of the proportions of the animal may be conceived. It probably reached a length of 60 or 70 feet and a height of 10 feet.

CETTE, sét, France, seaport town in the department of Hérault, built on a neck of land between the lagoon of Thau and the Bay of Biscay, 18 miles southwest of Montpellier. The space enclosed by the piers and breakwater forming the harbor can accommodate about 400 vessels; and the harbor is defended by forts Saint Pierre and Saint Louis. A broad, deep canal, lined with excellent quays, connects the port with the Lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to Ceste an extensive inland traffic; and it has an active foreign commerce. The principal trade is in wine, brandy, salt, dried fruits, fish, dyes, stuffs, perfumery and verdigris. Ceste has shipyards, metallurgical works, salt-works, glass-works, factories for the manufacture of syrups and grape sugar, etc., and carries on extensive fisheries. After Marseilles, it is the principal trading port in the south of France; and it is much resorted to as a watering place. Pop. 33,049.

CETTINE, csé-tén'ye, or CETINJE, chét-tén'ye, Montenegro, the capital of the principality; situated in a lofty mountain valley, 19 miles east of Cattaro, on a promontory of the palace of the ruler and the government buildings, a convent founded in 1478, a girls' institute and other schools, an arsenal and a theatre. Turkish invaders sacked and burnt the town in 1683, 1714 and 1785. Many famous Montenegrin rulers lie buried here. Pop. about 4,500.

CETUS (Lat. whale), a large constellation lying on both sides of the equator, but mostly south of it, one of Ptolemy's original 48. It is surrounded by Pisces, Aries, Taurus, Eridanus, Fornax, Sculptor and Aquarius. It contains the remarkable variable star Omicron Ceti or Mira. It was discovered by Fabricius in 1596. It becomes visible to the naked eye once in 11 months, and after a few days passes out of sight, becoming a star of the ninth magnitude.

CETYL, së'ti, in chemistry, a radical corresponding in structure to the ethyl compounds. It is formulated as CH₃CH₂ and is derived from spermaceti.

CEUTA, čo'o-ta, Morocco, a strongly fortified place belonging to Spain, on the coast of Africa, opposite Gibraltar. The town occupies the site of the Roman colony of AD Septem
Fréres, so called from the seven hills rising here in a group, of which the most prominent are Montes Almina and Flacho; on the latter, the ancient Abyla (one of the Pillars of Hercules), is a strong fort, and on the former, among beautiful gardens, lies the New Town. Ceuta contains a cathedral, a hospital and convent. The manufacture of coarse silk is one of its important industries. From China in 1415 it was captured and annexed by the Portuguese, and fell to Spain in 1580. It has resisted several sieges by the Moors (1694–1720 and 1732), and is still the most important of the four African presidios. Pop. 23,907.

CEVA, châ-vâ, Tommaso, Italian mathematician and poet: b. Milan, 20 Dec. 1648; d. Naples 7 Oct. 1709. He entered the Order of Jesuits in 1663, and spent his life as an instructor in various colleges. His more important mathematical works had reference to angles, for the trisection of which he invented a mechanical instrument. He wrote several books in Italian and in Latin, and many poems in Latin and Italian, two of which, entitled "Philosophia nova-antiqua"; and "Puer Jesus," are still admired. His mathematical works are "De Natura Gravium" (1669) and "Opuscula Mathematica" (1669).

CEVALLOS, thâ-vâ-lâs, Pedro, Spanish diplomatist: b. Santander, Biscay, 1761; d. Madrid 5 May 1838. He studied at Valletta and entered on a diplomatic career. Having been appointed secretary to the embassy at Lisbon, he there married a niece of Manuel Godoy, Duke of Alcudia, the Prince of Peace, and became afterward Minister of Foreign Affairs. In the disputes between Charles IV and his son Ferdinand he adhered to the latter. Aware of the influence which Cevallos possessed over the Spanish people, Joseph Bonaparte was anxious to gain him over, and offered to take him into his service. Cevallos accepted with apparent willingness, but on arriving at Madrid united with the Spanish junta against Joseph, and was sent by them on a mission to London, where in 1806 he published his celebrated work on Spanish affairs, referring more especially to the proceedings at Bayonne, "Exposition des faits et des trames qui ont préparé l'occupation de la couronne d'Espagne." After the Restoration he for some time maintained a great influence over Ferdinand, but on his opposing the marriage of the latter with a princess of Portugal he lost favor, was deprived of his office of Secretary of State and sent as Ambassador to Naples and Vienna. On being recalled in 1820 he retired to private life.

CÉVENNES, sa-vén, France, southern district, which at one time formed the northern part of the government of Languedoc. During the wars against the Albigenses and the Waldenses its mountains formed an asylum of numerous persons who had renounced many of the beliefs of the Roman Catholic Church. It now forms part of the departments Haute-Loire, Loire, Ardèche, Gard and Aveyron. Consult Stevenson, R. L., "Travels with a Donkey" (London 1895); and Ribard, "L'Histoire cénovié d'après des documents" (Cazillac 1898).

CÉVENNES, sâ-vén (ancient CEBENNIA), the chief mountain range in the south of France, between the Alps and the mountains of Auvergne, and lying mainly west of the Rhone. With its continuations and offsets, it forms the watershed between the river systems of the Rhone and the Loire and Garonne. Its general direction is from northeast to southwest, beginning at the southern extremity of the Lyonnais Mountains, and extending under different local names as far as the Canals du Midi, which divides it from the northern slopes of the Pyrenees. They are divided into the South and North Cévennes. The Cévennes extend for over 150 miles, through or into nine departments, the central mass lying in Lozère and Ardèche, where Mount Lozère attains 5,864 feet, and Mount Mézen (the culminating point of the chain) 5,754 feet. The average height is from 3,000 to 4,000 feet. The mountains consist chiefly of Primary rocks, covered with Tertiary formations, which in many places are interrupted by volcanic rocks. The Cévennes served as a retreat for numerous Protestant families after the revocation of the Edict of Nantes.

CEYLON (Sanskrit simhala, from simha, lion; Latin Taprobane, and Hindu Sīlān), an island possession and Crown colony of Great Britain, in the Indian Ocean, about 60 miles southeast of the southern extremity of Hindustan, from which it is separated by the Gulf of Manar and Palk Strait. It lies between lat. 5° 55' and 9° 50' N., and between long. 79° 41' and 81° 54' E., having the shape of a pear, with the broad end south. Length, about 266 miles; average breadth, 100 miles; area, 25,304 square miles. The northern and northwestern coasts are flat and monotonous, those on the south and east bold and rocky, presenting a highly picturesque appearance, which is further heightened by the exuberant vegetation, the noble palm forests, the luxuriant corn fields and the verdant slopes of the mountains enameled with bright flowers, herbs and creeping plants, whose delicious perfume spreads far and wide. Many parts of the coast, at its southern and northern extremities, are studded with small, rocky and somewhat barren hills, some of them overgrown with palms, and presenting a singularly beautiful appearance. At Trincomalee, on the northeastern coast, there is one of the finest natural harbors in the world; at Galle on the southern coast there is also a harbor; while the harbor at Colombo, the capital, is capable of admitting the largest vessels, and is now the regular calling-station for many steamers to and from Calcutta, China and Australia. Between the island of Manar on the northwestern coast of Ceylon and the island of Ramiseram on the coast of India is a ridge of sandbanks called Adam's Bridge, which nearly connects Ceylon with the continent, being intersected only by three narrow shallow passages, the remainder being covered with two or three feet of water at full tide. These channels admit only very small vessels, but ships of some size can get through between Ramiseram and the mainland.

Mountains.—The mountainous regions of Ceylon are confined to the centre of the southern and broader part of the island. They grad-
ually diminish to hills of moderate elevation as they recede from the central mass, and are succeeded on the western side by a flat tract extending to the coast. Their average elevation is somewhere about 2,000 feet, but there are several summits upward of 7,000 and 8,000 feet high. The highest summit is Pedrothallagalla (8,800 feet). Adam’s Peak, standing 7,449 feet, is the most remarkable from its conical form, the distance from which it is visible from the sea and from the sacred associations with which it is connected, the summit being the point from which Buddha, according to his followers, ascended to heaven, a gigantic footprint bearing testimony to the fact. Other summits are Tolapella (7,720 feet) and Kirrighalpota (7,810 feet). The forms of the mountains of Ceylon are singularly varied. They most frequently occur connected in chains, and terminate in round or peaked summits. Their sides are always steep and occasionally precipitous and rocky. There is no proportional correspondence between the heights of the mountains and the distance of the rock on the summit; many of the valleys are extremely narrow. The deepest are in the heart of the mountains. Some are between 3,000 and 4,000 feet deep, and not over half a mile wide.

Rivers and Lakes.—The rivers of Ceylon, though numerous, especially on the southern and southwestern sides, are small, being merely mountain streams, navigable only by canoes, and that but for a short distance from their mouths. The Mahavela-ganga, which rises near Adam’s Peak, and falls into the sea by a number of branches near Trincomalee, is by far the most important. It has a course of 134 miles and drains upward of 4,000 square miles. The timber growing on its banks in great abundance, consisting of balmalillie, ebony, satin-wood, etc., is floated down to the harbor during the freshets. Of the remaining rivers the Kalaniganga, the Kala-ganga and the Maha Oya reach the sea on the western coast; and the Gintotaganga at Galle. All the rivers are liable to be surcharged with rain during the monsoon, and to inundate the level country. Subsequently the heat of the sun drying the country produces malaria. There are numerous extensive lagoons or back-waters round the coast, but no lakes in the island. The average rainfall is from four miles broad. There are rills and streamlets rushing along in every direction among the mountains, so overhung with superabundant vegetation as to be frequently invisible.

Geology and Mineralogy.—Ceylon is mostly formed of ancient stratified rocks, but owing to the obliteration of fossil remains it is doubtful whether they have been deposited on the beds of seas or lakes. The mountains are composed of Primary and metamorphic rocks, the prevailing rock on the island being gneiss, though laterite (or “cakbook”) and a sort of dolomite also occur in considerable quantities. In the Nuwara-Eliya district and elsewhere there are large alluvial tracts. Basalt is found near Galle and Trincomalee, and at Pettigallakanda. All the Oya rivers are bedded on the alluvium of gneiss. The western coast of the island is believed to be rising. Plumbago is found in sufficient quantities to make it of commercial importance, and among the metals occurring in the island are iron in fair quantity, manganese, gold, platinum, molybdenum, nickel, cobalt, copper and tin. No coal has been found, but nitrogen and salt occur (the latter is also a somewhat important article of manufacture). Gems of many kinds are abundant, particularly near Ratnapura. They are found either embedded in the rock or washed down in the alluvium of riverbeds, and include, sapphires, amethysts, topazes, moonstones, garnets, spinel, sapphires, rubies, cinnamon stones, etc. There are hot springs at Bintenna, Trincomalee and Puttalum.

Roads and Transportation.—Ceylon is now well provided with roads. A highway has been made from Colombo to Nuwara-Eliya, 6,000 feet above the level of the sea. A continuous line, 769 miles in length, makes the entire circuit of the coast, and every town of importance is connected by roads with the two chief cities. The roads in general are good, many of them being macadamized, and in the neighborhood of the chief towns are adapted for carriages. During the monsoons, however, the roads in many parts are impassable from inundations. The building and roads, bridges, streets and canals forms one of the chief items of expenditure of the government. Railroad extension is also a government affair, and there are now about 604 miles in all, the main line being that between Colombo and Kandy (75 miles). In the early part of the 19th century, there was not a single road in the country, merely a few pathways, the greater part of the island being then covered with impenetrable forests.

Climate.—Where the jungle has been cleared away and the land drained and cultivated, the country is healthy; where low, wooded tracts and flat, marshy lands abound, covered with a rank, luxuriant vegetation, the climate is eminently insalubrious, showing, what is now pretty well understood, that mere heat has little to do with the unhealthfulness of tropical climates. The heat is not so great as on the neighboring coast of India, the sea-breezes moderating the temperature. At Colombo, on the western side of the island, near the equator, the mean temperature does not exceed 3°, and the annual range is from 76° to 86° F. At Nuwara-Eliya (6,000 feet high) the annual range is from 52° to 80°. The easterning part of the island being exposed to the northeastern monsoon, has a hot and dry climate, resembling that of the coast of Coromandel; while the western division, being open to the southwestern monsoon, has a humid climate like that of the Malabar coast. The quantity of rain that falls annually in Ceylon is estimated at three times the quantity that falls in England, the rains being less frequent, but much heavier. The interruption which the course of the monsoons meets with from the mountain ranges of the island causes deluges of rain to fall on one side, while the other is parched with drought. At Kandy, in the interior, the average annual fall of rain is 85.3 inches; at Colombo, on the seacoast, 75 to 80 inches. The prevalent diseases are those of the liver and intestines, accompanied by fever. Elephantiasis and other cutaneous complaints are common. The very fatal disease called beriberi (Hydrops asthmaticus) occasionally occurs.

Animals.—Most of the animals found on the opposite continent are native to this island,
excepting the royal tiger, which does not exist here. Elephants are numerous, especially in the northern and eastern provinces, where they sometimes do great injury to the growing crops. The elephants of Ceylon are esteemed for their superior strength and docility. The eagerness with which they are hunted has greatly reduced their numbers; licenses for the capture and exportation of elephants must be obtained from the government. Bears, buffaloes, leopards, jackals, monkeys and wild hogs are numerous. There are several species of deer, including the chief crop, but latterly the cultivation of tea, cinchona and cacao has been carried to such an extent that the island has become less dependent on a single article of produce. Notwithstanding the fact that the fallow deer (properly the great red Sambar and spotted axis) are most abundant. Porcupine, bandicoots, squirrels (flying and other), bats, mongoose, are to be found, as are also the pangolin or scaly ant-eater and the loris or Ceylon sloth. Flying foxes and rats are numerous. Pheasants, snipes, partridges, pigeons, peacocks and a great variety of birds, of splendid plumage, are plentiful. Crocodiles, serpents and reptiles of all sorts abound. Of the 26 distinct species, six only are venomous. Among the insects are the leaf and stick insects, the ant-lion, the white ant, etc.

Vegetable Products.—In the luxuriance of its vegetable productions Ceylon rivals the islands of the Indian Archipelago, and in some respects bears a strong resemblance to them; its most valuable products are tea, rice, coffee, cinnamon and the cocanut. Coffee used to be the chief cultivated crop, but disease has within recent years much reduced the product. Cinnamon grows in the southwest, to which it is almost exclusively confined, requiring a sandy soil with a moist atmosphere. The trade in this spice was reserved as a government monopoly by the Dutch when they had possession of the island; all that was collected beyond the quantity which it was thought could be sold at a monopoly price being burned. This absurd system was followed by the English for some years after their conquest of Ceylon, but was abandoned in October 1832, when the trade in cinnamon was declared free, subject to a duty on exportation. The cocanut-trees grow along the entire western and southern coasts in countless numbers, each tree yielding usually between 500 and 1,000 nuts in the year. Every part of this invaluable tree is capable of being turned to profitable account. The Palmrya palm, which grows principally in the northern part of the island, is of hardly less importance than the cocanut, being productive in seasons of drought, when the crops fail. The jaggery palm, or kittul-tree, is cultivated for the sake of its sap, which yields a coarse sugar; its pith furnishes a kind of sago, and its fruit is also eaten. The talipot palm, also, of the jack-tree, and breadfruit trees, the fruit of which is used by the natives for food, both raw and cooked; the timber, also, of the jack-tree, being a sort of wood, is much used by the natives for making furniture and in house-building. The Ceylon areca nut, celebrated for its superior qualities, is exported in large quantities. Tobacco is raised principally in the northern district and is of excellent quality. Indigo grows wild, but is not sought after. The cardamom plant is abundant, but inferior to that of Malabar; fruits and culinary vegetables are produced, the latter in the elevated districts, in great variety and profusion. The island abounds with a number of various descriptions, including calamander, satin, rosewood, iron, jack, halmalile and other beautiful woods adapted for cabinet work. Agriculture generally, and the cultivation of the more valuable native products of the island in particular, are improving. As ready supplies and licenses for the capture and exportation of elephants must be obtained from the government. Bears, buffaloes, leopards, jackals, monkeys and wild hogs are numerous. There are several species of deer, including the chief crop, but latterly the cultivation of tea, cinchona and cacao has been carried to such an extent that the island has become less dependent on a single article of produce. Notwithstanding the fact that the fallow deer (properly the great red Sambar and spotted axis) are most abundant. Porcupine, bandicoots, squirrels (flying and other), bats, mungooses, are to be found, as are also the pangolin or scaly ant-eater and the loris or Ceylon sloth. Flying foxes and rats are numerous. Pheasants, snipes, partridges, pigeons, peacocks and a great variety of birds, of splendid plumage, are plentiful. Crocodiles, serpents and reptiles of all sorts abound. Of the 26 distinct species, six only are venomous. Among the insects are the leaf and stick insects, the ant-lion, the white ant, etc.

Pearl-fishery, etc.—There has long been a pearl-fishery on the coast of Ceylon, carried on as a government monopoly. The fishery sometimes fails for years, there having been none, for instance, between 1837 and 1854, or between 1863 and 1874. Although the government still continued a strict surveillance over the banks, and occasionally subjected them to a careful examination, scarcely any trace of the pearl oyster was to be found. No cause has yet been discovered for its disappearance. When the pearl-fishery is in existence it is confined to the Gulf of Manar, where the oyster banks extend for 60 or 70 miles along the coast south of Manar, and perhaps 10,000 people, including 2,500 divers, will assemble in the fishing season. The Ceylon pearl is nearly as large as the Ormus or the Arabian coast. The chalk or conch fishery was at one time carried on to a great extent, employing about 600 divers, but has greatly declined owing to the little demand now made for them in Bengal, to which the greater part were sent. The chank is a sea-shell (Voluta gyro), adapted for cutting into rings, these being formerly used in great numbers by the native women of Hindustan for bracelets and anklets.

Manufactures and Trade.—The manufactures of Ceylon are very unimportant with the exception of arrack, which is distilled from the juice of the cocconut-tree. The spinning and weaving of cotton goods, generally of the coarsest kind, was at one time a considerable industry, but is now dying out. There are numerous oil-mills for pressing the cocconut kernels to express the oil. The Singhalese make good artisans, as is experienced at Colombo, where they are employed in making steam engines and other machinery. They are skilful in carpentry and wood-work, expert workers in gold and silver and excel in the
CEYLON

manufacture of lacquered ware. Salt is a government monopoly, being collected from shallow lagoons which at certain seasons are overflown by the sea, or it is manufactured in pans, the property of the government. The exports are chiefly tea, coffee, copra, rubber, cinnamon, cinchona, cocoanut products, areca nuts, cacao, cardamoms, plumbago, tobacco. Tea has only begun to be exported in recent years, and the export increased from 2,392,975 pounds in 1884, to more than 183,000,000 pounds in 1900, and by the value of it is more than twice that of exports of rubber; but the area devoted to the latter product increases rapidly. The trade of Ceylon is chiefly carried on with Great Britain and India. The principal articles of import from Great Britain are coal, cotton manufactures, apparel and haberdashery, iron and steel manufactures, machinery, etc. From other countries are imported rice, dried fish, wheat, sugar and a variety of commodities. In 1913 the imports totalled £53,089,540 in value, and the exports £83,692,283.

Government, etc.—The government of Ceylon is conducted by a governor and two councils, executive and legislative, of both of which the governor is the member in chief composed of seven members, including the governor; the other of 21 members, including the members of the Executive Council, other officeholders and unofficial members selected by the governor as representative of the different classes and interests in the community. The powers of the councils are limited, being subordinated to those of the governor. All laws must be approved by the Secretary of State for the Colonies before they can take effect. Any individual properly qualified may be appointed to the most responsible situation, without reference to service, nation or religion, and native Sinhalese have occupied some of the highest posts. The island is divided into nine provinces—the Eastern, Western, Northern, Southern, Central, North Central, North-western, Sabaragamuwa and Uva, and subdivided into districts. In each province is stationed a government agent. The criminal law has as its basis the Code of 1817; the civil law is of Roman-Dutch derivation but is modified by colonial ordinances. For the administration of justice there are in the civil and criminal departments, a Supreme Court, established at Colombo; also a Vice-Admiralty Court, provincial courts in various districts; beside magistracies, local boards in the towns and the native village councils. The chief sources of revenue are the customs duties, railroad receipts, land rents and salt farms. The chief articles of export are now rice. The revenue for 1913 was £17,057,510; expenditures £15,890,310. The public debt amounts to about £23,000,000; but the finances are in a very healthy condition, as the public debt of the colony has been mostly incurred for the construction of railroads.

Races.—The present population of Ceylon is composed of Sinhalese or Ceylonese, descendants of immigrants from Hindustan who entered the country in the 5th century B.C., Malabars from the south-western coast of India, Moors, Malays, Veddas and a small proportion of Europeans and their descendants. The Sinhalese inhabiting the coasts are a mild, timid race, obsequious to strangers, and hospitable and humane. Their stature is rather below the middle size; their limbs slender, but well shaped; eyes dark, finely cut features, hair long, smooth and black, turned up and fixed with a tortoise-shell comb on the top of the head; color varying from brown to black, or rather from the lightest to the darkest tints of bronze. The Singhalese of the interior, or Kandian Singhalese, are a superior race, being stouter, handsomer, and of more manly and independent bearing, with a greater degree of intelligence. The Malabars of Ceylon are similar in all respects to those of the continent. The Mohammedans or Moors are an energetic and industrious people, and engross a large proportion of the commerce and traffic of the island. The Veddas are supposed to be a portion of the aboriginal inhabitants of Ceylon. They inhabit the most secluded and inaccessible parts of the island, and subsist entirely on wild fruits and roots. Around the loins is their only clothing; and their habitations, generally of small dimensions, are formed for security among the branches of large forest trees. They are a robust and hardy race, but extremely peaceable and inoffensive. The other inhabitants consist of Dutch, Portuguese and English, some Malays or natives of the Eastern Archipelago, a few Chinese and Parsee traders and a varied population sprung from the intermixture of these races with each other. The descendants of the Dutch and other Europeans are known as burghers. The population is rapidly increasing. In 1832 it scarcely amounted to 1,000,000; while in 1881 it was 2,750,000. In 1901 the total was 3,576,990, including 2,334,817 Sinhalese, 952,237 Tamils, 224,719 Moors and in 1908, 4,038,456. The census of 10 March 1911 showed the number of inhabitants to be 4,110,367. The number of laborers on the plantations was about 510,000 in 1912. This includes a large number of coolies who come from India for employment.

Religion, Language, Education.—More than half the population are said to be Buddhists, and about 800,000 are of the Hindu religion (sects of Brahmanism). Buddhism is chiefly prevalent in the interior and generally along the Singhalese of the seacoasts. It is maintained and protected by the British government, agreeably to the treaty of 1815. On the western and southwestern coasts numbers of the Singhalese profess the Roman Catholic religion. There are a number of Episcopalian clergymen in the island, subordinate to the bishop of Colombo; various other Protestant bodies have places of worship, but the Protestants are less than half the number of the Hindus. The Singhalese have a colloquial language peculiar to themselves, but their classic and sacred writings are either in Pali or Sanskrit. The Malabars use the Tamil. English is becoming more and more common, and there is scarcely a roadside village in Ceylon now where the traveler could not find some persons to speak English, or interpret for him. The government has a department of public instruction, and good progress is being made in education throughout the islands. In the year 1914 there were more than 325,000 children participating in public instruction, a number of the schools being maintained or aided by the government.
There are schools maintained also by the Church Missionary Society, by the Wesleyan, the American and the Baptist Missionary societies, besides a number of private and some regimental schools.

Antiquities, History, etc.—The Sinhalese are a historical record of events for 24 centuries; and their authenticity, as regards description of ancient towns and buildings, and other works of art, is established by existing ruins, proving that the island had been, at a remote period, inhabited by a powerful and numerous people long forgotten, and for ages hidden by dense jungle growths, the ancient capitals of Ceylon now afford a wonderland of interest for the archaeological investigator and the tourist alike. Scores of bell-shaped relic houses, ranging up to 400 feet in height and 1,500 feet in circumference, form the gigantic ruins that now make up the principal monuments to the magnificent civilization, the rival of Rome in luxury and architectural grandeur. The cities were two in number, Anuradhapura, the ancient Sinhalese capital for about 1000 B.C. to 500 A.D., and Polonnawura, the mediæval capital, which flourished in the 12th century. The grandeur of the mighty capital Anuradhapura can be guessed from the fact that the king's pleasure garden in the centre of the city was 20 square miles in extent. After his conversion to Buddhism, King Tissa donated these gardens for religious uses. The ruins of the temples and dagabas erected here form the majority of the monuments that not only bear record to the vastness and splendor of that age, but are now—2,000 years later—taking their places among the wonders of the world.

Starting from the centre of the modern native town, numbering scarce 50,000 souls, on a tour of the ruins, one comes at first to the forest of monoliths remaining from the original 1,600 granite columns upon which rested the remarkable Brazen Palace. As this edifice, built by King Dutthagamini about 200 B.C. for his Buddhist monks, is typical of all the palaces of that day, the following description, written about 500 A.D. by Buddhist monks is of interest: "This palace was 100 cubits square—length, breadth and height all being the same. In it there were nine stories, each with 100 apartments. All these apartments were highly finished in silver; all the cornices thereof were embellished in gems. The flower ornaments thereof were also set with gems, and the tinkling festoons were gold. In the centre of the great hall of the palace was an ivory throne, on one side of which was a sun in gold, on another the moon in silver, on a third the stars in pearls, ending with the building was covered with brazen tiles, hence its name, the Brazen Palace. Next in importance comes the Ruanwel Dagaba. A dagaba, or ancient Sinhalese cistern, was built of 300 brick and stood about 100 solid bricks built both as a monument for and to protect for all time a tiny sacred relic hidden in the centre of its base. The Ruanweli is in a much ruined state, but enough remains to show its ancient structure. The Thuparama Dagaba, near by, is in good repair. It was built by 300 brick and stood about 100 feet. An existing structure in Ceylon or India, and is still, though much smaller than the others, a remarkable monument to the skill of its builder. Originally 176 ornamental pillars of graded heights surrounded the Thuparama; of these but 31 now remain standing. The Abhayagiriya Dagaba is 405 feet high, with a dome 300 feet in diameter and a base covering eight acres. Other monuments are equipped with its beautiful "moonstone" entrance and decorative guard stones by the side; marble bath tanks equaling Rome's in luxury; elephant houses and great tanks where the state elephants were wont to take their morning plunge, and where the royal elephants were stabled; the curious Isuruminiya temple dug out of a mammoth boulder on the edge of an artificial lake, and finally the sacred Bo-tree itself, transplanted here in 288 B.C. and said to be the oldest cultivated tree in the world. It was originally a branch of the fig tree under which Buddha had been accustomed to sit and meditate. Polonnawura, the mediæval capital, lay 40 miles southeast of Anuradhapura. A British archaeological commission is at work here, excavating a temple from about 1000 B.C. to 500 A.D. Temples, monasteries, dagabas rivaling the Pyramids in magnitude engage the attention of the visitor. The most interesting of all relics discovered was the temple called the Gal Wickare, and the three giant figures at its entrance—a statue of Buddha 15 feet high; a statue of Ananda, Buddha's disciple, 23 feet high, and a recumbent statue of Buddha, 46 feet long. Other remarkable remains are the theatres, bathing halls, gardens, fountains, public buildings that shone with roofs, doors and windows gold, and the vast combed monuments at the rock of Sigiri. At Dambulla there is a celebrated cave temple, dating from the 1st century A.D.

Ceylon was known to the Greeks as Taprobane. In 543 B.C. it was conquered by Vijaya, a prince from the mainland of India, and for several centuries the island enjoyed great prosperity under the generally beneficent rule of his dynasty. The Hindu immigrants brought with them the civilization of their own country, and a great part of Ceylon became covered with towns and villages. Several of Vijaya's successors had to contend with invading Malabars, and these ultimately secured the sovereignty. A restoration of the line of Vijaya in the 11th and 12th centuries contributed to the return of something of the ancient grandeur of the island.

Little was known regarding it in Europe until 1505, when the Portuguese established a regular intercourse with Ceylon, being encouraged thereto by a native king. The Portuguese were subsequently expelled by the Dutch in 1658, after a stubborn struggle of 20 years duration. The Dutch soon opened up an extensive and profitable trade with Holland, and they constructed several canals to serve as means of communication between their various posts on the island. Their activities, however, though beneficial on the whole to the Sinhalese as well as themselves, was essentially a selfish and exclusive one. British intercourse with the island began in 1763, and in 1795, owing to the war with France and Holland, Great Britain was induced to attempt an effective occupation of it. In that year the island was occupied in the following year Colombo; and by these victories all the Dutch forts were transferred.
to Great Britain. By the Peace of Amiens (1802) the whole coast territory was formally ceded. The King of Kandy, who remained in possession of the central mountainous region, perpetrated such atrocities on his own people that many of their chiefs in 1815 entreated Great Britain to withdraw its forces. A short campaign was ended by the capture of the tyrant and his deportation as a prisoner to India, and since then the whole island has been under direct British rule. A serious rebellion in 1817 and another in the late 1840s and 1850s were put down by the British. Only breaks in the generally tranquil subsequent history of the colony. British rule has contributed very largely to the material advancement of the island by the construction of roads and railways, the extension of the Dutch canal system, the restoration of irrigation tanks, the bridging of rivers and the development of its great natural resources. Two important events in its modern history have been the rise and development of coffee-planting (say from 1837 onward) and the rise of native coffee-planting (about 1878) in its place. The decline of coffee-planting, as is well known, has been caused by a leaf-fungus. The planting of cinchona, cacao and rubber-trees has also helped to add to the resources of this small island, which is now self-supporting and even exporting small quantities of these products.

The principal towns of the island are Colombo, Trincomalee, Kandy, Galle, Jaffna and Kornegalle. The urban population is 11.8 per cent of the total number of inhabitants which, on 1 Jan., 1914, was given as 4,402,097. See also above: RACES.

CÉZANNE, Paul, sà-zán', French painter: b. Aix-en-Provence 1839; d. there 1904. He was the son of a banker and so, in spite of the failure of his pictures to find purchasers for the greater part of his lifetime, he did not, most happily, have to contend with poverty. Emile Zola, a friend of Cézanne's and it was he who induced the latter to come to Paris in 1861. From this year on his time is divided between Aix and Paris, the years from 1861 to 1882 being spent principally at the capital, where he came into contact with the best men of his generation. The latter years of his life were passed mostly in the south where he could work out his ideas more quietly. Zola had introduced Cézanne to his friend Manet and the young painter was soon acquainted with the whole group to be styled the Impressionists, Renoir and Pissarro being especially his friends. He exhibited with them in 1874 and again in 1877, when he sent in 17 oil paint-

ings. Discouraged by the ridicule of critics and by his differences with the Impressionists, he retired in 1879 to Aix, where he spent the remainder of his life. In this seclusion he developed a style of amazing originality, which has exercised a profound influence upon the radical younger generation that hailed him as a prophet and a leader. After a fervent and profound study of the old masters and an adhering acceptance of the art of Delacroix and Courbet, Cézanne's next step was, logically, to make himself master of the principles of his predecessors. This he did, especially during the two years that he lived with Pissarro at Auvers-sur-Oise, 1873-74. But while the modern ideas of light were his study at this period he never lost sight of the masters of the Louvre, and he made endless experiments in applying latter-day knowledge to classic principles of design. Imagine Poussin painted again according to our ideas of nature" was one of his characteristic remarks. With the early years of the 80's he is ready to begin painting where personal inclination takes on more and more prominence as compared with inherited values. As a true Frenchman, and a true classicist in the best sense of the word, the qualities he adds to his art in later life are as clear from his first those of the same man in less emphasized form, as the art of the past. Cézanne observed the design and color of the old masters and found that with the best of them these qualities are present as a living organism throughout the entire picture. He saw that it was precisely in this regard that the painting of his time was falling short of the excellence of the past. Without dreaming for a moment of returning to the vision of nature or the formula of painting of the old masters, he applied their demand for a firm basis of design to the painting of the earlier 19th century. The picture at the Luxembourg, 'L'Estaque,' shows him on the road to his new style, the landscape at the Metropolitan Museum (1888) shows him firmly in possession of it and already obtaining his results with the assured stroke of a master. His later years, however, showed no inclination to rest on his achievement or to repeat himself. On the contrary he goes on until the picture becomes more and more clear to the younger generation (who began to follow him about 1885-90) that a profound idea of nature and an overwhelmingly sufficient statement of her aspects can be made by the setting down of a few essentials. His treatment of form and color rose to always grander heights and he is to-day almost universally considered one of the greatest of creative artists. While the larger part of his works is still in private collections he is represented, besides the museums noted above, in the Louvre ("The Card Players" and "Flowers"), at Berlin ("Still Life" and "The Bouquet"), at the Neue Pinakothek, Munich ("Self-Portrait" and "Fruits"), at the Museums of Mannheim, Christiania, in the Havemeyer collection, New York, etc. Consult Meyer and Graefe, "Paul Cézanne" (Berlin 1910), and Burger, "Cézanne and Hodler" (Munich 1913). The story of Cézanne's struggles and career is depicted in Zola's "L'Œuvre," of which he is the hero. The Chabanneau, shā-hān' Chabanne, French philologist: b. Nontron, 4 March 1831; d. 1909. From 1877 until his death he was professor of Romance languages at Montpellier. In 1895 he
was made a chevalier of the Legion of Honor, and later was the recipient of an honorary doctorate from the University of Halle-Wittenberg. He was not only a leading authority on Provençal philology, but made numerous valuable contributions to the history of Languedoc. He wrote *Histoire et théorie de la conjugaison française* (1868); *Grammaire limousine* (1876); *La langue et littérature provençales* (1879); *Biographies des troubadours* (1885); and contributed largely to the *Revue des langues romanes.*

**CHABANEL, Noel,** Jesuit missionary among the Huron Indians: b. France, 2 Feb. 1613; d. 8 Dec. 1649. In 1630 Chabanel entered the Jesuit novitiate at Toulouse and was professor of rhetoric in several colleges of the Jesuits in that province. He was sent to Canada in 1643, where, after studying the Algonquin language for a time, he was sent as missionary to the Hurons, among whom he labored until his death. He had as companion of his labors the Rev. Charles Garnier. Their deaths at the hands of a renegade Huron are told of in the Jesuit Relations of 1649—50. Consult Shea, *History of the Catholic Missions* (New York 1855).

**CHABAS, shá-bá, François,** French Egyptologist; b. Briisacourt, 2 Jan. 1817; d. Er saillies, 17 May 1882. Though at first engaged in commerce, he found time to become a learned linguist, but it was not till 1851 that he gave himself up to the study of hieroglyphics. The first results of his studies appeared in 1856, followed by a series of invaluable books and papers, elucidative chiefly of two important periods of ancient Egyptian history—the conquest of the country by the Hyksos and the time of their expulsion. Among the more important works are *The Shepherd in Egypt*; *History of the 19th Dynasty and especially of the Period of the Exodus*; and *Studies of Historical Antiquity from Egyptian Sources.* From 1873 to 1877 he edited *L'Egyptiologie.*

**CHABAZITE,** a member of the zeolite family; crystals of variable composition, but in general definable as a hydrated silicate of aluminum, calcium and sodium, with small amounts of potassium and occasionally of barium and strontium. It has a hardness of from 4 to 5 and a specific gravity of about 2.1. It is transparent or translucent, and varies in color from white to pale red or yellow. It occurs in rhombohedral crystals that are sometimes barely distinguishable from cubes, and also in amorphous forms. It is widely distributed, and usually occurs in connection with basalt, syenite, gneiss, or mica, or hornblende schist.

**CHABERT DE COGOLIN,** shá-bár dé kô-gô-lân, Joseph Bernard, MARQUIS, French geographer; b. Toulon, 28 Feb. 1724; d. 1 Dec. 1805. He entered the marines as a cadet in 1741. In 1759 he sailed to the North American coast, and on his return published the result of his observations in an astronomical and hydrographical work, entitled *Voyage sur les Côtes de l'Amérique Septentrionale* (1753). In 1758 he was made a member of the Academy of the American war Chabert distinguished himself so highly that in 1781 he was made commander of a squadron. In 1792 he was made vice-admiral.

During the same year the Revolution drove him to England. In 1800 he lost his sight in consequence of his intense application to study, and in 1802 returned to Paris, where Bonaparte assigned him a pension. In 1804 he was appointed a member of the Bureau des Longitudes, and in 1805 presented to it a map of Greece and a description of the coasts of that country.

**CHABLAI, shâ-bâ,'** France, a district in Savoy, south of the Lake of Geneva. At one time it formed part of the kingdom of Sardinia, but in the 11th century came into the possession of the counts of Savoy. In 1860 it was ceded to France, along with the rest of Savoy, by Victor Emmanuel, King of Sardinia. It now forms the arrondissement of Thonon (its ancient capital), in the department of Haute-Savoie.

**CHABLIS, shâ-bé,** France, town in the department of Yonne, on the left bank of the Serein, 11 miles east of Auxerre. It stands in the midst of vineyards which produce the celebrated white wine known by its name. Of the most esteemed are Clos, Bouguerots, Moutonne, Grenouille, Montmaires, Lys and Vaux-Dessirs. The annual product is about 4,400,000 gallons, but the quantity sold over the world as Chablis in Germany is in great quantity, there are manufactories of biscuits. Pop. 2,727.

**CHABOT, shá-bó, François,** French revolutionist; b. Saint-Geniez, France, 1759; d. Paris, 5 April 1794. In early life he entered the Capuchin order, which he abandoned in order to devote himself to the Revolution. The bishop of Blois nominated him his vicar-general, and succeeded in getting him chosen deputy to the national convention for the department of Loire-et-Cher. In this capacity he displayed the bitterest animosity against the King and his ministers and all deputies friendly to moderate courses, and labored incessantly to overturn the throne. His party, from occupying the higher seats of the national convention, was designated by the name of "La Montagne," which it has since retained. The conversion of the cathedral of Notre Dame into a prison in which Reason is said to have originated with Chabot. He at last became suspected by his party of bribery and falsification. When he saw that he was lost he swallowed poison and three days afterward he was guillotined.

**CHABOT, Jean-Baptiste,** French hagiographer; b. Vouvray, Indre-et-Loire. He was educated at the Seminary of Tours and at Louvain University, also at the Sorbonne School of Higher Studies. He was ordained to the priesthood in 1885 and for some time had charge of the department of missions in the Ministry of Public Instruction. He was director of 'Corpus Scriptorum Christianorum Orientalium' (Vols. I-LXXVI, 1903-14) and associate editor of 'Corpus Scriptorum Semiticum.' He was a member of the Academy of Inscriptions and Belles-Lettres, which awarded him prizes in 1897 and 1900. In 1895 he was one of the nominees for the chair of Arabic languages and literatures at the Collège de France. His published works include 'Notes d'epigraphie et d'archéologie Orientale' (1897-1901); 'Lettres ecclésiastiques du VIIIe au XIIIe siècle d'aprés la chronique de Michel le Syrien' (1901); 'Narsai le Docteur et les origines de
CHABOT—CHACO

l’Ecole de Nisibe’ (1805); ‘Eclaircissements sur la litterature syriaque’ (1806); ‘Les langues et les litteratures arameennes’ (1910); ‘Les Saints Evangiles, with Introduction and Notes’ (1911). He edited ‘De Sacti Isaici Namivine Vita, Scriptis et Doctrina’ (1892); ‘Histoire de Mar Jabalaha IIII et du moine Rabban Cauma’ (1895-96); Jesus-Yahh Adiabenus, ‘History of Jesus Sabrau’, Syriac text and introduction (1897); ‘Symodicon Orientale’ (1902); ‘Doctrina et Origines Monophyllicae sitarum illustrandarum’, etc., etc. He collaborated in ‘Orientalische Studien’ (1905); the Revue Semitique, Revue Biblique, etc.

CHABOT, Philippe de Brion, French admiral; b. about 1480; d. 1 June 1543. Having bravely defended Marseilles in 1524, he was made prisoner at Pavia in 1525. Appointed admiral immediately after his release, he was sent to Italy in 1529 to negotiate the ratification of the treaty of Cambrai by Charles V. Made commander-in-chief of the forces of Savoy in 1535, he lost the conquest of part of the country and of Piedmont, but was censured for not following up his victory. On his return to France he became involved in the intrigues of the court and charges of fraud upon the national treasury were brought against him. Found guilty and imprisoned, he was soon afterward pardoned by the King at the urgent solicitation of the Duchesse d’Etampes, and reinstated in his position. He is said to have been the first to suggest the project of colonizing Canada. His letters in manuscript are at the National Library of France in two volumes.

CHABRIAS, kâбр-last, Athenian general. In 392 he succeeded Iphicrates in the command of the Athenian forces before Corinth, was afterward sent to chastise the ‘Eginetes for their depredations on the coast of Africa, and assisted Evagoras in Cyprus, and Acoris in Egypt, against the Persians. In 378 he commanded the army which the Athenians sent to the aid of Thebes against the Lacedemonians, under Agesilaus, on which occasion he saved his troops from impending defeat by a military manoeuvre renowned in antiquity, commanding them to await the attack of the enemy with pointed spear and shield resting on one knee. In 376 he won an important victory over the Lacedemonians near the Naxian长城. The Athenians having abandoned the alliance of Thebes, he defended Corinth against Epaminondas. He took part in the expedition against Thrace at the outbreak of the so-called social war. At the siege of Chios his vessel was the first to enter the harbor, but becoming isolated and disabled was soon abandoned; he alone refused to save his life, and fell fighting, 357 B.C. He was the last of the great Athenian generals. Demostenes said that he conquered 17 cities, took 70 vessels, made 3,000 prisoners and enriched the treasury of Athens with 110 talents. One of his apothegms, for which he was celebrated, was that an army of stags led by a lion is superior to an army of lions led by a stag. His history was written by Cornelius Nepos.

CHABRIER, shâbr-e’er, Alexis Emmanuel, French composer; b. 18th March 1841; d. Paris, 13 Sept. 1894. He at first studied law, but presently turned his attention to music. He composed the operas of ‘Gwendoline’ (1886) and ‘Le Roi Malgre Lui’ (1887). Other works by him are ‘Dix Pieces Pittoresques’ and ‘Espaha,’ an orchestral rhapsody.

CHAC-MOOL, shâk-mool, according to tradition, a chief of the Maya Indians of Yucatan. In 1876 a statue was discovered in the ruins of Chichen-Itza, Yucatan, to which Le Plongeon gave the name of Chac-Mool, because he supposed it to be a representation of the chief. The statue was taken by the Mexican government and placed in the National Museum of Mexico, but the correctness of Le Plongeon’s identification is in question among archaeologists.

CHACABUCO, châ-kâ-book’o, Chile, a mountain and mountain pass, 28 miles north of Santiago, in the province of that name. It is celebrated as the scene of a decisive victory of the republicans over the royalist troops on 12 Feb. 1817.

CHACMA, châk’ma, the Hottentot name for the baboon (Cynocephalus porcarus) native to western Africa. It is grayish-black in color and has a well-marked crest of hair along the neck. It is larger than the allied species of its native region. See !BABON.

CHACO, châk’o, South America, a government or territory in the north of the Argentine Republic bordering on the Paraguay River. Its chief town is Resistencia. See CHACO, El; CHACO, EL GRAN.

CHACO, El, Argentina, a territory (‘territorial government’), bounded on the north by the territory of Formosa, on the east by Paraguay and the province of Corrientes, on the south by the province of Santa Fé and on the west by the provinces of Salta and Santiago del Estero. Its area is 62,000 square miles, and its population about 14,000. The surface is even, but sparsely watered. The southern part is slightly higher and is covered with heavy forests of trees, the wood of which is of great economic value. Its capital is Resistencia, on the right bank of the Paraná River, with a population of 3,500. The districts near the river are inhabited by civilized people, who cultivate the soil or exploit the forests, while Indians roam in the interior. The national government has discouraged emigration by selling land to settlers at the average price of 31 cents for an acre.

CHACO, El Gran, that great, low-lying, alluvial plain situated in the interior of South America and bounded on the east by the rivers Paraná and Paraguay, and on the south and west by the Argentine provinces and the republic of Bolivia. It extends roughly over 10 degrees of latitude and 5 of longitude, comprising an area of about 200,000 square miles. The word Chaco or Chacu is supposed to have signified a drive of wild animals or a hunting ground; but in this instance it was employed figuratively. The region received its name (probably long before the Spanish conquest of Peru) on account of the Inca armies invading these lands. The savage inhabitants, being no match for Inca trained troops, would naturally fly in all directions. Such was called a ‘Chaco’ drive. Politically the great Chaco is under the domination of the republics of Paraguay, Argentina and Bolivia, but with the exception of a fringe of settlements near the boundaries, the
interior is entirely in the hands of Indians, the principal tribes being the Matacos, Chiriguanas, Tobas, Lenguas, Suhin, Kisapang, Chamacocos and the Bauris. The estimated total population is 115,000, but it is impossible to speak with accuracy owing to their nomadic habits and the difficulty of obtaining anything like a census. (See the article PARAGUAY.) Consult Grubb, W. B., An Unknown People in South America (London 1911). The author of that book is recognized in South America as the greatest living authority on the Indians of the Chaco.

CHACORNAC, chá-kór-nák, Jean, French astronomer. b. Lyons, 21 June 1823; d. near there, 20 Sept. 1873. He is principally known for his discoveries of asteroids, which came into connection with his work on the formation of ecliptic charts of the stars. His asteroid discoveries were six in number, and most of his work was done at the Paris Observatory under Leverrier. He published 'Atlas écliptique' (1856), and 'Atlas des annales de l'Observatoire impérial de Paris' (1860-63).

CHAD, chád. See TCHAD.

CHADBAND, Rev. Mr., a personage in Dickens' 'Bleak House.' He is a hypocritical minister, who pretends to be humble and to despise the world, but is in reality extremely selfish and self-indulgent.

CHADBOURNE, chá'bórrn, Paul Ansel, American educator and writer. b. North Berwick, Me., 21 Oct. 1823; d. New York, 23 Feb. 1883. He was graduated from Williams College in 1848, and became professor of chemistry and physics there in 1853. He taught the same subjects at Bowdoin and the Berkshire Medical College. He was president of the Massachusetts Agricultural College at Amherst, 1867, and again in 1882; of the University of Wisconsin (1867-70); of Williams College (1872-81). He became very active in politics, served twice in the Massachusetts senate and carried on manufacturing enterprises. He wrote 'Natural Theology' (1867); 'Instinct in Animals and Men' (1872); 'Relation of the Natural Sciences to the Intelact' (1880); and edited 'Public Service of the State of New York.'

CHADD'S FORD. See BRANDYWINE CREEK.

CHADRÓN, Neb., city and county-seat of Dawes County, 350 miles north of Denver, Colo., on the Chicago and Northwestern Railroad. It has a large trade in live stock and is the seat of a State normal school. It contains a Carnegie library, several churches and schools and a public park. The waterworks are the property of the city. Pop. 2,689.

CHADWICK, Sir Edwin, English social and sanitary reformer; b. Longsight, near Manchester, 24 Jan. 1848; d. East Sheer, Surrey, 6 July 1890. England is indebted to him for its first sanitary commission, organized in 1838, and the office of registrar-general established through his persistent effort and advocacy. A lawyer by profession, he became private secretary to 'Unknown Land,' was appointed assistant commissioner on the first English Poor Law Commission in 1832, and secretary of the Poor Law Board, an office he held for 20 years. From 1848 to 1854 he was also a commissioner of the Board of Health, when he retired into private life, but kept in close touch with former interests by his numerous contributions to medical and anatomical subjects to periodical literature. He was made K.C.B. in 1889.

CHADWICK, French Ensor, American naval officer; b. Morgantown, W. Va., 29 Feb. 1844. He was graduated at the United States Naval Academy in 1864, some six months before the end of the Civil War; served later in the South Atlantic, Pacific, West Indies and on the European station; was sent abroad in 1882 as naval attaché with general orders covering Europe, though specially attached to the London legation until 1889; commanded Yorktown 1889-91; was chief intelligence officer 1892, and in same year was made chief of Bureau of Equipment in the Navy Department. Became a captain in 1897. During the war with Spain he commanded the armored cruiser New York, the flagship of the North Atlantic squadron, and was chief-of-staff to Admiral Sampson. Was promoted five numbers for "eminent and conspicuous service in battle." Was president of Naval War College 1900-03; became rear-admiral 1903; commander-in-chief, South Atlantic squadron 1904; retired 1906. Has written and spoken much on public questions; is member Newport Representative Council; of National Institute of Arts and Letters; American and National Geographical societies; corresponding member Massachusetts Historical Society; author 'Temperament, Disease and Health' (1892); 'An Unsolved Problem' (in Congressional procedure, 1896); 'Causes of the Civil War' (Vol. XIX, American National Series, 1906); 'Relations of the United States and Spain'; 'Diplomacy and War' (1909-11); 'The American Navy' (1914).

CHADWICK, George Whitefield, American composer; b. Lowell, Mass., 13 Nov. 1854. He studied under Stephen Emery and Eugene Thayer in America and under Richter, Reinecke, Rheinberger and Jading in Germany, where he went in 1877. On his return to America in 1880 he became organist of Saint John's Church and joined the staff of the New England Conservatory of Music, of which he became director in 1897. From this time his career has been one of ever increasing activity as composer, conductor, organist and teacher, and in the latter capacity he has numbered among his pupils such well-known musicians as Horatio Parker, Arthur Whiting, Wallace Goodrich, Frederick S. Converse and Henry Hadley. As a composer he is regarded by some foreign critics and by many of his countrymen as the leader of the American school. His leaning is toward the highest instrumental forms, which he handles with considerable skill. In 1897 he received the honorary degree of M.A. from Yale University and in 1905 that of LL.D. from Tufts College. His works are: for orchestra—Three symphonies in C minor, B flat and F; six overtures, 'Rip Van Winkle,' 'Thalia,' 'The Miller's Daughter,' 'Melpomene,' 'Adonais' (1899); 'By Bentharn, was famed in F; suite in A; suite sinfonique; for chorus with orchestra—'The Viking's Last Voyage' (1880); 'The Pilgrims' Hymn' (1883); 'Lovely Rosabelle' (1889); 'Phoenix Expirans' (1891);
CHADWICK — CHAFFINCH

‘The Lily Nymph’ (1892); ‘Dedication Ode’ (1883); ‘Columbian Ode’ (1892); ‘Aphrodite’; ‘Tam O’Shanter.’ His most ambitious work is a lyric drama, ‘Judith’ (1900). Two other works for the stage are ‘Ballad Opera’ (1893), and ‘The Quiet Lodging’ (1892). He has also written many compositions for piano and organ.

CHADWICK, James Read, American Physician: b. Boston, Mass., 2 Nov. 1844; d. 1905. He graduated G.A. at Harvard 1865; M.D. 1871; and pursued further studies abroad. In 1873 he began practice in Boston, and became distinguished as a gynecologist. He was a founder of the American Gynecological Society, its secretary 1876-82, and president 1897. A strong advocate of cremation, he was president of the Massachusetts Cremation Society from 1894 till his death. He contributed many articles on his specialty to the ‘Transactions’ of the American Gynecological Association, the Boston Medical and Surgical Journal, the American Journal of Obstetrics, etc.

CHADWICK, John White, American writer and Unitarian clergyman: b. Marblehead, Mass., 19 Oct. 1840; d. Brooklyn, N.Y., 11 Dec. 1904. His radical sermons attracted attention, and he was a liberal contributor to current literature. From 1864 till his death he was pastor of the Second Unitarian Church in Brooklyn, N. Y. Among his works are ‘A Book of Poems’ (1875); ‘The Bible of To-day’ (1878); ‘Origin and Destiny’ (1883); ‘A Daring Faith’ (1885); ‘The Man Jesus’ (1887); ‘Faith and New Old and New Unitarian Belief? ‘The Power of an Endless Life’; ‘The Revolution of God’; ‘Theodore Parker, Preacher and Reformer’ (1900); ‘George William Curtis’; ‘Later Poems’ (1905).

CHÆRONEA, kær-ō-ne-a, an ancient town in Boeotia, near the Cephissus, on the borders of Phocis, at the head of the last defile where a stand could be made against an invader of central Greece, famous as the scene of several celebrated battles of antiquity. An important battle was fought near it in 447 B.C. by which the Athenians lost the supremacy in Boeotia. A still more celebrated battle was fought 338 B.C., in which Philip of Macedonia defeated the united forces of the Athenians and Boeotians, and crushed the liberties of Greece. A mound of earth, about a mile from the modern village of Kapreina, which occupies the site of the old city, still marks the place where the Thebans who fell in the battle were buried; the grave was also marked by a magnificent colossal lion (quite recently restored). In a third battle, fought at Chaeronea, Sulla defeated the generals of Mithridates, 86 B.C. Plutarch was a native of this town.

CHÆTODONTIÆ. See BUTTERFLY-FISHES.

CHÆTOPODA, kē-tōp’ō-da, a class belonging to the phylum Annelida, characterized by the presence of a single row of tube-like spines (chaetae), usually four bundles to a segment. They comprise the earthworms (q.v.), the leeches, certain fresh-water and numerous marine annelids, such as Serpula arenicola, the lobworm and many other genera; the most common and one of the largest American chaetopods is the ‘clamworm’ (Nereis virens), which is associated with the clam of the New England coast, burrowing deeply in the mud. The marine forms undergo a metamorphosis, hatching as a free-swimming larva called a trochopod. Some of the forms, as Nais, Syllis, Astylocus, etc., also multiply by a process of self-division called strobilization, and by alternation of generations. Some of them, as Serpula and Spiorbis, live in solid calcareous tubes or shells. Certain forms are luminous. The tracks of chaetopod worms occur in Cambrian strata, which are so much like those made by existing forms as to show that the type has undergone little change since the Cambrian Period, which lies at the very base of the Paleozoic Age. Sometimes practically all the Annelata are known as chaetopods. See ANNULATA.

CHAFARINES, chā-fā-rē-nás, or ZAFFARINES, Spain, an archipelago of three islands, off the coast of Morocco, opposite the mouth of the Muluya River, and near the Algerian frontier, three miles north of Capedel Agha. The Zafran of the Arabs and the Roman Tres Insulae, they were annexed by Spain in 1848, forestalling by a few days a French expedition sent out for the purpose. A great land-locked harbor, sheltering the largest ships, has been created by a breakwater uniting the central island Isabella II with El Ray, the near-by islet. Del Congress, the largest of the islands, is rocky and hilly. Pop. 750.

CHAFER, the British name for a scarabeid or dung-beetle. The larger ones, called cockchafers, are very destructive to vegetation, especially in the larval state.

CHAFFEE, Adna Romanza, American soldier: b. Orwell, Ohio, 14 April 1842; d. 1 Nov. 1914. In 1861 he entered the 6th United States Cavalry; was promoted to be first lieutenant in 1865, and in the same year received the brevet of captain for gallant conduct at Dinwiddie Court House. In 1897 he was made lieutenant-colonel, and in 1898 saw service in Cuba during the Spanish-American War, distinguishing himself at El Caney, and was brevetted major-general of volunteers. In 1900 he was sent to take command of the United States forces in China, being promoted to be major-general of volunteers, and took an important part in the expedition against Peking. In 1901 he was made a major-general in the regular army and in 1902 was placed in command of the division of the Philippines. He was made commander of the Army of the East in 1903, and was chief of staff of the United States Army in 1905, and was retired 1 Feb. 1906.

CHAFFINCH, Fringilla coelebs, a brilliant-colored and well-known European finch, one of the most popular and most valuable cage-birds (q.v.). It is found in large numbers throughout the Continent and England, and is migratory in the more northern parts, remaining, however, in England and Ireland through the winter, where it is shot in great numbers for market purposes. The top of the head and nape of the neck of the male are bluish-gray, the back is chestnut and the black wings are streaked with two conspicuous white bars. It is sought not only because of its loud,
clear and pliable voice, but because of its docility and beauty. Its voice is susceptible to training, and its value greatly increases by cultivation, the wild bird having an unpleasant and shrill cry. These birds sometimes have a repertoire of as many as six tunes, the words of which they sing with almost human articulation. Their training and rearing from the nest is an important industry throughout Europe, and particularly in Germany. For a full account of the crowns of song of the chaffinch see Bechstein's 'Cage-Birds.'

CHAFIN, Eugene Wilder, American prohibitionist, temperance advocate and Presidential candidate: b. East Troy, Wis., 1 Nov. 1852. He studied law and practised at Waukesha from 1876 to 1900. He was superintendent of the Washington Home, Chicago, from 1901 to 1904. He became known as an eloquent speaker and an active organizer in the temperance and prohibition movements, and was the candidate on these questions selected for several public offices, notably for the governorship of Wisconsin in 1898, and the presidency of the United States in 1908 and 1912. He was admitted to the bar of the Supreme Court of the United States in 1908. In 1909 he settled in Arizona. His published writings include 'Voters' Handbooks' (1876); 'Lives of the Presidents' (1896); 'Lincoln, the Man of Sorrows' (1908); 'Washington as a Statesman' (1909).

