COMMERCIAL OF THE WORLD, INTERNATIONAL
COMMERCIAL GEOGRAPHY

BAIN, CHARLES W., M.A.*
Professor of Ancient Languages and Literatures,
University of South Carolina.
CLASSICAL LITERATURE

BOOCHER, ROSE, A.B.
Editorial Staff of the Americana

BOYNTON, HENRY VAN NESS*
Brigadier-General, U. S. A.
CIVIL WAR IN AMERICA
(Revised by Irving E. Rines)

BREWER, WILLIAM T., A.M.
Professor of English, Columbia University

COLERIDGE, SAMUEL TAYLOR

BROOKE, C. F. TUCKER, M.A., Litt.B.
Assistant Professor of English, Yale University

BROOKE, C. F. TUCKER, M.A., Litt.B.
Assistant Professor of English, Yale University

BROOKE, C. F. TUCKER, M.A., Litt.B.
Assistant Professor of English, Yale University

BROPHY, TRUMAN W., M.D., D.D.S.
Chicago, Ill.

CLEFT PALATE

BUELL, MARCUS D., S.T.B., D.D.
Professor of New Testament Greek and Exegesis,
School of Theology, Boston University

COLOSSIANS, EPISTLE TO THE-

CAIRNS, WILLIAM B., Ph.D.
Associate Professor of American Literature,
University of Wisconsin

COMMENORATION ODE

CALLAHAN, JAMES M., Ph.D.
Professor of History and Political Science, West Virginia University

CONFEDERATE STATES OF AMERICA,
RECOGNITION OF THE
CONSERVATION OF NATURAL RESOURCES

CANFIELD, ARTHUR G., Ph.D.
Professor of Romance Languages, University of Michigan

CONTES BLEUS

CARNEY, SIDNEY H., Jr., M.D.
Historian, Society of Colonial Wars, New York

CARLY, WILLIAM N. C., M.A., L.H.D.
Librarian, Newberry Library, Chicago

CLEVELAND, GROVER

CARMAN, EZRA A.*
Brigadier-General, U. S. A.

CLOYD'S MOUNTAIN, BATTLE OF
COLD HARBOR, BATTLE OF
CORINTH, ADVANCE ON AND BATTLE OF

CARVER, THOMAS N., Ph.D., LL.D.
Professor of Political Economy, Harvard University

CONSUMPTION (ECONOMIC)

COCHRANE, CHARLES H.
Founder of New York Master Printers' Association,
Author of "Modern Industrial Progress"

COLOR PHOTOGRAPHY
COLOR PRINTING
COMPOSING-MACHINES

CONVEYER

COCKRELL, L. M.*
Late United States Senator from Missouri

CONGRESS OF THE UNITED STATES
(Revised by members of the staff)

CORNHER, JOHN HUBERT, LL.B.
Editorial Staff of the Americana

COLOMBIA

CONFUCIUS

COUNBE, CLEMENT W.
Technical Art Expert, New York

COLORS IN ART AND SYMBOLISM

CORONA

COWLES, ALFRED A.*
Vice-President of The American Brass Company

COPPER AND BRASS INDUSTRY, THE

CROTON, JAMES E., Ph.D., LL.D.
Professor of Logic and Metaphysics, Cornell University

CIVIL LIST, a term signifying in the United States, (1) a list of the entire expenses of the civil government, (2) the revenue appropriated to support civil government, (3) an officer of the civil government who are paid from the public treasury.

In England the meaning of the term formerly represented the whole expenses of the government with the exception of those of the army, navy and other military departments. It is now limited to expenses proper to the maintenance of the household of the sovereign. It was once a principle in England, as also among Teutonic nations, that the monarch was to pay all the expenses of government, even including those of the army, from the possessions of the Crown, the domains, and that the subjects were not obliged to contribute anything more than they voluntarily engaged to. From this principle, which is proved by the history of the origin of the domains, it appears that the Crown lands in general cannot be considered the private property of the ruling family. On the contrary, they are, in general, the property of the state and have been given to the prince to defray the expenses of government. Until the Restoration the whole expenses of the government continued to be defrayed out of the royal revenue. The first Parliament of Charles II. fixed on £1,200,000 as the ordinary revenue of the king in time of peace. For this they provided by taxation, which ultimately produced more than the amount of the grant. The same taxes were continued during the reign of James, and produced on an average £1,500,000, in addition to which he received extraordinary grants. At the commencement of the reign of William, the Commons made still further restriction on the royal control of the revenue. They voted £1,200,000 as the revenue of the Crown in time of peace, one-half of which was appropriated to the maintenance of the king's government and the royal family, the other to public and contingent expenditure. The outbreak of war prevented this arrangement from being strictly carried out, but the Commons maintained the principle of separating the regular and domestic expenses of the king from the public expenditure, and establishing a systematic and periodical control over the latter. The amount actually voted to the king for life in 1697 was £700,000 and the same vote was made at the commencement of the reigns of Queen Anne and George I. On the accession of George II. £830,000 was voted. Besides the regular vote, grants had been frequently made to defray debts incurred in the expenditure of the sovereign. On the accession of George III. the civil list was fixed at £900,000, but instead of being paid out of the appropriated revenues in which the Crown lands were included, these were surrendered, and it was charged on the ordinary taxation. Large extra grants had to be made during this reign. At the commencement of the reign of Victoria a civil list of £385,000 per annum was settled on her majesty for life for the support of the royal household, and the maintenance of the dignity of the Crown, £60,000 being allotted to the privy purse. In 1901 the civil list of the king of England was raised to £470,000; £110,000 of this being for the privy purse.

CIVIL PROCEDURE. See Court.

CIVIL RIGHTS BILLS. 1. An act to carry out the intention of the 13th Amendment, prohibiting slavery—which it was alleged the Southern States were attempting to nullify by public and private action—and secure the political equality of the descendants of the slaves with the whites. It provided that all persons born in the United States and not subject to any foreign power, excluding Indians not taxed, were citizens of the United States and entitled to the same immunities, in respect of race or color, or previous condition of servitude, except as punishment for crime; punished as a misdemeanor any deprivation of such right under color of State law; transferred cognizance of such cases from the State to the Federal courts; entrusted the execution of the act to national officers only, and fined them for refusal; punished resistance to the officers; provided for fees; empowered the President to send officers to any district where the act was likely to be violated, and to call out the national forces to execute it; but permitted an appeal to the Supreme Court. Significantly, it employed somewhat the same means to emancipate the negro which the Fugitive Slave Law did to re-enslave him, especially in overriding or supplanting State officers; and for the same reason—they could not be trusted in the sections where it was to be enforced. The bill was passed in the Senate 2 Feb. 1866, 33 to 12; in the House 13 March, 111 to 38. Andrew Johnson vetoed it 27 March, and it was passed by the requisite two-thirds over his veto, in the Senate 6 April and in the House 9 April. Even so, the debate had brought out
two grave doubts of its constitutionality; that the protection of civil rights under the Constitution belonged not to Congress but to the States, and that under the Dred Scott decision (which stood as a precedent for the Supreme Court until reversed), negros could not become citizens even by emancipation. This led to the proposal of the 14th Amendment (see Constitution, Amendments), which passed both Houses in June.

An act extending the foregoing to the exclusion of negroes from juries and from equal privileges in schools, public conveyances, hotels, theatres, etc. This had been persistently urged by Charles Sumner, for some years before his death; was offered as an amendment to the Amnesty Bill of 1872, and lost by only one vote; again introduced into the House in December, and referred to a committee; on 30 April 1874, a few weeks after Sumner's death, it passed the Senate, but the House rejected it; it finally passed both Houses in February 1875 and was signed 1 March. For an account of its partial invalidation, see next article.

CIVIL RIGHTS CASES. These were five test cases in the United States Supreme Court of the constitutionality of sections 1 and 2 of the second Civil Rights Bill, described above; decided in one group, October term, 1893, and reported and cited under the title above. All came up from Circuit Courts; three on certificates of division of opinion, two on appeal for error; and while the decision on the act was adverse to all, and the first three were found for defendant, the error was admitted and the decision given for plaintiff in the last two. Two of them were for hotel discrimination, two for theatre discrimination, one for railroad discrimination; the first four submitted 7 Nov. 1882, the last one 29 March 1883. The cases were: U. S. v. Murray Stanley, from the Kansas district: hotel case. U. S. v. Michael Rogers, from the Colorado district: refusal of a negro to sit in the dress circle of Maguire's Theatre, San Francisco. U. S. v. Samuel Nichols, Western Missouri district: hotel case. U. S. v. Samuel D. Singleton, southern New York district: refusal to allow the negro a seat in the Grand Opera House, New York. Richard A. Robinson and Sallie A. Robinson, his wife, against the Memphis and Charleston Railroad Company: refusal to allow the wife a seat in the ladies' car from Grand Junction, Tenn., to Lynchburg, Va. The decision of the court was given by Justice Bradley, Harlan dissenting. The terms of the act are that

All persons within the jurisdiction of the United States shall be entitled to all the rights and equal enjoyment of the accommodations, etc., of inns, public conveyances by land or water, theatres and other places of public amusement, and that laws must be 'applicable alike to citizens of every race and color, regardless of previous condition of servitude.' The second section affixes penalties. The court held that these two sections are unconstitutional as applied to the States, not being founded on either the 13th or 14th Amendment (see Constitution, Amendments). It holds slavery, which is not constituted by a denial of civil equality; the latter is prohibitory merely on the States, not on individuals, and it was not alleged that the discrimination was made under State laws. Congressional legislation for enforcing the latter amendment is not direct legislation, but corrective, counteracting or redressing State legislation of a sort forbidden by the amendment. For private injury from discrimination, the remedy must be sought in State laws—to withdraw it from which was the precise object of the act.

CIVIL SERVICE, that branch of the public service which includes all executive offices not connected with the army or navy. The term is not applied to the direct representatives of the people, as the President of the United States or the governor of a State. Owing to the complexity of modern government and the variety of its functions, the civil service has become very complex, and the problem of its effective administration a difficult one.

In Great Britain the service comprises various departments, such as the home office, the foreign office, the war office, admiralty, post office, customs, excise, etc. Formerly, appointments to the civil service in Great Britain were the gift of the executive government, and were obtained by influence, while the bestowal of them was used as a means of gaining parliamentary support on behalf of the government. Those appointed were temporary and were apt to show whether they were competent or not. In 1855 examinations were instituted to test the efficiency of all candidates for subordinate posts; but for some time candidates were specially nominated for these posts. As more than one might be nominated for a post, competition was gradually introduced, and in 1870, it was directed that appointments in the civil service should (with certain exceptions) be filled by open competition, as was already the case with appointments in the Indian civil service. The appointments to what are known as clerkships in the civil service are divided into two classes or divisions, with different age limits and salaries. In the higher division, while the examinations are open and competitive, the salaries are much better; the two divisions are kept quite distinct; and it is rare for a person to be promoted from the lower to the higher. For a number of appointments open to competition, a special certificate, the 'clerkship certificates,' are necessary, while there is also a special limit of age. A large number of subordinate appointments in the postal and telegraph service, the excise, etc., are on a different footing from the clerkships just mentioned and are not so well paid. All persons who have served in an established capacity in the permanent civil service are given a pension, varying with the length of service, at the time of retirement. The total expenditure of the civil service of Great Britain is about $90,000,000.

In the United States the Constitution provides that the President, 'with the advice and consent of the Senate,' shall appoint all officers of the United States whose appointments are not otherwise provided for by the Constitution. This gives the chief executive power to choose the heads of departments, as well as their subordinates. In the separate States the appointive power of the chief executive is much more limited. The heads of State departments such as the attorney-general and comptroller, etc., are elected by the people, and usually have the constitutional right to select most of their own subordinates. The governor
therefore appoints only his own secretaries, etc., members of commissions, heads of bureaus and the like. With the development of party government in the United States, the patronage placed in the raw hands of the officials through their power of appointment has led to the giving of offices as a reward for party service (the spoils system) and to considerable inefficiency and unnecessary expense in public administration. A reform is being brought about by the appointment of officials according to merit in public examinations. (See Civil Service Reform). On 30 June 1915 the civil service positions under the Federal government numbered 454,116, of which 9,692 were appointed by the President. To these may be added 28,605 positions under the civil government of the Panama Canal Zone, making a total of 482,721 positions in the government service.

CIVIL SERVICE REFORM, the improvement of the civil service in methods of appointment, rules of conduct, etc.; in the United States, the movement for the appointment of public servants according to their fitness for their work, rather than to their services to the party in power. In the year 1835 a debate took place in the Senate of the United States on the condition of the civil service, and especially on the abuse of the power of appointment and removal to serve party ends instead of public ends. Among the senators who took part in the debate were the three whom history has judged the strongest in that famous body, Daniel Webster of Massachusetts, Henry Clay of Kentucky and John C. Calhoun of South Carolina. Differing widely in their views of party policy and rivals in ambition, they were of one mind as to the true nature of the public service and as to the errors and evils that had crept into it. Mr. Webster, then in the prime of his young manhood, had already won the title of the "Great Ex- pounder of the Constitution." He thus stated the idea in which the others heartily joined: "The theory of our institutions is plain; it is that government is an agency created for the good of the nation, and that the office is the agent and servant of the people. Offices are created, not for the benefit of those who are to fill them, but for the public convenience." There is no doubt that this is indeed the true theory of our institutions. It is to be found in all the early writings of the men who formed the government. It is the basis of the Declaration of Independence, that "governments are instituted among men" to secure the rights of "the governed" from whose consent "they derive their just powers." When our national government was founded it was the only one in which offices were not a privilege, but a trust imposed by the choice of the people and for their sole interest. Neither birth nor rank nor wealth gave any title to them. Each of the men who held them was intended to be, in the words of Webster, "the agent and the servant of the people." The party had grown out of the needs of the American people, and fitted them closely. As colonists they had had to work and fight hard for the right to live and the means to live as free men in a wild land, far from the homes of their fathers, amid many perils and hardships. There was no ruling class among them. To attend to the common business of each little settlement, they were led to choose among their own number the agents best fitted for the task. These offices of these days were, as in the towns of New England they still are, "select-men," "trustees." The name shows what was expected of them, and what was their title to employment. As the towns were grouped in counties and the counties in States, the public business grew more complex and required a larger number of agents with different duties and powers, but the idea held. They were still agents, selected men, trustees. From the most modest unpaid village or town officer to the President of the United States, the commander-in-chief of the army and navy of the nation and its representative in the eyes of the world, no man in the public service in this country is anything but the agent, the trustee of the people.

One result of the growth of the public business has been that only a small part of the agents for doing this business are chosen directly by the people. Those thus chosen are entrusted with the employment or appointment of a very large number of others. The chief difference between the two classes is that those elected are expected to carry on the public business in a way that the majority of the voters are in general agreed upon. They are the choice of the majority party and, so far as the rights of all permit, they are the agents of that party. When the views and wishes of the majority change, these agents are usually changed also. But the far greater number of agents for doing the public business are appointed or employed. The duties of nearly all these are the same no matter what may be the policy of the majority party. In the national government, for instance, the main work for those in office, except the highest, is the collection and expenditure of the taxes. They are collected on goods brought into this country for sale or on goods made here for sale; in other words, customs, duties, and internal revenue taxes. Parties differ widely as to which class of taxes should be the highest. But high the custom duties should be. But all parties agree that the taxes of all sorts should be collected according to law honestly and fairly, that the money should be carefully accounted for and none of it stolen or wasted. Agents for this purpose need to be good business men of character and ability; they do not need to be of one party or another. Again, the Post-Office Department does a great part of the business of the government. It collects mail matter of all kinds, transports it, delivers it at home or abroad, makes large payments on money orders and sells the stamps by which the cost of its work is paid. As to this work, there is no difference at all between parties and there has never been. The agents engaged in it need only to be honest and efficient. They do not need to be of one party or another. In all offices where the duties are of this sort, it is plain that those engaged in them should be selected for merit only, promoted as the service requires and removed only for failure or incapacity to do their work in the best manner.

Such a policy would answer to Webster's statement of the theory of our institutions and to the practice of the early Presidents. Wash-
CIVIL SERVICE REFORM

ington declared: "In every nomination to office I have endeavored, so far as my own knowledge extended or information could be obtained, to make fitness of character my primary object. In the first 39 years of the history of the government the six Presidents made only 112 removals. A few years later, when Webster had to define anew the true theory of the public service, a very different practice had grown up. It was frankly described in that same debate by Mr. Marcy, a senator from New York. He said: "The politicians of the United States are not so fastidious as some gentlemen are as to disclosing the principles on which they act. They see nothing wrong in the rule that to the victor belongs the spoils of the enemy." This theory is plainly the opposite of the true one. Under it elections do not merely settle the policy of the country, as to which parties may unfussily differ. They become contests for spoils as well and tend to become more and more contests for the spoils and less disputes as to principle. The spoils are the offices, the places of trust and these tend to be given not to those best fitted to perform their duties, but to those who have claims on the public service. The service is hurt by putting out tried men and putting in untried men and since the untried men are chosen for other reasons than fitness, they are apt to be poorer officers. Since they owe their employment to party favor and do not get it on their merits, they are likely to be less faithful and less honest. They are liable to be turned out at the next election and they are tempted to make all they can from their places. The offices tend to be regarded as great sources of revenue but for the benefit of those who fill them. The service tends to become poorer, less honest, more costly. Any large private business conducted in this way would surely come to disaster. So would the business of the government if it had not the pockets of the taxpayers to draw from.

The Merit System.—The merit system prevailed in the service of the United States government for about a half-century after 1830. It also prevailed in greater or less degree in the service of the several States and of the larger cities. It was not confined to any one party. All were more or less corrupted by it. The effect on the politics of the country was very bad. The pressure for public employment, always strong, became extreme. Probably the election of 1860 was as largely decided by moral conviction as any in the history of the country. Yet, one month after he took office, President Lincoln groaned under the burden of this pressure. "I wish," he wrote, in his simple phrase, "I could get time to attend to the Southern question. I think I know what is wanted and believe I could do something toward quieting the rising discontent, but the office-seekers demand all my time. I am like a man so busy letting rooms in one end of his house that he cannot stop to put out the fire that is burning in the other." In the crisis of the war for the Union he was visited by a committee of New York politicians, and he opened his address with a reference to the "awful burden of the nation's fate weighin. on the president." "Gentlemen," interrupted Mr. Lincoln, "it is not the fate of the nation that worries me most just now: it is your peaky post office." These incidents throw a strong light on the waste of time, of money and of strength imposed by the spoils system. The degradation and pollution of politics were even worse effects. The office-holders, living on the spoils of the public, did little for the public and the organization of their party, whichever it happened to be, and made the free exercise of honest preference among the voters difficult and often impossible. The scramble between factions in the party in possession became as intense as between opposing parties. In the custom house in New York, five collectors of the same party made 1,878 removals in a period of 1,565 business days and the service grew steadily worse. In 1881, Guiteau, an office-seeker from New York, where a bitter factional fight had long been raging, half-crazed with disappointed greed, assassinated President Garfield, to whom he charged his failure.

The Merit System.—This proved the turning point. At the next session of Congress bills were introduced for the establishment of the merit system and a law was passed in January 1883. It was entitled "An Act to Regulate and Improve the Civil Service of the United States, to secure appointment and promotion in the service for fitness. For this purpose appointments were to be made from those graded highest as the results of open competitive examinations, the appointments being made final only after a period of probation or trial. This system was to be extended throughout the service as fast and as far as the President should direct. When any part of the service was to be brought under the system, it must be arranged in classes by order of the President; hence the term "classified service" means, under the law, the part of the service in which the merit system is applied. Within the classified service, the examinations for appointment and for promotion are chiefly competitive; that is to say a list, called an "eligible list," is made of all applicants passing a fixed grade, in the order of their standing, and a selection is made by the appointing officer from the three highest on this list. This selection is for the period of probation or trial, six months, at the end of which term, if his conduct and capacity are satisfactory, the probationer is absolutely appointed; if not, he is discharged. Non-competitive examinations are held according to the rules laid down by the President. In these all applicants passing a fixed grade are eligible to appointment without regard to their relative standing. The rule as to probation is the same as in the other cases. The law requires that all examinations shall be practical in their character and as far as may be shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service to which they seek to be appointed. Close attention is paid to this requirement. In the first place, weight is given to the experience of the candidates in the kind of work they seek, when such experience can definitely be known. Then each class is tested as to knowledge. The chairman opened his address with a reference to the "awful burden of the nation's fate weighin. on the president." "Gentlemen," interrupted Mr. Lincoln, "it is not the fate of the nation that worries me most just now: it is your peaky post office." These incidents throw a strong
actual excellence in the performance of work counts in promotion. For places requiring special knowledge, trained examiners are employed. For instance, the examiners who set the questions and rated the answers in the case of the supervising architect were prominent architects from various parts of the country. They were able, from the records of the candidates, to test not only professional knowledge, but business capacity. In all cases the examiners are selected from those who are well informed as to the work to be done. The application of this law is to be carried out and watched by a commission, known as the United States Civil Service Commission, made up of three members, appointed by the President with the advice and consent of the Senate. This commission aids the President in the formation of the rules under the law, and, with the aid of examiners, sets and conducts the examinations. All appointing officers are required to report to it all changes in the classified service; of which the list is made by the President as well as of its own examinations and other proceedings. All officers of the service are required to aid in the performance of the duties of the commission.

One of the worst evils of the spoils system was the fact that public employees were made to pay a large fraction of their salaries to party funds, and another was that these employees were forced to work for the party in order to keep their places. Both these practices are now forbidden by law in the service of the United States. No one in the service is allowed to use his official authority or influence to coerce the political action of others. All persons in the service are forbidden to ask or receive political contributions from others in the service. Such contributions cannot be solicited in any place or building used by the government. By the rules, which have the force of law, no question can be asked of candidates for appointment as to their political or religious opinions; no disclosures of such opinions can be considered; no change of rank or pay can be made because of such opinions. Under the spoils system, the office-holder got his place from his party and was paid by his party. The law intends to put a stop to that; it holds the officer bound only to earn his pay by honest work, and free to spend it as he chooses. The law further holds him without fear of harm or hope of aid from outside, to do his duty to his employers, the whole people of the United States. It aims to put the people and those who work for them on the same footing that is maintained in honorable private business between employers and employed.

The merit system has been greatly extended since the passage of the law. Under President Arthur, who signed the law in 1883, some 16,000 places were brought within its provisions. The number is now over 120,000. While this advance has other sides to it, there has been a frequent change of party in the government of the country than in any like period in our history. Each succeeding President, until the present, has, in the discretion which the law confers on him, added to the number of places removed from the spoils system. President McKinley withdrew a considerable number of places from the merit system for reasons urged upon him by the heads of some departments. The effect has been unfortunate. President Taft, near the close of his administration, transferred all the fourth class postmasterships to the classified service. President Roosevelt increased the number by including the deputy collectors of customs and internal revenue. The merit system has been extended to the service in the Philippine Islands in a way that promises to make the work of governing there clean, efficient and fair to a degree that could hardly have been looked for. In this region the bond of trusteeship rests upon our government with a peculiar and solemn obligation. The United States have taken control of the affairs of the people of these islands as the result of a war with Spain, without the assent of the people in the first instance, and against resistance by a portion of them which was overcome by arms. It would be a sore disgrace if their affairs were not managed honestly and purely and for the interest of the governed. The merit system on the island of Puerto Rico, as well as in the Philippines, has been established there, under the general guidance of an experienced and skilled examiner from Washington. As many natives as practicable are being employed. It is still too early to judge of the final outcome, but the beginning is promising.

The chief aim of the merit system is, on the one hand, to get the best service for the government—that is, for the people—and, on the other hand, to remove from the party contests of the country the corrupting influence of the vast number of business places offered as spoils to the victors. The methods of competition and probation are not perfect, and, like all other human methods, are liable to mismanagement. But they are the best that have ever been tried, and they are very effective. The test of competitive examination is shown to be thorough and practical by the fact that only a very small number of those who pass that test are dropped after probation or trial. Another proof is the much larger amount of work done by persons so selected. During 10 years before the adoption of the merit system in the departments at Washington the number of clerks increased from 3,500 to 5,523, or 58 per cent. During 13 years after the system was adopted the number actually fell off 211, or 3 per cent, while the work of the departments had largely increased. Another proof of the efficiency of the system is the small number of changes that take place in it compared with those that take place in the branches of the service where the system is not yet applied.

The entrance examinations are held in all parts of the land, and men and women are selected for the departments at Washington with no regard whatever for their party views or the influence of politicians. This has been of great effect in laying to rest the passions bred by the Civil War, and giving to the dwellers in the South a sense of fair common rights and duties as citizens of the nation. It is a great and lasting gain.

In 1884, laws for the introduction of the merit system were enacted in New York and Massachusetts, and later laws authorize the system in the service of cities in Wisconsin and Illinois. In Massachusetts and in New York the system has made much progress and the results have been good in proportion as the
CIVIL WAR IN AMERICA

The Civil War of 1861–65 was inaugurated by the determination of seven Southern States to withdraw from the Union. (See United States—Causes of the Civil War; Efforts to Settle the Slavery Question). South Carolina led by passing an ordinance of secession 20 Dec, 1860, followed by Mississippi, 9 Jan. 1861, Florida, 10 January; Alabama, 11 January; Georgia, 19 January; Louisiana, 26 January; and Texas, 1 February. On 7 February the Choctaw Nation declared its adherence to the Confederacy. See United States—Secession; Secession in the United States.

During the autumn of 1860 and the early spring of 1861 the forts, arsenals, customhouses and other government property in those States, with few exceptions, had been seized by State troops, and large sums were voted for arming the States. Georgia leading in November 1861 by appropriating $1,000,000. Maj. Robert Anderson, a Federal officer, who held Fort Moultrie on the inner line of Charleston harbor, becoming aware of active preparations for capturing that work, withdrew, on the night of 26 December, and found himself in the centre of the harbor. This move hastened results. Immediate preparations were made for bombarding the fort. The first firing upon the flag was 9 January by the batteries erected against Fort Sumter, the inciting cause being the appearance of the Star of the West (q.v.) off the harbor. This vessel had been sent from New York with provisions for Sumter, and with the accompanying fleet withdrew without replying to the fire.

Delegates from the seceded States met at Montgomery, Ala., 4 February, and 8 February adopted a provisional government, “The Confederate States of America” (q.v.) and the next day elected Jefferson Davis of Mississippi President, and H. St. John of Georgia Vice-President of the Confederacy. See United States—The Confederacy; Confederate States of America.

On 1 March Gen. P. G. T. Beauregard, appointed by the Confederate government, was sent to Charleston and took charge of the preparations for reducing Fort Sumter. On 4 March Abraham Lincoln was inaugurated as President of the United States. On 10 April Beauregard was instructed to demand the surrender of the fort, and, in case of refusal, to reduce it. The next day Anderson received and promptly declined a demand to evacuate, and at daylight 12 April, the Confederate batteries opened upon Fort Sumter, compelling its surrender on the 14th. The expectation of a relieving fleet probably hastened this attack. See Fort Sumter.

With the news of the attack and surrender the country received President Lincoln’s proclamation calling for 75,000 volunteers, and Congress was summoned to meet on 4 July. In an instant discussion over the power to coerce States, the discussion of peace conventions and movements and all similar perplexing questions were brushed aside, and the North responded with intense enthusiasm, the predominating sentiment being the preservation of the Union. The South was equally aflame, rallying under the banner of State rights.

On 8 April President Davis had called for 20,000 volunteers, and the day following President Lincoln’s proclamation he asked for 34,000. Two days later the Confederate Congress authorized the raising of 100,000 men. Three days after the surrender of Sumter, Virginia seceded, followed 5 May by Arkansas and Tennessee, and 20 May by North Carolina, the belief being then general that a policy of coercion had been decided upon. The border States of Kentucky and Missouri were held to the Union by their loyalty, and Maryland was held at first by the direct power of the national government, and later by its own loyalty. The first two were represented in the Confederate Congress throughout the War. The movement to take Missouri into the Confederacy was
thwarted by Gen. Nathaniel Lyon, who captured Camp Jackson near Saint Louis 10 May, and on 17 June, having already taken the State capital, in a brief engagement dispersed a force which Governor Jackson had gathered at Booneville. This resulted in relieving the capital from those plotting secession. Kentucky at first declared for neutrality, but at the election for members of Congress, 20 June, it was made clear that the State was lost to the Confederacy. In May the Confederate capital was moved from Montgomery, Ala., to Richmond, Va., where troops from all parts of the Confederacy were rapidly assembling. In like manner, the Northern States were pouring troops into the national capital, and Washington soon became a vast military camp. The Union forces crossed into Virginia 24 May and encamped opposite Washington.

For a brief time Baltimore resisted the passage of troops to the capital. Four hundred Pennsylvanians reached Washington 18 April, but the 6th Massachusetts regiment was attacked in Baltimore 19 April. The 7th New York reached Washington 25 April from Annapolis, Brig.-Gen. B. F. Butler, with the 8th Massachusetts, had reached Annapolis on the 20th, and on the 22d had proceeded to the Relay House. On the night of 13 May he occupied Baltimore, and thenceforth the route to Washington was unobstructed. Harper’s Ferry (q.v.), with its arsenal and machinery for manufacturing small arms partially destroyed, was seized by the Confederates 19 April (see Shenandoah Valley). The Gosperton Navy Yard, near Norfolk, 20 April, with guns, stores, ships and machinery of immense value.

On 20 May General Butler, having been made a major-general of United States volunteers, was assigned to the command of the Department of Virginia and North Carolina, with headquarters at Fort Monroe. On 10 June he moved against a force under Gen. J. B. Magruder at Big Bethel (q.v.) and was defeated. While it was comparatively a small affair, like another about the same time at Vienna in front of Washington, both caused widespread dissatisfaction and mortification on the North. See also ROMNEY; NEW CREEK.

Under President Lincoln’s call Ohio promptly organized 13 regiments, and 23 April Capt. George B. McClellan was appointed major-general of Ohio militia. On 14 May he was commissioned major-general in the regular army and assigned to the Department of the Ohio, embracing that State, Indiana, Illinois, and, later, West Virginia. In May the Confederate government had dispatched a small force to Grafton, W. Va., under Col. G. A. Porterfield, with the purpose of breaking the Baltimore and Ohio Railroad. On 26 May General McClellan threw troops from Ohio and Indiana into the State, defeating Porterfield at Philippi (q.v.), 3 June. West Virginia seceded from Confederate Virginia 17 June, and set up a State government which was recognized by President Lincoln on the 26th. On 9 July United States senators were elected, and on the 13th they took their seats at Washington. Congress met in special session 4 July. It legalized all President Lincoln’s acts with respect to the army and navy, and authorized a further call for 500,000 men, a national loan of $250,000,000 and an increase of the navy to render effective the blockade of the Southern ports which had been declared 19 April by President Lincoln.

Following the Philippi defeat, the Confederates sent Gen. Henry A. Wise to the Kanawha Valley, and Gen. Robert S. Garnett to Beverly. Gen. William S. Rosecrans, who was commissioned brigadier-general in the regular army 16 May, joined General McClellan from Ohio, and 11 July defeated the Confederate forces under Col. John Pegram (q.v.) at Rich Mountain (q.v.). On 13 July General Garnett, during the retreat of his column, was killed at Carrick’s Ford. His command escaped, leaving General McClellan in control of northwestern Virginia.
The latter part of July, upon hearing of the arrival of Gen. J. D. Cox of Ohio in the Kanawha Valley, Gen. Robert E. Lee was ordered to the westward of Virginia; and the campaign for regaining the State failed, and by November the Confederate authorities decided to abandon the plan of occupying it. General Lee was ordered to the command of the Department of South Carolina, Georgia, and Florida. See West Virginia Campaign of 1861; Scarey Creek; Camp Barton; Camp Alleghany; Carnifax Ferry; Gauley Bridge; Romney.

Early in July the army in front of Washington under Gen. Irwin McDowell (q.v.) prepared to move against the main Confederate army under General Beauregard in front of Manassas. The flanks of each army toward the Shenandoah were protected by strong forces, Gen. Robert Patterson commanding on the Union side, and confronting Gen. Joseph E. Johnston (q.v.).

The Union advance was hastened by an almost universal cry in the North of "On to Richmond." Gen. McDowell left his camp on the Virginia side of the Potomac on the afternoon of 16 July with five divisions, encountering an advance brigade of Beauregard's army at Fairfax Court-House. This, with two other brigades, withdrew with light skirmishing to the main lines, which had been established behind Bull Run, its right at the crossing of the railroad from Manassas to Alexandria, and its left at the crossing of the Warrenton turnpike from Alexandria. McDowell's forces were concentrated about Centreville on the 18th, and one brigade had quite an affair on that date at Blackburn's Ford. On the 20th General Johnston arrived with all except one brigade of his army and assumed command. On the 21st McDowell, feinting in front,turned the Confederate left, and maintained a successful battle until near 4 o'clock, when the last brigade (three regiments) of Johnston's army arrived with a battery on the Union right and checked its advance. A brigade of General Beauregard's troops moving farther to the left and more directly on the Union flank, changed this check into a retreat, which soon became a panic, and the entire Union army left the field in disorder. The Army of the Potomac followed the panic increased, and only ended when the army was inside of the fortifications of Washington. (See Bull Run, First Battle of.) The North was astounded at the result, and the South correspondingly elated. Both sections immediately redoubled their efforts to prepare for vigorous war. General McClellan was summoned from West Virginia and given command of the Department of the Potomac, and began to organize the troops pouring in from all parts of the North. On 20 August he took command of the Army of the Potomac, then for the first time organized under that title, and 1 November he was made commander-in-chief of the armies of the United States in place of Gen. Winfield Scott who had resigned on account of failing health. In the rapid organization going forward in both sections, the South had the advantage of the services of the majority of regular officers from that section who resigned their commissions to fight under their States.

After Bull Run there was little heavy fighting during the remainder of 1861, both sides devoted their chief attention to establishing their lines. On 15 August Jefferson Davis ordered all Northern men to leave the South within 40 days, and if men from the United States, under Lincoln proclaimed the seceded States in insurrection and prohibited all intercourse. On the Union side, General Butler in command of a joint expedition of land and naval forces, sailed from Fort Darling and Florida in and around the forts guarding Hatteras Inlet (q.v.) opening the way to Pamlico Sound. On the lines of the Army of the Potomac the Union forces under Col. E. D. Baker, senator from California, were defeated at Ball's Bluff (q.v.), 21 October, Colonel Baker being killed. On 7 November a joint expedition from Annapolis, under Gen. Thomas West Sherman and Adm. S. F. Duport, captured Port Royal, thus securing one of the most important harbors on the Southern coast. (See Port Royal Bay; Port Royal Ferry). Gen. E. O. C. Ord, with a Union brigade, defeated a brigade under J. E. B. Stuart, at Dranesville, 20 December. Gen. N. P. Banks, with the Union army in the Shenandoah, General Rosecrans commanded in West Virginia. See also Pensacola in the Civil War; Fort Pickens.

On 29 Nov. 1861, Gen. Quincy A. Gillmore was ordered to reconnoiter Fort Pulaski at the mouth of the Savannah River. On 1 December he reported that it could be reduced with batteries at 1,700 yards' distance, a third greater than foreign authorities laid down as practicable against permanent works. His batteries opened 10 April 1862, breached the walls within 24 hours and the fort surrendered 11 April.

Gen. Robert Anderson was assigned to the Department of Kentucky 28 May. His headquarters were fixed at Cincinnati on account of the position of Kentucky in regard to neutrality, but on 1 September his headquarters were moved to Louisville. On 8 October General Anderson's health failing, Gen. W. T. Sherman succeeded to the command of the Department of the Cumberland. On 9 November this Department was discontinued, and under the title of the Department of the Ohio, embracing the States of Ohio, Michigan, Indiana and most of Kentucky and Tennessee, Gen. D. C. Buell was assigned. Gen. Buell was succeeded 21 December, 1862, by Gen. G. H. Thomas. See also Charleston, South Carolina, in the Civil War; Fort Pickens.

Gen. J. C. Frémont was ordered to Missouri, and assumed command 25 July. Before his arrival General Lyon had moved against forces under Gen. Sterling Price with which ex-Governor Jackson was seeking to regain the State (see Carthage; Springfield), and in the battle of Wilson's Creek (q.v.), 10 August, where Gen. Ben McCulloch commanded, Lyon was killed and Price occupied southern Missouri. On 15 November he assumed command, advanced against Price, and occupied Springfield. (See also Lexington, Siege of). Gen. H. W. Halleck succeeded Frémont, assuming command 19 November. Gen. David Hunter then in command in Virginia drew under orders, leaving the Confederates in possession of southern Missouri for the rest of the year.
On the Confederate side, Gen. Joseph E. Johnston commanded the Army of Northern Virginia (Stonewall) during much of 1861. Gen. Robert E. Lee was in the Shenandoah until November. Gen. Humphrey Marshall and Gen. G. B. Crittenden in eastern Kentucky, Gen. A. Sidney Johnston at Bowling Green, Gen. G. J. Pillow, J. B. Floyd, Simon B. Buckner, and N. B. Forrest at Fort Donelson, Gen. Leonidas Polk at Columbus, Ky., and General Price in Missouri. Thus stood the opposing lines at the close of 1861. Half the year had been spent in establishing them. The campaigns of 1862 began early and were prosecuted with the greatest vigor on both sides.

From January to April Gen. H. H. Sibley, with Texas forces, was engaged in attempting to secure New Mexico to the Confederacy. He inflicted much loss on Union posts and commands under Gen. E. R. S. Canby, but abandoned his purpose the middle of April and retired to Fort Bliss. See VALVERDE.

On 6–8 March a severe battle occurred at Pea Ridge (q.v.) or Elkhorn Tavern, Ark., between the forces of Gen. S. R. Curtis and Earl Van Dorn, resulting in the retreat of the latter. As Gen. George H. Thomas was concentrating to attack General Crittenden at Beech Grove, Ky., opposite Mill Springs (q.v.) on the Cumberland River, the latter marched at night from his entrenchments and attacked Thomas at Logan's cross roads the morning of 9 January. The Confederates were defeated, pursued to the river and dispersed. This, with Gen. J. A. Garfield's movement up the Big Sandy, and his defeat of Humphrey Marshall at Prestonburg (q.v.), 10 January, broke the right of the Confederate line through Kentucky. On 6 February Admiral Foote's fleet, supported by Grant's forces, captured Fort Henry on the Tennessee, and Grant's army, moving at once to Fort Donelson on the Cumberland, forced its surrender on 16 February, with 15,000 men. (See FORT HENRY AND FORT DONELSON). Gen. A. Sidney Johnston (q.v.) then evacuated Bowling Green 15 February, and Gen. Leonidas Polk withdrew from Columbus 16 March, as the movements of the latter being hastened by Gen. John Pope's advance on New Madrid and Island No. 10. This latter was captured 7 April. The Confederate forces in Kentucky and Tennessee then withdrew to the line of the Memphis and Charleston Railroad. General Johnston establishing his headquarters at Corinth. General Buell, moving rapidly from Kentucky, occupied Nashville, 25 November. General Johnston, learning that Buell was to join Grant, whose army had been brought from Fort Donelson to Pittsburg Landing, and was camped there awaiting Buell, marched from Corinth to attack Grant before the junction could take place. The Union army was unexpectedly attacked 6 April at Shiloh Church, two miles and a half in front of Pittsburg Landing, and forced back to the immediate vicinity of the landing. The advance of Buell arrived about sundown, and during the night four divisions, three of Buell's army and Lew Wallace's of Grant's, reached the field. The next day the Confederates under General Beauregard, being largely outnumbered, were defeated and returned to Corinth. Gen. A. Sidney Johnston was killed near the close of the first day's fight. See SHILOH.

General Halleck arrived from Saint Louis 11 April and took command. General Pope's army was brought from Island No. 10. On 30 April an advance began on Corinth (q.v.) by slow approaches. The Confederates brought Price and Van Dorn from west of the Mississippi. On 30 May General Halleck's lines were close to the city, and an attack was intimated when it was found that the Confederates had already evacuated the place. After a short pursuit under Pope and Buell, as far as Blackland, the Union army was concentrated at Corinth, and extensive fortifications were erected. The army was then joined by Buell with the Army of the Ohio was sent toward Chattanooga, with orders to repair the railroad.
as he advanced. Gen. Braxton Bragg, who had succeeded Beauregard, proceeding to Chattanooga by way of Mobile and moving rapidly north behind the Cumberlands, compelled Buell to withdraw to the Ohio River to protect his department, which included Indiana, Ohio and Michigan. (See MORGAN'S RAID). Gen. E. Kirby Smith, at the same time, invaded Kentucky by way of Cumberland Gap (q.v.), defeated Union forces at Richmond (q.v.), 30 August, and threatened Cincinnati. Buell, upon receiving news, hastened upon Bragg. On 8 October resulted the battle of Perryville (q.v.), by which Bragg was compelled to abandon Kentucky. Passing through Cumberland Gap he retired to Chattanooga, whence he advanced to Murfreesboro in central Tennessee, and went into winter quarters. See HARRISTON; PARKER'S CROSS ROADS.

In September Price and Van Dorn, who had previously joined Beauregard from beyond the Mississippi, moved against Grant and Rosecrans in the region of Corinth. Price was defeated by Rosecrans 19 September, at Iuka (q.v.), and Van Dorn, supported by Price, 4 October, at Corinth (q.v.). (See also HATCHIE RIVER). From this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, then styled the Fourteenth corps. On 30 October General Rosecrans relieved General Buell, and concentrated his army at Nashville (q.v.). On 26 December he moved toward Murfreesboro to attack Bragg. The battle began on the last day of the year, and continued during the days of 1-2 Jan. 1863. (See STONE RIVER). General Bragg retreated the night of 3 January, eventually taking up positions at Smythville, Tullahoma and Waus- trace. General Rosecrans occupied Murfreesboro. The respective armies remained on these lines until Rosecrans' advance in June 1863.

While Rosecrans was succeeding at Murfreesboro, there was a noted Confederate victory at Galveston (q.v.). General Magruder, with a fleet of ordinary river boats, protected by hay and cotton bales, captured the Harriet Lane 1 January, sunk the gunboat Westfield and received the surrender of the forces holding the city. The Confederate Alabama (q.v.), arriving shortly after, captured the gunboat Hatteras. Both river fleets of armored and unarmored gunboats, mortar-boats and rams were actively engaged on the western rivers. The Union fleet under H. W. Halleck, was composed of 45 vessels of various classes and 38 mortar-boats. The Confederate fleet, Commodore Montgomery, was somewhat less, but contained several formidable vessels. Commodore Foote's gunboats captured Fort Henry on the Tennessee and played an important part at Fort Donelson, Pittsburg Landing and New Madrid. Commodore Montgomery awaited Foote's fleet, now under the command of Com. C. H. Davis, before Memphis. The Union fleet was made up of 5 gunboats with 68 guns and 4 rams; the Confederates of 8 gunboats with 28 guns. After a desperate battle, 6 June, against great odds, the Confederate Fort Matilda was destroyed and Memphis surrendered to the fleet. (See also SAINT CHARLES). Davis left Memphis 29 June and 1 July reached Young's Point, where he joined Adm. David G. Farragut's fleet from New Orleans, which had run the Vicksburg batteries.

The year 1862 closed with very general dissatisfaction over the long inaction of General McClellan. Gen. Joseph E. Johnston was at Manassas and Centreville with some 50,000 men, but General McClellan, misled by his secret service, continually insisted that there were three times that number. The Army of the Potomac numbered fully 150,000 present for duty. The Potomac was blockaded and the Confederate flag floated on Munson's Hill in sight of Washington. On 31 January President Lincoln gave the Mississippi and ordered the army to move on Manassas not later than 22 February. McClellan asked leave to present a plan of his own for a movement down the Potomac, up the Rappahannock, across to York and thence to Richmond, and left the way open for Gen. G. W. Morgan at Cumberland Ford, Ky., to seize Cumberland Gap.

Just as his movement began occurred the ominous attack. 8 March, of the Confederate ironclad Merrimac, Flag Officer Franklin Buchanan, which suddenly moved out from Norfolk and attacked the Union fleet in Hampton Roads (q.v.), sinking the frigate Cumberland, capturing and destroying the frigate Congress, doing much other damage and startling the entire Eastern coast. On resuming operations the next day the Merrimac was met and foiled by the Monitor, Lieut. John L. Worden (q.v.), which had just arrived. The Merrimac then retired to Norfolk, being blown up when the Confederates evacuated that city, 9 May. See MONITOR AND MERRIMAC.

McClellan was unwilling to undertake his Peninsula campaign (q.v.). On 11 May the Army was relieved from the general command of the armies. The Army of the Potomac was transported to Fort Monroe and the movement up the peninsula toward Yorktown (q.v.) began 4 April. Heavy rains caused delays from the start. It was found at Washington that the designated number of men had not been left for the proper defense of the capital. McDowell's corps was therefore retained. Arriving before Yorktown with about three times the strength of the enemy, he concluded to lay regular siege to the position. (See LEE'S MILLS). Parallels were therefore opened, nearly 100 heavy siege guns were brought up and at the end of a month, as his batteries were about to open, Gen. J. E. Johnston evacuated the place. McDowell withdrew toward Richmond. He halted at Williamsburg (q.v.), where on the 5th an attack was made upon his lines and at night he withdrew toward Richmond. (See WEST POINT, ENGAGEMENT AT). McClellan followed to the Chickahominy and, on 26 May the Union fleet in the James made an unsuccessful attack on Drewry's Bluff (See FORT DARING), eight miles below Richmond. On
May the right of his army crossed the Chickahominy (see also HANOVER COURT HOUSE) and advanced to Seven Pines, or Fair Oaks (q.v.), about five miles from Richmond, where he was attacked by General Johnston 31 May. The prompt advance of Sumner’s corps from the other side of the Chickahominy prevented serious disaster. At the close of the day General Johnston was badly wounded and carried from the field. Gen. Gustavus W. Smith commanded temporarily and was succeeded 2 June by Gen. Robert E. Lee, who continued in command of the Army of Northern Virginia until Appomattox. On 1 June the battle was renewed by the Confederates, the troops regained their lost ground and Lee withdrew to the fortifications of Richmond.

On 16 June the Union forces on James Island in Charleston harbor, under General Benjamin, met with a severe repulse at Secessionville (q.v.). General Stonewall Jackson, by a brilliant campaign in the Valley, had prevented the most of McDowell’s corps, then in the vicinity of Fredericksburg, from reinforcing McClellan. (See Shenandoah Valley; Kernstown; McDowell; Front Royal; Harrisonburg). By moving rapidly down the Valley he defeated Banks at Winchester (q.v.) and forced him across the Potomac, 26 May. Returning, he defeated Gen. J. C. Frémont at Cross Keys, 8 June, on one flank and Gen. James Shields at Port Republic, 9 June, on the other, and after a week spent in deceiving General Frémont into the belief that he was about to advance down the Valley, by a rapid and unsuspected movement he appeared 25 June at Ashland on the flank of McClellan’s army in front of Richmond. Then followed the Seven Days’ battles, beginning with Mechanicsville 26 June and ending at Malvern Hill 2 July; whence the Army of the Potomac withdrew to Harrison’s Landing on the James. (See Seven Days’ Battles; Oak Grove; Mechanicsville; Gaines’ Mill; Peach Or- and Gen. James Longstreet’s corps to Gordonsville. Pope took the field 29 June and threatened Gordonsville again. “Stonewall” Jackson advanced on the 7th, reaching Cedar Mountain on the 9th. Here Banks attacked and was defeated. Jackson retired beyond the Rapidan, and upon Lee, with Longstreet, coming up, Pope retired behind the Rappahannock. By a long detour, by way of Salem and Thoroughfare Gap, Jackson moved rapidly around Pope’s right and 26 July destroyed his stores at Bristoe Station and Manassas in his rear, retiring, to the former battlefield of Bull Run. On the 23d Reynolds’ division from the Army of the Potomac joined McDowell and on the 25th Gen. S. P. Heintzelman’s corps, two divisions, arrived and the next day Fitz-John Porter’s corps of two divisions reached Pope. The battle of Gainesville followed on the 28th, resulting in the retirement of two of McDowell’s divisions. At Groveton on the 29th the head of Longstreet’s forces reached the field and
took part in the closing fight. All the battles of the campaign had been desperately fought by both sides. On the 30th occurred the second battle of Bull Run (q.v.). Pope was defeated, but withdrew un molested to Centreville beyond Bull Run. He was joined by the strengthening corps of Sumner and Franklin from McClellan's army. A flank movement by Jackson led to the battle of Chantilly (q.v.). Pope then, under orders, 2 September, withdrew his army to the fortifications of Washington.

Pope was then relieved; his forces were added to the Army of the Potomac and McClellan took command of the combined army. The first Confederate invasion of the North followed. On 3 September Lee put his army in motion from Chantilly toward the Potomac. The crossing was accomplished in the vicinity of Leesburg on the 5th, the army moving forward to Frederick, where on the 7th Lee issued a proclamation setting forth that his army had come to help them regain the rights of which they had been despoiled. This was coldly received. Upon learning that the garrison of Harper's Ferry (q.v.) had not withdrawn, he detached forces which invested and captured it that evening, killing 2,300 men and over 70 guns. (See MARYLAND HIGHLIGHTS.) Lee, who, with Longstreet's command, had marched to Hagerstown, turned back to hold Turner's Gap in South Mountain (q.v.), but was defeated on the 14th and fell back to Sharpsburg, where he was subsequently joined by the forces detached against Harper's Ferry.

McClellan advanced from Washington 5 September toward Frederick, Md., the right wing and centre passing through that place on the 13th, the right moving to Turner's and the left to Crampton's Gap. Both these positions were carried on the 14th after sharp fighting. On the 15th Lee took position on the high ground beyond Antietam Creek and in front of Sharpsburg. Gen. Joseph Hooker's corps attacked his left toward evening of the 16th, the fighting continuing until after dark. The general engagement began at daylight on the 17th, lasting for 14 hours, the losses being greater that of any other day during the war. (See ANTIETAM.) The advantages were with the Union army, though Lee maintained his lines during the 18th, but at night withdrew and crossed the Potomac, ending the first invasion of the North. (See MARYLAND CAMPAIGN OF SEPTEMBER 1862.) Lee remained a month about Winchester (see SHEPHERDSTOWN [Boteler's Ford]), and upon the Union army's crossing into Virginia and moving toward Winchester he took position behind the Rappahannock.

Near Warrenton, 7 November, McClellan was superseded by Gen. Ambrose E. Burnside, under an order dated 5 November. The latter took position opposite Fredericksburg (q.v.) 19 November, and 13 December, forced a crossing into the city and below it. After great slaughter, largely incurred in assaults on Marye's Heights, he was repulsed and obliged to recross the river. The next month he attempted to cross above Fredericksburg, was repulsed, and the Lee line was driven back. With clouded hope, the army finding itself actually stalled, the movement becoming known as the great Mud March. After this failure Burnside was relieved by Hooker 26 Jan. 1863.

The navy was active and effective throughout 1862. The blockade became exceedingly stringent for the Confederacy; warlike and commercial supplies alike were very difficult to obtain. On 11 January General Burnside and Commodore L. M. Goldsborough sailed from Fort Monroe, capturing Roanoke Island (q.v.) 5 February, Newbern (q.v.) 14 March, and taking Fort Macon (q.v.) with its garrison 26 April. See also SOUTH MILLS.

1863: General Butler and Admiral Farragut sailed from Fort Monroe 25 February for a move against New Orleans (q.v.). After a terrific engagement, participated in by Commander D. Porter with mortar-boats, and in which the Confederates exhibited great endurance, the chain across the river below forts Saint Philip and Jackson was cut, and 24 April Farragut forced his fleet past the forts, and after terrific fighting, during which the Paruns was sunk by the fire of the forts, appeared before New Orleans on the 25th. General Lovell, who held the city with a small force, some 3,000, retiring. General Butler arrived with his troops 1 May, and took full possession, taking Baton Rouge 9 May, and Natchez on the 13th, neither being fortified and evacuated by the Mississippi. He ran past the batteries at Vicksburg and joined Commodore Foote's (Davis') fleet from Memphis at Young's Point. Retiring to New Orleans, thus running the Vicksburg batteries a second time, he found letters from Washington urging him to clear the Mississippi. On 25 June his fleet, with Porter's mortar fleet, was assembled at Vicksburg, and on the 28th, after a short engagement, two ships and five gunboats ran the batteries and again joined Davis' fleet above the city. On 15 July the Confederate ironclad Arkansas came out of the Yazoo, ran directly through the Union fleet, none of its vessels having steam up, and gained the shelter of the Vicksburg batteries. Farragut ran the batteries that night, and attempted to destroy the Arkansas while passing the city wharves, but failed. On 20 July his fleet was ordered to New Orleans, where it arrived on the 29th. Grant, at Memphis, on 11 November, began his first move against Vicksburg (q.v.), by ordering his troops forward to Grand Junction, purposing to move along the railroad by way of Holly Springs and Grenada to the rear of the city, while Sherman should co-operate from Memphis. A raid by Forrest destroyed long reaches of railroad above Jackson, and the destruction of the depot of supplies with its immense stores at Holly Springs (q.v.) 20 December, by Van Dorn, effectually paralyzed Grant's advance toward Vicksburg.

Sherman was then sent, 20 December, from Memphis down the Mississippi to ascend the Yazoo and attempt the capture of the defenses of the city at Haines' Bluff. He assaulted at Chickasaw Bayou (q.v.) 20 December, with disastrous results, and returned to the mouth of the Yazoo, where he was met by Gen. J. A. McClernand with orders to as-
CIVIL WAR IN AMERICA

sume general command. This officer at once moved up the Arkansas River with Porter's gunboat fleet and Sherman's and G. W. Morgan's corps, captured Fort Hindman (q.v.) 11 January, and returned to Young's Point. From this position the Vicksburg campaign of 1863 began, which opened the Union operations of that year.

The first attempt was to cut a canal across the peninsula opposite Vicksburg, which would allow the army to move below Vicksburg. After working on this from 22 January to 7 March, a flood destroyed it. Efforts were next made to open a way through Lake Providence to the Red River, making a circuit of 350 miles to a point below the city. Both this plan and one for the east side through the Yazoo pass leading to the rear of the city, being actively opposed by the Confederates, and found otherwise exceedingly difficult, were abandoned. See Yazoo Pass and Steele's Bayou.

A way was finally found from Milliken's Bend (q.v.) by way of New Carthage to a point on the river opposite Bruinsburg. On the night of 16 April the memorable running of the Vicksburg batteries by the fleet of Admiral Porter, conveying transports, was successfully accomplished. The means of ferrying his forces over the Mississippi being thus secured, the advance of the army crossed 30 April. Port Gibson was captured 1 May, after a stubborn and most gallant defense against a greatly superior force by Generals Bowen, Baldwin and Cockrell. Grant was then on solid ground in rear of Vicksburg. See also RAYMOND.

He moved at once to intervene between Pemberton and Vicksburg and Johnston, who was seeking a junction with Pemberton. Johnston was forced out of Jackson by Sherman's and Gen. James B. McPherson's troops 14 May. Grant then turned toward Pemberton, advancing from Vicksburg, defeated him at Champion's Hill (q.v.) on the 16th, again at Big Black Bridge (q.v.) on the 18th, whence Pemberton withdrew into Vicksburg, followed by Grant. On the 19th Grant ordered an assault, which was repulsed, and again on the 22d, with the same result. A regular siege was then undertaken, and Pemberton's army was starved out and surrendered 4 July. See also JACKSON, SIEGE OF; YAZOO CITY.

On 24 May 1863, Gen. J. M. Schofield, who had been active and prominent in Missouri from the first, relieved General Curtis in command of the Department of the Missouri. During the Vicksburg campaign he sent all troops that could be spared to Grant. Upon their return he was able to advance General Steele to the line of the Arkansas and hold it thereafter. (See also HELENA; LITTLE ROCK; PINE BLUFF). During 8–14 June, Grant received a division from Gen. S. A. Hurlbut's command, under Gen. Sooy Smith, one from the Department of the Missouri, under General Herron, and two divisions of the Ninth corps under Gen. J. G. Parke. During the operations of General Grant about

Vicksburg General Banks was active in Louisiana. After three unsuccessful attempts against Port Hudson (q.v.), which he twice assaulted, it finally surrendered 8 July, upon hearing of the capture of Vicksburg.

In January, February and March 1863, the Union ironclads under Admiral Dupont made unsuccessful attacks upon Fort McAllister (q.v.) in the Ogeechee River, but in one of them destroyed the noted blockade-runner Nashville. The Confederates were active on the North Carolina coast early in 1863 (see NEWBURN; WASHINGTON; SUFFOLK) and General Hoke captured Plymouth (q.v.) 20 April 1864. See also ALBEMARLE, THE.

The campaign of the year in the Army of the Potomac was opened by Hooker. (See STONEMAN'S VIRGINIA RAID). On 28 April Gen. John Sedgwick’s corps was thrown across the Rappahannock at Fredericksburg, the rest of his army crossing above at Kelly’s ford, and thence advancing across the Rapidan at Ger-
manna and Ely's fords, to and beyond Chancellorsville (q.v.). His force was fully twice that of Lee. On 1 May Hooker's advance fell back to Chancellorsville. On 2 May *Stone-wall* Jackson's corps of three divisions was descried at different times during the day from several points of Union troops moving toward its right. No preparations were made to guard against a flank attack, though orders to that effect were early given. At 6 p.m., while the troops of the Eleventh corps holding the right with Jackson's solid columns burning upon them and disastrously routed the Union right. On the 3d Sedgwick's corps advanced from Fredericksburg to Salem Church, was defeated that afternoon, and recrossed the river on the night of the 4th. The night of the 2d Jackson, reconnitering in front of his pickets, was mistakenly fired on by them and mortally wounded. On the 3d, by hot fighting, Hooker's lines were forced further to the rear. The 4th passed without an engagement, as Lee, with the loss of part of his army at Salem Church. The night of the 5th Hooker, thoroughly defeated, recrossed the river, and his army was reassembled at Falmouth.

On 3 June, Lee, from Fredericksburg, began his second invasion of the North, Longstreet's troops leading. After minor engagements in the Valley (see Fleetwood and Brandy Station; Winchester, Second Battle of; Middleburg, Alie and Upperville; Hanover, Martinsburg), Gen. R. S. Ewell's advance crossed the Potomac at Williamsport 15–16 June, moved forward to Chambersburg, and had reached the vicinity of Harrisburg and Columbia on the Susquehanna, and captured York 28 June, when recalled to Gettysburg, where Lee's army was concentrating. See Stuart's Raid to Chambersburg; Wrightsville.

Meantime, the Army of the Potomac under Hooker reached the vicinity of Frederick, when Hooker, not being allowed to order the garrison of Harpers Ferry--over 10,000 strong (under Meade) to move, asked to be relieved, and Gen. George G. Meade succeeded him. The two armies met at Gettysburg 1 July. A three days' battle followed. Lee retreated the night of the 3d, but was again in rear of the Potomac without a battle, and after a month's rest in the Shenandoah resumed his former lines behind the Rappahannock. (See Gettysburg, Battle of). Meade followed later to that stream. (See Manassas Gap; Jeffersonport; Kelly's Ford; Rappahannock Station). With the exception of the Mine Run campaign (q.v.) 26 November to 2 December, inaugurated by General Meade, but without important results, both armies remained in their camps until the spring of 1864. See also Richmond, Kilpatrick's Expedition to.

The campaign of the Army of the Cumberland for 1863 began 23 June, the objective being the recovery of middle Tennessee. (See also Sanders' Raid into East Tennessee.) The Union army under Rosecrans held the line of Stone's River, headquarters at Murfreesboro; the Confederates under General Bragg, the general line of Duck River, with headquarters at Tullahoma. By Bragg's lead at Shelbyville and turning his right, both flanks being established in entrenched camps, Bragg was forced out of his lines and retreated over the Cumberlands and across the Tennessee to Chattanooga. It was chiefly a strategic campaign, carried on in continuous rains of most unusual severity, occupying nine days, and involving a total loss of only 590 killed, wounded and missing. The Union line advanced to the western base of Lookout Mountain. See Thompson's Station; Vaught's Hill; Streak's Raid from Tuscumbia; Morgan's Raid; Tullahoma Campaign.

The succeeding campaign, having Chattanooga for its objective, required extensive repairs to the railroad and an accumulation of supplies sufficient for leaving a base for a month, and moving in a mountainous region largely barren. The movement began 16 August. Bragg was at Chattanooga. Rosecrans' army lay along the western base of the Cumberlands from Winchester to McMinnville. Rosecrans feinted with his left corps, Gen. T. L. Crittenden's, by throwing it from McMinnville over the mountains, its advance being into the base of the valley of the Tennessee River. This led to the belief that a junction was to be formed with Burnside from Knoxville, or an attack made upon the city from that quarter. Bragg, as a result, fixed his attention upon this move. The line between Crittenden's corps, Thomas' and the right, Gen. A. McD. McCook's, lay between the Cumberlands and the Tennessee River some 30 miles below Chattanooga, continued over the Sand Mountains, and ascended the Lookout range—all bold mountains with passaded summits crossed only by very difficult and widely separated mountain trails. When Rosecrans' columns were ascertained to be on Lookout, Bragg, 7 and 8 September, withdrew from Chattanooga, the heads of the Union columns having in the meantime descended into McMULMORE'S Cove, south of Chattanooga. Upon Bragg's reaching Lafayette, 26 miles south of Chattanooga, he awaited Longstreet's arrival from Virginia, meantime unsuccessfully demonstrating against Rosecrans' centre and left east of Lookout in the valley of the Chickamauga. Crittenden's corps, after having accomplished its diversion, had crossed the Tennessee, left one brigade in Chattanooga, 9 September, and moved south through Rossville to a position on Lookout Mountain, while Bragg occupied Hixson's Mill on the Chickamauga. Bragg, strengthened by Longstreet, started back 17 September toward Chattanooga, seeking to interpose between Rosecrans and that city. Rosecrans, by a night march, 18 September, proceeded toward Chattanooga, formed his lines between Bragg and the city, nine miles south of it, at Chickamauga (q.v.). A two days' battle, 19 and 20 September, ensued for the possession of the roads to Chattanooga. At noon of the second day Longstreet broke through a gap at the centre of the Union lines, cut off two divisions of the right wing, and forced them with fragments of other divisions from the field, Rosecrans, McCook and Crittenden being caught in the break. General Thomas, with the greater part of seven divisions, held the field, and at night withdrew to Rossville and there reformed the army between Bragg and the city, thus securing its possession without further fighting. On the 24th, Thomas pressed the 2d, and formed his lines in front of the city, which Rosecrans soon rendered impregnable by heavy earthworks. Bragg's lines embraced Lookout.
Mountain and Missionary Ridge heights overlooking the city, the mountain position closing the river line of supplies. The situation of the Union army soon became precarious for want of food and forage. (See also PHILADELPHIA, TENN., MILITARY OPERATIONS AT.) Hooker, with Eleventh Corps, and the next day, Hooker with the order from the Army of the Potomac, reaching Bridgeport 30 September; and Sherman, with four divisions from the vicinity of Vicksburg. Grant was assigned to general command, arriving 23 October. Rosecrans was replaced by Gen. George H. Thomas 19 October. The river line of supplies was opened 28 October upon a plan devised by General Rosecrans and executed by Gen. W. F. Smith. Hooker being brought forward to Lookout Valley, and troops from Chattanooga forming a junction with him. The battle of Chattanooga (q.v.) occupied three days. On 23 November, in the centre, threw forward one division, supported by four, and captured the advanced line of Bragg. The night of the 23rd, Sherman crossed the river six miles above the city and seized an unoccupied range overlooking the north end of Missionary Ridge. On 24 November, Hooker carried the western and southern slope of Lookout Mountain, and Sherman, the north and east. He moved against the south end of Missionary Ridge. The afternoon of 25 November, Thomas, at the centre, assaulted Missionary Ridge, his storming line being two and a half miles from the earthworks at the foot of the ridge, and next the ridge itself, capturing 37 guns on the summit, and forcing a general retreat. From this time Chattanooga remained in Union control to the close of the war. See also RINGGOLD GAP.

The same day that Rosecrans started from Winchester, Tenn., for Chattanooga, Burnside with the Army of the Ohio (Twenty-third corps) left Lexington, Ky., for Knoxville, Tenn. (q.v.), his Ninth corps being still with Grant near Vicksburg. He reached Knoxville 2 September. Being ordered to assist Rosecrans at Chattanooga, he was held by demonstrations of a small force from making the junction. (See ROCKSVILLE; CAMPBELL'S STATION.) On the 29th, he carried the earthworks at the foot of the ridge, and next the ridge itself, capturing 37 guns on the summit, and forcing a general retreat. From this time Chattanooga remained in Union control to the close of the war. See also RINGGOLD GAP.

On 12 March 1864, General Grant, who had been commissioned lieutenant-general, that grade having been revived by Congress, was placed in command of all the armies. Early in April he had formed a plan for a combined movement of the armies to begin toward the last of the month, and had communicated the same to Meade with the Army of the Potomac, Butler at Fort Monroe, Sherman at Chattanooga and Banks at New Orleans. The main Confederate armies were those of Lee, at Orange, with Longstreet at Gordonsville, confronting Meade in the vicinity of Culpeper, and Johnston at Dalton, Ga., facing Sherman in the vicinity of Chattanooga.

Grant's general plan was for Gillmore, from South Carolina, with 10,000 men, to join Butler at Fort Monroe, giving him 23,000 troops for a move up the James to capture City Point, threatening Petersburg and the rear of Richmond. (See RICHMOND, UNION CAMPAIGNS AGAINST.) Burnside, with 25,000 men assembling at Annapolis, was to join Meade, and the Army of the Potomac was to advance toward Richmond by Lee's right. Sherman, with three armies, the Cumberland, Grant, George H. Thomas, the Tennessee, under McPherson, and the Ohio, under Schofield, aggregating nearly 100,000 men, was to move against Johnston's army at Dalton and follow it. (See also MARIETTA, EXPEDITION TO; YAZOO CITY.) Banks was to leave the Red River; country to Steele and the navy, abandon Texas and move against Mobile with his 25,000 men, re-inforced by 5,000 from Missouri.

Grant established his headquarters with the Army of the Potomac, Meade 30 August, in the direction of the army under Grant's general orders. The Army of the Potomac moved toward the Rapidan in the early morning of 4 May, and by night all the troops had crossed.
Grant's force was about 119,000, and Lee's about 62,000. Lee pushed rapidly to his right and struck Grant's advance in the Wilderness (q.v.), 5 May. Terrific fighting followed till the night of the 6th. (See TOWN'S TAVERN). Lee pushed on to Spotsylvania (q.v.), reaching it in advance of Grant and interposing on the line to Richmond. Both armies entrenched, and from the 8th there was bitter fighting until the night of the 20th (see Po River), when Grant started for North Anna (q.v.). From Spotsylvania 8 May, P. H. Sheridan (q.v.), commanding Grant's cavalry, made a raid around Lee's army, encountering and defeating J. E. B. Stuart at Yellow Tavern 11 May, where Stuart was killed. Sheridan spent a day within the outer defenses of Richmond, and joined Butler on the James. (See RICHMOND, SHERIDAN'S RAID ON COMMUNICATIONS WITH). Grant proceeded to move to his left, everywhere opposed by Lee, fighting heavily at North Anna and Bethesda Church (see also HAWES' SHOP; the rear of Richmond was defeated. Lee occupied the Petersburg lines. Grant attacked the works several times unsuccessfully from 15 to 18 June. On 30 July an attempt on the works was made by exploding a mine. The explosion was a great success, but the assault to follow it was a failure. This was the battle of The Crater.

From the establishment of Grant's lines before Petersburg frequent and heavy fighting continued until about 1 November, but with little permanent impression on General Lee's lines. (See JERUSALEM PLANK ROAD; DEEP BOTTOM; GLOBE TAVERN; REAMS' STATION; POPLAR SPRINGS CHURCH; HATCHER'S RUN [BOYDTOWN ROAD]; FAIR OAKS—DARBYTOWN ROAD). The Union left, however, was extended across the Weldon Railroad. On 28 September General Butler, with two corps, crossed to the north side of the James and captured Fort Harrison (q.v.), a position from which Richmond was seriously threatened. On 16 Novem-

PAMUNKEY AND TOTOPOTOMOY), reaching Cold Harbor (q.v.) 2 June. On the 3d Grant assaulted along his whole line, to meet in an hour with terrible slaughter and repulse, so serious that an order for a second assault was not carried out. Grant had failed to interpose between Lee and Richmond. From Cold Harbor he sent Sheridan with his cavalry to occupy the attention of Fitzhugh Lee's and Hampton's (q.v.) cavalry while he withdrew to the James. Sheridan defeated both at Trevilian Station. (See TREVILIAN RAID; also SAINT MARY'S CHURCH). Grant then moved without interruption to the James, reaching it 13 June, and crossing it in the vicinity of City Point and Bermuda Hundred (q.v.). General Butler had occupied these points 5 May. (See also SWIFT CREEK). On the 14th Butler carried the outer defenses of Drewry's Bluff (q.v.), but was thence driven back by Beauregard's troops, who had arrived from the south, and his contemplated movement toward Petersburg (q.v.) and Butler, supported by Porter's fleet, was sent to capture Fort Fisher (q.v.), but failed. During the winter the lines of each army were greatly strengthened. On 7 December Grant had extended his left 20 miles to Hicksford on the Weldon Railroad. On 22 June Gen. James H. Wilson, with two divisions of cavalry, moved against the railroads south of Richmond, destroying nearly 50 miles of track, and inflicting much other serious damage. His return route was blocked, but he brought his forces in with some loss of both artillery and trains. He had severed all railroad connections with Richmond, and they were not fully restored for several weeks. (See WELDON AND SOUTH SIDE RAILROADS). Gen. Franz Sigel's campaign began 1 May. On the 15th he moved up the Shenandoah to New Market and was defeated, cadets from the Virginia Military Institute taking prominent part. At Grant's request Sigel was suspended and Gen. David Hunter assigned. The latter pushed on to Lynchburg (see PRID-
CIVIL WAR IN AMERICA

MONT), but was compelled by Gen. Jubal A. Early (q.v.) to retreat from that point by way of the Kanawha and Ohio rivers to Parkersburg, and thence by rail to the east. Gen. George Crook's wing of Sigel's column from the Kanawha penetrated to the Tennessee and Virginia Railroad at Wytheville (q.v.). See also CLOYSE'S MOUNTAIN.

On 6 May General Sherman moved from the vicinity of Chattanooga against General Johnston in Dalton. The Union, which had in round numbers 100,000, the Confederates being about half as strong. After vainly attacking the gaps and ranges in front of Dalton for several days, Sherman passed his army through Snake Creek Gap leading to the rear of Dalton. This compelled General Johnston to retire from his camps, and he was defeated at Resaca (q.v.). Johnston resisted stubbornly at every step, but he was successively flanked out of every new position until he reached Atlanta. (See ROME; DALLAS; NEW HOPE CHURCH; MARIETTA; PINE MOUNTAIN; KOLES FARM; KENESAW MOUNTAIN; SYMRENA CAMP GROUND).

Fighting had been in progress at some points of the line from May till September. Johnston was defeated at Chattanooga July 10 and Hood attacked at Peach Tree Creek (q.v.) and was repulsed with great loss. He then moved out of Atlanta and attacked, and was again defeated. (See LEGETT'S OR BOLD HEAD). General McPherson, commanding the Army of the Tennessee, was killed. The next attack was at Ezra Church (q.v.) 28 July, upon the Army of the Tennessee, this also being repulsed after three hours' severe fighting, with much loss. See also SHERMAN'S MAON RAID.

On 2 September Sherman occupied Atlanta, which was evacuated as a result of his moving to the rear of the city on Jonesboro (q.v.). Hood first raided Sherman's railroad communications, fighting heavily at Allatoona 5 October, and soon after moved northward. General Thomas was sent to resist his movement if he invaded Tennessee, and Sherman started 15 November on his March to the Sea (q.v. See also GRISWOLDVILLE). While it was originally intended by him to attack Hardee in the vicinity of Atlanta, then from Atlanta to Mobile, the harbor there having been captured 5-23 August by Farragut and Canby, he decided upon the alternative which Grant had suggested before the campaign opened, and started for Savannah.

The fight of Farragut's fleet in the harbor of Mobile, which decided Sherman's march to Savannah, was one of the most brilliant in naval warfare. (See PORT GAINS AND PORT MORGAN; MOBILE BAY; FORT BLAKEY). The Confederate fleet was destroyed, including the far-famed ironclad ram Tennessee. Sherman reached Savannah with slight opposition. (See FORT MCALLISTER; also HONEY HILL). On 17 December he summoned Hardee to surrender. The latter refused, and on the night of the 20th retired with his force of 10,000 without molestation. The next morning the Union army entered.

Meantime Hood had invaded Tennessee with the intention which Sherman's three armies had been confronted from March till September. General Thomas left with two small but excellent corps, by great exertion organized an army to oppose Hood. (See SPRING HILL). On 30 November General Schofield, commanding in the field in front of Hood, inflicted a nearly fatal blow upon him at Franklin (q.v.). After General Thomas' forces were united at Nashville (q.v.) 15-16 December, he attacked Hood's encampments in front of the city and dispersed and practically annhilated his army. See also RUSSELLS'S RAID FROM EAST TENNESSEE; SALTVILLE.

The forced retreat of Hunter from Lynchburg over the mountains of West Virginia left the Shenandoah unprotected. On 13 November Early entered it, drove Sigel across the Potomac (see MARTINSBURG; MARYLAND HEIGHTS), then on 9 July defeated Wallace, who was in small force at Monocacy, Md. (q.v.), threatened Baltimore and appeared before Washington 11 July. Here he was met by veterans of the Sixth and Nineteenth corps, Army of the Potomac, hurried to Washington by Grant, and forced into rapid retreat. (See WASHINGTON, EARLY'S ATTEMPT ON; SNICKER'S FERRY AND BERRY'S FERRY; STEPHENSON'S DEPOT; SHERIDAN'S RAID; SHERIDAN, SECOND BATTLE OF). Upon the withdrawal of the troops from the Army of the Potomac Early again sent a force under Gen. John McCausland, into Pennsylvania, and these invaders burned Chambersburg (see McCausland's RAID). Sheridan, being assigned to command, forced Early beyond Staunton; and devastating the Valley, he withdrew to Cedar Creek. While Sheridan was absent Early attacked and drove the army out of its camps. Gen. H. G. Wright, however, rallied the troops near Middletown and restored the battle. Sheridan arriving, the army advanced, and Early was so seriously defeated as to close the campaign in the Valley. See SHERIDAN'S RAID; SMITHFIELD; OPEQUON; FISHER'S HILL; CEDAR CREEK; MILFORD; NINEVEH.

The first movement of the final campaigns of 1865 began 2 January in Tennessee, when General Schofield with the Twenty-third corps left Columbia, Tenn., for Clifton on the river bound for the east. The corps left Alexandria on transports soon after 1 February, and landed at the mouth of Cape Fear River, 9 February, where the Tenth corps was established, which, under Gen. Alfred H. Terry, advanced to Cape Fear. Fisher (q.v.) that had been most stubbornly and gallantly defended against the army and the fleet by Gen. W. H. C. Whiting. Fort Anderson was attacked by army and fleet, and abandoned 19 February; the position of Town Creek was carried 20 February, and Wilmington (q.v.) was taken 22 February. Operating next day by way of Newbern, Gen. R. F. Hoke was defeated at Kinston (q.v.) 10 March. Goldsboro (q.v.) was occupied by General Schofield on the 21st. Sherman's army joined Schofield here on the 23d. On 26 January General Terry had been dispatched to co-operate with Admiral Porter in reducing Fort Fisher at the mouth of Cape Fear River. A previous expedition under General Butler, 13-16 December, had failed, but the fleet had remained, and Porter had appealed to Grant to send another force. Terry's troops effected a landing above the fort 13 January. The next morning he was entrenched across the peninsula. Early on the 15th he had undergone a terrific bombardment, which was continued until a force of marines was landed in the afternoon to co-operate in the assault of the army. This was delivered at 3.30 in the afternoon, the flank of the work next the river being
March. See also Stoneman’s Raid in East Tennessee, Southwestern Virginia and Western North Carolina.

On 2 March Sheridan advanced up the Valley, defeated Early at Waynesboro (q.v.) and proceeded through Charlottesville and along the Richmond and L. Railroad, destroying roads and stores, and joined Grant at Petersburg. Gen. James H. Wilson, operating under Gen. George H. Thomas, crossed the Tennessee 22 March with a thoroughly equipped mounted force of 12,500, and 1,500 dismounted, to follow, until horses could be captured. (See Wilson’s Raid from Chickasaw to Selma and Macon). His first objective was Selma, Ala. A portion of Forrest’s cavalry was encountered and defeated at Montevallo 30 March. The fortifications of Selma (q.v.) were carried against Forrest 2 April, and immense war supplies and plants for the manufacture of war materials destroyed. Montgomery surrendered 12 April; West Point was captured 15 April, after sharp fighting; Columbus was carried by a night assault 16 April; Macon surrendered 20 April. Here Wilson received notice of the Sherman-Johnston truce. An expedition, sent out 7 May by Wilson from Macon, under Colonel Pritchard, Fourth Michigan, captured Jefferson Davis, 10 May, at Irwinsville, Ga. On 6 February the Confederates made a heavy attack at Hatchet’s Run on Grant’s left, but were finally repulsed with a Union loss of about 1,500. (See Hatchet’s Run [Dankey’s Mill and Armstrong’s Mill] Battle of). The night of 24 March Gen. J. B. Gordon made a daring and most successful assault upon the right of Grant’s lines at Petersburg, capturing Fort Stedman (q.v.) and three strong works. These were recaptured the next day.

The Army of the Potomac was the last to move in the opening campaigns of 1865. It had occupied its lines before Petersburg without general movement from November till the last of March. The general movement, which was to the left, began on the 29th, and brought on the battle of Dinwiddie Court House (q.v.) and White Oak Road on the 31st, and the battle of Five Forks (q.v.) on 1 April, in which latter engagement the Confederates were defeated. On 2 April the Confederate entrenchments were carried, and General Lee abandoned his lines during the night, having notified President Davis during the forenoon that he would begin a retreat on Amelia Court House that night. Jefferson Davis received this dispatch in church. He and his Cabinet immediately collected personal effects and Confederate archives, and left Richmond on a special train. Gen. Godfrey Weitzel received the surrender of the city on 3 April.

General Lee’s army was assembled at Amelia Court House 5 April, and continued its retreat at night. On the 6th General Meade advanced on Amelia Court House, but, finding that General Lee had left, he moved toward Deatonsville (Sailor’s Creek), where the most
of Ewell's corps, the rear of Lee's army, was captured 6 April. (See SALUTON'S CREEK). About the same time General 30,000 men of the divisions of Anderson, Pickett and Bushrod Johnson (q.v.), were captured. Lee continued his retreat and reached Farmville on the morning of the 7th. Here his troops received their first rattling since the retreat began. At 11 o'clock Union troops appeared in the march was renewed, his men being greatly exhausted with loss of sleep, hunger and hard marching. On this day the correspondence began between Generals Grant and Lee, which, on the 9th, resulted in the surrender of Lee's remaining forces at Appomattox. The number paroled was 28,231 officers and men, extra duty men and detailed men of every description, this remnant being all that was left within the control of General Lee of his magnificent fighting machine, the Army of Northern Virginia. See FARMVILLE AND HIGH BRIDGE.

In North Carolina Sherman and Schofield moved against Johnston, occupying Raleigh 13 April. On the 14th Johnston asked for a conference, and on the 18th terms of surrender were agreed upon, subject to the approval of the President of the United States. These, being deemed in part political, were disapproved, and General Grant was sent to Raleigh to insist upon the same terms made with Lee. These General Sherman demanded of and received from General Johnston 26 April, and the war was over, though small independent forces were in the field. Gen. C. S. Foreman, Dick Taylor in Alabama not surrendering to General Canby till 4 May. The last engagement of the war occurred at Palmetto Ranch, Tex. (q.v.).

President Lincoln made nine calls for troops during the war. Under these about 2,800,000 men of all classes were enlisted, including emergency men of a few weeks, three, six and nine months' men, two and three years' men, conscripts and substitutes. There were 52,000 drafted men held in service, 5,000 conscripts who sent substitutes, and 42,000 men who sent substitutes, although not themselves drafted. The Confederate records are very deficient, having been largely destroyed. The best evidence in support of the statement that the War Department places the Confederate strength at something over 600,000. After Mr. Davis' call of the first year a general conscription act was passed 16 April 1862, including all white men between the ages of 18 and 35 for the term of three years. On 27 Sept. 1862, this act was extended to include those of 45 years. On 17 Feb. 1864, the law was extended to those between 17 and 50, the term to be for the war. According to the latest compilation of the record and pension office of the War Department, the total number of deaths from all causes in the Union army during the war was 359,528. As many records are incomplete, the actual number must be somewhat larger. On the basis of the figures given there were killed in action, 67,058; died of wounds received in action, 43,012; died of disease, 224,586. The Confederate losses were quite as severe in proportion to strength, but the records are wanting in such an extent as to make estimates of little value. The most complete records show that 74,524 Confederates were killed or died of wounds and that 39,927 died of disease. These returns are very incomplete and nearly all the Alabama rolls are missing.

Revised by Irving E. Rines.

CIVILIANS, in common speech a word denoting a person whose employments are usually of a civil character as distinguished from one who belongs to the army or navy, while in legal acceptation it designates one who is 'learned in civil or Roman law.'

CIVILIS, Julius, Germanic leader of the Batavi in their revolt against the Romans, 69-70 A.D. At one time he held a command in the Roman army, but being more than once charged
The invention of the harpoon, c. B.C. 16000, is perhaps the oldest device for catching fish. This invention, said Vitruvius, was destined to exert a very strong influence on the habits of the people. This new means of obtaining an abundant food supply probably diverted the Cro-Magnons in part from the arduous and more dangerous pursuit of the larger kinds of game. Some 10,000 years later man invented the net which in some form he used for catching fish, thus refining still further his food-getting methods. The introduction of metals the hook was added to man's fishing-tackle.

Agriculture.—When man ceased to live on what Nature provided without effort on his part, and attempted to produce his own food supply, he wrought a mighty revolution in his habits and character. He had to stay in a place long enough to plant and to reap and this acquired a sense of ownership. The first hints of agriculture are met with in the rough axe-like flints presumably employed "for breaking clods, hoeing the ground and other simple agricultural operations," and finely wrought flint knives, curved somewhat at the point and likely used as sickles. The earliest sickles used in the Euphrates Valley, before B.C. 5000, were wooden models of a sheep's lower jaw set with flint points as a cutting edge. With the introduction of the plow, c. B.C. 5000, at first nothing better than a two-handled hoe and called "the scratching wood," drawn by a human being and later by oxen, agriculture became a definite part of life and made possible large and well organized communities. Even more important in the progress of civilization was the increased fertility of the soil and the extension of crop-growing in spots naturally unfavorable, wrought by the invention of schemes of irrigation. Ur-Nina, c. B.C. 3000, is among the first recorded as building irrigating canals who thus by increasing the fruitfulness of the Babylonian fields made possible the growth and prosperity of the great Euphratean cities and the consequent human development.

Domestication of Animals.—The domestication of animal changed man's attitude toward the animal world and put a demand on his own at his service. About B.C. 10000, from evidences found at Oban in northwestern Scotland, the dog was the companion of man. At about the same time man domesticated to some extent the plateau horse and the forest horse and two varieties of cattle, the Celtic Short-horn and the Longhorn. From Babylonian records we learn that prior to B.C. 3000, oxen were used in agricultural operations and donkeys pulled wheeled carts and chariots.

Fire.—Without the use of fire, man could not have risen above the lowest depths of savagery and barbarism. Something of its importance may be judged from the fact that it early became an object of worship. To keep it burning was a religious duty and the fashioning of metals at the earliest forges was regarded as more than a human occupation.

The earliest evidences of the use of fire thus far discovered date c. B.C. 60000 and consist of "charred wood and bones" found "up to that time. In increasingly improved form remained man's most effective weapon until the invention of the gun."
by employing it as a weapon to drive the bears from the caves in the Neander valley.

In the grotto of La Mouthe a stone lamp, c. B.C. 16000, has been unearthed. This lamp, not unlike some used in Dordogne at the present day, is a piece of sandstone wrought into the shape of a shallow bowl, into which was placed, according to Berthelot, animal fat and a wick. About B.C. 10000 the flint miners of Norfolk had lamps of chalk with a much deeper bowl that carried a greater supply of fat, more likely that they might labor for a longer time in their underground workings. These lamps represent man's first attempt to put fire to domestic and industrial use. The life of man was profoundly affected by discovery of ways and means to cook his food. It meant better food and better health. When he took the fire and put it on a crude stone hearth just within the hut, it meant a better home and the gathering about the hearth marks the beginning of the family circle with all that that has meant. It was another step out of savagery when man with the aid of fire felled trees and hollowed logs to serve as boats. Much more momentous for civilization was the day when he discovered that copper could be smelted from the rocks, and that these metals could be fashioned into very useful tools. Just when or where this happened there is no telling, but it would seem that the people in the Nile and Euphrates valleys made this discovery and were using metals before or by B.C. 3500. Bronze came into use in Egypt as early as 3700 and there are indications of the use of iron as early as B.C. 3300.

Not less important for the upward progress of man was the invention by which he was able to make fire at any time and place he chose. It is believed that certain flint "fabricators" belonging to the period B.C. 7000 were used in conjunction with nodules of iron pyrites for producing fire, the oldest "flint and steel." Mining.—Picks made of flint and "the antlers of the red deer" found in the Thames Valley and elsewhere point to an organized mining industry for obtaining flint, needed for toolmaking as early as 8000 B.C. The oldest picks made from deer antlers still retain the impression of a miner's thumb on the chalky clay which adheres to the surface. There had been no change in the character of mining tools when man began to mine for copper, tin, silver and gold, c.B.C. 4000. That he should be patient and persistent enough to wrest these metals from the earth with such difficulty bears witness to his determination to live more effectively.

Metal-Working.—The discovery of metal, and that it could be wrought to any desired shape, put into human hands resources by which man speedily lifted himself above the level of the Stone Age. Tools and weapons of metal simultaneously increased man's skill and speed as a worker. Metal-working enabled human ingenuity to manifest itself in many far-reaching inventions and improvements. To indicate all that it meant to man in his struggle to get out of the slough of savagery and barbarism, in which he had been for many thousands of years, is impossible within the limits of this article. A hint may suffice. A hollowed tree trunk or a bitumen-lined rush contraption would have been the limit of water navigation had the art of metal-working not been discovered. House building and city building would have been practically impossible nor would there have been carts and chariots.

Textiles.—The growing of flax, first met with c. B.C. 7700 and the spinning-wheels, dolls of pottery or stone used as balance wheels on primitive spindles, are good enough evidence that by this time man had invented the art of weaving. The first woven stuff must in the nature of things have been very coarse, but among predynastic Egyptians, earlier than B.C. 5000, weaving of a remarkably fine order, impossible without a loom it would seem, was already an accomplished fact. In China the silk industry attained a high degree of perfection B.C. 2500. It is recorded that B.C. 7700 cotton was grown in the gardens of Sennacherib, that the people gathered and "carded it for garments." When man learned to weave "fine linen" for the covering of his nakedness he felt a new dignity and received an added impulse toward a conscious superiority.

Building and Architecture.—The first step toward housing himself was taken when the Neanderthal man drove the wild beasts out of the cave in which they could be sculptured on by himself. Probably man never really lived in the cave. From schematic drawings in lines and dots on the walls of the cavern of Font-de-Gaume it is assumed that c. B.C. 30000 to B.C. 25000 huts and shelters built of logs and covered with hides were grouped around or within the entrances of the grottos and caverns. As late as the Danish Middens, c. B.C. 9000 and the lake-dwellers, the huts without chimneys and with walls of wattle and daub were sorry enough places. The invention, in the Euphrates Valley before B.C. 6000, of the brick, a piece of clay, sun-dried and later (about B.C. 5000 burnt, easily handled, was epoch-making. Cut-stone, used where clay is scarce, is brick only of larger size. This seemingly simple invention revolutionized man's whole mode of living. It no longer became necessary to rebuild after every storm or season. The durability of building material encouraged him to take a greater pride in the appearance of his house. One stone he gave to the home a new and richer meaning.

There had always been a community life. Groups of huts resembling villages were built by the lake-dwellers and long before. Better houses, impressive temples and palaces inspired men to live a better sort of community life. Old manners and customs underwent a refinement that made them almost new. New political orders appeared. The cities and towns of increasing pretentiousness which sprang up in Egypt and Babylonia and elsewhere, the direct product of the invention of brick and the use of stone for building, became the cradle of real civilization.

The architect is largely responsible for the great strides toward civilization made between B.C. 4000 and B.C. 3000. The engineer, with architectural and artistic skill lavished upon temples and tombs and public buildings during this period and the centuries immediately following gave to mankind a new scale of values. The architect and engineer for a grand thousand years, improved the life and living conditions. The invention of the arch, before B.C. 3000, besides making lighter buildings pointed the way to the bridging of streams, making road building possible. The use
of heavy blocks of stone taught men how to work together as a unit, giving rise to a new sense of human solidarity.

Art.—The birth of the artistic sense added another powerful influence to the process of civilization. As early as c. B.C. 25000 interesting examples of art appear. In the ivories, in the drawings on reindeer horn, human statuettes sculptured in ivory and soapstone, like those found in the Grottes de Grimaldi. The men of Aurignacian and Magdalenian times covered the walls of the caves with black and colored line drawings and pictures done elaborately in colors. The earliest instance of the use of color is perhaps the crude outline of a mammoth in red ochre on the wall of the cavern of Pindal, and what seems to be the finest example is the picture of a bison on the ceiling of the cave of Altamira c. B.C. 16000. Whether this art arose out of man's desire to beautify the caves where he and his fellows congregated, or whether it had something of a religious or magical origin and served merely to impress on man to describe and record what he saw, there is perhaps no knowing. This prehistoric art would indicate that man was feeling his way toward something other than a purely material and sensuous life. The use of reliefs descriptive of military exploits, industrial activities, religious and domestic relations which with increasing beauty adorn the cities of the Euphrates from b.c. 6000 and on, must have widened man's conception of things, enlarged his thoughts and deepened his interest in human affairs. The wonderful sculpture which filled the Grecian world before and after B.c. 500 must have done much to awaken in the people a love of the beautiful and a distaste for whatsoever was ugly. Perhaps most important of all, this artistic impulse cradled the written word.

Music.—Without art in its broadest sense man's divergence from the animal would have been less pronounced. In his contemplation of actual and possible beauty man is led to hate whatsoever is low and mean. Music helps to lift man to this level of higher appreciation and refinement of the feelings.

2600 B.C. is often classified as a musical instrument then music may be said to date from c. B.C. 20000. Whistles of that period which still give forth some sound, made from the phalanges of the reindeer, have been found in the caves of Perigord and elsewhere. M. Joly says that there have been found in the caves of the Pyrenees of the same period, tubes made of the bones of birds, which may have formed part of a flute like that which tradition ascribes to the god Pan. On a terra-cotta plaque, found in the lower strata at Nippur, c. B.c. 4000, is pictured a shepherd playing a lute. A rock-cut sculpture found at Tel-lo, c. B.c. 3000, shows men with cymbals and pipes and one playing a harp of very primitive construction, and is suggestive of the music of Egypt. What part this primitive music played in the life of the ancient peoples it is hardly possible to guess. At a quite early time it was used to celebrate notable events and entertain kings and princes. It also became an important part of religious ritual. In Greece, in the age of the Tyrants, music became a dominant feature, greatly influencing its literature and national and community life. It was one of the chief cultural agencies and gave rise to institutions which have run through the centuries since played no small part in awakening and directing and shaping the thoughts and emotions of the people. The festival chorus, c. B.c. 500, so important in Grecian life, developed into the drama and the place where the chorus, dressed in goat skins and faces covered with masks, sang the song-stories became the theatre.

Domestic and Social.—For many thousands of years after his beginning man ate like the animal, and had no speech. Back of B.C. 25000 he attempted to cover his nakedness with the pelts of animals. Whatever its immediate effect it led straight to a civilizing interest in appearances and the welfare of the body. With the invention of the needle, c. B.c. 25000, and its notable improvement, c. B.c. 10000, the clothing of the body not only became a habit but something of an art. Even though it originated, as some insist, as a sexual device, it became a mark of civilization. Fine clothes seemed to call forth finer manners and emotional development, other than clothing, such as the wearing of necklaces, c. B.c. 20000, as well as earrings, armlets and girdles may have originated in a desire to attract attention, or for religious or magical purposes, or as means of rank and accomplishment, but it led to a pride of person which must have urged the people ever further from animal-like habits. The shaving of the face and the cutting of the hair before B.c. 4000 in Egypt is evidence of a desire in man to fashion his life after his own ideas.

With the invention, c. B.c. 9000, of a vessel that would hold water and allow of heating the water either by putting in hot stones or placing the vessel over the fire it became for the first time possible for man to cook his food and, in the matter of food and eating, marks his definite departure from savagery. Cooked food meant a more varied and healthful diet. It moved him to think of how he should eat. Before B.c. 4500 man was served very coarse bread made of crushed wheat and barley and millet.

The use of the horns of cattle, as in two bas-reliefs beneath the overhanging cliff of Laussel, c. B.c. 20000, and clay and other natural products as domestic utensils helped further to humanize the method of eating and drinking. Other and more practical utensils were fashioned soon as ever man learned the art of fashioning and hardening clay into pottery. The invention of the potter's wheel, c. B.c. 3500, and the kiln for firing, added greatly to the beauty and usefulness of design, and by increasing the output the refining influence of pottery upon the methods of eating food was more widespread and effective. The importance of table manners is recognized and insisted on in the sayings of Ptah-hotep, c. B.c. 3200.

With the rise of the art of wood- and metal-working, the home of the wealthier classes and eventually of the poorer, were furnished with stools and chairs and couches and bedsteads (after B.C. 3000). By thus adding to the comfort of the home it became a more desirable place and naturally exerted an increasing influence upon the habits and character of the people.

No single fact has been more influential in the process of civilization than the rise of the
family. Respect, consideration for one another, chastity, obedience, honor, sacrificing love, virtues altogether fundamental to civilization, are its direct product. Judging from the precepts of Ptah-hotep, c. B.C. 3200, care and consideration for one another was the proper thing. Man was not considered as an isolated individual, but as a member of a family. In Babylonia the importance of the family is recognized in the laws regulating marriage, divorce, rights of wives and children, c. B.C. 2700. The precepts of Khensu-hotep, B.C. 1500, counsel children not to forget that love bestowed upon them in the Hebrew Decalogue somewhat later it is a religious obligation for children to honor father and mother. This creates an increasing interest on the part of the parents in the bringing up of the children. The author of the Hebrew Proverbs urges parents to "train up the child in the way he should go." Thus each new generation becomes trained a little more thoroughly in the ways of civilization.

Government.—Forms of government do not impress without a fundamental thing could not well be any departure from the savage stage. Belonging to early Aurignacian times, B.C. 25000, and particularly in the later Magdalenian period, B.C. 12000, many horn imitations have been found, conspicuous among them being the somewhat mysterious bâtons de commandement formed of an antler with one or more circular holes, supposed to have been, as Mr. Osborn says, "insignia of authority borne by the chiefs...of possible primitive tribal organizations. It is pretty certain, according to Mr. Budge, that as far back as c. B.C. 8000 the Sumerians or their immediate ancestors were politically organized with a king at the head of things. These primitive efforts at law and order forced our wilder ancestors to hold themselves in check, to be less wild, to think before they acted. The earliest hint that men were beginning to adjust their disputes by presenting them to another for judgment is c. B.C. 4000, though no doubt the custom was older. Urukagina, ruler of Lagash, c. B.C. 2700, is among the earliest known law-makers; the most noted is Hammurabi, c. B.C. 2200. These laws are attempts to compel a certain orderliness in human relationships and in human activities. This growing custom of making a man face the wrong of his acts and inflicting a penalty therefor, compelled him to see the need of taking some thought as to the character and consequences of his deeds. Here and there a man, long before Hammurabi, made notable efforts to give a more civilized character to human relationships. The districts of Lagash and Umma were ready to fly at each other's throat over a boundary dispute whereupon Mesilim, king of Kish, c. B.C. 3000, intervened and the trouble was arbitrjated. The introduction of slavery, whatever its later evils and the inhumanity of its beginnings, helped to transform man from the wanderer and loafer into a world citizen.

Before man can reach up to any worthy degree of civilization there must be justice and humanity as well as order and industry in human affairs. These important elements enter definitely into life with the Hebrew legislation of c. B.C. 2300. Some 50 years later in Greece, Hesiod, a farmer poet, raised a cry for social justice. In Palestine this cry grew into a religion in the time of Josiah; in Greece it resulted in the constitutional reforms of Solon, c. B.C. 590, and later in democratic institutions, and the rise of the spirit of democracy. In the time of Herodotus and Pericles, c. B.C. 450, the people of Greece took active part in political affairs. At the same period a further step forward in civilization was taken when the people of Rome demanded the right to share in the making of new laws. Socrates, c. B.C. 400, brought into being the idea that government should aim to make it possible to live the best sort of life. It was a small contribution perhaps to civilization when the kings of smaller states conceived and put into practice the idea of getting together to defeat some particularly powerful and ambitious neighbor. It was a step out of international disorder and savagery when Burnaburiash, king of Babylon, B.C. 1400, thought to improve the relations between his kingdom and that of Egypt by marrying an Egyptian princess. Militarism was often the only weapon that could be used to protect the attainments of civilization from destruction, and that was what the Egyptians who frequently made war upon the settled communities. The introduction of the horse, B.C. 1900, was a benefit conferred by militarism. The need of transporting large bodies of soldiers and supplies and the need of controlling the horses led to the planning and actual building of roads so essential to civilized communities.

The doctrine of the divine right of kings also became a decisive factor in the progress of civilization c. B.C. 3000. The Egyptian kings adopted the title "Son of the Sun" and the Babylonian Priest-king Gudea, B.C. 2400, was deified and worshipped after his death. The doctrine of the king as the specially chosen of the deity grew from generation to generation, giving superhuman authority to his utterances and sanctity to his person.

Commerce.—In remote prehistoric days it was found to be generally advantageous for the man who could make arrow-heads better than anyone else to keep to that job and trade his wares for the food which the hunter brought home and could spare.

With the growth of cities in the Euphrates and Nile valleys and elsewhere the city dwellers needed food, clothing, and other necessities, and the builders needed materials from far and near, and so commerce rapidly grew to large proportions, challenging the food growers to grow more food and others to exercise their ingenuity to devise means of transportation of this increasing commerce. Records of B.C. 2500 in Babylonia, and the same must have been true in Egypt, make mention of commercial agents, bookkeepers, grain measurers, boatmen, gardeners, capitalists, fishermen; houses and land and cattle and slaves were bought and sold; money was loaned at interest at the general rate of 20 per cent; contracts of all sorts were made and guaranteed. By B.C. 1000 the Phcenicians were altogether a commercial people establishing purely commercial towns westward to the Mediterranean and eastward and southward as well. These commercial cities were outposts and sources of civilization. From the very first, commerce contributed heavily to the process of civilization in that it gave rise to the spirit of fair-dealing, honesty and truthfulness.

Transportation.—Civilization can make but little headway so long as man is nothing better than a beast of burden. It is possible that in
Civilization

prehistoric times he began to shift burden-carrying from his shoulders to the backs of animals. Racks, which were hollowed logs as early as B.C. 10000 may have helped in the matter. With the establishment of cities in the valleys of the Nile and Euphrates a considerable system of water transportation speedily developed. Rafts and basket-like vessels were propelled by oars, lined within and covered without with bitumen, were likely the earliest type of water-carriers before B.C. 5000. Real boats did not lag far behind and the presence of a ship with mast and decks and oars in the Deluge legend would indicate that by B.C. 4000 water transportation had attained a high degree of development, and that somewhere near to this date over-sea ports were visited. Eannadu, B.C. 4000, one of the Euphratean cities, built brick-lined canals for transportation purposes, and the great Hammurabi B.C. 2200, complains that a navigable canal connecting Ereh with the Euphrates was blocked so that the ships could not go up it. An exceedingly ambitious project was the canal dug by Pharaoh, B.C. 2000, connecting the Nile with the Red Sea. A 15th century B.C. painting at Karnak represents Queen Hatshepsut's fleet of five ships equipped with sails just returned from a voyage to the land of Punt. The sea-going vessels under the Phoenicians and the Greeks in no essential thing differ from these early boats and ships. With the establishment of harbors and docks and lighthouses (at Alexandria, B.C. 300) the mercantile marine which has had so great an influence upon the life of the world, became an important factor in the process of civilization.

Land transportation, except for the camel caravan, amounted to little because perhaps draft animals were too costly and wheeled vehicles, as seen in an 8th century inscription, impossibly cumbersome. The first real road to be planned was the highway which Alexander the Great proposed to build from Egypt to Carthage. The most notable feat of transport was the hauling on sledges of immense blocks of stone from quarry to boat and boats to Pyramid and up to the level desired.

The development of transportation made possible the thorough settlement and organized life without which manners and customs were incapable of permanent improvement. Journeying from place to place and dealing with peoples near and far distant, men were compelled to think of the world and life in larger terms.

Science.—At a remote date man became an observer of the overhead and of things about him. Peopling the overhead and every nook and cranny on earth with beings kindly or malicious was the sum total of his attempts to know the world he lived in. The desire to know how these kindly or malicious spirits wrought their will, resulted in the great complicated system of astrology and divination which possessed the world for so long a time and the elaborate observations necessary to the working out of astrological schemes led to the discovery or invention of time divisions, a matter of utmost importance to commercial and industrial life. As early as B.C. 4241 in Egypt a calendar divided into days and weeks and months, very similar to our own and containing 365 days in the year was in use. Without such a time measurement contracts of any sort could not be made, nor agreements entered into. The necessity of dividing time into small divisions to measure the length of time man should work, led to the invention of the clock—a water or sand clock. What is known as the oldest clock in the world is the "shadow clock" bearing the name of Thutmose III, B.C. 1400. These primitive observatories furnished the material out of which was eventually fashioned the science of astronomy which has done so much to rid man of the terrors of astral and meteorological spirits and make long distance navigation possible. Reasoning from what he learned from the ancient Babylonian astronomical lists, Thales told the people to expect an eclipse of the sun before the end of the year B.C. 585. Centuries before Babylonian astronomers had sometimes predicted eclipses, but the importance of the prediction of Thales is that it led him and others to realize for the first time that eclipses and other strange happenings in the sky were due not to the anger or good will of gods but to the operations of natural laws—the first real break with superstition. The understanding of the forces and operations of nature had begun and the way was open to the serviceable use of natural forces. Erasthenes, B.C. 200, suggested that the earth was round, that India could be reached by sailing to the westward and with surprising accuracy he computed the size of the earth. Aristarchus, B.C. 150, demonstrated that the earth and planets revolve around the sun. All ideas that give man a greater mastery, boost civilization. Such is the idea suggested in the Jacob story, Gen. xxx, 37, c. B.C. 850, that the character of the offspring of cattle can be controlled; and the belief set forth in Jer. xxxi, 29 that the conduct of parents affects the unborn generations.

The three centuries preceding the Christian era are notable for many important mechanical inventions or discoveries. Archimedes of Syracus, B.C. 267 to 212, invented the pulley and lever. Screws and cranks and cogwheels and waterwheels and the endless chain came into use at this time. Euclid perfected his geometry.

Medicine.—For long centuries the people on earth were few because human mortality was exceedingly high. From the first, man suffered grievously from disease and deformities. Such conditions were an almost insuperable obstacle to the advance of civilization. Little is known of prehistoric medicine. Whether the trepanned skulls found in prehistoric strata are instances of surgery or a religious ceremony is an open question. The amulet frequently worn by neolithic peoples, B.C. 9000, is the best clue we have to the character of prehistoric medicine. During most of the historic period back of the Christian era, sickness, being considered the result of demon possession or other supernatural influence, cures were to be had by exorcism, incantations and prayers. The library of Assurbanipal has furnished a mass of literature descriptive of the disease demons and the prescriptions supposed to possess the required potency to rout them. Similar descriptions come from Egypt dating back to B.C. 3000. Other cures for diseases were in existence as witness the seal of a Babylonian physician, Ur-Lugal-Edina, which shows as symbols of his profession, scalpel,
lancets (or knives) and cups. The laws relating to doctors in the code of Hammurabi give a hint of what was being done to combat disease and deformity. The scientific treatment of disease may be said to begin with the labors of Hippocrates, B.C. 460-377. By his researches and improvements in medical science, and physiology, made possible by the opportunity for the vicious section of criminals granted him by the king of Egypt, Herophilus, c. B.C. 300, laid the foundation for surgery and a more scientific medicine.

Religion.—Religion has played its part in helping and hindering and shaping civilization. The discovery at Le Moustier of the skeleton of a youth belonging to the Neanderthal race, c. B.C. 40000, with indications that a food offering had been made at his burial, is taken by some to show that at this early date man had some sort of belief in immortality. Apart from this instance of doubtful significance there are no other hints of religion until late Aurignacian times. (To be continued in a later period and widely scattered throughout Europe have been found statuettes of limestone and soapstone and plastic models of the female figure. These statuettes, usually about four and a half inches high, are believed to have been household gods of these primitive folk and were carried with them in their wanderings as was done by the Hebrews some 19,000 years later (Gen. xxxi, 19). Of religion as organized around the altar or systematized into ritual, there is little evidence from prehistoric times. The belief in spirit survival which plainly prevailed among the prehistoric peoples influenced the habits of men and women. By about B.C. 8000 kings and chiefs were buried with considerable pomp and ceremonial, and whether for the purpose of appeasing the spirits of the departed or recalling to mind the virtues and worthy deeds of the dead we do not know, but it became the custom for the people to gather regularly at the tombs and hold high festival. Such festivities drew the bonds of fraternity a little tighter, the sense of community interest was quickened, and the friendly rivalry in the sports of the occasion put a little finer spirit into human relationships. The mingling of religious and social ideas, the merging of religious and political, religion is conspicuous in his activities. He worships gods which are usually fearful and many, and believes that these gods cause all things to happen. Man does not control himself but the gods control him. It is difficult to estimate the influence on a person's character which must have been wrought by the belief that the gods watched him; that what he did either pleased or angered the gods. The whole political structure of the world at and since that early time has been greatly affected by the close association of tribe and palace, ruler and priest, and the inevitable rise of the idea of the sanctity of the person of the king and the infallibility of his commands. King Guats of Lagash, c. B.C. 2400, was defined and worshipped and the Egyptian kings of the fifth dynasty, c. B.C. 3500, claimed descent from the Sun god Ra. The choice of Saul as king, I Sam. x, 1, is another instance. Religion influenced architecture. It created the ziggurat, pyramid development in Babylonia, it fashioned the pyramids of Egypt and its great temples; the famous Greek temples and the development of art and sculpture are but the outward expression of the religious impulse and ideas. The belief that the gods could be influenced or their will learned by mysterious rites performed by specially equipped persons created the priesthood and gave it a great control of human affairs, making the priesthood a large factor in the government of countries. The idea of deity as law-giver also profoundly affected human conduct. It gave to the crudely civilized man of c. B.C. 3000 a reason for obedience to law more powerful than any that had yet pressed upon him. Hammurabi, c. B.C. 2200, as receiving the law from Shamash, the god of law and justice. A similar origin is given to the Mosaic law. It is the deity that demands a certain kind of conduct and punishes the contrary. It was a momentous thing for civilization when, as in Amos, B.C. 750, the deity denounces hard-heartedness, greed, oppression, corruption, and the high value in the other world of good deeds and kindness here, as pictured in the Egyptian Book of the Dead about B.C. 3000, must have awakened a sense of the eternal importance of right living. The civilizing value of the idea of a God as a God of Righteousness proclaimed by the Hebrew prophets has even yet not been fully realized, and when mankind is at last made virtually a religion, religion was destined to play a greater part in lifting civilization to higher levels.

Mora.—Closely bound up with religion are the moral principles which have been learned from time to time. However much civilization has always depended on material progress for its advancement it is something very much more than that. Civilization is nothing less than the humanization of man in society. No matter how learned, or clever or powerful, a man is not civilized unless he is in the best sense human. It was an epoch in the progress of man when Urukagina B.C. 2800 swept the whole army of political and priestly officials from office because they were guilty of taking bribes, thwarting justice and imposing exorbitant taxes. The high moral obligations which the Hebrew prophets insisted publicly that the people must meet, the rising protest against inhumanity in the increasing light of history, religion is conspicuous in his activities. He worships gods which are usually fearful, and many, and believes that these gods cause all things to happen. Man does not control himself but the gods control him. It is difficult to estimate the influence on a person's character which must have been wrought by the belief that the gods watched him; that what he did either pleased or angered the gods. The whole political structure of the world at and since that early time has been greatly affected by the close association of tribe and palace, ruler and priest, and the inevitable rise of the idea of the sanctity of the person of the king and the infallibility of his commands. King Guats of Lagash, c. B.C. 2400, was defined and worshipped and the Egyptian kings of the fifth dynasty, c. B.C. 3500, claimed descent from the Sun god Ra. The choice of Saul as king, I Sam. x, 1, is another instance. Religion influenced architecture. It created the ziggurat, pyramid development in Babylonia, it fashioned the pyramids of Egypt and its great temples; the famous Greek temples and the development of art and sculpture are but the outward expression of the religious impulse and ideas. The belief that the gods could be influenced or their will learned by mysterious rites performed by specially equipped persons created the priesthood and gave it a great control of human affairs, making the priesthood a large factor in the government of countries. The idea of deity as law-giver also profoundly affected human conduct. It gave to the crudely civilized man of c. B.C. 3000 a reason for obedience to law more powerful than any that had yet pressed upon him. Hammurabi, c. B.C. 2200, as receiving the law from Shamash, the god of law and justice. A similar origin is given to the Mosaic law. It is the deity that demands a certain kind of conduct and punishes the contrary. It was a momentous thing for civilization when, as in Amos, B.C. 750, the deity denounces hard-heartedness, greed, oppression, corruption, and the high value in the other world of good deeds and kindness here, as pictured in the Egyptian Book of the Dead about B.C. 3000, must have awakened a sense of the eternal importance of right living. The civilizing value of the idea of a God as a God of Righteousness proclaimed by the Hebrew prophets has even yet not been fully realized, and when mankind is at last made virtually a religion, religion was destined to play a greater part in lifting civilization to higher levels.

This invention gave to life practically a new beginning. Man came to have a past as real as the present. A sense of permanence and continuity was given to life. All man's thoughts were widened. It opened the way out of the terrible ignorance which had held him down for nearly half a million years. From recording names and transactions and events man soon set to recording his thoughts, his speculations, and this set others thinking and speculating on things. Man began to seek and find an intellectual life. There grew up a literature as for example the Precepts of Ptah-hotep in Egypt, c. B.C. 3900, by which the thoughts and achieve-
ments of one generation were passed on to the generations that came, thus making progress a sure thing. The value of the invention of writing is seen in the fact that when a man signed his name or his mark to a contract (B.C. 3000 and earlier most likely), he was held in the grip of an obligation to do what he had agreed. A nation of scribes to make record of the king's doings; the making and administration of laws must needs have men who could write down the laws and the judgments of the courts; the temples must have men able to chronicle religious matters, and so men had to be trained for these semi-intellectual jobs. We can hardly speak of the existence of schools and yet whatever the limitations of the training given men to fill these semi-intellectual positions the effect must have been to increase the number of those who could read and write and create a desire on the part of an increasing number to be able to read and write. The school idea as we understand it is met with in Greece before B.C. 500. When old enough the boys were sent to a school conducted by some poor citizen, or an old soldier or a foreigner. Music and writing were taught, and what perhaps was of greater importance the boys learned many passages from the old poets. Of inestimable importance in the history of civilization is the school of Athens, where Socrates, Plato, Zeno and Aristotle set forth political and social and philosophical ideas which exercised a marked influence upon the thought and character of the persons then living and all generations since. The rise of the gymnasium, B.C. 300 to B.C. 200, where the youth attended lectures on rhetoric, science, philosophy and mathematics was a notable step toward creating and setting the fashion for an educated citizenship. Not least influential in the pre-Christian scholastic institutions was the school of intellectuals gathered in Alexandria, B.C. 300 and after. Men came hither from all civilized countries to listen to lectures containing the latest thought in astronomy, the mystery of grammar and religion. Here the Septuagint version of the Old Testament was compiled.

The founding of libraries is an item that deserves place in this summary. Copies of laws, of religious rituals, of medical prescriptions, commercial papers, and treaties between nations multiplied and were found in considerable numbers in all important cities of the ancient world. But so far as known Assurbanipal, B.C. 668-626, grandson of Sennacherib, was the first to make a collection of the literature of the people and arrange it so that it could be used and was designed to be used. Of much greater importance was the founding of the library at Alexandria by Ptolemy, B.C. 304. The library was the creation of the gifted poet and philosopher Callimachus who originated the name "book" and created the science of publishing correct editions of old works. Here too began the making of dictionaries.

There is a great deal of material for the history of civilization is exceedingly voluminous. All histories of ancient peoples contain matter for this purpose. For those who wish to get at the origins, the series of British Museum guides *The Antiquities of the Stone Age*, *The Bronze Age*, *The Early Iron Age*, *The Egyptian Collections*, *Babylonian and Assyrian Collections* are authoritative; for the prehistoric period, Osborn, H. F., "Men of the Old Stone Age"; Joly, N., "Man Before Metals"; for the historic, Jastrow, M., Jr., "The Civilization of Babylonia and Assyria"; Bosca, W. St., C., "The First of Empires"; Breasted, J. H., "Ancient Times"; Petrie, W. M. F., "History of Egypt"; Morgan, L. H., "Ancient Society"; Tylor, "Primitive Culture"; for Greece, Botsford, G. W., and Sihler, E. G., "Hellenic Civilization".

Charles Graves,

**Chaplain, New York State Assembly.**

**CIVILIZATION, An Introduction to the History of a noted work by Henry Thomas Buckle, an Englishman, published 1847-61.** Although the progress of science has uncovered facts that prove the weakness of an occasional principle in the "History of Civilization," the work remains one of the greatest contributions of modern times to the needs of man as a human document, to be read by the light of scientific discovery. No book of its time was more influential in turning the direction of men's thoughts to the phenomena of social and political science.

**CIVILIZATION IN EUROPE**, a history, by Francois Guizot. In this work Guizot begins with the fall of the Roman Empire, and ends with the opening of the French Revolution. Although he analyzes all the important facts of history between the great landmark of 476 and the convocation of the States-General in 1789, he is far more anxious to grasp their import than to give a vivid relation of them; and, therefore, facts in themselves play but a small part in his exposition. They are simply a help in his effort to discover the great laws that direct the evolution of humanity, and to show growth in development in the individual and in society. His investigations are limited to purely social development, and he does not touch upon the intellectual side of the question.

**CIVITÀ-DI-PENNE**, che' ve tai de pënnà, Italy (the ancient Pomerium), a small town in the province of Teramo, the seat of marble quarries. The first important work was the mausoleum erected in the cathedral at Lucca Pietro de Noceto, secretary to Pope Nicholas V. His greatest works are, in the same church, six statues of white marble representing personages of the Old Testament; bust of the humanist, Pietro di Avenzio; two beautiful angels belonging to the former Altar of the Sacrament, the shrine of which is in the...
South Kensington Museum, London; the tomb of his friend and patron, Domenico Bentini, a miniature octagon temple; the statue of Saint Sebastian; the altar of Saint Regulus, and the pulpit of the cathedral. Among his architectural works is the Bernardini palace at Lucca, of simple style and also the little temple which contains the miraculous crucifix in the church of San Martino. He also erected a monument to Saint Romans in the church of San Romano. The Uffizi Gallery at Florence contains a statue, a satirical description of the lower walks of literature in Paris. This first success was repeated with the later novels 'La Bouscassée' (1869); 'Six morceaux de littérature'; a series, 'Urbains et ruraux,' 'Une Maudite,' for which he suffered four weeks' imprisonment, and many others.

CLADIA, klâ'dî-ām, a genus of plants of the sedge family (Cyperaceae), with about 30 species natives of tropical or temperate climates. They are akin to the Rynchosporas, the spikelets oblong or fusiform, few-flowered, variously clustered. Scales and monograms by Yriati; Roselli (1891); Cappelletta (1892); Volpi (1893).

CLAAR, klâr, Emil, German stage director: b. Lemberg 1842. He was at first an actor making his debut at the Burg Theatre, Vienna. Later he appeared at Graz, Innsbruck and Berlin. In 1870 he was stage manager of the Stadt Theatre, Leipzig, and in 1870-71 of the Court Theatre, Weimar. From 1879 to 1900 he was director successively of two large houses at Frankfort-on-the-Main, and after 1900 was manager of the Schauspielhaus there. His published works include 'Gedichte' (1868); 'Neue Gedichte' (1894); 'Weltliche Legenden' (1898); 'Samson und Delila' (1872); 'Shelley,' a tragedy (1876); 'Die Schwestern' (1892); 'Königsalzgrief' (1895).

CLACKMANNAN, Scotland, the county town of Clackmannanshire, nine miles east of Stirling, on the Forth. Coal, iron and limestone are found nearby. Close to the town are the ruins of a castle of the Bruces. Pop. 2,203.

CLACKMANNANSIRE, Scotland, the smallest county, being only about nine miles long, seven wide and comprising an area of about 34,927 acres or 55 square miles. Its greatest length is 10 miles from north to south, and its nine miles broad from east to west. It lies on the north side of the Forth, by which it is bounded southwest. On all the other sides it is enclosed by the counties of Perth, Fife and Stirling. The north border of the country is occupied by the Ochil Hills, but the other portions are comparatively level, and in general are exceedingly fertile, yielding large crops of oats, barley, wheat, turnips and other green crops. The minerals are valuable, especially coal, which abounds. There are ironworks, breweries and distilleries, woolen manufactures, tanning, glassworks, etc. Pop. 31,121, or 570 to the square mile. The county unites with Kinrossshire in sending a member to Parliament. The principal towns are Alloa (the largest, and famous for yarn), Alva, Tillicoultry, Dollar and Clackmannan; the last is the county town. It is rather poorly built, but has an interesting old tower and an old market-cross.

CLACTON-ON-SEA, England, a popular watering-place on the 'coast of Essex, 19 miles southeast of Colchester by rail, with admirable facilities for sea-bathing, and of easy access from London both by rail and steamboat. It stands on cliffs over 40 feet high. The church of Great Clacton, one and a half miles distant, dates partly from Norman times. Pop. 9,777.

CLADEL, Léon, klâ-del, French浪漫ism: b. Montauban, 13 March 1835; d. 1902. He rose suddenly into prominence with his story, 'Les martyrs ridicules' (1862), a satirical description of the lower walks of literature in Paris. This first success was repeated with the later novels 'La Bouscassée' (1869); 'Six morceaux de littérature'; a series, 'Urbains et ruraux,' 'Une Maudite,' for which he suffered four weeks' imprisonment, and many others.

CLADOCERAC, a small leguminous tree resembling the locust, with two species, one in Manchuria, the other (C. lutea) in eastern United States. It is called yellow wood, yellow ash, yellow locust and fustic in various places. The American or Kentucky yellow-wood is a species with smooth bark, and sometimes grows above 50 feet in the rich soils of Kentucky and Tennessee. The wood, which weighs about 40 pounds to the cubic foot, is strong and hard, and of a bright yellow color. It produces a dye of considerable commercial value, its bark having cataphoretic properties.

CLAFLIN, Horace Brigham, American merchant: b. Milford, Mass., 18 Dec. 1811; d. Fordham, N. Y., 14 Nov. 1889. He received a common school education, worked in his father's store until he was of age, when he went to Worcester, Mass., and in partnership with his brother-in-law, engaged in the dry goods business on a large scale. In 1843 he established in New York the firm of Bulkley & Clafin, importers and jobbers of dry goods; in 1851 it became Clafin, Mellin & Company, and in 1864 H. B. Clafin & Company, by which it is best known. Mr. Clafin conducted an enormous business extending all over the world. Since 1864 it has been the largest merchantile business in the United States, its sales in a single year having reached $72,000,000. Its financial strength, and the money market's firm confidence in Mr. Clafin's methods and integrity, enabled the firm to pass safely through most of the financial crises of the last 40 years. In 1861 and in 1873 it had to ask for slight ex-
tensions of time in which to settle accounts, but all were paid with interest before maturity. In 1864 Mr. Mellin retired from the firm and the name became H. B. Claffin & Company. Mr. Claffin was a man of domestic tastes, fond of books and horses, active in charitable institutions, and an intimate friend of Henry Ward Beecher.

**CLAFLIN, John**, American merchant: b. Brooklyn, 24 July 1850. He was graduated at the College of the City of New York in 1869 and in 1869–70 traveled in Europe and the East. He entered the dry goods business with his father’s firm, H. B. Claffin & Company 1870, and in 1873 became a member of the firm. In 1890 he organized the H. B. Claffin Company and in 1909 organized the United Dry Goods Companies. He was president of both organizations until 1914, when he retired. He has served as trustee of many financial and charitable corporations.

**CLAFLIN, William**, American merchant and statesman: b. Milford, Mass., 6 March 1816; d. 5 Jan. 1905. He was educated in the public schools and at Brown University. For many years he was engaged in the shoe and leather business in Saint Louis, Mo., but later settled in Boston, Mass. He was elected to the State house of representatives 1849–53; to the senate 1850 and 1861; was a member of the Republican National Committee 1864–72; lieutenant-governor of Massachusetts 1866–68; and governor 1869–71. From 1877 to 1881 he was a Republican member of Congress. He was vice-president of Boston University 1869–72 and its president from 1872. The degree of LL.D. was conferred on him by Harvard and Wesleyan universities.

**CLAGHORN, Kate Holladay**, American writer: b. Aurora, Ill., 12 Dec. 1863. She was educated at Bryn Mawr College, and has been engaged in research work for the United States Industrial Commission, was registrar of records 1906–12; is connected with the New York Tene- nant House Department and the New York School of Philanthropy since 1912; is a member of various social workers’ associations and the Protection of Italian Immigrants. Besides contributions to periodicals, she has published ‘College Teaching for Women’ (1897).

**CLAIBORNE, or CLAYBORNE, William**, American colonial official: b. Westmoreland, England, about 1389; d. about 1476. He went to Virginia as surveyor in 1621 and four years later became secretary of state of the colony. In 1627–28 he explored Chesapeake Bay, in 1631 founded a trading post on Kent Island. This post flourished and in time sent a representative to the general assembly of Virginia. Kent Island was included in the grant to George Calvert, first Lord Baltimore, whom Claiborne had previously opposed bitterly in London. He took up arms to enforce his claims to Kent Island but was soon driven off. Maryland and Virginia continued to wrangle about it until 1776. When Virginia and Maryland decided in favor of Charles II, Clai- borne sought and obtained a place on the Crom- wellian commission to reduce that state to submission. When Richard Bennett became governor of Virginia under the new régime Claiborne was made secretary of state. In Maryland all Catholics were removed from of- fice, which act caused general discontent and friction until 1658, when Lord Baltimore again came into possession of the province. After the Restoration Claiborne lost all influence at court and died in obscurity many years later. W. H. Carpenter’s novel, ‘Claiborne and the Devil’ (1845) is based on his career. (See VIRGINIA—HISTORY). Consult Mereness, ‘Maryland as a Proprietary Province’ (New York 1901); Claiborne, J. H., ‘William Claiborne of Virginia’ (1917).

**CLAIBORNE, William Charles Cole**, American politician: b. Sussex County, Va., 1775; d. New Orleans, La., 23 Nov. 1817. He received a good education, studied law at William and Mary College and engaged in its practice in Nashville, Tenn. He assisted in forming the constitution of Tennessee, and represented that State in Congress 1797–1801. In 1801 he was appointed governor of Mississippi Territory, and in 1804 of the territory of Orleans, that part of the Louisiana purchase lying south of the territory of Mississippi and of the 33d parallel. When Louisiana became a State and adopted its constitution, he was elected governor 1812–16. During the War of 1812, he assisted with Jackson in driving off the British at New Orleans. He was later elected United States senator, but died before taking his seat in that body.

**CLAIBORNE STAGE**, in American geology, the rocks, principally shales and limestones, laid down in Middle Eocene time along the Carolinas and the Gulf States and around an arm of the sea that reached northward to the present mouth of the Ohio River. See EOCENE SERIES; TERTIARY SYSTEM.

**CLAIM**, a challenge of ownership of a thing which is wrongfully withheld from the possession of the claimant. The assertion of liability of some one, to the party making it, to do some service or pay a sum of money. The possession of a settler upon lands owned by a government which is not used for any particular purpose, and from which no benefit is derived. When a new section of country is opened up, the government gives to each settler a certain amount of land on condition that he will live there, and improve and cultivate the soil for a definite time. The land taken is called a claim, and the settler receives an absolute title to the property when the conditions have been complied with. The ground must be staked out so that the particular claim may be identified. Mining claims are of this nature. Generally it is required that they be staked out, that a description of the claim be filed and that a certain amount of work be done within a specified time. These claims are considered personal property until the conditions are complied with, and are subject to sale and transfer, it being necessary for all but the original settler to be able to show how and through whom he acquired title, in order to get a complete and absolute title from the government, as it is necessary to show that the land has been used, and in what manner, for a definite length of time, before the settler acquires his title from the government. There are claims for labor and wages by mechanics for work done, by materialmen for material furnished or by pilots for pilotage. When filed of record these claims become liens
against the property which has been benefited by the work, material or care bestowed upon it.

Claims, when filed in the name of a municipal corporation for improvements, such as opening or widening a street, laying sewers or any municipal improvement, are liens against the property benefited.

CLAIMS, Court of. See COURTS.

CLAIRAC, kla-rak', France, a town in department Lot-et-Garonne, on the Lot, 16 miles northwest of Agen. It was built about an abbey in the 8th century. It was the first town in the south of France to declare in favor of the Reformation, and was the scene of many conflicts between the Roman Catholics and Huguenots. It has a large trade in white wines. Théophile Vial was born here in 1626. Pop. 2,388.

CLAIRAUT, kla-ro, Alexis Claude, French mathematician: b. Paris, 15 May 1713; d. there, 17 May 1765. In his 11th year he composed a treatise on the four curves of the third order, which, with his subsequent 'Recherches sur les courbes a double courbure' (1731), procured him a seat in the Academy at the age of 18. He accompanied Maupertuis to Lapland, to assist in measuring an arc of the meridian, and obtained the materials for his work 'Traité de la figure de la terre' (1743 and 1808), in which he proved, contrary to the opinion of Cassini, the flattening of the earth toward the poles. In the field of mathematics, Clairaut studied curves of the third order, tortuous curves and projections, and was the first to find the singular solution of a differential equation of the first degree in X and Y. The equation used by Clairaut, often called Clairaut's form, is \( y = px + f(x) \) in which \( p = \frac{dy}{dx} \). In physics, he explained capillary action by demonstrating the necessity of considering the attraction between the parts of the fluid itself; computed the change in gravity at a high altitude, and so fully demonstrated the figure of the earth that little essentially new has since been added. In 1752 he published his 'Théorie de la lune' (1752 and 1765), and in 1759 calculated the return of Halley's comet. Besides the works already mentioned, he wrote 'Eléments de géométrie' (1741 and 1765); 'Eléments d'algèbre' (1746 and 1760); 'Théorie du mouvement des comètes' (1760). A brother, who died at the age of 12, published in his ninth year a treatise entitled 'Divers Quatdraturas of Circular Ellipses.'

CLAIRIN, kla-ran, George Jules Victor, French portrait painter: b. Paris, 11 Sept. 1843. He studied in Paris under Picot and Pilis, and obtained a second class medal at the Paris Exposition in 1889, and the Legion of Honor medal in 1888. Besides portraits he has painted several brilliant scenes from Spanish history. His paintings are fine in color, effective in composition and have always aroused wide interest. Among them are 'The Benediction of the Swords'; 'Allah! Allah!'; 'The Two Hostile Tribes'; 'After the Victory'; 'The Massacre of the Albarracín'; 'A Moorish Sentinel' (Metropolitan Museum, New York); 'Entering the Harem' (Walters Gallery, Baltimore). His portraits include those of Mounet-Sully as Hamlet (1889), Sarah Bernhardt and Madame Krauss. He also executed a number of effective decorative paintings in the Paris Opera, the Bourse and in the Salle-des-Jeux at Monte Carlo.

CLAIRVAUX, kla-vwa', clar-vah' (clara valis, lightsome vale), a village of northeast France, on the river Aube, 40 miles southeast of Troyes, noted as the site of the celebrated abbey of Cistercian monks, founded in 1115 by Saint Bernard, who was its abbot till his death in 1153. It was a vast establishment, comprising within its enclosure a large portion of monks professed, lay brothers, laborers and artisans employed in various industries. There was a large and magnificent church; four cloisters surrounded by buildings for housing the monks, conversi or lay brothers, the novices and the superannuated members of the order; the abbots' hall with the guest house adjoining it, the kitchen, refectory, infirmary, scriptorium, etc.; all these were grouped in one portion of the monastic domain. In another portion were the fish tanks, the wine-press, slaughter-house, barns and stables, saw-mill, grist-mill, oil-mill, tannery, tile works, etc., producing all necessary supplies for the use of the inmates. At the Revolution the monks were turned out and the lands and buildings, except the church which was destroyed by fire, occupied for public uses; the buildings are now used as a penitentiary and workhouse.

CLAIRVOYANCE (Lat. clarus, clear, + videre, to see), defined as the power of perceiving without the use of the organ of vision or under conditions in which the organ of vision with its natural powers alone would be useless. It comprises the sight of things past, present or future. Various methods of clairvoyance are recounted; by direct vision of things at a distance (opaque substances being no hindrance); by looking into a black surface; by looking into a stream of water, into a crystal, etc.; or by laying the object to be described on the forehead or chest of the clairvoyant; but clairvoyants now usually represent the cerebral region as the seat of illumination. From remote antiquity the possession of such powers by famous persons has been believed. In the Old Testament (2 Kings vi, 15-17) is an account of the opening of the inner vision in the case of the servant of Elisha in answer to the prayer of the prophet.

Clairvoyant powers were claimed for the Pythia at Delphi. Apollonius of Tyana and Diodorus Siculus testify to the clairvoyance of the Indian sages. Macrobius gives an instance of clairvoyance on the part of the oracle of the Heliotopolian god when consulted by the Emperor Trajan. Tertullian speaks of a seeress who could prophesy and prescribe for the sick. Clairvoyance was known among the nations of antiquity, and is still generally accepted as an undoubted fact among Eastern nations. As instances of clairvoyants in later times may be mentioned Jacob Böhme (1575-1624) and Emanuel Swedenborg (1688-1772), the Swedish scientist and founder of the religious body called "The Church of the New Jerusalem." The phenomena of clairvoyance have been carefully observed. The clairvoyant state seems to be intimately connected with the mesmeric, the somnambulistic and the so-called "biological." Mesmeric somnambulism and clairvoy-
CLAM — CLAN

ance were first brought to notice by Puysegur in 1784. The clam-voiant is usually in a state of trance, which may be induced by mesmeric passes. In this state he is sometimes conscious, only of his mesmerizer; in others, his clam-voainment is unresistible; but the clam-voiant may enter the trance state spontaneously, or he may even be in possession of his ordinary faculties, both of which characteristics are to be found in Choklak, the German novelist. In a second-sight, as found in Denmark, parts of the body, especially in the Highlands of Scotland, the seer is not in a state of trance similar to that in other forms of clairvoyance. Others consider that the results are to be explained by telepathic communication between the minds of one or more living persons and that of the percipient. Some modern scientists claim that the discovery of the X-rays, by Roentgen, in 1895, has solved a number of the questions raised by clairvoyance. Consult Flournoy, From India to the Planet Mars. (New York 1900); Podmore, Apparitions and Thought Transference (London 1895); Hyslop, Enigmas of Psychological Research (Boston 1906).

CLAM. While the vernacular name clam is indiscriminately applied to any large edible bivalve, it usually refers to the northern long-necked or soft-shelled clam (Mya arenaria), in distinction from the round clam, hard-shell clam, or quahog (Venus mercenaria), which extends from Cape Cod southward, though occasionally found as far north as the Maine coast (Casco Bay) and the Gulf of Saint Lawrence at Shediac. The soft-shelled clam occurs throughout the Atlantic Coast from North Carolina to Greenland, and on the British shores, where it is called "gaper," and is everywhere on the American coast a valuable article of food. The so-called black "head" is the siphon, which is veryextensible and divided by a fleshly partition into two passages, opening out by two orifices surrounded by a circle of delicate sensitive tentacles; into the lower opening passes the sea-water, carrying minute animals, young and old, and diatoms, around to the mouth, which is in the larger end of the body; through the other or upper opening of the siphon the excreta is expelled. The clam has a tongue-shaped "foot," by which it burrows into the mud or sand to a depth of several inches. The clam may be of either sex, male or female; it is very prolific, extruding an inconceivable number of eggs into the sea, where they are fertilized. The young larvae (veligers) swim at the surface, where they are borne in all directions, until after a few days, the shells becoming heavier, they sink to the bottom, and, resting on the seaweed or stones at the bottom, they become attached by a few byssus threads. Clams begin to spawn by the end of the first year of their life, and in Narragansett Bay are sexually mature and the eggs become ripe when the animal is only an inch long. The breeding season begins in May, reaches its height in June and ends in July. Of course clams cannot feed when the tide is out, hence they grow more slowly when living near high-tide line. When the young begin to burrow, they are usually solid, and they get only the first two months of their life, when one-quarter to one-half inch in length, they are attacked by crabs, eels and starfish (q.v.). In Rhode Island attempts at restocking clam beds and raising clams artificially have met with success and promise valuable results in clam-culture. Clams have been taken five and three-quarters inches long, and weighing 15 ounces. Attempts have been made to plant the clam on the Pacific Coast.

The round, or little-necked clam, or quahog, as it is called in New England, lives in the sand from Cape Cod to Texas, just below low-water mark, and abounds at the mouth of estuaries. The shell is heart-shaped, rather thick and heavy. This bivalve is fished by means of long rakes and tongs, or is dredged like oysters. It has a very large "foot," and plows through the sand, but does not burrow deeply.

The beach, surf or hen clam is Spisula (formerly Macra) solidissima. The large edible species of the southern coast is the painted clam (Calistea gigantea). Several large Pacific Coast bivalves are edible and known as clams, being species of Taper, Laxidimus and Glyci- men. Very unlike any edible clam is the giant clam (Tridacna gigas) of the coral reefs of the Pacific Ocean, whose shell often weighs upward of 400 pounds and whose soft part amounts to 20 pounds of edible flesh. Consult Mead, 300-33d Annual Report of the Commissioners of Inland Fisheries of Rhode Island; Mayer, Sea-Shore Life (New York 1906).

CLAM-GALLAS, klám'-gállás, Eduard, Count, Austrian general: b. Prague 1805; d. 1891. He entered the army in 1823 and reached the rank of major-general in 1849. He commanded the Transylvanian corps which joined the Russians and defeated Bern at Sepsiszentgyörgy. He commanded the First Division of Bohemian Regulars in 1850 and won distinction at Magenta and Solferino in 1859. In 1866 he was defeated by the Prussians at Hühenwasser, Podol, Münchéngrätz and Gitschin. These disasters led to his appearance before a military tribunal, which acquitted him because the chief responsibility for the several defeats was traceable to his superior.

CLAMECY, klám-mé-sé', France, town in the department Nièvre, 38 miles northeast of Nevers, left bank Yonne, at the mouth of the Beuvron. It was formerly surrounded by enormous walls, and defended by a castle which commanded the town and environs. One of its suburbs, situated on the opposite side of the Yonne, was the seat of a bishopric in partibus, known as the bishopric of Bethlehem, founded in 1180 for the bishop of that place, who had been expelled by the Saracens. Wood-rafts for the supply of Paris with fire-wood are made up here, and floated down the Yonne and Seine. The parish church, founded in 1497, is remarkable for its tower and for some fine sculptures. Clamecy carries on several industries, the chief being hat-making. Pop. 4,889.

CLAN (Gael. clann, Gr. clan, cland, off-spring, tribe), a tribe or number of families, bearing the same surname, claiming to be descended from the same ancestor and united under a chieftain representing that ancestor. The members shared certain rights and privileges, and vowed to avenge each other's wrongs. The clan system is essentially the same as that existing among the Arabs, the Tartars and tribes similarly situated. The clan differs from the village or pugis, which
was the first step toward the enlarging of tribal life. From ancient times the "clans" existed in Ireland. The system is said to have sprung out in a series of exiles of King Malcolm II was reigning, but it may have been of greater antiquity. In 1747 the legal authority of the chiefs over their followers was abolished as a punishment for the part which the former had taken in the insurrection which ended in 1745 at Culloden. While the clans flourished they were divided into two, the clans of the borders and those of the highlands. Consult Mayne, 'Hindu Law and Usage' (London 1881); see also 'Ancient Society' (New York 1878); Leist, 'Griecho-italische Rechtsgeschichte' (Jena 1884); Meyer, 'Geschichte des Altertums' (Bonn II, Stuttgart 1893); Krauss, 'Sitze und Brauch der Suidslawen' (Vienna 1885); Skene, 'Celtic Scotland' (3 vols., Edinburgh 1876-80); Lang, 'The Secret of the Totem' (London 1905); Bradley, 'Malta and the Mediterranean Race' (London 1912).

CLAN-NA-GAEL, klàn-na-gèl, Irish secret society, founded in the United States for the purpose of aiding in securing "Home Rule" for Ireland. The Society has been charged with some grave crimes, said to have been perpetrated for the purpose of intimidating the British government; but so little is really known about the workings of the organization nothing positive can be asserted.

CLOSAURUS, klò-sôr'us, TRACHADON, or TRACHODON, a genus of duck-billed dinosaurs (see DINOSAURIA) of the Cretaceous Period. This dinosaur was bipedal, herbivorous, resembling the hadrosaurus (q.v.), but its remains are found in the Upper Cretaceous formations of North America. A mounted skeleton possessed by Yale University is 30 feet long and stands 14 feet high.

CLAP, Roger, American pioneer: b. Salecom, Devonshire, England, 6 April 1669; d. Boston, Mass, 2 Feb. 1691. He came to America in 1630, and with other colonists settled the present Dorchester, Mass. In the course of his life he held several military and civil offices, being captain of Castle William 1665-80, and receiving a general court 1652-56. His 'Memoirs,' written for the instruction and benefit of his children, were originally published by Rev. Thos. Prince (1731). Other editions are 'Memoirs of Roger Clap; Relating Some of God's Remarkable Providences to Him in Bringing Him Into New England' (Boston 1807; Pittsfield 1824; and an edition with preface, etc., printed by the Dorchester Antiquarian and Historical Society, Boston 1844).

CLAP, Thomas, American clergyman: b. Seicuate, Mass, 26 June 1703; d. New Haven, 7 Jan. 1767. He was settled as a minister at Windham, Conn., in 1727, and in 1739 was elected president of Yale College. He contributed much to improve that institution, and through his efforts a college edifice and chapel were erected. He was a man of extensive erudition, gave great attention to mathematics and astronomy and constructed the first orrery made in this country. He published a 'History of Yale College' (1766); 'Nature and Foundation of Moral Virtue and Obligation' (1769); 'Nature and Mutations of Meteorism' (1781), etc.; and had made collections for a history of Connecticut; but most of his manuscripts were plundered in the expedition against New Haven, under General Tryon. He had a deep interest in the controversy 1708, while Maclaurin and Whitefield, and opposed the latter, not so much upon religious grounds as from a misapprehension of Whitefield's designs.

CLAPBOARD, kláp'bôrd, colloq. kláb'bôrd, a thin, narrow board commonly used for covering the sides of wooden buildings. Clapboards are usually of white pine, four feet long and eight inches wide and are made much thinner on one edge than on the other, so that when nailed on to each other one can lap a little over the one next below it. This makes the covering of the building much tighter than if the boards were only set together one above the other and keeps the rain from driving in. Clapboards are sawn out of solid logs, not by sawing them clear through, as in making common boards, but by sawing from the outside to the middle or heart of the log. They are thus made thicker on the outside than on the inside. They are afterward smoothed in a planing machine.

CLAPHAM, a southwest suburb of London, lying a mile south of the Thames and adjoining Battersea, with which it forms a parliamentary borough, three miles south-southwest of Saint Paul's. Pop. 51,353. Clapham Common is still an open common of 200 acres. Clapham Junction, in Battersea parish, is one of the busiest and most perplexing railway junctions in the world.

CLAPHAM SECT, a name given by Sydney Smith to the Evangelical party in the Church of England; the Rev. Henry Venn was the vicar of Clapham, and one of the most eminent Evangelicals—Zachary Macaulay, Wilberforce (q.v.), E. J. Eliot, James Stephen, Charles Grant, Henry Thornton and the Rev. W. Romaine—all lived there. Thackeray's 'Newcomes' has made the phrase familiar to a later generation.

CLAPNET, a ground net used by bird catchers, consisting of two equal parts about 12 yards long by 2½ wide, and each having a slight frame. They are placed about four yards apart, and are pulled over by the catcher. They enclose any birds on the intervening space. They are much used by the bird catchers who supply the London market.

CLAPP, Cornelia Maria, American zoologist: b. Montague, Mass, 17 March 1849. She was graduated at Mount Holyoke College in 1871, and studied also at Syracuse University and the University of Chicago. In 1896 she became professor of zoology at Mount Holyoke. From 1888 to 1902 she carried on investigations at the marine biological laboratory at Woods Hole, Mass. She has contributed articles to technical journals on professional topics.

CLAPP, Henry Austin, American dramatic critic: b. Dorchester, Mass, 17 July 1841; d. there, 19 Feb. 1904. He was for many years clerk of the Supreme Judicial Court of Massachusetts and a well-known dramatic critic on the Boston press. He also lectured extensively on Shakespeare and other writers. 'Reminiscences of a Dramatic Critic' (1902).
CLAPP, Moses Edwin, American legislator: b. Delphi, Ind., 21 May 1851. He was graduated LL.B. at the University of Wisconsin in 1873 and was admitted to the bar in the same year. In 1878-80 he was county attorney of Saint Croix County and attorney-general of Minnesota in 1897-98. In 1896 he was candidate for the Republican nomination for governor and in 1901 he was elected to fill the unexpired term of C. K. Davis in the United States Senate. He was re-elected in 1905 and 1911.

CLAPPERTON, Hugh, Scottish explorer: b. Annan, Dumfriesshire, Scotland, 1768; d. near Sokota, central Africa, 13 April 1827. He entered the merchant service, but was impressed into the navy, served in the East Indies and on the Great Lakes in the War of 1812, becoming a lieutenant; returned to England in 1817. In 1822, with Dr. Oudney and Denham, he went to Africa, where he remained till 1825, returning with valuable information, though the destination of the course of the Niger was left undetermined. On his return to England Clapperton received the rank of captain, and, with Richard Lander, who published an account of his chief's experiences, and three others who died early in the expedition, he immediately engaged in a second expedition, to start from the Bight of Benin. Leaving Badagry in December 1825, he penetrated to Katunga, within 30 miles of the Quorra or Niger, but was not permitted to go further. At Sokonko the Sultan of Bello refused to allow him to proceed to Bornu and detained him a long time in his capital. He was the first European who traversed the whole of central Africa from the Bight of Benin to the Mediterranean. Consult Lander, 'Records of Captain Clapperton's Last Expedition' (1830), and the narrative by Oudney.

CLAUDE, klok, a body of paid applauders at a public performance, according to tradition, an invention of Nero's. The recollection of this gave a 16th century poet, Jean Durat, the idea of the Fandango. In 1820 this body of people was organized by M. Santon who opened an office for the supply of claquers. By 1830 the claqua had become a regular institution. There are several orders of claquers. The chef de claqua studies the piece, maps a series of applause. The commissaire learns the piece by heart and calls the attention of his neighbors to the good parts between the acts. The rieurs laugh loudly at the jokes. The pleureurs feign tears at the sad parts; the chatouilleurs keep the audience in good humor and the bisseurs simply clap their hands to secure encore. At the present time the claqua is a recognized feature of theatrical management in Paris, and although said to be employed in London and New York, the use of such artifices is not recognized as legitimate outside of the French capital.

CLARE, Israel Smith, American historian: b. Lancaster County, Pa., 24 Nov. 1847. He has published 'Illustrated Universal History' (1876); 'Compendium of Universal Geography' (1884); 'Library of Universal History' (1890); 'History of British-Boer War' (1900); 'Illustrated History of All Nations' (15 vols., 1906); 'True History of the Human Race' (1916). He has also edited, or translated, a series of historical poems and many newspaper and magazine articles on historical, economic and foreign political subjects.

CLARE, John, English peasant poet: b. Helpstone, Northamptonshire, 13 July 1793; d. Northampton, 20 May 1864. He led a rambling, unsteady life until 1818, when he was obliged to accept parish relief. In 1818 his poem, 'Descriptive of Rural Life and Scenery' met with a favorable reception, and the issue of his 'Village Minstrel' in 1821 won him many friends. A subscription furnishing him with 645 annually was, however, dissipated by 1823, and his 'Shepherd's Calendar' (1827), which he hawked himself, was not a success. He brought out a new work, the 'Rural Muse,' in 1835, but became insane shortly afterward, and the greater part of his subsequent life was passed in the Northampton Lunatic Asylum. Clare was a genuine poet, and his pictures of rural life are eminently truthful and pleasing.

CLARE, Saint, or SAINT CLARA, Italian nun: b. Assisi, 11 July 1194; d. 11 Aug. 1253. She was born of a noble family of Assisi. When very young she was attracted by the accounts of the work being done by Saint Francis (q.v.), a young man of her native place. At an early age she decided to give her life wholly to God and to work for him in poverty. She sought and received the advice of Saint Francis, and when only 18 years of age, gave up the world and began to devote herself wholly to charity. Other pious young women soon joined her and in time a recognized religious order was founded. For some years they had no special rule, but in 1218 they adopted the rule of Saint Benedict. Later (1224) Saint Francis gave them a rule, mitigating the rigors of the fast, but recognizing holy poverty in the extreme. Two years after her death she was canonized by Alexander IV. The order which she founded is known throughout the world as the Poor Clares; but several branches of the order have been established as Order of Saint Clare, the Escorial Poor Clares and the nuns by which first known, the Order of Poor Ladies. Another and a correct title is Second Order of Saint Francis. The differences in the branches are the rules of poverty. Saint Clare allowed none of her nuns nor her body to be divided individually nor as a body. She followed the practice of Jesus Christ. They did not own the houses in which they lived. Some of the branches, as a body, have corporate rights of property. At the end of the 16th century they numbered nearly 50,000. The nuns devote themselves chiefly to the education of the young. They are under the jurisdiction of the General and Provincials of the Friars Minor. The story of the life of Saint Clare is found in the Bollandist 'Acta Sanctorum on the 11th of August,' and sketches in various 'Lives of the Saints.' Saint Clare is known by the name of Princess of Poverty. See ORDEES, RELIGIOUS.

CLARE, Ireland, maritime county in the province of Munster; boundaries north and east, Galway Bay, county Galway; south and west, the Shannon separating it from Tipperary, Limerick and Kerry; west, the Atlantic. Area, 852,389 acres. Less than one-fifth of this area is under tillage, 80,000 acres are under water and what remains is mountain land. The cliff scenery on the coast...
is magnificent. The surface is irregular, rising in many places into mountains of considerable elevation, particularly in the east and west and northwest districts. The grazing lands are excellent; the chief minerals are limestone, lead and coal, and on the hills and in the valleys coal and iron deposits are almost undeveloped. The chief crops are oats and potatoes. Sheep and cattle on the hillsides, salmon in Conderlaw Bay, the rivers Shannon and Fergus and at Dunbeg are sources of income. There are oyster beds near Ballyvaughan and along the shores of Burren. Frieeze and hosiery are manufactured. The chief town is Ennis. Pop. 104,232, of which 98 per cent are Roman Catholics.

CLARE COLLEGE, University of Cambridge, founded in 1320, and first called "University Hall." In 1336 its patronage was given by Richard de Baden, then chancellor of the university, to Elizabeth de Burgh, sister of the Earl of Clare. Her object in giving her riches to this college was to educate young men who would become priests, in order to replace the many clergymen who died from the plague. Many noted men have been educated in this school, among them Bishop Latimer and Archbishop Tillotson. In 1914-15 there were a master, 17 fellows, 32 scholars and 36 undergraduates. There are fellowships open to B.A.'s or persons of a higher degree, without restriction as to marriage. The master and fellows elect to the vacant fellowships, and the master is elected by the fellows. The foundation scholarships are eight of not less than $300, eight of not less than $100, four of $250 per annum each; three of about $300 per annum, tenable for three years, with preference to cler- gymen's sons, with several minor scholarships.

CLAREMONT, Cal., village in Los Angeles County, on the Atchison, T. and S. Fe Railroad, 35 miles east of Los Angeles. This is the centre of a large fruit growing and raisin making region, and large crops of oranges and lemons are raised here. It is the seat of Pomona College, a Congregational institution, founded in 1888. Value of its tenable property is $1,464,410. Pop. 1,114.

CLAREMONT, England, a mansion situated at Esher in Surrey, 15 miles southwest of London. Early in the 19th century it was the residence of Prince Leopold of Saxe-Coburg, afterward king of the Belgians. Louis Philippe, king of the French, resided here in 1848-50 and died there. It was long the headquarters of the Orleans party.

CLAREMONT, N. H., town in Sullivan County, on the Boston and Maine Railroad, 50 miles north of Concord. The cotton- and woolen-mills obtain their power from the Sugar River. There are also paper-mills, shoe factories, a diamond drill factory, and lumber, granite, brick and marble yards. There are two national banks with a combined capital of $200,000; Stevens High School, and the Fisk Free Library, founded in 1873 and containing 8,000 volumes, are located there. There are six churches. The town was first settled in 1769, the predominating nationality in the population now being French Canadian. Claremont contains a Carnegie library and owns its waterworks. Pop. 7,529.

CLAREMORE, Okla., city and county-seat of Rogers County, 25 miles north of Tulsa, on the Saint Louis and San Francisco and the Saint Louis, Iron Mountain and Southern railroads. Since 1905 it has become popular as a health resort, owing to the discovery of a time of medicinal springs. It is a stock-raising and oil centre. There are brickworks. The waterworks and electric lighting plants are the property of the city. Pop. 2,866.

CLARENCE, Dukes of, a title of English dukes whose origin and early history is identical with that of the family of Clare, earls of Gloucester, who are sometimes called earls of Clare, b of which "Clarence" is a later form.

The 1st Duke of Clarence was LIONEL OF ANTWERP: b. Antwerp, 29 Nov. 1338; d. Alba 7 Oct. 1368. He was the third son of Edward III, who received the title through his wife, Elizabeth, a direct descendant of the Clares, who brought lands called the "Honour of Clare" as part of her dowry. He took possession of her large Irish inheritance and was created Earl of Ulster. A few months before he was created Duke of Cornwall, his authority was ineffective and he returned in disgust to England. After the death of Elizabeth he was married to Violante of Pavia and died during the wedding festivities. Chaucer was at one time a page in the household of Lionel. His only child, Philippa, married the 3rd Earl of March, by which union Clarence became the ancestor of Edward IV.

The next was THOMAS, DUKE OF CLARENCE: b. 1388; d. 1421. He was lieutenant of Ireland (1401-13) when he landed the English fleet (1405); opposed his elder brother who was afterward Henry V; was for a short time at the head of the government, leading an unsuccessful expedition into France in 1412. When his brother became king, Thomas became a member of the royal council. He was present at Harfleur and led the assault on Caen in the expedition into Normandy. He was killed at Beaugé whilst attacking the French and their Scottish allies. He left no legitimate issue and the title again became extinct. It was resumed by GEORGE, DUKE OF CLARENCE, English prince: b. Dublin, 21 Oct. 1449; d. London, 18 Feb. 1478. He is chiefly celebrated for his tragical end, and for the use made of his name and history by Shakespeare. He was the son of Richard, Duke of York, and brother of Edward IV, king of England, and on his brother's accession to the crown in 1461 he was, as the reward of his assistance, created Duke of Clarence, and in 1462 lord-lieutenant of Ireland. When the Earl of Warwick deserted the cause of Edward, Clarence entered into alliance with him, married his daughter in 1469, retired with him to France and afterward landed with him at Dartmouth in September 1470, and in a Parliament held at Westminster by the Lancastrians had the crown settled on him, failing the issue of Henry VI. Clarence had already mediated a double treachery before leaving France, and at Coventry, on 30 March 1471, he left the party he had espoused on the field of an imminent battle and joined his brother Edward, the town of Warwick. Clarence seized his estates and was created Earl of Warwick and Salisbury in his wife's name. Clarence's wife having died in 1476, he offered himself, on the death of Charles the Bold, to Mary, heirress of the estates of Burgundy, but
the king opposed his suit, which hardly needed his opposition to cause it to miscarry. Some of his friends were about the same time hurriedly put to death on an accusation of magic. Clarence appeared in the council to complain of the injustice of their sentence. For this interference with justice he was committed to the Tower. A parliamentary commission which condemned him to death, and he was found dead in the Tower. He was survived by two children, Margaret, Countess of Salisbury, and Edward, Earl of Warwick. Consult Stubbs, W., 'Constitutional History' (Vol. III, Oxford 1895); Ramsay, J. H., 'Lancaster and York' (Oxford 1892); Oman, C. W. C., 'Warwick the Kingmaker' (London 1891). On the title generally see Cokayne, G. E., 'Complete Peerage' (1887-98).

CLAIRENCE HARBOR, a bay on the west coast of Alaska, 45 miles southeast of Cape Prince of Wales. It is in Seward Peninsula, on the east side of Bering Strait. An Eskimo village, Port Clarence, has long been situated on the northeast shore. Here in May 1892 Dr. Sheepshanks, the commissioner of education for Alaska, established the Teller Reindeer Station, as an industrial school for instructing the natives in the management and propagation of the domestic reindeer.

CLAIRENCE ISLAND, (1) An island south of South America and west of Tierra del Fuego; lat. 54° 10' S., long. 71° 20' W. (2) An island of the South Shetland group, south of Fuegia. Lat. 61° 16' S. It is glaciated.

CLAIRENCE RIVER, a large river of Australia, rising in the McPherson Mountains and flowing eastward for about 250 miles through a fertile valley into Shoal Bay, New South Wales. It is navigable for 50 miles, to Grafton for vessels of 10 feet draught, and small steamers ply to Moelville, 30 miles farther up. It has a bar at its mouth where there is a lighthouse, lat. 29° 25' S., long. 153° 25' E., and a costly breakwater.

CLAIRENCE STRAIT, (1) In the Persian Gulf, between the island of Kishm and the mainland. It is from 3 to 13 miles broad and has many islands. (2) In Alaska, between the Prince of Wales Archipelago and Duke of York Island. (3) In Australia, the channel between Melville Island and the northwest coast, communicating with Van Diemen Gulf.

CLAIRENCEUX, or CLARENCEUX, klar.en-shoo, or su, an officer of the English heraldic college. The jurisdiction of this provincial king-of-arms includes England south of the Trent; that of Norroy, the second king-of-arms, the territory north of that river. The duties of the office include the granting and survey of arms, the registry of descent and marriages, etc. It takes its name from the Duke of Clarence, son of Edward III.

CLAIRENDON, Edward Hyde, Earl of, English statesman; b. Dinton, Wiltshire, 18 Feb. 1609; d. Rouen, France, 9 Dec. 1674. He commenced his political career in 1620, when he was returned to Parliament. In this Parliament he argued in favor of a grant to the king, which was subsequently imposed by Parliament. He was returned to the Long Parliament (November 1640) by the borough of Saltash, and laid aside his legal business to devote himself to his parliamentary duties. At first he acted with the more moderate of the popular party, but soon found reason to change his course. A dread of democracy seems first to have led him to oppose his former friends, and his speeches and votes soon attracted the favorable notice of the court. He was offered the solicitor-generalship, which he declined, but agreed, at the king's request, to consult with his regular advisers, Falkland and Colepepper. Hyde was an honest and independent supporter of the royal authority, disposed to make moderate concessions to the popular demands and in no way responsible for the rash measures of the king, which were often taken without consulting any of his advisers. Upon the breaking out of the civil war he attached himself to the king's party, became Chancellor of the Exchequer and member of the privy-council; and after vainly attempting to bring about a reconciliation between the contending parties, was appointed by the king to wait upon the Prince of Wales, who was first sent with an army to the west. Afterward, on the continued ill success of the expedition, he retired to Jersey in 1646. Here he remained for two years, while the prince was in France, and during that time began his 'History of the Rebellion.' He likewise composed in Jersey the various writings which appeared in the king's name as answers to the manifestoes of the Parliament. On the capture of the king, Hyde received orders to rejoin the Prince of Wales, but was becalmed and taken prisoner by pirates from Ostend. In September 1652 he resided at Charles at The Hague, who sent him to Madrid to see if any assistance could be obtained from the Spanish court. On the failure of this negotiation he retired to Antwerp, but soon resumed the business of the exiled court, of which he continued to be the most trusted adviser, first at Paris and afterward at The Hague, where Charles II appointed him Lord-Chancellor of England in 1658. After Cromwell's death Edward Hyde contributed more than any other to the success of the measures which placed Charles II on the throne. He subsequently possessed the entire confidence of the king, who loaded him with honors. In 1660 he was created Baron Hyde, and in 1661 Viscount Cornbury and Earl of Clarendon. When the parliamentary party occurred to disfranchise him in the licentious court of Charles II; among these was the marriage of the Duke of York, the king's brother, to his daughter. The Duke, while at Breda, the residence of his sister, the Princess of Orange, became acquainted with Anne Hyde, Clarendon's eldest daughter, maid of honor to the princess, and married her secretly, 3 Sept. 1660, in order to legitimize their first child, born on 22 October. Anne was acknowledged as Duchess of York in December 1660, and two daughters, Anne and Mary, were of the fruit of this marriage, both of whom ascended the British throne. In 1663 Lord Bristol made an attempt to impeach the chancellor in Parliament, which, however of some of the acts of the administration were questionable, proved unsuccessful. The Duke of Buckingham, moreover, was continually laboring to make the chancellor ridiculous in the eyes of the king, and his position as chancellor was continually assailable for all the faults of the administration. The ill success of the war against Holland, the sale of Dunkirk and other events ex-
cited public indignation. The king’s displeasure was changed into hatred when he saw his plan of repudiating his wife and marrying Lady Stuart defeated by Clarendon, who effected a marriage between this lady and the Duke of Richmond. The king deprived him of the offices and an impeachment for high treason was commenced against him. The Lords refused to imprison him on a general accusation by the Commons. This gave rise to a dispute between the two houses, the Lords ordering Clarendon to Calais, leaving an expostulatory letter to the Lords, which they communicated to the Commons, who ordered it to be burned by the common hangman. The Lords still refused to join in his attaint, but agreed with the Commons in an act of banishment and incapacity. The hatred of the nation pursued him even to the Continent. At Evreux he was attacked by some British sailors, dangerously wounded and with difficulty rescued from their hands. He passed the next six years at Montpellier, Moulins and Rouen, at which latter place he died. His remains were afterward carried to England and buried in Westminster Abbey. Lord Clarendon, as long as he was minister, was the friend and supporter of the king against the factious and the defender of his country’s freedom against the abuse of the royal power. Ingratitude and prejudice the more easily ruined him, as his stern and proud character prevented his gaining friends. Among his many writings, the most important is the History of the Rebellion, from 1641 Down to the Restoration of Charles II. It is the most valuable of all the contemporary accounts of the Rebellion, and contains many excellent pen portraits of the chief actors in its events, but it is somewhat unequal, digressive and lacking in proportion. Consult Lister, Life of Lord Clarendon (1838).

CLARENDON, George William Frederick Villiers, 4th Earl of, English statesman: b. 12 Jan. 1800; d. 27 June 1870. By his mother, Lord Clarendon was indirectly related to the Hydes, the family of the great Earl of Clarendon, author of the History of the Rebellion. He was educated at Cambridge, entered the diplomatic service at an early age and in 1833 was appointed Minister-Plenipotentiary to the court of Madrid. He was instrumental in negotiating a treaty, signed in 1834, called the Quadruple Alliance, in which the four contracting parties—England, France, Spain and Portugal—agreed to unite in expelling Don Carlos and Don Miguel, pretenders to the Spanish and Portuguese crowns, from the Peninsula. In 1838 Lord Clarendon succeeded to his uncle’s title. In January 1840 he was appointed lord privy-seal; and was lord-lieutenant of Ireland from May 1847 to February 1852. The most notable events of this latter period were the great Irish famine and the rebellion headed by the ‘Peelites.’ Lord Clarendon’s administration in regard to both of these difficulties was both firm and philanthropic; but his early popularity somewhat declined in Ireland, which was perhaps due to his impartiality in declining to adopt the measures of the Roman Catholic or the Orange party. He was Secretary of Foreign Affairs in 1853–58 and during this period the Crimean War was concluded, Clarendon being one of the British negotiators of the treaty of peace. He was again Foreign Secre-
lage of Clarendon, in Wiltshire. These laws, finally digested into 16 articles, were brought forward by the king as ‘the ancient customs of the almshouses’ and as such by the council. They consisted, however, partly at least, of reforms introduced by the king himself. Ten of the articles were condemned and six allowed by Pope Alexander III. The six articles approved were of comparative slight importance, mostly confirming the privileges of the ecclesiastical order; among the condemned articles the most important were the first, providing that disputes between laymen and ecclesiastics as to adovsons should be tried in the King’s Court; third, that ecclesiastics accused of any offense against justice should be answerable to the civil courts for the civil offense, and to the ecclesiastical courts for the ecclesiastical offense; fourth, that ecclesiastical dignitaries should not go out of the kingdom without the king’s leave; eighth, that appeals should be made from the court of the archbishop to the King’s Court, and should not go to the pope (or, to the pope) without the king’s consent; ninth, that in the event of a dispute between a layman and an ecclesiastical as to whether the civil or ecclesiastical court should have jurisdiction in certain cases of tenure of property, the tribunal should be determined by the king’s chief justice under a recognition of 12 lawful men; 12th, that pleas of debt should belong to the king’s jurisdiction. Notwithstanding the entreaties of the other prelates, and in defiance of the opinion of Becket, after a momentary appearance of yielding, peremptorily refused his signature to the articles. After the murder of the archbishop, the king, on his reconciliation with the pope in 1172, was compelled to promise the abolition of all laws and customs hostile to the clergy; and at the Council of Northampton in 1176 the constitutions of Clarendon were materially modified in favor of the ecclesiastical order, although some of them remained permanent gains to the civil power. Consult Stubbs, ‘Constitutional History of England’ (Vol. I, Oxford 1896); Pauli, ‘Geschichte von England’ (Gotha 1853–56); and for the text of the ‘Constitutions,’ Stubbs, ‘Select Charters Illustrative of English Constitutional History’ (7th ed., Oxford 1890).

CLARENDON PRESS, Oxford, the name by which the press of the University of Oxford is distinguished. In January 1586 delegates de impressione librorum were appointed by the Convocation of the University. About this time Joseph Baines was appointed printer to the University, and others bore the title after him. In 1633 Archbishop Laud procured letters patent granting a large license in printing to the university, with a view to the publication of manuscripts from the Bodleian Library. The work was carried on from 1713 to 1830 in the building known as the Clarendon, the cost of which was defrayed partly from the sale of Lord Chancellor Clarendon’s ‘History of the Reigns of Edward II and III,’ the copyright of which was sold to the university. The management of the printing office is committed to a board consisting of the vice-chancellor and 10 other members of Convocation, nominated by the vice-chancellor and proctors as vacancies occur. Five are perpetual delegates and five are nominated for a term of seven years. The south side of the present building (the additional accommodation required and opened) is appropriated to the printing of Bibles and prayer-books. The north, called the ‘learned’ or ‘classical’ side is assigned for the printing of university documents, books printed by authority of the delegates and those sent in by private authors and publishers. These printed for the university itself (but no others) bear on the imprint ‘E Typographo Clarendoni-ano,’ or ‘At the Clarendon Press.’ Some admirable specimens of typography have been produced by the Clarendon Press. It has now an American branch.

CLARENS, klär-rän, Switzerland, a village in the canton of Vaud, on the northeastern coast of Lake Geneva, about 50 miles from Geneva and 1,200 feet above sea-level. The healthfulness of the climate and the beauty of the place make it a resort for invalids. It is the scene of Rousseau’s ‘Nouvelle Héloïse.’

CLARES, Poor. See CLARE, SAINT; ORDERS, RELIGIOUS.

CLARET, a name originally given to wines of a light-red color, but now applied to the red wines imported from France, chiefly from Bordeaux. These wines vary in composition according to the locality, season and age, but the produce of each vineyard usually retains its own peculiar characteristics. The most esteemed are those produced at the vineyards of Lafitte, Latour, Chateau Margaux and others. Many of the claretts formerly sold in the United States were nothing more than the vin ordinaire used by the French peasants and working classes, but since the development of the California grape industry as good domestic claret can be obtained here as anywhere. A genuine claret should contain from 10 to 12 per cent of proof spirit. Fictitious claretts were sometimes prepared by mixing a rough cider with a cheap French wine and coloring with cochineal, logwood, elderberry, hollyhock, indigo, litmus, red ochre, bage, beet-root or ros-aniline. To detect these coloring matters the following method may be adopted: Make a jelly by dissolving five grams of gelatine in 100 cubic centimeters of warm water and pour it into a square dish. From this cake of jelly cubes about three-fourths of an inch square are cut with a sharp, wet knife and are immersed in the wine; they are taken out after 24 to 48 hours, washed slightly and sections cut in order to see how far the coloring matter has penetrated. If the wine is pure, the color will be confined to the edges of the slice, or will not have penetrated more than an eighth of an inch. The coloring matters mentioned above permeate rapidly and color the jelly.

CLARETIE, klär-té’, Arsène Arnaud, called Jules, zhüel, French novelist and dramatist: b. Limoges, 3 Dec. 1840; d. 1913. He studied at the Lycée Bonaparte of Paris and became known as a feuilletonist and dramatic critic. During the Franco-Prussian War he acted as correspondent for Paris papers for a brief period. He wrote a long series of very successful novels, the most noteworthy of them being ‘Madeleine Bertin’ (1868); ‘The Million’ (1882); ‘Monsieur les Mille’ (1882); ‘Notis, Manners of the Time’ (1883); ‘The American Woman’ (1892). He wrote also some
CLARIBEL — CLARISSA HARLOWE

striking chapters of contemporary history, as "The Revolution of 1870-71;" "Paris besieged;" "Five Years After: Alsace and Lorraine since Annexation." His dramatic compositions relate mostly to the time of the great Revolution. He became administrator of the Comédie Française in 1885, and was chosen member of the Académie Française in 1888. Among his critical works are "La vie moderne au théâtre" (1868-69); "Molière" (1871); and "Histoire de la littérature française" (1905).

CLARIBEL. (1) The bride of Phaon, as told in Spenser's "Faerie Queene." Philemon endeavors to injure her by false stories to which Phaon gives credit and kills Claribel. When he learns of the deception he murders Philemon. (2) A poem by Tennyson.

CLARIBEL, Sir, a knight who figures in Spenser's "Faerie Queene." One of four knights who fight for the false Florimel. Belsebom enters the combat with them; Arthur ends the fray, as it is "stained" by him.

CLARIFICATION, the separation of the insoluble particles that prevent a liquid from being transparent. It may be performed by depuration, filtration or coagulation. In the first of these operations the liquid is permitted to subside, without being in the least disturbed, until all the particles which were in suspension are precipitated; it is then decanted. This mode of clarification can be used only when the substance operated on is in a large quantity, or is of a nature not to be altered during the process. Clarification by coagulation is performed with the assistance of albumen (as in-glass or white of eggs) added to the liquor for this purpose, which, by the action of heat, of acids, etc., becomes solid, forms a mass and precipitates the extraneous substances. Clarification is also now commonly effected by centrifugal machines.

CLARINDA, Iowa, city, county-seat of Page County; situated on the Nodaway River, 79 miles southeast of Council Bluffs and the Chicago, B. and Q. Railroad, and is 45 miles east of the Missouri River. It is surrounded by an agricultural and stock-raising country and contains carriage factories, brick works, flour-mills, iron works and two banks. The city exports live stock, poultry, butter, eggs, seeds, grain and coal. Valuable coal beds are near the city; also a State asylum for the insane. Pop. 4,000.

CLARINET, or CLARIONET, a woodwind musical instrument with a single vibrating reed, a cylindrical tube and a trumpet-shaped mouth. It is played by means of 18 holes, of which 13 have keys. Its scale, though including every semitone within its extremes, is by no means diatonic. Its lowest note is E below the F clef, from which it is capable, in the hands of good performers, of ascending more than three octaves sharply divided into four distinct qualities of tone characterized by clearness derived from clarinetto or clarion, signifying clarity of tone. Its powers through this compass are not everywhere equal; the player, therefore, has not a free choice in his keys, being generally confined to those of C and E, which indeed are the only keys in which the clarinet is heard to advantage. The music for this instrument is therefore usually written in those keys. There are, however, B flat clarinets, A clarinets, D clarinets, B clarinets and G clarinets; the three latter are not ordinarily used.

CLARION, Pa., borough and county-seat of Clarion County, 100 miles northeast of Pittsburgh, on the Clarion River and the Pennsylvania Southern Railroad. Oil, lumber and natural gas are produced in large quantities in the neighborhood. The borough has coal works, cigar factories and bottle factories, also a county courthouse and a State normal school. The borough was settled in 1839 and incorporated two years later. It is governed by a burgess and a borough council, the former being chosen for a three-year term. Pop. 2,900.

CLARION, a musical instrument of the trumpet kind, with a narrower tube and a higher and shriller tone than the common trumpet.

CLARISSA FURIOSA, a story by W. E. Norris, first published in 1896. It may be regarded in the light of a satire on the "New Woman," and is perhaps the least successful of the clever author's novels. The most of the story is taken up with the semi-public life to which the heroine devotes herself after she has separated from her husband. The workmanship is good, but the writer's want of genuine interest in his characters is felt.

CLARISSA HARLOWE. 'Clariissa Harlowe' is the novel upon which rests the fame of Samuel Richardson. As originally published, it consists of seven volumes, which appeared in instalments; the first two volumes in November 1747, the third and fourth in April 1748, and the fifth, sixth and seventh in the following December. The great length was occasioned in part by the form of narrative which the author adopted in this as well as in his other novels. Though Richardson was not the first novelist to make a free use of letters, he was the first one to weld several groups or series of letters into a coherent whole. And yet, in the ordinary sense, Richardson has no story. He takes a simple situation, which he carefully elaborates and then works out in minute detail. Clarissa is the daughter of a country squire, still in her teens, whom her family try to force into marriage with a man whom she loves. In her dilemma she places herself under the protection of Lovelace, a libertine, whose character she suspects but does not fully know, and flees with him to London. Her confessed lover betrays her by the basest act of treachery. Clarissa dies of a broken heart, and Lovelace expiates his crime in a mortal duel. This is all there is to 'Clariissa Harlowe' as a story.

It is the workmanship—the sure and certain hand manipulating a multitude of emo-
tional incidents — that interests the reader of the novel. Richardson records Clarissa’s emotions from day to day, and from hour to hour, in the most distressful situation. One can almost hear her heart beat. There are two volumes depicting her state before she elopes, and a volume is necessary to describe her death. The result is a wonderfully realistic effect. People wrote and talked about Clarissa as if she really lived in the flesh, and they sought out the places associated with her name. While the novel was in progress, men and women, some of them unknown to the author, wrote to him, pleading that he should save the heroine from the fate they feared was impending; but he disregarded their remonstrance and let the tragedy move on to the inevitable end. There emerges a young woman of exalted character, beautiful and amiable, who, being smugged by a villain, prefers death to life. 'Clarissa Harlowe' has become in our literature a type of pure womanhood, and Lovelace the type of the arrant villain, whose virtues — and he has many — are completely eclipsed by one shameless vice.

The novel, at once translated into several languages, created a sensation throughout western Europe. On its plan hundreds of novels have been written in England, France and Germany. From it derive, for example, MacKenzie’s 'Man of Feeling,' Rousseau’s 'La Nouvelle Héloïse,' and, through Rousseau, Goethe’s 'Sorrows of Werther.' To Mrs. Klopstock, over in Germany, 'Clarissa' was a 'heavenly book'; and Diderot, the French philosopher, placed it on his shelf by the side of Homer, Euripides, Sophocles and the Bible. A Dutch clergyman doubted not that certain parts of the novel, if found in the Bible, would be pointed out as manifest proofs of divine inspiration. Macaulay claimed to know it almost by heart, and Alfred de Musset pronounced it 'le premier roman du monde.' Of course many readers have not felt this enthusiasm, and the novel has been called tedious, overwrought and sentimental. It is indeed difficult for anyone, not psychologically inclined, to maintain an interest in an emotional story where for pages nothing may happen more exciting than a domestic incident. Lady Mary Wortley Montagu, though she admitted that Richardson described a squire’s household as it was, thought the novel on the whole a strange performance; and Horace Walpole called it a picture of ‘high life as conceived by a book-seller,’ and a romance as it would be spiritualized by a Methodist teacher. More recently, the late W. E. Henley denounced Richardson and all his ways as immoral. To say the truth, the fame of ‘Clarissa’ has deservedly suffered much abatement in popular esteem. Nor is Richardson any longer the model for the novelist. The fact, however, remains that he wrote a great book — the first complete fictitious biography of a woman; and he was master from day to day in a part of art that had impressed her on the world as a real woman who once lived and suffered martyrdom for her sex. In the fine words of Mrs. Barbauld, Richardson’s first biographer, we see in the character of Clarissa ‘that virtue is triumph- ant in every situation; that in circumstances the most painful and degrading, in a prison, in a brothel, in grief, in distraction, in despair, it is still lovely, still commanding, still the object of our veneration.’

WILBUR L. CROSS,
Professor of English, Yale University.

CLARK, Abraham, American patriot: b. Elizabethown, N. J., 15 Feb. 1726; d. Rahway, N. J., 15 Sept. 1794. He studied for the bar and practised in his native State with success. After serving as sheriff of Essex County, he was chosen a delegate to the Continental Congress in 1775 and signed the Declaration of Independence. He was a member of the Continental Congress 1776-78, 1780-83 and 1785-88, 1791-94; of the Constitutional Convention of 1789, and aided in framing the Constitution of the United States.

CLARK, Albert Curtis, English classical scholar: b. Salisbury, 21 Feb. 1859. He was educated at Balliol College, Oxford, was fellow of Queen’s College 1882, lecturer 1882-87 and tutor 1887-1913. Since 1913 he is Corpus Christi professor of Latin at Oxford. His publications are ‘Collations from Harleian MS. of Cicero 2682’ (1891); Cicero’s ‘Pro Milone, Cesariane, Philippice’ (1900); ‘The Vetus Clunianensis of Poggio’ (1903); ‘Inventa Italorum’ (1909); ‘Fontes Prose Numerose’ (1909); ‘Cururs in Medieval and Vulgar Latin’ (1910); ‘Prose Rhythm in English’ (1913); ‘The Primitive Text of the Gospels and Acts’ (1914); ‘Recent Developments in Textual Criticism’ (1914). He edited the Oxford ‘Cicero.’

CLARK, Alonzo Howard, American scientist: b. Boston, 13 April 1850. He left his studies at Wesleyan University to enter the service of the United States Fish Commission, making a thorough study of the work. In 1889 he was sent as expert commissioner to the Paris Exposition of that year. From 1889 to 1908 he was assistant secretary of the American Historical Association. He has written ‘History of Fish Industries of the United States’; ‘Whales and Sea Fisheries’; ‘History of the Mackerel Fisheries’; ‘Food Industries of the World’; ‘Statistics of Fisheries of Massachusetts’ (1882); ‘History of Mackerel Fishery’ (1883); ‘National Register of the Society of the Sons of the American Revolution’ (1902).

CLARK, Alvan, American astronomical-instrument maker: b. Ashfield, Mass., 8 March 1808; d. Cambridge, Mass., 19 Aug. 1887. He was at one time a portrait painter in Boston; but in 1844 his attention was turned to telescope making. Two years later he definitely adopted the business of astronomical-instrument making and in time achieved a world-wide reputation. His famous telescopes include the Chicago 18½-inch, the Washington 26-inch, the Russian 30-inch and the California 36-inch. Consult ‘Proceedings of the Royal Astronomical Society’ (Vol. XVII, London).

CLARK, Alvan Graham, American astronomer: b. Fall River, Mass., 10 July 1832; d. Cambridge, Mass., 9 June 1897. He was a son of Alvan Clark (q.v.), and became associated with him under the firm name of Alvan Clark & Sons. In 1859 they began work on an object glass with an aperture of 18½ inches, which ultimately became the property of the Astronomical Society of Chicago. With this instrument Clark discovered the companion of Sirius.
for which the French Academy awarded him the Lalande medal. Other telescopes constructed largely under his supervision were that for the Naval Observatory, a 26-inch instrument with which Prof. Asaph Hall discovered the satellites of Mars; the McCormick telescope for the University of Virginia; the great 30-inch one for the Saint Petersburg Imperial Observatory; the powerful Lick telescope, with an aperture of 36 inches, at Mount Hamilton, Cal. (1886), with which Jupiter's fifth satellite was discovered; and, finally, the greatest of his achievements as a maker, the wonderful Yerkes lens of 40 inches, the gift of C. T. Yerkes to the University of Chicago, and installed in the observatory at Lake Geneva, Wis. As an astronomer he made several discoveries of double stars. See Telescope, Construction.

CLARK, Sir Andrew, Scotch physician: b. Aberdeen, 28 Oct. 1826; d. London, 6 Nov. 1893. He was educated at Aberdeen and Edinburgh. After an unusually brilliant career as a student of medicine at Edinburgh, he assisted Dr. H. E. Bennett and Dr. Robert Knox, the anatomist; had charge for four years of the pathological department at the Haslar Naval Hospital; curator of the museum of the London Hospital (1853), and assistant physician there (1854). After 1857 he became associated with the College of Physicians, becoming an officer of that body and president in 1888. He had a large practice in London, and wrote on many subjects, especially tuberculosis. He will live in remembrance as the "beloved physician" of George Eliot.

CLARK, Champ, American statesman: b. Lawrenceburg, Anderson County, Ky., 7 March 1850. In his own biography he gives his early life: "Worked as a hired hand, clerked in a country store, edited a country newspaper and finally practised law." He was graduated at Bethany College A.B. 1873, and at the Cincinnati Law School LL.B. 1875. He was president of Marshall College, West Virginia, 1873-74; was admitted to the Missouri bar in 1875, and practised in Bowling Green, Mo., from 1880. He was attorney of Louisiana, Mo., and Bowling Green, Mo., 1878-81; presidential elector in 1880; prosecuting attorney in Pike County, Mo., 1885-89; representative in the State legislature of Missouri, 1889-91; representative from the 9th district of Missouri in the 53d Congress, 1893-95; was defeated for the 54th Congress by a music teacher at a time when Missouri sent 11 Republicans to Congress, and elected from the 9th district of Missouri to the 55th and successive Congresses, including the 64th Congress. He served on the House Committee on Foreign Affairs, and on the Committee on Ways and Means. He served as vice-president for Missouri in the Trans-Mississippi Congress, held at Denver, Colo., in May 1891, and was chairman of the Democratic National Convention of 1904; and chairman of the committee to notify Judge Alton B. Parker of his nomination for the Presidency. He was minority leader in the second session of the 60th and 61st Congress, and was elected speaker of the House of Representatives of the 62d, 63d and 64th Congresses. In 1912 he was the leading candidate for the Democratic nomination for President at the National Convention at Baltimore, leading on 29 ballots and receiving a clear majority on nine ballots, but was defeated by Governor Wilson of New Jersey.

CLARK, Charles Edgar, American naval officer: b. Bradford, Vt., 10 Aug. 1843. He entered the naval service in 1860; took part in the battle of Mobile Bay and in the bombardment of Fort Morgan, and was promoted captain in 1866. In March 1868 he took command of the battleship Oregon at San Francisco, and when war with Spain was deemed inevitable, received orders to proceed to Key West, Fla., with all haste. After a voyage of over 14,000 miles he joined the American fleet in Cuban waters on 26 May, and on 3 July commanded his ship at the battle of Santiago. In March 1899 he was assigned to duty at the League Island navy yard; was promoted rear-admiral 16 June 1902, and retired 9 Aug. 1905. He wrote 'My Fifty Years in the Navy' (1917).

CLARK, Charles Heber ("Max Adeler"), American journalist: b. Berlin, Md., 11 July 1841; d. 10 Aug. 1915. In 1865 he entered newspaper work as reporter on The Philadelphia Inquirer. In 1865 became editor of The Philadelphia Inquirer. In 1867 he was associated with Philadelphia Evening Bulletin and later as editor and one of the owners. In 1882 purchased the Textile Record and edited it until 1903. From 1887 to 1897 he edited The Manufacturer. He wrote much on economic themes, but was best known to the general public as a humorist under the pseudonym, Max Adeler. He published 'Out of the Hurly Burly'; 'Random Shots'; 'Elbow Room'; 'The Fortunate Island'; 'Captain Bluit'; 'In Happy Hollow'; 'The Quakeress'; 'By the Bend in the River.'

CLARK, Charles Hopkins, American newspaper editor: b. Hartford, Conn., 1 April 1848. He was graduated at Yale in 1871 and since that year has been connected with the Hartford Courant, the oldest newspaper continuously published in America. After 1890 he was editor-in-chief. He has served as president and director of important corporations and since 1909 as director of the State Reformatory. In 1910 he became a fellow of the Corporation of Yale University.

CLARK, Charles Kirk, Canadian alienist: b. Elora, Ontario, 1857. He was educated at the University of Toronto and began his medical career under the tutelage of Joseph Workman. He became assistant superintendent of Hamilton and Rockwood hospitals for the insane, then superintendent of Rockwood Hospital for Insane and eventually superintendent of Toronto Hospital for Insane until 1911, when he became superintendent of the Toronto General Hospital. He is also professor of psychiatry at Toronto University and dean of the medical faculty there since 1907. He has done a great deal of medico-legal work in Canada and is one of the authorities on psychiatric matters in the Dominion. He has written many brochures on psychiatric and medico-legal subjects; also many articles on neurology. He is editor of the Medical Bulletin of Toronto University, one of the editors of the Journal of Insanity and of the Johns Hopkins Press.

CLARK, Clarence Don, American legislator: b. Sandy Creek, N. Y., 1 April 1851. He was educated at Iowa State University and was
admitted to the bar in 1874. He practised his profession in Delaware County, Iowa, 1874-81 and at Evanston, Wyo., since 1881. He was a member of the 51st and 52d Congresses (1889-93) from the new State of Wyoming, was United States senator 1895-99 to fill a vacancy and was re-elected in 1899, 1905 and 1911. In the 63d Congress he was chairman of the Committee on Geological Survey.

CLARK, Alexander, Canadian pathologist: b. Grantham, Scotland, 29 Aug. 1836; d. 1912. He went to Canada when a child, graduated at Victoria University in 1858 and practised medicine in Ontario with great success. He was head of the Provincial Asylum for the Insane at Toronto 1875-1905. He was twice president of the College of Physicians and Surgeons of Ontario. He was the author of 'Pen Photographs' (1873); 'Josiah Garth,' a novel.

CLARK, Edward, American architect: b. Philadelphia, Pa., 1822; d. 1902. He studied architecture under Thomas U. Walter and succeeded the latter as architect of the extension to the United States Capitol in 1865. He was a member of the commission appointed by Congress for the completion of the Washington Monument, chairman of the committee for the construction of the Congressional Library. He was a member of the American Institute of Architects and trustee of the Corcoran Art Gallery, Washington, D. C.

CLARK, Edwin Charles, English jurist: b. Yorkshire, England, 5 Nov. 1835. He was educated at St. John's School and Trinity College, Cambridge. He practised for a short time as a conveyancer in London, being called to the bar at Lincoln's Inn, 1860. From 1872 to 1914 he was Regius professor of civil law at Cambridge. His books are 'Early Roman Law: Regal Period' (1872); 'Analysis of Criminal Liability' (1880); 'Practical Jurisprudence: a Comment on Austin' (1883); 'Cambridge Legal Studies' (1888); 'History of Roman Private Law' (1905).

CLARK, Francis Edward, American clergyman: b. Ayler, Quebec, 12 Sept. 1851. Son of Charles G. Symmes, he was orphaned at eight years and adopted by his uncle, Rev. E. W. Clark, whose name he assumed. He was graduated from Dartmouth College in 1873 and continued his studies at Andover Theological Seminary. He became pastor of a Congregational church at Portland, Me., and there organized the first Young People's Society of Christian Endeavor, 2 Feb. 1881. He was pastor of the Phillips Congregational Church in South Boston, Mass., 1883-87, and in 1887 was made president of the United Society of Christian Endeavor; since then he has devoted his time to the Christian Endeavor work as its president and the World's Christian Endeavor Union, and is editor of the 'Christian Endeavor World'; has traveled around the world five times in the interests of the work. He is the author of many books and leaflets relating to Christian Endeavor work and to Christian Endeavor journeys. He has published 'Our Vacations' (1874); 'Life of William E. Harwood' (1877); 'Our Business Boys' (1883); 'Looking Out on Life' (1883); 'Danger Signals' (1884); 'Young People's Prayer Meetings' (1887); 'Ways and Means' (1890); 'Christian Endeavor Saints' (1890); 'Our Journey Around the World' (1894); 'The Mossback Correspondence' (1898); 'The Everlasting Arms' (1895); 'World-Wide Endeavor' (1895); 'Old Lanterns and New Motors' (1897); 'A New Way Around an Old World' (1900); 'Training the Church of the Future' (1902); 'Christian Endeavor Manual' (1903); 'The Gospel in Latin Lands, with Mrs. Clark' (1909); 'Old Homes of the New Americans' (1912); 'The Whole Land of Asia Minor' (1914); 'In Christ's Own Country' (1914).

CLARK, Galen, American naturalist: b. Dublin, N. H., 1814; d. 1910. He engaged in placer mining in California in 1853 and after a few years became a guide to tourists in the Yosemite Valley. In 1857 he discovered the great redwood growth at Mattole and in 1865 he became guardian of the Yosemite Valley Park. He was succeeded by another, but from 1890 until his death he was again guardian of the park. He was esteemed as an authority on the geology and other natural features of the Sierra Nevada. He wrote 'The Indians of Yosemite Valley' (1904); 'The Big Trees of California' (1907); 'The Yosemite Valley, its History, Characteristic Features and Theories as to its Origin' (1910).

CLARK, George Rogers, American pioneer: b. Monticello, Va., 19 Nov. 1752; d. near Louisville, Ky., 13 Feb. 1818. He studied surveying and at 20 settled in Ohio, serving in the Indian wars of that region. In the spring of 1775 he was employed as deputy surveyor under Captain Lee and removed to Kentucky in 1775. In June 1776 he represented Kentucky in the Virginia legislature. He was soon regarded as the leader of that country, procuring the organization of the territory and securing the much needed gunpowder for its protection. Governor Patrick Henry gave him the rank of lieutenant-colonel and detailed him to raise troops for the conquest of Illinois. Clark attacked the British post at Kaskaskia and took possession of the French villages up the Mississippi. Cahokia and Vincennes. In 1777-1778 he was promoted to the rank of colonel. In 1780 he proceeded to the mouth of the Ohio and built Fort Jefferson. After receiving the commission of brigadier-general, he attempted to attack Detroit; but the expedition proving unsuccessful, he returned to Kentucky and subsequently founded Fort Nelson on the site of Louisville. His successes in the Northwest, however, saved much territory to the colonies in the final treaty of peace with Great Britain. In 1780, Clark negotiated a treaty with the Shawnees. He then set out to conquer the tribes on the Wabash, but this, too, proved a failure, and he turned his efforts toward supporting the cause of the French of the Mississippi Valley against the Spaniards. He returned to Kentucky in his later years in great penury but was relieved a few years before his death by a grant of 8,049 acres of land in Indiana and an annuity from the Virginia legislature. He wrote that 'a New Path' (1888) for the conquest of Indiana. Consult English, W. H., 'Life of George Rogers Clark' in 'Conquest of the Country Northwest of the River Ohio 1778-1783' (2 vols. 1896); Roosevelt, 'Winning of the West 1829-1860', New York 1889); Butterfield, 'History of G. R. Clark's Conquest of the Illinois and Wabash Towns,'
CLARK, Hubert Lyman, American zoologist: b. Amherst, Mass., 9 Jan. 1870. He was educated at Amherst and at Johns Hopkins University. From 1899 to 1905 he was professor of biology at Olivet College; in 1905-12 he was assistant in invertebrate zoology at the Museum of Comparative Zoology, Harvard, and curator of echinoderms after 1912. He has carried on scientific investigations in Jamaica, Bermuda and Torres Strait, Australia, and published many papers dealing with birds, snakes, echinoderms and flowers.

CLARK, Eugene, American novelist: b. New York. She was educated at Madame de Silva's French and English School and by private tutors. She has published 'Will Shakespeare's Little Lad' (1897); 'The Victory of Eary Gardner' (1897); 'The Heresy of Parsons Medlicott' (1900); 'God's Puppets' (1901); 'Santa Claus' Sweetheart' (1906); 'A Charming Humbug' (1908); 'We Four and Two More' (1909); 'The Robert Colyer Anthology' (1911); and 'Rymed Receipts' (1912).

CLARK, Isaac, American theologian: b. Charlestown, Mass., 30 June 1833. He was graduated at Yale in 1856, studied at the Union Theological Seminary 1858-59 and was graduated at the Andover Theological Seminary in 1861. He entered the Presbyterian ministry in 1861 and held pastorates at Elmina, N. Y., 1861-68; Aurora, Ill., 1868-72; Brooklyn 1872-74; Rondout 1874-82 and Northampton, Mass., 1882-91. After 1891 he was professor of theology, homiletics and English exegesis, and after 1915 Dean of the School of Theology of Howard University.

CLARK, Sir James, Scottish physician: b. Cullen, Banffshire, 14 Dec. 1788; d. Bagshot Park, 29 June 1870. He studied law at Aberdeen, receiving his M.A.; and then medicine at the University of Edinburgh, and entered the navy as assistant surgeon in 1809, and continued in the service till 1815, when he returned to Edinburgh. After devoting some time to foreign travel, he settled in Rome, where he continued to practise from 1819 to 1826. He returned to England in 1826, and became physician to the Duchess of Kent in 1835, and on the accession of Queen Victoria was appointed first physician in ordinary to the queen, and shortly afterward made a baronet. He retired from practice several years before his death, but continued till near the close of his life to act as consulting physician to the royal family. Soon after his return to England Sir James Clark published, as a result of his continental observations, a work 'On the Sanative Influence of Climate' (1829), and a 'Treatise on Pulmonary Consumption and Scrofula' (1835).

CLARK, John Bates, American economist: b. Providence, R. I., 26 Jan. 1847. He was graduated at Amherst in 1872, and studied also at Princeton and Zürich. He was appointed professor of economics and history at Carleton College 1877, at Smith College in 1882 and at Amherst in 1893. He was lecturer on economics at Johns Hopkins University 1892-94, and president of the American Economic Association 1893-95. He has been professor of economics at Columbia since 1895. In 1911 he was appointed director of the division of economics and history of the Carnegie Endowment for International Peace. He is a member of the Royal Swedish Academy of Arts and Sciences. He has received the following honorary degrees: Ph.D. and LL.D. from Amherst; LL.D. from Princeton; LL.D. from the University of Christiansia. He has published the following works: 'Zoology, Harvard, Capital and Its Earnings' (1888); 'Wages' (1889); 'The Distribution of Wealth' (1901); 'The Control of Trusts' (1901); 'The Problem of Monopoly' (1904; revised, in collaboration with John Morris Clark, 1913); 'Essentials of Economic Theory' (1907), and numerous articles in scientific periodicals and monographs on economic subjects. Professor Clark occupies the first place among American economists. The distinguishing features of his economic theory are his distinction between the static and dynamic forces in economic life and a final productivity theory of wages and interest.

CLARK, John Emory, American scientist: b. Northampton, N. Y., 8 Aug. 1832. He was prepared for college at the Concord Academy of West Poulney, Vt., and entered the University of Michigan, where he was graduated with the degree of Bachelor of Arts in 1856. The degree of Master of Arts followed in 1859. He was professor of mathematics in the Michigan State Normal School 1859-71, and assistant professor of mathematics in the University of Michigan 1857-59. During the year 1859-60 he studied at the universities of Heidelberg, Munich and Berlin. From 1861 to 1862 he was a United States deputy surveyor in Dakota. In August 1862 he entered the Union army as captain of the 5th Michigan Cavalry. On 3 July 1863 he was promoted to the rank of major, and was honorably discharged 25 Feb. 1865. On 13 March 1865 he was made brevet lieutenant-colonel, United States Volunteers. In 1866 he returned to teaching, and was professor of mathematics and physics, and, after one year, of mathematics and astronomy, in Antioch College, Ohio, till 1872. In the summer and fall of 1869 he again served the government as deputy surveyor in Colorado, and in the summer and fall of 1872 he was assistant astronomer to the United States Northern Boundary Commission. The latter part of the academic year 1872-73 he was instructor in mathematics in the Sheffield Scientific School of Yale University, and in June 1873 was appointed professor of mathematics in that institution. He held that position till June 1901, when, on account of impaired health, he resigned his chair and was made professor emeritus.

CLARK, Jonas Gilman, American philanthropist: b. Hubbardston, Mass., 1 Feb. 1815; d. Worcester, Mass., 23 May 1900. He began life as a carriage maker and acquired a fortune in business and real estate in Hubbardston. He is noted as the founder of Clark University (q.v.), at Worcester, Mass., which he endowed with $2,000,000 in 1887. He also conferred gifts on his native town. He bequeathed $200,000 to Clark University, which was augmented by $1,000,000 and the residue of his estate conditionally.

CLARK, Joseph, English painter: b. Cerne Abbas, Dorsetshire, 4 July 1834. He was educated by William Barnes, "The Dorset Poet"
CLARK, (Josiah) Latimer, English engineer; b. Great Marlow. He invented a gutta- percha coating for underground wires and the Clarke cell. He also made valuable investigations in regard to electric currents in submarine cables. He invented a submarine cable covering of asphalt, hemp and silica, and was engineer in charge of the laying of several submarine cables. He published 'An Elementary Treatise on Electrical Measurements' (1868); 'Electrical Tables and Formulae' (1871); 'Dictionary of Metric and Other Measures' (1891); 'Memoir of Sir W. F. Cooke' (1895).

CLARK, Kate Upon, American journalist and editor; b. Camden, Ala., 22 Feb. 1851. She was graduated at Wheaton College in 1869 and from the Westfield (Mass.) Normal School 1872. She was married to Edward Perkins Clark in 1874 (d. 1903). In 1872-73 she taught in High School, Cleveland. She has edited many periodicals and departments and has lectured on literary, educational and domestic topics. She is a contributor to St. Nicholas, Youth's Companion, Atlantic Monthly and other magazines. She published 'Bringing Up Boys' (1901); 'White Butterflies' (1900); 'How Dexter Paid His Way' (1901); 'Move Upward' (1902); 'Up the Witch Brook Road' (1902); 'The Dale Twins' (1906); 'The Adventures of Spotty' (1907); 'Donald's Good Hen' (1907); 'Art and Citizenship' (1907).

CLARK, Lewis Gaylord, American journalist and humorous writer; b. Otisco, N. Y., 5 March 1810; d. Piermont, 3 Nov. 1873. In 1834 he became editor of the Knickerbocker Magazine, and with Irving, Bryant, Longfellow, Haleck and Willis as contributors, made it one of the most literary publications of that time, and an inspiration to a higher standard of periodical literature. 'The Editor's Table,' written by him, overflowed with amusing stories and witty sayings. It was discontinued because of lack of funds in 1859. He was assisted out of his pecuniary difficulties by the sale of 'The Knickerbocker Gallery,' a book compiled by former contributors to the magazine. The 'Knickerbocker Sketch-Book' (1850) and 'Knick-Knacks from an Editor's Table' (1853) are his only publications in book form.

CLARK, Marcus, Australian novelist: who produced in 'For the Term of His Natural Life,' a powerful problem novel dealing with the convict system over which there was strong agitation in Australia in 1857-58; and also in England, where it was shown that the convict system was then costing the country about £500,000 a year without any adequate advantage to England herself and that the evil done to the convicts was unfelt. In his novel Marcus Clark showed up these conditions so vividly that he found his audience as wide as the English-speaking world.

CLARK, Michael, Canadian legislator; b. Belford, Northumberland, 12 May 1861. He was educated for the medical profession at Edinburgh University, and practised in England for some years. While in practice, he took a lively interest in public affairs, was a member of the school board of Newcastle-on-Tyne and took the unpopular course of denouncing on public platforms the policy that led up to the South African War of 1899-1902. He emigrated to western Canada in 1902 and engaged in ranching and farming in Alberta. In 1908 he returned to the Dominion House of Commons in the Liberal interest, and was re-elected in 1911. As a strong free-trader, he occupies a somewhat unique place in parliamentary life. After the outbreak of the Great War in 1914 he gave a steady support to the Borden administration in the measures which were deemed necessary to carry through Canada's part in the world conflict. He supported the compulsory service measure of the government in 1917 and voted against the referendum on that subject proposed by his party leader, Sir Wilfrid Laurier. His pungent and somewhat unsparing criticisms of Sir Willard's attitude, while they aroused enthusiasm among the Conservatives, were hotly received by the majority of his own party. It had been his intention to resign from Parliament at the general election of 1917, but the announcement that he would accept nomination in his riding if a party fight were avoided was followed by the withdrawal of the Conservative candidate. He is one of the most incisive debaters in the House and one of the best platform speakers in the Dominion.

CLARK, Thomas March, American Protestant Episcopal bishop; b. Newburyport, Mass., 4 July 1812; d. 7 Sept. 1903. He was graduated at Yale in 1831, and four years later entered the Presbyteriant ministry, but in 1836 took orders in the Episcopal Church. He was successively rector of Grace Church, Boston (1836-43); Saint Andrew's, Philadelphia (1844-47); Trinity Church, Boston (1847-51); and Christ Church, Hartford, Conn. (1851-54). In the year last named he was consecrated bishop of Rhode Island. From 1859-1903 he was the presiding bishop of the Episcopal Church and was written 'Formation of Character'; 'The Efficient Sunday-school Teacher'; 'The Dew of Youth'; 'Early Discipline and Culture'; 'Reminiscences' (1895).

CLARK, Victor Selden, American economist; b. Fortageville, N. Y., 12 June 1868. He was educated at the universities of Minnesota and Chicago and in 1892-93 studied at Göttingen and Bern. In 1893-97 he was high school principal and superintendent in Minnesota. He was superintendent of public instruction and president of the Insular Board of Education of Porto Rico under the military government. In 1902-09 he was engaged in investigating foreign and insular labor conditions for the United States government. In 1910 he was placed in charge of the laws of Hawaii and in 1910-13 was commissioner of immigration, labor and statistics for the Territory of Hawaii. He resigned to resume active charge of the division of manufactures and economic history at the Carnegie Institute. He has published 'Education in Porto Rico' (1902); 'Labor Conditions in Cuba' (1902); 'Labor Conditions in Hawaii' (1903-15); 'La-
bor Conditions in Mexico' (1908); 'Canadian Industrial Disputes Act' (1909); 'Women and Children Wage Earners in Great Britain' (1908); 'History of American Manufactures' (1915).

CLARK, Walter, American jurist: b. Halifax County, N. C., 19 Aug. 1846. A.B., University of North Carolina 1864, A.M. 1867, LL.D. 1888. He became lieutenant-colonel in the Confederate States army 1864, at 17 years of age, being the youngest officer of this rank in either army; was admitted to the bar in 1868; judge of the Superior Court of North Carolina 1885-89; judge of the Supreme Court 1889-1902; chief justice since 1 Jan. 1903. He is the author of 'Annotated Code of Civil Procedure' (3d ed.); translated from the French Constant's 'Memoirs of Napoleon' (3 vols., 1895); compiled and edited 'North Carolina State Records' (16 vols., 1894-1907); 'Histories of North Carolina Regiments 1861-65' (5 vols.); also issued reprints of 164 volumes of 'North Carolina Supreme Court Reports' with annotations; edited article 'Appeal and Error' in 'Cyclopedia of Law and Procedure'; is a contributor to magazines.

CLARK, Walter Eli, American public official: b. Ashford, Conn., 7 Jan. 1869. He was graduated at Wesleyan University in 1895 and became in the same year a reporter on the Hartford Post. In 1897 he was Washington correspondent to the New York Commercial Advertiser, and in succeeding years was Washington correspondent for several important journals. In 1909 he was made governor of Alaska by President Taft and remained in that office until 1913. He has contributed articles to magazines and weekly periodicals.

CLARK, William, American explorer: brother of George Rogers Clark (q.v.): b. Virginia, 1 Aug. 1770; d. Saint Louis, Mo., 1 Sept. 1838. He emigrated with his family at the age of 14 to the falls of the Ohio, in Kentucky, on the present site of Louisville. In 1808 he was appointed, in conjunction with Capt. Meriwether Lewis (q.v.), to the command of an expedition designed to explore the northwest territory lying between the Mississippi and the Pacific Ocean. He acquitted himself with consummate ability in this hazardous employment, which required the combination of military and scientific skill. His journal and the account kept by him of the astronomical observations made by him and Captain Lewis have been published. He was appointed in 1813 governor of the Northwest Territory and superintendent of Indian affairs, which office he retained till 1820, when Missouri was created a State. Two years afterward he was again appointed commissioner and superintendent of Indian affairs. See LEWIS AND CLARK EXPEDITION.

CLARK, William Andrews, American business man and politician; b. near Connells-ville, Pa., 8 Jan. 1839, of Scotch-Irish parentage. He had a common school education and was preparing for college which was interrupted by the removal of his family to Iowa. In that State he attended an academy at Birmingham and later spent a year in the Wesleyan University at Mount Pleasant, Iowa, where he also studied law. He afterward taught school in the State of Missouri, 1858-60. In the spring of 1862 he drove a team from Atchison, Kan., to South Park, Colo., and then worked in the mines at Central City, Colo., for nearly a year. In 1863 he migrated to Grasshopper Mines, a new discovery in eastern Idaho, which afterward became a part of the State of Montana, where he mined two years in placer-dig- gings. He later formed a copartnership in a large mercantile and banking business, in which he had a minor interest, which continued until 1872, when he sold his interest in the mercantile business and organized the Bank of Deer Lodge, Mont., of which he became president. He has continued in the banking business up to the present time, being now senior member of the firm of W. A. Clark & Brother at Butte, Mont. In 1872 he first visited the mining camp at Butte, Mont., where he made some purchases, and has ever since that time been interested in large mining operations. In order to qualify himself for this business in the winter of 1872-73 he took a special course in the Columbia School of Mines; his interests were afterward enlarged until at the present time he is owner of large mining interests in Montana, Idaho, Utah, Nevada and Arizona, where he is the principal owner of the famous United Verde Copper Company's mines, and is now the largest individual producer of the different metals in the United States, and probably the entire world. In connection with Mr. E. H. Harriman he built the railroad extending from Salt Lake City to Los Angeles and San Pedro Harbor. A unique feature of this transaction was that no bonds were ever sold. The road was built from cash furnished by the principals, and this is now one of the leading railroad interests in the western country. He was appointed by the governor to represent Montana as State orator at the Philadelphia Centennial Exposition of 1876, and was also appointed a commissioner of the New Orleans Exposition in 1884. He was grand master of Masons in Montana in the years 1877-78. He was appointed by the governor as major of a battalion of volunteers at the time of the invasion of the Nez Perce Indians, who were led by Chief Joseph. In 1884 at the nomination of the Democratic Convention of Montana he was elected president. In 1898 a second convention was called, of which he was likewise elected president, and under the constitution then framed Montana was admitted into the union of States. In 1898 he was elected by the State legislature as senator from Monta- nana, but a protest was filed and an investigation of his election ordered. Before a report was made he resigned and returned to Montana where the question was decided by the people of his State and he was re-elected by a large majority in the year 1901 and served a full term in the Senate. He was placed on important committees and was a member of the Committee on Foreign Relations. At the close of his term he declined to be again a candidate for re-election and has been continuously engaged in the many industries which are owned and controlled by him.

CLARK, William Bullock, American scientist; b. Brattleboro, Vt., 15 Dec. 1860. He was graduated at Amherst College in 1884. After a course of European study he became instructor in geology at Johns Hopkins Uni-
CLARK — CLARKE

CLARK UNIVERSITY, a coeducational institution in Atlanta, Ga.; organized in 1870 under the auspices of the Methodist Episcopal Church; reported at the end of 1915: Professors and instructors, 40; students, 440; number of volumes in library, 5,000; value of property, $250,000; president, W. W. Foster, D.D.

CLARK UNIVERSITY, Worcester, Mass., founded in 1887 by the gift of Jonas Gilman Clark (q.v.), and the work of the Mary Endowment of the United States (1915).

CLARK, William George, English scholar: b. March 1821; d. York, 6 Nov. 1878. He was educated at Trinity College, Cambridge, whence he was graduated in 1844, becoming elected fellow, tutor and public orator of the university (1857); took orders in the Established Church, but gave up his orders in 1869, explaining his reasons therefor in a pamphlet, 'The Present Dangers of the Church of England' (1870). He visited Spain (1849) and toured Greece (1856). He published an account of these travels in 'Gazpacho' (1850) and 'Peloponnesus' (1858). He assisted in founding the Journal of Philology in 1868, but is best known for his editorship with William Aldis Wright (q.v.) of the noted 'Cambridge Shakespeare' (1853-66). The 'Globe Shakespeare' (1864) was also edited by Clark and Wright. Clark published also 'Lectures on the Middle Ages and the Revival of Learning' as well as lesser works. He left a considerable portion of his property to the college, which was used for the endowment of the Clark Lectureship in English Literature at Trinity.

CLARK, Sir William Mortimer, Canadian administrator: b. Aberdeen, Scotland, 24 May 1836; d. Prouts Neck, Me., 11 Aug. 1917. He was educated at Marischal College, Aberdeen, and Edinburgh University; was admitted a writer to the Signet in Edinburgh in 1859, and settled in Toronto, Canada, in the same year. He was called to the bar of Ontario in 1869 and became Q.C. in 1880. In that year he was elected chairman of the board of management of Knox College, Toronto, a position he held until his death. He was a senator of the University of Toronto for a number of years and was lieutenant-governor of Ontario (1903-08).

CLARK, William Thomas, American soldier: b. Norwalk, Conn., 1831; d. 1905. He was appointed lieutenant of an Iowa regiment at the opening of the Civil War, and at its close he had reached the rank of major-general. He was chief-of-staff of General Grant's Army of the Tennessee. After the war he settled at Galveston and there he established the first negro school and befriended the black race at considerable risk to himself. In 1869-72 he was in Congress and secured the first appropriation for the Negroes and other improvements for Galveston harbor.

CLARK FORK, an important fork of the Columbia River, formed by the Flathead and Missoula rivers, Montana. It flows through Lake Pend d'Oreille in Idaho and enters Washington, joins a river and flows into the Columbia River on the Canadian frontier. Its length is about 650 miles.

CLARK UNIVERSITY, a coeducational institution in Atlanta, Ga.; organized in 1870 under the auspices of the Methodist Episcopal Church; reported at the end of 1915: Professors and instructors, 40; students, 440; number of volumes in library, 5,000; value of property, $250,000; president, W. W. Foster, D.D.

CLARK UNIVERSITY, Worcester, Mass., founded in 1887 by the gift of Jonas Gilman Clark (q.v.), and the work of the Mary Endowment of the United States (1915). At first the institution was devoted wholly to post-graduate work. Those only were admitted as students who had taken a first degree and who gave promise of high attainment in some department of science. No entrance examination was required. The design and organization of the university were entrusted to G. Stanley Hall, formerly a professor of philosophy at Johns Hopkins University, Baltimore, and for years a close observer of schools and educational methods in America and Europe. But few departments have been organized, namely, mathematics, physics, anthropology, biology, philosophy and psychology. Pedagogy (1899) was made one of the sub-departments of the psychology department. Characteristic features in the design is that professors and students should meet on the same plane, the professors to be as older students, the students to lecture occasionally on special subjects. Instruction is entrusted in some degree to the fellows and also to the dons. The latter representing the highest academic university appointments. Original work is encouraged and demanded, and a number of fellowships and scholarships have been founded so that worthy students of limited means may devote themselves to research along special lines and not be hindered or hampered by doing outside work for the purpose of continuing their studies. No attempt has been made to secure large numbers of students; in such a school a small number is desirable. In 1892-93 there were 53 students; in 1896-97, 38; in 1898-99, 48; in 1909-10, 110; in 1913-14, 90. There are 25 professors, 20 fellowships and 10 scholarships. In the library are 65,000 volumes, and the following publications are issued by the university, but not officially: American Journal of Psychology; Pedagogical Seminary; Mathematical Review.

Upon the death of Mr. Clark in 1900 the university received a bequest of additional funds for research—$600,000 for a library fund and $150,000 for a library building; $100,000 for an art department, and $1,300,000 for the establishment of an undergraduate department. In 1902 a collegiate department was established, of which Edmund C. Stanford is president. G. Stanley Hall is president of the university. See Hall, G. Stanley.

CLARKE, Adam, Methodist clergyman and scholar: b. Moybeg, County Londonderry, Ireland, 1762; d. London, 26 Aug. 1832. He became an itinerant Methodist preacher in 1785 and continued to travel in various circuits till 1805, when he took up his residence in London, where he passed a considerable part of his subsequent life. He was learned in the Oriental languages and published a commentary of the Scriptures (1810-26), and various other works, among the rest a 'Bibliographical Dictionary.'
CLAVER

(1802). Consult the 'Life' by Etheridge (London 1858).

CLAVER, Alexander Ross, English astronomer: b. 1828; d. 1914. He entered the Royal Engineers in 1847, was transferred to the Ordnance Survey in 1850 and retired as lieutenant-colonel in 1881. He was a delegate to the International Geodetic Congress in Rome in 1858. In 1861 he was awarded the Royal medal of the Royal Society. He published the results of two investigations on the figure of the earth and 'Comparisons of the Standards of Length of England, France, Belgium, Prussia, Russia, India, Australia' (1866); 'Determination of the Position of Feagham and Havefordwest' (1867); 'Comparisons of Standards and Lengths of Cubits' (1873); 'Geodesy' (1880).

CLAVER, Sir Caspar Purdon, British art connoisseur: b. County Dublin, Ireland, 1846; d. 1911. He entered the Art Training School at South Kensington in 1862, assisted in the construction of the Houses of Parliament and the South Kensington Museum in 1865–67 and in 1879 was architect to the English legation in Persia. In the following year he was commissioned to organize the Eastern collections at the South Kensington Museum. In 1890 he became director of the Museum and was knighted in 1902. In 1905 he became director of the Metropolitan Museum, New York, from which ill health compelled his retirement in 1910. He exerted much reorganization in the Museum and during his régime many acquisitions were made.

CLAVER, Charles Cowden, English writer: b. Enfield, Middlesex, 15 Dec. 1787; d. Genoa, Italy, 13 March 1877. His father kept a small school and had John Keats as one of his pupils; but in 1810 gave it up and removed to Ramsgate. The son frequently went up to London, where he came into contact with Leigh Hunt, Shelley, Hazlitt, the Lamb and Vincent Novello, and in 1828 he married Mary, the eldest daughter of Novello. He engaged for some time in business as a bookseller and a music publisher and from 1834 till 1856 lectured throughout the country, mainly on poets and poetry. His publications include his 'Hundred Wanderers' (1814); 'Adam the Gardener' (1834); 'Shakespeare Characters,' chiefly those subordinate (1863); and 'Molière Characters' (1865), the two last being collections of some of his lectures. He is best known, however, by the edition of Shakespeare which he annotated in conjunction with his wife and by the 'Shakespeare Key' (1879). His wife has written his biography (London 1887).

CLAVER, Edith Emily, American librarian: b. Syracuse, N. Y., 5 Nov. 1859. She was graduated at Syracuse University in 1881, and after teaching school some years took up library work. Having served as head cataloguer at Columbia University Library and at the Newberry Library in Chicago, she became chief cataloguer of public documents for the national government in 1895 and librarian of the University of Vermont in 1898. Laving there in 1909 for travel and study, she has since lectured and written on library matters, making United States government publications a specialty. She has published 'Guide to the Use of United States Publications' (1916).

CLAVER, Edward Daniel, English traveller, antiquary and mineralogist: b. Willingdon, Sussex, 1769; d. London, 9 March 1822. In 1799 he started on an extensive and laborious tour through Denmark, Sweden, Lapland, Finland, Russia, Tartary, Circassia, Asia Minor, Syria, Palestine, Egypt, Greece and Turkey, returning in 1802 through Germany and France. On his return he obtained from Cambridge University the honorary degree of LL.D., in consideration of the services rendered to its public libraries and institutions by his liberal contributions, among which the greatest, perhaps, in value is the celebrated manuscript of Plato's works, with nearly 100 others and a colossal statue from Eleusis, believed by him to be that of Demeter (Ceres). To him also the British nation is indebted for the acquisition of the famous sarcophagus of Alexander the Great, which he discovered in the possession of the French troops in Egypt and which was by his means surrendered to the British army. In 1807 he commenced a course of lectures on mineralogy at Cambridge, and in 1808 a professorship of mineralogy was instituted there in his behalf. He himself had made a splendid collection of mineralogical specimens, which was purchased after his death by Cambridge University. In 1805 he became vicar of Harlton and in 1819 rector of Yeldham, Essex. In 1817 he was appointed librarian of Cambridge University. A complete edition of his travels appeared in 6 volumes (1810–23) and another in 11 volumes (1816–24), under the title of 'His Travels, which are the most popular of his works, are attractive from the enthusiasm of the writer and his prolific imagination.'

CLAVER, Sir Edward George, English lawyer and politician: b. London, 15 Feb. 1841. He was admitted a barrister of Lincoln Inn in 1864 and was solicitor-general 1886–92. He sat in the House of Commons for Southwark in 1880, for Plymouth 1889–1900 and for the city of London, 1906. He held a leading place at the bar and in Parliament, but disagreement with the Unionist party on the South African War and on the question of tariff reform led him on two occasions to retire from the House of Commons. He retired from the bar in 1914. He has published a 'Treatise on the Law of Extradition' (1886), three volumes of speeches and addresses and contributions to biblical literature.

CLAVER, Elijah, American soldier of the Revolution: b. North Carolina; d. Wilkes County, Ga., 15 Dec. 1799. He removed to Georgia in 1774, became a captain in 1776 and distinguished himself in engagements both with Indians and British on the frontiers of Georgia; was appointed a colonel of militia, engaged in the battles of Musgrove's Mill and Blackstock's, afterward promoted brigadier-general and contributed to the capture of Augusta in June 1781. At the battle of Long Cove he was severely wounded and on his recovery joined the command of General Pickens. He afterward fought many battles and made several treaties with the Creek Indians. He was accused in 1794 of a design to establish an independent government in the Creek nation, where he had settled in violation of law, and was suspected
of accepting a commission and receiving emolu-
ments from the French government.

CLARKE, Frank Wigglesworth, American
He was graduated from the Scientific School
of Harvard University in 1867, was instructor
at Cornell 1869, professor in Howard Univer-
sity 1873-74 and professor of chemistry and
physics, University of Cincinnati, 1874-83. He
has been chief chemist of the United States
Geological Survey and honorary curator of min-
ers, United States National Museum, since 1883.
He is a member of many American and foreign
scientific societies and was a member of the
International Jury of Awards at the Paris Ex-
position of 1900 and received from the French
government the decoration of the Legion of
Honor; past president of the American Chemi-
cal Society and Washington Academy of
Science, member of National Academy. He has
published 'Weights, Measures and Money of All
Nations'; 'Elements of Chemistry'; 'A Report on
the Teaching of Chemistry and Physics in the
United States,' the Smithsonian 'Constants of
Nature,' 'The Dicta of Geo-
chemistry' or the chief work of the American
school. He is also author of more than 100 scientific essays
and memoirs published in magazines and
scientific journals. His most important con-
tributions to science have been his 'Recalculation
of Atomic Weights' (3d ed., 1910), his in-
vestigations upon the constitution of various
silicates and his 'Treatise on the Dicta of
Geochemistry.' He is joint author with L. M.
Dennis of two recent works, 'Elementary
Chemistry' and 'A Laboratory Manual.'

CLARKE, George Johnson, New Bruns-
wick statesman: b. Saint Andrews, New Bruns-
wick, 1 Oct. 1857. He was educated there and at
Fredericton, was admitted to the bar of New
Brunswick in 1886 and practised law in Saint
Stephen. He was elected in 1903 as member for
Charlotte County in the Conservative in-
terest to the provincial legislature; was speaker of the assembly in 1909; attorney-general of
the province January 1914, and became Premier
and Minister of Lands and Mines in December of
the same year.

CLARKE, Helen Archibald, American
writer. B. Philadelphia. She was educated in
governesses, at private schools, and by tutors
in languages and is a graduate of the musical
department of the University of Pennsylvania.
She is editor (with Charlotte Porter) of 'Poet
Love,' a journal devoted to the study of litera-
ture and literary criticism; also review writer
for the Dial, and a contributor to various maga-
azines. She is one of the founders of the American Drama Society, in which she is chair-
man of the Play Reading section; of the Ameri-
can Music Society of which she is president.
She lectures on Browning and on modern
drama; is honorary member of the Boston and
New York Browning Societies. She is editor
(with Charlotte Porter) of 'Poems of Robert
Browning,' 'The 'Clergyman,' 'Guide to the
Book' (1897); 'Clever Tales' (1897);
'Mrs. Browning's Complete Works' (6 vols.,
1900); 'The Pembroke Edition of Shakespeare'
(12 vols., 1903); 'Poets' Parleys' (1903); and
is author of 'Browning's England'; 'Brow-
ning's Italy'; 'Lovelace's Counsellor'; 'Guide
to Mythology'; 'Ancient Myths in Modern
Poets'; 'Hawthorne's Country' (1910); 'The
Poets' New England'; 'Dramatic Scenes and
Pictures from the Ancient Epic'; 'Starry-
locks in Butterfly-Land' (performed a Boston
1912; 'Browning and His Century'; 'Geth-
semane,' a symbolic poem set to music by Gus-
tav Strube; and, with Charlotte Porter, 'Brow-
ning Study Programmes' (1900); 'Shakespeare
Studies' (1902); 'Balastre', performed in Boston 1915; 'Hermes at School.'

CLARKE, Henri Jacques Guillaume,
Comte D'Hunebourg and Duc de Feltre,
French military officer: b. Landrecies 1765;
d. 1818. He was educated at the Ecole
Militaire, Paris, joined the cavalry and was
made brigadier-general for his services at
Landau. He lost his command in 1793, but was
reinstated two years later and made a general
of division. Cannot appointed him chief of the
topographical bureau at the Ministry of War.
The Directory sent him to Italy to observe
Napoleon there but Clarke fell in with that
commander's aims and later became his private
secretary. He was governor of Vienna in 1805,
of Berlin in 1806 and from 1807 to 1813 was
Minister of War in France. He was Royal-
ist after the fall of Bonaparte, was with Louis
XVIII at Ghent during the Hundred Days,
and was again Minister of War in 1815-17.

CLARKE, Jacob Augustus Lockhart,
English physician: b. London 1817; d. 1880.
He was educated in France and studied medi-
cine at Guy's and Saint Thomas' hospitals,
London. He engaged in private practice and in
original research in microscopic anatomy and
pathology. A group of cells in the spinal column is known as 'the posterior vesicular
column of Clarke.' A list of his special papers
on professional topics is contained in 'Catalogue
of the Library of the Medico-Chirurgical
Society' (1879).

CLARKE, James Freeman, American
Unitarian clergyman and author: b. Hanover,
N. H., 4 April 1811; d. Boston, Mass., 8 June
1888. His first pastorate was at Louisville
1833-40. He then settled in Boston in 1841;
and was pastor of the Church of the Disciples
which was organized especially for him, and of
which he had charge till his death. He was a
clear thinker and a leader in all reform and ed-
cational movements. From 1867-71 he was
professor of natural religion and Christian doc-
tine in Harvard University. Together with
Emerson and William H. Channing, he pre-
pared the 'Memoirs of Margaret Fuller
d'Ossoli.' His chief work was 'Ten Great
Religions.' Among others were 'Service
Hymn-book and Hymn-book of the Church
of the Disciples'; 'Christian Doctrine of
Prayer,' 1854, new edition 1874; 'The Hour
Which Cometh'; 'Orthodoxy: Its Truths and
Errors'; 'Steps of Belief'; 'Events and Epochs
in Religious History'; 'The Ideas of the
Apostle Paul'; 'Self-Culture'; 'Anti-Slavery
Days'; 'Every-Day Religion'; and 'Vexed
Questions.' 'Theology' performed a translation
from the German of De Wette; 'Campaign
of 1812' (1848); 'Eleven Weeks in Europe.'
Consult Hale, E. E., edition of Clarke's 'Au-
tobiography, Diary and Correspondence' (Bos-
ton 1891).

CLARKE, James P., American public
official and legislator: b. Yazoo City, Miss., 18
Aug. 1854; d. Little Rock, Ark., 8 Oct. 1916. He attended the common schools of Yazoo City and later obtained a finished education by saving his earnings as a printer on the Yazoo Herald. He studied law at the University of Virginia and admitted to the bar in 1878. In 1883 he began practising law at Helena, Ark. He entered the political field in 1886, when he was elected to the house of representatives of Arkansas. He was elected to the State senate in 1888, becoming president of that body in 1891 and obtaining the mantel-stones to him. He was elected governor of Arkansas in 1894 and at the close of his term of office moved to Little Rock, where he resumed his law practice. He took his seat in the United States Senate on 9 March 1903, succeeding James K. Jones, and was re-elected in 1909 and 1915. He was a member of the Democratic National Committee. Senator Clarke has been president pro tem of the Senate since the Democratic party gained control in 1913. He was chosen by the party convention to succeed the late Senator Frye, of Maine, after a spirited contest and was elected to the place in the Sixty-fourth Congress despite determined opposition based upon his sensational revolt against the administration Ship Purchase Bill in the previous Congress. In the closing days of the 1916 session he presided over the Senate owing to the absence of Vice-President Marshall. The railroad Eight Hour Bill was passed with Senator Clarke in the chair, but he was one of the two Democratic senators to vote against the measure, and he refused to sign it. He was many times the leader in opposition to measures proposed by his party. The climax to his independence was reached when he led the Democratic revolt against the Ship Purchase Bill, which gave new life to the Republican filibuster against the measure and made its passage impossible. When the bill was reintroduced in the 1916 session, however, with the government ownership and operation features to which Senator Clarke objected, revised and modified, he supported it. He proposed the amendment to the Philippine Bill of 1916 which would give absolute independence to the islands in four years.

CLARKE, John, American clergyman: b. Suffolk, England, 8 Oct. 1609; d. Newport, R. I., 26 April 1676. He was a physician in London, and came to Massachusetts soon after its first settlement; but being one of the friends of Anne Hutchinson, was obliged to flee with her and her associates from that colony. Proceeding to the south, they were welcomed by Roger Williams to his vicinity, formed themselves into an organization, and obtained from the Indians a district to which they gave the name of the Isle of Rhodes or Rhode Island. The settlement commenced in 1638, at Pocasset, and Clarke began to employ himself as preacher. In 1644 he founded at Newport the second Baptist church in America, and became its pastor. Venturing a few years later to preach in the vicinity of Boston, he was arrested by an officer of the government, was convicted of sedition and then before the court, and was condemned for what were adjudged false teachings, to pay a fine of 20 pounds or be publicly whipped. In 1651 he was sent to England in company with Roger Williams as an agent of the colony of Rhode Island, and published there a book entitled 'Ill News from New England, or a Narrative of New England's Persecution.' He succeeded in obtaining a revocation of Mr. Coddington's commission as governor, and remained in the colony after the return of Williams, till at the end of a 12 years' mission he had procured a second charter for the colony, which secured to every person at all times his own judgment and conscience in matters of religious concernment. Bancroft refers to him as 'one of the most modest and virtuous Clarke, the persevering and disinterested envoy.' Upon his return in 1663 he resumed the pastorate of his church at Newport, which he retained till his death. He served in the general assembly from 1664 to 1669, became deputy governor in 1669 and 1671, and afterward codified the Rhode Island laws. In his will he left his farm for charitable purposes, the income of it only to be expended; and it has since produced annually about $200. Consult Richman, 'Rhode Island' (New York, 2 vols., 1902).

CLARKE, John Hessin, American jurist: b. Lisbon, Ohio, 18 Sept. 1857. He was graduated at Western Reserve University in 1877, and was admitted to the Ohio bar in 1878. He practised law in the courts of Ohio from 1878 to 1914, when he was appointed United States district judge at Cleveland by President Wilson. He has been conspicuous in progressive movements in Ohio and in the nation at large, and has taken an especial interest in the naturalization and Americanization of foreigners. In July 1916 he was nominated by President Wilson as an associate justice of the Supreme Court of the United States, to succeed Charles Evans Hughes, the Republican nominee for the Presidency.

CLARKE, John Mason, American geologist: b. Canandaigua, N. Y., 15 April 1857. He studied at Amherst and the University of Gottingen, and in 1881-84 was professor of geology and mineralogy at Smith College. In 1885 and 1886 he was lecturer on geology at the Massachusetts State College of Agriculture at Amherst. In 1894 he was appointed professor of geology in the Rensselaer Polytechnic Institute at Troy, and in 1898 State paleontologist of New York, becoming State geologist and director of the Museum in 1904. He has written 'New Devonian Crustacea' (1882); 'Cirriped Crustacea from the Devonian' (1883); 'Gebr. deutsche oberdevonische Crustaceen' (1884); 'On Devonian Spores' (1885); 'On the Higher Devonian Faunas of Ontario County, New York' (1886); 'Early Devonian History of New York and Eastern North America' (1908); 'The Euryterida of New York,' with Ruedemann (1912); 'The Heart of Gaspe: Sketches in the Gulf of St. Lawrence' (1913), and about 200 scientific memoirs, papers and addresses.

CLARKE, McDonald, American poet: b. Bath, Me., 18 June 1798; d. New York, 5 March 1842. He was an eccentric character, familiarly known as 'the mad poet'; and was the subject of a meeting and then before the court, and was condemned for what were adjudged false teachings, to pay a fine of 20 pounds or be publicly whipped. In 1651 he was sent to England in company with Roger Williams as an agent of the colony of Rhode Island, and published there a book entitled 'Ill News from New England, or a Narrative of New England's Persecution.' He succeeded in obtaining a revocation of Mr. Coddington's commission as governor, and remained in the colony after the return of Williams, till at the end of a 12 years' mission he had procured a second charter for the colony, which secured to every person at all times his own judgment and conscience in matters of religious concernment. Bancroft refers to him as 'one of the most modest and virtuous Clarke, the persevering and disinterested envoy.' Upon his return in 1663 he resumed the pastorate of his church at Newport, which he retained till his death. He served in the general assembly from 1664 to 1669, became deputy governor in 1669 and 1671, and afterward codified the Rhode Island laws. In his will he left his farm for charitable purposes, the income of it only to be expended; and it has since produced annually about $200. Consult Richman, 'Rhode Island' (New York, 2 vols., 1902).

CLARKE, John Hessin, American jurist: b. Lisbon, Ohio, 18 Sept. 1857. He was graduated at Western Reserve University in 1877, and was admitted to the Ohio bar in 1878. He practised law in the courts of Ohio from 1878 to 1914, when he was appointed United States district judge at Cleveland by President Wilson. He has been conspicuous in progressive movements in Ohio and in the nation at large, and has taken an especial interest in the naturalization and Americanization of foreigners. In July 1916 he was nominated by President Wilson as an associate justice of the Supreme Court of the United States, to succeed Charles Evans Hughes, the Republican nominee for the Presidency.

CLARKE, John Mason, American geologist: b. Canandaigua, N. Y., 15 April 1857. He studied at Amherst and the University of Gottingen, and in 1881-84 was professor of geology and mineralogy at Smith College. In 1885 and 1886 he was lecturer on geology at the Massachusetts State College of Agriculture at Amherst. In 1894 he was appointed professor of geology in the Rensselaer Polytechnic Institute at Troy, and in 1898 State paleontologist of New York, becoming State geologist and director of the Museum in 1904. He has written 'New Devonian Crustacea' (1882); 'Cirriped Crustacea from the Devonian' (1883); 'Gebr. deutsche oberdevonische Crustaceen' (1884); 'On Devonian Spores' (1885); 'On the Higher Devonian Faunas of Ontario County, New York' (1886); 'Early Devonian History of New York and Eastern North America' (1908); 'The Euryterida of New York,' with Ruedemann (1912); 'The Heart of Gaspe: Sketches in the Gulf of St. Lawrence' (1913), and about 200 scientific memoirs, papers and addresses.

CLARKE, McDonald, American poet: b. Bath, Me., 18 June 1798; d. New York, 5 March 1842. He was an eccentric character, familiarly known as 'the mad poet'; and was the subject of a meeting and then before the court, and was condemned for what were adjudged false teachings, to pay a fine of 20 pounds or be publicly whipped. In 1651 he was sent to England in company with Roger
Broadway' (1833); 'A Review of the Eve of Eternity' (1820); 'The Elixir of Moonshine by the Mad Poet' (1822); 'Death in Disguise' (1833); 'A Cross and a Coronet' (1841). One of his best known conceits was 'Now Twilight Lets Her Curtain Down and Pins it With a Star.'

CLARKE, Mary Victoria Novello Cowden, English story-writer, essayist and Shakespearean scholar: b. London, 22 June 1809; d. Genoa, Italy, 12 Jan. 1898. She married in 1858 Charles Cowden-Clarke, with whom she wrote the 'Shakespeare Key' and edited an edition of Shakespeare's plays. Her best known work is her 'Concordance to Shakespeare,' published in 1844-45, which cost 16 years' labor. Other works from her pen are 'The Girihood of Shakespeare's Heroines' (1850); 'World-noted Women' (1858); 'Trust and Remittance' (1873); 'A Rambling Story' (1874); and an interesting autobiography, 'My Own Life' (1886).

CLARKE, Samuel, English theological and philosophical writer: b. Norwich, 11 Oct. 1675; d. London, 17 May 1729. He became chaplain to Dr. Moore, bishop of Norwich, and between 1699 and 1701 published 'Essays on Baptism, Confirmation and Repentance,' replied to Tolard's 'Amynor,' and issued a paraphrase of the Gospels. He was then presented with two livings, and in 1704 and 1705 delivered the Boyle lectures at Oxford on 'The Being and Attributes of God,' and on 'The Evidences of Natural and Revealed Religion.' In 1706 he published 'Immortality of the Soul,' and a Latin version of Newton's 'Optics.' He was then appointed rector of Saint Benet's, London, and shortly afterward rector of Saint James' and chaplain to Queen Anne. In 1712 he edited 'Cesare Cremonini's Commentaries,' and published his 'Scripture Doctrine of the Trinity,' which became a subject of much controversy and of complaint in the Lower House of Convocation. His later productions were his discussions with Leibniz on the 'Freedom of the Will,' and his Latin version of part of the 'Iliad.' His collected works were published in 1738.

CLARKE, Samuel Fessenden, American naturalist: b. Geneva, Ill., 4 June 1851. He was graduated at the Sheffield Scientific School of Yale in 1878 and took the degree of Ph.D. at Johns Hopkins in 1879. In 1879-81 he was fellow in biology at Johns Hopkins and since 1881 has been professor of natural history at Williams College. He is a member of the American Association for the Advancement of Science and of many other learned bodies and has written much on hydroids.

CLARKE, William Egle, English naturalist: b. Leeds 1853. He was educated at Yorkshire College. He was made curator of the Leeds Museum in 1884 and in 1888 became assistant in the Edinburgh Museum. In 1906 he was appointed keeper of the natural history department of the Royal Scottish Museum, at Edinburgh. He also served as acting editor of the 'Annals of Scottish Natural History' and the 'Naturalist' and was joint editor of the 'Scottish Naturalist.' He published 'Handbook of Yorkshire Vertebrata' (1881) and 'Studies in Bird Migration' (1912).