CHAGOS, châ'gös, ARCHIPELAGO, a group of islands in the Indian Ocean, nearly on the same meridian as the Laccadives and Maldives, and probably a continuation of them. It extends from lat. 7° 30' to 4° 44' S. and long. 70° 50' to 72° 50' E. The largest, called Diego Garcia or Great Chagos, 100 miles south of the main group, is about 12½ miles long by 6 broad, is of a crescent shape and consists of a coral atoll covered with cocoa palms, and enclosed by a harbor four miles broad. Fish abound, and excellent green turtle may be found on the shores. The islands belong to Great Britain, and form a dependency of Mauritius. Cocosnut oil is the chief product. Fowls and poultry are raised in abundance. c. Pop. 750.

CHAGRES, châ'gras, a river of Panama rising in the Cordillera de San Blas, flowing southwest, west and northwest into the Caribbean Sea. The mouth of the old river bed is about seven miles west of Colon. The river supplies the water required to operate the locks of the Panama Canal, which follows the bed of the stream from Mindi to Gamboa. The tremendous rise of this river during freshets, as much as 32 feet in 24 hours, presented one of the most formidable engineering problems in connection with the construction of the canal. The building of the Gatun Dam, thereby forming Gatun Lake, successfully solved the problem.

CHAGRES, Panama, a seaport on the north coast of the Isthmus of Panama, at the mouth of a river of the same name. It acquired some importance at one time as the station at which steamers landed the mails for the west coast of America. The terminus of the railroad across the isthmus was, however, in 1885 fixed at Aspinwall (now Colon), about eight miles northeast and Chagres then greatly declined.

CHAILLÉ, shâ-yâ, Stanford Emerson, American physician: b. Natches, Miss., 9 July 1830; d. New Orleans 19 July 1892. He was graduated at Harvard in 1851, and received his M.D. at Tulane University in 1853, subsequently studying in Europe for three years. During 1862-63 he was medical inspector of the Confederate army in Tennessee, and later had charge of various military hospitals. He was a member of the National Board of Health, and in 1879 was president of the Havana yellow-fever commission. Since 1858 he held various professorships in Tulane University, Louisiana, and since 1886 was dean of the medical department, and professor of physiology, hygiene and pathological anatomy. He has published 'Yellow Fever in Havana and Cuba'; 'Origin and Progress of Medical Jurisprudence, 1776-1876' (1877); 'Laws of Population and Voters' (1872); 'Living, Dying, Registering and Posthumous Veneration of Louisianians, 1869, 1874, 1875'; 'Intimation of Voters in Louisiana' (1876). From 1857 to 1868 he was coeditor and proprietor of the New Orleans Medical and Surgical Journal.

CHAILLÉ-LONG, Charles, American soldier, explorer and diplomat: b. Princess Anne, Somerset Co., Md., 2 July 1842; d. Virginia Beach, Va., 24 March 1917. He was educated at Washington Academy, 1860, and was graduated from the Columbia Law School in 1880. He enlisted in the Union army in 1862; was promoted captain and mustered out in 1865; appointed lieutenant-colonel in the Egyptian army 1869; chief of staff to General Gordon 1874-77, during which time he concluded a treaty with King M'Tesa annexing Uganda to Egypt; 19 July 1874, discovered Lake Ibrahim and solved the problem of the Nile sources August 1874; was wounded at M'Rooli 17 Aug. 1874; promoted colonel and brigadier, took part in the conquest of the Niam-Niam country, and in the expedition to the east coast of Africa 1875-76, and in August 1877 returned to the United States. Returning to Egypt in 1882, he became acting consul of the United States at Alexandria from June to August 1882, after the massacre of 11 June. He was a member of the general and secretary of legation to Korea 1887-89; secretary of the Universal Postal Congress, Washington, May 1887; and chargé d'affaires (October 1897-September 1898) of the special commission to the Paris Exposition 1900. In 1910 he was awarded a gold medal by the American Geographical Society in recognition of his part in the final solution of the problem of the Nile sources. He has published 'Central Africa. Naked Truths of Naked People' (1876); 'L'Afrique Centrale' (1877); 'The Three Prophets' (1884); 'Les Sources du Nil' (1891); 'L'Egypte et ses Provinces Perdues' (1892); 'La Corée ou Chosen La Terre du Calme Matinal' (1894); and compiled, translated and edited 'Les Combattants Français de la Guerre Américaine' 1778-83'; 'My Life in Four Continents' (1912); and contributions to French and American reviews and magazines on Egyptian and African subjects.

CHAILLU, châ-yâ, Paul du. See Du CHAILLU.

CHAIN ARMOR. Called also mail armor, chain mail, or even mail. The term
coat-of-mail (taken from the French cotte de mailles) is often, by extension, used to cover the entire body (cuisse) of chain armor, hauberk, chausses, etc. The earliest body defenses started with the Eastern jazerons (jackets protected with bronze scales or plates), dating back to very early historic times. The more regular chain armor was preceded by body defenses of leather or quilted cloth having metal rings sewn or otherwise fastened to them, the better to protect against blows or cuts. Doubtless chain armor was introduced to Europe from the East, where it was in use in very early times and where it is in use, in places, to this very day. Unfortunately, pieces of chain armor dating, authoritatively, earlier than the 14th century are almost unknown. The thinness of the link necessitated by the weightiness of such armor and the very large metal surface exposed to the atmosphere caused rust to annihilate it rapidly unless steadily cared for. The Norsemen (Vikings) used chain armor, as firmament and shield the more navies men. Trajan's Column (A.D. 114) shows Roman chain armor (lorica catenata) in use similar to that of the 13th century. The hastati (spear-men of the first line soldiers of the Roman Republic) appear to have worn armless chain armor reaching to the hips, the second line men (principes) also wore chain armor, while the third line (triarii) wore a breast plate.

The use of chain armor died out after the fall of the Roman Empire, to be revived by the 11th century, commencing with the hauberk (body armor). By the 12th century the entire mail armor was in use, consisting of head-covering, body armor, leg and foot defense, all in mail. The so-called Bayeux Tapestry depicts the Norman warriors of William the Conqueror (1066) wearing a hauberk in combination with a coif of mail (head defense) over which is worn a conical nasal helmet. (See HELMETS). The hauberk (coat of mail) of the 11th century had short, roomy sleeves, and below was split front and rear to allow easier motion and permit the knight to ride astride his horse. It reached, when standing, somewhat below the knees. The tunic (a short linen shirt worn beneath the mail) appears to have been adopted by the 12th century, reaching to the feet. The tunic disappeared early in the 13th century, being displaced by the gambeson (called, also, gambes, wambais and haketon), which was quilted. This was worn sometimes by foot soldiers and knights as the sole body defense, or was worn beneath the hauberk to break the impact of blows on the chain armor. The gambeson was long enough to reach the knees and importantly shows up (in old illustrations) for a few inches beyond the shorter hauberk. The complete hauberk (or great hauberk) was the privilege of the knight. The cost of a full coat of mail in the early days of that armor was very great, as each ring had to be wrought. Wire drawing was not invented till 1306, by Rudolf of Nuremberg; which discovery reduced the expense of making mail enormously. It brought the shortened hauberk, called haubergeon, into the general possession of the men of the line. Over the hauberk was worn the surcoat (jupon), sometimes a quilted gambeson when it was gambised (quilted).

These surcoats were of rich, costly textile and soon became a background on which to depict the wearer's coat-of-arms. A shoulder-patch (or patch) of recognition, so as to be known to other combatants. The surcoat was slit, usually, to permit riding astride the horse. It was sleeveless till the second half of the 13th century, when arm coverings were added. At this period the surcoat reached nearly to the heels. Knights of the 12th century wore mail leg armor (chausses), haut de chausses covering the entire leg, or bas de chausses from the knee down. This leg armor became a kind of armored stocking reaching down over the entire foot by the end of the 13th century. But the common soldier, on account of the great cost of a full suit of mail, wore a swathed leather leg covering, and no coif of mail over the head. In the United States mail sleeves were added to the hauberk. Over the surcoat the sword was belted to the left side. Worn over the coif (or head mail) was either a bassinet or casque. (See HELMETS). The nasal helmet had disappeared by then. The nose covering helm (bassinet) followed, and, for battle, a heaume (pot-helm) placed over it became the popular method. First these heaumes, or great helmets, were flat-topped, then some were slightly rounded on top. The conical sugar loaf helm followed (1300).

The shield worn in this period was convex and kite or heater shaped and was decorated often with the owner's heraldic bearings. See SIGILS.

A species of armor called banded mail seems to have been worn occasionally as early as the end of the 12th century, to become popular by the 13th century. Doubt still surrounds its composition, but illustrations of the period show defined bands (some say leather thongs) passing at intervals over the mail. Banded mail appears in engravings as late as the 14th century.

Reinforced Mail Period (1250-1400). Called also Transition Period, because it, by stages, developed into the Plate Armor Period. Gradually the need for strengthening certain parts of mail seems to have arisen, and we find additions or reinforcements appearing.

Spilt armor appears also early in this period. It consisted of split front and rear mail covered with and attached to some fabric—as velvet, silk, etc. This was soon evolved into the brigandine, which was a corselet of textile with overlapping small metal plates fastened (usually riveted) to it. The textile was usually worn on the outside, thus exposing the rivets to view.

By the end of the 13th century a cuirbouilli (boiled leather) cuirass was worn over the hauberk. At this time came the poleyns or genouillieres, caps of metal or boiled leather, to protect the knees; also began the practice of using ailettes or diminutive shields worn at the shoulders perpendicularly. Next came the leg front plate protection termed besmbergs. Then appear disc-plates on the shoulders and elbows. A rerebrace plate on the back, the upper arm is strapped over the mail; the coude, or coutiere, plate is fastened to the elbow. The vambrace reinforced the mail protecting the front of the lower arm from elbow to wrist. A quilted upper-bracer is worn over the hauberk and over this again the surcoat.
The coif of mail had already become separate from the hauberk and then disappeared; and a camail (neck protector of chain mail) was attached by staples to the helmet (sallet) and surcoat. A strap with buckle in the rear held the camail from "riding" up. The lower edge of the hauberk usually continues for about two inches in view lower than the jupon -- the sleeveless surcoat. Gauntlets with gaudlings (knuckle points or knobs) arrive in this so-called "camail and jupon period." (See GAUNTLETS). By the 14th century we find the solieret (foot armor) the first laminated plate armor worn by the knights. See SOLENERET.

By the first half of the 15th century we have come to a time when the knight is found wearing a full harness (panoply) of plate armor with chain mail hauberk beneath and chain mail camail over neck and shoulders.

The arablest (cross-bow) was introduced in the 12th century to be used for sport as much as for war. See CROSS-BOW. See also BARD, BOWS, CUIRASS, DAGGERS, GAUNTLETS, HELMETS, MACE, SHIELDS, SPIRS, SWORDS; also JAPANESE AND ORIENTAL ARMS AND ARMOR.

CLEMENT W. COUMBE.

CHAIN-BRIDGE. See BRIDGE.

CHAIN-CABLE. See CABLE.

CHAIN-SHOT, a projectile consisting of two balls connected by a bar or chain, formerly used for cutting and destroying the spars and rigging of an enemy's ship. It was invented by Admiral De Witt in 1666, but has long been disused.

CHAIN-SNAKE, a harmless terrestrial snake ranging from the Great Lakes to Mexico. In length it is from four to five feet, the color varying with the species. In the East and South the typical form (Ophioblus guttatus) is glossy black, with a chainlike pattern of yellow lines covering its back; the belly is dirty yellow, banded with white, and the head and neck are black, spotted with yellow. A larger vari- ety, found west of the Mississippi, is "cream-colored, sharply marked with rings of black." Chain-snakes feed upon small mammals, amphibians and reptiles, including venomous serpents.

CHAINES, shén, Marius, French Oriental scholar: b. Tarascon-sur-Rhône, 10 Aug. 1873. He was educated at the Sorbonne School of Higher Studies and at the School of the Louvre, Paris. In 1897 he was ordained to the priesthood and entered the Society of Jesus. He was successively professor of Oriental languages at Saint Joseph's University, Beirut, Syria, the Gregorian University, Rome, and the Pontifical Biblical Institute, Rome. He has written 'L'Egypte et le Sudan' (1902); 'Grammaire éthiopienne' (1907); 'Compendium Morphologie Coptae' (1910); 'Inventaire sommaire des manuscrits éthiopiens de Berlin acquis depuis 1878' (1912); 'Catalogue des manuscrits éthiopiens provenant de la collection Antoine d'Abbadie' (1912); 'Catalogue des manuscrits éthiopiens de la bibliothèque d'Académie Mond- don-Vidalüh' (1913); 'Etude sur le texte original des Apophthegmes des Pères d'après le texte grec et le texte copte' (1912); 'Rituel éthiopien' (1913). He contributed articles on Coptic and Ethiopian history and philology to L'Orient chretien, la Revue Sémique, Bes- sarion; the Arab review, Al Machriq of Beirut, 'Nuovo Bolletino di archeologia cristiana' of Rome, and to Recherches de science re- ligieuse of Paris.

CHAINS AND CHAIN MAKING. A chain consists of a series of links similar which either are fixed to one another so that they form a continuous flexible metal line. The chain is one of the most familiar as well as one of the most useful of mechanical devices. Its origin is undoubtedly very ancient; remnants of excellent Roman chains may be found in the museums of the world. The uses of chain are many. The
three principal uses are for the hoisting of materials, for the transmission of power and for the conveying of materials. Chains are also used as fire hose reels, as restraints, as elevator counterweights, for preventing the slipping of motor car wheel and in many other ways too numerous to mention.

All chains may be divided into two general classes, namely, those called from the fundamental forms of the links. Coil chains consist of series of links, generally oval in shape, which interlock by passing through one another. Block chains consist, fundamentally, of flat bars which are joined together by cylindrical pins so that the bars are free to articulate about the pins. Coil chains are sometimes loosely called crane chains from the fact that they are generally used in connection with cranes. Block chains are sometimes called link chains, pitch chains and sprocket chains. Coil chains may be subdivided into open link chains, studded link chains, twisted link chains, safety chains, ladder chains and jack chains, while block chains may be subdivided into simple block chains, silent chains, detachable chains and pinle chains. Open link chains are composed of series of interlocking oval links. The links of such chains are generally made from round bars, the size of the chain being taken as the diameter of the bar from which the links are made. The most common example of an open link chain is the ordinary crane hoisting chain. The links of studded link chains are similar to those of open link chain, being provided, in addition, with studs or braces across the center of the links. These studs strengthen the links, enabling such chains to safely carry loads 20 to 25 per cent in excess of those which may be safely carried by open link chains of the same dimensions. Twisted link chains are made up of links similar to those of open link chains but which have been twisted through an angle of 90 degrees. Safety, ladder and jack chains are of minor importance. The first is made up of small flat links which are stamped from sheet metal; the latter two consist of twisted interlocking wire links. Simple block chains consist of single series of flat bars, each having round holes near its ends, which are joined together by means of pins, rivets or bolts which pass through these holes. Ordinary bicycle chain is, perhaps, the most common example of such a chain. Multiple block chains, or leaf chains, consist of series of flat bars, similar to those which compose simple block chains, which are placed side by side upon the same pins. A chain of this type has the general appearance of a number of bicycle chains joined side by side. Silent chains are of the multiple block type, being made up of series of flat bars which have profiles on one side much like gear teeth in appearance. Chains of this type operate over sprocket wheels which look very much like spur gears. Roller chains are essentially block chains in which the flat bars have been separated to allow of the introduction of a roller between them. Detachable chains are composed of rectangular or oval interlock by sliding over one another. This interlocking of the links by sliding over one another eliminates the necessity of using pins for joining the links. Pinte chains are made up of U-shaped links which have barrels at one end and which are joined by means of pins in the form of either rivets or bolts. Chains are generally made of wrought iron, steel or malleable iron. Wherever it may be subject to excessive corrosion, brass, bronze or some other corrosion-resisting material is used. Chains as ornaments are generally made of brass, bronze and the precious metals. Chains used as suspension chains and for hoisting are almost exclusively made of wrought iron, for the ductility and toughness of wrought iron, together with its excellent welding properties, make its use desirable despite its comparatively low tensile strength. The iron used is a specially rolled grade, of high tensile strength and great ductility, the object being to secure a chain which, on the application of a sudden stress—as, for instance, when a ship is riding at anchor in a heavy seaway—will stretch and so resist the strain gradually, instead of snapping, as would be liable to happen with material of higher tensile strength but small ductility or power of elongation. The small sizes of coil chain are sometimes made of steel but, in general, all chains are made of iron; those made of wrought iron. Simple block chains, multiple block chains and silent chains are usually made of mild steel provided, generally, with hardened steel bushings and pins. One or two types of silent chains are equipped with rocker joints which obviate the necessity of using bushings. Roller chains are made of steel and of malleable iron. Roller chains made of steel are similar in construction to block chains. Those made of malleable iron are generally provided with cast iron rollers. Detachable and pinle chains are made, almost exclusively, of malleable iron because of the peculiar form of the links which makes it economical to cast them, although of late many of the smaller sizes of detachable chain have been made from steel on automatic punching presses. The links of pinle chains are sometimes provided with case hardened renewable bushings. The pins for joining the links of pinle chains are usually steel.

Coil chains of open, studded or twisted link type are usually hand-made. Many of the smaller sizes—up to $\frac{3}{8}$-inch—are made on automatic machines, while chains above two inches are made with the aid of power presses and steam hammers. Whether by hand or by automatic machinery or with the aid of power presses and steam hammers, the same operations are involved. The bar from which the links are to be made is first cut up into pieces long enough to make single links; the ends of each of these pieces are next scarfed and bent so that when the link is formed the scarfed ends will come together; the scarfed piece is next formed into the shape of the finished link; the formed link is then drawn through the last link of the finished chain and its ends are welded. When making studded or twisted link chain, the additional operation of placing the stud or twisting the link is necessary. These operations are generally performed after the link has been welded. The weld is usually located at the end of the link.

In the smaller sizes the whole operation of chain-making by hand is done by a single smith without any helper. The length of completed chain is hung upon a hook or some convenient support near the anvil, and the operation of
forging the link proceeds as follows: In his fire the smith will have two or three short rods of the desired length for one link, gives it a couple of blows to form the welding scarf, bends it through, say, about 130 degrees, hooks it into the end of the completed chain, and brings the ends together for welding. He then raises the links in his fire, places the abutting ends over what is known as the bick-iron, gives it a few taps to ensure a good weld, brings over a "dolly" (which is hinged at the outer end of his anvil and when brought over registers above the bick-iron), and with half a dozen blows on the dolly, accompanied with a dexterous movement of the link, the weld is completed and the link smoothed up to a neat finish. The rapidity with which the smiths do this work is very remarkable. Thus, in the case of a 7/16-inch chain, with 30 links to the yard, an expert smith will cut off from the iron bar, scarf, bend up into shape, and weld the links, at the rate of 18 yards in a day of nine working hours, which is two yards per hour, or one link per minute. The only thing that is done in this way is the forging heavy chain; two helpers are used, the iron is cut to about one-foot lengths, and several of these are being heated in the fire at the same time. The operation is as follows: The various steps succeeding each other with great rapidity: First, the helper to the right of the anvil draws the heated piece, drops one end into an eye at the end of the anvil, and bearing down upon the anvil, bends the piece over to an angle of about 45 degrees. The smith then takes it in his tongs, and with a few taps of the anvil it is bent. It is heated again, passed through the end of the chain by the smith, laid flat on the anvil and the welding scarfs are put in with a few blows of the sledge. The link is now raised to a welding heat, welded by a few blows by the helper, left over the bick-iron, the hinged dolly is brought over, and a few rapid blows on the dolly, while the smith turns the link to and fro, serve to bring the weld up to a smooth finish. The link is now laid on edge; a single blow from the sledge brings it into shape, and with another blow or two of the smith's hammer the link is finished. At the forge as many as 35 links will be added to a 1/4-inch chain in one hour, or about one every two minutes.

One type of machine making coil chain winds the bar from which the chain is made upon a mandrel in the form of a spiral much similar to a spring. Each loop of the spiral is then cut apart at an angle of 60 degrees so as to form a scarf, and is welded in a set of dies under a drop hammer operated by a workman. Another type of machinery automatically performs all of the operations, including the welding, taking in a plain round bar and turning out a finished, assembly chain. Weldless chains up to one inch have recently been made with some success by passing a red hot cruciform bar through a series of machines. The first operation consists of welding pieces to the bar, the second operation cuts away the web which joins the links, and the third breaks the links apart and finishes the chain. Coil chain larger than 2-inch can be made entirely by hand only at a tremendous expense of severe labor and time and it is virtually impracticable to attempt to make such chains without the use of power presses for forming the links and steam hammers for welding them. Chains smaller than 2-inch which are made by hand are generally superior to those made by machinery, while beyond 2-inch machine-made chains, after proper annealing, are of both stronger and more uniform.

Ladder, jack and similar types of welded chains are made by machines which automatically cut off the wire, form the links, interlock them and twist or bend the ends of the links together. Chains of this type can only be made in small sizes and can be used for only unimportant work such as for horse haulers, fences, dog chains and the transmission of hand power. Chains made of precious metal are generally made by machinery in a manner analogous to that used in making iron or chain. The links with the exception that the links are either left open or are closed by brazing instead of welding. Very often the links of such chains are stamped and brazed by hand. The operations involved in the manufacture of block chains are few and simple in which simple and multiple block chains, silent chains and steel roller chains are made are stamped from metal bars of the required width and thickness, the holes for the pins being generally punched while the links are being stamped. In the case of extremely accurate chains, the holes are drilled and the links are finished and polished. The pins of chains of this type are either drop forged, cold rolled or machine turned. The rollers of roller chains intended for light duty are made of pipe or tubing cut to proper length. For severe duty it is necessary to use rollers which are made by boring out solid shafting. Chains of these types are assembled by hand, usually with the assistance of a small power hammer for forming the rivet heads. The links of malleable iron detachable and pintle chains are cast and annealed in the usual manner. After annealing, the links are thoroughly cleaned by tumbling and are then assembled to form the finished chain. Some of the smaller sizes of detachable iron chain are assembled by hand while the larger sizes being assembled by hand. All pintle chains are hand assembled with the aid, when the chain pins are riveted, of small power hammers for upsetting the heads of the rivets. All chains which are to be used for important work are tested after manufacture in order to eliminate the defective links. This is done by subjecting them to test loads well above those under which they are to work and cutting out all links which exhibit defects. Chains which operate over sprocket wheels are also tested for accuracy of pitch and are well oiled and well limbered up before being shipped.

Chains used to hoist materials are generally of the coil type—open link chains being most commonly used. In unusual cases and under peculiar conditions block chains have been used for this work, one notable though disastrous instance being the failure of the link 1 1/2 in. above the centre span of the Quebec bridge. Chains used for ship's cables are of either the open link or the stubbed link type. Chains for this duty have been made from bars as large as four inches in diameter. Chains for
the transmission of power are generally of the simple block, multiple block, roller, silent or pinile types. For low speeds, simple and multiple block and pinile chains are most satisfactory; for medium speeds, roller chains are used; for high speeds, silent chains are usually employed. Small sized coil chains are frequently used for the transmission of hand power or for conveying small materials. The links are generally of the simple block, roller, detachable or pinile type, although long pitch, open link coil chains were formerly quite extensively and are now sometimes used for this work. Chains which convey materials are generally equipped with attachments which serve to carry buckets, flights, aprons, etc., which actually do the conveying. Block chains for the conveying of materials are made with pins up to three inches diameter and in pitches up to three feet.

Surveyor’s chains are open link chains of peculiar construction. The links are relatively long and the ends, instead of being welded, are joined by means of small circular links. A chain consists of 100 links which aggregate 100 feet in the United States and 66 feet in England.

Although each coil link chain consists of two thicknesses of bar, it must not be presumed that a chain possesses double the strength of a single bar; actually there is a reduction of three-tenths of the strength, due to the formation into links, so that the chain has but about seven-tenths of the united strength of two bars of the same diameter of iron. Moreover, as the strength per square inch of a heavy bar is not so great as that of a smaller diameter iron, there is further reduction to be made on this account.

The chain industry is not confined to any one particular country or any one locality. The complete absence of statistics makes it impossible to even approximate its extent.

Technical data on chains may be found in various standard works on machine design and in the following works: ‘Machinery’s Handbook’ (ib. 1914); Kent, ‘Mechanical Engineers’ Pocket Book’ (ib. 1916); Marks, ‘Mechanical Engineers’ Hand Book’ (ib. 1916); Year Book of the American Society for Testing Materials (New York).

CHAIR, an article of domestic furniture—a movable seat having four legs, a back and sometimes arms; usually for the accommodation of one person. Chairs were much less common, both with the ancients and in the Middle Ages, than they are in modern times; hence the reason why chair and cathedra have retained their appanage of state and dignity. We still speak of the chair of justice, and the chairman of a meeting, and cathedra is now most widely known by its derivative cathedral, the name still given to a metropolitan church.

It was not until the 16th century that chairs became at all common. Our knowledge of chair design is derived from monuments, sculpture and paintings, and a few examples in the museums. Ancient Egypt developed a splendid type of ebony and ivory, or of carved and gilded wood, covered with costly stuffs, with figures of animals or human figures as supports. A chair much of the same type comes from Nineveh. Greek chairs stood up straight; and from the frieze of Parthenon we get the chair of Zeus, a square seat, with a bar back and thick turned legs, ornamented with sphinxes’ heads and the claws of beasts. Characteristic Roman chairs were of the same type. The curule chair was like our folding chair, but eventually received a great deal of ornament.

The most famous of all chairs is that of Saint Peter at Rome, which is exhibited only once in a century. It appears to be Byzantine work of the 6th century. It is of wood overlaid with carved ivory, representing the labors of Hercules. Another renowned seat is the ‘Chair of Dagobert’ in the Louvre. It is of cast bronze, partially gilt, supported on legs terminating in the heads and feet of animals.

For a long time the chair remained the symbol of honor and power. It appeared in all the houses of the royalty and nobility. This chair soon acquired a high back and arm rests, and the lower part was usually filled in, with a panelled or elaborately carved front. The seat was hinged and sometimes closed with a key.

In the Renaissance, chairs became common and less architectural, and from this time on varied with the styles of dress and sizes of houses. They gradually became lighter, and took on a more strictly utilitarian character, becoming smaller and more numerous. After the middle of the 17th century, upholstery began to take the place of the leather seat. The heavy chair of the Tudor period gave way to the slender more elegant form improved by Chippendale and later by Adam. In France, the chair of the Louis XVI period had an oval back, ample seat, descending arms and round legs. Its seat was covered in tapestry. The Empire brought in low, squat, unattractive but very comfortable chairs.

Some well-known varieties of the present day chair are the BATH CHAIR, an invalid’s chair on wheels, to be pushed along by an attendant, so called from its common use in Bath, England; the FOLDING CHAIR, having seat, legs and back hinged and jointed so that it can be folded up when not in use; the EXISTING CHAIR, a seat mounted on rockers; MORRIS CHAIR, a cushioned seat with a hinged cushioned back which can be inclined at various angles. See SEDAN CHAIR.

CHAIR OF SAINT PETER, The, a relic at Rome of which the first known mention was made by Eunomius in 500, and a feast in honor of which was instituted or restored by Paul IV in 1558. It was exposed for public veneration by Fius IX in 1807. It is of wood overlaid with ivory and gold. The name is also used to denote the See of Rome or the office of the papacy, from the tradition that Saint Peter was the first bishop of Rome.

CHAISE, sház, (1) a two-wheeled carriage for two persons, with a calash top, and usually drawn by one horse. (2) A French gold coin issued by Louis IX in the 13th century. It was equal to about three gold dollars in the United States. It took its name from the representation of the seated king on the face of the coin. Chaisses were also coined in England in the reign of Edward III.

CHALCEDON, kál-se’dón, a city of ancient Bithynia, opposite Byzantium, at the entrance of the Euxine, about two miles south of
the present site of Scutari. Chalcidon is said to have been founded before Byzantium, about 677 B.C. by a colony from Megara. It flourished in trade and finally joined the Athenian League when the Greek cities freed themselves from Persian rule. The Spartans won it during the Peloponnesian War. It was a flourishing town when it came into possession of the Romans, under the testament of Nicomedes 74 B.C., as included in the treaty of the line of the Strymon. In the war against Mithridates the Romans had fled to Chalcidon to escape Mithridates, who followed them, destroyed the protection of the port, burned four ships and captured the remainder. It was captured by Chosroes II of Persia in 616 A.D. after which it was finally destroyed by the Turks, by whom it was taken about 1075.

At Chalcidon in 451, Marcian, the Emperor of the East, held the fourth general council for the purpose of destroying the ascendancy of the Monophysite doctrines obtained in 449 by the influence of the Alexandrian patriarch Dioscorus at the (so-called) robber-synod at Ephe- sus; and define the Christian faith so as to gain the adherence of the Nestorian and Monophysite heresies. The council opened on 8 Nov. 451 under the guidance of Paschasinus, the bishop deputed by Leo I. About 600 bishops, mostly from the East, were present. It deposed Dioscorus, and after violent debates the articles of faith settled by them declared, in opposition to the Monophysites, the belief of two natures in Christ, existing without mixture or change, without division or separation, so that by the union of the two natures in one person and substance their distinction is not destroyed, but the characteristics of each are retained. Besides this creed the council promulgated 30 canons against clerical abuses, of which canons the 28th conceded to the See of Constantinople second rights and privileges to the Roman, but Pope Leo I refused to confirm it. Rebellions in Palestine and Egypt were the immediate consequences of the decrees of the council of Chalcidon against Dioscorus and the Monophysites; and not till after a long period of ecclesiastical contests did the Chalcidon formula of faith obtain the undisputed authority which it now has in the Catholic, Greek and many Protestant churches.

CHALCEDONY (from Chalcodon, an ancient Greek town in Asia Minor), a cryptocrystalline variety of quartz, transparent or translucent, with a waxy lustre, and white, gray, blue, brown or black in color, but commonly of a tint suggestive of diluted milk, marked with veins, circles or spots. It occurs in masses, also very frequently in mammillary, botryoidal and stalactitic forms. It is used for ornament and is often called "white agate." There are several varieties, as common chalcedony, chry- soprase, sard and sardonyx.

CHALCEDONY, the name applied to those agates, in which opaque white chalcedony alternates with the translucent gray variety.

CHALCIS, kal'tis, Greece, town and capital of the island of Negropont or Euboae, at the junction of the Talanta and Eripos channels. The latter is narrowed to 85 feet at Chalcis by a rock, surmounted by a castle, partly of Venetian origin and partly Turkish. A stone bridge crosses here. The main channel, 120 feet wide, was once crossed by a drawbridge, which has been removed in clearing and widening the channel for larger vessels. The modern town is notable for its monasteries. Ancient Chalcis was one of the greatest of the Ionic cities, carried on a large trade and planted numerous colonies. It had also colonies on the coast of Macedonia and Italy, in Sicily and in the islands of the Aegaean Sea. The Chalcians joined the Boeoitians in a war with Athens, in which they were defeated 500 B.C. After the Persian wars Chalcis became tributary to Athens. The Chalcians revolted 445 B.C., along with the Eubeans, but were defeated by Persians; the power occurred 411 B.C., and Chalcis for a short time became independent. A bridge was at this time built across the Euripus, and fortified, a passage sufficient for a single ship being left in the middle. It was subsequently occupied by the Macedonians, and fell under the yoke of the Romans. It became a place of great military importance, was nearly nine miles in circumference, and contained several temples, theatres and public buildings. Chalcis was the birthplace of the orator Lysicles and the poet Lycophron and Aristotle died there. Chalcis joined the Achaean in their last war with Rome, when the city was taken and destroyed by Mummius. It was afterward rebuilt, and about the beginning of the Christian era was the chief city of Eubea. It was held by the Venetians from 1210 to 1470, when it was taken by the Turks. Pop. about 10,000.

CHALCIS, kal'tis, FLIES, a family (Chalci- didae) of parasitic Hymenoptera, allied to the ichneumon flies, and with similar habits. The fore wings are nearly veined; the posterior wings are small and many-keeled. The eggs are laid on the margins of the prothorax not reaching the tegule; while the ovipositor issues from before the end of the abdomen. The chalcids are generally minute, a few almost microscopic, most of them black, with metallic lustre. The goodly proportion of them are secondary parasites, that is, are parasitic on other chalcids; some deposit their eggs in galls. Typical genera are Pteromalus (P. puparium), Semiotellus and Chalcis. Isosoma hordei is the wheat joint-worm, which is not carnivorous or parasitic in other insects. Our largest chalcid is Leucopis affinis. Aside from the immense benefit these chalcid flies confer on agriculture by destroying noxious caterpillars, etc., the fig insect (Blastosiphon flyssorum) is the agent in enhancing the value and flavor of figs. See Capsriciation.

CHALCOCITE, kal'tk-sit (zalk'tis, "copper"), a native sulphide of copper having the formula CuS. It crystallizes in the orthorhombic system, and also occurs in massive and granular forms. It has a specific gravity of about 5 to 3, and a specific gravity of from 3.5 to 5. It is opaque and leaden in color, with a metallic lustre. It is used in the United States it occurs in crystals at Bristol, Conn., massive as the principal copper ore at Butte, Mont., and similarly in many copper mines of the world. A similar species of Chalcopyrite crosses here. A main channel, 120 feet wide, was once crossed by a drawbridge, which has been removed in clearing and widening the channel for larger vessels. The modern town is now one of the most attractive in Greece, and consists of an inner walled town and an outer or suburban portion, the walls being the work of the Venetians. In the inner town the streets are narrow and the houses lofty. Several of the churches were formerly mosques of "Ainun. Ancient Chalcis was one of the greatest of the Ionic cities, carried on a large trade and planted numerous colonies. It had also colonies on the coast of Macedonia and Italy, in Sicily and in the islands of the Aegaean Sea. The Chalcians joined the Boeoitians in a war with Athens, in which they were defeated 500 B.C. After the Persian wars Chalcis became tributary to Athens. The Chalcians revolted 445 B.C., along with the Eubeans, but were defeated by Persians; the power occurred 411 B.C., and Chalcis for a short time became independent. A bridge was at this time built across the Euripus, and fortified, a passage sufficient for a single ship being left in the middle. It was subsequently occupied by the Macedonians, and fell under the yoke of the Romans. It became a place of great military importance, was nearly nine miles in circumference, and contained several temples, theatres and public buildings. Chalcis was the birthplace of the orator Lysicles and the poet Lycophron and Aristotle died there. Chalcis joined the Achaean in their last war with Rome, when the city was taken and destroyed by Mummius. It was afterward rebuilt, and about the beginning of the Christian era was the chief city of Eubea. It was held by the Venetians from 1210 to 1470, when it was taken by the Turks. Pop. about 10,000.
Chalandys, a city in the Chaldean MS., The, a skit at the expense of the publisher Constable, and of the Edinburgh notables specially interested in the Whig *Edinburgh Review*; prepared by the editors for the seventh number of the new Tory *Blackwood's Magazine*, October 1817. In form it was a biblical narrative in four chapters, attacking Constable, and was perpetrated by James Hogg, the "Ettrick Shepherd." The original paper was greatly enlarged and modified by Wilson ("Christopher North") and Lockhart.

Chaldee, kāl'dē, Language, a form or dialect of the Babylonian and also of the Aramean, one of the three principal varieties of the ancient Semitic. The region called in Scripture Aram may be described generally as occupying the northern and northeastern divisions of that corner of Asia which was the home of the Semites who lived in Western Asia, bounded on the north by the Taurus Range and the river Tigris, which latter also formed its eastern boundary; on the west by the Mediterranean and Mount Lebanon; and on the south by Palestine and the Arabian desert. The Aramaean language was very extensively known not only within the limits above mentioned, but beyond them. The princes of Judea and Assyria were familiar with it; it was spoken in the palace of Nebuchadnezzar, and even formed the medium of communication between the Persian court and its subjects in Judea and Samaria. It may also lay claim to a high antiquity, being probably the language of Abraham previous to his migration into Palestine, and certainly of his grand-nephew Laban. Unfortunately the older monuments of the language have perished, the Chaldean portions of Daniel and Ezra being the earliest specimens we possess of a language which had probably existed and flourished at least 2000 years before. There is another dialect of the Aramaeans besides the Chaldee, namely, the Syriac, and in this as well as in the Chaldee numerous writings are still extant, but they are all of comparatively recent date. The Chaldee literature is usually arranged in two divisions: the biblical Chaldee, or those portions of the Old Testament which are written in Chaldee, namely, Daniel from ii, 4 to vii, 28; Ezra iv, 8 to vi, 18 and vii, 12–26; and Jeremiah x, 11; and the Chaldee of the Targums and other later Jewish writings. The former is distinguished by a closer approach to the Hebrew idiom, and is therefore considered less pure than the Chaldee of the Targum of Onkelos, the oldest and most valuable of the Targums. Consult Brinton, "Protohistoric Ethnography of Western Asia" (Philadelphia 1895); Delattre, "Les Chaldéens" in "Revue des questions historiques" (Paris 1896); Meyer, Edward, "Geschichte des Altertums" (3d ed., Leipzig 1913); Winckler, "Untersuchungen zur altorientalischen Geschichte" (Leipzig 1889).

Chaldean, kāl'dē'ān, Christians, a branch of the Nestorians, in communion with the Roman Catholic Church. The patriarch is directly subject to the Propaganda, is an archbishop, and the priests, who are very poor, number 108. In all essentials of doctrine and morals the Chaldean Christians are in perfect conformity to the Catholic Church, but the clergy are permitted to marry before taking the higher orders, and not a few customs and rites of the Nestorians are found among them. About 40 monks in the monastery of Mar Jurgis follow the rule of Saint Anthony. In 1826 the Chaldean Christians numbered 120,000, but in consequence of wars, famines and Kurdish cruelty, the present population is about 40,000.

Chaldean Bay, sah-lēr, or BAY OF CHALBEURS, an inlet or arm of the sea in the
Gulf of Saint Lawrence, between Quebec and New Brunswick. It is about 85 miles in length from east to west and has a maximum width of over 20 miles. Its depth is 250 feet. The French fleet was here defeated by the British in 1760. There are a number of islands in this bay, notably Shippegan, near its mouth. The navigation is good and the mackerel fishery is important.

CHALICE. The ecclesiastical cup in which the consecrated wine is administered at the ceremony of sacrament. The early Christians used plain glass chalices at first, then they became decorated with gold leaf. Wood is said by some to have been the very first material used. With the advance from severe poverty the Church made the vessel in successive stages from horn, then ivory, and, with wealth at disposal, the precious metals were utilized; bone chalices were used in Germany, which material was forbidden in 767. Chalices were classified by the clergy as ministeriales (used for distributing the wine), offertorii (used by the deacons for offering the wine to the faithful), magiores and minores (according to their respective sizes). The first of these usually had handles (calices ansati), as they were very large and heavy. The ecclesiastical chalice is made up of three parts: the cup or bowl; the stem with its middle swelled into a bulb or other kind of protuberance (termed a knob) to hinder its slipping when held; and the foot. In very early times the paten was considered as an integral part in the term chalice.

The first form of chalice would appear to have been the Grecian cantharus shape, if we notice the altar depictions of the 6th to 9th century. Next appeared the effigy form of the present day, but much larger. An example of the great size some of these ancient altarpieces attained is shown in the statement that Charlemagne (742-814) presented Saint Peter's at Rome with a pure gold chalice weighing 53 pounds. They became smaller after the 12th century, losing their handles and the bowl becoming conical or semi-ovoid. The distribution of the wine from the large chalices was made through the medium of a small pipe (fistula or calamus) of gold, silver or ivory, and which was furnished with one or several handles. Examples of these are still extant. Chalices may also be divided into the following classes: Pontifical handsome chalices for use on festive occasions; those used at common mass; traveling chalices for visiting distant places—usually small and frequently in parts that could be separated and packed in a small compass; funeral chalices, generally of lead or other common metal for burial with bishops. Cripps (noted authority) divides chalices into their respective periods thus: (1) Norman type (circa 1170-1350), with circular feet. (2) Gothic type (circa 1350-1510), with hexagonal feet; bowls conical at first, then less so. From 1490-1510, feet with toes. (3) Tudor type (circa 1510-36), with six-lobed and flowing feet; bowls often less conical. From 1525 to 1536, bowls nearly hemispherical; feet with flowing outline.

Octavius Morgan tells us the feet were made out of the round (usually hexagonal) to prevent the chalice from rolling when laid upon its side to drain. Fine enamel and chased work usually appear on the knob, stem and foot, frequently representing emblems of the Passion or other sacred subjects. The bowl is, generally, quite plain and highly polished, so as to be easily kept clean. A cross also appeared on one side, which the officiating priest kept facing him. A fair impression of the prevailing chalice forms in the different periods (including the heavy post-Reformation vessels) can be gained from the accompanying outlines.

CHALICOTHERIUM, a mammal of the extinct, encolopod family, Chalicothereidae, fossil in various parts of the northern hemisphere from the Eocene Epoch onward; the type disappeared toward the close of the Miocene Epoch in America and in Europe, but persisted in southern Asia; at least, into Pliocene. Among the better known genera are Permatherium, Moropus, Macrotherium, Chalicothereum and Ancylotherium. They were small, deer-like, forest-dwelling animals, perhaps resembling ponies in form, and with teeth of a hooved

animal but long-burrowing claws like those of a rodent. Scott ("Land Mammals in the Western Hemisphere," New York 1913) says: "Moropus, the little shrew of South America, was as grotesque a creature as could well be imagined. . . . With rather a small and somewhat horse-like head, long neck, long fore limbs and shorter hind limbs, three-toed feet, which were armed with enormous claws. The problem of their habits and mode of life is still unsolved, but it is inferred that they fed chiefly on leaves.

CHALIER, Joseph, French revolutionist: b. Lyons 1747; d. there 1793. Educated for the Church; instead, he engaged in business, and as traveler for a Lyons firm visited Spain, Portugal and Italy. At the outbreak of the French Revolution in 1789, he was in Paris and associated with Robespierre, Marat and Desmoulins. Returning to Lyons he became the first member of the municipal bureau, and led in the civic reorganization that ensued, his administration being approved when assailed in the Legislative Assembly. Defeated by a royalist in an election for the town council in 1793. He was a leader of the local Jacobins, and in 1793 precipitated a conflict which ended in his arrest and his execution, notwithstanding stay proceedings of the Convention, his memory as "a martyr of liberty" surviving. Consult Wall, N., 'Les Premières Années de la Révolution à Lyon' (Paris 1894).

CHALK. In geology chalk is a soft, friable, finely granular variety of limestone or carbonate of lime, and may in color range from pure white to grayish or buff. It is a marine deposit, composed principally of the shells of foraminifera. In the United States are some great beds of chalk of Upper Cretaceous Age. One is exposed for 250 miles from Austin to Sherman, Tex., and is nowhere much less than 600 feet thick. Chalk beds of the same age, Colorado stage, are found in Arkansas, Kansas and in Montana, while the great chalk belt of Texas extends southwest from Austin into Mexico, being found in the states of Chihuahua, Coahuila and New Mexico. In Arkansas and Texas this chalk formation and its associated chalky marls is being developed as furnishing excellent material for making Portland cement. No statistics of the amount thus used at present are available. In England the Upper Cretaceous series is marked by great beds of chalk and chalky limestones, and includes the Cenomanian, Turonian, Senonian stages. Such strata extend across England from Flamborough Head on the east coast to west of Dover on the south coast. The chalk-mining industry of England is of importance, the total amount of chalk produced being about 4,500,000 tons annually. Part was used for cement-making and part for making refined chalk. When freed from grit by washing, it is called whiting, and is used for cleaning silver and making putty. When mixed with some binding substance it is used as a marking material. It is also used in farming to lower the Moeseen genus (of North America) of iron, containing much clay. To this fact it owes its firm, compact texture. It has an ochre-red color and is used chiefly by carpenters for marking marks and by printers for marking on cloth; the inner, by painters. It occurs in thin beds in clay-slate and gray wacke-slate in parts of Germany.

CHALKLEY, châk'le, Thomas, American Quaker itinerant preacher: b. London, 3 March 1675; d. Tortola, West Indies, 4 Sept. 1741. He spent his life preaching in New England and the Southern colonies; toward its end he made his home near Philadelphia. His chief work was his 'Life, Labors and Travels,' whose quaintness made it popular even outside the Society of Friends, and has caused it to be several times reprinted.

CHALLEMEL-LACOUR, shâl-mêl-lä-kor, Paul Armand, French statesman: b. Avanches, 19 May 1827; d. Paris, 26 Oct. 1896. He was graduated at the Ecole Normale in 1849, became a professor in the schools of Pan and Limoges, and soon fell under the ban of political proscription—became a leader of the local Jacobins, and in 1793 precipitated a conflict which ended in his arrest and his execution, notwithstanding stay proceedings of the Convention, his memory as "a martyr of liberty" surviving. Consult Wall, N., 'Les Premières Années de la Révolution à Lyon' (Paris 1894).

CHALLENGE, originally, an accusation, charge or claim. A challenge to jurors is an objection either to the whole panel or array, that is, the whole body of jurors returned, or to the polls, that is, to the jurors individually; and it is either peremptory, that is, without assigning any reason, or for cause assigned. A peremptory challenge is allowed to be made only by the party accused, and not by the government or prosecuting officer, and only in capital cases; and is said to be permitted on the ground that a man is liable to conceive a prejudice against another from his mere looks and appearance, for which he can give no reason: and such may be the case of the accused; and it is conceded, in favor of life, that in such case he may exclude the juror without assigning any reason; and also on the ground that, by questioning a juror as to any objection to him, his prejudice may be excited thereby against the prisoner, who, to save himself from the effect of such prejudice, is permitted to have him rejected. The ground on which peremptory challenge is allowed supposes the prisoner's life to be in danger, and he is not entitled to it if he pleads in bar or abatement, for the trial of these pleas does not decide on his life. He must, before making such challenge, plead "not guilty," or some plea the trial of which decides on his life. Having pleaded such a plea, the accused might, by the common law, peremptorily challenge 35 jurors at 22 Hen. VIII c. 14 limited the number to 20 in felony. The regulating statute now in force in Great Britain is 6 Geo. IV c. 1. By the law of the United States a peremptory challenge of 35 jurors is allowed in trials for trea-
son, and 20 in those cases of felony mentioned in the statute. A challenge of the whole panel may be made because the jury is illegally drawn, and the validity of a jury thus challenged rests upon the question of suitability, age, etc., or is near of kin to one of the parties, has been guilty of felony, is interested, or is subject to any other exception, according to the common principles of proceeding or the provisions of any statute on the subject. In courts-martial a prisoner who objects to either of the judges must assign his reasons. In other words peremptory challenges are not allowed in these courts. The privilege of challenging here belongs equally to the prisoner and the prosecutor. The right of challenging the member of a court-martial prevails on the continent of Europe, as well as in England and America.

A challenge to a duel is punishable in England with fine and imprisonment. The tendency of modern statutes in the United States is to subject all persons connected with a challenge to serve criminal punishment, and to declare their ineligibility to any public office, either for life or for a limited term. See Duiz.

CHALLENGER EXPEDITION, an expedition conducted in 1872–76, under the auspices of the British government, for the purpose of exploring the open ocean. The Challenger was fitted with everything that could be carried in the way of appliances for scientific research, and placed in command of Captain Nares. Prof. Wyville Thomson and scientific staff conducted the investigations and determined the depth of waters, the configuration and conditions of sea-floor, the fauna, the currents, atmospheric conditions, etc. During the three and a half years they covered nearly 70,000 nautical miles. The route was south to Madeira, thence to the Canaries, the West Indies and north as far as Nova Scotia; south again to Cape Verde, then to Cape of Good Hope, Australia, the China Sea, Japan, west coast of South America, through the Straits of Magellan and back to England. The narrative of the expedition is told in popular form in Moseley's 'A Naturalist on the Challenger.' A complete account of the scientific results was gradually published in 50 splendid volumes, by Wyville Thomson and Dr. John Murray.

CHALLIS, James, English astronomer: b. Braintree, Essex, 12 Dec. 1803; d. Cambridge, 3 Dec. 1882. In 1836 he was elected Plumen professor of astronomy at Cambridge and director of the observatory. In 1861 he was succeeded in the latter position by Adams, but retained the professorship of astronomy till his death. He is best known for his work upon the theory of astronomical instruments, and for his observations in connection with the discovery of the planet Neptune. His inventions include the collimator and trans-ponder, and the meteoscope. He contributed about 225 essays to publications and in addition several independent works on astronomy, mathematics and physics.

CHALLIS, Alexander, Scottish journalist, editor and miscellaneous writer: b. Aberdeen, 29 March 1759; d. London, 10 Dec. 1834. His father was the founder of the first Aberdeen newspaper. He received a good classical and medical education in his native city. About 1777 Chalmers went to London, and was employed as a contributor to the Saint James' Chronicle, the Morning Chronicle, the Morning Herald and various critical magazines and reviews. He edited numerous editions of the English classics, particularly the 'British Essayists,' (45 vols., 12mo, 1813), commencing with the 'Tatler,' and ending with the 'Observer,' together with prefaces, histories and biographies; the 'Spectator'; 'Tatler'; and 'Guardian' (12 vols., 8vo, 1822); an edition of Shakespeare, with biographical and historical notes, in 1809; 'The English Poets from Chaucer to Cowper,' with Johnson's 'Lives,' and additional 'Lives' by Chalmers (21 vols., royal 8vo, 1810). The most important and valuable of Chalmers' extensive literary labors, however, was the 'Gentleman's Biographical Dictionary,' (21 vols., 8vo, 1812–17), the fullest body of biographical information published up to his time in England, and which has rendered invaluable service to subsequent compilers.
CHALMERS, George, Scottish antiquary: b. Fochabers, Elginshire, 1742; d. 31 May 1825. Having studied law at Edinburgh, he removed to America in 1763, where he practised that profession for upward of 10 years, till the colonies declared themselves independent. Chalmers, being a keen Loyalist, returned to Great Britain, where he was in 1786 appointed to the office of clerk of the Board of Trade. Previous to his appointment he had published ‘Political Annals of the United Colonies’ (1780); ‘Estimate of the Comparative Strength of Great Britain During the Present and Four Preceding Reigns’ (1782); and ‘Opinions on Interesting Subjects of Public Law and Commercial Policy, ARISING FROM American Independence’ (1784). In 1790 he published a biography of Daniel Defoe; in 1794 a biography of Thomas Ruddiman; in 1800 he edited the works of Allan Ramsay, with an elaborate memoir of the poet; in 1805 the works of Sir James Stewart of Coltness, also with a life prefixed; and in 1806 the writings of Sir David Lindsay of the Mount. The first volume of his ‘Caledonia’ (1807), in quarto, dedicated to the learned and patriotic nation, produced a great interest and desire for the production of its author. It professes to be an account, historical and topographical, of North Britain, from the most ancient to the present times; and the original intention of the author was, that it should be completed in four volumes 4to, each containing nearly 1,000 pages. Chalmers left the remainder of his great work nearly ready for the press; and it was subsequently published complete, with numerous annotations. He also wrote ‘A Chronological Account of Commerce and Coinage in Great Britain’ (1810). Throughout he displays profound research into the history of Scotland and is still considered authoritative.

CHALMERS, George Paul, Scottish painter: b. Montrose 1836; d. Edinburgh, 28 Feb. 1878. After serving in succession under a ship chandler, he went to Edinburgh in 1853 in order to become an artist. He was elected an associate of the Royal Scottish Academy in 1867, and four years later was elected to full membership. His pictures, which are characterized by rich coloring, consist mainly of portraits and subjects, though during his later years he produced several landscapes. The most important are the ‘Favorite Air’ (1864); ‘End of the Harvest’ (1873); ‘Running Water’ (1875); ‘Threecore Years and Ten’ (1875); ‘Prayer’ (1876); ‘Knitting’ (1876); and ‘The Legend’ (unfinished). Consult his biography by Pinnington (Glasgow 1897); and Caw, ‘Scottish Painting’ (Edinburgh 1908).

CHALMERS, James, Scottish missionary: b. Ardrishaig, Argyll, 1841; d. Goarihari Island, 8 April 1901. After early mission service in Glasgow, he was accepted by the London Missionary Society and was appointed in 1866 to Rabalborya in the South Pacific where the natives named him ‘Tamate’ the well known. After 10 years’ enthusiastic missionary work he was transferred to Nauru Island in 1891, with a brother missionary, Rev. Oliver Tompkins, he was killed by cannibals at Goarihari Island. His character and work were the source of cordial appreciation on the part of R. L. Stevenson. Consult Lovett, R., ‘Tamate: Autobiography and Letters of James Chalmers’ (1902).

CHALMERS, Thomas, Scottish theologian: b. Anstruther in Fifeshire, 19 April 1780; d. Edinburgh, 30 May 1847. At the age of 12 he was sent to the University of Saint Andrews, for the purpose of studying for the Church, and after passing through a curriculum there seven years, was licensed as a preacher in July 1799, the rule of the Scottish Church requiring that a licentiate should have reached the age of 21 being dispensed with in his case, in virtue of the exceptional clause in favor of those possessing rare and singular qualities. In May 1803 he was presented to the parish of Kilmany, in the northeast of Fifeshire, and opened classes of his own for teaching mathematics in the town of Saint Andrews. These were so successful that he commenced a class in chemistry also, his lectures on and demonstrations in which created quite a sensation. About this time his views as to the obligations of a Christian pastor were very different from what he was subsequently led to entertain, and he deemed it a sufficient fulfilment of these to return to Kilmany and thence back to Saint Andrews on the Monday mornings, devoting the bulk of his time to scientific pursuits. In 1808 he published an Inquiry into the Extent and Stability of National Resources, the object of which was to show that the Berlin decree would not touch the real foundations of the prosperity of Great Britain. Illness and bereavement among other causes led in 1810 to a spiritual revitalizing of his own life, and from this time may be dated his extraordinary hand on the moral and religious life of Scotland. In 1813 his article on Christianity appeared in the Edinburgh ‘Encyclopedia,’ and shortly afterward his review of Cuvier’s ‘Essoy on the Theory of the Earth,’ in the Christian Instructor. In this last he propounded the interpretation of the first verses of Genesis, afterward adopted by Dr. Buckland, with a view to make the truths of revelation and the discoveries of geological science harmonize. His fame as a preacher had by this time extended itself throughout Scotland, and a vacancy having occurred in the Tron Church of Glasgow, he was elected to the charge by the town council, and inducted on 21 July 1819. In the month of November following he commenced his series of astronomical discourses, in accordance with a custom observed in Glasgow, of the city ministers delivering in rotation a course of sermons in the Tron Church on Thursdays. These created a sensation such as no sermons had ever before produced in Glasgow. It is related, that when the hour of delivering them arrived, merchants and men of business would regularly leave their desks and proceed to the Tron Church, while the more liberal among them would, in addition, grant a similar indulgence to their clerks and assistants. In the commencement of 1817 these discourses were published, and attained a sale of nearly 20,000 copies by the end of the year. They raised their author to the high degree of the preacher of the day, and in a visit which he shortly afterward paid to London, the most distinguished literati and statesmen crowded to listen to the wondrous oratory of the Scottish divine.
The main object which engaged Chalmers on his arrival in Glasgow was the reorganization of the parochial system, so as to provide a place of worship by which foreign ministers might be visited and reclaimed, and the young instructed in the lessons and duties of religion. Special efforts were directed to the establishment of Sabbath-schools. Great exertions were also made by him to get new churches erected throughout Glasgow, the poor church accommodation providing for scarcely a third of the inhabitants. In this he ultimately succeeded, and in addition, a new parish church (Saint John's) were erected and endowed expressly for himself by the town council of Glasgow. To this he was in 1819 transferred from the Tron. In this charge he had as his assistant for two years Edward Irving (q.v.). The fatigues, however, which unremitting attention to parochial affairs involved were becoming too much for his health, and on the vacant chair of moral philosophy, in the University of Saint Andrews, being offered to him, he accepted it (1823).

In 1826 the divinity chair in the University of Edinburgh became vacant, and Chalmers was unanimously elected to it by the town council. This appointment he held till the disruption of the Scottish Church in 1843. In 1832 he published his 'Political Economy,' and shortly afterward appeared his contribution to the celebrated Bridgewater Treatises, 'On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man.' In 1834 he was elected a corresponding member of the Royal Institution of France. An importance matter which now largely engaged his attention was the subject of church extension, which he had zealously advocated from the days of his ministry in Glasgow. But Lord Melbourne's government was little disposed to aid the Church of Scotland on this occasion, and it was consequently obliged to carry out its scheme on the voluntary principle. Amid the various public movements with which Chalmers' name stands connected, there is none in which it more prominently occurs than in relation to the great non-intrusion movement in the Scottish Church. Throughout the whole of this memorable controversy, from the passing of the veto law by the General Assembly to the Disruption in 1843, he acted as the leader of the Evangelical party in their struggles with the civil power, and may be regarded as the founder of the Free Church, of the first assembly of which he was moderator. He was also the originator of the sustentation fund, out of which the ministers of that body are principally supported. Having vacated at the Disruption his professorial chair in the Edinburgh University, he was appointed, on the establishment of a new college in connection with the Free Church, to the offices of principal and primarius professor of divinity in that institution. The energy which made Chalmers remarkable as an orator was infused into all his practical undertakings; and the social and religious movements which he inaugurated left their mark far beyond the bounds of his own country. His published works are very numerous embracing sermons, tracts, essays, works on political economy, the parochial system, church establishments, etc. They exhibit the same energy of conviction, together with a breadth and profundity of view, which, though many of his theories have not been accepted by other thinkers, will always make them a rich mine of instruction to inquirers into the complicated relations of human society. Consult 'Lives,' by Hanna (1840-52); Fraser (1881); Mrs. Oliphant (1893); Blaikie (1897). See FREE CHURCH OF SCOTLAND.