CLARKE, William Horatio, American organist: b. West Newton, Mass., 1840; d. 1913. He filled positions as organist in Dedham, Boston and Woburn; was for some years superintendent of schools at Dayton, Ohio; was organist of Tremont Temple, Boston, Mass., 1878-87, where he retired to Reading, Mass., where he built the fine four-manual organ in Clarigold Hall. He published 'New Method for Reed Organs' (1869), and 'Outline of the Structure of the Pipe Organ' (1877); 'Short Service Preludes' (1893) and 'Vocal and Orchestral Information' (1904); 'Artistic Information for Reed Organs' (1905); 'How to Use Organ Stops and Pedals' (1908); 'Standard Organ Building' (1909).

CLARKE, William Newton, American Baptist clergyman: b. Cazernovia, N.Y., 2 Dec. 1841; d. 15 Jan. 1912. He was graduated at Colgate University 1861 and at Hamilton Theological Seminary 1863. He filled pastorates at Keene, N. H., Newton Centre, Mass., Montreal, and Hamilton, N. Y., 1863-90, and was a professor in Toronto Baptist College 1883-87. From 1890 to 1908 he was professor of Christian theology and from 1908 to his death professor of ethics, at Colgate University, Hamilton, N. Y. He wrote 'Commentary on Mark' (1881); 'Outline of Theology' (1897); 'What Shall We Think of Christianity?' (1899); 'A Study of Christian Missions' (1900); 'The Use of the Scriptures in Theology' (1905); 'The Christian Doctrine of God' (1909); and 'Sixty Years with the Bible' (1909).

CLARKE, William Robinson, Canadian clergyman: b. Inverurie, Scotland, 1829; d. 1912. He was educated at Aberdeen and at Oxford. He became prebendary of Wells in 1870, came to Canada in 1882 and in the same year was appointed professor of mental and moral philosophy in Trinity University. He retired in 1908. He became widely known in America as preacher, writer and lecturer. He attended several Anglican synods and in 1891 became a fellow of the Royal Society of Canada and in 1900 was its president. For a time he was editor of the 'Canadian Churchman.' His publications include 'The Redeemer' (1863); 'The Comforter' (1864); 'The Four Temperaments' (1864); 'Witnesses to Christ' (1888); 'Savonarola' (1892); 'The Anglican Reformation' (1896); 'The Paraclete' (1900); 'Pascal and the Port Royalists' (1902). He translated Hagenbach's 'Christian Doctrine' and Hefele's 'History of the Councils.'

CLARKSBURG, W. Va., county-seat of Harrison County, situated in the north central part of the State, on the West Fork River, a
branch of the Monongahela, and on the Parkersburg branch of the Baltimore and Ohio Railroad. It is a town on the Short Line, the Monongahela and the West Virginia and Pittsburgh divisions of the Baltimore and Ohio Railroad also enter the city. The city lies in a section abounding in natural resources, natural gas, coal, and oil being plentiful; and the farm, grazing and timber lands very valuable. Clarksburg is called the "Fuel City of the Fuel State." The manufactures are many and varied, there being glass, art pottery, chair and cigar factories, chesnut and carbon works, wood-working plants, machine shops, foundries, bottling works, a brewery and a grain elevator with a capacity of 80,000 bushels. There are five banks in the city with a combined capital of $675,000, and doing an annual business of $90,000,000. Among the notable public institutions are the City, the Kessler and the Harrison County hospitals.

There is an excellent free school system with a public high school, supplemented by Broadus Classical and Scientific Institute, Saint Joseph's Academy and Elliot Commercial College. The city has nine church edifices. The city was first settled in 1772, became a borough in 1785, and was incorporated as a city in 1899. The city is proud of being the birthplace of the famous "Stonewall" Jackson. Its municipal affairs are administered by a mayor, recorder, elected annually, chief of police and a council of 10 members, one-half of whom are elected each year. Pop. 9,201.

CLARKSDALE, Miss., city and county-seat of Coahoma County, 75 miles south of Memphis, Tenn., on the Yazoo and Mississippi Valley Railroad. There is a large trade in lumber and in agricultural products. The city contains an Elks' Home and a Carnegie library. The waterworks and electric-lighting plants are municipally owned. Clarksdale has adopted the commission form of government. Pop. 4,079.

CLARKSON, Matthew, American soldier and philanthropist: b. New York, 17 Oct. 1758; d. 25 April 1825. Both his father and grandfather were prominent colonial officials. He was with the Northern army in 1777; was wounded at Fort Edward; at Saratoga acted as aide-de-camp to Gen. Benedict Arnold, and was present at Burgoyne's surrender. He also took part in the campaigns in the Carolinas 1781, and was aide to Gen. Benjamin Lincoln at Yorktown. He was brevetted a lieutenant-colonel, and for 14 years was major-general of the New York militia; was a member of the State legislature; president of the Bank of New York; governor of the New York Hospital for 30 years; and was an active worker in prison and public school reform. Consult 'The Clarksons of New York' (New York 1875-76).

CLARKSON, Ralph Elmer, American artist: b. Amesbury, Mass., 3 Aug. 1861. He was educated at the Amesbury High School, studied art at the Boston Art Museum until 1884 and at the Julien Academy under Lefebvre and Boulanger in 1884-87. He exhibited at the Salon of 1887, and returned soon after to New York where he painted portraits. In 1892 he again went abroad, spending part of the time in Italy. He returned to America in 1895 and settled in Chicago. He is president of the Chicago municipal art commission and was member of the American art jury at the Paris Exposition of 1900; member of the art committee to the national jury of award at the Saint Louis Exposition of 1904. He is one of the founders of the Friends of American Art and is a member of several art societies. Perhaps his best works are "The Twilight of Honor." CLARKSON, Thomas, English philanthropist and emancipationist: b. Wisbeach, Cambridgeshire, 28 March 1760; d. Playford Hall, near Ipswich, 26 Sept. 1846. He was originally intended for the Church, and studied at Saint John's College, Cambridge. He early formed a connection with a Quaker association for the suppression of negro slavery, and was introduced to Mr. Wilberforce and other distinguished opponents of slavery. While the latter advocated the cause of abolition in Parliament, Mr. Clarkson was obtaining information and evidence on the subject, in attending meetings in different parts of the country, and generally conducting the agitation throughout England for the suppression of the slave traffic. In 1788 a small society, the privy council made an inquiry into the state of the African trade, and in that year a bill mitigating some of the worst cruelties of the traffic was passed. In 1791 a motion by Wilberforce in favor of putting an end to the trade was lost by 163 to 88; but his labors, and those of his party, were at last successful in England, the slave-trade being abolished by a bill passed 25 March 1807. This point gained, their next effort was to procure the total abolition of slavery in the British colonies, and in this also, after a long struggle, they succeeded, by the passing of the emancipation act in 1833. Clarkson published the 'Memoirs of William Penn' (1813), and numerous works and pamphlets in opposition to the slave trade.

CLARKSVILLE, Tenn., county-seat of Montgomery County, situated on the Louisville and Nashville Railroad near the junction of the Red and Cumberland rivers. It is the trade centre of a large tobacco-growing district, and has a number of tobacco factories, being one of the 10 leading cities of the United States in the manufacture of snuff. It also manufactures lumber, flour and agricultural implements. Valuable iron ore deposits have been discovered in the vicinity. It is the seat of the Southwestern Presbyterian University, and of a Methodist school for girls. Pop. 8,548.

CLARKSVILLE, Tex., the county-seat of Red River County, on the Texas and Pacific Railroad, about 15 miles south of the Red River, and 100 miles northwest from Dallas, in the centre of a fertile cotton country, and its industries are such as are related to the raising and marketing of this staple, with some traffic in grain, hides and live stock. Pop. 2,065.

CLASS, CLASSIFYING, CLASSIFICATION. When the domain of a science comprehends a very great number of objects which it is necessary to describe, or whose analogies and differences require to be assigned, it is always useful, and sometimes indispensable, to make a methodical distribution of these objects, to group those which present the greatest number of similar characteristics, to form with these groups new assemblages, continuing the process till a limit is reached where this mode
of generalizing may be stopped. The highest assemblage in this ascending series is a "class" (though this term may not be technically applied to it); the procedure necessarily, in forming it "classifying," and the result, extending over some entire branch of natural science, is a "classification." We do not begin to classify till we feel the need of it, for the task requires analysis, multiplied comparisons and researches as the most developed naturally and isolated notions which we had previously been contented to amass without regular arrangement. It is only, however, after the revision necessary for such arrangement has been undertaken that science can be said to have begun. The first attempts at generalization and classification often exercise a very important influence on the future progress of any science, and may even extend to the period when it seems to be approaching its perfection. A science consists principally in the relations of the facts observed, or knowledge acquired in connection with it. If the relations thus established are founded on accurate observations, they become the basis of any important and most prolific truths which human reason is able to discover. But if the imagination has been allowed to take part in the work, if it has either furnished the materials or directed the construction of the edifice, it must sooner or later be demolished, and rebuilt with better selected materials and on more solid foundations. In modern times geology commenced with faults of this description, and still seems to have difficulty in avoiding them. Natural history, to which a good classification is so essential, was not very fortunate in its first combinations: systems took possession of it, and too often blinded the inquirer to great truths which otherwise he could hardly have failed to discover. Influenced by this love of system, many, instead of submitting to the laborious investigation of facts, have come forward with some new fanciful combination, and made it almost their sole business to secure the credit of their particular classifications by overthrowing those of their predecessors or rivals. In a subject so comprehensive as natural history it seems vain to hope for a perfect classification until the resources of embryology are exhausted. Zoologists generally adopt a consistent system of classification, the basis of which is the resemblances of animals at various periods of their growth. The impulse to this line of research was given by Darwin. Being a strictly natural method, inasmuch as the affinities by common descent are sought after to the neglect of mere outward resemblances at a later period of life, the arrangements suggested by it to different naturalists show a considerable amount of harmony, and even those who oppose Darwin's generally tend to a consistent system of classification by embryological or genealogical classification. For the classification of the animal kingdom see Anatomy, Comparative.

CLASSICAL LITERATURE. The term "Classical Literature" is usually applied to the literatures of Greece and Rome, though separate periods of these and other literatures are also called classical.

GREEK LITERATURE

Greek Literature may be conveniently divided into periods, as follows: (1) Ancient or Classical, from Homer to Demosthenes (c. 700 to 300 B.C.); (2) Alexandrian, from 300 B.C. to the subjugation of Greece by Rome in 146 B.C.; (3) Greek to Roman, from 146 B.C. to the division of the empire in 330 A.D.; (4) Byzantine, from 330 A.D. to the capture of Constantinople in 1453 A.D.

I. The Classical Period.—The literature of the classical period is not artificial, but was developed naturally and without the direct intervention of a human mind. Each period, each branch of the race, Ionian, Æolian, Dorian, contributing its part, till the whole culminated in the glorious Attic, which is still the admiration of the educated world. We have no remains of Greek poetry before the Homeric poems, but the highly developed art displayed in them as well as the smoothness of the metres shows that some form of poetry must have been cultivated before such a state of perfection could have been reached. As forerunners then we may mention the Linus song and the songs of Talamant and Hylas, also hymns to the gods, marriage hymns, dirges, all which must have attained considerable amount of art in an early period of composition. During this mythic period from which we receive barely the names, such as Orpheus, Musæus and Eumolpus, to mention the best known, were developing metrical form, appropriate epithets, fixed phrases, which became the professional stock of later periods.

1. Epic Poetry.—The only remains of this early period are the Homeric poems, the 'Iliad' and the 'Odyssey.' The 'Iliad,' poem of Ilium or Troy, has for its subject the wrath of Achilles, about which is grouped in the most artistic way the development of the events during the 10 years' siege. It consists of 24 books and more than 15,000 lines. The 'Odyssey,' poem of Odysseus or Ulysses, tells of the wanderings and homecoming of Odysseus after the capture of Troy, into which are woven many beautiful myths giving light and shade to the dangers and trials through which the hero passed till he reached his home in Ithaca. This also consists of 24 books, but with only a little over 12,000 lines. Down to the end of the 18th century all the world believed that these poems were the work of one man, Homer, when Wolfe's 'Prolegomena ad Homerus' appeared in 1795. It is true that the ancients as early as 170 A.D. contended that Homer was the author of the 'Iliad,' though not of the 'Odyssey,' but this was as far as they went, and even then there was great opposition to this view of the 'Separatists,' as they were called. Vivo, of Naples, about 1700, had suggested that Homer was a myth, but it remained for Wolfe to bring forward plausible proofs of his contention that the poems were not originally one composition, but made up of several shorter poems, each on a common plan. Wolfe based his arguments on the belief that writing did not exist before 600 B.C., and that the poems were first collected and written down by order of Pisistratus and his son, and that poems of such length could not be written down by oral recitation. Following Wolfe, Lachmann and other scholars divided the poems into lays, which they believed were collected by a school of bards, called Homerides, and later put into their present form by order of Pisistratus. The question of authorship is not certainly settled, but scholars now generally accept the view that
the two poems belong to separate periods, and that each is a growth from two or three smaller poems. The poems are more closely related, though Fick has tried to show that they are Æolic. As epic lays must have existed in abundance before the 'Iliad' and 'Odyssey' were reduced to form, it is only natural that we should find the metre represented in songs, which along with a number of hymns were all credited to Homer, but which are now described as the Epic Cycle, which has come down to us from Proclus, probably the grammarian of the 2d century after Christ. These poems lack the unity of the 'Iliad' and 'Odyssey' and were far inferior to them. Among the most important were the 'Oedipoeia,' 'Thebaid' and 'Epigoni,' all dealing with Thebes; the 'Ethiopiad' and the 'Capture of Troy,' probably originally one poem; and the 'Little Iliad' were a continuation of the 'Iliad,' while the Cyprian lays were an introduction to it; the 'Nostoi,' containing the story of the Greek heroes after the fall of Troy, and the 'Teleogony,' dealing with the death of Odyssey, by his son Tele-
genius, fitted in with the 'Odyssey.'

2. Didactic.—Closely following epic poetry is the didactic, which is like epic in form and metre. Its origin is also obscure, but we must also here suppose that some forms existed before Hesiod (c. 800 a.c.), its great representative. His poem, 'Works and Days,' treats of the arts of husbandry with an attached calendar of 60 verses. The poem is a pessimistic comment on life, with a high moral tone, filled with saws, maxims, allegories, etc., with occasional flashes of genius. The 'Theogony,' formerly attributed to Hesiod though probably not by him, treats of the origin of things and the genealogy of the gods. Other works ascribed to Hesiod are the 'Catalogue,' the 'Eoiae,' the 'Ægimius,' and the 'Shield of Heracles.'

3. Lyric.—As epic was dying, lyric, which had lain dormant during this brilliant period, and which also has its origin in the above-mentioned hexameter verse followed by elided dactyls, began to be artistically cultivated. This is a natural development, for when men began to look less to their overlords and to think more of their own concerns, this change of feeling was reflected in their poetry. The new personal lyric sprang up in the place of the old impersonal epic that dealt with kings and their doings. Lyric may be subdivided into the Iambic and Elegiac, which are only partially lyrical, and the Melic, the true lyric type, which is itself subdivided into Æolic (or monodic) and Dorian (or choral) lyric. Preceding both these subdivisions is the name, cultivated by Terpander and Olympus, of which only fragments remain.

(a) Elegiac.—This was used at first in threnodies and funeral lamentations, but by the 7th century its sphere was greatly extended and it was now employed to describe all sorts of personal reflections, especially of a didactic or moral nature. The metre is a distich consisting of a dactylic hemistich followed by a tetrameter, which is really a verse composed of two catalectic, dactylic trimeters. It was recited, not sung, and was very energetic and lively, being early used as a means of conveying personal reflections. It was almost at the same time that the Elegiac was developed the Iambic, which was probably connected with the worship of Demeter. It early acquired a satyric turn, to which its lively tripping meter is especially adapted. It was an entirely different type from the Elegiac, but became early associated with it, because it had many characteristics in common, and the two types were often cultivated by the same poet. Thus epic songs, which were soon given up musical accompaniment. Among the masters in this department may be mentioned Callinus (730 B.C.? ) of Ephesus, who wrote martial elegies and was probably the first elegiac poet, though this honor is also claimed for Archilochus. Archilochus (700 B.C.) of Paros, who wrote some elegies, is mostly famed as the most illustrious wielder of iambic verse, which he is said to have invented and of which he is the earliest writer. Semonides (691 B.C.) of Amorgus, who has little originality, but is not without some elegance, is chiefly known by his satyric poem in iambic verse on women. Tyrtaeus (650 B.C.), the fabled lame schoolmaster of Athens, like Callinus, wrote martial elegies. By himerus (580 B.C.), the sweet-voiced singer, was the first to use elegy for the expression of love. Solon (594 B.C.) of Athens, the soldier and patriot, wrote elegies of a martial and political nature. Theognis (546 B.C.) of Megara, was a sharp and poignant writer of gnomic elegy. Phocylides (540 B.C.) of Miletus was another gnomic writer, and finally comes Hipponax (546 B.C.) of Ephesus, best known as the inventor of the scatun, choliambic and hymn. Which is an iambic trimeter that ends with a spondee, and thus produces a sort of shock, often humorous in effect. Here may also be mentioned the epigram, the literary form of which was the elegiac distich. It was cultivated by Archilochus to some extent, but the most distinguished writer of epigram was the lyric poet, Simonides of Ceos.

(b) Melic.—Unlike the preceding, the melic type was musical throughout. It was especially adapted to religious chants and held its sway in every realm of human passion. It is highly valuable, not only from a literary but also from an historical standpoint. The Æolian type, which was not only monodic, but also choral, is much more ancient, and the Dorian, which was generally choral. Alceus (606 B.C.) of Mitylene was a vigorous, graceful, passionate writer of songs of love, scholia, politics and some hymns. Sappho (611 B.C.), also of Mitylene, though probably born at Eresos, the greatest of women poets, wrote love songs of the most passionate character, full of subtle charm and exquisite grace. She also wrote epithalamia. Both these poets used the highly colored Lesbian dialect and both were often imitated by Horace. Closely allied to this form and content, though differing from it in dialect, was Anacreon (540 B.C.) of Teos, an Ionian city, who was a writer of love songs and hymns, and while not possessing the genius or passion of either Alceus or Sappho, yet wrote graceful verse, with the ca-calla, a kind of pentameter, which is really a verse composed of two catalectic, dactylic trimeters. The poems called 'Anacreontics' are imitations of the Alexandrian Age, and are not altogether bad, some possessing considerable merit. The Dorian type, much more ornate and more high-sounding than the Lesbian, dealt mostly with matters of religion and of public interests, taking as its
subjects the mythical traditions of the Dori ans, and was sung at festivals in honor of the gods and heroes or in commemoration of some athletic or religious ceremony. The Doric dialect is Dorian of an artistic literary type, and the form varied from the simple narrative to the highly artistic dialogue. The most important forms in the order of their development were the Pæan, a hymn of religious thanksgiving to Apollo, the Hyporchema, also a hymn to Apollo, accompanied by dancing; the Parthenion, a sort of processional song, sung by a chorus of young girls; the Dithyramb, in honor of Dionysus, of a wild and passionate nature, sung by a chorus encircling an altar; also march songs, marriage songs and such like. Thaletas (700 B.C.) of Crete is mentioned as developing the Pæan, and Hyporchema, the metre of which he brought from his native land to Sparta. Alcmæon (650 B.C.) of Sardis wrote hymns, Pæans, hyporchemata and scholia, and especially gave artistic form to the Parthenion. His poetry is easy, graceful and often tender. Arion (650 B.C.) of Methymna is especially noted as the founder of the Attic dithyramb. Stesichorus (611 B.C.) of Himera in Sicily treated epic subjects in lyric form and is famous for adding the epode to the strophe and antistrophe, of choral song, whence he gets his name, his real name being Tisias. Ibycus (560 B.C.) of Rhegium in Italy, somewhat like Stesichorus in form and content, wrote both hymns and love songs. But the great masters of choral lyric arose after the Persian wars, which had a tendency to unite the widely scattered Greeks into one people and brought Athens and Athens, which then became the literary centre of the known world. Simonides (556 B.C.) of Ceos, an Ionian, of keen observation and philosophic temperament, gave his genius to the cultivation of the Doric lyric and achieved the highest fame. He was also distinguished in other departments of poetry, notably the elegy and the epigram, hymns to the gods, Pæans, dirges, odes of victory, etc. Simonides is also remarkable as being, so-to-speak, the first native poet, for he was an Ionian by birth, wrote in the Doric dialect, and at Athens, the future world power. Next may be mentioned his nephew, Bacchylides (470 B.C.), of whom 20 poems were extant. Of these, 45 complete odes of victory, written in honor of the victors at the great national games, besides many fragments representing almost every species of lyric composition.

4. Drama.—As its name implies, drama is distinguished from epic by action, and grew out of the cult of Dionysus, which was deeply tinged with religion. The people of one section would gather together and worship Dionysus, the god of wine, at vintage time. When in time, the chorus leader impersonating Dionysus told of some adventure, the chorus would burst into song suited to the feelings aroused by the story, which might be sad and dirge-like or joyous and hilarious. Later this story of adventure and the chorus singing it collapsed into a dialogue, and when such dialogue was repeated several times during a festival and then extended to other myths, drama was begun. In time costumes were improved and masks were added; from the simple dialogue noted above, dialogue was now carried on between the chorus leader and one member of the chorus instead of the entire chorus, so that the number of actors was increased to two and later to three. The chorus was at the same time reduced to 12 or 15 (in comedy to 24), and thus became less prominent. When the drama developed, special actors were demanded and these were paid by the state. There was no theatre at first, though soon seats of wood were erected, and later of stone, cut out of the rock on the slope of a hill, with a capacity of 20,000 people; there was no covering. At the front of the seats was the orchestra or circular dancing place, in which was an altar, about which the chorus performed its evolutions. At the rear of the altar was a wall for the scenery and behind this was some rude machinery, such as the noted eccylisma, a sort of rolling platform; there was likely no stage. Dramatic representation was under the care of the state and consisted of a contest among three poets, each of whom contended with three pieces and a satyr drama. The drama was divided into tragedy and comedy, which grew up side by side, though tragedy was first to attain artistic form.

(a) Tragedy.—Passing by Thespis, Phrynichus and others who were helping to develop tragedy, we come to the masters, Æschylus, Sophocles, Euripides, in whose hands tragedy reached its greatest height. Æschylus (525-456 B.C.) was a stern, proud, deeply religious man, with a vigorous imagination, and gifted with the power of seeing the grand and terrible in nature. His plays show vigor and subtlity of thought rather than grace and delicacy. He is believed to have composed about 70 dramas and 20 satyr dramas, of which only seven have come down to us, the best being the 'Agamemnon' and the 'Prometheus Bound.' Sophocles (495-406 B.C.), the greatest of the three tragic writers, was a man of charnal logic and severity, endowed with brilliant poetic talent: his imagination was happily not so vigorous as Æschylus's, but more spontaneous and versatile, and he had a very keen insight into and appreciation of human nature. His plays exhibit deep reflection and serious thought combined with the most exquisite grace and perfection of form. Of about 120 plays only seven are extant, of which the best are the 'Antigone,' 'Electra' and 'Edipus Tyrannus,' the last being perhaps the greatest tragedy ever written. Euripides (480-405 B.C.), though a great poet, did not maintain the lofty standard set by Æschylus and Sophocles. He was a man of keen sensibility, with a highly impressionable and sympathetic nature, a glowing imagination, but thoroughly impregnated with the sophistry of his time. He possessed much grace and beauty, but lack the power of Æschylus and the perfection of Sophocles. There are often passages of brilliant effect, and he rises to his greatest height in the portrayal of the innermost feelings of the heart. He was not so popular in his lifetime as he
became later, and so of his 75 or 90 plays, only 18 are preserved, exclusive of the 'Rhesus,' which is certainly spurious. The best plays are perhaps the 'Medea,' the 'Iphigenia at Aulis' and the 'Ion.'

Comedy.—From corium, which was a rustic procession bearing an emblem of fecundity and singing phallic chants at the country Dionysiac festivals, with which comedy was closely associated. When comedy became important it was taken under the care of the authorities at Athens and the competitions were held especially at the Lenaia, about the end of winter. Comedy is usually divided into the "Old," "Middle" and "New." Old comedy, which held sway from about 480 to 400 B.C., usually dealt with some political or moral subject, and was characterized by the wildest extravagance of fancy and indulgence of keen personal satire accompanied with brilliant and too often coarse wit. Like tragedy, it had a structure of its own which varied little in the different plays. The Parabasis, consisting of songs and spoken passages, is a relic of the old corium and was used to present the personal views of the poet. The language is the spoken Attic, its highest products being in elegant and with the most exquisite grace. Middle comedy (400-330 B.C.), which arose at the end of the Peloponnesian War, loses the vivacity and extravagance of the old and has to do with character sketches and everyday life rather than with political satire. Its chief representatives were Antiphanes (425 B.C.?) and Alexis (390 B.C.). New comedy lost the chorus, and giving up the artificiality of the former period, came nearer to real life, taking its subjects from everyday experience, of which love is the enduring type. This is the prototype of the Latin comedians, Plautus and Terence, and was cultivated by Diphilus, Apollodorus, Philemon, Menander, Posidippus and others, of whom the last is the greatest. No plays of these writers are extant, but the fragments abundantly testify to the loss we have sustained. Earlier than Attic comedy is Sicilian, which was cultivated chiefly by Epicharmus and Sophron.

5. History.—While poetry was at its highest point of development, Greek prose was coming into life in Ionia and now became the medium of philosophical writings, which had earlier used the almost prose Iambic verse. The beginnings of history were made by the compilers of ancient myths and legends, records of events, genealogies, etc., mostly of a local nature, and later they extended their sphere to foreign countries, when some geography and description were added. It was an unscientific kind. Among these early writers of history may be mentioned Hecateus of Miletus (c. 500 B.C.), Pherecydes of Leros (450 B.C.) and Hellanicus of Mitylene (450 B.C.). But the only one whose work is extant is Herodotus of Halicarnassus (484-406 B.C.), called the "Father of History." In the earlier part of his life he was a great traveler and visited nearly every part of the then known world, making researches for his future work. His history consists of nine books named after the Muses, of which the first part treats of the Persian Empire, its rise and power, while the latter half deals with the Persian invasion of Europe. He weaves into his work much geographical and social material. He uses the Ionic dialect and is really the first writer of artistic prose. His style is simple, graceful and charming. We cannot doubt his sincere search after truth, but his love for the marvellous and his great skill as a story-teller led him into exaggeration and caused him to bring in many side issues, which raise suspicion as to his credibility. Thucydides of Athens (471-400 B.C.), the greatest historian of Greece and one of the greatest of the world, wrote in eight books a history of the Peloponnesian wars, using the Attic dialect, and is justly styled the first philosophical historian, inasmuch as he not only gives the events, but also seeks the causes and the political and moral lessons to be drawn from them. Banished, probably for failure in a naval battle, he watched the progress of the war from the outside, but he was absolutely impartial. The speeches, largely imaginary, serve to convey his philosophical ideas of the causes of events. His style is exceedingly forceful and intense, his expressions in a large measure to his striving after brevity, for every sentence is overcharged with thought. Xenophon (434-355 B.C.), also of Athens, continued the work of Thucydides in the first two books of his 'Hellenica,' which consists of seven books and is a very vivid account of the march of the 10,000 Greek mercenaries with Cyrus the Younger, when he tried to wrest the kingdom from his brother Artaxerxes. Xenophon was himself a member of the expedition, at first as an onlooker, but later as a leader, so that he gives us a vivid and interesting personal account of it. Among other works are 'Cyropedia' (or Education of Cyrus), a sort of historical romance, in eight books, the 'Memorabilia of Socrates,' a vindication of the great philosopher, the 'Economicus,' was the greatest. He has written short essays, and other essays, some probably spurious. Other historians of whom only fragments are extant are Ctesias (415 B.C.) of Cnidus, physician at the court of Artaxerxes; Mnemon, who wrote, in Ionic Greek, histories of Persia and India, Philistus of Syracuse, Ephorus of Cyme, Theopompos of Chios, the last two from the school of Isocrates, and the authors of the Attic, collections of historical and archaeological material.

6. Philosophy.—Although philosophy had its beginnings in Ionia at the same time with history we have no literature extant before Plato. Thales, Anaximander and Anaximenes were the first to seek the causes of things and bused themselves in an unphilosophic kind. Among these early writers of history may be mentioned Hecateus of Miletus (c. 500 B.C.), Pherecydes of Leros (450 B.C.) and Hellanicus of Mitylene (450 B.C.). But the only one whose work is extant is Herodotus of Halicarnassus (484-406 B.C.), called the "Father of History." In the earlier part of his life he was a great traveler and visited nearly every part of the then known world, making researches for his future work. His history consists of nine books named after the Muses, of which the first part treats of the Persian Empire, its rise and power, while the latter half deals with the Persian invasion of Europe. He weaves into his work much geographical and social material. He uses the Ionic dialect and is really the first writer of artistic prose. His style is simple, graceful and charming. We cannot doubt his sincere search after truth, but his love for the marvellous and his great skill as a story-teller led him into exaggeration and caused him to bring in many side issues, which raise suspicion as to his credibility. Thucydides of Athens (471-400 B.C.), the greatest historian of Greece and one of the greatest of the world, wrote in eight books a history of the Peloponnesian wars, using the Attic dialect, and is justly styled the first philosophical historian, inasmuch as he not only gives the events, but also seeks the causes and the political and moral lessons to be drawn from them. Banished, probably for failure in a naval battle, he watched the progress of the war from the outside, but he was absolutely impartial. The speeches, largely imaginary, serve to convey his philosophical ideas of the causes of events. His style is exceedingly forceful and intense, his expressions in a large measure to his striving after brevity, for every sentence is overcharged with thought. Xenophon (434-355 B.C.), also of Athens, continued the work of Thucydides in the first two books of his 'Hellenica,' which consists of seven books and is a very vivid account of the march of the 10,000 Greek mercenaries with Cyrus the Younger, when he tried to wrest the kingdom from his brother Artaxerxes. Xenophon was himself a member of the expedition, at first as an onlooker, but later as a leader, so that he gives us a vivid and interesting personal account of it. Among other works are 'Cyropedia' (or Education of Cyrus), a sort of historical romance, in eight books, the 'Memorabilia of Socrates,' a vindication of the great philosopher, the 'Economicus,' was the greatest. He has written short essays, and other essays, some probably spurious. Other historians of whom only fragments are extant are Ctesias (415 B.C.) of Cnidus, physician at the court of Artaxerxes; Mnemon, who wrote, in Ionic Greek, histories of Persia and India, Philistus of Syracuse, Ephorus of Cyme, Theopompos of Chios, the last two from the school of Isocrates, and the authors of the Attic, collections of historical and archaeological material.
Empedocles (492) of Agrigentum. Anaximenes (510 B.C.) of Clazomenae was one of the deepest thinkers of the time. He carried philosophy to Athens, where it received its highest perfection in Socrates (469–399 B.C.), who, though he wrote nothing, gave the mightiest impulses to his disciples. First and foremost is Plato (428–348 B.C.) of Athens, who founded his School in Athens. Plato, of a highly sensitive and poetic temperament, received the best possible education, which he enriched with extensive travel. He wrote much in every department of philosophy, ethics, metaphysics, politics, using the dialogue, with Socrates as the central figure. The vivid imagination and dramatic style which are seen in all his writings rendered them ever fresh and attractive. Forty-two dialogues are extant, of which about 25 are genuine, the best known being the 'Apology,' 'Crito,' 'Phaedo,' with the longer works of the 'Republic' and the 'Laws.' Only fragments remain of Heralcides Ponticus, the scholar of Plato. Aristotle (384–322 B.C.) of Stagira was the most distinguished pupil of Plato. As the idealistic disciple of the Academy he founded the School. He was a practical man, wholly unlike the idealist Plato. He ranged over the entire world of knowledge, treating everything from the practical standpoint, as opposed to the idealistic and speculative. His works, written in the common dialect, in a clear and precise, though often bald style, are very numerous, as he wrote on every department of knowledge, literature, philosophy and science. His greatest works are the 'Nicomachean Ethics,' the 'Politics,' Highly valuable also is the 'Athenian Constitution,' which was discovered in 1891.

7. Rhetoric and Oratory.—Real Greek prose began at Athens between 430 and 410 B.C. The great orators of the early period, Themistocles and Pericles, did not write their speeches, as did the later orators, of whom only 10 were deemed worthy of a place in the Alexandrian canon. First in order comes Antiphon (480 B.C.), whose style, elaborate and rich, exhibits a fondness for antithesis somewhat like that of Thucydides. Fifteen speeches are extant. Andocides (440 B.C.), of whom we have four speeches, is not a stylist, though he shows much talent for vivid dramatic effect. The two cultivated judicial oratory. Lysias (440 B.C.) was an almost perfect stylist and greatly admired in Attic prose. Thirty speeches, composed in plain but graceful style, are extant. Isocrates (436 B.C.), of whose speeches 21 are preserved and who wrote speeches to be read rather than delivered, is famous for his smoothness of diction and periodic structure, a style which has been transmitted through Cicero to all the modern literatures. Isaeus (420 B.C.), of whom we have 11 speeches and a fragment of a 12th, resembles Lysias in style, but is much more vigorous. Demosthenes (384 B.C.) who was a pupil of Isaeus, carried oratory to its highest pitch. He was an indefatigable worker, and his speeches were elaborated, as charged, they are sincere, vigorous and intense, showing purity of diction and perfection of form. Famous is the oration 'On the Crown' in reply to his contemporary, Philippus (399 B.C.), himself a distinguished orator. Æschines (385 B.C.) wrote some good fluent prose, but lacking in sincerity. Two other contemporaries were good orators, but far inferior. Lycurgus (390 B.C.) and Hyperides (389 B.C.).

8. Medicine.—The only works extant are those of Hippocrates (460 B.C.) of Cos, who was the founder of medicine. These are written in the Ionic dialect in plain language and without any pretensions of style.

II. Alexandrian Period (300–30 B.C.).—In this age the spontaneous production of literature ceased and in its stead arise science and criticism, for the enlargement of the Greek world by the conquests of Alexander rendered the appeal to the learned few rather than to the masses inevitable. Prose becomes now more important than poetry, which is mostly learned and highly artificial. Ideality and art are gone; imitation and science have come in. Alexandria as a centre of literary activity rivals Athens. The following departments were cultivated:

1. Poetry.—Besides the new comedy, the most important is the pastoral poetry, the only new style, cultivated by Theocritus (270 B.C.) of Syracuse. His poems, called idylls, deal with the rustic life. The original metre is hexameter. Theocritus is largely artificial and conventional, but exhibits true emotion and a deep feeling for nature. Thirty-one idylls are extant besides some epigrams and fragments. Bion (200 B.C.) of Ionia, and Moschus (c. 150 B.C.) of Syracuse, also cultivated pastoral poetry with considerable success. Here may also be mentioned Herondas (250 B.C.), whose recently discovered poems, called 'Mintambi' (sketches), were published in 1891. Learned poetry was represented by Callimachus (260 B.C.), of whom we have six hymns and some epigrams, but only fragments of his elegies. Apollonius Rhodius (194 B.C.), a grammarian, wrote an epic on Jason, called 'Argonautica,' in imitation of Homer, but it is highly artificial. Lycothephrus (260 B.C.) cultivated tragedy. In didactic poetry Aratus (270 B.C.) wrote a poem on astronomy, which has little merit, and Nicander (150 B.C.) wrote a medical treatise in verse. Nicander also wrote 'Georgics,' which had some influence on Virgil, and 'Metamorphoses,' which were used by Ovid. Parody and satire also flourished in the hands of Timon (280 B.C.) of Phlius, whose satirical poems are called 'Timo.'

2. Philosophy.—The old philosophy was gone and in its stead we find Stoicism and Epicureanism (qq.v.). Here may be mentioned Theophratus (374–287 B.C.), whose work on 'Characters' is still extant, and Chrysippus, the Stoic.

3. Philology and Criticism.—The establishment of the Museum by Ptolemy I gave great impetus to philological and critical study. Zenodotus (280 B.C.), who began the work of revising and explaining the Greek poets, wrote memoirs and lists of rare words and phrases. Aristophanes (200 B.C.) of Byzantium, who introduced the signs used to mark accents, and Aristarchus (150 B.C.), the text critic, were the greatest of the Alexandrian scholars. The science of grammemetics was developed. Apollodorus (140 B.C.) wrote a work on mythology. Dionysius Thrax (110 B.C.) wrote the first grammar, which was used as a textbook as late as the 12th century.

4. Science.—Some advance had been made in astronomy, mathematics and geography, when Euclid (300 B.C.) gave to the world his 'Elements of Geometry,' which is still a famous
work. Archimedes (d. 212 B.C.), who invented the screw, was a distinguished scientist, as was also Apollonius. Eratosthenes (d. 194 b.c.) founded scientific geography and chronology. Here we may mention Hipparchus (160 b.c.), the founder of scientific astronomy, and also the Athenian philosophers, especially the Peripatetics, who busied themselves with science.

5. History.—History was but sparingly cultivated, its greatest representative being Polybius (204-122 B.C.). His work was a record of Roman conquests in 40 books, of which we have the first five entire and fragments of the remaining.

III. Roman Period.—In this period Greek literature spread over the civilized world. Incipient universities sprang up in different places and with them the striving after form and style, especially in prose, poetry being practically neglected.

1. History was cultivated in the early part of this period by Diodorus Siculus (b. 40 B.C.), who wrote a history of the world in 40 books, of which only books I-V and XI-XX with some fragments are preserved. Dionysius of Halicarnassus (d. 7 B.C.), of whose Archeology (or Roman History) books I-X have reached us, is much better known by his rhetorical work and critical essays on the classic prose writers. We may also mention in this department Josephus (37 A.D.), who wrote a history of the Jews, Arrian (100 A.D.), who wrote the history of Alexander’s expedition and of India, and Dio Cassius, Appian and Herodian, who wrote histories of Rome.

2. Biography was especially cultivated by Plutarch (40 A.D.), whose Parallel Lives and ethical works have come down to us. Diogenes Laërtius, Flavius Philostratus and Apollonius of Tyana were also composers of lives.

3. Geography was represented by Strabo (18 A.D.) in 17 books, and Pausanias (160 A.D.), whose description of Greece is of the highest value. We may also mention Ptolemy (160 A.D.) of Alexandria, whose geography, based on mathematical and astronomical principles, held its own till replaced by the Copernican System.

4. Philology was studied by Julius Pollux, and Phrynus, the Atticists, and by the grammarians Apollonius Dyscolus and his son Herodian. Athenæus (190 A.D.) is especially known for his ‘Diepophistias,’ or ‘Table Talk,’ which is very dry, but has a wide range and contains valuable material. Galen (160 A.D.), besides his medical work, wrote on Plato and Hippocrates. Polyæus (170 A.D.) and Ælian (220 A.D.) have left us collections of anecdotes.

5. Rhetoric was systematized by Hermogenes (170 A.D.) It was also cultivated by Longinus (c. 213 A.D.), to whom is ascribed the work ‘On the Sublime,’ Dio Chrysostum (c. 50 A.D.), and others. Especially worthy of mention is Lucian (264-196 A.D.), the satirist and rhetorician, whose works are of varied interest and constitute the best prose since the decline.

6. Philosophy was little cultivated. We may mention Epictetus and Marcus Aurelius, the Stoics and Moralists, Plotinus and Porphyry, the Neo-Platonists and Sextus Empiricus, the skeptic.

7. Poetry was practically neglected. The only name worthy of mention is Babrius (40 A.D.), who put the fables ascribed to Æsop into comic verse.

8. Here may also be mentioned the Christian writers, Justin Martyr (c. 105 A.D.), Clement of Alexandria (c. 150 A.D.) and his pupil, Origen (c. 185 A.D.), who wrote in the Greek spirit for the advancement of the Christian dogma, apologetics, and polemics, and exegesis. We have the novelist Heliodorus (390 A.D.) with his followers, Achilles, Tatus and Chariton. In poetry only Nonnus’s (c. 400 A.D.) ‘The Adventures of Dionysus’ and Quintus Smyrnaeus’s ‘Iliad’ are worth mentioning. Well known is Stobæus’s ‘Florilegium and Eclogae’ and the ‘Anthology of Cephalas,’ now called ‘Palatine’ Libanius gives some interesting features of university life. Learning is represented by Chaerobulus, the grammarian, Constantine the Great, the early historians of Homer, Ptolemy, Hesychius and Suidas, the lexicographers. Zosimus, Procopius and Zonaras cultivated history. The most important of the Christian writers are Eusebius, Gregory and Chrysostom.

ROMAN LITERATURE

The Romans were an intensely practical people, endowed with less imagination and less creative power than the Greeks, and also lacked their fine feeling for the beautiful. Hence their literature does not have the same freshness and originality, though it is not less important, for through Cicero the prose style of Isocrates was transmitted to modern literature, and their laws live in many modern constitutions. The literary activity of the Romans may be divided into five periods: (1) Prehistoric; (2) Archaic from Livius Andronicus to Cicero (240-70 B.C.); (3) The Golden or Classical (70 B.C. to 14 A.D.); embracing the Ciceronian and Augustan Periods; (4) The Silver Age (14-117 A.D.); (5) The Period of Decline (117-500 A.D.).

I. The Prehistoric Period.—The beginnings of Roman Literature were in poetry and we find here carmina or songs on historical subjects, hymns to the dead, sacred songs, etc., composed in the Saturnian metre, and some epitaphs. The beginnings of drama are seen in the farce plays, ‘Fescennini,’ ‘Satura,’ ‘Atellana.’ Prose was confined to treatises, annals, laws, of which latter we may mention the ‘Leges XII Tabularum,’ which were committed to memory as the commandments. The only prose writer of this period was Appius Claudius Cæcus, whose speech against Pyrrhus was long extant.

II. The Archaiic Period.—Historic Roman Literature begins with Livius Andronicus (284-204 B.C.), who besides making a dull and dry translation of the ‘Odyssey,’ wrote comedies and tragedies based on the Greek. Cn. Nævius (264-196 B.C.), a historical writer of panegyric and epitaphs, composed the first Latin verse on the First Punic War, still using the Saturnian metre but showing more skill and originality than Livius Andronicus. The most important comedian of all is T. Maccius Plautus (254-184 B.C.), to whom about 130 plays are ascribed. Of these Varro selected about 70 as genuine, and probably 19 others are genuine. Of the plays selected by Varro as genuine, 20 are still extant and considerable fragments of the 21st, the
'Vidularia.' Plautus's plays are all based on the Greek. He shows great ability in working out the plots, handles his metres freely, but skilfully, and is a perfect master of the popular speech. His dialogue is bright and lively, full of rude wit and keen humor. His plays were long exhibited on the stage and, was Studied in the Senecan schools and imitated in modern times. P. Terentius (185-159 B.C.) was brought as a slave to Rome, where he was liber-
ated. His intimacy with Scipio Africanus and Caio Lælius gave rise to the belief that Scipio was the author of his plays. Six plays are extant, which are mostly imitated from Man-
der. Terence has neither the luxuriant genius nor the creative ability of Plautus and lacks his pungent wit, but he is more reflective, more melodious, more artistic. His language is that of the best cultivated circles, and possesses elegance and grace. He was greatly admired by later Romans, and like Plautus has been a model for modern dramatists. Here may also be mentioned Statius Cæcilius, who imitated the style of the comedies of the Greeks, and Lucullus Lænnus, the enemy and rival of Terence. The Fabula Togata or national comedy found its chief representative in L. Afranius (c. 150 B.C.), a man of considerable ability. Tragedy was cultivated especially by M. Faccunus (220-132 B.C.), of whose 13 plays we have only frag-
ments, and L. Accius (170-94 B.C.), who wrote about 40 tragedies. He was greatly admired by Cicero, Horace and others. Besides Livius Andronicus and Cn. Navius, already mentioned, the epic was treated by Q. Ennius (239-169 B.C.), who far outshone the others and may be called with Horace "Father Ennius," as the real founder of Latin poetry. His great work, be-
sides comedies, tragedies, satura, was the 4 An-
nales" in 18 books, of which only fragments are preserved. His verse is often rude and forced, but he was a man of talent, possessing a vivid imagination and great skill in handling the language. He introduced the hexameter verse to take the place of the Scaenianus. His 123 marks an epoch in the language changes pro-
duced. He was greatly admired by Cicero, who was fond of quoting him. Ennius also wrote satura, but he was surpassed in this by C. Lucilius (84 B.C.), who, although unfinished, was full of keen wit and searching criticism of public men and public affairs. Lucilius deserves special mention for giving the satura the nature of an invective poem. About 900 fragments are preserved.

Before prose was sufficiently developed, the early historians, especially Q. Fabius Pictor (c. 210 B.C.) and L. Cinnius Alimentus (c. 209 B.C.), used the Greek tongue. The real founder of Latin prose is M. Porcius Cato (234-149 B.C.), a voluminous writer on many subjects. His works comprise "Origines" in seven books, on the rise and growth of Rome and the origin of Italian cities, "De Re Rustica," still extant, and many speeches. Among other historians may be mentioned S. Cornelius Sisenna (119-57 B.C.), Claudius Quadrigarius, Velerius Antias and Licinius Macer, whose work was much used by Livy. In oratory, besides Cato, we find S. Sulpicius Galba, C. Gracchus, M. Antonius, L. Cassius, Q. Cornelius Maximus, M. Cornelius Cæcchinius and Q. Hortensius (114-50 B.C.), who was the bridge between these orators and Cicero. Also worthy of mention are S. Ælius Petus, who wrote the first law book, 'Trifer-
tita,' and L. Ælius Stilo, the first philologist. The 'Rhetorica ad Herennium,' in four books, an important work on rhetoric, also belongs to this period. Its author is unknown, but it does not belong to Cicero or Cornificius, to each of whom it has been ascribed.

III. Golden or Classical Period.—This period contains the best of Roman literature and may for convenience be divided into the Ciceronian and Augustan ages, the former be-
ing characterized by the highest development of prose, the latter of poetry.

(a) The Ciceronian Period.—The first great writer of this age is M. Terentius Varro (116-
28 B.C.), of ancient family and high rank, who was the most learned man and most extensive writer of ancient Rome. In his works, 74 in number, in more than 600 volumes, he treated almost every conceivable subject, literature, oratory, history, philosophy, grammar, juris-
prudence, geography, agriculture, etc. Of especial importance are his 'Sature Menippae,' in which he used both prose and verse to satirize the condition of his times. By far the greatest name in Roman literature is M. Tullius Cicero (106-43 B.C.), the son of a Roman knight, born near Arpinum in Latium. He was remarkably endowed both physically and mentally. He was tall and commanding in appearance, possessed of a fine memory, vivid imagination, quick and ready wit, intense feel-
ing and a kindly, generous disposition. To these natural gifts he added the most untiring energy in his eager acquirement of knowledge of every kind and enjoyed the instruction of the very best masters. He was an intense and honest patriot, but lacked political sagacity and the courage of his convictions. His appreci-
ation of the beautiful, supplemented by his study of the Greek writers, led him to reproduce their thoughts in Latin, and thus he became the founder of the finest prose that ever was known to the Romans. His highest achievement was in oratory, and his speeches, both political and legal, are among the finest remains of Roman literature. His correspondence was prolific and is of immense value from an historical as well as from a linguistic point of view. In his later years, when the spirit of Republican ascendency, he retired to private life and com-
pied his philosophical works, largely as a solace for his troubles, but also to acquaint his people with the best systems of the Greeks. Of over 100 speeches we have 57 complete, and fragments of about 70 others, while the rest are known to us only by tradition. The greatest speeches are the four against Catiline, one for Milo, one against Verres and the second against Antony, one of the most powerful in-
 vectives in any language. His rhetorical works are an outgrowth of his preparation for oratory. In this work his aim was to modify and fit existing systems to Roman needs. The rhetor-
 ical works are as follows: 'De Inventione,' in two books, very 67 B.C. 'De Oratore,' in three books, in dialogue form, with the two great orators, L. Crassus and M. Antonius, as the chief speakers, a splendid work, full of vivacity and eloquence and composed in magnificent style; 'De Oratore,' in three books, in dialogue form, a history of Roman oratory. In the 'Orator ad M. Brut-
um,' Cicero paints his ideal orator. In the
general, orator, historian and grammarian. His chief literary works that have reached us are 'Commentarius de Bello Gallico,' in seven books, and 'De Bello Civili,' in three books, written in an elegant, simple and clear style. The eighth book 'De Bello Gallico' was written by A. Hirtius as was the 'Bellum Alexandrinum,' but the 'Bellum Africum' and the 'Bellum Hispaniense' are by unknown hands. Cornelius Nepos (99-28 B.C.), the friend of Catullus, Cicero and Atticus, is an antiquarian of whom only a part of the 'De Illustribus Viris' is extant, written in an easy, but often monotonous and impure style. Caius Sallustius Crispus (86-34 B.C.), the enemy of Cicero and Pompey, was the first to treat historical writing as an art, and took for his model Thucydides. Of his works, the 'De Coniuratione Catilinae' and the 'Bellum Jugurthinum' have reached us entire, but of the histories, in five books, we have only fragments. Sallust's style is very concise and his language is artificial and archaic, and, though sometimes obscure, it is extremely forcible and vivid. Poetry in this period was cultivated by T. Lucretius Carus (98-55 B.C.), who wrote a didactic poem in six books, 'De Rerum Natura.' He sought to free the mind from all kinds of superstition by a rational study of nature, basing his work on the philosophy of Epicurus. Lucretius was a masterful genius with great poetic instinct and independent spirit. On account of the poverty of the language in philosophical expression, the archaic style of the poem and the dry and abstruse subject-matter, it is often difficult to understand. Horace and Ovid were greatly influenced by him. The greatest poet of the period, and perhaps the greatest Rome ever produced, was C. Valerius Catullus (87-53 B.C.), the lyricist, from whom we have 116 poems on various subjects in various and sometimes rare metres. Catullus, impulsive and frank by nature, is pre-eminently the poet of passion, showing his best work in his short love songs, which are written in splendid, but simple and chaste, style.

(b) The Augustan Period. — P. Virginius Maro (70 B.C.) the first great epic writer of Rome, enjoyed the highest educational advantages, was gentle and pure, amiable, bashful, not a genius, but a slow, laborious worker, carefully polishing all he wrote. His extant poems are 'Bucolici,' or 'Eclogae,' 10 in number, which are imitations of Theocritus; 'Georgica,' in four books, in which he followed Hesiod, Aratus and others as models, though great independence is shown, as the subject was congenial to his personal taste and experience. The warmth and vividness, skilful use of language and pleasing arrangement of the episodes make these the most artistically perfect of all the Roman poems that have reached us. The 'Aeneid,' in 12 books, never received the poet's finishing touch, so that he wished it to be destroyed. This vast epic poem, one of the greatest epics of the world, treats of the adventures of Aeneas, the 'Odyssey' being the model for the first six books, the 'Iliad' for the last six. The language is elegant and at times sublime, the Homeric epic, the Homeric poems. Besides these, several minor poems are perhaps wrongly attributed to Virgil. Q. Horatius Flaccus (65-8 B.C.), the most popular poet of Rome, brought the satire to its
highest perfection. We have two books of satire, the former containing 10, the latter eight, poems. Horace was the skilled poet par excellence, of the tone good-natured, though at times sharp, and the style easy and conversational. At about the same time, and in like tone, were produced the Epodes, which, like the Odes in form, are like the Satires in content, though more specific and less generous. The Odes, by which Horace is probably best known, and which are based on Greek models, especially Alcaeus, Sappho and Anacreon, though not wholly dependent on them, are elaborately wrought out, showing much warmth of feeling, but little of passion and imagination. The skillfully handled metres, the well-chosen language as well as the artistic and happy setting, make the Odes the delight of all. In his later years he produced the 'Epistles,' in two books, of which the first has 20, the latter three, poems. These are of the same general character with the Satires, but show greater care and better style. Especially famous is the third epistle of the second book, called by Quintilian "Liber de Arte Poetica," in which Horace discusses with fine taste a series of literary questions. Albinus Tibullus (c. 54-19 B.C.), the Roman elegiac poet, is known in this country for his warm and sympathetic. Four books of elegies are ascribed to him, of which the third and part of the fourth are spurious. They show a refined taste, great felicity of expression and smoothness of metre. Sextus Propertius (c. 50-15 B.C.), a younger contemporary of Tibullus, also wrote elegies, of which we have five books. He was sensuous and passionate by nature, full of fire and originality, but often obscure and difficult on account of the multitude of mythological allusions. P. Ovidii Naso (48 B.C.-17 A.D.) was a man of vivid imagination and high poetic temperament, but frivolous and self-indulgent. He was a wonderful story-teller, and the elegance and grace of expression combined with the easy and skilful handling of the metres constitute Ovid's peculiar charm, but these very gifts of nature prevent him from taking the highest rank, for the labor of polishing was irksome to him. We have the following poems: 'Epistulae,' or (for seven times) love letters by men and women in the heroic age, in elegiac metre; 'Amores,' in three books, chiefly erotic; 'Ars Amatoria,' in three books, and the 'Remedia Amoris,' in two books, its counterpart; 'Medicamina Faciei,' only partly extant; 'Metamorphosen Libri XV,' in hexameter verse, treats of various myths and their sources after Greek models; 'Fotorum Libri VI' is a calendar, with an account of the origin of Roman festivals; 'Tristium Libri V' recounts the troubles of his and his wretched plight in a strange land; 'Epistularum ex Ponto Libri IV' are of a like nature and the 'Ibis,' a very abusive poem against some unknown enemy, and finally the 'Halieutica,' a didactic poem about the fishing. The lines are preserved, treating of the fish in the Black Sea. Here may also be mentioned Gaius Faliscus, whose 'Cynegetica' is in a very perfect state, and Manilius, whose work on astronomy (or better astrology) is dry but not without interest. The greatest prose writer of this age was T. Livius (59 B.C.-17 A.D.) of Patavium, a man of vivid imagination, generous feelings, possessed with a love of truth and gifted with fine oratorical powers. His language, graceful and elegant, is made more charming by the archaisms and poetic coloring. Livy is a fine master in the portrayal of character and is perhaps the greatest stylist of the Romans. The charge of provincialism is hardly if at all discernible to us. Besides his philosophical and rhetorical works, with which note the history of Rome in 142 books, 'Ab Urbe Condita,' of which books I-X and XXI-XLV are preserved, while of the rest we have epitomes, a very unsatisfactory substitute. Other prose writers of this period are Annaeus Seneca (c. 54-36 A.D.), a writer on rhetorical subjects, Pomponius Trogus, who wrote a universal history in 44 books, of which a compendium was made by Justinus, and Vitruvius Pollio, from whom we have 'De Architectura Libri X.' In law, we may mention S. Fulcius Rufus, A. Ohius, M. Antonius Labes and C. Ateius Capito. In grammar and philology, P. Nigidius Figulus, who, besides his work on theology and natural sciences, wrote a book 'Commentaria Grammatica'; M. Vernius Flaccus, author of 'Fasti' and 'De Verborum Significatu;' and Iulius Hyginus, who wrote on history, geography, agriculture, astronomy, etc., commentaries on Virgil and 27 fasti. IV. Silver Age.—C. Vellius Paterculus (18 B.C.-31 A.D.), the court historian under Tiberius, wrote an 'Abridgment of Roman History,' in two books, classical in vocabulary, but exaggerated and artificial in style. Valerius Maximus (fl. A.D. 26) was not an historian, but a compiler, and his 'Factorum et Ditorum Memorabilium Libri IX,' without taste and sometimes without sense, seems to be a collection of models for rhetoricians. Much more important is A. Cornelius Celsus (fl. A.D. 50), the scientist, of whose encyclopedia we have still extant the eight books on medicine. Here also belongs Phaedrus, whose 92 fables in imitation of Aesop are good both as to metre and style. By far the most important writer of this time is L. Annaeus Seneca (4 B.C.-65 A.D.), poet and philosopher, who wrote on numerous subjects in a striking and brilliant, but highly artificial style. Besides many works known only by name, we have: 'De Amore'; 'De Beneficiis,' in four books; 'Naturales Questiones,' in seven books; 'De Clementia,' in two books, and 'Apologetica,' a bitter satire on the Emperor Claudius, and 'Epistulae Morales ad Lucilium,' 124 letters on moral subjects, abounding in saws and maxims. The correspondence with Saint Paul is spurious, but there is now little doubt that the tragedies ascribed to him are genuine. Q. Curtius Rufus (fl. A.D. 50) wrote 'Historiae Alexandri Magni Libri X,' of which books I and II are lost; not a great work, though at times, vivid and dramatic, resembling Livy in the words and phraseology, but Seneca in the form of the sentences. Here may also be mentioned M. Columella, whose work, 'De Rustica,' only 12 books out of 13, lines are preserved, treating of agriculture; besides these, considerable technical knowledge and good taste, and Pomponius Mela, whose 'De Situ Urbis,' in three books, reflects Seneca's style; A. Persius Flaccus (34-62 A.D.), the Stoic, whose six satires have been much admired on account of their ethical value; and A. Seneca (35-65 A.D.) wrote numerous poems, of which only 10 books of the 'Pharsalia' have reached us. This work has some fine passages, but the style
is highly artificial like Seneca’s, his uncle. To Petronius Arbiter is ascribed the satirical novel, originally in 20 books, of which only fragments are now extant, and of these the ‘ Cena Trimalchionis,’ a coarse, but witty description of a banquet given by C. Ptilius Secundus, Pliny the Elder (23–79 A.D.), a naval officer, wrote on history, tactics, grammar, rhetoric, etc., but the only work that we have is his ‘ Naturalis Historia,’ in 37 books, which is a compilation from numerous works, rich in learning, but dry and often crude in style. C. Valerius Flaccus, under Vespasian, wrote ‘Argonautica,’ in eight books, after the manner of Apollonius Rhodius, in a highly artificial and rhetorical style, which is often obscure. C. Silius Italicus (23–101 A.D.), under Domitian, wrote ‘Punica,’ in 17 books, on the Second Punic War, imitating Livy in matter and Virgil in style. From P. Papiarius Statius (45–96 A.D.) we have the incomplete poem, ‘Achilleis,’ in one and a half books, ‘Thebais,’ in a highly florid and artificial style, rich in mythological lore, and the ‘Silvae,’ in five books, consisting of 32 pieces, in various metres and of much greater interest than the two preceding poems. Of M. Valerius Martialis (c. 40–120 A.D.), we have 1,555 epigrams, in various metres, full of wit and scatological sarcasm, but often coarse and obscene. M. Fabius Quintilianus (35–95 A.D.), the great teacher of rhetoric, has always enjoyed a wide reputation. The only work that has come to us is his ‘Institutio Oratoria,’ in 12 books, outlining the complete course for instructing an orator, making an interesting and valuable book. Quintilian’s aim was to bring back the old style, especially Cicero’s, and though he condemns in vigorous language the artificial style of his day, especially of Seneca, the philosopher, he was unable to free himself entirely from the stylistic defects of his age. Sextus Iulius Frontinus (40–103 A.D.) was a distinguished mathematical writer, of whose work on ‘Surveying’ only extracts are extant; we also have his ‘Strategemata,’ in three books, and ‘De Aquis Urbis Romae,’ valuable for the information it contains. The greatest poet of this period is Dec. Lucanus Iunularis (66–140 A.D.) who wrote the 16 satires in five books, in which he satirizes the hideous vices of his time in a most interesting and realistic manner. His language is forcible and drastic, though often obscure. The most distinguished, prose writer of the decline is P. Cornelius Tacitus (55–119 A.D.), whose extant works are as follows: ‘Dialogus de Oratoribus,’ considered doubtful by some on account of its diffuse and florid style; ‘Agricola,’ a very valuable and sympathetic biography of his father-in-law, in rhetorical style; ‘Germania,’ an historical monograph, also in rhetorical style, a valuable contribution to our knowledge of the ancient Germans; ‘Historiae,’ originally in 14 books, of which only 1–5 are extant, contains an account of the Flavian dynasty; ‘Annales,’ or more correctly ‘Ab Excessu Divi Augusti Liber,’ originally in 16 books, of which only I–IV and XII–XV are extant, and parts of V, VI, XI and XVI, which treat of the dynasty of the Flavian dynasty; ‘Sallust in his style, which is now grave and compact, now sonorous and grand, very irregular at times, but always energetic. A charming writer of this time is C. Plinius Secundus (62–113 A.D.), Pliny the Younger, nephew and adopted son of Pliny the Elder. He was an orator and an earnest and conscientious historian, a careful student of his authorities, and tried to be impartial. He shows the influence of Cicero and Sallust in his style, which is now grave

**V. Period of Decline.** The most important writer of this age is Suetonius, whose ‘Lives of the Twelve Caesars’ and some fragments of his other works have come down to us. Here also belongs Florus, with his tasteless ‘Epitome of Roman History,’ the grammarians Terentius Scaurus, Fronto, the rhetorician; the jurists Ulpianus, Marcellus and Gaius, Aulus Gallus, whose ‘Notices Attice’ contains valuable material; Apollodorus, a voluminous writer of prose and verse, whose ‘Metamorphoses Libri XI’ is best known; the Christian writers Minucius Felix, who imitated Cicero and Seneca, and Tertullianus, author of the ‘Apologeticus,’ and the grammarians, Acron and Porphyry, authors of commentaries on the classics, and the grammarians, Marcus and Macrobius, the Christian writers, of whom the last is the Christian writer; and Nonius Marcellus, the lexicographer. In the 4th century worthy of mention are the grammarians and commentators, Victorinus, Donatus and Servius, Eustropius and Ammianus Marcellinus, the historians; the poets, Ausonius and Prudentius, a Christian poet; Damus and Ambrosius, writers of Christian hymns, and Claudius, a brilliant poet for his time; and the Christian writers, Hieronymus (Saint Jerome), who translated the Bible, and Augustine (Saint Augustine), the best of the late Christian writers. With these it is perhaps best to close this sketch of Roman literature, though the writing of Latin continued for many centuries after these.

CLAUDE LORRAINE, kléd lör-ˈrən, or LORRAIN, so-called, French landscape painter and etcher: b. Chamagne in Lorraine, France, 1600; d. Rome, 25 Nov. 1682. His real name was CLAUDE GELEE: he was called Lorraine from the province in which he was born. When 12 years old it is said he went to live with his brother, an engraver in wood, at Cherbourg. Afterward a relation of his took him to Rome, where the sight of some paintings of the Flemish painter, Godfrey Waels, who was then living in Italy, enchanted him so much that he traveled to Naples to study with the artist. Returning to Rome after two years, he was employed by the landscape-painter Agostino Tassi, as a color-grinder and otherwise. He is next said to have studied the paintings of Giorgione and Titian, whereby his coloring and chiaroscuro were greatly improved. After making a journey into his native country, and residing for some time at Nancy, he settled in 1627 in Rome. Here he attracted the notice of Cardinal Bentivoglio, and was introduced by him to the Pope Urban VIII, who gave him orders for four paintings. His position being now assured, he had many other eminent patrons, and was enabled to live much at his ease. The principal galleries of England, France, Spain, Russia and Germany are adorned with his productions. The public and private galleries of England are richest in these works, a number being in the National Gallery, others at Dulwich, at Windsor Castle and elsewhere.

Clau de possessed the greatest power of invention, by which he gave an inexhaustible variety to his paintings, united with an ardent and persevering study of nature. The truth with which he portrays the effect of the sun in every part of the day, soft breezes playing through the tops of the trees, and all the delicate beauties of nature, is surprising; and all his rivals fell far short of equaling the dewy humidity which he threw over dark, shadowy places. His figures are poor, and he used to say: "I sell my landscapes, and give my figures into the bargain." In a great number of his paintings the figures are the work of other artists. Claude most frequently chooses views in which the eye loses itself in agreeable prospects, without being able to define their limits. He often introduces grand architectural structures, and makes his landscapes the scenes of mythological and historical events. Claude himself made a collection of some 200 drawings

He retired to Holland, where he was received by the Prince of Orange, who settled a pension on him and allowed him to preach at The Hague. The most important of his works is his 'Défense de la réformation' (1673, Eng. trans., 1815). He also published a well-known 'Traité de la composition d'un sermon.'}

CLASSIFICATION OF VOTERS. See VOTING, VOTING.

CLASTIC, a term used to describe rocks that consist of particles or fragments of other rocks, mechanical sediments, in contrast to those of chemical or organic origin. They may be either terrestrial or marine. Sandstones, shales and conglomerates are clastic, while most limestones are not.

CLAUDE, kläd, Jean, French theologian: b. La Sauvetat, near Agenois, 1619; d. The Hague, 13 Jan. 1867. He studied at Montauban, officiated as pastor at Nimes and Montpellier, but owing to his opposition to the government scheme for the reunion of the Protestants and Roman Catholic was interdicted from preaching. The controversial abilities of Claude rendered him formidable and obnoxious to the Catholic party. In 1662 he obtained a post at Montauban, but was forced to relinquish it. He went to Paris, where he received an appointment to the pastorate of Charenton (1666). On the very morning on which the revocation of the Edict of Nantes was registered at Paris, he was ordered to leave France within 24 hours.

1875-80); Sittl, 'Geschichte der griechischen Litteratur' (3 vols, Munich 1883-87); Christ, 'Geschichte der römischen Literatur' (2 vols, Munich 1896-97); Müller's 'Handbuch der klassischen Altertumswissenschaft,' Munich 1898; and for the later periods, Susemihl, 'Geschichte der griechischen Litteratur in der Alexandrinerei' (Leipzig 1891); Krumbacker, 'Geschichte der byzantinischen Literatur' (Vol. IX, Müller's 'Handbuch der klassischen Altertumswissenschaft,' Munich 1897); Count, 'La poésie alexandrine' (Paris 1882); Jubb, 'The Growth and Influence of Classical Greek Poetry' (Boston 1894); Wright, 'A Short History of Greek Literature' (New York 1907); Wagner et al., 'Die hellenistisch-römische Kultur' (Leipzig 1905); 'Die hellenistisch-römische Kultur' (ib. 1913).

CLAUDIANUS — CLAUDIUS

of his pictures. This record, now in the collection of the Duke of Devonshire, is known as the Liber Veritatis. Consult Dilke, Lady E. F., 'Claude Lorrain, sa vie et ses œuvres' (Paris 1884); Dulcea, 'Claude Gellée, le Lorrain' (London 1887); Grahame, G., 'Claude Lorrain, Painter and Etcher' (London 1895); Earlam, E., 'Claude Veritas' (London 1819).

CLAUDIANUS, kla-dí-ā'nus, CLAUDIUS (commonly known as CLAUDIAN), Roman poet: b. Alexandria about 365 A.D.; d. about 408. He went to Rome in 395 A.D., where his poems gained him such renown that a statue was erected to his honor in the forum of Trajan. Besides several panegyric poems on Honorius, Stilicho and others, we possess his epic, the 'Rape of Proserpine,' an unfinished Gigan
tomachia, idylls, epigrams, epistles and occasional poems. Claudian, whose native tongue was Greek, possessed a remarkable command of the Latin language, and displays poetic powers of a high character, brilliancy of diction, truth of description and richness of illustration. The best editions of his works are those of H. Halmann (1760); Jeppe (1876-79); Koch (1893). There is a metrical translation of his works by A. Hawkins (1817). Consult Hodgkin, Claudian: The Last of the Roman Poets (London 1875); Creet, C. H., 'Rome's Past in the Poems of Claudian' (in the Classical Journal, Vol. VI, pp. 108-15, 1910).

CLAUDIUS, kla-dí-ās, the name of a distinguished Roman family which under its head, Attus Claudius, a Sabine, settled at Rome about 504 B.C. and soon branched off into a patrician and a plebeian stock, the former known as the "Pulvini," the latter as the "Marcelli." 1. Atius, aedile among the patricians, changed his name to Appius Claudius. 2. Claudius, Appius, surnamed Crassus, was consul in 471 and 451 and also one of the decemvirs. His amours with the daughter of the plebeian centurion Virginius resulted in a plebeian insurrection and the resignation of the decemvirs. The patrician Claudii were characterized throughout their whole history by their haughty and tyrannical bearing, which manifested itself particularly toward the plebeians; while the plebeian branch were equally distinguished for the resolute assertion of the rights of their order. The patrician Claudii counted among their members 28 consuls, 5 dictators, 7 censors, etc. (See Appius Claudius Crassus). The plebeian form of the name was Clodius.

CLAUDIUS I. or, in full, TIBERIUS CLaudius DRUSus NERO GERMANIcUS, 4th Roman emperor: b. Lyons, 10 B.C.; d. 54 A.D. He was the youngest son of the elder Claudius Drusus Nero and Antonia the younger, daughter of Augustus' sister. His early education was left to women and slaves; owing to his ill health it was thought he would never become a robust man. He accordingly escaped the hostile notice of Caligula, and availed himself of the leisure and more or less enforced retirement to compose extensive literary works in Latin and Greek, which have unfortunately not been preserved. Among other works he wrote a Roman history, embracing the period from the death of Cesar to his own time. After the murder of Caligula, the body-guard, who were ransacking the palace, discovered him secreted in a corner, dragged him out and proclaimed him emperor (41 A.D.). The Senate, who had determined on the restoration of the republic, declared him an accessory to the assassination of Caligula and pronounced him a public enemy (46). Claudius, suddenly transferred from retirement and oppression to uncontrolled power, distinguished the beginning of his reign by some praiseworthy acts; he recalled the exiles and restored their property; he had his estates in Sicily restored and those in Greece confiscated; he ordered the execution of the traitor Varus, the murderer of the Great Dionysus, and had Caligula's death avenged. He restored to the dominion of Rome and erected several large buildings for the public good. He made Mauretania a Roman province; his armies fought successfully against the Germans, and kept possession of several strong places in Britain. But while he was living in comparative retirement (for he never wholly abandoned the practice of earlier years), his wives, particularly the infamous Messalina, together with his freedmen, administered the government, sold offices and places of honor and committed the greatest atrocities unpunished. He died of poison administered by his fourth wife, Agrippina (mother of Nero), who entertained the suspicion that her husband (and uncle) might otherwise live long enough to recover the appointment of Nero as successor to the Imperial power. Claudius was deified in due course. His deification was the cause of Seneca's pasquinade entitled 'Apocolocyntosis.'

CLAUDIO M (MARCUS Aurelius FLAVIUS), surnamed GOTHICUS, Roman emperor: b. Ilyria 214 A.D.; d. of the pest at Sirmium 270 A.D. He was raised to the throne immediately after the death of Gallienus, in 268, and by his splendid victories over the Alemani and the Goths, he proved himself worthy of the confidence of his soldiers, who made him emperor because he was a good military leader.

CLAUDIUS, Appius, surnamed CECUS ('the blind'), a patrician of Rome, who, when chosen to the censorship in 312 B.C., endeavored to break down class-distinctions by nominating men of humble birth as candidates for senatorial rank. He performed an important service for all the public by the construction of the road (Appian Way) and the aqueduct which bear his name, though he is said to have procured the removal of his colleagues from office that he might be able to appropriate the whole honor of these works to himself. In his old age he became blind; but when the deputy of Pyrrhus (280 B.C.), had gained over the Senate, which was on the point of accepting peace on the terms offered by him, Appius caused himself to be led into the Senate-house, and in a celebrated speech, of which Cicero speaks in the highest terms, succeeded in persuading the Senate to resolve that they would listen to no proposals of peace in which the evacuation of Italy was not made an essential condition. From his two sons spring the two best known branches of the Claudian family, the one distinguished by the surname of Pulcher and the other by that of Nero.

CLAUDIUS, Matthias, mat-té-'äs klów- di-ās, German poet and prose writer: b. Rheinfeld, 15 Aug. 1740; d. Hamburg, 21 Jan. 1815. In 1775-1812 he made a collection of his compositions, which had appeared in the Wandsbeck Merkur, in which book the addition of some which had not been printed, and gave the collection the title 'Asmus omnia sua Secum Portans,' or 'Complete
CLAUSE — CLAUSEN

Works of the Wandsequ Messenger. His works are written in a natural, and often humorous, pu stve, and support the cause of good morals, benevolence, patriotism, and purity, while they attack folly and vice with the weapons of ridicule and scorn. Many of his songs have been set to music and have become a part of the national melodies. He also made a number of translations from the English and French.

CLAUS, klowz, Karl Friedrich Wilhelm, German zoologist: b. Cassel 1835; d. 1899. He studied at Giessen under Leuckart. He was appointed professor of zoology in Marburg in 1863, in Göttingen in 1870 and Vienna in 1873. He was also director of the Triest Zoologischen Garten. His 'Textbook of Zoology' (1867); 'Uebcr den Bau und die Entwicklung der Gonadcn' (1878); 'Ueber Metamorphose der Squilliden' (1872); 'Lehrbuch der Zoologie' (6th ed., 1897; Eng. trans., London 1897).

CLAUSEL, Bertrand, klaw-zel, French marshal: b. Mirepoix, 12 Dec. 1773; d. near Toulouse, 21 April 1842. After gaining a high reputation by his services on the Pyrenees, in Haiti, Italy and Dalmatia, he accompanied Junot and Massena to Spain in 1810. He laid siege to Ciudad Rodrigo, and was wounded at Salamanca. By his skill and conduct the army of Portugal was preserved and led into Spain. In 1813 Napoleon rewarded his valor by conferring on him the chief command of the forces in the north of Spain. On the restoration of the Bourbons he came to the United States, and lived here for a long time in retirement at Mobile where he wrote his 'Exposé justification'. But when Charles X was made king in 1829 he received from Louis Philippe the command of the French troops in Algeria, which he retained till 1836, when he resigned in consequence of the defeat he had sustained at Constantine, and returned to France. Consult, 'Mémoires de la Révolution du Maréchal Clausel' (Paris 1837); Duchesse d'Abriart's 'Mémoires'; Blanc, L., 'Histoire de dix ans'; Devaujol, 'Histoire des deux restaurations'; and the article on 'Clausel' in 'La Grande Encyclopédie.'

CLAUSEN, klaw-zan, George, English artist: b. London 1852; d. 1888. After studying at South Kensington 1867-73, he was in Paris under Bouguereau and Freulay and subsequently visited Holland and Belgium, exhibiting at the Royal Academy in 1876, 'High Mass at a Zuyder Zee Village.' Besides many works on religious themes he has painted 'Laborers at Dinner'; 'Brown Eyes'; 'Evening Song'; 'Turning the Plow.' He became a member of the Royal Academy in 1908.

CLAUSEN, Thomas, German astronomer: b. Nübel, Schleswig, 1801; d. 1885. From his early years he devoted himself to astronomical studies and was for several years assistant at the Altona Observatory. In 1842-72 he was engaged, first as observer, afterward director, at the Dorpat (Yuryer) Observatory. He made many important contributions to astronomical science and made extensive calculations relating to the paths of comets.

CLAUSEWITZ, klaw'z-ev, Karl von, Prussian military officer: b. Burg, 1 June 1780; d. Breslau, 16 Nov. 1831. His family settled in Germany at the end of the 13th century. He first saw service in the Rhine campaigns of 1793-94, receiving his commission at the siege of Mainz. After his return from garrison duty he began to study and finally entered the Berlin Academy for young officers, where he came greatly under the influence of von Stein. In 1803 he was made aide-de-camp to Prince August and served in the campaign of Jena (1806). He was captured with the prince at Frenzja and was for two years a prisoner. Returning to Prussia in 1809, he became departmental chief in the Ministry of War; teacher in the military school, instructor to the Crown Prince, and assisted Scharnhorst in the reorganization of the Prussian army. In the Russian War of 1812 he served as adjutant to General Phull and organized the Landwehr of East Prussia. He was present also in the Waterloo campaign as chief of General Thielmann's staff. In 1818 he was appointed head of the Allgemeine Kriegsschule. In 1819 he was chief of staff of Field-Marshal Gneisenau, chief of the dissolution of whose army he resumed his artillery duties. He died of cholera. His works were edited by his widow (Berlin 1832-37, 1874). They include his masterpiece, 'Vom Kriege' (in the first 3 vols.), an exposition of the philosophy of war. He is the founder of modern strategic science. English and French translations have been published. The remaining volumes cover the military history of the period. He wrote also a life of Scharnhorst and letters. Consult Schwartz, 'Leben des Generals von Clausewitz und der Frau Marie von Clausewitz' (2 vols., Berlin 1877); von Meerheim, 'Karl von Clausewitz' (Berlin 1875); Bernhardi, 'Leben des Generals von Clausewitz' (10th Suppl., Militärisches Wochenblatt, 1878).

CLAUSIUS, klaw-z's-üs, Rudolf, German physicist: b. Köslin, Pomerania, 2 Jan. 1822; d. Bonn, 24 Aug. 1888. He studied at Berlin and afterward lectured on natural philosophy as privat-docent at Berlin, and as professor at the Zürich Polytechnic School. In 1859 he was appointed to the chair of natural philosophy at Bonn. He was elected a foreign member of the Royal Society in 1868, and in 1879 was given its highest honor, the Copley medal. His scientific labors cover parts of the field of optics and of electricity, but his especial work was his contribution to the science of thermo-dynamics, and the honor of establishing which on a scientific basis he divides with Rankine and Thomson. To his research is due the discovery of the second law of this science that "heat cannot of itself pass from a colder to a hotter body." His studies in electrolysis are also important, particularly his theory that a part of the ions are free to unite with other ions and are not in complete union. These uncombined ions are brought together under the action of the current at the anode and cathode. His mathematical methods he also applied to the theory of the steam-engine, the dynamic of kinetic theory of gases, and to electricity and electro-dynamics. His great works are 'Die mechanische Wärmetheorie' (1876); 'Die Potential-funktion und das Potential' (1859); and
CLAUSON-KAAS — CLAVICLE

(Über das Wesen der Wärme, verglichen mit Licht und Schall) (1857). For a biography consult Riecke, 'Rudolf Clausis' (Göttingen 1889).

CLAUSON-KAAS, klauˈzɔn-ˈkås, Adolph von, Danish educator: b. near Altona, Holstein, 1826; d. 1906. He joined the Danish cavalry but resigned to devote himself to the promotion of education. He founded the Danish Clubs for Home Industry in 1870 and lectured on manual training in several of the larger European cities in 1873-78. He advocated the revival of working schools for boys, aiming at training the hand and eye along with the mind. He conducted training schools in Saxony and instituted courses in drawing and modeling in the institute for the blind at Dresden.

CLAUSZ-SZAVARDY, Wilhelmina, Austrian pianist: b. Prague, 1834; d. 1907. She received her musical education at the Proksch Institute of Prague. She made a tour of Germany in 1849 and came under the notice of Berlioz at Paris, where she had little success at first. Later under the patronage of Madame Ungher-Sabatier she attained the fullest measures of success and thereafter toured through Europe. She was especially successful as an interpreter of Bach and Beethoven. She married the author, Frederick Szavardy in 1857.

CLAUSTHAL, klauˈstāl, Prussia, mining district and town in the province of Hanover. It is situated on the Zellerbach, 26 miles northeast of Göttingen. It stands in a bleak district, on the top and slopes of a hill, about 1,800 feet above the sea. It is regularly laid out, having been frequently burned down and rebuilt, but the houses are generally of wood. It contains a government mining school, with a good collection of models of mines and minerals, a library of about 40,000 volumes, a mint at which 14,000 silver dollars are coined weekly, and over 600 gold ducats yearly, and it has also a church, courthouse and gymnasia. The mines of Clausthal yield silver lead, copper, iron and zinc, and are among the most valuable and productive in Germany. They are owned and operated by the Prussian government. One of the mines reaches 500 feet below the level of the highest point and is drained by a tunnel through the mountain to a distance of six miles. The machinery of the mines is worked by water power, and every stream in the vicinity is carefully appropriated to this purpose; the various canals, which extend from mill to mill throughout the mines, have an aggregate length of 125 miles. These mines have been worked since the 11th century. The mines furnish employment to the greater portion of the men, and a number of knitting mills give employment to the women.

CLAVA CORONE, klaaˈvo ˈkaːnə-ˈniː ("the Key of the Crown"), one of the names given to the star Alpha Corone Borealis, the brightest in the Northern Crown. The more common name is that of Arabic derivation, Alphaca.

CLAVARIA, klaˈvär-ˈtə, a genus of fungi, belonging to the Hymenomycetes, many of them edible. They are known in general as the coral fungi, as their fleshy sporophores are often like branching coral in form. The spores are produced over the whole surface of the branches. One species (C. botrytis), growing in Germany, is a common article of food. It has a sweetish taste, and is said by Liebig to contain mannite (q.v.). Another species (C. flavo) is used in the same way. Another species is the goat's beard fungus. See FUNGI, Moulds.

CLAVERACK, klāˈvər-ək, N. Y., town in Columbia County, on the Boston and Albany Railroad, about 30 miles south of Albany. The town was settled in 1660, and has a Dutch Reformed Church building dating from 1767, and a courthouse erected in 1784, a home for crippled children, public library and Fresh Air Home for Children. The chief industries are agriculture and the manufacture of flour and farm implements. The town is the seat of a well-known school called the Hudson River Institute, established in 1854. It was organized as a town in 1778 and was the county-seat from 1786 to 1809. The government is administered by town meetings held every two years. Pop. 4,114.

CLAVERHOUSE, kləˈvər-əs. See GRAHAM, JOHN.

CLAVICHORD, a keyed musical instrument, now out of use, somewhat in the form of a spinet, the strings of which are supported by five bridges. One distinction in the clavichord is that the strings are covered with pieces of cloth, which render the sound sweeter, and at the same time the tone is softer, and is not being heard at any considerable distance. On this account it was formerly much used by the nuns, who could practise on it without disturbing the dormitory. It is sometimes called the "dumb spinet." It was used in Germany until the beginning of the 19th century. Bach used it in preference to the pianoforte; Mozart used it in composition and Beethoven also preferred it. Several clavichords were manufactured as late as 1806 for the revival of ancient music by Mr. Arnold Dolmetsch. (See PIANOFORTE.) Consult Hopkins, A. J., 'Old Keyboard Instruments' (London 1887); Krebs, K., 'Die besaßten Klavierinstrumente bis zum Anfang des 17 Jahrhunderts' (Leipzig 1892); Sachinger, 'Geschichte des Klavichords' (Basel 1910).

CLAVICLE, or COLLAR-BONE, a bone situated immediately above the first rib, stretching from the upper border of the manubrium of the sternum, outward and backward to the acromion process of the scapula or shoulderblade. It connects the upper limb, the arm, with the trunk, and is so fastened that while its inner end rests on the sternum and cartilage of the first rib the outer end is associated with the scapula, supporting it firmly in its varied positions and preventing it from falling forward from the chest. The clavicle is a long bone, and in men is much heavier than in women. It is absent or imperfectly developed in those animals which do not use large movements of the fore-limbs and is very much exaggerated or modified in animals such as birds, that exercise the arms very extensively. The clavicle is very frequently broken in children from the results of a direct fall, and as it does not always occasion a marked deformity the operation is at times difficult. Consult Morris, 'Human Anatomy' (3d ed.); Gerrish, 'Text-Book of An-
ATOMY by American Authors, 2d ed.; Spalteholz, Anatomy, See SHOULD-JOINT.

CLAVIGERO, kla-ve-har-o. Francisco Xavier Saverio, Mexican historian: b. Vera Cruz, Mexico, 9 Sept. 1731; d. Bologna, Italy, 2 April 1775. He was educated as an ecclesiastic, and resided 36 years in the provinces of New Spain, where he acquired the languages of the Mexicans and other indigenous nations, collected many of their traditions and studied their historical paintings and other monuments of antiquity. The first of his researches was a History of Mexico, written in Italian, of which an English translation was published in 1787 by C. Cullen (2d ed., 1807). This is a most comprehensive work, affording a great deal of information relative to the natural and civil history, antiquities and religion of Mexico; but it displays more industry than judgment on the part of the author. On the suppression of the Jesuits by the Spanish government in 1767, Clavigero went to Italy, the Pope assigning him a residence in Ferrara and then in Bologna, where he established a literary academy. Consult Castro, Ag, Eloge del P.-Fr. Clavigero (Ferrara 1787).

CLAVIJÓ Y FAJARDO, José, kla-ve-ho ñ fa-ja-rdo, Spanish publicist: b. Lanzarote, Canary Islands, 1730; d. 1806. He lived in Madrid, where he had the reputation of an intelligent scholar, and published a journal, El Pensador, and instituted a campaign against the public performance of autos sacramentales, securing their prohibition in 1765. For more than 20 years he superintended the publication of the Mercurio Historico y Politico de Madrid, with which he had been entrusted as early as 1773. He likewise translated Buffon's Natural History into Spanish (1783-90). He was vice-director of the Cabinet of Natural History and director of the Teatro de los Sitos when he died. His love affair with the sister of Beaumarchais won him the life-long enmity of that author. He was of a mild disposition, pleasing manners and a clear understanding. He had also an abundance of courage, aggressiveness and the gift of pungent expression which are the equipment of a good journalist. Goethe resented his tragedy Clavigo on Beaumarchais' story.

CLAVIS, kla-vis (Lat. key), a drawing, index, etc., which serves as a guide to the understanding of another work; for instance, clavis Ciceronia, clavis Homericca, etc.

CLAWS, sharp hardenings of the skin at the end of the limbs of animals. The term is often applied to the chelic and similar structures at the end of arthropod limbs, but is best restricted to the horned nails found at the end of the digits in most reptiles, on the toes, and often on the thumb and first finger, of birds, and seen in perfection in many mammals, such as the carnivores, rodents, edentates and others, where the nails are sharp and serve for scratching and clinging. See Hoof; Horn; Nail.

CLAXTON, Alexander, American commodore: b. Maryland about 1790; d. Talcahuma, Chile, 7 March 1841. He entered the navy as midshipman 19 April 1812 and served in the sloops of war Wasp in her action with the British sloop of war Frolie, on 18 Oct. 1812. He was promoted to the rank of master commandant in March 1820, and to that of captain in 1831, performing much active service in both grades. He died while in command of the squadron in the Pacific Ocean.

CLAXTON, Kate (Stevenson), American actress: b. Somerville, N. J., 1850. She was the daughter of Spencer Wallace Cone, and was married to Charles Stevenson, in 1872. She made her début in Chicago with Miss Lotta in 1870, and in the same year joined Daly's Theatre Company, but her success dates from 1873, when she acted Mathilda in 'Led Astray.' As Louise in The Two Orphans she attained great celebrity. She was playing the part at the Brooklyn Theatre when, on the night of 5 Dec. 1876, that structure was destroyed by fire with great loss of life. She is considered one of the best emotional actresses of her time. Her first starring tour was in 1876.

CLAXTON, Philander Priestly, American educator: b. Bedford County, Tenn., 28 Sept. 1862. He was graduated at the University of Tennessee in 1882 and studied also at Johns Hopkins 1884-85. In 1885-86 he studied education and school administration in Germany. For several years he was superintendent of schools in North Carolina. In 1896 he became professor of pedagogy and director of the Practice and Observation School at the North Carolina State Normal and Industrial College. In 1902-11 he was professor of secondary education and from 1906-11 inspector of high schools at the University of Tennessee. In 1911 he was appointed United States commissioner of education. He is the author of many addresses and published articles on education. He edited the North Carolina Journal of Education in 1897-1901 and the Atlantic Educational Journal in 1901-03. In 1902-11 he was superintendent of the Summer School of the South.

CLAXTON, Thomas Folkes, English astronomer: b. London, 29 April 1874. He was educated at the Colfe Grammar School and joined the Greenwich Royal Observatory in 1890. In 1895 he became assistant director of the Royal Alfrid Observatory, Mauritius, and was made director the following year. In 1909 he was appointed director of the Royal Observatory at Hongkong. His publications include Annual Magnetic and Meteorological Observations, Mauritius (1896-1910); Seismological Observations (1898-1919); Magnetic Survey, Pamphleouis (in Proceedings of the Royal Society, Vol. LXXVI, 1905); Climate of Pamphleouis; and several papers on cyclones in the south Indian Ocean.

CLAY, Cassius Marcellus, American diplomatist: b. Madison County, Ky., 19 Oct. 1810; d. 21 July 1903. He was graduated at Yale in 1832, and three years later was elected to the legislature of Kentucky and again in 1837 and 1840. The improved jury system and the common school system of Kentucky were due in large measure to his efforts while in the legislature. He denounced the scheme of Texan annexation as designed for the extension of slavery, and in 1844 traversed the Northern States, addressing immense audiences in favor of the Whig presidential candidate. On 3 June 1845 he issued in Lexington, Ky., the first num.
CLAY, Clermont Claiborne, American senator: b. Huntsville, Ala., 1819; d. there, 3 June, 1836. He was graduated at the University of Alabama in 1835, and after studying law in the University of Virginia was admitted to the bar in 1840. He was elected to the Alabama legislature, 1842, 1844 and 1845; was judge of the Madison County Court 1846-48. He was chosen United States senator in 1853, and re-elected in 1859, receiving every vote in the legislature. In the Senate he supported the admission of Kansas under the Lecompton resolution, and was an ardent advocate of the State sovereignty doctrine. He was formally expelled in 1861, and became a senator in the Confederate Congress. In 1864 he was a secret agent of the Confederacy in Canada, but in May 1865 gave himself up to the United States authorities and was a fellow prisoner of Jefferson Davis at Fort Monroe. After his release in April 1866 he returned to the practice of law in Huntsville.

CLAY, Frederick, English composer: b. Paris, 3 Aug. 1839; d. Great Marlow, 24 Nov. 1897. He studied music at Paris, and settled in London as a composer for the stage, his most successful production being 'Lalla Rookh' (1877). This cantata also contained his most popular song, 'I'll Sing Thee Songs of Araby'; one chorus being 'She Wandered Down the Mountain Side,' and 'The Sands-o' Dee.'

CLAY, Green, American soldier: b. Powhatan County, Va., 1757; d. Kentucky, 31 Oct. 1826. He was a cousin of Henry Clay (q.v.). He went to Kentucky early in life and there acquired a fortune as a surveyor. He filled many local offices, was a member of the convention that ratified the Federal Constitution, of the Kentucky Constitutional Convention of 1799, and served for many years in the State legislature. On 16 March 1813, Governor Shelby commissioned him as a brigadier general and in May of that year, when General Harrison was besieged by the British at Fort Meigs, on the Maumee River, Clay came to his relief with 3,000 volunteers. He was left in command of the fort and successfully defended it against a combined attack of British and Indians under General Proctor and Tecumseh.

CLAY, Henry, American statesman: b. Hanover County, Va., 12 April 1777; d. Washington, D. C., 29 June 1852. Clay was born in a region of Virginia which was already declining and from which people were constantly emigrating. His parents were, however, well-to-do owners of slaves. The father, John Clay, was a Baptist preacher of local reputation as an orator. The elder Clay died when Henry was four years old, leaving the mother with seven small children. Mrs. Clay remarried and added six more children to her flock. The stepfather was a gentleman of good social standing and he secured for Henry, a position as assistant to the clerk of the Virginia High Court of Chancery, where he came under the immediate influence of Chancellor George Wythe who had been the teacher of Jefferson and John Marshall. With the meagre training common to American boys of that day, young Clay began the study of law under the great master. He was licensed to practise at the Virginia bar in 1797 and almost immediately thereafter he emigrated to Lexington, Ky. He found a hearty welcome in the new community and within a short period he was associated with Thomas Hart, a lawyer and real estate speculator known all over the West. In 1799 he married Lucretia Hart, the daughter of his patron. About the same time he began to take an active interest in political affairs, and wrote and spoke extensively on the slavery question and the famous Kentucky resolutions, thus extending his influence and preparing the way for his election to the legislature in 1803. The issue which brought him into public life was prepared by Felix Grundy who was attacking with wide popular support a Lexington insurance company which had obtained a charter in surreptitious manner to do a banking business. Banks were extremely unpopular in the West in 1803. Clay championed the cause of the local corporation and waged a successful war in its defense. Although the majority of the assembly had been elected specially to annul the charter of the company, Clay defied that purpose and so discomfited Grundy that he emigrated to Tennessee. Clay was now one of the acknowledged leaders of Kentucky; but he was so ardent a Republican that he fell an easy prey to the blandishments of Aaron Burr who visited Lexington in 1806 seeking recruits for his expedition against Mexico. Clay became sponsor for Burr's patriotism and denounced the activity of the Federalist district attorney who sought to convict the former Vice-President of the United States court. Clay appeared as Burr's counsel without fee and his friends made a hero of the defendant. But toward the end of the year Clay was elected to the United States Senate to fill an unexpired term. On his way to Washington he read the President's proclamation calling upon all men to assist in the arrest and detention of Burr as a conspirator against the country. Immediately Clay and all Kentucky reversed their positions and without loss of popularity to Clay was a second term to a short term in the Senate in 1808. During this period of service in Washington he advocated the annexation of Canada and denounced the United States bank in unmeasured terms; "he was a democrat of the first fire," as John Quincy Adams contemptuously nodded to his diary. But Clay was already a man of mark and when, in 1811, he was elected by the Lexington district to a seat in the national House of Representatives his career as a statesman began. He was then only 34 years
old and a new member, but he was promptly chosen speaker in preference to older members and recognized parliamentarians. For five weeks Clay and his western program: War with England, the immediate invasion of Canada and the suppression of Indian hostilities on the border which were everywhere supposed to be the result of English encouragement. When the returned men of this way of thinking to Congress from nearly all western and southern districts and Clay was the natural leader of the insurgents. He organized the committees of the House so that his war program could be given the right of way, while he and his friends, John C. Calhoun and Peter B. Porter of New York, stiffened the backs of the President’s advisers and brought the peaceful and long-suffering Madison to the point of promising hearty support. Between Clay, as leader of the House, and Madison, the candidate of the party for re-election in November 1812, the reluctant Senate was finally compelled to yield, and war was declared in July. Great Britain was defeated and Madison looked about for some way of securing an early peace. A commission to treat with England was appointed. Clay was a member notwithstanding all he had done to bring on the war and he hastened to join John Quincy Adams and the other commissioners at such point as England should designate. After anxious delays and humiliating experiences, the treaty of Ghent was signed. Clay returned to Kentucky in 1815 and was again elected to the House of Representatives of which he became speaker at the opening session. This office he now held with the exception of one term, when he refused an election, till 1825. His influence was undiminished and he did as much as any other, perhaps, to secure the elevation of James Monroe to the presidency in 1816. But when Monroe was inaugurated he appointed Clay’s political opponent, if not open enemy, John Quincy Adams to a cabinet office. Clay resented this as settling the succession till 1832 and Clay and his friends were deeply offended. He refused a seat in the Cabinet and all his Western friends likewise refused high appointments from the Administration. As speaker of the House, Clay opposed every important measure of the President and offered policies of his own which threatened to break up the solidarity of the Republican party. Andrew Jackson, who had been sent to Florida to quiet disturbances there and who had carried his measures with a high hand, was a special object of Clay’s anger. But the long and ominous struggle of the South and the East over the admission of Missouri, 1819–20, drew him into co-operation with Monroe and he became the principal author of and sponsor for the Missouri Compromise (q.v.). The accepted custom of the party since 1801 to allow the Secretary of State to succeed to the presidency was attacked by Clay so bitterly that the different groups fell asunder and each prepared to move for election in 1824. Clay was the candidate of the West; John Quincy Adams of the East; William H. Crawford of the South. Late in the campaign Jackson entered the race and the West divided its strength. The election showed that neither had won and that Clay was the intended beneficiary of the compromise. The list of candidates, could not be considered by the House when it came to select the next President. Crawford had been stricken with paralysis and this reduced the contest to two aspirants, Jackson, whom Clay had denounced before the House and the country, and Adams, the most disliked man in the country among Clay’s constituents and whom he had denounced since 1817. When Congress met in December, the one anxious query of all was what would Clay do. Few public men have ever been reduced to such a difficult position, the more difficult since the leaders of the West were almost unanimous in urging him to support and thus elect Jackson. To put Jackson in the President’s chair would have been a self-denying act on Clay’s part, for the country would not have been willing to take two Western men in succession as presidents. Early in January Clay announced that he would support Adams. This decision alienated his stronger Western supporters, Amos Kendall, Frank P. Blair and Thomas H. Benton. The disappointment of the people of Kentucky was very great. But what weakened Clay’s position for the rest of his life was his acceptance of the position of Secretary of State in Adams’ Cabinet. Followers of Crawford, like John Randolph, now joined Jackson’s friends and set up the cry of “bargain and sale, coalition of Puritan and blackleg,” between Adams and Clay, which led to a duel of comic outcome. As chief of the Cabinet Clay was on the defensive during the four stormy years that followed. The Senate was little more than a national Jackson campaign committee, and even the House weakened in its support of the Secretary of State. When Jackson was at last elected Clay went home to mend his fences. Jackson had carried Kentucky in the recent election and nearly all Clay’s prominent former friends had deserted him. He desired to be elected to the Senate in 1830 and he began a canvass of all the counties to regain his former popularity. R. M. Johnson, a man of little pretension to high leadership, opposed him. After a long and bitter contest Clay won by a very close vote in the assembly. It was the greatest contest of his life before his own people, for had he been defeated his position as a national leader must have been ruined. Once more in Washington, he began in the winter of 1832 to arrange the program for the presidential campaign of that year. His American system, formulated in 1823–24, now received its widest advertisement. That is, he would stand for a protective tariff to the point of excluding all serious competition of foreign goods with domestic manufactures, for internal improvements which should absorb whatever revenues there might be, and for a strong national bank, which should have a monopoly of the government’s financial business. It was clearly a compromise, for the South and the few Western States which he might control against the South and the greater West which followed Jackson. He was the logical candidate of the opposition and he made every effort to win, but the election showed that Jackson had carried every State except Massachusetts, Rhode Island, Connecticut, Delaware,
Maryland and Kentucky. It was the most decisive election in American history since that of 1804. Yet Clay continued to lead the opposition in Congress and the country against the "Goths and Vandals," as he called Jackson and his party. A break between Jackson and Clay was inevitable, for a long time, now became inevitable. Nullification by South Carolina of the Federal tariff laws followed. Jackson denounced Calhoun and the nullification movement in December 1832. Civil war was imminent. Feeling on the worst. Clay now changed his view entirely as to the tariff. He brought in a compromise measure and extended his hand to Calhoun, who joined him in opposition to Jackson. The compromise tariff scheme of Clay became a law in 1833 and nullification was given up in South Carolina. A second time he had patched up a peace between the irreconcilable interests of the country.

Clay remained in the Senate during the next decade and he was the master mind of the Whig party, which he dominated. He declared he wanted to make peace between the North and the South. He planned the campaign of 1836 against Van Buren and he seems to have named the three Whig candidates of that year, the object being to cause the election to be carried to the House as in 1834, and successfully blocked every important measure of Van Buren till June of 1840, when another election was approaching. He was a candidate for the nomination of the Whigs in 1840, but William Henry Harrison won the prize. In the fall Clay swallowed it and lent himself loyally to the campaign which followed— the famous log-cabin and hard cider campaign. Harrison won. Clay shaped the new administration and laid plans for the future only to find that death of President Harrison removed from his reach control of affairs. When John Tyler succeeded to the presidency Clay undertook to guide the footsteps of the "inexperienced" man. Tyler refused guidance and Clay denounced him and called upon the Cabinet to resign. The Administration broke to pieces and a new Cabinet was formed. Clay now retired from the Senate with a formal farewell, which reminds one of Jackson's farewell of May 1837. He was again the choice of his party for the presidency. The issue then before the country, the annexation of Texas, had been made by Tyler and on it the Whigs were sorely divided; one-half following the lead of John Quincy Adams, declared that annexation would be to them the dissolution of the Union; the other half, guided by Southerners like Preston and Mangum, were almost as earnestly in favor of annexation. Between these diverging forces Clay made a poor campaign and lost the election to James K. Polk, whom he had ridiculed at the beginning with the query: "Who is Polk?" This third defeat was an ordeal which he did not endure without signs of bitterness. He remarked in a letter that he hoped the country would survive. The Mexican War developed hostile groups in the Democratic party and in 1848 Clay was again a candidate before the Whig convention. Thurlow Weed, architect and master of the great political machine of New York, was the choice of Clay's followers. But Stephens of Georgia and John J. Crittenden of Kentucky, former friends of Clay, secured the nomination of Gen. Zachary Taylor, who was elected. Taylor organized his administration without the aid of Clay. But the problem of the time was once again to determine which of the two hostile sections, the East or the South, should have its way. The territories which had been ceded by Mexico were to be organized, and California was of the greatest importance to the Union as a State. The South demanded that slavery should be allowed in the territories and that California should come in as a slave State or not be admitted at all. How could the inexperienced Taylor solve the problem? More than 70 years of age, and marked with the evidences of many campaigns, Clay offered himself once more to the legislature of Kentucky as a candidate for the Senate. He was elected without difficulty and he appeared in Washington in December 1849. The Southerners, both Whigs and Democrats, were preparing for a Southern convention in Nashville the following June. The object of this gathering was to secede from the Union in event slavery should ever be abolished in any of the territories. The leaders of the East were equally resolute. There was to be no further extension of slavery and they were talking of secession in the event of failure. In January Clay offered himself as a prize to the Southern leaders, and he prepared his program of concession and sought support from Webster, from his old friends of the South and from moderate newspapers like the Washington Union, official organ of the Democratic party. Calhoun opposed him. William H. Seward of New York opposed and the influence of the President was wholly against him. Webster's speech of 7 March gave him a great advantage and later the members of the Nashville convention elected his friends to preside over that body. Still, the South stood firm against him in Washington, and Taylor threatened to send an army into the disputed region. The deadlock lasted till 9 July, when the death of the President put Clay's friend Fillmore into the executive chair. The Cabinet was reorganized in the interest of the compromise and one by one the items of the measure became law during the remainder of the summer. The principal of these was that of the admission of California as a free State, the enactment of a rigid fugitive slave law and the provision that the new territories south of the line of 36° 30' might be left to determine for themselves whether they would have slavery or not. It was the greatest triumph of Clay's life, the third treaty of peace between the sections which he had arranged. The country received the news of the passage of the compromise with salutes of a hundred guns in the leading cities and men breathed a sigh of relief when they knew the crisis was passed. Some Southern leaders retired from public life as a protest and extremists in New England declared they would never obey the fugitive slave law. But the great majority North and South held the greatest hope of Clay's life had been repeatedly denied him because of that sectional rivalry which he alone had proved able to quiet from time to time. He felt that he had been hardly handled by the country and the people of the country felt the closing of Alexander H. Stephens of Georgia and John J. Crittenden of Kentucky, former friends of Clay, secured the nomination of Gen. Zachary Taylor, who was
the Senate to the last, where he died on the scene of his greatest triumphs as well as of his bitterest defeats.

Bibliography.—Clay, Thomas H., 'Henry Clay' (in 'American Crisis Biographies,' Philadelphia 1910); Colton, Calvin, 'The Life and Times of Henry Clay' (2 vols., New York 1886); Contamin, E. E., 'Life of Public Servants of Henry Clay' (New York 1859); Schurz, Carl, 'Henry Clay' (in 'American Statesmen,' Boston 1887). There are still other works on Clay, but no really good and critical biography has thus far been published.

Professor of American History, University of Chicago.

CLAY, any aluminous silicate having plasticity; that is, which can be molded, when moist, into forms which become stone-hard after exposure to a red heat or higher temperature. Plasticity is a physical quality, apparently having little relation to chemical composition, and the exact reason why one clay is more plastic than another is even yet largely a matter of speculation. In a broad way clays may be classified: (1) Pure clays, mostly silica and alumina, with small amounts of iron, lime, magnesia, soda and potash; (2) sandy clays or loams, comprising much of the arable soil of the world; and (3) limy clays or marls, clays containing a high per cent of lime. Clays are also given a great variety of names, according to special characteristics and economic use. The important divisions, based on use in the arts, are: Kaolin, or China clay, pottery clay, fire clay and brick clay.

Origin of clay.—The base of all clays is the mineral kaolinite, having the formula Al₂O₃·2SiO₂·H₂O, giving silica 46.3 per cent; alumina, 39.8 per cent; water, 13.9 per cent. It is made up of minute hexagonal plates. It results from the decay of feldsparic rocks, particularly granites and gneisses. Surface waters percolating through such rocks leach out the potash in the feldspar; some silica is also leached out and left in a hydrated state. Kaolinite is the union of the broken-down alumina of the feldspar with the hydrated silica. Thus were formed in place the kaolin deposits of Cornwall, England, and some of the kaolin of North Carolina and Pennsylvania. (See GEOLOGY, section on Work of the Atmosphere.) By the erosion of the land the kaolin and other products of rock decay are carried away and deposited as silts in lakes or in the ocean. Also, under the grinding of glaciers, rocks are reduced to a fine rock flour, forming glacial clays (boulder clay or till). The beds of clay laid down in the ocean may be buried deeply under other deposits, and by heat and pressure be changed to shale. When the sea bottom is elevated and the new land surface eroded, the shale may distillate into clay again, or the shale itself may be mined by man, ground and used as clay.

Varieties of clay.—Pure kaolin or China clay is rare. It is pure white and almost free from impurities. The common chemical impurities in the crude material are iron, lime, magnesia, alkalies, magnesia and titanium, and the common mineral impurities are quartz, feldspar, mica, calcite, magnetite, limonite and pyrite. If the product is white, contains very little iron and is low in alkalis it passes in the trade as kaolin. Kaolin has little plasticity, and in making pottery other clays are often added to give this quality. It may occur as residual kaolin in the position of the original feldspar body, a vein or dike, or, if transported by streams and deposited at a distance in beds, as sedimentary kaolin. Residual kaolin is apt to be of better quality than sedimentary, containing less iron and other impurities.

The United States imported about 235,438 tons of kaolin in 1912, valued at $1,528,257, the production for 1901 having been 97,253 short tons. Kaolin is mined in De Kalb and Jefferson counties, Ala.; at Hockessin, Del.; in Taylor County, Ga.; at Blandford, Mass.; in Macon, Jackson and Montgomery counties, N. C.; in Chester and Delaware counties, and in the South Mountain region, Pa.; in Aiken County, S. C.; and in Lake County, Fla.; and there are deposits in Missouri, Tennessee, Texas, Arizona, Utah and several other States. In 1910 the United States produced 34,221 short tons of kaolin, valued at $253,971.

Besides being used in making pottery and white tiling and brick, kaolin is largely employed in the manufacture of paper, for weighting the paper and giving a better surface. The largest pottery manufacturing centers in the United States are at Trenton, N. J., and East Liverpool, Ohio. Nearly all the Chester County, Pa., kaolin goes to those places. The South Carolina kaolin is nearly all used in paper-making.

Fire Clays differ much in color, hardness, texture and composition, and some clays used in making fire brick are not particularly refractory, but are used for their high plasticity. Strictly a fire clay is a nearly pure mixture of sand and clay with only traces of iron, lime and magnesia, and hence makes white or light colored bricks which can stand very high temperatures. According to Ries a clay should not be considered refractory unless its fusing point is above 2700° F. Fire clays are divided into plastic and stiff, the former, if hard when dug, becoming plastic when ground and mixed with water; the latter, though sometimes having nearly the same composition, do not become plastic when similarly treated. Fire clays, like kaolins, are sometimes residual products of the decay of feldspar veins, but most are of sedimentary origin. Some form the underclay of
coal seams, but all such underclays are not refractory. The underclays of the Michigan coal beds are not. Fire clays in the United States are found in rocks of many geological periods, but chiefly in the Carboniferous and Cretaceous. Workable deposits are known in 18 States; important deposits being in western Pennsylvania; in the coal-mining region of Ohio; in a belt across New Jersey from Perth Amboy to Trenton; in Cecil, Garrett and Allegany counties, Md.; near Saint Louis, Mo.; near Woodstock and Anniston, Ala., and near Golden, Colo. Potters' Clay.—Clays for potters' use, apart from the materials used in accessory work, such as fire-brick, saggars, etc., are divided into two classes, kaolins and ball clays. The former term is derived from the Chinese kao-ling, meaning lofty hill. The Chinese porcelain clay was found in quantities in a hill thus named, and the term applied to the clay served to define it. The word kaolin is now applied by common consent to a residual clay which remains after burning. A red-burning clay is one which lies as it was formed. Masses of feldspar have been decomposed, the contained potash has been gradually dissolved by carbonated waters, and the residue of silica and alumina has been left. There are usually more or less undecomposed feldspar and grains of quartz associated with the clay, and hence most kaolins are washed before being put on the market. Kaolin is well known as forming one of the ingredients in Chinese porcelain, the other ingredient being a quartzite feldspathic rock called in China petunite. For Sévres porcelain kaolin is obtained from Limoges. Ball clay,—probably corrupted from bowl clay,—is a sedimentary clay, having been washed up and redeposited. It is valued for its high plasticity which kaolin does not possess. The purest ball clay is found in Florida and is sold under the name of "plastic kaolin." Most of these clays burn to a cream or almost a stone color. They are mined in New Jersey, Kentucky, Missouri, Colorado and other States, in addition to the Florida clay already mentioned. Ball clays are not usually washed before use. Brick Clays are mixtures of sand and pure clay with lime, magnesia, iron, potash and soda; in fact, bricks are often made from sandy mixtures which are not properly clay. A mixture with considerable iron burns red, from the oxidation of the iron. Carbonate of lime, or magnesia, by forming light-colored silicates, counteracts this red color. Thus the red clays of Wisconsin, which sometimes contain 20 per cent of lime, make the cream-colored Milwaukee brick. The sedimentary glacial clays are largely used for brick-making in the Northern States, while sedimentary surface clays and loams are employed in the Western States and residual clays in the Southern States of this country. All that is required is that the brick shall be of good color, dense, hard and of regular form. Brick material of good quality is found in nearly every State of the Union. For making paving-brick a clay or shale should be relatively high in lime, iron and the alkalis, that it may vitrify well in burning. When ground and mixed the clay or shale should be free from gravel and plastic, and should shrill but not when burned. Of the Western States Illinois leads in the production of paving-brick, with Missouri second. The very plastic clay known as gumbo in the Southern States, besides other clays, is burnt in small lumps and used as ballast by a number of railroads. Terra cotta, used in fire-proof construction and for decoration, may be made of any clay that will make good, strong brick and contains no excess of soluble salts that will "whitewash" on weathering.

Method of Mining.—The 'clay, if it lies at or near the surface, is first stripped of soil or sand and gravel; sometimes as much as 30 feet being removed. In New Jersey the clay is often dug in pits as deep as the thickness of the bed. Usually clay beds are worked either by digging the clay entirely from the base of the bank, by working the bank on an incline of about 30 degrees or, where the bank is over 30 feet high, by working in benches six to eight feet wide and seven to nine feet high. Steam shovels and other earth-moving machinery are used. When the clay is at too great a depth, it is often worked by undermining several feet and then breaking a foot or more from the face by wedges. Blasting is used in very tough clay and in shale. If the clay lies at some depth, drifts large enough for a man and a wheelbarrow are driven into the bank side by side. Sometimes a shaft is sunk and drifts driven from the base, this method being used in Pennsylvania and Ohio and in the fire-clay beds of Missouri.

Egyptianized Clay.—A discovery which gives good promise of affecting the clay industry and its various branches has been made by Mr. E. G. Acheson of Niagara Falls. While experimenting in crucible manufacture, Mr. Acheson had occasion to search for a clay possessing certain qualities. After a series of experiments the account of Egyptian brick-making given in the fifth chapter of Exodus attracted his attention, and conceiving the idea that some property in the straw used in brick-making in Egypt might give him the result he sought, he boiled a quantity of straw, obtaining a dark-red liquid which he used in the treatment of clay, finding it excellent for increasing its plasticity. He sought out the principle, and determined that the agent was tannin. He treated other clays with water in which tannin was in solution, and realized that he had made an important discovery.

The name given by Mr. Acheson to clay treated by his process is "Egyptianized clay." He has discovered that it is practicable so to treat clay and other earthy materials as to ensure greater strength in the products made therefrom, also to greatly reduce the shrinkage and warping in the process of drying and baking and to increase the solubility and the plasticity of the material. By his process, non-plastic clays may be rendered plastic and plastic clays made more plastic by treatment with tannin or an agent having the astringent principles of tannin.

It has been found by experts of the highest standing that clay so treated is changed in a remarkable manner. Even one-half of 1 per cent of tannin develops a wonderful effect, requiring 13 per cent less water to make the clay soft. The maximum effect of the process and treatment, however, seems to be obtained
by the use of 2 per cent of tannin in a 10-day treatment, consisting in keeping the clay wet, so that the tannin is dissolved. In the burned form the strength of the clay is increased 50 per cent, while in the sun-dried form it is increased in tensile strength 350 per cent. It is also observed that the Acheson treatment removes the cracking tendencies of many clays. In cases where clay articles are to be made of a certain size, they can be made more exact by the Acheson process, as there is less shrinkage. All parts intended to carry loads may be greatly increased in strength, while there is decreased porosity. Many of the plastic clays are off color, but non-plastic clays of desired color will be brought into service by the Acheson process. In making glass pots it now takes months to age or temper the clay, while with the Acheson process the maximum effect is obtained in a 10-day treatment. It is told of the Chinese that the people of one generation prepare the clay for the use of the next, all of which time is spent in making the clay plastic. Under the Acheson process the results are said to be more pronounced in 10 days than those obtained by old methods in years.

The total value of the clay products made in the United States in 1909 was $168,895,365. The output of the leading States was as follows:

See CLAY-WORKING MACHINERY.

CLAY CENTRE, Kan., the county-seat of Clay County, is situated on the Union Pacific and Chicago, Rock Island and Pacific railroads, and on the Republican River, which supplies ample water power and which is utilized by the electric light and power plants, both of which are owned by the municipality. The principal industries are flour mills, cigar, steel-tank, broom and cement-block factories and brickworks. There are two large greenhouses, which make extensive shipments to all parts of the State. Pop. 3,438.

CLAY IRON-STONE, oxide of iron (hematite) mixed with clay or sand, an iron ore of importance in England. It is hard and red to brownish in color. The name is also given to the argillaceous carbonate of iron occurring in nodules and beds in the coal regions of Pennsylvania, Ohio and other States. When intimately mixed with coal, as in Scotland ("black-band ironstone"), it is of importance as an iron ore.

CLAY MARL. See MARL; SOIL.

CLAY PRODUCTS. See MINERAL PRODUCTION OF THE UNITED STATES.

CLAY-WORKING MACHINERY, machines designed for the proper preparation of clay which is subsequently used in the manufacture of bricks, tiles, pipes, etc., in the production of which the importance of the proper preparation of the clay can scarcely be over-estimated. A great many of the subsequent difficulties, imperfections and the amount of waste product in the manufacture of articles from clay may be traced directly to the absence of proper treatment of the clay prior to its use in the molding machines. Among the principal machines of this class are the bevel-gear clay granulator and feeder, designed to work on a horizontal plane and reduce plastic, lumpy clay into a mass of uniform texture, before it is fed into the crushing machines. It consists of a tub the sides of which may be made either flared or vertical, with a horizontal shaft located near the bottom of the tub, and a main shaft of large diameter, carrying forged-steel knives. These machines are frequently used to feed into disintegrators, or some form of crushing rolls used for fine grinding, affording the advantage of having such crushers feed uniformly instead of being alternately overloaded or empty. The double shaft clay feeder and mixer (Figs. 1 and 2) is designed for preparing and feeding plastic clay. As a feeder it forms the bottom of a clay storage bin and will discharge the material at a uniform rate determined by the speed at which the pulleys is driven, by the pitch at which the knives are set and by the position of the adjustable gate which

![Fig. 1.—Bevel-Gear Clay Granulator and Feeder](image1)

![Fig. 2.—Detail of Clay Granulator](image2)
regulates the final control. It may also be used to advantage as a double shaft pug mill, in which case the clay bin and the gate are omitted. The standard machine is bevel geared with the driving pulley on the right-hand side as shown in the illustration. Driving pulley may be placed on the left-hand side if desired. The machine may also be built spur geared. The standard machine discharges the material at the end of the mixing chamber opposite the driving gears, but the machine may be built so as to discharge the material between the mixing chamber and the gear frame.

The mixing and pugging machine is designed to mix two or more ingredients, or dry and wet materials, and to deliver a thoroughly mixed, well-pugged mass, in uniform quantity. It is especially valuable as a mixer of "grog" or ground calcined material with plastic clay, ground shale with tough clays, and other finely ground or granular material with plastic binders.

Fig. 3 shows an all-iron and steel dry pan, which is probably the most useful machine for grinding shale, such as is generally used in the manufacture of street paving bricks, and in fact all of the ordinary brick clays when dried sufficiently to pass through a screen. The machine consists essentially of a pair of heavy iron rollers which rotate vertically and grind against an iron disc of sectional plates rotating horizontally. In the machine illustrated, the grinding rollers are 48 inches in diameter by 10 inches face, their combined weight together with that of their shafts and boxes being about 12,000 pounds. The plows or scrapers run close to the screens and are so constructed that the portions subject to wear are easily and cheaply renewable. The capacity of this machine depends entirely upon the nature of the material ground and the amount of moisture contained in that material and the size and pattern of the screen openings. The total weight of the machine is about 30,000 pounds, and it is fitted with a friction-clutch pulley 48 x 12 inches.

A type of wet pan especially valuable as a mixing and clay preparing machine is shown in Fig. 4. It is a thorough pugger and mixer for all kinds of clay. The rollers or grinding rollers have hard chilled faces, are 48 inches in diameter, with 7-inch faces. This machine is now generally supplied with a mechanical unloader for emptying the batch mechanically. Fig. 5 shows a form of the clay disintegrators employed to work plastic clays in which stone and gravel are embedded. It consists of two rollers, one of which is driven at a high rate of speed (700 revolutions per minute) while the other is run at a rate varying from 50 to 100 revolutions per minute and acts merely as a feed roll. The fast running roll is equipped with steel bars which project slightly beyond its face and act with a cutting action against lumps of strong, tough clays, and also throw out the larger stones against which they come in contact, while the pebbles are crushed and ground up with the clay. It has a broad, heavy iron bedplate. The parting strain between the two cylinders is borne by two heavy through-bolts which pass from one journal box to the other and also enable the regulation of the space between the rolls, varying the capacity of the machine and the degree of fineness of the ground material. Compound clay crushing rolls are made in a great variety of patterns. The machine illustrated in Fig. 6 combines the features of a disintegrator and a smooth roll crusher and is especially useful for the working of clays that require an extra amount of preparation. The upper section is made of two rolls running at variable speed. Similar to that of the disintegrator, the small or high speed roll has projecting blades of hardened steel. The large roll operates at a slower speed. The effect of the combined motions of these rolls is to shred or separate the material and prepare it for the further action of the lower section, which is composed of two large chilled-face rolls for finer grinding. The lower rolls may be adjusted close to each other and thus act as fine grinders of the material partially pre-
pared by the upper set. The hollow-ware machine shown in Fig. 7 is particularly adapted for the manufacture of all kinds of hollow ware, such as fireproof partitions, and a great variety of other shapes from plastic material. There has been continuous progress in hollow-ware machines, due to increased use of hollow brick for partition walls. Sewer-pipe

![Fig. 6.—Four-Roll Compound Clay Crusher](image)

manufacture in the United States increased about 60 per cent in the period between 1904 and 1916, and there was a corresponding increase in the making of drain tile machines. Flower pot machinery has also come into considerable use. A variety of drying systems have been developed for hastening the drying of the clay in manufacture. One of these is the rotary clay dryer, having a long cylinder of large diameter, heated by a furnace. Clay feeders are made to supply material properly mixed to hollow-ware machines and the like. The clay plow and gatherer is a machine for taking clay from the surface of a field. There are several types of cutting machines on the market for separating the clay into bricks or delivered in predetermined quantity in an even, constant flow. Since about 1905 there has been great improvement in methods of transportation about clay properties. Steam, electric and gasoline locomotives are employed to handle light tram-cars. A great variety of dryer cars are built, with single, double and triple decks. An increasing number are made with steel decks, upper decks being often made to fold or slide away. Other machinery used in clay working, such as conveyors, steam shovels, kilns, pyrometers, etc., will be found described under those titles.

**C. B. Sharpe**

*The American Clay Machinery Company.*

**CLAYBERG, John Bertrand,** American lawyer: b. Cuba, Ill., 8 Oct. 1853. Received his early education in the schools of Cuba and later entered the law department of the University of Michigan, from which he was graduated in 1875. He was admitted to the bar in 1875 and was employed by Judge Thomas M. Cooley in his works of 'Taxation' and 'Torts.' He moved to Montana in 1884 and in 1889 was appointed attorney-general of the then Territory of Montana. From 1891 to 1911 he was a non-resident lecturer on mining law at the University of Michigan and during many years of that time was also non-resident lecturer on the law of irrigation. He has been an extensive contributor to the law journals of the United States. In March 1903 he was appointed chief of the Supreme Court Commission of the State of Montana and continued to perform the duties of that office until the work of the Supreme Court was brought to date, and resigned 1 April 1905. In 1911 he organized the law department of the University of Montana and is the consulting dean of that department and a non-resident lecturer on mining law. He moved to San Francisco in 1912, at which place he has continued practice as a lawyer.

**CLAYBORNE, William.** See CLAIUROHE, William.

**CLAYDEN, Peter William,** English Unitarian clergyman and author: b. Wallingford, England, 20 Oct. 1827; d. London, 19 Feb. 1902. After being pastor of Unitarian congregations at Boston, Lincolnshire, 1855-59; Rochdale 1860; and Nottingham 1860-68, he became one of the staff of the London Daily News on which he remained till 1896, in the meantime establishing the Reading Observer in 1873, remaining its proprietor for six years. He was president of the Institute of Journalists (1893-94). He published 'The Religious Value of the Doctrine of Continuity' (1866); 'Scientific Men and Religious Teachers' (1874); 'England Under Beaconsfield' (1880); 'Samuel Sharpe, Egyptologist' (1883); 'The Early Life of Samuel Rogers' (1887); 'Rogers and His Contemporaries' (1889); 'England Under the Coalition' (1892).

**CLAYMORE,** formerly the large two-handed, double-edged sword of the Scotch Highlanders; now the name is given to a basket-hilted, double-edged broadsword, closely resembling the cuirassier's broadsword of the 17th century in England.

**CLAYPOLE, Edward Waller,** American geologist: b. Herefordshire, England, 1 June 1835; d. Long Beach, Cal., 17 Aug. 1901. He was
graduated at the University of London in 1862; was professor of geology and biology in the Antioch College, Yellow Springs, Ohio, of Butchel College, Akron, Ohio., and for a time was on the geological survey of Pennsylvania. He was the author of numerous reports on the geology of Pennsylvania, Pa., and of papers and essays on geological and biological subjects. He was a member of a number of geological societies in London, Edinburgh and America, and of the American Association for the Advancement of Sciences.

CLAYPOLE, Noah, the sneaking, cowardly apprentice in Dickens' 'Oliver Twist,' who robs his master's till, joins Fagin in London and by turning state's evidence insures the conviction of Bill Sykes for the murder of Nancy.

CLAYS, klās, Paul Jean, Belgian artist: b. Bruges 1819; d. 1900. He studied under Vernet and Gudin at Paris. At first he failed of success, but later by adopting a broader style he attained a large measure of success. His favorite subjects were the waters of the Netherlands. His drawing is inferior but his coloring is delicate and his work has splendid charm. His best known works are 'Bay of Ostend' (Brussels); 'Shipwreck on the Shetland Islands' (Brussels); two marine views in the National Gallery, London; 'Open Sea' (Munich); and 'Celebration of the Freedom of the Port of Antwerp,' in the Metropolitan Museum, New York.

CLAYTON, Augustine Smith, American lawyer: b. Fredericksburg, Va., 27 Nov. 1783; d. Athens, Ga., 21 June 1839. He was graduated at the University of Georgia 1804; was admitted to the bar and practised with eminent success. He served in the State legislature; was judge of the Superior Court 1819–25 and 1828–31; and a representative in Congress from 1831 to 1835. He was removed from the Supreme Court for differing with the legislature on one point of controversy concerning the occupation of the territory of the Cherokee Nation by the State of Georgia. In Congress he opposed the tariff and United States bank measures. He is said to be the author of the pamphlet 'Crockett's Life of Van Buren.' He compiled 'The Laws of Georgia, 1800–10' (1812).

CLAYTON, Henry DeLamar, American jurist: b. Barbour County, Ala., 10 Feb. 1857. He was graduated at the University of Alabama in 1877. He was admitted to the bar in 1878 and from 1880 to 1914 practised at Eufaula, Ala. He was register in chancery of Barbour County 1880–84 and member of the Alabama general assembly in 1890–91. In 1893–96 he was Federal district attorney for the middle district of Alabama. He was a member of Congress from 1897 to 1913, and after 1888 was a member of the Democratic National Committee and was chosen permanent chairman of the Democratic National Convention at Denver in 1908. Since 1914 he has been United States district judge for the middle and northern districts of Alabama.

CLAYTON, James Benjamin, American clergyman: b. Washington, D. C., 9 Feb. 1867. He was educated at Columbian (now George Washington) University and at the Southern Baptist Theological Seminary. He spent several years in evangelistic work and held pastorates at Norfolk and Falls Church, Va., 1890–91; Hannibal, Mo., 1897–98; Hynesboro Park, Md., 1898–99; and Washington, D. C., 1910. In 1903–09 he was chief clerk of the bureau of American ethnology, and since 1911 has been dean of the theological department of Potomac University. He is an extensive contributor to periodicals on educational and religious topics, especially comparative religion, symbolism and folklore.

CLAYTON, John, American botanist: b. Fulham, England, 1686; d. Virginia, 15 Dec. 1773. In 1705 his family came to Virginia, where his father became attorney-general, and took up his residence near Williamsburg. He entered the office of Peter Beverley, clerk of Gloucester County, succeeded him and held the office for 51 years. He was an enthusiastic botanist and throughout his long life delighted in exploring and describing the plants of his region. Gronovius and Linnaeus published an account of specimens of Virginia flora given them by Clayton (Leyden 1739–43), and Gronovius' son named a genus of herbaceous plants Claytonia in his honor. Clayton's studies of Virginia natural history were published in the Philosophical Transactions of the Royal Society, and his descriptions of some new species of plants are to be found in the third volume of Peter Forse's 'Tracts.' Two folio volumes of manuscript, almost ready for the press, were burned with the records of New Kent County during the Revolutionary War. See CLAYTONIA.

CLAYTON, John Middleton, American statesman: b. Dagsboro, Del., 24 July 1796; d. Dover, Del., 9 Nov. 1856. He was graduated at Yale in 1815, admitted to the bar in 1818, and became a leading lawyer in the State. He was elected United States senator in 1829 and held office till the close of 1836, when he resigned. He was then appointed chief justice of his native State and continued on the bench for nearly three years. In 1845 he was elected to the Senate and remained there till March 1849, when he became Secretary of State under General Taylor. In this capacity he negotiated the Clayton-Bulwer Treaty (q.v.), adjusting the respective claims of Great Britain and this country in Central America. Clayton held office on General Taylor's death in 1850, but remained in the Senate till his death. He was a zealous Whig, an able debater and a statesman of high talent and upright character. Consult: Comigs, J. P., 'Biography of John Middleton Clayton' (in Papers of the Historical Society of Delaware, No. 4, Wilmington 1882).

CLAYTON, Powell, American soldier and diplomatist: b. Bethel, Pa., 7 Aug. 1833; d. Washington, D. C., 25 Aug. 1914. He received an academic education in Bristol, Pa.; later studied civil engineering and went to Lewenworth, Kan., as engineer and surveyor in 1859. When the Civil War broke out he entered the Union army as captain of the 1st Kansas Infantry. In May 1863 he led a successful expedition against a band of guerrillas on the White River, Ark., and also to destroy Confederate stores; and in 1864 was promoted brigadier-general of volunteers. At the close of the war he settled in Arkansas; was elected governor
in 1868; United States senator in 1871-77; appointed Minister to Mexico in 1897 and raised to the Senate. His name was also associated with that of his Countryman.

CLAYTON. N. Y., town in Jefferson County, on the Saint Lawrence River, forming the gateway to the Thousand Islands. It is on the New York Central Railroad and is connected with Watertown by bus service. The principal industry is shipbuilding. There are two banks, a parochial school and a high school; also a town-hall. It is governed by a president and board of trustees which it elects yearly. As a summer resort it is very popular. Pop. about 3,000.

CLAYTON ACT, a so-called anti-trust act, passed by Congress 15 Oct. 1914, prohibiting corporations to create monopolies by indirect dealing, such as offering their products at special low prices until their competitors are driven out of business. The act forbade any forms of contract by which the purchaser of an article might buy the same kind of article or accessory articles from a competitor of the seller. Other clauses of the act forbade holding corporations and interlocking directorates. To the trade commission and also to the interior commerce commission was given power to end these discriminations and other violations of the strong clauses against monopoly. One clause declared that the provisions of the act should not apply to fraternal, labor or agricultural associations, not conducted for profit.

CLAYTON-BULWER TREATY, a treaty existing from 1850 to 1901 between the United States and Great Britain. It was an agreement designed to prevent either country from securing exclusive rights over any interoceanic canal across Nicaragua. (See PANAMA CANAL.) Its origin represented a supposed mutual withdrawal from positions rapidly generating war. Its lifetime has two opposite phases: (1) That in which the United States, wishing no such extension of its hold on it, was hurried to it as a bulwark against British encroachments, opposing only an injurious interpretation of it; (2) that in which the same power did wish such privileges, endeavored first to gain British assent to its abrogation, and after long and fruitless struggles and repeated threats of abrogating it without such assent, was only witheld from the abrogation by a compromise treaty which replaced the old. The three periods were as follows:

1. The English colony at Belize (now British Honduras), for a century or more had strengthened their position against the Spaniards by a vague protectorate over the Mosquito Indians, occupying the northeast coast of Nicaragua. They termed their chief laying claim to and held their dominion over "Mosquitia," usually called the Mosquito Coast. In 1815 they crowned one of them at Belize and, when the Spaniards lost control of Central America in 1822, had him set up a claim to boundaries reaching down into Costa Rica, which the Spaniards, finding the San Juan River, where the canal would run if built. In 1841 this sovereignty was enforced by raiding San Juan del Norte at the mouth of the river, and carrying off the commandant; in 1847 the Spaniards,rganizing resistance, were driven out. In the first of January next he should "reassume his lawful control" over the San Juan, and early in the year the English seized the town and regained it Greytown. A new English treaty was then made with Nicaragua, reasserting the occupation. This roused great excitement in the United States, as equally a blow at the Monroe Doctrine and against American control of the canal; and an over-zealous Nicaragua charged of the fire-eating Polk administration drafted a treaty for United States fortification of the canal, and a guarantee of Nicaragua's sovereignty over all the territory she claimed. This, if we made its provisions active, meant war with England. The pacific Taylor administration then in power framed a milder treaty for a right of way merely, allowing Nicaragua to make similar ones with other nations. This still left Greytown as an apple of discord, and conflicted with the English treaty. Both England and America were on edge with suspicion: the former (whom events justified) that American expansion would end in a claim to entire control of the canal, which would prejudice British colonial interests; the United States, that the English recognition of a fictitious and swollen sovereignty by a tribe of savages over the Atlantic end of the canal foreshadowed the total exclusion of the United States. Each party in fact wanted only to bar the other's monopoly. John M. Clayton (q.v.), Secretary of State, opened negotiations with the English Minister, Sir Henry Bulwer, in January 1850, for a joint control. Meantime Great Britain, to secure the Pacific end, sent an expedition to occupy an island in the Gulf of Fonseca (then supposed to be the natural western terminal) our then Nicaraguan representative, E. G. Squier (q.v.), obtained a temporary cession to us of Tigre Island, the nearest one to Nicaragua, to block this scheme, pending a formal treaty; shortly afterward the British expedition arrived, and seized Tigre for debt. Clayton, in great fear lest the popular indignation should force his hand, pushed the treaty through without sufficient insistence on clear definition of the points at issue. It was signed 19 April, and passed the Senate, 42 to 11. Its provisions were that (1) neither power was to have exclusive control over the proposed canal; (2) neither was to fortify the canal or its vicinity; (3) neither was to occupy, fortify, colonize or have dominion over any part of Central America, either directly or through any alliance or protection, intimacy, connection, or influence in or over it; (4) the two powers should mutually guard the safety and neutrality of the canal, and invite all other nations to do the same; (5) they should aid and protect any authorized and reasonably operated canal company; (6) the fifth article (to establish a general principle) should extend also to any other means of isthmian transit.

England did not formally withdraw her Mosquito protectorate, but with the neutralization of the canal it ceased to have any object, and was thought sure to drop. Before the ratifications were exchanged, however, Lord Palermo wrote to Bulwer that the British government would interpret the treaty as not applying to Honduras for its dependencies. This could include Mosquitia, and it was Clayton's duty to settle that point before proceeding; but in fear of having his treaty wrecked, and confident of no practical evil resulting, he assumed that it referred only to the
CLAYTON-BULWER TREATY

islands, did not press Bulwer for assent to this construction, concealed the three quoted words from the Senate and the attorney-general and the ratifications were exchanged 4 July. Great Britain had won a distinct diplomatic victory; she had secured a pledge from the United States to co-operate in Central America, while herself retaining the entire eastern coast of Nicaragua.

2. The ambiguous interpretation of the treaty satisfying neither power, Daniel Webster (q.v.), who succeeded Clayton in 1850, undertook negotiations with Bulwer to modify it; but what each side most desired was what the other would not grant — recognition or abandonment of the bogus Mosquito claim to the mouth of the river. In 1851, to clear up the meaning of the word "dependency," Great Britain occupied Greytown; proclaimed afresh the Mosquito protectorate; and in November one of her men-of-war fired on the American vessel Prometheus for refusing to pay port dues at Greytown. England returned the question which Bulwer had shirked must be settled. About this time the English had started a project to build a ship railroad across Honduras; and to hold the approaches, their government reoccupied (August 1851) a group of islands off the northern coast, called the Bay Islands, formerly part of Belize. American suspicion once more became hot; and the new Pierce Senate in December ordered an investigation into the way the treaty had been kept, called for the papers and for the first time found how they had been tricked — not, however, by the English diplomat, but their own. In great wrath, they denounced the occupation of the islands and the Mosquito protectorate as an infraction at once of the treaty and the Monroe Doctrine, and Marcy, now Secretary of State, instructed Buchanan, Minister to England, to insist on the British evacuation of all English territory in Central America except Belize. Lord Clarendon replied that Belize was not a part of Central America as understood by the treaty; that the Bay Islands were a part of Belize; that the treaty did not refer to Mosquita, but only prohibited further colonization; and that the Monroe Doctrine was no part of international law. Just as a Frenchman opened the Mosquito Indians and the American settlement south of Greytown led to a United States gunboat bombardment and burning the latter. Then William Walker (q.v.), with the aid of a Nicaraguan faction, became for a time the master of the state, ostensibly in the interest of the United States, whose slaveholding government at last received a representative from his; and the British believed that this country intended to retain possession of Nicaragua. On the other hand, Costa Rican action against Nicaragua was laid to English incitement. Walker continued to make mischief till shot in 1860. Dallas, who succeeded Buchanan, drew up with Clarendon a treaty of 7 Oct. 1859, which came to grief on the question of the Bay Islands. In 1857 Buchanan became President, and supported his Secretary of State, Lewis Cass, in making a preferential canal treaty with Nicaragua: to which Great Britain objected as violating the Clayton-Bulwer Treaty; and it was not ratified. In the fall of that year, Buchanan announced his intention of proposing an entire abrogation of the treaty and arranging a new one on a satisfactory basis. Lord Napier, now British Minister, proposed three alternatives: a mutual abandonment of the treaty and return to the status quo ante; submission of the question to arbitration; and the awaiting the issue of treaties pending between Great Britain and the Central States. The last was accepted, and the results were satisfactory enough to prevent further trouble for more than 20 years. The Bay Islands were retroceded to Honduras on condition of not parting with them to any other nation; the Mosquito protectorate was abandoned, and a reservation set up for the Indians by Nicaragua, which was to pay them $5,000 a year or else the rights reverted to Great Britain; and Greytown became a free port under Nicaraguan sovereignty. The conditional clauses of the renunciation were not pleasing to the United States, and in fact the money was never paid, partly because Nicaragua expected the United States to back its refusal; but on the whole the settlement was accepted as a happy ending to the controversy. Growing sentiment in favor of exclusive United States control of the canal sometimes fretted against the treaty, a host of treaties and other international actions were based upon its validity, and it was never more than appealed to when British acts (as the erection of Belize into the colony of "British Honduras" in 1862) were assumed to violate it.

3. The latent feeling in favor of exclusive control was stirred into active life by the French canal at Panama, and the fear that it would give that nation the military control of Central America. In March 1880 President Hayes sent a special message to Congress enunciating the policy of "an American canal under American control," expanded later into the claim that the banks of the Nicaragua Canal would be a continuation of the United States shoreline. As a result, Congress passed several resolutions recommending the abrogation of the Clayton-Bulwer Treaty. Garfield in his inaugural of 4 March 1881 spoke (though less strongly) in the same strain; the project of a joint European neutralization of the Panama Canal was arousing much American feeling. J. G. Blaine (q.v.), then Secretary of State, approved the movement, and evinced a desire to modify the treaty. In a circular to the European powers, 24 June 1881, he declared that the United States would in future allow no foreign interference in the control of any isthmian canal, whose neutrality we would ourselves guarantee; and that any European action toward sharing in such guaranty would be held equivalent to an alliance against the United States. Lord Granville, for Great Britain, replied briefly that this matter was already settled by the Clayton-Bulwer Treaty, and his government relied on its observance. Meantime and afterward, 19 and 29 Nov. 1881, Secretary Blaine sent two long arguments of his position to James Russell Lowell, then Minister to England. He did not, however, allege that the treaty was null, or commit the country to an open repudiation of it, but complained of it as so contradictory of interpretation, and mutually vexatious, that it ought to be no longer binding under new circumstances. He also asserted that the joint control would be virtually exercised by England, from her superior naval strength. In fact, however, the treaty provided
not for a joint control, but a joint refraining from control, and prevention of any other power gaining control. Lord Granville replied by two despatches of 7 and 14 Jan. 1882, traversing the logical and historical arguments adduced. Garfield's murder led shortly to Blaine's retirement, and F. T. Frelinghuysen's accession to his place. The American government further correspondence was, that England would not give up the treaty, and declared that the United States was stopped by its own acts from interfering with it, and that the Monroe Doctrine was a mere assertion of force, having no standing in international law, and had the same place in diplomatic argument as a list of the military or naval forces. Congress and the President (Arthur) were much dissatisfied with this result; and the latter proceeded to draw up a treaty with Nicaragua in flat defiance of the Clayton-Bulwer Treaty. It formed a perpetual alliance between the United States and Nicaragua, whose territorial integrity this country guaranteed; save that the United States was to build a canal and have exclusive control over it, and own in fee simple a strip on each side. The Senate shrunk from this direct repudiation, without stronger cause than yet existed, and refused, 32 to 23, to ratify the new treaty. Mr. Cleveland's accession put a stop to the agitation for many years, as he disapproved of the new movement, preferring a union of the nations in a common protection of what was for their common interest. So far from any attempt to repudiate the treaty, on two important occasions it was appealed to in protest against acts of Great Britain. The first revival of the feeling of 1880-84 in practical form was in President McKinley's second annual message, December 1898, favoring a canal under American control; and few then doubted that it must be through Nicaragua. The acquisition of new territory and the increase of the navy led many who had been opposed to the movement to change their views and favor a canal through which the United States at all times could pass its war vessels, and from which it could exclude its enemies. Others continued to argue that if the country were not superior in naval force it could not maintain that privilege against its enemies, and if it were, could enforce it against them in any event, and that an exclusive control only made the canal the instant mark of our enemies. But the dominant feeling was strongly against the treaty; congressional resolutions declared it void; the press denounced it; and the sentiment was in favor of President Arthur's old scheme of acquiring a strip of land along the canal outright. The British feeling was by no means strong for the treaty, but it preferred a modification by decent diplomatic forms rather than a violent abrogation. To take the movement out of the hands of newspapers and demagogues, the American and British governments hastened to devise a new arrangement which should gain control. Lord Granville replied and a treaty was negotiated by Secretary John Hay on our side and Sir Julian Pauncefote on the other, known as the first Hay-Pauncefote Treaty, signed 5 Feb. 1900, and sent to the Senate that month. This was not dignant, as the new treaty not only did not abolish the old, but proclaimed it in force and binding; adhered to its principles of neutralizing the canal, which were what the growing sentiment wished to reverse; and was in fact only the Clayton-Bulwer Treaty in modified and somewhat tighter form, in all the points which had become most obnoxious. The "Davis Amendments," proposed in committee, practically nullified the neutrality feature, but neither it nor the main treaty had been acted upon when the Senate adjourned in June. The period for ratification was extended to 5 March 1901; but the platforms of both parties insisted on exclusive American control. The amendments added to it in the following session of Congress made it unacceptable to Great Britain, which refused to ratify it, and it expired by its own limitation. The two statesmen, however, drew up another, less satisfactory in some respects than the old, and which specifically abrogated the Clayton-Bulwer Treaty, but succeeded in saving its general principles of neutralization (see HAY-PAUNCEFOTE TREATY); and it was ratified 16 Dec. 1901. By the irony of fate, this question of the control of a Nicaragua canal, so burning for half a century, and thrice referred to, and once, seems to have been dealing with a contingency never to happen, as the entire subject matter was set aside in favor of the Panama Canal (q.v.). Consult Travis, 'The History of the Clayton-Bulwer Treaty' (Ann Arbor, Mich., 1901); of 'Publications of the Michigan Political Science Association' (Ann Arbor, Mich., 1900).

CLAYTONIA, a genus of plants of the purslane family (Portulacaceae), so named in honor of the American botanist, John Clayton (q.v.). It is among the earliest and most beautiful of the American wild-flowers, these two qualities giving it its common name of spring beauty. There are at least 25 species, most of them natives of North America. The plants grow in damp woods and wet places, and are found at all elevations up to 5,000 feet, in the region of Nova Scotia, south to the Gulf and westward to the Pacific Coast. The plants are low succulent herbs, the delicate rose-colored flowers striped with pink veins, and the leaves linear or oblong. C. perforata, Spanish lettuce, common from British Columbia to Mexico, is used as an anti-scorbutic in household medicine. C. tuberosa, a native of Siberia, supplies a root that is eaten by the natives.

CLE ELUM, Wash., city in Kittitas County, 100 miles southeast of Seattle, on the Chicago, Milwaukee and Saint Paul and the Northern Pacific railroads, and on the Yakima River. It is a coal-mining and agricultural centre and has dairying, fruit-growing and lumber industries. It contains a hospital and owns its waterworks. The city was founded in 1887 and was incorporated in 1905. Pop. 2,749.

CLEANTHES, kli-àn'thez, Greek Stoic philosopher of the 3d century B.C. He was a native of Assos, in Lydia, but, visiting Athens, became a zealous disciple of Zeno. In order to attend on that master in the day, he was accustomed to labor by night. His mind and his bodily strength were immense, and despite all obstacles, he studied so successfully as to become Zeno's successor, 263 B.C. Of his writings only some fragments remain, among which is his noble 'Hymn to Zeno,' written by Stobaeus (ed., 1, 2, 12). The fragments have been collected by Wachsmuth, 'Commentatio de Zenone et Cleante' (1874); and Pearson
CLEAR — CLEAVAGE

CLEAR, Cape. See CAPE CLEAR.

CLEAR LAKE, a body of water lying in a picturesque region in Lake County, Calif., 110 miles north of San Francisco. It is 25 miles long, and from 2 to 10 miles wide. The outlet is Cache Creek.

CLEAR LAKE, Iowa, a city in Cerro Gordo County on the lake of the same name. The Chicago, Milwaukee and Saint Paul and the Mason City and Clear Lake railroads connect with the town. The principal industry of the city is ice transportation. There are three banks whose combined resources amount to $1,100,000. There are schools, a city hall and a Carnegie library. It is popular as a summer resort. Pop. 5,350.

CLEARANCE OF VESSELS, the examination of them by the proper custom-house officers, and the giving of a certificate that the regulations have been duly complied with. Vessels are said to clear inward or outward according as they arrive or depart.

CLEARCHUS, kli-ark'kus, Spartan general who commanded about 13,000 Greeks in the army of Cyrus the Younger when that Persian prince tried to wrest the throne of Persia from his brother, Artaxerxes II. When Cyrus was defeated at Cunaxa (401 B.C.), Clearchus and his chief officers were seized by treachery and put to death. Consult Xenophon, 'Anabasis'; and the account in Smith, 'Dictionary of Greek and Roman Biography and Mythology' (Boston 1849).

CLEARFIELD, Pa., the county-seat of Clearfield County, on the Susquehanna River (west branch), and on the Pennsylvania Railroad. It is situated in the west-central part of the State, and is surrounded by a rich agricultural region, underlying which are deposits of coal, fire-clay and limestone. It has several novelty works, lumber mills, flouring mills, planing mills, brickyards, and a steel plant, and has manufactories of sewer pipe, clay-working machinery, refrigerators, cut glass, silk velvet, knitting machines, wagons, swngs, foundry products, tanned leather, etc. Clearfield was settled in 1806, and in 1840 was incorporated as a borough. Pop. 6,851.

CLEARING-NUT, a small tree (Strychnos potatorum) of the same genus as the nux vomica, the seeds of which are used in India for settling or clearing muddy water. The seeds are rubbed upon the inside of the water-vessel, and within a few minutes after the water has been introduced it becomes clear, the sediment and non-soluble ingredients having sunk to the bottom. The wood is very hard and heavy, and is used for cabinet-making and house-building.

CLEARSTORY. See CLEARESTORY.

CLEARWING, a small moth with transparent wings, the caterpillars of which are the borers that destroy peach-trees and fruit-bushes. Although common in America they are mostly importations from Europe or Asia.

CLEARLY, James Vincent, Canadian clergyman: b. Waterford, Ireland, 18 Sept. 1828. He was educated at Royal College, Maynooth, and ordained to the Roman Catholic priesthood in 1851. He became president of Saint John's College, Waterford, in 1873, and in 1880 was appointed bishop of Kingston, Canada, the see being made an archbishopric in 1889. In 1896 he reopened the Theological Seminary of Regiopolis College in Kingston.

CLEAVAGE. Many crystalized substances when sharply struck or subjected to pressure or heat or other disturbing forces split into fragments bounded by smooth plane surfaces which are parallel to crystal faces of the substance.

If the separation can be obtained with equal ease in any part of any crystal and if there is only a mechanical limit to the thinness of the resulting plates this tendency to break parallel to crystal faces is called cleavage. If, however, the separation can be obtained at irregular intervals, and only in some crystals, the character is called parting, and has a different origin.

Cleavage occurs with equal ease parallel to all corresponding crystal faces, thus, for instance, a crystal of galena will cleave equally well parallel to all the faces of the cube. Cleavage is due to differences in cohesion, and conforms strictly to the theory of a regular internal structure. (See CRYSTAL.) The breaking in one direction more easily than another implies differences of cohesion in different directions, and the break is a plane because all lines perpendicular to it are directions of equal minimum cohesion, and finally the cleavage with equal ease parallel to corresponding faces implies equal cohesion at right angles to all of these.

A structure model shows not only that among the different sets of parallel molecular planes those parallel to the common crystal faces contain the largest number of molecules but also that the consecutive planes of such a set are furthest apart from those of other sets, and in that being further apart there is weaker cohesion.

The ease of cleavage is not a measure of the absolute strength of cohesion but a proof of marked differences in cohesion in different directions. Diamond and fluorite illustrate this. The property is shown equally well by the polyhedral and the faceless crystal independent of the external form.

Cleavage is in general limited to directions parallel to symmetry planes or perpendicular to axes of symmetry or parallel to the faces of prominent crystal forms. It may occur in the same substance parallel to the faces of two or more crystal forms; for instance, gypsum splits easily into plates parallel to the faces of one form and these plates again break parallel to the faces of two others.

Directions of cleavage are sometimes indicated by a pearly lustre, due to repeated light reflections from cleavage rifts, or distinct cracks may occur. The absence of these is not proof that cleavage cannot be obtained, but only that the separation has not been started.
CLEAVAGE — CLEBURNE 79

Cleavage is usually obtained by resting the crystal on a firm support, placing the edge of a knife or small chisel parallel to the supposed direction of cleavage and striking a quick, sharp blow upon it with a hammer. In some instances the cleavage is only obtainable by such methods as heating and suddenly plunging into cold water.

Cleavage is a valuable aid in classification and identification, the number of directions, the relative ease and above all the characteristic angles leading to rapid and safe conclusions.

CLEAVEAG, Rock. See ROCK CLEAVEAG.

CLEAVELAND, Moses, American pioneeer: b. Canterbury, Conn., 29 Jan. 1754; d. there, 16 Nov. 1806. He was graduated at Yale in 1777, and began the practice of law in his home town, being several times elected to the legislature, and in 1790 commissioned a brigadier-general of militia. He was a leading shareholder in the Connecticut Land Company which had bought for $1,200,000 the land in northeastern Ohio reserved to Connecticut by Congress, and subsequently known as the Western Reserve. In 1796 Cleaveland went out with a party of 50 to survey the tract and arrange for its settlement by immigrants. After successfully negotiating with the Indians who claimed certain rights to the region, the party arrived at the present site of Cleveland, 22 July 1796. Cleaveland immediately chose it as a place for his home and surveyed it into town lots, and the members of the party named it Cleaveland in his honor. In 1830, when the Cleveland Advertiser was founded, the headline was found too long for the form; the editor therefore dropped the letter "a" in the first syllable of the city's name, and the new spelling of Cleveland was soon generally adopted.

CLEAVEALAND, Parker, American mineralogist: b. Rowley, Mass., 15 Jan. 1780; d. Brunswick, Me., 15 Oct. 1858. He was graduated at Harvard 1799, and was appointed tutor there 1803. In 1805 he was chosen first professor of mathematics and natural philosophy at Bowdoin College. Applying himself with energy to the new sciences of chemistry and mineralogy, his studies resulted in a treatise on 'Mineralogy and Geology' (1816; 2d ed., 1822; 3d ed., 1836), which brought him the offer of the chair of mineralogy in Harvard, which he declined, as he likewise did the presidency of Bowdoin in 1839. He stood first in his subject in this country, was a popular and lucid lecturer, an enthusiastic and inspiring teacher. When the medical school was founded at Bowdoin in 1820 he was made its dean and librarian.

CLEAVERS, one of the 70 common names applied to certain species of bedstraw (q.v.), of the madder family, occurring throughout the whole United States; troublesome weeds, probably naturalized from Europe. Other names by which they are known are goat-grass, catchweed, beggar-lice, burhead, clover-grass, clingrascal, scratch-grass, wild hedge-burs, stick-a-back or stickle-back, gosling-grass, goslingweed, turkey-grass, pigtail, grip or grip-grass, loveweed and sweethearts. They are as common in Europe as in America, and seem not to be much used except in Sweden, where for many years their prickly stems have been used as strainers for milk. They have sometimes been used for a yellow stain to color cloth or cheese. Cleavers were supposed to be of household medicine as a diuretic, but is now so used only in the most remote settlements.

CLEBSCH, klish, Rudolf Friedrich Alfred, German mathematician: b. Königsberg, Prussia, 1833; d. Göttingen, 7 Nov. 1872. He was educated at Königsberg, where his masters included Hesse, Richelot and F. Neumann. From 1858 to 1863 he was professor of theoretical mechanics at Giessen and at Göttingen in 1868. With Neumann he founded in 1868 the Mathematische Annalen. He is prominent as a geometer because of his contributions to the theory of invariants and his use of the notion of the deficiency of a curve and his applications of the theory of elliptic functions to geometry. He wrote much also on the general theory of algebraic curves and took a prominent part in solving the generalized form of Malfatti's problem, and the Pfaffian problem of differential equations. For these and for his contributions to Clebsch consult Mathematische Annalen (Vol. VII); Lindemann edited his Vorlesungen über Geometrie (Leipzig, Vol. I, 1876; Vol. II, 1891; new ed., 1906).

CLEBURNE, Patrick Ronayne, American soldier: b. Cork County, Ireland, 17 March 1828; d. Franklin, Tenn., 30 Nov. 1864. While a student at Trinity College, Dublin, he ran away and enlisted in the English army, in which he served for three years. He came to America, settled in Helena, Ark., studied law and practiced successfully until the Civil War. Joining the Confederate army as a private, he rose rapidly to a brigadier-generalship, commanded a brigade at Shiloh, was wounded at Perryville and commissioned major-general, December 1862. He distinguished himself greatly in many fierce engagements, notably at Murfreesboro, Chickamauga, Ringgold Gap and Missionary Ridge, receiving the thanks of the Confederate Congress. He was killed at the battle of Franklin, after carrying two lines of Union works, and shortly after saying to a confederate: "I have more hope in the final success of our cause than at any time since the first gun was fired." He was a soldier of quick perception and strong character, and early and boldly advocated freeing the slaves, and the enlistment of the young and able-bodied negroes in the Confederate service. He was called the "Stonewall of the West," and instituted the Order of the Southern Cross. Consult the biographical speech by General Gordon (in Southern Historical Society Papers, Vol. XVIII, Richmond 1889).

CLEBURNE, Tex., the county-seat of Johnson County, on the Trinity and Brazos Valley, the Missouri, Kansas and Texas and the Gulf, Colorado and Santa Fé railroads. It carries on a large trade in grain, live stock, cotton, wool, hides and products, and has on compresses, cottonseed-oil mills, flour mills, foundry and machine shops, and shops of the Gulf, Colorado and Santa Fé Railroad. The courthouse, Carnegie library and high school are notable features. There are municipal waterworks. Pop. (1910) 10,364, being more than treble that of 1890, when it had a population of 3,278.
CLEFT HEATON, kläk-ča-tôn, England, town in the county of York, West Riding, situated on a declivity in the Spen Valley, five and one-half miles southeast of Bradford. It is well built, has a technical institution, handsome premises belonging to the co-operative association, a fine town-hall; large trade in textiles, card wire manufacturing and machinery. Pop. 12,866.

CLEFT, kläf. 1. Joost (yoost-) Van, called Zotze (mad) Cleef; b. Antwerp about 1510; d. about 1559. He was one of the most celebrated painters of his time, and in regard to beauty of coloring may challenge comparison with the most distinguished Italian masters. His excessive vanity and eccentricity caused him to be described as "mad." A portrait of him and his wife are to be found in the gallery of Windsor. Althorp possesses his portrait. 2. Jan (Jan) Van, a painter; b. Venloo, Guelderland, 1646; d. Ghent 1716. He was a pupil of De Cayer, and belongs to the Flemish school, of which he is one of the most eminent masters. His works, which resemble those of Foussin, are particularly remarkable for beauty of design and coloring. The churches of Ghent are adorned with many of his paintings, in which the heads of children and the countenances of women are very beautiful.

Clef (Fr. for key), a character placed at the beginning of a staff to show the elevation of that particular staff in the general clavitory or system, and to determine the names of the notes according to their positions on the staff. See Musical Elements and Terms.

CLEFT PALATE. Cleft palate is the result of failure of union, in embryo, of the elements of which the palate is composed. Cleft palate, including the velum, uvula, hard palate and alveolar process, with harelip, either single or double, invariably is congenital. Defects of the palate resulting from trauma or disease do not occur as frequently as congenital defects.

Every developing child, prior to the second month of gestation, has a cleft palate. A child who has a complete congenital cleft palate, has in the palate at birth, with rare exceptions, the normal amount of tissue, although it is not united in the middle line. It is cleft. Nature does not often fail to develop the necessary tissues to form a normal palate, but sometimes does fail to bring them into apposition and unite them. Cleft palate is not, therefore, with few exceptions, due to arrested development nor absence of palatal tissues, but, as the child’s age advances, the arch spreads and the muscles, for want of proper activity due to the separation, fail to develop as the other muscles do that are normally employed. There are, anatomically, 15 forms of cleft palate, some but slightly and others widely differing in deformity and treatment.

The simplest form is a cleft of the azygous uvula only. The most complicated form presents a complete cleft of the soft and hard palate; the vomer is separated from the hard palate; the premaxillary bones are not only separated from the hard palate, but often protrude far beyond the tip of the nose, with the further complication of double harelip which sometimes, though rarely, extends to the eyes. The nostrils are abnormally broad and flat. In cases of single harelip and cleft palate, the vomer is nearly always attached to the long side of the palate.

There are six centres of ossification in forming a palate — two palatal, three maxillary, and two palatal. These six bone centres carry with them other tissues, the soft parts consisting of periosteum, mucous membrane, connective tissue, etc. All these centres are assembled during the formation of the palate, like a piece of machinery. If nothing interferes with the bones meeting and uniting, the palate will be normal. If, however, from any cause the bones fail to unite, the child will have a cleft palate, accompanied very frequently by harelip.

Cleft palate seriously interferes with deglutition in a young infant. The child, consequently, is poorly nourished. The open palate makes it difficult for the child to draw its milk, and what little it may get often regurgitates through the nose. A cleft palate nipple used with the bottle, or artificial velum which is employed in conjunction with the breast, will enable the child to swallow its food without difficulty. The English author, Lawson Tait, has stated that the mortality of children who have cleft palate is so great by reason of their inability to nurse properly, even with proper nutrition, that an early operation is desirable.

Etymology of Cleft Palate.—The literature of this subject is voluminous and largely conjectural. Among the causes assigned are heredity, maternal pre-natal impressions, defective nutrition during the early months of gestation, intervening mucosa in tooth enamel formation, uterine inflammation, venereal diseases and pressure. These causes may be divided into two classes: Predisposing and Exciting.

PREDISPOSING CAUSES OF CLEFT PALATE

Heredity.—The factor of heredity is so well recognized that reference to it here might seem unnecessary. In many cases the physical characteristics of the parents, normal or abnormal, may be observed in their children. The shape of the head, nose, eyes and ears of the children resemble those of a parent. The parents may have normal palates while a grandparent or even a great grandparent (and, no doubt, progenitors further back of whose physical conditions the parents know nothing), having had the defect, transmitted it to grandchildren or to generations even more distant.

It is thus the law of atavism, or reversion to type, asserts itself. The statement often made by parents, that no ancestor ever had a cleft palate or harelip, applies usually only to their grandparents whom they have known. As to those further back, as a rule, they know nothing.

Maternal Pre-Natal Impressions.—Maternal pre-natal impressions are firmly believed in by many mothers, but proof that cleft palate has been due to such impressions has never been established. At the ninth week of embryonal life, or about the close of the second month, the fissures about the orbit and between the palate have been effaced and the bones are united. The fright or shock which the mother sustained, to which she ascribes her child’s defect, as a rule, occurred subsequent to the time when nature completes the union of the
3 Complete single cleft of the entire soft and hard palate, usually accompanied by single harelip. The maxillary bone is separated from the premaxillary bone.

4 Tripartite cleft, extending through soft and hard palate, separating premaxillary bones from the maxillary bones. Often complicated with double harelip.

Forms 1 and 2 should not be operated until between 12 and 18 months, just before speech is attempted; forms 3 and 4 should be operated in early infancy, prior to the sixth month. The bones should be approximated before the harelip is operated.
various bony elements which form the palate. After the bones are united no shock, however severe, could separate them.

Defective Nutrition.—Defective nutrition or general debility of the mother during the early months of gestation, from any cause may delay union of the palatal plates. Nature does not, as a rule, fail to develop the necessary bone and soft parts to form a normal palate, but it does fail to bring the parts in apposition and unite them.

Mothers who have suffered from a severe illness during the first 10 weeks of gestation may be so poorly nourished as to bear a child with cleft palate or other deformities. A pregnancy shortly following the birth of a child often draws heavily upon a mother's vitality, especially if she is not strong, and the enfeebled condition may be followed by deformity of her child.

Intervening Mucosa in Tooth Formation and Supernumerary Dental Rudiments as Factors.—Professor Warnekros holds that cleft palate is always due to the rudiments of supernumerary teeth. Among the many causes that have been assigned for failure of union of the palate within the first two months of embryonal life the one advanced by the late Dr. C. E. W. Bodecker is, I believe, most to be relied upon. It is based upon anatomical and physiological grounds. He believed that the membrane from which supernumerary teeth, or any other teeth, were developed prevented union of the bone.

We know that in the formation of the teeth, the mucosa dips deep down into the submucous tissue and forms the epithelial lamina, which contracts into the epithelial cord at the distal end of which the enamel organ is formed. It is too well known to admit of discussion that a layer of epithelium, under certain conditions, will form an obstruction to union of the tissues between which it intervenes.

It seems that Bodecker's conclusion, namely, that this epithelial cord delays union of the parts forming the maxilla; and the force exerted by the tongue and mandible from the beginning of the third month until birth and several months later, would account for the breaking down of the maxillary bones and the creation of the cleft.

Venereal Disease and Uterine Inflammation.—The influence of venereal disease on the developing child unquestionably causes many physical defects. Likewise, inflammation of the uterus might easily affect the development of the palate as well as other parts.

Exciting Causes of Cleft Palate.

Pressure.—In early intra-uterine life, between the second and third months, the tongue is much smaller than at birth. It occupies a great deal of space between the developing bony plates of the palate, and may interfere with the bones meeting and uniting.

At the third month the muscles of mastication become active, and the mandible brings pressure on the soft, flexible un-united bones of the palate and, acting as a wedge, mechanically forces them further apart, thus widening the breach.

If an examination be made of a young child with a complete cleft palate, it will be noticed that the upper alveolar ridge is outside of the lower ridge. The upper arch is, therefore, spread by the wedge formed by the lower jaw.

The normal position of the fixuts in utero is such that the weight of the entire facial body may be readily thrown upon the vertex and the pressure thus exerted would tend to force the mandible into contact with the sphenoid region and compress it against the forming hard palate. The flexed position of the head, with the symphysis of the mandible resting on the sternum, may contribute to some extent to the force which is exerted by the mandible. It is generally accepted that the lower jaw acts as a matrix or mold upon which the upper jaw is formed.

Treatment of Cleft Palate.—The object to be attained in operating on cleft palate and harelip is not only to overcome the visible deformity, but to ensure, as nearly as possible, correct phonation.

The importance of the palate as an organ of speech is often overlooked, and the following quotation from the late Dr. G. Hudson-Makuen, noted author on voice-production, shows the necessity of a normal palate for perfect phonation:

"There is a popular notion that the tongue is the chief organ of speech and that the sense of taste is located in the palate. Both the palate and the tongue are important organs of speech, but the former is more so, for not only is it essential in the enunciation of nearly all the elements of speech, but, owing to its direct attachment to the larynx, it is also an important factor in the production of voice. The vowel sounds may be articulated when the palate is defective, but their resonance is so much impaired that they are scarcely recognisable, and their pitch cannot be changed with any degree of accuracy. It is in the articulation of consonant sounds, however, that the palate is especially essential."

When to Operate.—The time to treat a cleft palate is as early after birth as possible, preferably within the first month, when the separated bones of a cleft palate should be closed.

Palate Surgery is Bone Surgery.—A palate can never be normal unless the bones are united. Bone surgery, therefore, is necessary when the bones of the hard palate and the alveolar process are separated.

Steps in Operating.—Three steps are called for: (1) The bones should be united and the lip placed in its normal position. (2) The lip should be closed, usually about four weeks after the bone operation. (3) Finally, the soft palate should be closed so that the patient, when becoming old enough to speak, will speak distinctly. This is done about the 14th month.

The cleft should be closed before ossification of the bones is far advanced, while they may be bent and moved without fracture. Bone at birth is about one-half organic matter, hence it is not difficult to bend the bones and close the cleft a few days after birth. Protruding pre-maxillary bones should never be removed, but should be fixed in the arch and held firmly in place until they unite with the maxillary bones and complete the arch.

The highest degree of success in the treatment of cleft palate is obtained by operating in early infancy, at which time the operation is more safely performed, but successful operation may be made at any time in life. If the patient has a harelip only, it may be operated upon at any time.

TRUMAN W. BROPHY, M.D.
CLEISHBOTHAM, klēsh'bōth-am, Jede-diah, a character in Scott's 'Tales of My Landlord,' who is represented to have collected the stories, of which Peter Pattison is the imaginary writer.

CLEISTHENES, klēs-thē-nēz, or CLIS-THENES, an Athenian politician who flourished about 500 B.C. He was the grandson of Cleisthenes of Sicyon, and the son of Megacles, and at the end of the rule of the Pisistratidē (510 B.C.) was a leader of their enemies. When, with the assistance of the Delphian oracle and the Thracian Brestias, the Pisistratidē was banished from Athens, Cleisthenes, in order to secure his ascendency over his rival Isagoras, chose to defend the cause of the people and succeeded in introducing some important changes in the constitution of Athens; among the division of Attica into 10 instead of 4 tribes, each consisting of several demi, under demarchs; the increase of the number of the senators from 400 to 500, 50 of each tribe; and, above all, the establishment of the 10 tribes (q.v.) by remarking in the history of that state. Cleisthenes, being suspected of the desire of tyrannical power, was himself banished, but afterward returned and triumphed over his enemies.

CLEISTOGAMOUS FLOWERS (from Gk. klēstōgō, closed, and γαμος, marriage). In most of our familiar plants the flower is open to the air, so that there is a possibility of cross-fertilization. Indeed, in many plants, such as the primrose, the gentian, etc., self-pollination is rendered difficult if not impossible by the structure and development of the flower. In the other plant, however which are the dog-violet, Impatiens fulva, Impatiens noli-tangere, etc., the reproduction of the plant is carried on in part, at least, by flowers that never open, and are hence of necessity self-pollinated. These flowers are called cleistogamous. They are more or less abortive: their petals are absent or stunted and colorless, and they lack the nectar and scent that attract insects in other blossoms. No insects are known which possess only cleistogamous flowers. For example, in the dog-violet we find in addition to the fertile cleistogamous flowers the showy but usually sterile blossoms which alone are known to the casual observer. The sterility of the ordinary flowers of the dog-violet is due, not to any intrinsic defect of the pistil or the germ included therein, but to the fact that the anthers are often contain no pollen, and still more to the fact that they are not frequented by bees. When artificially fertilized the open flowers yield as much seed as the cleistogamous ones. A very interesting fact about some cleistogamous, such as that of the dog-violet (Viola canina) is that the pollen-grains give rise to their tubes in situ. These must find their way from the anthers across the cavity of the flower to the stigma before they can fertilize the ovules. The mechanism of this peculiar process is not at all understood. According to Darwin, the cleistogamous flowers are not merely ordinary flowers in a state of arrested development, as the existence in certain cases of a very complete series of transitional forms between the cleistogamous and the perfect flowers might seem to show, but have undergone modifications which fit them especially for self-fertilization. They form a kind of insurance to the plant against interruption of the more customary modes of fertilization, and this may have caused their evolution in plants which already had a tendency to mature some of their flowers before they were completely open. Consult Darwin, C., 'Forms of Flowers' (London 1877).

CLOTILDE. In 'Clotilde,' Madeleine de Scudéry undertook to do for Parisian bourgeois society what she had done for the aristocratic précieuses in 'Le Grand Cyrus.' The story of 'Clotilde' appeared in 1654, the tenth and last in 1660. Together they count over 8,000 pages. The scene opens in ancient Carthage, soon shifts to Carthage and thence to Rome, but without the least effort at historic detail. The heroine is the daughter of a Roman exiled by Tarquin, her lover a son of Lars Porsena. Much is said of Brutus, Tarquin, Lucretia, the last masquerading as a past-mistress in précieuse coquetry, whose deeds of cruelty the reader as cold as it apparently did not do the author. The interest of 'Clotilde' is not in the story and never was, but in the 73 characters, each painted from life, each picturing some wealthy bourgeois with aspirations to culture, some précieuse ridicule or perhaps some Madame, Car- ron, with a few from higher spheres, among whom may be named Louis XIV (Alcandare), his finance minister, Fouquet (Cléomine) and Mlle. de Longueville (Clotilde). What did most to make 'Clotilde,' a sensation in its day, stamped it as a manual of gallantry, and has preserved its memory till ours, was its "Map of Tender-land," watered by the rivers of Inclination, Esteem and Gratitude, with many allegorized cities, many by-ways and false paths to places whose names suggest stages of flirtation, frivolity, gallantry and so on, with a Dangerous Sea and, beyond, an "unexplored land," the whole a sort of preliminary study for a psychological novel, not without ingenious originality, though the general idea of an allegorical map was old.

Benjamin W. Wells.

CLEMANGES, kla-mănzh, Mathieu Nicolas, French theologian: b. Clemanges 1360; d. about 1430. He studied at Paris under Pierre d'Ailly and Gerson. The professor of theology at the University of Paris, and in 1393 became rector there. In the hope of helping to heal the Papal Schism of the time, he accepted the position of private secretary to Benedict XII, the anti-pope at Avignon; but when Benedict excommunicated the French king in 1407 Clemanges resigned his office and lived in voluntary exile with the Carthusian monks. Here he devoted himself to his studies and writing, endeavoring in the Church, and seeking to place the study of theology upon a wider basis; his writings had much influence on the deliberations of the Council of Constance. In 1425 he went back to Paris where he continued to lecture at the College of Navarre until his death. His works were collected and published by Lydus (1613). Cons-ult Müntz, 'Nicolas de Cleemanges, sa vie et ses écrits' (Strassburg 1846); and Creighton, 'A History of the Papacy' (London 1882).

CLEMATIS, a genus of climbing vines or ascending herbs, of the crowfoot family (Re-munculaceae). It numbers upward of 150 spe-
cles, and is widely distributed throughout the temperate regions of the world. In the United States between 20 and 25 species are recognized. The best known is the virgin'sbower (C. virginiana), a vine that climbs over shrubs and along fences. It is common from New Jersey to Texas and west to Kansas and Manitoba. Its sprays of white flowers make a showy appearance from July through September. Other species are found west of the Mississippi River, extending to the Pacific Coast, and south to the Gulf of Mexico. The only English species (C. sinalo) is called traveler's joy. Many species, chiefly of Asiatic origin, are commonly cultivated because of their showy flowers.

CLÉMENCEAU, Georges Benjamin Eugène, é-chan klá-mǒh-só, French editor and statesman; b. Château de l'Aubraie, Feole, Vendée, 28 Sept. 1841. He studied medicine at Paris, and began the practice of his profession there.

In 1860 he was 20 Georges was thrown into prison for shouting "Vive la République!" on the streets of Paris, in the midst of the celebration of one of the Imperial anniversaries. He served his term in jail, and then, practically an exile, he came to America.

Between 1865 and 1869 he lived in the United States, chiefly in New York and in Stamford, Conn. Before he left France he had made the acquaintance of William E. Marshall, the artist who made the famous engraving of Lincoln, and it was as his friend, and indeed upon his invitation, that the young physician came to New York. During his stay there Clemenceau studied American ideas, conditions of living, government and language. He had had no academic knowledge of English when he left France; it soon became idiomatic. He traveled, too, visiting the Middle West, and going as far south as Richmond. But he could not travel further in the South, he said, because the condition of that section of the country, just defeated in the Civil War, was too sad for him to contemplate. He returned to New York, was a constant reader at the Astor Library, and made a number of good friends, especially in the Press. Then he moved to his neighbor on 12th Street. When Clemenceau failed to build up a medical practice and the money that he got from France proved insufficient, Bushe introduced him to the mistress of a girl's boarding school, a Miss Aiken, who employed him as teacher of the French language and literature in her "young ladies' seminary" at Stamford.

There Clemenceau translated the works of John Stuart Mill into French, was an indefatigable student of American politics, and became known as a serious scholar. Early in 1870, he left the school where he had taught for two and a half years, and returned to France.

Throughout the Franco-Prussian War and the Revolution he was mayor of the district of Montmartre. One of his duties during the siege was to see that 150,000 men were properly fed. Another was to look after thousands of refugees. He was also responsible for large amounts of money, and they tell a story that, before the accusations against any one's honesty that might be made in those trying days, he took the precaution of engaging an expert accountant to "check up" and make public his use of every son of public funds. At the end of the war he did all he could to gain "home rule" for Paris, and then found himself the enemy of the Commune. In 1871 he was elected to the General Assembly, and it is interesting to note that he was opposed to a treaty of peace. From 1871 to 1876 he was a member of the Paris Municipal Council, of which he became president, and in 1876 he was elected member from Montmartre in the Chamber of Deputies, where he soon became leader of the Radicals. From the outset of his career in the French Parliament he was the bitter opponent of the Royalists, and soon became known for his eloquence and independence of action. Men could not predict the action of Clemenceau. He was independent even in his radicalism, and he followed no leader but his own principles. They called him the undisciplined vandal in those early days when he was making a reputation as an upsetter of other men's careers.

His political power was increased by his journalistic activities. In 1880 he founded the Justice, the great daily paper, of which he became chief editor. He destroyed the Fourton-Broglié administration. He overthrew Boulanger. He caused the fall of Jules Grévy and of Jules Ferry. He wrecked the Dreyfus movement; a fact of which position of M. Freycinet at least three times. Yet his own policy was a consistent radical Republicanism, clear and practical; he stood for the realization of all that the Revolution had hoped and dreamed. He was opposed, we may note, to the alliance with Russia, determined that his country should not be joined in so close a friendship with a despotic power. He unceasingly upheld the complete separation of Church and state. He urged constantly the development of French resources to the utmost. And those who have watched his career closely point out the growth of the man's political philosophy from his early reckless radicalism to the saner advocacy of a just and free democracy.

But in 1893 he fell. He fell with a completeness that was universally believed to be hopeless. He was disgraced, finished. He was accused of complicity in disloyalties and dishonesties in connection with the M. Dreyfus scandal. He met every charge against his integrity. The attack on him in the Chamber utterly broke down. But his own constituents turned against him. He was literally put out of politics. For nine years he had no connection with the government of France. But two years after his overthrow a very different Clemenceau made his appearance in the world of French letters. The wily politician, the reckless duelist, the insolent hound of his foes, was gone. In his place was a philosopher and litterateur, a man who wrote exquisite prose, a lover of nature, a friend of humankind. Among his writings during that period were a book on the philosophy of nature, 'Great Pan'; a novel of social life, 'The Strongest'; a play of which the scene was laid at the court of China, and some notable criticisms. But he returned in a few years to journalism. His old paper had gone down in the wreck of its chief's career. But when the Dreyfus affair suddenly burst upon France, a new gain for Clemenceau. The case was taken up by M. Clemenceau, made its appearance. It was devoted to the proving of Dreyfus's innocence. Clemenceau was back in the active
world of French affairs with a vengeance. With his tireless defense of Dreyfus, he became, as someone has said, "the sentiment con-
scious" of France. In Clement-
ecau’s paper that Zola published his famous ‘J’accuse.’ Month after month Clementeau wrote articles of which Sydney Brooks states: "They remain, I suppose, the most brilliant mas-
terpieces of polemics that French literature has pro-
duced since Pascal’s famous ‘Provincial Letters.’ At the time of their appearance their effect was prodigious. No publicist did more, very few did as much, to guide French opinion through the mazes of that exhausting cri-
sis." And the political world that Clemen-
tecau thus dramatically re-entered, he has never left. In 1902 the same constituency that had forsaken him in his hour of trial returned him triumphantly to the Senate. In the spring of 1906 he was appointed to public office as Min-
ister of the Interior. In November of that year, upon the retirement of M. Sarrien, he became Premier. While he was in office the most important thing that happened was the great miners’ strike, which the Socialists organ-
ized. Knowing his revolutionary tendencies, the miners expected his sympathy, especially when he went personally to investigate their complaints. But with the first outbreak of violence Clementeau became a ruler of iron. The soldiers were called out and the riots were put down. Clementeau found himself attacked by the Socialists and involved in a personal controversy with M. Jaurès. But when he asked the latter whether he, in a position of authority, would have acted differently, the Socialist leader was unable to reply. In 1909 his old enemy, Delcassé, rose up suddenly and over-
threw his Ministry. A discussion over naval affairs sprang up almost over-night. There were scandals, investigations, controversies. In a verbal duel with Delcassé—in the early years of Clementeau’s activity his duels were fre-
quently not verbal—the Premier, to quote a newspaper dispatch, "seemed, for the first time in his Parliamentary career, to lose his head." Certainly he lost his temper, declared that Delcassé had "humiliated France," and stalked out of the room. The President shortly after offered Clementeau the Premiership to M. Jaurès. But Clementeau’s power was not broken. He kept his place in the Senate. In 1912 he overthrew Caillaux’s Ministry. In 1913 he wrecked Briand’s Cabinet on the issue of pro-
portional representation. He started a new paper, L’Homme Libre. When the war began in 1914 he entered the Viviani Ministry. For some time he was chairman of the Parlia-
tary Committee on the Army.

His patriotism is well known, but he has never hesitated in the midst of the stress of war to argue, criticise and actually attack where he believed that a need for opposition existed. In September 1914, he published in his paper—which he had moved to Toulouse—a plea for preferential treatment for German prisoners from Alsace. For this the Journal was ordered suspended for eight days. Clementeau did not stop publication. He changed the name of his paper L’Homme Libre (The Free Man) to L’Homme Enchaîné (The Man in Chains). And its editor continued to criticise. The paper was temporarily suppressed several times.

In April of 1917 he was outspoken in his censure of the management of the allied offensive. He was somewhat scornful of America’s long-continued neutrality, but was enthusiastic in his welcome to the United States entered the war. In the autumn of 1917 Clementeau began the parliamentary attack against ‘Bolo-
ism’ and on that issue the Painlevé Ministry fell in November. Clementeau was summoned to the Ministry and immediately set about forming his Cabinet. He has written plays, novels, philosophic essays and sociological studies, including ‘De la génération des ele-
ments anatomiques,’ ‘La mèlée sociale’ (1894); ‘Le grand loup’ (1895); ‘Les reains, la voile du bonheur; (1899); ‘Aux embuscades de la vie’; ‘Les requins; a play. See BOLO, PAUL; CAIL-
LAUX, JOSEPH; FRANCE — HISTORY.

CLEMENTS, Jeremiah, American politician:

b. Huntsville, Ala., 28 Dec. 1814; d. there, 21 May 1865. He was graduated at the University of Alabama 1833, studied law at Transylvania University, Ky., and was admitted to the bar, 1834. He was United States attorney for the northern district of Alabama 1838; a member of the State legislature 1839-41, 1843-44; in 1842 raised a company of volunteer troops and went to Texas, having been appointed lieu-
tenant-colonel, and subsequently held the same rank in the regular service. In 1848 he was governor of the civil and military department of purchase in Mexico, holding the position until the end of the war. He was a United States senator 1849-53, and held high rank as an able and eloquent debater. He took part in the Alabama secession convention, and though protesting against its action, subsequently yielded and held office under the Confederacy. He left in manuscript an unfinished history of the war in northern Ala-

CLEMENTS, Samuel Langhorne, American humorist; more generally known by his pseudo-
ym M. M. Leon Bourgeois. He was born in 1835; d. Redding, Conn., 21 April 1910. He received only a scanty school education, and in 1848 became apprentice to a printer, subse-
sequently working at this trade in Philadelphia, New York and elsewhere. He afterward learned the business of pilot on the Mississippi, but left this occupation to become secretary to his brother, who had been appointed secre-
ary of Nevada Territory. He then tried his fortune at the Nevada mines. In 1852 he became local editor of a newspaper in Virginia City, but soon went to San Francisco, where he was for some time a reporter. After meeting with slight success in the Calaveras gold-
diggings he returned to journalism in San Francisco. In 1866 he went to the Sandwich Islands, and on his return commenced his lecturing career. A trip to the Mediterranean, Egypt and Palestine followed. He edited for a time a newspaper in Buffalo, and soon after married and settled in Hartford, Conn. He traveled widely, and many of the scenes and incidents in his books are drawn from his journeys. He lost heavily through the failure
SAMUEL LANGHORNE CLEMENS ("MARK TWAIN")
CLEMENT VI

Pope. He was a native of Saxony, Suidiger by name, and was made pope by Emperor Henry III, whose chancellor he had been, in 1046 on the abdication of Gregory VI. He was the earliest of the six German pontiffs and a determined opponent of simony.

CLEMENT III, Pope: b. Rome; d. March 1191. He was a Roman by birth and cardinal bishop of Palestrina. He was elected Pope in 1187; preached the third crusade against the Saracens, made the Scottish Church directly dependent upon Rome rather than on York. There was an anti-pope with this title, who died in 1100.

CLEMENT IV (GUT FOQUELS, GÉ FOOK), Pope: b. Saint Gilles, France; d. Viterbo, 29 Nov. 1268. He was descended from a noble Provençal family. He served first as a soldier; later he became archbishop of Narbonne and cardinal bishop of Sabina. He became Pope in 1265, succeeding Urban IV, and was the friend and protector of Roger Bacon. He vigorously supported the claims of Charles of Anjou against Manfred, son of Frederick II, in the dispute concerning the two Sicilies.

CLEMENT V (BERTRAND D’AGOUST, BÉTRAN DÀ-GOOST), Pope: b. Bordeaux 1264; d. Roquemaure, Languedoc, 20 April 1314. He became Pope in 1305 and at the time of his election was archbishop of Bordeaux. He transferred his see from Rome to Avignon, and thus commenced the Babylonian captivity of the Church, which lasted about three-quarters of a century. Philip the Fair influenced him in his actions. Another memorable event of his reign was his bull suppressing the order of the Knights Templar, 1311. Consult Rabanis, Clement V et Philippe le Bel (Paris 1858); Lacoste, Nouvelles études sur Clement V (Bordeaux 1896).

CLEMENT VI (PIERRE ROGER, RÉ-ZHÁ), Pope: b. near Limoges, France, 1292; d. Ville-neuve d’Avignon December 1352. He succeeded Benedict XII in 1342. He refused to return to Rome from Avignon. The Emperor Louis of Bavaria was excommunicated and humiliated by him. In his capacity of ruler of the kingdom of Naples, he acquitted Queen Joanna of the murder of her husband, and his purchase secured possession of Avignon. He also resisted the advances of Edward III of England and made an attempt to bring about a reunion of the Latin and Greek churches.
CLEMENT VII (GIOVanni de Medi.]i, má'dé-chè'), Pope: b. Florence about 1475; d. Rome Sept. 27, 1534. He succeeded Adrian VI in 1523. His sympathies were at first with the Imperial party, but he found it expedient, after the success of Charles I at Pavia, to join the other Italian powers in a league with France. An attack from the Roman nobles again drove him to seek another alliance with the emperor. His vacillating conduct incurred the wrath of the Imperial party. The constable Bourbon, with the connivance of the emperor, invaded the papal territory with an army and sacked the holy city and held the Pope a prisoner for six months. After being released, he took refuge at Orvieto. Returning to Rome in 1529, he made peace with Charles, who promised to restore the Medici at Florence, and was crowned by the Pope in 1530. Clement urged the emperor to persecute the Lutherans in Germany, and evaded all demands for a general council. His refusal to sanction the divorce of Henry VIII created a breach with England; the weakness of his policy lost half of the German membership of the Church, and his rule was decidedly unsuccessful. The title of Clement VII was adopted also by the anti-pope Robert of Geneva 1378-94.

Clement VIII (Filippo Alessandrini], Pope: b. Pistoia, 1536; d. May 1605. He succeeded Innocent IX, 1592, reconciled Henry IV to the Church and ordered the execution of Giordano Bruno. He annexed Ferrara to the states of the Church. During the last years of his reign the controversy arose between the Jesuits and Dominicans on the question of grace, to settle which he established the Congregatio de Auxiliis Divine Gratiae in 1597. He was a man of great sincerity and piety and an erudite scholar, as shown by his revised editions of the Vulgate, the breviary and the liturgical books. The anti-pope Clement VIII resigned, 1429, but did not close the western schism.

Clement IX (Giulio Rospigliosi, tòspè'le-ó'sè), Pope: b. Pistoia, 1606; d. 9 Dec. 1669. He succeeded Clement VII to the papal chair in 1667. In his pontificate was arranged the "Pax Clementina," which for a time closed the Jansenist controversy.

Clement X (Emilio Altieri, ál-té-à're), Pope: b. Rome, 13 July 1590; d. 22 July 1676. At nearly 80 he succeeded Clement IX and during his pontificate a notable controversy arose with Louis XIV relating to the enjoyment, during vacancy, of episcopal revenues and the right of filling such vacancies. Because of his age, much of the government was left in the hands of his nephew, Cardinal Paluzio Paluzzi. 

Clement XI (Giovanni Francesco Al- bani, ál-bà'né), Pope: b. Pesaro, Italy, 22 July 1649; d. 19 March 1721. He was elected successor of Innocent III in 1700, and in 1713 sent forth the call to the bulls, "Vineam Domini salvabit," and "Unigenitus" in condemnation of Quesnel's treatise on Grace and Predestination. The bull was opposed by the Jansenists, but approved by the Jesuits. The persuader in his efforts to obtain the English crown in 1715 was supported by the late Cardinal, Consult Latt. The "Vie de Clement XI" (1752).

Clement XII (Lorenzo Corsini, kór-sè'nè), Pope: b. Florence 1652; d. 6 Feb. 1740. He was the successor of Benedict XIII in 1730, and was the first pontiff to oppose Freemasonry. 

Clement XIII (Carlo della Torre Rez- zonico, kàr'tô dèl-là tòr'ra rët-so-në'kò), Pope: b. Venice March 1693; d. Feb. 1769. He succeeded Benedict XIV in 1758. He supported the rights of the Church and did all in his power to protect it against encroachments of the free-thinking groups which were gaining power in Portugal and France. He published a bull in behalf of the Jesuits after their expulsion from France and Spain in 1767.

Clement XIV (Giovanni Vincentio Antonio Ganganelli], Pope: b. San Arcangelo, near Rimini, Italy, 31 Oct. 1705; d. 22 Sept. 1774. He was a Franciscan friar, a man of great piety and worth; the friend and confidant of Benedict XIV. He was elected Pope in 1769 after a struggle in which cardinals influenced by various of the Catholic powers made interest in favor of the suppression of the Society of Jesus. When the new Pope showed an unwillingness to do the will of the powers, the charge was made that he had received the support of the French and of the conclave upon his promise to suppress the order; but this charge has been conclusively proved to be without foundation in fact; yet such was the urgency of the powers, he felt himself constrained in the interest of peace and of the Church to disband the Jesuit order, which he did in the apostolic brief Dominus ac Redemptor which declares the Society of Jesus dissolved forever. The fact that the brief had been drawn up and completed in November 1772 but was not published till July 1773 is proof that he was loath to publish so severe a decree against the order. After its issue he fell into a rapid decline, presumably from remorse, and though all his life he had been exceedingly vigorous, died little more than 12 months after the brief was published. It was this pontiff who founded the Clementine Museum in Rome. Consult Caraccioli, "Vie de Clement XIV" (1775); Theiner, "Geschichte des Pontificats Clement XIV" (1835) Von Reumont, 'Ganganelli (Papst Clement XIV), seine Briefe und seine Zeit' (Berlin 1847); Ragnivan, 'Clément XIII et Clément XIV' (Paris 1854).

Clement, kla-mä'it, (Frédéric Jean) Edmund, French dramatic tenor; b. Paris, 1897. He received his education at the Institution Nôtre-Dame de Chartres and at the Paris Conservatory. His first appearance was in 'Mireille' at the Opéra Comique. He has sung in the leading cities of Europe and America. His most popular rôle is Don José in 'Carmen.' He created rôles in 'Bienvenuto'; 'Falstaff'; 'Xavière'; 'L'Amour à la Bastille'; 'L'Ile du rêve'; 'Beaucoup de bruit pour rien'; 'Le Juif polonais'; and 'La petite maison'. He has also appeared in 'La Damnation de Faust,' 'Fra Diavolo'; 'Don Juan'; 'L'Eclair'; 'Don Pasquale'; and 'Prosperine.'

Clement, Ernest Wilson, American educator: b. Dubuque, Iowa, 21 Feb. 1860. He was graduated at the University of Chicago in 1890. He taught for three years by Clement, Secondary, 1890-97 and at the Mito High School, Japan, 1887-91. For the next three years he was teaching in the United States. In 1894 he became principal of
CLEMENT OF ALEXANDRIA — CLEOBIS AND BITON

of the Duncan Academy, Tokio, retaining this post until 1911 when he was appointed teacher of the First High School, Tokio. In 1896–97 he was acting interpreter of the American legation at Tokio, a member of the Asiatic Society of Japan in 1896–1900 and again after 1911. He was editor of the Japanese Evangelist 1899–1909 and of the Christian Movement in Japan 1907–09. He is a frequent contributor to American and Japanese periodicals. His published works include: 'Handbook of Modern Japan' (1903); 'Japanese Floral Calendar' (1904); 'Christianity in Modern Japan' (1905); 'Hildreth's Japan as It Was and Is' (1906); 'Japanese Chronology' (1910); 'Short History of Japan' (1915).

CLEMENT OF ALEXANDRIA, Saint (Clemens Alexandrinus), Greek theologian, one of the most eminent and learned of the fathers of the Church. Very little, almost nothing, is known regarding his life. The first mention of him is in a letter of Eusebius of Caesarea and Photius; they give his name as Flavius Titus Clemens, and later writers add to the name the designation Alexandria. Of his birthplace or of his family name and surname one might infer that he was of Latin race; but he wrote in Greek, and his writings do not indicate any special acquaintance with Roman life or thought. Whether he was a native of Alexandria or of some Greek city cannot be decided. He was a convert from paganism and had an intimate acquaintance with the literature of Greek philosophy, but of the circumstances of his conversion to Christianity we know nothing. He was supposedly a disciple of Pantaenus, director of the Catechetical school of Alexandria and became his successor, and had among his pupils Origen, who in turn succeeded him. Further, Clement was a priest of the church of Alexandria. The persecution of the Emperor Severus Severus drove him from Alexandria. He wandered to Palestine and Asia Minor, but there is no definite information as to the rest of his career. A list of his writings is given by Eusebius, Saint Jerome and others, but the titles of the 10 separate works, namely: 'Hortatory to the Greeks'; 'The Tutor'; 'The Stromates' (usually called Stroma); this as its title indicates is a patchwork or collection of miscellaneous observations; 'Who is the Rich Man that is Saved?' These four works have come down to us complete or nearly so. The remaining six titles are works that have been lost: 'Outlines'; 'On the Passover'; 'On Fasting'; 'On Slander'; 'Exhortation to Patience'; 'The Church Rule.' The 'Hortatory to the Greeks' exposes the absurdities and immorality of the pagan religions; but the Greek philosophers and poets had a notion of the true author of the universe. 'The Tutor' sets forth the rule of Christian living. 'The Stromates' is a miscellany but it consists of the author's own studies of questions and problems in philosophy, literature, history, etc., not of passages taken from other authors. The treatise on the eucharist in Mark x, 17–31, is a very judicious exposition of the passage in the Gospel of Mark x, 17–31. Consult editions by Potter (Oxford 1715) printed in Migne's 'Patrologia Graecorum' (Vols. VIII and IX, Paris 1857); Eng. trans. in 'Ante-Nicene Fathers' (Vol. II, ed. by A. C. Coxe, New York 1885). Consult also 'Clement' (in Smith and Wace, 'Dictionary of Christian Biography' (London 1886-98)); Bigge, 'The Christian Platonists of Alexandria' (London 1889); de Faye, Eugène, 'Clément d'Alexandrie' (Paris 1898).

CLEMENTI, Muzio, klà-mà-té, Italian pianist and composer: b. Rome 1752; d. Evesham, England, 13 March 1832. He studied under a relative, Buroni, and in 1761 became an organist. He studied counterpoint with Carpani and singing with Santarelli. As early as his 12th year he wrote a successful mass for four voices, and had made such progress in the pianoforte that an Englishman, Mr. Beckford, took him to England to complete his studies. He was then engaged as director of the orchestra of the opera in London, and his fame having rapidly increased, he went in 1780 to Paris, and in 1781 to Vienna, where he played in a contest with Mozart before the emperor. In 1784 he repeated his visit to Paris, but after that remained in England till 1802, when he went back to the Continent. He returned in 1810 to England, where he settled down as superintendent of one of the principal musical establishments in London, and after the failure of his concern formed a partnership with Collard. He was absorbed in the mechanical perfection of the piano and also with the writing of theoretical works. As a pianist he was unequalled. His most important compositions were his 60 sonatas for the pianoforte and the great collection of studies known as the 'Gradus ad Parnassum,' a work of high educative value. He represented perhaps the highest point of technique of his day, and his influence on modern execution has led to his being characterized as "the father of pianoforte playing." Among his pupils are Field, Cramer, Moscheles, Kalkbrenner and Mendelssohn. He was interested in Westminster Abbey; C. A. Ferris, Great Violinists and Pianists (New York 1894); Shedlock, 'The Pianoforte Sonata' (London 1895); Frojo, 'Muzio Clementi, la sua vita, le sue opere e la sua influenza sul progresso dell' arte' (Milan 1878).

CLEMENTINES, so named after Pope Clement V, who during his pontificate (1305–14) had compiled the canons of the Church, chiefly out of the canons of the 15th Council of the Church, Vienne (1311). The Clementines are one of five great collections of Church laws, examined and decided upon according to the methods employed by ecclesiastical authority out of which the Corpus Juris Ecclesiasticus is made up. The Clementines constitute five books of this, and were edited and published by the Benedictines (9 vols. with appendix, 1885–92).

CLEMONS AGRICULTURAL COLLEGE, an educational (non-sectarian) institution in Clemson College Station, S. C.; organized in 1890; reported at the end of 1917: volumes in the library, 18,490; students, 819; professors, 65.

CLEOBIS, klè-o-bis, and BITON, bî-tûn, two Greek youths, the sons of Cydippe, chief priestess of Hera (Jun) at Argos. At the Heraia, a feast in honor of the goddess, it
was customary for the chief priestess to be drawn by two white oxen. Herodotus relates that on one occasion the procession had already begun to move and the oxen had not arrived, upon which Cleobis and Biton drew the chariot of their mother for a distance of 45 stadia, up the mountain where the Temple of Hera stood. The people applauded, and the mother was so affected by this instance of filial affection that she begged the goddess to grant her sons the beatific bliss which could be conferred on mortals. While the youths were yet in the temple a soft sleep fell upon them and they never awoke. The Argives placed the statues of Cleobis and Biton in the temple at Delphi, and in the temple at Argos they were represented drawing a chariot of their mother. Consult Cicero, ‘Tusc. Pol.’ (Bk. I, 47); Stobaeus, ‘Sermones’ (169).

CLEOBULUS, klē-ō-būlōs, one of the Seven Wise Men of Greece. He was a native and tyrant of Lindus, or according to some, of Caria, and flourished 500 B.C. He traveled to Egypt to learn wisdom, like many of the sages of Greece. He was a wise king of Rhodes, and was succeeded on the throne by his daughter Cleobulina, whose riddles are not less famous than his own. He was the first to give literary form to riddles. Diogenes Laërtius has preserved several of his riddles. Consult Diogenes Laërtius (I, 89-93); Mullach, F. G., ‘Fragmenta Philosophorum Graecorum’ (Bk. I).

CLEOBROTUS, klē-ō-brotōs, an ancient Greek military leader, son of Pausanias, king of Sparta, succeeding his brother Agesipolis I. During his reign began the Theban War, in which he commanded the Spartans against Epaminondas and Pelopidas. He was killed in the battle of Leuctra, which happened 8 July 371 B.C., according to the Julian calendar. See EPIAMNONDAS.

CLEOME, klē-ō-mē, a genus of plants, herbs and shrubs of the caper family (Capparidaceae), comprising about 75 species, natives of tropical regions. Less than 10 species are found in the United States, most of them adventitious additions from South America, escaped from gardens. The native varieties belong to the Rocky Mountain region, and when found to westward are naturalized specimens. Pink cloeome or Rocky Mountain bee plant (C. serrulata) has a stem from two to three feet in height, the pinkish-white flowers very showy and attractive. Its native habitat is the Rocky Mountain region from Canada to Arizona and Mexico, but it extends eastward to Lake Michigan. The spider flower (C. spinosa) of the eastern seaboard, from New Jersey to Florida, is a South American species escaped from culture.

CLEOMENES, klē-ō-mē-nēz, the name of three kings of Sparta, of the Agiad line: (1) Cleomenes I, the son of Anaxandridas, whom he succeeded about 520 B.C. His chief exploit was the crushing victory near Tyrins over the Argives. (2) Cleomenes II, the brother and successor of Cleombrotus I. There is no record of his reign, except that it lasted from 327-309 B.C. (3) Cleomenes III, king from 236 to 220 B.C. He was the son of Leonidas II and the last of the Agiads. He distinguished himself in a war against the Achaeans. Returning to Sparta he put to death the ephori, made a new division of lands, introduced again the old Spartan system of education and bestowed the full franchise upon many who had not before had it. He lived very simply, was just and friendly and treated his enemies with generosity. He showed himself an able general in a war against the Macedonians and the Achaeans united, but at last lost the important battle of Sellasia (222 B.C.). He fled to Egypt, where he attempted to raise an insurrection, but finding no supporters committed suicide. He was one of Sparta's best and ablest men, and with him perished the hope of Spartan empire. Consult Plutarch, ‘Cleomenes, Aaratus’ (34-46); Philostratus (5-6); Polybius (II, 45-70; V, 35-39; VIII); Holm, ‘History of Greece,’ (Vol. IV, cc. 10, 15).

CLEOMENES, or THE SPARTAN HERO, a play by Dryden and Southerne, acted in 1692.

CLEON, klē-ōn, Athenian demagogue, killed at Amphipolis, Macedon, 422 B.C. He was the son of Cleoneutus and was a tailor by trade, but became well known in public affairs before the death of Pericles. By the year 427 he was high in favor with the people and distinguished himself by the atrocious proposal that all the adult males of the revolted Mytileneans should be put to death and the women and children sold for slaves. In 425 he took prisoners those Spartans who had been blockaded by an Athenian force in the island of Sphacteria. The next year Aristophanes attacked him in his comedy of the ‘Knights’—as he did also in the ‘Wasps’ in 422—satirizing his venality, rapacity, ignorance, violence, and licentiousness. The portrait was probably correct in the main. In 422 he was sent to Chalcidice against Brasis, who was capturing the Athenian tributary cities there. He was taken unwares by a sally of Brasidas and was slain at the city of Amphipolis. His death paved the way for the peace of Nicias in 421. Consult Grote, ‘History of Greece.’ (Vol. VI, London 1888); Beloch, ‘Die attische Politik seit Perikles’ (Leipzig 1884); Holm, ‘History of Greece,’ (Eng. trans., Vol. II, Chap. 23, New York 1902).

CLEOPATRA, klē-ō-pa-trā, the name of several Egyptian princesses, of whom the most renowned was the eldest daughter of Ptolemy Auletes: b. 69 or 68 B.C. d. 30 B.C. With her eldest brother Ptolemy she shared the throne of Egypt. Both were minors at the death of their father, and were placed under the guardianship of Pothinus and Achillas, who deprived Cleopatra of her share in the government 49 B.C. She went to Syria, and was formulating plans for obtaining her rights by force, when Caesar came to Alexandria, and, captivated with her charms, successfully seconded her
CLEOPATRA'S NEEDLES

89

claims. Pothinus stirred up a second revolt, upon which the Alexandrian War commenced, in which the elder Ptolemy lost his life. Caesar proclaimed Cleopatra queen of Egypt; but she was compelled to take her brother Ptolemy, who was only 11 years old, as her nominal husband and colleague on the throne. The Queen subsequently made a journey to Rome, where Caesar received her magnificently, and, in order to secure the affection of the Roman people, he erected a splendid feast to be prepared, desired her attendants to leave her, and put an asp, which a faithful servant had brought her, concealed amongst flowers, on her arm, the bite of which caused her death almost instantaneously. This is, however, some doubt as to the exact method by which she took her life. Her body was interred near that of Antony. At the time of her death she had reigned 21 years. Her daughter by Antony married the king of Mauretania; their son, Ptolemy, last of the line, was slain by Caligula in 40 A.D.

CLEOPATRA'S NEEDLES, two obelisks, formerly at Alexandria, one of which is now in New York, the other in London. They are made of red syenite, quarried at the First Cataract, and were originally erected by Thothmes III in the 40th year of his reign (about 1,460 B.C.) in front of the portico of the great temple of Heliopolis, the On of the Scriptures, and the place where Moses was born and brought up. From Heliopolis the two obelisks were removed to Alexandria in 13-12 B.C., as shown by inscriptions on the claw of one of the bronze crabs placed by the Romans under the corners of the obelisk when they set it up in Alexandria nearly 17 years after the death of Cleopatra. How, then, they came to be called Cleopatra's Needles is not apparent; but it may be conjectured that they had been removed by her order some time before, and perhaps by the Romans on their second site, or that their removal was the carrying out of an intention formed by Cleopatra. Mr. (after Sir) Erasmus Wilson, to whom the credit may be awarded of having been chiefly instrumental in getting the British obelisk conveyed to London, assumes that the association of Cleopatra's name with the two obelisks represents the popularity of the queen and the affectionate regard of her subjects, rather than any participation of herself in their transport or erection. The obelisk now at London lay for a long time prostrate in the sand. In 1820 it was presented by Mehemet Ali to the British nation, but the British government never did anything for its removal, which was at last effected solely through the public spirit of several private individuals, the obelisk being erected on the Thames embankment in 1878. The other obelisk was presented to the United States by the Khedive of Egypt, and its transportation to its present position in Central Park, New York, where it was erected in 1881, was made possible by the liberality of W. H. Vanderbilt. It stands upon four bronze crabs, reproductions of the original crabs upon which the obelisk formerly stood. Two of the originals are now in the Metropolitan Museum, New York. The "needle" in London is somewhat the taller of the two, being 68 feet 5½ inches in height, as against 67 feet 2 inches, the height of the other. The lateral measurements at the base are in one pair of opposite sides 7 feet 5 inches and in the other pair; in the one in New York, 7 feet 9½ inches, and 8 feet 2½ inches. The weight of the British obelisk is rather more than 186 tons, and its mass 2,552 cubic feet. Both obelisks are inscribed with
hieroglyphs, engraved to a depth of several inches and carefully polished. The hieroglyphs are inscribed in vertical columns, which are read from the top downward; and in each case the middle column is in honor of Thothmes, by whom the obelisks were first erected, and the side columns in honor of Rameses II.

CLEEPSYDRA, klép-sí'dra, or WATER-CLEPSYDRA, an instrument for the measurement of time by the escape of water from a vessel through an orifice. Its origin is extremely ancient, and has generally been attributed to the Egyptians. Two descriptions of clepsydræ have been employed—one in which the water merely escapes through the orifice, the other in which the same level is constantly maintained by the introduction of a fresh supply of water, and a uniformity of efflux secured by retaining throughout an equal amount of pressure on the fluid as it issues from the bottom of the vessel. In one kind of water-clock the measure of time is registered on a dial-plate by means of a hydraulic apparatus acted on by the efflux of water from a cistern. The simpler form was used in Athenian courts where a speaker was allowed so much water for his speech, according to the importance of his case. The more complicated form is said to have been invented by Plato; or by Ctesibius, according to some. Both forms were introduced into Rome in 159 A.D. These instruments are now scarcely ever constructed.

CLERC, Laurent, klär, French deaf mute: b. La Balme, Isère, France, 26 Dec. 1785; d. Hartford, Conn., 18 July 1869. At the age of 12 years his uncle took him to Paris, and placed him in the institution for the deaf and dumb. He became the favorite pupil of the Abbé Sicard. His intellectual condition, like that of most of the un instructed deaf mutes, was at this time deplorable. "If had," he says, "a mind, but it did not think; I had a heart, but it did not feel. My mother had endeavored to show me the heavens, and make me know God, but her attempts were vain; I could comprehend nothing. I believed that God was a tall, big, and strong man, and that Jesus Christ, having come to kill us, had been killed by us, and was a cross as one of our triumphs." Under the skilful instruction of the Abbé Sicard he made rapid proficiency, and in 1803, after passing eight years in the institution, he was appointed tutor, and in 1806 a salaried teacher. In 1816 Clerc formed the acquaintance of Gallaudet (q.v.), who persuaded him to accompany him to this country, here to lay the foundation of deaf mute instruction. (See DEAF MUTES). They succeeded in establishing an institution, since known as the American Asylum for the Deaf and Dumb, at Hartford. On 15 April 1817 the asylum was opened with seven pupils, and Messrs. Gallaudet and Clerc installed as teachers. The greater part of the teachers sent to other institutions for the deaf and dumb from this mother asylum received their training at his hands. He married a deaf mute, but his children could both hear and speak.

CLERESTORY, or CLEARSTORY, the upper part of the nave in churches, above the triforium where a triforium is present, and formed by walls supported on the arches of the nave, and rising above the roof of the side aisles. In these walls windows are inserted for the purpose of increasing the light in the nave. This clearestory was an essential feature of the Christian basilicas; occurs also in Hagia Sophia and the Byzantine churches. In Norman architecture the three stories of pier arcade, triforium and clerestory are of nearly equal height, but in Gothic the clerestory becomes relatively of greater significance and in late Gothic work is often very lofty.

CLERGY (Lat. clericus, from Gk. kêrios, a lot), in the Christian Church, that portion of the faithful which is set apart for the ministry of religion. The separation from the laity became more marked through the multiplication of offices and titles, privileges, rights, peculiar dress and habits. In the Roman Catholic Church there are eight grades or distinctions of clergy: androgynous clergy, that is, the three simple clerics, those of the four minor orders and those of the three sacred orders of subdeacon, deacon and priest (q.v.). The last three are regarded as being of divine institution. The simple cleric is one who has received the ecclesiastical tonsure; by that rite he is made a cleric or cleric, and as such is entitled to certain rights, privileges and immunities and assumes certain obligations not incumbent on the laity. In Protestant churches the distinction between clergy and laity is much less wide. See Holy Orders.

CLERK, formerly the name given to an ecclesiastic. Since learning of all kinds at first centred in the Church, the name was assumed by all men of learning, whether belonging to Church or laity. At present the term designates one who has charge of an office or department, subject to a higher authority, as a board, corporation, etc.; a secretary, as the clerk of the House of Representatives or Senate, clerks of the various courts, etc. In England a parish officer, a layman used to be the responses in the church services and to perform other duties connected with the parish; a parish clerk. The mediaeval use of the terms "clerk in holy orders" and "clerk in minor orders" still exists to distinguish the various ministers of the Established Church.

CLERK-MAXWELL, James. See MAXWELL.

CLERKIE, Agnes Mary, Irish astronomer: b. Skibbereen, Ireland, 10 Feb. 1842; d. London, 20 Jan. 1907. She gave her life to astronomical research, was awarded the Astomian prize and became a member of the British Astronomical Association. She was also honorary member of the Royal Astronomical Society. She published 'A Popular History of Astronomy in the Nineteenth Century' (1885; rev. ed., 1905); 'System of the Stars' (2d ed. 1905); 'The Herschels and Modern Astronomy' (1895); 'Problems in Astrophysics' (1903); 'Modern Cosmogonies' (1906); 'The Concise Knowledge of Astronomy' (with J. E. Gore and A. Fowler 1898). She contributed to the 'Catholic Encyclopedia,' the 'Dictionary of
CLEOPATRA'S NEEDLE, CENTRAL PARK
CLEOPATRA'S NEEDLE, CENTRAL PARK, NEW YORK
National Biography' and the 'Encyclopedia Britannica.' She also wrote for the Edinburgh Review, the Tablet, Knowledge, etc.

CLERKENWELL, England, parish of London south of Saint Paul's Cathedral and within the metropolitan borough of Finsbury. It is inhabited by the better class of workingmen in the metal trades, being noted for its output of watches, optical instruments and articles of gold and silver. Technical education is provided in these trades by the Northampton Polytechnic Institute. The name comes from the well around which the parish clerks of London used to meet. An attempt by Fenians to destroy the Clerkenwell prison was made on 13 Dec. 1867. Pop. 57,123.

CLERMONT, The, the name given by Robert Fulton (q.v.) to the steamboat in which he made his first trip from New York to Albany, 11 Aug. 1807. The speed attained was only five miles per hour.

CLERMONT-FERRAND, klär-mon-fér-rán, the capital of the department of Puy-de-Dôme, of which it is the capital, 113 miles west of Lyons. It is situated on a hill at the foot of the volcanic range in which the summit of the Puy is conspicuous. It was originally the capital of the Arverns. It received considerable importance under the Romans and became a bishop's see in 250. It was afterward sacked by the northern hordes, but soon recovered, and was selected in 1095 for the meeting of the great council in which the crusades originated. In 1536 it became the capital of the duchy of Auvergne. Among its natives are Gregory of Tours, Pascal and General Dessaix. The most remarkable edifices are the Gothic cathedral, a huge, irregular, gloomy pile, begun in 1248, and recently completed by the construction of the west front and two towers; the church of Notre Dame, founded in 580, and encrusted externally with rude mosaics; the townhouse, courthouse, theatre, general hospital, etc. There are also a medical and a theological college, technical schools, observatory, library containing about 125,000 works, botanic garden and museums of natural history and antiquities. It is the centre of a great rubber industry. Other manufactures consist chiefly of chemicals, animal manure, pine tar, nails, hats, machinery, etc.

It is an important centre of trade. Near it there are two mineral springs. Pop. of commune (1911) 65,386.

CLERMONT-TONNERRE, to-när, the name of a distinguished ancient family of counts in Dauphiny. One of the most celebrated is STANISLAS MARIE ADELAIDE, COUNT de: b. 1757; d. 1792. At the breaking out of the Revolution in 1789 he took his place in the States-General as deputy of the nobility. He maintained the cause of a constitutional monarchy and incurred the distrust of both the Aristocratic and Republican parties. As a counterpoise to the influence of the Jacobins, he, in concert with Malouet and other friends of monarchy, founded the Monarchical Club; and with Fontanes started the Journal des Imparfaits. The club having been denounced by Barnave as a band of conspirators, was dissolved, and the journal was suppressed after an existence of only two months. In 1791 he was arrested on the charge of having aided the king in his attempt to escape, but regained his liberty on taking an oath of fidelity to the National Assembly. The next year he was dragged by a mob before the section. As no sufficient ground of detention appeared he was dismissed, but was pursued and murdered. His collected speeches were published under the title 'Recueil des opinions' (Paris 1791).

Clémence Marie Gaspard, MARQUISE, afterward DUKE DE: b. Paris 1779; d. 1855. After receiving education at the École Polytechnique he entered the army, served in Italy, Germany and Spain and became aide-de-camp to Joseph, king of Spain. After the restoration of Louis XVIII he was Minister of Marine and in 1823–27 Minister of War. The revolution of July was distasteful to him and he retired from political life.

CLÉRON, Joseph Othenin Bernard de (COMTE D'H AUSSONVILLE), French statesman and writer: b. Paris 1809; d. 1884. He entered the diplomatic service and was successively secretary of embassy at Brussels, Turin and Naples. In 1842-48 he was minister of Foreign Affairs. He was elected a member of the French Academy and in 1878 he was named Senator perpetuel. He was active in behalf of the Alsatian exiles after the war with Prussia in 1870. His works include 'Histoire de la politique extérieure du gouvernement français de 1830 à 1848' (1850); 'Histoire de la réunion de la Lorraine à la France' (1854–59); 'L'Eglise romaine et le premier empire' (1864–69). During the war of 1870-71 he published several pamphlets and political letters which exerted considerable influence throughout France; of these the most widely circulated was 'La France et la Prusse devant l'Europe.'

CLÉRÉ, klär-è, Jean Baptiste, the valet de chambre of Louis XVI: b. near Versailles, 11 May 1759; d. near Vienna, 27 May 1809. When in 1792 the royal family of France were imprisoned in the Temple, Cléry was one of the few servants permitted to remain with them. After the death of Louis XVI, a few days before his death, divided a loaf of bread with his faithful companion of his misfortune, the only proof of his regard which he was able to show him. After the king's death, Cléry was devoted to the Dauphin. He wrote a journal of what passed in the Temple from the captivity of Louis XVI until the death of the Dauphin; it has been several times republished.

CLÉSINGER, klär-zän-zhâ, Jean Baptiste Auguste, French sculptor: b. Besançon, 22 Oct. 1814; d. Paris, 7 Jan. 1883. He obtained considerable reputation for busts of distinguished persons, and also executed statues and historical groups. His colossal bust of 'Liberty,' and his statues of 'Fraternity,' 'Woman Bitten by a Serpent,' 'The Gipsy Girl,' and of Rachael and Cruvellier in some of their principal parts, are among his best works. Others are 'Phryne'; 'Louise of Savoy,' in the Luxembourg Gardens; and the statue of 'Music,' on Chopin's grave. His work is of masterly technique, but lacks depth. He was commissioned by the French government to execute an equestrian statue of Francis I. He married
a daughter of Madame Dudevant (George Sand).

CLE SSE, kluˈsɛ, Antoine, Belgian popular poet; b. The Hague 1816; d. Mons 1889. To the day of his death he followed his trade of armorer. His first ballad, 'Godfrey de Bouillon,' won for him a gold medal. His popular songs 'Beer' and 'The Family Name' (meaning Belgian, including Fleming, Walloon, etc.) cast into great favor with the people. He wrote also a comedy, 'A Poet.' Two volumes of 'Songs' (1866–88) contain all his popular ballads, with the music. They were published at Mons (1886). Consult Potviva, 'Histoire des lettres en Belgique' (Brussels 1882).

CLETHRA, klɪθrə, the typical genus of the family Clethraceae, or white-alder family. The family has but this single genus, which numbers about 30 species, indigenous to Japan, Madeira, Mexico, South America and the eastern seaboard of North America. The United States species are the sweet-pepperbush or white-alder ('C. alnifolia'), found near the coast from Florida to Maine, and the mountain sweet-pepperbush ('C. acuminata'), a shrub or small tree growing in the mountain woods of Virginia, North Carolina and Georgia.

CLEVEDON, England, watering-place on the Bristol Channel, about 15 miles southwest of Bristol. It is the burial-place of Hallam, the historian, and of his son Arthur, whom Tennison's 'In Memoriam' has made famous. Here Coleridge lived in 1795. Clevedon Court is the Castlewood of Thackeray's 'Henry Esmond.' Pop. 6,111.

CLEVELAND, Charles Dexter, American author: b. Massachusetts 1802; d. 1869. He was graduated at Dartmouth in 1827 and became professor of Latin and Greek in Dickinson College, and of Latin in the University of the City of New York. He was United States consul at Cardiff, Wales, 1861–67. His chief works include an edition of 'Milton's Poetical Works' with a 'Life' (1851). 'A Complete Concordance to the Poetical Works of John Milton' (1867); 'English Literature in the Nineteenth Century' (1851); and compendiums of 'English Literature' (1847); 'American Literature' (1858); and 'Classical Literature' (1861).

CLEVELAND, Chauncey F., American lawyer and politician: b. Hampton, Conn., 16 Feb. 1799; d. there, 6 June 1867. He was admitted to the bar in 1819, became active in local politics as a Democrat, and in 1826 was elected to the State legislature, serving 12 terms in all; and was speaker of the lower house in 1836, 1838 and 1863. He was appointed attorney-general of Connecticut in 1832; and was elected governor in 1842 and 1843; in both years the popular vote was indecisive and he was chosen by the legislature. In 1849 and 1851 he was elected to Congress. He was one of the leaders in the organization of the Republican party; in 1860 was a presidential elector; and in 1861 was a delegate to the Peace Congress.

CLEVELAND, Frederick Albert, American economist: b. Sterling, Ill., 17 March 1865; d. New York City 8 Nov. 1917. He was in instructor in finance at the latter institution in 1900–03, and from 1903 to 1905 was professor of finance at the School of Commerce, New York University. He served as accounting expert on several commissions, including that on the finances of New York City. He was in President Taft's commission on economy and efficiency (1911) which recommended a national budget. He was appointed director of the bureau of municipal research in 1907. His publications include 'Growth of Democracy in the United States' (1898); 'Funds and their Uses' (1902), school edition as 'First Lessons in Finance' (1903); 'The Bank and the Treasury' (1905); 'Chapters on Municipal Administration and Accounting' (1909); 'Organized Democracy' (1913); 'Railroad Capitalization and Promotion,' with F. W. Powell (1908); 'Railroad Finance,' with F. W. Powell (1912).

CLEVELAND, John, English poet and satirist: b. Loughborough, June 1613; d. London, 29 April 1658. He studied at Christ College, Cambridge, where Milton was a fellow-student; became a fellow of King's College 1634; and M.A. 1635. A royalist and gifted satirist, he was judge-advocate at Newark 1645–46, but after its capitulation underwent a series of vicissitudes and wanderings until his death. Among his contemporaries, Cleveland's poems were held in higher esteem than Milton's; 'The Rebel Scot'; 'Rupertism'; 'Smectymnuus, or the Club Divines'; 'Fuscara, or the Bee Errant'; and three elegies on the king, are the most noteworthy. Consult Berdan, J. M., 'The Poems of John Cleveland' (New York 1903).

CLEVELAND, (Stephen) Grover, 22d President of the United States: b. Caldwell, N. J., 18 March 1837; d. Princeton, N. J., 24 June 1908. Grover was the fifth of a family of nine children born to Rev. Richard F. Cleveland, a graduate of Yale (1829), and Katharine, his Quakerian clergyman, and Ann Neal, the daughter of a Baltimore merchant of Irish descent. He received a common school and academic education at Fayetteville and Clinton, N. Y.; the successive residences of the family after leaving Caldwell, and was preparing for college when his father's sudden death (1853) changed his prospects entirely. To support himself and to aid in providing for the rest of the family he secured a clerical position in the New York Institution for the Blind, where his older brother William was a teacher. In 1855 he started West, but on his way stopped at Buffalo to visit an uncle, Lewis F. Allen, a stock breeder and publisher of 'The Herd-Book of American Short-Horn Cattle.' His uncle advised him to stay in Buffalo and employed him in the preparation of the 'Herd-Book,' until a position as clerk and copyist was secured in a law office, August 1853. He at once set to work with perseverance and industry, and thus made himself useful and master the rudiments of the law, with the result that in 1859 he was made managing clerk of the firm at a salary of $600 (increased to $1,000 in 1863) and admitted to the bar. He graduated a. m. at Pauw University in 1860. For the bar, but gave up practice in 1896 and there-
GROVER CLEVELAND
Twenty-second and Twenty-fourth President of the United States
enlist, he borrowed money to pay for a substitute. In 1863 he was appointed assistant district attorney of Erie County, serving with zeal and energy. He attended every one of the 12 grand juries which met during each of the three years and in each case was a majority of the cases. As the Democratic candidate for district attorney in 1865 he was defeated by his friend Lyman K. Bass. In 1869 he became a member of the law firm of Laning, Bass & Seiberling. In 1870 he was appointed sheriff of Erie County (1870), he performed his duties faithfully and used his leisure in prosecuting further professional studies. At the end of his term (1873), he joined the firm of Bass, Cleveland and Bisell, acquired increasing success in practice and took a still higher position at the bar. In 1881 the citizens of Buffalo determined to check the flagrant corruption in the city government. Cleveland was elected mayor on the Democratic ticket by a majority of 3,500 though the Republican State ticket received an average majority there of 1,600. As mayor, he displayed a thorough knowledge of the laws and a clear perception of the needs and rights of the city. He insisted upon the city assuming property claims; saved the city over $1,000,000 by preventing corrupt schemes and bargains; and won the gratitude of people and press irrespective of party. On 22 Sept. 1882 he was nominated for governor against the Republican candidate, Charles J. Folger, and elected by the unprecedented majority of over 192,000 votes. As governor he conducted a thoroughly business-like administration, making frequent use of his veto power, but his vetoes were always clearly in accord with his duty under the law. His record as mayor and governor won for him the Democratic nomination for President, 10 July 1884. The ensuing campaign was unusually bitter. Its broad distinguishing feature was the rise in the Republican party of the independent or "mug-wump" movement supporting Cleveland. During the contest, discussion of the record in Congress of James G. Blaine, his Republican opponent, met by a violent counter attack upon Cleveland's personal character. At the election Cleveland received 219 electoral votes to 182 cast for Blaine, and was inaugurated President 4 March 1885, having resigned his governorship on 6 January. Only the briefest mention can indicate the important and difficult questions that marked his administrations. His first message recommended a reduction of the tariff, the extension of civil service reform, regulation of the presidential succession and the settlement of the fisheries dispute with Great Britain. His removals from non-political offices were less sweeping than those of any President since Jackson; of 987 bills passed by Congress up to 5 Aug. 1886 he vetoed 102, chiefly pension bills; he won a sharp contest with the Senate over suspensions and nominations; and devoted his 1887 message entirely to the existing tariff, denouncing it as vicious and unnecessary and demanding the abolition of all duties on foreign manufactures. Defeated for re-election in 1888, he retired to the practice of law in New York city (1889–93). Re-elected in 1892, he took office in 1893 in the midst of threatening currency and financial conditions. His inaugural declared that "so far as the executive branch of the government can intervene, none of the powers with which it is invested will be withheld when their exercise is deemed necessary to maintain our national credit or avert financial disaster." Accordingly he forced the repeal of the Sherman Silver Purchase Act, killed the bill for coinage the seignorage, maintained the treasury's gold reserve by the successive issue of government bonds and saved its credit throughout the world, despite furious opposition by large sections of his own and the Republican party. By favoring the free coinage of silver. He repudiated the Hawaiian annexation treaty made by President Harrison, enforced the neutrality laws during the troubles in Cuba, while firmly supporting American interests there, and insisted upon arbitration of the British-Venezuelan boundary dispute. During the Chicago strike in 1894, he effectively asserted the executive's right to interfere in State affairs in the interest of law and order. At the close of his term he resided in Princeton, N. J., where he resided till his death. He delivered an annual series of lectures on public affairs at Princeton University and wrote a number of articles on important questions with which he was required to deal while President. In 1904 he was regarded as a candidate for a third term, but emphatically declined to be so considered. In 1884 Cleveland's popular majority was 62,683; in 1888 it was 98,017; in 1892 it was 380,810. President Cleveland's messages and other public papers will be found in Richardson's "Messages and Papers of the Presidents, 1789–1897" (Vols. VIII, IX, Washington 1898). A collection of his magazine articles appeared in book form (1904) under the title "Presidential Problems," and he also published "Fishing and Hunting Sketches" (1906).

Bibliography.—Campaign lives of Cleveland by Thomas W. Handford and Eugene T. Chamberlain, Wm. Dorshimer, Pendleton King and Deshler Welch, appeared in 1884; of these Handford-Chamberlain's is the fullest and most authentic. Consult also Foster, 'A Century of American Diplomacy' (New York 1900); Gilder, 'Grover Cleveland' (New York 1910); Henderson, 'American Diplomatic Questions' (New York 1901); Hensel and Parker, 'The Life and Public Services of Grover Cleveland' (New York 1906); McClure, 'Our Presidents' (New York 1906); Recollections of Grover Cleveland' (New York 1909); Rice, William Gorham, and Stetson, Francis Lynde, 'Was New York's Vote Stolen?' (New York 1915); Siva, 'A Man of Destiny' (New York 1885); Whittle, 'President Cleveland' (London 1896); Williams, 'Mr. Cleveland: A Personal Impression' (1909).

W. N. C. CARLTON, Librarian, Newberry Library, Chicago.

CLEVELAND, England, a hilly district in the North Riding of Yorkshire, about 28 miles long and 15 broad, between the Tees and the coast at Whitby and giving it its name to one of the parliamentary divisions of the county. The district gave the name to a famous breed of horses, the Cleveland bays. It has developed enormously since the discovery of its extensive deposits of iron ore, which is smelted chiefly at Middleton.

CLEVELAND, Ohio, city and county-seat of Cuyahoga County. The city of Cleveland
was chartered in 1836, 21 years after its incorporation as a village in 1815; the original survey was made under the superintendence of Moses Cleaveland for the Connecticut Land Company in 1796. It is now the site of many of the clothing and manufactures, its position on the south shore of Lake Erie, giving it direct contact by rail and lake with sources of America's great mineral wealth. The city has an area of 56.65 square miles and lies 60 feet above the lake and 580 feet above the sea-level; 357 miles by rail east of Chicago; 140 miles northwest of Pittsburgh; 623 miles by rail northwest of New York; and 183 miles west of Buffalo. The city's location, as regards the Great Lakes, and its proximity by rail to the coal and coke regions of Ohio and Pennsylvania are great assets. Its geographical position has made it the most economical point in the United States for the assembling of these ingredients of iron and steel and it is not out of place to mention that the Standard Oil Company had its beginning here. To picture the Cleveland of 1918 in the terms of the 1910 census is to have stopped the activities of 850,000 people a half hundred years ago in this history. The tax duplicate of Cuyahoga County, in which Cleveland is located, has increased over $278,000,000. The assessed valuation of Cuyahoga County is $1,491,080,810, which is greater than that of any one of 34 States of the Union, and exceeded by only 14. Over $33,000,000 were added to the deposits of Cleveland banks during the 12 months of 1917. The bank deposits of Cleaveland in 1917 amounted to $522,229,391, and are assessable but not assessed. The bank clearances for 1917 show a gain of 50 per cent over 1916, or about $1,250,297,918. The building permits show that Cleveland is essentially a city of individual homes as well as of great mercantile and industrial establishments, and figures also should take into account the growth of adjoining suburban communities where thousands of Clevelanders have their homes. The total number of building permits in Cleveland for the year 1917 was 11,952, at a valuation of $30,483,750.

Manufactures.—The total value of goods manufactured in Cleveland in the year 1914 was $352,415,652, an increase of $30,457,052, or 9.6 per cent over the figures of five years previous. The capital invested in Cleveland manufactures was $312,908,956. The number of industrial " establishments" enumerated by the census was 2,346, as compared with 2,148 in 1909. The value of material used was fixed at $198,515,000 as against $154,915,000 in 1909, a gain of 28.1 per cent. The value added by manufacture to these products was $153,925,488, an increase in five years of 31.5 per cent. The value added by manufacture for the year 1914 was 46.3 per cent of the total value in 1914, and 43 per cent in 1909. The salaries and wages of industrial plants in 1909 were $63,559,000, and this rose in 1914 to $92,868,865, an increase of 46.1 per cent. The number of salaried employees was 17,766 in 1914 as compared with 12,224 in 1909, an increase of 5,526, or 45.2 per cent. The average number of wage earners in 1914 was 103,334, as against 84,728 in 1909, the increase being 18,406, or 22 per cent.

Industries and Value of Output.—Iron and steel works and rolling mills, $8,752,000; foundry and machine shop products, $50,951,- 000; automobiles, including bodies and parts, $27,117,000 (an increase of 486.4 per cent over 1904); slaughtering and meat packing, $24,- 757,000; women's clothing, $18,632,000; printing and publishing, $14,099,000; paint and varnish, $10,093,000; men's clothing, including shirts, $9,956,000; malt liquors, $6,528,000; stoves and furnaces, including gas and oil stoves, $6,621,- 000; hardware, $5,766,000; lumber and timber products, $4,916,000. Industries in which the production passed the million dollar mark include copper, tin and sheet iron products, confectionery, hosiery and knit goods, tobacco manufactures, brass and bronze products, cutlery and tools, cars and general shop construction and repairs, chemicals, millinery and lace goods, fancy and paper boxes, furniture and refrigerators, patent medicines and druggists' preparations and shipbuilding. Only New York has a larger production of women's outer garments than Cleveland, where something like 10,000 people are engaged in this one industry. Over $1,000,000,000 is spent for designing alone. There are no sweatshops in the Cleveland garment industry, no child labor, no exhaustive rush season with its subsequent long season of slackness and unemployment. In direct contrast to conditions in other garment manufacturing cities, Cleveland's plants are models in construction, sanitary conditions and welfare provisions.

Commerce.—Cleveland's remarkable growth in wealth and population is mainly due to its excellent geographical situation. It is the economic focus of the Lake Superior iron and the Middle States coal regions; and nowhere else in the United States can these two products be brought together with less cost for transportation. In 1917 the total movement of freight was 37,306,259 net tons, of which 24,877,522 tons were received and forwarded by rail and the remainder by lake. Grain receipts in 1917 amounted to 13,037,254 bushels; fed grain shipments to 5,190,256 bushels. These were included 2,094,953 bushels of wheat received and 598,595 bushels shipped; 202,555 bushels of corn received, 1,226,335 bushels shipped; 4,575,497 bushels of oats received, 1,883,681 bushels shipped; 54,070 bushels of barley received, 72,838 bushels shipped; and 268,984 bushels of rye and other cereals received, 93,842 bushels shipped. Flour receipts were 804,039 barrels and shipments 262,054. Iron ore receipts in 1917 aggregated 9,077,161 gross tons. Cattle and calves received in 1917 numbered 135,560, hogs 648,332 and sheep 182,065. The 1917 imports at Cleveland were valued at $10,812,369 and the exports at $6,859,935. For the Ohio customs district Cleveland is the headquarters, imports amounted to $16,616,285 and exports to $40,998,255.

Civic Growth.—The civic growth of Cleveland has not lacked in interest. Its group plan of public buildings is (1918) approaching visualization, inking in as each are completed, and these, with the Public Library, will mark the four corners of the project. This work has been the outgrowth of many years' work on the part of the Cleveland Chamber of Com-
merce, the city administration being assisted by
such well-known architects as the late Daniel
H. Burnham, John M. Carrere, Arnold W.
Brunner and John C. Olmsted. The first two
named buildings overlook the shore of Lake
Erie and the other two face Superior avenue.
Beneath the spur of the Huron lake front
is to be constructed a Union Depot of com-
mensurate dignity with the other public build-
ings and at a cost of about $4,500,000. From
this station a Mall 570 feet wide will extend to
the Library, and Library building a distance
of nearly 2,000 feet. The arrangement for the
transfer of surface city land on the lake front
to the railroads will produce $1,400,000, which
will be available for the future acquisition of
property remaining to be acquired in the pro-
posed Mall. However, owing to delay in the
building of the Union Station on the lake front
and by reason of changing conditions, it may be
consolidated with other terminal stations in and
about the Public Square. It might be said that
the cost of the City Hall Building is about
$3,330,000, the County Building about $5,000,000,
the Federal Building $3,875,000 and the Library
$3,000,000, making something like $15,000,000 for
building purposes alone. A referendum for a
bond issue of $20,000,000 is included in the
issue on the ballot at the election of 1917 for a Public Hall and
Auditorium. Work already has been com-
mented on this building and is progressing as
rapidly as possible under existing war conditions.

Bridges.—Officially and legally Cleveland is
one city, but from the earliest days it has been
in reality two, divided at its centre by a deep
ravine and flats, through which the Cuyahoga
River makes its way to Lake Erie. Factories,
buildings and warehouses, with both water and
rail facilities, find in the flats an advantageous
location, but through traffic down one side and
up the other has been out of the question from
the first. It was to obviate this that 40 years
ago the Superior Viaduct, three-quarters of a
mile of stone arches, with a swing bridge at the
river, was erected, but the swing bridge to let
the lake boats through to the up-river docks,
with its 15 minutes' delay several times a day,
was enough to choke the development of the
west side, where the business district grew up around
the Public Square and public buildings. A
second viaduct was erected farther south
between Central avenue on the east side and
Clark avenue and West 14th street on the
west, but the steady growth of the city made
even these provisions inadequate, and a new
high level bridge has been completed to con-
nect Superior avenue and the Public Square
on the east with Detroit avenue on the west.
This bridge has two levels to carry the immense
traffic between the east and west sides. It
spans the river at a height which allows the
largest stacks and masts on the Great Lakes
to pass under it, 96 feet above mean lake level
and 93 feet above the highest known water
level. The upper floor of the bridge is 121
feet above the river. Six street car tracks
occupy the lower level of the bridge, and road-
way and sidewalk on the upper level. The
Hippodrome span is of steel, 591 feet in length, and 12 spans
of concrete carry the rest of the upper structure,
which has a length over all of 2,880 feet. The
width is 81 feet 6 inches; width of roadway,
45 feet; width of sidewalks, 14 feet 9 inches
each. Twenty-eight miles of concrete piles
were used, 108,000 cubic yards of concrete,
3,000 tons of reinforcing steel and 3,800 tons
of structural steel. Five million dollars has
been voted for another bridge across the river
between Huron lake front and the west side.

Harbor Facilities.—Cleveland has 14.2
miles of lake frontage, protected by a break-
water 5/4 miles in length, which has been con-
structed by the Federal government at a cost
of approximately $600,000, and an additional
$1,000,000 has been expended in dredging
and maintenance. The total lake front protected
by the breakwater is 28,035 feet. The harbor
has a spacious entrance, and the extension of
East Ninth street has made possible the con-
struction of two passenger piers, affording
ample dockage for passenger service from De-
troit and Buffalo. These docks are located
east of the harbor entrance, while the harbor
to the west affords uncalled facilities for
handling iron ore. The Cuyahoga River, which
flows into Lake Erie at Cleveland, is also lined
with docks, adjacent to which are many furn-
caces, factories and lumber yards.