CHÂLÖNS-SUR-MARNE, shà-ló-n sûr mär, France, a city and capital of the department of Marne (Champagne), 107 miles east of Paris. It lies principally on the right bank of the Marne, here crossed by a stone bridge of three arches, built in 1787. Low walls now supply the place of the old ramparts, the entrance being by six gates, which open to six main roads. The principal public buildings are the cathedral of Saint Etienne, destroyed by fire in the 13th century, and restored by Louis XIV; the church of Notre Dame, of the 12th and 13th centuries, and now restored; the Hotel de Ville, built in 1772; the Hotel de la Prefecture, built in 1764, one of the finest buildings of the kind in France; public library, museum, hospital, etc. There is a promenade, occupying about 18 acres, formerly planted with superb elm trees, which the Germans cut down for fuel during the Franco-Prussian War. It is the seat of a bishopric, and of one of the schools of arts trades, where 300 pupils are maintained and instructed at the public expense. There are manufactures of woolen and cotton goods; cotton mills, tanneries, etc. Châlons was fortified and established by the Romans. Christianity was preached here about the year 250. On the plains between Châlons and Troyes Attila suffered defeat in 451. From the 10th century it formed a kind of independent state, governed by its bishops, till 1360, when it was united to the Crown. A celebrated camp was established by Napoleon III in 1856, at the distance of about 18 miles from Châlons, for the purpose of training the French troops. In 1870 the town was occupied by the Germans after MacMahon's withdrawal, Pop. of commune 31,367.

CHÂLÖNS-SUR-SAÔNE, sön, France, a town of northeastern France, in the department of Saône-et-Loire, 81 miles north of Lyons. It is situated on the Saône, here crossed by a bridge of five arches, communicating with the suburb of Saint Laurent. It is irregularly built, and is surrounded by a wall and the remains of ancient fortifications. The public buildings include the church of Saint Vincent, built in 1386-1440; a bishop's palace of the 15th century; an extensive library, a gallery of painting, etc. Châlon is the seat of a tribunal of first resort and of commerce, and has a communal college. A branch of the celebrated Creusot ordnance and engineering works is here established, and it is the second industrial city of Burgundy. There are manufactories of leather, cloth, glass, etc., and a considerable trade in grain, flour and wines. The Saône becomes navigable for steamboats here, and there is steamer connection with Lyons. Caesar had grain magazines at Châlons, and it bred wolves are very common under Gontran. In 1273 Edward I of England, being invited to a tournament here on his return from Palestine, attended with 1,000 men-at-arms; and some disputes having arisen, the
CHALYBEATE WATERS—CHAMÆROPS

English attacked the French, killed a great number and left the tilting-ground strewed with the dead. This event is known as "the little war of Châlon." The town suffered considerably, especially from the wars of the 15th and 16th centuries, and from the invasion of the allies in 1814. Pop. of commune 31,550.

CHALYBEATE, ka-lih'eh-ät, WATERS, those which contain salts of iron in sufficient quantity to give them a special value in the treatment of cases of anemia, etc. Iron or steel waters are used by the inhabitants of Spa, for example, to cure ones at Schwabach in Nassau; one at Pyrmon, Waldeck; and one at Cheltenham, with a very high proportion of iron carbonate.

CHALYBITE, kāl'bit, or SIDERITE, a common iron ore. It is iron protocarbonate, FeCO₃, containing 48.2 per cent of metallic iron. It occurs in rhombohedral crystals, also in tabular, globular, compact or earthy form, but mostly commonly cleavable-massive. Its hardness is 3.5 to 4, but in the siliceous variety, clay iron stone, found in many coal formations, it sometimes runs up to 7. Its specific gravity is about 3.85, lustre vitreous to pearly, color usually brown or yellowish-gray. It is generally nearly opaque. It occurs in enormous quantities in Austria, also at Roxbury, Conn. It is a frequent associate of silver, lead and copper ores. Clay iron-stone is considered the most important iron ore of England.

CHAM, shān (pseudonym of AMÉDEÉ DE Noé), French caricaturist: b. Paris, 26 Jan. 1819; d. 6 Sept. 1879. He adopted the name Cham (Häm) as one of the sons of Noah, his father being M. de Noé (Noah). The son of a peer of France, he attended the Polytechnic school; but following his artistic inclinations, became a pupil of Delaroche and Charlet, and acquired distinction as a caricaturist by his spirited and humorous contributions to the Paris Charivari and by the publication of several collections of caricatures, among the best of which are 'Années comiques' (1880); 'Les folies parisiennes' (1883).

CHAMA, kā'ma, a genus of bivalve mollusks, the typical one of the family Chamidae. The shell has foliaceous valves, the upper one smaller, one valve attached to another body by the left umbo; the hinge tooth of the free valve is received between two teeth of the other. The chamas are found less than 50 fathoms deep in tropical seas, especially among coral reefs. Fifty recent species are known, and one fossil, the latter from the Cretaceous, onward. The still existing Chama gigas sometimes weighs 300 pounds, and may measure four feet across. The byssus by which it adheres to the rock is so tough that a hatchet is required to cut it through. One valve is sometimes used in churches as a baptismal font.

CHAMÆROPS, kā-mér'rops, a genus of palms established by Linnaeus, and remarkable as containing the species of the palm family found at the greatest distance from the equator. It is characterized by its flabelliform leaves, polygamous and sometimes dioecious flowers, and its three-sided, scarious, drupes. C. humilis is the only palm native of Europe. It is confined, however, to its hottest parts, and even there is generally only from four to five feet high. Its trunk, from five to six inches in diameter, is closely covered with triangular hard scales, the bases of the old leaves of the new leaves grow in a tuft at the top. Sometimes the stem does not appear at all; and the leaves, apparently issuing from the ground in the form of a large fan, have procured for the plant the name of the palm. It sometimes houses the stem attains the height of 15 feet or more. The leaves are used for thatch and
other purposes, and they furnish a large quantity of fibre, which forms an article of commerce and yields a material that may be used instead of horse-hair.

CHAMALARI, chā-mā-lārē, or CHAMALHARI, a peak of the Himalaya Mountains, at the western extremity of the boundary line between Bhutan and Tibet. Height 23,929 feet.

CHAMBA, British India, a state of the Punjab district, north of the districts of Kangra and Gurdaspur and in the Lahore division of North India, area, 3,216 square miles. It is a mountainous tract, shut in on almost every side and traversed by two hill-ranges. The crops consist of all kinds of grain and the supply of iron and slate is plentiful. The Sanatorium of Dalhousie is in this district. The annual revenue is about $170,000. Pop. 135,873.

CHAMBAL, chūm·bul, a river in Rajputana, Central Provinces of British India, flowing into the Jumna; length, 750 miles.

CHAMBER, a term having various technical meanings. The chamber of a cannon is that part of the bore of a cannon which receives the powder with which it is charged. The chamber of a mine is the place where the charge of powder is lodged that is to be used for blowing up the works. In several languages chamber is used to designate a branch of government whose members assemble in a common apartment. A chamber of commerce is a board or association to promote the interests of the trade and merchandise. See CHAMBERS OF COMMERCE.

CHAMBER MUSIC. The name given to music particularly designed for performance in a room or small hall with few performers, as contrasted with music requiring many performers and given on a stage in a larger hall, or in the opera-house. It is generally, though it was not formerly, applied to instrumental music only. Originally it meant music for the few, usually, of course, the wealthy, who cultivated it in the privacy of their homes and who, as in the case of the Esterhazy family, in whose service Haydn spent 30 years of devoted effort, made of it a profession. As early as the time of Louis XIV, with his "Maître de la Musique de la Chambre de Roy," chamber music was recognized as a separate branch of the art. Dance tunes were its earliest basis and in the form of suites were written or arranged for various combinations of instruments. (The lute figured prominently at first, but was gradually elobowed out by the members of the violin family). A little later, the more highly developed sonata form was utilized; and while to-day this designation is confined to pieces for piano or piano and one other instrument, the first sonatas were written for instruments in combination and especially for stringed instruments. Corelli, one of the greatest Italian composers (1653-1713), composed no less than 60 sonatas, among them 24 "Sonate da Camera" for several different instruments of the violin group.

The string quartet (written for two violins, viola and 'cello) is the typical chamber music of modern times and, beginning with Haydn, nearly all of the great composers have contributed generally to this form of music. While not a pioneer in this field, Haydn is entitled to the credit of giving to the string quartet the stamp of perfection as an art form, which has belonged to it ever since; and to the Esterhazy family as his patrons, and to other noblemen who bore somewhat similar relations to Mozart and Beethoven may be attributed the great impulse to this character of musical composition. In the immense volume of Haydn's works, his chamber music bulk large. Directly inspired by Haydn's efforts, Mozart began to write quartets and he dedicated six of the best to Haydn. The relations of Haydn and Mozart, and their remarkable reaction on each other, form a most interesting chapter in musical history. Haydn, who outlived Mozart many years, composed his best chamber music after Mozart had died, and it bears the unmistakable impress of the younger man's influence. Beethoven's activities in chamber music furnish clear evidence of the high seriousness with which composers have always approached this branch of their art. Comparatively early in his development, he wrote six quartets (Opus 18); and he made further essays as his career progressed. Finally, his sonatas and symphonic works and his great mass in D finished, he turned to the quartet, which he treated as a peroration, to the quartet and wrote five, which rank with his finest works. Since Beethoven's day, chamber music has undergone little change or development. There have been beautiful additions to its literature. Schubert, Schumann, Brahms, Franck and Tchaikovsky have all poured rich new wine into the old bottle; but it remains as Beethoven left it, the most chaste receptacle for musical thought yet fashioned. In addition to the string quartet, chamber music furnishes compositions for many other combinations of string instruments alone—trios, quintets, sextets and still larger groups—and, quite frequently, for piano and strings and, less often, for combinations including one or more wind instruments. Schubert's octet for two violins, viola, cello, bass, clarinet, horn and bassoon is one of the most important works in this field. But here, obviously, the approach is definitely toward the orchestra, with its variegated tonal tints, which are foreign to the true conception of chamber music. Next to the string quartet, the piano quartet and quartet are the favorites of the more modern composers. The piano quintets of Schumann, Brahms and Franck form a magnificently triumvirate. To the musician universally, chamber music represents the purest form and the highest achievement in the art. Without the extraneous attractions of program, orchestral color or scenic effect, depending for its appeal on the most abstract presentation of creative thought, it has evoked triple composers the finest manifestations of their genius; and the contributions of Debussy, Ravel, Schönberg and others of the ultra-modern schools show that the appeal is as potent to-day as it was in the last century. Consult Kiburn, N., "The Story of Chamber Music" (London 1904); Krause, E., "Die Entwicklung der Kammermusik" (Hamburg 1904); Schering, A., "Geschichte des Instrumentalkonzerts" (Leipzig 1905).

LEWIS M. ISAACS.

CHAMBERLAIN, Alexander Francis, American ethnologist and educator; b. Kenninghill, Norfolk, Conn., 1824; d. Worcester, Mass., 8 April 1914. He graduated at Toronto University in 1886 and from 1886 to 1891 was examiner in modern
languages successively at Toronto University, Trinity University and in the educational department of the province of Ontario. In 1892 he was appointed lecturer and afterward assistant professor of anthropology at Clark University. Under the auspices of the British Association he made a special investigation of the Kootenay and Chinook Indians in British Columbia. He was editor of the Journal of Anthropology. He contested by election a fellowship of the Royal Society. He was elected a fellow of the American Association for the Advancement of Science. He wrote "Report on the Kootenay Indians" (1892); "Language of the Mississippian Indians" (1892); "The Mythology of the Columbian Discovery" (1893); "Child and Childhood in Folk Thought" (1896); "The Child: A Study in the Evolution of Man" (1900); "Poems" (1904), and contributions to various periodicals on South American and Asiatic tribes and people.

CHAMBERLAIN, Basil Hall, English Japanese scholar: b. Southern, 18 Oct. 1850. He is a grandson of Basil Hall (q.v.). He is emeritus professor of Japanese and philology at the Imperial University of Tokio, and has published "The Classical Poetry of the Japanese" (1880); "Translation of the Koran" (1883); "A Rumanized Japanese Reader" (1886); "Language, Mythology and Geographical Nomenclature of Japan in the Light of Aino Studies" (1887); "Luchuan Grammar" (1885); "Handbook of Colloquial Japanese"; "Things Japanese" (1890); "Japan in the East" (1893); "The Structure and History of the Japanese Language" (1895).

CHAMBERLAIN, Charles Joseph, American botanist: b. Sullivan, Ohio, 23 Feb. 1863. He was graduated at Oberlin College in 1888, taught in Ohio and Minnesota 1888-93, when he entered the University of Chicago, from which he received the degree of Ph.D. in 1897. In the last-named institution he was assistant in botany 1896-99, associate 1899-1901, instructor 1901-07, became assistant professor in 1907, associate professor in 1911 and professor in 1915. He spent 1901-02 at Bonn, Germany, in research work, was editor of "Journal of the Botanical Literature" in 1899-1903; and since 1902 has edited the department of cytology of the "Botanisches Centralblatt." He is also a regular contributor to the "Botanical Gazeteer" of the Smithsonian Institution of America, of the Association Internationale des Botanistes, of Die deutsche Botanische Gesellschaft and the Naturforscher Gesellschaft der Königliche Universität zu Kiew. He is also a fellow of the American Association for the Advancement of Science. He has published "Methods in Plant Histology" (3d ed., 1915); "Morphology of Gymnosperms" in collaboration with John M. Coulter (2d ed., 1910); "Morphology of Angiosperms," in collaboration with J. M. Coulter (1903); and various articles especially on cycadaceae, in which connection he has made four exploring expeditions to the tropics of southern Mexico, besides expeditions to Cuba, New Zealand, Australia and Africa. His anthropology at Clark University.

CHAMBERLAIN, Daniel Henry, American politician: b. West Brookfield, Mass., 23 June 1835; d. 13 April 1907. He was graduated at Yale in 1862 and at Harvard Law School in 1863. In 1864 he was commissioned lieutenant in the 5th Massachusetts colored cavalry, served in Maryland, Louisiana and Texas and was promoted captain. In 1866 he settled as a cotton planter in South Carolina. Upon the call for a constitutional convention he was chosen a delegate, and was subsequently elected attorney-general, a position he held for four years. From 1872 to 1874 he practised law at Columbia, S. C. He was governor of the State 1874-77. Though renominated in 1876 and re-elected in January 1877, his election was contested by Wade Hampton as Democratic candidate for governor. After the inauguration of President Hayes, both contestants were invited to a conference at Washington, which resulted in the United States troops (which had been sent to support Chamberlain) being withdrawn from South Carolina and Governor Chamberlain withdrawing his claim to election. He resumed law practice in New York city until his retirement to West Brookfield, Mass. He has published several addresses and pamphlets, the latest of which is "Charles Sumner and the Treaty of Washington" (1902). Consult Allen, "Governor Chamberlain's Administration in South Carolina" (1888).

CHAMBERLAIN, George Earle, American legislator and State governor: b. Natchez, Miss., 1 Jan. 1854. He was graduated in 1876 from Washington and Lee University and began practice as a lawyer in Oregon, where he became a member of the State legislature, district attorney, State attorney-general and in 1902 and 1906 Democratic governor of Oregon. In 1909 he was selected United States senator for the term ending 1915 and in this position was chairman of numerous important committees, including the public lands committee. He was re-elected for the term 1915-21.

CHAMBERLAIN, Houston Stewart, English-German author: b. Southsea, England, son of a British admiral, 9 Sept. 1855. He was educated in France and England and in 1870 settled at Stettin, Germany, where he continued his studies under Professor Kuntze and devoted himself to research in German civilization and culture, also studying music under Ruthard. He married one of Wagner’s daughters in 1878. From 1885 to 1889 he resided in Dresden where he settled permanently in Vienna. Writing with equal ease in German, English and French, he is a prolific contributor to periodical literature, and besides his fine and comprehensive biography of Richard Wagner, his magnum opus, in German (1896), English (1897), French (1899), his published works include "Die Grundlagen des 19 Jahrhunderts" (2 pts., 1899-1901), reprinted in many editions; translated into English by Lord Redesdale (1910); "Das Drama Richard Wagner's" (1892); and other Wagner books; "Worte Christi" (1901); "Heinrich von Stein" (1903); "Immanuel Kant" (1905); "Goethe" (1912).

CHAMBERLAIN, Jacob C., American missionary: b. Sharon, Conn., 13 April 1835; d. 2 March 1908. He was graduated at Western Reserve University 1856; studied at the Dutch Reformed, Church Theological Seminary 1859 and took a medical degree at the College of Physicians and Surgeons, New York. In 1859, he went as a medical missionary to southern India and till his death resided in the Madras presidency. He established a hospital and dispensary at Madanapalli 1868 and another at
Palamanair 1872. He translated the Reformed Church liturgy into Telugu Madras (1873), and also Hymns for Public and Social Work (1881). He wrote 'The Bible Tested' (1878; 7th ed. 1885); 'Native Churches and Foreign Missionary Societies' (1879); 'Winding up a Horse; or Christian Giving' (1879); 'Break Coconuts Over the Wheels; or All Pure China' (1885); 'The Kingdom in India: Whose?' (1907); 'The Cobra's Den and Other Stories of Missionary Work among the Telugus of India' (1900).

CHAMBERLAIN, John Loomis, American army officer: b. New York, 20 Jan. 1858. He was graduated at the United States Military Academy in 1880. For years he was an officer of the line. He was graduated from the Army Service School, the Artillery School at Fort Monroe and the Army War College, and for four years (1884-88) he was an instructor at the Military Academy, West Point. In the winter of 1890-91, while a junior officer in the service, he took an active part in the campaign against the Sioux Indians. In 1891-93 he was chief ordnance officer of the Missouri department and in 1895-96 served as instructor in military tactics at the West Point Military Academy. In 1897-98 he was appointed military attaché at Vienna, but resigned this post on the outbreak of hostilities with Spain. Throughout the war he served as a major of United States Volunteers with the Seventh Army Corps. In 1900 he became a major in the inspector-general's department through a competitive examination, open to all captains of the line. He investigated the Pacific transport service in 1901, the result being a complete reorganization of the personnel. He has seen nearly five years' service in the Philippines and in the course of his duties has also visited China and Japan. In 1913 his investigation of the aviation section of the Signal Corps resulted in changes of policy and a reorganization of the service. In February 1917 he was appointed inspector-general, with the rank of brigadier-general, and on 6 Oct. 1917 was appointed major-general.

CHAMBERLAIN, Joseph, English statesman: b. London, 8 July 1836; d. Birmingham, 2 July 1894. He was for a time at University College School, London, and in 1854 entered into partnership with his cousin, Joseph Nettlefold, as a screw manufacturer in Birmingham—a business in which his father was also interested. He retired from active business life in 1874 after having amassed a handsome fortune. He was by this time coming to the front as the "rising hope" of the advanced Radicals. As a member of the Birmingham School Board, and its chairman from 1874 to 1878, he took up an attitude of uncompromising hostility to the denominational school system. In 1869 he was elected a member of the Birmingham Town Council. His tenure of the mayoralty (1874-76) was notable for sweeping reforms; new municipal buildings were built, the gas and water undertakings were municipalized, and a great city improvement scheme was successfully carried out. After an unsuccessful parliamentary contest at Sheffield in 1874, he was in 1876 returned unopposed for Birmingham. He rapidly made his mark in Parliament; he infused new life into the Radical organization, and on the return of the Liberals to office in 1880 entered the Cabinet as president of the Board of Trade. To Mr. Chamberlain's exertions was due the passage of the Bankruptcy Act, and his attempt to amend the merchant shipping acts, though unsuccessful, formed the basis of later legislation. His influence meantime was rising in the country; he stood out as an opponent of "coercion" in Ireland and favored a large measure of self-government, and in the election of 1885 he preached the doctrine of "ransom" and the "restoration" of property with a frankness that alarmed moderate Liberals, and inaugurated an "unauthorized program" which included free education, small holdings and a graduated system of taxation. After that election and the subsequent defeat of the Salisbury ministry and when the tenure of the Liberal government in office depended on the Irish vote and a Home Rule measure became imminent, he accepted the presidency of the Local Government Board, but resigned on 15 March 1886 on account of hostility to Mr. Gladstone's Home Rule Bill of that year. As a "dissentient Liberal" he voted against that measure and assisted materially in the defeat of the Liberals at the polls at the ensuing general election. For a time it seemed as if the breach in the Liberal ranks might be healed by a "Round Table" conference in 1887 it grew wider and Mr. Chamberlain became the object of intense dislike on the part of the Home Rule party. He held no office in the Unionist administration from 1886 to 1892, but his influence was felt in legislation, and he succeeded in getting some radical measures passed, such as free education. As a member of the commission to settle the fisheries dispute with Canada, he visited Washington in 1887 and succeeded in negotiating the Chamberlain-Bayard Treaty, which however was refused ratification by the American Senate. Another result of his visit was that he married in 1888, as his third wife, Mary, daughter of William C. Endicott, Secretary of War in President Cleveland's first administration.

On the elevation of Lord Hartington to the House of Lords as the Duke of Devonshire in 1891, Mr. Chamberlain succeeded to the leadership of the Liberal Unionists in the House of Commons. During the passage of Mr. Gladstone's second Home Rule bill (1893) through the House of Commons, Mr. Chamberlain was the life and soul of the opposition, his discussion of the various amendments being marked by a masterly debating power and keen analytical skill. On the return of the Unionists to power in 1895 he was appointed Secretary for the Colonies. His tenure of that office may be said to have been the turning point in the relations of the colonies with the mother country; his sympathetic understanding of colonial aspirations was soon apparent, and his talents as a business man and skill in administration found a fruitful field. When the "Jameson Raid" occurred in the Transvaal, he at once took action; it was not an action on the part of the British authorities, and he subsequently denied in the most distinct manner having had any personal foreknowledge or suspicion of what was about to take place. The country was sharply divided on his conduct of the negotiations preceding the outbreak of the
war with the South African Republic in 1899, but his influence in the country was a main cause in the Unionist triumph in the *Khaki* election in 1900. On the conclusion of hostilities he visited South Africa and personally inspected the measures adopted to repair the ravages of war. His influence was manifest in the provisions of the Workmen's Compensation Act of 1897, and he carried through the Australian Commonwealth Bill in 1900.

In 1903 Mr. Chamberlain launched another "unauthorized" campaign, which aimed at the reversal of the traditional free trade fiscal policy of Great Britain and at the setting up of preferential tariffs within the Empire, and he resigned his place in the Cabinet the better to pursue this missionary enterprise. He found support from the majority of the Unionist party; but a powerful minority, including such distinguished men as Devonshire, Goschen and St. Aldwyn, stood for the old policy; Mr. Balfour, on whom devolved the duty of keeping his party together, gave to "tariff reform" but a dubious and hesitating support; the Unionist party was rent in twain; and at the general election of 1906—at which Mr. Chamberlain's policy was only one among other issues—the Unionist government sustained a disastrous defeat. Mr. Chamberlain from 1903 had been conducting a strenuous campaign on behalf of "tariff reform" that had severely taxed his strength, and his last years were spent as an invalid; but from time to time he continued to inspire his followers with messages in the press.

Mr. Chamberlain was the first purely business man, untaught in any of the universities, to rise to a commanding place in British public life, and he profoundly affected the style of debating in the House of Commons. His life, spare figure, clean-cut, incisive features and single eyeglass were essential parts in the "make-up" of a singularly forceful and dominating personality. In his talents as an administrator, in his capacity for getting through business, he was almost unrivalled. As a debater he was cool and resourceful, a hard but a clean hitter, and never so dangerous an antagonist as when he seemed to be fighting in a disadvantageous position. His utterances had a sort of quiet influence which a disastrous defeat made him powerful no less in the country than on the floor of the House; but these characteristics proved an embarrassment when translated into the field of foreign relationships. He had, as Lord Morley has said, a "genius for friendship" both private and public; and his trait in his character, and the response it evoked, were happily illustrated in his relations with those whom he was proud to call "his own people," the constituents of the city of Birmingham, who from first to last, for a period of nearly 40 years, through all his mutations of opinion, stood by him with an unshaken and almost unexamined fidelity. Consult biographies by Creswicke (4 vols., London 1900-05); Jeyes (ib. 1896); Mackintosh (ib. 1906); Morris (ib. 1900); and Viscount Morley's "Recollections" (2 vols., 1917).

CHAMBERLAIN, Joseph Austen. English politician, son of Joseph Chamberlain (q.v.): b. 1863. He was educated at Rugby and Trinity College, Cambridge. He was Civil Lord of the Admiralty 1895-1900, Financial Secretary to the Treasury 1900-02, Postmaster-General 1902-03, Chancellor of the Exchequer 1903-06, and since 1915 Secretary for India in the coalition government. He represented Worcestershire in the House of Commons 1892-1914 and since the latter year has represented his father's old constituency, West Birmingham.

CHAMBERLAIN, Joshua Lawrence, American soldier and educator: b. Brewer, Me., 8 Sept. 1828; d. 24 Feb. 1914; graduated at Bowdoin College 1852 and Bangor Theological Seminary 1855; received the honorary degree of LL.D., Pennsylvania College, 1866, and from Bowdoin College 1889; professor of rhetoric and oratory, Bowdoin, 1856, and as 1861 professor of modern languages of Europe. On 8 Aug. 1862 he entered the army as lieutenant-colonel of volunteers and served through the Civil War in the Army of the Potomac in every campaign and nearly every great battle from Antietam to Appomattox, and was several times wounded, twice severely. He received the Congressional Medal of Honor for his remarkable conduct in the defense of Round Top, Gettysburg, 2 July 1863, and was advanced to the command of a brigade. On 18 May 1864 he was promoted brigadier-general on the field by General Grant for distinguished gallantry in leading a desperate charge, and early the following spring he received a special promotion as brevet major-general, "for conspicuous gallantry in action." In June 1863 he commanded two brigades of the first division, fifth corps. In the order disbanding that army he was retained in the service and was offered a colonelcy in the regular army, but the condition of his wounds induced him to decline the service, and in January 1866 he returned to Maine.

In the autumn of that year he was elected governor of Maine, and served in that office for four terms. In 1871 he was chosen president of Bowdoin College, and continued in that position for 12 years, his administration being marked by a broadening of the course and a large increase in the resources of the college. During this time he was elected major-general of Maine, to command the militia of the State. In 1880 when for a term the State was without a legal State government, he was called to the capital "to preserve the peace and institutions of the State." This he accomplished without the use or show of military force. In 1883 he retired from the presidency of Bowdoin and settled in New York to practise law. In 1885 he went to Florida and engaged in the work of railroad building and public improvements on the West Coast. He was much sought for as a writer and orator. He published "Maine, Her Place in History" (1877); "Reminiscences of the Spanish War" (1898); "Property: Its Office and Sanction" (1900); "De Monts and Acadia" (1904); "Ruling Powers in History" (1905). He also edited "Universities and Their Sons" (1898).

CHAMBERLAIN, Mellen, American lawyer, librarian and historian: b. Pembroke, N. H., 4 June 1821; d. Chelsea, Mass., 25 June 1900. He was graduated at Dartmouth College in 1844 and at the Harvard Law School in 1848. In 1849 he was admitted to the bar, opened a law office in Boston and made his residence in
CHAMBERLAIN, Montague, American naturalist: b. Saint John, New Brunswick, 5 April 1844. He was educated privately, both his parents being teachers. Though engaged in mercantile pursuits, he devoted much time to the study of natural history and came to be well known as an ornithological writer. In 1889 he became assistant secretary of the Lawrence Scientific School of Harvard University, and from 1893-1900, secretary. A member of several scientific bodies, his chief publications are ‘Canadian Birds’ (1870); ‘Birds of New Brunswick’ (1882); ‘Mammals of New Brunswick’ (1884); ‘Systematic Table of Canadian Birds’ (1887); ‘Birds of Greenland’ (1892); ‘Some Canadian Birds’ (1895); ‘The Church Aves’ (1887); ‘Malverne Birds’ (1889); ‘The Penobscot Indians’ (1899), etc.

CHAMBERLAIN, Nathan Henry, American clergyman: b. Bourne, Mass., 25 Dec. 1830; d. there, 1 April 1901. He graduated at Harvard, 1853, and studied theology at the divinity school there, and at Heidelberg, Germany, eventually becoming a Unitarian minister. He was pastor at Canton, Mass., 1857–59, and at Baltimore, Md., 1860–63. He then took orders in the Episcopal Church, and became rector at Birmingham, Conn., 1864–67; Morrisania, N. Y., 1866–71; Milwaukee, Wis., 1871–73; Somerville, Mass., 1874–79; East Boston, Mass., 1882–89. He then retired to devote himself to literary pursuits. His books are ‘Autobiography of a New England Parish’ (1864); ‘The Sphinx in Aubrey Parish’ (1889); ‘What is the Matter with our loves?’ (1890); ‘Samuel Sewall and the World He Lived In’ (1897), an admirable study of colonial life in New England; ‘Life of Sir Charles Napier’; ‘An Itinerary of Cape Cod.’

CHAMBERLAIN, Samuel Selwyn, American journalist: b. Walworth, N. Y., 25 Sept. 1851; d. San Francisco, Cal., 25 Jan. 1916. He was graduated from New York University in 1875, and at once entered the journalistic field with the New York Herald; he went abroad with Mr. Bennett of the Herald, and was for a time editor of the Paris edition of that journal.

In 1879 he became editor of the World, but left in 1881 to take charge of the Evening Telegram in 1881. He founded Le Maitre de Paris in 1884 and edited it for two years and then returned to the United States. In 1889 Mr. Hearst engaged him as editor of the San Francisco Examiner, and he remained on the Pacific coast until 1895, when he came to New York as editor of the Morning Journal, but, also having engaged the editor of the Philadelphia North American, which soon resumed its old place among the successful publications of that city. In a year or two Mr. Chamberlain returned to the Hearst service, and until his death acted as general staff officer. He went to the Chicago Times, was recalled to the New York American, and for several years, until the spring of 1915, had been the Hearst representative in London. His last work was editor of the Boston American. He was recognized as an exceptionally able newspaper man; his forte was a news touch of charming delicacy; he had unerring news perception and understood and carried out feature ideas that were distinct.

CHAMBERLAIN, S. D., city and county-seat of Brule County, on the Missouri River, and on the Chicago, Milwaukee and St. Paul Railroad, 85 miles southeast of Pierre. It is a thriving stock-raising centre, and has flour mills, bottling works and a cement factory. The public institutions include a free library, sanitarium, Columbus College and the river island park of 1,000 acres, donated to the city by the Federal government. Chamberlain is governed by commissioners. Pop. 1,275.

CHAMBERLAIN (Germ. Kammerherr; Ital. Comandante), court officer, originally employed as the keeper of the private apartments of a prince, or of a treasury, called in the 10th century camera (whence the word chamberlain). The golden key, which is worn by the chamberlains of the European courts, is an old custom on two small golden buttons (as well as the buttons themselves, when the key is omitted), indicates also the origin of the office. At present the employment of chamberlains (when their office is not merely nominal) is to attend on the persons of the princes and their consorts. There is generally a chief or high chamberlain. This officer in England is called Lord Great Chamberlain of England. His office is one of great antiquity and honor, being ranked as the sixth great office under the English Crown. It is entirely distinct from that of Lord Chamberlain of the Household (see below). To the Lord Great Chamberlain belong lodging and livery at the king’s court; and there are certain fees due to him from each archbishop and bishop when they perform their homage to the king; and from all peers at their creation, on doing their homage. At the coronation of the sovereign, he has an allowance of 40 ells of crimson velvet for his own robes. This officer, on the coronation day, is to bring the king his shirt, coat and wearing apparel, and after the king is dressed, he claims his bed and all the furniture of his chamber for his fees; he also carries at the coronation the coat, gloves and linen to be used by the king on that occasion, also the sword and scabbard, the gold to be offered by the king, and the robes royal and crown; he dresses and undresses the king on that day, waits on him before and after dinner. etc. This
officer has also the care of providing all things in the House of Lords during session; the government of the palace of Westminster; and he disposes of the sword of state to be carried before the king, to any lord he pleases. The office of Lord Great Chamberlain of England is hereditary, and has descended through the two sisters and coheresses of the 4th Duke of Ancaster (d. 1779) to its present holders, the Earl of Airlie and the Marquess of Cholmondeley and the Marquess of Lincolnshire, who act in rotation. The last-named performs the duties during the present reign. The keys of Westminster Hall and the Court of Requests are delivered to the Lord Great Chamberlain on all solemn occasions. He goes on the hand of the sword, next the king’s person. The Gentleman Usher to the Black Rod, Yeoman Usher, etc., are under his authority.

The Lord Chamberlain of the Household is an officer who has the oversight and direction of all the officers belonging to the king’s chambers, except the precinct of the king’s bedchamber. He has the oversight of the officers of the wardrobe at all His Majesty’s houses, and of the removal of wardrobes or of beds, tents, veils, music, comedians, hunting, messengers, etc., retained in the king’s service. He moreover has the entire oversight and direction of the sergeants-at-arms, of all physicians, apothecaries, surgeons, barbers, the king’s chaplains, etc., and administers the oath to all officers above stairs. To his department belong the two dramatic censors, called examiners of plays.

The Chamberlain of London receives and keeps the city money which is laid up in the chamber of London; he also presides over the affairs of masters and apprentices, and admits duly qualified persons to the freedom of the city, etc. His tenure of office only lasts a year, but he is usually re-elected.

All at monarchical courts there are almost as many different chamberlains as there are kinds of chambers; the English chamberlains here cited, and their duties, may be taken as typical.

CHAMBERLIN, Joseph Edgar, American journalist: b. Newbury, Vt., 6 Aug. 1851. Under his pen-name was papers in Newport, R. I., Fall River, Mass., Chicago and Boston. From 1890 to 1900 he was assistant editor of the Youth’s Companion, an essayist and magazine writer. During the Spanish War he was war correspondent of the New York Evening Post in Cuba; was literary editor, editorial writer and art critic of the New York Evening Mail 1901–15; with the Boston Transcript as editorial writer since 1915. He has published The Listener in the Town (1896); The Listener in the Country (1896); ‘Life of John Brown of Ossawatomie’ (1899); and ‘The Ii’s of History’ (1907).

CHAMBERLIN, Thomas Crowder, American geologist: b. Mattoon, Ill., 25 Sept. 1843. He was educated at Beloit College and the University of Michigan; was professor of natural science at Whitewater Normal School, Wis., 1869–73; professor of geology at Beloit College 1873–82; president of the University of Wisconsin 1887–92; and has been dean of the scientific faculty of the University of Chicago from 1892. He was assistant State geologist of Wisconsin 1873–76, and State geologist from 1876–82. He became United States geologist in charge of the glacial division 1882–1907, and was geologist of the Peary Relief Expedition 1894. He is a member of many scientific societies, and in 1907 was president of the Illinois Academy of Science, and president of the Chicago Academy of Sciences 1898–1914. He is the author of ‘Geology of Wisconsin’ and of many important papers printed by the United States Geological Survey and is editor of the Journal of Geology.

CHAMBERS, Edward Thomas Davies, Canadian journalist: b. Safron Walden, Essex, England, 1852. He emigrated to Canada in 1870, and after teaching a short time entered journalism, becoming chief editor of the Quebec Daily Chronicle in 1897. He has published ‘The Port of Quebec’ (1890); ‘The Haunts of the Ouaniche’ (1891); ‘Quebec: Ancient and Modern’ (1892); ‘Quebec, Lake Saint John and the Saguenay’ (1893); ‘Chambers’ Guide to Quebec’ (1895); ‘The Book of the Ouaniche and its Canadian Environment’ (1896); ‘Angler’s Guide to Eastern Canada’ (1898); ‘Sportsman’s Companion’ (1899); and the Quebec Tercentenary History’ (1909).

CHAMBERS, Ephraim, English miscellaneous writer and encyclopedist: b. Kendal, Westmoreland, about 1680; d. 15 May 1740. On leaving school he was apprenticed to a mathematical instrument and globe maker in London. Here he acquired such a taste for the study of science, and made so much proficiency in it, that he not only formed the design of compiling his famous Cyclopedia, or an Universal Dictionary of the Arts and Sciences, but actually wrote some of the articles for it behind his master’s counter. The first edition of this work was published in 1728, and Chambers was soon after chosen F.R.S. Two subsequent editions, in 1738 and 1739, appeared previously to his death. A French translation of the Cyclopedia was the basis of the Encyclopédie of Diderot and D’Alembert. A revised and enlarged edition brought out first by Scott and Hill, and afterward, 1781–86, by Dr. Rees, who latterly built upon it the work known by his own name.

CHAMBERS, Ernest John, Canadian litterateur: b. Penkridge, Staffordshire, England, 16 April 1862. He was educated at Montreal High School, engaged in journalism in that city for many years, as newspaper correspondent he served with General Middleton’s forces in the Northwest Rebellion (1885); and was editor of the Calgary Herald 1888–89. He was appointed gentleman usher of the Black Rod in the Canadian Parliament in 1904. From 1893–96 he was editor of the Canadian Military Gazette, and since 1908 has edited the Canadian Parliamentary Guide. Among other works, he is the author of ‘Canada’s Fertile Northland’ (1908) and the ‘History of the Royal Northwest Mounted Police,’ and he has written many regimental histories of the Canadian militia. During the Great War he acted as chief press censor for Canada.

CHAMBERS, Robert, Scottish prose-writer and publisher: b. Peebles, 10 July 1802; d. Saint Andrews, 17 March 1871. He and his brother William (q.v.) began in poverty as
small booksellers; issued penny leaflets of useful information for the people, written in a clear and simple though not infantile style, which became very popular, and at last took regular periodical form in Chambers' Journal, and the great publishing-house which bears the name of both developed gradually. The 'Chambers' Encyclopedia for the People' was the basis of the Journal, and edited by the brothers Robert wrote also 'Traditions of Edinburgh'; 'History of the British Empire'; 'Domestic Annals of Scotland'; 'The Book of Days'; 'Cyclopedia of English Literature'; 'Ancient Sea Margins,' etc., but his most important work was the anonymous 'Vestiges of Creation.'

CHAMBERS, Robert William, American artist and novelist: b. Brooklyn, N. Y., 26 May 1865. He began his career as an artist after studying at the Julian Academy, Paris, and became an illustrator for various New York weeklies; but he soon abandoned this for the literary field in which he achieved considerable success through his popular novels. He wrote a drama, entitled 'The Witch of Ellengowan,' for Ada Rehan, which was performed at Daly's Theatre, and a historical romance written 'In the Yellow Quarter' (1893); 'The King in Yellow' (1893); 'The Red Republic' (1894); 'A King and a Few Dukes' (1894); 'The Maker of Moons' (1895); 'Oliver Lock'; 'The Mystery of Choice' (1892); 'Lorraine' (1896); 'Ashes of Empire' (1897); 'The Haunts of Men' (1898); 'The Cambic Mask' (1899); 'Outsiders' (1899); 'The Conspirators' (1900); 'Cardigan' (1901); 'The Maid at Arms' (1902); 'The Maids of Paradise' (1903); 'With the Band of Ballads; Jole' (1905); 'The Reckoning' (1905); 'The Tracer of Lost Persons' (1906); 'The Fighting Chance' (1906); 'The Three of Heaven' (1907); 'The Younger Set' (1907); 'Some Ladies in Haste' (1908); 'The Firing Line' (1908); 'The Danger Mark' (1909); 'Special Messenger' (1909); 'Ailsa Paige' (1910); 'The Green Mouse' (1910); 'The Adventures of a Modest Man' (1911); 'The Common Law' (1911); 'Blue Bird Weather' (1912); 'Lapopette' (1912); 'The Streets of Ascalon' (1912); 'The Business of Life' (1913); 'The Gay Rebellion' (1913); 'Anne's Bridge' (1914); 'Between Friends' (1914); 'The Hidden Children' (1914); 'Quick Action' (1914); 'Athalie' (1915); 'Who Goes There!' (1915); 'Police!!' (1915); 'The Better Man' (1916); 'Barbarians' (1917).

CHAMBERS, Talbot Wilson, American clergyman: b. Carlisle, Pa., 25 Feb. 1819; d. New York, 3 Feb. 1896. He was graduated at Rutgers, 1834; studied theology at the Reformed Church Seminary there, and also at Princeton. He was pastor of the Reformed Dutch Church in Somerville, N. J., 1839-40. In 1849 he was installed a pastor of the Collegiate Dutch Church in New York, and remained in association with the Middle Dutch Church congregation until his death in 1871. He was a member of the American Bible Revision Committee, and for many years chairman of the committee on versions of the American Bible Society. He wrote 'The Noon Prayer Meeting in Fulton Street' (1857); 'Memoir of Theodore Frelinghuyzen' (1863); 'Exposition of the Book of Zechariah' (1874), in 'Lange's Commentary'; 'The Psalter a Witness to the Divine Origin of the Bible' (1875); 'Companion to the Revised Version of the Old Testament' (1887). He was a member of the Greely relief expedition and was also engaged in a survey of the Nicaragua Canal route. He became captain in 1908, and was at the War College in 1892-93, and subsequently served as commanding officer of various vessels, was assistant chief of the Bureau of Ordnance in 1907-09, and member of the General Board in 1911, when he became connected with the Bureau of Navigation and was put in charge of the development of aviation.

CHAMBERS, Sir William, English architect: b. of Scottish parents, Stockholm, Sweden, 1726; d. London, 8 March 1796. He was educated at Ripon, in Yorkshire, and while very young went as supercargo to the East Indies, resided for some time in China, and brought back many materials, which were afterward published. He then devoted himself to the study of architecture, and on returning from travels in France and Italy was appointed drawing master to the Prince of Wales, afterward George III. He laid out the original gardens at Kew in the Chinese style, and built the villa of the Earl of Beauford at Rhoopham, in the Italian style, a mansion for Lord Abercorn, near Edinburgh, and houses for Lord Melbourne and the Earl of Gower, at Whitehall and in Piccadilly. His masterpiece was Somerset house in London, which he rebuilt in 1775. He published, in 1759-68, a 'Treatise on Civil Architecture'; in 1772, a 'Dissertation on Oriental Gardening.'

CHAMBERS, William, Scottish publisher and miscellaneous writer: b. Peebles, 16 April 1800; d. Edinburgh, 20 May 1833. He was a brother of Robert Chambers (q.v.). He published 'Things as They Are in America' (1853); 'American Slavery and Color' (1857); 'France: Its History and Revolution' (1858); 'Stories of Old Families,' etc. In 1859 he bestowed on his birthplace the commodious suite of buildings known as the Chambers Institute, comprising a library, reading-room, lecture-room, art-gallery and museum. Of his native county he published a history in 1864. In 1865 he was elected lord provost of Edinburgh, in which capacity he organized and carried out many extensive and useful measures of sanitary improvement. Between 1871 and 1883 he spent upward of $100,000 in the restoration of Saint Giles' Cathedral, Edinburgh.

CHAMBERS OF COMMERCE, associations formed by tradesmen and merchants for the purpose of protecting and furthering the commercial interests of the community to which the chamber belongs. In America and England he was a member of the American Bible Revision Committee, and as a member of the committee on versions of the American Bible Society. He wrote 'The Noon Prayer Meeting in Fulton Street' (1857); 'Memoir of Theodore Frelinghuyzen' (1863); 'Exposition of the Book of Zechariah' (1874), in 'Lange's Commentary'; 'The Psalter a Witness to the Divine Origin of the Bible' (1875); 'Companion to the Revised Version of the Old Testament' (1887). He was a member of the Greely relief expedition and was also engaged in a survey of the Nicaragua Canal route. He became captain in 1908, and was at the War College in 1892-93, and subsequently served as commanding officer of various vessels, was assistant chief of the Bureau of Ordnance in 1907-09, and member of the General Board in 1911, when he became connected with the Bureau of Navigation and was put in charge of the development of aviation.

CHAMBERS, Washington Irving, American naval officer: b. Kingston, N. Y., 4 April 1856. He was graduated from the United States Naval Academy in 1876. He served on various vessels, and in 1883-84 was in the office of naval intelligence. He was a member of the Greeley relief expedition and was also engaged in a survey of the Nicaragua Canal route. He became captain in 1908, and was at the War College in 1892-94, and subsequently served as commanding officer of various vessels, was assistant chief of the Bureau of Ordnance in 1907-09, and member of the General Board in 1911, when he became connected with the Bureau of Navigation and was put in charge of the development of aviation.

CHAMBERS, Six Williams, English architect: b. of Scottish parents, Stockholm, Sweden, 1726; d. London, 8 March 1796. He was educated at Ripon, in Yorkshire, and while very young went as supercargo to the East Indies, resided for some time in China, and brought back many materials, which were afterward published. He then devoted himself to the study of architecture, and on returning from travels in France and Italy was appointed drawing master to the Prince of Wales, afterward George III. He laid out the original gardens at Kew in the Chinese style, and built the villa of the Earl of Beauford at Rhoopham, in the Italian style, a mansion for Lord Abercorn, near Edinburgh, and houses for Lord Melbourne and the Earl of Gower, at Whitehall and in Piccadilly. His masterpiece was Somerset house in London, which he rebuilt in 1775. He published, in 1759-68, a 'Treatise on Civil Architecture'; in 1772, a 'Dissertation on Oriental Gardening.'

CHAMBERS, William, Scottish publisher and miscellaneous writer: b. Peebles, 16 April 1800; d. Edinburgh, 20 May 1833. He was a brother of Robert Chambers (q.v.). He published 'Things as They Are in America' (1853); 'American Slavery and Color' (1857); 'France: Its History and Revolution' (1858); 'Stories of Old Families,' etc. In 1859 he bestowed on his birthplace the commodious suite of buildings known as the Chambers Institute, comprising a library, reading-room, lecture-room, art-gallery and museum. Of his native county he published a history in 1864. In 1865 he was elected lord provost of Edinburgh, in which capacity he organized and carried out many extensive and useful measures of sanitary improvement. Between 1871 and 1883 he spent upward of $100,000 in the restoration of Saint Giles' Cathedral, Edinburgh.
advance upon proposed legislation, and in the Hanse cities they must by law be consulted before certain kinds of legislation can be considered. Various methods were employed to promote the ends of such associations are the following: The influence of legislative action for the benefit of commerce; not infrequently legislators engaged in drafting regulations affecting industry seek the views of the more important chambers, paying regard to trade statistics, the gaining of economical or other advantages, by combination, the settlement by arbitration of mercantile disagreements. The oldest body of the nature of a chamber of commerce was started in Marseilles at the close of the 17th century. The value of such bodies became apparent and they sprang up rapidly throughout the civilized world. In mediæval Venice and in the Hanse towns they do not seem to have existed in the sense in which they are understood to-day. The first institution of the kind in the United States, the New York Chamber of Commerce, was organized in 1768 and incorporated by royal charter from King George III in 1770. There are now similar bodies in every city and town of consequence in the United States, officered by men of standing, and commanding and rendering intelligent and effective service. The oldest chamber of commerce in Great Britain, that of Glasgow, dates from 1783. Edinburgh followed two years later, and for long held a leading position, but the most important British chamber of commerce at the present time is that of London, founded so lately as 1881. It has instituted a series of examinations in commercial subjects, and lectures are delivered under its auspices. Junior and senior commercial certificates are granted after examination to those who display the amount of knowledge required. In 1860 there was formed an Association of Chambers of Commerce of the United Kingdom, which holds annual meetings in London. It includes nearly 100 chambers.

The extension of the functions of chambers of commerce in the United States has been considerable in the decade between 1890 and 1900. The movement had its origin in Germany and grew out of the organized efforts of the last 20 years to foster the world commerce of the empire. The chambers of commerce in leading cities like Berlin and Hamburg undertook the commercial training of young men, with a view to their future advancement in mercantile life and the consular service. The result was the securing of a higher order of talent in such pursuits. The hint thus thrown out was promptly taken up in the United States. The New York Chamber of Commerce, in 1899, voted a fund for the endowment of a lecture course on commerce at Columbia University in Chicago a chair of commerce was established by that city's chamber at the University of Chicago, and in August 1900 a School of Commerce, Accounts and Finance was established by the University of New York. Students were given the opportunity of the study of commerce at the University of Chicago. The course is given in commerce, economics, and law. The students are selected from the best of the graduate students in commerce, and are given a thorough training in the principles of commerce.

CHAMBERSBURG, Pa., borough and county-seat of Franklin County, on the Conococheague and Falling creeks and the Cumberland Valley and Western Maryland and the Philadelphia and Reading railroads, 49 miles west-southwest of Harrisburg. In Early's raid in the Civil War General McCausland entered Chambersburg with Confederate cavalry, 30 July 1864, and demanded a tribute of $100,000 in gold; this not being paid he set fire and two-thirds of it burned, causing a loss of $1,000,000. It was soon rebuilt, chiefly of brick or stone, and is now the seat of Wilson College for women, and has an academy, several churches and newspapers, public schools, two national banks and an assessed property valuation of $3,000,000. There are manufactures of hosiery, flour, furniture, wool, dresses, paper, iron, milling machinery, engines, boilers, soap, steam and hydraulic machinery, iron castings, silk, ice and condensed milk; and the shops of the Cumberland Valley Railroad are situated here. The United States census of manufactures for 1914 recorded 59 industrial establishments of factory grade, employing 1,920 persons, of whom 1,049 were wage earners receiving annually $755,000 in wages. The capital invested aggregated $3,740,000, and the year's output was worth $3,075,000: of this, $1,528,000 was the value added by manufacture. In the environs blue limestone, freestone and marble abound. Its government provides for a chief burgess, elected for three years, and a borough council. Chambersburg was first settled (in 1730) by Benjamin Chambers, an immigrant from Ireland, and was for many years called "Falling Spring." It was incorporated in 1803. Pop. 12,000.

CHAMBERTIN, shahn-bay-tahn, a superior red Burgundy wine, named after the place where it is produced, in the department of Côte d'Or.

CHAMBÉRY, shahn-back-ehr, France, capital city of the department of Savoy, 45 miles south-southwest of Genoa, at the junction of two small rivers, near the Isère, between two mountains on the border of a fertile plain. It is an archbishop's see, and contains a cathedral, six hospitals, a castle, now the prefecture, the palace of justice, barracks, a covered market, a college, a museum and a public library with 40,000 volumes. The old ramparts have been converted into public walks. In its vicinity are excellent baths, much frequented in summer. Its suburbs are large with many fine villas. It has considerable manufactures and distilleries; trade in lace, silk, soap, paper, etc. Chambéry was founded about the 10th century. It was under feudal lords till 1230, when it was ceded to Thomas, 1st Count of Savoy, who built the castle, where the prince of Carrara resided till the government was removed to Turin. The town was surrendered to the French in 1792, and became the capital of the department of Mont Blanc. It was retroceded in 1815, and again ceded to France in 1860. Pop. 22,958.

CHAMBEZI, chahm-bee-zi, a river of Africa, rising in the highlands south of Lake Tanganjika, about lat. 9° 40' S. and long. 33° 15'E. Its tributaries are large, and form a considerable stream, which flows southwest to Lake Bangweelo.
CHAMBLISS, Charles Edward, American entomologist: b. Petersburg, Va., 20 Aug. 1871. He was graduated at the University of Tennessee in 1892, and from 1894 to 1900 was instructor in zoology and entomology there, and in the same period was entomologist of the Tennessee Agricultural Experiment Station. He was State entomologist of Tennessee 1900-01, when he became associate professor of zoology and entomology at Clemson College and entomologist of the South Carolina Experiment Station and State entomologist 1907-08. Since 1908 he has been agronomist in charge of rice investigations for the United States Department of Agriculture.

CHAMBLSY CANAL. See Canadian Canal.

CHAMBLSY RIVER. See Richelieu River.

CHAMBORD, šànbór, Henri Charles Ferdinand Marie Dieudonné, COMTE DE, Duke of Bordeaux, French noble: b. Paris, 29 Sept. 1821; France, 24 Aug. 1883. He was the last representative of the elder branch of the French Bourbon dynasty, and was called by his partisans Henry V of France. He was born after the assassination of his father, Prince Charles Ferdinand d’Artois, Duc de Berry. Charles X, after the revolutionary outbreak of 1830, abdicated in his favor; but the young count was compelled to leave the country with the royal title unrecognized by the nation. He lived successively in Scotland, Austria, Italy and London, keeping a sort of court, and occasionally issuing manifestos. In 1846 he married the Princess Maria Theresa, eldest daughter of the Duke of Modena; and in 1851 inherited the domain of Frohsdorf, near Vienna, where for the most part he subsequently resided. While abstaining from violent attempts to seize the crown, he let slip no opportunity of urging his claims, especially after Sedan; but his belief in divine right, and his failure to recognize accomplished facts and modern tendencies, destroyed all chance of his succession.

CHAMBORD, a castle, park and village in central France near Blois, department of Loir-et-Cher. The splendid castle stands in the middle of a park, enclosed by walls extending seven leagues. It contains 440 rooms, 13 large staircases, and stables for the reception of 1,200 horses. It was built in the Gothic style, by Primatice, for Francis I, and completed under Louis XIV. Here Francis I indulged his inclination for gallantry; here the arts first sprang to life in France; and here King Stanislaus Leczinsky resided for nine years. In 1743 it was given by Louis XV to Marshal Saxe, who died there in 1750. The Emperor Napoleon I gave the domain of Chambord to Marshal Berthier, and in 1821 a company of Legitimists bought it and gave it to the Duke of Bordeaux, son of the Duke de Berry and grandson of Charles X. It was bequeathed to the ducal family of Parma in 1883.

CHAMBRE, shân-brä, Georges, MARQUIS DE, French general: b. Paris 1783; d. 1848. He served in the Napoleonic wars, fell into the power of the Russians, was banished to the Ukraine and not permitted to return to France until after the fall of Napoleon. From 1823 to 1829, he filled high military positions at Vincennes and Périgean. He wrote various works on military subjects. A second edition of ‘Philosophie de la guerre’ appeared in 1835, and a ‘Life of Vauban,’ written by him, appeared in the ‘Plutarque Français.’ His most important production is his ‘Histoire de l’expédition de Russie,’ which appeared in 1837, and has since passed through several editions.

CHAMBRE ARDENTE, šânhbr ård-dänt (‘fiery chamber’), an apartment hung with black and lighted with tapers, in which the corpse of a person of distinction is deposited before the funeral ceremonies. The name was formerly given in France to an apartment, similarly draped and lighted, in which sentence of death, frequently by burning, was pronounced on heinous offenders. In a historical sense the term is exclusively given to those extraordinary tribunals which, from the time of Francis I, directed the persecutions against heretics, and acted as a sort of inquisition. The members of the tribunal were named by the Pope. They ferreted out heretics, directed the proceedings against them, pronounced sentence, and also saw it carried into execution. A chambre ardente was established by Louis XIV to put a stop to the numerous cases of poisoning which, after the proceedings against the Marchioness of Brinvilliers, were brought before the public. Many persons of the highest rank, among others the Marshal of Luxemburg and Princess Louise of Savoy, were brought before this court, which, however, existed only for two years, and ceased in 1686. The last exercise of its powers was the condemnation of the celebrated sorceress, Voisin. Consult Weiss, ‘La chambre ardente’ (Paris 1889) and Ravaissin, ‘Archives de la Bastille’ (Paris 1866-84).

CHAMBRE INTROUVABLE, an-troov-ä-bl (‘the chamber whose like is not to be found’), the term applied to the French Chamber of Deputies which met after the second return of Louis XVIII (from October 1815 to April 1816), and which by its fanatic loyalty threatened to plunge France again into anarchy and commotion, their dissolution merited universal rejoicing. The electoral law of 5 Feb. 1817 prevented the return of a similar chamber.

CHAMELEON, kâ-mê’lyon or kâ-mê-lë-ôn, lizard belonging to the family Chamaeleontidae. The chameleons are generally considered as constituting a sub-order or equivalent primary division of the Lacertilia (q.v.). All parts of their anatomy present striking peculiarities. The parietal and squamosal bones of the skull form a bony tripod which supports the conspicuous crest or casque on the posterior part of the head. In many species the strangeness of the physiognomy is enhanced by warts, serrated crests and prominent spines. Trifid teeth are situated on the ridge (acrodon) of the maxillary and dentary bones, but the premaxillary is toothless. The eyelids are divided, the posterior being completely united, leaving only a minute circular orifice through which the animal sees, and which moves with the eyeball in its almost constant roving. More remarkable still the two eyeballs move quite independently of each other, one may be directed at an object behind while the other views one in
front. The tongue is club-shaped at the free end and slips into a sheath at the base, from which it can be projected to a distance of more than three times the length of the animal. The total length of the feet, which have five toes arranged in two opposed sets on both fore and hind feet. The lungs are produced into a series of long tubular diverticula, which extend to all parts of the trunk, so that the chameleon is enabled to swell up its body in the fashion of a toad when angry or threatened. These animals subsist entirely on insects caught by the protrusile, somewhat sticky tongue; and are reproduced by eggs laid in the ground.