Public Health, etc.—The average annual
mean temperature of Cleveland for a period of
33 years was 51.30°. The highest temperature
in 1917 was 95° F. and the lowest 8°
below zero. The normal rainfall is 35 inches.
According to the city's new charter, the de-
partment of health includes the bureau of food
and dairy inspection, division of housing, bu-
reau of child hygiene and bureau of tuber-
culosus—the last named one of the model in-
stitutions of the country.

Notable Buildings.—Euclid avenue, for-
merly renowned for its spacious lawns and
elaborate homes, is rapidly becoming the new
shopping district of Cleveland. Under the
Cleveland Building Act, which regulates the
height of the building by the width of the
avenue on which it fronts, 12 stories is the
ordinary limit for office building construction.
This, it is hoped, will produce something of
a uniformity of heights rather than a skyline
composed of ill-proportioned skyscrapers and
abnormally low buildings. Speaking generally,
rather than excessive height or garish design,
marks the present day building construction
here. The Rockefeller Building, the Brother-
hood of Locomotive Engineers Building, the
new Guardian Savings Bank, the Williamson,
Citizens' Savings & Trust Company, the large
department stores of the May and Bailey com-
panies, William Taylor & Son Company, the
Halle Brothers Company, the Higbee Company,
the banking establishments of the First Na-
tional, the Cleveland Trust Company, Union
Commerce National and the Cleveland National
banks are interesting examples of modern con-
struction, as are the Swetland, Rose, Garfield,
American, Trust, Cleveland Electric, Illumi-
nating Company, Leader-News, Cleveland
Plain Dealer and Press newspaper buildings,
the Statler, Olmsted, Hollenden, Winton and
Cleveland hotels. In semi-public buildings the
Cleveland Athletic Club structure, the Y. M.
C. A., the Hippodrome and commercial, Federal and municipal buildings, which
are located on the proposed Mall, are important
features of Cleveland's architectural growth.
There are four large arcades on Euclid avenue,
reaching through to Superior and Prospect avenues, that are of distinctive architectural interest.

Boulevards, Parks, etc.—The first park was given to the city by J. H. Wade in the early 1870's. The present park system was initiated by a group of six men. Mr. Charles Bulkeley was elected first president of the Park Board in 1888, and much of the credit for Cleveland's 2,428 acres of city parks and 43½ miles of walkways belongs to him and the Park Board as then constituted. Along the lake front in the heart of the city are open grounds marked by the entrance to the proposed Mall; five miles east of this lies Gordon Park, a beautiful spot donated by the late W. J. Gordon, containing 113 acres of lawn and woods; six miles to the westward is Edgewater Park, stretching 6,000 feet along the lake and containing 125 acres of attractive playgrounds. These are the principal park sites, but six miles back of Gordon Park, connected by a magnificent boulevard, lies Shaker Lakes, a beautiful natural spot of 300 acres, just outside of the city limits in the attractive suburb of Cleveland Heights. Mr. Patrick Calhoun gave a piece of land lying between Euclid avenue and Cedar avenue which forms the gateway to the Shaker Lakes. About equal distance to the south of Edgewater Park lies Brookside Park, and midway between this and Garfield boulevard is Woodland Hills Park of 113 acres filled with playgrounds and devoted to athletic sports, while Garfield, Lakeview, Lincoln and Washington parks, with Monumental park in the Public Square, afford extensive and attractive breathing spots for Cleveland's growing populace. At the entrance of Edgewater Park and beginning a boulevard system that leads from the new high level bridge and extends to the extreme western limit of the city is Bulkeley boulevard. A new public bath house was erected at Edgewater Park ready for the opening of the 1914 season. The building is designed in Spanish Mission style, is a very permanent style of construction with steel frame and brooksh walls. The first floor contains 665 separate rooms and two locker rooms for boys, furnished in all accommodations for about 3,000 bathers at one time. A concrete retaining wall has been built in front of the bath house to keep the beach from extending farther inland. The city's recreational facilities may be said to contain 18 playgrounds, 3 public baths, 2 municipal dance halls, 43 baseball diamonds, 15 football grounds, 67 tennis courts and 14 skating ponds. Brookside Park contains 2 tennis courts and 14 skating ponds. At least 154 acres are utilized. The valley connecting Gordon Park with the Shaker Lake district is known as Rockefeller Park, much of the territory being donated by Mr. John D. Rockefeller, whose estate at Forest Hill is a park in its own right. Rockefeller Park, containing a municipal dance hall, is maintained, while at Woodland Hills Park there is a "neighborhood center" and the shelter-house there is utilized as a dance pavilion in the same manner as at Edgewater. Refreshment stands and a small charge for dancing privileges make the receipts not only cover expenses but show a small net profit. A vacant lot and home garden movement has obtained a strong foothold in Cleveland and in 1914 more than 15,000 "war gardens" were cultivated, producing about $300,000 worth of vegetables.

Public Utilities.—The greater part of the electric light, power and steam heat for the city and surrounding towns is furnished by the Cleveland Electric Illuminating Company. The newly erected municipal electric lighting plant was started on 1 July 1914; it has a capacity of 25,000 kilowatts. The city water is taken from Lake Erie through a series of tunnels connected with water stations, or cisterns, some distance from shore. There are 985 miles of mains and the daily consumption in 1917 was 103,882,227 gallons. A $3,500,000 filtration plant with a capacity of 130,000,000 gallons of water per day was ready for operation 1 Nov. 1915. Three new sewage disposal plants are under construction.

Area, Streets, etc.—The area of the city of Cleveland is 56.65 square miles. The total length of streets and alleys is 77.5 miles, of which 603.2 miles are paved. There are 792 miles of sewers, a number of which are located outside of the city limits, carrying the sewage to the points of disposal. Since 1900 there have been 59 railways crossings separated, and there still remain 180 railway crossings at grade, of which 23 are switch tracks; 30 of the main line crossings will be separated in the near future as litigation for this purpose has either been completed or is pending.

Railroads.—Seven trunk lines touch Cleveland, viz., the New York Central, the Pennsylvania, the Cleveland, Cincinnati, Chicago & St. Louis, the Baltimore & Ohio, the New York, Chicago & St. Louis (Nickel Plate), the Erie and the Wheeling & Lake Erie. The largest fresh-water passenger steamships in the country supply daily service between Cleveland, Buffalo and Detroit, and there is also through passenger steamboat service to Duluth. The Cleveland Railway Company operated 372 miles of track in 1917 and owned 1,477 revenue cars, with a seating capacity of about 73,850 persons. Under the "Tayler Plan" of operating the Cleveland railway, the city controls the service under the supervision of a street railway commissioner who fixes the schedules, routes, stops, etc., and reserves the right at all times to take over the entire system, in the meantime guaranteeing 6 per cent on investment. This guarantee is governed by a sliding scale, which is regulated from time to time by withholding or extending the penny price of transfers. The maximum rate is four cents cash, or seven tickets for 25 cents, and one cent for a transfer. This rate is in effect in which the fare may have to be increased because of increased cost of labor, materials and equipment.

Fire and Police Service.—The divisions of fire and police are operated by the department of public safety in Cleveland. There are 84 firemen, separated into 54 companies, and 807 policemen, operating from 14 precincts. The appropriation for the division of police for the year 1918 is $1,350,741; for the division of fire, $1,038,491.

Libraries and Museums.—The Cleveland
CLEVELAND, OHIO

1 New High Level Bridge across Cuyahoga River, connecting East and West sides of Cleveland
2 New Terminals of C. & B. Line and D. & C. Line, East Ninth Street, Cleveland
3 Federal Building
Public Library, whose prospective home will make the fifth building in the group plan of public edifices, contains over 600,000 volumes. There are 14 large branch libraries and 11 smaller branches, 8 high school and 10 grade school libraries, 42 deposit stations, 66 delivery stations and 6 children's stations, also 486 classroom libraries, the Municipal Reference Library and the Library for the Blind, making 645 agencies for circulating books in addition to the main library. The Library has 9 of its 30 volumes and the Adelbert College Library 9,300. The Cleveland Museum of Art (incorporated in 1913) is based on the John Huntington Art Polytetchnic Trust and the Kelley Trust, which became in 1913 the Horace Kelley Art Foundation.

Education.—Cleveland is conspicuous for its system of public instruction. In 1917 there were 116 public elementary schools, with 3,017 teachers and 91,983 pupils; 14 public high schools, 9 junior high schools and 10 parochial high schools. The city is the seat of Western Reserve University, with academic, medical, pharmaceutical, dental, law and library schools; the Case School of Applied Science; a public high school and a central high school; a garden school, besides numerous private and commercial schools, schools for nursing training, art, music, languages, etc. Other colleges are Saint Ignatius College and the Cleveland School of Pharmacy.

Finances.—In 1917 the real estate valuation was $747,785,510, the personal property valuation $450,928,050 and the total tax rate $15.55 per $1,000. The city has six national banks and a Federal Reserve Bank. The bank clearances for 1917, as reported by the Cleveland Clearing House, were $3,730,204,000, as against $2,473,916,082 in 1916.

Federated Charities.—The Welfare Federation, Cleveland, through its 59 affiliated organizations, which render practically every kind of human service, during the year 1917 aided over 33,100 people, from giving them food and clothing to caring for them when sick and providing wholesome recreation. The Federation, according to its inception four years ago has cut the cost of charitable collection one-third and has greatly increased the amount of money collected and the number of givers. It has increased the efficiency of the separate organizations and promoted co-operation among them. The Federation was unique at the time of its organization in having specific representation of organizations, donors and the city at large on its board of trustees and in planning not only financial but social work. It is still the largest institution of its kind in the world.

Modern Reformatory Methods.—Cleveland's most widely known public institution of charity and correction is the Warrensville Farm Colony. The division of charities and correction presents the problem of developing the usefulness of Cleveland's unfortunate, delinquent and dependent people as well as caring for the sick and poor for their own sake and for the reputation of the city. This has been done through two institutions somewhat peculiar to Cleveland in their construction and operation. One is known as the Farm Movement at the City Correction Farm at Warrensville, Ohio, and the other is the House of Correction at Hudson. These institutions are the outgrowth of the city's desire to furnish better opportunities for its unfortunate in accordance with a special ordinance of the city council. The great tract of land at Warrensville, consisting of about 2,000 acres, was originally named the Cooley Farms, in recognition of the welfare director who planned and executed the Cleveland system of handling minor violators of the law. The Correction Farm property consists of a Colony and the Russell Almshouse, the place of residence of the infirm or almshouse group of people; the Overlook Farm, on which is erected the new sanatorium for tuberculosis patients; the Correction Farm, on which is the workhouse or house of correction group; and the Highland Park Farm, on which has been laid out a magnificent municipal cemetery. Each one of these separate farms consists approximately of 500 acres of land. Together they form a great tract in one body over 2,000 acres, or more than three square miles, which furnishes a favorable environment and varied opportunities for work to the residents and inmates of the different villages. It is not a collection of institutions located on an ordinary farm in the kinder garden training school, besides numerous private and commercial schools, schools for nurses' training, art, music, languages, etc. Other colleges are Saint Ignatius College and the Cleveland School of Pharmacy.

Churches.—There are in Cleveland about 425 churches of all denominations, many of which occupy buildings of monumental architecture. The churches include 70 Roman Catholic, 32 Baptist, 2 Christian Reformed, 2 Church of God, 31 Congregational, 11 Disciple, 25 Episcopal, 7 Evangelical, 2 Free Methodist, 3 Friends, 14 German Evangelical Synod, 19 Lutheran, 53 Methodist Episcopal, 27 Presbyterian, 1 Welsh Presbyterian, 1 Reformed Church in America, 1 Reformed Church of Hungary, 14 Reformed Church in the United States, 2 Dutch Reformed in America, 1 Reformed Episcopal, 2 Swedenborgian, 1 Unitarian, 3 United Brethren, 8 Unitarian, 6 United Presbyterian, 1 Universalist and 40 miscellaneous.

Newspapers.—Cleveland has one morning and two evening English newspapers with a circulation of 470,000 daily and two Sunday
newspapers with a combined circulation of 325,000.

Commercial Organization.—The Cleveland Chamber of Commerce was founded in 1848 as the Board of Trade of the City of Cleveland and was reorganized in 1893 as The Cleveland Chamber of Commerce. Since 1899 it has occupied its own building in the northeast corner of the Public Square. The Chamber has become famous for its activity along civic lines, closely identified with all important civic movements. It initiated the Group Plan for Cleveland public buildings, the Welfare Federation of Cleveland and the new tenement-house code. Throughout the year speakers of national reputation address Tuesday luncheon meetings of the membership. The organization’s facilities include a large auditorium with a seating capacity of 1,000, a club, restaurant and a commodious library. There is a Manufacturers’ and Wholesale Merchants’ Board, a Convention Board, a Retail Merchants’ Board, an Association of Women’s Wear Manufacturers and a Traffic Bureau maintained in connection with the Cleveland chamber.

War Activities.—With the entrance of the United States into the world war Cleveland became one of the most important munitions and war accessories centres in the country. Almost since the beginning of the war Cleveland industries have been actively engaged in the manufacture of war materials for the Allied governments. When the United States became an active participant Cleveland industries at once began to organize so that they might give the government the most efficient co-operation. A war industries commission, organized by the Chamber of Commerce, made a complete survey of Cleveland’s industries, so that government contracts could be handled without loss of time and in a manner calculated to give the government the best possible industrial service. This survey includes equipment of plants, capacity of plant, number of workmen and other data which shows at once in what quantity and at what speed any needed war materials can be turned out either in part or as a whole. Cleveland now is manufacturing practically every war necessity from uniforms to tanks and transports. The big plant laboratories of The National Electric Lamp Association at Nela Park have been turned over for government research work.

The Housing Problem.—Cleveland, like other large industrial centres, early in the war faced the problem of caring for tens of thousands of workers, permanent and “floating,” attracted to the city by increased wages, improved working conditions and the expansion of industry. Early in the fall of 1917 a survey made by the Chamber of Commerce showed that there was urgent need for at least 10,000 homes which could be sold at around $3,500 on easy payments and rental properties which would bring from $18 to $30 per month. The corporation known as The Cleveland Real Estate and Housing Company was organized by a number of the city’s leading business men and social workers. While this company is not a philanthropy its incorporators will handle the housing problem at a minimum expense and with minimum profits. One of the problems that this organization will work toward solving will be providing proper accommodations for more than 15,000 negroes.

Foreign Trade.—The foreign trade department of the Chamber of Commerce, since its organization in 1915 as a division of the Cleveland branch of the Bureau of Foreign and Domestic Commerce of the Department of Commerce, cooperated in an unofficial capacity with the War Trade Board at Washington, in assisting and advising Cleveland merchants with respect to Trading with the Enemy and the Exports Control acts.

City Government.—The city of Cleveland is governed under a charter prepared and proposed by a charter commission at a popular election on Tuesday, 1 July 1913. In order to get a comprehensive grasp of the more important provisions of the Cleveland government the following brief outline may be of assistance: Party primaries are eliminated, candidates for municipal office being nominated by petition only. The short ballot principle has been carefully observed. At each election the voter is called upon to express his choice for only two officials—the mayor and the councilman from a ward. The recall is provided for city officials upon a petition signed by 15,000 electors in case of officials elected at large and 600 electors in case of officials elected from wards. The charter provides for a council of 20 members elected from wards for a term of two years, the salaries to be fixed by the outgoing council and its functions limited to legislation. The mayor and heads of departments have seats in the council with the right to take part in discussions, but without a right to vote. A recall petition may be placed before the council by an initiative petition signed by 5,000 electors. If not passed by the council it must be submitted to the voters at the next regular election, or an additional petition containing the signatures of 5,000 additional electors will compel its submission to a vote of the people at a special election. If a majority of those voting thereon vote in favor of the proposal it thereby becomes an ordinance. A petition of 10 per cent of the total vote of the last municipal election will compel the submission of an ordinance to a vote of the people. The mayor is elected for a term of two years and responsibility is definitely fixed on him for the proper administration of the affairs of the city. The administrative functions are divided among seven departments with a director at the head of each appointed by the mayor. These are the department of law; department of public service; department of parks and public property; department of public welfare, having to do with health, charities, recreation, research and publicity and employment; the department of public safety, including the divisions of police, fire, bureau of roads and measures; the department of finance, embracing the divisions of accounts, treasury, assessments and licenses, and the division of public utilities for the supervision of water, light and heat. Appropriate funds are assigned to those divisions in the charter or the power is given to the council to so assign by ordinance. A civil service commission is also provided for. It was the belief of the commission in presenting this charter to the voters that it would provide a simplified election system, definitely fix the responsibility upon
CLEVELAND, CINCINNATI, CHICAGO AND SAINT LOUIS RAILWAY

administrative officers, secure administrative accountability, and reserve to the rights of the city in matters relating to franchises, provide a merit system in the appointment of public officers and furnish Cleveland with a far better form of government than under the former plan. A preferential plan of elections provides for first and second choice ballot, and if no candidate shall receive a majority of the first-choice votes, then the second-choice votes received by such a candidate shall be added to the first-choice votes and the candidate receiving the largest number of first and second-choice votes combined, if such constitute a majority, shall be elected.

History.—For the claim of Connecticut to the territory from lat. 41° to 42° 1' N. and 120 miles west of the Pennsylvania line, see Western Recesses. That State conveyed its title to the Connecticut Land Company, which in 1796 sent out Moses Clevelend to survey the land and establish New Clevelend; and his party, having surveyed 60 miles, ran the line north from the Cayugahoga and extended it to the lake, reaching the latter 22 July. Clevelend at once fixed on the plateau as the capital of the new State, and had it laid out, with the square and its two main streets (not intersecting) as now, with the same names, but Euclid (then called Middle Highway) only starting from Huron street; it was not cut through to the square until 1815. The settlement was given Clevelend's name, but not his chosen spelling, the first survey map bearing Cleveland; usage fluctuated, but was fixed in 1831 by the adoption of the shorter form by a newspaper, it is said because the Cleveland would not go into a headline. The soil being poor, most immigrants went on into the interior; early commerce was on the Ohio, and for a decade Cleveland remained a hamlet with a few dozens at most, those mainly Connecticut people. It became a part of Jefferson County in 1857, of Trumbull County in 1850, the Union becoming a county in 1870 and the administration of the Western Reserve, and of Geauga County, its county-seat in 1805, just after it had become a port of entry; in 1810 Cuyahoga County was formed with Cleveland for its seat, probably about 100 inhabitants. They must have been of good quality, however, as a library was started in 1811. In 1814 Newburg was set off, and for many years was the more important of the two, from its water power. On 1 June 1815 Cleveland was incorporated as a village; and in 1816 the first bank was started. In 1818 the first newspaper was issued, the Cleveland Gazette and Commercial Register. In 1820 it had grown to 600. In 1824 the first steam vessel was launched. But two great events happened to it near the end of that decade. In 1827 the Ohio Canal was opened to Akron and in 1832 to the mouth of the Scioto at Portsmouth; and in 1828 the cutting of a channel across the bar at the river mouth, giving it 10 feet of water, was completed. These were its making, in 1830 the town had grown to 6,000 in 1840. In 1830 with about 4,000 people it received a city charter, two days after its neighbor Brooklyn across the river had received one and the city lasted until 1833 and was then annexed to Cleveland. In 1834 a horse railroad with wooden rails was built to Newburg. The same year five steam railroads were chartered from Cleveland to everywhere, and the Ohio Railroad to the Maumee sold a good deal of stock; but the panic of 1837 ended such speculations, and it was not until 1846 that more were even chartered, and about five years later before the first one was built. The advantage was immense, and it leaped from 17,000 to 43,000 within a few years. About the time of the Civil War the iron industry began to take root and the manufacture of iron products for the government during the war crowded its manufactories, as did that of clothing. Since then its history is mainly that of an enormously expanding industrial city, but one that has never forgotten to keep its intellectual growth and the spirit of culture abreast of its material. Cleveland was in 1872 it annexed East Cleveland; in 1873 Newburg; in 1893 West Cleveland and Brooklyn. In 1896 it celebrated its centennial.

By MURON T. HERRICK, President of Cleveland Chamber of Commerce.

CLEVELAND, Tenn., city and county-seat of Bradley County, about 30 miles from Chattanooga, on the Southern Railroad. In addition to the usual industries of a town in an agricultural region, it has stove-works and woolen and flax mills, chair factory, box mill, ice and cold-storage plant, lumber and planing mills and a coffin factory. It is the site of Centenary Female College. Settled in 1820, it was incorporated about 1830. The waterworks are owned by the city. Pop. 5,549.

CLEVELAND, CINCINNATI, CHICAGO AND SAINT LOUIS RAILWAY COMPANY, The. This road, better known as the Big Four Route, was chartered in Ohio in 1889 as a consolidation of the Cincinnati, Indianapolis, Saint Louis and Chicago Railway, the Cleveland, Columbus, Cincinnati, Indianapolis and Saint Louis Railway and the Indianapolis and Saint Louis Railway companies. In 1890 the Ohio, Indiana and Western Railway was purchased. In 1912 the Columbus, Springfield and Cincinnati Railroad, the Hampton Road and the Cincinnati and Springfield Railroad were added by merger. In 1913 the Cairo, Vincennes and Chicago Railway and the Chicago, Indianapolis and Saint Louis Short Line Railroad were added to the system, and in 1915 another merger brought in the White Water Railroad, the Cincinnati, Wa-bash and Michigan Railway, the Cincinnati and Southern Ohio River Railway and the Fairland, Franklin and Maumelle Railroad.

On 30 June 1916 the company operated 2,383 miles of road, of which 1,688 miles were owned by the company, the remainder being held under leases, contract, proprietary rights or trackage rights. On 31 Dec. 1915 the capital stock outstanding totaled $57,056,300, of which $10,000,000 was preferred, and $47,056,300 was common. Of the latter, the New York Central Railroad owned $30,207,700. On the same date the Big Four owned $21,793,868 of the stock of other railroad. $1,017,675 of the bonds. In 1912 the company purchased coal lands in Illinois aggregating 76,000 acres.

For the year ended 30 June 1916 the operating revenue amounted to $43,878,002 and the operating expenses to $29,138,080; net operating revenue being $14,741,922. The interest on the funded debt amounted to $4,851,981.
and the tax accruals to $1,556,131. Rents paid for leased roads, equipment and other expenses reduced the net income to $7,103,089, of which $6,866,275 was passed to profit and loss account, wiping out a deficiency and leaving a credit balance of $1,763,933.

The year's transportation service totaled 16,851,148 train miles, an average of 7,072 train miles per mile of road. The number of passengers transported was 8,735,964 and the amount of freight moved was 31,443,141 tons, about 15,000,000 tons being bituminous coal. The revenue per passenger carried averaged $1.04, and per passenger mile, two cents. The revenue per ton of freight averaged $0.97, and per ton mile, a little more than one-half cent. The equipment consisted of 804 locomotives, 365 passenger cars, 76 baggage and express cars, 40 postal cars, 400 refrigerator cars, 16,376 box cars, 11,024 coal cars, 1,106 flat cars and 655 flat cars. The road forms a part of the New York Central Railroad system.

CLÉVES, klāv (German Klève), Prussia, chief town of the Rhine province, 70 miles northwest of Cologne and four and one-half miles from the Rhine, with which it is connected by a canal. It has manufactures of machinery, tobacco, leather and cotton. In the center of the town is the old and renowned Schwansenburg (Swan's Castle), the ancient residence of the dukes of Clèves, founded, according to tradition, by Julius Caesar. The collegiate church, dating from the 14th century, contains monuments of the counts and dukes of Clèves. Under the Treaty of Xanten in 1614 Clèves passed into the possession of the Elector of Brandenburg (now represented by Prussia). Pop. 18,135.

CLEWS, Henry, American banker: b. Staffordshire, England, 14 Aug. 1840. He studied for the ministry, but left school to enter mercantile life at New York, whither his father had taken him on a visit. After the panic of 1857 he organized the banking firm of Stout, Clews and Mason, which later became Livermore, Clews and Co. At the outbreak of the Civil War he was appointed by Secretary of the Treasury S. P. Chase government financial agent for sale of bond issues to continue the war. In 1877 he organized and has since been the head of the banking firm of Henry Clews and Co. He was appointed by General Grant fiscal agent of the United States government for all foreign nations. He also was adviser and agent in organizing the new financial system of Japan. He was a founder of the Union League Club, New York, and originated, organized and was 55 years a member of the Committee of Seventy. He published ‘Twenty-eight Years in Wall Street’ (1885); ‘Wall Street Point of View’ (1900); ‘Fifty Years in Wall Street’ (1908); ‘Speeches and Essays’ (1910).

CLICHÉ, klé-shá’, an electrolyte or stereotype cast from an engraving used to print from.

CLICHY-LA-GARENNE, klé-shé-lá-gär-nén, France (Latin, Cigiacum), town in the department of the Seine, near the right bank of the Seine, and on the railway between Paris and Saint Germain, about four miles northwest of Paris. In the 7th century it was frequently the residence of the court. It contains a parish church, the erection of which is due to the celebrated Vincent de Paul, who was curate of Clichy in 1612; and has manufactures of starch, rubber, white-lead, chemical products and varnish, etc. Pop. 46,607.

CLICK BEETLE, a member of the family Elateridae, also known as the dung beetle and skipjack. When disturbed these beetles curl up and lie on their backs on the ground for a few moments and then begin a series of springs into the air accompanied by a clicking sound. When the beetle lands on its feet it pauses. The larvae, known as wireworms, are brownish yellow in color and often live several years before attaining maturity. They live under bark and in rotten stumps and some are found in the roots of grass, Indian corn or of certain vegetables. When in great numbers they do considerable damage. Fall plowing is considered the best remedy against them. There are about 300 species in America and 7,000 species are known altogether. Consult De Candeeze, “Monographie des elaterides” (1857–81); and Le Conte, ‘Revision of the Elateridae of the United States’ (in Transactions of the Philosophical Society, Vol. X, Philadelphia 1853).

CLIENTS, citizens of the lower ranks in ancient Rome who chose a patron from the higher classes, whose duty it was to assist them in legal cases, and to take a paternal care of them. The clients, on the other hand, were obliged to portion the daughters of the patron if he had not sufficient fortune, to follow him to the wars, to ransom him if taken captive and to vote for him if he was candidate for an office. If a client died without issue and had made no will, his property fell to the patron. Clients and patrons were under mutual obligation not to accuse each other, not to bear witness against each other and in general not to do one another injury. This relation continued till the time of the emperors. It may be considered as the transition from a patriarchal state, in which family relations are predominant, to a well-developed political system, securing the rights and independence of the individual. In modern law, a client is one who retains or consults an attorney or counsellor at law for advice, or to manipulate any action at law or to represent him in legal matters. The strictest confidence is required of the attorney, the breach of which may be heavily punished.

CLIFF. Nearly vertical rock walls are formed in a variety of ways by natural means. In the development of a drainage system in any high-lying tract of country, ravines, gorges, and canyons are formed by the down-cutting streams, as Watkins Glen, N. Y., the gorge of the Niagara River and the Grand Canyon of the Colorado. After long erosion the softer rocks may be removed, leaving the harder with steep faces standing above the surrounding country, as at the Delaware Water Gap in the Catskill mountains and many places in the Appalachian Mountains. In high mountains glaciers dig out deep channels. Cliffs formed in these ways may be called cliffs of erosion. Where a high coast borders any large body of water the waves eating into the rock between the modern shores of Scotland, southern England, the coast of Maine and elsewhere. Such cliffs may be called sea cliffs. Cliffs may also be formed
by the rock fractures known as "faults," where the rocks on one side of a fracture rise faster than they are worn down by weathering. Such cliffs are not uncommon in many parts of the West, being especially prominent in arid regions like the Colorado plateau, where weathering is slow. Such cliffs may be called "fault cliffs."

**CLIFF-DWELLERS.** This term, although of broader application, means in America that prehistoric race that built the houses and villages whose ruins are found in the southwestern part of the United States, and especially in the valley of the Rio San Juan and its tributaries. This river rises in the extreme southwestern corner of Colorado, and flows westward along the borders of adjoining States to a junction with the Rio Colorado. Its course lies mostly in a series of deeply depressed valleys, bounded on each side by tablelands (mesas) with abrupt and lofty faces, which in its lower course confine it in deep and narrow canyons and tributaries which cut their way from their mountain-sources down through the soft sandstones of these mesas to the river, forming thus side-canyons, some of which have broad bottoms on both sides of the now shrunken streams, always hemmed in by steep walls that have weathered into ledges and recesses varying in depth with the varying hardness of their strata. The principal tributaries from the north are the Animas, the Mancos, the Holywater, and the McElmo, in Colorado, whose canyons are cut through the Mesa Verde; and the Montezuma in Utah; and from the south the Chaco, in New Mexico, and the De Chelly and Navajo creeks in Arizona. The walls of all these streams, and of lesser tributaries, abound in the cliff-dwellings and other remains of prehistoric inhabitants.

Rumors of such ruins led to an effort by the United States Geological Survey in 1874 to find and investigate them, and a party led by W. H. Jackson and Ernest Ingersoll crossed the mountains in the summer of that year and made a hasty survey of the Mesa Verde region. This party discovered the since famous ruins of the Mancos Canyon and many others westward, and Mr. Ingersoll's letters to the New York Tribune in 1874 contained the first intelligent account of them; while Jackson's report, in the Annual Report of the Survey for that year, gave extended details, illustrated from photographs taken in the field of these novel and interesting remains. Since that time extensive explorations of this region by the Bureau of Ethnology and by private persons have brought to light vast additions to this information; and the government has made national reservations of certain districts, in order that these ruins may be preserved and easily visited.

The area in which the cliff-dwellings occur is practically coextensive with that in which are now found traces of town-building and relies architecture. This explains the general likeness throughout this region (and locally elsewhere in Arizona and northern Mexico) in architecture, implements, style of decoration, etc., shown by the ruins, establishes their close relationship, historically, with the existing village-Indians of the Plateau (or Pueblo), and shows that in early periods, as now, numerous tribal groups were represented in the region, and that then, as now, "there was a general community of culture if not of kinship in blood." This similarity, and the evidence of records and tradition, make it certain that the builders of these abandoned houses and towns were men of the same sort as, if not directly ancestral to, the modern Pueblo Indians.

The valleys occupied are characterized, as has been said, by cliff-like walls and sandstone enclosing large spaces of flat bottom-lands, in which the soil is fertile when supplied with water. It will produce good crops under irrigation—an art well understood by both ancient and modern inhabitants of that arid region. The annual rainfall even now is considerable, and there is evidence that anciently it was much more copious.

As to the origin of these vanished "cliff-dwellers," nothing is known; but it is evident that centuries ago these valleys were occupied by a considerable, sedentary population, who had fixed homes and cultivated fields for crops of corn (maize), beans, gourds and probably other things, by means of extensive systems of irrigation. They made pottery, cloth, baskets, etc., and stone implements, but nothing metallic.

In this peaceful and industrious life they were exposed, however, to raids from the nomadic and more savage tribes of the mountains and plains north and east of them, and hence were compelled to concentrate their homes into defensive villages, to build fort-like walls and erect watch-towers along their frontiers and on surrounding heights. These structures, as indicated by their ruins, appear essentially like those now occupied in New Mexico and Arizona. The habits and general culture of these prehistoric people, or peoples, were apparently much the same as those of their descendants when first visited by Spanish explorers in the 16th century.

The walls of the canyon-valleys were composed of sandstones in strata of varying hardness, so that in many places the wearing away of a softer layer left a long and wide recess sometimes several yards in depth, overhanging by harder rock. These natural shelters were sometimes low and easily accessible, and were naturally taken advantage of, as good situations for storehouses for grain and for residence. Often there was room for only one or two houses, which could be built economically, as little more was required than a front and one or more side walls, enclosing a space of the ledge-floor and roofed by the overhanging rock. Such single houses were often found occupying niches hundreds of feet above the valley-floor. In several places, however, the recesses, or shallow caves, were of sufficient length and depth to accommodate a large number of houses, forming a real village, with granaries, kivas and protective front walls. The most extensive of these towns yet known is that in Walnut Canyon, a tributary of Montezuma Creek, Colorado, called Cliff-Palace. This contained about 100 rooms, which had been leveled and extended by building supporting walls along its irregular front, and long and prosperous occupancy is evident. This and another remarkable ruin nearby called Spruce Tree House, lately cleared of rubbish, are on national reservations and in the custody of the
CLIFF SWALLOW—CLIFFORD

Smithsonian Institution. Such reservations also ensure the continued safety of similar remains in various places elsewhere. See CASA GRANDE, etc.

The construction of these houses is described in the Handbook of American Indians as follows:

In the large shelters the buildings are much diversified in plan and elevation owing to the irregularities in the conformation of the floor and walls. The first floor was the rock-surface, or, if that was uneven, of clay and flagstones, and upper floors were constructed of poles set in the masonry, often projecting through the walls and overlaid with smaller poles and willows, finished above with adobe cement. The masonry is excellent, the rather small stones, gathered in many cases from distant sites, being laid in mortar. The stones were rarely dressed, but were carefully selected, so that the wall-surface was even, and in some cases a decorative effect was given by alternating layers of larger and smaller pieces and by chinking the crevices with spalls. The walls were sometimes plastered inside and out and finished with clay paint. The doorways were small and squarish, and often did not extend to the floor, except an opening or square notch in the ceiling for the passage of the feet. The lintels were stone slabs, or consisted of sticks or small timbers. Windows or outlook-aper-tures, were numerous and generally small. Where the way is very steep niche-stairways were cut in the rock-face, making approach possible. Ladders of notched logs were also used.

In some parts of this district, as, especially on the eastern side of the Jemez Plateau, in New Mexico, great numbers of dwelling-places have been dug out of the rock, or crevices have been enlarged and the front walled up. Arizona and Mexico show these also. They are associated with the cliff-houses, but are more properly classified and described elsewhere. See CLIFF-DWELLERS.

The age of these ruins, by whom built, and when and why they were abandoned, are matters of conjecture, with few substantial bases for hypothesis. They certainly antedate the coming of white men, for no objects of metal, nor any evidences of domestic animals have been found. Estimates as to antiquity vary from 500 to several thousand years—the latter probably very excessive. Many places have evidently been occupied within comparatively recent times, and 1,000 years seems enough to allow to the oldest. The best opinion is that pressure by enemies led to the making of these inconvenient habitations, and that this with the increasing dryness of the climate (of which other evidence exists) finally compelled retreat. Speaking of the Mesa Verde district, Dr. J. Walter Fewkes, of the bureau of ethnology, who is perhaps the best informed man in the country on this subject, expresses the subjoined opinion: "A common object of the ancient cliff-dwellers was to gain a livelihood against their unfavorable environment until a too exacting nature finally overcame them. One of the primary reasons was change of climate, which caused the natural supply to diminish and the crops to fail; but long before its final desertion many clans abandoned the place and drifting from point to point sought home-sites where water was more abundant. Where the descendants of Cliff Palace "The dwell, or whether they are now extinct, can be determined only by additional research.

Bibliography. Annual Reports United States Geological Survey (Hayden's, 1874, 1876); Reports Bureau of Ethnology and Bulletins, especially Nos. 30, 41, 50, 51; Hodge, Handbook of American Indians (Washington 1907); Nordenskiold, Cliff-dwellers of the Mesa Verde (Stockholm 1893).

CLIFF SWALLOW, a swallow of North America, also known as the caves swallow, which makes its nest about barns and outbuildings. It has a white forehead, a gray breast and collar and a square tail. Its nest is always placed on the outside of the building, unlike that of the fork-tailed barn swallow. Before the country was settled these birds nested in colonies on the sides of cliffs. Its nests in these situations were globular with a narrow neck. With the advent of civilization the birds abandoned the cliffs and began to build their nests in the better-sheltered eaves of houses and barns. Their nests have also in some cases lost their flask-like form, now being mostly in the shape of a cup. Consult Knowlton, 'Birds of the World' (New York 1909).

CLIFFORD, the name of a very old English family and barony, taken from the village of Clifford in Herefordshire, although the family was mainly associated with the north of England. The founder of the family, Walter, son of Richard Fitz-Ponce, a Norman baron, acquired the castle of Clifford, in Herefordshire, under Henry II, and hence took the name of Clifford. Among the noted members of this family were ROBERT DE CLIFFORD, a prominent soldier during the reigns of Edward I and II; JOHN, the 9th baron, who fought on the side of Henry VI and is celebrated by Shakespeare in 'King Henry VI'; RICHARD, bishop of Worcester and London; HENRY, 10th baron, a student of astronomy and astrology who is celebrated by Wren in 'The White Doe of Rylstone.' In 1525 the Cliffords became earls of Cumberland, but in 1643 this title became extinct. The male line of the Cliffords is at present represented by the baronial family Clifford of Chudleigh. The first Baron Clifford of Chudleigh was Thomas Clifford, one of the members of the Cabal, who was raised to this dignity in 1672. Consult Cokayne, 'Complete Peerage' (1887-98).

CLIFFORD, Cornelius, American clergyman: b. New York, 24 Aug. 1859. He was educated at Saint John's College, Fordham, and in the Jesuit scholasticates of Woodstock, Md., Innsbruck, Austria, and Saint Asaph, Wales, and at Louvain University. He entered the Society of Jesus about 1883; was professor of rhetoric at Georgetown University 1887-89, and Saint Francis Xavier's College, New York, 1889-90. He was transferred to England in 1892 and was headmaster of the senior school at Wimbledon 1895-97. He was ordained to the priesthood in 1896 and in 1898-99 was at Beaumont College, Old Windsor. He quitted the Society of Jesus in 1899 and was appointed professor of logic and history at Merriam Park
College, Saint Paul, Minn. In 1900-03 he edited the Providence Visitor and in 1905-07 was an assistant in the Assumption Church, Morristown, N. J. The two years following he taught philosophy and Church history at Seton Hall College, New Jersey, becoming in 1909 pastor of a church at Whippany, N. J. Since 1913 he has lectured on scholastic philosophy to candidates for the M.A. and Ph.D. degrees at Columbia University. He is the author of The Parish Mission (1903); To the Burden of the Time (1904). He is a contributor to the Catholic Encyclopedia (1910), the Month, Tablet, Spectator (London), etc.

CLIFFORD, George, Earl of Cumberland: b. Westmoreland 1558; d. 1605. A celebrated English navigator. He studied at Cambridge, where he received the degree of M.A. in 1576. He had become Earl of Cumberland in 1570. In 1588 he was placed in command of the Elizabeth Bonaventure and fought the Spanish Armada. He was noted as a buccaneer and cleared last valuable prizes.

CLIFFORD, Harry Ellsworth, American electrical engineer: b. Lowell, Mass., 21 April 1866. He was graduated at the Massachusetts Institute of Technology in 1886, and spent three years as a graduate student at Harvard. In 1892 he was assistant in physics, instructor in theoretical physics 1898-95, assistant professor of theoretical physics 1895-1902, associate professor of theoretical electricity in 1902-04 and professor of theoretical and applied electricity in 1904-09 at the Massachusetts Institute of Technology. In the latter year he was appointed professor of electrical engineering at Harvard University. He also engages in a consulting practice.

CLIFFORD, Sir Hugh, English colonial administrator and civil servant: b. Loum Con, 5 March 1866. He entered the Malay States civil service in 1883 and was British resident at Pahang (1896-99), colonial secretary of Trinidad (1903-07) and of Ceylon (1907-12); governor of the Gold Coast Colony in 1912. He was created K.C.M.G. in 1909. He has published 'In Court and Kampong' (1897); 'Studies in Brown Humanity' (1898); 'In a Corner of Asia' (1899); 'Bushwhacking' (1901); and is joint author with Sir Frank Swettenham of a 'Dictionary of the Malay Language'; 'Further India' (1904); 'Heroes of Exile' (1906); 'The Downfall of the Gods' (1911); 'Malayan Monochromes' (1913); 'The Farther Side of Silence' (1916).

CLIFFORD, John, English Baptist clergyman: b. Sawley, Derbyshire, 16 Oct. 1836. He was educated at the Baptist College, Nottingham, University College, London. He was minister of the Pradest Street and Westbourne Park churches, London (1858-1915). He was president of the London Baptist Association (1879), of the Baptist Union (1888 and 1889) and of the Baptist World Alliance (1905-11), of the British Chautauqua (1899-1900). He has received degrees from several colleges as well as that of D.D. from Bates College, Lewiston, Me. He was one of the acknowledged leaders, not only of the Baptist community, but of a militant Union family in England. He organized the 'passive resistance' movement against the English Education Act of 1902, which largely contributed to the overthrow of the Unionist government in 1906. He was editor of the Baptist Magazine (1870-83) and has published 'Familiar Talks with the Young' (1872); 'Is Life Worth Living?' (1880); Daily Strength for Daily Living' (1885); 'The Dawn of Manhood' (1886); 'The Inspiration and Authority of the Bible' (1892); 'The Christian Certainties' (1893); 'Typical Christian Leaders' (1896); 'God's Greater Britain' (1899); 'The Secret of Jesus' (1904); 'Union of Strength for Daily Christianity' (1906); 'Gospel of Gladness' (1912); 'State Education after the War' (1916); 'The Spirit of Man in 1916' (1910).

CLIFFORD, Lucy Lane, English novelist, married to William Kingdon Clifford (q.v.) 1875, after whose death in 1879 she turned to literature for support. Her writings, some of which are notably original and striking, include 'Very Short Stories' (1882); 'Mrs. Keith's Crime' (1885); 'Love Letters of a Worldly Woman,' which attracted much attention (1881); 'The Last Valuable Prize.'

CLIFFORD, Nathan, American jurist: b. Rumney, N. H., 18 Aug. 1803; d. Cornish, Me., 25 July 1881. Through his own efforts he obtained a common school and academic education, studied law and began practice in York County, Me., 1827. He was a member of the State legislature, 1830-34; speaker of the House, 1833, and attorney-general of the State, 1834-38. He served two terms as representative in Congress, 1839-43, advocated Van Buren's re-election, took part in public discussions with the leading Whig orators and established a reputation as one of the most eloquent of Democratic champions. He was United States Attorney-General under President Polk, and a special commissioner to Mexico to arrange terms of peace between that country and the United States, and he negotiated the treaty which secured California as a part of the United States. He resumed law practice in Portland, Me., 1849, and won an enviable reputation for forensic ability. In January 1858 President Buchanan appointed him associate judge of the United States Supreme Court. As the oldest associate judge in 1877, he presided over the electoral commission, conducting its proceedings with noteworthy impartiality, though a firm believer in Hamilton's election. He published 'United States Circuit Court Reports' (2 vols., 1869).

CLIFFORD, William Kingdon, English mathematician: b. Exeter, 4 May 1845; d. Madeira, 3 March 1879. Educated in his native city and at King's College, London, he proceeded to Trinity College, Cambridge, where he graduated in 1867 as second wrangler. In 1871 he was appointed professor of applied mathematics at University College, London, a post which he held till his death. In mathematics his teachings and writings are regarded as
CLIFFSIDE—CLIMATE

marking an epoch in the history of the science in England. His "Canonical Dissection of Riemann's Surface," his theory of "Biquaternions" and his memoir "On the Classification of Loci" may be mentioned as his most important contributions to this subject. He also wrote on philosophical subjects. Among his works the most important are "Elements of Dynamics" (Vol. I on "Kinematic," 1878); "Seeing and Thinking" (1879); and "Common Sense of the Exact Sciences" (1885, completed by Karl Pearson). In 1882 appeared a collection of his "Mathematical Papers" and in 1879 his "Lectures and Essays."

CLIFFSIDE, N. J., borough of Bergen County, on the Hudson River, opposite New York city, with which it has ferry connection. It is mostly a residential suburb of the cities of New York, Jersey City and Hoboken. Pop. 3,395.

CLIFTON, Ariz., city and county-seat of Graham County, 120 miles northeast of Bisbee, on the San Francisco River, and on the Arizona and New Mexico, the Morenci Southern and other railroads. Copper mining and stock raising are the principal industries. Division offices of the Arizona and New Mexico Railroad are located here. Pop. 4,874.

CLIFTON, England, popular watering-place of Gloucester County. It is a suburb of Bristol situated within the city boundary, on the summit of lofty cliffs, whence its name. A suspension bridge 703 feet long here crosses the river Avon 245 feet above its bed. Clifton contains many handsome residences but neither trade nor manufactures. It is known for its hot mineral springs. Clifton College, founded in 1862, takes high rank as an educational institution.

CLIFTON FORGE, Va., city in Allegheny County, 190 miles northwest of Richmond, on the Chesapeake and Ohio Railroad. It contains railroad repair shops, foundries and machine shops, flour mills, an ice-cream factory and planing mills. Iron ore and limestone are found near by. The city owns the waterworks. Pop. 5,748.

CLIFTON HEIGHTS, Pa., borough in Delaware County, six miles southwest of Philadelphia, on the Darby River, and on the Philadelphia, Baltimore and Washington Railroad. It has manufactories of woolen and cotton goods, towels and hosiery. It contains also a public library. Pop. 3,155.

CLIFTON SPRINGS, N. Y., summer and health resort in Ontario County, about 28 miles southeast of Rochester, on the New York Central and Lehigh Valley railroads, famous for its sulphur springs. It contains the Clifton Springs Sanitarium, the latter surrounded by three parks. There are manufactories of pumps, insect sprayers, automobiles, bicycles and tinware. Settled about 1850, Clifton Springs was incorporated as a village in 1859. The waterworks and electric light plant are owned by the municipality. Pop. 1,600.

CLIMACTERIC (annus climactericus), a critical year or period in human life wherein, according to astrologers, there is some notable change. These are the principal life crisis of a person. The second year of the life of a person is exposed to great danger of death. The word comes from κλιμακτικός, the step of a ladder or stair. The first climacteric is, according to some, the season only to the product of the multiples of the first, as 14, 21, etc.; 63 and 84 are called the grand climacteries and the dangers attending these periods are supposed to be great. Some held, according to this doctrine, every seventh year a climacteric; others allowed this title only to the product of the multiplication of the climacterical space by an odd number, as 3, 5, 7, 9; others considered every ninth year as a climacteric. The idea of climacterics is very ancient and has purely symbolic, i.e. psychological, significance. The notion of seven-year changes as real, apart from such unconscious psychological symbolizations, is an error.

CLIMATE (Gr. κλίμα, a slope or inclination). The term was used to denote the effect of the oblique rays of the sun on the temperature of the earth and its atmosphere. Today it is applied to the sum of the atmospheric conditions as recorded for a long period of time; or, in other words, it is the totality of weather, while "weather" is the physical condition of the atmosphere at a given time or during a limited period.

One may well speak of the weather to-day, or of last month, or of some past year; but not of the climate of a day, a month or a year. The climate of a place is what may be expected to occur as the result of a study of its continuous weather records for a long period of years—the atmospheric pressure, the temperature, the rainfall and snowfall, the time and frequency of frost, the extremes of heat and cold, the direction and velocity of the wind, the amount of air that flows from the different points of the compass, the amount and intensity of sunshine, the humidity and transparency of the atmosphere and its electrification.

The study of the causes of the weather and of the laws of storms constitutes that branch of science known as meteorology; climatology is to be considered as a subdivision of meteorology.

Climates may be broadly divided into marine, continental, mountain and plain with the many variations produced as these conditions gradually or precipitately shade off the one into the other.

Basis of Climate.—If the axis of the earth's rotation were perpendicular to the ecliptic (the plane of its orbit) there would no seasonal changes, for the rays of the sun would fall upon every point on a parallel of latitude with the same angle of incidence on each day of the year. There would be but one season at any place and it would never end; and there would be little variation in the intensity of storms. But as the axis of the earth is inclined at an angle of 23½° to the plane of its orbit and as the direction toward which it points remains nearly constant, there are but two days in each year when both hemispheres (north and south) are exactly one-half in sunshine and one-half in darkness, that is, at the two autumnal and vernal equinoxes, when the sun crosses the equator. At all other times in each hemisphere the angle at which the sun's rays strike the earth, the depth of the air through which they pass, the length of the day, and the proportions of each hemisphere immersed in sunlight, are increasing or decreasing. As the two latter conditions increase in the northern hemisphere
near the equator the sun's rays at midday fall perpendicular to the surface of the earth, and there is virtually no change in the length of the day and consequently there is little variation in the daily or seasonal temperature. As the variation in the length of the day increases with the latitude, there are regions, in the temperate zone, where the length of time that the sun's rays falls upon the earth each day more than compensates for their obliquity. On this account the interior of continents may have at midday a higher temperature than prevails at the equator.

Solar energy is about 7 per cent greater at perihelion (the point in the earth's orbit nearest the sun) than at aphelion (the point farthest away). As perihelion occurs in December, or the summer time of the southern hemisphere, and aphelion in its winter, that region has a greater annual range in the intensity of solar insolation than the northern hemisphere. If the land surfaces of the two hemispheres were equal in area, the southern would have colder winters and warmer summers than the northern and this is the case in the southern hemisphere where the land area is large. But the great capacity of water for heat and the slowness with which it radiates the same, modifies seasonal extremes that otherwise would be much greater.

**Variations in Climates.**—If the earth were all water or all land and if the land were everywhere of the same elevation, most of the factors that cause variations in climates—often considerable for regions of the poles—would be eliminated from the equation. Every point on the same parallel of latitude would have the same mean annual temperature and the same average heat in summer and the same average cold in winter. New York and London, separated by 11 degrees of latitude, would not, as now, have about the same mean annual temperature. If it were all water, there would be no such extremes of heat and cold as we now know. It is probable that a thermometer exposed in shade four feet from the surface of the earth would not anywhere—even at the equator—ever register above 90° F.; there would be no frost within 35° or 40° of the equator, and zero temperatures would be recorded only in regions within 30° of the poles. If it were all land the heat would be much more intense than now in the tropics and in the temperate and frigid zones the heat of summer and the cold of winter would reach extremes unknown at this time.

All the anomalies of climates are caused by the different specific heat capacities of land and water; their different powers of conduction and radiation; the irregular distribution of these two surfaces; the widely-varying elevations of the land; the trend of mountain ranges; the prevailing direction of the winds, and the carrying of large quantities of heat by ocean currents from the equator toward the poles and the relative quantities of cloud and rain or snow. It is germane to the proper understanding of climate to know something in detail of the manner in which the air is heated. At 100 or 200 miles above the earth's surface there is only the hypothetical ether, which, while too tenuous to be detected, may be measured by methods or appliances so far known, is supposed to be the medium that transmits solar heat.
energy to the earth and diffuses it through space. This energy, coming in many different wave-lengths and with widely varying intensities of vibration, produces several different phenomena as it is absorbed by or passes through the air, or as it impinges on the surface of the earth. The waves differ in their effects on different objects, depending on the length and the absorptive response of the substances upon which they fall. The waves have heating, lighting and chemical effects simultaneously in themselves and it is only the nature of the objects upon which they fall that tends to differentiate them. The atmosphere, even at the surface of the earth, absorbs but a small part of the heat-waves. They therefore reach the earth and warm its surface; and the earth in turn, by radiation, convection and conduction sends back into the air long heat-waves, which, unlike the shorter solar waves, are reabsorbed and changed by the atmosphere. The atmosphere is thus mainly warmed from the bottom upward. This accounts for the perpetual freezing temperatures of very high mountain peaks, although they are nearer the sun than areas at the same latitude. At the top of a mountain of one mile in free air the temperature is about the same at midday as at midnight. Only during recent years have we begun to realize how extremely thin is the stratum of air next the earth that has sufficient heat for the inception, growth and maturity of both animal and vegetable life. The raising of the thermometer shelter at the New York city observatory from an elevation of 150 feet above the street to an elevation of 300 feet has caused an apparent lowering of the mean annual temperature of 2.5°F. On the hottest day in summer, if one could be lifted up to a height of only 1,000 feet in free air, he would find a marked change in temperature. The United States Weather Bureau at 16 stations made a total of over 1,200 kite observations in the United States in 1897. They showed an average decrease of 7.4°F. for the first 1,000 feet of ascent during the warm months and when the observations were taken near the hour of the maximum heat. The decrease was frequently as much as 15°. At the height of six miles the cirrus clouds common to this level are, on account of the low temperature, always composed of minute ice spicule, never of watery droplets like the lower cumulus clouds. In the middle latitudes of both hemispheres the air at this height is ceaselessly flowing toward the east, passing uninterruptedly over the cyclonic and anti-cyclonic systems that cause our storms and cold waves at the surface of the earth. Glashier and an assistant ascended to a height of about 30,000 feet. They suffered greatly from the cold, which measured many degrees below zero although the time of year was 5 September. At the height of six miles the average temperature, determined by many balloon ascensions, is about —50°F.

The difference between continental and marine climates is marked. The same amount of heat will raise the temperature of a land surface four times as high as it will raise that of a water surface. Land is a good absorber and a bad radiator; water is a poor absorber and a good reflector. The absorbed heat does not penetrate into the ground to any great depth. The land, therefore, retains its absorbed heat near the surface and quickly and freely radiates that which it has absorbed. These conditions give to large land surfaces much higher temperatures during the day and much lower temperatures during the night, than obtain over a water surface of the same latitude and much colder winters and much warmer summers. As an illustration, it may be stated that the Bermudas, islands in the North Atlantic Ocean, have a mean daily range of temperature of only 10°F., and an annual range of only about 50°; while Memphis, Tenn., near the same latitude, in the interior of a large continent, has a daily range of 17° and an annual range of 112°. At Memph a temperature of 104° has been recorded in summer and —8° in winter. At Bermuda the temperature generally reaches 90° during the summer, but very rarely exceeds that figure, while temperatures below 45° are also infrequent. The two places are, therefore, determined by the direction in which the coast is directed and the direction and force of the prevailing winds.

In the middle latitudes of both hemispheres the prevailing winds are from the west, and therefore continents lying in these regions have a marine climate in their western coastal regions, where the air moves from the water to the land, and nearly continental climate in their eastern coastal regions, where the general movement of the air is from the land to the sea.

The distance to which moist and equable air conditions extend inland is determined by the elevation of the land and its trend relative to the incident winds, and the proximity of mountain ranges. The humid air from the Pacific meets the lofty range that skirts the western shore line of both North and South America; it is forced up the mountain side until the cold of elevation and the cooling of the air by expansion as it ascends cause it to precipitate its moisture mostly upon the western side of the mountain, and by the decrease in wind speed, the continent benefits from that life-giving moisture which, were it not for the interception of the mountains, would spread a mantle of luxuriant vegetation 1,000 miles inland. If the disintegrating effects of temperature and rainfall had worn down the Sierras, the Platteau, and the rugged crags of the Rocky Mountains to the height of the Appalachians, the vaporous atmosphere of the Pacific would flow eastward far more freely than now, and meet that which, by the convective action of cyclones, is frequently carried from the Atlantic Ocean and the Gulf of Mexico inland to the Mississippi Valley; then rain would be more abundant and the whole of the United States would have arable land.

The specific heat of water is greater than that of almost any other substance. It requires 10 times the quantity of heat to raise a pound of water one degree that it does to raise a pound of iron one degree. Solar rays penetrate the sea to a considerable depth; they are quickly and uniformly absorbed by the strata thus penetrated. In consequence of these laws and conditions a vast quantity of heat is stored by
the ocean in the tropics and slowly given to 
the air as the ocean currents carry the warm 
water toward the poles. In this connection the 
writer would correct what he believes to be an 
exaggerated popular idea relative to the effect 
of the Gulf Stream on the climate of Europe. 
The North Atlantic circulation, flowing north-
ward on the western side of the ocean (except 
a southward current from Davis Strait that 
sheds Labrador and somewhat affects the tem-
perature of the New England coast), and south-
ward along the coast of Europe, is many times 
more effective in modifying climate than is the 
Gulf Stream. That the western part of Europe 
is warmer, more humid and subject to less 
radical changes in temperature than equal lati-
tudes in North America, except on the Pacific 
Coast, is due primarily to the great ocean that 
lies on the west of Europe. Without ocean currents of any description, this body of water 
would give the air that moves from it to 
Europe a more equable temperature than is 
possessed by the eastern part of the North 
American continent. Continents, therefore, 
partake largely of marine climates on their 
western borders, and principally of continental 
climates on their eastern borders.

Climate affects the health, happiness and 
well-being of people more than any other con-
dition that goes to make up their environment. 
Within the broad confines of the United States 
there are many, but not all, shades and varie-
ties of climate. One of the questions most fre-
quently asked is, "Where shall I find a climate 
possessing both dryness and equability of tem-
perature?" To this interrogatory reply must 
be made that the ideal climate as regards 
equability of temperature and absence of mois-
ture does not exist in the United States, but 
that the nearest approach to it will be found in 
the great Southwest.

The temperature of the Southwest is not 
equable in the sense of having an extremely 
small daily range, but it possesses the quality 
of annual uniformity in a greater degree than 
will generally be found elsewhere except on the 
seacoast, and there the humidity is great. 
The most equable temperature on the globe 
will be found in the cold tropical and pla-
teaus of the tropics. Santa Fé de Bogota, in 
the United States of Colomba, has an average 
temperature of about 59° F. for all months of 
the year, and the range for the entire year is 
less than is often experienced in a single day 
in some parts of the middle latitudes. But 
while the ideal temperature may be found on 
the higher elevations of the tropics, the rain-
fall is much greater and more continuous than in 
the more temperate regions.

The temperature of a place depends chiefly 
on three conditions,—latitude, elevation and 
contiguity to large bodies of water. At sea-
level in the tropics extreme conditions of heat 
and moisture produce great physical dis-
comfort. But even under the equator it is pos-
sible to escape the tropical heat of low levels 
by ascending from 4,000 to 6,000 feet. In the 
economy of nature there is a certain limit be-
yond which the two extremes, dryness and 
equability of temperature, cannot coexist; thus 
we may find a region so deficient in moisture 
as to satisfy the requirements of the case, but 
the very lack of moisture is a condition that 
facilitates radiation and thus contributes to 
great extremes of temperature. Regions may 
be found, as on the lower Nile, where there is 
a lack of rainfall coupled with a high and mod-
erately uniform temperature. The mean win-
ter temperature of Cairo, Egypt, is 56° F.; 
mean summer temperature, 83°; a range from 
winter to summer of 27°. The mean winter 
temperature of Phoenix, Ariz., is 52°; mean 
summer temperature, 86°; a range of 34°. It 
is by no means difficult to find a counterpart 
of the far-famed Egyptian climate in the great 
Southwest.

The dryness of the air and the clearness of 
the sky are the conditions upon which daily 
ranges of temperature depend; the greater 
these, the greater the range of temperature 
from day to night. While a high summer tem-
perature is characteristic of the Southwest and 
other portions of the Rocky Mountain plateau, 
it is a fact that the sensation of heat as ex-
perienced by animal life there is not accurately 
measured by the ordinary thermometer. The 
sensation of temperature which we usually re-
fer to is the temperature of the atmosphere 
depends not only on the temperature of the air 
but also on its dryness and the velocity of the wind. 
The human organism, when perspiring freely, 
evaporates the moisture of its surface to the 
dry air of the interior arid regions, and thus 
lowers its temperature and prevents sunstroke, 
which, in the more humid regions from the 
Mississippi Valley eastward, occur in great 
number with the air temperature much less 
than obtains in the West.

The meteorological instrument that registers 
the temperature of evaporation, and thus in 
some measure the actual heat felt by the human 
body, is the wet-bulb thermometer. The latter, 
as indicated by its name, is simply an ordinary 
mercurial thermometer whose bulb is wetted 
with water at the time of observation.

Effect of Climate on the Races.—Climate 
is the most potent of any factor in the environ-
ment of races. It is climate and soil, plus 
heredity and form of government, that produce 
either vigorous or weak peoples. In this re-
spect the United States is unexcelled by any 
other region of the world.

Climate, soil and good heredity may pro-
duce a race large of stature and of great physi-
cal endurance, but unless such a people exists 
under a liberal form of government, in which 
public education is fostered and the arts and 
sciences taught, it is unable to employ its 
strength in those lucrative vocations that give 
a high per capita of wealth. It is weak in de-
fending itself, either in war or in commerce, 
against a people of less numerical strength 
that is liberally educated, skilled and humanely 
governed.

If we consider the invigorating effect of cold 
air alone we might expect to find the strongest 
peoples inside of the Arctic Circle; and if we 
consider fruitfulness of soil alone we might 
reasonably expect to find the dominant peoples 
in the tropics. But the fact is that the greatest 
human potentiality occurs somewhere between 
these two extremes. The boundaries cannot be 
accurately determined by the naming of cer-
tain parallels of latitude, but the conclusion 
is made to the truth in the statement that 
the most vigorous people physically and the
most resourceful mentally will be found in the regions that produce an abundance of cereal crops.

It is probable that much of the activity that has caused the United States to take such a commanding place in the world is caused by the ingenuity and industry of the people. In the midst of the cold, they have reaped the harvest of their labors, and have prospered.

Climate

Changes were measurable and apparent. But evidence is now multiplying that these views will need to be modified. The records left by moraines, the changing shores of inland seas, and the thickness of the annual rings of the sequoia trees, which live for several thousand years, strongly indicate that since the last glacial period, of which there have been at least several, there have occurred climatic oscillations measurable by only a few thousand years and others whose span would come within one to several hundred years. Gradually geologists have unraveled the skein of glacial tracings and perceived that the ice periods consisted of at least four epochs separated by interglacial epochs, during which the climate became mild as at present, or even milder. Then evidence was found of other glacial periods farther back in geologic time, also divided into epochs. In certain regions vast sheets of ice spread southward to the southern part of the temperate zone, while at other times tropical conditions existed. Greenland and Iceland are the new areas, and it is now known that the ice sheets which were located in the last ice age showed that the melting of the ice sheet did not progress uniformly. Several times the melting ceased and the climate seemed to return to glacial conditions, but these changes were minor in comparison to the great pulsation of glacial periods which caused the vast ice sheets. There are other evidences that there have been changes of climate other than the slow mutation between glacial periods. A study of the abandoned strands of inland seas yields strong evidence that the waters did not fall regularly, but in irregular periods of wet and dry times which were measured by hundreds of years rather than by thousands. Huntington, whose valuable studies and researches have been long-continued and in many parts of the world, believes that during the past 20,000 or 30,000 years the climate of the earth has been subject to a great number of small changes, just as during the immense lapse of geological time it has been subject to a less thorough consideration number of great changes, each of which in turn seems to have been diversified by many minor variations. But this does not mean that there have been changes that are appreciable during the period of an individual life, for the world as a whole has not made a careful comparison of meteorological records.

Certain it is that the advance students of to-day are turning to the sun and studying variations in its radiations and other forms of activities with the hope of solving the problems of changing climate and the initiation and continuance of storms. The writer agrees with those who believe that variations in the number and magnitude of sunspots, prominences and faculae are not the cause of variations in terrestrial weather and climate but are themselves the effects of the same solar cause that effects earth conditions.

Effect of Forests on Climate.—It is often said that the climate of a place depends largely upon the extent and proximity of forested areas; that the number of cloudy days and the amount of rainfall are modified by change of forest extent and drouths and floods affected. It is certain that in some regions trees once grew more abundantly than at present. This, however, should not be taken as proof that.
destruction of the forests has resulted in a decrease of rainfall. The forests have diminished—in some cases wholly disappeared—and it is also true that the precipitation is less; but this decrease of rainfall might better be regarded as the cause rather than as the result of the barren condition of the soil. There is no evidence that the forests were ever more extensive in Alaska and in other high altitude countries than they now are. Nevertheless, in these countries, just as in the arid regions of great continents, there is evidence of a long-period climatic change—a decrease of precipitation or an increase of temperature, or both—a change that cannot be due to deforestation.

Professor Humphreys, of the Weather Bureau, says: "These universal slow climatic changes that for thousands of years have been modifying the glaciers and changing the inland seas might very well have led to extensive forest destruction; but that it itself was the effect and the destruction of the trees the cause seems most unlikely."

In the Lop Basin of Chinese Turkestan, Huntington found vast areas covered with the dead skeletons of trees. He says: "It has often been asserted that the destruction of forests has been the cause of the decrease in rainfall. In the Lop Basin the opposite appears to be the case; the supply of water has diminished, and therefore the forests have died."

The late Prof. Cleveland Abbe says: "In this day and generation, the idea that forests either increase or diminish the quantity of rain that falls from the clouds is not worthy to be entertained by rational, intelligent men."

Gases exposed over forests catch more rain than similar gages exposed at the same elevation over unwooded adjacent areas. This is due to the fact that the forests restrict the movement of the wind, and not to a difference in the precipitation.

The covering of tobacco plants with cheese cloth results in establishing a local climate which will continue so long as the cloth remains in position. Extremes of temperature, both heat and cold, are reduced, and the resulting climatic change produces a marked effect upon all vegetation grown under the artificial conditions. A rank vegetable growth may have a heavy frost deposited upon it, while the same character of soil that grew the vegetation immediately adjacent, at the same level, but covered with two inches of sand may receive no frost. This is due to the difference in specific heat of the two surfaces, the sand gaining a higher temperature during the day with the same insolation than the vegetation or the unsanded surface, and radiating heat at a greater rate during the cold hours of night, thus keeping at a higher temperature the air immediately next the ground.

The erection of a tent, of a barn, of a dwelling-house, of a village, or the growth of a great city, respectively, influence the local climate in proportion to the area that is covered, modified by the character of the materials used in the constructions, each different form of matter having a different coefficient of absorption, reflection and radiation. Likewise the vegetable covering of the earth may have a local appreciable effect. The flooding of an area, the cutting away of forests and the covering with sand may have either minute or considerable effects upon local climates in proportion to the magnitude of the areas affected; but this does not mean that there is any great difference in the climatic effect between a forest covering and one of bushes, of grass or of growing crops; and it does not signify that there is sufficient change in the thermal conditions, due to the activities of man, as to make an appreciable difference in the temperature at an altitude of 1000 feet. In fact, to effect the general climatic conditions, or to cause storms to be more frequent than formerly, or of greater severity, or to increase the amount of precipitation.

Rainfall records for 100 years in New England and 60 years in the Ohio Valley do not show any appreciable effect on rainfall as the forest areas have been changed to cultivated fields. The precipitation for the last half of each period is practically the same as for the first half, but the rain current in both cases shows pronounced oscillations in periods that vary from 8 to 11 years.

**Effect of Forests on Floods.**—Until recent years it has been quite generally believed that the effect of forests on the movements of water was to diminish the frequency and intensity of floods and to maintain higher stream-flow during dry periods. But a careful study by eminent scientists of the history of floods in the principal rivers of Europe for the period covered by the past 200 to 500 years, of the run-off of the streams of Wisconsin by Prof. D. W. Mead, of the University of Wisconsin; of the streams in the Yellowstone Park and elsewhere in the Rocky Mountains by Chittenden; of the Missouri, Mississippi and Ohio rivers by army engineers; and of the rivers of the Ohio Valley by the writer; do not confirm this view. Opinions differ. Forsters and many geologists take the affirmative side of the question, while meteorologists and constructing hydraulic engineers generally take the view that the bitter, permeable soil of seedtime, and the growing crops of summer and fall, each year, and the covering of bushes that quickly shades the ground when trees are cut, may be as potent as the forests themselves in the conservation of moisture and in the restricting of run off.

It is not clear how the planting of trees at the headwaters of streams can be effective in minimizing or controlling floods, as it requires only a superficial survey to show that of the various basins that catch precipitation and shunt it down into the valleys where it may accumulate and cause floods, only a minute area lies at the head-waters of streams. If it be granted that the planting of trees, or their preservation, reduces the destructiveness of floods, which it will not, then the trees must be placed where the flood waters fall in order to be effective, which is on the slopes and alluvial Plains some distance from headwaters, and it is not practicable to turn these food-producing areas back to the forest condition without doing a direct and positive injury to humanity.

**Climate and Animals.**—The geographic distribution of animals is doubtless the outcome of definite laws—laws that stand in close
CLIMATE AND CLIMATIC SPECIES AND VARIETIES

relation with the past history of the earth through a large portion of geological time. What those laws are forms a subject of great importance in studies of evolution—a subject, it may be reckoned, entirely too great to be adequately treated in the present connection. Naturalists are generally of the opinion that all animals have been produced from those that preceded them by some process of slow transmutation or development, and that this modification of animal forms took place very slowly, as evidenced by the fact that the historical period of nearly 4,000 years has hardly produced any perceivable change in a single species. That marked changes in the climate of the earth have occurred during the remote past there can be no doubt, and that those changes left a marked impress upon the fauna of the globe there can also be no manner of doubt. The great northern ice sheet and the accompanying cold of the glacial period, if it did not cause the extermination of the receding fauna, doubtless led to its migration to more congenial climates.

The part played in the faunal distribution of the globe by the present climate seems to be indirect rather than direct, although there are many facts which seem to point to a direct relation. While it is true that the fur-bearing animals of the frozen north are generally to be found in Arctic regions, yet they send their representatives far into the temperate latitudes, and indeed into the borders of the regions inhabited by the more exclusively tropical species. On the other hand, the tiger, whose home is naturally associated with the hot districts of India and the Indian Archipelago, is equally at home in the elevated regions of the Caucasus and the Himalayas, where his footprints are not infrequently found impressed in fields of snow. Other groups of animals are more limited in their migrations. Some are so closely adapted to an arboreal life that they never stray far beyond the limits of forest vegetation, while others are so tolerant of climatic change that the limit of their possible range is conditioned only by the character and quantity of the food supply and the interposition of impassable physical barriers.

Climate and Plants.—The factors necessary to the development of plant life are light, heat, soil and moisture. The ideal conditions as regards these essentials do not usually obtain, or, if they do, the species of plants seek to take possession of the region, so that there is a continuous struggle for existence in which many more plants fail than succeed.

The climatic factors heat and moisture are combined in several ways in different parts of the globe, and these combinations give widely different vegetation; thus a maximum of heat and a minimum of water give desert conditions where only specially adapted plants can exist. If, on the other hand, a maximum of heat is combined with a maximum of water, the result will be vegetation that exists only in the tropics. The possible combinations of the two climatic factors are very numerous, as are also those of soil and the effects of animal life and human agencies. Yet the vegetation of the globe is susceptible to a fairly definite classification. Following Humboldt, and adopting such terms as express in a general manner the vegetation characteristic of each zone, we have the following classification:

<table>
<thead>
<tr>
<th>Zones of Average</th>
<th>temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Palms and bananas</td>
<td>70°—82°</td>
</tr>
<tr>
<td>2. Two-ferns and figs</td>
<td>70°—78°</td>
</tr>
<tr>
<td>3. Myrtles and laurels</td>
<td>68°—72°</td>
</tr>
<tr>
<td>4. Evergreens</td>
<td>60°—68°</td>
</tr>
<tr>
<td>5. Deciduous trees</td>
<td>48°—60°</td>
</tr>
<tr>
<td>6. Conifers</td>
<td>40°—48°</td>
</tr>
<tr>
<td>7. Lichens, saxifrages and dwarf shrubs</td>
<td>32°—40°</td>
</tr>
<tr>
<td>8. Lichens and mosses</td>
<td>32° and below</td>
</tr>
</tbody>
</table>

While in a general way these zones stretch around the world in wavy belts, somewhat as do the isotherms, similar belts may be found encircling mountain peaks and chains with increasing altitude above sea-level. Indeed it is possible to pass successively from tropic to Arctic vegetation on a single mountain peak in the tropics.

WILLIS L. MOORE
Professor of Meteorology, George Washington University.

CLIMATE AND CLIMATIC SPECIES AND VARIETIES. Although a half century ago it was generally held that changes of climate have not profoundly affected organisms, yet the recent detailed study of varieties has shown that climate and local influences have been the causes of origin of probably a very large number of the species contained in our museums and described in biological literature. Among insects, birds and mammals it has been estimated that from a third to a half of the known species are climatic or local species or varieties, or local races. As is well known, Americans born of foreign parentage are larger than their ancestors, whether English, Irish, Germans or French; and Boroditch has shown that the children of Americans of both sexes born in the United States are larger than those of foreign races. Certain modifications in the cephalic index have also been observed. This is generally attributable to difference in the climate of the Old and New Worlds, our American climate being drier, more changeable and stimulating than that of Europe. It appears that the introduced English sparrow has undergone a gradual modification since its introduction into this country about 40 years ago. Bumpus has critically examined
over 1,700 eggs of this bird, one-half from England and the other half from Providence, R. I. It was found that the eggs of the American race or breed vary more than the European, that they are smaller and of a singular beauty of discoloration and with a much greater amount of color variation. This is attributed by the author to a suspension of natural selection. However this may be, it belongs with the class of facts which show that the modification is primarily due to the change from one climate to another. E. S. Darrell has found that a common European snail (Helix nemoralis), introduced into this country soon begins to present variations not known to exist in England, while of the introduced butterfly (Peris napi), 12 American varieties, and of P. rapae four varieties have appeared on American soil within the few years which have elapsed since their appearance and spread on this continent. Where different mammals are transported from temperate to tropical countries the wool tends to become replaced by hair, and other changes occur. The turkey does not vary in temperate regions, but when acclimated in India it degenerates in size, is incapable of laying eggs; in Europe there is no change, and the long pendulous appendages over the back develop enormously. Cold has naturally the inverse effect; mammals transported to the north from the tropics become more or less woolly. As the result of the severe winters and the elevation of Angora in Asia Minor, the cats, shepherd dogs, goats and hares are clothed with a long fleece-like wool. Islands present different climatic features from the mainland, being damper, etc., and hence the birds, reptiles and other animals present slight but constant differences from their allies and probable ancestors on the nearest continents. Not only that each group, as in the case of the Galapagos Islands, but even each island is tenanted by a distinct local variety of birds. This has also been noticed by Wallace in the East Indian Archipelago. The swallow-tail butterflies of islands tend to have shorter tails, and the outlines of the wings differ. Ocean races become incipient species, and by being isolated are prevented from crossing with the original stock or species, and in this way geographical varieties or representative species are produced. When great changes have taken place in the topography, portions of land cut off from the continent, or continents become divided, species have arisen. Thus in the late Tertiary, Asia and America were continuous, but when Bering Strait was formed, the bison of this country and that of Europe (aurochs) became specialized, becoming different species. In this way multitudes of species have probably arisen over all parts of the world. See Distribution of Living Mammals; Plant Geography.

CLIMATE IN THE TREATMENT OF DISEASE. The relation of climate to health and disease is a definite one and its varying conditions become more specifically available in the treatment of disease concerning them becomes more exact. Many are the genetic concept which is gaining prevalence, of a developed response of man to his environment, which determines his adaptation at all levels of his being psychical as well as physical introduces a very important element into the consideration of this relationship. The more accurate knowledge concerning the factors which enter into climate obviates the more general classifications of the past which assigned certain groups of disease to groups of climatic conditions for therapeutic effect. The more specific fitting of very definite and varying individual conditions to certain climatic elements and the avoidance of others as injurious includes also an intelligent utilization of certain climatic conditions available close at hand which in the past were passed over in ignorance of their advantages or of methods of appropriating them. All this has introduced a new economy into the climatic treatment of disease and is further indicative of more complete knowledge and control of environment in the light of individual need and capacity for adaptation toward the environment.

The chief objective features of climate relative to health are the chemical composition of the atmosphere, presence and proportion of gaseous constituents and presence or absence of septic solid particles; the mean or extremes of temperature; humidity; diathermy or permeability to heat rays; intensities of climatic conditions; density and pressure of atmosphere; prevailing winds, their direction and velocity. The condition of the weather, that is, the particular manifestation of climatic conditions at certain times or periods; its also of practical importance in determining the availability on the part of the patient of the advantages of the general climate. The average number of fair, rainy or cloudy days and also the condition of the soil in regard to drainage or retention of the moisture are of such practical significance. Artificial conditions, likewise, must enter into the choice of a suitable climate, living conditions, comfortable accommodations, presence or absence of sanatoria or other facilities for medical attention.

The complexity of the human body and its functions realizes its best health and usefulness in a well-adjusted balance between work and rest. It is best suited therefore by a climate of a moderate degree of cold at night. For an invalid, however, special conditions must be sought adapted to his particular condition. Certain climates possess certain qualities which supply these definite requirements. Marine or ocean climates are characterized by their equability, not only in the daily range of temperature but throughout the seasons as well, the presence of a large body of water tending to equalize temperature, moisture, winds, etc. The temperature varies, however, of course, with the latitude. The humidity of ocean climates acts as a veil, as it were, which mitigates the fierce heat by day and gives up the heat at night to the air. Sea air is also impregnated with the vapors of salt, and perhaps those of iodine and bromine, and it is free from dust and bacteria. There is always abundance of ozone. The ocean climate has a sedative effect upon the nervous system and a stimulating, tonic effect upon appetite and digestion. It increases the body metabolism and conducive to sleep. Sea voyages are of value in certain conditions of mental exhaustion, also in certain chronic catarrhal and rheumatic conditions. They are of benefit also in scrofula, hay fever and asthma. Island climates, if the islands are
not large, afford the advantages of a complete ocean climate. Coast climates are less equitable because of the disturbing influences of increased land heat radiation. They are usually less humid, precipitation being more active. Winds are often an important factor in coast climates, hence a knowledge of the local conditions is essential to estimate correctly the qualities of any given coast climate in its variation from the perfect ocean climate. Inland climates vary in temperature and humidity. As a rule they are drier than coast climates. This is modified, however, by the proximity of large bodies of water. The dry warm climate is of value to delicate or elderly people, or to those in a temporarily weakened state. It is also suitable for pulmonary tuberculosis in many cases, chronic bronchitis, rheumatism, cardiac and renal diseases. It is the climate of deserts such as of Egypt, the lower regions of Arizona and New Mexico and the pine belts of some of our States. It is rich in ozone, the air is pure, there is an abundance of light and warmth. Prevailing violent winds and the consequent presence of dust offer a disadvantage.

Dry and cold climates of low levels may be of advantage to certain persons with good resisting power, since to some individuals cold acts as a stimulant and tonic and increases carbon dioxide output. The climate of higher altitudes is dependent also upon the surrounding country and nearness to ocean or mountain ranges. Its advantages for tuberculosis lie in the purity of the air, greater opportunity for direct exposure to sunlight and its stimulation through quickened respiration and circulation to increase in red blood corpuscles. There is at the same time lessened protein metabolism which therefore increases the storage in the tissues. The increased activity put upon the circulatory and respiratory organs makes such climate unsuitable in valvular disease of the heart and rapidly advancing pulmonary disease. Middle altitudes are usually chosen for sanatoria for tuberculosis. Many of these places, because of latitude and dryness of climate, are not most of the high altitudes. Tuberculosis of long standing with much expectoration seems to do best in a warmer atmosphere not too far from the sea, such as the climate of Egypt, or of Arizona. Moderately moist and cold climates are not to be recommended therapeutically, though various resorts have certain advantages in opportunity for change, accessibility in being near large centres of population, and afford amusements, games, etc., with good regimen for those in need of rest. The moist, low, warm, inland climate is the poorest in therapeutic value. It is enervating, depressing and mosquito-ridden, hence malarious and noxious in many particulars.

Such a variety of climatic influences and effects serves principally to emphasize the individual difference of response. This is evident not only in the special disease complex which has been built up and seeks its peculiar relief; it lies also in the symbolic or ritual value which each climatic element in environment has to that particular individual in his expression of himself in relation to his surroundings and his success or failure attained thereby. Hence the problem becomes one not alone of better understanding of climatic conditions and the elements which constitute them, but far more in appreciating and knowing the meaning and value of individual effort toward adaptation expressed through health and disease and the part this greater whole which the elements of climate play. This manifests itself in individual difference of response to the same climatic factors and in the difference in ability to extract from this portion of environment useful material for creative functional activity, which is here, or that imperfect compromise between environment and antagonistic individual tendencies which results in disease symptoms and finally death.

SMITH ELY JELLIFFE.

CLIMATOLOGY, CLIMATOGRAPHY. See CLIMATE.

CLIMAX (Gr. κλίμακις, a ladder or stairs), a rhetorical figure in which a series of propositions or subjects are presented in such a way that the least impressive comes first, and there is a regular gradation from this to the most impressive or final; opposed to anti-climax, in which the ideas are presented in the reverse order.

CLIMBING-FERN (Schizaea), a family of ferns, mostly tropical. It contains 5 genera and 75 species, two of which are represented in eastern North America. One Schizaea pusilla, or curly grass, is a rare fern found in wet soil in the pine barrens of New Jersey and in Newfoundland and Nova Scotia. The other is the Hartford fern (Lygodium palmatum), occurring in moist thickets and open woods along the eastern seaboard of the United States from New Hampshire to Florida. The plant is a slender and flexible climber with palmate leaves, surmounted by a panicle of forked pinnules, making it a very desirable decorative house-plant.

CLIMBING-FISH, or CLIMBING-PERCH, a spiny-rayed fish (Anabas scendens) of the family Anabantidae which, with the Osphromenidae, constitute the sub-order Labirinthodonts. Characteristic features are the labrinthine structure within the gill-cavity, formed of excessively delicate plates of bone covered in life by a moist membrane and enclosing airspaces between them.

In the climbing-perch this organ is greatly developed above the gills, and extremely complex, and serves as an air-breathing organ of such great importance that the fish is able to live out of water for several days without distress, during which it regularly breathes air. When it returns to the water it uses its gills, so that it may be regarded as truly amphibian. This species is about eight inches long, and is found inshore waters of India, Burma, the Malay Islands and, according to Semper, in the Philippines. Its name was given to it by the Malays in reference to its alleged habit of climbing trees in search of insects upon which, and small mollusks, it feeds. They described it as scrambling up palm-trunks by means of the rough edges of its gill-covers and the thick climactic elench in a feat is possible, especially on a sloping trunk, for these fishes do creep about rocks and cross spaces of land, but recent naturalists have not seen any tree-climbing. Consult Semper,
CLIMBING PLANTS. See LIANAS.

CLINCH, Charles Powell, American poet and play-writer: b. New York, 20 Oct. 1797; d. there, 16 Dec. 1860. For many years he was editor, literary critic, and dramatic critic for the press; also writer of many poems, theatrical addresses and dramas. In 1835 he was elected a member of the State legislature. Having lost his estates in the great New York fire, he obtained a place in the New York custom-house, where he became deputy and then assistant collector. Among his publications are 'The Spy'; 'The Expelled Collegiates'; and 'The First of May.'

CLINCH RIVER, a stream that rises among the hills in the southwest part of Virginia, passes into Tennessee, flows through the valley between Clinch Mountain and Powell Mountain, and unites with the Holston at Kingsport, to form the Tennessee. Its length is estimated to be 200 miles, for more than half of which it is navigable by small boats.

CLINEDINST, Benjamin West, American artist: b. Woodstock, Va., 1860. He studied for a year in Baltimore and for five years in Paris under Cabanel and Bonnat and first attracted attention in New York with his illustrations for Leslie's Weekly. He is a painter of portraits and pictures in the genre style, and in 1900 was awarded the Evans prize of the American Water Color Society. He is best known as a popular illustrator of stories in the leading illustrated magazines, Harper's Magazine and Scribner's Magazine, especially containing much of his work. He has illustrated the works of Hawthorne, Stevenson and Mark Twain, although he works also in oil and water colors. His sympathetic collaboration with the author gives his work an especial charm. He has painted portraits of Theodore Roosevelt, Admiral Peary, Gen. Curtis Lee, Edward Echols, etc.

CLINGMAN, Thomas Lanier, American statesman: b. Huntsville, N. C., 27 July 1812; d. Roanoke, N. C., 4 Nov. 1897. He was graduated at the University of North Carolina 1832, adopted the legal profession, and was a member of the State legislature 1856-40. He was elected to Congress as a Whig and with the exception of the 29th Congress, served continuously from 1843 to 1858, when he was appointed United States senator. During his service in the House he took part in all the leading debates, not missing, it is said, a single day's session, and for a time was chairman of the Committee on Foreign Affairs. He later joined the Democratic party. Entering the Confederate army as a colonel, he was promoted brigadier-general 17 May 1862, commanding the North Carolina troops, and served until his surrender with General Sherman. In Apr. 1865. After the war he was chiefly engaged in mining and scientific pursuits. The important mica mines in Mitchell and Yancey counties were first opened by him. He also made known the existence of the copper of the Transylvania region in North Carolina. He published a volume of 'Speeches and Writings' (1877); 'Follies of the Positive Philosophers' (1878); and 'The Tobacco Remedy' (1885).

CLINGMAN'S DOME, a peak of the Smokey Mountains, near the boundary between Tennessee and North Carolina. It was so named in honor of Thomas L. Clingman (q.v.). Its height is 6,619 feet above the sea-level.

CLINIC, an institution devoted to the examination and free treatment of patients, for the purpose of giving medicine and at the same time offering an opportunity to students of medical colleges for practical instruction. Clinics are usually held in dispensaries, where, by reason of free treatment, many patients congregate, thus affording good clinical material. The term "clinical medicine" is applied to the branch of medicine occupied with the investigation of diseases at the bedside.

CLINK-STONE. See PHONOLITE.

CLINOMETER, klī-nōm′ē-tér, an instrument used for taking the dip and strike of rock strata. In its commonest form it consists of a sort of protractor with a pendulum attached. When the clinometer lies horizontally the indicator points to 0 degrees, and when inclined the amount of inclination is shown at once by the pendulum. It is most convenient to combine compass and clinometer in one instrument.

CLINOPODIUM, a genus of herbs or low shrubs of the mint family (Menthaeae) containing about 50 species, of which several occur in the southeastern United States and California. The plants are known under the common names of wild basil, calamint and basil balm.

CLINTON, Charles, American colonist, ancestor of the Clintons in New York: b. County Longford, Ireland, 1690; d. Ulster, now Orange County, N. Y., 19 Nov. 1773. His grandfather was an adherent of Charles I, and after the defeat of the royalists fled for refuge to the north of Ireland; and his mother was daughter of a captain in the parliamentary army. Having determined with a number of his friends to emigrate to America, he chartered a ship, and sailed for Philadelphia 20 May 1729. After a passage marked by the attempt of the captain to starve the passengers in order to possess their property, and in which after the death of several, among whom were a son and daughter of Mr. Clinton, it was proposed, but not attempted, to wrest the command from the captain, he was landed with his companions 4 October at Cape Cod. The place for a permanent settlement was selected in the spring of 1731 in Ulster County, N. Y., about six miles west from the Hudson River, and 60 miles north from New York. Clinton was chiefly occupied as a farmer and land surveyor, but was also judge of the County Court, and in 1756 was appointed lieutenant-colonel, and served with two of his sons in the expedition against Fort Frontenac.

CLINTON, De Witt, American statesman: b. Little Britain, New Windsor, Orange County, N. Y., 2 March 1769; d. Albany, 11 Feb. 1828. His descent on the father's side was from English ancestors long domiciled in Ireland, and on the mother's side he was of French extraction. His education was received in a grammar school near his home, continued at the academy in Kingston, Ulster County, and completed at Columbia College, where he bore away the col-
CLINTON

lege honors in 1786. He immediately engaged in the study of the law and was admitted to the bar in 1789. His ardent temper and earnest ambition carried him at once into the political field, and his sentiments, sympathies and affections determined his position under the banner of his kinsman, George Clinton, the chief within the State of the Republican party. While the question of the adoption of the Federal constitution was yet a subject of popular discussion, he proved his zeal and controversial power by writing a series of letters signed "A Countryman," in reply to the celebrated letters of the "Federalist." He entered the legislature in 1797 and the State senate in 1798, soon becoming the leader of his party in the State. In 1801 he became United States Senator, resigning in 1803 to assume the office of mayor of New York. He remained undisturbed in the mayoralty from 1803 until 1807, when he was removed. He was reappointed in 1809, was displaced in 1810, was restored in 1811 and thenceforward continued therein until 1815. Within the period of near 12 years, Clinton was also a member of the senate of the State from 1805 until 1811, was lieutenant-governor from 1811 to 1813, and during a portion of that time also held a seat in the council of appointment. He was an unsuccessful candidate for the Presidency in 1812. He adopted early and supported ably and efficiently the policy of the construction of canals, from Lake Erie and Lake Champlain to the tide-water of the Hudson, and showed to his fellow citizens, with what seemed a spirit of prophecy, the benefits which would result from those works to the city, the State and the whole country, in regard to defense, to commerce, to increase of wealth and population and to the stability of the Union. In 1815 he presented a memorial to the legislature in behalf of the construction of the Erie Canal and in 1817 a bill was passed authorizing the work. In 1817 he was elected governor of New York and re-elected in 1820. He declined re-election in 1822, but was again elected in 1824, and after overcoming constant, unremitting and factious resistance, he had the felicity of being borne, in October 1825, in a barge on the artificial route to all to have constructed from Lake Erie to the bay of New York, while bells were rung and cannons saluted him at every stage of that imposing progress. No sooner had that great work been undertaken in 1817 than the population of the State began to swell with augmentation from other States, and from abroad; prosperity became universal; the older towns and cities expanded, new ones rose and multiplied; agriculture, manufactures and commerce were quickened in the movements, and wealth flowed in upon the State from all directions. He was re-elected governor in 1826, dying while in office. He wrote 'Discourse before the New York Historical Society,' 'Memoir on the Antiquities of Western New York,' 'Lectures on the Natural History and Internal Resources of New York;' 'Speeches to the Legislature.' Consult Alexander, 'Political History of the State of New York' (Vol. I, New York 1806); Hosack, 'Medical Dictionary' (New York 1828); McBride, 'De Witt Clinton and the Origin of the Spoils System in New York' (New York 1907); Orth, 'Five American Politicians' (Cleveland 1906); Renwick, 'Life of De Witt Clinton' (1840); Campbell, 'Life of De Witt Clinton' (1849).

CLINTON, George, Vice-President of the United States; b. Little Britain, Ulster County, N. Y. 26 July 1739; d. Washington, D. C., 20 April 1812. He was a son of Charles Clinton (q.v.) and served as lieutenant under his brother James at the capture of Frontenac, but afterward studied law. He was a member of Congress in 1776, and voted for the Declaration of Independence, but was summoned to the army as brigadier-general before it was prepared for signature. In 1777 he was elected governor and at the same time lieutenant-governor of the State of New York, which latter office was, on his acceptance of the other, conferred upon Mr. Van Courtlandt. He held the office of governor during the next 18 years, for which eventful period the history of his life is that of the State. He was again chosen governor after spending five years in private life, in 1801, and in 1804 became Vice-President of the United States. Consult 'Public Papers of George Clinton' (6 vols., New York 1899-1902).

CLINTON, George, American botanist; b. Polo, Ill., 7 May 1867. He was educated at the University of Illinois and at Harvard University. He was assistant botanist at the Illinois Agricultural Experiment Station and assistant in botany at the University of Illinois in 1893-1902, and since 1902 has been botanist at the Connecticut Experiment Station and botanist of the Connecticut State Board of Agriculture. He is the author of botanical monographs and experiment station bulletins dealing with parasitic fungi and contributions to botanical magazines.

CLINTON, George Wylie, American negro bishop; b. Cedar Creek Turnpike, Lancaster County, S. C. 28 March 1839. He was educated at Brainerd Institute, at South Carolina University and at Livingston College, Salisbury, N. C. In 1870 he entered the ministry of the American Methodist Episcopal Zion Church. He taught for 12 years in the Lancaster (S. C.) High School and Union (S. C.) graded schools and was for eight years principal of the Atkinson Literary and Industrial College at Madisonville, Ky. He founded the American Methodist Episcopal Zion Quarterly Review in 1889 and edited it for two years. In 1902-06 he edited the Star of Zion and was elected bishop in 1896. He is a member of the executive committee of the Federal Council of the Churches of Christ in America and is prominent in the social and educational work among the negro race. He is the author of 'The Negro in the Ecumenical Conference of 1901'; 'The Three Alarm Cries' (1906); 'Tuskegee Lectures' (1907); 'Christianity under the Searchlight' (1909).

CLINTON, Sir Henry, English general; b. about 1738; d. Gibraltar, 23 Dec. 1795. He was the grandson of Francis, sixth earl of Lincoln, served in the Hanoverian War and was sent to America as major-general in 1775. He took part in the battle of Bunker Hill, and in the battle on Long Island which resulted in the evacuation of New York (1783); McBride, 'De Witt Clinton and the Origin of the Spoils System in New York' (New York 1907); Orth, 'Five American Politicians' (Cleveland 1906); Renwick, 'Life of De Witt Clinton' (1840); Campbell, 'Life of De Witt Clinton' (1849).
ilton to evacuate Philadelphia, he commanded an expedition to South Carolina in 1780, and blockaded and captured Charleston. He sailed from New York with 7,000 men to relieve Cornwallis on the very day that the latter capitulated. He resigned in 1781, returned to England the next year and died soon after he had been appointed governor of Gibraltar. He wrote a narrative of his conduct in America (1833), and a letter to Lord Cornwallis on the subject of the capital of Virginia. See also the 'Observations on Stedman's 'History of the American War' (1784).

CLINTON, James, American military officer: b. Little Britain, Ulster County, N. Y., 9 Aug. 1736; d. there, 22 Dec. 1812. He was the fourth son of Charles Clinton (q.v.). With his father he served at Fort William Henry in 1758, as captain, and commanded it in 1763 the forces raised to protect Ulster and Orange counties against the Indians. He accompanied Montgomery to Quebec in 1775, and was appointed brigadier-general the following year. While his brother George was governor of New York, he was overpowered at Fort Clinton by the superior force under Sir Henry Clinton, and being severely wounded narrowly escaped with his life. He afterward served against the Indians under Sullivan in 1779 and was present at the surrender of Cornwallis. After the peace he was commissioned to adjust the boundary line between New York and Pennsylvania and occupied many distinguished civil stations. His son was De Witt Clinton.

CLINTON, Canada, town of Huron County, Ontario, situated on the Buffalo & G. branch of the Grand Trunk Railway, about 32 miles northwest of Stratford. Its industries are numerous. There are salt-wells, a tannery, a grain-elevator, and a flour mill and factories for the production of carriages, organs, threshing-machines, fanning-mills, etc. Pop. (1911) 2,554.

CLINTON, Ill., county-seat of De Witt County, situated on the Illinois C. Railroad, about 42 miles northeast of Springfield. The chief industry of the region is farming. There are machine shops here, and the city has an electric-lighting system and waterworks, several churches and two public schools. It has adopted the commission form of government. Pop. 5,165.

CLINTON, Iowa, city and county-seat of Clinton County, situated on the Mississippi River and on the Chicago & N. W., Chicago, M. & St. P., Chicago, B. & Q., Chicago, R. I. & Pac. and Iowa Midland, 128 miles west of Chicago and 60 miles southeast of Dubuque. The city is a trade centre for a region of 50 miles radius and has large manufacturing and other industries, including lumber mills, furniture factories, saw and door factories, iron bridge works, gasoline engines, boats, automobiles, wagons, harness, boxes, brick, locks and railroad machine shops. The United States census of manufactures for 1914 reported 105 industries and establishments of factory grade, employing 3,178 persons, of whom 2,679 were wage earners, receiving annually $1,614,000 in wages. The capital invested aggregated $8,068,000, and the year's output was valued at $10,484,000; of which, $3,519,000 was the value added by manufacture. The city has a good public library, hospitals, business colleges, Warburg Lutheran College, Mount Saint Clare Academy, Our Lady of Angels Seminary, churches of all denominations, public schools, five banks with a combined capital of $800,000, electric lights and railways. The present form of government is by a mayor and a council of nine members who are elected biennially. Pop. 26,800.

CLINTON, Mass., town of Worcester County, 12 miles northeast of Worcester, 14 miles from Fitchburg, and on the rivers of Boston, the Nashua River, and the Boston and Maine, New York, New Haven and Hartford and Massachusetts Central railroads. It contains a national bank, with a capital of $200,000, a savings bank and two co-operative banks. The Bigelow Free Public Library contains over 41,000 volumes. There are several churches and also the Clinton Hospital and the Clinton Historical Society. The town has recently erected one of the finest municipal buildings in the State at a cost of $200,000 and the union station is also a noteworthy building. There is a fine system of parks and playgrounds and there are many excellent schools. The great metropolitan reservoir and dam, costing $15,000,000, which supplies the city of Clinton and 18 neighboring towns with water, is situated here. There is electric and gas service and an electric car service connects Clinton with the surrounding towns. The chief industries are the manufacture of wire-cloth gingham, carpets and rugs, woolens, worsteds, Turkish towels, yarns, gasoline engines, harness, and iron and brass castings. The government is administered by means of town meetings. The board of selectmen holds office for three years and appoints the chief of police and other subordinate officials. Up to 1850 Clinton was a part of Lancaster (q.v.), but it was then incorporated as a town. Pop. 13,075.

CLINTON, Miss., town in Hinds County, 10 miles west of Jackson, on the Alabama and Vicksburg Railroad. Hillman College and the Mississippi Baptist College are located here. The city owns the lighting plant and the waterworks. Pop. 767.

CLINTON, Mo., county-seat of Henry County, 37 miles northwest of Sedalia, on Missouri, K. & T., the Saint Louis and San F. and Kansas City, Clinton and Springfield railroads. Clinton has three flour mills, two corn-meal mills, cooperation and railroad division shops, ice plant and foundry and gas-engine factory. It has two banks with a combined capital of $75,000, and has an annual business of $25,000,000. Clinton has an excellent public school system, and also colleges for men and women, including Bind College for Women and Clinton Business College. The city was first settled in 1837, became a borough in 1858 and a city in 1876. It is governed by a mayor and a council of eight members elected for two years. Pop. 4,992.

CLINTON, N. Y., village of Oneida County, situated on the New York, O. & W. Railroad, nine miles south of Utica. In the neighborhood there are stone quarries. The chief interest of the place lies in its educational institutions. Here is located Hamilton College (q.v.), and there are seminaries for young women, an academy and a union school. Iron
ore mines and mineral springs are found in the vicinity. Pop. 1,236.

CLINTON, Okla., city in Custer County, 95 miles west of Oklahoma City, on the Washita River, the Chicago, Rock Island and Pacific, the Saint Louis and San Francisco, the Clinton and Oklahoma Western, the Kansas Central, Mexico and Orient railroads. It has cottonseed-oil mills, alfalfa mills, cotton compresses and a bread factory. The most noteworthy buildings are the municipal hospital and the courthouse. The electric-lighting plant and waterworks are the property of the municipality. Pop. 2,781.

CLINTON, S. C., town in Laurens County, 60 miles northwest of Columbia, on the Seaboard Air Line and the Columbia, Newberry and Laurens railroads. The town is the seat of the Thorwell Orphanage and the Presbyterian College of South Carolina. Cotton manufacture is the chief industry. The municipality owns the electric-lighting plant and the waterworks. Pop. 3,300.

CLINTON STAGE, in American geology, the middle member of the Niagara Series of the Silurian System. It comprises shales and shaly sandstones, and some limestone, and is typically developed at Clinton, N. Y. From New York the series extends southward along the Appalachians to Alabama, reaching its maximum thickness of over 800 feet in Pennsylvania. From the Appalachians the series stretches 1,000 miles eastward, except for the area of the Cincinnati anticline, to Wisconsin, where the series is represented by limestones. From one to three beds of oölitic hematite (fossil iron ore), from 1 to 10 feet thick, are found in the Clinton at many points along the Appalachians and have yielded considerable ore. See NIAGARA SERIES; SILURIAN SYSTEM.

CLINTON STATE PRISON, penitentiary located at Dannemora, Clinton County, N. Y. It was begun in 1844. The prison buildings are in a quadrangle which encloses 37 acres of land. The site was chosen with the object of employing the prison inmates in the mining and manufacture of iron, much ore being discovered on the 37 acres surrounding the prison. Cotton spinning, the making of clothing, tinware and wooden ware are the industries conducted there at present.

CLINTONIA, a genus of plants of the lily-of-the-valley family (Cornvallariaceae), named after De Witt Clinton, naturalist and governor of New York. It comprises six species, four of which are natives of North America, the other two being Asiatic. Yellow clintonia (C. borealis), has greenish-yellow drooping flowers, with blue berries. It grows in moist woods from Newfoundland south to North Carolina, and westward to Wisconsin and Minnesota. The white clintonia (C. umbellulata) is found in the woods of New York and New Jersey, and as far south as Georgia, and westward through Tennessee.

CLINTON'S BIG DITCH, a phrase applied to the Erie Canal, connecting the Hudson River with the Great Lakes. The name was given in derision, because the canal was planned and carried to completion by De Witt Clinton.

CLINTONVILLE, Wis., city in Waupaca County, on the Pigeon River, and on the main line of the Chicago and Northwestern Railroad, 50 miles north of Fond du Lac. It is well built, has concrete streets and walks, public and parochial schools, a Carnegie library, several churches, two banks, opera-house and a city park. It manufactures automobiles, tractors, sashes and doors, washing machines and contains machine shops, feed mills, saw and planing mills, pickle and kraut factories and an ice plant. It is located in a thriving dairying section. The waterworks and electric-lighting plants are the property of the municipality. Pop. 4,000.

CLIO, from Gr. κλειον, to celebrate), daughter of Zeus (Jupiter) and Memnon (Memory), the muse of history. She is represented with a wreath of laurel upon her head and a roll of papyrus in her right hand. She was the mother of Hyacinthus and Hymenæus. There was also a sea nymph named Clio, daughter of Oceanus and sister of Boreas, who figures in Greek mythology.

CLIONIDÆ, klē-on-idē, a family of Pteropoda (q.v.), which lack the shell and external gills, have the body spindle-shaped with wing-like fins situated near the head, and a tuft of head provided with short tentacles. They are pelagic animals of remarkable transparency, and live in vast numbers in the Arctic and Antarctic seas. Their chief popular interest lies in the fact that one species, Clione borealis, although only about an inch in length, furnishes the chief food of the great whalebone whales of the north. The whalers call the schools of these pteropods brit and deem their presence a good sign of whales.

CLIP HOOKS, two hooks, the points of which are turned in opposite directions. These points are made to overlap and lock closely so as to form a single eye when the necks of the hooks are lashed together. The eyes of the hooks are on the same pivot and are also designed to fit closely to each other when not in use.

CLIPPER, the word used to designate a modern construction of large sailing vessel. The peculiarities of these vessels are, their long sharp bow, their greatest beam lying abaft the centre of the ship and their depth of keel. The speed attained by the opium traders had attracted the attention of naval architects generally, and the shipbuilders of Great Britain (notably those of Aberdeen and Liverpool) and of America vied with each other in producing vessels which, while preserving fair carrying capabilities, should, as the primary requisite, be fast sailors. In this they succeeded to a remarkable extent, and the feats of the Atlantic, Australian and Chinese clippers, some of which attain an average speed during the voyage of over 15 miles an hour, used to be an object of great interest and excitement among those connected with shipping and ocean traffic. Owing to the improvements in steam vessels, and the many advantages possessed by them over sailing vessels, clippers, as a special type of ship, are now little heard of. The effect of the model was shown in many subsequent ships and yachts.

CLIPPER BOW, an overhanging bow, found in some wooden steamers. It differs from the bow of the old sailing ship in that it rises in a smooth curve from cut water to bowsprit, while the latter had a reverse curve as it
nearly the bowspirit. Most modern steamers have a vertical stem.

**CLISSOLD, Augustus**, English Swedeborjan: b. about 1797; d. Tunbridge Wells, 1 Nov. 1852. He was graduated from Exeter College, Oxford, in 1823 was ordained priest, held the curacies of Saint Martin-in-the-Fields, and Saint Mary, Stoke Newington, and about 1840 withdrew from the ministry. He had become a very close friend of the Church of England, and when retaining through life his connection with the Church of England, he was president of the Swedish Association, became a life member of the Swedish Society and liberally assisted it with funds. Clissold translated and published at his own expense Sweden's 'Principia Rerum Naturalium' (1845-46) and 'Economia Regni Animalis' (1846). He wrote also many original works, the larger part on Swedish and Swedish views.

**CLISTHENES.** See CLISTHENES.

**CLITOMACHUS** (Gk. Κλείτομαχος), Greek philosopher: b. Carthage about 190 B.C.; d. Athens about 110 B.C. He went to Athens about 146 B.C., where he became identified with the Third, or New, Academy, of whose founder, Carneades, he was one of the most distinguished disciples. On the death of Carneades in 129 B.C., Clitomachus succeeded to the academic chair. Carneades wrote nothing, and Clitomachus was the chief expositor of the system of the New Academy. Diogenes Laërtius is authority for the statement that he wrote 400 books on philosophical subjects. Cicero, who appears to have devoted considerable study to the work of Clitomachus, praises him highly in the 'Academia.' He followed in his teachings the largely skeptical views of Carneades, denying the possibility of attaining absolute truth, or any certain criterion of truth. Of his works there remain only a few titles and some renderings by Cicero in the 'Academia.' Consult Zeller, 'Les Systèmes Epicuréens et Sceptiques' (trans. by Reicheil, London 1892).

**CLITUS**, klītū's, son of Dropis, and foster brother of Alexander the Great. He was one of the generals of Philip and Alexander, and served the life of the latter in the battle of the Hellespont, in 336 B.C., and restored of discipline in the Macedonian army, which had just lifted up his arm to kill Alexander. He held high positions in the Macedonian armies and in 328 was made satrap of Bactria. Notwithstanding this service, however, Alexander killed him in a fit of anger at a banquet in honor of Dosiscuris, an act of which he repented sorely afterward.

**CLIVE, Catherine Rafter, KITTY CLIVE**, English actress: b. London 1711; d. 6 Dec. 1785. She was the daughter of a poor Irish gentleman living in London, and coming to the notice of Colley Cibber, manager of Drury Lane Theatre, made her début there at 17. She achieved instant success and till her retirement from the stage in 1769 was one of the most popular actresses of the time, her forte being comedy. The largest of the revues was 'The Argyle Club,' the Forum and Velabrum and was called the Clowca Maxima (the greatest or main sewer). It is said to have been constructed under the direction of King Tarquinus Priscus (616-578 B.C.), but none of the existing part is older than the 3d century B.C. It is still used in

**CLIVUS,**
the drainage of Rome. It received numerous other branches between the Capitoline, Palatine, and Quirinal Hills. It is formed of three concentric rows of enormous stones, piled above each other without cement. The height inside is about 13 feet and its width is about the same. The flooring is like that of a Roman road. During the Empire, the duties of the censor included the supervision of the cloaca. Under Cato they were repaired. Special "eautiores cloacarum urbis" were placed in charge of them during the Empire.

In anatomy a cloaca is a part of the intestine in which the intestinal, ovarian and urinary outlets terminate. This structure exists in birds, in reptiles, in the amphibia and in the mammalian order Monotremata. In the Rotifera also the perivisceral cavity terminates in a dilatation or cloaca, which forms the common outlet for the digestive, generative and water vascular system. There is a cloaca also in insects, and one also in tunicated mollusks. The latter is sometimes called the atrial chamber. In the embryonic development of man there is a period during which a cloaca also exists.

CLOCK. All instruments for the accurate measurement of time have three parts in common. One is a vibrating body, which may be a pendulum swinging under the force of gravity, or a balance wheel vibrating on its axis through the action of an elastic spring. The second feature is a source of power, which may be a weight or a stiff steel spring, called the mainspring; the object of either is to keep up the vibrations of the balance wheel or pendulum, which would otherwise soon cease through friction and the resistance of the air. The third feature is a system of wheelwork by which the power is transmitted from its source to the vibrating body, and by the revolutions of which the time is indicated. The instruments by which these results are brought about may be classified as watches, chronometers and clocks.

The watch is a portable form of the instrument, generally so constructed as to be carried in the pocket and moved about into any position without interfering with its going. This requires that the source of power shall be a spring, and the vibrating body a balance wheel. The chronometer (q.v.) is a larger and more accurate watch constructed on the same general principles, but intended, when moved, to maintain a horizontal position. The term is sometimes applied to the most accurate pocket watches; and to distinguish it from them the chronometer proper is sometimes called a marine chronometer. The term is chosen because the instrument is used to keep time at sea for the determination of a ship's longitude.

Construction.—In the original construction of the clock, to which this article is especially devoted, the vibrating body was the pendulum and the source of power a weight which could be wound up with a key. But, in order to secure the advantage of being easily handled and moved about, it is now very common to make the smaller class of clocks with either a main spring or a balance wheel or both. But such clocks, unless made in the most expensive way, do not keep time as accurately as those with weights, the latter are, therefore, to be preferred in all cases where a clock can be kept in one and the same position, and is wanted to keep fairly good time for considerable periods.

In the earliest instruments of these different kinds the vibrating body was a small horizontal bar, which moved back and forth under the influence of the wheel work. This was before the idea of applying a weight to keep up and regulate the vibrations had been conceived. Such instruments were extremely inaccurate in their results. The possibility of the pendulum clock dates from the time of Galileo, who first showed clearly that a pendulum completed its swings in nearly the same time, whatever its arc of vibration, which time was dependent on its length. But the practical inventor of the pendulum clock was Huyghens, the great Dutch astronomer of the 17th century. He invented the various appliances of the clock, the striking apparatus excepted, in substantially the form that we have them to-day. What is sometimes called the astronomical clock does not differ in principle from the ordinary pendulum clock, and has nothing except that it is made with the greatest perfection throughout in order to go with the utmost attainable uniformity from day to day. So successful have clock-makers been in recent times that an astronomical clock was constructed by Audemars with a beat of a tenth of a second during a day would be regarded as practically useless. A good clock of the kind should keep time within three or four hundredths of a second a day.

The accompanying plate shows in detail the parts of the ordinary clock. Fig. 1 gives a lateral view of the wheel work. An end view of the mechanism is shown in Fig 2. P, Fig. 1, is a weight suspended by a cord which rests in a spiral groove going round and round the main cylinder C. In order that the clock may be wound up at any time, a ratchet wheel DD, Fig. 2, is used with a grooved cylinder, around which is wound a cord carrying the weight. The manner in which the ratchet acts is too obvious to need description. It is to be remarked that, in the ordinary house clock, the action of the wheel work stops while the weight is being wound up. As the clock then loses all the time taken to wind it up, the best class of clocks are constructed with a second ratchet wheel, which keeps the clock going. The action of the weight is transmitted through the train of wheels d, e and f, to the scape wheel GH, which acts on the pallets IR, connected with the crutch which acts on the pendulum. In Fig. 1 By is the pendulum and its crutch vibrating in a plane perpendicular to that of the paper. In the upper part of its length, which passes through the crutch U, it turns on a horizontal axis which can be seen in the figure extending horizontally from the framework of the clock from just above X to the right. Thus, as the pendulum vibrates the arm of the crutch UX vibrates with it. This vibration releases alternately the teeth of the scape wheel GH, a double motion of the pendulum back and forth being required in order that first one tooth and then the other may escape. As shown in the figure the end R of the anchor is moving upwards, the tooth H of the scape wheel being just about to slide off. During the time that the pallet R is holding the scape wheel, the pendulum is pressing the side of the crutch against the pendulum. When the tooth H escapes, the an-
The construction of the escapement is of the utmost importance when the best performance of a clock is required. If one examines the second hand of an old-fashioned house clock he will notice that, at the moment of each beat, the second hand moves forward to one second and then has a slight motion backward before the next beat. This backward motion takes place immediately after one tooth has escaped, and continues until the pendulum has swung to its greatest distance on one side. This backward action, throwing extra action on the pendulum tends to accelerate its motion. Hence, good clocks are provided with a "dead beat" escapement invented by Graham. In this form the pallet on which the teeth of the escape wheel rest is at a radius from the center of motion of the anchor to the pallets themselves. The action of the escape wheel then does not begin until the pendulum reaches a certain point of its downward swing, which point is the same whether the swings are wide or narrow.

Under the system just described, the pendulum is kept in continuous vibration and the wheel work in continuous motion from the time the clock is wound up until it is run down. But it is also necessary that the clock shall at every moment, show the time on its face. This is brought about by the wheels O and N, Fig. 1, one of which is arranged to revolve in an hour, the other in 12 hours. The result is too familiar to need any description. If the wheel work which moves the hands were rigidly connected with that of the clock, the latter could not be set without moving the whole of the clock work. The system of wheel work which carries the hands is, therefore, so arranged as to be held on the axis c, by friction, thus admitting of its being turned at pleasure, while it is held by the axis so long as the hands are untouched. The minute hand is rigidly attached to axis c, the hour hand is held on as a hand in turning the wheel work of the two hands. Generally, but not always, the hour hand is held on its axis only by friction so that it can be turned around at pleasure without interfering with the other hand or with the going of the clock.

Regulation.—It is, of course, necessary to the correct going of a clock that the length of the pendulum should correspond to the number of the teeth in such a way that, as the pendulum goes through its natural vibrations, the wheels shall go according to the time of day. In the old-fashioned house clock, and in most good modern clocks, when it is desired to show seconds as well as hours and minutes, the teeth are taken on the pendulum in each direction. It is then called a "seconds pendulum." There are then 30 teeth in the escape wheel, the latter turning through one-sixtieth of the revolution as each alternate tooth escapes. The seconds pendulum is about 9% the length of the first. It is not easy to move a clock about when the pendulum is so long. Hence, in ordinary clocks for household use either a balance wheel or a shorter pendulum is used. If the latter is one-fourth the length of the seconds pendulum, it will vibrate in half a second. But, as clocks are constructed, the pendulum is not always made to vibrate in any simple fraction of a second. In this case, although a second hand may be put on the clock, and may go through its revolution in a minute, its motions will not beat seconds.

The rate of going of ordinary clocks varies with the temperature, the clock going faster the lower the temperature. In the case of the pendulum clock this is because the pendulum rod contracts with cold and expands with heat. If a balance wheel is used, not only does the balance contract with cold but the spring which moves it becomes stronger; so that for a double reason the clock goes faster in cold weather. Hence if accurate time is to be kept the pendulum or balance wheel must be compensated for changes of temperature. To show how this is done in the case of the balance wheel, see CHRONOMETERS. For the two methods of compensating a pendulum, see PENDULUM. Between the extremes of temperature to which the house clock is ordinarily subjected the differences of rate will only be about five or six seconds a day. As few people are able to regulate their clocks to this degree of precision it is only in very good clocks that compensation is attempted. The effect of heat and cold is much greater on the balance wheel than on the pendulum and may amount to half a minute of more a day.

Striking Mechanism.—The striking mechanism of the clock is brought about by a separate train of wheel work with its separate weight or spring, as shown in Fig. 2. There are two systems of making a clock strike the hour, one of which may be called the continuous system, and is used in clocks of American construction, while the other is mostly used in French clocks. The continuous system is one in which the striking goes on in its regular order, two always following one, three following two, and so on, no matter how the hour hand may be situated. In this system if the clock begins striking wrong through, running down or from any other cause, it will continue to strike wrong until a proper adjustment is made. This is effected by touching a spring or pulling a wire in the clock, by which the striking mechanism is set in action and the clock made to strike around until it comes to the right hour. The French system is arranged with an eccentric cam on the axis of the hour wheel which stops the striking mechanism when the hammer of the clock has struck a number of strokes corresponding to the position of the hour hand. On this system the striking mechanism needs no adjustment to strike correctly always.

Electric Clocks.—With the discovery of electricity and its development as a motive force, the horologists were among the first to attempt its use, as the ideal power to operate clocks. In the earlier devices the weight of the pendulum was changed from the usual vertical body to a horizontal form, provided with a coil, and caused to swing between two electro-magnets placed on the lowest point of the pendulum arc. Electrical connections made and broken alternately by
CLOCK AND WATCH INDUSTRY — CLOCKS

attachments to the pendulum stem actuated the magnets so as to attract the swinging weight as it approached the magnets and repel it after it had passed the centre. These impulses, however, were found in practice to be unmanageable, and quite inadequate to the task of keeping the clock movement uniform. This impulse was extended to a row of electromagnets set in an arc close below the weight of the pendulum, the impulses of attraction and repulsion being taken up consecutively by one magnet after another. This device proved impracticable. Another device experimented with was the release by electrical action of a weighted bar, which in falling gave the stem of the pendulum a direct push. The bar was immediately pulled back to its normal position by an electro-magnet, to be again released when the pendulum should begin to flag in its appointed swing.

The so-called electric clocks of the present day are not time keepers but time transmitters. The actual measurement of time is made by a large mechanical clock movement actuated by weights hanging from the barrel of a windlass—the centuries old and unrivalled "power" of the clock-maker. An electric current controlled by the clock mechanism is utilized to move steel hands on a distant dial, or on several dials simultaneously—as in the case of tower clocks with four dials. Or it may be used to move the hands on the dials of many clock faces in a large establishment. Electricity is also used in a similar manner to synchronise with a single master clock a series of individual clocks scattered over a wide area. The devices for this kind of regulation generally act only upon the hands, forcibly moving them at stated intervals into the exact position of the hands on the master clock. A common application of electricity to tower clocks is through a mechanism known as the "waiting train." The auxiliary works which move the hands is speeded up slightly to cover a half minute (or some other period) in two or three seconds less than the exact time. The train of wheels is then halted by a catch which is thrown off by an electro-magnet at the correct instant, and the auxiliary movement is stopped. An adaptation of electricity to clocks is as a power to operate winding mechanism. To the winding-post a revolving armature is attached, and switches are so arranged with trips that as the weights near the bottom of the run the current is switched on and winding continues until the weights are at the top, when another trip throws the current off.

Tower Clocks.—Tower or turret clocks are subject to unusual stresses owing to their exposed location as to wind pressures, and the fact that the very large and heavy hands are out in the open, unprotected from the weather, and so liable to be irregularly loaded with snow and sleet. The great difficulty of building a clock of sufficient power to overcome these varied stresses, while steadily pursuing its delicate task of measuring time accurately, led to the separation of the time keeping function from the time displaying mechanism, and connected by two by means of an electric, pneumatic or hydraulic transmission. The clock mechanism proper may then be located in a room near the ground where it is not affected by the swaying of the tower by the wind. It may be driven by a comparatively light weight, and an auxiliary independent train in the tower, run by a heavy weight, be merely controlled by the clock. The weight in the tower train may be entirely dispensed with, and the power operating the hands furnished by hydraulic pressure, or by compressed air for an electric clock train, released, in all cases, by delicate connections made or broken by the clock mechanism. These auxiliary power movements are generally arranged to operate pallets which impart direct motion to "escape wheels" and thus content with the usual wheel train to move the hands. The so-called "jumper clocks" are of this type, the half-minute or minute jumps being produced by a power impulse released by the master clock, acting on a ratchet-wheel.

CLOCK AND WATCH INDUSTRY. See Watch-making, Modern.

CLOCKS, Historical and Celebrated. The most ancient form of clock was the clepsydra (q.v.) or water-clock. The clepsydra having been developed into a device with a dial and indicator operated by the current of water, the next step was the escapement. Archimedes is credited with this device. The necessity of some contrivance to regulate the descent of the weight led to the invention of the escapement and pendulum, a rude form of which is said to have been produced by Gerbert of Aurvergne, afterward Pope under the name of Sylvester II, who died in 1003. In an old chronicle it is related that Charlemagne received a clock from Harun Al-Rashid in 809, in which small bells were attached and in which figures of horsemen, at the hour of 12, came forth through doors and retired again. There is a more exact description of this work of art in the Franconian annals, attributed to Reinhard, in which it is particularly said to have been a clepsydra and that at the end of each hour little balls of metal fell upon a bell and produced a sound. In the 12th century clocks were made use of in the monasteries, which announced the hour by the sound of a bell put in motion by means of wheels. From this time forward the expression "the clock has struck" is often met with. The hand for marking the time is also made mention
CLOCKS

of. Of William, abbot of Hirschat, who died at the end of the 11th century, his biographer relates that he had a large clock on the celestial hemisphere. Short as this account is, it still appears probable that this abbot was the inventor of clocks. In the 13th century there is again mention of a clock given by the Sultan Saladin to the Emperor Frederick II. This was probably put in motion by weights and wheels, as it marked the hours, the course of the sun, the moon and the planets in the zodiac. In the 14th century there are stronger traces of the present system of clock-work. Dante mentions clocks. Richard, abbot of Saint Albans, made a clock in 1326 which indicated the course of the sun and moon, as well as the ebb and flow of the tide. Large clocks on steeple were first made use of in the 14th century. In 1340 a monk named Peter Lightfoot made for Glastonbury Abbey a clock with an escapement and regulator for securing equal motion. At the time of the Reformation it was removed to Wells Cathedral where part of it still remains. In 1535, the mechanism was brought to Oxford, and the clock was supplied with new works and the dial somewhat remedied and a minute circle and index added. At the base of the arched pediment which surrounds the square of the dial is an octagonal projection from which rises a paneled turret. Around this, fixed to two rings of wood, are sets of horsemens which formerly revolved in opposite directions as the hour was struck.

Of all horological machines, the successive clocks at Strassburg Cathedral have perhaps attracted the most attention as mechanical curiosities. These have been three in number. The first was constructed about 1352, the second in the latter part of the 16th century. Early in the 19th century it was evident that reconstruction was necessary, and this was ultimately entrusted to Charles Schwilgke, who entered on his task in 1838 and completed it about the middle of 1842. On the 2d of October of that year the new life of the resuscitated marvel was solemnly dedicated. In the hour bell is a celestial globe indicating sidereal time, and the rising, setting and passage over the meridian of Strassburg of all stars visible with the naked eye. Behind this is a calendar showing months, days of the month, dominical letters and all feast days. Above the calendar is a gallery with allegorical figures representing the days of the week (Sunday, Apollo drawn in a chariot by horses; Monday, Diana drawn by a stag; Tuesday, Mars; Wednesday, Mercury; Thursday, Jupiter; Friday, Venus; Saturday, Saturn, or Saturnus), which pass in order from left to right. Above this is a dial for showing ordinary time, a planetarium and a globe showing phases of the moon. Next come movable figures representing the four ages of man, which strike the second stroke of each quarter on a bell. A genius seated beside the ordinary dial strikes the first note of each quarter with a sceptre; the genius on the opposite side turns an hour-glass at each hour. Death strikes the hour with a bone. At midnight the whole clock strikes 12. At noon before Christ, bowing at his feet, he makes the sign of the cross. During the procession a clock perched on the top of the left-hand turret flaps its wings, ruffles its neck and crows three times.

A clock at Berne which dates from 1527 presents some curious features. Three minutes before the hour a wooden cock crows three times, claps its wings; in another bell a procession of bears (baren, referring to the name 'Berne') passes around a seated figure of a bearded old man; the cock (above the arch, and to its right) then crows again. The hour is struck on a bell at the top of the tower, by a figure with a hammer, and at each stroke, the bearded figure raises his sceptre and opens his mouth, while he turns an hour-glass; a bear inclines his head at the same time. Then the cock crows again. Another celebrated clock is at Venice, which dates back to the 17th century. It has a dial of blue and gold and is surmounted by bronze figures which strike the hours upon a bell. On Ascension Day, and for 14 days after, figures of the Magi come forth in procession and salute the Virgin and Child (as shown above dial) when the clock strikes 12.

Yet another is the clock of the English Houses of Parliament at Westminster. It was designed by Lord Grimthorpe (then Mr. E. B. Denison) and was first set going in 1644. The tower is 320 feet high and the dials are 180 feet from the ground. Each of them is 22½ feet diameter, of opalescent glass set in an iron framework. The hour figures are two feet long and the minute spaces one foot square. The works contain three trains—one drives the hands, another the mechanism for striking the hours, the third the chimes. The pendulum is fully 13 feet long and weighs nearly 700 pounds. The going parts of the clock requires winding once a week, the striking parts twice. The hour bell weighs 13 tons, the quarter bells collectively eight tons. Though there are clocks with larger dials, this clock is probably the most powerful as well as the most accurate of all large timekeepers. It cost more than $110,000.

The United States has produced numerous notable clocks, most of them, however, smaller than the great clocks of Europe, if we except several that have been erected on great buildings of late years. Among the early American clocks which have become famous in our land, one made by David Rittenhouse, in Philadelphia in 1767, and since then known by his name. It has six dials, each of which marks different astronomical events. The "Columbus, Ohio, clock" also records numerous astronomical events and contains many miniature figures, which are made to perform various motions. This clock is 11 feet high by 18 wide. Donaldson, Wilkes-Barre and Hazleton, all in the State of Pennsylvania, have also produced notable clocks.

Felix Meyer of New York, in 1880, after 10 years' work and experimenting, produced a remarkable clock, which showed local time in hours, minutes and seconds, the days of the week and the month, the seasons, the signs of the zodiac, the revolutions of the earth round the sun and on its own axis, the movements of the planets round the sun and the phases of the moon. It shows the difference in time at Washington, San Francisco, Chicago, Cairo, Melbourne, Constantinople, Peking, London, Paris, Berlin, Vienna and Venice. At noon the clock strikes the quarter-hour, a youth the half-hour, an old man the three-quarter-hour and death the hour, while Washington rises from his seat and, extending his right hand, presents the Declaration of Independence. A servant opens a door and the other Presidents of the United
CLODD—CLODIUS

States, up to the time when the clock was made, each dressed in the characteristic costume of his day, come forward, salute the first President of the nation and, passing on, disappear through another door. The Meyer clock is 18 feet high, 8 wide and 5 deep and contains over 2,000 copper balls.

One of the notable modern clocks of the United States is that in the tower of the Metropolitan Life Building in the city of New York, where it was placed in 1909. It has four dials, each 20 feet in diameter and situated one in each side of a tower nearly 350 feet above the street. This tower, which is twice this distance in height, is crowned by a lantern which signals, by flashes, the hours and quarters, the hours being lighted up by 88 white lights and the quarters by 56 red ones, the two giving a total candle power of 16,262. One of the features of this clock is a set of chimes which, among other things, sounds the hours and the quarters from 8 A.M. to 6 P.M. An idea of the size of this clock may be gathered from the fact that the minute hand measures 17 feet and the hour hand 13 feet 4 inches.

In the office of the director of the building is a clock which controls all the machinery of the largest clock and handles the time service of the whole building. It is driven by electricity and is self-winding. Naturally the great dial, situated as it is at such a height from the city street, is one of the noteworthy features of the clock. The numbers on it are 4 feet high and the minute marks are 10\(\frac{1}{2}\) inches long. The minute hand is lit up by 16 and the hour hand by 10 incandescent lamps.

The largest clock in the United States is that erected over the works of the Colgate Company, in Jersey City. Its enormous dial is 38 feet across and it contains within its circle 1,134 square feet. The minute hand is 20 feet long and the mechanism is run by a 2,000-pound weight. The clock itself weighs six tons and its hands are outlined by incandescent lights, while brilliant red lamps mark each numeral. The minute spaces, which are 24 inches apart, are also shown by electric lamps. It has been estimated that the extreme end of the minute hand can swing more than half a mile in course of a day. The second largest clock was built for the Edison Electric Illuminating Company, Boston, Mass. Specifications: Dial, 34 feet in diameter; weight of hands, 875 pounds; hour hand, 14 feet 4 inches long; minute hand, 18 feet 6 inches long.

CLODD, Edward, English writer: b. Margate, Kent, 1 July 1840. He entered commercial life in 1860 and was secretary of the London Joint Stock Bank, 1872-1915. He is the author of 'The Childhood of the World' (1872); 'The Childhood of Religions' (1875); 'Jesus of Nazareth' (1880); 'Myths and Dreams' (1885); 'Story of Creation' (1888); 'Story of Primitive Man' (1895); 'Primer of Evolution' (1895); 'Pioneers of Evolution' (1897); 'God and All His Works' (1900); 'Story of the Alphabet' (1900); 'Thomas Henry Huxley' (1902); 'Animism' (1906).

CLODIA, one of the three sisters of Publius Claudius Pulcher (q.v.). She was married about 60 B.C. to Quintus Metellus Celer, who died the following year, probably from poison. Cicero having rejected her advances, she received a mortal hatred against him, and, in concert with her brother, used every possible means to effect his ruin. On her accusing Cælius Rufus of an attempt to poison her, Cicero undertook his defense, and depicted her dissolute life in a speech which is still extant. Her younger sister Clodia married Lucullus but was put away on account of her conduct. Consult the 'Prolegomena' to Ellis's edition of Catullus (LXIII-LXXII, Oxford 1889).

CLODION, clô-de-ôn' (real name CLAude MICHEL), French sculptor: b. Nancy, Lorraine, 1738; d. Paris 1814. His mother was a daughter of Jacob Sigisbert Adam, a prominent French sculptor. Clodion went to Paris in 1755 and entered the studio of his uncle, Lambert Sigisbert Adam, also a sculptor. Upon his uncle's death he continued his studies with Pigalle. In 1759 the winning of a prize opened the way for him to go to Rome three years later. He remained there five years for the Duc de la Rochefoucauld and Catherine II of Russia. When he returned to Paris it was with the fame of a successful artist. The king, the nobility and many other wealthy patrons kept him busily at work—not including the clergy who looked upon his things with sujets libres with no little severity. As daring as his nude groups occasionally are, however, the sculptor's style is so masterly, his classical feeling for relations of form is so sure—even when copying in realistic manner the charms of a pretty model—that it would need a prude indeed to object to him. He is to be ranked with the most admirable of the Dix-Huitièmes artists. Like so many of them he was relegated to a quite secondary place after the Revolution, which hated his patrons and had no use for the elegance in ideas or in art of the foregoing period. Clodion himself felt that he was no longer a man of his time. He withdrew to his native Nancy when commissios failed in Paris. The capital lured him back however in 1798 and he tried to fit in with the new style in art. It is pleasant to know that he again achieved some measure of well-being, though he never again reached the point of happiness and favour that he enjoyed under Louis XVI. We may note the following works by Clodion in public galleries: Nantes, 'Children Dancing About Pan'; Versailles, 'Faith'; Berlin, 'Amours' and 'Faun and Amours'; New York (Metropolitan Museum), 'Bacchus, a Nymph and Cupid,' and 'The Fascination of Wine.' Mention may also be made of his 'Montesquieu' and 'Vestal crowned with Flowers' at the Palais de l'Institut, his decorations for the Arc du Carrousel and the Colonne de la Grande Arche all in Paris, and his statue and relief of Saint Cecilia at the Rouen Cathedral. Consult Thirion, 'Les Adam et Clodion' (Paris 1885).

CLODIUS, Publius, surnamed Pulcher, a Roman politician, son of Appius Claudius Pulcher, who lived from about 93 to 52 B.C. In the third Mithridatic War he served under his brother-in-law Lucullus but himself ill-treated, he stirred up a revolt and then joined the army of another brother-in-law, Quintus Martius Rex, proconsul of Cilicia. He was given command of the fleet and fell into the hands of pirates, but obtained his liberty. He then went to Syria where he stirred up another mutiny. Returning to Rome in 65 B.C.,
he rendered Cicero service as a bodyguard. There was no sufficient reason extant for believing that he was implicated in the Catilinian conspiracy. Cicero’s violent attacks on the action of Clodius at the mysteries of the Bona Dea where he attempted an intrigue with the wife of Caesar made Clodius resolve revenge. Aristides, the Sicilian who had been consul when it was decided to expel him as a quaestor, renounced his rank and was elected tribune of the people. He enacted corn laws, re-established the guilds and adopted other measures destined to gain popular favor. Having gotten rid of Cicero, he confiscated his property and became master of Rome with the aid of gangs and secret societies. He resisted the proposal of the recall of Cicero by force. He became a candidate for the praetorship against Titus Annius Milo. The rivals collected armed bands and fought in the streets of Rome where Clodius was killed. The celebrated speech of Cicero in defense of Milo has saved the name of Clodius from oblivion. Consult Plutarch’s Lives, E. F. Beesley, E. S. ’Cicero and Clodius’ (in Fortnightly Review Vol. V) ; White, H., ’Cicero, Clodius and Milo’ (New York 1900).

CLOD-JURGENSBURG, klôt-yoo’gên-boor, Peter Karlovitch, BARON, Russian sculptor: b. Petrograd 1805; d. 1887. He studied at the art school of his native city, served for a short time in the army, and studied sculpture at the Petrograd Academy, where he was afterward a professor. He was very successful in depicting horses in action. His noteworthy works are the horses of the quadriga group on the triumphal arch at Petrograd and the four groups of ’Horse Tamers’ in bronze, on the Anitchkov Bridge, Petrograd. There are replicas of two of the latter at the Schloss, Berlin, and at the Piazza del Re, Naples.

CLEGIA, kli’zh-a, a girl of Rome, who, the legends say, having been given up to Porsena as a hostage, escaped to Rome by swimming the Tiber. The Romans, however, to keep faith with Porsena, sent her back to him. Porsena would not retain her, but, as a reward for the help she had given the Romans, freed her and her fellow hostages, and also gave her several of the Etrurian youths for her service. A statue was erected in her honor on the Via Sacra.

CLOG ALMANAC, an almanac or calendar made by cutting notches or characters on a clog or block, generally of wood. The block had generally four sides, three months for each edge. The number of days is marked by notches, while various symbols are used to denote saints’ days, the golden number, etc.

CLOISONNÉ, in ceramics, a method of enameling, applies for the most part to metal, since the effects are more easily attained than when it is applied to porcelain; specimens of the latter sort being, indeed, chiefly regarded as curiosities. In Cloisonné work (so-called from Cloison, a partition), fine metallic walls of the same material as the basis (for example, copper) are soldered by a strong cement by one edge to the basis; and these walls in this manner form numerous cells or compartments, in which the vitrifiable enamel pastes of various colors are placed. The enamel is then vitrified by severe firings—three or four generally being required before enough enamel can be applied to afford an approximately level surface—and subsequently is ground and polished to a high degree. The Gauls in Roman times and previously made cloisonné, and it was employed for decorative purposes in shrines, altar-pieces and church plate in the Middle Ages. It has not since been used until recent experiments were attempted. The Oriental cloisonnés are well known, particularly the Japanese. The art is said to have been introduced into Japan from China in the 16th century of the Christian era. Japanese cloisonné is made chiefly at Owari, Kii-to, Tokio and Osaka. In later specimens of the Japanese work the partitions are reduced to a minimum, apparently making no separation between the color masses of the enamels. The finest examples of the Oriental cloisonnés display great brilliancy. See CERAMICS.

CLOISTER (O. F. cloistre, Lat. clausivm, bar, enclosed place), a court enclosed by covered walks. The latter are, strictly speaking, the cloisters, the central space being termed the cloister garth. The walks, or ambulatories, are open on the side toward the garth and when pertaining to monastic or collegiate establishments were intended for the use of monks or nuns or the clergy attached to the church. The cloisters are usually, though not invariably, placed on the south side of the church. They are commonly square on the plan, having a plain wall on one side, a series of windows between the piers or columns on the opposite side and covered with a vaulted or ribbed ceiling. They form part of the passage of communication from the church to the chapter-house, refectory and other parts of the establishment. The chapter-house usually opens from the east walk, the refectory and certain other domestic buildings of a monastic house from the south walk. Sometimes there was a second story, but these have rarely been preserved. Both the Romanesque and Gothic types prevail. Germany presents some fine examples of the former style of architecture at Maulbronn and Heiligenkreuz. In southern France the same type is seen in the monasteries at Arles and Velay. In Italy the Gothic archéd cloister—with its ornate pillar groups often varied with enameled and mosaic decorations are found at Salerno, Palermo, Amalfi. The later Roman school developed a form exquisite in delicate canonic form where a good example is to be found at the Lateran. France furnishes some very interesting examples, notably that of Mont Saint-Michel (q.v.) on the coast of Normandy where the great cloister is built on the roof of a vaulted chamber, since the building itself is constructed on the top of a sheer, almost perpendicular, rocky height. Spanish cloisters are of both types,—the royal convent of Huelgas near Burgos, of the arcaded form, is remarkably beautiful. Greater elegance of form is attained in those of Moncalce and Cefalu in Sicily. In England the Gothic form is to be seen at Gloucester, Hereford, Norwich, Westminster and Canterbury. Several important colleges also have cloisters, for example Eton and Winchester, Magdalen at Oxford and Christ Church.

Cloisters were used as places for quiet walks and contemplation; parts for lectures, education, study and recreation. Lavatories, or sometimes large fountain basins were provided on extensions of the ambulatory, so that the monks might wash before going to meals. The garth
CLOISTER AND THE HEARTH — CLOOTS

was usually a plot of grass accessible in only a few places by means of gaps in the low walls of the arcade.

CLOISTER AND THE HEARTH. The. Charles Reade's 'The Cloister and the Hearth' (1861), like George Eliot's 'Romola' (1863), is a very great historical novel dealing with the Renaissance. George Eliot confines her theme to Western Italy, making a profound psychological study of a few typical characters. Charles Reade gives a broad picture of the life of the period not only in Italy but in France, Germany and especially Holland. Each novelist is supreme in the field chosen.

The events of Reade's novel are supposed to have occurred toward the close of the 15th century. The hero is one Gerard Eliasson, a Dutch boy of humble birth, who displays in his youth a wonderful talent as a copist and illuminator of Latin and Greek manuscripts. He is desperately in love with Margaret Brandt, the beautiful daughter of a physician — half alchemist, half magician. The lovers are formally betrothed, but their marriage is prevented, and Gerard flees to Rome, the centre of the new art and learning, with the intention of returning to Margaret after his fortune has been made and his fame has been established. The long journey to Rome on foot through dense forests infested with wolves and robbers, the association with other travelers met or overtaken by the way, the motley groups encountered at inns, and the varied life of the Eternal City, enabled the author to unfold a panorama such as fiction had never known. All the picturesque elements of the Renaissance are in Reade's novel. In his pages we see, too, just how the people lived, what they did, what they thought, amid the uncertainty and turmoil when ancient ideas were coming into conflict with the ideals of the mediæval church. There is the household of a Dutch shopkeeper in contrast with the sumptuous court; the village curate, the hermit, the great monasteries and the great unblessed churches with nave and chancel open to the sky, and — Dominican friars traversing the banks of the Rhine and preaching to the people. We witness the cruel administration of the law, we see the wheel and the rack and gibbets, from which despairing rollers hung by the neck. There is a thrilling escape from the tower of a prison, and a desperate encounter with bears, and a castle stormed and besieged, and a shipwreck — all in the mediæval style of wild adventure.

The world is in utter confusion. The bow and arrow are still used, but gunpowder is coming in; manuscripts are copied and illuminated, but books have been printed in a strange new manner. There is no faith; there is only superstition, fanaticism, and sorcery. The Pope has written an indecent novel; the ritual of the Church is only a revival of pagan worship in a new form, and the scholar in the presence of cardinals denounces the Church and lauds Greek hedonism above all else. Finally, the deep tragedy of the age is depicted in the story of the lovers. While in Rome, Gerard hears that Margaret is dead, and, hopeless of further happiness in this world, he becomes a Dominican friar. And then he returns to Holland and finds that she is still alive and the mother of a boy. But there can now be no life together, for he has given himself to the Church, which permits no union between the cloister and the hearth. The beauty, the conduct and the temper of Margaret are beyond all praise. There is no finer feminine character in fiction. The golden-haired son of Margaret and Gerard lived to be Erasmus, the great scholar and divine whose name soon resounded through the Western world. With Erasmus dawned a new civilization.

WILBUR L. CROSS, Professor of English, Yale University.

CLONMEL, Ireland (Gaelic, *Vale of Honey*), a municipal borough situated on both sides of the Suir, a part in Tipperary and a small part in Waterford, and 90 miles southwest of Dublin. Three stone bridges cross the Suir and connect the parts of the town; it has good streets, well paved and well lighted. Clonmel was founded by the Danes and has long been noted for its love of learning. The fame of the schools established by the Franciscans in the 13th century extended to all the seats of learning on the continent. Traces of its old walls and moat are still preserved, and its chief edifices now in the town are an Episcopal church, two Roman Catholic churches, a Franciscan abbey, the courthouse, jail, barracks, free library, town-hall, convents, schools, lunatic asylum, etc. The trade is chiefly in grain, cattle and provisions; and there are flour mills, creameries, a brewery, etc. Laurence Sterne, the novelist, was born in Clonmel, and Lady Blessington, the writer, was born nearby. Pop. 10,209.

CLONTARF, Ireland, suburb of Dublin, in Dublin County, three miles northeast of Dublin, on Dublin Bay. It contains many handsome villas and is much frequented during the summer months for sea-bathing. Clontarf is famed in Irish history as the scene of the overthrow of the Danish power in Ireland by Brian Boromone on 23 April 1014. Pop. about 4,800.

CLOOTS, klôts, Jean Baptiste von, Prussian baron, well known during the Revolutionary scenes in France under the appellation of Anarchist Cloots: b. Gnadenthal, near Cleves, 24 June 1755; d. 24 March 1794. He became possessed of a old dowerland, and partly dissipated through misconduct. He was educated in France and traveled in different parts of Europe and formed an acquaintance with many eminent individuals, among whom was the celebrated Edmund Burke. At the age of 21 he returned to France and published an attack on revealed religion entitled 'Certitude des preuves du Mohamétisme.' The first work in which he distinguished himself was the ridiculous masquerade called the 'Embassy of the Human Race,' partly contrived by the Duke de Liancourt. On 19 June 1790, Cloots presented himself at the bar of the National Assembly, accompanied by a considerable number of enthusiastic followers from the slums of Paris dressed in the various nationalities, English, German, Italian, Spanish and others. He described himself as the orator of the human race and demanded the right of confederation, which was granted him. To show his democratic spirit he abandoned his title and rank (but not his income). At the bar of the Assembly, 21 April 1792, he made a strange speech, in which he
recommended a declaration of war against the king of Hungary and Bohemia, proposed that the Assembly should form itself into a diet during a year and a half, and offered to raise a Prussian legion, to be called the Vandal Legion. The 27th of the same month he advised the assembly to set a price on the heads of the king of Prussia and the duke of Brunswick, praised the action of John J. Ankarström, the assassin of the king of Sweden, and, among other absurd expressions, he said, "My heart is French and my soul is sansculotte." He displayed no less hatred to Christianity than to royalty. In September 1792 he was nominated deputy from the department of the Oise to the national convention, in which he voted for the death of Louis XVI in the name of the human race. He became an object of suspicion to Robespierre and his party, was arrested and condemned to death. He published several works, the chief of which are "L'Orateur du genre humain" (1791); "Base de l'organisation de la république du genre humain" (1793). Consult Avenel, "Anarchie Cloats, l'orateur du genre humain" (Paris 1863); Bax, "Outlines from a New Standpoint" (London 1891).

CLOSE TIME, a period of the year during which animals in a certain way are protected by law, and are not allowed to be caught or killed. Such animals are chiefly those that are killed for food or sport, and include birds, fishes and quadrupeds, as well as certain others—crabs, lobsters and oysters, for example.

CLOSURE (often needlessly clôture, the same word in French), the European substitute for the American "previous question": the power of shutting off debate when the speaker or the majority think it has exhausted legitimate argument and is used for mere obstruction. As the efficacy of providing power can be guaranteed, it is also a possible weapon of mere gag-law; but it has shown itself to be the only method in which parliamentary institutions can be worked. In Congress the "previous question" has existed for years, but because of its smaller size the Senate did not consider such a rule necessary until the closing hours of the 64th Congress, which terminated 4 March 1917. The filibustering tactics of the "little group of wilful men" had prevented the passage of the armed ship bill prior to adjournment, wherefore on 8 March 1917 the special session of the Senate passed a closure rule making possible the limitation of debate. The rule provides: "That at any time a motion signed by sixteen Senators to bring to a close the debate upon any pending measure is presented to the Senate the presiding officer shall at once state the question, and on the same day after the Senate meets on the following calendar day but one, he shall lay the motion before the Senate and direct that the secretary call the roll and upon the assemblage that a quorum is present, the presiding officer shall, without debate, submit to the Senate, and may vote the question: That the sense of the Senate that the debate shall be brought to a close.

"And if that question shall be decided in the affirmative by a two-thirds vote of those voting, then said measure shall be the unfinished business to the exclusion of all other business until disposed of.

Thereafter no Senator shall be entitled to speak in all more than one hour on the pending measure, the amendments thereto and motions affecting the same, and it shall be the duty of the presiding officer to keep the time of each Senator who speaks. Except by unanimous consent no amendment shall be in order after the vote to bring the debate to a close, unless the same has been presented and read prior to that time. No dilatory motion, or dilatory amendment, or amendment not germane, shall be in order. Questions including questions of relevancy and appeals from the decision of the presiding officer, shall be decided without debate."

In the British Parliament no such rule existed till 1882, debate being unlimited; and the fairness of its members, and their unity of feeling as Englishmen, had prevented any serious ill results. But about 1872 Isaac Butt, the leader of the Irish Home Rule party, began the policy, carried on after his death by Parnell, of putting a stop to all legislation on English subjects until all Irish demands had been granted, by talking against time, making irrelevant motions, calling for divisions on every motion, etc. For many years Parliament struggled under this, extremely loath to tie down the immemorial freedom of debate, but was finally forced to act, and in 1882 passed a closure rule, which allowed the speaker, on request of 40 members, to pronounce debate closed and call for a vote. In 1902 the present rule was adopted, providing that upon the proposal of a question a member might move that the question be put and if the rules be not abused by such a motion and the right of the minority be not infringed, then the question should be put at once and decided without further debate or amendment. In 1887, in order to shut off debate on the Irish Crimes Act, the House of Commons, owing to the ineffectiveness of the closure rule, employed a measure known as the "guillotine." Debate on only four out of the 20 clauses had consumed 27 days, wherefore a motion was adopted providing that at the end of the following week the chairman, without further debate, should put the questions necessary to end the committee stage. Because of its severity, the procedure became known as the "guillotine." In 1893, in connection with the Home Rule Bill, "closure by compartments" was adopted, under which debate on certain clauses should cease on a specified date, debate on certain other clauses should cease on another specified date, and in this way to the end of the measure under discussion. The French clôture dates from Louis I, the "Good King," in 1581. See Previous Question; Parliamentary Law; Legislative Bodies; Rules Governing. Consult Cushing, L. S., "Law and Practice of Legislative Assemblies" (Philadelphia 1907); Hinds, A. C., "Digest and Manual of the Rules and Practice of the House of Representatives" (Washington 1908); Lowell, A. L., "The Government of England" (rev. ed., New York 1912); May, Sir F. E., "A Treatise on the Law, Privileges, Proceedings and Usages of Parliament" (12th ed., London 1917).

CLOTAIRE I, klo-täär', I, son and successor of Clovis (q.v.), first king of the Franks in Gaul, reigned as sole king from 558 to 561. CLOTAIRE II, a king of the same Merovingian dynasty, reigned over the Franks 30 years later.

CLOTHE. See Weaving.

CLOTHES MOTH, a moth (Tinea pellionella), of the family Tineidae, in which the wings are long and narrow, pointed at the end, and with a long finger. It is pale buff-yellow, with no definite markings. It may be seen flying about the house the last of May, or still
earlier if the weather be warm, when it lays its eggs in woollens and furs. The young caterpillar is white, and begins on long threads, or in long con
struct a flattened cylindrical case in which it lives, dragging the case about with it. The mischief is done by the worm, the caterpillar working through the next 10 months, finally changing to a pupa in its case. The caterp
moth belongs also to this group. There is a straw-colored species *Tinea bistriella*, which spins silk over its food, but does not make a case. A cocoon is spun before pupation out of fragaments of cloth. The best preventative is cold storage at a temperature of 40° F., or the use of naphthalium or camphor. Woolen gar
ments should be carefully brushed and put away in cotton sacks or in camphor trunks, or wrapped tightly in stout paper, or stored in large pasteboard boxes rendered tight by gum
ming a strip of wrapping paper around the edge, so as to seal the box completely. Consult Packard, 'Guide to the Study of Insects'; Howard and Marliatt, 'The Principal House
hot of Weaving the United States' (in Bulletin 4 of the United States Department of Agriculture).

CLOTHING. See COSTUME; DRESS.

CLOTHING INDUSTRY IN AMERICA. As shown by the 1914 census of manufact
ures in the United States, the value of the factory product of clothing exceeded that of all other industries except three, which, in order of magnitude, were iron and steel, slaughtering and meat packing and foundry and machine-shop products. Of the total for the clothing industry, $1,297,273,396, the value of clothing for men and boys was $458,210,985, or 35.3 per cent; clothing for women and children, $473,888,354, or 36.5 per cent; shirts, collars and other fur
nishings, including corsets, $122,440,522, or 9.4 per cent. Census statistics for these branches of the industry are shown in an accompanying table. Clothing for women and children and for men and boys is ranked among all industries in 1914 seventh and eighth, respectively, in number of wage ear
ners, and 13th and 12th, respectively, in value of product.

Clothing manufacturing is peculiarly an American industry. By far the greater quantum of the clothing worn in the United States is factory-made. All classes of people in this country buy more clothes and are better dressed than corresponding classes in other countries. In Europe clothing factories are comparatively few and small. Only a limited amount of special lines of clothing is imported into the United States. The statistics of imports and exports during the fiscal year ended 30 June 1914, a month before the war in Europe began, are: Wearing apparel of wool, imports, $2,968,125; exports, $2,148,235. Wearing apparel of cotton, except hosiery and other knit goods, imports, $2,388,167; exports, $8,220,620. Wearing apparel of silk, imports, $4,246,345; exports, $13,118.

Clothing produced in European factories does not equal the American product in style except for women's outer apparel. Models of women's dresses, suits and cloaks are brought from Europe. In other lines the styles of cloth
ning worn in the United States originate with American style designers, though occasionally suggestions from Europe are adopted. The styles of clothing for men in America are de
termined by fashion rather than by custom tailors. Clothing manufactures are the most extensive advertisers in this country. The styles of factory designers are attrac
ively illustrated in newspaper and magazine advertising cases of the factory line, and factory garments have been greatly popularized by this wide publicity. The best grades of factory clothing, though sold for much less than the handiwork of cus
tom tailors, is well tailored and compares favorably with it. The factory-made clothing industry has grown at a much more rapid rate than the population. The increase from 1900 to 1910 in the population of the continental United States, Alaska excluded, was 21 per cent, while the increase from 1899 to 1909 in the value of product was: clothing for men and boys, 75.5 per cent; for women and children, 142.1 per cent.

Before ready-to-wear clothing was manuf
actured, clothing was made in the home by or by tailors, or purchased from second-hand clothing suppliers; today the second-hand clothing supplied to some extent the demand for cheap apparel. The necessity for replenishing the clothing of sailors during their few days in port led to the manufacture of ready-made clothing at New Bedford about 1826 and at Boston about 1830. Production on a larger scale was begun about 1831 by George Opydey, later mayor of New York, who had a store in that city, with a branch in New Or
leans. About 1834 his son-in-law, John D. Scott, moved from New Jersey to New York city, to take charge of the clothing factory, and thereafter the name of the firm was John D. Scott & Co. They had a large Southern trade, and soon opened branch stores in Charles
ton and Memphis. They supplied clothes for planters, but their product was mostly garments of cheap materials for slaves on plantations. Other men, some of them merchants, began manufacturing clothing for sailors, for Southern negroes and, after 1848, for gold miners in California. Not a large amount was made for other classes before 1861. Until then the factories were principally in New York, Bos
ton, Philadelphia and Baltimore, near the tex
tile mills, and where a labor supply was obtain
able, but some we in Rochester, Cincinnati, and other cities. The cutting was done in the shops or factories, but many of the garments were made up in the homes of the workers. Some were sent to rural communities to be made up by females in the families of farmers during winter or in any spare time.

The Civil War gave a great impetus to the industry. Manufacturers lost their Southern trade, but secured large government contracts, and many new factories were started to supply army uniforms. Sizes of clothing were stand
ardized by measurements that the government furnished, and these measurements were used in making clothing for civilians after the war. The requirements of the soldiers who returned to civil life in 1865, the re-establishment of Southern trade, the increase of immigration and the very rapid development of the West led to a large expansion of the industry. In the seventies and eighties small merchants, clerks, teachers and men in other lines wished to look upon good appearance but could not afford to patronize custom tailors,
began to buy factory-made clothing. Only a few factories now make separate trousers, the demand being for suits of the same material. Formerly manufacturers sold mostly to jobbers, but now nearly the whole output is sold directly to retailers. By 1907 tailor-to-the-trade houses were established. They make suits from measurements forwarded by merchants whose custom they select from the line of samples and stylebooks. Mail order houses sell both ready-made clothing and made to order suits.

The industry could not have grown to its present magnitude without the invention of many labor-saving machines and devices. Production was greatly increased by the sewing machine, which, patented by Howe in 1846, was introduced in this industry about 1850. By 1855 10 important improvements were patented, for making chain or lock stitches, with two or more threads, and one for working button holes. The speed, 800 to 900 stitches a minute, was about doubled when mechanical power was applied, and by 1900 was increased to 4,000 stitches per minute, with the machines or attachments for serging, felling, binding, seaming, seam-closing, two-row stitching, blind stitching, canvas front making, collar and lapel padding, sleeve inserting, button hol ing and button sewing. While most operations formerly done by hand are now done by machines, hand work is still considerably employed in felling and some other operations on the better grades of factory product. The first tool besides shears for cutting was a long knife, which, introduced about 1870, is still used for cheap garments. Pushed up and down through a slot in a table, it cuts many layers of cloth. The first power cutting machine, introduced in 1872, had a reciprocating blade, and soon afterward a belt cutter was invented. Machines, electronically operated, that could be pushed about the cutting table to follow pattern marks, were introduced in 1892. One variety, with a circular knife cut a maximum of three inches of cloth, and one with a reciprocating knife cuts six to eight inches. Shears are still used for cutting the better grades of clothing. In large factories linings are laid on the cutting table by an automatic laying machine. Ordinary irons were formerly used for pressing and still are for coats of the better grades. Irons heated from within by gas from a rubber tube were introduced about 1903, and pressing machines about the same time. A machine operated by a pedal was followed by a more powerful machine operated by steam.

Still another important factor in the development of the industry has been the adoption of more efficient methods of manufacturing. Before the Civil War, one worker usually made an entire garment by hand or by hand and machine. After factories were enlarged to make army uniforms subdivision of labor was introduced. The work has been divided more and more, so that now the operations in making a coat number from 30 to 60 or more. This subdivision, by which each worker performs only one separate operation, permits the employment of less skilled labor, and thus increases, as well as cheapens, production. Only by a minute subdivision could manufacturers have utilized the hordes of unskilled immigrants after 1880.

Before, during and after the Civil War, the making of garments after cutting was largely done under the contract system and the workers were employed for long hours at low pay. For 10 years after 1865, when large numbers of Russian Jews entered the industry, sanitary conditions in the shops were at their worst. Immigrants slept, cooked, ate and worked in small, dirty, foul-smelling rooms, without adequate ventilation or sanitary requisites. These places were usually called sweat-shops. The evils of such conditions were remedied in New York city, the most congested clothing centre, by the Tenement House Act of 1892, which prohibited contractors from manufacturing in their homes. Manufacturers adopted trade marks and began extensive advertising campaigns. The money thus spent was wasted unless the product was of uniform quality. Manufacturers, therefore, gave closer attention to the work done in the shops of their contractors. In many cases one of the lofts in the factory building was rented to the contractor, and this practice continues, a shop so situated being called an inside shop. To secure better workmanship, the contract system has had more and more abandoned, and in many of the larger factories all work is done under one roof by labor that the manufacturer directly employs. In Rochester splendid clothing factory buildings have been erected, and in the larger cities there are new factory buildings with all needful sanitary arrangements. Of the 4,830 establishments making clothing for men and boys in 1914, the 2,331 regular factories had 123,939 wage-earners and the 2,499 contract shops 49,068. Corresponding figures for establishments making clothing for women and children were: regular factories, 4,470, with 151,930 wage-earners; contract shops, 1,094, with 16,957. Of the 510,595 wage-earners in the whole clothing industry, reported by the 1914 census of manufacturers, the males and females 16 years of age and over were respectively 36.1 and 62.6 per cent; and workers under that age, 1.3 per cent. Women, who operated sewing machines exclusively, were gradually supplanted as operators to a large extent by Hebrew men who, in the early 80's, began to come in large numbers from Europe. Women are still largely employed for hand-finishing, which consists mostly of felling. Cutters and pressers have always been men. Few children have ever been employed in the industry. During recent years working conditions have been greatly improved, partly through legislation and partly by agreements of labor unions with manufacturers or manufacturers' associations. Working-day hours have decreased and sweat-shops practically no longer exist. Of the wage-earners in the whole industry, those that worked where the prevailing hours of labor per week were 54 or less were 58.1 per cent in 1914. Despite the decrease in working hours, the earnings of employees have increased. In all branches of the industry nearly all employees are paid for piece-work, instead of wages, and they, as well as the manufacturers, prefer the piece-work system, mainly because the workers differ so greatly in skill and speed.

The first census record of clothing manufactured for men and boys was for 1849, the first record of clothing for women and children was for 1859. Garments made by dressmakers
constituted the women's clothing shown by the records for 1859 and 1869. Factory production of cloaks began about 1870 and of women's suits, dresses, waists and skirts about 1880. After 1890, the manufacture of these garments increased at a wonderfully rapid rate. In 1914, the value of the factory product of clothing for women and children surpassed that of clothing for men and boys. In both branches of the industry, the factory, shop and working conditions have been about the same and similar machinery has been used. In the manufacture of clothing for women and children there is less subdivision of labor and more hand-work than so often if the collars were detached. She began to make separate collars for him about 1825 and to make them for sale a little later. Ebenezer Brown, a small dry-goods dealer in Troy, began, about 1829, to sell separate collars made by members of his family. They were called "string collars," because they were tied around the neck with tapes attached to the ends. By 1840 five other collar-making shops were started in Troy. To this day the collar business is largely centred there. The business is probably more localized than any other of the same magnitude in the United States.

The first shirt factory of which there is a

in the manufacture of clothing for men. Most of the factory-made clothing manufactured in the United States is produced in New York city, and nearly three-fourths in the State of New York. Corsets are manufactured principally in Connecticut and New York city. While models for styles of women's outer apparel have been mostly imported from Paris, many new designs have, in recent years, originated in America. All muslin underwear manufactured in the United States is of domestic designs. The wife of a blacksmith in Troy, N. Y., is credited with having invented separate collars for shirts. It occurred to her that she would not need to wash and iron her husband’s shirts

record was owned by David and Isaac N. Jordan, merchants in New York city. They frequently received from the South orders for shirts which they employed —seamstresses to make. In 1832 they started a factory for making stock shirts. In 1840 another firm in New York city began manufacturing shirts, and in 1845 a shirt factory was established in Troy. At the present time the production of shirts in Troy about equals that in Philadelphia or Baltimore, and the production in these three cities about equals that in New York city.

WALTER B. PALMER, Formerly Special Agent, Bureau of Foreign and Domestic Commerce.
CLOTHO, one of the three Fates (q.v.). In zoology, Clotho is a genus of snakes of the tribe Viperina, family Viperidae. *C. aristans* is the puff-adder of the Cape of Good Hope. In astronomy, Clotho is the name of the 97th asteroid, discovered by Tempel 17 Feb. 1868.

CLOTILDA, Saint, the daughter of Chilperic, King of Burgundy: b. about 475; d. Tours 545. In 493 she became the wife of Clovis, king of the Franks. She was the chief means of securing the conversion of her husband to Christianity, and largely influenced his life. After his death she lived a life of austerity at Tours. She was canonized a few years after her death. Her remains were buried in the church of Saint Géneviève at Paris, and burned at the Revolution to prevent their desecration; the ashes are still in the church of Saint Leu. There is a statue of her in Luxemburg and a fine church was built in her honor in Paris about 1850. Consult Kurth, ‘Sainte Clotilde’ (Paris 1905).

CLOTTING. See PATHOLOGY.

CLOTURE, klō-tür. See CLOSURE.

CLOUD, Saint, or CLODOALD, son of Clodomir and grandson of Clovis, King of France. After the death of his father and the murder of his two brothers he became a monk and found refuge in a monastery near Paris, which took from him the name of Saint Cloud. He died there in 560.

CLOUD, Virginia Woodward, American author: b. Baltimore. She was educated in private schools in Baltimore, is unmerry and has been a writer by profession since 1893. She is literary editor of the Baltimore *News* and member of the board of managers of the Woman’s Literary Club. Her publications include ‘Down Durley Lane’ (1898); ‘A Reed by the River’ (1902), and 19 connected tales of the Revolutionary and Colonial periods; character studies of women, now republished in many collections of readings; a trilogy of connected tales; ‘Jevellettes; also the ‘O’Tara Stories,’ published in *Harper’s Weekly* and *Uncle Remus’s Home Magazine*, and many stories, poems, etc., in leading magazines. She is represented by portrait and poems in the *Bible of the Nation*.

CLOUBERRY, a plant (*Rubus chamaemorus*) called also knobberry, mountain bramble and mountain raspberry, is found in peat-bogs and swamps from Maine and New Hampshire westward and northward to Alaska. The plant is of humble growth, the leaves few, large-lobed and kidney-shaped, the flower large and white, the fruit orange-red and of an agreeable flavor. It is a native of the northern parts of America, Europe and Asia. In Great Britain it is very confined to elevated moors. In Norway and Sweden it is much more abundant; the fruit is highly valued and makes excellent preserves. In Canada it is abundant in the north and greatly prized in Newfoundland, New Brunswick, Nova Scotia and northern Quebec. It is difficult to find among other parts of the horizon; it is the *Rubus geoides*, whose fruit is as large as a raspberry and one of the few native fruits of Tierra del Fuego and the Falkland Islands.

CLOUDBURST, a sudden and violent rainfall, covering a limited territory and of brief duration. The term generally connotes six or more inches of rainfall and at the rate of 10 or more inches per hour. The area covered by the heavy rains is probably not more than an acre; or not more than a square mile by the lighter storms. It occurs in the hottest season and most frequently on the slopes of mountains and in arid region vapor is generally accompanied by severe and continuous lightning. The cloud-burst is caused by the contact of a warm current of air, surcharged with moisture, with a cold current, the result being swift condensation and immediate precipitation of the water formed. Consult Ferrel, ‘Recent Advances in Meteorology’ (Washington 1886), and his ‘Popular Treatise on the Winds’ (New York 1889); Hahn, ‘Lehrbuch der Meteorologie’ (pp. 301–70, 1st ed., Leipzig 1901).

CLOUDS, masses of minute globules of water or crystals of ice and snow suspended in the atmosphere.

The minute globules of water that make the cloud are evidently condensed from the invisible moisture that is always present in the air in greater or less quantities. The studies of Aitken, J. J. Thompson, Wilson and others have thrown considerable light on the processes of condensation. If pure, dry air — that is, air from which all dust and traces of electricity have been removed — be mixed with pure water and the moisture be cooled below the temperature of saturation, it will be found that condensation of water vapor does not generally occur. If, however, fine dust be injected into the pure mixture without altering its temperature or pressure, a fine mist is developed at once. It has also been discovered that if a charge of electricity, however small, be introduced, condensation takes place at once. From these experiments it is inferred that nuclei of some sort, such as dust particles or electric particles, are necessary for the formation of water globules, other conditions being favorable.

The original classification of clouds by Howard in 1835 took account of form only. A more recent classification — the one now in general use — takes account of both the form of the cloud and its altitude. In this system three principal forms are recognized, namely, cirrus, cumulus and stratus, with subdivisions. These three main classes present the most obvious differences in form and shape; they develop at widely different altitudes and move with varying velocities. It is possible to further subdivide each class into a number of varieties, and in practice this is done when an observer becomes skilled in distinguishing the special forms and subdivisions of the main types.

The definitions of the principal types as recommended by the International Cloud Committee, and generally adopted by meteorologists, are given below.

*Cirrus* (Cl.).—Isolated feathery clouds of fine fibrous texture, generally of a white color, frequently arranged in bands, which spread like the meridians on a celestial globe over a part of the sky and converge in perspective toward one or two opposite points of the horizon. (In the formation of such bands Cl. S. and Cl. Cu. often take part.)

Cirrus clouds are the highest of all and move with the greatest velocity. They develop up to a height of about 10 miles, although their mean height is a little over six miles, being higher in summer than in winter. Their aven-
age velocity in winter is about 75 miles per hour, and in summer 65 miles per hour. They may be formed by mixture of air strata of different temperatures or by the cooling of a moist streak in the upper atmosphere by expansion and radiation. In the latter case, if the surrounding air be very dry, the newly-formed cloud is soon dissipated.

*Cirro-stratus* (Ci. S.).—Fine whiskit veil, sometimes quite diffuse, giving a whiskit appearance to the sky, and frequently covered with a smooth and sometimes a cloudy, condensed, semi-transparent or almost non-existent structure, exhibiting tangle fibres. The vein often produces halos around the sun and moon.

This cloud, as its name indicates, is one of the composite forms. Its structure is much on the same order as that of pure cirrus; in fact, it is generally composed of cirrus fibres tangled and interlaced in a most complex manner. The variety of forms, however, is practically unlimited and it undergoes rapid changes, especially in advance of a cyclonic disturbance. Like cirrus, it is composed of crystals of snow or ice, develops at a great elevation and moves with high velocity.

*Cirro-cumulus* (Ci. Cu.).—Fluffy cloud. Small white balls and wisps without shadows, or with very faint shadows, which appear in groups and often in rows.

This is a broken layer of cloud, of which the component masses are not fibrous, like cirrus, but more or less rounded. A second, although rather rare form of cirro-cumulus, is the mackerel sky of northern Europe. The cloudlets in this case are rounded, but not fluffy. The altitude of cirro-cumulus ranges from four to six miles and its movement, like cirrus and cirro-stratus, is quite rapid.

*Cumulus* (Cu.).—Woolpack clouds. Thick clouds whose summits are domes with protruberances, but whose bases are flat. These clouds appear in a diurnal ascensional movement which is almost always apparent. When the clouds are opposite the sun the surfaces which are usually seen by the observer are more brilliant than the edges of the protruberances. When the illumination comes from the side, this cloud shows a strong actual shadow; on the sunny side of the sky, however, it appears dark with bright edges. The top usually has a sharp border above and below. It is often torn by strong winds, and the detached parts (fracto-cumulus) present continual changes.

This cloud is undoubtedly formed by the condensation of water vapor in the summit of an ascending column of air. The flat base of the cloud and marks the level at which the condensation temperature is reached, and the upper dome-shaped summit represents the head of the air column protruding into colder space. In the temperate latitudes it is usually a cloud of the warm season and forms at an altitude of about a mile above the surface of the earth. Its average rate of movement ranges from about 20 miles per hour in summer to 30 in winter. There are many special varieties and forms of cumulus cloud.

*Alto-cumulus* (A. Cu.).—Dense, fleecy cloud. Larger white or grayish balls with shaded portions, grouped in flocks or rows, frequently so close together that their edges merge into a large, more or less compact (passing into S. Cu.) toward the centre of the group, and more delicate and wispy, (passing into Ci. Cu.) on its edges. They are very frequently arranged in lines in one or two directions.

Alto-cumulus clouds may occur when the ascending currents are not strong enough or do not persist long enough to form thick cumuli, or they may represent the vapor that is condensed in the upper portion of a series of atmospheric waves as suggested by Von Helmholz. The alto-cumulus ranges from one and a half to two miles. It is higher than the cumulus level, although the summits of cumulus clouds often penetrate into and above it. The mean velocity of alto-cumulus clouds is about 40 miles per hour, but somewhat higher in winter and lower in summer.

*Cumulo-nimbus* (Cu. N.).—Thunder cloud; shower cloud. Heavy masses of clouds, rising like mountains, towers or anvil, generally surrounded at the top by a veil or screen of fibrous texture or lime-like nimbuses-like masses of clouds. From their base generally fall local showers of rain or snow, and sometimes hail or sleet. The upper edges are either of compact cumulus-like outline, and form massive summits, surrounded by delicate false cirrus, or the edges themselves are drawn out into cirrus-like filaments. This last form is most common in spring showers. The front of thunderstorm clouds of wide extent sometimes shows a great arch stretching across a portion of the sky, which is uniformly lighter in color.

Cumulo-nimbus clouds are of massive dimensions and the most impressive of all clouds in the realm of nature. The upper surface of this cloud, which is sharp and well defined in the earlier stages of its formations, becomes soft and wispy soon after rain begins to fall from its base. The cloud itself may be divided into three planes, namely, the lower, consisting of vapor, the middle of water and the upper of ice or snow. The tops of some of these clouds reach 6 or 8 or even 10 miles into the atmosphere. Professor Bigelow computes that the temperature in one of the lowest of these clouds ever observed fell from 79.5° F. at the ground to —24° F. at a height of nearly nine miles.

*Stratus* (S.).—Fog, stratus, sea fog. When this stratum is born by the wind or mountain summits into irregular fragments they may be called "fracto-stratus."

This cloud, as its name implies, is merely a horizontal sheet floating at a low elevation and without any special structure. It is generally formed by the intermingling at the surface of contact of air strata of different temperatures, and it indicates a horizontal flow of air rather than an ascensional movement in the case of cumulus clouds. The average elevation of stratus clouds is less than half a mile and their average velocity about 15 miles per hour.

*Strato-cumulus* (S. Cu.).—Large balls or rolls of dark cloud, which frequently cover the whole sky, especially in winter, and when the condensation temperature is reached, and the upper dome-shaped summit represents the head of the air column protruding into colder space. In the temperate latitudes it is usually a cloud of the warm season and forms at an altitude of about a mile above the surface of the earth. Its average rate of movement ranges from about 20 miles per hour in summer to 30 in winter, and its rate of movement varies from 20 to 30 miles per hour. It is often a thin cloud through which patches of blue sky can be seen. Again it covers the sky and presents a deep undulating surface with a tendency to break up into long parallel rolls or bars.

*Alto-stratus* (A. S.).—Thick veil of a gray or bluish color exhibiting in the vicinity of the sun and moon a brighter portion, and which, without cause from the wide horizon. This form shows gradual transitions to cirro-stratus, but, according to the measurements made at Upsala, was only one-half the altitude.

The average height of this cloud is about three and a half miles in summer and three
Forms

Cirro-stratus  Cirro-cumulus

Alto-cumulus  Nimbus

Cumulus  Cumulus-nimbus
miles in winter. Its average velocity ranges from 40 to 50 miles per hour.

*Nimbus* (N.).—Rain cloud. Dense masses of dark formless clouds with ragged edges, from which generally continuous rain or snow is falling. Through the breaks in these clouds there is almost always seen a high sheet of cirro-stratus or alto-stratus. If the mass of nimbus is torn up, small fragments of cloud are floating much below a great nimbus, they may be called "fractional nimbus" ("scoud" of the sailors).

As soon as rain falls from a cloud it is called a nimbus, whatever its form before the beginning of rain, with one exception, namely, when rain begins to fall from a lofty cumulus cloud it is called a cumulo-nimbus to distinguish it from a system of pure nimbus clouds, the latter being flatter and more in the nature of a sheet cloud.

**Colors of Clouds.**—The brilliant colors sometimes assumed by clouds at sunrise and sunset are probably caused by selective absorption and reflection of light by dust particles or vapor haze in the atmosphere. The clouds of the day-time, especially those having a great elevation, are white, since they reflect the greater part of the light incident on them.

The bases of cumuli are generally of a dark shade, while the portions in shadow are mostly of a gray color.

Thunder clouds sometimes have an olive-green tint, and this is thought by some observers to portend high winds and heavy rainfall.

**Utilization of Clouds in Weather Forecasts.**—This topic has been the subject of considerable study by Ley, Abercromby and others in Europe, and by McAdie, Clayton and the writer in the United States. In forecasting weather changes from synoptic charts the clouds frequently show the advance of a cyclonic disturbance, but not before the same information is given by the circulation of the surface winds and the fall in the barometer. Unfortunately it is not possible to fully describe and diagram the significant features of the various cloud forms so that they may be available at a central weather station; in the case of a solitary observer, however, some skill in making local predictions of the weather may be attained by a careful study of cloud forms in connection with the barometer.

**Methods of Observation.**—The kind, amount and direction of clouds form a part of meteorological observations whether made for purposes of weather forecasting or for purely climatic studies. In the last-named event it is chiefly desired to know the extent of sky covered with cloud on the average of the season, since one is then able to judge of the nature of the climate with respect to sunshine. In weather forecasting it is important to know, not only the kind of cloud observed, but both its direction and apparent velocity, although in actual practice the last named is rarely attained. This information is best obtained by means of a nephoscope. An excellent form of nephoscope was devised by Prof. C. F. Marvin, United States Weather Bureau, in 1896. Professor Marvin's nephoscope is shown in the illustration.

The circular frame, A, is mounted upon three leveling screws, and its upper surface is graduated to degrees, numbered from 0 to 360, the numbers increasing in a direction contrary to the direction of motion of clock hands. The plate and mirror, \( M \), revolve smoothly within the circular rim, \( A \), being carried upon a hollow vertical axis at the centre. The arm, \( B \), carrying the sighting staff, \( S \), also revolves upon the central axis, the outer end traversing the narrow annular space between the mirror and graduated rim. The staff, \( S \), is telescopic in construction, and is attached to the arm at \( B \) by a hinge which permits the staff to be inclined from the vertical to any extent, but always in a plane perpendicular to the mirror. The top portion of the staff is provided with a crosshead, which is surmounted by a small sighting-knob, \( s \). The crosshead is adapted to receive the secondary staff, \( S' \), which slides with gentle friction through the crosshead, and is tipped at either end with small secondary sighting-knobs, \( s' \) and \( s'' \). By reason of the telescopic construction of the staff, \( S \), the crosshead cannot only be turned about in any direction, but it and the sighting-knob, \( s \), can be raised by various amounts, being held in place by friction. The hinge, \( B \), is made in such a manner that when the staff, \( S \), is placed in a vertical position, the small rod sliding inside can be forced down into a hole in the hinge, the effect of which is to lock the hinge so that the staff is held rigidly in a vertical position.

In using the nephoscope the observer looks down upon the mirror, \( M \), and observes the reflection of the cloud. By moving his eye he brings a point of the cloud image and the reflection of the sighting-knob, \( s \), into coincidence at the centre of the mirror. The head should be held so that the knob is always seen at the centre of the mirror. The cloud image will then appear to move away from the centre of the mirror. The mirror is then revolved until the graduated line becomes parallel with the motion of the cloud, when its direction of motion may be read off and its apparent velocity determined by timing the image as it passes along the graduated scale of the mirror.

Other forms of the nephoscope have been devised and used, mostly in European countries, and Prof. Cleveland Abbe, of the United States Weather Bureau, has devised a very convenient form of nephoscope for use on vessels at sea.

In determining the height of clouds, direct observations of their angular altitude are made by two observers at the ends of a measured base-line, whence the altitude may be computed by trigonometric formulae. The same results may be obtained by photography, but the method is not so direct and the computations are more laborious. Consult Clayden, *Cloud Studies* (London 1905). The literature of the subject...
CLOUDS — CLOUS

is to be found in the reports of weather bureaus and in meteorological journals.

ALFRED J. HENRY,
Professor of Meteorology, United States Weather Bureau.

CLOUDS, The, a comedy by Aristophanes; acted in 423 a.c. It is an attack on the new spirit of intellectual inquiry with Socrates as the general type of faulty teacher. The "Sophists" whom Aristophanes attacks are those who delved in science and the professors of letters and rhetoric. Though one of the most interesting and poetic of the author's plays, the people refused to hear it a second time. But its literary popularity counterbalanced its failure on the stage.

CLOUET, Ido-e, French family of artists, descendants from Flemish ancestry. I. JEAN, ya'han, the first known of the family, was in 1475 a resident of Brussels. His works are unknown. 2. His son JEHANNET: b. 1485; d. 1541. He migrated to France and located at Tours. In 1518 he went to Paris and became court painter and valet de chambre to Francis I. A portrait of the King, in the Louvre, is said to have been painted by this artist, also another portrait of the King, in the Pitti Gallery, Florence, is credited to him. Several other pictures in European galleries are said to have been painted by him. In all the style is that of the Flemish school.

3. François, son of Jehanet: b. 1510; d. 1572; succeeded his father as court painter to Francis I and retained the position under Henry II, Francis II, Charles IX and Henry III. He executed the wax masks of Francis and Henry II. His portraits are mostly unknown but many have been attributed to him, among them full lengths of Henry II (Uffizi), Charles IX (Vienna), Elizabeth of Austria (Louvre) and a miniature of Catherine de Medicis (Vienna Museum).
His works are mentioned in the records of the court. Some authorities mention a brother of François, but of him nothing positive is known.

Consult De Laborde, Léon. 'La Renaissance des arts à la cour de France' (1855); Grandmansion, 'Les Arts en Touraine' (1870).

CLOUGH, klooh, Anne Jenima, English educator: b. Liverpool, England, 20 Jan. 1820; d. Cambridge, 27 Feb. 1892. She was a sister of John CLough (see). Her girlhood spent in Charleston, S. C., opened a day school at Liverpool in 1841. Becoming interested in the general subject of education, the North of England Council for Promoting the Higher Education of Women was founded through her efforts, and from this sprang the idea of the Cambridge higher local examinations. Lectures for women having been established at Cambridge in 1869, Miss Clough, in October 1871, took charge of a house of five women students, out of which grew the present Newnham College, over the administration of which she presided until her death. During her busy career she accomplished much for the higher education of English women. Consult Clough, B. A., 'Mémoire de Anne J. Clough' (1897).

CLOUGH, Arthur Hugh, English poet: b. Cambridge, 7 Jan. 1819; d. Florence, Italy, 13 Nov. 1861. He studied under Arnold at Rugby, then at Balliol College, Oxford, and became a fellow of Oriel College in 1842. In 1849 he became head of University Hall, Lon-

Nov. 1862. He took part in the siege of Yorktown, the Seven Days' battles in June 1862, Mobjack Bay, Antietam Hill, Second Bull Run, Fredericksburg, Chancellorsville and Gettysburg, being twice brevetted for gallant conduct at the latter. He served on the frontier and in Indian campaigns 1868–86, as judge advocate in major cases and cases 1868–86, was assistant to the judge advocate-general 1886–90 and professor of law at West Point 1890–96.

During the Spanish-American War he was appointed a brigadier-general of volunteers and served on the staff of Major-General Miles. He attained his lieutenant-colonelcy 12 Feb. 1892. He was the author of lectures on Military Law and Suspension of the Writ of Habeas Corpus, delivered at Union College in the Butterfield lecture course.

CLOUTIER, kloo'ys', François Xavier, Canadian bishop: b. Sainte Geneviève de Bataiscan, 2 Nov. 1848. He was educated at Three Rivers and Laval University, and ordained to the priesthood in 1872. He was consecrated bishop of Three Rivers 25 July 1899.

CLOUDE, klood', Claude, the unerring flower-hud of an East Indian tree (Eugenia aromatica) somewhat resembling the laurel in its height and in the shape of its leaves. The flowers grow in clusters, and the petals are small, rounded and of a bluish color; the fruit is an oval berry. The Molucca Islands, where the raising of different spices was formerly carried on by the Dutch colonists to a great extent, appear to be the native land of the clove, and the best are still brought from that quarter. At one time, bowing in deference to a lucrative trade, of commerce in this article to themselves, the Dutch destroyed all the trees growing in other islands and confined the propagation of them to that of Ternate. But both clove- and nutmeg-trees were transplanted from the Moluccas into the islands of Mauritius and Bourbon, and the clove is now cultivated with success in many warm countries, including Zanzibar and the West Indian islands. At a certain season of the year the clove-tree produces a vast profusion of flowers. The operation of gathering is performed between the months of October and February, partly by hand, partly by hooks and partly by beating the trees with bamboo. The clove is subsequently dried by exposure to the smoke of wood fires, afterward to the rays of the sun. When first gathered they are of a reddish color, but by drying they assume a deep-brown cast. This spice yields a very fragrant odor and has a pungent, pungent and warm taste. It is most frequently used in culinary preparations. When fresh gathered, cloves will yield, on pressure, a fragrant, thick and reddish oil; and by distillation a limpid essential oil.

The medical value of cloves is due to the presence of eugenol, C₆H₅OH, in the volatile oil. Eugenol is extremely active, acting like the phenol, or carbolic acid group, to which it is related. Clove is a marked local anesthetic, astringent and bactericide, an excellent stimulant to the sympathetic nervous system, expelling flatus from the stomach and the intestines, by increased peristalsis, and increasing the flow of the gastric and intestinal juices. Its value in toothache is due to its anesthetic and bactericide action. A number of new compounds of eugenol are on the market. Benzoyl-eugenol and cinnamyl-eugenol are used in the treatment of tuberculosis.

CLOVE-BARK, the bark of various aromatic trees, used in the manufacture of drugs and spices. A tree (Dicyeliium Caryophyllatum) of Brazil supplies a cinnamon-like cylinder which is commonly known as clove-bark in the American markets and is used in medicine as cassa Caryophyllata. The name is often given also to cillulaw and cinnamon.

CLOVE-PINK, or CLOVE GILLYFLOWER, the carnation (Dianthus Caryophyllus), more especially a whole-colored, clove-scented variety of it.

CLOVER, Richardson, American naval officer: b. Hagerstown, Md., 11 July 1846. He was graduated at the United States Naval Academy in 1867. He was advanced through the various grades, attaining that of rear-admiral in 1907. He had charge of the survey of southeastern Alaska in 1885–86, was hydrographer at the Bureau of Navigation 1886–93 and chief of the Office of Navigation since 1897–98. He commanded the Bancroft during the war with Spain and afterward returned to the Naval Intelligence Office. In 1900–03 he was naval attaché at London, and in 1906–08 was president of the Board of Naval Inspection and Survey. He was retired 11 July 1908.

CLOVER, species of the genus Trifolium, belonging to the pea family (Fabaceae). Of Trifolium about 400 species have been described; they are most abundant in the northern temperate zone, a few in South America and South Africa. Some are very important in agriculture, either for pastureage, fodder or for soil-improvement.

The word "clover" is also applied to species of related genera, as bur-clover (Medicago), sweet clover (Melilotus), bush and Japanese clovers (Lespedeza), prairie clover (Petalostemon), etc.

The true clovers (Trifolium) are herbs with mostly three-foliolate leaves; purple, pink, white or yellow small flowers in dense heads or spikes; and straight membranous pods containing one to four seeds.

The most important species to the farmer is the common red clover (Trifolium pratense), now naturalized in North America, being native of Europe and northern Asia. It has been grown in England for over 300 years. It is a more or less hairy perennial, growing from six inches to two feet high. The flower-heads are dense, oval or ovoid, about one inch long; flowers white or nearly so, rarely white, remaining erect in fruit; calyx sparingly hairy. It is one of our best forage plants for nutritive value, high yield and good range of adaptability; it is commonly found in meadows and pastures and is used as a green manure. It flowers from April to November. The seed weighs about 60 pounds to the bushel, and, if sown alone, 10 to 12 pounds will sow an acre.

Zigzag clover, cow-grass and marl-grass or mammoth clover (Trifolium medium) may be an offshoot of T. pratense. T. pratense differs in being a larger plant, having zigzag stems, the flower-heads larger, longer stalked and often of a deeper purple color, with a practically smooth calyx tube. It is a native of Europe and Siberia and blooms during the summer.
Alsike or Swedish clover (Trifolium hybridum) is an erect perennial, growing one to two feet high. Its flowers are pink to white and are open about the same time as those of timothy. It is suited to heavy clay soils and is not adapted to soils that would stand irrigation. It has smaller and shallower roots than common clover. It is sometimes sown alone, when, owing to its small seed, four pounds per acre is sufficient. It is better suited to mixtures. It was introduced into Great Britain from Sweden in 1834.

White, Dutch or honeysuckle clover (T. repens) is a common perennial, low-growing plant with white to pinkish flowers, native of Europe, Siberia and perhaps of the northeastern United States. Its method of seeding makes it permanent. As its yield is small it is seldom grown alone, but is often incorporated in mixtures. It is a bee-plant and is common on nearly all soils. See DUTCH CLOVER.

Crimson, carnation, Italian or scarlet clover (T. incarnatum) is an erect, hairy annual, growing six inches to three feet high. The leaflets are nearly sessile, the flower-heads are terminal, oblong or ovoid, one to two and a half inches long; petals, purple, pink or white, sessile; calyx hairy. It is often grown as a catch or cover crop in orchards, etc., and sometimes for grazing and hay. It is quite ornamental and is now grown by the florist.

Yellow clover or hop clover (T. agrarium) is a hairless or slightly hairy annual clover, growing 6 to 18 inches high, with small yellow flowers which are open between May and September. It is common along roadsides and waste places. T. procumbens is also called yellow clover or hop clover; it is more spreading and hairy than the above. It is common on dry soils. Alexandrian or Egyptian clover (T. alexandrinum) is an annual, bearing oval, pale yellow or whitish flowers. As it is an important fodder in Egypt it is presumed that it will be of value for the Southern States. Rabbit-foot, stone or old field clover (T. arvensis) is a common annual of no value. T. dubium is the least hop clover or hop-trefoil, also called yelow-suckling clover, and is regarded by some as the true shamrock.

Uses and Feeding Value.—Clovers are grown for hay, pasture, silage, green-manuring, cover-crops and soil improvement. Clovers or some other legume should have a place in every rotation, because of their deep, fleshy root system and capacity for appropriating free nitrogen from the air in the soil by means of bacteria on their roots. Their deep roots penetrate the sub-soil and transfer valuable plant food to the surface soil, which is liberated when they decay. It has long been known that the growing of legumes improved the soil; Pliny recommended that such crops be grown previous to grain crops. The wisdom of this is now supported by recent research. In 1888 it was announced that the nodules on the roots of leguminous plants were colonies of bacteria, and that their work was to take up nitrogen from the soil-air for the benefit of their host; hence we have the fact that a large quantity of nitrogen can be removed from the soil for a series of years in the form of clover-hay or alfalfa hay — yet the surface soil be richer in nitrogen at the end of the period than it was at the beginning. Flowing a crop of clover under as green-manure is a very effective way of enriching the soil in humus.

This is now practised in orchards to a considerable extent; the tillage they receive and the crops removed rapidly deplete the fertility of the land, hence the introduction of the practice of seeding down the orchards during the summer with some legume, as crimson clover, cowpeas, soy-beans, etc., to add humus, protect the land from washing during the fall and winter and in wet seasons, by using up the moisture, to aid in maturing the buds of the trees and enable them to stand the winter; the crop being plowed under the following spring when cultivation begins.

The average percentage composition of clover is given as—

At the Wisconsin station, clover cut three times in one year yielded 25 tons of green forage per acre; this may be regarded as a maximum yield. The first cutting, made 29 May, contained only 8.2 per cent of dry matter and was on this account unsatisfactory as a soil-building crop, although, generally speaking, this crop is a most valuable one for this purpose, being relished by all stock. The total dry matter contained in the three crops was nearly four tons per acre.

If given in excess while green, or grazed, it is liable to cause bloat. To prevent this, give dry fodder in addition, and do not turn the animals out when they are very hungry or the dew is on. Clover pasture is excellent for growing pigs, and they may be fattened on it.

Experience has shown that the best time to cut clover for hay is when one-third of the heads are turning brown. As ordinarily cured it is liable to be dusty, hence it is not considered a satisfactory feed for horses. For growing and idle horses, bright, clean clover hay is both economical and valuable. Hay from overripe crimson clover is dangerous for horses; the bristly hairs accumulating in the intestines, form balls, causing stoppages and death. Clover hay is a most valuable forage for cattle, especially milch cows; 10 to 12 pounds may be fed daily, its high nitrogen content permitting a reduction of the amount of concentrated feed.
It is one of the best coarse fodders for sheep, and when chaffed fine is used for feeding laying hens in winter.

Clover Diseases.—The common diseases are: Clover rust (Uromyces trifolii), which appears in various stages on the leaves, leaf-stalks and stems of the plant, particularly of white clover. White minute cups appear in spring or early summer, accompanied or followed by small brown spores, which are finally followed by darker spores which live through the winter and germinate the following spring. Clover rot (Sclerotinia trifoliorum) attacks many legumes. The disease causes a browning of the stem and leaves, which are soon spotted with a white mold, which ultimately forms solid, wavy, black bodies often half an inch long. These produce mushroom-like bodies the following spring. Burning over the infested field and a proper rotation of crops are advocated for both diseases.

A leaf-spot (Pseudopezia trifolii) is often destructive, especially during a wet fall. The leaves are covered with small black spots. Dodder (q.v.) is a parasitic plant responsible for considerable loss in some places.

Insects.—Of the various insects which injure clover the following are prominent: The clover-root borer (Hydastes trifolii), which has in some sections killed the clover the second year, thus necessitating a change in the rotation of the crops. The clover-stem borer (Languriro mozaerti) is widely distributed. The clover-leaf beetle (Phytomonus punctatus) is a weevil which feeds at night, consuming all parts of the plant. The clover-leaf midge (Cecidomyia leguminicola) is one of the worst pests; the eggs are laid in the blossoms, where the larvae feed on what should be the seed. They pupate in the ground or in the seed. There are two or three broods annually. Various insects attack the stored hay, the most common being the clover-bay worm (Asopia costalis).

CLOVES, Oil of. See CLOVE.

CLOVIS, king of the Franks: b. about 465; d. Paris, 27 Nov. 511. He succeeded his father, Childeric, in the year 481, as chief of the warlike tribe of Salian Franks. He united with Ragnaciaire, king of Cambray, declared war upon Syagrius, the Roman governor at Soissons, and utterly routed the Romans near Soissons, in 480. Soissons was then made the capital of the new kingdom of the Salian Franks. Clovis married Clotilda of Burgundy (q.v.), who had been educated in the Christian faith and was desirous that her husband also should become a Christian. When he was hard pressed in a battle against the Alemanni at Tolbiac in 496, Clovis called on the God of Clotilda and the Christians. Consequently, when the victory was won, and territory of the Alemanni submitted to him, he was solemnly baptized at Rheims, 25 Dec. 496, with several thousand Franks, men and women. Hostilities soon broke out between Aalaric, king of the Visigoths, and Clovis. In an engagement fought at Vouglé, near Poitiers, the latter gained a complete victory, slaying his enemy with his own hand. After this victory Clovis received the honor of the consulsship from the Emperor Anastasius. In the last year of his reign Clovis had called a council at Orleans, from which are dated the peculiar privileges claimed by the kings of France in opposition to the Pope. His plans for a unified Frankish kingdom, for which he labored unscrupulously all his life, were frustrated in 511 by the loss of Burgundy, which divided the newly organized realm among his four sons. Consult Gregory of Tours, 'Historia Francorum' (Bk. II, ed. by Arndt for the 'Monumenta Germaniae Historica,' Hanover 1883); Junghaus, 'Geschichte der fränkischen Könige Childerich und Chlodwig' (Göttingen 1857); Schultze, 'Deutsche Geschichte von der Urzeit bis zu den Karolinger' (Vol. II, Stuttgart 1896); Kurth, 'Clovis' (2d ed., Paris 1901).

CLOVIS II, king of Neustria and Burgundy: d. 655. He was the second son of Dagobert, whom he succeeded in 638.

CLOVIS III, king of France: d. 695. He was the son of Thierry III, whom he succeeded in 691 at the age of nine. He reigned five years, under the guardianship of Pepin d'Heristal, mayor of the palace.

CLOWES, Clowz, Frank, English chemist: b. Bradford, Yorkshire, 1848. He was educated at the Royal School of Mines, London, Royal College of Science, Dublin, and the University of Würzburg, and was professor of chemistry at University College, Nottingham, 1881-97, and its first principal. He has published 'Text-book of Practical Chemistry and Qualitative Analysis'; 'Text-book of Quantitative Analysis'; 'Elementary Practical Chemistry'; 'Introductory Quantitative Analysis' (1890), etc.

CLOWES, Sir William Laird, English naval critic: b. London, 1 Feb. 1856; d. there, 14 Aug. 1905. He was educated at King's College, London; and from 1876 to 1895 was correspondent for various newspapers. He wrote much on naval development and on art and sociology. His works include 'The Needs of the Navy' (1902); 'Four Naval Campaigns' (1902); 'Told to the Marines' (1902); 'Naval Black and Navy White' (1892); 'Elocuens' (1889). He was the editor and chief contributor to 'The Royal Navy; a History' (1897-1903). He was knighted in 1902.

CLOWN, a rôle peculiar to the stage of English-speaking people, but bearing some resemblance to the graciosos of the Spaniards, and the Hanswurst of the Germans. The origin of the word is uncertain, some deriving it from the Latin colonus, in the sense of a peasant farmer, and others connecting it with certain Scandinavian and other Teutonic words. On the old English stage, the clown was the privileged laughter-provoker, who, without taking any part in the dramatic development of the piece represented, carried on his improvised jokes and tricks with the actors, often indeed addressing himself directly to the audience instead of confining himself to what was going on stage. In Shakespeare, on the contrary, a distinct part was assigned to the clown, who no longer appears as an extempore jester, although he now has a few lines to the limit extent in keeping with his traditional functions. At a later period the clown was altogether banished from tragedy and allowed to appear only in the after-piece, performing gro-
tesque dances, singing comic songs, etc. He is now confined to the pantomime, where his part is generally of a more burlesque character than that of the French Pierrot; and in circuses where his performances are of the tumble variety.

CLOYD'S MOUNTAIN, Battle of. On 3 May 1864 Gen. George Crook of the Union army marched from Fayette, W. Va., to break the Virginia and T. Railroad at the New River bridge. He had 11 regiments of infantry and two batteries of artillery, in all about 6,100 men, brigaded under Col. H. G. Sickel, C. B. White and R. B. Hayes. He marched through Raleigh, drove a small Confederate cavalry force from Princeton and on the 8th reached Shannon's Bridge, seven miles from Dublin, where he was joined by 400 cavalry. Here he found next morning that the Confederates—three regiments and a battalion of infantry and two batteries—under Gen. A. G. Jenkins and Col. John McCausland, were barring his way, strongly posted behind log and rail breastworks, on a steep and thickly wooded spur of Cloyd's Mountain, with guns sweeping the road and open country in front. Crook opened on the position with artillery and musketry, and then, under cover of the timber, sent White with his own brigade and two regiments of Sickel's to turn the enemy's right, and the moment they were engaged Sickel and Hayes charged directly to the front across a meadow swept by artillery and musketry fire and up the steep ridge. Parts of the line were repulsed, again to rally and go forward, and after a hard contest, in which bayonets and clubbed muskets were used across the works, they were carried, the Confederates retreating to Dublin, leaving, as Crook reports, 230 unwounded men as prisoners, and two guns, in his hands. The Union loss was over 600, that of the Confederates about 500. General Jenkins was mortally wounded and left on the field. Crook followed the retreating troops, and when near Dublin encountered about 500 of Gen. John H. Morgan's command, under Colonel Smith, that had come from Sattville and endeavored to cover McCausland's retreat. These Crook drove back and at night he occupied Dublin. On the 10th he marched to Newborn and thence to New River Bridge, which McCausland tried to save, but after a two-hours' artillery duel in which Crook had 11 men killed and wounded, he seized and destroyed the bridge and the railroad for a considerable distance, then marched by way of Union, Alderson's Ferry and Lewisburg to Meadow Bluff, which he reached on the 19th, his march harassed by the enemy's cavalry. Crook's entire loss was 109 killed, 513 wounded and 72 missing. On his return march he was obliged to leave 200 of his wounded, with surgeons, who were captured. The Confederate loss, as reported, was 76 killed, 262 wounded and 200 missing or captured. Consult 'Official Records' (Vol. XXX, XVII); Pond, 'The Shenandoah Valley in 1864.'

E. A. CARMAN.

CLOYNE, Ireland, town 16 miles south-east of Cork. It has an ancient cathedral, near which is a round tower, a free school, founded by Bishop Crow in 1726, and is the seat of a Roman Catholic bishopric. It has boot and shoe manufactures. From 1638 to 1833 it was the see of a bishop belonging to the Established Church of Ireland, but in the latter year it was united with Cork and Ross. From 1734 to 1753 George Berkeley, the philosopher, was bishop of Cloyne. Pop. of parish 2,203.

CLFR. (Lat. clerus, to divide, to count, expenses being shared by the members), a company of persons associated for some common object—social, literary, political, etc. It has been claimed that social clubs were known to the ancient Romans, but the evidence of their existence is scanty. Inscriptions tell of clubs of Roman citizens in foreign cities and also of military clubs. For several centuries the club has been a peculiar institution in England and of late it has become a prominent feature in American life. It is not easy to determine at what time clubs originated in England, but Ocelev mentions one to which he belonged (during the reign of Henry IV), called "La Courte de Bone Compaignie." In 1659 Aubrey explained the word "clube" as meaning "a sodality in a tavern." He adds, "Here we had a balloting-box and balloted how things should be carried." The earliest London club of any celebrity was established about the beginning of the 17th century at the Whitehall Tavern, Friday street (otherwise known as Bread street). Among its members were Shakespeare, Sir Walter Raleigh (the founder), Beaumont, Fletcher, Donne and Selden. Ben Jonson figured at another club at the Devil Tavern, near Temple Bar. It appears certain that clubs existed alongside of coffee-houses in the 17th and 18th centuries. At that time, however, their character was very different from what it is now. The coffee-houses of those days were the nearest representatives of the modern clubs, while the clubs were commonly nothing but a kind of restaurants or taverns where people resorted to take their meals. There was one feature, however, which was peculiar to clubs from the first, and distinguished them from coffee-houses; namely, that, while anybody was free to enter a coffee-house, it was absolutely necessary that a person should have been formally received as a member of a club, according to the custom before he was at liberty to enter it. Almack's, Brooks' and White's were among the best known coffee-houses. Among the earliest of the London clubs was the Kit-Cat Club, founded in the reign of Queen Anne. Among its 40 members, who used to meet at the shop of a pastry-cook (Christopher Cat or Katt), in order to do justice to certain mutton pies for which he was famous, were six dukes, among them the Duke of Marlborough; five earls; many of the most distinguished leaders of the Whig party, such as Sunderland, Halifax, Sir Robert Walpole and others; and several of the leading authors of the day, among them, Vanbrugh, Congreve, Addison and Steele. The last two owed to the club idea the form given to the Spectator. Another club formed about the same time was the Beefsteak Club. Originally these two clubs had no pronounced political views, but in the end they began to occupy themselves with politics, the Kit-Cat Club being Whig and the Beefsteak Club, Tory. There have been several Beefsteak clubs since. During the last century it was common to give eccentric names to clubs and the conditions of being admitted to membership in any one of
these clubs were as a rule equally remarkable. Among these may be mentioned the Surly Club; the Split-farting Club; the Ugly Club (of which Wilkes was elected president for life, and Mirabeau was an honorary member); the Unfortunate Club; the Lying Club, the members of which were called upon to tell the single truth during their sitting, unless they had been expressly authorized to do so by the president. Perhaps the most celebrated club of the 18th century was that which was first called 'The Club,' but which was afterward known as the Literary Club. It was founded in 1764 and numbered among its members Dr. Johnson, who was for a long time its president, Sir Joshua Reynolds, Edmund Burke, Oliver Goldsmith, Edward Gibbon and other distinguished men. In 1864 the 100th anniversary of its foundation was celebrated. In the rules which Dr. Johnson wrote for another club, the Apollo, he coined the still-serviceable word, 'clubbable.' In 1800 there were only half a dozen clubs existing in London, and within a century there were 100, with a total membership of 80,000. The most important London political clubs of the present day are the Carlton Club, founded by the Duke of Wellington, and the Reform Club, the principal club belonging to the Conservative party in the kingdom and the building in which its members meet, which is the most palatial edifice of the kind in the kingdom, may be regarded as the headquarters of the Conservative party. This club was founded in 1832 (2,000 members). The Reform Club, the building belonging to which stands next to that of the Carlton Club, was long the great club of the Liberal party, founded in 1837. Among the other important London clubs are the National Liberal, Constitutional, United Service, Athenaeum, Army and Navy, Travelers, Garrick, Primrose, etc. Similar clubs were started in the chief cities of England and in the colonies.

The first English society to take the name of club was Le Club Politique, established in 1782, and a few years later, Le Club de Boston or Club des Américains, was formed in Paris. The political clubs had no regular form, as they were formed during revolutionary epochs. The Club des Jacobins, the Club des Feuillants, the Club des Cordeliers and the Club de Montmorency were the most famous clubs of the time of the first French Revolution and formed the storm-centres of that movement. None of the French clubs survived the coup d'état of 9 Nov. 1799, by which Napoleon overthrew the Directory. Two clubs were formed during the revolution of 1830, but they were both dissolved by the law relating to associations. At the revolution of February 1848 hosts of clubs started into existence, the most celebrated of which was the Central Republican Society (Société centrale républicaine), but their duration was short, for the Constituent Assembly in the following year ordered them all to be closed.

About the same period as in France, political clubs were introduced into Italy, Germany and Spain, especially during the time of the first French Republic. In 1848 in Germany, however, they were put down by a law of the empire in 1793 and in 1832 a federal decree was issued prohibiting all kinds of political societies and assemblies. In 1848 the number of clubs found in Italy, and particularly in Germany, was very great, but their collapse was as sudden as their rise. Later in the century municipal clubs, somewhat on the 'good government' order, arose in Prussia. The city of Berlin had 75 such organizations in 1896. Some of these clubs inter mixed savings-bank features. Social clubs of the English type have not spread rapidly on the Continent. In France the name cercle was given to clubs of this nature. The most fashionable clubs of Paris are Le Cercle de la rue de Roquent and the Jockey Club. Many sports besides horse-racing are represented in the club life of the French capital. The automobilists and the devotees of yachting, fencing, etc., have their separate organizations. There are also cercles for army officers, for literary men, for artists and one connected with agricultural interests. Alpine clubs (q.v.) are found in many European countries. The French society of that name has numerous branches. Catholic clubs of workmen exist in different parts of the country.

Although clubs were not unknown in the United States toward the close of the 18th century (the Hoboken Turtle Club dating back to that period), yet the principal club belonging to the Conservative party were slow previous to the Civil War. Among those antedating the War were the Union Club of New York (1836), the Somerset Club of Boston (1857) and the Maryland Club of Baltimore (1857). The Union League Club of New York (1863) grew out of the purpose to defend and perpetuate the national integrity, to encourage loyalty to the Federal government. Other Union League clubs were formed later in Philadelphia and other cities; and in all the important centres of the country there grew up large and flourishing societies of a political or social nature, or such as combined the two features. The Manhattan Club became the chief social Democratic club of New York. The Saint Nicholas Club represented a different type, a society founded upon a similarity of ancestry or antecedents and endeavoring to preserve historical associations. As these organizations have increased in number they have become more varied in character, until not only politics, science, art, music, literature, sociology, religion, philanthropy and professional, commercial, social and sporting life are all represented, but the subdivisions are bewildering and continually increasing. Athletic clubs of various kinds are numerous and popular, abroad as well as in America.

University clubs draw together the college-bred men of various sections or cities. The largest one of the kind in the United States is that in New York, which has over 3,500 members. The city has also a Yale, a Harvard, a Princeton and several other college clubs. Among the largest clubs of the metropolis, in addition to those already mentioned are the following: New York Athletic, New York Yacht, Century, Army and Navy, Metropolitan, Players, Lotus, The Knickerbocker Club, Authors' Club, Press Club, Grolier Club, Catholic Club, Holland Society, etc. The Chicago Athletic Club has 3,000. In Philadelphia, addition to the Union League, the Manufacturers' Club, the Art Club, the Rittenhouse, and the New Century, are numerically strong. Clubs devoted to the cultivation of vocal music, many
formed of the German element in our cities, are prominent. Among these societies are the Liederkrantz, the Arion and the Mendelssohn.

Wherever the Anglo-Saxon race is represented in sufficient numbers, even in the remotest parts of the globe, the club idea has taken root, and we find English-speaking clubs or such as are suggested by or modeled upon English originals. India has more than 300 clubs; Peking has its Reform Club; Cairo its Cycling Club, and Zanzibar its Golf Club. The Scottish Thistle Club of Hawaii shows its origin in its name and springs from the same source as the Caledonian clubs of America. Indeed, the tendency of men of a common blood to seek, when on a foreign soil, a social bond of unity, accounts for a special type of club. The line between organizations calling themselves societies and those known as clubs is not always distinctly marked, but in general it may be said that where the social element is slight or lacking, the term club is inappropriate. This element entered largely into organization of many women's clubs in the early history of such societies, but their literary, professional and especially their philanthropic features have become more prominent of late years. See Boys' Clubs; Girls' Clubs; Mothers' Clubs; Women's Clubs; Workingmen's Clubs.

CLUB-FOOT. See Hand.

CLUB-FOOT (Lat. Talipes), a congenital or acquired distortion of the foot of which there are several forms. Sometimes the foot is twisted inward (T. varus); sometimes the heel is raised and the toes only touch the ground (T. equinus); sometimes the foot is twisted outward (T. valgus); or it rests only on the heel (T. calcaneus). The deformity consists in shortening and contraction of the muscles and tendons of the feet, but ultimately the bones become distorted. If attended to in time, the foot may be gradually coaxed to its natural shape, and even in more advanced cases the deformity is usually curable by modern surgery. The deformity is usually acquired in anterior poliomyelitis, the changes involving the tendons, muscles, bone and ligaments. The treatment is manual, mechanical or surgical. Stamped was the first to make a clubfoot in 1731. Consult Gould and Pyle, 'Cyclopedia of Medicine and Surgery' (Philadelphia 1912).

CLUB-Moss, the common name of the Lycopodium, a family of cryptogamic plants allied to the ferns, containing four genera and 150 species. Two of the genera, Lycopodium and Seloutium, are found in America, and two in Australia only. The club-mosses are found as gigantic fossils in the Upper Silurian, Devonian and Carboniferous periods, and are a marked feature of the rocks of the two latter periods. See Lycopodium.

CLUBROOT, ANBURY, or FINGER-AND-TOE (Plasmodiophora brassicae). This fungous disease is known under the above common names; it attacks turnips, cabbages, cauliflowers and allied plants, often seriously injuring the crop. The term "club-root" arose from the club or wart-like excrescences which result from a plant being infested; owing to the tendency of the root to split up in this manner the term "finger-and-toe" is also applied. In Europe these knob-like growths cannot be regarded as conclusive evidence of this disease, as they may be due to attacks of a gall insect. This fungus belongs to a very low order known as the slime-fungus; it can readily enter the young host plant, where it grows and reproduces rapidly; by the time the host should be mature, in fall, the fungus has formed millions of spores, which live over winter. The fungus can live for years in the soil, and no means of killing it is known, although applications of lime and potash reduce its destructive powers. Measures of prevention are advocated, as, keeping the land free from cruciferous weeds, as wild mustard, etc., and destruction of all affected roots by burying with quicklime, or burning; and rotation of crops. Special attention should be paid to the seedbed which is often the source of the spreading of the disease.

CLUGNET, cloo'ny, Joseph Léon Tiburce, French Orientalist: b. Lyons, France, 8 May 1848. He was educated at the University of Lyons, the University of France, the Episcopal College, Ware, England, and the Episcopal College of Gibraltar. He was appointed professor of rhetoric at the Collège de Fontaine and fought in the Franco-Prussian War. From 1875 to 1880 he was librarian of the University of Lyons and since 1880 has devoted himself to research work in Oriental languages, hagiography and folklore. From 1898 to 1908 he was director of the Revue de l'Orient chrétien. In 1912 the Minister of War bestowed on him the Military Medal of the Volunteers of 1870-71. He has published 'Géographie de la soule' (1877); 'Carte des régions séricoles' (1877); 'Nouveau guide du tourist au Mont-Dore' (1877); 'Sculptures préhistoriques situées dans les environs des lacs des Merveilles' (1877); 'Glossaire du patois Gilhoc' (1883); 'Dictionnaire grec-français des noms liturgiques en usage dans l'Eglise grecque' (1895); 'Les offices et les dignités ecclésiastiques dans l'Eglise grecque' (1899); 'Bibliographie du culte local de la Vierge Marie' (3 vols. 1897-1905); 'Die rite et récis de l'abbé Daniel le Scétiote' (Greek text, 1901); 'L'Empire ottoman,' (translation of Kelner's German text, 1877); 'Calendrier de l'Eglise copte d'Alexandrie,' (from French text, 1895); 'La mort de l'Ordre du Temple,' by the Étendard, du Grand Sauvage, et du Mont Blanc' (1879). He was also one of the editors of 'Bibliothèque hagiographique orientale' (1901—1909) and is editor of Polybiblios.

CLUMBER SPANIEL. See Spaniel; Dog, Sporting Spaniel.

CLUNIACS, or CONGREGATION OF CLUNY, kli-ni, a monastery of that branch of the Benedictine order known as the Congregation of Cluny, or as Cluniacs. It was founded in 912, at Cluny, or Cluny, 15 miles from Macon on the Saône. In the 12th and 13th centuries Cluny was perhaps the most notable monastic foundation in Europe; it had many hundred monasteries under the jurisdiction of its abbot. The first Cluniac house in England was founded by the Earl of Warrenne, companion-in-arms of William the Conqueror. The church of the mother, established at Cluny, built in the 11th century, was regarded as one of the wonders of the world: this monument of Gothic architecture was at the Revolution secularized by the republican government and was sold to the commune of Cluny, and by them
was leveled with the ground. Napoleon, on being invited by the townsman to visit the place, made reply, "No; you are vandals." There were suppressed by Henry VIII in England and Wales 35 Cluniac houses, one of them a constituent part of an estate.

CLUNY, or CLUGNY, a town in the department of Saône-et-Loire, France, 12 miles northwest of Macon. It has an industrial college and manufactures pottery, paper, leather and yarn. It has several splendid pieces of architecture, the Benedictine abbey of the 9th century, the church of Notre Dame dating from the 13th century; the church of Saint Marcel with a 12th century steeple; the ruins of Saint Mayeul, the abbot's palace; portions of fortifications; picturesque houses and other historical monuments. The abbey church, before the erection of Saint Peter's at Rome, was the largest of its kind in Europe. It was destroyed in 1790. A model is preserved in the town museum. Cluny is the birthplace of the artist Eugène. Antoine Brongniart, Bernard, "Les chartes de l'abbaye de Cluny" (Paris 1876-94); Dufcett, "The Archives of the Ancient Abbey of Cluny" (1886); Penjon, "Cluny, la ville et l'abbaye!" (Cluny 1872).

CLUNY, hoo'ny, Hôtel de, a Gothic edifice in Paris, built by the Benedictines of Cluny in the 15th century. It is located on the site of a Roman palace. In 1515 it became the residence of Mary, widow of Louis XII, and James V of Scotland was married there in 1537. It passed over to the state during the Revolution, and in 1833 was purchased by the antiquarian Du Sommerard. In 1842 it was purchased, together with its museum collections, by the state.

CLupeide, a family of soft-rayed fishes, containing the shads, herrings, anchovies, pilchards, sardines, etc., elsewhere described. These are mostly marine, but none live in deep water. The best known species go in schools and are anadromous; and those of northern seas include several of the most abundant and valuable of marine food-fishes. About 200 living species are named, and fossil members of the family are numerous, especially in Cretaceous and early Tertiary strata.

CLURICARNE, kloor'ri-kon, in Irish mythology, an elf of evil disposition who usually appears as a wrinkled old man and has knowledge of hidden treasures.

CLUSERET, kloo-zher', Gustave Paul, French officer and Communist: b. Paris, 13 June 1823; d. Toulon, 23 Aug. 1900. He was educated at Saint-Cyr, distinguished himself during the insurrection in Paris, fought in the Crimean War and in Africa against the Kabyles and became a captain in 1855. In 1858 he resigned his commission and in 1860, as commander of the French volunteers, joined Garibaldi in the expedition to Sicily and Naples. He came to the United States soon after the breaking out of the Civil War, and after serving on General McClellan's staff became a brigadier-general. In 1864 he edited the New Nation, in New York. Subsequently he returned to Paris, and was War Minister of the commune in April 1871. By his endeavors to improve the military organization of the Communist troops he gave offense to the central committee, but was accused of treachery and imprisoned at Mazas. From Paris he fled to England and Mexico, and was condemned to death by a military tribunal in 1872. He was, however, pardoned and allowed to return to Paris in 1880, and in 1888, 1889 and 1893 was elected to the Chamber of Deputies. He published "Memories du général Cluseret" (1882-88).

CLUSTERED COLUMN, or CLUSTERED PIER, in architecture, a pier which appears to consist of several columns or shafts clustered together; they are sometimes attached to each other throughout their whole height and sometimes only at the capital and base. This form was used in the Middle Ages, though not absolutely unknown to the ancient East, since one has been found at Tello. It is supposed to have originated from an attempt to vary the square pier then in use. From this Romanesque pier, which had a square core on each face of which a semi-column or shaft was attached, developed the Gothic clustered pier based on a circular core and more slender and varied. A fine example is in the Amiens Cathedral. There are many variations of this form of pier, depending on the size, grouping, number, the connection with vaulting ribs, etc. The clustered column vanished in the Renaissance, except in its simplest forms.

CLUTCH, a mechanical device by which rotary motion of a shaft is transmitted to another gradually without shock by means of connecting elements normally independent. The connection is established in several ways, as by teeth, by cams, by friction of two surfaces or by electro-magnets. Friction clutches of various types are in common use, and of these the type is perhaps that most frequently met with. Clutches have found extensive application in motor vehicles. Consult Holman, "Motor Vehicles" (New York 1917); Souther, "Transactions of the American Society of Mechanical Engineers for 1908."

CLUTE, Willard Nelson, American botanist: b. Painted Post, N. Y., 26 Feb. 1809. He was educated in the public schools and in 1839 became assistant curator of the botanical department of Columbia University. In 1898-99 he was curator of the New York botanical garden. From 1903 to 1910 he was instructor in biology at the Joliet High School, and in 1910-11 at the Curtis High School, Chicago. Since 1911 he has been head of the biology department of the Flower Technical High School for Girls, Chicago. He was formerly publisher of the Plant World, also editor and publisher of the Fern Bulletin and the American Botanist. He has published "A Flora of the Upper Susquehanna Valley" (1898); "Our Fenns in their Haunts" (1901); "The Fern Collector's Guide" (1902); "The Fern Allies of North America" (1905); "Laboratory Botany for the High School" (1909); "Agronomy for High Schools" (1912); "Laboratory Manual and Notebook in Botany" (1913).

CLUTHA, kloot'ha, sometimes called Molyneux, the largest river of New Zealand, in the southern part of the South Island. It receives the waters of Lakes Wakatipu and Wakatipu and flows in a southeasterly direction, traverses the province of Otago and empties into the sea in Molyneux Bay, after a course of 150 miles.
CLUTTERBUCK, Captain Cathbert, the feigned editor of three of Scott's novels, 'The Monastery,' 'The Abbot' and 'The Fortunes of Nigel.'

CLUVER, klo'vër, or CLUVERIUS, Philipp, German geographer and antiquarian: b. d. Leyden 1623. He applied himself first to the study of law, but afterward, against the will of his father, almost exclusively to history and geography. Being on that account left without support by his father, he was compelled to enter the service of the Austrian army, but at the end of two years he returned to his favorite pursuits. He now traveled through England, Scotland, France, Germany and Italy and then settled in Leyden, where he was made "Geographus Academicus." In 1617-18 he undertook a second journey through Italy and Sicily on foot. His first geographical work, "Germania Antiqua," was published in 1616. Two carefully prepared antiquarian works, one on Sicily, Sardinia and Corsica, the other on Italy, followed. His most important work was not published till after his death. It is entitled "Introductio in universam Geographiam tam Veterem quam Novam," and is the first successful attempt at a systematic treatment of geography in the whole extent of its historical and political relations. The first edition appeared at Leyden in 1629, but it has been frequently republished. The complete edition is that of Bruzen de la Martiniere (1729). His other works are "Italia Antiqua" (1624) and "De Tribus Rheni Alvei atque Ostii." (1611).

CLUYSENAAR, the name of a Dutch and Belgian family of architects, the most famous of whom was JEAN-PIERRE: b. Kampen, 23 March 1811; d. Brussels, 16 Feb. 1880. He studied at the Academy of Fine Arts at Brussels and under Suys. His works are numerous. Among them are the Palace of Arenburg and the palaces of the Academies (with Suys); the galleries of Saint Hubert at Brussels, where are also the hospital for the blind, hotels, the opera-house and the Royal Conservatory of Music. There are numerous churches, hotels and other buildings of note. His work has been found throughout Belgium. His son, ALFRED, b. Brussels, 24 Sept. 1837; d. there, 23 Aug. 1902, at first studied sculpture with his father, but was more attracted to painting and subsequently studied art in Brussels and Paris, exhibiting "A Dominican Meditating" in 1861. Other pictures of his are a 'Vocation,' now in the Brussels Museum, and a 'Mazeppa,' and six large mural paintings for the University of Ghent. Consult Lucas, C., 'Essai d'un Catalogue alphabetic des architectures belges et hollandais,' in the Revue generale d'architecture, Paris.

CLWYD, klo'yd, Wales, a river in County Denbigh, rising on the northeast of the Bronbanoeg, and entering Abergele Bay, after a course chiefly northwest of about 30 miles, during which it is joined by several small tributaries.

CLYDE, Lord. See CAMPBELL, SIR COLIN.

CLYDE, N. Y., village of Wayne County, 35 miles west of Syracuse, on the New York Central and West Shore railroads, and on the State Barge Canal. Its industrial establishments include a boiler and steam-engine factory, a canning factory, harness works and glassworks. Pop. 2,695.

CLYDE, Ohio, village in Sandusky County, 75 miles southwest of Cleveland, on Cleveland, Cincinnati, Chicago and St. Louis, the Lake Shore and Michigan Southern, the Wheeling and Lake Erie and the Lake Shore Electric railroads. The village is the birthplace of Gen. James B. McPherson, and a fine monument has been erected to his memory. It has a Carnegie library and manufactures cutlery, barrels, screens, automobiles, etc. The village owns the waterworks and electric-lighting plants. Pop. 2,815.

CLYDE, kild, Scotland, a river which rises as Daer Water in the Lowther Hills in the southern extremity of Lanarkshire. Its watershed is approximately coincident with the boundaries of that county. In its upper reaches it is a mountain stream flowing through bleak uplands. Near Lanark are the celebrated falls, named respectively Bonnington Linn, Corra Linn, Dundaff and Stonebyres Linn, the finest of the series being Corra Linn, with a triple leap of 84 feet. Within four miles at this section the river descends from 560 feet to 200 feet. From Lanark to Bothwell it flows through a fertile and well wooded country famous for its orchards and from that point its course is through the greatest mining and industrial district in Scotland. Passing through Glasgow, at Dumbarton (91 miles from its source) it begins to expand into an estuary and reaches the Irish Sea at the southern extremity of the Island of Bute. Its drainage area is 1,461 square miles. The estuary is indented by numerous lochs, affording panoramas of exquisite beauty, and it is dotted by numerous watering places (Gourrock, Dunoon, Rottenay, Ayr, etc.). Its principal tributaries are the Douglass Water, the Mouse, the Lethan, the Avon, the Calder, the North Calder, the Kelvin, the White and Black Cart and the Leven. The Clyde by artificial deepening is now navigable by large ocean-going steamers to Glasgow, where, rather more than 100 years ago, there was only a depth of 15 inches at low water. It is the most important river for commerce in Scotland, with a great ship-building industry located on its banks in the sections between Glasgow and Dumbarton.

CLYDEBANK, a police burgh and town of Scotland, in Dumbartonshire, on the north or right bank of the Clyde, about six miles west by north of Glasgow. It is of modern origin, its chief industry being ship-building. Pop. 16,202.

CLYDESDALE, a breed of horses named from the valley of the Clyde in Lanarkshire, Scotland. Clydesdales are about 16 hands high, are compact and muscular in build, and have a long, easy stride. They vary in color, being black, gray, brown or bay, and are used for draft-horses. Specially fine specimens of this breed are found in the eastern United States, in the service of the municipal fire departments of large cities. See Horses.

CLYDSDALE, or PAISLEY TERRIER. See Dog.

CLYMENE, kl'm-e-né, the daughter of Oceanus, and mother of Atlas and Prometheus.
CLYMER, Klé-mér, Ella Dietz, American poet: b. New York. She began her career as an actress, then went to Europe and won a European reputation. She has published three volumes of poems: 'The Triumph of Love' (1878); 'The Triumph of Time' (1884); and 'The Triumph of Life' (1885). She was one of the founders of the *Sorosis* Society, and its president in 1889.

CLYMER, George, American statesman: b. Philadelphia 1739; d. Morrisville, Pa., 23 Jan. 1813. He was orphaned at the age of one year, received an education at the College of Philadelphia (now University of Pennsylvania), entered mercantile life when a lad and acquired a competence. He was prominent in public affairs prior to the Revolution, and in 1772 was appointed by Governor Penn to the position of justice of the Court of General Sessions and of the County Court of Common Pleas of Philadelphia. In 1775 he became one of the first Continental treasurers. He was chosen in 1776 to succeed a member of the Continental Congress who had refused to sign the Declaration of Independence, to which he promptly affixed his signature, the 8th after John Hancock's. He was active in the patriot cause during the Revolution, served under Cadwalader in the battle of Princeton and was a member of the convention that framed the Federal constitution. In 1778 he was elected a member of the first Congress under that instrument. In 1778 he was one of the special commissioners sent by Congress to treat with the Indians at Fort Pitt. In 1790 he declined a re-election, and in the succeeding year was appointed collector of the excise duties on spirits, the collection of which in Pennsylvania led to the whiskey riots. Clymer acted firmly, yet temperately in the troubles, till finding the office distasteful, he resigned it, and was appointed, with Pickens and Hawkins, to negotiate a treaty with the Cherokee and Creeks in Georgia. After this he retired from public life, but devoted much of his time to study. He became president of the Philadelphia Bank and the Academy of Fine Arts. No man was more adverse to the assumptions of aristocracy, to the excellencies, honorables and esquires, who, he said, abounded more in the United States than in any other country in the world. He seldom spoke in public, but when he did his ideas were expressed in language keen, pithy and laconic. Consult Dickinson in the *Magazine of American History* (Vol. V, New York 1880).

CLYSTERS, an old term used to denote medicaments introduced into the lower bowel, usually for the purpose of expelling its contents. See ENEMATA.

CLYTEMNESTRA, klit'-ém-nést'ra, daughter of King Tyndareus and Leda, and half-sister of Helen. She bore her husband, Agamemnon, two daughters, Iphigenia and Electra, and one son, Orestes. During the absence of Agamemnon in the war against Troy she bestowed her favors on *Ægisthus*, and, in connection with him, murdered Agamemnon on his return from Troy, and, together with her paramour, governed Mycenae for seven years. Her son, Orestes, killed them both.

CLYTIE, klí-té, the daughter of Oceanus and Thea, who pined away through love for Apollo, who deserted her for Leucothea. Through the pity of the gods, she was changed by them into a sunflower. The name the Greeks gave it was "heliotropia," of the same family as our heliotrope.

CNICUS (Latin for safflower, which name was first given to the thistle), a monotypic genus of the family *Asteraceae*. The plant is an annual herb which came originally from the southern part of Europe, but is now sparingly naturalized in eastern North America. *C. benedictus*, or, as it is sometimes called, Saint Benedict's thistle, was formerly used as a febrifuge, but is now rather considered a tonic and diaphoretic.

CNIDUS, ni'dús, or Gnidos, Asia Minor, a town in the province of Caria, at the extremity of the long narrow peninsula of Triopium. It was a favorite resort of Aphrodite (Venus), who was hence surnamed the Gnidian Goddess. Her temple here contained her statue by Praxiteles. Here in 314 B.C. the Athenian Admiral Conon defeated the Spartan fleet under the leadership of Pisander.

CNOSSUS, no'sús, or GnoSSus, more ancinctly Cnosus, or Gnous, now Makro Teikho, the capital of Crete in the time of Minos, was built on the Caratrus, a short distance from the northern coast, and founded by Dorian, who diffused their civilization over the island. Homer mentioned it as already a great city, and the residence of the celebrated Cretan king; it long maintained its preponderance, until it was weakened by the growing importance of Cydonia and Gortyna. It was renowned in mythology by numerous legends of Jupiter, born, married, and buried in its vicinity; of Minos, Ariadne, the minotaur, and the labyrinth. In later times it became a colony of the Romans. *Æneas*, the skeptic philosopher, and Chersiphron, the architect of the temple of Diana in Ephesus, were born there.

COACH, a large, closed, four-wheeled vehicle generally constructed to carry passengers inside and outside. It is used as a general term to cover all such vehicles, but the typical coach involves four wheels, springs and a roof. It took its name from the place whence it came, Kocs, a Hungarian town between Raab and Buda. The coaches of the Middle Ages were exceedingly elaborate and ornate. As late as 1550, Paris possessed only three coaches; Spain in 1631 could boast of a coach with glass windows in the possession of the Infanta.

In England a kind of carriage called a "whirlicote" was in use in the reign of Richard II; but coaches, properly so called, are stated by Stow to have been introduced in 1564 by a Dutchman, who became coachman to Queen Elizabeth. Stow adds:

*After a while, divers great ladies, with as great jealousie of the queenes displeasure, made them coaches, and rid in them up and downe the countrey, to the great admiration of all the beholders; but then by little and little they grew usual among the nobilitie, and other sorts. Within twenty years became a great trade of coach-making.*

They were, however, for a long period confined to the aristocracy and the wealthy classes. Sometimes six or even eight horses were har-
nessed to the coach, partly no doubt for the sake of display, but chiefly because the wretched state of the roads required that number. At first coach-wheels were very low, which circumstance also contributed to prevent the attainment of any considerable speed, and to make it necessary to use several horses to draw them; and no one seems to have pointed out the advantage of large wheels until, in 1771, a Mr. Moore for a short time attracted a good deal of attention by pointing out the fact that it was much easier to draw a coach or cart with large wheels than with small ones, and by actually constructing a coach "very large and roomy," which was "drawn by one horse, and carried six persons and the driver, with amazing ease, from Cheapside to the top of Highgate Hill," coming back "at the rate of 10 miles an hour, passing coaches-and-four, and all other carriages it came near on the road." A contemporary account states that this coach had two large wheels, nine and one-half feet in diameter.

Hackney-coaches (q.v.) were first used in London in 1625. They were then only 20 in number, and were kept at the hotels, where they had to be applied for when wanted. In 1635 an attempt was made to restrain their use by a proclamation of Charles I; but, this being found unsuccessful, their number was limited, and a commission was given to the Master of the Horse to grant licenses for their use. In this year only 50 were licensed. In 1634 one Captain Baily, who had formerly been a sea-captain, hit upon the plan of keeping a number of hackney-coaches, with drivers in livery, standing at a particular place (the "Maypole," in the Strand), where they might be had when ever they were wanted. Hackney-coaches now rapidly became more general. The four started by Captain Baily in 1634 had increased to 200 in 1652, to 800 in 1710 and to 1,000 in 1771.

The following facts relating to the history of stage-coaches are taken from Chambers’ Cyclopedia of Days:\  Stage-coaches were introduced into England about the same time as hackney-coaches. The first stage-coach in London appears to have run early in the 17th century, and about the middle of the same century they appear to have become general both in London itself and in the better highways in the neighborhood. Before the end of the century they were started on three of the principal roads in England. Their speed at first was very moderate, about three or four miles an hour. They could run only in the summer, and even then their progress was often greatly hindered by floods and by the wretched state of the roads generally. In 1700 a week was considered a marvelously short space of time to take to travel from York to London; and even 60 years later a fortnight was spent in going between Edinburgh and London. The first stage-coach that traveled between Glasgow and Edinburgh, which was set on foot in 1749, occupied two days. The first efforts to accelerate the speed of traveling was made by a body of Manchester merchants in 1754, who started a conveyance to which they gave the name of the "Flying Coach," and which was intended to connect the distance between Manchester and London in the unusually short period of four days and a half. In their prospectus, the proprietors of the new vehicle made the following announcement:

However incredible it may appear, this coach will actually (barring accidents) arrive in London in four days and a half after leaving Manchester.

Thirty years later, Mr. Palmer, of Bath, after a considerable amount of opposition, succeeded in inducing the government to put in practice certain suggestions which he made, by which he showed that great saving both in time and money in the conveyance of passengers and letters would be effected. The result was the establishment of the system of mail-coaches, which continued to be the means of traveling in England until their place was taken by the railways. The first mail-coach started between London and Bristol on 8 Aug. 1784.

The introduction of steam and motor cars has gradually superseded the manufacture of coaches. But they are still made to some extent. The typical American coach is the Concord coach, so-called from the place of manufacture. Two famous coaches of Great Britain are the King's state coach, which was executed by Sir William Chambers, with paintings on the walls by Cipriani dating back to 1761; and the coach of the lord mayor of London of about the same date. Both are highly ornamented and the bodies are suspended on straps.

Coaching became a very popular exercise in the early 19th century. It required considerable skill to manipulate four spirited horses on the bad roads which were then available. The sport survived, in a more limited measure, the introduction of railways. In 1856, the Four-in-Hand Club was started in England; and the Coaching Club in 1870 as successor to the old Bensington Driving Club (1807-52). In America the New York Coaching Club began in 1875. To-day the sport has developed, in great centres and cities of the world, in the form of horse-racing. For a history of vehicles and their manufacture, see CARRIAGE; CARRIAGE AND WAGON INDUSTRY.

Consult the Badminton, "Driving" by the Duke of Beaufort (1888); Roger, "Manual of Driving" (Philadelphia 1900); Nimrod, "Essays on the Road" (1876); Adams, "English Pleasure Carriages" (London 1837); Trench, "History of the Art of Coach Building" (London 1877); Gilbey, "Early Carriages and Roads" (London 1903); Straus, "Carriages and Coaches: Their History and their Evolution" (London 1912).

COACH, or DALMATIAN, DOG. See Dog.

COACH HORN, a tapering horn of brass or copper used to sound a few simple calls. It has no keys and its range is limited to six open notes (C-G-C-E-G-C'). The horn varies from 42 to 56 inches in length. The calls have a recognized place in coaching and were, of course, much more generally known in the days of the stage coach. To-day the horn like coaching is employed generally in connection with racing or by the few coaching clubs in the wealthier centres, as New York, London, Paris, Berlin, etc.

COACH-WHIP SNAKE, an American snake (Zamenis flagelliformis), characterized by a long, narrow head, projecting upper jaw, superior orbital plates large and projecting
COADJUTOR—COAL

• much over the eyes; nostrils large, lateral and near the end of the snout; eyes large, iris dark green; mouth large, lower jaw long and attenuated like a whip-cord, which it also resembles in the braided appearance produced by the arrangement and dark border of the scales. The color of the head, neck and a third of the body is glister black, becoming paler toward the tail, which is tawny brown; the scales of the tail have dark margins; the lower surface in front is bluish slate, behind white clouded with brown; the colors vary in their shades, but near the head it is always black. They sometimes attain the length of seven feet. It moves with great swiftness, and feeds on young birds and small animals; though inoffensive to man, it defends itself bravely, twining its long folds around its enemy. The species is found in the South from the Atlantic to the Pacific. A red color phase is found in the West. The coach-whip snake is a congener of the black snake.

COADJUTOR, a Latin term, nearly synonymous in its original meaning with assistant, and applied by the Romans to a kind of deputation or lieutenant given to magistrates to assist them in a press of business, or supply their place in absence. The term was afterward introduced into the Church and given to persons who were associated with prelates, archbishops or bishops, to assist them or act as substitutes for them in the discharge of their functions. The appointment usually made the coadjutor the successor of his principal, and in this way great abuses arose. The abuse of appointing relatives in this capacity, making the office of bishop hereditary, made rapid strides until the Council of Trent introduced several reforms, by providing that the nominations of a coadjutor should not take effect except in cases of necessity or manifest utility, the Pope being made sole judge of these cases. Coadjutors, as now understood, are of two kinds, one temporary and revocable, allowed on account of illness or other incapacity, and allowing no right of succession; the other irrevocable and carrying with it the right of succession. The Council of Trent did not favor the "irrevocable right of succession," but the Pope grants it in special cases. A coadjutor differs from a "suffragan," in that the former is appointed to an old or infirm bishop, while the latter is assistant to a bishop whose see is too large, and has charge of a portion of it, the bishop remaining in charge of the central portion. The term and the office is not confined to the Roman Catholic Church; it is in use also in the Anglican Church.

COAGULATION (Latin, to curdle*), the peculiar change from the state of a liquid to that of an amorphous solid, exhibited, under certain conditions, by proteid bodies and their solutions. The hardening of an egg by boiling is well understood instance of the process. In this case the change is induced by heat, and begins when the temperature reaches 160° F. or thereabouts. Another familiar case is the clotting of blood, which occurs from a very different cause. The blood contains two albuminous substances, named in the phenomenon, and which are known respectively as fibrinogen and fibrinoplastic substance. These are normally held in solution; but as soon as the blood is removed from the body they undergo a change whose nature is not well understood, the proteid of which is a stringy, elastic, fibrous or jelly-like solid known as fibrin.* Casein, the principal proteid constituent of milk, does not coagulate from the direct application of heat, but it coagulates very quickly when rennet is introduced, and it also coagulates spontaneously under the influence of certain of the products of fermentation that develop in the milk after it has been exposed to the air for a time.