But the chameleon is most famous for a faculty by no means confined to it, but common to many lizards and other animals — the well-known faculty with which it changes its colors. This is accomplished at the will of the animal, or by the direct influence of external stimuli, by a relatively simple mechanism. The outer portion of the skin or epidermis is transparent; beneath this is a layer of cells filled with granules and oil-drops that appear white or yellow; among and beneath these are large irregular chromatophores, or cells filled with black and red pigment granules. These chromatophores are under the control of the nervous system, and have the power, when appropriately stimulated, of sending out long branchial processes filled with pigment into the spaces between and external to the light-colored cells. When this occurs the latter cells are concealed by a pigment curtain and the animal appears dark-colored; when, on the other hand, the chromatophore processes are withdrawn, and the pigment is concentrated in the deeper layers of the skin, the animal appears pale. The rapid play of colors is due to the interchange of these two conditions in varying degrees.

More than 50 species of chameleons are known, belonging to the typical genus Chamaeon, and a few others. With the exception of a few species which inhabit Arabia and India, and one whose range extends across the Mediterranean into southern Spain, all are confined to Africa, and a large number of the strangest forms to the island of Madagascar. The common chameleon (C. vulgaris) inhabits the shores of the Mediterranean and Asia Minor, and through being so well known to Europeans, has made the peculiarities of these lizards almost proverbial.

In the United States the name chameleon is commonly applied to a lizard (Anolis carolinensis) and its allies, belonging to a quite different group, a genus of the family Iguanidae. Like its African namesake it changes its colors with great facility. (Consult Proceedings Amer. Acad. Arts and Sciences, XL, 10, 1904).

It may be bright green, yellowish-gray, rich brown, or almost black, and the male is peculiar in having a series of conical thickenings on the elastic skin which can be inflated by means of a pair of delicate bony rods belonging to the skeleton of the trunk, when it appears of a flaming orange or vermilion color. They are dainty, smooth-bodied little animals, and are chiefly arboreal, jumping from twig to twig in pursuit of insects with an activity that contrasts strongly with the sluggishness of the European chameleon, which depends almost entirely on its tactile tongue to secure its game. Anolis carolinensis is the only member of the genus which enters the United States, and is quite common in Florida and other southern States, from which many were shipped to the North a few years ago to supply the requirements of a silly fashion in vogue at that time of wearing one of these pretty lizards secured to the dress by a tiny golden chain about its neck. Owing to the ignorance of the wearers, many of the chameleons quickly succumbed to thirst, as they, in common with most lizards, require a constant supply of water. Consult Gadow, Amphibia and Reptiles' (New York 1911); Ditmars, The Reptile Book (New York 1907); Fycraft, Story of Reptile Life (London 1905).

CHAMELEON, a southern constellation containing nine stars, lying within the Antarctic polar circle.

CHAMELEON MINERAL, manganese of potassium, so called because a solution of it changes from green, through a succession of colors, to a rich purple.

CHAMFORT, shan-T'or, Sébastien-Roch Nicolas. French revolutionist: b. Auvergne 1741; d. 1794. He left school to become an abbé, but refused a benefice. For a time, his efforts to publish his works were unsuccessful. He finally made his début as a littérateur under the name of Chamfort, and obtained some success as a dramatist and as a critic, which, however, secured him a place in the French Academy, a pension and a place at court. An independent and somewhat misanthropic spirit made him, however, in spite of his interest, favor the Revolution, of which he became the epigrammatist. He resigned his employment at court, and took the literary editorship of the Mecresse de France. He won several academic prizes, as on his essays on Molière and La Fontaine. The King added 1,200 livres to his pension and the Prince de Condé made him his secretary, a post which he found uncongenial to his Bohemian tastes. He withdrew to Auteuil, and thence to Holland, but returned and became a member of the Academy in 1781. An unfortunate love affair made him quit the court, but he gathered about him at the house of M. de Vaudreuil a congenial circle which included Mirabeau. He furnished Siéyes with the idea and the title of his famous pamphlet Qu'est-ce que ce Tiers-État? and forged such popular watchwords as: Guerre aux châteaux, paix aux chaumieres ("War to the castles, peace to the cottages"). He was employed by Roland in the National Library and published the first 26 Tableaux Historiques de la révolution. Threatened with imprisonment, he endeavored to blow out his brains. Though not immediately fatal, the wounds he inflicted on himself ultimately caused his death. His poetry has now little reputation. His best work, Mustapha and Zangir, at which he labored for 28 years, exhibits him as a feeler for the soul of Revolution and Voltaire. It is praised for purity of style and mildness of sentiment; but, as a French critic pungently observes, he reserved all his mildness for his tragedies. A collection of 1,800 bow mosa, under the title "Chamfortiana,"
is now considered the best memorial of him. His ‘Œuvres complètes’ is in five volumes (1824-25); a selection from his writings appeared as ‘Œuvres de Chamfort’ (1852 with a prefatory note by Houssaye). In 1879 appeared ‘Œuvres Choisis’ (2 vols., with a preface and notes by M. De Lesecure). Consult Sainte-Beuve, ‘Cassérius du Lundi’ (Vol. IV. Paris 1857–62), and Félixson, ‘Chamfort’ (Paris 1895).

CHAMIERS, šã-měr’, Frederick, English name; born London 1796; d. 1870. He entered the navy in 1809, took part in the last campaigns against the French and distinguished himself in the American War of 1812. He retired in 1833 with the rank of captain, and living at Waltham Hall, acted as a justice of the peace for the counties of Hertford and Essex. He imitated Captain Marryat in making his experience of a sea life the basis of a series of romantic tales, but did not equal him in humor and imagination. He has, however, been credited with great fidelity to nature. His principal works are ‘The Life of a Sailor’ (1834); ‘Ben Brace’ (1835); ‘The Arethusa’ (1836); ‘Jack Adams’ (1838); ‘Tom Bowling’s Log’ (1839). He also published a revue of the scenes witnessed by him in the revolution of 1848, in which his prejudice against some of the leading participants obscures the veracity of his statements.

CHAMINADE, šã-nâ, Cécile Louise Stéphanie, French composer; b. Paris, 8 Aug. 1861. She studied at Paris under Le Couper, Sisley, and Benjamin Godard; soon acquired a high reputation as a pianist, and played at concerts in Paris, Berlin, Vienna, London, Constantinople and other cities. She visited the United States in 1908 and made a successful tour, but has not maintained her hold on the public. She has resided in England for a number of years. Her compositions, which are widely known, include ‘Callirhoe,’ a ballet symphony performed with great success at Marseilles (1889), Lyons (1889), and Bordeaux (1901); ‘Les Amours,’ ‘Ménétriers,’ ‘Au Matin;’ and a number of songs, among which are ‘Madrigal,’ ‘Chanson Slave,’ ‘Ritournelle,’ ‘Fleur de Matin;’ and ‘Sans Amour.’ She has also written a concerto for piano and orchestra, two trios, a quartet, and a large number of works for piano solo, piano and violin, etc.

CHAMISSO, šã-mèss’ô, Adelbert de (properly Louis Charles Adelaïde de Chamisso de Boncourt), German poet and naturalist; b. at the castle of Boncourt, Champagne, 27 Jan. 1781; d. Bersis, 21 Aug. 1838. When a boy his family were driven by the breaking out of the Revolution to seek an asylum in Berlin. On the Peace of Tilsit he returned with his family to France, and in 1810 was appointed professor in the University of Nièvre. The year after, he returned to Prussia, and during three years devoted himself enthusiastically to the study of natural science at Berlin. Count Komansoff having in 1815 fitted out a vessel, under the command of Otto von Kotzebue, for the discovery of the northern passage, Chamisso accepted the appointment of naturalist to the expedition, and added greatly to his store of scientific knowledge. He afterward took up his residence at Berlin, was appointed superintendent of the botanic garden and re-ceived the diploma of doctor from the university for the collections in natural history which he had presented to the museum. His abilities as a naturalist are displayed in his work ‘De Animalibus quibusdam e Classe Vermimin’ (1819); and his ‘View of the Most Useful and the Most Noxious Plants of North Germany, with Remarks on Scientific Botany.’ In 1827, partly for the purpose of rebutting the charges brought against him, he published ‘Views and Remarks on a Voyage of Discovery,’ and ‘Description of a Voyage Round the World.’ Both works display great accuracy and industry. His last scientific labor was a tract on the ‘Language of Owbye.’ His reputation as a naturalist has been somewhat eclipsed by that which he acquired as a poet. As early as 1804–06 he, in concert with Varnhagen von Ense, published a collection of poems, under the name of the ‘Muses’ Almanac; and in 1813 appeared his celebrated and most original tale, ‘Peter Schlemihl,’ which has been translated, among other languages, into English, and admirably illustrated by Cruikshank. His poetry is marked by vigor, correctness and a spirit of the German language; but is in general of a gloomy and terrific cast. He is the author, however, of several humorous pieces; and his political poems are distinguished by caustic, yet wholesome, raillery. Many of his ballads and songs are masterpieces of their kind. (See Peter Schlemihl’s Wundersame Geschichten.) Consult Geiger, ‘Aus Chamissos Frühlingszeit’ (Berlin 1905); Hitzig, ‘Leben und Briefe von A. von Chamisso’ (1839); Fulda, ‘Chamisso und seine Zeit’ (Leipzig 1881); Koßmann, ‘Der deutsche Musenalmanach, 1833–39’ (The Hague 1899); Raymon, ‘A von Chamisso als Natursfacher’ (ib. 1889).

CHAMOIS, šã-măi or šäm’; a horned animal (Rupicapra rupicapra) classed among the goat-antelopes, and native to the mountains of middle and southern Europe from the Pyrenees to the Caucasus and Georgian Mountains, and as far east as Persia. The chamois found in the Pyrenees and in the Caucasus differ in local peculiarities from the Tyrolese, which is the race-type. This is about the size of a goat; but its neck is shorter, its horns are more slender, and that of the goat is more graceful. The general color is brown; the head pale, almost yellow, with a dark marking on each cheek; the nails black. The short black horns rise straight from the forehead, and are recurved at the tip. The chamois may be found in summer, in the highest Alpine altitudes, close to, and indeed beyond, the snow-line. In winter it seeks the forests, where it is somewhat protected. In the Alps, where they have been much hunted, the herds are small. The chamois is now rare in Switzerland, but there is an annual season in May and June. The chamois is famous for its agility. The creature is timid; and when feeding in flocks, one is always on the watch to announce danger by a peculiar whistling noise. Chamois-hunting as a sport is almost impossible in the Alps, as the animal has been so reduced by continuous hunting that the remaining ones are protected by law—only a few being annually at the disposal of the hunter; but in the Carpathians and eastward the sport is not restricted. Chamois leather is valuable.
COMMERCIAL CHAMOMILE-CHAMPS DE MARS

Commercially for its softness and warmth. (See Leather). Ordinary chamois leather, however, is prepared from sheep-skin or goat-skin. The flesh of the chamois is esteemed a table delicacy, and its antlers are still much prized for their curvatures and their father's horns, being from 10,000 to upward of 15,000 feet high, are always snow-clad excepting where the peaks are too perpendicular for snow to lie. From the snowy range proceed the glaciers, some of which approach close to the cultivated fields. They are very numerous, and of different sizes; but the two most important are the Glacier des Bossons and the Mer de Glace, the latter one of the largest glaciers in the Alps. From its lower extremity, called the Glacier des Bossons, the meltings of the glaciers flow off, in greater or less volume according to the season of the year, from under a naturally formed ice-arch, the source of the Arveyron, the name given to the stream thus formed, which is an affluent of the Arve. The lower slopes of the mountains are covered with timber, through which is frequently to be seen the devastating course taken by the avalanche. The soil is not fertile, but it is assiduously cultivated; and the inhabitants, who are gathered together in numerous villages, of which Chamouni or Le Prieuré is the chief, raise barley, oats, spelt, flax, potatoes, etc., raise cattle and keep bees. During the winter, yarns, cloths, hats and implements are made, and many articles of wood are carved. All the valley is famous for its scenery, which was first brought to public notice by Windham and Pococke, two Englishmen who visited it in 1741. It presents various points from which the whole mass of Mont Blanc may be seen at one view. The village of Chamouni (3,415 feet), 39 miles east-south-east of Geneva, originated in a Benedictine priory founded about 1090. It has several hotels, and is supported mainly by visitors to the scenery of the valley. The ascent of Mont Blanc is commonly made from this village. There is a monument to De Saussure, who did much to bring the valley before the notice of travelers. Pop. 2,850.

CHAMP CLOS, shān klā (Fr. "a closed-in field or area"), formerly a place summary for duels between those who wished to determine, in that manner, either a lawsuit or dispute of honor. This name was also given to the place set apart for tournaments.

CHAMP DE MARS, shān-de-mār, Paris, extensive area, on the left bank of the Seine, between the Seine and École Militaire, which originally formed a part of the Army of France in the Pennine Alps, fully 3,000 feet above sea-level. It is about 12 miles long, and only about half a mile wide; lies southwest to northeast, its east side formed by Mont Blanc and other lofty peaks of the same range, and its west side by Mount Brévent and the Aiguilles Rouges. It is traversed in its whole extent by the Arve, which leaves the valley by a narrow gorge at the southwest end, through which also passes, high above the river, the highway to Sallanches and Geneva. At its north end the valley communicates with Canton Valais by two roads and a bridle-path, the latter crossing the Col de Balme; and it may also be left by other passes, as the Col de Grand, but they are difficult and dangerous, and only suited for practised and daring pedestrians. The mountains on the west side of the valley, though attaining a height of 8,500 feet above sea-level, are not covered with snow in summer; but those on the east side, in the Mont Blanc, being from 10,000 to upward of 15,000 feet high, are always snow-clad, excepting where the peaks are too perpendicular for snow to lie. From the snowy range proceed the glaciers, some of which approach close to the cultivated fields. They are very numerous, and of different sizes; but the two most important are the Glacier des Bossons and the Mer de Glace, the latter one of the largest glaciers in the Alps. From its lower extremity, called the Glacier des Bossons, the meltings of the glaciers flow off, in greater or less volume according to the season of the year, from under a naturally formed ice-arch, the source of the Arveyron, the name given to the stream thus formed, which is an affluent of the Arve. The lower slopes of the mountains are covered with timber, through which is frequently to be seen the devastating course taken by the avalanche. The soil is not fertile, but it is assiduously cultivated; and the inhabitants, who are gathered together in numerous villages, of which Chamouni or Le Prieuré is the chief, raise barley, oats, spelt, flax, potatoes, etc., raise cattle and keep bees. During the winter, yarns, cloths, hats and implements are made, and many articles of wood are carved. All the valley is famous for its scenery, which was first brought to public notice by Windham and Pococke, two Englishmen who visited it in 1741. It presents various points from which the whole mass of Mont Blanc may be seen at one view. The village of Chamouni (3,415 feet), 39 miles east-south-east of Geneva, originated in a Benedictine priory founded about 1090. It has several hotels, and is supported mainly by visitors to the scenery of the valley. The ascent of Mont Blanc is commonly made from this village. There is a monument to De Saussure, who did much to bring the valley before the notice of travelers. Pop. 2,850.
people, at which he placed before the representatives of the nation the articles of a supplementary constitution, called the Acte addi-
tif, intended to establish the legality of his throne. It has also been the site of international expositions of 1867, 1878, 1889 and 1900. See Paris.

CHAMP DE MARS, (Latin Campus Martius), and CHAMP DE MAI, shăn-
dé-má, the annual public assembly of the Franks. They were held originally in March and called from the place of meeting Champs de Mars; in the 8th century they were transferred by Pepin, the father of Charlemagne, to the month of May, and called the Champs de Mai. At the Champs de Mai, all questions relating to public affairs, such as war, peace, the enactment of laws, were decided by the majority. These assemblies were held irregularly under the Merovingians, but became more frequent and systematic under the first Carolingians, being called together only the nobility and the clergy; but Charlemagne ordered that every count should bring with him 13 men from his jurisdiction, to represent the people in the General Assembly. The first decree was that it be departed from this usage, but Philip IV, who reigned from 1285 to 1314, restored the third estate by calling together delegates from the cities.

CHAMPAIGNE, Philippe de, Flemish painter; b. Brussels, 26 May 1602; d. Paris, 12 Aug. 1674. He went to Paris at the age of 19, and worked on the decorations of the Luxembourg under Duchesne; he was later appointed court painter by Marie de Medicis. He was also a member and finally rector of the Academy of Painting and Sculpture. His coloring is excellent and his portraits possess great merit. His best pictures are at Vincennes and at Paris; among them are a portrait of himself, a portrait of Richelieu, 'The Apostle Philip,' and 'The Last Supper,' all in the Louvre.

CHAMPAGNE, chám-pán' (Fr. shăn-
pán-ye), France, an ancient province which, after the Revolution formed one of the 12 great military governments of the kingdom. The name Champagne, formerly Champaigne, is derived from the vast plains (Lat. campus, "a plain") which occupy the territory. Champaign was bounded on the north by Hainault and the bishopric of Liège; on the east by the duchy of Luxembourg and Lorraine; on the south by Franche-Comté and Burgundy; and on the west by L'Orléanais, L'Isle de France and Picardy. It forms at present the departments of Meurthe-et-Moselle, Haute Marne, Aube, Ardennes and part of those of the Yonne, the Aisne, Seine-et-Marne and Meuse. The land is fertile, and produces the celebrated wine called after its name. In the Middle Ages it was a part of the region of Troyes which Troyes was the capital, and was united with France when Louis Hutin, Count of Champagne, succeeded to the throne of France under the title of Louis X in 1314.

CHAMPAGNE, a French wine made chiefly in the department of the Marne, in the former province of Champagne. It is commonly divided into river and mountain wines (vins de la rivière de Marne, and vins de la montagne de Reims), the former being for the most part white, the latter red. Not all of these wines are sparkling or frothing, though by the name "champagne" is generally understood such wine as has been subjected to an imperfect fermentation, and contains a quantity of carbonic acid gas, generated during the insensible fermentation in the bottle, this gas being disengaged on remaking by which it was detained in solution. The briskest wines are not always the best; they are, of course, the most defective in true vinous quality, and the small portion of alcohol which they contain immediately escapes from the froth as it rises on the surface, carrying with it the aroma, and leaving the liquor that remains in the glass nearly vapid. Hence the still or the creaming or slightly sparkling Champagne wines (vins crémants or demi-
mousses), are more highly valued by connoisseurs and bring greater prices than the full-frothing wines (vins grand-mousses). By icing these wines before they are used the tendency to effervescence is in some degree repressed; but when they are not thus prepared precaution is unnecessary. In general, it may be observed that the vineyards on the banks of the Marne supply the choicest wines, and that the quality degenerates in proportion as they recede from the river. Among the white wines of Champagne the first rank is generally assigned to those of Sillery, the produce of the vineyards of Verzenay, Mailly, Raumont, etc. Of the Rheims Mountain wines those of Verzi, Verzenay, Mailly, Boury and Saint Basle are most esteemed; but the Clos Saint Thierry furnishes perhaps the finest red champagne. The soil of the principal vineyards throughout Champagne is composed of a loose marl resting on chalk and sometimes mixed with flints. For the manufacture of the white Champagne wines black grapes are now generally used. In making the red wines the grapes are trodden before they are introduced into the vat. Champagne, when well made, and placed in cool cellars, will retain its good qualities from 10 to 20 years. See WINE AND THE WINE MAKER.

CHAMPAGNY, shăm-pán-yé, Jean Baptiste Nompère (nón-pá') de (Duke de Cadore), French naval officer, diplomatist and politician; b. Roanne, 4 Aug. 1756; d. Paris, 3 July 1834. He entered the navy in 1780, and was a member of the States-General, National and Constituent Assemblies. Thrown into prison in 1793, he was released after the 9th Thermidor (1794), and became councillor of state. He was employed by Napoleon as Ambassador to Vienna, and as Minister of the Interior and of Foreign Affairs, and he negociated the marriage with Marie Louise. After Napoleon's downfall he transferred his allegiance to the Bourbons, under whom he was restored to the Chamber of Peers.

CHAMPAIGN, shäm-pán', Ill., a city in Champaign County, on the Illinois Central, the Cleveland, Cincinnati, Chicago, St. Paul and other railroads, 48 miles southeast of Bloomington. It is the trade centre of the richest agricultural county in the State. It has an ice and cold storage plant, railroad shops, extensive foundries and tool and textile factories. It is the twin town of Urbana,
which contains the University of Illinois, and it has a fine public library, several parks and a high school. Settled in 1855, it was incorporated in 1860. Its government is administered by a mayor and city council. The electric-light plant is owned by the city. Pop. (1910) 12,421.

CHAMPAK, চ্ছাঁপাক, an East Indian tree (*Michelia champaca*), of the natural order Magnoliaceae. It has large axillary flowers of a deep yellow color, and very fragrant, which are much celebrated in Hindu poetry. The tree is sacred to Krishna, and the women of India adorn their hair with its blossoms. The bark has tonic properties.

CHAMPE, แชม, John, American soldier: b. Loudon County, Va., 1752; d. Kentucky about 1798. He was selected by request of Washington to go to New York as a deserter and spy, and if possible to seize and bring off Arnold in time to save the life of André. Champe undertook the enterprise with considerable success. Amphitheatrical, with difficulty, was hotly pursued by his comrades as a deserter, reached New York, underwent an examination before Sir Henry Clinton, and by him was consigned to General Arnold, who gave him in the British army his former rank. He discovered the custom of Arnold to walk in his garden at a late hour every night, formed a plan with a comrade to seize and gag him there, and to take him between them as a drunken companion to a boat on the Hudson, whence arrangements were made for his transportation to the American headquarters. On the appointed night Arnold failed to appear in the garden, and Champe, after waiting for him till near morning, returned with deep chagrin to his position in the British army. It proved that Arnold had the day before changed his quarters, preparatory to the embarkation of his troops for Virginia. There was nothing left for Champe but to embrace the first opportunity to escape to the America army, which he did soon after landing in Virginia, and joined the troops under General Greene. Washington discharged him from further service, lest, falling into the hands of the enemy, he should be immediately put to death. He died before Washington could reward him for his services.

CHAMPEAUX, ช้านปู, Guillaume de, French philosopher: b. Champeaux, about 1050; d. 1121. He was so called from the place of his birth. He studied at Paris under Anseline, de Laon and Manegold, and afterward himself opened a school there, in which he had numerous pupils. The schools opened by De Laon and Champeaux are regarded by Pasquier as the origin of the University of Paris. Among the pupils of Champeaux were Robert de Belbeu, one of the most distinguished prelates of the age, and still more famous, Abelard. Jealous of the younger man's acumen he retired from his school and founded in 1113 the abbey of Saint Victor. A few months later he was bishop of Châlons. He defended the doctrine of realism against the nominalism of Abelard; but it is only in the works of Abelard that any record of their contention remains. Champeaux has left a treatise on the origin of the soul, "De Origine Animæ," in which he examines the question how children dying without baptism are justly damned, which he concludes by referring to the unfathomable judgments of God. The only other work of his which has been printed is "Moriaia Abhreviation," an History of the city council. The electric-light plant is owned by the city. Pop. (1910) 12,421.

CHAMPION, or CHAMPARTY (Lat. campsis partitio, "a division of land"), in law, a bargain with the plaintiff or defendant in any suit to have part of the land, debt or other thing sued for, if the party that undertakes the suit prevails therein, the champertor carrying on the party's suit at his own expense. It is a species of maintenance, and is generally held to be illegal both in courts of common law and equity; but in some of the States of this country such agreements are recognized by law, and the tendency is toward freedom of action in these as well as other contracts. See MAINTENANCE.

CHAMPIER, ชานเพียร, Symphorien, French historian: b. Saint Symphorian-le-Loize, Lyons; d. Lyons about 1540. Famed as a physician, with powerful friends at court and an ample fortune, he took delight in literature and the society of literary men, himself writing a series of poems for 'Virtuous Ladies' (1503), in four divisions, entitled 'The Flower of Dames,' 'The Rule of Love,' 'The Prophecies of the Sibyls' and 'The Book of True Love,' respectively. His best history is an account of 'Princes and Battles' (1502).

CHAMPION, or CHAMPION, the French name for the common mushroom (Agaricus campestris). See AGARIC.

CHAMPION, one who undertakes to defend, in combat or by argument, another person, a doctrine or a cause. In the rudest state of society men avenge their own wrongs without restraint. The first step commonly made toward a better state of things in the rude beginnings of political society is to confine this right within certain bounds, and allow it to be exercised only with certain formalities. This
CHAMPION'S HILL

was done by the feudal institutions of Europe, which recognized in many circumstances, under the toleration of the Church itself, the right of privatcly gaining land. In some countries, however, particularly in England, the legal recognition of the right of combat had this injurious effect, that the practice became so settled as to be allowed to continue even after more rational ideas had grown up on the subject of the admittance of just combat. The combat, after it had become a common means of settling disputes, was not always waged by the contending parties. This was the case, indeed, in appeals of felony, and if the heir, either from sex or age, was incapable of "waging his battle," as it was called, the question was left to a more rational mode of settlement. But in the writ of right, the last and most solemn decision respecting real property, the tenant was required to produce his champion, who threw down his glove as a challenge to the champion of the demandant, and the latter, by taking it up, accepted the challenge. The laws authorizing judicial combat, though fallen into disuse, continued to disgrace the English statute-book till 1819. Even the right to the English crown was in some degree put in issue by appeal to judicial combat; and the appearance of a champion offering battle to any one who gainsays the right of the king to the crown was till recently a part of the ceremonial of an English coronation. This office was for four centuries hereditary in the family of Dymoke, of Lincolnshire. The champion's function was to ride into Westminster Hall in full knightly armor, throw down his gauntlet and proclaim his readiness to defend the title of the sovereign to the crown against any one disputing it. The last exercise of the office was at the coronation of George IV.

The term "champion" is also used in the realm of athletics to designate one who is preeminent in a certain branch.

CHAMPION'S HILL, Battle of. On 30 April 1864, General Grant crossed to the east side of the Mississippi River at Bruinsburg, 32 miles in a direct line below Vicksburg. On 1 May he marched to Port Gibson, defeating a Confederate force under Gen. J. S. Bowen. The next day, at the post of Hanks' Ferry, and of the 3d Grant reached Hanks' Ferry; then, after bringing up supplies, marched north-east to interpose between the Confederates, under Gen. J. C. Pemberton, in and near Vicksburg, and those at Jackson, the capital of Mississippi, 40 miles east of Vicksburg. The battle of Raymond was fought and won on the 12th, and on the 14th Gen. Joseph E. Johnston was attacked, defeated and driven north from Jackson, Grant occupying the place. Learning from an intercepted dispatch, one of three sent by Johnston to Pemberton, on the 13th, that Pemberton had been advised to march with all his available force on Clinton, 10 miles west of Jackson, and attack Grant's rear, while Johnston operated on his front or flank, Grant, leaving Sherman with two divisions to destroy all property and manufacturing establishments, turned the rest of his army from Clinton, Raymond and Auburn, on Bolton and Edwards Station, on the Vicksburg and Jackson Railroad, the nearest points where Johnston could unite forces with Pemberton, and at night of the 15th the various divisions were near their designated positions. Pemberton, with the three divisions of C. L. Stevenson, J. S. Bowen and W. W. Loring, was near Big Black River on the 14th when he received one of the triplicate dispatches sent by John- son on the 13th. Anxious to hold Vicksburg and the line of the Big Black, 13 miles east, he questioned the wisdom of acting upon Johnson's suggestion and called a council of his leading officers, a majority of whom agreed with Johnston; but he adopted the suggestion of Loring and Stevenson, to move on Grant's rear in the direction of Raymond and advanced on the 15th for that purpose, Loring's division halting at night on the Raymond road at Elliston's, six miles east of Edwards' Sta-
CHAMPLAIN 373

ing of the 16th, Grant, who was at Clinton, heard that Pemberton was marching to attack him, upon which he sent orders for MacPherson, with the divisions of Logan and Crocker, to close up rapidly on Hovey, and for the four divisions under MacPherson, Pemberton, and middle roads to move forward cautiously and establish communications with each other. He then hastened by the Clinton road to the front. A. J. Smith, advancing on the Raymond road, attacked and drove in Loring's skirmishers about 8 o'clock. At 9 o'clock on the middle road engaged those in his front, artillery was brought up and opened fire, but McClellan, who was in command of the four divisions, more than half the army on this part of the field, doubtful if Grant wanted him to bring on a general engagement, deferred attack until 2 P.M., when he received Grant's order to attack, upon which he ordered Smith and Osterhaus to attack vigorously and "press for victory," but the attack was not a vigorous one. Crocker again charged the town, who being fought out and decided on the right, on Champion's Hill. Hovey, advancing on the Clinton road, began skirmishing with Stevenson at 10 o'clock and began to form line for a general attack, directed by Grant to wait until McClellan could be heard from. Logan came up at 11 o'clock; nothing had been heard from McClellan and line was formed for a general attack, Hovey south of the Clinton road and Loring on his right. It was about noon when Hovey advanced with great spirit, climbed Champion's Hill and attacked; finally, after a hard contest with varying success, driving back the right of Stevenson and capturing 11 guns, soon after which Logan, who had worked around on Stevenson's left, on the north side of the hill, attacked and drove back Stevenson's left and captured seven guns. The positions thus gained were held until 2 o'clock. Meanwhile Stevenson, who had been compelled to take ground to the left to meet Logan's flank movement and cover the road to Baker's Creek and Edwards' Station, had induced Pemberton to draw Bowen to the left and close the interval between the two divisions and Loring was ordered to close in on Bowen. It was about 2 o'clock when Bowen closed in on Steverson and his two leading brigades, F. M. Cockrell's and Green's, attacked Hovey furiously and drove him back down the hill, Hovey contesting every foot, but forced to abandon nine of the captured guns. As Hovey fell back two regiments of Crocker's division came to his support, and the Confederates were checked. Artillery was now massed and poured such an effective enfilading fire upon Stevenson's line that it was much shaken, and Hovey and Crocker again charged up the hill, driving Stevenson and Bowen, after a desperate resistance, before them; and Pemberton, seeing his left entirely broken, at 3 o'clock gave the order for a general retreat, which he ordered Loring to cover. Before this, Loring, leaving Gen. Lillard, Tilden's brigade on the Raymond road to oppose Smith and Blair, had already with two brigades nearly closed up on Bowen, and when the retreat began was forming his men between the Clinton and Raymond roads, when he was attacked by Osterhaus, and soon gave way, falling back to the Raymond road. Meanwhile A. J. Smith had advanced on the Raymond road, defeated and killed Tilghman. Loring reunited his command and retreated on the Raymond road, but when he came to the ford of Baker's Creek he found it in Union possession, upon which he was obliged to find a crossing lower down, and realizing that he had been cut off from Pemberton's army, he moved off to the south, abandoning his artillery, and on the 19th joined Johnston, who meanwhile had recaptured Jackson. Stevenson's and Bowen's division was left behind. On July 5th, Grant following as far as Edwards' Station, where darkness ended the pursuit. Grant says he fought the battle with about 15,000 men actually engaged in four hours of hard fighting, preceded by two or three hours of skirmishes, some of which rose almost to the dignity of battle. The Union loss was 410 killed, 1,844 wounded and 187 missing. The Confederate loss was 380 killed, 1,018 wounded, 2,441 missing and 24 guns taken. Grant pursued next day, the 17th, defeated Pemberton at the Big Black and on the 19th invested Vicksburg. Consult "Official Records" (Vol. XXIV); Green, "Mississippi;" Grant, "Personal Memoirs;" The Century Company's "Battles and Leaders of the Civil War," Vol. III, 488. E. A. Carman.

CHAMPLAIN, shān-plān or shām-plān', Samuel de, French navigator, colonizer and soldier: b. Brouage, Saintonge, about 1570; d. Quebec, 25 Dec. 1635. In early life he served in the army of Henri IV, as quartermaster of cavalry, but in January 1590 he sailed as captain of the Saint Julien to the West Indies, Mexico and Panama. On his return (1601) he prepared a record of this cruise, with charts, etc., which is preserved in manuscript form at Dieppe. An English translation was published in 1859, and it appeared in the original in 1870. In March 1603 he sailed for North America, and explored, by boat, the Saint Lawrence River up to the Falls of Saint Louis, and down to Gaspe, and published a small book describing his voyage. In May 1604 he sailed with Marquette along the shores of Nova Scotia, wintered on the island of Saint Croix and founded a colony at Port Royal. From 1604 to 1606 he made careful surveys and charts of the coast as far as Cape Cod. He revisited France in 1607, but sailed again in 1608, and founded Quebec, which, owing to the development of its fur-trade, rapidly increased in size. In 1609 he accompanied an Algonquin and Huron expedition against the Iroquois, and thereby discovered Lake Champlain, on the borders of which the Iroquois were defeated. From September 1609 to March 1610 he was engaged in bringing over French mechanics for his colony. In 1611 he established a trading-post at the present site of Montreal. He became lieutenant-governor of New France, 8 Oct. 1612; received the band of Indians against the Iroquois, traversing a large part of the present State of New York; fortified Quebec in 1620, but was compelled in 1629 to surrender to an English fleet, and was taken to England. Released again for New France, with three well-equipped vessels, and spent his last years in the government and development of the French colonies. A complete edition of its works was published in 1870, Laverdiere and Casgrain being the
editors. An English translation by Charles Otis, with a memoir by E. F. Slafter appeared in Boston (3 vols., 1878–82). Consult 'Voyages of Samuel de Champlain, 1604–18' (New York 1907); Parkman, 'Pioneers of France in the New World' (Boston 1865); Sedgwick, in 'The Historical Biographies Series at the New York'.

Colby, 'Canadian Types of the Old Régime', (1908).

CHAMPLAIN, Lake, a body of water chiefly in the United States, between the States of New York and Vermont, but having its northern end six miles within the Canadian boundary, in the province of Quebec. Its extreme length, north to south, is about 125 miles; breadth, from half a mile to 15 miles; area, about 600 square miles. It is 90 feet above the level of the sea. It was discovered in 1609 by Samuel Champlain, governor of Canada, whence its name. It is navigated by steamboats and other vessels, and is deep enough for ships of the largest class. Its waters are carried northward to the Saint Lawrence by the river Richelieu or Sorel, which, in conjunction with the Champlain Canal, affords year-round navigation for large vessels, and forms a well-frequented line of communication. The south end of the lake is connected by a canal with the Hudson River, Lake Champlain thus affording water communication between the Saint Lawrence a few miles below Montreal and the Atlantic at New York. Upwards of 50 islands are scattered over its surface; and it receives numerous streams, none of which are very important. The scenery along its sides is picturesque. The Green Mountain Range lies about 20 miles east of the lake; on the west are the Adirondacks. It abounds in salmon, shad, pike and other fish; in winter it is usually frozen over. The chief port on its banks is Burlington, Vt. The other towns of importance are Rouses Pond, Plattsburg, Port Henry, Crown Point and Whitehall in New York. During the wars between the United States and Great Britain, this body of water was the scene of numerous military operations.

The Champlain Society, whose headquarters are at Toronto, has published important historical writings dealing with the history of New France. In July 1909 a celebration was held in honor of the tercentenary of the discovery of Lake Champlain, which was participated in by many nations.

CHAMPLAIN, Lake, Battle of, in the War of 1812. During 1812 and 1813 no important naval operations had taken place on Lake Champlain. On 3 June 1813 the British cleared the lake of the few small American vessels, and captured the commander, Whereupon Lieut. Thomas MacDonough (q.v.) was ordered to construct a new navy. During the following winter and spring both Americans and British pushed forward the building of sloops, brigs and gunboats. The British were first afoot but the summer passed in maneuver as Sir George Prevost with 11,000 men was preparing to cross the border. Brig.-Gen. Alexander Macomb (q.v.) with 1,500 regulars and 700 militia under Gen. Benjamin Mooers had encamped at Plattsburg and had thrown up works on the southern side of the town just across the bridge over the Saranac, but as the village was untenable when the British approached from the north, Macomb destroyed the bridge and retired to his breastworks. From 6–11 Sept. 1814 the two armies continuously skirmished and the British brought up heavy ordnance preparatory to assaulting the fort, but when Prevost held MacDonough's fleet in the bay he decided before attacking to await the arrival of the British fleet under Capt. George Downie. On the morning of 11 Sept. 1814 the fleet appeared, consisting of the Constance, Linnell, Chubb and Finch, besides 12 smaller gunboats. The American fleet consisted of the Saratoga, Eagle, Ticonderoga and Preble, besides 10 gunboats. While the weight of metal thrown by the American fleet surpassed that of the British, the latter had 60 long range guns to MacDonough's 45 and thus if the battle were fought at long range the advantage lay with Downie. But MacDonough anchored his fleet so that Downie would be compelled to pass between him and the land and could not come to anchor on his broadside or range of the American cannonades. Downie anchored his flagship, the Constance, 300 yards from MacDonough's flagship, the Saratoga, and at the first broadside nearly blew the American vessel out of the water, killing or wounding one-fifth of the crew. While these two vessels were engaged, the Eagle disabled the Chubb but was herself soon driven out of the fight; the Ticonderoga drove the Finch to Crab Island where she surrendered; but the British gunners forced the Preble to seek shelter. This left the Linnell free to aid the Constance, which, having suffered severely, lacked the power to silence the Saratoga. Thus exposed to the concentrated fire of both ships the starboard guns of the Saratoga were soon silenced but MacDonough let go his stern anchor, winded his ship and brought the unused port battery to bear on the Constance, with the result that in 15 minutes Downie struck his colors. The Saratoga next opened on the Linnell and compelled her to surrender, whereupon the remaining British gunners, with the aid of their sweeps, moved away and escaped with every ensign down. The American loss was 52 killed and 89 wounded; and the British loss 57 killed and 92 wounded and 224 taken. Meanwhile while Prevost was shelling Macomb's defenses and endeavoring to cross the Saranac in the hope of crushing the Americans by assault. As these efforts were fruitless and as control of the lake was in American hands Prevost, during the night of 12–13 September, sent away his baggage and artillery and retreated, leaving behind only his sick and wounded. The Americans pursued a short distance but quickly returned. Champlain Stage—Champneys 275

Champlain Stage, the name given by American geologists to the subsidence that was a feature of the close of the Glacial Epoch in New York, New England, Ontario, and Quebec. At the beginning of the Glacial Epoch the elevation of this section of the continent may have been greater than now, but when the ice-sheet finally retreated the sea extended up the Saint Lawrence River nearly to Lake Ontario, and the lower Ottawa River and Lake Champlain were occupied by salt water. The stage is named from the lines of old sea beaches containing whale and walrus bones, thus showing the submergence, typically developed about Lake Champlain. The total amount of the depression varied, being greatest over the Saint Lawrence Valley. About New York harbor the coast was depressed fully 70 feet; at Albany 355 feet. Along the Maine shore the land was 150 to nearly 300 feet lower than now, and in the Saint Lawrence valley the depression was over 500 feet, making allowance for the previous elevation the total depression in the Saint Lawrence Valley reached 1,500 feet. The climate of Champlain times was probably warmer and moister than that of the present. On the Pacific coast are evidences of depression in the region about Mount Saint Elias, shells of Champlain species being found at an altitude of 5,000 feet. (See Glacial Period: Quaternary Period). The term Champlainic system has been proposed to replace Orдовiscian system, but the proposal has not met with general acceptance.

Champleye, shân-lye-â', Enamels. See Art Enamels.

Champlin, châm-plûn, James Tilt, American educator: b. Colchester, Conn., 9 June, 1811; d. Portland, Me., 15 March, 1882. He was graduated as valedictorian at Brown University in 1834, and was tutor there 1835–38. He was a Baptist pastor at Portland, Me., 1838–41; professor of Greek and Latin, Waterville (Colby) College 1841–59; president of the college 1857–73; professor of intellectual and moral philosophy 1858–73, when he removed to Portland to devote himself entirely to literary work. He published a large number of school and college textbooks, including English, Greek and Latin grammars, editions of Æschines and Demosthenes orations, Tacitus, and Butler's 'Anology of Religion.' Others are 'Text-book of Intellectual Philosophy' (1860); 'First Principles of Ethics' (1862); 'Political Economy' (1868); 'Scripture Reading Lessons' (1876); 'Constitution of the United States; with Brief Comments on the Constitutions of England and France' (1880).

Champlin, John Denison, American author: b. Stonington, Conn., 29 Jan., 1834; d. 8 Jan., 1889; graduated at Amherst College 1856, and admitted to the bar in 1859. In 1864 he became associate editor of the Standard at Bridgeport, Conn. He afterward published The Sentinel (1865–69) at Litchfield, Conn. He devoted himself entirely to literature from 1869, and became associate editor of the 'American Encyclopædia' (1875). Author 'Young Folks' Cyclopaedia of Common Things' (1879); 'Young Folks' Catechism of Common Things' (1880, 1906); 'Young Folks' Cyclopaedia of Poems and Places' (1880, 1889, 1911); 'Young Folks' Astronomy' (1881); 'Young Folks' History of War for the Union' (1881); 'The Ghost Coach' (1886); 'Young Folks' Cyclopaedia of Games and Sports' (with Arthur E. Bostwick, 1890); 'Young Folks' Cyclopaedia of Literature and Art' (1901); 'Young Folks' Cyclopaedia of Natural History' (1903); 'The Tragedy of Anne Hutchinson' (1911). Editor 'Fox's Mission to Russia' (1873); 'Cyclopaedia of Painters and Paintings' (1886–88); 'Cyclopaedia of Music and Musicians' (1886–90); 'Liber Scriptorum' (1893). Associate editor 'The American Cyclopaedia' (1873–77); 'The Standard Dictionary' (1892–94); 'Orations, Addresses, and Speeches of Chauncey M. Depew' (1910).

Champney, châm-pnî, Benjamin, American artist: b. Ipswich, N. H., 29 Nov., 1817; d. Woburn, Mass., 14 Dec. 1907. He went to Boston in 1834, and studied for a time in a lithographic establishment. From 1841 to 1848 he studied painting in Paris and Italy, exhibiting in lithographic form in several times the Paris Salon. He worked chiefly in landscape and flower painting, and his White Mountain paintings, which are owned in and around Boston, are famous. After 1853 he passed most of his summers in North Conway, N. H. He painted also a panorama of the Rhine and published 'Sixty Years' Memories of Art and Artists' (1900).

Champney, Elizabeth Williams, American author: b. Springfield, Ohio, 6 Feb. 1850. She was graduated at Vassar College 1869, has traveled extensively in Europe and written many papers for Harper's and the Century. She is president of the board of managers of the Messiah Home for Children. She has published 'The Bubbling Teapot'; 'Howling Wolf and His Trick Pony'; 'All Around a Palette'; 'Bourbon Lilies'; 'Rosemary and Rue'; 'In the Sky Garden'; 'Vassar Girls Abroad'; 'Witchcraft in the United States'; 'Dames and Daughters of Colonial Days'; 'Romance of the Feudal Châteaux' (1900); 'Romance of the Renaissance Châteaux' (1901); 'Romance of the Bourbon Châteaux' (1903); 'Romance of the French Abbeys' (1905); 'Romance of Italian Villas' (1906); 'Romance of Roman Villas' (1908); 'Romance of Imperial Rome' (1910); 'Romance of Old Belgium' (1913).

Champneys, châm-pnîz, Basil, English architect: b. 1842. He was educated at Trinity College, Cambridge, and after studying architecture with the architect William, of Land daff, began the practice of his profession in 1867. Important works of his are the divinity and literary schools of Newnham College and the Archaeological Museum at Cambridge; Indian Institute, Robinson Town at New College and Mansfield College, Oxford; Rylands Library in Manchester; Butler Museum at Harrow; and Quincentenary buildings at Winchester College. He is cathedral architect at Manchester. He has published 'A Quiet Corner of England,' a delightful description of
CHAMPOLLION—CHANCEL

Rye and Winchelsea (1875); 'Henry Merritt: Art Criticism and Romance' (1879); 'Coventry Pacquet: Memoirs and Correspondence' (1900).

CHAMPOLLION, shânh pó̂l yôn, Jean François, le jeune, French Egyptologist: b. Figeac, Lot, France, 23 Dec. 1790; d. Paris, 4 March 1832. At an early age he devoted himself to the study of Hebrew, Arabic, Coptic, etc. In 1807 he read a paper before the Academy of Grenoble on the ancient Egyptian geographical names, which he endeavored to explain by the Coptic. He then went to Paris, where he continued his Oriental studies, paying particular attention to the Coptic, and endeavoring through it to find the key to the Egyptian hieroglyphics. In 1809 he became professor of history at Grenoble, but soon retired from this post and went to Paris, where he devoted himself almost exclusively to the study of Egyptian antiquities. Assisted by the trilingual inscription of the Rosetta stone he at length discovered the key to the graphic system of the Egyptians, the three elements of which—figurative, ideographic and alphabetic—he expounded before the Institute in a series of memoirs in 1823. These were published in 1824 at the expense of the state, under the title of 'Précis du système hiéroglyphique des anciens Egyptiens.' In 1824 he went to Italy, and investigated the collections of papyri and other Egyptian antiquities in the principal cities there. In 1826 Charles X appointed him to superintend the new department of Egyptian antiquities in the museum of the Louvre. In 1828 M. Champollion went as director of a scientific expedition to Egypt, at the expense of the King. He was admitted a member of the Academy of Inscriptions in 1830. In 1831 the chair of Egyptian archaeology was created for him in the Collège de France. His principal works are 'Grammaire Égyptienne' and 'Dictionnaire hiéroglyphique,' both published after his death. His 'Notice manuscrits' (1844 et seq.) gives an adequate description of the results of his Egyptian journey. Of the numerous books and essays published during his life the most noteworthy are 'Panthéon égyptien' (1824); 'Sur l'écriture hiéroglyphique' (1821); 'Sur l'écriture démotique' (1824). They are indispensable to the student of hieroglyphics. Consult Champollion, Aimé, 'Les deux Champollion, leur vie et leurs œuvres' (Grenoble 1888).

CHAMPOLLION FIGEAC, fé-shâ̂h, Jean Jacques, French archaeologist, elder brother of the preceding: b. Figeac, Lot, 5 Oct. 1778; d. 9 May 1867. He completed his studies at Grenoble, published his first archaeological memoirs in 1803, and was named successively librarian of Grenoble, professor of Greek literature, secretary and dean of the faculty of letters of the same town. He took an active part in everything connected with science and letters in the department of the Isère. He acted as secretary to Napoleon in drawing up under his direction the account of his memorable passage from Elba to Grenoble. In 1828 a place was made for him as keeper of the manuscripts in the Royal Library, and shortly afterward he was installed in the chair of paleography in the Ecole des Chartes. He was made an officer of the Legion of Honor in 1866. His principal works are 'Antiquités de Grenoble' (1807); 'Paléographie universelle'; 'Nouveaux éclairs sur la ville de Cularo, aujourd'hui Grenoble' (1814); 'Annales des Lagides' (1819); 'Traité élémentaire d'archéologie' (1843); 'Écriture démotique égyptienne' (1843); 'L'Egypte ancienne et moderne' (1850); besides several other interesting works on Oriental history, and on the language and antiquities of the department of the Isère. He collaborated in editing the manuscripts left by his brother. Consult the authority cited above.

CHAMPS ELYSEES, shâ̂n'să̂l'se'ês (Fr. Fr. "Elysian Fields"), a large avenue in Paris, with its surrounding gardens. It extends from the Place de la Concorde to the Arc de Triomphe de l'Étoile, a distance of one and a quarter miles, and is a famous public resort and promenade. The lower end forms a park, on either side of which are placed the Palais de l'Elysée and the two Palais des Beaux Arts, occupying the site of the old Palais de l'Industrie. It became the property of the Crown in 1616 and was ceded to the city in 1828.

CHANCE, chân'se, Dr. (believed to have been Direcchymus), Spanish physician: b. Seville; who became a companion of Columbus on his second voyage in 1493. One of the principal authorities for this voyage is the letter which he wrote to the Catholic college at Seville, giving an account of his journey. No record has been kept of his subsequent life.

CHANCE, in its original and strict meaning, is a description of events which cannot be subsumed under any law, causal or theological. Strictly speaking, it is an idea which few men would now be disposed to admit as corresponding to anything which really exists; the religious mind excluding it as inconsistent with the belief in the divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be, popularly accepted as a term denoting an unknown cause, or a cause so remote that it is overlooked when events are considered superficially and apart from their universal connection, and as the mathematical theory of events which are chance in this derived sense, see PROBABILITY, THEORY OF.

CHANCE, Games of. See GAMBLING.

CHANCE ACQUAINTANCE, A, a story by William Dean Howells, published in 1873. This agreeable and entertaining sketch contains many charming descriptions of the picturesque scenery and places about Quebec.

CHANCE-MEDLEY, homicide happening in self-defense, on a sudden quarrel or in the commission of an unlawful act, without any deliberate intention of doing mischief.

CHANCEL, that portion of a church occupied by the clergy, and often separated from the nave and aisles by screens of carved stone or oak. The screen separating the chancel from the nave was called the jamb because an ancienrood or large crucifix was usually placed on it, accompanied with two figures representing Saint John and the Virgin Mary. In the chancel were situated the high altar, the sedilia, or seats for the officiating clergy, and the piscina, in which the water used for washing
the hands of the celebrant was poured. It usually contains carved seats or stalls, occupied by the clergy not engaged in the services. These are enriched with carvings and have canopies of carved oak. The chancel occupies the same place with the apse in the churches of basilicas, and was called so from the cancelli, or rails used in the early churches to separate the clergy from the laity. The chancel is always at the east end of the church (churches being technically considered as having their major axes extending east and west) and is often constructionally a separate building opening from the nave with a lower roof elevation and raised several steps above the nave. In architecture the term is often employed as synonymous with choir (q.v.).

CHANCELLOR, Charles Williams, American physician: b. Spottsylvania County, Va., 19 Feb. 1833; d. Washington, D. C., 3 Jan. 1915. He studied at Georgetown College and the University of Virginia, 1848-52, and was graduated at Jefferson Medical College, Philadelphia, 1864. During the Civil War he was medical director of General Pickett's division in the Confederate army, 1863-65. He was professor of surgery in and dean of Washington University, Baltimore, 1866-75; secretary of the Maryland State board of health, 1876; president of the Maryland State Insane Asylum, 1880; and United States consul at Havre, France, 1893-97. Among his numerous reports and articles on medical and sanitary topics are the following: 'Report upon the Condition of the Prisons, Reformatory and Charitable Institutions of Maryland' (1875); 'Contagious and Infectious Diseases' (1878); 'Mineral Waters and Seaside Resorts' (1883); 'Drainage of the Marsh Lands of Maryland' (1884); 'Awards 1886'; 'Sewerage of Cities' (1886); 'Climate of the Eastern Shore of Maryland.'

CHANCELLOR, Richard, English navigator: d. 10 Nov. 1556. He seems to have been brought up in the household of the father of Sir Philip Sidney and was chosen in 1553 as captain of the Bonaventure and pilot-general of Sir Hugh Willoughby's expedition in search of a northeast passage to India. The ships were parted in a storm off the Lofoden Islands and Chancellor, after waiting seven days at Vardøhus, the rendezvous agreed upon, proceeded alone into the White Sea and traveled thence overland to the court at Moscow, where he was very hospitably treated and was able to conclude a treaty giving freedom of trade to English ships. His interesting account of Russia was published in Hakluyt's 'Navigations.' Next spring Chancellor rejoined his ship and returned to England, where his hopeful reports led to the establishment soon after of the Muscovy Company. In the summer of 1555 he made a second voyage in the Bonaventure to the White Sea, and was at Moscow once more in the succeeding winter. In July 1556, he set sail on his voyage homeward, but was lost in the wreck of his ship in Aberdeen Bay off the Aberdeenshire coast.

CHANCELLOR, an officer supposed to have been originally a notary or scribe, under the Roman emperors and named cancellarius, because he sat behind a lattice — called in Latin cancelli — to avoid being crowded by the people. There are, however, other derivations of this title. Whatever may have been its origin, the office and name of chancellor were undoubtedly known at the court of the Roman emperors, where the title seems to have signified originally a chief secretary or secretary, who was afterward invested with several judicial powers and with superintendence over the other officers of the empire. From the Roman empire the title and office passed to the Roman Catholic Church and hence every bishop of to this day his chancellor, the principal judge of his consistory. When the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preserved its chancellor, with different jurisdictions and dignities according to their different constitutions. In all he seems to have had the supervision of all charters, letters and such other public instruments of the Crown as were authenticated in the most solemn manner, and therefore, when seals came into use, he had always the custody of the king's great seal. This officer has now great authority in all the countries of Europe. The Lord High Chancellor of Great Britain (originally of England) is the first judicial officer of the Crown and exercises an extensive jurisdiction as head of the judiciary, as first lay person of the state after the blood-royal. He is always one of the commissioners appointed to represent the sovereign in opening and closing Parliament or giving the royal assent to bills. He is created by the delivery of the great seal into his custody. In like manner the act of taking away the seal formally terminates his office. He is a Cabinet Minister and a privy councilor in virtue of his office, is speaker of the House of Lords by prescription and in that office has the right to address their lordships as well as to vote. He vacates office with the ministry which appoints him. He has a salary of £10,000 and, no matter how brief his tenure of the office may be, is entitled to a pension of £5,000 a year on vacating it. When Sir Robert Finlay was in December 1916 nominated for the office in the Lloyd-George government, he is believed to have created a precedent in stipulating for waiving of the pension in his case. Lord Chancellor presides over the Court of Appeal and the privy council in the exercise of judicial functions. He has the appointment of all justices of the peace in the kingdom, is visitor, in the king's right, of all royal foundations and patron of all Crown livings, the higher dignities in the Church of England being nominated by the Prime Minister. The office having in early times been always filled by ecclesiastics (for no others were then capable of an employment requiring his rank), he became keeper of the king's conscience; and by special appointment he now exercises a general superintendence as guardian over all infants, idiots and lunatics, though these latter powers are not necessarily attendant on his office, as Blackstone seems to have imagined, but can be delegated by the Crown to any other judicial officer, as in fact they were delegated even as late as the reign of James I, when the seals were held by Dr. Williams of Westminster and afterward bishop of Lincoln. The great seal has been not infrequently put in commission and was last so on the resignation of Lord Thurlow in the year 1793.
vice-chancellor was appointed to preside in the courts of equity by 53 George III, c. 24, and two by 5 Vict. c. 5, § 19. The two last-mentioned were at first subordinate vice-chancellors, but they were afterward made of equal rank. They sat in separate courts, and an appeal lay from their decisions to the Lord Chancellor. They latterly sat in the chancery division of the Supreme Court of Judicature. See CHANCERY; SUPREME COURT OF JUDICATURE.

The Chancellor of Ireland. There is a Lord High Chancellor of Ireland, who is the head of the judicial bench, with a salary of £8,000. He is not a member of the British ministry. The chancellorship of Scotland was abolished at the union. The Scottish Chancellor had no independent jurisdiction in equity, as there has never been a separate court of equity in Scotland; but he presided in Parliament, and was head of all the courts of judicature and of the Scottish office of chancery, in which all charters and other writs appointed to pass the great seal were recorded.

The Chancellor of the Exchequer is the Finance Minister of the Cabinet and as all questions of supply originate in the House of Commons, a peer is ineligible for this office, which originated in the separation of the chancery from the exchequer in the reign of Henry III. The holder of this office in recent years is generally held as having the reversion to the premiership, with which it has occasionally been conjointed.

The Chancellor of the Duchy of Lancaster is the representative of the Crown in the management of the lands of the duchy, which are the personal property of the sovereign. The office is a sinecure and is usually held by a minister of Cabinet rank, of high standing in the country, but who is unable to bear the physical strain incident to the management of a heavy department.

The Chancellor of a University is an official at the head of the university, generally a man of rank, whose duties are more or less nominal, but who is regarded as conferring the degrees. At Oxford his duties are almost entirely discharged by the vice-chancellor; the chancellor's own acts being limited to the signing of diplomas, etc. Under the vice-chancellor are four pro-vice-chancellors, nominated by him from among the heads of colleges, to one of whom, in his absence from the university, he delegates his authority. The chancellor of Cambridge University, whose duties are very similar to those of the Oxford official, is elected biennially by the senate; but there is no instance, at least in modern times, where a re-election has not taken place.

Chancellor of the Order of the Garter and Other Military Orders, an officer who seals the commissions and the mandates of the chapter and assembly of the knights of the order, keeps the register of their proceedings and delivers their acts under the seal of their order. The title "chancellor" is given, in England, to several officers of other bodies.

Chancellors of Other European Countries. — The chancellor was the highest officer in the German states and by the influence of his office was one of the most important. In Germany this dignity was from the remotest times vested in one of the higher clergy, until the head of the German clergy, the archbishop and Elector of Mainz, united it forever with his office as arch-chancellor of the empire. The two other spiritual electors held the same dignity, but they were merely titular; the archbishops of Cologne, as arch-chancellor of Italy; the archbishop of Trèves, as arch-chancellor of Gaul and Arles, that is, the kingdom of Burgundy, once belonging to Germany. The arch-chancellor of Mainz, on the contrary, had important alliances and political influence in the Diet and of the public business, as well as of all Imperial chanceries. The Elector appointed a vice-chancellor, who was the actual minister of the empire at the Imperial court. In the new German empire the Chancellor (Reichskanzler) is the president of the Federal Council (Bundesrat), and has the general conduct of the imperial administration. All laws of the empire, after being sanctioned by the Emperor, must be countersigned when promulgated by the Chancellor.