COAHIUILA, kō-á-we'lä, Mexico, state bounded on the north by the United States, on the east by Nuevo Leon, on the south by San Luis Potosi and Zacatecas and on the southwest, west and northwest by Durango and Chihuahua. Its area is about 63,745 square miles. The capital is Saltillo. The principal mountain ranges are in the districts of Rio Grande and Monclova. Besides these we may mention the Sierra Madre, in the Saltillo district; the Sierra Pájila, in Parras; and Sierra Noas, in Viesca. The rivers are Rio Grande (also called Rio Bravo), forming the boundary line with the United States, the Sabinas, forming the boundary between the districts of Monclova and Rio Grande; the Alamos, Monclova, Patos, Saltillo, Aguanaval, Nazas and their tributaries. The principal lavas are those in the district of Parras, Viesca and Monclova. Extending from the foot of the mountains northward are sterile plains, where the heat is intense; to the southeast lies the Laguna region, fertile and temperate; the mountainous district, rich in minerals, has frequent frosts. In general the climate is not healthful, the most common diseases being malarial fevers, typhus, rheumatism and affections of the respiratory and digestive organs. Mining has recently become one of the chief industries. Silver, lead, coal, iron, zinc, copper and gold are found. The first position, however, is still held by agriculture. Cotton, corn, wheat, sugarcane, etc., grow rapidly; and grape-culture is attracting special attention. The grapes of Parras are considered by some experts equal if not superior to the Malaga and Granada varieties. Cattle-breeding is carried on quite extensively. The export trade is principally with the United States, to which, among other products, are brought tallow and its various manufactures. The commerce of Coahuila is in the hands of Americans, Spaniards, Germans and Frenchmen; its total trade is of the estimated value of $11,000,000, or $12,000,000, silver, per annum. Manufactures are cotton and knitted goods, wines, tanned skins and hides, soap, candles, cheese, shoes, molasses, furniture, pottery, carriages, wagons and chocolate. The railroad system includes a number of important lines. There are good wagon roads; also trolley lines to Tepic. The state is divided into five districts subdivided into 33 municipalities. Pop. 280,899.

COAITA, kō-Tī-tā. See Spider-monkey.

COAL, a mineralized form of carbon, constituting one of the metamorphic rocks. It is found in seams or beds, often in a series separated by intervening strata of sedimentary rocks.

Origin.—Many theories have been advanced as to the origin of coal. Thus coal
beds have been attributed to the drying up of petroleum lakes on old land surfaces, to the separation of carbon by some fanciful chemical process from limestone and to accumulation of seaweeds along old ocean beaches. These hypotheses may be held in abeyance for discussion; they may help explain some particular instance, but are so unsupported by facts that they are of no wide application. The generally accepted theory applies to practically all kinds of coal deposits and is, briefly, as follows:

When the woody material, cellulose, of the leaves and stems of plants, falls on the ground, it soon oxidizes or decays, and the oxygen, hydrogen, carbon and nitrogen present pass into the air or soil as gases, the hydrogen and oxygen chiefly as water vapor, the carbon as carbon dioxide and the nitrogen as ammonia. Finally, the original material, say the trunk of a great tree, only the ash, composed chiefly of silica, alumina and iron oxide, is left. Thus it happens that the leaves, twigs and branches that have fallen for thousands of years in a forest are represented by a few inches of vegetable mold or humus, plant substance not yet reduced to ash. If, however, the ground be covered by water, as in a swamp, air is partly excluded, and decay proceeds so slowly that vegetable or animal remains may be preserved for long periods of time. Still oxidation goes on; the dead plants gradually give up their hydrogen, oxygen and carbon as water, marsh gas and carbon monoxide and dioxide, and change to a mass of partly decayed vegetable fiber or even to a black muck.

A damp climate and a land surface from which the rainfall runs off slowly, favor the formation of extensive swamps, though in a climate as damp as that of Ireland peat bogs climb hill sides, the mosses (Sphagnum), the chief plant growth in such swamps, dragging up water by capillary action. On the plains of Alaska and Siberia, where the ground is permanently frozen, mosses cover the ground with a thick mat, and such swampy plains are called tundras. In a lake country can be found areas with a little investigation were at no very remote date covered by shallow bodies of water, but are now swamps, the original lakes having been filled by the dead mosses, rushes and other aquatic plants. Along the seashore in a region of average rainfall, where the coast is of low relief and the rivers sluggish, sand-bars form by wave action off shore, and behind these bars are salt lagoons and marshes, changing, farther from the ocean, to brackish, and finally fresh-water, swamps.

Fresh or brackish water and a fairly warm though not torrid climate are indicated by the fossils of plants and animals found in or near coal seams. From these facts and from the vast extent of some coal fields it is believed that coal formed in coastal swamps, possibly of the type of the Dismal Swamp in Virginia. Now if we suppose such a swamp-covered coast to sink slowly, the encroaching ocean would cover the accumulated peat and mud with sand and silt until finally the swamp might be buried thousands of feet by sediments from the receding land surface. Instead of steadily sinking, however, the probabilities are that during the great coal-forming epochs the land alternately sank and rose through thousands of years, and thus one swamp was buried over another, resulting in those alternating beds of coal, shale and sandstone characteristic of all coal fields.

The progressive diminution of hydrogen and oxygen in carbon can be shown by the following table from Percy's 'Metalurgy,' in which carbon is taken at the constant amount of 100:

</tbody>
</table>

The loss of water and of combined carbon, hydrogen, oxygen and nitrogen, in the change from peat to coal, caused a great loss of bulk. The pressure of overlying strata, or of those earth movements that warp and fold the rock formations, reduced the bulk still more. Thus it can happen that a coal seam only one foot thick may represent what was 50 feet of peat in the ancient swamp, and it is fair to assume that an average seam of true coal is not one-fifth the thickness of the original peat beds.

Some geologists have believed that when the old swamps now represented by coal seams were accumulating thick beds of peat, the climate was torrid, while the earth's atmosphere contained a higher percentage of carbon dioxide than now. It may be said, however, that a torrid climate is not necessary for the existence of great swamps; and as to a higher percentage of carbon dioxide in the air, were the present land surface of the globe covered with a layer of coal one foot thick, the carbon contained therein, if restored to the atmosphere, would mean an increase in the amount of carbon dioxide of only about 5 of 1 per cent. This about represents the difference between air in the city and in the country, and the effect of such an increase in stimulating plant-growth is of course very considerable.

Following the submerging of the fallen vegetable substance biochemical changes take place through the action of certain bacteria and the material soon loses its vegetable structure and becomes metamorphic. Being later subject to stresses of earth movements, either through foldings of the strata, with more or less heat, or, through subsidence and the deposit of sedimentary rocks, to heavy pressures this metamorphic bacterial residue becomes a true rock. The great variation in its constitution is due to the endless variation of conditions during its transmutation.

As to the age of the coal formations it may be said that true peat deposits are all of later age than the Tertiary, and in North America only peat and incoherent lignite occur in later formations than the middle Tertiary (Miocene) though the early Tertiary (Eocene) formations contain great areas of lignite. In Europe there are lignite deposits in the Triassic and in the Carboniferous. The great coal-forming age in North America and in Europe was the Carboniferous, though true coals occur in the Permian and in the Triassic, and in North
America there are very important coal fields of Cretaceous Age. Isolated pockets of coal, but no workable coal fields, occur in pre-Carboniferous formations. See CARBONIFEROUS SYSTEM.

An idea of the relative compositions of peat, lignite, and true coals may be had from the following table:

Varieties of Coal.—Various elaborate schemes of classifying coal have been advocated, but have not gained popular acceptance. In large part in this country the word coal is often applied to a true lignite. However, since the chief heat-producing element in coal is carbon, a classification in wide use is based on the value of the coal as fuel; that is, on the percentage of carbon present and the condition of the carbon.

Part of the carbon is fixed, that is, cannot be driven off by heating in a retort; part is combined with the hydrogen and nitrogen as volatile hydrocarbon compounds which can be driven off. The percentage of fixed carbon is highest in anthracites, but even the semigraphitic anthracite of Rhode Island contains a considerable percentage of hydro-carbons.

The proportion of the volatile hydro-carbons to the fixed carbon in a coal is called its fuel ratio. On this basis the distinctions usually made are lignite, bituminous, semi-bituminous, semi-anthracite and anthracite. Cannel coal, in which the percentage of volatile hydrocarbons is very high, is believed to be of different origin from other coals. It may represent accumulations of seeds, spores, resins or gums, and possibly of fish remains, in pools in the ancient swamps.

Generally speaking, in anthracite the volatile matter is below 6 per cent, in bituminite below 10 per cent, and in semi-bituminous between 12 and 18 per cent and in bituminous above 18 per cent. In cannel coal the volatile matter may be as high as 50 or even 65 per cent.

Lignite, or brown coal, is brown to black in color, though the powder is always brown. It often shows plainly its vegetable origin, containing stems that look like undecomposed wood. The lustre may be resinous or dull; the specific gravity is 1.0 to 1.5, some kinds floating on water. When burned in a gas flame, generally contain a high percentage of water, crumble easily and slake to mud on long exposure.

Bituminous or soft coal is black; the powder is black; the lustre may be resinous or dull; the specific gravity is 1.25 to 1.4. It contains less water than lignite and bears transportation better. Bituminous coals are subdivided according to their properties or uses, into coking, free-burning, smokeless, gas, coals, etc. Coking coals partly fuse or cake in burning. If low in ash and very low in sulphur they are highly valued for forging and for making coke and gas. The famous coals of the Cumberland region in Maryland are classified as semi-bituminous. In coking coals the less volatile hydrocarbons present, the higher the yield of coke, but in gas coals the more hydrocarbons the better. A good gas coal will give 10,000 cubic feet of gas per ton. Smokeless coals burn with little smoke and are used for domestic purposes and for steam production.

Cannel coal (from canny, "a candle"), is black or brownish, has a dull lustre, does not soil the fingers and show few or no traces of vegetable structure. It grades into bituminous shale. It contains from 40 to 60 per cent of volatile matter, lights readily, burns with a steady flame, and is used as a fuel for open grates, but chiefly for enriching gas made from other coal. It is mined in the United States at Cannelburg, Ind., and in the Jellico district, Ky.

Anthracite, called also hard coal, is black with a black powder and does not soil the fingers. The specific gravity is 1.3 to 1.75. It kindles slowly, but, owing to the high percentage of fixed carbon, burns without smoke and gives an intense heat. It was formerly much used in this country for melting iron and is still used as a steam fuel, but its chief use is for household purposes.

Generally speaking, the less water, ash and sulphur in a coal the better. The water must be evaporated before the coal burns; ash represents inert matter and sulphur is objectionable for several reasons. A first-class coal should not contain over 6 or 7 per cent of ash and a good gas coal should have less than 7 per cent sulphur.

The following table gives the composition of some representative American lignites and coals:

Coal Fields of the World.—North America, Europe and Asia contain the great coal fields of the world. In southern Africa, in Australia and in New Zealand are deposits
of importance. Only small and disconnected areas are known in South America and the only mines worked on a large scale are in Chile and Argentina. As to Asia, the coal fields of China are vast and of great promise but are still practically undeveloped. Coal is abundant in India and Burma and the output is increasing fast, particularly from the mines in Bengal. The rather small coal field of Japan is being opened rapidly. The chief coal-producing states of Australia are New South Wales and Queensland. The South African mines are in Cape Colony, Natal and the Transvaal.

Great Britain long led the world in coal production, but was passed by the United States in 1899. The important coal fields of Great Britain lie in southern Scotland, stretching, with interruptions, from the coast of Ayr to the mouth of the Firth of Forth; in the north of England, in Durham and Northumberland counties; in central England, where the several fields worked include parts of 10 counties, the most important being Yorkshire and Lancashire; in the west of England, near Bristol, and in the Forest of Dean; and the very important South Wales field in the counties of Monmouth (Ebbw Vale), Glamorgan and Carmarthen (Wales), this field producing the best coal mined in Great Britain.

On the continent of Europe, Germany, France, Belgium, Russia, Austria-Hungary, Italy, Sweden and Spain have coal fields of more or less importance. The French coal fields may be grouped in three divisions, those of the north, of the centre and of the south. The northern field, in the departments du Nord and Pas de Calais, extends into Belgium. The fields of central France are generally small and irregular, the most important being in the department of the Loire. In the south of France the coal fields of Alais and of the Aveyron are of some importance. The coal field of Belgium is a narrow belt extending across the country, except for a short interruption, from the Pas de Calais in France to the Aix-la-Chapelle coal field in Prussia.

Of the German states, Prussia has the largest and best coal fields. These include the Aix-la-Chapelle and the Eschweiler; the very important coal fields of the Ruhr, or of Westphalia; and, extending into Bavaria, the Saarbrücken field, perhaps the most remarkable in Europe for the number of seams and total thickness of coal. In the extreme south-east of Prussia are the important and comparatively undeveloped coal fields of Silesia at the head waters of the river Oder. Of the other German states, Saxony is a considerable producer of coal, the most important mines being near Zwickau.

In Austria-Hungary, coal fields extend from Lower Silesia into Bohemia, and from Upper Silesia into Moravia with mines near Schlan, Radnitz and Pilsen. There are also great deposits of lignite, extensively developed near Einbogen and Bilin, and valuable mines of lignite-bituminous coal near Fünfkirchen in southern Hungary and about Syria and Caucasia in the Russian Empire.

The most important coal field of Russia is the Donetz basin, between the Don and the Dnieper rivers. It covers a large area and is being developed steadily. Spain has several coal fields, one of some importance in the Asturias, and two others but little developed. Lack of railroads has prevented their exploitation.

North America, as noted before, surpasses all the continents in the extent and variety of its fuel supplies. The United States leads the world in coal production, and there is little prospect of any country surpassing it before that far distant day when the great coal fields of China are well opened. Canada has coal fields of importance near Pictou and on Cape Breton Island in Nova Scotia, known as the Acadian coal field; also a vast and but partly developed field of lignite and true coal in Alberta and eastern British Columbia, and another field on Vancouver Island. Alaska has workable beds of lignite on the coast and in the Yukon Valley at Rampart and Circle City.

The Mexican coal fields are of much local importance, but are not likely to produce any coal for export. The principal field is in the state of Coahuila, extending from Eagle Pass to Sabinas. Coal seams have been worked in Sonora, Hidalgo and Michoacan. During the past five years the output of coal in Mexico has greatly decreased on account of the unsettled political conditions.

The following table showing the production of coal and lignite of the chief coal-producing countries of the world is compiled from the United States Geological Survey figures:

In 1913 the world's production of coal had reached the enormous total of nearly 1,500,000,000 tons. On account of the unsettled conditions brought about by the war, there was a decrease in 1916, but the output in 1915 exceeded that of 1913. According to statistics compiled by the Coal Trade Journal, the output in the United States during 1915 amounted to 525,124,700 tons.

During the past 15 years the production of coal in the United States has exactly doubled; that of Great Britain has increased one-fifth while Germany's production has increased 80 per cent during the same period. Our annual tonnage now almost equals the combined production of Great Britain and Germany.

The coal fields of the United States, not including Alaska, are of various ages from the Carboniferous to the Eocene, the two great horizons being the Pennsylvanian of the Carboniferous, and the Laramie of the Cretaceous. The total area covered by possibly productive seams of lignite, bituminous coal and anthracite is over 450,000 square miles.

Of these vast reserves about 60 per cent is soft coal, including sub-bituminous and lignite, the rest being hard coal or anthracite, semi-anthracite and bituminous.

According to recent classification made by the United States Geological Survey, the coal fields of the United States are divided into six
provinces," on a geographical basis, as follows:

(1) Eastern province, including the bituminous area of the Appalachian region; the Atlantic Coast provinces comprising the blast fields near the Richmond and the Deep and Dan Rivers' fields of North Carolina and the anthracite regions of Pennsylvania, in all 70,000 square miles. (2) Gulf province, including the lignite fields of Arkansas, Mississippi, Louisiana, Arkansas, and Texas, comprising 2,100 square miles in which there have been actual development with areas believed to contain workable lignites embracing 78,000 square miles. (3) Interior province, including all the bituminous regions of the Mississippi Valley and the coal fields of Michigan, covering a total area of 132,900 square miles. (4) Northern and Great Plains provinces, including the lignite areas of North and South Dakota, and the bituminous and sub-bituminous areas of northeastern Wyoming and northern and eastern Montana, covering 88,590 square miles. (5) Rocky Mountain province, including the mountain regions of Montana and Wyoming and the coal fields of New Mexico, an area of 37,000 square miles. (6) Pacific Coast province, including the coal fields in California, Oregon and Washington, an area of 1,900 square miles.

Owing to the competition of lower-priced bituminous coal in the form of coke, the use of anthracite for smelting iron has declined greatly of late years, and its consumption for industrial purposes is not increasing. For steam- and gas-producing purposes, peas, wheat, buckwheat and rice, are much used, and these chiefly on railroads running through the fields or in cities having strict smoke ordinances. Anthracite, being clean, smokeless, having great heating power, and burning slowly, is chiefly used for household purposes and is sent to market broken into lumps of several sizes, known as broken or grate, egg, stove and chestnut, these being called prepared sizes, in distinction from the small or steam sizes before mentioned. The market supplied by the Pennsylvania mines is along the Atlantic seaboard from Nova Scotia to Georgia, also a narrow strip of country extending from Montreal westward through Quebec, Ontario, and the States of the Union bordering on the Great Lakes. The three States of Pennsylvania, New York and New Jersey consume over two-thirds of the anthracite and about half of the rest goes to New England; thus almost 80 per cent is consumed in the East.

The bituminous coals of the Appalachian field include gas, coking and steam coals of the highest grade. The largest and best seams or those most easily opened have been exploited so far, and the resources of the Appalachian field are still enormous. The State of West Virginia alone is estimated to contain more workable coal than the whole of Great Britain. The best-known of these is the rich anthracite zone of the elliptical Butler field, in Pennsylvania, producing coking, gas and steam coals, shipped largely to seaboard points; the Broad Top, in Pennsylvania, producing coal of rather better grade, shipped to the same markets; the Cumberland, in Maryland and Pennsylvania, and the rich fields of the Allegheny coal, shipped to the seaboard and to interior cities from Canada to the Rocky Mountains; the Pittsburgh, in Pennsylvania, whence come gas and steam coals largely used locally, but also shipped to points on the Great Lakes and on the Ohio River and lower Mississippi; the Connellsville, in Pennsylvania, yielding coal used chiefly for making a standard grade of coke; the Hocking Valley, in Ohio, whence are shipped steam coals to_noteably to distant ports on the Great Lakes; the Kanawha, in West Virginia, shipping gas and steam coal to various points on the Great Lakes or on the Ohio River and lower Mississippi; and the New River, Flat Top and Pocahontas fields in West Virginia, producing steam, gas and coking coals of varying excellence, the best grades having no superior, which are shipped mostly to seaboard points, though an increasing tonnage is made into coke to supply blast furnaces at Pittsburgh, Chicago and various Ohio cities. In eastern Kentucky is the Jellico field, whence gas and steam coal is shipped to a wide territory, including seaboard cities, and in eastern Tennessee are several large fields of coking and cooking coals, used locally and shipped to compete with the Jellico coal. The important district in Alabama is about Birmingham: the coal is shipped to Atlantic and Gulf ports for steam- and gas-making, and a large proportion of the output is made into coke for use in local furnaces and foundries.

The eastern interior field covers western Indiana, nearly the whole State of Illinois and part of Kentucky. The coal is of Carboniferous (Pennsylvania) Age, but in general lies in thinner veins and is of poorer quality than that of the Appalachian field. Most of the output is used as a steam fuel by railroads and in the many manufacturing cities that lie in or near the field. Certain grades are much used as a household fuel. The field contains no first-class coking coal.

The northern interior field covers a large area in the southern peninsula of Michigan and has been opened chiefly by the mines near Bay City and Saginaw. The seams are comparatively thin, and the coal is generally of poorer quality than that of Indiana and Illinois. The output is used locally. The beds are of Upper Carboniferous Age.

The west central field extends from western Iowa across western Missouri and into northwestern Arkansas and eastern Nebraska and Kansas, through Oklahoma into Texas. The coal beds vary widely. In parts of the field the coal is barely more than lignite, while in northwestern Arkansas it approaches semi-anthracite. The markets supplied cover a great area. Fully half of the output is used by railroads, and of the other half at least 40 per cent is used for household purposes. The measures are Carboniferous.

The Rocky Mountain field includes the numerous disconnected areas lying in narrow belts along either flank of the range from the Canadian frontier southward for miles into Montana, Utah, Wyoming, Colorado and New Mexico having mines. Along the flanks of the mountains and in the parks or plateaus in the main range the coal is largely bituminous; but eastward from the range the coal measures, which are a part of Aper Cretaceous (Laramie) Age, are lenticic, and vast beds
COAL CITY—COAL LANDS

of lignite underlie the plains of Montana, Wyoming and North and South Dakota. The mining opened up some of the great transcontinental railroads, the chief users. In places the coals make good coke, used by local smelting plants. The resources of the field are vast and but little developed.

The Pacific Coast coal field is of Tertiary Age and most of the output is lignite. It includes some unimportant basins in California, several fields in Oregon, of which the Coos Bay has been most developed, and the Roslyn and Puget Sound fields in Washington, the former producing a good bituminous coking coal. The California and Oregon fields are of little more than local importance, but the Washington mines supply railroads and steamships and are an important factor in the coal trade of San Francisco. The rank of the principal coal-producing States is shown by the following table compiled from figures published in the 1915 report on the "Production of Coal" prepared by the United States Geological Survey:

The coal reserves of the United States lying not deeper than 3,000 feet are estimated at 3,350,000,000 tons; 1,000,000,000 being in the Appalachian fields 2,350,000,000 in the Rocky Mountain and Great Plains fields. Up to the close of the year 1916 the output of all the mines was in round numbers, 11,500,000,000 tons, and as half a ton of coal is wasted for every ton produced and sold, it is estimated that the total exhaustion of the country's coal fields to the date cited amounted to 17,250,000,000 tons. As compared with the amount of coal existing in all the United States fields, this exhaustion amounts to one-half of one per cent of the supply; and, at the present rate of use there is coal enough underground to supply the country for about 4,000 years to come.

The coal being consumed at present in the United States comes: from the anthracite fields of Pennsylvania, 70 per cent; from the bituminous coal area of the Appalachian area, 20 per cent; and from the great Western fields, 10 per cent. Although the anthracite area in the northeastern part of Pennsylvania is less than 500 square miles, it has yielded in the aggregate 2,626,500,000 tons, and it is estimated that four times that quantity remains untouched. Fully 70 per cent of the country's coal lies west of the Mississippi, but it is mostly of semi-bituminous and lignite grade. The high grade bituminous coal of the Appalachian area is being exhausted more rapidly in proportion to the supply than even the very limited anthracite deposits, and geologists assert that its complete exhaustion is not far off. See Fugza.

RICHARD FERRIS,  
Editorial Staff of The American.

COAL CITY, III, village of Grundy County, 60 miles southwest of Chicago, on the Atchison, Topeka and Santa Fe, the Chicago and Alton and other railroads. Coal mining is the chief industry, followed by manufactories of clothing and bricks and tiles. Pop. 2,667.

COAL GAS, the gas produced by the destructive distillation of bituminous coal. See GAS, ILLUMINATION, HISTORY OF.

COAL GAS POISONING. See CARBON-DIURPHIDE; COAL MINING; GAS POISONING.

COAL LANDS. On 1 July 1864 the first act which specifically mentions coal lands in the public domain became law. This law fixed the minimum price at $20 per acre but in 1873 an act was passed reducing the price to $10 per acre where the land purchased was situated more than 15 miles from a completed railroad. Only 160 acres are allowed to individuals, whereas associations may enter 320 acres, or twice that number after they have expended $5,000 in development. An effort has been made to induce Congress, as part of the program to conserve the natural resources of the country, to provide for the lease or sale of coal deposits without the rights to the soil, subject to various regulations. Up to 1 Nov. 1910, pending legislation, more than 80,000,000 acres of coal lands had been withdrawn from entry. On 22 June 1910 an act became law providing for the entry of coal lands as agricultural lands, but to the United States is reserved all right and title to coal in such lands and the right to prospect for, mine and remove the coal.

By act of 6 June 1900 such of the public land laws as related to coal lands were extended to Alaska but since these laws contemplated a public survey before location a supplementary act was passed 28 April 1904 permitting individuals to locate claims of 160 acres (at a flat rate of $10 per acre) by permanent monuments, and when entry applications were made (within three years) they were to be accompanied by plats and notes of private surveys. Individuals soon learned that conditions in Alaska prevented the profitable working of a 160-acre claim independently and accordingly on 28 May 1908 Congress passed a remedial act permitting the consolidation of individual claims located in good faith, up to 2,560 acres of contiguous land, but the act
COAL MEASURES—COAL MINING

contained a stringent anti-monopoly provision. On 12 Nov. 1906 an executive order was issued withdrawing all coal lands in Alaska from entry under the coal land laws, but a later order modified this so as not to apply to claims which had been made prior to that date. In 1914 another act was passed to settle the disputed question of Alaska coal lands, a part of the lands being reserved and the rest arranged in such a way as to prevent the monopoly of the coal deposits by any co-operation. On 30 Dec. 1914, the United States Commissioner of Public Lands issued an order under the provisions of which several local permits have been issued for the free mining of coal lands comprising 10 acres or less. There have been several accusations made against public officials in connection with the methods of acquiring these lands, which led to the Ballinger-Pinchot controversy, the Congressional investigation of the Interior Department and the Forest Service, the dismissal of Pinchot and Glavis and the subsequent resignation of Secretary Ballinger. See PUBLIC DOMAIN; LANDS, PUBLIC. Consult “Public Coal and Public Rails and Private Farms and Private Coal” in the New England Historical and Genealogical Register, Vol. XXXII, pp. 781–82 (June 1915); U. S. General Land Office, “Coal Land Laws and Regulations Thereunder” (Washington); “Undeveloped Coal in the Public Domain of Alaska,” United States Division of the Interior, Agriculture, Geology and Mines, 1911-1914, pp. 505–06 (5 March 1910); Van Hise, C. R., “Conservation of Natural Resources” (New York 1910).

COAL MEASURES. See COAL; CARBONIFEROUS SYSTEM.

COAL MINING. Coal mining differs from metalliferous mining chiefly in the better ventilation required, the extent and regularity of mine workings and the necessity of getting out the mine product with as little dust as possible. The principal gases found in coal mines are carbon dioxide, CO₂, heavier than air, suffocating, but not inflammable, called choke-damp by miners; carbon monoxide, CO, about as heavy as air, is formed from the fat of the seam; white dust, carbonized and powdered from the coal; carbon dioxide, heavier than air, not inflammable and not poisonous, but poisonous and inflammable, but easily detected by its odor. Of these gases, marsh gas, given off in large quantities in some mines, is the chief agent in coal-mine explosions. A mine is said to be fiery when the coal-seams give off much fire-damp. Many of the deeper coal mines of Great Britain, France and Germany are very fiery. The most fiery mines in the United States are in the anthracite region of Pennsylvania, the South Wilkes-Barre shaft at Wilkes-Barre being one of the most fiery mines in the world. Mixtures of marsh-gas and air in certain proportions explode violently on contact with flame. Coal-dust in the air makes a much smaller proportion of marsh-gas an explosive mixture.

Coal-dust work in places where sufficient air to carry away the gas does not circulate, or to enable them to work in very fiery mines, safety-lamps are used. In a safety-lamp the flame is enclosed by wire gauze and cannot ignite gas in the air outside the gauze, unless the gauze is heated to the combustion point of the gas. The safety-lamp was invented by Sir Humphry Davy in 1815 and has been improved in various ways. Many patterns are in use; one of the latest types used in this country is an electric lamp, to which is attached a leadplate battery, carried on the belt, a cable connecting it with the lamp, which is held in a steel shell, carried on the cap. A safety-lamp indicates the presence of fire-damp by the lengthening of the flame.

Carbon dioxide and carbon monoxide given off by the coal in place are produced in the mined-out areas known as “gob.” These gases are the chief constituents of after-damp, the gases resulting from an explosion of dust or fire-damp. They, rather than the shock, cause the terrible loss of life in mine explosions, since men may be killed by carbon monoxide without knowing they are in danger.

Good ventilation is thus a prime necessity in coal mining. It is sometimes secured by a furnace over a shaft, the fire producing a sufficiently strong up-current. But in all fiery mines, and generally in all large mines, large revolving fans, sometimes 35 feet in diameter, are used to circulate the air. The fans may be driven by the exhaust or force in air (up-draft or down-draft); various types of mine fans are used, but the majority of those in service in Great Britain and at the larger mines in this country are modifications of the Lister type. As most coal-seams worked are a few feet thick, but of considerable extent, and as in this country at least, most coal-beds lie flat or dip at low angles, a coal-mine can be opened in a more regular way than a metalliferous mine. Two systems of mining are used— the pillar and room (“board and pillar”), and the long wall. The first, generally used in the United States, consists in taking out various portions of the coal as the work proceeds from the mine-opening, and the remainder in working back toward the opening. The long wall system, used in certain bituminous districts in the United States, and extensively used in England, consists in taking out all the coal in a long passage from the mine-opening, the roadways and air-passages being protected by packs or walls. It is best suited for thin coal-seams with weak roofs, while the pillar-and-room system is best suited for thick seams with rock roofs. The two systems grade into each other.

Coal is broken from the face of the seam by the miner under-cutting it with his pick and then putting in a blast strong enough to bring down the coal. Black powder is generally used in this country. Abroad explosives making less flame are required by law in many districts, and in some of the very fiery German mines wedges operated by hydraulic power are used. Blasting, or “shooting off the solid,” is practiced extensively, entirely in some sections, 15 per cent of the total production being so mined in 1915, but it is considered a wasteful and a dangerous method, as it not only causes cavings, but shatters the coal. Fine coal is less valuable than lump, and dusting greatly increases the danger of an explosion.

To under-cut the coal, machines are sometimes used. Those in general use in this country are of two types: the Harrison, or puncher type, with a reciprocating piston impelled by
COAL MINING

compressed air, carrying a cutting bit; and the chain machine, having an electrically driven chain carrying cutting teeth. The latter type, though not favored for fiery mines, is probably more used in newly opened mines, than the former. No machines are used in the Pennsylvania district. Of the total bituminous coal (442,624,436 tons) mined in the United States in 1915, 243,237,551 tons were under-cut by machines.

There has been a steady tendency toward the increasing use of machinery. In 1903 only 27.6 per cent of the total production of bituminous coal in the United States was machine mined. In 1910 it had increased to 41.7 per cent and in 1915 it was over half — 55 per cent. In that year 15,692 machines were in operation in the coal mines of the country, distributed (in part) as follows: Pennsylvania, 5,935; West Virginia, 2,479; Illinois, 1,787; Ohio, 1,459; Kentucky, 1,399; Indiana, 660; Alabama, 373; Colorado, 293.

Many other states have been employed in mining bituminous coal in Kansas, Oklahoma, Missouri, Indiana and Illinois, where there are areas of flat-lying coal veins near the surface. Some of these shovels have a dipper capacity of eight to ten yards.

The coal, when broken down, is roughly sorted by the miner or his helper and loaded into mine cars which are hauled to the main haulage roads by mules. Here the cars from the various gangways are usually made up into trains (or "trips") and hauled to the shaft bottom or the entrance of the mine by a wire rope (tail-rope haulage), by a compressed air locomotive, or by an electric locomotive. Sometimes the cars are attached singly to an endless wire rope like cars on an ordinary surface cable road (endless rope haulage). Mines of the shaft type are to be found in largest numbers in the hard-coal districts. The hard-coal mines are likewise the deepest. Occasionally an extreme depth of 1,500 feet is attained. Two other styles of mines are found in both anthracite and bituminous fields,—"drifts" and "slopes." The drift mine is dug straight into the mountain from one side. The passageway or heading may be an upward trend. The slope mine slants downward to the extent of perhaps 35 or 40 degrees, the main heading often measuring a mile or more in length.

An interesting process also is "pocket mining," but this is practised comparatively little to-day. A outcrop of coal at various points on the side of the mountain suggests the possibility of a rich mineral vein. Digging is begun directly into the bed of coal projecting at the surface. This form of mining is seldom highly profitable, for when the digging has progressed at considerable expense to a point where the mine should be expected to pay, all operations are suddenly cut short by the encountering of solid rock, which, owing to some upheaval of the past, has faulted the vein of coal from its natural course. These pockets at intervals in the mountains where pocket mining is done present an interesting sight. About Shickshinny, Pa., they are numerous.

In shaft mines, and especially those of anthracite, mules are used very extensively. Where mechanical power is employed to haul trains in the main haulage-ways, these beasts bring the cars only from the side headings or the rooms. The mules do not see daylight for months at a time. In bituminous drift mines evolution has included the introduction of miniature trolley trains of 40 or 50 cars, each train being in charge of a motorman and brakeman. In anthracite mines steam locomotives of a small and peculiar type, known as "hogs," haul the trains. In a slope mine cable trains transport the coal. One end of the cable is attached to the train, and the other winds upon a drum at the power house. When the cable turns a corner it passes around what is known as a "bull wheel." Twenty-five-ton cars may comprise a cable train of soft coal. Anthracite cars often hold four and a half tons. In soft-coal mines the man in charge of the cable train is called a "rope rider." In bringing his cars out of the mine he sits upon the ring which connects the cable with the train. In the anthracite slopes a man stands upon the side of a car ready to "sprag" the wheels when a stop is made. Spragging consists in throwing short but stout lengths of wood into the openings between the four spokes of the car wheel. The height of the bituminous vein is often not more than four or five feet, thus making the quarters of the miners rather cramped. The height of the anthracite only two-thirds loosened from the vein is of value. The miner must use good judgment in loading only the paying coal. To handle and transport chunks in which slate predominates is unprofitable. Even the better coal has more or less slate in it, while in bituminous coal the slate is principally at the top and bottom of the vein and not mixed with the product as mined.

Off from the main or side headings of a hard-coal mine "breasts" or "chambers" are opened. In bituminous fields these are known as "rooms." A tunnel or neck 40 to 60 feet long may connect the room proper with the main passageway. Beyond the neck the chamber may broaden out to a width of 30 or more feet, continuing indefinitely. The coal between the rooms forms what is known as a "rib" or "pillar." As the rooms begin to broaden to their maximum width, timber beams are placed between the floors and ceilings to support the loose rock and earth. Apart from supporting the great mass of solid rock, they are of little service.

When all the coal that it is practical to mine in the chambers has been extracted, the work of drawing the ribs between the rooms is begun, eventually allowing the rock above to cave in. In addition to securing the coal in the ribs, this process is necessary, that the weight of the mountain bearing upon the entrance to the mine may be lightened. As mining progresses, the weight is thrown upon the main heading, until, were it not for the drawing of the ribs, this main passageway would close.

When drawing a rib, the soft-coal miner keeps but one "face bed" in mind, and does not care how much of the rib he will be able to remove before the rock above his head will fall. The first warning of approaching danger is a drumming noise from the layer of stone overhead. Sometimes this noise may be heard for hours before the final crash; in anthracite mines it may be perhaps weeks before. Again, it may come with marked suddenness.

The coal, when brought to the surface, is
COAL MINING MACHINERY

screened, and at many bituminous mines it is shipped as lump and slack. Sometimes it is broken and washed, and in the anthracite region of Pennsylvania, where coal is shipped in seven or more sizes, the coal, as it comes from the mine, is passed through the breaker.

A modern coal breaker built on the side of a hill has a full capacity of 300 tons per day. This breaker is 300 feet in length and 180 feet in height. It is capable of turning out 1,000 tons of clean coal per day. Some breakers have a much larger capacity. The Moosauqua breaker was originally built at a cost of $50,000, but with recent improvements and the installation of the latest machinery its total cost reaches $100,000. It is heated by steam.

The anthracite is brought to the head of the breaker over a little railway leading from the mine in the side of the mountain. The coal, when dumped from the cars, passes over a screen 30 feet in length through which the fine coal sifts. The big chunks next pass to the breaker proper, where rolls with sharp teeth crush it. It next runs into a screen which is cylindrical in shape, and not unlike a locomotive boiler in appearance. As the coal is handled in this device, it falls through perforations of different sizes, each size dropping into a separate chute. On benches at intervals on these chutes, the breaker boys, presided over by a foreman. As the coal passes slowly down the chute at their feet, these lads pick the slate from it and throw the refuse into a parallel chute. The inexperienced boys are always at the upper end of the chutes. They succeed in picking a part of the slate from the coal, and then it passes to the next workmen in line, who continue the operation until, by the time the product has reached the boys at the bottom of the chutes, it is pretty well cleaned. The coal is also washed to free it from sulphur. From the chutes the various-sized coal finds its way into bins, from which it is discharged into cars.

Mechanical contrivances for sorting have recently been installed at great cost in modern breakers. These inventions are spiral in shape, and provide for riddling the coal of much of its slate by centrifugal force. But even with these machines the final operation must be performed by boys or men.

A large amount of the soft coal of Ohio and Pennsylvania is brought to the lower harbors of the Great Lakes, bound for the Northwest and Canada. The cars which carry this coal have a capacity of 100,000 pounds, whereas, in the early days of the coal industry in this country, coal cars scarcely carried 1,800 pounds. On reaching the lake ports, coal for Canada may be taken 60 miles across Lake Erie in car ferries. But the bulk of the coal that comes to the lake ports is unloaded directly into the holds of lake vessels by means of most wonderful machinery, which, in some cases, can pick up a 50-ton car and dump its contents as quickly as a bale of coal could be emptied into the magazine of a store. Some of these machines can be operated by three men, and yet have a capacity of 700 tons per hour. A large and modern coal vessel can carry a coal cargo of 6,000 tons. More than 2,500,000 tons of coal have gone to the head of the Great Lakes in a single season.

Historically considered, coal mining perhaps dates back to about the end of the 12th century. Coal, as an inflammable substance, seems to have been known to the ancients, and to the Britons before the Romans visited their island, it being found frequently in ravines and beds of rivers of a color and texture so decidedly different from the strata which in general accompany it; but as at that period for centuries afterward, the country was covered with immense forests, which supplied abundance of fuel for every purpose of life, there was no necessity for using coal as fuel. The working of coal, therefore, only became an object of attention as population and civilization advanced, when agriculture began to be studied, the woods cleared away and the arts of civil life cultivated; accordingly we find that the working of coal in Great Britain, as an article of commerce, is comparatively of modern date. The first charter giving liberty to the town of Newcastle-upon-Tyne to dig coal was granted by Henry III in 1229; it was then denominated "sea-coal," on account of its being shipped for places at a distance. In the year 1291 the Newcastle coal-trade had become so extensive and important that laws were enacted for its regulation. In Scotland coal began to be worked much about the same time; and a charter was granted in the year 1291 in favor of the abbots and convent of Dunfermline, in the county of Fifes, giving the right of digging coal in the lands of Pittencruech, adjoining the convent. Coal began to be used for iron-smelting about the beginning of the 17th century. The working of coal gradually increased, though on a very limited scale, until the beginning of the 18th century, when the steam-engine was brought forward by Newcomen in the year 1705, and was applied to collieries in the vicinity of Newcastle about the year 1715. This machine produced a new era in the mining concerns of Great Britain, and, as it were in an instant, put every coal-field within the grasp of its owner. Collieries were opened in every quarter; and the coal-trade rapidly increased to an astonishing extent. This extension of the trade was greatly aided by James Watt, who so very much improved the construction and power of the steam-engine as to render it one of the most complete and most useful pieces of mechanism. See COAL MINING MACHINERY.

RICHARD FERRIS,
Editorial Staff of The American.

COAL MINING MACHINERY. During the past 50 years numerous machines have been introduced for mining coal. In the United States coal mining by machinery has proved most successful and divides the field with drill-
COAL MINING MACHINERY

ing and blasting. 56 per cent of the coal product of the United States is now machine mined. In Europe, where coal mining by machines had its origin, the development has been slower. In Great Britain less than 10 per cent of the coal output is mined by machines. In the United States the practice has been to adapt the machines to the methods of mining in use, while abroad the attempt is often made to modify the mining methods to suit a particular type of machine. To obtain the best results methods and machines must be so planned and so operated as to secure the maximum of efficiency. The installation of mining machines, with the necessary plant for the production and transmission of power, requires large capital expenditure, with operating, maintenance and depreciation charges, and therefore machines should be kept steadily at work. A loss of 25 per cent of machine time means that one-fourth of the invested capital is idle and earning no profit to meet the fixed charges. It is particularly important to increase the length of the working faces, and to reduce the distance between the different places to be worked by the same machine, in order to increase the time that the machine is working without interruption, and to reduce the idle time when the machine is moved from one place to another. The machines should not be permitted to stand idle when ready for work, which means that the operations of timbering, track shifting, breaking down and loading of the coal, and especially the movement of the loaded and empty coal cars, must be so organized and systematized as to keep the mining machines at work. Incidentally such organization of the mine work reduces the cost of these auxiliary operations and increases the output.

The advantages which have led to the large use of coal mining machines are in part direct saving of cost, and in part indirect increase of profits. The direct savings are often small, the indirect gains are sometimes large. The direct saving of labor cost is largely offset by increased wages paid to the machine miners and to their helpers. Machine mined coal contains less slack or fines than that mined by powder, and the coal sells at a higher average price. Machine mining lessens the amount of powder used, a comparatively small saving, but lessens the chance of fire-damp and coal dust explosions, avoiding destruction of life and property, a very great gain. Machine mining increases the output both directly and indirectly, and thus increases the earnings on the invested capital, and repays that capital in a shorter term of years.

Coal-mining machines are operated by compressed air or by electricity. Electric power is much more efficient on account of the smaller power losses in generation and transmission. Compressed air is safer and should be used in mines in which there is danger of fire-damp explosions. By the use of explosion proof motors, storage battery locomotives and carefully insulated transmission lines, the employment of electricity is made more safe and by effective ventilation of the mine workings the coal mine explosion or fire-damp explosions is reduced. The tendency to-day is toward increased use of electric power.

Coal mining machines are of five types: (1) Rotary boring machines; (2) rotary bar cutters; (3) rotary disc machines; (4) endless chain machines; (5) puncher machines. They are also divided according to their special application or their method of operation into: (1) Heading machines; (2) breast machines; (3) short wall machines; (4) long wall machines; (5) centre cut machines; (6) shearing machines; (7) loading machines; (8) combined cutting and loading machines; (9) conveyors.

Rotary boring machines are chiefly used for boring blast holes in coal or in the softer rocks. They have been used for boring air-ways of small diameter and for boring entries.

The rotary machines for boring blast holes are known as coal augers and are made in many forms, driven by hand, compressed air, or electricity, and mounted on bars, columns or other forms of support, or simply held in place by hand.

Figure 1 is an auger drill operated by compressed air. The machine itself weighs but

![Fig. 1](image)

24 pounds and requires 18 cubic feet of free air per minute at 80 pounds pressure. Where the coal is soft it may be operated as a breast drill. For harder coal or soft rock it should be provided with a feed screw and column support. These small power drills are also made to be driven by electricity, direct or alternating current, and of different sizes and weights, from 24 pounds to 125 pounds for the machine alone and from one-half to three horse power.

These auger drills are not adapted for use in very hard rock but can be used in bituminous coal, anthracite, rock salt, gypsum, fire clay, shale, slate and similar rocks of medium hardness. In such material they will bore from one to eight feet per minute.

Figure 2 is a one and one-half horse power electric auger drill mounted on a column, with a

![Fig. 2](image)

differential feed screw, by which the rate of boring can be adjusted to the hardness of the rock.
Figure 3 shows example of the cutting edges of these auger bits; (a) and (b) are the shapes usually employed; (c) is effective in soft material, and (d) is one of the forms used for larger holes four or five inches in diameter. For boring deep holes in cored workings, the twisted rods are made in sections of convenient lengths with socket joints.

Air hammer drills, with automatic rotation, and twisted cruciform drill steel with cross-hits, have been successfully used for boring blast holes in anthracite coal. These drills are more effective than augers in anthracite and can be used in hard rock. The twisted steel acts as a twist auger for discharging the cuttings from the hole.

The puncher machines (Figs. 4 and 5) are designed like machine drills, the cutting tool being fastened to the end of a piston rod driven at high speed by compressed air. Puncher machines are also designed for piercing coal. They are used instead of a pick for cutting coal. They are used chiefly for undercutting long faces of coal or in long-wall work. Disc machines are not often used in this country, but are much favored abroad. The disc is armed with cutting chisels, which are replaced when dull, often twice or three times per shift. The disc is mounted on a flat arm, and is driven by a gear-wheel which engages in radial teeth inside of the cutting edge. This construction permits the disc to enter the coal nearly its full diameter. The cutting wheels are sometimes arranged to be tilted so as to follow irregularities or avoid obstacles. Either compressed air or electric motors may be used. The machines are heavy, weighing one to two tons, and are usually run on a track laid along the face, which also acts as a guide to resist the tendency of the machine to swing out of line from the action of the cutter wheel. Sometimes the machine slides on the floor without rails, and is guided between the face and the first row of props. The machine is pulled forward by a wire rope anchored at one end and attached to a windlass on the machine.

*Ingersoll-Rand Heading Machine.
The machines require from 15 to 30 horse power and average 8 to 12 square yards of undercut per hour, 3 to 7 feet deep. The kerf is $3\frac{1}{2}$ to $5\frac{1}{2}$ inches high and 3 feet to $5\frac{1}{2}$ feet deep and is frequently made in the underclay. The tendency seems to be toward the use of heavier and more powerful machines and to the use of motors permitting a heavy overload. At times disc machines may use as much as 50 to 100 horse power from friction on the disc or binding from the weight of the coal. The coal as it is undercut is supported at frequent intervals by sprags to prevent the cutting wheel from being caught and held by the premature settlement of the coal.

Bar cutters have been much improved in recent years, and are now powerful and efficient machines. While generally driven by electric motors, compressed air has been used. The cutter bar, from 5 to 8 feet long, is tapered from 3 inches to 7 inches in diameter and has spiral ribs which act as a screw conveyor to remove the cuttings. The bar revolves 300 to 400 times a minute and has a reciprocating motion of two inches. The steel cutting bits are pointed and are inserted at intervals in the spiral rib. Sometimes they are inserted in the hollow between the ribs when a narrow kerf is desired. The kerf in any case is wider than with a disc machine. Sometimes this may be an advantage. The machines weigh from one to two tons and have motors of from 18 to 26 horse power. In some of the English machines the bar can be raised and lowered while at work and can be swung through an arc of 180 degrees.

The American machine* in Fig. 7 is a short-wall machine and is shown loaded on its truck for transportation. At work it slides on the floor and is moved about by its own windlass and chain. Bar machines have about the same capacity as disc machines, 5 to 15 square yards per hour. A bar machine permits close sparring and is not so likely to be caught by the weight of the coal as a disc machine, and will free itself with less expenditure of power. Bar machines follow irregularities and avoid obstacles in cutting, more readily than disc machines. They can be used for undercutting in narrow rooms or entries. Bar machines operate with less noise than any other type of coal cutters.

Chain machines practically divide the field with puncher machines in this country, with a tendency toward the adoption of the chain for new installations. In these machines the cutting bits are inserted in alternate links of an endless chain, which runs in guides on the cutter arm. As in other coal cutters, provision is made for easily replacing worn bits. In the breast chain machines the cutting takes place at the end of the cutter bar, in other types of chain machines at the side of the cutter bar. Fig. 8 is a chain breast machine. It is mounted on a fixed frame, at right angles to the face of coal to be undercut, and slides forward cutting its way into the coal for the desired depth. The machine is then withdrawn, the frame moved to a new position and a second undercut made alongside of the first. This type of machine is best adapted for narrow work in small rooms and entries, but even for this work is being superseded by the short-wall machine.

*Not yet on the market.

Figure 9 is a chain breast machine as modified for a vertical or shearing cut. It is raised and lowered on the standard by its own power. A coal cutting and loading machine* has been developed which consists of a breast machine for undercutting, combined with two shearing machines and a battery of puncher machines. The machine is mounted on a carriage running

*Jeffrey cutting and loading machine.
on rails and is provided with an endless belt conveyor and car loader. This machine will cut and load into mine cars at one operation a block of coal 5 feet wide, 7 feet deep and the slides and swings about on the floor of the working place by its own power. A separate power driven truck is used to move the machine from one working place to another. The load-

full height of the coal seam, up to 7 feet. It is said to have a capacity of 75 to 100 tons per eight hours. It can be used for driving entries 10 feet or less in width at the rate of 20 feet per shift of eight hours.

The chain short-wall machine (Fig. 10) is an improvement of the breast machine, and is designed to avoid the labor and loss of time of the breast machine in withdrawing the coal and unloading of the machine is effected by its own winch.

The manner in which the short-wall machines are operated is shown in Fig. 11. At (a) the machine has been unloaded; (b) shows it in place for making the sumping cut; (c) is the position taken for the same purpose where the roof is bad and the props are set close to the face; at (d) the sumping is finished and the cutter and shifting the frame at each cut. The short-wall machine, like the disc and bar machines, is designed for continuous work. The machine is provided with a winch or drum and machine is ready to travel across the face; (e) shows the machine cutting across the face; (f) the cutter arm is advanced for hard cutting; (g) shows how the machine is manipulated where a
nodule of hard pyrite is encountered; (h) the cutting arm is turned out to set the bits and (i) returned to continue the cut; (k) the undercutting is finished; (l) machine is ready to widen out a room; (m) cutting along the side; (n) moving and loading the machine on its truck. The above illustrations show the ease with which the short-wall machines are manipulated.

Short-wall machines as now constructed weigh about two and one-half tons and are provided with 30 horse-power motors, either electric or compressed air. The cutter bars are from 5 to 10 feet long. Long cutter bars increased greatly the capacity of the machine and diminish the cost of cutting per square yard and per ton of coal. They can be used, however, only where conditions are favorable.

As short-wall machines are used for undercutting the coal in entries and rooms, their capacity is greatly reduced by the time lost in going from one working place to another, and in unloading and loading the machine and starting work at each place. Under average conditions from six to eight working places can be undercut in a shift of eight hours.

The endless chain long-wall machine (Fig. 12) differs from the short-wall type in that the cutter bar is pivoted so that it can be swung through an arc of 180 degrees. In cutting the bar is at right angles to the machine. This permits the machine to travel in a narrower space, so that props can be set within three feet of the space. The short-wall machine requires a space of six or seven feet.

The arc wall or turret type of chain machine (Fig. 13) represents the latest development in coal cutting machinery. It is mounted on a self-propelling truck, and is operated from the track without the delay of unloading. The cutter bar swings through a semi-circle and the machine is mounted on three standards and can be raised or lowered about one foot. By the use of different sized offset brackets, or by attaching the cutter bar without offset, the machine can be built to cut the kerf at the floor or roof of the coal seam or at any desired level between. This permits the kerf to be made in a dirty or slaty seam. The machine weighs six to seven tons and is provided with powerful motors. With a seven and one-half-foot cutter bar it commands a width of 20 feet. For rooms of greater width the track must be shifted or laid along the face. Two tracks may be used. It can be operated in an entry of ordinary width. The capacity of the machine is said to be about double the short-wall machine and three times that of the breast machine.

The loading of mine cars by hand is a slow operation. Fig. 14 shows a shoveling machine in successful use in the metal mines, which is now coming into use in the coal mines as well. These machines have a loading capacity of one to two tons of coal per minute. They are built to work in coal seams as thin as four feet and can be used in narrow entries, rooms or long-wall workings. The machines weigh from 5 to 10 tons, and require 7½ to 12 horse power. They are driven by compressed air or electric power, and are generally equipped with motors 50 per cent above actual power requirements. The shovel should have sufficient lifting power to break up coal which has fallen in large blocks.

In long-wall mining the rapid loading of the coal from the long working face is difficult. The use of conveyors, extending along the face, to move the coal and load it on cars in the haulage entries greatly facilitates this work. Face conveyors are particularly useful in thin or inclined coal beds. These conveyors are of
three types: (1) Small cars run back and forth by mechanical means, singly or in trains. These can be used in thin coal beds up to any inclination, but do not provide for continuous loading. (2) Shaking troughs, used in inclined workings. The trough of sheet metal is given a combined reciprocating and up-and-down motion, and the coal is dropped in a small inclina-
tion. The breakage of coal is sometimes a serious objection. (3) Continuous mechanical conveyors either endless belt or scraper lines. The endless belt type conveys the coal with minimum power and minimum breakage. These conveyors are loaded by hand or a shoveling machine may be used for the purpose. The remarks at the beginning of this article on the importance of keeping mining machines steadily at work by effective organization applies with especial force to loading and conveying ma-
chinery. The haulage system must be well designed and equipped and efficiently operated so that there may be no failure to supply mine cars as they are needed at any given point in the mine.

Mine Haulage.—Up to a very recent period, the coal cut by the various machines already described has been hauled from the side headings or rooms to the shaft bottoms almost ex-
clusively by mules, but they are being rapidly supplanted by improved systems of steam haul-
age in the anthracite coal regions, and electric haulage in the bituminous drift mines adopted to meet the demands of various conditions which necessitate haulage systems of greater speed and power than that afforded by the use of mules.

The solution of the problem of mine haul-
age, constantly increasing in complexity by the longer haulage consequent on the extension of the mines, and the demand for a larger output, requires the consideration of several important factors, such as the grades of the haulage roads, the height of the veins of coal and the expense of the installation and maintenance of the vari-
ous forms of haulage machinery. Electricity as applied proves superior to all but the use of mules in these conditions better than any other form of power, and the development and extensive use of the electric mine locomotive is the natural result of the best efforts in this direction.

These locomotives are made in a great variety of forms and are equipped with single or double multipolar motors. They range in weight from 2½ to 15 tons, and are operated either by the more familiar overhead trolley wire, or the later third-rail systems. The latter consists of a stationary third rail of heavy iron bars running between the two track rails which are used as the return conductor. The bars of the third rail are perforated at regular intervals throughout their entire length, and are made into a continuous rail by means of fish plates. The locomotive consists of a substantial steel frame mounted on suitable track wheels. This frame also carries two steel sprocket or traction wheels, which are driven by the electric motors of the system, inside the machine, by means of suitable gearing. These sprocket wheels engage the third rail through the perforations therein, and serve the double purpose of driving the locomotive along, and taking up the current from the third rail to feed the electric motor. The third rail is en-
closed in a casing, and is usually laid about five inches off the centre of the regular track, thus allowing sufficient room for the animals to work without interrupting the operation of the system, while the third rail is being installed. The chief advantage of the system appears to be its positive working; the practicability of using light rails on heavy grades; and the minimum consumption of power in moving the dead weight of locomotives of comparatively light tonnage. The loco-
motives used at the present time in operating the *Morgan* electric third rail haulage systems range from 6,000 to 10,000 pounds in weight, and range in capacity from 75 to 150 horse-
power. The smaller machines are equipped with single motors and the larger with double motors, wound for either 250 or 500 volts, as may be desired.

These locomotives as well as those operating the trolley systems are capable of hauling trains of 40 to 50 cars each, or about double the number of cars usually comprising a cable train. These cars are made in a great variety of forms to adapt them for different kinds of service, and have either steel or wooden sides. They are arranged to open at the side, or with a *drop-gate* having *wings* which prevent the coal from spilling out at the ends of the gate when lowered. This gate also serves as an extension platform from which the coal may be conveniently shoveled.

HENRY S. MUNROE,
Minning Engineer, Washington, D. C.

COAL OIL, a volatile oil distilled from petroleum (q.v.).

COAL-TAR, or GAS-TAR, the opaque, viscid, black or brownish liquid arising as a by-product from the dry distillation of bitumi-
nous coal in the manufacture of coal gas, and also in the manufacture of coke. It consists principally of the substances grouped under the name of "aromatic hydrocarbons," and varies in composition according to the grade of coal distilled, the degree of heat employed in the distillation, and the shape of the retorts used. In the lower temperatures at which coke is made (about 850° F.) the tar consists of photo-
gen, paraffin oil, lubricating oils, paraffin, cresol and about 57 per cent of pitch; and the yield of tar may be as high as 20 gallons to the ton of coal. In the high temperatures employed in making coal gas (from 1650° to 1830° F.) the tar consists of benzene (benzol), toluene, naphthalene, anthracene, heavy oils, much cresote, and about 82 per cent of pitch; and the amount secured is about nine gallons per ton of coal. In the latter case many of the constituents of coke tar are broken up into permanent gases by the higher temperature. With horizontal retorts the yield of tar is about two gallons less per ton of coal than with vertical retorts.

The specific gravity of coal-tar ranges from 1.0 for low temperature tar to 1.2 for that produced at high temperatures.

Up to about the middle of the 19th century coal-tar was regarded as a waste product and thrown away, or burned under the retorts. About 1846 it began to be used in Germany for making roofing felt, and distillations of tar were used to impregnate railway sleepers. A year or two earlier, in England, coal-tar napthha had been employed successfully as a solvent for India rubber. The discovery in
1856 of coal-tar colors caused a great demand for the crude substance, and it became a commercial product of increasing value.

**Production and Uses.**—The production of coal-tar in the United States in 1915 was 276,743,885 gallons of which 39,021,748 gallons (14 per cent) was used for fuel, and 237,724,137 gallons was sold into commerce. Of the total product 186,278,000 gallons came from old-style bench retorts and by-product coke ovens, and 51,446,444 gallons from gas plants. The aggregate value of the product was $6,656,276; an average value of 2.8 cents per gallon. The world's production in 1901 was reported at 2,660,440 tons: the United Kingdom producing 908,000 tons, Germany, 590,200 tons, and the United States, 272,400 tons. These three countries thus produced two-thirds of the whole.

The principal uses now made of coal-tar are:  

- as fuel—its heat value being nearly double that of coal; in preserving timber, stone and brickwork from the effects of moisture; in making resins and distillate varnish papers; as paint for metals; as a cement, in place of pitch; in the manufacture of lampblack and soot; as a top-dressing for roads; in the manufacture of dyes and medicines; in the production of solvents and explosives; and, to a limited degree, in gas manufacture—improvable at the prevailing value of coal-tar.

A considerable amount of the coal-tar marketed is artificially made by mixing coal-tar pitch with enough heavy oil (from petroleum) to give it the required fluidity at normal temperatures. (See also articles, **COAL-TAR COLORS**; **COAL-TAR PRODUCTS**; Consult Lewes, "Carbonization of Coal" (1912); Lunge, "Coal Tar and Ammonia" (1899); Wagner, "Coal Gas Residuals" (1914); Warnes, "Coal Tar Distillation" (1913).

**COAL-TAR COLORS**, the coloring matters or dyes artificially prepared from substances derived from coal tar. They are exceedingly numerous, and are mostly of complex chemical constitution belonging to the group known as aromatic compounds (q.v.). They consist chemically of the natural element carbon in association with hydrogen, nitrogen, oxygen, sulphur and other elements. The coal-tar colors are of the greatest importance in the arts, and are used in the preparation of dyes and calico-printing. In popular language they are often called aniline colors. This designation is incorrect, however, for although they include the colors of the aniline class of some of them are derivatives of phenol, anthracene and other substances. Some prejudice exists against the coal-tar colors in the public mind, because they are believed to be less permanent than the natural animal and vegetable colors, for which reason they are substituted. This criticism was quite justifiable some years ago, but a considerable number of coal-tar colors are now known which are fully as fast as the natural ones, and in some cases the coal-tar color has a decided advantage in this respect. The coal-tar color industry had its origin in England, where for 14 years it maintained pre-eminence, but the centre of the industry soon passed to Germany, then distilling enormous quantities of coal for other purposes. The first coal-tar dye was made by a German chemist. He called it *mauveline*. In 1858 A. W. Hofmann published a paper in which he showed that magenta (aniline red) can be prepared by the action of carbon tetra-chloride upon aniline, and in 1859 Versguin first separated fuchsin, and manufactured magenta in quantity. During the next few years various other colors, notably aniline blue, were discovered and placed on the market; and anilined black was discovered by Lightfoot in 1863. This coal-tar color industry was greatly stimulated when Graebe and Liebermann effected the synthesis of alizarin from anthracene in 1868, thereby opening up a new and important field of chemical activity. Previous to this date alizarin was obtained from madder-root, but it is now almost exclusively manufactured from anthracene. Caro produced the first eosin dye in 1874. The synthesis of indigo was the result of a long series of investigations, the final step in which was taken by Baeyer in 1878; and in 1880 a German company placed on the market a substance known as nitrophenyl-propion acid, for depositing artificial indigo upon fibres by Baeyer's method. Other methods for the artificial manufacture of indigo have since been discovered, but the natural dye is still largely used.

The marks that are used in commerce for designating the shade of a color consist usually of certain letters affixed to the name of the color to be described. Thus R is used for red, O for orange, J or G for yellow (Fr. jaune, Ger. Gelb), B for blue and V for violet. Thus *Scarlet RR* or *Scarlet 2R* signifies a scarlet whose tint inclines toward red, and the doubled R signifies that an intermediate color is recognized, whose tint lies between that specified and the pure scarlet. Aniline blue occurs in a reddish shade which is designated as "aniline blue R"; while the finest quality of aniline blue is designated as "aniline blue 6B." Much attention has been paid to the connection between the color of a substance and its chemical constitution. It is known that color depends on the structure of the molecule, but no absolute rule can be given for predicting the color of a compound whose formula is known. In the case of the aromatic series, however (which is of special interest to the student of coal-tar colors), the following may be said: All of the aromatic hydrocarbons are colorless (or white), and the same is true of such of their mono-sulfides in dyeing and calico-printing by replacing one atom of hydrogen with OH, NO, or NH. If two hydrogen atoms are replaced, the resulting compound is also colorless if the radicals introduced are alike. If they are unlike, and one of them is NO,, then the resulting compound is colored. For example, benzene, C, is colorless, and so also are its derivatives, aniline (C,H,NH,) and nitrobenzene (C,H,N,). NO, which are obtained by replacing one atom of hydrogen by NH and NO, respectively. But if a second atom of hydrogen in the benzene nucleus of aniline be replaced by NO, we have the compound NO,C,H,NH, which is known as nitroaniline and is yellow. The presence of certain atomic groups in the molecule of a compound appears to have a strong influence, also, upon the color of the compound. This is particularly noticeable in the quinones, which contain the group O,O, and in the azo compounds, which contain the group N=N:- in 1856. He called it *mauveline*. In 1858 A. W. Hofmann published a paper in which he showed that
COAL-TAR COLORS

stance which unites directly with the animal or vegetable fibres of the fabric to which it is applied, or with a mordant with which these fibres are impregnated. According to Witt's theory, a true dye must contain two species of molecular groups, one of which is called the chromopyl. ("color-bearing", while the other serves to make the compound acid or basic, so that it can form salts. The chromophores are very numerous. They have a distinct effect upon the color of the dyes formed with their aid. The groups NO₂, N₂N, and O.O. as examples of chromophores. Compounds that contain chromophores but are neither acid nor basic are called chromogens ("color-generators"). They are not dyes, but may be transformed into dyes by the introduction of a salt-forming group such as OH or NH₂. Azobenzene, C₆H₄N.N.C₆H₄, is a colored substance, but it is not a dye. It is a chromogen, however, because it contains the chromophore-group N.N.; and if one of its hydrogen atoms is replaced by the group OH, the compound C₆H₄N:N.C₆H₄OH, known as oxyazobenzene, is obtained, which is a true dye. Again if one of the atoms of hydrogen in azobenzene is replaced by NH₂, the compound C₆H₄N:N.C₆H₄NH₂ is also a true dye, and is known to chemists as amidooazobenzene. (Consult Hjelt, "Principles of General Organic Chemistry," from which these examples are taken). Coloring matters that are basic in nature are always used, in dyeing, in the form of salts; that is, it is the compounds of these substances with acids that are used, and not the free bases themselves. "Substantive" coloring matters are those that are directly absorbed from solution by the fibre to be dyed. "Adjective" coloring matters are those that are not directly absorbed in this manner, but which require the fibre to be first "mordanted," or charged with certain metallic salts, or "animalized" with albumen, or treated in some other manner, before the dyeing can be done.

Of the 155 distinct chemical substances found in coal-tar, only nine are used in making coal-tar colors. These are benzol, toluol, xylol, phenol, naphalene, anthracene, methyl anthracene, phenanthrene and carbolax. Nearly all of the coloring matters of coal-tar dyes are made from benzol, naphthalene and anthracene.

From the nine derivatives, or "crudes," are made about 270 substances called "intermediates" which are not dyes, but from which the dyes are made. The latter numbered recently over 1,500, entirely distinct, and each requiring a separate process of manufacture. It is worthy of note in passing that the list of 270 intermediates does not by any means exhaust the possibilities of the nine coal-tar crudes. On the contrary, it is estimated that there are probably more than 2,000 of these intermediate substances, with millions of individual dyes yet to be discovered. In Germany alone upward of 8,000 patents have been granted for as many different coal-tar dyes and distinct processes of making them. Bülow calculated that theoretically 3,160,000 azo-dyes alone may be produced.

Classification.—Several different classifications of the coal-tar colors have been proposed, some from the chemist's standpoint, others from the dyer's point of view. The classification here given is according to Wahl, and is based upon the chromophore dominant in each group, the factor of greatest moment to the manufacturer of coal-tar dyestuffs.

I. Nitro-dyestuffs.

II. Nitroso-dyestuffs or quinone-oximes.

III. Azo-dyestuffs.

IV. Hydrazones.

V. Stilbene dyestuffs.

VI. Diphenylmethane dyestuffs.

VII. Triphenylmethane dyestuffs.

VIII. Xanthene dyestuffs.

IX. Acridine dyestuffs.

X. Anthraquinone dyestuffs.

XI. Quinone-imide dyestuffs (indamines, indophenols, oxazines, thiazines, azines).

XII. Indigo and indigoid dyestuffs.

XIII. Thiazol dyestuffs.

XIV. Sulphur dyestuffs.

XV. Aniline black.

Nitro-dyestuffs.—The dyes in this group contain the chromophore NO₂ which gives an acid character to the molecules of which it is a dominant constituent. This acid reaction is carefully preserved in making combinations to produce new colors. The majority of the dyes are derived from the phenols or naphthols, or their sulphonic acids.

As examples of this group may be mentioned picric acid, aurantiac, martius yellow, victoria orange and naphthol yellow S. Picric acid was the first of the artificial dyestuffs, having been made in the 18th century by the action of nitric acid on hides, and aloes, and also on natural, indigo. As its color (yellow) is not fast either to light or to washing, it is rarely used except in small admixtures with other dyes. Aurantiac dyes wool and silk a shade of orange. It has been succeeded by some of the azo-dyes, Martius yellow dyes wool and silk a bright yellow which fades with heat, and is not altogether fast as to washing. Victoria orange dyes wool and silk yellow; and naphthol yellow S., also known as acid yellow, dyes wool and silk a brilliant yellow.

Nitroso-dyestuffs.—The nitrosophenols are obtained either by the action of nascent nitrous acid on phenol, or by the action of hydroxylamine on the quinones;—hence the alternate title quinone-oximes. Their dyeing properties depend on their combination with metallic mordants, the one most commonly used being ferric hydroxide, which yields intense shades of green. The most important dyes of this group are fast green or Russian green—an olive shade, gambin G and gambin R and naphthol green, all produced on an iron mordant.

Azo-dyestuffs.—This group is founded on the chromophore N₂N. An intermediate step is the production of diazo-compounds—by treating the salt of a primary aromatic amine with nascent nitrous acid. While these diazo-compounds are, for the most part, colorless, they combine with amines and phenols to form dyes of great intensity. Further, azo-dyestuffs containing an amino-group may be diazotised to yield another series containing two N₂N chromophores: these are called diazo-compounds. Similarly other series are produced—trisazo-compounds, with threeazo-chromophores, and tetrazo-compounds, with fourazo-chromophores.

The production of azo-compounds requires, first, the diazoisation of the primary amine; second, the "coupling" of the diazo-compound thus formed with an amine or a phenol; third, the precipitation of the dyestuff from the solution.
COAL-TAR COLORS

In the process of diazotisation, the salt of an amine is converted into the corresponding salt of the diazo-compound by the action of nascent nitrous acid, produced by the decomposition of sodium nitrite with dilute hydrochloric acid. As diazo-compounds decompose by heat, the process is carried on at between 15° and 32° F.

In "coupling," the substance to be combined with the diazo-compound is dissolved in an alkaline solution (if it is a phenol or a naphthol, or their sulfonics, or acids; in an acid or neutral solution if it is an amine), and the diazo-solution is added while the whole is stirred constantly.

The dyestuff rarely separates of itself, and is precipitated usually by the addition of common salt; in some cases by a mineral acid. The dyestuff solution is warmed and stirred vigorously while the salt is being added. The liquid is then treated in a filter press, and the cakes dried in a vacuum oven. The dye is finally ground in an impeller, and standardized to a certain strength of color by the addition of salt, sodium sulphate, dextrine, etc.

The monoazo-dyes fall into two groups: the hydroxyazo-compounds, derived from a benzene hydroxybenzol; and the monoazo-compounds, derived from naphtholene. Of the first group, tropoecin O or resorcin yellow is an example: it dyes wool a reddish shade of yellow. Another example is chrysoidine: it dyes wool and silk, and also cotton when mordanted with tannin, shades of orange. Of the second group, examples are found in azorubine S, azocein and the "Crocein" and "Ponceau" series, giving shades of yellow, orange and red on wool.

Of the mordant monoazo-dyes, examples are found in the diamond yellow, and, specifically, of the chrome-mordanted dyes, diamond black.

Several of the insoluble salts of the monoazo-dyes are made into pigments: they are chiefly shades of red and purple.

Of the disazo-dyes, napthol blue-black and other blacks, Bismarck brown, Biebrich scarlet and Kongo red, are important examples. Through the coupling with tetrazo-compounds is obtained a large number of dyes with a wide range of color, notably the extensive series of diamin colors.

The trisazo-dyes are represented by benzo olive and benzo blue-black.

Hydrazone.—This group of colors is produced by the action of hydrazine or substituted hydrazines on aldehydes and ketones. The most important member of this group is tartrazine, which dyes wool an extremely fast brilliant yellow of a greenish hue. The flavazines, hydrazine yellows and xylene yellows belong to this group, and also does eriochrome red, which gives dull red shades to wool. These may be changed to bluish reds by after-chroming.

Stilbene Dyestuffs.—Stilbene or diphenyl-richene is the source of several well-known dyes long in use. They arise from the treatment of p-nitrotoluene sulphon acid, alone or in the presence of amido-compounds, with caustic soda. By varying the conditions as to temperature and dilution of the soda, various colors are obtained: obtained sun yellow or heliocrisin and direct yellow, which dye cotton directly shades of orange. Through the action of oxidizing agents, greener shades are obtained. Stilbene yellow and stilbene orange and the Mikado yellows belong to this group.

Diaphenylmethane Dyestuffs.—Oxidation of diaphenylmethane gives a ketone—benzophenone, and this, on reduction, yields a secondary alcohol—diphenylethanol or benzylandrol, which, on further reduction, gives diphenylmethane. These compounds are colorless: the dyes of this group are obtained from their amido-derivatives or alkylamido-derivatives which are capable of undergoing an acid or neutral solution if it is an amine), and the diazo-solution is added while the whole is stirred constantly.

The dyestuff rarely separates of itself, and is precipitated usually by the addition of common salt; in some cases by a mineral acid. The dyestuff solution is warmed and stirred vigorously while the salt is being added. The liquid is then treated in a filter press, and the cakes dried in a vacuum oven. The dye is finally ground in an impeller, and standardized to a certain strength of color by the addition of salt, sodium sulphate, dextrine, etc.

The monoazo-dyes fall into two groups: the hydroxyazo-compounds, derived from a benzene hydroxybenzol; and the monoazo-compounds, derived from naphtholene. Of the first group, tropoecin O or resorcin yellow is an example: it dyes wool a reddish shade of yellow. Another example is chrysoidine: it dyes wool and silk, and also cotton when mordanted with tannin, shades of orange. Of the second group, examples are found in azorubine S, azocein and the "Crocein" and "Ponceau" series, giving shades of yellow, orange and red on wool.

Of the mordant monoazo-dyes, examples are found in the diamond yellow, and, specifically, of the chrome-mordanted dyes, diamond black.

Several of the insoluble salts of the monoazo-dyes are made into pigments: they are chiefly shades of red and purple.

Of the disazo-dyes, napthol blue-black and other blacks, Bismarck brown, Biebrich scarlet and Kongo red, are important examples. Through the coupling with tetrazo-compounds is obtained a large number of dyes with a wide range of color, notably the extensive series of diamin colors.

The trisazo-dyes are represented by benzo olive and benzo blue-black.

Hydrazone.—This group of colors is produced by the action of hydrazine or substituted hydrazines on aldehydes and ketones. The most important member of this group is tartrazine, which dyes wool an extremely fast brilliant yellow of a greenish hue. The flavazines, hydrazine yellows and xylene yellows belong to this group, and also does eriochrome red, which gives dull red shades to wool. These may be changed to bluish reds by after-chroming.

The flavazines, hydrazine yellows and xylene yellows belong to this group, and also does eriochrome red, which gives dull red shades to wool. These may be changed to bluish reds by after-chroming.

Stilbene Dyestuffs.—Stilbene or diphenyl-richene is the source of several well-known dyes long in use. They arise from the treatment of p-nitrotoluene sulphon acid, alone or in the presence of amido-compounds, with caustic soda. By varying the conditions as to temperature and dilution of the soda, various colors are obtained: obtained sun yellow or heliocrisin and direct yellow, which dye cotton directly shades of orange. Through the action of oxidizing agents, greener shades are obtained. Stilbene yellow and stilbene orange and the Mikado yellows belong to this group.

Diaphenylmethane Dyestuffs.—Oxidation of diaphenylmethane gives a ketone—benzophenone, and this, on reduction, yields a secondary alcohol—diphenylethanol or benzylandrol, which, on further reduction, gives diphenylmethane. These compounds are colorless: the dyes of this group are obtained from their amido-derivatives or alkylamido-derivatives which are capable of undergoing an acid or neutral solution if it is an amine), and the diazo-solution is added while the whole is stirred constantly.

The dyestuff rarely separates of itself, and is precipitated usually by the addition of common salt; in some cases by a mineral acid. The dyestuff solution is warmed and stirred vigorously while the salt is being added. The liquid is then treated in a filter press, and the cakes dried in a vacuum oven. The dye is finally ground in an impeller, and standardized to a certain strength of color by the addition of salt, sodium sulphate, dextrine, etc.
groups in suitable positions. The anthra-
quinone dyestuffs are classified as (1) oxan-
thraquinones; (2) amidoanthraquinones; and
(3) those which contain also another chromo-
gen besides anthraquinone.

The oxanthraquinones dissolve in alkalis
to form violet or blue solutions. Their value as
colour depends on the fact that they form insol-
uble lakes with metallic hydroxides. The most
important members of the group are alizarin and purpurin, both of which are formed
naturally in the root of the madder plant. Alizarin gives shades of bluish-red to violet and
brown, with different mordants. Purpurin
gives shades of scarlet on an alumina mordant.
Anthracene blue is another important dye in
this group; with chrome-mordanted material it
gives a shade of blue.

The amidoanthraquinone and hydroxyamido-
anthraquinone dyestuffs produce very bright
shades which are fast as to light. The most
important are those which contain one or two
NH groups, which represent sulphonated
aromatic nucleus. In the amido-group are
alizarin cyanine green, anthraquinone violet,
and alizarin astrol: in the hydroxyamido-
group, alizarin saphir, alizarin celestol and
alizarin indigo blue.

Among the dyestuffs arising from the com-
bination of other chromogens with anthra-
quinone, characteristic examples are alizarin
blue, alizarin green S and alizarin indigo
blue.

An important group of dyes of the anthra-
cene class are the so-called anthraquinone vat
dyestuffs. They are insoluble in water, but
give soluble products on reductions and have
decided affinity for textile fibres. These vat
dyes are complex compounds of high molecular
weight, containing nitrogen, sulphur and other
groups in addition to the ketone groups of
anthraquinone. They are classified as indan-
threnes (a title now used for all the anthra-
quinone vat dyes), in shades of blue, gray and
magenta, flavanthrenes, and indanthrene yellow,
also orange and scarlet; benzanthrenes, includ-
ing cyananthrene and violanthrene, indanthrene
violet and indanthrene green; the anthraqui-
noneimides, indanthrene red G and indanthrene
blue A; and the acridanthrenes, comprising the extensive series of the algal
dyes — in shades of yellow, red, blue and violet.
These vat dyes are used almost exclusively for
the dyeing of cotton, but may be employed also for
wool which has been treated with formalde-
hyde.

Quinone-Imide Dyestuffs.—This class in-
cludes the indamines and indophenols derived
from p-quinone; and the oxazines, thiazines
and azines derived from ortho-quinone yellow.

The indamines are produced by oxidizing an
equimolecular mixture of a p-diamine and a
monamine in cold dilute solution. Phenylene
blue, Bindschneider's green and toluylene blue
are examples. The indamines are not used in
dyeing because they hydrolyse in the presence
of acids. They are used as raw material for
making the oxazine, thiazone and azine dyes.

The indophenols are also sensitive to acids,
and are used as raw material for making sul-
phur dyestuffs.

The thiazenes contain a characteristic ring
composed of nitrogen, carbon and sulphur.
Lauf's violet is an example of the subdivision
thiazines, and methylene blue of the subdivision
thiazones.

The oxazines differ from the thiazenes only
by the substitution of an oxygen atom for the
characteristic sulphur atom of the latter. If
the auxochromes introduced are amido- or alkyl-
amido- groups, the resulting dyestuffs are
oxazines: if hydroxy-groups they are thia-
zones. Capri blue and Meldola's blue are ex-
amples of the first division, and resorufine and
resazurine of the second.

The azine dyestuffs are all phenazonium de-
rivatives. They are subdivided into eurhodines,
eurhodoles, safranines, mauveines and indu-
lines. The eurhodines are weak bases, of which
the monoacid salts are red, and the diacid salts,
green. The most important dye of this group
is toluidene red. The eurhodines are obtained
by heating eurhodines with concentrated hydro-
chloric acid at 180°. The safranines are basic
dyestuffs, which form three series of
salts. The monoacid salts dye wool, silk and
tanned cotton shades of red. The mauveines
are phenyl-derivatives of the safranines. The
This group is now only of historic interest, mauveine
having been the first coal-tar color discovered.
The indulines are considered phenylamido-de-
rivatives of the mauveines. They are used in
the printing of cotton fabrics. The grey dye-
stuffs known as nigrosines belong to this
group.

Indigo and Indigoid Dyestuffs.—The produc-
tion synthetically of indigo (the coloring
matter of the indigo plant) was accomplished
in 1875 by the oxidation of indol by ozone.
But it was not until 1890 that Heumann's syn-
thesis with phenylglycine and its carboxylic acid
afforded a profitable method of commercial
manufacture. The sodaamide modification of
this process is the one now chiefly employed.
Indirubine, a red dyestuff, is the isomer of
indigo, with which it occurs in the natural
sources of indigo. It is synthesized by con-
densing isatin chloride with oxindol. Not used
itself as a dye, its bromo-derivatives are valu-
able.

The indigoid dyestuffs are characterized by
the presence of the indigo group, and are of
two classes: symmetrical, obtained by oxidizing
products similar to indigoids, and unsym-
metrical, prepared by condensing a compound similar to
indoxyl with a cyclic ketone, such as isatin.
The principal commercial dyestuffs in this
division are the thioindigo series of fast scarlets,
reds and violet-reds used on cotton; and the
substituted indigoid dyestuffs. The latter
includes the ciba dyes, polyhalogenated
derivatives of the indigoid division and the
Helindone series. The first are vat dyestuffs
for wool, cotton and silk, in shades of yellow;
the second, wool dyestuffs of orange, scarlet, pink
and red.

Thiazol Dyestuffs.—The thiazol ring is het-
erocyclic, containing three carbon atoms, one
nitrogen atom and one sulphur atom. The
first known derivative of this class was
phenylbenzothiazol, obtained by fusing benzani-
 tide with sulphur. The most important deriva-
tive is primuline, containing a free NH group,
which may be diazotised on the fibre and then
combined with amines to produce dyes giving
various shades. This class includes the so-called
"Ingrain dyes," which are fast to washing, but
not fast to light. The colors are yellow, red,
garnet and brown. Chloroprene, thiophlavine, thiazol and thiazol yellow belong to this class.

**Sulphur Dyestuffs.** — The sulphur or sulphide colors result from heating various organic substances with sulphur. They are direct dyes for vegetable fibres. Commercially, the sulphur dyes are known by many different names. They are nearly all colored powders, insoluble in water, acids and the other usual solvents, but soluble in cold alkalis in the presence of reducing agents. Two methods of preparing them are employed: the first is to treat substituted aromatic amines with chloridinitrogen; the second, to reduce indophenols or indamines. Several fine black dyes — vidual black, fast black, immedial black, etc. — blues, yellows and olives, maroon, browns and bronzes are found in this valuable class.

The sulphurized vat dyestuffs form a distinct division under the sulphur class. They are produced by the action of polysulphides on certain organic compounds, but they are in some respects different. They are divided into (1) sulphurized anthracene derivatives, and (2) sulphurized vat dyestuffs of indophenols and allied compounds. The first are prepared by melting anthracene and some of its more complicated derivatives with sulphur at high temperatures. Indanthrene olive is a type of this class: it is obtained by melting anthracene with sulphur at 480° F. Other colors in this group are the cibarnes — blue, black, green, yellow, orange and brown. The second division includes indocarbon and most of the hydron series — blue, blue-black and violet.

**Amine Black.** — An insoluble dye obtained by treating anilme with acid oxidizing agents. In its solid form it is not used in printing cotton fabrics, but is always developed on the fibre by special processes. Aniline black is perhaps the most important of all dyes for cotton fabrics. Depending for its color upon oxidation, it is thoroughly fast, and ungreenable. See COAL TAR; COAL-TAR PRODUCTS.

**COAL-TAR PRODUCTS.** Coal-tar is separated into its many valuable constituents by distillation at gradually increasing temperatures. This is done usually in an iron still cylindrical in shape, about as high as it is in diameter, with a domed top and a conical bottom. The charge is usually 20 tons of tar, which has previously been completely freed from its water content. The distillate passes through a condensing coil surrounded with water which is cold at first but is changed at intervals to hot — to prevent blocking of the coil with solid substances which crystalize out.

The products of this primary distillation are (1) light oils of a specific gravity of 0.90 to 0.95, coming over up to the temperature of 342° F., in amount varying from 2 to 8 per cent of the charge of tar; (2) middle, or carbolic oils of a specific gravity of 1.01, coming over above 342° and up to 446°, in amount, 8 to 10 per cent of the tar; (3) heavy, or cresote oils of a specific gravity of 1.04, coming over above 446° and up to 518°, in amount, 8 to 10 per cent of the tar; and (4) anthracene oils of a specific gravity of 1.10, coming over above 518° and up to 752°, in amount, 16 to 20 per cent of the tar. The residues of the still is pitch in amount, about 50 per cent of the original charge of tar.

These primary distillation products are treated in various ways to secure the large variety of coal-tar products known to commerce and utilized in the economic arts.

The light oils are first redistilled, to separate them from a small admixture of the middle or carbolic oils. Then the purer liquid is agitated at a low temperature with concentrated sulphuric acid in cast iron, lead-lined wooden vessels. This operation fixes the bases, and the unsaturated hydrocarbons, phenols, and sulphur compounds are dissolved or reformed. The acid portion is drawn off and yields ammonia sulphate and a crude benzole washed with water and a weak solution of caustic soda, and, after drying, is fractionally distilled.

The fractions are collected in four portions: (1) the "first runnings," up to a temperature of 158° F.; (2) benzole; (3) naphthalene, pentane, hexane and acetone-nitrite; (2) light benzole, coming over above 158° and up to 252°; (3) heavy benzole, coming over above 252°, and up to 350°; and (4) carbolic oils, which are turned back into that portion of the primary products.

The "crude" benzole thus obtained is again distilled, and separated into pure benzole, toluol, xylol and a residue which is called "solvent naphtha." The pure benzole and toluol thus obtained yield coal-tar dyes. The 90 per cent benzole is used in making a motor fuel, in laundry work and in the manufacture of illuminating gas. Solvent naphtha is used extensively in the rubber industry.

The middle or carbolic oils contain naphthalene, phenol and the cressols. Naphthalene crystallizes out when the oil is allowed to stand, and the crystals are separated in a centrifugal machine and by pressure. After the naphthalene is removed, phenol to the extent of 40 per cent is obtained by fractional extraction with a 10 per cent caustic soda solution, and then neutralized by sulphuric or carbonic acid — which precipitates the phenol fluid. This, again, is fractionally distilled and subjected to cold, when the phenol crystallizes out, leaving the cressols still liquid. The pure phenol is used in making picric and salicylic acids. The cressols remain in three forms mingled together — ortho-cresol, para-cresol and meta-cresol — and are used in the crude form as a disinfectant.

The heavy or cresote oils are a combination of neutral and acid oils, chiefly: naphthalene, dinaphthalene, methylnaphthalene, xylanol, naphthol and paraffins. The cresote oils are used principally for preserving.

The anthracene oils contain some carbolic acid besides the anthracene. The latter is separated out by chilling the oils to a temperature where the anthracene crystallizes into what is known as crude anthracene, from 10 to 12 per cent of that from 2 to 8 per cent of phenanthrene, methylanthracene, diphenyl, naphthalene, pyrene, cretene and carbazol. The crude anthracene is subjected to a pressure of 3,000 to
4,000 pounds to the square inch in a hydraulic press heated by steam. Nearly all the phenanthrene and naphthalene flow out in liquid form. The remainder is washed with solvent naphtha, and with the acid pyridine liquid from the first treatment of the oils, and anthracene of 90 per cent purity remains.

Anthracene, when oxidized, yields anthraquinone, from which is obtained alizarine, and thence the whole large group of alizarine dyes. The fluid remaining after washing the light oils with sulphuric acid contains pyridine, and the other bases—the picolines, lutidines, etc., Ammonia gas is run into the liquid until the pyridine separates—as an oil. Quinoline is separated in the same way from the sulphuric acid washing of the heavy oils. It is used in making indigo.

These secondary products yield, besides the coal-tar colors, an extended list of medicinal drugs, perfumes, flavorings, disinfectants and preservatives, burning and lubricating oils, pigments, photographic chemicals, etc. Only a few of these can be mentioned here.

From benzol are derived nitrobenzene, yielding aniline and thence the aniline colors; erythroisine, used to render photographic plates orthochromatic; fluorescein, used in testing the purity of drinking waters; the flavoring "light almond oil," and a similar perfume; acetanilide, the basis of headache powders; and the hypnotic, acethophene.

From toluol are derived the preservative benzoic acid, and its salts; picric acid, trinitrotoluol and other high explosives; the benzaldehydes, and others; and the drug saccharine, 300 times sweeter than sugar.

From phenol come nitrophenol, and the amidophenol dyes; coumarin, the artificial vanilla flavoring; carbolic acid, the surgeon's sterilizer; and salicylic acid and its medicinal salts.

Xylo is the source of xylidine scarlet and other dyes.

Naphthalene yields napthol and amidonapthol dyes; is vaporized to enrich and add to the brilliancy of coal-gas; and is burned to produce a high grade of lamp black.

From quinoline come antipyrine and other antipyretic medicines, and the photographic developers, hydroquinone, eikonogen, etc.

Naphthalene, which forms 50 per cent of the bulk of coal-tar is the base of many waterproofing and paving materials, and the source of most artificial asphalt.

Production.—When the European War broke out in August 1914, there were in the United States six factories making coal-tar colors. They employed about 400 operatives, and manufactured annually about 3,300 short tons of coal-tar dyes. The consumption in the United States was about 29,000 short tons, of which 22,000 tons came from Germany. At the close of 1915, there were 14 concerns making finished dyestuffs in the United States, and a score or more making intermediates. Several of the larger textile mills also have established dye-making plants of their own. The aggregate production for 1915 was about 15,000 tons, with a much larger output in sight for 1916. See CHEMISTRY, PROGRESS OF.

Bibliography.—Beschall, 'Dyestuffs and Coal Tar Products' (1911); Cowell in 'The British Coal Tar Industry' (1915); Lewes, 'The Carbonization of Coal' (1912); Lunge, 'Coal Tar and Ammonia' (1900); Wagner, 'Coal Gas Residuals' (1914); Warnes, 'Coal Tar Distillation' (1915).

RICHARD FERRIS,

Editorial Staff of The Americana.

COAL WASHING. Coal washing consists in the removal from coal of the impurities which it contains in nature. Some of these cannot be removed because they are part of the coal itself; for example, some of the ash, of the phosphorus and of the sulphur. Others, as slate, bone or impure coal, and pyrite, can be removed to a certain extent by washing, because they are mechanically mixed with the true coal. The need for washing lies in the fact that when the slate is removed a ton of coal has greater heating power and is worth more to the consumer, and when pyrite is removed the coal has less sulphur and it is more advantageous for making coke and from it iron and steel. Coke for the iron business should not contain over 1 per cent sulphur nor more than 6 to 10 per cent of ash.

Bituminous Coal.—The operation of washing bituminous coals consists of three steps: crushing, screening and washing. Of the many breakers the Bradford breaker has been much used. It consists (see Fig. 1) of a revolving cylinder with perforated walls for screening the coal and with longitudinal lifting plates which lift and drop the lump coal and thus break it. The hard lumps consist mainly of pyrite balls and slate and are sent direct to the dump as waste: the fine coal is then ready for the washer. Crushing rolls with inserted teeth (see Fig. 2) are used in many collieries for crushing

Fig. 1—The Bradford Coal Breaker

Fig. 2—Toothed Rolls
the coal, the two rolls revolving toward one another break the coal which is fed in between them. The closer the rolls are set together and the finer the teeth, the smaller will the coal be broken.

The Jeffrey-Robinson coal washer (see Fig. 3) consists of a cone which is fixed and is fed with its crude coal through the spout, g; it has revolving arms and from the arms are vertical revolving stirring rods, b, b; a current of water rising through the coal is fed in from the pump, p, and the annular distributing pipe and screen, i. This rising current loosens the coal which the revolving rods still further stir, and the heavy slate and pyrite settle to the bottom and are drawn into the pocket, d, by the upper gate valve, e, and later are discharged by opening the lower gate valve, f. The clean coal over-flows at the top at j, is scraped over the coarse screen, k, by the scraper conveyor and discharged at m; the fine coal which passes through k is scraped forward on the fine screen, l, by its scraper conveyor and discharged at m' ; the fine clay and sludge pass through this fine screen and are separated from the water which is returned to do more washing. The New Century Nut Coal Jig (see Fig. 4) has a screen in a tank with two compartments, the screen occupies one compartment while a plunger occupies the other. As the plunger is pushed down it causes a rush of water up through the screen, the coal and heavy impurities resting on the screen are made liquid and mobile by the rising water, and the heavy particles quickly find their way to the bottom while the light pure coal rises to the top and overflows at the end and is saved; the heavy slate and pyrite are discharged under a gate and over a slight dam and are discharged as refuse beneath. The Pittsburgh jig (see Fig. 5) has no plunger to actuate the water, but it has its screen mounted in a large box and this box moves up and down in the water tank; as the box moves down the water rushes up through the intake valves and up through the perforated metal bottom or screen and liquefies the coal and slate, allowing the coal to rise to the top and the slate to settle to the bottom; the cleaned coal overflows and is carried off by a drag conveyor while the slate is let out from time to time by opening the slate gate. It goes to the bottom of the tank and is removed mechanically from there.

For cleaning very fine coals, bumping washing-tables are used. The Campbell table (Fig. 6) is one of these; it is operated by what is called the cam spring and bumping post mechanism; the cam pushes the table down hill gently and is followed by the spring which pulls the table up hill more rapidly until it strikes the bumping post; at this instant all the particles on the table are jarred forward, the slate being heaviest is beneath, while the coal which is lightest is above; on the return stroke the water is acting to float this coal down hill. The end point is that the slate is all discharged at the upper end while the coal is discharged at the lower end. To do this the table is suspended on rods. The upper part of the table slopes slightly more than the lower part and the surface has thin cleats on it to prevent the slate from moving down hill.

A Robinson washery in Alabama is reported to treat 700 to 800 tons a day of which 40 per cent is shipped as lump and nut coal; the remainder, about 400 tons, is washed. A plant of
this sort costs from $5,000 to $8,000; the cost of washing the coal for labor at washer is $2 per day; for labor at boilers, fuel, etc., $4; for supplies, $3. This figured for 400 tons would be 2½ cents a ton. The water required is 35.1 gallons per ton of coal washed.

COALDALE—COALS TO NEWCASTLE

the smaller sizes of anthracite the jigs have done very good work and are standard for cleaning those sizes. See COAL.

Massachusetts Institute of Technology, Author of "Ore Dressing."

COALDALE, Pa., borough in Schuylkill County, 15 miles north of Pottsville, on the Central of New Jersey and other railroads. It is a coal mining centre and seat of the Panther Valley Mining Institute. Pop. 5,154.

COALGATE, Okla., town and county-seat of Coal County, 120 miles S and SE of Oklahoma City on the Chicago, Rock Island and Pacific and the Missouri, Kansas and Texas railroads. Coal mining and cotton raising are the chief industries. The waterworks are municipally owned. Pop. 3,255.

COALING STATIONS, depots established by maritime governments at various important points throughout the world, where the ships of the navy may obtain supplies of coal. The utility of such stations, when properly fortified, as points of refuge, defense and repair for warships in the event of war can hardly be overestimated. The more important British stations are Aden, at Trincomalee (Ceylon), Singapore, Hongkong, Sierra Leone, Saint Helena, Mauritius, Jamaica and Simon's Town (Cape Colony). During 1898-1900 the United States established coaling stations for its navy at San Juan, Porto Rico; Pearl Harbor, Hawai; Pag Island, Samoa; Cavite, near Manila; at the chief port of Guam, Ladrone Islands; and at convenient points in Cuba; and coal "piles" at La Paz, Mexico, and at southeast of Oklahome. Some of the British coaling stations supply both naval and mercantile vessels.

COALINGA, Cal., city in Fresno County, 100 miles west of Fresno, on the Southern Pacific Railroad. It contains a Carnegie library and has a grammar school and a high school. It is in a very productive oil centre, there being about 1,300 producing wells in the district. The city has oil-field supply houses, a refinery and machine shops. Distilled water is supplied direct to the houses through pipe lines. Pop. 4,199.

COALITION, a combination of bodies or parts of a body into one body. In political history it means a temporary alliance or union for joint action of various powers or states; and especially of parties or members of parties. Several noted coalitions are (1) English: the joining of the Whig Party under Fox with the stronger faction of Lord North for the purpose of ousting the strongest body under Lord Shelburne; the coalition of the Whigs and the Peelites under Lord Aberdeen in 1852-53; and the Liberal Unionists and Conservatives in Lord Salisbury's third ministry in 1895. (2) American: the joining of the Henry Clay party in the United States Electorate with the J. Q. Adams faction for the defeat of the supporters of Andrew Jackson.

COALS TO NEWCASTLE. To carry coals to Newcastle means to do something that is superfluous. Newcastle being a great coal field, carrying coals there would be a type of unnecessary action. The French have a saying "to carry water to the river" for the same

![Diagram of the Campbell Table](image)

**Fig. 6 — The Campbell Table**

Anthracite coal comes from the mine in all sizes from large lumps down; the larger lumps must be broken and then the coal is screened into the commercial sizes known as steamboat, egg, stove, chestnut, pea, etc., and the slate, bone, dust, etc., are separated by hand picking and mechanical means.

**Trade Sizes for Anthracite Coal.** The table shows the distance between the screen bars or the diameter of screen opening which determines the various sizes of anthracite coal as known to the trade.

It will be at once noticed that the market requires many more sizes of anthracite than of bituminous coal. This is because anthracite requires that its lumps shall be all nearly of the same size in order that they shall burn freely upon a grate. The anthracite breaker, as it is called, consists of a systematic grouping together of screens, rolls, where breaking is required, of picking chutes from which the boys pick the slate as the coal slides past them, and of shipping bins to which the different sizes are fed and from which the coal is loaded into cars to be shipped by train to the market. Besides hand picking, several mechanical slate pickers have been devised which depend upon some physical feature of the slate, as for example, its tendency to come in thin, flat plates, while the coal is more cubical in form; they have the disadvantage that a thin, flat piece of coal ranks as slate and is lost. For
thing, and there are equivalents in almost every language.

**COALVILLE**, England, a town in Leicestershire, 15 miles north of Leicester. It is a coal-mining centre and has iron foundries, car shops and brick works. Pop. 18,548.

**COALVILLE**, Utah, city and county-seat of Summit County, 40 miles southeast of Ogden, on the Union Pacific Railroad, and on the Weber River. It has large stock raising and agricultural interests and coal mining is an important industry. The city owns the waterworks and lighting plants. Pop. 976.

**CÓMAO**, P. R., town on the Cóamo River, 15 miles northeast of Ponce. It is celebrated for its mineral springs known as Baños de Cóamo. The town is situated in a municipal district of the same name. Pop. (town) 4,000; municipal district, 12,000.

**COAN**, kó'an, Titus, American missionary; b. Keelingworth, Conn., 1 Feb. 1801; d. Hilo, Hawaii, 1 Dec. 1882. He was ordained as a Congregational minister in 1833 and in that year explored Patagonia, where his attempt to establish a mission was unsuccessful. In 1835 he sailed for the Hawaiian Islands, and for the remainder of his life was a missionary at Hilo, where he converted more than 14,000 natives and organized missions from Hawaii to the Marquesas and Gilbert Islands. The largest volcano in the world was in his parish and for 40 years he was his unwearied explorer and historian. He published many valuable papers dealing with the volcanoes of Hawaii and two books, 'Adventures in Patagonia' (1880), and 'Life in Hawaii' (1881). The latter is considered a classic of missionary literature.

**COAN**, Titus Munson, American physician and author, son of Titus Coan (q.v.): b. Hilo, Hawaii, 27 Sept. 1836. He was educated at Williams College and at the College of Physicians and Surgeons of Columbia University. From 1868 to 1865 he served as intern at Bellevue Hospital and in army hospitals. From 1863 to 1865 he served as assistant surgeon in Admiral Farragut's squadron. He now resides in New York where he founded in 1880 the New York Bureau of Literary Revision. His writings include: 'Ounces of Prevention?' (1885); 'Hawaiian Ethnography' (1899); 'The Natives of Hawaii: A Study of Polynesian Charm' (1901); 'Climate of Hawaii' (1901). He edited *Topics of the Time*.

**COANZA.** See KWANZA.

**COAST ARTILLERY**, a branch of the United States army entrusted with the defense of the coasts. For its function see Coast Defense; for its organization see Army Organization, and for its armament see Artillery and Guns. In 1918 a great part of the coast artillery was being used as heavy artillery in France.

**COAST DEFENSE**, systematic protection of the country against hostile attack along its coast-lines. The term should not be confused with Coast Defenses, which implies only those works erected at special points, for the defense of limited sections of the coast. In providing such defenses of attack and to consider not only the safety of its territory, but also the security of its commercial interests. In any system of coast defense a good navy is the most important feature; and so essential is it considered, that all other means are regarded as adjuncts or auxiliaries of the navy. Along a well-defended coast, in suitable places, stations or points of support where is stored the requisite material for building, equipping, repairing and supplying naval vessels, and where provision is made for furnishing men when additional force is needed. Forts are built in places where the coast artillery may co-operate with the navy in obstructing the advance of an enemy intending to capture a city or to invade the country; where their guns may command the entrance to a harbor or other approach by water; wherever they may cripple the enemy's attack on the defensive fleet, leaving it free to attack the enemy in turn; where forts may assist each other and co-operate in repelling an invasion or preventing a blockade or a bombardment; where minor channels of approach may be closed or guarded, thus enabling the navy to give entire attention to the main channel, etc. Torpedo-boats, submarines, harpooners, the searchlight, whirling the harbor and permits detection of the enemy's movements, and hydroplanes, are all valuable aids for the forts. The unfortified coast, as well as the land approaches to cities, must be defended in time of war by whatever means are at command.

The guns for coast defense change with the places and purposes for which they are to be used. To pierce the side armor of battleships, the flat trajectory, high-powdered ammunition for projectiles intended to fall on the decks of an enemy's ships, the high-angle guns (mortars or howitzers) are employed. The number and size of guns vary with the estimated number and calibres of those which may be brought to bear by an enemy. From the depth and length of the channel may be determined how many and what classes of ships the enemy can operate in it, their armament, etc., and from these data the number and calibres of guns needed may be calculated.

The difficulty of obtaining naval supplies after war has been declared makes it necessary to store them during times of peace. Besides quantities of supplies at points of support for the navy, important harbors are generally equipped with torpedo storerooms, cable-tanks, mining casemats, etc., for use in emergencies.

The tactics of coast defense have changed greatly since the beginning of the last decade of the 19th century. Besides defense against attack upon fortified places preparation is also necessary for resisting assaults upon unfortified coasts. The length of the United States coast-line makes its secure fortification a matter of great difficulty and expense.

Methods of reconnaissance are important for defense as well as for attack. The defense seeks to veil all batteries, and even in times of peace a journey along a fortified coast might not discover many forts or other means of defense. For an attack, in preparation for attack or in action, seeks to discover the nature and strength of the defenses; and the defense in turn uses all possible methods of ascertaining the number and classes of the enemy's ships, the probable line of attack, whatever may be discoverable in regard to his strength and purposes. Pictures of every important warship
in the world are studied by certain officers of every navy and so close are some of these studies that a war vessel may be recognized by such an officer in any position in which he sees it. For the important work of reconnaissance, observation stations are fully equipped for the coast artillery, photograph, drawings, descriptions of warships, telescopes, etc., for use in procuring information of the enemy, being fully provided. One of the chief means of observation is the aeroplane or hydroplane.

In times of peace a country may, to its peril, neglect its coast defense, as was shown by the condition of the defenses of the United States at the beginning of the war with Spain. European nations have for years divided their tidal regions into naval zones and have assigned to each zone reserves, torpedo divisions, lighthouse establishments, coast-guard services and signal stations.

In France the naval authority is made paramount and all naval affairs are in charge of the Minister of Marine, assisted by a chief of staff. Not only the mobile defenses, but the coast fortresses, submarine mines and the fort batteries are under control of the minister or his aide. In the United States the navy is jointly responsible in several grand divisions, under a chief of staff, with the Secretary of the Navy, as now, at the head of the department.

In recent times the navies of all leading countries have been enlarged, fortifications multiplied and strengthened, and more attention given to training young men in the tactics and strategy of defense, involving immense increase of national expenditure. In this general advance of naval preparation our own country is now maintaining a steady and quickened pace and questions of coast defense must here be solved with equal energy and intelligence. The work of providing a proper armament for the exposed harbors of the United States has been progressing as rapidly as the Congressional appropriations would permit. Since the outbreak of the war with Spain, and especially since the beginning of the European War, Congress has been more liberal with its provisions for pushing this work. According to the annual report of the United States Board of Ordnance and Fortification for 1895, at the rate of progress then being made, it would require 50 years of work to place the great stretch of seacoast in proper condition for defense. The board recommended an appropriation of $2,000,000 for engineer work in the construction of implements, fortifications, etc., and one of $5,000,000 for the construction of guns, mortars, gun-carriages, coast armament and ammunition. Concerning future advancement, the board recommended that it be along the following lines: the development of smokeless powders; the development of a high explosive that can be safely discharged in a shell at a high velocity with certainty of detonation; the development of rapid-fire field and seacoast guns and of an efficient system of fire control for harbor defenses. Recent reports show that satisfactory progress has been made, but these lines except that the use of armor-plates in forts has been abandoned for the more satisfactory earth and concrete emplacements.

By the beginning of 1915 all ports of commercial and strategic value along both coasts of the United States had been fortified, with the exception of the entrance to Chesapeake Bay. During the previous year five 14-inch guns were manufactured, to supersede some of the 12-inch guns, hitherto the heaviest of our coast artillery, but not here adequate to match the modern 15-inch guns with which the larger battleships are being equipped. These latest 14-inch guns are designed to fire 1,600-pound projectiles with a maximum range of 18,000 yards.

It has been proposed by a committee of the Fortification Board to mount 16-inch, wire-wound guns at Cape Henry, throwing a projectile weighing 2,200 pounds. Mobile guns, of at least 12-inch caliber, mounted on special trucks that may be drawn along the railroad by locomotives, or along well-laid roads by huge motor cars, such as are being used by the Germans, were recommended for the defense of these sections of the coast not within the zone of protection of the permanent works.

The fortifications at both ends of the Panama Canal have been completed and the guns mounted; similar works are either completed or under construction in all the outlying possessions of the United States and in Manila Bay, several 14-inch, wire-wound guns, each weighing 70 tons, are being mounted. The present policy of armament contemplates the emplacement of at least one 16-inch gun in the system of fortifications guarding every important harbor. The importance of these coast defenses may be realized from the fact that there is within range of modern gunfire, from 10 of our principal harbors, property to the value of over four and one-half billions of dollars. Up to 1912 approximately $125,000,000 had been spent or appropriated for coast defenses.

The army troops of the coast defense are classified with reference to their duties as follows: Coast artillery, regulars, who man the guns as far as possible; coast artillery, militia, who are required to man certain guns in order to complete the personnel lacking in regulars; coast artillery supports, whose function is local protection of fortifications against quick land raids from unprotected points and the coast guard, which is composed of large bodies of infantry, cavalry and field artillery, prepared to oppose formal landings by the enemy.

The regular establishment of the coast defense at about the beginning of the European War was distributed as follows:

In Manila Bay ...ere are 11 companies; in Hawaii 6, and in Panama 8. On 1 July 1914 the total force above enumerated amounted to 70 officers and 10,988 enlisted men.

The establishment of the coast artillery is 1,201 officers and 29,973 men by a bill passed by Congress in 1916. This force is practically sufficient to man all the necessary defenses. See BLOCKADE; BOMBARDMENT; FORTIFICATION.

COAST DEFENSE GUNS. See GUNS, HISTORY AND DEVELOPMENT.

COAST AND GEODETIC SURVEY, United States. To all nations whose territory touches the sea or other water navigable to any extent, or who have any interests in the commerce of the sea, a full and complete knowledge of the coast—its nature and form, the character of the sea bottom near it, the location of reefs, shoals and other dangers to navigation, the direction and strength of currents and the character and amount of magnetic disturbance—is of the greatest moment. To supply this knowledge the governments of all maritime nations have in modern times executed surveys of their coasts by the most exact methods.

Some idea of the importance to this country of like operations and their extent may be formed when it is remembered that the coast line of the United States and Alaska, measured along its general trend, exceeds 10,000 miles in length. To represent the actual shore line as surveyed, which includes all the islands, bays, sounds and rivers in the littoral or tidal belt, these figures would have to be multiplied many times. To this must be added the shore line of Porto Rico, the Hawaiian Islands and the Philippine Islands. The length of the general shore line of only 14 of the principal islands of the latter group exceeds 11,000 miles.

On the recommendation of President Thomas Jefferson, Congress in 1807 authorized the establishment, as a bureau under the Secretary of the Treasury, of a national coast survey. For the purpose of furnishing geographic positions and other data to State surveys, the scope of the bureau was in 1878 enlarged and its designation became the United States Coast and Geodetic Survey. The superintendents of the survey have been F. R. Hassler (1816–18, 1832–43); A. D. Bache (1843–67); Benjamin Pierce (1867–74); Carlile P. Patterson (1874–81); Julius E. Hilgard (1881–85); Frank M. Thorn (1885–89); T. C. Mendenhall (1889–94); W. W. Dufield (1894–97); Henry L. Pritchett (1897–1900); O. H. Tittmann (1900–15); E. L. Jones (1915—).

The plan upon which it is organized is the outgrowth of trial and experience during the first 50 years of its existence and from its inception almost every year has seen some new field officers and other men enlisted. Under the direction of a superintendent there are two great divisions of its work. They are the field and the office. The field work includes all of the practical operations of the survey on land and sea. In conformity with the plan of reorganization of 1843, the work upon the land was divided between civilian assistants and officers of the army, the hydrographic parties being in charge of naval officers. Since 1861 no officers of the army have been stationed with the survey and the conduct of the hydrographic work was about equally divided between the civilian assistants and naval officers until 1896, when the naval officers were relieved, and since which time none have been assigned to the survey. The civilian assistants—now called hydrographic and geodetic engineers—and aids consist of a body of trained experts permanently attached to the survey and numbering about 152. The service owns a fleet of 15 steamers and one schooner, besides steam and motor launches. The office is that part of the establishment which receives the records, original sheets, etc., representing the results of field work. They are registered and deposited in the archives until in turn they are taken up for examination, computation and adjustment, prepared for publication and finally published. Original charts are reduced or enlarged, engraved, electrotyped and printed. For the convenience of administration the main office at Washington are carried on by eight divisions, each having some specified portion of the general work to perform. In these divisions are employed clerks, draftsmen, computers, engravers, instrument makers, printers, etc., numbering in all about 191. There are sub-offices at San Francisco, Seattle, New York, Galveston and Manila.

Many of the field operations of the survey being performed in the United States, and the primary triangulation, together with the determination of geographic positions by means of astronomic methods, must furnish the foundation upon which the whole rests. On the Atlantic Coast a chain of triangles, beginning at the eastern boundary of Maine, stretches to the Gulf, constituting an oblique arc, which, besides serving as a basis for the coast triangulation, adds much to our knowledge of the figure of the earth from 0 to 5,000 miles.

On the recommendation of President Thomas Jefferson, Congress in 1807 authorized the establishment, as a bureau under the Secretary of the Treasury, of a national coast survey. For the purpose of furnishing geographic positions and other data to State surveys, the scope of the bureau was in 1878 enlarged and its designation became the United States Coast and Geodetic Survey. The superintendents of the survey have been F. R. Hassler (1816–18, 1832–43); A. D. Bache (1843–67); Benjamin Pierce (1867–74); Carlile P. Patterson (1874–81); Julius E. Hilgard (1881–85); Frank M. Thorn (1885–89); T. C. Mendenhall (1889–94); W. W. Dufield (1894–97); Henry L. Pritchett (1897–1900); O. H. Tittmann (1900–15); E. L. Jones (1915—).

The plan upon which it is organized is the outgrowth of trial and experience during the first 50 years of its existence and from its inception almost every year has seen some new field officers and other men enlisted. Under the direction of a superintendent there are two great divisions of its work. They are the field and the office. The field work includes all of the practical operations of the survey on land and sea. In conformity with the plan of reorganization of 1843, the work upon the land was divided between civilian assistants and officers of the army, the hydrographic parties being in charge of naval officers. Since 1861 no officers of the army have been stationed with the survey and the conduct of the hydrographic work was about equally divided between the civilian assistants and naval officers until 1896, when the naval officers were relieved, and since which time none have been assigned to the survey. The civilian assistants—now called hydrographic and geodetic engineers—and aids consist of a body of trained experts permanently attached to the survey and numbering about 152. The service owns a fleet of 15 steamers and one schooner, besides steam and motor launches. The office is that part of the establishment which receives the records, original sheets, etc., representing the results of field work. They are registered and deposited in the archives until in turn they are taken up for examination, computation and adjustment, prepared for publication and finally published. Original charts are reduced or enlarged, engraved, electrotyped and printed. For the convenience of administration the main office at Washington are carried on by eight divisions, each having some specified portion of the general work to perform. In these divisions are employed clerks, draftsmen, computers, engravers, instrument makers, printers, etc., numbering in all about 191. There are sub-offices at San Francisco, Seattle, New York, Galveston and Manila.

Many of the field operations of the survey being performed in the United States, and the primary triangulation, together with the determination of geographic positions by means of astronomic methods, must furnish the foundation upon which the whole rests. On the Atlantic Coast a chain of triangles, beginning at the eastern boundary of Maine, stretches to the Gulf, constituting an oblique arc, which, besides serving as a basis for the coast triangulation, adds much to our knowledge of the figure of the earth from 0 to 5,000 miles.

On the recommendation of President Thomas Jefferson, Congress in 1807 authorized the establishment, as a bureau under the Secretary of the Treasury, of a national coast survey. For the purpose of furnishing geographic positions and other data to State surveys, the scope of the bureau was in 1878 enlarged and its designation became the United States Coast and Geodetic Survey. The superintendents of the survey have been F. R. Hassler (1816–18, 1832–43); A. D. Bache (1843–67); Benjamin Pierce (1867–74); Carlile P. Patterson (1874–81); Julius E. Hilgard (1881–85); Frank M. Thorn (1885–89); T. C. Mendenhall (1889–94); W. W. Dufield (1894–97); Henry L. Pritchett (1897–1900); O. H. Tittmann (1900–15); E. L. Jones (1915—).

The plan upon which it is organized is the outgrowth of trial and experience during the first 50 years of its existence and from its inception almost every year has seen some new field officers and other men enlisted. Under the direction of a superintendent there are two great divisions of its work. They are the field and the office. The field work includes all of the practical operations of the survey on land and sea. In conformity with the plan of reorganization of 1843, the work upon the land was divided between civilian assistants and officers of the army, the hydrographic parties being in charge of naval officers. Since 1861 no officers of the army have been stationed with the survey and the conduct of the hydrographic work was about equally divided between the civilian assistants and naval officers until 1896, when the naval officers were relieved, and since which time none have been assigned to the survey. The civilian assistants—now called hydrographic and geodetic engineers—and aids consist of a body of trained experts permanently attached to the survey and numbering about 152. The service owns a fleet of 15 steamers and one schooner, besides steam and motor launches. The office is that part of the establishment which receives the records, original sheets, etc., representing the results of field work. They are registered and deposited in the archives until in turn they are taken up for examination, computation and adjustment, prepared for publication and finally published. Original charts are reduced or enlarged, engraved, electrotyped and printed. For the convenience of administration the main office at Washington are carried on by eight divisions, each having some specified portion of the general work to perform. In these divisions are employed clerks, draftsmen, computers, engravers, instrument makers, printers, etc., numbering in all about 191. There are sub-offices at San Francisco, Seattle, New York, Galveston and Manila.

Many of the field operations of the survey being performed in the United States, and the primary triangulation, together with the determination of geographic positions by means of astronomic methods, must furnish the foundation upon which the whole rests. On the Atlantic Coast a chain of triangles, beginning at the eastern boundary of Maine, stretches to the Gulf, constituting an oblique arc, which, besides serving as a basis for the coast triangulation, adds much to our knowledge of the figure of the earth from 0 to 5,000 miles.
the greater part of the Canal Zone and the Philippine Islands has also been topographically surveyed.

In the determination of astronomic positions the exact methods originally developed in the survey have been adhered to and perfected. The methods of using the zenith telescope for latitude and the telegraph for longitude have been constantly improved.

The topographical operations have been mostly restricted to a narrow margin, not often over three to five miles wide, along the coast and surrounding harbors, bays and rivers up to the head of tide water. In some cases it has been somewhat more extensive, notably in the survey of the District of Columbia, where the scale was 1:4800 and the contour interval only five feet.

The hydrographic operations have extended as far out from the coast as was necessary for the interests of navigation and have included all harbors, channels, bays, etc., as far as the work has gone. Much work has been done in the investigation and mapping of submerged rocks by the wire drag. Deep-sea soundings have been made extensively, especially in and about the Gulf Stream. Much attention has been given to tides, and continuous series of tidal records have been obtained at several important points.

The results of the operations of the survey in connection with the study of terrestrial magnetism can be found on its charts and in its other numerous publications on the subject. In addition to the determination of the magnetic elements at many widely distributed points, and their frequent redetermination for secular variation, special observations are also made at certain base stations, with the aid of self-registering instruments, for the purpose of obtaining the record of the numerous variations of the earth's magnetism continually taking place.

The study of the force of gravity as a part of the great geodetic problem has received attention for 30 years and the survey has of late years developed methods and instruments which will lead to a great extension of the work at a less cost than by older processes, but without lowering the standard of accuracy.

A network of precise levels has been established in a general way the United States, connecting the Atlantic Ocean, the Gulf of Mexico, the Great Lakes and the Pacific Ocean.

Throughout its history the survey has constantly been called upon to determine boundary lines, both State and national, which have been in dispute.