The Chancellor of France held a position analogous to that in England, was the highest officer of state and the only one who, when once appointed, could not be dismissed. In case, therefore, it was desired to separate the office from participation in affairs, a keeper of the seals (garde des sceaux) was appointed. As the Chancellor was properly the Minister of Justice, he was chosen from the body of jurists. A relic of his spiritual character was, that all his furniture, liveries and even his coat, were black.

CHANCELLORSVILLE, The Battle of. The Chancellorsville campaign included the battle of Chancellorsville, 1–3 May 1863, the action at Marye's Heights, 3 May 1863, and the engagement at Salem Church, 3 and 4 May 1863. In the fore part of April 1863 the Army of the Potomac, under General Hooker, and the Army of Northern Virginia, General Lee, confronted each other on opposite sides of the Rappahannock at Fredericksburg. Lee was so strongly entrenched on the south side of the river from Port Royal to Banks' Ford on the left, a distance of 25 miles, that an attack on his front was not to be thought of, and Hooker concluded to march his cavalry far beyond and around Lee's left, destroy his communications with Richmond and compel him to leave Fredericksburg, when he proposed to fall on his flank and rear as he fell back. For this purpose General Stoneman with 10,000 cavalry was put in motion, 13 April, under orders to ascend the Rappahannock, cross it west of the Orange and Alexandria Railroad, attack Lee's cavalry wherever found, and plant himself firmly across his line of retreat. Stoneman found the Rappahannock and other streams so swollen by heavy rains that he was compelled to abandon the movement, and Hooker modified his plans. He determined to flatten Lee's position and compel him to come out and fight on open ground of Hooker's own choosing. Lee had, in and around Fredericksburg, exclusive of cavalry, about 60,000 men and 170 guns; the two divisions of McLaw and R. H. Anderson of Longstreet's of the end of Jackson's of the end of A. P. Hill and D. H. Hill, commanded by R. E. Rodes; Trimble, commanded by R. E. Colston and J. A. Early. Hooker had, not including his 12,000 cavalry, about 118,000 men.
and 380 guns, divided into seven corps: First, Gen. J. F. Reynolds; Second, D. N. Couch; Third, D. E. Sickles; Fifth, George G. Meade; Sixth, John Sedgwick; Eleventh, O. O. Howard; Twelfth, H. W. Slocum. Both armies were in the best of condition. On the 27th the Eleventh and Twelfth corps marched for Kelly's Ford, 25 miles up the Rappahannock, arriving on the 28th, and being joined by the Fifth corps, all crossed the river next morning, the Eleventh and Twelfth corps marching for Germanna Ford on the Rapidan, the Fifth corps for Ely's Ford, lower down the same stream. Pleasonton's cavalry brigade accompanied the two columns. Some opposition was met at the fords, and at 2 P.M. of the 30th, after some sharp encounters with Stuart's cavalry, on the Germanna road, the three corps united at Chancellorsville, 11 miles west of Fredericksburg, and were joined the same day by two divisions of the Second corps, under Couch, which had crossed the Rappahannock at United States Ford, the Third-corps also being near. The cavalry was thrown out on the roads toward Fredericksburg and Spottsylvania. Hooker had concentrated with great ability 71,000 men on Lee's left and joined them before night. Mahone's and Posey's brigades of Anderson's Confederation division had been guarding United States Ford; the passage at Germanna Ford turned this position, and the two brigades on the 29th fell back to Chancellorsville, where Anderson had come up with Wright's brigade. Next morning Anderson fell back with the three brigades to near Tabernacle Church, four miles, and began to throw up works covering the roads converging at that point. These movements on Lee's left were covered by demonstrators on his right and front below Fredericksburg. They began as early as the 21st, and on the 29th Sedgwick, with the First, Third and Sixth corps, moved to points two to four miles below town, threw pontoon bridges across the river and crossed troops to hold them. On the 30th he was ordered to demonstrate on Lee's right down the river, and the Third corps marched by the north bank of the river for Chancellorsville. Sedgwick's movements did not impress Lee for the 30th, as he was unable to get entire out of the tangled forest, onto open ground, before being beaten in detail, ordered the columns back to Chancellorsville, thereby giving up the advantage of position practically gained and losing the confidence of his corps commanders. Jackson and Mc Laws followed the retiring troops and felt the lines with skirmishers, and McLaws got guns in position and cannonaded the left of the line. Hooker's line, as completed on the morning of the 2d, extended from the Rappahannock on the left to a point on the Germanna plank road full two and a half miles west of Chancellorsville. The Fifth corps and a division of the Second was on the left, facing east, the right in advance of the Chancellor House. The Twelfth corps was south of the plank road, its left less than one-fourth of a mile in front of the Chancellor House, its right near Hazel Grove, a little over a mile southwest of Chancellor's. Birney's division of the Third corps was on the right of the Twelfth, and the Eleventh corps continued the line from Dowdall's tavern westward beyond Talley's farm. The works held by the Twelfth, Third and Eleventh corps faced south, those of the
Twelfth in form of a bow, the plank road being the string of the bow; those of the Eleventh ran in a straight line generally just south of the road. For nearly the entire distance the line ran through an almost impenetrable forest of scrub-oak and pine. There was a spacious clearing around the Chancellor House, where Hooker had his headquarters, and open ground around Dowdall’s. A division of the Second corps and two of the Third were in reserve. Pleasanton’s cavalry was near Chancellor’s House. On the evening of May 26, Lee had a conference with Jackson. To attack Hooker’s 71,000 men, behind works, with 48,000, was cer-
tain to entail a terrible loss of life, and it was determined that Jackson, with nearly 30,000 men, infantry, cavalry and artillery, should march across Hooker’s front and assail his right flank and rear, Lee remaining with McLaws’ and Anderson’s 18,000 men to watch his left, demon-
strate on it, and guard the roads to Fredericks-
burg. Jackson moved on the morning of the 2d with his accustomed celerity, and about 4:30 p.m. his head of column was on Hooker’s right and rear, and he began to form line a scant mile from the right flank of the Eleventh corps. His movement had been discovered and misunder-
stood. As early as 9 o’clock, Sickles was seen marching a mile or so to the south; informa-
tion of the fact was sent to Slocum and How-
ard, and the instructions to both to strengthen their flanks. Hooker soon came to the con-
clusion that Lee was retreating, and about 1 p.m. Sickles, at his own request, ordered to take two divisions of the Third corps, move out and attack, which he did, falling on Jack-
son’s rear at Welford’s Furnace, taking some prisoners. Barlow’s brigade of the Eleventh corps was sent to Sickles and Pleasanton’s cav-
alty joined him, but the forest was too dense for cavalry operations, and Pleasanton with-
drew two of his regiments and battery to Hazel Grove, where Sickles had left some of his artillery. Williams’ division of the Twelfth corps was sent from its works to form on Sickles’ left, attack Anderson’s left and roll him back on Chancellorsville. Williams was about to attack when Jackson fell on the flank of the Eleventh corps and went back to his works. The Eleventh corps was badly posted and, though repeatedly informed by brigade and regimental commanders and picket officers of the gathering enemy on the flank, the superior officers, with one exception, lulled into security by the pleasing reports that Jackson was retreat-
ing, made no adequate provision against a flank attack, and most of the men were preparing supper when the storm broke. Jackson had formed his 26,000 infantry in three lines across the plank road, a mile on either side of it, artil-
lery in the road, and a little after 5 o’clock gave the order to advance. The lines advanced with a rush, startling the game in the forest. The Union skirmishers were quickly driven in, and with a wild yell the Eleventh and Twelfth corps struck the right brigade of Devens’ division, flanked it, and after two or three rounds had been fired it gave way, the enemy following, striking and flanking everything in the way. No troops in the world, so our officers could say, could resist such an attack. Some regiments made heroic stand and fought brilliantly, but in 30 minutes Devens’ division of 4,000 men was routed and the Confederates advanced upon Schurz’s di-
vision, which had changed front. Schurz held ground about 20 minutes, and then fell back upon Buschbeck’s brigade, east of Dowdall’s. Here Schurz rallied some of his men. Busch-
beck stood three-quarters of an hour, and it was after 7 o’clock, when, attacked in front and flank, he fell back in good order to Fairview, where 40 guns of the Eleventh and Twelfth corps were being massed on high ground in his rear. Howard’s corps had been driven two miles in less than two hours, losing nearly 1,500 killed and wounded and 1,000 prisoners. The force of Jackson’s attack had spent itself; his two leading divisions — Rodes’ and Colston’s — had become inextricably mixed; the men were tired and hungry, and Jackson suspended their further advance and ordered A. P. Hill to re-
lieve them. Meanwhile Hooker had sent Berry’s division of the Third corps and Hays’ brigade of the Second to the west edge of the open field north of the road; on Berry’s right were some of Schurz’s regiments; and Williams, desisting from his attack on Anderson, regained part of his works and formed south of the road on Berry’s left, Buschbeck in his rear. This covered the road at a distance of a little over a half mile west of Chancellor’s House. Sickles, when informed of Howard’s disaster, fell back from Welford Furnace to Hazel Grove and formed on Pleasanton’s left. Barlow drew up in Pleasanton’s rear, all close to Williams’ left and front. The two Con-
 federate lines fell back to the open ground around Dowdall’s, to re-form rear. A. P. Hill was brought up and his leading brigade pushed along the plank road beyond the intersection of a road leading left to White House, and United States Ford, the road to be taken by Hill to cut off Hooker’s retreat. While Jackson was reconnoitering on this road, beyond his main line, skirmishing began between the opposing pickets in the woods, and as Jackson, with his staff and orderlies, was riding back, the mounted body of the Twelfth and Fifteenth corps, the Federal guns being silent, moved to the plank road, causing some confusion to the Con-
 federate column on it. During this time A. P. Hill, next in command, was wounded; the intended advance was suspended, and Gen. J. E. B. Stuart was ordered to make a reconnaissance. During the night and early morning some changes were made in the Union line by which the approaches on the right to the United States
Ford were covered by Reynolds' corps and part of Meade's, and the Eleventh corps took position on the extreme left vacated by Meade. At 9 P.M. Hooker, not knowing that Sedgwick's entire corps was at Fredericksburg, ordered him to cross from Falmouth and march to the south side of the river to Chancellorsville and attack Lee's rear at daylight, 3 May, while he attacked in front. Pleasanton and Sickles were ordered to fall back from Hazel Grove at dawn. Pleasanton at 5 o'clock, and Sickles was following when his rear was caught by the oncoming Confederate line. Stuart, who had assumed command of Jackson's corps, advanced at 5 o'clock, 3 May, with great impetuosity, his right attacking Sickles as his rear brigade was about retiring from Hazel Grove. The brigade was soon driven, four guns were captured and Stuart swept away. Thirty Confederate guns were put in position at Hazel Grove which swept the open ground of Fairview and poured an enfilading fire on the right of Geary's division of the Twelfth corps, which was fighting Anderson, and at the same time Geary's left was being pounded by McLaw's guns. The battle now became fierce along the entire line of the Confederates. On the right Stuart's men fought French's division of the Second corps and the three divisions of the Third taking the Union works, being driven from them and retaking them. Williams was fighting Stuart's right, Geary of the Twelfth corps was desperately engaged with Johnson, and on his left, covering Fredericksburg road, Hancock's division of the Second corps was resisting the fierce attacks of McLaw. Stuart gradually gained ground and united his right with Anderson's left near Hazel Grove. The Union ammunition began to fail, and finally, about 9 o'clock, French, of the Second corps, the Third corps and Williams' division of the Twelfth, after frightful losses, began to fall back, and the Confederates gained the west of the Chancellor plateau and swept it with artillery. A cannon-shot struck a pillar of the Chancellor House against which Hooker was leaning. He was knocked down and stunned, and Couch's right was second in command, was instructed by Hooker to withdraw, was positioned already selected, about three-fourths of a mile north of the Chancellor House, and covering United States Ford. The right and centre, closely pressed, fought their way back; Geary, attacked in front, right flank and rear, followed; Hancock followed Geary; before noon the troops were in the new position, and here the battle of Chancellorsville proper ended, for, before Lee had completed preparations to renew his attack, he heard of the capture of Fredericksburg and Marye's Heights and the advance of Sedgwick. Suspending further operations against Hooker, he turned his attention to Sedgwick, sending McLaw's division to oppose him. When Sedgwick received Hooker's order of 9 P.M., 2 May, to cross the river at Fredericksburg, he had already done so and was three miles below the town. It was 11 P.M. when he received the order; he had 14 miles to march before nightfall, so remaining on the river covering Banks' Ford. The line was five or six miles in length, Newton, on the right, facing McLaw on the west; Brooks, in the centre, facing south, confronting Anderson, and Howe, on the left, facing east, opposing Early. Skirmishing went on all day, and at 6 o'clock, Lee, after reconnoitering the position, ordered an attack to break the centre. Newton was not seriously attacked but Howe and Brooks were assailed with great
spirit. Early, falling upon the former and endeavoring to turn his left, in which he did not succeed, two of his brigades being repulsed and thrown into confusion by Howe's artillery. An attack on Howe's right and Brooks' left was also repulsed. The Confederates continued the contest until darkness put an end to it. Sedgwick then withdrew from the field to Banks' Ford, where he was covered by 34 guns on the north side of the river, but he had lost so heavily and was scattered so closely that, with Hooker's approval, he crossed the river during the night, taking with him nine captured guns and about 1,400 prisoners. His loss, since crossing the river on the 2d, had been 3,200 killed and wounded and 1,500 captured. During the night Gibbon recrossed the river to Falmouth, and on the morning of the 5th Lee was again in full possession of the south side of the river below Chancellorsville. Early was left to hold Fredericksburg, and Lee marched back with McLaws and Anderson to renew the battle with Hooker. A heavy storm came up, converting dry ravines into torrents and the soil to deep mire, and the attack was deferred until next morning. When day came Hooker had revisited the lines of the United States Forces and the Army of the Potomac marched to its old camp, and Lee returned to his old position at Fredericksburg. The Union loss at Chancellorsville was 1,082 killed, 6,849 wounded and 4,215 missing. Including the losses at Fredericksburg, Marye's Heights and Salem Church, the union loss in the entire campaign, 27 April to 5 May, was 1,606 killed, 9,762 wounded and 5,919 missing; an aggregate of 17,287. The Confederate loss during the campaign was 1,665 killed, 9,081 wounded and 2,018 captured; an aggregate of 12,764. A., 'The Campaign of Chancellorsville'; Hamlin, A. C., 'The Battle of Chancellorsville'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

E. A. CARMAN.

CHANCERY, formerly the highest court of justice in England, now consolidated with the other superior courts in the Supreme Court of Judicature.

The Court of Chancery obtained its name from being under the jurisdiction of the Lord Chancellor and its purpose was never more succinctly expressed than in Cowel and Jacob's Law Dictionary: 'All the other justices in the Kingdom are tied to the law, but the Chancellor hath the King's absolute power to moderate the written law, govern his judgment by the law of nature and conscience, and ordering all things justa aequum et bonum.... He is not bound by the written law, but by conscience and equity, according to the circumstances of the matter.' And in the words of King James I, "When the rigour of the law in many cases will undo a man, then the Chancery tempers the law with equity, and so mixes mercy with justice, as it preserves a man from destruction." The jurisdiction of the court was therefore wide; and between it and the common lawyers a long struggle ensued. Its jurisdiction was inoperative in ordinary common law cases, or in civil cases in which the common law courts could render adequate justice. The great objection of the common law practitioners was that the very extensive powers of the chancellor's court were exercised, not according to fixed rules of law, but at the discretion of the chancellor. In course of time, however, under a succession of able chancellors, the body of law administered by it became quite as fixed as the common law. Thus there came to be the anomaly of two co-ordinate sets of tribunals adjudicating on the same matters on conflicting principles. It was thus quite possible for a suitor to win in the Court of Chancery who had not the smallest chance of prevailing in the common law courts. In the caustic words of Lord Chancellor Westbury, one tribunal was set up to do injustice and another to stop it. The distinctive functions of the Court of Chancery remained until the passing of the Judicature Acts of 1873 and 1875. (See below.) The Court of Chancery embraced six superior courts called high courts of chancery and numerous inferior courts. The superior courts were the Court of the Lord High Chancellor, the Court of Chancery, the Court of Common Pleas, and the Court of Appeal in Chancery, constituted by the Lord Chancellor sitting alone with either of the two lords justices in appeal or by the two lords justices sitting together apart from the Lord Chancellor; and the courts of the three vice-chancellors. The ordinary legal jurisdiction of chancery embraced the issuing of writs for a new Parliament; of pleas of scire facias to repeal letters patent, and of all original writs. There was also a jurisdiction acquired by statute or special delegation in issuing writs of habeas corpus and inquiring into charitable uses. There were numerous other powers conferred by act of Parliament, and the Lord Chancellor, together with the lords justices of appeal, had exclusive authority over the persons and property of idiots and lunatics. Appeals in bankruptcy were heard by the Court of Appeal in Chancery. The sittings and business of this court of appeal were regulated by the Lord Chancellor.

The procedure of the Court of Chancery at one time, by reason of its traditions and forms (commonly known as "red tape") became so cumbersome as partially to defeat its own ostensible aims and rendered reform imperative. Charles Dickens made a determined attack upon the delays of chancery practice in his 'Bleak House,' and subsequent changes have been commonly attributed to his influence.

The English Court of Chancery is now a division of the High Court of Justice, which is itself one of the two departments of the Supreme Court of Judicature in which are united all the higher courts of justice in England, exclusive of the appellate jurisdiction of the House of Lords with the privy council, and the immortal judges of chancery as a division of the High Court of Justice are the Lord Chancellor, who presides over the division, and six justices. According to the provisions of the act by which the Supreme Court of Judicature was established, the division of business both as to its commencement and its transfer, was made subject to rules of court and orders of transfer. By the operation of these provisions chancery, like the other divisions of the court to which
it now belongs, was gradually to cease to be a separate department; but in the meanwhile, subject to these rules and orders, certain causes and matters were assigned to chancery until they were provided for otherwise. These are enumerated in the Supreme Court of Judicature Act (36 & 37 Vict. c. 66, § 34), and are (1) all causes and matters pending in the High Court of Chancery at the commencement of the act (finally fixed for 1 Nov. 1875); (2) all causes and matters to be commenced after the commencement of the act under any act of Parliament by which exclusive jurisdiction in respect to such causes or matters has been given to the Court of Chancery, or to any judges or judges thereof, except appeals from County Courts; (3) administration of the estates of deceased persons; partnerships; mortgages; raising of portions or other charges on land; sale and distribution of the proceeds of property subject to any lien or charge; trusts, charitable or private; rectification or setting aside or cancellation of deeds or other written instruments; performance of contracts between vendors and purchasers of real estates, including contracts for leases; partition and sale of real estates; worship of infants and the care of infants' estates. Chancery, as a division of the High Court of Justice, has no exclusive right to the administration of equity, the act already mentioned making provision under certain rules for the concurrent administration of law and equity in all the divisions of the Supreme Court of Judicature. The Court of Appeal in Chancery no longer exists and its functions are transferred to the Court of Appeal, which in the new Supreme Court of Judicature is the complementary department of the High Court of Justice. The affairs of lunatics are still under the supervision of the Lord Chancellor. See also EQUITY.

In the United States the general tendency has been likewise to abolish courts of chancery as separate departments, and equity jurisdiction is generally conferred on the courts of law. Delaware, New Jersey and Tennessee are among the few States that still retain the former practice.

In the Catholic Church the chancery denotes (1) the office in a diocese whence come those documents necessary for the exercise of episcopal power; (2) the office in Rome which drafts and expedites the bills or briefs by which the mind of the Pope is made known to Christendom or to particular suitors.

CHANCERY. See SY Rush.

CHANCROID. A contagious venereal disease characterized by the presence of one or more, often several, suppurative ulcers, chiefly located in the genital regions. These are due to infection by the organisms of dirt and are not true syphilitic lesions. Very frequently both hard and soft ulcers are communicated at the same time, but they can be distinguished. Chancroid is definitely a dirt disease and is due to uncleanness as well, perhaps, as to a specific micro-organism, the streptobacillus of Ducrey. Chancroid usually develops within 24 to 48 hours after infection as a minute macule or pin-point vesico-pustule surrounded by a reddish halo. This increases day by day until a pustule or ulcer about the size of a small coin is developed. This ulcer is usually a soft ulcer. There is not much induration in the connective tissue beneath it, which is one of the distinguishing features between it and true syphilitic chancre. Chanceroids are usually multiple, whereas chancres are usually single. They persist usually from three to six weeks and are often very difficult to cure, and furthermore a patient with chancroid may reinfect himself and thus spread the lesion at times very widely.

CHANDA, chând-dâ or chând-dâ, India, chief town of the district of Chanda in the Nagpur division of the Central Provinces and 90 miles south of the town of Nagpur. It is surrounded by a stone wall five and a half miles in circuit, from 15 to 20 feet high, 10 feet thick and flanked with rough towers large enough for the heaviest guns; inside which are cultivated fields and detached villages, while there are also suburban quarters outside. There is a citadel now enclosing the jail, tomb of the Gond kings, three interesting temples, massive monoliths, etc. Outside the walls is a large water tank constructed under Gond rule and a collection of ancient statuary known as Rayappa's idols, the largest of which is 25 x 18 x 3 feet. The town has a public park, civil station and military cantonments. Chanda is the commercial centre of the district with manufactures of silk, cotton, dyestuffs, slippers, bamboo work and gold and silver work. It has numerous schools and a mission station. The district contains considerable iron and coal deposits. Pop. (1911) 19,866; the district has an area of 10,156 square miles and a population of 677,544.

CHANDLEUR, shân-dél-âr, ISLANDS, a group of about 15 small islands in the Gulf of Mexico about 25 miles off the east coast of Louisiana, from which they are separated by Chandleur Sound. There is a lighthouse on the northern end of the northernmost island which is in lat. 30° 2' N. and long. 88° 52' W.

CHANDELIER. An apparatus suspended from the ceiling or vault and supporting two or more lighting units. Usually, in modern times, the lights are supported on arms or branches radiating from a central shaft. The chandelier may be said to have originated in the ancient suspended oil lamp (hylkimos) of several wicks (polymicros) used by the Romans. (See Fig. 1). By the 4th century A.D. the Catholic Church began to use corona, phari,
chandeliers were fashioned in this manner. In the 14th century chandeliers began to take on a star or radiation form with six to eight branches supporting a number of candles or lamps. These were mostly of bronze. In this period a species of trophy device in chandeliers took form in Germany, made up of the horns of the animals of the chase (stag, elk, elephant, etc.). This fashion remained popular till the 18th century. In the 15th century wooden crosses acted as chandeliers frequently. Oak was much favored, and, while many were quite plain, others, for church use, had elaborately carved centrepieces from which radiated handsomely decorated carved arms of forged iron supporting candle sockets; others were enameled for copper, a few of silver. The plain crown light still persisted. The 16th century retained much of the radiate style of the preceding century but rock-crystal decoration (which had been practised in a modest way since the 13th century) appears (from documentary evidence) to have become more general. Flanders produced lovely chandeliers at this time which are yet much admired. To this century belongs the famous historic "Galilee" chandelier in the cathedral of Pisa, a magnificent work of bronze of the Italian Renaissance, whose swinging is said to have led to the pendulum in horology. In the 17th century a few wooden chandeliers were still produced, but with artistic carved decoration—most of them were constructed for temporary (festivals, etc.) use. Under Louis XIV Dutch copper chandeliers became popular. This style had a central shaft composed of a number of balls relieved by balustrade forms. A common device was to have the chandelier surmounted by a royal crown, ducal or other coronet. Very elaborate chandeliers were produced in this century in wrought iron, bronze and copper (Flanders was doing very fine work in copper castings). Silver was used to some extent, also rock crystal was becoming quite the vogue; but the former was alone used by royalty, nobility and the Church. The crystal ornament was becoming a part in the establishments of the wealthy. In the 18th century the thorough combustion (sootless) of oil was becoming effective (Argand, Lange, Quenquet inventions), and we have suspended lamps largely replacing candles in chandeliers. Under Louis XV and Louis XVI were constructed for lay use more chandeliers of great importance than ever before, the Church having had the very large and elaborate pieces. The furnishing of civic homes with luxurious decoration was a new growth, and, by the second half of the 18th century, practically all chandeliers had crystal ornament. Every chandelier by this time had arms or branches; the "console" or reclining to wall form prevalent. A common style of crystal decoration consisted of interlacing strings of faceted crystal beads—often so elaborate as to be cumbersome. Ordinary glass sufficed usually, but rock crystal was favored by the wealthy. The chandelier, in some form, was now common property among

![Diagram of a chandelier](image)

**Fig. 2.—The great 13th century Corona Chandelier at Aix-la-Chapelle Minster. Details: Left, section of railing; right, style of tower decoration.**
all classes of city dwellers, except the very poorest. In chandeliers de luxe we find porcelain (Dresden and Sévres) flowers figuring as ornament, and soon the usage of these fisticle delier body a mere accessory hidden in garlands of crystal beads. Immense, gorgeous constructions were made for use in the theatres, etc., the most noted being that of the Grand Opéra House, Paris, by Garnier. With the introduction of hydrogen gas for lighting purpose no great transformations occurred in the forms used for chandelier (often termed gazolier) construction, pipes taking the place of bar metal and gas nipples displacing the old candle pricket or the later sockets. But, with the comparatively recent invention of illumination by electricity, a wider field has been given for the designer to work in. In America very artistic forms have evolved in the electrolier, some reverting to the classic Greco-Roman lychnus, others showing modern originality.

CLEMENT W. COUMBE.

CHANDERNAGORE, chún-der-ní’gør or chún-der-na’gór, or CHANDARNAGAR, India, town on the right bank of the Hugli, 16 miles north-northwest of Calcutta. Its only manufacture is cotton cloth, and there is no trade but with Calcutta. The French established a factory there in 1678, and in 1688 obtained a formal cession of it, together with its territory of about three and a half square miles, from Aurungzebe. It was three times taken by the British, first in 1757, but finally restored to the French in 1816. Chandernagore is under a sub-governor, subordinate to the governor of Pondicherry. Pop. of town and territory 20,000, including a small military detachment and a few Europeans and Eurasians, the great bulk being natives.

CHANDLER, Abiel, American merchant: b. Concord, N. H., 1778; d. Walpole, N. H., 22 March 1851. He was graduated at Harvard College in 1806, and was for many years a merchant in Boston. He died a widower, without children, and devised $50,000 to Dartmouth College. The Chandler School of Science at Dartmouth was established in 1851 in pursuance of this bequest. For many years this was maintained as a separate department, but has recently been formally incorporated into the college and it is now known as the Chandler scientific course leading to the degree of bachelor of science.

CHANDLER, Charles Frederick, American chemist: b. Lancaster, Mass., 6 Dec. 1836. He studied at the Lawrence Scientific School of Harvard College and at the universities of Ber-
lin and Göttingen, receiving his doctor's degree at the latter in 1856. He was professor of chemistry in Union College, 1857-58, and professor of analytical and applied chemistry in the Columbia College School of Mines, 1894-1903. In 1858 he was elected to the chair of chemistry in the New York College of Pharmacy, and in 1876 to the chair of chemistry and medical jurisprudence in the College of Physicians and Surgeons. He became chemist to the metropolitan board of health in 1865, and its president in 1873, being instrumental in securing great reforms in connection with the sanitary condition of the markets and the purity of the food supply, notably in the case of milk. He is a member of the chemical societies of Berlin, London and Paris, and of the National Academy of Sciences. With his brother, Prof. William Chandler, he founded the American Chemist, a monthly journal devoted to chemical science. To this and to the annual reports of the New York health department he has contributed many papers on chemistry, water-supply of cities, purification of coal gas, petroleum, sewage, and glucose. Among the numerous reforms introduced during the administration of Professor Chandler were the segregation of slaughter-houses and the passage of the Tenement-House Act, providing that the plans of every tenement-house must first be submitted to the Board of Health.

CHANDLER, Francis Ward, American architect: b. Boston, 30 Sept. 1844. He was graduated at the Lancaster Academy in 1861, served in the 53d Massachusetts Volunteers in 1861-63. He studied architecture and worked with Ward and Van Brunt, Boston, in 1864-67. He spent 1867-69 in Paris and in 1869-70 was assistant in the architectural department of the Massachusetts Institute of Technology. In 1871-74 he was assistant architect in the Treasury Department, Washington. From 1874 to 1888 he was a partner of E. C. Cabot, Boston, and in 1888 became professor of architecture in the Massachusetts Institute of Technology, becoming professor emeritus in 1911. He has published 'Construction Details' (1892); 'Notes on Stones, Cement, Mortars and Concretes' (1892); 'Municipal Architecture in Boston' (1898) and many articles in the Technology Quarterly.

CHANDLER, Frank Wadleigh, American writer: b. Brooklyn, N. Y., 16 June 1873. He was graduated at the Polytechnic Institute of Brooklyn, 1894; studied literature and philosophy at Columbia, University, and at Oxford, London and Paris, 1895-99. In 1899 he was appointed professor of literature and history in the Polytechnic Institute, and in 1901 lecturer in comparative literature at Columbia. In 1910 he became professor of English and comparative literature in the University of Cincinnati, and in 1913 he became dean of the College of Liberal Arts of the same university. He has written 'Romances of Roguery, an Episcope in the History of the Novel' (1899); 'Some Themes of the Novel's Evolution in East and West' (1900); 'The Literature of Roguery' (1907); 'Aspects of Modern Drama' (1914).

CHANDLER, Richard, English archaeologist: b. Elson, Hampshire, 1738; d. Tilehurst, Berkshire, 9 Feb. 1810. He was educated at Winchester and at Queen's and Magdalen colleges, Oxford. His first important work was 'Marmora Celorum,' a comprehensive and elaborate description of the Oxford marbles. He afterward traveled through Greece and Asia Minor, with Revett, architect, and Pars, a painter, at the expense of the Dilettanti Society, to examine and describe the antiquities. The materials collected in his travels were published by his friend in the following publications: 'Ionian Antiquities' (1769); 'Ancient Inscriptions' (1774); 'Travels in Asia Minor' (1775); and 'Travels in Greece' (1776). He was an Anglican clergyman and at his death was rector of Tilehurst, near Reading.

CHANDLER, Seth C., American astronomer: b. Boston, Mass., 16 Sept. 1845; d. there, 31 Dec. 1913. He was long attached to the Harvard Observatory; was awarded the gold medal of the Astronomical Society of London in 1896 for his determination of the laws of variations of latitude on the earth's pole and his researches on variable stars. In 1896 he became editor of the Astronomical Journal. He is well known for his investigations and observations of the phenomena of variable stars, the computation of comet orbits, and, in connection with Ritchie, for devising a system of astronomical code-telegrams for the announcement of astronomical discoveries. He also invented the Almacantar, and published a very complete treatise on the method of its use.

CHANDLER, William Eaton, American politician: b. Concord, N. H., 28 Dec. 1835; d. 30 Nov. 1917. He was graduated at Harvard Law School in 1855, entered the New Hampshire legislature in 1862, was speaker 1863-64, became judge-advocate-general of the Navy Department in 1865, and Secretary of the Navy in 1882, serving three years. In 1887-1901 he was a United States senator from New Hampshire. In 1901 he became president of the Spanish Treaty Claims Commission, and was a member of the New Hampshire Constitutional Convention in 1902.

CHANDLER, Zachariah, American merchant and statesman: b. Concord, 10 Dec. 1813; d. 1 Nov. 1879. He received a common school education, and early in life went to Detroit, and engaged in the dry goods business, in which his energy and ability soon brought success and put him in possession of a handsome fortune. He was mayor of Detroit in 1851, the defeated Whig candidate for governor of Michigan in 1852, an active organizer of the Republican party in 1854, and in January 1857 was elected to the United States Senate to succeed Gen. Lewis Cass. The same energy and ability which had made him successful in business he now applied to the organization of the Republican party and he was soon recognized as one of the most formidable opponents of all slavery. He opposed the admission of Kansas under the Lecompton constitution 1858, and he was the author of the famous "blood letter," in which he said "without a little blood-letting, this Union will not, in my estimation, be worth a rush." A close friend of Lincoln, he was more radical than the latter, and often differed from him in matters
of public policy. In July 1861 he introduced a sweeping confiscation bill which failed to pass and in July 1862 violently assailed McClellan in a speech in the Senate. He was re-elected to the Senate in 1863 and in 1869; served as Secretary of the Interior in the Cabinet of President Grant from 1875-77; was chairman of the Republican National Committee in 1876; was re-elected to the Senate in 1879, where he led the attacks on Jefferson Davis. He was a man of imposing presence, great energy and perseverance. He was found dead in bed on the morning after delivering a political address in Chicago. Consult Curtis, W. E.: "Life of Zachariah Chandler" (New York 1879).

CHANDOGYA, chun'dõ-jí'ã, the name of a Brahman of the Samaveda in Hindu literature. It is in 10 books, 8 of which are known in the Occident as 'Chandogya Upanishad.' It has been translated by Müller in his 'Sacred Books of the East' (Vol. I).

CHANDOS, the name of a noted English family, descended from a follower of William the Conqueror, the last representative in the direct male line being Sir John Chandos (d. 1420). Chandos, the ancestor of the Brydges family, successively lords and dukes of Chandos. Their descendant, Sir John Brydges, was lieutenant of the Tower under Queen Mary, and was created Baron Chandos in 1554, 5th Lord Chandos (1573-1744). 8th Lord Chandos, sat in Parliament for Hereford from 1698 to 1714, and was created duke of Chandos in 1719. The lucrative post of paymaster of the forces abroad supplied means for building a palace at Canons, near Edgware, which cost $1,000,000, but was torn down at the Duke's death. Here Handel lived two years, wrote anthems for the chapel service and produced 'Esther.' In 1796 the title passed by marriage to the family of Grenville, which retained the title of Duke of Buckingham and Chandos till 1889, when the 3d and last duke died. His widow, the dowager Countess Egerton, is still (1918) Duchess of Buckingham and Chandos from her first marriage. The duchess will die with her.

CHANDOS, Sir John, English soldier: d. 1370. He was descended from Robert de Chandos, who came from Normandy with the Conqueror in 1066. The earliest military records about John Chandos state that he was at the siege of Cambrai in 1337, at Crecy in 1346 and Poitiers in 1356, when he rescued his friend, the Black Prince, on the battlefield. He was soon afterward appointed "regent and lieutenant" of the king of England in France, and vice-chamberlain of the royal household. In 1364 he commanded Montfort's and the English forces against Charles de Blois; the latter was killed and the redoubtable Bertrand du Guesclin fell a prisoner to Chandos. In 1367 the Black Prince induced him to join a military expedition across the Pyrenees into Spain against Henry de Trastamare, who was aided by du Guesclin. In the ensuing battle at Navarette Chandos gained the victory and again captured Du Guesclin. Retiring in 1368, Chandos was again called to arms against the French in 1369. He was wounded and died sailing to, and at, Le Havre 1 Jan. 1370. A gallant, chivalrous warrior and one of the original Knights of the Garter, his death was regretted alike by friend and foe.

CHANDPUR, chünd- or chãund'poor, India, a town in the Bijapur district of the Northwest Province, about 40 miles east-northeast of Meerut. It is thriving, well paved and drained; there is a trade in sugar and grains, besides some manufactures of cotton cloth, pipes, etc. Pop. 13,000.

CHANDRA, BHATTOPADHYAYA, Bankim, Indian novelist. See CHATTOPADHYAYA BANKIM CHANDRA.

CHANEY, Lucian West, American biologist: b. Heuvelton, N. Y., 26 June 1857. He was graduated at Carleton College in 1878. He spent three years as high school principal and circuit-superintendent of schools at Fergus, Glencoe, Minn., and in 1882 was appointed instructor in biology at Carleton College and was professor there from 1883 to 1908. In 1907-09 he was special agent of the United States Bureau of Labor to investigate dangerous occupations of women and children and in 1909 he was appointed expert in industrial hygiene in the same bureau. He has also explored the Rocky Mountain glaciers, one of which bears his name, and has published 'Employment of Women in the Metal-Brydges; the ancestor of the Brydges family, successively lords and dukes of Chandos. Their descendant, Sir John Brydges, was lieutenant of the Tower under Queen Mary, and was created Baron Chandos in 1554, 5th Lord Chandos (1573-1744). 8th Lord Chandos, sat in Parliament for Hereford from 1698 to 1714, and was created duke of Chandos in 1719. The lucrative post of paymaster of the forces abroad supplied means for building a palace at Canons, near Edgware, which cost $1,000,000, but was torn down at the Duke's death. Here Handel lived two years, wrote anthems for the chapel service and produced 'Esther.' In 1796 the title passed by marriage to the family of Grenville, which retained the title of Duke of Buckingham and Chandos till 1889, when the 3d and last duke died. His widow, the dowager Countess Egerton, is still (1918) Duchess of Buckingham and Chandos from her first marriage. The duchess will die with her.

CHANG-CHAU, chäng-chow', China, city in the province of Fu-kien, the capital of the department of Chang-Chow, 35 miles west-northwest of Amoy, which is its port. It is on the Kiu-lung estuary. It stands in a valley surrounded by hills and intersected by a river. Its walls are about four and a half miles in circumference and immediately within is a space planted with large trees. It has broad granite-paved streets with fine stores. The chief building is a Buddhist temple dating from the 8th century. A wooden bridge nearly 800 feet long, resting on 25 stone piles, spans the river. The city has manufactures of silk, sugar, crystal and bricks, and carries on an extensive domestic and export trade in tea and sugar. It is the centre of the silk manufacture of the province. Pop. about 300,000.

CHANG-SHA, chäng-shã, China, capital of the province of Hu-Nan, on the Siang River, about 350 miles north of Canton. It is not a treaty port, but has an important native trade carried on in small boats. It is surrounded by a wall and has an important silk industry. Pop. 250,000.

CHANGA, a species of mole-cricket (Scaptcericus didactylus) indigenous in Porto Rico. The changa is found throughout that island, living in galleries in the earth, and damaging the crown and roots of the tobacco, sugar cane and small crops; it is the most serious insect pest of the island. (See MOLE-CRICKET.) Consult Barrett, 'The Changa, or Mole-Cricket'; 'Bulletin No. 2, Porto Rico Agricultural Experiment Station' (Washington 1902).

CHANGARNIER, shãn-gãr'nã-ã, Nicolas Anne Théodole, French general: b. Autum, 26 April 1793; d. Versailles, 14 Feb. 1877. He was educated at Saint-Cyr and the École de Guerre, Algeria, where for 18 years he saw much active service. On the proclamation of the republic in 1848 he acted as provisional government-genera
of Algeria, but returned to Paris to take command of the garrisons of Paris and of the national guard. He did much to check the outbreaks of the Anarchist party during 1849. At the coup d'état in December 1851, after being imprisoned in Ham, he went into exile till the Franco-Prussian War. Then he offered his services to Napoleon III. He was in Metz with Bazaine, and, on its capitulation, retired to Brussels. He returned to France in 1871, entered the Assembly, and assisted M. Thiers in reconvening the army.

**CHANGE OF COLORS.** See Camouflage.

**CHANGE OF FUNCTION.** During the metamorphosis of insects, Crustacea, and other animals, organs at first adapted for certain uses become, with change of conditions of life, media, and consequently of habits, adapted to quite different uses or functions. Thus in the young larva (Nauplius) of many of the lower Crustacea, the three pairs of head appendages are formed for swimming; the first two pairs afterward change into the two pairs of antenna, the third pair becoming the jaws of the adult. In the tadpole, which lives on dead leaves or animal matter, the intestine is very long and coiled, but in after life, when the frog feeds on living insects, it is very much changed in form, being much shorter. These are examples of an ontogenetic change of function. There are many examples of change of function by suppression of the original or chief function, what was a minor use becoming the chief one. Examples of a phylogenetic change of function are the transformation of the jaws of biting insects into the needle-like elements, aiding in the formation of the beak of bugs (q.v.); the transformation of the hypopharynx of caddisflies into the piercing organ of fleas and flies; the modification of the maxilla of biting insects into the spiral tongue of the butterfly. The mouth-parts of bees and butterflies lost their primitive functions and adopted entirely new shapes and uses after flowers appeared. Among fishes the oldest example is the change of swimming-bladder of the gar pike, where it also functions as a breathing organ, until in the lung-fishes, which have probably descended from some ganoid, it becomes a lung. These changes of functions are due to change of the surroundings, and consequently of habits, finally bringing about change of function. Hertwig states that a muscle may from many causes become functionless, but finally becomes transformed into a ligamentous band. What are the gill-supports of fishes may, as the results in certain of their descendants of the adoption of a terrestrial mode of life, become in part degenerate, while another part persists by assuming a new function, forming the jaws, the hyoid bone and the small bones of the ear, which are morphologically the same structures as the gill-arches. Consult Dohm, 'Der Ursprung der Wirbeltiere und das Prinzip des Funktionswechsels'; Hertwig-Kingsley, 'Manual of Zoology.'

**CHANGE OF LIFE.** See Menopause.

**CHANGELING,** a child left or taken in the place of another. It was, at one time a common superstition that young children were liable to be stolen or changed by fairies before being baptized; and hence they were carefully watched till that ceremony was over. It was thought that the fairies were always anxious to change their own starving elves for the more robust children of men. The children so left were called changelings, and were known by their greater backwardness in growth or learning; hence, stunted or idiotic children were regarded as changelings. The poets allude to this superstition occasionally, e.g., Shakespeare and Spenser.

**CHANGO,** an Indian tribe inhabiting the rainless region of northern Chili, near the desert of Atacama. Their territory was formerly much larger and their language, now extinct, appears to have been a distinct stock. Consult Boman, 'Antiquités de la Région Andine' (Vol. I, Paris 1910), and Chamberlain, in *Journal de la Société des Amér. de Paris* (N. S., Vol. VII, p. 183, 1910).

**CHANK-SHELL,** the shell of a gastropod mollusk (Turbinella pyrum). An extensive fishery of these shells, which live in water from 12 to 15 feet deep along the shore of Ceylon and India, has been established at Tuticorin. The shell is a sacred emblem of 'fishu, who is often represented as holding a 'fishu' shell in his hand. They are used by the Hindu women as bangles and leg ornaments, or anklets. The chank appears as a symbol on the coins of some of the ancient Indian empires, and is still retained on the coinage of the Rajah of Franvaco.

**CHANTER, Amelie Rives.** See TROUBETSKOV.

**CHANTER, William Astor,** American explorer: b. Newport, R. I., 11 June 1867. He studied at Harvard, but left the university to make explorations in Africa. With Chevalier Ludwig von Höhnel, he started from Zanzibar in September 1892 to explore the region east and west of Mount Kenia. They reached the coast on the return journey June 1893. He was elected to the New York legislature in 1897 and to Congress in 1898 as a Democrat. He served in the War with Spain and was commended in General Shafter's reports. He has written 'Through Jungle and Desert' (1896) and 'Travels in Eastern Africa,' etc.

**CHANNEL-BILL,** a gigantic Australasian cuckoo (Stryphrops Nova-hollandiae), having the size, and in some cases, the cry of a hawk, brown and gray above and whitish below, with bare scarlet skin surrounding the eyes. It takes its name from two deep grooves in the side of the bill. It is probably parasitic, feeds on both fruit and insects, is migratory and utters a shrilling cry like the syllable 'krok.'

**CHANNEL ISLANDS,** a group of islands in the English Channel belonging to Great Britain, off the west coast of the department La Manche, in France. The islands lie 10 to 30 miles distant from the Normandy coast and 50 to 120 miles south of the English coast. They consist of Jersey, Guernsey, Alderney and Sark, with some dependent islets; area, 75 square miles. They are picturesque and very fertile and are celebrated for a peculiar breed of cattle, the chief strains of which are the Jerseys, Guernseys and the Alderneys, which differ from each other in minor characteristics. Boland, 'Les îles de la Manche' (Paris 1904). The islands are almost totally exempt from
CHANNELS — CHANNING

CHANNELS, or CHAIN-WALES, of a ship, pieces of wood or iron projecting edgewise like a ledge from the ship’s outside, abreast of and extending somewhat behind the masts. They serve to extend the shrouds and to prevent them from touching the gunwale or being injured by rudder and capstan.

CHANNING, Edward, American historian: b. Dorchester, Mass., 15 June 1856. He graduated at Harvard in 1878, and in 1883 was appointed instructor in history there, becoming successively assistant and full professor of history and is now Lea professor of ancient and modern history. He has written ‘The Narragansett Planters’ and ‘Town and County Government of the English Colonies in North America’ (Johns Hopkins Studies, 1883-84); ‘Columbus and His Companions,’ in Winsor’s ‘Narrative and Critical History of the United States’ (1888); ‘The United States, 1765-1865’; in collaboration with A. B. Hart and F. J. Turner, ‘Guide to the Study of American History’ (1912); and with T. W. Higginson, ‘English History at $130,000 annually. There are important fisheries of turbot, conger eels, oysters, lobsters, monster crabs, etc. The quarries of Jersey and Guernsey are extensively worked and export fine granite for building purposes. There is daily communication by steamer with various English and French ports and an average of 3,000 vessels of 200,000 gross tonnage enter and clear the Channel Island ports annually. The chief town is Saint Helier, on the island of Jersey. Among the farming population the vernacular is old Norman French, which differs in peculiarities of spelling and pronunciation in each island and even in parishes of the same island. English predominates in the town districts, which contain a large proportion of British and many French residents.

Military service at fixed periods is compulsory on all male natives and residents. Cave dwellings and numerous megalithic cromlechs, tumuli and menhirs prove the habitation of a prehistoric race. A few old Norman chapels remain: the oldest churches, St. Brelade’s, Jersey, and Saint Sampson’s, Guernsey, date from 1111, and earthworks, fortifications and castles dating from Roman and subsequent periods exist. The Romans occupied the islands during the 3d and 4th centuries; Caesar (Jesu) and Sarmia (Guernsey) occur in the ‘Itinerarium’ of Antoninus. After the Conquest the islands alternated between Norman and English rule until 1204, when with the loss of Normandy they remained faithful to England and steadfastly resisted many subsequent attempts on the part of France to capture them. In the reign of Henry VI the French held part of Jersey for six years. During the civil war they were the scene of many notable events. A French expedition landed in Jersey in 1781, but after a short fight the island was lost. During the French and American wars, the islanders fitted out many privateers and captured many rich prizes. The islands are favorite asylum for political refugees. Their numbers have included Benjamin Franklin, Edward Clarendon, Victor Hugo and General Boulanger. President Lincoln’s wife was a frequent visitor. Pop. (1911) 96,500. Consult Ansted, ‘Channel Islands’ (1893); Boland, ‘Les îles de la Manche’ (Paris 904).

CHANNING, Edward Tyrrel, American scholar: b. Newport, R. I., 12 Dec. 1790; d. Cambridge, Mass., 8 Feb. 1856. He was a brother of William Ellery Channing, 1780-1842 (q.v.). He studied law with his elder brother, Francis Dana Channing, in Boston, and was admitted to the bar. He gave his attention chiefly to literature and carried forward a careful and critical study of the Greek and Roman classics, with that of the great writers of England. The ‘North American Review’, earliest permanent periodical in America, had its origin in a club of young men, who, in the winter of 1814-15, projected a bi-monthly magazine. Willard Phillips, afterward author of the celebrated works on the law of patents, was to be its editor. The committee on politics was composed of George Cabot, James Lloyd, John Lowell, Josiah Quincy and others. The chief managers were to be President Kirkland, Jared Sparks, George Ticknor, Mr. Channing, Richard H. Dana and John Gallison. At this time, William Tudor, author of the ‘Life of James Otis,’ returned from Europe with a matured plan for a quarterly review; and as the field was not large enough for two such works, the plan of the magazine was modified so that of Mr. Tudor, and the first number of the ‘North American Review’ was issued in May 1815, as a bi-monthly, the quarterly publication not being adopted until the commencement of the eighth volume. Tudor edited it for two years and in 1817 it passed under the control of a club. Jared Sparks was chief editor for one year when the duty was undertaken by Channing, aided by his cousin, Richard H. Dana. In October 1819, Mr. Channing was succeeded in the editorship of the Review by Edward Everett, having been appointed by Boston professor of rhetoric and oratory in Harvard University. This post he held for 32 years, resigning it in 1851. During all this
time, the department of rhetoric and oratory, including the charge of all the English compositions of the students which had great influence over their reading and taste, was filled by Joel Barondy. In 1814 he took his degree in 1798 and though at first inclining to the study of medicine, presently decided upon the profession of the ministry. After his graduation he spent two years in Virginia as a tutor, but in pursuance of his ascetic views regarding renunciation and the necessity of subsiding the animal nature, he endeavored to accustom himself to hardships during this period, even denying himself sufficiency of food and clothing. The result of this unwise course was to implant in him the tendency to disease that made him for the greater part of his career a semi-invalid. Returning from Virginia he took up the study of theology, making at the start a careful study of the evidences of Christianity, wishing, as he said, to know what Christ taught and not what men made him teach. In 1801 he was made regent of Harvard, the duties of this office being light and the salary sufficient for his support while continuing his studies. In 1802 he preached his first sermon at Medford, Mass., from the text "I am no gold and have I none, but such as I have, give I thee." In 1803 he was ordained pastor of the Federal Street Church in Boston and continued in that relation for the rest of his life. In the earlier years of his ministry the denominational spirit was not especially strong in him and with the ministers of the Trinitarian churches in Boston, he was on most friendly terms. His opinions were ripening during this period, however, and in 1819, at the ordination of Rev. Jared Sparks in Baltimore, he preached a sermon in which for the first time he gave free expression to the principles of Unitarian Christianity, upholding the exercise of reason in religious matters; declaring the Bible to be "a book written for men in the language of men and its meaning to be sought in the same manner as that of other books." He also objected to the doctrine of the Trinity, affirming his belief that Christ was distinct from and inferior to God, and sent to men as a great moral teacher, not as a mediator between erring man and offended deity. This discourse gave rise to much controversy and fixed definitely the Unitarian position as distinguished from that of the Trinitarians. It made him, moreover, the recognized leader of American Unitarianism; and much as he disliked controversy he never hesitated from uttering what he believed to be the true because of hostile criticism. His greatest dread was of becoming creed-bound and thus losing perception of new truths, and he even spoke of himself as "little of a Unitarian," and standing aloof from those who strive and pray for clear light, for a purer and more effectual manifestation of Christian truth." After 1824 Rev. Ezra Stiles Gannett was associated with him in the ministry of the Federal Street parish and from this epoch his time was largely given to philanthropic and literary work, the asceticism of his youth having long since been supplanted by a more wholesome understanding of life and its requirements and duties. He visited Europe in 1822 and became acquainted with Coleridge and Wordsworth. He was one of the first to acknowledge the greatnes of the latter, and save Shakespeare, he read no poet oftener. Channing was a fearless defender of freedom and upheld Garrison when that great abolitionist was the most generally detested person in Boston. In the pulpit his mission, as he saw it, was to free men's minds from servile conceptions of God, to disabuse religion of its benumbing terrors and to show forth to men the real significance of their moral natures. His writings on theological, social and philanthropic themes have received the widest circulation and been translated into French, Italian, German, Icelandic, Russian and Hungarian. The most notable of them include 'Evidences of Revealed Religion'; 'Essay on National Literature' (1823); 'Remarks on the Character and Writings of John Milton' (1825); 'Character and Writings of Fénelon' (1829); 'The Duty of the Free States' (1835); 'Negro Slavery' (1835); 'Self Culture' (1838). He had a life-long abhorrence of slavery, but in his 'Duty of the Free States' his feelings on the subject find fullest expression. His name, moreover, was associated with the most of the social reforms of his day and besides bearing a part in the great anti-slavery agitation, he warmly sympathized in the temperance movement, was an ardent lover of peace and deeply interested in schemes for educational advance. He stood for intellectual and spiritual ideas and foresaw dangers both to nations and individuals in the spread of materialism, in the contented adoption of inadequate aims, complacent satisfaction with permissible interests. In an age when comparatively few religious leaders dared to think outside of narrow prescribed limits, Channing stood forth as the intellectual champion of freedom. Much of his influence may have been due, no doubt, to the singular sweetness of his disposition and his entire nobility of character, but more of it was due to the fact that he spoke with utter fearlessness and thus inspired other men to free themselves from the fetters of dogma or of intellectual timidity. Although two generations have passed since his death, his name is still both familiar and beloved and his beneficent influence, far from lessening its hold upon men, has deepened and widened with the years. Channing's literary style, while not highly ornamental, was both clear and vigorous and his sentences were usually short and direct, though it is said that his personal preferences in the writings of others were for long and involved sentences. On 1 June 1903, a bronze statue of Channing by Herbert Adams was unveiled in the Public Garden in Boston, Mass., its site being opposite the Arlington Street Church, the successor of the Federal Street Church, of which he was so long pastor. The statue and its monumental setting were the gift of members of the church in consultation 'Lives' by W. H. Channing and C. T. Brooks (3 vols, London 1848, and reprinted Boston 1880); 'Correspondence of Channing and Lucy Aiken'; Peabody, 'Reminiscences'; Chadwick, 'W. E. Channing' (Boston 1903);
CHANNING — CHANT DU DÉPART

and Eliot, ‘Four American Leaders’ (Boston 1906).

CHANNING, William Ellery, American poet, nephew of William Ellery Channing, the elder: b. Boston, Mass., 10 June 1818; d. Concord, Mass., 23 Dec. 1901. After some years spent in newspaper work he retired to Concord, where he lived the life of a recluse. His chief writings include ‘Poems’ (1843-47); ‘The Woodman’ (1849); ‘Near Home’ (1858); ‘The Wanderer’ (1872); ‘Conversations in Rome’ (1847); and ‘Youth of the Poet and Painter’; ‘Thoreau, the Poet-Naturalist’ (1873); ‘Eliot’; ‘John Brown’.

CHANNING, William Henry, American clergyman: b. Boston, 25 May 1810; d. London, 23 Dec. 1884. His father, Francis Dana Channing, died when he was very young. He graduated at Harvard College in 1829, and entering the Unitarian ministry preached with much success in New York, Cincin-
nati, Nashua, Boston and Rochester. Settling in England, he succeeded James Martineau as pastor of the Hope Street Chapel in Liverpool, 1852-62. He was for two years chaplain of the Houses of Parliament, but from the close of the Civil War lived entirely in England. He published ‘Memoirs of Dr. William Ellery Channing’ (1848); ‘Life and Writings of James H. Perkins’; ‘Memoirs of Madame Oswald (Margaret Fuller), in connection with R. W. Emerson and J. E. Clarke’ (1852). His addresses and discourses were often extempon-
aneous and delivered in a style highly im-
pasioned and imaginative. During a consid-
erable part of his career he was an earnest ad-

CHANNUKAH, Han’ na-kä. See BEFANA.

CHANSON DE ROLAND, the culmina-
tion of a cycle of ‘Chansons de Geste’ or ‘Songs of Valor,’ celebrating the heroic achievements of Charlemagne. Its date is proved to be not later than 1055, possibly as early as 1000. They are inspired especially by the joy and pride of the triumph of Christian armies over the Mohammedan invasion, which, through the gate opened by the Moors of Spain, threatened to subdue all Europe. The subject of the poem is the avenging of the death of Roland at Roncesvalles by Charlemagne. The French text of the ‘Chanson’ was first published in Paris by M. Francisco Michel in 1837, and afterward in 1850 by M. F. Genin. Tyrwhitt, in his edition of Chaucer, was the first to use English readers to the ‘Chanson’; but English tradition has it that the song was sung by the Norman Taillefer just before the battle of Hastings. The best and oldest French manuscript, called the ‘Digby,’ is preserved in the Bodleian library at Oxford. The French poem contains 6,000 lines. A frag-
ment of 1,049 lines, translated in Middle Eng-
lish from what is known as the Lansdowne manu-script, is published by the Early English Text Society. The first modern edition is by Michel (Paris 1837). Consult editions by Müller (Göttingen 1878); Gautier, Leon (Tours 1872 et seq.); Stengel (Heilbronn 1888); Seelmann, ‘Bibliographie des altfranzösischen

Rolandliedes’ (Heilbronn 1888); Paris, Gast-

CHANT, Laura Ormiston Dibbin, Eng-
lish lecturer and reformer: b. Chestow, Mon-
mouthshire, 1848. In 1876 she was married to Thomas Chant. She has taught in schools as well as nursed in hospitals and has lectured widely both in England and the United States on literary and scientific subjects, being a prom-
inent advocate of woman’s suffrage and temper-
ance. In the crusade against the Empire Music Hall, London, she played an important role. When the Bulgarian wars she took relief to the Arme-
nian refugees, and at the time of the Greco-
Turkish War she took nurses to the Greek frontier and Crete. She has published ‘Verona and Other Poems’; ‘Short Novellas’, and several collections of original songs.

CHANT, a short musical composition
adapted to the singing of the psalms and canti-
cles. Chants are single when adapted to a single verse, and double when adapted to two verses, the former consisting of two strains of three and four bars respectively, and the latter being twice that length. More recently quadra-
ipple chants extending over four verses have been introduced. The complete chant consists of four parts, namely: (1) The intonation or

initial phrase leading up to the reciting note; (2) The reciting note, which is the dominant of the mode employed; (3) The mediation, or main body of the chant; and (4) The termina-

tion or concluding phrase. In modern Angli-

can chants, however, there is no intonation. The origin of the plain song of the Church is unknown, but the first attempt to reduce the traditional music to some definite system was made by Saint Ambrose, bishop of Milan (d. 397). More important, however, is the Antiphonarium of Gregory the Great, which appeared in the latter half of the 6th century and soon established itself as the chief and in fact only authority on Church music. The Gregorian tones were introduced into England by Saint Augustine, and in the course of their history in that country they underwent many modifications in the various local ‘fuses.’ During the civil war and the Commonwealth they went out of use, but were revived at the Restora-

tion. Not long afterward, however, the Gregorian chants began to give place to the modern double chants, and in recent years that attempts have been made to revive them. A new impetus has been given to the use and popularization of plain chant in recent times by the first encyclical letter of Pius X, his *motu proprio* and the introduction of Gregorian music in all the Catholic churches throughout the world. See GREGORIAN CHANT.

CHANT DU DÉPART, shán dû dâ-pâr (Fr. ‘Song of Departure’), a popular French military song of the period of the Revolution, written by the poet Marie Joseph Chenier, to the music of Mélis. The occasion for its com-
position was the celebration of the fifth anniversary of the taking of the Bastille.

CHANTABON, shán-tá-bún', or CHANTIBAN, Siam, an important commercial port on the east side of the Gulf of Siam, near the mouth of the Chantiban River. It is occupied by the French as security for fulfilment of the treaty of 1893. It is a place of considerable trade. Pop. 30,000.

CHANTAL, shán-tá-l, Baronee de, Jane Frances Frémoy (främ-yó), SANT, French devotee, foundress of the order of the Visitatio B. V. M.: b. Dijon, France, 1572; d. Moulins, 13 Dec. 1641. She married C. de Rabutin, Baron de Chantal, who died 1600. After his death she devoted her life to charity. The institution of the Visitatio nuns was founded in 1610 at Annecy, and at her death it had 87 houses, and 60 years later 150 houses with 6,000 inmates—nuns and girls receiving a secular and religious education. She was canonized by Clement XIII in 1767; her day in the Roman Calendar is 21 August. Her life and letters were published at Paris (1874-79).

CHANTECLEER, shán-'t-klār'. The most original play of Edmond Rostand, although by no means his best, is 'Chantecler,' produced in 1910. The public, which had first been captivated by the dashing 'Cyrano de Bergerac,' and then charmed by the more ambitious 'L'Aglon,' had for a decade yearned for another piece from the poet's pen. When it came, after judicious heralding, it proved, to many, something of a disappointment. A tour de force, brilliant, witty and novel, it was nevertheless seen to stand apart from the main development of the modern drama. Rostand, as a romanticist, had sought to clench with unconventional garb figures to be used in a satire. From his observation of barnyard animals he caught the notion of presenting contemporary society in hide and feathers. Accordingly, he offered a dramatic fable, its central theme the faith of Chantecler, the cock, in his mission as the bringer of the dawn. Chantecler believes that his joyous song directly evokes the sunrise. Great is his distress to find, when the envious Hen Pheasant has screened his eyes with her wings, that Pope's bell, that dawn has brightened without him, and that he and his work are of little moment in the scheme of creation. Yet he will leave the forest whither the Hen Pheasant has beguiled him, and return to his barnyard to proclaim, though he cannot produce, the day. His companion, freshly enthralled by this evidence of his courage in defeat, flies up to protect him by diverting to herself the attention of a hunter, but, caught in a snare, she dies. Incidentally, the play laughs at the social climbers who attend the Guinea-Fowl's five o'clock tea, at the cynical Blackbird, the fancy cocks who are fops and faddists, and the spiteful birds of night. More sympathetic are the hero, Patou the dog, a good old idealist, and the Hen Pheasant, who repays with man the enchantress, piqued by man's devotion to his work, yet ready to lay down her life for him. The style of this fantasy is a marvelous mixture of poetry and slang, witty quips and smart local allusions jesting passages of lyrical beauty. No translator could help to render its rich and poetic quality, although the English versions of Gertrude Hall (1910) and J. S. Newberry (1911) are worthy attempts toward this end. M. F. Liberra has written a critical analysis of the play entitled 'The Story of Chantecler' (1910).

FRANK W. CHANDLER.

CHANTERELLE, an edible mushroom (Cantharellus cibarius) of a bright orange color, with a pleasant fruity smell, growing in woods and on dry pastures. See MUSHROOM.

CHANTIBUN. See CHANTABON.

CHANTILLY, shán-té-yé, France, town in the department of Oise, 25 miles north-northeast of Paris, on the Nonnette, celebrated for its two splendid chateaux. The smaller of the two chateaux is of recent construction and is regarded as one of the finest specimens of French Renaissance. The older and larger chateau was made famous by the presence of the most brilliant men of the time, La Fontaine, Racine, Molilère, La Bruyère and Boileau. In 1632 it passed to the house of Condé, but the greater part was demolished at the Revolution. The last Prince of Condé bequeathed the domain to the Duc d'Aumale in 1830. The present building and domain, including a gardens and gardens, an extensive forest, etc., were presented by the Duke to the French Institute in 1866. The chateau contains a valuable library and a precious collection of works of art. The place was formerly celebrated for its manufacture of lace ("Chantilly lace"), but the manufacture have fallen off. It is a great horse-racing and training centre with a fine course, and noted for the three annual race meetings held here. Pop. 5,556.

CHANTILLY, shán-till', or OX HILL, Battle of. On Sept. 1, 1862, the day of the second battle of Bull Run, General Lee marched his army by way of Sudley Ford around Pope's right at Centreville, to seize Fairfax Courthouse and interpose between Pope and Washington; and at night Jackson, who was in advance, bivouacked six miles west of Chantilly, on the Little River turnpike, Longstreet some distance in rear. Next morning General Stuart informed Jackson that a part at least of the Union army was at Fairfax Court-House, and that Pope's task, that Pope's job, was passing on the road from Centreville to that place. Jackson moved cautiously toward Fairfax Court-House, and on reaching Ox Hill, three miles east of Chantilly, was informed by Stuart that the Union force seemed very strong on the road in front. Then Jackson formed line on Ox Hill ridge, his artillery massed on the left of the road, his infantry on the right, extending in the direction of the Centreville road. He had not completed his formation when he became aware of an approaching column from the Centreville road, upon which he strengthened his right and threw out skirmishers. About 1 P.M. Pope, who had heard of Jackson's advance toward his rear, sent Gen. I. I. Stevens with nine regiments, about 3,000 men, of Reno's corps to gain the road two miles east of Chantilly and hold Jackson in check until the army could be brought into position at Fairfax Court-House. Stevens moved from near Centreville across the fields, unexpectedly struck Jackson's advancing skirmish-line, threw off from his right, and drove it back into a body of woods. Jackson then advanced a regiment from the woods,
which was immediately driven back by Benjamin's battery. Stevens now formed a column of assault, six regiments in three lines, two regiments in a line. At 4.30 P.M. he placed himself in the centre of this column of 2,000 men, on open ground, and ordered it forward. Benjamin shelling the woods in front. Not a sight nor sound betrayed the presence of an enemy, until the advancing column, ascending a gentle slope, came to within 75 yards of the woods, when from a worm fence bordering them came a terrible volley from Branch's brigade, smiting the column with great effect, men going down by the score. At first it began to waver, but quickly bracing up returned the fire; five color-bearers of the 79th New York, Stevens' old regiment, went down in succession. The assault was checked, Stevens ran forward, seized the colors and, calling upon his men to follow him, all rushed forward, routed Branch, and gained the fence, Stevens falling dead on it, with a bullet through his brain and the colors under his arm. The column pushed on into the woods. At the moment of reaching the fence a sudden and terrific thunderstorm and fierce gale burst over the field, blowing the rain into the faces of the men on both sides, impeding their movements and wetting their ammunition. Jackson brought up fresh men, and after a contest of more than an hour the six regiments were driven out of the woods and fell back to the point where they had formed, and on the right of where Birney's brigade of Kearny's division had come up. Meanwhile three regiments of Reno's command had been sent in on Stevens' right, one only of which, the 21st Massachusetts, became seriously engaged and was repulsed with great loss. General Kearny now came up with a battery, which he put in position and went to the right for a regiment to fill an interval on Birney's right. He met the 21st Massachusetts as it came out of the woods, and was leading it to the left when his attention was called to the fact that the Confederates were advancing from the woods and through a cornfield on Birney. He spurred his horse into the cornfield to reconnoitre, ran upon a skirmish-line, saw his mistake and turned to ride back, when he was shot through the body and killed. A shout went up from the Federals and the Confederates, which was ended by darkness; the regiment withdrew, the Confederates retired to the woods and the battle was ended, neither side having permanently gained a foot of ground. The other two brigades of Kearny came up, and the ground was held until 3 o'clock in the morning of the 2d, when Kearny's and Reno's men fell back to Fairfax Court-House after the last of Pope's army from Centreville had passed. Pope fell back to Washington, and Lee marched to cross the Potomac at Maryland. The Union loss at Chantilly was about 800; that of the Confederates about 700. In the death of Kearny and Stevens the Union army lost two of its best officers. Consult 'Official Records' (Vol. XI); Sherman, 'Narrative of the War'; (Vol. II); Gordon, G. H., 'Army of Virginia.'

E. A. CARMAN.

CHANTRY, chân'tri, Sir Francis Legatt, English sculptor: b. Jordanthorpe, Derbyshire, 7 April 1781; d. 25 Nov. 1841. The chief amusement of his boyhood was in modelling figures in clay and drawing likenesses and at his own request he was apprenticed in 1797 to a carver and gilder at Sheffield. Here he attracted the attention of J. Raphael Smith, a mezzotinto engraver and portrait-painter, who, perceiving his decided inclination for drawing and modeling, gave him instructions, which tended greatly to prepare him for his future career. He then set up as a portrait-painter. By 1802 he was resident in London, studying at the Royal Academy. Having acquired much reputation as a sculptor, he became the successful candidate for the marble bust which the inhabitants of Sheffield had resolved to erect to the memory of the Rev. J. Wilkinson (1805-06). This interesting work, which may be said to have finally decided his future course, is in Sheffield Parish Church. Having settled permanently in London, he presented numerous busts at the exhibitions of the Royal Academy. About the same time he was a successful candidate for a statue of George III. for the city of London, and soon was universally regarded as the first monumental sculptor of the day. In 1815 he was chosen an associate and in 1818 a member of the Royal Academy. In 1819 he visited Italy, where he was elected a member of the academies of Rome and Florence. He was knighted in 1835. His most celebrated works are the 'Sleeping Children,' a monument erected to two children of the Rev. W. Robinson, in Lichfield Cathedral; the statue of Lady Hussey, Duchess of Bedford, in Woburn Abbey; Lady Frederica Stanhope with her infant child, in Chevering Church; Sir Joseph Banks, at the British Museum; Roscoe and Canning, at Liverpool Town Hall; James Watt, at Glasgow; the bronze statue of William Pitt, in Hanover square, London; and statues of Horner, Sir J. Malcolm, etc., in Westminster Abbey, and a statue of Washington in the State House at Boston, Mass. His finest works are his busts, among the best of them being Sir Walter Scott, James Watt, Wordsworth and Porson. His full-length figures are said to betray an insufficient acquaintance with anatomy, and several of his equestrian statues in bronze are still more defective. The postures are formal, and the horses, in their masses, are as infirm and inanimate. He made munificent bequests, amounting to £150,000, for the advancement of fine art, the Royal Academy being endowed with a large fund known as the Chantry Bequest for the purchase of works of sculpture and painting by artists residing in Great Britain. See 'Lives' by Jones (1849); and Raymond (1904).

CHANTRY (old French, Chanterie), an ecclesiastical endowment to provide for the celebration of masses for the prosperity of the living or repose of the dead. Previous to the Reformation chantries were very numerous, almost every family of importance having founded one or more. Wealthy founders would endow a church or monastery, in which religious services should be celebrated continually. For less wealthy founders, an altar in the church of the locality was made to suffice. Sometimes small chapels, called chantry chapels, were connected to the main edifice and occasionally, as at Wakefield and Bradford-on-Avon, such chapels
were erected on bridges. The residences of priests engaged in the services were known as chapter houses or colleges. The Chantry schools were widely spread over England prior to the Reformation. Chantries were finally dissolved in England by King Edward VI, and nearly all endowments were devoted to the purposes of the Crown. For the text consult Green, Henry, "Documents Illustrative of the History of the English Church," pp. 328–57 (London 1896).

CHANUTE, čanut, Kan., city in Neosho County, 125 miles southwest of Kansas City, Mo., on the Atchison, Topeka and Santa Fé and the Missouri, Kansas and Texas railroads. The city was incorporated in 1873, and adopted the commission form of government in 1912. Manufactories here include railroad shops, glassworks, brick and cement plants, smelters, drilling-tool works and flour mills. The United States census of manufactures for 1914 recorded 57 industrial establishments of factory grade employing 190 persons, of whom 131 were wage earners, receiving $69,000 annually in wages. The capital invested aggregated $430,000, and the net value of output was valued at $480,000: on this $234,000 was the value added by manufacture. Most of the industrial plants utilize the abundant natural gas of this locality, which is also used for lighting and various domestic purposes. The recent discovery of extensive oil-fields in the vicinity has led to a new and important industry, over 2,000 productive oil-wells having been opened. This industry promises rapid growth for the city, and also developments of great importance to the State. Pop. 11,000.

CHANZY, shan-zē', Antoine Eugène Alfred, French general and politician: b. Nouart, Ardenennes, 18 March 1823; d. Châlons-sur-Marne, 4 Jan. 1883. After a course at the military school of Saint-Cyr, he became sub-lieutenant of infantry in 1843, and was sent to Algeria and eventually became major. He subsequently served in Italy and Syria, but on becoming colonel he returned to Africa in 1868. On the outbreak of the war with Germany, in 1870, he was created general of division, and after gaining the battles of Coulmiers and Patay, was put in command of the second army of the Loire. Here he fought heroically against the much stronger and more disciplined German forces, but finally had to retreat. He was elected to the National Assembly for the department of Ardennes, and during the Commune he narrowly escaped with his life. When peace was declared he was elected to the National Assembly and became in 1872 commandant of the Seventh Army Corps. In 1873 he went to Algeria as governor-general, in 1875 he was elected life senator and in 1879 he stood for the presidency. In that year also he was sent to Russia as Ambassador, a post which he held till 1881, when he became commander of the Sixth Army Corps. He published "La deuxième armée de la Loire" (1871). Consult biographies by Chuquet (Paris 1884) and Villefranche (Paris 1890).

CHAO-CHOW, chow-chow' China, a city in the province of Kwang-tung, on the river Ham, 195 miles northeast of Hongkong. It is the centre of an important maritime division of the province. The channel leading to it is very shallow, so that ships of large burden can sail up only at high water. This city was included in the Treaty of 1858 as a port open to foreign trade, but the foreign trade is transacted at Swatow. Pop. estimated about 200,000.

CHAOIS, according to the signification of the word, the void which embraces all things. Hesiód mentions, as the original principles of all things, Chao, Earth and Eros (Love); other ancient poets made Chaos alone the primate source from which everything is derived; others added to it Night, Erebus and Tartarus; and others still represented Chaos as the parent of the Earth and Heaven; after the production of which Earth and Heaven made the universe. Modern writers commonly understand by chaos the uniform primæval matter from which the universe was made.

CHAP-BOOKS, a species of cheap literature, in the form of small pamphlets, which preceded the popular periodicals of the present day and were so called because prepared for sale by the chapmen, or pedlars, who hawked them from district to district. They were largely productions of the provincial presses. The writers are mostly unknown, but one of the author of Scottish chap-books was Dougal Graham (1724–79), bellman of Glasgow. Their matter was of the most varied character, including theological tracts, lives of heroes, martyrs, interpretation of dreams, fortune telling, weather forecasts, stories of ghosts, goblins and witches, and songs and ballads. After 1800 the chap-books declined in popularity, and were succeeded by the Penny Magazine and other cheap publications. Collections of chap-books are now found only in the libraries of bibliophiles. Consult "Notices of Fugitive Literature and Chap-Books" (Percy Society, Vol. XXIX, London 1851); "Popular English Histories" (Vol. XXI, 1848); Ashton, "A History of the Chap-Books of the Eighteenth Century" (London 1852); Fraser, "Humorous Chap-Books of Scotland" (1873); Faxon, "Ephemeral Bibliolots," in "Bulletin of Bibliographical Pamphlets" (Boston 1903); "Catalogue of American and English Chap-Books," in "Bibliography of Curiosa," Cambridge (1905). Consult also Nisard, "Histoire des livres populaires" (Paris 1854), and Simrock, "Deutsche Volksbücher" (13 vols., Berlin 1839–67).

CHAPAIS, shā-pā', Joseph Amable Thomas, Canadian journalist and statesman: b. Saint Denis de la Bouteillerie, Quebec, 1858. He was graduated at Laval University in 1879 and was called to the bar in the same year. From 1879 to 1884 he was private secretary to the lieutenant-governor of Quebec and from 1884 to 1901 edited Le Courrier des Canadien Quebec. He became a member of the legislative council in 1892 and was made speaker in 1895. In 1893 he was a member of Taillon's Cabinet and in 1897 was Minister of Colonization and Mines. In the latter year he retired from public life and was appointed to the Senate of Canada, where he remained until 1901, when he was made chevalier of the Legion of Honor in 1902. His published works include "Les congregations enseignantes et le brevet de capacité" (1883); "Discours et conférences" (2 vols., 1884–94); "Voyage au pays de l'Ouest" (1901); "Jean Talon, intendant de la Nouvelle France" (1904); Mélanges de
polémique et d’études religieuses, politiques et littéraires1 (1905); ‘Le Marquis de Montcalm 1712-1759’ (1911).

CHAPALA, chá-pa-lá, Mexico, a lake on the high plateau of Jalisco, surrounded by steep, bare mountains. It has an estimated area of 1,300 square miles, and contains many islands. The Rio Lerma is its chief tributary stream, entering from the east; its outlet is the Rio Grande de Santiago.

CHAPARRAL-COCK, chá’ pa-ral’. See Road-runner.

CHAPEAUX, shá-pó (Fr. chapeaux), a name applied to the partisans of France in Sweden in the 18th century, while those of Russia were called bonnets (caps). Having instigated war against Russia in 1741, and again in 1756, the calamities thus inflicted upon Sweden impaired the popularity of the chapeaux. Succeeding in 1769 in regaining their former position, the party was soon extinguished altogether by the advent of Gustavus III and his reforms. The same names were also formerly applied in the French Academy, the chapeaux constituting the party supported by the philosophers and the public, and the bonnets that partly upheld the clergy and the court.

CHAPEL (Fr. chapelle, Lat. capella), a name for religious edifices of various kinds, especially for such as had a subordinate position. In England and Scotland there are several kinds of chapels—parochial chapels, subordinate to, but distinct from, the mother church; chapels of ease, built for the accommodation of the inhabitants, in large parishes; university chapels, and private chapels, whose names explain their uses. The term is also applied to small buildings attached to cathedrals, and separately dedicated. In England Nonconformist places of worship are commonly called chapels in distinction from those of the Established faith to which the term church is applied. In the early history of Massachusetts Bay Colony the Congregational body was the established church, and the first Episcopal church in Boston was consequently termed that name, *King’s Chapel,* to the present time. (See King’s Chapel.) The word chapel is also applied to an association of union workmen in a printing-office for the purpose of promoting and enforcing order among themselves. Consult Bond, ‘Wetherin Abbey’ (London 1909); Martin, ‘Manual of Ecclesiastical Architecture’ (Cincinnati 1897); and article ‘Chapelle’ in Viollet-le-Duc, ‘Dictionnaire raisonné de l’architecture française’.

CHAPEL HILL, N. C., town in Orange County, on the Southern Railroad, 28 miles northwest of Raleigh. It is a lumbering centre and has cotton and knitting mills and a woodworking plant. It is the seat of the University of North Carolina and has a Carnegie library. Chapel Hill was incorporated in 1851 and its government is vested in a mayor and council. Pop. 1,149.

CHAPEL ROYAL, in the Church of England, a body composed of two deans, 36 royal chaplains, 10 priests, a lay choir and an organist. The services are performed in an oratory in Saint James’s Palace. In Scotland such appointments are purely honorary, carrying neither emolument nor any special duty.

CHAPLEIN, sháp-lün, Jean, French poet, one of the earliest members of the French Academy; b. Paris, 4 Dec. 1595; d. there, 22 Feb. 1674. Having gained a high literary reputation, after writing a preface for Marini’s ‘Adone,’ translating Alcamia’s ‘Guzman de Alfarache’ and composing four odes, he conceived the project of writing an epic on Joan of Arc, ‘La Pucelle,’ which proved a total failure, although he spent over 20 years on it. The first 12 cantos appeared in 1656; and to so high a pitch had public expectation been wrought, that notwithstanding the adverse criticism of Boileau and Voiture, six editions came forth within the following 18 months. Eight new parts appeared in 1757, and the concluding four parts, which never were printed, are in manuscript in the Imperial library of Paris. Bona, to whom he dedicated a poem and whom he assisted in concocting literary works, conferred a pension on him; he presided over the organization of the French Academy, took a conspicuous part in the early labors of that body, sat as academic critic, and, under *Cid* and possessed during nearly 40 years a literary prestige, which was broken by his ‘Pucelle,’ although he remained in favor with the court. Consult his ‘Lettres’ (ed. in part by T. de Larroque, 2 vols., Paris 1889-82); ‘Lettres inédites,’ ed. by L. G. Pellissier (1894); Duchesne, Julien, ‘Les poèmes épiques du XVIIe siècle’ (1780); Fabre, A., ‘Les ennemis de Chapleain’ (1888); Molénes, E. de, ‘La Pucelle par Jean Chapleain’ (Paris 1891); Fabre, ‘Chapleain et nos deux premières Académies’ (Paris 1890); Mühlau, A., ‘Jean Chapleain: Eine, biographisch-kritische Studie’ (Leipzig 1893); Searles, ‘The Library of Jean Chapleain’ (Chicago 1910); Saintesbury, George, ‘History of Criticism’ (Vol. II, 1911).

CHAPLLE, shá-pel’, Placide Louis, American Roman Catholic prelate; b. in the diocese of Mende, France, 28 Aug. 1842; d. New Orleans, La., 9 Aug. 1905. He studied at the College of Enghien, Belgium, but in 1858 came to the United States and after completing his theological course at the Baltimore Seminary, was ordained priest by Archbishop Spalding in June, 1865, the missions of Montgomery County, Md., being the scene of his first ministerial duties. In 1871 he was made assistant at Saint John’s Church and afterward rector of Saint Joseph’s Church, Baltimore, whence he was appointed to the rectoryship of Saint Matthew’s Church, Washington. He became vice-president of the Bureau of Catholic Indian Missions and helped to found the Catholic College. On 21 Aug. 1891, he was made coadjutor to the bishop of Santa Fé; in 1893 was elevated to the titular archiepiscopal see of Sebaste and in less than a year succeeded to Archbishop Salpointe in the see of Santa Fé. He was soon transferred to the diocese of New Orleans, assuming his new charge on 10 Feb. 1898. In September 1898 Pope Leo XIII appointed him apostolic delegate to Cuba and Porto Rico, in 1899 the Philippines being added to his care. Subsequently he spent three months
in the discharge of his official duties in his country's new possessions. Within eight months he consecrated four bishops for Cuba, and three more for sees in other places. He died at New Orleans of yellow fever.

CHAPERNON, shā’p är-n, a cap or hood. Such a covering is worn by Knights of the Garter, and was at one time in general use but was later appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places is called a chaperon, probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

CHAPIN, Anna Alice, American author: b. New York, 16 Dec. 1880. She was educated privately and studied music under Harry Roderich. In 1906 she was married to Robert Peyton Carter. She early began to write, publishing her first work at 17. Her works include 'The Story of the Rhinegold' (1897); 'Wonder Tales from Wagner' (1898); 'Wotan, Siegfried and Brünnhilde' (1899); 'Master of Music' (1901); 'George' (1905); 'Lady Calmore's Flirtations' (1903); 'Babes in Toyland,' with Glen McDonough (1904); 'Makers of Song' (1905); 'The Stronger Call' (1905); 'The Heart of Music' (1905); 'The Story of the United States Navy' (1907); 24 chaplains in the United States navy; 4 with the rank of commander, 7 of captain, 5 of lieutenant-commander, 1 lieutenant and 7 lieutenants (junior grade). Their duties, responsibilities and remuneration in general correspond with the relative army rank.

CHAPLIN, Edwin Hubbell, American clergyman: b. Union Village, N. Y., 29 Dec. 1814; d. New York, 27 Dec. 1880. In 1837 he was ordained to the Universalist ministry, was a pastor in Virginia, N. C., and Pennsylvania, and in 1842, in Charleston and Boston, Mass., 1838-48, and then accepted a call to the Fourth Universalist Church in New York, a connection he retained until his death. He became editor of The Christian Leader in 1872, succeeding Dr. Emerson as editor. Sermons and addresses are 'Duties of Young Men' (1840, 9th ed., 1856); 'Duties of Young Women' (8th ed., 1856); 'Characters in the Gospels' (1852); 'Discourses on the Lord's Prayer' (1850); 'The Crown of Thorns' (1860); 'The Desolation of Sin' (1854); 'Moral Aspects of City Life' (1853); 'Discourses on the Beatitudes' (1855); 'Select Sermons' (1860); 'Living Words' (1861); 'Lessons of Faith and Life' (1876); 'God's Requirements' (1891); 'The Church of the Living God, and Other Sermons' (1881); 'Consult Ellis, 'Life of E. H. Chapin' (1883).

CHAPLIN, Henry Edgerton, American biologist: b. Wilbraham, Mass., 9 May 1859. He was educated at the Massachusetts Agricultural College and at Boston University. In 1886-87 he was post-doctoral fellow in zoology and biology at Johns Hopkins University. He taught in secondary schools and engaged in agricultural journalism in 1881-86, taught at the Pennsylvania State Normal School in 1888-90 and from 1891 to 1900 was professor of biology at Ohio University. Since 1900 he has been instructor in biology and physiography in a New York high school. He is joint author of Chaplin's and Retger's 'Elementary Zoology and Guide' (1890) and has written many scientific monographs.

CHAPLAIN, a clergyman not having a parish or similar charge, but connected with a court, the household of a nobleman, an army, a prison, a ship or the like. Army chaplains in the United States are appointed by the President and are assigned or transferred by the Secretary of War. They are usually attached to the various army posts. By acts of Congress, approved 1901, 1904, 1906 and 25 Jan. 1907, provision is made for 67 army chaplains, 15 of whom may be majors; those of less than seven years' service, first lieutenants; and the remainder captains. They are required to make a monthly report to the adjutant-general of the duties performed, and to keep a record of all marriage, funeral or baptismal services performed by them. Another duty is the instruction of the enlisted men in the common English branches of education. Chaplains are chosen from all religious denominations and must be under the age of 40 at time of appointment. There are 4 in the United States navy; 4 with the rank of captain, 7 of commander, 5 of lieutenant-commander, 1 lieutenant and 7 lieutenants (junior grade). Their duties, responsibilities and remuneration in general correspond with the relative army rank.

CHAPLAIN OF THE FLEET, a novel by Walter Besant and Janet Rice, published in 1881. It gives a detailed account of the famous Liberties or Rules of the old Fleet prison in London, and of the Fleet marriages of the 18th century. These *Rules* were houses in certain streets near the Fleet Market, where prisoners for debt were allowed to live outside the prison, on payment of fees. This novel is considered one of the best of those written under the firm-name of Besant & Rice.

CHAPLEAU, shā-plō, Sir Joseph Adolphe, Canadian statesman: b. Sainte Thérèse de Blainville, Quebec, 9 Nov. 1840; d. Montreal, 13 June 1898. He was educated at the colleges of Terrebonne and Saint-Sulpice and in 1866 became a member of the bar. He represented Terrebonne in the Quebec legislature, served successively in the capacities of Solicitor-General, Provincial Secretary, Provincial Premier, Minister of Agriculture and Public Works, in the government of Quebec, and was finally appointed Secretary of State for the Dominion in 1883. He was lieutenant-governor of Quebec in 1893-98, and for some years was professor of international law at Laval University.

CHAPLIN, Charles, moving picture actor: b. France, 16 April 1889. His parents were English music hall artists touring central Europe at the time of his birth. Chaplin adopted a variety-stage career in his early youth and traveled for some years through the English provinces, performing in pantomime and disport with a charming and disarming acrobatic "stunts." Another accomplishment credited to him is that of playing the violin and 'cello—left-handed. He eventually joined the Fred Karno Company, an old English troupe performing ludicrous sketches in which pantomime, burlesque and knock-about acts were hilariously blended. With this company he
came to New York in 1911, playing a part in a sketch entitled, "A Night in a London Music Hall." Chaplin's distinctive style of acrobatic humor led to his being engaged by Mr. George Kessel to play in moving picture productions. With the enormous development and growth of this popular form of entertainment, Chaplin became a world-wide celebrity and one of the highest paid actors in the profession.

CHAPLIN, Chaplin, Charles Joshua, French portrait painter: b. Les Andelys, 6 June 1825; d. Paris, 30 Jan. 1891. He was of English parentage, but was naturalized as a French citizen. Under Napoleon III he was engaged in decorating the Tuileries and the Elysée, and he also painted many ceilings and wall decorations in Parisian public and private buildings, as well as various portraits, mainly those of women. Among his best pictures are 'Souvenirs,' in the Luxembourg and 'Haïdee,' in the Metropolitan Museum, New York.

CHAPMAN, Alvan Wentworth, American botanist: b. Southampton, Mass., 28 Sept. 1809; d. 6 April 1899. He graduated at Amherst 1830, studied medicine in Georgia and Florida, and in 1846 settled in Appalachiaca, where he was called in 1862 for the U. S. S. Virginia, he was the collector of customs 1866-69. He attained a high rank as a botanist, and the genus Chapmania was named in his honor. He wrote 'A Flora of the Southern United States, Arranged According to the Natural System' (2 vols. by D. C. Eaton) (1860, 2d ed. enlarged, 1883; 3d ed., 1897).

CHAPMAN, Carlton Theodore, American artist: b. New London, Ohio, 18 Sept. 1860. He was educated at Oberlin, Ohio, and received his artistic education at the National Academy of Design and the Art Students' League, New York, and at the Julian Academy, Paris. He has made a specialty of marines and landscapes, and is famed for his representation of the naval battles of the United States. His latest works include 'The Delaware,' 'The S. S. Gloucester and the Spanish Torpedo Boats,' 'A Squally Day—North River,' 'Off Ellis Island,' 'The Argus and the Pelican,' 'The Bonhomme Richard and the Serapis,' 'The Lighthouse,' 'The Dark Sea,' 'The Pacific Coast,' 'The Mystic Pool,' 'Battle of Cape St. Vincent.' He is a member of the National Academy of Design and was awarded medals at all recent expositions.

CHAPMAN, Frank Michler, American naturalist: b. Englewood, N. J., 12 June 1864. Since 1887 he has been assistant curator in the department of vertebrate zoology in the American Museum of Natural History, New York. He made some excellent close-range photographic studies of bird life. He is editor of 'Bird-Lore' and associate editor of 'The Auk.' His work has been published in various life journals, etc., he has published 'Hand-book of Birds of Eastern North America' (1895); 'Bird-Life, a Guide to the Study of Our Common Birds' (1897); 'Bird Studies with a Camera' (1900); 'A Color Key to North American Birds' (1901); 'The Eastern Sub-Marine Life of the State' (1903); 'The Warblers of North America' (1907); 'Camps and Cruises of an Ornithologist' (1908).

CHAPMAN, George, English poet, the earliest and perhaps the best translator of Homer: b. about 1559; d. London, 12 May 1634. He is supposed to have been educated at Oxford 1576, proceeded to London, where he made the friendship of Shakespeare, Spenser, Marlowe and other distinguished writers of the time. As to his personal history little is known, but he is supposed to have held some post in connection with the court. The first of his works, so far as known, was the 'Shadow of Night,' a poem published in 1591. His translation of the 'Iliad,' in rhyming lines of 14 syllables each, was published in three separate portions, in 1598, 1600 and 1603. It has been highly commended by such poets as Pope, Keats and Coleridge, as also by Lamb. A sonnet 'On First Looking Into Chapman's Homer' ("Then felt I like some watchet of the skies, etc." is well known. In 1614 appeared his translation of the 'Odyssey' in the same metre as the 'Iliad,' followed in the same year by that of the 'Battle of the Frogs and Mice' and the Homeric hymns. He also translated Hesiod's 'Works and Days' and portions of various classic poets. He wrote numerous plays, almost all now forgotten, though containing some fine passages. The earliest of these was 'The Blind Beggar of Alexandria,' a comedy, 1598. He was associated with Jonson and Marston in writing the comedy of 'Eastward Ho!' which from its satirical reflections on the Scotch is said to have nearly brought severe punishment on the authors. Among his tragedies are 'Bussy d'Ambois'; 'Cesar and Pompey'; 'Revenge for Honor'; and two dramas on the life of Marshal Biron, which Swinburne characterizes as 'a storehouse of lofty thought and splendid verse, with scarcely a flash or sparkle of dramatic action.' An edition of his works was published (1873-74). Consult Swinburne, 'George Chapman: a Critical Essay' (1875); Arnold, Matthew, 'On Translating Homer.'

CHAPMAN, J. Wilbur, American clergyman, evangelist and author: b. Richmond, Ind., 17 June 1859. He studied for the pastorate in Haverford College and was graduated 1879 at Lake Forest University. He was educated in theology at Lane Seminary, Cincinnati, Ohio. The degree of D.D. was conferred upon him by the University of Wooster. The degree of L.L.D. was conferred upon him by Heidelberg University, Otterbein, Ohio. He has filled pastorates in Indiana, Ohio and New York. His special ministry was in the First Reformed Church in Albany, N. Y.; the Bethany Presbyterian Church, Philadelphia, and the Fourth Presbyterian Church, New York city. Much of his ministry has been along evangelistic lines. He was an intimate associate of D. L. Moody, a noted evangelist. For 10 years he was the corresponding secretary of the General Assembly's committee on evangelistic work in connection with the Presbyterian Church. He is the representative at large of this committee at the present time. For 10 years he has given his time to evangelistic work. In addition to the larger cities in the United States, he has labored in Canada, the West Indies, Australia, Tasmania, New Zealand, the Philippines, China, Korea, Japan, Ceylon, England, Ireland, Scotland and Wales. He is the
author of: 'Receive ye the Holy Ghost'; 'And Peter'; 'Kadesh Hamme'; 'The Lost Crown'; 'The Secret of a Happy Day'; 'The Surrendered Life'; 'Spiritual Life in the Sunday School'; 'From Life to Life'; 'Present Day Parables'; 'Life of D. L. Moody'; 'Present Day Evangelization' (1903); 'The Problem of the World' (1911); 'Chapman's Pocket Sermons' (1911); 'Revival Sermons' (1911); 'Present Day Evangelization' (1912).

CHAPMAN, John Jay, American lawyer and essayist: b. New York, 1862. He was graduated from Harvard in 1884; was admitted to the New York bar and was in active practice there until 1898. His essays and speeches have attracted considerable attention on account of their striking individuality and original point of view. His published volumes include 'Emerson, and Other Essays' (1898); 'Causes and Consequences' (1898); 'Practical Agitation' (1900); 'Four Plays for Children' (1908); 'The Maid's Forgiveness' (1908); 'A Sausage from Bologna', a comedy in verse (1909); 'Benjamin Arnold', a tragedy in verse (1911); 'Learning and Other Essays' (1911); 'Neptune's Isle' (1912); 'William Lloyd Garrison' (1913).

CHAPMAN, Maria Weston, American reformer: b. Weymouth, Mass., 1806; d. there 1885. She was a daughter of Warren Weston, and received her education in her native place and also in England. In 1829-30 she was principal of the Young Ladies' High School, Boston. She married in 1830; became an active opponent of slavery in 1834; and after the death of her husband in 1842, went to Paris, France, and assisted the anti-slavery cause with her pen. She returned to America in 1856. She edited the autobiography of her friend, Harriet Martineau (1877); wrote 'Right and Wrong in Boston'; Report of the Boston Female Anti-Slavery Society' (1836); 'Right and Wrong in Massachusetts' (1840). She compiled the anti-slavery hymnbook 'The Songs of the Free' (1836).

CHAPMAN, William, Canadian poet: b. Saint-Francois de l'Île de Rimouski, Quebec, 1850. He was educated at Levis College, studied law and for a time engaged in trade. Later he entered the civil service of his native province. He also did some journalistic work in Montreal and Quebec and in 1902 became a French translator for the Dominion Senate at Ottawa. He has written 'Les Quebequoise' (1876); 'Le laureat' (1894); 'Les deux Copains' (1894); 'Les aspirations' (1904), which received a prize from the French Academy; and 'Les Rayons du Nord' (1910), which gained the highest prize from the French Academy.

CHAPMAN'S HOMER. George Chapman (1559-1634), writer of plays and contemporary of Spenser, Marlowe, Jonson and Shakespeare, was a great translator in the great tradition of adaptations that brought foreign literature, the English Bible and so many versions and adaptations of the ancient classics. He published seven books of the 'Iliad' in 1598, and by 1616 had published together the 'Iliad' and the 'Odyssey', complete in rhymed syllable. The literature of his own time contains much complimentary allusion to him, and the esteem of later generations is manifest in many glowing tributes from eminent literary characters, probably the most familiar and the most stimulating being Keats' 'I wandered lonely as a cloud'; 'much have I travelled in the realms of gold'.

"Oft of one wide expense had I been told That deep-browed Homer ruled as his demesne; Yet did I never breathe before Till I heard Chapman speak out loud and bold.

"The loud and bold" of Keats contains or suggests the qualities that have made Chapman's translation live in spite of the lack of polish, of exactness, and sometimes of dignity, that are charged against it. Pope, his later rival, says "he covers his defects by a daring fiery spirit that animates his translation." Even Matthew Arnold, the severe critic of all translations of Homer, who declares that "in a verse translation no original work is any longer recognizable," characterizes Chapman as "plain spoken, fresh, vigorous, and, to a certain degree, rapid." Arnold, however, condemns him on the whole. "Homer," he says, "is rapid in his movement, Homer is plain in his words and style, Homer is simple in his ideas, Homer is noble in his manner. . . . Chapman renders him ill because he is fantastic in his ideas. . . . His conceits are un-Homeric, and his rhyme is un-Homeric; Homer's language and movement are un-Homeric; his diction often offends . . . by wanting Homeric nobleness." He condemns him most of all because he cannot forbear to interpose a play of thought between his object and its expression. Chapman translates his object into Elizabethan, as Pope translates it into the Augustan of Queen Anne; both convey it to us through a medium." For the Elizabethan age," write Butcher and Lang in the preface to their translation of the Odyssey, "Chapman supplied what was then necessary, and the mannerisms that were then deemed of the essence of poetry, namely, daring and luxurious conceits. . . . Without Chapman's conceits, Homer's pathos would hardly have been what the Elizabethans took for poetry; without Pope's smoothness, and Pope's points, the Iliad and the Odyssey would have seemed tame, rude, and harsh in the age of Anne." If, as Arnold reasonably insists, the real function of translation is the attempt to satisfy the scholar who has also poetical feeling, Chapman must be said to be pleased most those not perfectly possessed of the means of really judging him as a translator, but who come to his work more or less as to an original poem in the Elizabethan manner. Such readers will find him admirable for what R.H. Horne calls "his commanding energies, fulness of faith in his author's genius, and in his own inspired sympathies, his primitive power, and rough truthfulness of description;" and will feel not only the inspiration of the Homeric narrative but the inspiration of the translator himself.

CHAPPE, shahp, Claude, French abbé and inventor: b. Briçon (Sarthe) 1763; d. Briçon, 23 Jan. 1805. Having invented an ingenious system of signals to communicate at a distance with his friends, he presented it to the French Legislative Assembly in 1792. It was successfully tried between Paris and Lille, on a length of 48 leagues, and in the same year the name of Chappé established several lines in France, and the one running north was first put in motion.
to announce the recapture of the town of Condé from the Prussians. The inventor was at once rewarded by the convention, which, by a decree, appointed him ingénieur télégaphiste. The lines were extended all over France, and the system was also adopted, with some alterations, through Germany and England. The attempt, which was subsidized by persons jealous of his invention, preyed so much upon his mind that he committed suicide. His semaphore consisted of an upright post, with a transverse bar at top, and with two smaller arms movable on pivots. The position of the bars represented letters or words, and the posts were placed within visible distance one of another. Messages were conveyed a distance of 150 miles in 15 minutes by this method. Consult ‘Histoire de la télégaphie’ (1824) by Ignace Urbain Jean Chappé, brother of Claude Chappé.

Chappe d'Autoroche, dô-tê-rosh', Jean, French astronomer: b. Mauriac, Auvergne, 2 March 1722; d. San Lucas, Cal., 1 Aug. 1769. He was a priest, but giving his whole attention to astronomy, became one of the assistants of Cassini in delineating the general map of France, and edited the astronomical tables of Halley. In 1760 he was designated by the Academy to make an observation of the transit of Venus over the sun’s disc, which Halley announced would happen 6 June 1761. He consequently set out for Tobolsk, in Siberia, which was pointed out as the most favorable point of observation. His mission was successfully accomplished; and returning to France at the end of two years, he published in 1768 his ‘Voyage en Sibérie.’ The following year he sailed for California to observe another transit of Venus, which was to take place 3 June. He was equally successful on this occasion, but died soon afterward. The results of his last expedition were published by Cassini, under the title of ‘Voyage de la Californie’ (Paris 1772).

Chapped Hands, a form of eczema (eczema ascites), caused by exposure to extremes of cold or wet, cracks and there is itching, pain and heat and in severe cases ulceration. The lesions are generally treated with oxide of zinc ointment, or a solution of borax in glycerin and rose water or with glycerin alone. The hands should be protected by warm gloves. Chapping may be avoided to a great extent by washing the hands with a bland soap in tepid water and thoroughly drying them afterward.

Chappell, William, English musical antiquary: b. 20 Nov. 1809; d. London, 20 Aug. 1888. For the most of his life he lived in London, where he was for some years a member of a great music publishing house. His first work of importance was ‘A Collection of National English Songs, Ballad and Dance Tunes’ (1838-40). He took a principal part in the foundation in 1840 of the Percy Society and the Musical Antiquarian Society and published the first volume of a ‘History of Music’ in 1874.

Chappell, Joe Mitchell, American journalist, La Porte City, Iowa, 18 July 1867. He studied at Cornell College, Iowa, and was engaged in journalism in Dakota, Ashland, Wis., and Chicago until 1897, when he became editor and publisher of the Bostonian, afterward changed to The National Magazine, Boston, Mass. He has written three novels ‘The Minor Chord’ (1895; new ed., 1898); ‘Boss Bart, Politician’ (1896); and ‘The Heart Chord’ (1916); also ‘Mark Hanna’ (1903); ‘Heart Throbs’ (1906); ‘The Panama Canals’ (1907); ‘The Happy Habit’ (1908); ‘Heart Songs’ (1909); ‘Little Helps’ (1910); ‘History Making’ (1911); ‘Heart Letters’ (1912). He has wide reputation as a speaker, having visited every State in the Union in his lecture tours. ‘Flashlights of Famous Men’ is his most popular lecture.

Chaptal, shap-tal, Jean Antoine Claude, Comte de Chanteloup, French chemist and statesman: b. Nogaret, Lozère, 4 June 1756; d. Paris, 30 July 1832. During his medical studies and practice he devoted much research to the science of chemistry, in which he soon became eminent, and was appointed professor at Montpellier, where he taught successfully the doctrines of Black, Lavoisier and Cavendish. He established chemical works near Montpellier, and the first attempt that was made to produce saltpetre was made by him. He was soon enabled to produce various chemicals hitherto imported, such as the mineral acids, alum, soda and salts of lead. The authorities of Languedoc heaped honors on him; the Spanish government offered him a pension of 50,000 francs to go to Spain, and according to his biographer, Washington wrote three times to Chaptal, inviting him to America. After the outbreak of the French Revolution he published a political pamphlet, entitled ‘Dialogue Between a Montagnard and a Girondist,’ and was arrested, but through the intercession of friends was liberated. The Committee of Public Safety placed him in charge of the powder mills of Grenelle, now a part of Paris, which produced, under his management, 3,500 pounds of gunpowder daily. Once more returning to Montpellier, he was elected member of the Institute, and devoted himself to science, until Bonaparte summoned him to the council of state, where he had the supervision of nautic and agriculture. When Lucien Bonaparte resigned the portfolio of the interior, Chaptal took his place as minister, and for four years performed the duties of the department with much administrative ability. He founded the conservatory, school of arts, chambers of commerce and society for encouragement of industry, introduced the modern French system of weights and measures, established a model farm and a system of distribution of agricultural seeds, reorganized the prisons and hospitals, extended the network of highways over the face of the country and organized the carrying out of the plans of extension of the Louvre and rues de Rivoli andcastiglione, since completed by Napoleon III. On Napoleon’s return from Elba, the Count was appointed director-general of commerce and manufactures and Minister of State. Louis XVIII struck him from the list of peers, but left him on the roll of the Academy. His works are all on chemical subjects, and may yet be consulted with advantage.

CHAPTER (Latin caput, head), one of the chief divisions of a book. As the rules and statutes of ecclesiastical establishments were arranged in chapters, so also the assembly of
the members of a religious order, and of canons, was called a chapter, because some or all of the chapters containing the rules were read there; and the place where they assembled, as well as the reproof administered to a delinquent member, by reading the rules of the chapter transgressed, had the same name.

The orders of knights, which originally had much of the ecclesiastical constitution, used this expression for the meetings of their members, and even some corporations of mechanics or tradesmen call their assemblies chapters. In England, as elsewhere, the dregs and chapters had the right to choose the bishop, but Henry VIII assumed this right as a prerogative of the Crown.

CHAPTER-HOUSE, a building attached to a cathedral, collegiate church or church belonging to a religious house in which the chapter meets for the transaction of business. Chapter-houses are of different forms, being sometimes regular polygons of 4, 8 or 10 sides, and in other cases circles or parallelograms; and their architecture is often noteworthy; sometimes they were the burying-places of clerical dignitaries. Among the most notable of English chapter-houses are those at Lincoln Cathedral (which is decagonal, with a central column), Salisbury, Wells, Southwell and York, the last named excelling all others in Great Britain in the beauty and richness of their carved stonework. There is a chapter-house at Bristol, of the Norman period, in shape a parallelogram, much enriched with arcading and various kinds of Norman ornament. The chapter-houses at Gloucester and Canterbury are likewise parallelograms, but of the Third Pointed or Perpendicular period.

CHAPULTEPEC, chá-pool'-te-pék ("Grasshopper Hill"), Battle of. This last considerable engagement of the Mexican War, which was followed by the immediate occupation of the City of Mexico, was fought 12-13 Sept. 1847. Chapultepec is an isolated rocky mound 150 feet high, two miles southwest of the city near Belén gate of the city, and guarding a main road into it; sharply precipitous on the northern, eastern and part of the southern sides, but on the west and southwest sloping gradually to level marshy ground near the city. The fort is surrounded by a cypress grove a Here Montezuma and his predecessors had their pleasure grounds, and Chapultepec was their country-seat. A fortified castle was started here by the viceroy Galvez in 1785, but left unfinished; from 1822 it was used as a military academy, in 1847 having some 40 students, who fought heroically in the battle. It was guarded by strong batteries, and its approaches were protected by walls (an aqueduct on the north) which shielded other batteries; through the marshy fields in front of these were irrigating ditches some large and deep, with high banks and sticky bottoms, very serious obstacles to troops and artillery. The one military defect of the castle for modern warfare was the limited force that could effectively use arms within it; the garrison of 800, commanded by Gen. D. Nicholas Bravo, was as large as could well operate there. Along its approaches were some 4,000 to 4,500 more troops, while Scott had 7,500; but Santa Anna dared not strip the other entrances to the city. By the battle of Molino del Rey (q.v.) on the 8th Scott had carried a set of long stone buildings southwest of Chapultepec and, though under its guns, forming some protection for hostile artillery. On the 12th Captain Huger planted heavy batteries there and at three other places, to restrain the south and west of the hill, the only accessible portions, on which an assault had been determined; and their fire gradually silenced that from Chapultepec, breached the defenses and caused much loss. About 8 a.m. on the 13th Scott launched two assaulting columns: Pillow on the west, from Molino del Rey through the cypress grove, supported by Worth; Quitman against the south, from the heights of Tacubaya, where Scott had his headquarters, supported by Persifor F. Smith’s brigade. Preceded by the pioneer companies with ladders, axes, picks and crowbars, and under a plunging fire, they surmounted all obstacles, cleared the approaches, broke through the walls, climbed the heights, entered the castle gates and having cut off retreat by the northwestern road to Mexico, captured the entire garrison. The approaches and castle had been mined, but the defenders waited too long before exploding the mines, and failed. The next day the American army overcame all remaining resistance and entered the capital. Their loss in these three days was 863 killed and wounded, included Col. T. B. Ransom killed, Pillow and Shields wounded. The Mexican loss was unknown, but certainly heavy, and included several gallant and brilliant officers; and 823 prisoners were taken, including three generals, one the commandant of the academy. Among the American officers prominently engaged were a remarkable number afterward distinguished in military and civil life: Robert E. Lee, Joseph E. Johnston, James Longstreet, "Stonewall" Jackson, David E. Twiggs, Gideon J. Pillow, D. H. Hill, J. B. Magruder, Barnard E. Bee, P. G. T. Beauregard, Geo. E. Pickett, Raphael Semmes; George B. McClellan, Silas Casey, E. V. Sumner, Jesse L. Reno, James Shields, I. I. Stevens, Z. B. Tower, William S. Harney; Thomas H. Seymour, John W. Geary, Mayne Reid. Franklin Pierce had been severely wounded at Molino del Rey, and at Wilcox, C. M., 'History of the Mexican War' (Washington 1892); Bancroft, H. H., 'History of Mexico, Vol. V' (San Francisco 1885).

CHAR, chär, a genus of fishes (Salvelinus alpinus) of the family Salmonidae. They were formerly classified in the same genus as the trout (Salmo), from which they are, however, differentiated by color, by smaller scales, by the structure of the vomer and by its red, instead of black, spots during the breeding season. There are several varieties of this fish, all having intense and beautiful colors; length from 10 to 15 inches; weight sometimes as high as two pounds, with high back and short intestine. All kinds are held in esteem for the table. They are found plentifully in the deeper lakes of England, Wales, Ireland and more rarely in Scotland, also in the Lake of Constance and Lake Geneva. The best known American variety is the brown trout, Salmo fontinalis; there is also a variety found in Maine, known as the Rangeley Lake trout, which is very similar to the European char.
CHARA — CHARACTERISTICS

CHARA, kä'ra, in botany, a genus of plants, the typical one of the family Character. The seeds are contained in pod-like or bole-shaped joints, known under the name of Gyrogonites, are found for the first time in the freshwater beds of the Jurassic (Oblitcic) formations. They are the minute spiral fruiting bodies of sporocarps of these plants.

CHARACEE, kä-rāče-ē, a family of cryptotamous plants, related to the Algae, composed of an axis consisting of parallel tubes, from which the branches are given off in whorls. The axes are either transparent or incrusted with calcium carbonate. The plants inhabit stagnant water, both fresh and salt, beneath which they are always submerged. They are found in almost every part of the world, but are most common in the temperate zones. Many species emit a disagreeable odor.

CHARACTER (from Gk. χαρακτήρ mark). While it is doubtless true that the things which we primarily weigh and evaluate in our discussion of moral worths are actions, the actions of an individual do not form a haphazard aggregate of unrelated deeds. There is a certain continuity in a man's acts, whereby one who knows him is able to predict pretty much what he will do under given circumstances. This continuity is due to the fact that behind the shifting play of emotions that is to be found in the mental life of everyone, there is a background of permanent emotional associations and emotional processes which changes very slowly or not at all. This stable background of the moral life is the character. Though a single deed may arise from the impulse of a mere fleeting emotion, and so falsify predictions made on the basis of a knowledge of a man's character, in the long run there will be found a very intimate correlation between a man's character and his deeds. As a result, our evaluation of a man's deeds can be and is vicariously transferred to his character. It is on account of this transference that we are able to speak of a noble character, a base character, etc., meaning, the character of a man who is wont to perform noble acts, or the character of a man who is wont to perform base deeds. All this permits us to assign a permanent moral worth to individuals, and this assignment is of the utmost social value, inasmuch as it points out who is of lasting detest, to society and needs suppression, who is of lasting benefit and needs encouragement. Consult Jastrow, J., 'Character and Temperament' (New York 1915); Shand, A. E., 'The Foundations of Character' (London 1914); White, W., A., 'Mechanisms of Character Formation' (New York 1916).

CHARACTERISTIC (from Gk. χαρακτηρικός). This term is used in many senses in mathematics. The characteristic of a common logarithm (q.v.) is its integral part, which is so chosen that the fractional part is never negative. The characteristic of a negative power of 10 next smaller than the number whose logarithm is taken, and can consequently be found by inspection, so that it is not usually given in tables of logarithms. The fractional part of a logarithm is called the mantissa, and is not altered if the number whose logarithm is to be found is multiplied or divided by a power of 10. Thus 35.78 and 91 all have the characteristic 1. 002, 0018 and 0.00948 have the characteristic -3. On the other hand, 7,000,000, 7, and 0.00007 all have the mantissa .845,098,0, etc.

The phrase, "characteristic of a family of surnames," is used by Monge of a certain set of lines dependent on the family. Let us give a one-parameter set of curves, \( F(x, y, z, a) = 0 \), where \( a \) is the parameter. Consider two surfaces of the family. In general, these will intersect in a line, whose value depends on the two values of \( a \) chosen. Consider the limiting position of this line as one value of \( a \) approaches the other. That is, consider a curve which satisfies the simultaneous equations \( F = 0 \) and \( \frac{dF}{da} = 0 \). This is called a characteristic of the family of surfaces. The locus of all the characteristics of a family of surfaces is its envelope.

In the phraseology of the 18th century, the characteristic triangle of a curve at a point is the triangle bounded by the tangent and abscissa at that point and a neighboring ordinate.

The word is also used to denote certain arithmetical invariants in the theory of algebraic forms, the cross-ratio of the four tangents which can be drawn to a plane cubic from a point itself situated on the cubic, and many things besides. It is a custom among mathematicians who arrive at a new idea to call it by a name familiar in other branches of the science, and so there is scarcely a department of mathematics which does not involve some concept known by the name "characteristic."

CHARACTERISTICS. Shaftesbury's 'Characteristics', consisting of six treatises collected and published in 1711: 'A Letter Concerning Enthusiasm'; 'An Essay On The Freedom Of Wit And Humor'; 'Advice To An Author'; 'An Inquiry Concerning Virtue Or Merit'; 'The Morals'; and 'Miscellaneous Reflections'. The book is the principal life work of a cultivated and high-minded Whig nobleman who, debarred by ill health from a public career, dedicated himself to the study, practice and inculcation of moral philosophy. Writing in the rationalizing age, Shaftesbury is primarily concerned to show that goodness and beauty are not determined by revelation, authority, opinion or fashion, but by the essentially constant and inalterable nature of man and things. From his 'Philosophical Regimen,' first published in 1900, it appears that he had reached his own convictions by a rigorous process of self-examination and self-discipline in imitation of his favorite classical masters, Epictetus and Marcus Aurelius. In common with the Stoics of antiquity and the Deists of his own time, he finds in the general harmony of the universe objective evidence of a supremely benevolent Mind, to whose purposes it is the part of every man's wisdom to conform. In distinction from Hobbes, he holds that human society was not created by a contract but was inherent, from the first appearance of man in the world, in the natural and necessary relationships of male and female, and children. In distinction from Locke, he denies that all our ideas are derived from experience, in-
sisting that our conceptions of right and wrong are, if not precisely innate, yet predetermined and appointed for us by our physical and mental constitutions and by our destiny as social beings. To study the "natural" law of one's own being, of one's relationship to one's fellow beings and to the universe is essential, Shaftesbury persuades us, to the character of a fine gentleman and a man of sense. To philosophize, in a just signification, is but to carry good-breeding a step higher. For the accomplishment of breeding is to learn what is decent in company or beautiful in arts; and the sum of philosophy is, to learn what is just in society and beautiful in Nature and the order of the world. This passage suggests what is perhaps the most personal aspect of Shaftesbury as a moralist; namely, his aesthetic sensibility, his identification of the good with the beautiful, his insistence that conduct is a fine art with principles analogous to those of music and sculpture, and to be relished by every gentleman of taste. To a public beginning to take pride in its civility, in its tolerant and equable temper, in its devotion to common sense, Shaftesbury's studious ease and serenity appealed; his admiring, his suave irony, his benevolent and optimistic metaphysics an acceptable antidote to the egoism of Hobbes and the pessimism of the theologians. He attained in the 18th century a wide reputation in England and abroad, influencing such men as Leibnitz, Herder, Franklin, Voltaire, Diderot, Montesquieu, Pope, Hutcheson, Hume and Butler. In the reaction which followed the French Revolution his political and religious liberalism was disparaged as atheistical and revolutionary; whereupon it was discovered that his style was artificial and pedantic. Within recent years there have been some attempts at a critical restoration, notably in J. M. Robertson's edition of the "Characters" (1900), and in Benjamin's "The Life, Unpublished Letters And Philosophical Remains" (1900), where Shaftesbury is ranked with Epicurists and Marcus Aurelius as one of the three great exponents of stoical philosophy. Consult also Hatch and complete edition of "Characters" (1870); Girycki, "Die Philosophie Shaftesbury's" (1876); Stephen, "English Thought In The Eighteenth Century" (1876); Fowler, "Shaftesbury and Hutcheson" (1882); Martineau's "Types Of Ethical Theory" (1885); Hatch, I. C., "Der Einfluss Shaftesburys auf Herder" (1901); Moore, C. A., "Shaftesbury and The Ethical Poets In England" (in Pub. Mod. Lang. Assoc., 1916); Walz, "Shaftesbury und das deutsche Geistesleben des 18 Jahrhunderts" (1909).

STUART P. SHERMAN.

CHARACTERS (Caractères). The 'Characters' of Jean de la Bruyère are a collection of reflections on human nature and conduct and of "portraits" of different types of character or varieties of moral development, studied with patient and penetrating observation combined with extraordinary skill in few precise, significant and revealing lines. They are distributed over 16 chapters: Works of the mind, personal merit, women, the heart, society and conversation, material possessions, the city, the court, persons in high station, the sovereign or the state, man, judgments, fashion, certain usages, the pulpit, the strong-minded. They derive in part from the 'Characters' of Theophrastus and appeared for the first time (1688) as an appendix to a translation that La Bruyère had made of that work, modestly wording behind the Greek even in the title: 'The Characters of Theophrastus, translated from the Greek, together with the Characters or the Manners of this Century.' They also continue the "portraits" that had long been popular in the novel of the times through a rare recreations of certain salons. But these portraits are no longer complimentary and flattering as those had been. Instead they insist pitilessly on the unlovely realities of motive that too often shaped behavior, also contributed of manners. La Bruyère was a sharp-eyed observer of the brilliant society of court and salon. Indeed, there were many complaints from those who saw themselves in the satiric pictures he drew, though he ascended the intention of painting particulars. His view of human nature is less embittered than that of his great contemporary La Rochefoucauld, in the Maxims, but it is stern and hard, lacking in pity and tenderness. To the composition of his "Characters," he owed command of the French language, which he cultivated with infinite pains, and the judgment of M. Vallery Radot is often quoted with approval: "If you wish to take an inventory of the riches of our language, if you wish to know all its ins and outs, its movements, its figures, its resources, there is no need to have recourse to a hundred volumes; read, reread La Bruyère." The "Characters," by the progress they mark in the art of psychological observation and moral characterization, made substantially to the development of the novel, and their influence was clearly seen presently in England in Addison and Steele. Several translations were made, one by Nicholas Rowe (1709). None, however, is at present current. The standard edition is that of M. G. Servois, in the series of the 'Grands Écrivains de la France' (3 vols., Paris 1865-68).

ARTHUR G. CANFIELD.

CHARADE, shārād (Fr.), a syllabic enigma, that is, an enigma the subject of which is a name or a word that is proposed for discovery from an enigmatical description of its several syllables taken separately, as of many individual words. A charade may be called complete if the different enigmas which it contains are brought into a proper relation to each other, and, as a whole, unite in an epigrammatic point. The French excel in this species of literary amusement, of which the following is a good example:

Quatre membres font tout mon bien
Mon dernier vaut mon tout.
Et mon tout ne vaut rien.

The answer is "zero": "my last is worth my whole, and my whole is worth my middle. One from the German goe "In front and behind, round; in the middle just a pound."

The answer is the name Otto, "la" being the equivalent of "le" a pound.

Acting Charades, a kind of entertainment made up of pantomime and dialogue, and im-
provided by the members of an evening party. The syllables and complete word are meant to be suggested by the various divisions of the piece. An example may suffice to convey the idea: Two of the parlor actors meet on the platform; they shake hands, one says "How do you do, Doctor?" They both pass off at once and leave the audience to guess the word, which is "metaphysician."

CHARADRUS, kā-rād'ër-ūs, the genus to which the plover belongs, forming the type of the family Charadridae, which includes also the lapwings, dotterels, oyster-catchers, turnstones, sandpipers, etc.

CHARALES, kā-rā'lež (from Latin chara, some unknown plant), a highly specialized order of the green algae or Chlorophyceae. By some authorities it is considered as a group—the Characeae—of rank equal to that of the Chlorophyceae (q.v.). Members of the group are found both in fresh and in salt water. There are held to be only two genera of Charales, Chara and Nitella, but each of these has been subdivided by recent authorities. All the members of the group bear a strong superficial resemblance to the Archegonia, for they appear to possess stem, leaves and roots. In fact, their general external aspect is that of a small Equisetum. They grow to a height of from three inches to three feet, but the stalk is exceedingly slender, rarely exceeding a fifth of an inch in thickness.

Although asexual reproduction by spores is unknown in the Charales, they have several different types of structures which are able to survive after being separated and which develop into new plants the spring after they leave the mother plant. Sexual reproduction is carried on through extremely complicated organisms whose closest analogues elsewhere are to be found among the brown algae. These organisms, which are differentiated into male and female, are to be found at the points where the so-called leaves give off their leaflets. In certain species they are to be found on different plants, but usually the same node bears both the curiously twisted oogonia and the antheridia, as the female and male organs are respectively called. In all male organs among plants, the antheridium of the Charales attains the highest degree of complexity.

The female cell or ovum is large and turbid with oil-drops and starch-grains, but the outer end is hyaline. The male cells or spermatozoids are of spiral form and taper, having two cilia at the smaller end. The product of the union of the spermatozoid and the ovum is the fertilized egg-cell or oospore. There is no alternation of generations with n chromosomes and 2n chromosomes to be found in any of the Charales. Nevertheless the oospore does not develop into the plant, but goes through the stage known as the proembryo. In Chara cincta, only the female of which is known, the ovum develops into an oospore parthenogenetically and chromosome-reduction takes place.

The precise affinities of the Charales are not well known. Their sexual organs are unlike those of the other green algae, but closely resemble those of the brown algae, but Chara does not contain a trace of the brown pigment of the latter. The position that has been assigned to them as precursors of the mosses is at least doubtful, although they show a close analogy to the Archegoniatae in their karyokinetic processes and in the form of the antherasxozoids. C. E. Allen, Characeae of North America (New York 1888); Filarsky, Die Characeen (Budapest 1893).

CHARBON ROUGE, shār-bōn roozh, or RED COAL, a kind of charcoal obtained by subjecting wood to the action of heated air from furnaces, or of steam raised to a temperature of 572° F. Air-dried wood, by the ordinary process, yields at most 21 per cent of black charcoal, while by the steam process 36 to 42 per cent of red charcoal is obtained. It is of a dark-red color and contains 75 per cent pure carbon and 25 per cent hydrogen and oxygen. It is used in the manufacture of gunpowder.

CHARCOAL, an impure variety of carbon, prepared from vegetable substances or bones. Wood charcoal consists of wood burned with but little access of air. Billets of wood are built into a heap, which is covered with earth or sand. The heap is fired at the center and the charcoals left near the bottom of the pile, and the gases escape at small openings above. For making fine charcoal, such as that of willow, used in the manufacture of gunpowder, the wood is burned in iron cylinders, or rather retorts, in which a process of destructive distillation removes the volatile hydrocarbons, pyrogenous acid, etc. By this more perfect means the process is accurately regulated. Charcoal is used in the arts as a fuel; as a polishing powder; a table on which pieces of metal are set; in medicine as a descorber of solutions and water; an absorbent of gases and aqueous vapors; a non-conducting packing in icehouses, safes and refrigerators; an ingredient in gunpowder and fireworks; and in the galvanic battery and the electric light.

Animal charcoal, used largely in sugar-refining and as a disinfectant and filtering medium, is prepared by calcining bones in closed vessels. These are either burnt directly or in retorts similar to those in which coal is distilled for the production of illuminating-gas, or they are earthenware pots, piled up in kilns and fired. Charges of 50 pounds of bones to a pot will require 16 hours of firing. The bones are then ground between fluted rollers, the dust removed and the granulated material used for charging the filters of the sugar-refiner. The material is used for removing color, feculences and fermenting ingredients from the syrup.

In medicine charcoal is sparingly used, but is of service in gastric indigestion in which there is much evolution of gas. Charcoal takes up the gas and therefore prevents distention and pain. It has no curative qualities and is solely alleviative. See LAMPBLACK.

CHARCOAL BLACK. See BLACKS.

CHARCOAL DRAWING. See ART DRAWING.

CHARCOT, šär-kō', Jean Baptiste Etienne Auguste, French explorer: b. Neulilly-sur-Seine 1867. He was an intern at the Hospital of Paris in 1890-94 and at the same
time an investigator at the Pasteur Institute. In 1896–98 he headed the clinic of the faculty of medicine at the University of Paris. In 1903–05 and again in 1908–10 he was leader of Antarctic exploration expeditions and afterward was made director of the Marine Laboratory at Cassini. He has published "Arthropodes" (1907); "Expédition antarctique française, 1903–05" (1908); "Deuxième expédition antarctique française, 1908–10" (1911); "Pourquoi Pas?" dans l’Antarctique (1911).

CHARCOT, Jean Martin, French physician: b. Paris, 29 Nov. 1825; d. 16 Aug. 1893. His specialty was in the treatment of nervous and mental diseases, and he performed many curious and successful experiments in hypnotism and mental suggestion, in the Salpetrière, where he founded a clinic for the treatment of nervous diseases in 1880. He published several works treating of these subjects.

CHARDIN, the leaves of artichoke (Cynara scolymus) covered with straw in order to Blanch them and make them less bitter. Beet chards are the leaf-stalks and midribs of a variety of white beet (Beta cicla), in which these parts are greatly developed, dressed for the table.

CHARDIN, Shahr-dan, Jean Baptiste Siméon, French painter, b. Paris 1699; d. 1779. His father was a carpenter. The young Chardin received his first instruction from Pierre Jacques Cazes and had practical experience in executing minor portions of pictures of fashionable painters. His first independent work was a sign for the office of a surgeon. In 1728 on the occasion of a religious procession, he exhibited two pictures, one of which, "The Ray," is now in the Louvre. He was already a master of still-life, the genre which was to be his principal occupation throughout his life. He was extremely conscientious, never beginning a new picture until the one preceding it was finished, and unceasingly consulting the object he was representing in order to be sure that his effect was true. Chardin was twice married, and the fact is not without importance when we consider the character of the man as reflected in his art. He was "good and modest" and the delightful glimpses of family life that he has noted in his pictures are surely a result of the conditions in his own home. Of his two children the son, Pierre, gave promise of becoming a painter of merit, but died prematurely at 37 years of age. Chardin was received as a member of the Académie de Peinture in 1728, and became its treasurer in 1755. In 1757 the King installed Chardin in an apartment in the Louvre where the painter spent the rest of his life. Diderot tells us that Chardin had a great understanding of art and could recognize it in others. The observation is certainly borne out by the fact that he was one of those who voted an encouragement to the young Louis David, who was to emerge in a style of painting so different from his own. He was a wise teacher, Fragonard being a pupil of his before he went to study with Boucher, and it was to his first master that he owed the best of his instruction. While Chardin’s picture, like the exquisite "Pourvoyeuse" or "Le Bénédicité" at the Louvre and the innumerable still-life pieces might seem at first to suggest the Dutch school, he is in reality akin to the Hollanders only through the fortuitous similarity of his subjects. He is of the Latin tradition and his color and his idea of light—a matter to which he gave great attention—come from the earlier Frenchmen, with their Italian heritage. The composition of Chardin’s work is also far removed from the Dutch—though one man of the latter nation must have appeared sympathetic to him, Vermeer of Delft. Even the latter, however, if he is easily Chardin’s peer in the matter of light, is not to be placed beside him as a colorist. From the gentle palette, so gay and so harmonious, the best influence has gone forth to the French colorists ever since, and not even Delacroix can make us forget the indebtedness to Chardin of such painters as Cézanne, Renoir and Manet. He was very happy in the portrayal of children, as in "Boy Blowing Soap Bubbles" and "Girl with Cherries," "The Diligent Mother" and "The Amusements of Private Life." The best known of his portraits are a pastel of himself, now in the Louvre, and the excellent likeness of Madame de Saintealle Aubé and Seccaine. From 1765 to 1767 he painted a series of decorative panels for the castles of Choisy and Bellevue, of which the "Attributes of the Sciences, Arts and Music" are now in the Louvre. His other works are in the National Gallery, London ("La Fontaine," and "Still Life"), at the Metropolitan Museum, New York ("Still Life"), and at other museums. The great treasury of it remains in the Louvre. Consult Edmund Pilou's "Chardin" (Paris 1909).

CHARDIN, Sir John, French Oriental traveler: b. Paris, 26 Nov. 1643; d. London, 26 Jan. 1713. Before he had reached his 22d year his father, a jeweler, sent him to the East Indies in order to buy diamonds. Chardin lived six years in Isphan, where he was less engaged in mercantile business than in profound studies and scientific researches, making use of his connections at court for collecting the most authentic information of the political and military state of Persia. He collected the most valuable materials relating to antiquities and history. In 1670 he returned to France, but again left France for Persia, in 1671, taking with him a considerable quantity of precious stones artistically set, exquisitely worked jewelry, etc. He spent 10 years partly in Persia and partly in India. In 1681 he arrived in London, when he received the honor of knighthood. He published the first volume of his "Travels into Persia and the East Indies," in London, in 1686. The other volumes were about to follow, when he was appointed Minister Plenipotentiary of the King of England to the States-General of Holland and agent of the English East India Company to the same. In 1711 two editions of his "Travels" appeared. He soon after returned to England. The exactness and truth of his statements and the extent of his knowledge, have been confirmed by all succeeding travelers, and have been serviceable to Gibbon, Helvétius and Montesquieu. The best edition of Chardin’s "Travels" is that by Langlé in 10 volumes (Paris 1811).

CHARDIN, Ohio, town and county-seat of Geauga County, 30 miles northeast of Cleveland, on the Baltimore and Ohio and the
Cleveland and Eastern Suburban railroads. It is an agricultural centre, has a large trade in dairy and maple products and contains a macaroni factory. The electric-lighting plant is municipally owned. Pop. 1,542.

CHARENTE, šá-rôn', France, an inland department, formed chiefly out of the ancient province of Angoumois and deriving its name from the river Charente, by which it is traversed; area, 1,487,447 acres; capital, Angoulême. It is in general uneven, with hills covered with chestnut-trees, sandy plains, meadows, etc. The principal rivers are the Charente, joined by the canal of Poitou with the Vienne, the Dronne, Tardoire, Bandiat, Touvre and Né. The wines of the department are of inferior quality and in little request for the table; but they yield the best brandy in Europe. The celebrated cognac brandy is made in the districts of Champagne, Cognac, Jarnac, Roulillac and Aigre from a grape called the folle blanche, which yields a white wine. The red wines furnish an inferior brandy, without the bouquet that distinguishes the genuine cognac. The wine-growers themselves carry on the distillation of each estate being furnished with stills and the necessary apparatus. Excepting brandy and paper, the manufactures of the department are inconsiderable, consisting of sacks, cloth, cordage, hats, shoes, naval guns, leather, gunpowder, flour and earthenware. The paper made at Angoulême is said to be the best in France. The department is divided into the five arrondissements of Angoumois, Barbezieux, Cognac, Confolens and Ruffec. Consult Coquand, Description physique, géologique, etc., du département de la Charente (1859); and Liévre, Exploration archéologique du département de la Charente (1861). Pop. 346,424.

CHARENTE, a river in France, rising in the department of the Upper Vienne; flowing west and emptying into the Bay of Biscay, about 10 miles below Rochefort, opposite the Isle of Oleron; length, 225 miles. It gives its name to two departments, Charente (q.v.) and Charente-Inférieure (q.v.).

CHARENTE-INFÉRIEURE, šá-fâ-ré-ér', France, maritime department on the west coast, bounded on the north by the department of the Vendée, on the west by the Loire, on the south by Gironde; area, 2,792 square miles. It comprises parts of the former provinces of Angoumois, Saintonge and Poitou. The principal rivers that traverse or bound the department are the Charente, Gironde, Sendre, Boutonne and Sèvre-Niortaise—all of which are navigable, as well as the canal of Brouage and that between Niort and Rochelle. The soil is fertile and well cultivated; and a considerable portion planted with vines. The soil produces hemp, flax, saffron, oats, wheat, rye, potatoes and fruit. The pastures are good and well stocked with cattle, horses and sheep. Along the coast are extensive salt marshes. The industries include the manufacture of salt, brandy, machinery, porcelain and faience ware and oyster and salt fisheries. The chief harbors are those of Rochefort and La Rochelle; the latter town is the capital of the department. Pop. 450,671.

CHARENTON-LE-PONT, šá-rôn-tôôn-le-pôⁿ, France, town situated about a mile to the southeast of Paris, with which it is connected by rail and tramway, at the confluence of the Marne with the Seine. It has numerous mercantile and manufacturing establishments, including boat building, piano making and porcelain and rubber goods. The stone 10-arched bridge across the Marne used to be considered as the key to Paris on this side; hence the memorable attacks upon it both in the civil wars of France and in those with foreign enemies. At Petit-Charenton is the celebrated asylum for the insane of both sexes. This establishment also contains a hospital for the care of accident victims in Paris, and a hospital for workingmen. From its connection with the asylum the town has given several significant popular phrases to the French language, equivalent to the use of Bedlam in English. A person of marked eccentricity is called a "Charenton boarder." Pop. 19,499.

CHARES, kâ-réz, the name of two well-known Greeks. The Athenian Chares was the general through whose incapacity the Thracian colony was lost to Athens during the Social War in 338-336 B.C., and who escaped to Persia to the designs of Persia, by entering for mercenary purposes the service of the revolted satrap, Artabazus. Although recalled in disgrace, Chares was sent in 349 to the aid of Olynthus, and again he returned without having achieved anything. In 340 he commanded the army sent to Byzantium against Philip, again gave evidence of his incompetency, was replaced by Phocion, but once more invested with the supreme command. In 338 the fatal issue of the battle of Chaeronea seems to have been mainly due to his ignorance. He was noted for his athletic figure, his profligacy and his unscrupulous recklessness. Chares, the sculptor, a native of Lindus, Rhodes, flourished toward the close of the 5th century B.C. He was a pupil of Lyssippus and the sculptor of the Colossus of Rhodes, one of the "seven wonders of the world," a representation of the Rhodian sun god erected in commemoration of the successful defense of Rhodes against Demetrius Poliorcetes in 305 B.C. See COLossus.

CHARGE, in heraldry, one of the bearings. This may be one of the ordinaries, as they are called, the straight line bearings, as less or chevron or a much more elaborate figure, as the representation of an animal or the head of one. Sometimes the charge is imposed upon another charge.

In gunnery, charge signifies the quantity of powder used at one discharge of a gun.

In military tactics, charge is the rapid advance of infantry or cavalry against an enemy, with the object of breaking his lines by the momentum of the attack. Infantry generally advances to about 100 yards and fires, then gradually quickens the pace into the charge step, and dashes at the enemy's line. Cavalry charges in echelon or column against infantry, which is usually formed in squares to receive the charge.

CHARGÉ D'AFFAIRES, šár-zhá dâf-fâr', a representative of a country at a less important foreign court, inferior to an ambassador, a minister or resident minister to whom is entrusted all matters of diplomacy. He is accredited not to the sovereign, but to the Minister for Foreign Affairs of a foreign power,
and holds his credentials only from the Minister for Foreign Affairs of his own country. The title is also given to the officer to whom the charge of an embassy is entrusted during the temporary absence of the ambassador or minister. In this latter case, this officer acts as the intermediary between two governments to the extent that formal diplomatic relations cannot be maintained, chargés d'affaires are often employed to exercise all the diplomatic functions.

**CHARGE OF THE LIGHT BRIGADE**

The a remarkable military movement made by nearly 700 British soldiers at Balata, 25 Oct. 1854. At the attack on Balata the Russians had been forced back by the 93d Highlanders. Major-General Sir John then sent down Captain Nolan, his aide-de-camp, with an order that the light brigade of cavalry, commanded by Lord Cardigan, was to charge along the southern line of heights and drive the Russians from the Turkish batteries. The order was not in itself an order of interpretation, but Cardigan, to whom it was transmitted by Lord Lucan, his immediate superior, could see nothing from where he was stationed, and believed he was to advance down the valley in front of him. Lucan must have perceived the proper line of advance; but he did not inform Cardigan of his error, and Nolan was killed just as he perceived the wrong direction the brigade was taking and was endeavoring to set it right. Cardigan headed straight for the Russian guns, "into the jaws of death," and the result was that the brigade of 673 mounted men was reduced in a few minutes to 195. "Some one had blundered." It was magnificent, but it was not war. Lord Raglan, the British commander-in-chief, was wrath at this error and the grave losses sustained, and Lucan was recalled. On his return to England in January 1855 Cardigan was treated as a national hero and ever after he regarded himself as a man who had done great things. The poem under this title by Tennyson, written to the metre of Drayton's 'Battle of Agincourt,' was published in quarto in 1855, and another edition in octavo was published in the following year under the title 'In Honorem.' It is worthy of note that "Some one had blundered," deleted in the first edition, was restored in the second and succeeding editions.

**CHARING CROSS**, a triangular piece of roadway at Trafalgar square in the city of Westminster, forming the titulary centre of London, so named from a cross which formerly stood at the village of Charing in memory of Eleanor, wife of Edward I. When the Queen's remains were brought in 1290 from Grantham to Westminster Abbey, the King accompanied the bier and erected at each stage where it rested a memorial cross. Of the 13 crosses raised, but two beside that in London remain. The original cross was demolished in 1647 by the Cromwellians as a symbol of Popish idolatry. The modern cross, erected in 1863, stands in the courtyard of the Southeastern and Central Railway. It is the type of the older one, of which it is as nearly as possible a reproduction, its style being the decorated Gothic of Edward's time.

**CHARIOT**, a vehicle used in ancient times either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honor to Erichthonius, a mythical king of Athens, who is said to have appeared at the Panathenaic festival, founded by him, in a car drawn by four horses. The ancient chariots had only one axle, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem to have made more than one pole, but the Lydians had carriages with two or three. In general the chariot was drawn by two horses. Such was the Roman biga, but we also read of a triga, or three-horse chariot, and a quadriga, or four-horse one. In ancient warfare chariots were of great importance; thus we read of the 900 iron chariots of Sisera as giving him a great advantage against the Israelites. The Philistines in their war against Saul had 30,000 chariots. The sculptures of ancient Egypt show that chariots formed the strength of the Egyptian army. We have also numbers of sculptures which give a clear idea of the Assyrian chariots. These resembled the Egyptian in all essential features. In modern times the name chariot has been given to a kind of light traveling carriage now out of vogue. An Etruscan chariot, in part reconstructed, may be seen in the Metropolitan Museum, New York. Consult Daremberg and Saglio, 'Dictionnaire des antiquités'; Guizot, 'Die Wagen und Fahrwerke der Griechen und Römer' (1817); Helbig, 'Das Homerische Epos aus den Denkmälern erläutert' (1884); Leaf, 'Journal of Hellenic Studies' (Vol. V); also article 'Currus' in Smith, W., 'Dictionary of Greek and Roman Antiquities' (3d ed., London 1890).

**CHARITABLE TRUSTS or CHARITIES**, any real or personal property gifted as a trust, which comes within an approved definition of a charity and which is for the benefit of an indefinite class of persons, sufficiently designated to indicate the intention of the donor, and constituting some public class of the public. Thus, a charitable trust or a charity is a donation in trust for promoting the welfare of mankind at large, or of a community, or of some class forming a part of it, indefinite as to numbers and individuals in short, a gift for general public purposes which definitions attempt to carry the implication of public utility in its purpose as the following: A charitable trust is a gift, to be applied consistently with existing laws, for the benefit of an indefinite number of persons, either by bringing their minds or their hearts under the influence of education or religion, by relieving their bodies from disease, suffering or constraint, by assisting them to establish themselves in life, or by erecting and maintaining public buildings or works, by lightening the burdens of government; a gift to a general public use, which extends to the poor as well as the rich. In charitable trusts the object is generally uncertain, because if described whose beneficent it would cease to be a charity and would be governed by the ordinary rules of trusts. While, generally speaking, charities are either public or private, it is only with what are known as public charities that the courts
concern themselves in applying the peculiar law relating to charities. The line of distinction which determines where a private charity ends and a public one begins is at times difficult to locate, and this has caused much of the apparent want of harmony which prevails among the decisions on this subject. Charitable trusts are not within the rule against perpetuities. In fact a charitable trust contemplates perpetuity as explained farther on. The general rule of law is that money or property devoted to a charitable use, where a trust is created, must, if the gift is accepted, be irrevocably devoted to such use.

Trusts for charitable uses are of ancient origin. In 1601 the English Parliament enacted the statute of 43 Elizabeth, which is frequently referred to as "The Statute of Charitable Uses," and that act has had an important bearing on the subject of public charities from that date until the present time. The statute was repealed in 1888, but the repealing act incorporated the preamble and it continues in force. Charitable trusts are recognized in all of the States of the Union, but a number of the States have never adopted the statute of 1888 and differ as to whether this statute is in force as part of the common law. The statute is important by reason of its enumeration in its preamble of purposes and objects which are considered charitable, as the courts of practically all jurisdictions give consideration and weight to this enumeration, regardless of the foundation of the law of charities in the particular jurisdiction. Uncertainty of the object is one of the characteristics of a charitable trust, and it has led to what is known as the cy pres doctrine, which is that the courts will interpret instruments creating charitable trusts so that if the exact object of the donor cannot be carried out the donation will be applied to something of a nature similar to that specified by the donor.

When a testator leaves property to his executors in such a manner that they are to be the sole judges of its use, and the executors do not act expeditiously, it is doubtful whether the trust will come into existence, as the executors were the only persons who could designate for what the donation was to be applied. In some jurisdictions the rule is that if the property can be applied to other than charitable purposes it is too indefinite.

In cases in which the particular charitable purpose does not exhaust the whole fund, if from the instrument creating the fund, the intention appears that the entire amount is for charity, the surplus will be devoted to some other charity and will not form a resulting trust for the heir or next of kin. A gift may be made to a charity not in existence, and a gift to a specific charity will not fail for want of a trustee.

After the trustee has come into existence, if the purpose for which the trust was created fails for any reason, it will be applied to some other purpose of a similar character, so as to fail as nearly as possible the purpose for which it was intended. (See Rhodes Scholarships).

Charitable trusts are not subject to the rule against perpetuities, which is that property cannot be tied up for more than a life or lives in being and 21 years thereafter. If property left to a charitable trust is limited upon another estate not a charitable trust, and the first estate is in violation of the rule against perpetuities, the trust will not be sustained; but after the trust once comes into existence the rule against perpetuities is not applied to it.

By English law all bequests for charitable purposes, to be valid, must be strictly for the public benefit; that is to say, in favor of institutions for the advancement of science and art; for the support of the poor; or for other objects connected with the welfare of the public; and such bequests include those in favor of the Church or of other religious bodies sanctioned by the law. Bequests for what are classed as superstitious uses are null and void. A body of commissioners (the charity commissioners), under whose superintendency such benevolent trusts are placed, was established under the Charitable Trusts Acts of 1853, 1855, 1860, 1869 and 1888, and lastly upon the Mortmain and Charitable Uses Act of 1891. They have the power of inquiring into the administration of all English public charities. (See Mortmain; Persons, Old Age, Pension, Entail; Trust; Rockefeller Foundation; Russell Sage Foundation). Consult Tudor, 'Law of Charities and Mortmain' (London 1890); Perry, 'Treatise on the Law of Trusts and Trustees' (5th ed., Boston 1899), and Pomeroy, 'Treatise on Equity Jurisprudence' (3d ed., San Francisco 1905).

CHARITIES. Public, philanthropic associations and institutions of public and private initiative, for the relief of sufferers from disease, poverty and misery. Following in the footsteps of civilization a development of charity has come, often slowly and haltingly, but ever persistently, until the treatment of dependent poor is now accepted as evidence of the civilization of a community. A glance through history discloses not merely neglect of the defective mentally and physically, by savage and barbarous peoples, but an aggressively cruel policy to rid the community of the burden of their care. Crippled children were left to die and helpless old persons were put out of the way.

Under the Hebrews, however, charity became recognized as a duty incumbent on persons of wealth to provide for those in need, the motives being obedience to Divine Law and practical pity for the unfortunate. In Greece and in Rome, the "libera" or free-born wealthy became patronizingly generous in liberal donations to the poorer classes. With the advent of the Christian Era charity in its broadest interpretation came to mean the exercise of humanity through the spiritual development of doing good, and the Church became a powerful organization in extending charity. Churches of all denominations have always looked after their poor and helpless; the Church is really the first organized charity. But the question arose as to whether, after all, it was not the duty of the community as a whole, rather than that of the Church, to do the poor. It is well for the Church to do all that it can, but the fundamental responsibility for the care of the poor rests upon the community. Whatever the Church does lessens the burden upon
Indeed the benefits from segregation are so marked and so convincing that the policy has been extended to different conditions in the same class. It is particularly noticeable in the modern treatment of chronic patients for whom special hospitals are constructed and special diet prepared. And yet the subject has not been exhausted. It is susceptible of further development and closer application. There is a pressing need for the proper discharge of the duties of the individuals, the aged, infirm, or the mentally defective. In the treatment of the cases of destitution and the moral character of the individual should always be considered. The demonstrated advantages of segregation may be summed up in the more intelligent attention that each class receives and in the choice of persons entrusted with the care of dependents, made with no other purpose in view than fitness for the position to be occupied. Poverty is not a crime, and the victims of poverty are no longer classed with criminals. As already mentioned the state has not always recognized this principle. On the contrary, it's theory and its practice formerly forced the poverty-stricken individual into association with the criminal. Protection, if sincere and no higher reason, the state should assume the responsibility of caring for its helpless classes. The conception of its duties were so vague and the method to be followed was so undefined, that the results were eminently unsatisfactory. Society regarded its dependents as being much on the same plane as its criminals and treated them much in the same way. Prisoners, dependent children, sick poor persons, the insane, the epileptics and the helpless aged were huddled together under one department of government and it was not infrequently the case that little or no discrimination was made in their care. General demoralization ensued and it became apparent that a remedy must be found if further progress was to be made in the development of the practice of charity. This remedy was found in segregation. It was clear that not only physical separation but governmental separation of the various classes was necessary. Custom and tradition were hard obstacles to overcome, but the doctrine of segregation were not to be denied, and after a long and bitter and often disheartening struggle they won their first victory, in the segregation of criminals. A separate and independent department of government was established for their care, although society retained in a large degree its old habit of regarding its criminals and its dependents in much the same light. But an opening had been made for segregation and its adherents were quick to press their advantage. The next demand was obtained the segregation of the insane and followed this up by the successful demand for the segregation of epileptics, idiots, dependent children, the sick poor, homeless men and women and the helpless aged. The aim was not merely to assure to each of these classes distinct physical separation from others, but to give to each a government of its own so that it could receive the undivided attention and care of persons competent to do the work entrusted to them and held directly responsible for it. So beneficial did the experiment of segregation prove to be that the practice of charity made strides for good after it was adopted far out of all proportion to progress in previous years.
and one of its chief endeavors has been to disassociate the plastic mind of childhood from impressions that would tend to retard reform in a child already starting on the downward path, as well as to protect a child not contaminated by vicious surroundings from influences tending to contaminate it. The crowning work of this endeavor was the establishment of children's courts, wherein the cases of children charged with crime are tried, free from even the sight of adult criminals. See Charity Organization Society; Charities and Correction, The National Conference of; Juvenile Courts; Delinquent Children; Pensions, Old Age; Pauperism; Sociology.

Charities and CorreGtion, The National Conference of. An annual convention of social workers which originated with an invitation extended by the American Social Services Association to different State boards of public charities, the delegates from which met in New York city 20 and 22 May 1874. It was found at that time that the members of the various States' boards which deal with public charity in the United States were desirous of a better acquaintance with each other and that they could meet together and discuss the questions in which they had a common interest with mutual profit and encouragement. It also appeared that a considerable number of persons not officially connected with the public charities were desirous of attending such a meeting and were both competent and willing to join in its debates or to contribute papers which should be the fruit of special research or long experience. Annual meetings were established and in 1893 rules of procedure were published, giving a definition of membership requirements and a fee of $2. In 1897 the fee was raised to $2.50. In 1903, a special class of sustaining members was created in addition. In 1916 the regular membership fee was raised to $3. The membership averages 3,000 and annual conferences are held in different cities throughout the nation. The permanent headquarters are at 315 South Wabash Avenue, Chicago, Ill. The history of organized social service and reform in the United States is revealed in the steady growth of this dignified and powerful association, and its usefulness is shown in the manner in which every branch of scientific social effort in America may be turned to the solution of all its main practical problems; practical application rivaling theory. Each year larger and extending issues have been attacked with confidence, a recent conference dealing with national measures to prevent unemployment, the abolition of alcoholism, the promotion of social programs and State policies in the treatment of the insane, feeble-minded and defective criminals. The quarterly 'Bulletins' and the annual 'Proceedings' give an account of the work done by the agency in the fight against the pedantic storehouse on the social and charitable reform efforts of the United States. Consult 'Proceedings of the National Conference of Charities and Correction, 43d Annual Session' (Chicago 1916 and previous volumes back to 1874).

Chariton, kär-tón, Greek prose writer: supposed to have flourished in the 5th or 6th century A.D. He was the author of a romance which describes the loves and adventures of Chares and Callirrhoe. Critics generally think that the birthplace usually assigned to the author is fictitious, and that it is by no means certain that he was a native of Aphrodias in Caria. The romance was first published with a learned commentary by D'Orville (3 vols., 4to, Amsterdam, 1810), from a MS. in Florence, the only one yet known.

Chariton, Iowa, city and county-seat of Lucas County, situated on the Chariton River and on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads. It is a fertile agricultural and stock-raising region, has coal mines and manufactures carriages and wagons, ice, cement blocks, agricultural implements, flour, windmills, tanks, pumps, pipes, etc. The city contains a public library and owns its waterworks. Pop. 3,794.

Charity (Fr. charité), one of the three great theological virtues, consisting of love to God and to men, or the disposition to love God with all our heart and our neighbor as ourselves. In a narrower sense, it signifies kindness and goodwill toward mankind in general, and in a still narrower sense, the giving of alms and the alms itself, philanthropy in its general sense. Charity also has the sense of liberality in judging others and their actions; and in law it has the sense of a gift in trust for the good of a community or a part of it; thus we have the term "public charity." Organized charity is the system of poor relief carried out by bodies of a quasi-public character, such as the Charity Organization Society in New York. See Charities, Public.

Charity, Sisters of. See Orders, Religious.

Charity Organization Society. The title given to numerous civic associations in the United States and Canada organized for the relief and cure of poverty; some designated under the alternative titles of associated charities, bureau of charities and united charities. As described under Charities, Public (q.v.), out of the feeling of the necessity for general improvement in charitable organized charity has grown. To every student of sociology the conviction comes that, as in all departments of life, organization, law and order, efficiency is essential in the administration of charity. The first modern step in this direction was the formation of a number of bodies, designed to replace indiscriminate alms-giving by individuals, and intended to increase the funds available for the help of classes that might have been neglected. Then followed the associations for improving the condition of the...
poor, which were not to deal in relief, except in so far as relief might tend to the permanent elevation, and not the fall, of those to whom it was given. The relief societies which had not increased in numbers, but these organizations for the improvement of the condition of the poor generally lost sight of the fundamental purpose of the organization and developed into mere relief societies. Neither filled the want, and so a third form of organized charity came into existence usually designated "The Charity Organization Society," which developed what is generally known as the city plan. The city plan in a broad sense covers the whole program in which and by which a community attempts definitely and conscientiously to prepare and control its development. The object is to advance civilization by making cities capable of maintaining and reproducing a high type of human life, an object absolutely essential both to city and national life. No considerable proportion of the expense of public charity can or will be borne out of any public treasury, except that of the city. Therefore it becomes almost exclusively a problem of municipal planning and finance to provide for the activities which a rising social conscience in a community demands. No great public policy has ever resulted from the uncontrolled conflict of purely selfish and individual aims or the indifferent, easy-going laissez-faire attitude of the old order. To quote an historical example, the awful excesses of the Parisian starvings of the French Revolution can be traced to the callous indifference of the royal parasitic, tax-imposing authorities, and unless that important problem is whole-heartedly looked after by the disinterested and generally unappreciated group of earnest social workers it is apt to be neglected. The cure for poverty lies not in the hands of the poor but in those of their more fortunate brethren. Since the First National Conference of Boards of Charities and Corrections, held in New York City 20-22 May 1874, and annually afterward in different localities, charity organization societies have multiplied in over 150 cities in the United States and interchange of ideas among the relief agencies is maintained and the working problems, ways and means and results of each year are discussed annually by means both of city and national conferences. On the general outline methods of a typical city association the evidence of Edward T. Devine, Ph.D., general secretary of the Charity Organization Society of the City of New York, founded in 1882, may be taken as authoritative. The first thing done is to investigate, and he says in his book, 'The Practice of Charity':

In modern organized charity, investigation has come to mean something more than it had meant for those who had proclaimed the necessity for discriminating between the deserving and the undeserving. Investigation is not solely or even primarily for the purpose of thwarting the expectations of imposters. It is not even merely a device for preventing the waste of charity upon unworthy objects, in order that it may be used for those who are really in need. Investigation is rather an instrument for the intelligent treatment of the cases. It is analogous to the diagnosis of the physician who does not attempt to treat a serious malady from a glancing at its symptoms, but who carefully inquires into the hidden and early manifestations of the disease, and seeks to know as much as possible of the condition, and with which he must reckon in effecting a cure. Investigation, therefore, while it should never be insconsiderable or blundering, or heartless, must be painstaking, conscientious, and benevolent. The kind of an investigation has been developed as one feature of organized charity and its possibilities have been only slightly unfolded, and they are realized only gradually in the experience of individual workers. It may be said that investigation may be too difficult or too tiring for the individual workers, or it may be neither. The investigation is made not for its own sake, but as a part of the whole system of the defects or misfortunes that have brought the applicant to seek relief. In the majority of cases, if the investigation is wise and complete, it will reveal personal sources and leading which will enable the situation to be met without calling in outside aid, and in this way, in the large proportion of cases instances, investigation might be said to become a substitute for relief.

The Charity Organization Society not only insists on investigations, but on co-operation. On this point Mr. Devine has this to say:

By co-operation is meant not merely agreement among various societies and organized agencies, upon general plans of co-operation, but rather co-operation in dealing with individual cases of distress upon the basis of facts as ascertained by investigation. It involves, in other words, acceptance of the plan of relief which is calculated to remedy the defects or to supply the deficiencies that have been discovered. This may mean that each of the co-operating individuals or societies shall supplement the efforts of the others by contributing part of the money or work needed, or it may mean that they will agree to a division of the work, each leaving to the other the part for which its facilities are adapted; or it may mean a division of the cases to be dealt with, one agreeing to leave entirely to the other such classes of individuals or families whose needs are to be met by the agency to which they are assigned. One of the simplest forms of co-operation is that between the Church and the relief agency, secured by effort to make the Church the friend of the individual or family, or other in the case of a given family, or secured by the agent of the Charity Organization Society finding in the case of a given family, or other in the case of a given family, or secured by the agent of the Charity Organization Society finding that, in the case of the material needs should be supplied by the relief agency, and the Church should provide the necessary spiritual oversight and the necessary formative influence for the children and, if necessary, reformative influence for older members of the family. It sometimes happens that the family has no need of reformation, that it contains within it, in all, the necessary resources for education and training, while the financial income alone is lacking, or not sufficient. In such circumstances, another friend may not be unwelcome in sickness or in trouble and in periods of unusual difficulty. Enlargements of social opportunities may all be entirely appropriate.

In order to carry out a scheme so comprehensive as this a machine was necessary, and charity organization made a machine, not merely to investigate objects of charity and to promote co-operation among all charitable agencies, but to keep a record of the case in charity, and to employ individuals, competent and trained, to do that work. It even went further, and established schools for professional social workers in charity, who receive pay for charitable work. Organized charity, by its insistence upon co-operation and its intelligent discussion of all matters pertaining to charity, exerts a powerful influence upon the State in its relation to charity. There can be no step backward by the State in its treatment of its dependents, which organized charity will not detect and seek to stop. The experience of its years of struggle to benefit the poor must be made known to officials having charge of charitable institutions and must be practically considered. The good done by organized charity is not confined to the relief that it gives individuals, or to the fraud that it detects, or to the imposition that it prevents, but it extends to the making of public opinion about charitable matters which forces good government in public charitable institutions.

State legislatures appoint State boards of charities, to visit and inspect all institutions, whether State, county, municipal, incorporated or not incorporated, which are of a charitable, eleemosynary, correctional or reformatory character, the legislatures making provision for the education and support of the blind, the deaf and dumb and juvenile-de
 CHARLEMAGNE—CHARLES VII 311

ingenuous as seems proper, and recognizing and supporting the efforts of any county, city, town or village to provide for the care, support, maintenance and secular education of inmates of orphan asylums, homes for dependent children or correctional institutions, whether under public or private control. The representative of the numerous forms of public charity and of the co-operation and efficiency attained under a city plan is the list of societies and organizations represented by delegates at the annual New York city conference, and also representative of the different complex problems involved is the list of subjects discussed (see CHARITIES AND CORRECTIONS, THE NATIONAL CONFERENCE OF). Consult Proceedings of the New York City Conference of Charities and Corrections (Albany 1910 et seq.).

CHARLEMAGNE, shahr-lé-mahn. See CHARLES (CHARLEMAGNE).

CHARLOEOI, shahr-lé-roi', Belgium, town, 20 miles southwest of Namur, containing extensive iron-works and mines. It was here Napoleon crossed the Sambre on his march to Waterloo. At the outbreak of the European War the town had a population of over 29,000. On 21 Aug. 1914 the 2d German army, under Von Buelow, had silenced the forts of Namur and on the 22d had pushed on to Charloei, the headquarters of the 5th French army, under Lanrezac, holding the line of the Sambre, with the British on its left extending from Binche to Mons, thence westward to Condé. After a heavy bombardment the Germans entered Charloei and turned it into a street battlefield. The fight raged fiercely from house to house, from the roofs and through the factories. The French colonials, Turcos and Zouaves furiously contested passages and alleys. Both Germans and French in turn were repeatedly driven out, and by night the town was in flames. The struggle continued all through the night, and in the morning the French were surprised by another German army, under Von Hausen, who attacked the right and compelled retreat. Simultaneously, the British were fighting Lanrezac in total ignorance of the latter's retreat. It was not till late in the afternoon that the British commander learned of the retreat and the fall of Namur. On the following day, 24 Aug. 1914, began the historic retreat that ended on the Marne.

Numerous charges of atrocities alleged to have been committed in the Charloei district were laid against the German troops. The Bryce Report (q.v.) states that in the village of Tamines a large number of civilians, including aged people, women and children, were "deliberately killed," and that the public square was "littered with corpses." At Mornanwelz the mayor and his man-servant were shot and the town-hall and 62 houses burned. Several men were shot and houses burned at Monceau-sur-Sambre, while at Montigny about 600 "hostages" were collected, several shot and 130 houses set on fire in the main street. See MONS; WAR, EUROPEAN: INVASION OF BELGIUM.

CHARLOEOI, shahr-lé-roi', Pa., city of Washington County, on the Monongahela River and on the Pennsylvania Railroad, 40 miles south of Pittsburgh. Industries include mining and the manufacturing of various kinds of glass and shovels. Charleroi was settled in 1890 and incorporated in the following year. The government is administered by a burgess, elected for four years, and a borough council, chosen on a general ticket. Pop. 9,615.

CHARLES (Karl Ludwig Johann Joseph Laurens), Archduke of Austria, 3d son of the Emperor Leopold II: b. Vienna, 19 Apr. 1771; d. Vienna, 30 Apr. 1847. As soldier, statesman and military historian Charles was one of the most brilliant members of the Hapsburg family. At the time of his birth his father was Grand Duke of Tuscany and his uncle was Emperor (Joseph II). Charles spent his youth in Tuscany; his education was derived from General Spanocchi, Count Hohenwart and the Archduchess Christine Maria. A political party in Belgium desired to elect him hereditary sovereign and grand duke, but The Hague Convention frustrated the plan. In his 20th year he distinguished himself at the battle of Jemappes; two years later he was made major-general and commanded the advance guard of Prince Josias of Saxony at Austerlitz and Neerwinden, defeating the French republican armies. In 1793 he was appointed governor-general of the Netherlands. His victories had recovered Belgium for Austria. He was appointed field-marshal of the empire and commander of the Austrian army on the Rhine in 1796; he opened the campaign by storming the heights of Altstetten and turning his retreat at Wetzlar into a victory over Jourdan. He followed this up with the other successes at Teining and Amberg, which compelled Moreau to make his memorable retreat. In the winter of 1797 he captured Kehl, the only position the French occupied in Germany, and on 11 November was appointed governor and captain-general of Bohemia. After the fruitless congress at Rastadt he put himself at the head of the Rhine army and again defeated his old opponent Jourdan at Ostrach and Stockach. Misunderstandings that arose between him and the Russian generals, Suvorov and Korsakov, and his weak state of health compelled him to throw up his command and retire to Bohemia. In the protracted struggle in the heart of Germany Napoleon's genius was on every occasion triumphant; once only, at Aspern, did Charles snatch a victory from him, but the battle of Wagram laid Austria at the feet of the French Emperor. A particular interest attaches to the Archduke Charles from the fact that he was the uncle of Marie Louise and acted as proxy on behalf of Napoleon in the first marriage ceremony held in Vienna, 11 March 1810; thus half married, she proceeded to Paris and married the Emperor in person on 1 April.

CHARLES, 1st DUKE OF LORRAINE: b. 953; d. Orleans 994. He early succeeded to his paternal inheritance. No sooner, however, was he invested with the direct claim to the crown of France, on the death of Louis V, and immediately endeavored to sustain his claim by force of arms; but in the first battle fought between the two powers he was made prisoner, his army entirely defeated, and himself cast into a dungeon in the gloomy castle of Orleans, where he died a prisoner, 994.

CHARLES VII, Emperor of Austria and King of Hungary as Charles IV: b. Vienna, 17 Aug. 1887. He is a grandson of the late Karl
Ludwig, brother of the late Emperor-King, Francis Joseph, and Princess Annunciata, daughter of Ferdinand II of Naples, and son of the Archduke Otto Franz Joseph. On 21 Oct. 1911 he married Zita, Princess of Bourbon and Parma. He became heir apparent to the throne on the assassination of his uncle, the Archduke Francis Ferdinand, at Sarajevo, Bosnia, 28 June 1914. He succeeded to the throne on the death of his grand-uncle, Emperor Francis Joseph, on 21 Nov. 1916, was crowned emperor at Vienna the December following. He was crowned king of Hungary and the oath to the Hungarian constitution 29 Dec. 1916.

CHARLES (şarl) I (*le Chauve,* or *the Bald*), King of France, son of Louis le Débonnaire: b. Frankfort-on-the-Main, 13 June 823; d. 877. He was invested by his father with the kingdoms of Alemania, Burgundy, Provence and Septimania, and subsequently with that of Aquitaine. On Louis' death in 840 Charles found himself confronted with two enemies — his half-brother Lothaire, who, as eldest son, claimed the whole of the Frankish dominions, and his nephew Pepin, who asserted, in right of his father, a preferable claim to the sovereignty of Aquitaine. After considerable bloodshed, a treaty was entered into between Charles and Lothaire at Verdun (843), by which the former received, as his share of the dominions of Charlemagne, all those territories comprehended between the North Sea on the one part, and the Meuse, the Scheldt, the Saône, the Rhone and the Mediterranean on the other. In 875, by the death of his nephew, the Emperor Louis II, he gained possession of the Imperial crown, and thereby provoked the hostility of his brother, Louis the German, who ravaged the territory of Champagne and otherwise committed great havoc in his dominions. In 877 he proceeded to Italy on a crusade against the Saracens, to which he had been summoned by the Pope, but died when crossing Mount Cenis.

CHARLES I (4le Gros,* or *the Fat*), King of France, also known as Charles III, Emperor of Germany: b. about 832; d. Neidelberg, Suabia, 18 Jan. 888. He was the son of Louis the German and the grandson of Louis the Débonnaire, and was recognized as Emperor of Germany by the Pope. In 885 he ascended the French throne, to the prejudice of his cousin, Charles the Simple, whose youth prevented him from asserting his rights, but in 887 he was deposed, and the following year died miserably, strangled, as is asserted, by his servants.

CHARLES III (*the Simple*), King of France, the posthumous son of Louis the Stammerer: b. 17 Sept. 879; d. 929. On his father's death France was divided between Charles' two brothers, Louis III and Carloman, and an aristocratic oligarchy. On the death of his brothers he ought in right to have ascended the throne, but his extreme youth prevented his claims being recognized, and his cousin, Charles the Fat, was proclaimed king in 885. On the deposition of the latter in 887 Count Eudes of Paris succeeded in obtaining the crown; but his death in 898 left Charles undisputed king of the whole country. The reign of Charles is chiefly noted for the piratical incursions of the Normans or Normans, who ravaged the coasts of France, sailed up the principal rivers and spread such dismay that, to conciliate them and put an end to their devastations, he agreed to cede to their chief, Rollon, the county of Rouen and the land of the Basques as a fief of the French Crown. Latterly also Charles' tranquility was much disturbed by the turbulence of some of his great vassals, who broke into open rebellion, declared the throne forfeited and proclaimed as king, Robert, brother of Count Eudes. Through the treachery of Herbert, Count of Vermandois, Charles was inveigled into the town and imprisoned in the fortress of Peronne. From this he was only liberated a short time before his death. Consult Eckel, A., *Charles le Simple* (Paris 1899).

CHARLES IV (*the Fair*), King of France, 3d son of Philippe le Bel: b. 1294; d. 1328. In virtue of the Salic law he ascended the throne in 1322, to the exclusion of the daughters of Philip the Long. He reigned six years, dying in 1328 without an heir of the direct line descended from Hugh Capet. Isabella, his sister, married Edward II of England, and was materially aided by Charles in fitting out, along with her paramour Mortimer, the expedition which resulted in the dethronement of her husband.

CHARLES V (*the Wise*), King of France, son of John II: b. Vincennes, 21 Jan. 1337; d. there, 16 Sept. 1380. While duke of Normandy, and during the captivity of his father in England, after the battle of Poitiers, he took the title of lieutenant of the kingdom. The vices and extravagances of the court were extreme, and the demands of the States-General for reform, headed by Stephen Marcel, provost of the merchants of Paris, were loudly and persistently urged. This assembly was supported in its claims by Charles the Bad, King of Navarre, who, as grandson of Louis le Huitin, maintained a preferable right to the crown. By artfully temporizing Charles contrived to detach the leading orders from the cause of the states, and having brought about indirectly the assassination of Marcel, succeeded in crushing their party. Meantime his father, John, still continued in captivity in England till liberated by the Treaty of Bretigny in 1360. Four years afterward he died, leaving Charles as successor to the French crown. The reign of the latter presents a series of combined hostilities and intrigues carried on with the view of establishing his power and extending his dominions. Great defensive skill was shown in this wars, and in these he was so far successful as to keep at bay the King of Navarre and deprive the English of a great part of their possessions in France. The magnanimity and wisdom of Charles have been greatly commended by his contemporaries and by posterity, and he is frequently referred to in literature with a fine justice. He was the founder of the Bibliothèque Royale. He erected the Bastille for the purpose of overlooking the Parisians, whose outbreaks
he had found reason to dread. Consult De-
lachalieu, "Histoire de Charles V" (Paris 1908).

CHARLES VI ("the Silly"), King of France, and son of Charles V: b. Paris, 3 Dec. 1368; d. 21 Oct. 1422. When his father died he was not 12 years old, and the contending pretensions of his uncles, the dukes of Anjou, Berry, Burgundy and Bourbon, ren-
dered his minority one of unbounded turbulence and license. In 1385 he married at Amiens Isabella of Bavaria. In 1388 he declared him-
self independent of guardians and took the reins of government into his own hands. His mild and amiable though somewhat dissipated character had already secured for him a con-
siderable share of popularity, when he was overtaken by the loss of his reason—a condi-
tion in which, with a few lucid intervals, he remained to the end of his days. The origin of this was constitutional, aggravated by a fright and a severe accident. Perhaps at no period in her history was France the scene of greater disasters and miseries than during the reign of this unhappy prince. The rival factions of the Burgundians and the Armagnacs kept up constantly throughout the country the horrors of a most rancorous civil war; while brigandage and every kind of violence prev-
aded everywhere. So much was such a con-
junction afforded the most favorable oppor-
tunity for an invader; and accordingly, in 1415, Henry V of England crossed over to Normandy with a numerous army, took Harfleur by storm and signally defeated the French forces in the battle of Agincourt. Improving these ad-
vantages he advanced into the country, gained possession of the capital and compelled the crazy King to sign the Treaty of Troyes (1420), by which his daughter Catharine was given in marriage to Henry, and Charles was also forced to disinherit his own son and to acknowledge Henry as his successor. Neither monarch long survived this celebrated pact, both dying within a few months of each other.

CHARLES VII, King of France, 5th son of Charles VI: b. Paris, 22 Feb. 1403; d. Meulan, 21 Mar. 1461. He was the product of the suc-
essive deaths of his elder brothers, Dauphin and heir-presumptive to the crown. On the King of England's death in 1422 his son, Henry VI, was proclaimed King of France at Paris. The war with the National party, represented by the Orleanist faction, with the Dauphin at their head, was maintained for several years by the English, under the command of the Duke of Bedford. So successfully did the latter conduct operations that Charles was brought to the verge of despair, and almost reduced to abandon the struggle as hopeless, when his fortunes were retrieved by the arrival in his camp of the Maid of Orleans, who by the enthusiasm which she inspired first turned the tide of fortune and then overthrew the armies in the home councils. Through the intervention of the Earl of Suffolk a marriage was concluded between the young King Henry VI and Mar-
garet of Anjou, niece of Charles VII's queen. In the treaty entered into on this occasion the territory of Maine was secretly surrendered to France, and subsequently, on hostilities being resumed between the two countries, the troops of Charles conquered the whole of Guienne and finally expelled the English from the last possessions in France except Calais. The last years of Charles' reign were embittered by domestic broils, in which his son and successor, Louis XI, took a prominent part against his father. So hemmed in at last was the latter by the emissaries of the Dauphin that he con-
ceived the idea of Louis having formed a deliberate plan to poison him; and so firmly was this notion rooted in his mind that he could only with the greatest difficulty be in-
duced to take any food. A romantic interest has been thrown around Charles VII by his early reverses and the re-establishment of French nationality, which he effected mainly through the heroism inspired by the Maid of Orleans. His personal character, however, was weak and contemptible, with no respect for principle, and he surrendered himself continually to sensual and degrading pleasures. His share in the treacherous murder of the Duke of Burgundy, and base abandonment to her fate of Joan of Arc, are staius on his memory which cannot be effaced. Consult 'Lives' by Beau-
court and Vireville.

CHARLES VIII, King of France, son of Louis XI: b. Amboise, 30 June 1470; d. there, 8 April 1498. He succeeded his father in 1483, his sister, Anne de Beaujeu, acting as regent till he attained the age of 20. In 1491 he mar-
rried Anne, the heiress of Brittany, and thereby annexed that important duchy to the French Crown. By so doing, however, he both broke faith with the daughter of Maximilian, king of the Romans, to whom he had been espoused, and also robbed Maximilian of his bride, a marriage by proxy having been already con-
cluded between him and Anne. The leading incident of Charles VIII's reign is his Italian expedition and conquest of the kingdom of Naples, to which he was instigated by Ludovico Sforza, the usurper of Milan. The extension to Naples was asserted in virtue of the rights to that sovereignty transmitted by the house of Anjou to the royal family of France. The whole of Charles' expedition reads like a page from one of the old chivalrous romances. With an army of 30,000 men, unprovided either with money or stores, he suddenly crossed the Alps, advanced rapidly southward, and meeting with scarcely any obstruction, arrived before the walls and gained possession of Naples. This conquest, however, he did not retain for many months. Having left 5,000 men to guard his new acquisition he returned to France, and had scarcely reached it when the arms of Gonsalvo de Cordova effected the reannexation of Naples to Spain. See Joan of Arc or Arc). The fresh spirit thus infused into the French was heightened by mismanagement on the part of the English, whose military oper-
ations were conducted with greatly diminished skill after the death of the Duke of Bedford, while discord and confusion prevailed in the home councils. Through the intervention of the Earl of Suffolk a marriage was concluded between the young King Henry VI and Mar-
garet of Anjou, niece of Charles VII's queen. In the treaty entered into on this occasion the territory of Maine was secretly surrendered to France, and subsequently, on hostilities being resumed between the two countries, the troops of Charles conquered the whole of Guienne and finally expelled the English from the last possessions in France except Calais. The last years of Charles' reign were embittered by domestic broils, in which his son and successor, Louis XI, took a prominent part against his father. So hemmed in at last was the latter by the emissaries of the Dauphin that he con-
ceived the idea of Louis having formed a deliberate plan to poison him; and so firmly was this notion rooted in his mind that he could only with the greatest difficulty be in-
duced to take any food. A romantic interest has been thrown around Charles VII by his early reverses and the re-establishment of French nationality, which he effected mainly through the heroism inspired by the Maid of Orleans. His personal character, however, was weak and contemptible, with no respect for principle, and he surrendered himself continually to sensual and degrading pleasures. His share in the treacherous murder of the Duke of Burgundy, and base abandonment to her fate of Joan of Arc, are staius on his memory which cannot be effaced. Consult 'Lives' by Beau-
court and Vireville.

CHARLES VIII, King of France, son of Louis XI: b. Amboise, 30 June 1470; d. there, 8 April 1498. He succeeded his father in 1483, his sister, Anne de Beaujeu, acting as regent till he attained the age of 20. In 1491 he mar-
rried Anne, the heiress of Brittany, and thereby annexed that important duchy to the French Crown. By so doing, however, he both broke faith with the daughter of Maximilian, king of the Romans, to whom he had been espoused, and also robbed Maximilian of his bride, a marriage by proxy having been already con-
cluded between him and Anne. The leading incident of Charles VIII's reign is his Italian expedition and conquest of the kingdom of Naples, to which he was instigated by Ludovico Sforza, the usurper of Milan. The extension to Naples was asserted in virtue of the rights to that sovereignty transmitted by the house of Anjou to the royal family of France. The whole of Charles' expedition reads like a page from one of the old chivalrous romances. With an army of 30,000 men, unprovided either with money or stores, he suddenly crossed the Alps, advanced rapidly southward, and meeting with scarcely any obstruction, arrived before the walls and gained possession of Naples. This conquest, however, he did not retain for many months. Having left 5,000 men to guard his new acquisition he returned to France, and had scarcely reached it when the arms of Gonsalvo de Cordova effected the reannexation of Naples to Spain. See Joan of Arc or Arc). The fresh spirit thus infused into the French was heightened by mismanagement on the part of the English, whose military oper-
ations were conducted with greatly diminished skill after the death of the Duke of Bedford, while discord and confusion prevailed in the home councils. Through the intervention of the Earl of Suffolk a marriage was concluded between the young King Henry VI and Mar-
CHARLES IX, King of France, son of Henry II and Catharine de Medici: b. Saint Germain-en-Laye, 27 June 1550; d. 30 May 1574. He ascended the throne at the age of 10, after the death of his brother, Francis II, and his mother assumed the regency. Parliament quiesced in this resolution, to avoid exciting new contests between the Guises and the princes of the blood. The Duke of Guise, who obtained possession of the person of the young King, was shot by an assassin before Orleans, in February 1563. In his last moments he advised the King and the Queen mother to negotiate with the parties. This advice was followed; a treaty was signed 19 March, and Havre taken from the English 27 July. The King, who was the same year declared of age, visited the provinces in company with his mother. At Bayonne he had a meeting with his sister Isabella, the wife of Philip II of Spain. This excited such suspicions in the Calvinists that they took up arms, and immediately formed the plan of attacking the King on his return to Paris. Being warned in season he escaped the danger; but this plot could not fail to arouse the hatred of Charles. After the battle of Saint Denis, 1567, in which the Constable of Montmorency lost his life, Catharine entered into negotiations for peace. But the Calvinists reserved certain of the places which they were to have surrendered and continued to keep up a communication with England and the German princes. A new civil war soon broke out. Notwithstanding the jealousy of Charles, Catharine placed the Duke of Anjou, her brother, at the head of the royal army. The Prince of Condé was shot in the battle of Jarnac in 1569, and the Admiral Coligny defeated at Montcontour in the same year, after which the King concluded peace (1570) on terms so favorable to the Calvinists that they seem even to have suspected treachery under them. The heads of that party did not therefore all appear at court when Charles celebrated his marriage with Elizabeth, the daughter of Maximilian II. By degrees this distrust disappeared, and the marriage of the young King of Navarre (afterward Henry IV) with Margaret, sister of Charles X, seemed to banish every suspicion. This marriage took place 18 Aug. 1572. But under the sinister influence of her mother a diabolical plot was being formed. On the 22d the first attempt was made on the life of Coligny, and on the 24th began that massacre known under the name of the massacre of Saint Bartholomew, from having taken place on the night of the festival of that saint. Civil war broke out for the fourth time, and Catharine now became aware of the errors of her policy. Charles could no longer conceal his aversion to her, and was on the point of assuming himself the reins of government, when he died, childless, in 1574. Consult Mérimée, "Chronique du régime de Charles IX" (Paris 1889).

CHARLES X, COMTE D’ARTois, King of France: b. Versailles, 9 Oct. 1575; d. Görtitz, Austria, 2 Nov. 1610. He was the youngest son of the Dauphin and brother of Louis XVI. He spent a dissipated youth, and left France in 1789, after the first popular insurrection and destruction of the Bastille. After Louis XVI had accepted the constitution of 1791, he invited Charles to return to France, but he refused, and the Legislative Assembly, after stopping his allowance on the civil list, confiscated his property in 1792. He afterward assumed the command of a body of émigrés, and acted in concert with the Austrian and Prussian armies on the Rhine. At a later period he made a descent on the coast of Brittany, but despairing of success, withdrew to England, and for several years found an asylum in the palace of Holyrood at Edinburgh. After the downfall of Napoleon he entered France with the title of lieutenant-general of the kingdom and issued a judicious proclamation, promising the reign of law and an entire oblivion of the past. In 1824 he succeeded his brother, Louis XVIII, under the title of Charles X, and gained a momentary popularity by the abolition of the censorship of the press, but reactionary measures soon followed, and the spirit of disaffection was so widely spread that a collision with the popular party became inevitable. Charles X endeavored to gain the start by a coup d’état, and issued his celebrated ordinances putting an end to the freedom of the press, decreeing a new method of election and setting aside a recent election to the Chamber. The revolutionary movement triumphed, and he was ignominiously driven from the throne in 1830. After formally abdicating in favor of his grandson, the Duc de Bordeaux, he revisited England, resumed his residence for a short time at Holborn, and finally settled at Görtitz in Styria. He was the last sovereign of the elder line of the house of Bourbon, a typical member of the family, incapable of learning and incapable of forgetting. See Lhoux, "Histoire du règne de Charles X" (1834).

CHARLES I, King of Germany. See CHARLES (CHARLEMAGNE).

CHARLES II, King of Germany. See CHARLES I of France.

CHARLES III, surnamed Le Gros, King of Germany. See CHARLES II of France.

CHARLES I, King of Great Britain and Ireland: b. Dunfermline, Scotland, 19 Nov. 1600; d. London, 30 Jan. 1649. He was the second son of James VI and Anne of Denmark. James succeeded to the crown of England in 1603, and on the death of Prince Henry in 1612 Charles became heir-apparent. Little is recorded of him previous to his romantic journey into Spain in 1623 in company with Buckingham, in order to pay his court in person to the Spanish Infanta. Through the arrogance of Buckingham this match was prevented, and the Prince was soon after contracted to Henrietta Maria, daughter of Henry IV of France. In 1625 he succeeded to the throne on the death of his father. The first Parliament which he summoned, being much more disposed to state grievances than grant supplies, was dissolved; and by loans and other expedients an expedition was fitted out against Spain (1626) which terminated in disgrace and disappointment of Louis XIII. The next year a new Parliament was summoned, and the distrust and jealousy prevailing between the King and this assembly laid the foundation of the misfor-
tunes of his reign. The House of Commons had fallen into the public purse, and he intimated a design of following his ancestors in the same path. We may therefore suppose that they were determined to continue his will, and suddenly and angrily dissolved them, after a short session, while they were preparing a remonstrance against the levying of tonnage and poundage without consent of Parliament. Charles then began to employ his threatened mode of raising funds by loans, benevolences and similar unconstitutional proceedings; which, however partially sanctioned by precedent, were wholly opposed to the rising spirit of civil liberty and to the constitutional doctrine which renders the Commons the guardian and dispenser of the public treasure. His difficulties were further increased by a war with France, intended to gratify the private enmity of Buckingham, who added to the odium against him by an ill-fated expedition to assist the Huguenots of Rochelle (1627).

In 1628 the King was obliged to call a new Parliament, which showed itself as much opposed to his project of raising money and after voting the supplies prepared a bill called "A Petition of Right, Recognizing all the Legal Privileges of the Subject," which, notwithstanding the employment of all manner of arts and expedients to avoid it, Charles was constrained to pass into a law.

The assassination of Buckingham in August 1628 removed one source of discord, but the Parliament which met in January 1629 manifested so determined a spirit against the King's claim of levying tonnage and poundage by his own authority, that it was suddenly dissolved, and Charles was determined to try to reign without one. For this purpose, having judiciously terminated the pending wars between France and Spain, he raised Sir Thomas Wentworth, after celebrated as Lord Strafford, to the principal place in his councils. This able statesman had begun his political career in opposition to the court, but having been gained over, was by his austerity, talent and firmness, a fit instrument to carry the spirit of resistance to prerogative, which had become so strong among the Commons. In ecclesiastical affairs Charles, unhappily for himself and the Church, was guided by the counsels of Laud, then bishop of London, a prelate whose learning and piety were accompanied by a zeal as indirect as intolerant.

Under these counsels about 11 years passed away in the execution of plans for raising money without the aid of Parliament, with other dangers and expediency. The arbitrary courts of high commission and star chamber, in the hands of Laud, also exercised in many instances the most grievous oppression. In 1634 ship money began to be levied, which being strictly applied to naval purposes, occasioned at large accursed in it with less than usual repugnance; and some writers, who attacked the court in opposition to the principle, were treated with so much severity that others were deterred from following their example. So desperate was the cause of liberty at this time appear, that great numbers of the Puritans emigrated to New England. It was in 1635 that Hampden commenced his resistance to the payment of ship money, the right to levy which, without authority of Parliament, he was determined to bring before a court of law. His cause was argued in 1638 for 12 days in the Court of Exchequer; and although he lost it by the decision of eight out of 12, the discussion of the question produced a very powerful impression on the public mind.

It was in Scotland, however, that formal warlike opposition was commenced. From the beginning of his reign Charles had endeavored to introduce into that country a liturgy copied from the English—an innovation which produced the most violent tumults and ended in the formation of the famous Covenanters in 1638, by which all classes of people mutually engaged to stand by each other and the abolition of episcopacy. The covenanters levied an army, which the King, opposed by an ill-disciplined English force, so equivocally inclined, that not able to trust his army agreed to a pacification known as the Treaty of Berwick (1639). His finances being exhausted, after an intermission of 11 years, he again assembled Parliament, which, as usual, began to grant supplies. Losing all patience, the King once more hasty dissolved it, and prosecuted several members who had distinguished themselves by their opposition. Raising money in the best manner he could devise, an English army was again made to proceed toward the north; but, being defeated by the Scots, it became obvious that affairs could no longer be managed without a Parliament, and in 1640 that dreaded assembly was again summoned, which proved to be the famous Long Parliament, whose career forms so memorable a chapter in English history. Charles soon found himself obliged to be a comparatively passive spectator of the ascendency of the House of Commons and was obliged, both in Scotland and in England, to yield to the torrent which assailed him.

In the meantime a flame burst out in Ireland, which had no small effect in kindling the ensuing conflagration at home. The oppressed Roman Catholic population of that country, during the confusion of the times, rose against the government for the purpose of regaining their rights. Very exaggerated accounts of the massacre of the Protestants are given by several historians. Later writers have established the fact that the number who perished in this insurrection was not great.

The Parliament being summoned, the King left the conduct of the war entirely to it; but it now became evident that the Commons intended systematically to pursue their advantages and to reduce the Crown to a state of complete dependence. They framed a remonstrance containing a recapitulation of all the errors of the reign; renewed an attempt for excluding bishops from the House of Lords; passed ordinances against superstitious practices and so inflamed the popular odium against the Episcopal orders as to intimidate its members from attending to their duty in Parliament.

At length, it being apparent that either zealous adherents or prerogative of those anxious to establish the government on a more democratic basis must give way, Charles caused his attorney-general to enter, in the House of Peers, an accusation against five leading members of the Commons, and sent a
sergeant-at-arms to the House to demand them. Receiving an evasive answer, he, the next day (4 Jan. 1642), proceeded himself to the House, with an armed retinue. Aware of this intention, they had previously withdrawn; but the King's appearance with a guard caused the House to break up in great disorder and indignation. The accused members retired into the closet, where a committee of the House was appointed under an officer appointed by Parliament, which also demanded control of the army. Here the King made his last stand, the matter having now arrived at a point which arms alone could decide. The Queen fled to Holland to procure ammunition, and Charles, with the Prince of Wales, proceeded north, and for a time fixed his residence at York. The King was received in his progress with a show of loyalty from the gentry; and many eminent and virtuous characters, the conscientious opposers of his arbitrary measures in the first instance, now joined his party. On the other hand, all the Puritans, the inhabitants of the great trading towns and cities, and those who had adhered to the government, sided with the Parliament; and in no public contest was more private and public virtue ranged on both sides, however alotted, as in all such cases, with ambition, bigotry and the baser passions. The royal standard was raised at Nottingham, 22 Aug. 1642.

The first action of consequence in the civil war was the battle of Edge Hill 23 Oct. 1642, which, although indecisive, enabled the King to approach London and produced considerable alarm. Nothing decisive, however, happened against the royal side till the battle of Marston Moor, which was gained chiefly by the skill and valor of Cromwell. Montrose's succession in the Scottish highlands in 1644-45 created divisions in favor of the royalists. The succeeding year (2 July 1644), however, completed the ruin of the King's affairs, by the loss of the battle of Naseby (14 June 1645).

Thenceforward a series of disasters attended his armies throughout the kingdom, and he took the resolution of throwing himself into the hands of the Scottish army, then lying before Newark, 5 May 1646. He was received with respect, although placed under guard as a prisoner; and, a series of abortive negotiations ensuing, an agreement was made with Parliament to surrender him to their commissioners, on the payment of a large sum, claimed as arrears by the Scottish army. The King was accordingly surrendered to the commissioners appointed by the House of Commons, to Holmby House, in Northamptonshire; subsequently to the headquarters of the army at Reading; and soon after to Hampton Court. In the meantime, however, the army and Independents becoming all powerful, he was led into some fears for his personal safety, and, making his escape with a few attendants, proceeded to the south coast. Not meeting a vessel, as he expected, he crossed over to the Isle of Wight, and put himself into the hands of the governor, whom he was lodged in Carisbrooke Castle.

While the King was in this situation, the Scots, regretting the manner in which they had delivered him up, and indignant at the proceedings of the English, marched a consider-
any theory of civil and religious liberty; but it is equally certain that he only sought to retain what his predecessors had possessed. There are periods in the history of every people in which old and new customs meet, and that a conflict becomes unavoidable; and it was the misfortune of Charles to occupy the throne at a time when the development of the representative system necessarily brought it into conflict with the claims of prerogative. If the Parliament of 1640 had a cure for that, it could only have been, as usually explained by Laud and the high churchmen of the day, it would have dwindled into a mere registry of royal edicts, like those of France. On the other hand, Charles acted a part which every monarch in his situation may be expected to act; for a philosophical appreciation of the true nature of a political crisis is scarcely to be expected from one who sits upon a throne. The most forcible accusation against Charles is on the score of insincerity. It is asserted that he never intended to fulfill the conditions imposed upon him, that all his compliances were feigned. This can scarcely be denied; but it is equally certain that some of the conditions might justly be demanded, and that they have been imposed in order to produce that conduct in the King which so naturally followed.

CHARLES II, King of Great Britain and Ireland, son of Charles I and Henrietta Maria, of France; b. London, 29 May 1630; d. there, 6 Feb. 1665. He was a refugee at The Hague on the death of his father, on which he immediately assumed the royal title. He listened to an invitation from the Scots, who had proclaimed him their king 5 Feb. 1649, and arrived in the Cromarty Firth 16 June 1650. Being obliged to throw himself into the hands of rigid Presbyterian, they subjected him to many humiliations and mortifications, which caused him to regard them ever after with extreme aversion. On 3 Sept. 1650 the Covenanting army was defeated by Cromwell at Dunbar. In 1651 Charles was crowned at Scone; but the approach of Cromwell soon rendered his abode in Scotland unsafe. Hoping to be joined by the English, who had offered to relieve the province of history as danger, Charles readily throwing open its gates to receive him. He was immediately pursued by that active commander, who, with a superior army, gained the battle of Worcester (3 Sept. 1651) and Charles, after a variety of imminent hazards, being on one occasion sheltered for 24 hours in the branches of the famous Boscoel oak, reached Shoreham, in Sussex, and from thence, France (16 October).

It is the province of the historian to state the circumstances that produced the Restoration, which General Monk so conducted that Charles, without a struggle, succeeded without hazard to all those dangerous prerogatives which had cost the nation so much blood and treasure, first to abridge and then to abolish. On 29 May 1660, Charles entered his capital amid universal and almost frantic acclamations; and the different civil and religious parties vied with each other in loyalty and submission. His first measures were prudent and conciliatory. Hyde, Lord Clarendon, was made Chancellor; and an act of indemnity was passed, from which those alone were excepted who were immediately concerned in the late King’s death. A settled revenue was accepted in lieu of high ship and purveyance and the army was reduced. In respect to religion, there was less indulgence; for not only were prelacy and the parliamentary rights of bishops restored, which was to be expected, but an act of uniformity (1662) was passed, by the result of which all the Presbyterian clergy were driven to a resignation of their livings. In 1662 he married Catherine of Braganza, a prudent and virtuous princess, but in no way calculated to acquire the affection of a man like Charles. The indulgence of his temper and the expenses of his licentious way of life soon involved him in pecuniary difficulties; and the unpopular sale of Dunkirk in 1662 to the French was one of his earliest expedients to relieve himself.

In 1665 a rupture took place with Holland. It was attended, in the first instance, by various naval successes; but France and Denmark entering into the war, as allies of the Dutch, the English were overmatched, and a Dutch fleet entered the Thames, and, proceeding up the Medway, burned and destroyed ships as high as Chatham (13 June 1667). The domestic calamities of a dreadful plague in 1665, and of the great fire in London in 1666, were among the disasters of the period. Soon after, Clarendon, who had become very considerable and was personally distasteful to Charles, was dismissed, and sought shelter from his enemies by a voluntary exile. A triple alliance between England, Holland and Sweden, for the purpose of checking the ambition of Louis XIV, followed (January 1668). It did honor to the political talents of Sir William Temple and was one of the few public measures of the reign which deserve approbation. In 1670 Charles threw himself into the hands of the five unprincipled ministers, collectively denominated the cabal, who supported him in every attempt to make himself independent of Parliament. The party troubles of this reign commenced about this time by the open declaration of the Duke of York, heir presumptive to the crown, that he was a convert to the Roman Catholic religion. Soon after the ministry broke the triple alliance and planned a rupture with the Dutch. On 20 May 1670 was signed the secret Treaty of Dover, under which the English King agreed to become a party to French aggression in the Netherlands and to favor the restoration of the Catholic religion.
in England. As the price of this astounding betrayal, Charles, always in financial straits, received subsidies from France and thus became a pensioner of Louis XIV. As the King did not have to apply to Parliament for money to carry on the projected war, he caused the exchequer to be shut up in January 1672. The naval operations (1672) against the Dutch were by no means successful, and a new Parliament being called, which strongly expressed the discontent of the nation, the cabal was dissolved and a separate peace made with Holland in 1674. Divisions in the Cabinet, fluctuations in the King's measures and parliamentary contests followed and occupied the next three years, till, in 1677, Charles performed a popular act, by marrying his niece, the Princess Mary, to the Prince of Orange. By taking some decided steps in favor of the Dutch he also forwarded the Peace of Nimoguen in 1678.

The same year was distinguished by the pretended discovery of the Popish plot for the assassination of the King and the introduction of the Roman Catholic faith. Notwithstanding the infamous characters of Oates and Bedloe, and the improbable nature of their disclosures, the project was supported by his Lord General;818 suspicion of the secret influence of a Catholic faction, met with universal belief, Parliament exhibiting nearly as much credulity and heat as the masses. Many Catholic lords were committed; Coleman, the Duke of York's secretary, and several others hanged; and a venerable nobleman, the Earl of Stafford, beheaded. The Duke of York thought fit to retire to Brussels, and a bill for his exclusion from the throne passed the House of Commons. Such was the state of the country that Charles was obliged to give way to some popular measures, and the great palladium of civil liberty, the habeas corpus bill, passed during this session. The temper of the Parliament was so much excited that the King first prorogued and then dissolved it. The Court now sought to establish a balance of parties; to distinguish which the terms Whig and Tory were about this time brought into use.

In 1680 a new Parliament assembled, and the bill for a Declaration of Indulgence which was rejected by the Lords. This Parliament was also dissolved in the next year and a new one called at Oxford, which proved so restive that a sudden dissolution ensued; and, like his father, Charles determined henceforward to govern without one. By the aid of the Tory gentry and the clergy he obtained loyal addresses from all parts of the kingdom, and attachment to high monarchical principles came again into vogue. The charge of plots and conspiracies was now brought against the Presbyterians. The Nonconformists generally were for the King, and a step which was of great moment, in the progress to arbitrary power, was the instituting of suits at law (quo warrants) against most of the corporations in the kingdom, by which they were intimidated to a renunciation of their charters, in order to receive them back so modeled as to render them much more dependent than before. These rapid strides toward the destruction of liberty at length produced the celebrated Rye House plot, the parties to which certainly intended resistance; but that the assassination of the King was ever formally projected seems very doubtful. It certainly formed no part of the intention of Lord William Russell, whose execution, with that of Algernon Sidney, on account of the plot, was one of the striking events of this disgraceful reign.

Charles was at this time as absolute as any sovereign in Europe; and had he been an active prince, the fetters of tyranny might have been completely riveted. Scotland, which at different periods of his reign had been driven into insurrection by the arbitrary attempts to restore Episcopacy, was very nearly dragged into submission; and the relics of the Covenanters were suppressed with circumstances of great barbarity. On his death-bed Charles became reconciled to the Catholic Church and received the last sacraments.

The character of Charles II requires little analysis. He was a confirmed sensualist and voluptuary; and his reign was the era of the most dissolute manners that ever prevailed in England. A dependent and pensioner of Louis XIV, in his need for money he betrayed the interests of the country. He was absolutely without moral sense. He cared more for his mistresses than for his kingdom, the reigning one for the time being was the real centre of influence and authority. Charles was a man of wit; and he possessed an easy good nature, but united with it was a total indifference to anything but his own pleasure. Yet, with all his selfishness and demerits as a king, Charles always preserved a share of popularity with the multitude from the easiness of his manners. Pepys' 'Diary' and other private documents, however, clearly show the opinion of the more reflecting portion of his subjects; and it is now pretty generally admitted that, as he was himself a most dishonorable and heartless monarch and man, so his reign exhibited the English character in a more disgraceful light than any other in English history. It need not be added that he left many illegitimate children, the descendants of some of whom are still among the leading nobility of the country. The fate of his son by Lucy Walters, the ill-fated Duke of Monmouth, is an affair of history.

Bibliography: 

CHARLES, or CHARLEMAGNE (CAROLUS MAGNUS), King of the Franks, and subsequently Emperor of the West, Holy Roman emperor: b. Poitiers, 13 May 742; d. there 28 Jan. 814. His father was Pepin the Short, King of the Franks, son of Charles Martel. After the decease of his father, in 768, he was crowned king, and according to the Frankish law, divided the Frankish dominions with his younger brother, Carloman; but the conditions of this partition were several times altered, without being ever adjusted to the satisfaction of the parties. Their mutual discontent was fostered principally by the King of the Lombards, Desiderius
CHARLES (CHARLEMAGNE) 319

(the father-in-law of both princes), because
Charlemagne had repudiated his wife. Desi-
derius sought revenge for the rejection of his
dughter by exciting and encouraging commo-
tions in the north; and he was assisted by
the circumstances that the nobles aspired to
independence. The people of Aquitania were
the first who attempted to become independent.
Charlemagne marched against them with rather
a small army; but he relied on the assistance of
his brother Pepin to do the fighting. The
Aquitains then belonged. Carloman appeared
indeed on the field, but at the decisive moment
deserted his brother, who was obliged to sus-
tain alone an unequal conflict. His great cour-
age and conduct, after a long and doubtful
contest, procured him the victory and the in-
surgents submitted (770). At Carloman's
death in 771, and after the flight of his wife
and her two sons to her father in Italy, Charle-
magne made himself master of the whole em-
pire, the extent of which was greater than ever.
It embraced, besides France, a large part
of Germany. He now formed the plan of
conquering the Saxons, for which his zeal for
the diffusion of Christianity served as a pre-
text. The paintings of Franks, Saxons, and
Westphalia, preferred pillaging to peaceful
occupations, and a wandering to a settled mode
of life. An irruption into the territory of the
Franks was the alleged cause of the first war
which Charlemagne began against them in 772.
The other wars were produced by the rebellions
of this warlike nation, which was never re-
duced to complete submission till the peace of
Seltz, in 803, after it had embraced Christianity.
Charlemagne deported great numbers of the
Saxons to Flanders and Switzerland and their
seats were occupied by the Ototrites, a vandala
tribe in Mecklenburg. During 32 years did the
Saxons resist a conqueror who, striving with
equal eagerness to convert and to subdue them,
never became master of their country till he
had transformed it almost into a desert. They
might have made a more successful defense
had they not been distracted by internal dis-
sensions. The most celebrated of their lead-
ers was Widukind, and next to him Albo, who
embraced Christianity and the See of Mayence.
While he was combating the Saxons on the
banks of the Weser, Pope Adrian implored his
assistance against Desiderius who had torn
from him the exarchate of Ravenna, which
Pepin the Short had presented to the Holy See,
and who was urging the Pope to crown the
nephews of Charlemagne, that Charlemagne
himself might be considered a usurper. Charle-
magne immediately left Germany and marched
with his army to Italy. Desiderius fled to Pa-
via, which was bravely defended by the Lom-
bards. The city fell, and Desiderius, with the
widow and sons of Carloman, were carried
prisoners to France. Desiderius ended his life
in a monastery. In 774 Charlemagne was
crowned king of Lombardy with the iron
crown.
In 778 he repaired to Spain to assist a
Moorsish prince, conquered Pamplona, made
himself master of the county of Barcelona and
spread the terror of his name. But on his return
his troops were surprised in the
valley of Roncesvalles by some Saracens, in
conjunction with the mountainiers, the Basques,
and the rear-guard defeated; remarkable from
the circumstance that Roland, one of the most
famous warriors of those times, fell in the
battle. (See Roncesvalles). The disaffection
of the tribes of Aquitania induced Charlemagne
to give them a separated ruler; for this purpose
he selected the youngest of his sons, Louis
(called le Débonnaire). The Lombards were
no less turbulent, and the Greeks made incess-
ant efforts to conquer Italy; and the nobles to
whom he had entrusted a part of the sovereign-
ity of this country expected the title of king
therefore gave them his second son, Pepin, for
a monarch; his eldest son, Charles, remaining
constantly with him, and assisting him in his
manifold undertakings. In 781 he caused these
two sons to be crowned by the Pope in Rome,
hoping to render the royal dignity inviolable
in the sight of their subjects. Charlemagne
had another son, also called Pepin, who was
the oldest of all his children, being the son of
his divorced wife. This circumstance probably
inspired the munificence of this son to the
elder Pepin, and prevented him from admitting
him to a share in the government.
After returning from Spain Charlemagne
was again obliged to take the field against the
Saxons. The year 788 he passed through
700 towns, and only one he passed without taking
up arms. As his power increased, he meditated
more seriously the accomplishment of the plan
of his ancestor, Charles Martel, to restore the
Western empire. On Christmas Day (800) he
was proclaimed Caesar and Augustus by Pope
Leo III; he was invested with the ornaments
of the ancient Roman emperors. The weak-
ness of the situation was, that the empire
could not subsist long in a family where the
authority was, by law, divided among the
children of the deceased monarch. Pepin,
King of Italy, died in 810, and his death was
followed by the next year by that of Charles, the
eldest. Thus of his legitimate sons only one
remained, Louis, King of Aquitania, whom
Charlemagne adopted as his colleague in 813.
Charles, who was five times married, was
buried at Aix-la-Chapelle, his favorite and
usual place of residence. He was deposited in
a vault, where he was placed on a throne of
gold, in full imperial costume.
Charlemagne was a friend of learning; he
deserves the name of restorer of the sciences
and teacher of his people. He attracted by
his liberality the most distinguished scholars to
his court; Charlemagne established an academy in
his palace at Aix-la-Chapelle, the sittings
of which he attended with all the scientific
and literary men of his court. All the members
of this academy assumed names characteristic
of their talents or inclinations. From Italy he
invited teachers of the language and mathe-
ematics, and established them in the principal
cities of his empire. In the cathedrals and
monasteries he founded schools of theology
and the liberal sciences. He strove assiduously
to cultivate his mind by intercourse with
scholars; and, to the time of his death, this
intercourse remained his favorite recreation.
His mother-tongue was a form of the Teu-
tonic, but he spoke several languages readily,
especially the Latin. He was less successful in
writing, because he had not applied himself
till he was further advanced in years. In
the winter he read much, and even caused a
person to read to him while he took his meals.
Charles IV, Holy Roman Emperor, of the house of Luxemburg: b. Prague, 14 May 1316; d. there, 29 Nov. 1378. He inherited the kingdom of Bohemia, and was crowned emperor in 1346 by five electors, hoping to occupy the imperial throne without opposition. But the princes of the empire regarded him as a servant of the Pope. He however used every effort to appease his enemies, married the daughter of the Elector of the Palatinate, gave Tyrol as a fief to the Elector of Brandenburg and was unanimously elected emperor and consecrated at Aix-la-Chapelle. But no sooner was he crowned than he took possession of the imperial insignia and conveyed them to Bohemia. In 1354 the Emperor went to Italy to be crowned by the Pope; but this favor he purchased on terms which made him an object of ridicule and contempt. He engaged to appear without any armed force. Having been consecrated king of Italy at Padua, he gave the Visconti in the possession of all the usurpations of which he had pledged himself to deprive them. He also annulled all the acts of his grandfather, Henry VII, against Florence, and by a treaty concluded at Padua resigned the latter city, with Verona and Vicenza to Venice. He refused the request of some Romans to claim the city, as belonging to him in the name of the empire, and in a treaty renounced all sovereignty over Rome, the states of the Church, Ferrara, Naples, Sicily, Sardinia and Corsica, and even took an oath not to return to Italy without the consent of the Pope. Despised by the Guelphs, detested by the Ghibellines, Charles returned to Germany, where he issued the celebrated Golden Bull (1356), the principle of which applied in the elections of the German confederation until 1806. General indignation was excited by the proposal made by the papal nuncio, with his consent, to introduce a tax, equal to the tithe of all ecclesiastical revenues, for the benefit of the Holy See. All the members of Diet opposed it; and Charles, in his anxiety to conciliate the princes of the empire, announced that he would propose to the assembly a reform of the Ger-
Charles V, Holy Roman Emperor, and King of Spain (in the latter capacity he is called Charles I): b. Ghent, 24 Feb. 1500; d. Yuste, Spain, 21 Sept. 1558. He was educated in the Netherlands under the care of William of Croy, lord of Chavreurs, who taught him history, formed him for affairs of state and from whom he acquired that gravity of manner which he retained through life. After the death of Ferdinand of Spain, his grandfather, in 1516, Charles of France, the brother of Ferdinand, succeeded the crown of Spain. The management of this kingdom was entrusted to the celebrated Cardinal Ximenes. In 1519 Charles, on the death of Maximilian, was elected emperor. He left Spain to take possession of his new dignity, for which he had to contend with Francis I, king of France. His coronation took place at Aix-la-Chapelle with extraordinary splendor. The progress of the Reformation in Germany demanded the care of the new emperor, who held a Diet at Worms. Luther, who appeared at this Diet with a safe conduct from Charles, defended his cause with energy and boldness. The Emperor kept silent; but after Luther's departure a severe edict appeared against him in his name which in truth was not intended to declare himself the defender of the Roman Catholic Church.

In a very few years the power of Charles became a source of uneasiness to most other princes of Europe. Pope Clement VII placed himself at the head of a league of the principal states of Italy, to which many others hastened; his ill-directed efforts were productive of new misfortunes. Rome was taken by storm by the troops of the Constable of Bourbon, sacked, and the Pope himself made prisoner. Charles publicly disavowed the proceedings of the Constable, went into mourning with his court and carried his hypocrisy so far as to order prayers for the deliverance of the Pope. Henry VIII of England now allied himself with the French monarch against Charles, who accused Francis of having broken his word. The war was terminated in 1529 by the Treaty of Cambray, of which the conditions were favorable to the Emperor. Charles soon after left Spain, and was crowned in Bologna as king of Lombardy and Roman emperor. In 1530 he seemed desirous, at the Diet of Augsburg, to reconcile the various parties; but not succeeding, issued a decree against the Protestants, which they met by the Schmalkaldic League. Notwithstanding his undertakings in favor of the Roman Catholic religion, Charles always practised moderation toward the Protestants whenever his interest left room for toleration. Nor did the Protestant princes hesitate to furnish their contingents when he was assembling an army against them. Against the Turks. Having compelled Solyman to retreat, he undertook in 1535 an expedition against Tunis, reinstated the Dey, and released 20,000 Christian slaves. This success added to the character of the emperor, which gave him still more influence in Christendom, and promoted his political projects.

The policy of Charles was to reconcile the two great religious parties, and with this end in view he alternately threatened and courted the Protestants. After some show of negotiation, he considered the Protestant princes raised the standard of war. The Emperor declared, in 1546, the heads of the league under the ban of the empire, excited divisions among the confederates, collected an army in haste, and obtained several advantages over his enemies. John Frederick, the Elector of Saxony, was taken prisoner in the battle of Mühlberg in 1547. Charles received him sternly, and gave him over to a court-martial consisting of Italians and Spaniards, under the presidency of Alva, which condemned him to death. The Elector saved his life only by renouncing his electorate and his hereditary estates, but remained a prisoner. Meanwhile the rest of King Frederick of Denmark, his ally, was re-established.

The emperor appeared more moderately inclined toward the vanquished party. On coming to Wittenberg he expressed surprise that the exercise of the Lutheran worship had been discontinued. On visiting the grave of Luther he said, 'I do not war with the dead; let him rest in peace; he is already before his Judge.' The Landgrave of Hesse-Cassel, one of the leaders of the Protestants, was compelled to sue for mercy. Notwithstanding his promise Charles deprived him of his crown, and after having dissolved the League of Schmalkalden the Emperor again occupied himself with the plan of uniting all religious parties, and for this purpose issued the Interim, which was as fruitless as the measures proposed by him at the Diet of Augsburg.

Neither was he successful in securing the Imperial crown for his son. Discord still agitated the public mind, and a new war broke out against him. Maurice of Saxony, whom he had invested, was unable to maintain the empire and formed a league, which was joined by Henry II, King of France, the successor of Francis.
CHARLES VI

The preparations had been made with the greatest secrecy. Charles was at Innsbruck supervising the deliberations of the Council of Trent, and meditating great plans against France and Turkey. He was expecting the aid of Maurice when this prince threw off the mask, appeared suddenly at the head of an army, and, in 1552, invaded the Tyrol while Henry II entered Lorraine. Charles was nearly surprised in Innsbruck. Maurice abandoned the Imperial castle to plunder, the Council of Trent was dissolved, and the Protestants dictated the conditions of the Treaty of Passau in 1552. Charles was not more successful in Lorraine. He was unable to recover Metz, which was defended by the Duke of Guise. In Italy he lost Siena by a revolt. He withdrew to Brussels, where, hard pressed by his enemies, he became gloomy and dejected, and for several months concealed himself from the sight of every one, so that the report of his death was spread through Europe. His last exertions were directed against France, with whom he connived to check his assaults. The Diet of Augsburg in 1555 confirmed the Treaty of Passau, and gave the Protestants equal rights with the Roman Catholics.

Charles, seeing all his plans frustrated and the number of his enemies increasing, resolved to transfer his hereditary states to his son Philip. Having convened the Estates of the Low Countries at Louvain, in 1555, he explained to them the grounds of his resolution, asserted that he had sacrificed himself for the interests of religion and of his subjects, but that his strength was inadequate to further exertion, and that he should devote to God the remainder of his days. At that time Charles conferred on Philip the sovereignty of the Netherlands alone. On 15 Jan. 1556 he conferred upon him, in like manner, the Spanish kingdoms and Sicily, reserving for himself merely a pension of 100,000 ducats. He selected for his residence the monastery of Saint Justus, near Plasencia in Estremadura, and here he exchanged sovereignty, dominion, and pomp for the quiet and solitude of a cloister. His amusements were confined to short rides, to the cultivation of a garden and to mechanical labors. He attended religious services in a simple and devout manner, and by degrees fell into such dejection that his faculties seemed almost impaired. He renounced the most innocent pleasures, and observed the rules of the monastic life in all their rigour.

Charles had a noble air and refined manners. He spoke little, and smiled seldom. Firm of purpose; slow to decide; prompt to execute; equally rich in resources and sagacious in the choice of them; gifted with a cool judgment, and always master of himself, circumstances developed his genius and made him great. Although he did not scruple to break his promises, he imposed, by the semblance of magnanimity and sincerity, even on those who had already experienced his perfidy. An acute judge of men, he knew how to use them for his purposes. In misfortune he appears greater than in prosperity. He protected and encouraged the arts and sciences, and is said to have picked up a brush which had fallen from the hand of Titian with the words, "If not beloved by an emperor, " By his wife Eleonora, daughter of Emanuel, King of Portugal, he had one son, afterward Philip II, and two daughters. He had also several natural children. No monster ever exercised a decided influence over him. He was indefatigable in business, weighing the reasons on both sides of every case with great minuteness. Wherever he was he imitated the customs of the country, and won the favor of all the peoples with whom he came into contact except the Germans. Consult Gachard, 'Correspondance de Charles Quint' (1859); 'Lives' by N. Robertson (Prescott's ed., 2 vols., London 1876); Armstrong (2 vols., London, with bibliographical introduction 1902); and Guintran (1865); Stirling, Maxwell, 'Cloister Life of the Emperor Charles V' (1852); Guintran, 'Kaiser Karl V' (1865).

CHARLES VI, Holy Roman Emperor, the 2d son of the Emperor Leopold I; b. 1 Oct. 1665; d. 20 Oct. 1740. His father destined him for the Spanish throne. The last prince of the house of Hapsburg, Charles II, disregarding the house of Austria, whose right to the Spanish throne was undoubted, according to the law of inheritance by descent, had by will made Philip, Duke of Anjou, second grandson of Louis XIV, heir to the Spanish throne. Accordingly, on the death of Charles II, Nov. 1700, Philip took possession of the vacant kingdom. England and Holland united against him, and this alliance was soon joined by Prussia, Portugal and Savoy. Charles was proclaimed king of Spain at Vienna, in 1703, and proceeded by way of Holland to England, from whence, in January 1704, he set sail with 12,000 men for Spain, which was almost wholly occupied by the French, and landed in Catalonia. He succeeded in making himself master of Barcelona; but was soon besieged there by his rival, Philip V. At the head of a garrison of hardly 2,000 men, he made the most obstinate resistance, till the long-expected English fleet appeared, which compelled the French speedily to raise the siege. This event was followed by alternate reverses and successes. Twice Charles reached Madrid, and twice he was driven from the city. The first time, in 1706, he caused himself to be proclaimed king in the capital under the name of Charles III. He had been a second time compelled to fly from the walls of Madrid when he was informed of the death of his brother Joseph I. According to the will of Leopold, this event placed the double crown of Charles V on his head; to his claims on Spain it added the more certain possession of the Austrian dominions. But the allies did not like to see such power united in the same hands. Charles returned to Germany, and on his arrival learned that, at Eugene's suggestion, he had also been elected emperor. It took place at Frankfort, in December 1711; and in the following year he received, at Presburg, the crown of Hungary. At the same time he still retained the empty title of King of Spain. He now prosecuted, under the conduct of Eugene, the Spanish war of succession; the allies concluded a peace with France at Utrecht in 1713, in spite of all the efforts of the Emperor to prevent it. He was obliged, in the following year, to sign the Treaty of Rastadt. This treaty secured him in the possession of Milan, Mantua, Sardinia and the Netherlands on certain conditions to his dominions to his daughter, Maria Theresa, in
default of male heirs, Charles strove to induce the powers to guarantee the Pragmatic Sanction, which settled the succession in her favor. He succeeded in gaining the concurrence of all the European powers. The reign of his princess was marked with perpetual agitations. The succession to the Polish throne, after the death of Augustus II, in 1733, disturbed the peace of Europe. Charles, with Russia, supported the cause of the Poles; but France and Spain declared themselves for Stanislaus Leszczynski. From this arose a war, which terminated, in 1735, in the loss of the Two Sicilies and a part of the duchy of Milan. Austria received Tuscany in exchange for Lorraine, and obtained Parma. Hardly had Charles finished this war, when his alliance with Russia involved him anew in a war with the Turks. In 1737 his troops invaded Serbia without any declaration of war, and occupied Nissa. But the Turks renewed their attacks with a continuously augmented force, and obliged the Emperor, after three unsuccessful campaigns, to cede to them by the Peace of Belgrade, in 1739, Wallachia and the Austrian part of Serbia, with Belgrade. History of the House of Austria (Vol. III, 3d ed., London 1873).

CHARLES VII (properly CHARLES ALBERT). Holy Roman Emperor: b. Brussels, 6 Aug. 1697; d. Munich, 20 Jan. 1745. He was the son of Maximilian Emanuel, Elector of Bavaria, then governor of the Spanish Netherlands. His youth was spent at the Imperial court, and in the war against the Turks he commanded the army of auxiliaries sent by his father. In 1722 he married the daughter of Joseph I, having previously renounced with mental reservations all rights which this marriage might give him to the succession to the throne of Austria. In 1726 he succeeded his father as Elector of Bavaria. He was one of the princes who protested against the Pragmatic Sanction, guaranteed in 1732 by the Diet of Ratisbon, and in consequence concluded a defensive alliance with Saxony. After the death of Charles VI, in 1740, he refused to acknowledge Maria Theresa as his heiress, founding his own claims to the succession on a testament of Ferdinand I. He appointed in the title of France with a considerable force. In 1741 he was recognized at Lintz as Archduke of Austria. The obstacles thrown in his way by Cardinal Fleury, who wished not to dismember the Austrian monarchy, as well as the want of artillery and ammunition, prevented him from getting possession of Vienna. On the other hand he took Prague, where he was crowned and proclaimed king of Bohemia. In 1742 he was unanimously elected king of the Romans: he made a solemn entry into Frankfort, and was crowned by his brother, the Prince of Cologne. But fortune soon deserted him. The armies of Maria Theresa reconquered all Upper Austria, and overwhelmed Bavaria. It was necessary to abandon Bohemia. Charles fled to Frankfort, and convoked a diet, when an attack of the king of Prussia on Maria Theresa allowed him to return to Munich in 1744. He was succeeded in the electorate by his son Maximilian Joseph, and in 1745 the Imperial dignity by Francis I, husband of Maria Theresa.

CHARLES I, King of Portugal: b. 28 Sept. 1633; assassinated, Lisbon, 1 Feb. 1908. He was the son of Luiz I and of Maria, the daughter of Victor Emmanuel II of Italy, and came to the throne 19 Oct. 1889. After that event a powerful republican element made itself felt in Portugal. The bitter rivalry between the Duke of Braganza, was assassinated along with his father, who was succeeded by his second son, Manoel.

CHARLES I (of HOHENZOLLERN-SIGMARIEN). King of Rumania; b. Sigmaringen, Germany, 20 April 1839; d. 10 Oct. 1914. The second son of Prince Karl of Hohenzollern, he entered the Prussian army early and held the rank of lieutenant of dragoons when, at the suggestion of the Prussian Ambassador, he was elected prince of Rumania 10 May 1866. He took the field with the Rumanian army as an ally of Russia in the Russo-Turkish War of 1877, and bore a distinguished part at the siege of Plevna. He subsequently proclaimed Rumania independent of Turkey and was crowned king 22 May 1881. He married in 1865 Princess Elizabeth von Neuwied, a "Sylva" (q.v.) well known as an author. On the death of their only child, the succession was settled in 1889 on Prince Ferdinand of Hohenzollern-Sigmaringen, a nephew of the King. King Charles during his reign did a great deal for the political and industrial interests of his people.

CHARLES I, King of Spain. See Charles V, Holy Roman Emperor.

CHARLES II, King of Spain: b. 11 Nov. 1661; d. 1 Nov. 1700. He succeeded his father, Philip IV, in 1665. In this reign, Spain, which for nearly three centuries had held the foremost rank in Europe as a great military nation, began rapidly to decline both in influence and glory, but such was the prestige attached to its name and past history, that it had long become powerless before it ceased to be respected. The King was a degenerate, feeble-minded and inert, a puppet alternately in the hands of the French and Austrian factions at his courts. Charles died in 1700, bequeathing his throne to the Duke d'Anjou, grandson of Louis XIV of France, an act which led to the calamitous "War of the Spanish Succession."

CHARLES IV, King of Spain: b. Naples, 12 Nov. 1748; d. there, 20 Jan. 1819. He came to Madrid in 1759, when his father, Charles III, after the death of his brother, Ferdinand VI, ascended the Spanish throne, and succeeded him 13 Dec. 1788. He married the Princess of Parma, Louisa Maria. Too imbecile in mind to govern, he was always ruled by his wife and his ministers, among whom Godoy, his wife's paramour, had unbounded influence over him. He had a due sense of his sanctity as an anointed king; and it is not known that he ever permitted to be revealed to himself the absurd position in which he was placed by the infidelity and masterfulness of his consort. The hatred which Godoy drew on himself from the grandees of the court brought on a revolution in 1808, which enabled Napoleon to dispose of the throne the Bourbons. Charles abdicated at Aranjuez, 19 March, in favor of his son Ferdinand, who in turn was forced to abdicate by Napoleon. Charles, who had repudiated his own abdication, finally ceded, at Bayonne, his right to the throne to Napoleon, who settled on
him for life the palace of Compiègne and a pension of 6,000,000 francs. Charles after this lost all hope of being king of France and his paramour, Godoy, but subsequently exchanged this residence for Rome.

CHARLES IX, King of Sweden: b. 5 Oct. 1550; d. Nyköping, 30 Oct. 1611. He was the fourth son of Gustavus Vasa and was chosen king in 1604. He fostered trade and mining, and established the University of Gothenburg, at the same time that he was subduing the turbulent nobles of the realm and forming alliances with the Protestant princes of Germany.

CHARLES X, King of Sweden: b. Nyköping, 8 Nov. 1622; d. Gothenburg 13 Feb. 1660. He succeeded his cousin, Christina, in 1654, and by his prudence and valor considerably extended his domains, wresting Livonia from the Poles, and several provinces from Denmark. After a short reign of six years, in which he was constantly engaged in war, sometimes meeting with severe reverses, but on the whole a considerable gainer, he was fatally attacked with an epidemic then raging among his troops, and was succeeded by his son Charles. Consult Bain, R. N., 'Scandinavia' (London 1905); Hanman, E., 'La Guerre du nord et la paix d'Oliva' (Papin 1893).

CHARLES XI, King of Sweden: b. 4 Nov. 1655; d. Stockholm, 15 April 1697. He succeeded to the throne at five years of age, but the country was governed by a regency till 1672. He then put in force a system of tyrannous exaction and arbitrary oppression, by which he in a short time made himself absolute. Having once become independent of the state, he studied to appease the people by ruling with justice and impartiality. In his wars—an evil legacy from the regency—he was unsuccessful, and lost much of his father's territorial acquisitions. He founded the University of Lund, reorganized the army and navy and strengthened the finances of the country.

CHARLES XII, King of Sweden: b. Stockholm, 27 June 1682; d. Frederikshald, 11 Dec. 1718. On the death of his father, in 1697, he was declared of age and while the young King showed but little inclination for business: he loved violent bodily exercises, and especially bear hunting. To his jealous neighbors this seemed a favorable time to humble the pride of Sweden. Frederick IV of Denmark, Augustus II of Poland and the Czar Peter I of Russia therefore concluded an alliance which resulted in the Great Northern War (1699). The Danish troops first invaded the territory of the Duke of Holstein-Gottorp. Charles proposed in the council of state the most energetic measures against Denmark, the result of which was the discomfiture of the Danes; thus ended the first enterprise of Charles XII, in which he exhibited as much intelligence and courage as disinterestedness. He adopted at this time that severe and temperate mode of life to which he ever remained true, avoiding relaxation and useless amusements and living on the simplest fare.

After thus checking Denmark the attacks of Augustus and Peter remained to be repelled. The former was besieging Riga, the latter moving on Narva, and was situated about the Gulf of Finland. Without returning to his capital—which in fact he never revisited—Charles caused 20,000 men to be transported to Livonia to meet the Russians, whom he found 80,000 strong in a fortified camp under the walls of Narva. On 30 Nov. 1700, between 8,000 and 10,000 Swedes placed themselves in order of battle, under the fire of the Russians, and the engagement began. In less than a quarter of an hour the Russian camp was taken by storm. Thirty thousand Russians perished on the field or threw themselves into the Narva; the rest were taken prisoners or dispersed. After this victory Charles crossed the Dvina, attacked the interments of the Saxons and gained a decisive victory.

The war continued: the Swedes gained a brilliant victory at Clissa; in 1703 all Poland was in possession of the conquerors. At Altranstadt Charles I dictated the conditions of peace in 1706.

In September 1707 the Swedes left Saxony on a Quixotic scheme of conquest. They were 43,000 strong, well clothed, well disciplined and enriched by the contributions imposed on the conquered. Six thousand were lost in the protection of the king of Poland; with the rest of the army Charles took the shortest route to Moscow. But having reached the region of Smolensk he altered his plan at the suggestion of the Cossack hetman, Mazeppa, and proceeded to the Ukraine, in the hope that the Cossacks would join him. But Peter laid waste their country, and the proscribed Mazeppa could not procure the promised aid. The difficult marches, the want of provisions, the perpetual attacks of the enemy and the severe cold, weakened Charles' army in an uncommon degree. Poltava, abundantly furnished with stores, was about to be invested when Peter appeared with 70,000 men. Charles in reconnoitering was dangerously wounded in the thigh; consequently, in the battle of 8 July 1709, which changed the fortunes of the Swedish hero and the fate of the North, he was obliged to issue his commands from a litter without being able to encourage his soldiers by his presence. The Emperor, with superior force and the enemy obtained a complete victory. He himself, together with Mazeppa, fled with a small guard, and finally found refuge and an honorable reception at Bender, in the Turkish territory. The regency in Stockholm took measures for the defense of the Swedish territory. Charles meanwhile negotiated at Bender with the Porte; succeeded in removing the ministers who were opposed to him, and induced the Turks to declare war against Russia. The armies met on the banks of the river Pruth, 1 July 1711. Peter seemed nearly ruined when the courage and prudence of his wife produced a peace, in which the interests of Charles were entirely neglected. This monarch, however, projected new plans, and through his agents solicited of the friendly auxiliaries against his enemies. But the Russian agents were no less active to prepossess the Porte against him, pretending that Charles designed to make himself, in the person of Stanislaus, the actual master of Poland, in order from thence, in conjunction with the German Empire, to attack the Turks. The seraskier of Bender was ordered to compel the King
to depart, and in case he refused, to bring him, living or dead, to Adrianople. Little used to obey the will of another and apprehensive of being given up to his enemies, Charles resolved to defy the forces of the Porte with the 200 or 300 men of which his retinue consisted, and, sword in hand, to await his fate. When his residence at Varnitza, near Bender, was attacked by the Turks he defended it against a whole army, and yielded only step by step. The house took fire, and he was about to abandon it when it became entangled, he fell and was taken prisoner. The Turks now removed their prisoner from Bender to Demotika, near Adrianople. Escaping in disguise he reached Stralsund on the night of 22 Nov. 1714. A combined army of Danes, Saxons, Russians and Prussians immediately invested Stralsund. Charles, during the defense, performed miracles of bravery. But being obliged to surrender the fortress, on 23 Dec. 1715, he proceeded to Lund, in Schonen, and took measures to secure the coast. He then attacked Norway. The Baron of Gortz, whose bold but intelligent plans were adapted to the situation of the Swedish monarchy, was at that time his confidential friend. His advice was that Charles should make the greatest concessions to the interests of Sweden by important concessions, make himself master of Norway, and from there win land in Scotland, in order to dethrone George I, who had declared himself against Charles. Gortz discovered resources for prosecuting the war, and entered into negotiations at Aland with the pleitotinaires of the Czar. Peter was already gaining and a part of Norway conquered; the fortunes of Sweden seemed to assume a favorable aspect; Charles was besieging Frederikshald, when, on 30 Nov. 1718, as he was in the trenches, leaning against the parapet and examining the workmen, he was struck on the head by a cannon-ball.

At Charles' death Sweden sank from the rank of a leading power. If that King knew when to make war, he did not know when to make peace. The Great Northern War passed through three stages—a war of defense on the part of Sweden, then a war of aggression and finally a struggle for its existence as a nation. In his last years Charles formed great plans for the improvement of its navy, trade and commerce. Firmness, valor and love of justice were the grand features of Charles' character, but were disfigured by rashness and obstinacy. These defects in his character earned him the nickname of the "Madman of the North." Consult Bain, R. N., 'Charles XII and the Collapse of the Swedish Empire.' (London 1895).

CHARLES XII. The History of a famous work by Voltaire, published in 1731. The eight books, and is considered its author's historical masterpiece.

CHARLES XIII. King of Sweden: b. 7 Oct. 1748; d. 5 Feb. 1818. He was the second son of King Adolphus Frederick. Appointed at his birth high-admiral of Sweden, his education was directed chiefly to the learning of naval tactics. In 1770 he commenced the tour of the Baltic, and the following year was recalled him to Sweden, where he took an important part in the revolution of 1772. His brother, Gustavus III, appointed him governor-general of Stockholm and Duke of Sundernland. In the war with Russia, in 1788, he commanded the fleet, defeated the Russians in the Gulf of Finland, and, in the most dangerous season of the year, brought back his fleet in safety to the harbor of Carlshamn, after which he was appointed governor-general of Finland. After the murder of Gustavus III, in 1792, he was placed at the head of the regency, and, happily for Sweden, preserved peace with other nations, while he united with Denmark for the defense of Sweden in the northern seas. In 1796 he resigned the government to Gustavus Adolphus IV, who had become of age, and retired to his castle of Rosersberg. He did not again appear in public life till a revolution hurled Gustavus Adolphus IV, in 1809, from the throne, and placed Charles at the head of the state, as administrator of the realm, and some months afterward, 20 June 1809, as king of Sweden, at a very critical period. The peace with Russia, at Frederikshamn, 17 Sept. 1809, gave the country the tranquility necessary for repairing its heavy losses and for completing the fabric of the constitution. He had already adopted Prince Christian of Holstein-Sonderburg-Augustenburg as his successor, and after his death, Marshal Bernadotte, who was elected by the Estates, in August 1810, to take the place of the Prince. On him he bestowed his entire confidence. His prudent conduct in the war between France and Russia in 1812 procured Sweden an indemnification for Finland by the acquisition of Norway, 4 Nov. 1814.

CHARLES XIV, King of Sweden. See Bernadotte, Jean Baptiste Jules.

CHARLES XV (Louis Eugène), King of Sweden and Norway: b. 3 May 1826; d. 18 Sept. 1872. He was the son of Oscar I, whom he succeeded 8 July 1859. He is well known for his liberal and popular rule, his reforms in the communal, ecclesiastical and criminal branches of the law. In his reign the Storting, or Parliament, was reconstituted and given a more representative character. He was also the author of a book of poems. Consult Booth-Holmberg, 'Carl V, somenskind man, konung och Roustnär.' (Stockholm 1891).

CHARLES, Elizabth Rundle, English writer of religious stories: b. Tavistock, 2 Jan. 1828; d. London, 28 March 1896. She was married to Andrew Charles in 1851. Her books have been widely popular in England and America, the most famous of them being 'The Chronicles of the Schönberg-Cotta Family.' (1863). Among her other works are 'Martys of Spain.' (1877); 'Diary of Mrs. Kitty Trevelyan.' (1865); 'The Draytons and Daventons.' (1867); 'Winifred Bertram.' (1866); 'Against the Stream.' (1873); 'The Bertram Family.' (1876); 'Lapsed But Not Lost.' (1877).

CHARLES, Jacques Alexandre César, French scientist: b. Beaugency, France, 12 Nov. 1746; d. 7 April 1823. He lectured on physical science in Paris, made the first balloon using hydrogen gas and in 1783 made with M. Robert the first ascent ever made in a balloon. A height of 7,000 feet was recorded. Among his other inventions are the thermometric hydrometer and a number of optical instruments. In 1787, he anticipated Gay-Lussac's law of dilatation of gases.
CHARLES,—CHARLES THE BOLD