The office of standard weights and measures, charged with the maintenance of the standards of length, weight and capacity, which was under the direction of the superintendent of the Coast and Geodetic Survey until 30 June 1901, is now an independent organization under the title of the "National Bureau of Standards."

The principal publications of the survey consist, among other things, of several hundred different charts; tide tables for all the principal and many minor ports; 'Coast Pilots,' containing minute sailing directions for all navigable waters along our coast; and the 'Report of the Coast and Geodetic Survey,' which contains besides the reports of the superintendent and his assistants on the conduct of the work, a series of special reports upon various technical and scientific operations of the service. For details of the work of the bureau see CHART; COAST PILOTS; GEODESY; HYDROGRAPHY; LEVELING; SURVEYING; TIDES.

COAST GUARD, a British force formerly under the Customs Department, but since 1856 under the Admiralty, and intended only to prevent smuggling, but now organized also for purposes of defense and governed by the Admiralty. The men, who are generally of men-of-war's men of good character, have high pay and are furnished with free cottages. The force numbers, with officers and men, about 3,000. In the United States the coast guard was formed by an act of Congress approved on 28 Jan. 1915 from the Revenue-Cutter Service and the Life-Saving Service (q.v.), established respectively in 1790 and 1871. It is under the administration of the Secretary of the Treasury in times of peace, of the Secretary of the Navy in times of war. It takes care of the saving of life and property along the coast and at sea, the enforcement of maritime law, the prevention of smuggling, the removal of obstructions to navigation, etc. It is commanded by a captain commandant, ranking with the vice-admiral. The other coast guard officers are senior captains and the engineer-in-chief, ranking with commanders in the navy; and captains, first, second and third lieutenants of the line and of engineers, ranking with lieuten-commander, lieutenant, senior grade, lieutenant, junior grade, and ensign, respectively. The establishment is: 1 captain-commandant; 6 senior captains; 31 captains; 37 first lieutenants; 94 second and third lieutenants; 1 engineer-in-chief; 6 captains of engineers; 28 first lieutenants of engineers; 51 second and third lieutenants of engineers; 2 constructors ranking as first lieutenants; 1 district superintendent ranking as captain; 3 district superintendents, ranking as first lieutenants; 4 district superintendents ranking as second lieutenants; 3 districtssuperintendents ranking as third lieutenants.

These officers are trained at the Coast Guard Academy, at New London, Conn. The ranks of warrant officers are master's mate, keeping-boatswain, gunner, machinist and carpenter. Petty officers and men are enlisted for a year.

The coast guard has about 268 shore stations.

COAST PILOTS, a book compiled to assist mariners in the navigation of their vessels, and, when from any cause they are without charts, to enable them to safely carry their vessels from port to port along the coast. The governments of all large maritime nations publish works for these purposes.

As early as 1796 a volume known as 'The American Coast Pilot,' by Capt. Valentine Furlong, was published in Newburyport, Mass., by Edmund M. Blunt, and the first edition met with so ready a sale that a second edition of the same work was published in 1798. Since the latter date numerous compilers have published coast pilots of the coast of the United States and its harbors. These works were compiled from charts, from reports by shipmasters published in the newspapers, and from surveys and the personal knowledge of the compilers, some of whom were experienced shipmasters.

The vessels of the Coast and Geodetic Survey (q.v.), while engaged in surveying the coast and harbors of the United States, collected
much information of importance to mariners which could not be shown on the charts or completely given in 'Notices to Mariners.' 'Coast Pilots' are published and distributed by the Coast and Geodetic Survey at the cost of the printing and binding. Similar information cannot be collected by private enterprise except at great cost and with imperfect means, and at the present time all the private publications contain such information relating to the coast of the United States are compilations from government publications and based generally on the work of the Coast and Geodetic Survey.

The compilation of the 'Coast Pilots' necessitates work in the office and in the field. The office work consists of the collection of the latest data from the reports and surveys of hydrographic and topographic parties, from the reports and surveys of the United States engineers engaged in the improvement of harbors and waterways, and from correspondence with local authorities and engineers. This information, in manuscript, is then put in the form of a volume which experience has shown to be convenient for the use of the mariner.

The work of a vessel of the survey, with the compilers of the 'Coast Pilot' on board, visits every part of the coast which is treated in the volume; the information collected in the office is verified and, if necessary, corrected on the spot; the sailing lines and directions are tested by running over them; such artificial aids and natural landmarks as are of use to the mariner are noted and hydrographic examinations of reported dangers and changes are made; pilots, masters and local authorities are interviewed and the latest information is incorporated, together with such notes as can only be obtained by observation and experience in the locality.

On returning to the office from the field work, this manuscript, correct to date, is prepared for the printer, and when printed the volumes are issued with a supplement or insertion sheet containing the changes which have occurred since the date of the preparation of the volume and while the matter was going through the press.

The 'Coast Pilots' published by the Coast and Geodetic Survey contain:

1. A tabular description of lighthouses, light vessels and fog signals; lists of life-saving stations, storm-warning display stations, and sea-coast telegraph stations, and information regarding tides, tidal currents, variation of the compass, etc.

2. Nautical descriptions of the coast and harbors and general information concerning the several bodies of water and harbors, including notes relative to pilots, depth of water, draft of vessels entering the harbor, supplies, facilities for making repairs, usual or best anchorage and other matters of practical value. In each case the information of this nature precedes the sailing directions and is printed in smaller type.

3. Sailing directions, with subordinate paragraphs treating of prominent objects, dangers, aids to navigation, etc. These are arranged in the order in which these matters would be considered in practice and be available when wanted promptly. For this purpose, and to afford a ready means of reference from one part to another, the sailing directions, where long, are divided into numbered or lettered paragraphs, printed in large type, each followed by its own subordinate remarks in smaller type.

4. Appendices, containing rules of the road at sea and in inland waters; laws and regulations relative to piloting, harbor control, national and local quarantine, and Marine Hospital service; and information regarding storm-warning displays.

5. Views of important points. These are only inserted in volumes which treat of localities which have not yet been surveyed or where the lighthouses and other aids to navigation are not sufficiently numerous to readily locate and navigate a vessel.

6. Sections of charts covering the coast treated in the volume to aid in finding the geographic positions of different localities. Index maps showing the limits of the charts covering the localities treated in the volume.

The 'Coast Pilot' publications of the United States Coast and Geodetic Survey include:

Six volumes of the 'United States Coast Pilot, Atlantic Coast,' as follows:

Part I. From Saint Croix River to Cape Ann.

Part II. From Cape Ann to Point Judith.

Part III. From Point Judith to New York.

Part IV. From Point Judith to Cape Henry.

Part V. From Chesapeake Bay Entrance to Key West.

Part VI. Gulf of Mexico, from Key West to the Rio Grande.

One volume of the 'Pacific Coast Pilot'; California, Oregon, and Washington.

Two volumes of the 'Pacific Coast Pilot'; Alaska: Part I, Dixon Entrance to Yakutat Bay, with Inland Passage from Strait of Fuca to Dixon Entrance; Part II, Yakutat Bay to Arctic Ocean.

United States Coast Pilot; West Indies, Porto Rico.

Coast Pilot' Notes in Hawaiian Islands.

Inside Route Pilot; Coast of New Jersey; New York to Key West; Key West to New Orleans.

Six volumes of 'Sailing Directions'; Philippine Islands.

It is manifest that publications of this character must be subject to numerous corrections in the details after the lapse of a few years. To maintain the volume in a useful form corrections are issued in 'Notices to Mariners,' insertion sheets and supplements; and each volume is revised and passed to a new edition when the corrections have assumed proportions that impair its usefulness, or more recent surveys show changes or furnish additions that render the old volume untrustworthy.

COAST RANGE. The Pacific shore of the United States rises abruptly from the ocean along nearly its whole length, with practically no coastal plain of any size from southern California to the Strait of San Juan de Fuca. The hills and low mountains which border the ocean are given the general name of the Coast Range. They do not form, however, a continuous ridge, but are rather parts of more or less disconnected uplifts, lower and possibly younger than the Sierra Nevada and Cascade ranges. North of the Strait of San Juan de Fuca the mountains of Vancouver Island and the Island Range of British Columbia mark the continuation of these
COASTAL PLAIN—COASTING TRADE

uplifts, although in British Columbia the name of Coast Range is given to the mountains which border the continental shore and are spurs of the Cascades.

In California the Coast Range comprises two parallel ridges, 400 miles long, 30 to 60 miles apart and parallel to the coast from Point Conception in lat. 35° to Cape Mendocino, the ridge on the coast being the Coast Range proper and the inner the Monte Diablo range; the two separate the Sacramento and San Joaquin valleys from the Pacific. In the south the coast ranges and the Sierra Nevada coalesce and the topography is complicated by east and west ranges; thus opposite the Santa Barbara channel is the Santa Inez Range, having a height of about 4,000 feet, and farther south is another east-and-west range, the Santa Monica. Still farther south the uplift is much broken and irregular without strongly marked ridges but with portions rising into central dominating points like the San Bernardino and San Jacinto mountains, about 11,000 feet high.

South of lat. 35° toward San Francisco Bay, there are no very high peaks. The highest peaks near the bay are Monte Diablo, 3,856 feet, an isolated peak that is a conspicuous landmark for miles; Mount Helena, 4,343 feet; and Mount Hamilton, 4,400 feet, the latter famous as the site of the great Lick Observatory. North of San Francisco Bay the heights of the summits gradually increase, and 150 miles north is Mount Bailey, 6,357 feet. Farther north the Coast Range becomes gradually a series of disconnected mountain groups, and near the Oregon line east-and-west ridges develop which unite with the Cascades, the most important of these being the Calapooya Mountains in Oregon.

Along the Oregon coast the uplift is low, being generally less than 3,000 feet. In Washington also the uplift is not great except in the Olympic Mountains between Puget Sound and the Pacific Ocean, which culminate in the fine peak of Mount Olympus, 8,150 feet.

Extending along such a length of coast, the coast ranges have a wide variety of climate and differ much in vegetation and attractiveness. In California, north of lat. 38° to San Francisco Bay, much of the outer range is covered with brush and timber; south, the mountains are covered with a thorny undergrowth known as chaparral. Near the coast, from Santa Barbara to San Francisco, there is a fair rainfall in the interior. The climate is very dry and the mountains are generally bare. North of San Francisco Bay the rainfall increases and the mountain valleys are fertile and picturesque. In Oregon the rainfall is heavy and in Washington very heavy; the mountains being covered with thick forests of fir, pine and spruce.

Geologically the mountains of the coast uplifts, besides being newer than the Sierra Nevada and Cascades, are also less broken through by granite than the Sierra, Nevada, and less covered by lava than the Cascades. The upheaval began in late Tertiary time, and perhaps continued into the Quaternary, Pliocene rocks being upturned at a high angle near San Francisco Bay. South of San Francisco Bay the rocks are on the lava of the Pacific Group. In the upheaval there are large areas of Cretaceous in the east side of the Monte Diablo belt. North of San Francisco Bay and in Oregon the proportion of Cretaceous increases and the Tertiary is much less. On Vancouver Island an uplift is believed to have taken place in Jurassic time. Generally speaking, the rocks of the Coast Range in California are much metamorphosed, and large masses of serpentine and similar rocks are not uncommon. In places these serpentines sometimes contain workable deposits of chrome iron ore, though, owing to the limited demand, the production is small. The chief mineral wealth of the Coast Range is in quicksilver and petroleum, though some gold has been washed from placers in southern California. The quicksilver occurs at a number of places in the range where the altered rocks are silicified, and the total production, though the ore is generally of low grade, has been large.

South of San Francisco Bay, in the Miocene, in places is a great thickness of bituminous shale, there being several thousand feet of it near Santa Barbara and Los Angeles. This shale has been used extensively as a material for paving streets. Valuable oil-fields have been developed near Los Angeles. Little coal has been found in the range in California, that is of poor quality. In Oregon is the Coos Bay field.

In Oregon and Washington the Coast Range contains very few mineral deposits of importance. On Vancouver Island, however, promising copper deposits are being developed on the west coast, and on the east coast are large and important coal mines.

The Coast Range naturally has no river systems, nor, except in California, is it a barrier to rivers of the interior. It is crossed by the Columbia, Coquille, Rogue, Klamath and other rivers.

For mineral resources of the range see COAL; PETROLEUM. See also BRITISH COLUMBIA; CALIFORNIA; OREGON; WASHINGTON.

COASTAL PLAIN. Where the foothills of a range of mountains descend to a lowland that slopes gently to the sea, this lowland is called a coastal plain. It represents what was once the sea floor, being composed of material eroded from the mountains and deposited in the sea. With further elevation the original surface of the plain may be removed by streams cutting their valleys and by the weathering of the valley slopes. The coastal plain of the Atlantic Seaboard extends from New York to Georgia. In the Carolinas and Georgia it is divisible into belts parallel to the shore. The outer is a smooth plain, often swampy, perhaps 50 miles wide with a gently rolling surface. Farther inland, where the streams have cut valleys, the surface is more hilly, and 100 miles inland is a belt of hilly country some 600 or 700 feet high covered with pine forests where the original surface of the plain has been nearly destroyed. Back of this come the higher hills, formerly mountains, of the old land, forming what is known as the Piedmont belt. Other instances of coastal plains are the east coast of Mexico, north and south of Vera Cruz, and the east coast of India, skirting the Bay of Bengal.

COASTING TRADE, trade carried on by sea between the ports of the same country. In some countries the coasting trade is retained as a home monopoly, and this used to be the case in the United Kingdom, but by recent laws the coasting trade of Great Britain has been
opened to foreign vessels, subject to the same rules, dues and regulations as British sailing ships and steamers; but power was given to impose by an order in council retaliatory prohibitions and restrictions on the ships of such countries as should impose restrictions and prohibitions on British ships. The dues and regulations to which vessels engaged in the coasting trade are subject are different from those which relate to vessels engaged in the oversea trade, and masters are required to keep books showing that their cargoes are strictly such as are allowable by the rules of the coasting trade. In the United States the coasting trade is restricted to vessels built and owned in the United States, as well as offerced and chiefly manned by United States citizens. The term also includes colonies or dependencies overseas. The commerce of the Great Lakes is included in the coasting trade. The great length of the sea and lake coasts, the number of good harbors and the fact that much of the coast region of the United States has been settled makes the coasting trade of this country the most extensive in the world. Many hundreds of sailing craft and steamers are used in this trade, carrying the products and people of one part of the country to other parts. This trade is increasing rapidly; the licensed tonnage of fisheries and trade in 1900 was 4,338,145 tons, an increase of nearly 1,250,000 tons in the preceding 50 years. In 1915 the licensed tonnage in the coasting and fishing trade was 6,468,384 tons for all vessels. Consult 'Annual Reports' of the Commissioner of Navigation.

COAT OF ARMS, heraldic insignia, originally embroidered on the tabard, a short coat worn by knights over the armor. They originated in the age of chivalry, when they were assumed as emblematic of the adventures and hopes of the knight, and were useful for distinguishing individuals from whom it was difficult to recognize when in full armor. The favorite emblem of the knight later became the adopted badge of the family; the figures or characters employed in the coat of arms began to receive meanings and symbols in language and science and heraldry came into existence. Modern nations have adopted coats of arms, in monarchial countries, sometimes an adaptation of the heraldic insignia of a dynasty. The coats of arms of the United States and of the individual States are arbitrarily adopted emblems without true heraldic significance. The emblem of a State sometimes represents its leading industry; some cities have also adopted similar coats of arms. See HERALDRY.

COAT OF MAIL, a piece of armor in the form of a shirt, consisting of a close net-work of iron or steel rings, or of a strong linen or leather jacket covered with small laminae or plates, usually of tempered iron, overlapping each other like the scales of a fish. See ARMS AND ARMOR.

COATBRIDGE, kō̆'brit̪̆j, Scotland, municipal burgh in Lanarkshire, nine and a half miles east of Glasgow. It owes its rise to the working of the coal and iron-stone in the surrounding district, and has grown rapidly from a village to a flourishing town. All the heavier metallurgical industries are here actively prosecuted. Nearly one-half of the blast-furnaces of Scotland are situated in this locality. Pop. 43,280.

COATES, Florence Earle, American author: b. Philadelphia, Pa., 1 July 1850. She was educated at private schools in New England and at the Convent of the Sacred Heart, France; she also studied some time at Brussels. In 1879 she was married to Edward Hormor Coates. She was president of the Browning Society of Philadelphia 1885-1903 and 1907-08; is member of the Society of Mayflower Descendants and the Colonial Dames of America. She has published 'Poems' (1898); 'Mine and Thine' (1904); 'Lyrics of Life' (1909); 'Ode on the Coronation of King George V' (1911); 'The Unconquered Air, and Other Poems' (1912). She is a contributor to Harper's, The Century, Scribner's Magazine, the Atlantic Monthly and the Athenæum, London.

COATESVILLE, Pa., borough of Chester County, 39 miles west of Philadelphia, situated on the Pennsylvania and the Philadelphia and Reading railroads. It contains a fine Y. M. C. A. building, a hospital, and is noted as an industrial centre, the establishments including iron and steel works, steel-plate mills, boiler works, brass and iron foundries, machine shops, a tube mill, silk mills and factories of tobacco, phosphate and automobiles. Settled about 1800, Coatesville was incorporated in 1867. The government is vested in a burgess, elected every three years, and a borough council chosen on a general ticket. There are municipal waterworks. Pop. 11,084.

COATI, kō̆-ā-tē, an American animal somewhat related to the raccoons, of which two species are known, constituting the genus Nasua. One inhabits Mexico and roves as far north as southern Arizona, the other lives in Brazil. The Mexican coati, or "coati-mundi" (N. nasua) is about the size of a house-cat, has a long cartilaginous snout which may be reflexed or stiffened at will, according to its owner's needs. Its fur is long, thick and a warm brown in color; and its tail is ringed like that of a raccoon. The Brazilian coati (N. rufa) is somewhat smaller than the Mexican and its fur is not so fine. Both species feed on fruits, eggs, insects, and sometimes small birds. They are readily tamed and make as good pets as the domestic cat. There are fossil remains of these animals from the Pleistocene period, and judging from these there was one species at least which was larger than any living one. Consult Popular Science Monthly (Vol. II, New York 1872); American Naturalist (Vol. X, Boston 1877); and 'Proceedings' of the United States National Museum (Washington 1889).

COATICOOK, kō̆-ā'kūk, Canada, town of Stanstead County, Quebec, situated on the Coaticook River, and the Grand Trunk Railroad. It has a number of factories and is a manufacturing centre. Pop. 3,165.

COATZACOALCOS, kō̆-ā'kā-ō̆'kō̆s, or SNAKE RIVER, a river of the isthmus of Tehuantepec in Mexico, which rises in the Sierra Madre and in the state of Oaxaca, Mexico, 130 miles southeast of Vera Cruz. It is navigable for large vessels for 30 miles, and is interesting as part of a route which has been surveyed for an inter-oceanic canal. A
city of the same name, with a population of about 3,000, is situated at the mouth of the river.

COBALT, a metal which occurs combined with arsenic, nickel and other metals; also as a sulphide and as an arsenate. After the ore has been calcined, oxide of cobalt remains, but impure from the presence of other metallic oxides. When this oxide has been purified and reduced to the metallic state the cobalt is obtained of a white color inclining to gray, and, if tarnished, to red, with a moderate lustre. Its fracture is compact; it is hard, brittle and of a specific gravity of 8.5 to 8.9. Like nickel, it is strongly magnetic. It undergoes little change in the air, but absorbs oxygen when heated in open vessels. It is attacked, though slowly, by sulphuric or hydrochloric acid, and is readily oxidized by means of nitric acid. Two basic oxides of cobalt are known, and some intermediate oxides. The protoxide is of an ash-gray color and is the basis of the salts of cobalt, most of which are of a pink hue. When heated to redness in an open vessel it absorbs oxygen and is converted into a higher oxide. It may be prepared by decomposing the carbonate of cobalt by heat in a vessel from which atmospheric air is excluded. It is easily known by its giving a blue tinge to borax when melted with it. It is employed in the arts, in the form of small, for communicating a similar color to glass, earthenware and porcelain. Small, or powder blue, is made by melting three parts of fine white sand, or of calcined flints, with two of purified pearl-ash and one of cobalt ore previously calcined, and fusing it out of the pots into a vessel of cold water; after which the dark-blue glass, or zaffre, is ground, washed and distributed into different shades of color, which shades are occasioned by the different qualities of the ore and the coarser or finer grinding of the powder. Small, besides being used to stain glass and pottery, is often substituted, in painting, for ultramarine blue, and is likewise employed to give to paper and linen a bluish tinge. The chlorides of cobalt are well known as a sym pathetic ink. When diluted with water so as to form a pale pink solution, and then employed as ink, the letters, which are invisible in the cold, become blue if gently heated. It is prepared by dissolving precipitated oxide of cobalt in hydrochloric acid with the aid of heat, and diluting with water. The nitrate of cobalt is obtained by dissolving cobalt or its oxide in nitric acid and crystallizing the solution. It is a deliquescent red salt, which dissolves in water with a pink color. The peroxide of cobalt is black, and is formed by adding a solution of bleaching-powder to a cobaltous salt, or by passing a current of chlorine gas through water holding cobaltous hydrate in suspension. It does not unite with acids; and when digested in hydrochloric acid the cobaltous chloride is generated with the disengagement of chlorine. When heated it is converted into one of the intermediate oxides.

Ores of Cobalt—"Bright white cobalt ore* is the popular name for the mineral cobaltite (q.v.), a sulph-arsenide of cobalt. "Gray cobalt ore," also sometimes called "tin-white cobalt, is the mineral smaltite (q.v.). It is the chief ore of cobalt in the diarsenide, though it always contains nickel and iron. "Red cobalt, also known as "cobalt-
COBAN, kö-bán', or VERA PAZ, Guatemala, city 90 miles northeast of the city of Guatemala, is the capital of the department of Alta Vera Paz, on the left bank and near the source of the Cojábón. It was formerly a mission station of the Dominicans, whose memory is still revered. It is picturesquely situated on the slopes of a hill and is irregularly built. Its modern buildings are of some merit. The town has minor manufactures and is the centre of a fertile district producing coffee, cocoa, vanilla and sugar cane. Pop. 30,770.

COBB, Henry Ives, American architect: b. Brookline, Mass., 19 Aug. 1859. He studied at the Massachusetts Institute of Technology and was graduated at Harvard in 1880. In 1881 he established himself in Chicago, and has built a large and lucrative general practice in the city and other parts of the country. In 1893 he was one of the national board of architects of the World's Columbian Exposition, for which he designed the Horticultural Hall, and at present is retained as a special architect for the United States government. Among the prominent public buildings erected from his design are the Newberry Library, city hall, courthouse, the opera-house, University of Chicago and church of the Atonement, all in Chicago; the Pennsylvania State Capitol at Harrisburg; American University at Washington, D. C.; Booth Memorial Theatre, New York, and government buildings at Chicago, League Island, Annapolis, etc.

COBB, Howell, American statesman: b. Cherry Hill, Ga., 7 Sept. 1815; d. New York city, 9 Oct. 1868. He was graduated at Franklin College in 1834, became a lawyer in 1836 and in 1843 was elected to Congress as a Democrat. He served eight years and was speaker of the House one term. Elected governor of Georgia in 1851, he returned to Congress in 1855, and was made Secretary of the Treasury by President Buchanan in 1857, resigning in 1860 to urge secession. As president of the Confederate Congress he assisted in drawing up the constitution of the Confederate government, and was one of the disapproval of Jefferson Davis. He held a Confederate military commission in the Civil War, but saw little service. In defense of slavery he published "A scriptural examination of the institution of slavery" (1856).

COBB, Irvin Shrewsbury, American author and humorist: b. Paducah, Ky., 23 June 1876. He was a short-hand reporter and contributor to comic weeklies until the age of 17; became editor of the Paducah Daily News at 19; and after holding important offices on minor newspapers became special writer and editor of the humorous section of the New York Evening Sun (1904-05); New York Evening World and Sunday World (1905-11); war correspondent for the Saturday Evening Post (1914-15), and lecturer on the war (1915). He has written plays, including 'Funabashi' (a musical comedy, 1907); 'Back Home' (written with Bayard Veiller, produced 1915); 'Guilty as Charged' (written with Harry Burke, produced 1915); and his books, 'Cobb's Anatomy' (1912): 'The Escape of Mr. Trimm' (1913); 'Cobb's Bill of Fare' (1913); 'Roughing it de Luxe' (1914); 'Europe Revised' (1914); 'Bibb, D.D.' (1916); 'Those Times, and These' (1917). He also wrote a series of parodies and humorous essays, 'New York Through the Funny Glass'; 'Live Talks with Dead Ones'; 'The Hotel Clerk,' etc. He has written for many magazines.

COBB, Nathan Augustus, American scientist: b. Spencer, Mass., 30 June 1859. He was graduated at the Worcester Polytechnic Institute in 1881 and later studied at Jena under Haeckel, Hertwig, Lang and Stahl. From 1891 to 1904 he was engaged as pathologist in the Department of Agriculture, New South Wales. In 1904-07 he was director of the division of pathology of the Hawaiian Sugar Planters' Experiment Station, Honolulu. In 1907 he became agricultural technologist of the Department of Agriculture of the United States, and also since 1913 he has served as acting assistant chief of the Bureau of Plant Industry. He has discovered and described about 1,000 new species of animals and plants of various parts of the world, mostly nema-todes. He has invented photographic and microscopic apparatus. He has written about 150 pamphlets and books, mostly on results of original research.

COBB, Sylvanus, American Universalist minister: b. Norway, Me., 1799; d. 1866. He took a prominent part in the anti-slavery and temperance movements, was for 20 years editor of the Christian Freeman of Boston. He was the author of 'The New Testament, with Explanatory Notes' (1864); 'A Compend of Divinity'; 'Discussions'; 'Autobiography' (Boston 1867).

COBB, Sylvanus, American novelist, son of the preceding: b. Waterville, Me., 1823; d. Hyde Park, Mass., 2 July 1887. He was editor and publisher of a periodical called the Rechabite, and besides contributing to other publications was a prolific story-writer. His most popular novels are 'The King's Talisman' (1851); 'The Patriot Cruiser' (1859); 'Ben Hamed' (1864); 'The Gunmaker of Moscow.' He published a 'Memoir' with his father's 'Autobiography' (Boston 1867).

COBB, Thomas Reed Rootes, American lawyer and soldier: b. Cherry Hill, Jefferson County, Ga., 10 April 1823; d. Fredericksburg, Va., 13 Dec. 1862. He was graduated at the University of Georgia 1841, was admitted to the bar and was reporter of the Georgia Supreme Court 1849-57. As a lawyer he enjoyed a wide reputation and large practice. In the Confederate Congress he was chairman of the Committee on Military Affairs, but later became a brigadier-general in the army and was killed at the battle of Fredericksburg. He wrote 'Digest of the Statute Laws of Georgia' (1851); 'Inquiry Into the Negro Slavery in the United States' (1858); 'Historical Sketch of Slavery from the Earliest Periods' (1859).

COBB, William Henry, American librarian: b. Rochester, Mass., 2 April 1846. He was graduated at Amherst College in 1867, was ordained to the 'grego' in 1872. He held pastorate at Plymouth, Mass., 1872-76, and Uxbridge, Mass., 1878-
87. In 1887 he was appointed librarian of the Congregational Library and assistant treasurer of the American Congregational Association, Boston. He was one of the three editors and publishers of the *Journal of Biblical Literature* after 1889. He has published ‘A Criticism of Systems of Hebrew Metre’ (1905); ‘The Meaning of Christian Unity’ (1915); also many articles in *Bibletica Sacra* (1873–99) and in the *Journal of Biblical Literature*.

COBB, kob, Frances Power, Irish philanthropist and religious writer: b. Dublin, 4 Dec. 1822; d. Aengwrt, Merioneth, 5 April 1904. She was one of the founders of the National Association in London. Some of her works are descriptions of her travels in Italy, Greece, Egypt and Palestine, the others treating mainly of theological, religious and humanitarian questions. In religion she had moved from orthodoxy to rationalism. The more important of her works is ‘Essay on Intuitive Morals’ (1855); ‘Pursuits of Women’ (1863); ‘Broken Lights: an Inquiry into the Present Condition and Future Prospects of Religious Faith’ (1864); ‘Ten Hours of Voluntary Labour’ (1867); ‘Dawning Lights’ (1868); ‘Darwinism in Morals’ (1872); ‘The Hopes of the Human Race’ (1874); ‘Duties of Women’ (1881); ‘The Peak in Darien’ (1882), and ‘The Scientific Spirit of the Age’ (1888). She also wrote an enormous number of pamphlets and edited an edition of the works of Theodore Parker.

COBBETT, William, English writer and politician; was the son of a farmer and publican: b. Farnham, Surrey, 9 March 1762; d. near Guildford, 18 June 1835. In 1783 he set out to make his fortune in London and arrived there with only a half a crown in his pocket. He succeeded in obtaining a situation as copying clerk to an attorney of Gray’s Inn, where he remained for nine months. Determined to find some other sphere of employment, he left London for Chatham, enlisted in the 54th Regiment, and after continuing there for a year proceeded with it to Nova Scotia. During his stay at Chatham he had set himself assiduously to study and the improvement of his mind. He remained in America for four years in America, during which time his regular habits and ability and attention in the discharge of his military duties effected his promotion to the rank of sergeant-major. In 1791 he returned to England with the regiment and shortly after arriving there obtained his discharge. After a short stay in England and a stay of six months in France in 1792 he embarked at Havre for America. He landed in New York in October 1792 and continued in America for eight years, where he occupied himself with literary labors, chiefly of a political kind, commencing his career by an attack on Dr. Priestley, then recently landed in America, in a pamphlet entitled ‘Observations on the Emigration of a Martyr to the Cause of Liberty,’ and signed *Peter Porcupine.* Under this famous nom-de-plume a succession of papers appeared, all of a strongly anti-Republican tendency, which were afterwards published in a book. Before leaving America he published a life of Thomas Paine. In June 1800 he sailed for England, and on his arrival started the *Porcupine*, which zealously supported the measures of Pitt, but met with little success. In a subsequent paper, the *Porcupine* was more fortunate; and it continued to appear regularly every week up to the period of his death. Not long after its commencement symptoms of a gradual change began to appear in Cobbett’s political opinions, and from highly conservative he passed over to extreme radical principles. In 1803 a prosecution for libel on the lord-lieutenant and other officers of state in Ireland was instituted against him and resulted in his being sentenced the following year to a fine of $2,500; while a second action, brought almost immediately afterward, subjected him to a second fine of the same amount. In 1810, owing to some remarks of his in the *Register* of 10 July 1809, on the flogging of some militiamen, he was again prosecuted for libel and sentenced to imprisonment for two years and a fine of $5,000. This last was paid by a subscription among his friends. Nowise daunted, he continued his attacks on government as soon as he was liberated and commenced his celebrated series of *Rural Rides,* which reached a sale of 100,000, and from its supposed influence on the working classes brought about the passing of the noted Six Acts. Partly to escape their operation, he retreated to the United States, and remained there for two years, residing principally in Long Island. He returned to England in 1819 and in 1820 endeavored, unsuccessfully, to be returned member for the city of Coventry. About the same period he commenced the *Register* a series of papers entitled ‘Rural Rides,’ afterward reprinted, which present most charming pictures of English country scenery and are among the best of his productions. In 1824–27 he published a *History of the Protestant Reformation in England and Ireland,* in which he vilified Queen Elizabeth and the leading reformers, but added in no way to his literary reputation. The work was eagerly adopted by the Roman Catholics, who caused translations to be made of it into various European languages. In 1831 he was again prosecuted for libel on the ground of an article in the *Register* alleged to be published with the view of exciting the agricultural laborers to acts of violence. He conducted his own defense in person for six hours, and the jury not being able to come to a verdict the trial ended in their discharge. On the passing of the reform bill in 1832 Cobbett was returned member to Parliament for Oldham; but his success in this capacity was indifferent. Nevertheless, at the general election in December 1834 he was again returned to Parliament for Oldham. In addition to the writings already referred to Cobbett is the author of an English and a French Grammar; ‘Advice to Young Men and Women,’ containing many useful hints; ‘Cottage Economy;’ ‘Village Sermons;’ ‘A Year’s Residence in America;’ and other works. Cobbett wrote in a pure and unadulterated English style, and his writings contain a great amount of information and sound practical advice. Consult E. Smith, ‘Life of Cobbett’ (1878).

COBBOLD, Thomas Spencer, English scientist: b. Ipswich 1828; d. 1886. He studied
anatomy under Crosse and afterward took a regular medical course at the University of Edinburgh. He went to London in 1837 and for the four succeeding years lectured on botany at Saint Mary's Hospital. After 1861 he lectured at the Middlesex Hospital and later lectured on geology at the British Museum. In 1873 he was appointed professor of botany and later of zoology at the Royal Veterinary College. His investigations were principally in connection with parasitic worms. His published works include: ‘Entozoa: An Introduction to the Study of Helminthology, with Reference more particularly to the Internal Parasites of Man’ (1864); ‘Tapeworms’ (1866); ‘Worms’ (1872); ‘Parasites’ (1879); ‘The Parasites of Elephants’ (1882); ‘Human Parasites’ (1882); ‘Parasites of Meat and Prepared Flesh Foods’ (1884).

COBBS, Nicholas Hammer, American Protestant Episcopal bishop: b. Bedford County, Va., 5 Feb. 1796; d. Montgomery, Ala., 11 Jan. 1861. While studying for the ministry in the Episcopal Church he was engaged in teaching for several years. He was ordained deacon in Staunton, Va., in May 1824, and priest in the same year, Va., by Bishop Moore. He was occupied in pastoral work in his native county for 15 years. In 1839 he became rector of Saint Paul’s, Petersburgh, Va., and in 1843 accepted a call to the rectorship of St. Mark’s, Cincinnati, Ohio. In 1844 he was elected bishop of Alabama, being the first to preside over that diocese, and was consecrated in Philadelphia, 20 Oct. 1844. Bishop Cobbs was a faithful overseer of the work committed to his charge, and was evidence of esteem for his memory a noble charity in Montgomery bears the name of the Bishop Cobbs’ Home for Orphans. He published some sermons and addresses.

COBDEN, Richard, English economist, the great apostle of free trade: b. Dunfermline, Dunfermline, 3 June 1804; d. London, 2 April 1865. A very meagre education at the grammar school of Midhurst, he was taken as an apprentice into a Manchester warehouse in London belonging to his uncle, where he rapidly made up for the defects of his education by his own diligence and soon acquired a thorough acquaintance with the business. In 1831, being left to his own resources, he obtained some advances of money, and, with some relatives, started a cotton manufactory at Sabden, Lancashire, which in a few years succeeded in producing fabrics equal in point of quality to the best manufactured in London. By several journeys that he now made to France, Belgium, Switzerland and the United States, chiefly in the interest of the firm, he not only increased his business connections, but matured and enlarged his views. His first political writing was a pamphlet on England, Ireland and America, which was followed by another on Russia. In both of these he gave clear utterance to the political views to which he continued through his life rigidly to adhere, rejecting the course of policy based upon the theory of the balance of power, advocating non-intervention in the disputes of other nations and maintaining it to be the only proper object of the foreign policy of England to increase and strengthen her connections with foreign countries in the way of trade and peaceful intercourse. These views, although disregarded or considered as visionary in Parliament, were warmly received in industrial and commercial circles, and Cobden had a considerable number of followers, especially in Manchester. After returning from extensive travels in the East and in Germany, he entered actively on a course of agitation with the view of carrying into effect his political views. Soon after the Anti-Corn Law League was formed in 1838, it was joined by Cobden, who expended all his energies on behalf of the cause to support which the league had been founded; and it was chiefly the extraordinary activity and perseverance of Cobden, joined to the zeal of his supporter Bright, that brought about the final victory of free-trade principles. In 1841 Cobden was returned to Parliament by Stockport. In his first speech in Parliament he took occasion to point out the unjust way in which the corn-laws operated, and, undeterred by the failure of his first attempts, returned again and again to this subject. After five years of unavailing contest he last succeeded in convincing Sir Robert Peel himself, at that time Prime Minister, of the pernicious action of the corn-laws, and in inducing him to bring in a bill for their repeal. The bill passed both houses of Parliament before the end of June 1846, and Sir Robert Peel was the first to congratulate Cobden on his victory in a speech delivered in the House of Commons. During this long struggle Cobden had been obliged to neglect his business, which before agitation commenced had been a highly prosperous one. As a compensation for the loss he had thus sustained a national subscription was made and a sum of about $400,000 presented to him. After again visiting several countries on the Continent, where he was generally received with enthusiasm, he returned to his parliamentary duties in 1847, having been returned without opposition as one of the members for the West Riding of Yorkshire. He now appeared as the champion of parliamentary reform, economy and retrenchment in the management of the finances of the country, and a policy of non-intervention; in all of which he found a firm and ready ally in Bright. His advocacy of these principles was not in every case added to his popularity. His opposition to the policy of Lord Aberdeen in 1853, which ultimately led to the Russian War, met with no success; and although in 1857 he carried a vote of censure on Lord Palmerston’s Chinese policy, his action in this case was displeasing to the country generally. In 1860 he negotiated a treaty of commerce with France, and in reward for his services on this occasion was offered a baronetcy, a seat in the privy-council and several other offices and dignities, all of which he persistently refused. A collection of his political writings appeared in 1867 and a collection of his speeches ‘Speeches on Questions of Public Policy’ (1870). Consult Garnier, ‘R. Cobden, les Ligues et la Ligue’ (1846); McGilchrist, ‘Life of Richard Cobden’ (1865); Morley, ‘Life of Richard Cobden’ (1881–83); McCann, ‘Six Radical Thinkers’ (1910).

COBDEN CLUB. The, an organization named after Richard Cobden, formed about a year after his death, through the influence of John Bright and others, for encouraging the
diffusion of free trade and the other economical and political principles with which Cobden's name is associated. The Cobden Club has distributed a vast number of books and pamphlets, especially in Great Britain, the United States and the British colonies.

COBEGO, kō-bè-gō. See COLOGO.

COBEN, Camden McCormack, American Methodist clergyman; b. Uniontown, Pa., 19 April 1855. He was educated at Allegheny College and the Theological School of Boston University and entered the ministry in 1876. He has been professor of English Bible and philosophy of religion at Allegheny College since 1906. He has published 'Ancient Egypt in the Light of Modern Discovery' (1892); 'Ezekiel and Daniel: a Critical Commentary' (1901); 'The Stars and the Book' (1904); 'Bible Etchings of Immateriality' (1905); 'Recent Explorations in the Holy Land' (1914); 'The New Art of Archaeological Discoveries in their Bearing on the New Testament' (1916) and contributions to the Homiletic Review, The Methodist Review and to the proceedings of learned societies.

COBHARM, Lord. See OLDCASTLE, Sir JOHN.

COBJA, kō-bē-hā, or PUERTO LA MAR, Chile, seaport in the province of Antofagasta (formerly belonging to Bolivia), on the shore of the Pacific, about 70 miles north of the town of Antofagasta. It stands in a desert region and is entirely dependent on the mines in the neighborhood. The roadstead is tolerably safe, but the landing-place is from good. All the water used for drinking must be obtained by distillation and the means of subsistence come from a considerable distance. It was formerly a considerable town, but has lost its commerce and now contains a population of but 500. It was once the only seaport of Bolivia but was ceded to Chile in 1883. It suffered from an earthquake and tidal wave in 1877.

COBLE, or COBBLE, a flat-bottomed boat with a square stern, furnished with a lug-sail and also propelled with oars. It has a sharp, high bow, is admirably constructed for encountering a heavy swell, and is used in fishing, especially on the east coast of Great Britain. The rudder extends for some distance below the stern. There is also a small rowing-boat with the same name used by salmon-fishers and others.

COBLENZ, kō-blěnts, Germany, a fortified city, anciently called Confluentes, from its situation at the confluence of the Rhine and Moselle. It is the capital of Rhenish Prussia and is finely situated on the left bank of the Rhine, in the angle between that river and the Moselle and connected by a pontoon bridge over the Rhine with Ehrenbreitstein. It consists of the old town, along the Moselle, and the new town, farther up the Rhine. Among the principal buildings are the church of Saint Castor, founded early in the 9th century by the son of Charlemagne; the Liebfrauen-Kirche of the 13th century; the so-called Kauhau, built in 1477 as a town hall, the ancient Burg erected by the archbishop of Treves in 1276, restored by the town; and the large electoral palace, now a royal palace, completed in 1786. In 1905 the government completed a magnificent new building in which to centre the activities of the city. At the extreme point of the city, at the junction of the rivers, stands the splendid equestrian statue of Emperor William I, erected by the province. Coblenz has numerous and excellent educational institutions, including a royal gymnasium, a teachers' seminary and a conservatory of music. Its principal industry is the production of the sparkling Moselle wine. There are also manufactures of ships, hats, machinery, pianos and lacquered wares. A system of four forts, including Ehrenbreitstein on the opposite bank of the Rhine, makes it very formidable. Metternich, the Austrian statesman, was born here in 1773.

Coblentz was known to the Romans as Confluentes. In 1018 it was conferred by Henry II upon the archbishops of Treves. After 1789 it was the headquarters of the French emigrés, and in 1794 it passed to France. In 1815 it was ceded to Prussia. Consult Daniel, 'Deutschland' (Leipzig 1893); Gunther, 'Geschichte der Stadt Koblenz' (Coblentz 1815); Bär, 'Urkunden zur Geschichte der Verfassung und Verwaltung der Stadt Koblenz bis zum Jahre 1500' (Bonn 1898). Pop. 56,487.

COBOURG, kōŏ-bûrg, Canada, town, port of entry and county-seat of Northumberland County, Ontario, on the Grand Trunk Railway, 69 miles northeast of Toronto and 92 miles west by south of Kingston. It has a safe and commodious harbor on Lake Ontario and enjoys a large export trade in provisions, lumber, flour, etc. It has regular steamboat connection with the important United States and other Canadian lake ports. The town is well built and has many fine residences. It was formerly the seat of Victoria University (q.v.), now located at Toronto. It has woolen mills, a car factory, carpet and clothing factories, breweries, etc., banks and weekly newspapers, electric lights, gas, electricity and waterworks. Pop. 5,074.

COBRA DE CAPELLO, the Portuguese name of an East Indian Elapine serpent, the Naja tripliodon, and sometimes applied to its congeners, among which is the king cobra, hamrady of India, Naja bungaroides, and an African genus, the Naja haje, or asp, all of which are reptiles of the most venomous nature. The former inhabits India and southeastern Asia, Java, etc. The ringhals of South Africa, sepedon hamadryas, is closely related, and is sometimes also known as cobra. All are remarkable for the manner in which they spread out or distend the sides of the neck and head when disturbed or irritated. In the cobra de capello the conformation necessary to this action is found in the most perfect condition, as some of the ribs are loosely articulated and moved by appropriate muscles on the sides of the neck, which, when expanded, give the anterior part of the body the appearance of an overhanging arch or hood, on the middle of which, posterior to the eyes, is a greenish-yellow mark, resembling the rim of a pair of spectacles. From this mark we have the name spectacled snake. With the approach of an individual or otherwise, the cobra raises the anterior part of its body, so as to appear to stand erect, expands its hood and is prepared to inflict a deadly wound. The poison fangs are attached to the anterior end of the maxillary bone and are permanently erect.
not movable, as in the rattlesnakes. So exceedingly poisonous is its bite that in numerous instances which are well authenticated death has followed within a few minutes; under ordinary circumstances a few hours is the longest term that intervenes from the infliction of the bite till the death of the sufferer, where prompt measures for his relief have not been resorted to. So numerous are these snakes in India, and so bold in frequenting human habitations, that the census returns attribute not less than 10,000 deaths annually to their bites.

The cobra may be as much as six and a half feet long and two inches through.

To minister to the curiosity of the multitude, the jugglers of India select these venomous reptiles for their exhibitions and having extracted their fangs keep them in cages or baskets to exhibit as dancing snakes. When the cage is opened, the juggler begins playing upon a pipe or other instrument; whereupon the cobra assumes the erect attitude, distends its hood and rears itself in this position until the music is suspended. It is possible that this snake, in common with lizards and other animals, is peculiarly affected by musical sounds, but it is much more likely that the swaying of the body of the charmer baffles the snake's attempt to strike. With the exception of the spectacle mark on the back of the neck and its distensible hood, the cobra is not especially distinguished as regards coloration or form. Consult: J. Conant, 'Reptiles of the World' (New York 1910); Boulenger, 'Snakes of the British Museum' (London 1893-96); Gentner, 'Reptiles of British India' (London 1901); Gadow, 'Amphibia and Reptiles' (London 1901). See HAMADYAB.

COBURG, kō'boorg, a noted family of Germany, dating from the 5th century, distinguished for intermarriages with royal houses, especially during the 19th century. A sister of Duke Ernest I became Duchess of Kent and mother of Queen Victoria; the duke's brother Leopold became king of the Belgians and married in succession daughters of George IV of England and of Louis Philippe; one of his nephews, Ferdinand, married the queen of Portugal and was regent of that kingdom, 1853; another, August, married a daughter of Louis Philippe; one of his sons, Duke Ernest II, declared the crown of Greece, 1863, and another, Prince Albert, was the husband of his cousin, Queen Victoria of England.

COBURG, or KOBURG, Germany, capital of the duchy of Saxe-Coburg-Gotha, situated on the left bank of the Ilz, 106 miles east by north of Frankfort-on-the-Main. Among the principal buildings is the Ehrenburg Palace, one of the town residences of the Duke of Saxe-Coburg-Gotha, formerly a monastery of the Recollets, but converted into a ducal residence in 1549. It contains some interesting pictures, tapestry, etc. Some of the old doors exhibit beautiful specimens of marquetry or inlaid work. There are one or two other palaces and various monuments, including a statue of Prince Albert, consort of Queen Victoria. The chief church is the Moritzkirche, a spacious building in the late Gothic style, with a tower 334 feet high. The government house is a handsome structure in the Italian style. The educational institutions comprise a gymnasium (founded in 1605), real school, normal school, etc. On an eminence overhanging the town is the ancient castle or fortress, now a museum, from which extensive views are obtained. In the museum are relics and writings of Luther, who resided here for three months in 1530, and here in the winter of 1531-32. This castle was occupied by the Swedes in 1632, and was unsuccessfully besieged by Wallenstein during the Thirty Years' War. Coburg has manufactories of porcelain and ceramic wares, carriages, furniture, etc., and has also malt-works, breweries, wooden and linen mills, machine works, colors, ironwork, lumber and basketware manufactories. Pop. 23,794.

COBURN, Foster Dwight, American farmer and agricultural writer; b. Jefferson County, Wis., 7 May 1846. After serving in two Illinois infantry regiments during the Civil War he went to Kansas in 1867. The agriculture of Kansas owes much to his expert knowledge and enthusiasm. He became secretary of the Kansas board of agriculture in 1882, and later, in 1894, holding the position until he resigned, 1 July 1914. He was a member of the department of live stock at the Saint Louis Exposition (1904). He was repeatedly a member of the board of regents of the State Agricultural College and president of the State Temperance Union; was editor for five years of the Kansas Live Stock Indicator. He is vice-president and director of the Prudential Trust Company, also of the Capitol Building and Loan Association, and director of the Bank of Topeka. In 1906 he was refused an appointment as United States senator. He published 'Swine Husbandry' (1904); 'Alfalfa' (1901); 'The Book of Alfalfa' (1906); 'Swine in America' (1909); 'Farm Poultry'; 'Silos and Silage'; and about 30 volumes on agriculture published by the State of Kansas.

COCA (Erythroxylon coca), a shrubby plant belonging to the family Erythroxylaceae, found wild in the mountainous regions of Peru and Bolivia, and cultivated in districts 2,000 to 5,000 feet or more above sea-level. The leaves are gathered and dried in the sun, and chewed in with a little powdered chalk. When taken in some quantity they produce an intoxication like that of opium. As the indulgence is repeated the appetite for it increases, while that for wholesome nourishment diminishes; the miserable victim loses all power of resisting his craving and becomes reduced to a condition of physical and mental prostration. When used in moderation coca lessens the appetite for food and enables those who have partaken of it to sustain greater fatigue than they otherwise could. It has been found the best preventive of asthmatic symptoms caused by the rapid ascent of lofty mountains. An infusion of the leaves is also used with the same effect.

COCAINE, ko'ka-in, a vegetable alkaloid, with the chemical formula C_{17}H_{21}NO_3, obtained from the leaves of the coca shrub (Erythroxylon coca) growing on the eastern slopes of the Andes and cultivated in Peru, Bolivia, Colombia and Brazil, and in Java, Ceylon and the Malay States. Cocaine was first isolated by Niemann in 1860. Its anæsthetic qualities were discovered by von Anrep in 1880, but it did not come into use as a surgical adjunct until Koller
COCAINE

Cocaine crystallizes from its alcoholic solution in small monoclinic prisms which melt at 208° F. and dissolve sparingly in cold water—though fairly in hot water—and freely in ether and alcohol. The hydrochloride is readily soluble in water.

Salts of cocaine are precipitated from solution by numerous reagents, among which are ammonia, caustic potash, sodium carbonate, picric acid, tannic acid, gold trichloride and platinum tetrachloride. Cocaine when taken internally is a cerebral stimulant, and moderate doses usually cause a pleasant sense of exhilaration and temporary increase in mental and physical power, though accompanied by a more or less complete loss of moral sensibility. This condition is followed by a corresponding period of depression. The sense of hunger and fatigue is lessened so that privations may for the time being be better endured under the influence of the drug. Moderate doses powerfully stimulate respiration, and, to a less degree, the heart and circulation. The temperature is not affected by small amounts, but in overdose it may be elevated several degrees. The drug is to a large extent oxidized in the body, though small amounts may be excreted by the kidneys. It is alleged that the quantity of nitrogenous material eliminated in the urine is decreased, indicating a reduction in tissue waste, but this has not yet been clearly proved. In poisonous doses cocaine produces narcosis—sometimes with epileptiform convulsions—with depression, followed by paralysis, of the sensory nerves and to a less degree of the motor nerves. The symptoms of poisoning vary greatly in different individuals. Moderately toxic amounts may give rise to disagreeable mental excitement and unrest, nausea, faintness, pallor, cold perspiration and prostration, or to a sense of malaise and depression. Large doses cause rapid respiration, feeble and accelerated heart action, dilated pupils, headache, dryness of the throat and muscular twitchings. General convulsions may supervene—or collapse occurs, the skin is cyanotic and cold, the blood pressure falls through great cardiac depression, respiration becomes slow and shallow and death occurs through failure of this function. The immediate cause of poisoning includes the evacuation of the stomach if the drug has been taken by mouth, and the use of stimulants such as ammonia, coffee, strychnine, ether or alcohol. If convulsions are present these must be combated by the inhalation of small amounts of ether or chloroform and the cautious administration of sedatives. Morphine is said to be the best physiological antidote. Cocaine is used internally to some extent as a stimulant in certain febrile and mental conditions, as well as on account of its topical action in gastric disorders or in obstinate vomiting, but its most important field of utility is the production of local anesthesia in minor surgery. When applied externally in proper strength it produces a loss of sensation, particularly to pain and touch, through paralysis of the terminations of the sensory nerves. Applied to the eye it causes anesthesia, contraction of the blood vessels, reduction of intraocular tension and dilation of the pupil, but the reflex to light is not lost and there is little or no paralysis of accommodation. Brought into contact with the tongue it destroys the sense of taste for bitter substances, though.
salt may still be recognized and sweet and sour fluids do not entirely lose their flavor. The sense of smell may be entirely abolished by the application of cocaine to the mucous membrane of the nose, but it is not absorbed from the unbroken skin. When injected under the skin a small amount of muslin soaked in a 1:100,000 solution of cocaine is applied to mucous membranes or of number of incisions or other painful manipulations may be practiced on the part so treated without giving rise to discomfort. For this purpose solutions varying in strength from 2 to 10 per cent are usually employed.

The applicability of local anaesthesia has been greatly extended by means of what is called nerve blocking. It has been found that on the injection of a small amount of a weak solution of cocaine into the trunk of the main nerve supplying a part, sensation is cut off in that region and painless operating is possible. A plan which enables extensive areas to be anesthetized with but small amounts of the drug is called Spinal Anesthesia method. For this purpose a very weak solution of cocaine, morphine and sodium chloride is injected into the tissues until considerable local swelling or edema is caused. In this way the effect of pressure on the local nerve filaments and the local anemia combine to aid the action of the very small amounts of the alkaloids.

A very great advance was made when it was found that it was practicable to produce anesthesia embracing almost the entire body by injecting cocaine solutions into the spinal cord by means of a long hypodermic needle usually inserted between the fourth and fifth lumbar vertebrae. Anesthesia of the legs and trunk about as high as the breasts is produced within 15 minutes and lasts from two to five hours. For this purpose as for use in other ways small quantities of adrenalin are often added to the cocaine solution with the idea of neutralizing some of its undesirable qualities. Spinal anesthesia, however, is not altogether without dangers or drawbacks, and will probably never be used as a routine procedure.

Owing to the more or less serious disadvantages of cocaine, particularly its tendency to produce grave poisoning in some persons even when small quantities are used, and also because of the difficulty of sterilizing its solutions without impairing their virtue, substitutes have been sought by the synthetic chemists, and with much success. By various combinations with the groupings in strychnine, to which cocaine is closely allied chemically, there have been developed eucaine-B, or beta-eucaine, nirvanine, novocaine, holocaine, stovaine and alypine. These all produce, when administered in sufficient quantity, a slowing down and diminution in the extent of the respiration and a fall in blood pressure. Use is also made of tropacocaine, an alkaloid found in the Java coca leaves. It is less toxic, though quite as effective in local anesthesia, as cocaine. The relative toxicity of these substances as compared with cocaine is approximately: cocaine, 100; alypine, 90; holocaine, 60; stovaine, 55; tropacocaine, 50; beta-eucaine, 40; nirvanine, 30; novocaine, 30. Cocaine is sometimes used in the treatment of the morphine habit, not infrequently with the result that the victim only exchanges one form of bondage for another no less pernicious. Many persons innocently acquire the cocaine addiction through the use of various nostrums in the form of snuff or sniffing liquids, ostensibly intended for the cure of nasal catarrh, hay fever, etc. The temporary alleviation of his symptoms produced by the compound induces the sufferer to continue its use until he is fairly in the grip of the disease, and the mind becomes so unbalanced that his will is no longer of any avail to him. The effect is then only temporary and the patient finally becomes mixed with the use of alcohol, and he begins to require larger and larger quantities to keep him清醒.

In the endeavor to check the ravages of cocaine and other habit-forming drugs several of the States have passed laws more or less stringent. The Federal Government has also aided to some extent with the so-called "Harrison Bill," requiring the registration of all persons who sell or administer the drug, and that these persons are required to record all sales. This law went into effect on 1 March 1915, and affected every person producing, importing, manufacturing, compounding, dealing in, dispensing, selling, distributing, or giving away coca leaves or any derivative or preparation therefrom. During the first three months of the fiscal year ending 30 June 1915, the registry showed 167 importers, 567 manufacturers, 1,106 wholesale dealers, 47,156 retail dealers, 36,504 dentists, 123,734 physicians and surgeons, besides 10,726 veterinarians. The records of the bureau of foreign and domestic commerce show that in the fiscal year ended 30 June 1915 there were brought into the United States 1,048,312 pounds of dry coca leaves, and 179 ounces of cocaine, eucaine, and their derivatives—the equivalent of 218,000 ounces of cocaine. According to the United States Pharmacopoeia of 1900 the average dose of cocaine is said to be 50 milligrams, or one-half grain, but deaths have been reported from amounts not much larger than this. On the other hand recovery has been observed in cases in which 20 grains and more of the drug had been taken by mouth. See DRUG HABIT.

COCAMA, kō-kāˈmə, or UCAYALES, a tribe of Tupian stock inhabiting the banks of the lower Ucayali River, in northeastern Peru, also near Nazca on the left bank of the Amazon, opposite the mouth of the Ucayali. Consult the works of De Castelnau and Marcoy and Rivet, 'Les langues guarani de l' Haut-Amazonie.' in Journal de la Société des Américanistes (Paris 1908).

COCANADA, kō-kāˈnāˈdə, India, the capital of the Godavari District, Madras, 315 miles northeast of Madras, and the second city on the
Coromandel coast. It is connected by navigable canals with the Godavari River. The harbor is siting and has caused the port trade to decrease. Great quantities of cotton are exported, also rice, sugar, oil, pulse and tobacco. Cheroots, iron and salt are manufactured. Pop. 54,176.

**COCEIUS**—**COCUS**

Köle-tsa'yooos, Heinrich von, German jurist: b. Bremen 1644; d. 1719. He studied at Leyden and Oxford; was in 1672 professor of law at Heidelberg, and in 1688 at Utrecht; in 1690 regular professor of laws at Frankfort-on-the-Oder. He went to The Hague in 1702, without giving up his office, on occasion of the disputes as to the hereditary succession of the house of Orange; and received for his services, in 1713, the rank of baron of the empire. As a lawyer he was the oracle of many courts, and his system of German public law ('*Juris Publici Prudentia*) was almost a universal academical textbook of this science.

COCEIUS, or KOCH, Johannes, Dutch theologian: b. Bremen 1603; d. Nov. 4, 1669. He studied at Hamburg and Franeker, under Saxes' Amma, a noted biblical scholar. Returning to Bremen in 1630, he taught biblical philology at the Gymnasium there; and in 1636 became professor of Hebrew and theology at Franeker until 1650, when he became professor of theology at Leyden. He was the leading exponent of the *covenant* or *federal* theology, which taught that the covenant was the basis of theology. There were two covenants, one before the fall, the *Covenant of Works,* and after the fall the *Covenant of Grace,* to fulfill which the Messiah was sent. The New Testament ideas in the Old Testament. A school of theologians which elaborated this philosophy were called *Coceian.* His chief works were 'Lexicon et Commentarius Sermonis Hebraici et Chaldaici' (Leyden 1666), a work which is the first scholarly dictionary of the Hebrew language; and 'Summa Doctrine de Fide et Testamento Deo' (1648) in which his religious views are expounded. He collected his works in a single volume, of which he was son in 12 folio volumes (Amsterdam 1673-75).

**COCO,** COCOA-ROOT, EDDEB, TARO, various plants of the genera *Caladium* and *Colocasia* of the family Araceae. They are widely cultivated for food in the tropical and subtropical islands of the Pacific, the West Indies and adjoining continental regions, and to a less extent in other warm countries. The edible part most desired is the starchy acrid tuber which is eaten like potatoes or made into poi, a substance obtained by roasting the tubers, pounding them with water to a paste and allowing the mass to ferment before being eaten either in that form or again prepared for the table. In this form the roots are a staple food of the Polynesians. During the process of roasting or boiling the tubers lose their acridity, while their color is improved. The young leaves of some species are used as pot-herbs. The principal species is *Colocasia antiquorum* var. *esculentum,* a perennial herb with heart-shaped peltate green leaves often three feet long and a small inconspicuous spadix. It is very popular as a bedding plant in the United States, since it gives a sub-tropical effect, especially when grouped with cannas and crotons. Popularly it is known as elephant's ear. It is easily grown, being started in the greenhouse, transplanted to the open ground after danger of frost, freely supplied with water and, at the approach of frost in the autumn, stored in a cool, dry cellar.

**COCOLITH,** the name given in 1858, by Huxley to one of certain minute oval or globular calcareous bodies found in countless numbers in the ooze of the Atlantic, either detached or adherent to small pieces of protoplasm. They have since been dredged up from other places, and found in chalk, and, according to Guembel, in limestone of all ages. He thinks they belong to *Melobesia,* a genus of algae.

**COCCOSTEUS,** a genus of fossil Arthrodira, originally classed with the Dipnoi, though regarded by others as aberrant Telcosomes, pertaining chiefly to the Devonian and Old Red Sandstone systems, but met with also in Silurian strata. The head and front of the trunk was protected by a great shield covered with tubercles. Besides this bony cuirass there was also a ventral shield beneath the belly of the body was naked. The skull was astostylic. The mouth was furnished with small teeth, like those of the modern Dipnoi. Pectoral fins were lacking, but pelvic and dorsal fins were present. See DIPNIFTHYS; DIPNOI.

**COCULUS INDICUS,** or fish-berry, as it is commonly known in the United States, is the seed of a herbaceous climbing vine (*Ana-mirta paniculata*), of the family Menisper-maceae. The dried berries are imported from the East Indies. The duple resembles a round berry, the size of a pea or larger, wrinkled externally, and with a brittle husk. The kernel is intensely bitter. It contains about one-fifteenth of its weight of a powerful bitter narcotic poison called picrotoxin, also bases called menispermine, a crystalline base, paramenispermine, and several organic acids. Picrotoxin is used as an adulterant in enriching and imparting a bitter taste to malt beverages, and is thrown into rivers in which fish abound to stupefy them, so that they may be readily caught. It has been used in the form of an ointment in certain skin diseases, and in decoctions for killing vermin in the hair of children and animals, although death is sometimes caused through this latter use. The symptoms of poisoning are twitching and inco-ordination of the muscles, increased reflex excitability, convulsions, coma and death from asphyxia.

**COCCUS,** in zoology, a genus of insects of the order Hemiptera, family Coccidae. See SCALE INSECTS; also COCHINEAL; KERMES; LAC.

In Medicine.—Coccus is also the name of a family of bacteria characterized by their spherical form and consisting of a number of genera, all named for certain growth characters. Thus cooci that grow in chains are termed Streptococci in which group the virulent bacteria that cause blood-poisoning, erysipelas and the organism of erysipelas are found; cooci that grow in pairs are termed diplococci. The *diplococcus* of pneumonia and the *diplococcus* of gonorrhoea are in this group. Others grow in bunches.—Staphylococci. The common organism of pus is *Staphylococcus pyogenes aureus,* by bacteriologists usually called *S.* *p.* *a.* Other spherical forms are known as *Micrococci,*
one of which group, the Micrococcus urea, is found in the urine as causative agent in excessive uriniferous fermentation. Some forms of this family group grow in packets. These are termed Sarcina. They are very abundant in the air, and are frequently associated with chronic gastric fermentations. A large number of different forms of this family are known, the greater majority of which are not pathogenic but very useful in agriculture and the arts, particularly in agricultural processes. As many as a hundred different species have been found in the air, and Chester has described 36 species of Streptococcus, 91 species of Micrococcus (Staphylococcus here included), 14 species of Sarcina, 3 species of Planococci, or movable cocci, and 3 species of Planosarcina. (See Bacteria.) Consult Chester, "Manual of Determinative Bacteriology."

COCYGMORPHÆ—COCHIN

1847 it was created an episcopal see. Pop. 24,512.

COCHEM, kö' kem, Prussia, capital of a district in the Rhine province, at the confluence of the Endert and Moselle, 24 miles southwest of Coblenz. It is beautifully situated, has a fine park on the river front. Here is a war monument by Schöff. Nearby is the episcopal castle of the archbishops of Trieres. It was destroyed by the French in 1689 and was restored in 1868. The city has several mills. Forestry and wine handling are important industries. Pop. 3,758.

COCHERY, kö' shi ré', George (Charles Paul), French public official: b. Paris 1855. He was the son of Louis Adolphe Cochery, was educated at the Lycée Condorcet and the École Polytechnique. He was successively director in the Department of Posts and Telegraphs, Minister of the Interior, president of the general council of Loiret, and in 1895-98 and in 1909-10 was Minister of Finance. He is a chevalier of the Legion of Honor.

COCHERY, Louis Adolphe, French statesman: b. Paris 1819; d. 1900. He practised law in Paris and became Chief of Cabinet in the Ministry of Justice during the Revolution of 1848. Afterward he was minister of finance, minister of the interior, and minister of justice; he was a deputy of the National Assembly and in 1868 founded L'Indépendant de Montargis. He was a member of the legislative assembly and opposed the war with Germany. In 1870 he became general commissioner of the National Defence in the department of Loiret. He was undersecretary of the Department of Finance under Daumet and was Minister of Posts and Telegraphs in 1878-85. He was elected senator in 1888.

COCHIN, ko' shén, Charles Nicolas, French engraver: b. Paris, 22 Feb. 1715; d. Versailles, 29 April 1790. He was the son of an etcher of note and his productions excelled those of his father. He was chosen engraver to the king (1739) and in this capacity portrayed a number of court subjects. The collection of his works contains more than 1,500 pieces, among which are 112 likenesses, in the form of medals, of the most renowned French scholars and artists of his time, who were among his friends. Besides his essays in the memoirs of the Academy, he published 'Voyage d'Italie' (1738); conferences on art under the title "Oeuvres diverses"; and also "Mémoires inédites du Comte de Caylus" (1780). His frontispieces and vignettes are remarkable for neatness and taste. His views of 16 French seaports are of great value. His composition in general is rich, delicate and pleasing. He was a member of the Academy, was ennobled in 1757, and occupied several places of importance. Consult Rocheblave, 'Les Cochins' (Paris 1893).

COCHIN, Henri Delays Benoit Marie, French educator and deputy: b. Paris 1854. He received his education at the Lycée Louis-le-Grand, Paris. He served in the Franco-Prussian War 1870-71, became an attaché of the Ministry of the Interior and after 1893 served continuously in the Chamber of Deputies, and in 1897, became a member of the Academy in 1911. He has published 'Giulietta et Romeo' (1878); 'Le manuscrit de M. Laronnier' (1880); 'Boccace' (1890); 'Un ami
de Pétrarque' (1892); ‘Chronologie du Canonicière du Pétrarque’ (1898); ‘Le frère de Pétrarque’ (1903); ‘La vita nuova de Dante traduite et commentée’ (1908); ‘Tableaux flamands’ (1909); ‘Jubilis d’Italie’ (1910); ‘Lamartine et la Flandre’ (1912); ‘Oceanam: livre du centenaire’ (1913); ‘Descartes’ (1913).

COCHIN, kô-chên, India, seaport of Hindustan, in the Malabar district of the Madras presidency, situated on the coast. It is a picturesque place with many quaint old Dutch buildings. Its harbor, though sometimes inaccessible during the southwestern monsoon, is the best on this coast. It is the chief port on the Malabar coast, and ranks third in importance in the Madras presidency. Cochinn was one of the first places in India visited by the Europeans. It was visited by Cabral in 1500; in 1502 Vasco da Gama established a factory; in 1503 Albuquerque built a fort, and here he died in 1524. In 1530 Saint Francis Xavier visited the seaport, and made many converts. In 1663 the Dutch took the place; in 1795 it fell permanently into British possession. Pop. 20,023.

COCHIN, a variety of the domestic fowl, imported from Cochin-China. It is a large, ungainly bird, valuable chiefly owing to its fecundity, eggs being laid even during the winter. They are brown, black, buff or variegated in color, and except in the black variety have yellow-feathered legs and single erect combs.

COCHIN-CHINA, a country forming part of the peninsula of southeastern Asia, and generally regarded as comprising the whole of Anam and Lower or French Cochin-China. Three of the six provinces into which the latter was divided were acquired at one period, and the remaining three at another period. A persecution of the French Roman Catholic missionaries in Anam furnished the French with an occasion of regaining a footing in the East. An expedition against Cochin-China was decided on in 1857, and Saigon was occupied. The Austro-Italian War deferred further operations till 1861, when the conquest of Metho gave the French possession of the most fertile district of Lower Cochin-China. The war continued till 5 June 1862, when a peace was concluded at Saigon with the king of Anam, which was ratified at Hué 15 April 1863. By this treaty the king agreed to cede to the French the three provinces of Bienhoa, Saigon and Metho, along with the island of Pulò Condore, to tolerate the Roman Catholic religion, to open three of the ports in Tonquin to French ships, and to pay an indemnity of 24,000,000 francs (about $4,800,000). Although the inhabitants were found to be on the whole sufficiently tractable, yet a few revolts took place, whereupon Admiral De la Grandière, on the pretext that all these disturbances had their origin in the provinces of Lower Cochin-China which had remained to Anam, namely, Vinhlong, Chaudoc and Hatien, took possession of these provinces, and declared them French territory, 25 June 1867. The territory thus acquired by the French was 21,980 square miles, and in 1915 had a population of 3,050,785. It is now organized in departments, prefectures, sub-prefectures and cantons. In 1882-83 France asserted a claim to the province of Tonquin, and indeed the entire Annam territory, and after some fighting this claim was conceded by the king. Tonquin was accordingly taken possession of by France in 1884. Anam (q.v.) forms a protectorate. In 1888 it became part of the governor-generalship of Indo-China, is under the administration of a lieutenant-governor, and is represented by a deputy in the French chamber. Anamites troops served under French leadership in the Allied campaign in the Balkans in 1916.

The northern and eastern parts of French Cochin-China are hilly, but the rest of the territory consists almost entirely of well-watered low alluvial land, and from the deposits brought down by the rivers, of extraordinary fertility. The lowlands, where the waters stagnate, are covered with a rank vegetation from 3 to 10 feet high; contiguous to the flowing streams are extensive rice-grounds. Where the soil is somewhat raised above the water-level it is very fertile, and in some places ranges of low hills follow the line of the coast. The more elevated districts are grown tobacco, sugarcane, maize, indigo and betel. Among the other products are tea, gums, cocoanut oil, silk, spices and various farinaceous and aromatic articles. The Anamites raise also great numbers of buffaloes, cattle, hogs and birds, the first being employed in agriculture, and, as well as oxen, for draft purposes; but since the French conquest, oxen are reserved more strictly for food. Industrial arts are as yet limited among the natives. They are skilful in all kinds of basket-work, in which they use the reeds and other similar materials which abound in the low lands; silk and cotton are also wrought. But they excel in the use of wood, of which their temples, pagodas and tombs are built, and ornamented with elaborate carving. They live in villages—numbering nearly 1,000—adjacent to the rivers, which, in the unsuitableness of the country for land traffic, form almost the only means of communication. Their houses are either tied together with straw, the roofs being supported with wooden pillars; the better class are in two sections, the inner apartments and the outer veranda, which serves for use in the daytime; they are often well furnished, and not distinguished.

The only roads at present are those connecting Saigon, the capital (pop. 1915, 100,000, with 11,250 white) with the principal towns. The most populous city is Cholon, with 191,655 inhabitants. There are 2,670 miles of telegraph in operation. The climate is humid and warm, and very trying for Europeans. The prevailing religion is Buddhism. There are some 600 schools in the territories. The principal export is rice, of which there is annually exported about 7,000,000 hundredweight, mainly to China; cotton and silk are also exported.

COCHIN-CHINA, Upper, or DONG-TRONG, a narrow strip of land, consisting of four provinces, on the east coast of Anam, to which empire it belongs, extending from Tonquin on the north to Champa on the south. The most important river is the Champa, or chief town, Phu-thua-thi, or Hué, stands. In the most fruitful parts of this region aloes wood (of the Aquilaria ovata), corn, sugarcane and cinnamon flourish. From October to January the weather is often very stormy, and
typhoons rage frequently. The climate is healthy and pleasant. Camphor is produced in the district in the utmost perfection.

COCHINEAL, koch'-i-nel, one of the scale insects (Coccus cacti), used as a dye. It is a native of Mexico, but has been introduced into Europe, Algiers, and the Canary Islands, where the plantations of cactus were cultivated for their nourishment. It is a small insect with the body and legs embedded in its abdomen in a deep mulberry color, and bristly in the posterior part; the legs are short and black. The principal district in which they are now reared is in the province of Oaxaca, those of the district of Mestique being considered the best insects. There are plantations of the nopal (Opuntia cincinnellifera), upon which they feed, the insects being tended with care equal to that ordinarily bestowed upon silkworms. Before the rains knock in the nopal branches covered with insects are cut off and brought under shelter to protect them from the weather. At the close of the wet season, about the middle of October, the plantations are stocked from these supplied with suspending little nests made of a soft woolly fibre, each containing 8 or 10 females, upon the spines of the nopal. The insects, warmed by the sun, soon emerge and lay their eggs, each female producing more than 1,000 young. These spread rapidly over the plants, and as the young females become impregnated they attach themselves to the leaves and swell to great size, presenting the appearance more of vegetable excrescences than of animated creatures. In this condition they are gathered for the cochineal. The males, which are few in number, not more than 1 to 100 or 200 females, are of no value for this purpose. The females are picked off with a blunt knife, the first crop about the middle of December, and subsequently several more of as many successive generations, the last being in May. A laborer can pick off in a day only about enough to make two ounces of cochineal. Those taken off full of young lose about two-thirds of their weight in the process of drying, to which they are subjected as soon as they are killed, which is done either by dipping them in a basket into boiling water, or placing them in a hot oven, or on plates of hot iron. By the first method, usually considered the best, the insects turn to a brownish red color, losing a portion of the white powder with which they were previously loaded between the wrinkles of the body. In the oven they retain this, and their color is then gray. Those killed on hot iron turn black. Such is the origin of the different varieties of cochineal known as "silver grains" and black grains, and the "foxy" of the London market, the last being those killed by boiling water, though others ascribe it to the former being the female before laying her eggs, and the latter after she has parted from them. The quality of the cochineal is the same in both cases. When dried, the cochineal presents the form of grains, convex on one side and concave on the other, about one-eighth of an inch in diameter, with the transverse wrinkles still visible, stated that it was necessary for the insects to weigh a pound. The market value of cochineal has declined so much since the introduction of coal-tar dyes that the cultivation of the insects has been abandoned elsewhere than in Mexico, and comparatively little of this dye is now produced there. See SCALE INSECTS.

COCHINEAL-FIG., a name given to Nopalea coccinellifera and several other species of cacti, natives of Mexico and the West Indies, the plants on which the cochineal insect lives. See CACTUS; COCHINEAL.

COCHITUATE, koch'-i-tayt, LAKE, Mass., a narrow body of water, about four miles long, 1 mile wide, 3 miles west of Boston. From this lake for many years Boston has derived its principal water-supply.

COCHLEA, koch'-le-a, an important part of the internal ear, so called from its shape, which resembles that of a snail-shell. See EAR.

COCHLEA RIA, koch'-le-ri-a, a genus of annual maritime herbs of the mustard family (Cruciferae). It numbers upward of 25 species, all native of the colder parts of the north temperate zone, and not familiar generally. About four species are found on the Arctic and northern Pacific coasts of North America. Two very distinct species quite well known are the horse-radish (C. armoracia), escaped from cultivation, and now found along the ground along streams, and scurvy-grass (C. officinalis), considered of great value as an antiscorbutic. If eaten fresh, it is a stimulant and diuretic, but is feeble if allowed to dry before being taken.

COCHRAN, kok'ran, John American soldier and lawyer: b. Palatine, Montgomery County, N. Y., 27 Aug. 1813; d. New York, 7 Feb. 1898. He was graduated at Hamilton College 1831, practised law in Oswego from 1834 to 1845, when he removed to New York, where his talents as lawyer and orator at once brought him into prominence. He was surveyor of the port of New York 1853-57, and a Democratic member of Congress 1857-61, serving as chairman of the Committee on Commerce. During the Civil War he commanded the United States Chasseurs in the Peninsula campaign; was commissioned a brigadier-general 17 July 1862, and commanded a brigade in General Couch's division of the Army of the Potomac; was with the reserve at the battle of Antietam and took an active part in the pursuit of the enemy. He was attorney-general of New York State 1863-65. In 1864 he was nominated on the Fremont ticket for the Vice-Presidency. He was active in securing Greeley's nomination for President in 1872, was president of the New York common council 1872, and acting mayor when Mayor Hall retired during the Tweed ring disclosures; again a member of the council in 1883, and a police justice 1889.

COCHRANE, Frank, Canadian statesman: b. Clarenceville, Quebec province, 18 Nov. 1852, and educated in the academy of his home town. He was for several years mayor of Sudbury, Ontario, in which town he had a hardware business and became interested in mining, lumbering and industrial ventures. He was returned for East Nipissing in the Conservative interest to the provincial legislature of Ontario in 1905, becoming, in 1906, Minister of Agriculture and Mines in the Whitney Cabinet. At the general election of 1908 he was returned M.P. to the Dominion Parliament, and on the defeat of the Laurier administration in 1911 accepted the portfolio
COCKATOOS (Cacatuidae)

1 The Slender-billed Cockatoo (Licmetis nasicus)  2 The Black or Crow Cockatoo (Calyptorhynchus galeatus)
COCHRANE — COCKBURN

of Railways and Canals in the Borden government.

THOMAS COCHRANE, 10th Earl of Dundonald, British naval officer: b. Annfield, Scotland, 14 Dec. 1775; d. Kensington, England, 31 Oct. 1860. While still a boy he was enrolled in the navy, and gained the rank of captain. He entered Parliament in 1806. He was noted for his attacks on naval abuses by which he himself profited. In 1814 he was accused of conspiring to circulate a false report of Napoleon's death for speculative ends, and though he protested his innocence he was imprisoned for a year, fined and was expelled from the navy and the House of Commons. In 1818 he accepted an invitation to organize the navy of Chile and performed many brave exploits during the contest with Spain. He left the service of the Chileans and was commander of the Brazilian navy from 1823 to 1825, when he resigned; because accused of insubordination. In 1827 and 1828 he commanded the Greek army. In 1832 he was cleared of the charges brought against him in 1814, and restored to the Order of the Bath and to the English navy. He was appointed vice-admiral in 1841; admiral in 1851, and rear-admiral of the United Kingdom in 1854. He was of an inventive turn also, and took out patents for lamps to burn oil of tar, for the propulsion of ships at sea, for facilitating excavations, mining, sinking; and as early as 1843 was an advocate of steam and screw propellers in warships. He was exceedingly daring, but his irascible temper and hastiness caused him many misfortunes. His son published a 'Life' based on his 'Autobiography of a Seaman' (1860-61).

COCHRANE, Canada, town in the Timiskaming district of Ontario, 500 miles north of Toronto, on the Transcontinental and the Timiskaming and Northern Ontario railways. It has a custom-house and is the trading centre for northern Ontario and northern Quebec and is an outfitting point for miners, trappers and hunters. There are repair shops of both railways here, and the town has electric lighting and power, water and sewerage systems. Pop. 1,715.

COCK. See POULTRY.

COCK LANE GHOST, a famous hoax by which many people of London were deceived in 1762, arising from certain knockings heard in the house of a Mr. Parsons, in Cock lane. Dr. Johnson was among those who believed in the supernatural character of the manifestations; but it was found out that the knockings were produced by a girl employed by Parsons, for the purpose of haunting Mr. Kent, a former resident whose wife had died. Her ghost was supposed to accuse him of murder. Consult Lang, 'Cock Lane and Common Sense' (London 1894).

COCK OF THE ROCK (Rupicola crocea), a South American bird of a rich orange color, with a beautiful crest, belonging to the family Cotingidae. The name, or its French equivalent, is also applied to several related species.

COCKADE (Fr. cocarde), a plume of cock's feathers, with which the Croats in the service of the French in the 17th century adorned their caps. A bow of colored ribbons was adopted for the cockade in France, which soon became a national emblem and party insignia. During the French Revolution, the tricolored cockade—red, white and blue—became the national distinction. National cockades are now to be found over all Europe. In Germany cockades of black, red and gold, after being forbidden in 1832, were again allowed in 1848, and even introduced into the army in 1850; however, they have again ceased to be publicly worn. In Italy the former emblem of the party of progress, the green, red and white cockade, was recognized by the government of Piedmont in 1848, and since the formation of the kingdom of Italy it has formed the national cockade. Consult Carter, 'Cockades: Their History and Significance' (Genealogical Magazine, Vol. III, London 1899); Racinet, 'Le costume historique' (Paris 1888).

COCKAIGNE, kok-án', Land of, an imaginary land of idleness and plenty, in which the houses were roofed with cake, the rivers ran wine and roasted fowl offered themselves to be eaten. The term was applied in derision to both London and Paris. The corresponding term in English is Rubbersland, and in German Schlaraffenland. The 'Land of Cockaigne', was the title of a satirical poem written not later than 1300.

COCKATOO, an English rendering of a Malayan name for certain species of birds of the parrot family (Psittacidae). They are comprised in Cacatua, and five other genera forming a sub-family, which, besides having some peculiarities of internal anatomy, is distinguished from true parrots by the greater height of the bill, and its being curved from the base, and by the lengthened, broad and rounded tail. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed pink or yellow feathers, with their tips directed forward, which can be erected and expanded like a fan, or depressed, at the pleasure of the bird. They live on fruits and seeds, insects, larvae, etc. The true cockatoos are all of generally whitish plumage, but often finely tinged with red, orange and other colors, or mixed with these colors in more brilliant displays. The cockatoos are confined to the Australian region and the neighboring Solomon Islands, with the exception of a single Philippine species. The sulphur crested cockatoos (Cacatua sulphurea and galerita) are well-known cage birds which may be taught a few words, but their vocal efforts are chiefly limited to the harsh cry cockato. Several allied genera are also given this name, as Calyptorhynchus and Microglossus, both of which are dark.

COCKATRICE, a fabulous serpent or serpent-like monster anciently believed to be hatched from a cock's egg. It is often simply another name for the basilisk (q.v.).

COCKBURN, kō'bern, Sir Alexander James Edmund, English jurist: b. 24 Dec. 1802; d. 20 Nov. 1880. He studied at Cambridge; was called to the bar in 1829, and soon became distinguished as a pleader before parliamentary committees. In 1847 he became member of Parliament for Southampton by the lieutenant; became solicitor-general and was knighted in 1850 and attorney-general, 1851-56. He was made chief justice of the common pleas in 1856; and lord chief justice in 1859.
Among the many famous trials over which he presided were the Tichborne case and the Wainwright murder. He represented Great Britain at the Geneva arbitration tribunal for the adjustment of the Alabama Claims, 1871-72.

COCKBURN, Alicia or Alison Rutherdord, Scottish lyrist: b. Fairnilee, Selkirkshire, about 1712; d. Edinburgh, 22 Nov. 1794. In 1731 she married Patrick Cockburn, advocate, and in 1753 was left a widow. She died a few years later, and the estate then passed to her children, who were heirs of her husband. She is remembered for her published works, which include a collection of poems, "The Smiling of Fortun" (1758), and a translation of the "Orphic Hymns" (1769). She was a member of the Edinburgh Academy and was known for her literary contributions.

COCKBURN, Sir George, English naval officer: b. London, 22 April 1772; d. Leamington, 19 Aug. 1853. He entered the navy in early youth, and about 1812 obtained the rank of rear-admiral. He took part in the capture of Washington City in 1814, and was present at the battle of New Orleans in 1815. He was a first naval lord of the Admiralty from 1841-46, and sat in Parliament for many years.

COCKBURN, George Ralph Richardson, Canadian educator: b. Edinburgh, Scotland, 15 Feb. 1834; d. London, Ontario, 17 Jan. 1912. He graduated at Edinburgh University 1857, went to Canada in 1858 and became rector of the Upper Canada Grammar School. In 1861 he was made principal of Upper Canada College, and under his administration of 20 years it attained a high reputation for the excellence of its teaching and discipline.

COCKBURN, Henry Thomas, Lord, Scottish judge: b. Edinburgh, 26 Oct. 1779; d. Bonaly, near Edinburgh, 26 April 1854. He was chiefly in connection with political cases that he rose to eminence in his profession, one leading transaction being his gratuitous defense of several persons tried for treason in the year 1818. He became solicitor-general for Scotland in 1830, and in 1834 one of the lords of session. "Memorials of His Time" (1856) is an invaluable record of the social history of Scotland, narrated in the most genial manner. Not less interesting is his life of his friend Lord Jeffrey (1852).

COCKBURN, Sir John Alexander, Australian statesman: b. Corseby, near Duns, Scotland, 23 Aug. 1850. He was educated at Kings' College, London, and settled in South Australia in 1875, where he was mayor of Jamestown 1877-81; sat in the House of Assembly for Burra 1884-87, and for Mount Barker 1887-98. He was Minister of Education 1885-87; Premier and Chief Secretary 1889-90; Chief Secretary 1892; Minister of Education and Agriculture 1893-98; agent-general for South Australia 1898-1901. He represented South Australia at the International Commercial Congress in Philadelphia in 1899, and other important conferences. He was created K.C.M.G. in 1900. See Chafer.

COCKER, Edward, English engraver and teacher of writing and arithmetic: b. 1631; d. 1675. He is said to have published 23 books of exercises in penmanship, one of which is preserved in the British Museum. The great work with which his name is so intimately associated is called "Cocker's Arithmetic," and it has become proverbial, was first published in 1678 under the title of 'Cocker's Arithmetic, Being a Plain and Familiar Method, Suitable to the Meanest Capacity, for the full Understanding of that Incomparably Useful Science, which is now Taught by the Abbot Schoolmasters in City and Country, Composed by Edward Cocker, late Practitioner in the Arts of Writing, Arithmetic, and Engraving.' The book reached a 37th edition by 1720, and upon it most of the succeeding treatises on arithmetic were based. Two other works bear Cocker's name—a treatise on 'Decimal Arithmetic' and an 'English Dictionary,' but it has been surmised that they are not of his authorship, but of that of his publisher, Hawkins.

COCKER, a variety of spaniel (q.v.).

COCKERELL, kôkér’l, Charles Robert, English architect: b. London, 28 April 1788; d. London, 17 Sept. 1863. He wrote monographs on the mausoleum of Halcarnassus and other archaeological subjects. Advancing to the front rank of his profession, he became an associate of the Royal Academy in 1829, a member in 1836 and professor of architecture in 1840, delivering lectures which were highly esteemed and largely attended. He was happier in following classic models than in the Gothic style. He was the designer of the Taylorian building at Oxford, and completed the Fitzwilliam Museum at Cambridge, and Saint George's Hall, Liverpool. He wrote on the 'Iconography of Wells Cathedral,' 'Sculptures of Lincoln and Exeter Cathedrals,' 'Tribute to the Memory of Sir Christopher Wren'; etc.

COCKERELL, Theodore Dru Allison, American zoologist: b. Norwood, England, 22 Aug. 1866. He was educated at the Middlesex Hospital Medical School. In 1887-90 he resided in Colorado, and there studied entomology, botany, etc. In 1891-93 he was curator of the public museum of Kingston, Jamaica, and was professor of entomology at the New Mexico Agricultural Experiment Station from 1893-96, and was entomologist there from 1893 to 1901. In 1903-04 he was curator of the Colorado College Museum and since 1904 has been lecturer on biology at the Colorado State Preparatory School. He was also lecturer on entomology 1904-06, professor of systematic zoology 1906-12 and since 1912 professor of zoology at the University of Colorado. He is the author of over 2,500 articles and notes in scientific publications, principally on mollusca, insects, fishes, paleontology and subjects connected with evolution.

COCKERMOUTH, England, town in the county of Cumberland. It is situated at the confluence of the Cockermere with the Derwent, 32 miles southwest of Carlisle by rail and 260 miles northwest of London. It has industries in textiles, paper, hats, agricultural implement works and tanneries. Coal mines are in the vicinity. The old castle, supposed to have been built soon after the Conquest, stands on a bold eminence. Mary Queen of Scots was im-
prisoned in it in 1568, and in 1648 it was dismantled by the parliamentary forces. Cocker-mouth is the birthplace of the poet Wordsworth, in memory of whom a fine stained-glass window has been inserted in the church of All Saints. Pop. 3203.

COCKFIGHTING, an ancient sport of unknown origin, but practised among both the Greeks and the Romans. An annual cockfight was instituted at Athens, and Æschines reproaches Timarchus, and Plato the Athenians in general, with their fondness for the cock-pit. The breeds of Rhodes and of Tanagra in Boetia were in great esteem in Greece. The Romans seem to have used quails and partridges also for this purpose. This sport has long been a favourite with both Americans and English, although repeatedly denounced and prohibited by the laws. The size proper for game-cocks may be said to be not less than four pounds eight ounces, nor above four pounds ten ounces. The strain from which the cock is chosen ought to be distinguished from which it attained its victory. For the combat they are armed with steel or silver spurs, or "gaffles." The place appropriated to fighting is called a "pit," and consists generally of a mound of earth covered with sod, and surrounded by seats in separate tiers. The battle is conducted by two "setters-to," who place the cocks beak to beak. When they are once "pitted" (this verb owes its origin to the sport of cockfighting), neither of the setters-to can touch his cock so long as they continue to fight, unless their weapons get entangled. In the Philippine Islands cockfighting is pushed almost to the verge of a craze. Nearly every village has its pit, and every peasant his cock. The peasant, too, is said to rescue his fighting-cock rather than his wife or child in the event of fire, and wherever he goes he takes it with him. The sport is there practised in a very cruel form, and many are ruined by excessive betting. Throughout all Spain-America cockfighting is more or less in favor. It was formerly a regular sport in the public schools of England, and schoolmasters received dues in connection with it. Cockfighting is still prevalent in China, Persia and Malacca. For early history consult Markham, "The Bear, the Lion, the Rat's Eye and the Reactions." London 1614; Fairfax, "Complete Sportsman" (ib. 1764); Blain, "Rural Sports" (ib. 1853).

COCKLE (Cardium), a genus of bivalve shellfish forming the type of the family Cardiidae. The general characteristics are—shells nearly equilateral and equivalvular; hinge with two teeth, one on each side near the beak, and two larger remote lateral teeth, one on each side; prominent ribs running from the hinge to the edge of the valve. The animal has a powerful foot with which it burrows in the sand. For this purpose it first distends it with water, to give firmness to it. This foot may also be used to enable the animal to move from place to place, for by first bending it and then suddenly straightening it the animal may project itself a considerable distance. The common cockle (Cardium edule) is common all round the coasts of the British islands wherever it finds suitable sand-beds to live in, and is also found in the Baltic, and elsewhere. It is much used as an article of food. A prickly species, the Cardium aculeatum, found on the coast of Devon, is also eaten. Among American species, which, however, are not eaten, are C. islandicum, found to the north of Cape Cod, and C. pinnatum, found about Long Island Sound. On the coast of Labrador Serripes groenlandicus reaches a large size, being nearly four inches long and two inches thick. This genus is represented by fossils from the Devonian Period onward, but it attains its maximum in recent seas. Consult Lovell, "Edible Mollusks of Great Britain."

COCKLE, kok'k. See CORN-COCKLE.

COCKLE, Order of the, that of Saint Michael, the knights of which wore the scallop as their badge. This order was instituted by Louis XI. of France, who began to reign 1461 A.D. The dress is thus described from a MS. inventory of the robes at Windsor Castle in the reign of Henry VIII.: "A mantell of cloth of silver, lymned withe white satten, with scalole sheelles. Item, a hoodel of crymsin velvet, embrued with scalolle sheelles, lymned with crymsin satten."

COCKLEBUR, coarse annual plants, species of Xanthium, belonging to the ragweed family (Ambrosiaceae). There are five species widely distributed throughout temperate regions. Some of these species occur very commonly in waste grounds in nearly every part of the United States. Wool-growers are seriously troubled by the hook-spined burs of these plants, which catch in the sheep's wool, deprecating its value. In South Africa the injury to the wool industry is so great that strict laws are enforced to keep the plant from multiplying.

COCKNEY, a nickname for a native of London, especially for a person both born and bred there, within the sound of Bow Bells, the term being often used with a certain sense of disparagement and as implying ignorance of either than city affairs, or as suggesting effeminacy. As to the origin of the word there has been much dispute, and many explanations, some of them sufficiently absurd, have been propounded. In the 14th and 15th centuries it was used to mean a petted or coddled child; and, according to the most recent etymology, its original meaning was "cock's egg," a small or misshapen egg. For an excellent study of the historical explanations of the use of this word, consult Murray, J., "New English Dictionary."

COCKPIT, in old time men-of-war, a place situated under the lower gun-deck, where the ship's surgeons tended the wounded. The term is also applied to the open space in a yacht or canoe in which the crew or passengers sit.

COCKRAN, kok'ran, William Bourke, American lawyer: b. County Sligo, Ireland, 28 Feb. 1854. He was educated in Ireland and France, receiving his L.L.D. from Saint Francis Xavier College in 1887. He came to America in 1871, taught school for several years and became principal of a public school in Westchester County, N. Y. At the same time he studied privately for the bar. He soon attained prominence as a lawyer, and entered actively into New York politics, his eloquence causing him to be much in demand as a Democratic public speaker. He was a member of Congress 1891-95, made noteworthy speeches
at the Democratic national conventions of 1884 and 1892, at the latter of which he opposed Cleveland's nomination; and in 1896 refused to follow his party on the silver question, campaigning for McKinley, and advocating the gold standard in effective addresses. He was re-elected to Congress in 1904 to succeed George B. McClellan, and again for the term 1905-09, after which he resumed his law practice in New York.

COCKRELL, Francis Marion, American senator: b. Johnson County, Mo., 1 Oct. 1834; d. 13 Dec. 1915. He was graduated at Chapel Hill College, Mo., 1853, studied law, and practised that profession until his election to Congress. During the Civil War he was a brigadier-general in the Confederate army, was severely wounded during Hood's invasion of Tennessee, and commanded a division in the operations around Mobile, Ala. He was chosen United States senator to succeed Carl Schurz, took his seat 4 March 1875, and was re-elected four times, his last term expiring 3 March 1911. From 1905-10 he was a member of the Interstate Commerce Commission and in 1911 he was United States Commissioner to readjust the boundary between Texas and New Mexico.

COCKROACH, any of the species of Blatta or allied genera, belonging to the family Blattidae, order Orthoptera. The body of the cockroach is much flattened, being adapted to life under the bark of trees, under stones, in cracks, etc. The four wings are much alike in size and net-veined; the antennae are long and slender, and to the end of the body are appended many jointed antenniform limbs which contain olfactory organs like those in the joints of the antennae. Cockroaches are hatched in nearly the same form as the parent, differing mainly in not having wings. The eggs are deposited in a bean-like case (oötheke), which is divided into two compartments, each containing about 30 eggs; these eggs-sacs are carried about for some time by the female, projecting from the end of her hind-body. One small native species (Phyllophaga pentagona) lives under stones, but the species abunding in our homes have been introduced from the Old World. The peculiar odor given out by cockroaches is expelled from glands in the hind-body, and either present in both sexes, or only in the males. In the cratron bug or common small cockroach of our cities, these glands are very large, giving out a fetid odor, and occur only in the males.

While nearly a thousand species of blattids are known to be now living and 200 fossil species are described, mostly from Palaeozoic strata, chiefly the carboniferous states, several forms are household pests. They swarm in our kitchens, spreading through those parts of the house warmed by hot water or steam pipes, and are troublesome from eating clothing, cereals, devouring the paste in bindings of books; they also abound in ships, where they devour ship biscuit, etc., impregnating the pantry with their disagreeable odor. On the other hand, the cockroach is an enemy of the book worm; in England, in particular, it is credited with great service in reducing their numbers. The development of the cockroach is slow and the number of eggs deposited not great. Phyllotromia germanica, the German roach or craton bug, reaches maturity in from four and a half to six months.

Of the many species known the most annoying is the German roach, whose native country is, however, not known, though supposed to have had an eastern origin. The Oriental cockroach (Periplaneta orientalis) is derived from tropical Asia, and is supposed to have been introduced into Europe two or three centuries since. The female is nearly wingless; it is a large dark brown species, living in colonies. The best remedies are insect powder, phosphorus paste, and a proprietary substance called German snowflake powder. Cockroaches have been introduced into the United States to control the nutria on entomology; also Howard and Marlatt, 'The Principal Household Insects of the United States' (Bulletin No. 4, U. S. Department of Agriculture, Division of Entomology, Washington 1896); 'Insects Injurious to the Household' (New York 1912).

COCKSCOMB, a name sometimes given the genus Celosia cristata of the amaranth family Amaranthaceae. It is an annual plant, native in the tropical regions of America, Asia and the East Indies. The naturalized plant from tropical America is found here. It was a member of the Interstate Commerce Commission and in 1911 he was United States Commissioner to readjust the boundary between Texas and New Mexico.

COCKSWAIN, or COCKSWAIN, colloq. kōk'sn, the officer who manages and steers a boat, and has the command of the boat's crew.

COCKTON, Henry, English humorous novelist: b. London 1807; d. 26 June 1853. His stories were very popular in their day, the most noted among them being 'Valentine Vox, the Ventriloquist' (1840). He wrote also 'Sylveste r Sound' (1844); 'The Sisters' (1844); 'The Love Match' (1847).

COCLES, kōk'lež, Horatius. See Horatius Cocles.

COCO DE ACEITE (oil cocoa), kō'ko dā å-sä'-ē-tä, a nut (and tree) native of Mexico, Central America and the northern part of South America, about the size of a walnut and very much like it in appearance. It contains a very edible white kernel much like the meat of a coconut. It is covered by a thin purple pellicle. The oil, which is sweet-scented, very readily congeals, in which condition it is soft and white as snow.

COCO DE MER, or SEA or MALDIVE DOUBLE COCONUT, the fruit of the Lodoicea sechellarum palm. The fruit weighs 40 to 50 pounds and usually contains four nuts which are 18 inches long and lobed at each end. Before maturing the inside of the nut is soft and edible. The hard black shell is carved into ornaments and the young leaves yield an admirable material for baskets and plaited work; the older leaves for thatching. As a sovereign antidote to poison, and long known only from specimens thrown up on the Maldives coasts by monsoons, it was supposed to grow on a submarine tree, and had other fables attached to it. The tree on which it grows is peculiar to some of the Seychelles Islands, reaches a height of 100 feet and has very large leaf-like leaves.
COCOA, or THE CHOCOLATE TREE: derived from the word Cacao, which has the scientific preference in English, from Mexican (Aztec) Caucatl, Cacahuatl, Chocolatl (the suffix *atl* meaning water). The origin of the word is in doubt, being by one authority assigned to another tribe than the Aztecs, and still another to that of its greatest production. Etymologically, however, it would seem to be the name in its doubled or intensive form of the tree from which it is produced, the word "Ca," among the Central and South American Indians, meaning "the plant," and, intensified, "Ca-ca-o," or "the plant or plants." It is analogous to "Yerba Maté," known to the Guarani Indians as "Caa" —"the plant." Botanically it bears the name Theobroma —the "Food of the Gods" — so called by Linnaeus.

The cocoa tree is indigenous to the sub-tropical and tropical portions of the Western Hemisphere. It is mentioned by the earliest of the Spanish-American chroniclers — particularly by those who wrote concerning the conquest of Mexico, in which country it was the principal beverage. It is stated (Prescott, and authorities cited by him) that the annual tribute of cocoa to the Spanish household included 420 chests of ground chocolate, 80 loads of red chocolate, 200 loads of chocolate, and 800 xicaras, the vessels from which the prepared beverage was drunk. The same authority states that the royal account book showed annual expenditures for cocoa to the amount of 2,744,000 fanegas (fanega, about 100 pounds). So generally was cocoa used that it constituted a part of the currency of the Aztecs, it being circulated in small bags each containing a specified number of beans.

The tree is a perennial evergreen of the natural order of Sterculiaceae, Bitteriaceae, thriving in low altitudes and high temperatures from —80° to 100° F. It is generally found at about 50 feet above sea-level, but recent experiments with cultivated varieties indicate that it may be successfully grown at 1,500 feet above the sea if compensating rainfall and temperature conditions exist. In its wild state the tree attains a height of 60 to 80 feet. The cultivation the growth is maintained at from 15 to 20 feet, to the end of producing a fuller developed fruit, for convenience in caring for the tree, and as a safeguard against high winds. At from five to seven feet from the ground the bare stem or trunk divides into several lateral branches, at the juncture of which rises another stem, which, in turn, divides likewise, and so on to the maximum height. The destruction of the perpendicular stem checks the upward growth of the tree. The leaves are large, alternate and undivided, of an oblong-lanceolate or lance ovate, acute shape, and the blossoms are pale-pink, five-petaled clusters growing from the axces of old leaf scars, developing into strawberries, cucumber-shaped fruit — about 20 to 30 per tree — with a five- or a ten-furrowed rind. The fruit, or pod — gathered twice every year — is from 5 to 10 inches in length and 3 inches in diameter, and is filled with a sweet pulp in which five rows of seeds, or beans, are embedded. These — the cocoa beans — are the part of value in commerce. They are from 0.6 to 1 inch in length, and are covered by a thin, fragile, paper-like skin, within which are the embryo and two oily cotyledonary lobes — the last named being the nourishment for the germinating seed, and the source of cocoa butter.

The preparation of the seed for commerce begins with its removal from the fruit, cleaning, drying and sorting, at which time it has a bitter, astrigent taste. It is then subjected to a sweating process by being piled in heaps and covered with green plantain or other leaves, or enclosed in a receptacle and buried for a few days. On extensive plantations these operations are carried on in specially constructed sweating houses, affording every facility for uniformity of treatment. At the end of this operation, a chemical change is noted, resulting in the loss of much of the bitterness and astrigency. After the sweating, the seeds are roasted (similar to the roasting of coffee), being then ready for the mill, the operations of which vary in accordance with the ultimately desired form of the cocoa or chocolate. The method ordinarily followed is to break and shell the roasted beans, grind the same with the addition of sugar, starch and flavoring matter, then mold and pack. The various products are: (1) The cocoa shells; (2) cocoa nibs, the broken or partly contained; (3) chocolate, the ground cocoa nibs with the addition of sugar, or sugar and starch and flavoring matter; (4) cocoa butter. So indiscriminately are the two terms, cocoa and chocolate, used, that the distinction between the two is in many cases not recognized, but the addition of other elements to the pure cocoa is commercially accepted as producing chocolate. Another form of cocoa is the paste passed through the grinding mill, known as flake cocoa. The usual commercial form of cocoa — known as both rock cocoa or chocolate— consists of cocoa, approximately 44 per cent, sugar 40 per cent, and arrow-root, or other form of starch, 16 per cent. Milk chocolate, so-called, is similar, with the addition of vanilla, cinnamon, or other flavoring extract, and condensed milk, and frequently an extra proportion of sugar.

The oil, fat or cocoa butter (Oleum Theobroma) is separated from the remainder of the bean during the crushing process in a series of horizontal millstones, each succeeding pair being closer set than its predecessor, at a temperature of 200° F. It is soluble in alcohol, melts at 85° and solidifies at 73°. At ordinary temperatures it is brittle, with a smooth and even fracture. Its taste and odor are pleasant, and it is utilized for sauces and in the making of pomatumos, soaps, etc. The shells that are removed from the cocoa bean are possessed of the same theobromic principle as the remainder of the seed, and they, in turn, are pulverized and used as a beverage, similar to tea or coffee. Of the chocolate forms most known are "simple chocolate," "iron chocolate," "vanilla chocolate," "Iceland moss chocolate," and others taking their names from certain added ingredients, such as saep, tapioca and sago, with which two or more of the medicated forms. As a beverage — by the addition of water or milk, or both — and as a flavoring principle, sweetmeat, and, to a considerable extent, as a food, cocoa or chocolate are well known, their use in the various prod-
COCOA-PLUM — COCONUT

The world's production of cocoa for the year 1905 was — according to the leading cocoa-trade journal, the Gordanian, of Hamburg — 143,537 metric tons (metric ton, 2,204.6 pounds); in 1915, 283,300 metric tons. The world's consumption for the same two years was, according to the same authority, for 1905, 143,666 metric tons; and for 1915, 294,300 metric tons. The production and consumption for 1915, according to the principal countries, is as follows (from computation of the Gordonian, re-published in United States Commerce Reports 26 May 1916):

Due to the successive rounding off, omitting fractions of tons, the preceding totals are less than the actual figures as elsewhere reported by the same authority.

During the fiscal year ending 30 June 1917, the United States imported 338,653,876 pounds of raw cocoa, valued at $39,834,279, and of prepared cocoa and chocolate (not including confectionery), 1,829,521 pounds, valued at $53,139. During the same year no raw cocoa was exported, but prepared cocoa and chocolate (quantity not given) to the value of $3,451,518 was sold abroad. Consult 'Cocoa Production and Trade' (Department of Commerce and Labor, Washington 1912); 'Cocoa Culture in the West Indies' (published by Agricultural Bureau of German Kali Works, Habana, n.d.); Commerce Reports, Bureau of Foreign and Domestic Commerce, Washington 1914-17.

W. B. GRAHAM.

COCOA-PLUM, the fruit of Chrysobalanus icaco, belonging to the family Rosaceae, is eaten in the West Indies. It is about the size of a plum, with a sweet and pleasant though somewhat austere pulp. The root, bark and leaves of the plant are employed as remedies in diarrhoea and other troubles. It has simple, alternate leaves and cymose flowers.

COCONUT, or COCOANUT, a palm tree (Cocos nucifera) probably native of tropical America, but widely distributed in warm countries throughout the world. The tree grows naturally on sandy shores bordering the sea or not far inland except where planted by man. It is remarkable as one of the first tree species to gain a foothold upon newly formed tropical islands. Its stem, which often attains a height of 100 feet, shows the growth of the Phyllophthora omnivora, both of which spread rapidly and destroy whole plantations. In addition, the cocoa beetle, a longicorn insect, is a destructive pest, boring into the trunk and branches of the tree.
followed by large hard-shelled nuts. Several of the spathes in various stages of development are usually found upon the trees, which often commence to bear when less than 10 years old and continue productive for more than half a century, yielding about 100 nuts as an annual crop.

Since the tree does not produce well when remote from the coast, it is planted along the shores upon sandy or shelly land where little else of value will grow. The seeds are the sole means of propagation. They are planted in rows in the nursery and when the seedlings are large enough they are transplanted about 20 feet apart, where they are to remain, given clean cultivation for three or four years, and then allowed to shift for themselves, occasional mulches of seaweed, etc., but no manure, being given. The only part of the United States in which the coconut palm bears fruit with reasonable certainty is the extreme south of Florida, but even there it has not become commercially important. It may be taken as an index of the dividing line between the tropical and subtropical regions, since it thrives best in regions where frost never comes.

This palm is one of the most important economic trees of the world. Its fruit is a staple food either ripe or unripe, raw or prepared in various ways, in many tropical countries. It is also exported to temperate climates, where the nuts are used in confectionery and for cake and dessert-making. The oil, of which there is about 70 per cent in the nuts, from which it is obtained by expression or heating in water, is largely used for making soap and candles and for food. (See COCONUT OIL.) The central part of the stems of young plants is used for food, as also is the terminal bud or "cabbage." A drink and a kind of sugar are made from the sap of the young spathes. The dried leaves are used for thatching, baskets, mats, etc., and the petioles for coir. The wood in the lower portions of the trunks of old trees is commercially important under the name of "porcupine wood," which is used in cabinet-making, etc. The fibrous centres of the nuts are used for cordage making, and is also the fibrous husk of the nuts (see Coir). This latter is widely used for making coconut-matting, which is put down in corridors where there is a great deal of trampling. It is exceedingly durable. The coconut shell is used for drinking cups and bottles, etc., and for ornament when carved and polished. The fibre of the husks is used by florists as a moisture-retaining medium in which to plunge potted plants and in which to propagate various seedlings and cuttings.

COCONUT CRAB. See ROBBER PALM.

COCONUT OIL, a solid, vegetable fat, largely used in candle making and in the manufacture of soaps and pomatum. This fat is expressed from the albumen of the coconut kernel, and is as white as lard, and somewhat firmer. From Manila and Ceylon large quantities are exported. (See COCONUT.)

COCON, kō-kōn', the pupa case of insects. See SILKWORMS; INSECTS; PUPA.

COCOS, a genus of palms. There are about 55 species, natives of South America, but cultivated for their fruits or for ornament in many warm countries. They vary considerably in height, but are all characterized by absence of spines, ridged trunks, pinnatisect leaves in a terminal crown or rosette, spadices erect at first, but later drooping, spathes two, flowers white or yellow, fruit of various forms. Some species are cultivated under glass on account of their graceful foliage. The most important species of the genus is unquestionably C. nucifera, the coco palm or coconut tree (see COCONUT). Of the other species the following are perhaps best known in the United States: C. flexuosa, a medium-sized Brazilian species often planted in southern Florida and southern California as a street tree and to some extent cultivated in northern greenhouses. C. eriospatha, a stouter, somewhat taller species from southern Brazil, is by some considered the hardiest of the genus and often planted along avenues in the region mentioned and in the West Indies. It is little cultivated under glass because of its rather coarse leaves. C. dactylifera, an Argentine species, found to be hardy in southern California as a street tree. It fruits but not freely, resembles those of the date palm. C. plumosa is the most generally cultivated street tree of the genus; it is of quick growth, soon reaching a height of 30 feet and, with age, 50 feet. It is a native of Ceylon and is a dwarf species from central Brazil, is unquestionably the most popular greenhouse palm, not only of the genus, but of all genera. Its foliage is small, delicate and graceful, and on this account it is frequently used as a table decoration. It is probably the most easily cultivated of the palms used in house decoration, and since it is of slow growth it retains its beauty for a considerable time, never becoming coarse or unattractive.

COCOS, or KEELING, ISLANDS, British India, a group of about 20 small coral islands, lying about 700 miles southwest of Sumatra and 1,200 miles southwest of Singapore, in the Straits Archipelago, being a little horseshoe-shaped cluster of isles lying south of Java at about the distance of a three days' sail by steamers. Estimated population in 1914 was 795. Census population (1911) 794. The inhabitants are divided between the Cocon natives and coolie laborers from Java. The islands have a romantic history. A Scotch sailor, John Cochrane, was here in 1825 and established himself as ruler; in 1851 he hoisted the British flag; but in 1857 the islands were formally annexed to Great Britain, and authority over them still remains in the hands of the Scotch sailor's descendants. An enlightened civil government is maintained; schools have been established; and industries connected with cocoanut and other products are carried on. In 1903, the islands were annexed to the settlement of Singapore in the Straits Settlements.

COCUM-BUTTER, or CUCUM-OIL, a pale, greenish-yellow solid oil obtained from the seeds of Garcinia purpurea, a tree of the same genus with mangosteen, used in India to adulterate ghee or fluid butter. It is used in some pharmaceutical preparations, in pomatum, etc. (See CUCUM.)

COCTYXUS (from Gr. kokys, to lament), a river of ancient Epirus which falls into the Acheron. Also, among the ancient Greeks, one of the rivers of the lower world.

COD, the typical representative (Gadus callarias or Gadus morhua) of a family (Gadi-
COD
dar, q.v.) of marine fishes of pre-eminent economic importance. Although most widely and generally known as the codfish, or simply cod, perhaps not less than 50 other names are applied to it more or less colloquially, many of them derived from the same root as cod. Not tied is moderately elongated, heavy in front, with a large head, and tapering gradually into a slender tail terminated by a slightly notched fin. There are three dorsal fins, none of which is elevated and two anal and the ventral fins are normal in structure and placed far forward on the throat. The mouth and eyes are large, and the chin bears a long barbel.Very small scales cover the entire body and most of the head. Although varying much in shade, the color is usually reddish-brown with small rounded spots of darker brown and a conspicuous pale lateral line. Unlike the haddock, all the bones of the shoulder girdle are thin and lamellar. There is much variation in size, some localities and schools always yielding large fish, others small or mixed. An average length is from three to four feet; and the weight from 7 to 40 pounds, but very much larger ones, several exceeding 100 pounds, and one of 160 pounds, have been recorded.

The cod is a cold water fish, preferring a temperature of from 35° to 45°. Whether there is more than a single species is doubtful, though it is well known to fishermen and ichthyologists that the Alaskan cod has much larger swimming-bladders than those of the Atlantic. The cod may be said to have a circumpolar distribution, ranging south in the Atlantic as far as the Bay of Biscay on the European side, and to Cape Hatteras on the American shore. In the Pacific it is abundant in the waters of Alaska and Bering Sea, and occurs on banks off the mouth of the Columbia River. The cod is sometimes found as far north as 80 degrees and probably beyond. Sometimes it enters fresh water, ascending rivers, as it formerly frequently did the Delaware, perhaps in pursuit of food. That any north-and-south migration takes place is doubtful, but seasonal migrations between deep and shallow waters, and irregular ones in search of food, are well known both on our coast and on those of Europe. Thus Professor Sars has described the so-called "mountains of fish" which annually approach the coast of Norway. North of Cape Cod the fish approach the shores during the summer, and retire, upon the approach of cold weather, to the deeper waters of the offshore banks, where they are followed by the Gloucester fishermen. On the shores of New Jersey and Virginia no cod are found except during the winter, the shallow waters becoming so warmed in summer that they are driven seaward to the cold Labrador current. Rocky and stony banks, where a rich fauna has congregated at moderate depths to about 120 fathoms, are the favorite resorts of the cod, but considerable numbers are taken down to 250 fathoms on the edges of the outer banks, and the trawl has brought up cod from a depth of 300 fathoms.

The cod devours everything of an animal nature that comes across its path, and the great dams are swallowed in their shells, and, after being digested, the hard parts are regurgitated in such numbers that the sea-bottom over large areas is said to be paved with them. Spawning takes place at moderate depths, but the buoyant eggs rise to the surface, where they float until hatched. On the European coasts the spawning season is in March and April, but with us during the winter. The fecundity of the codfish is truly astonishing, not less than 9,000,000 eggs having been estimated to be produced in a single year by a 75-pound fish, while 2,000,000 to 4,000,000 is the average yield of those of ordinary size. The eggs are small, about one-seventeenth of an inch in diameter, and, although buoyant, have no oil globule, as do many other pelagic eggs. They hatch in from 12 days to 3 weeks, and the young fry, which feed on small crustaceans, grow rapidly, becoming about two inches long in four months and about one foot at the end of a year, though the variation in size is very great. That there has been a great decrease in the numbers of cod frequenting the inshore banks is well known, and many suggestions have been made to account therefor. The late Professor Bullard connected it with the decrease in the number and size of the schools of herrings, a favorite food of the cod, itself due to the building of dams and other obstructions which have prevented their entrance into the rivers for spawning purposes. To attempt to overcome this condition the United States Fish Commission has been engaged for several years in collecting and hatching enormous numbers of cod eggs at its Gloucester and Woods Hole stations, with every promise of a considerable degree of ultimate success. During a recent winter, the last season for which statistics are available, no less than 338,000,000 cod eggs were thus handled.

Next to the herring, the cod is the world's most important economic fish. During 1901 the aggregate value of the fresh and salt cod landed at Gloucester and Boston, the two largest shipping points, was nearly $3,000,000, and the total annual value of the cod-fisheries of both sides of the North Atlantic is about $22,000,000.

Some idea of the magnitude of the cod-fishing industry may be gathered from the fact that out of a total population in Newfoundland of 220,000, more than half that number gains its livelihood and on those of Europe. Thus Professor Sars has described the so-called "mountains of fish" which annually approach the coast of Norway. North of Cape Cod the fish approach the shores during the summer, and retire, upon the approach of cold weather, to the deeper waters of the offshore banks, where they are followed by the Gloucester fishermen. On the shores of New Jersey and Virginia no cod are found except during the winter, the shallow waters becoming so warmed in summer that they are driven seaward to the cold Labrador current. Rocky and stony banks, where a rich fauna has congregated at moderate depths to about 120 fathoms, are the favorite resorts of the cod, but considerable numbers are taken down to 250 fathoms on the edges of the outer banks, and the trawl has brought up cod from a depth of 300 fathoms.

The cod devours everything of an animal nature that comes across its path, and the great dams are swallowed in their shells, and, after being digested, the hard parts are regurgitated in such numbers that the sea-bottom over large areas is said to be paved with them. Spawning takes
must be deemed to mean codfish, which, in the northern and southern coast settlements, is so often used as an equivalent of money as to be called ‘Newfoundland currency.’ It is measured by the quintal of 112 pounds, and in this form pays for food, clothing and medicines, as well as fees for physicians, the clergyman and the lawyer. The fish ‘flakes’ (see below) are so numerous in all the towns, that it would be impossible to guard their contents; so string nt laws have been passed to prevent theft, and the act and a chief is frequently sentenced to several years’ imprisonment, though he may take but a single fish.

While Newfoundland craft are to be seen in numbers upon the Grand Banks, during the last few years the crews have confined their operations largely to the waters in the vicinity of the island. Although the cod are somewhat smaller, they are fully as numerous and of excellent quality, while in a good season fish weighing 10 or 12 pounds are frequently caught. The vessels range in size from the schooner, 125 feet long and over 100 tons burden, to the sailboat manned by two men, who cast their lines or set their nets under the lee of the rocky cliffs, or on the shores of the little bays, that are formed from land, for schools of fish are to be found in proximity to the coast as well as 100 miles away from it, depending largely upon the course of the Labrador current, which furnishes the promise for many of the larger vessels are schooner-rigged, and usually carry two jibs, a mainsail, foresail and main topsail, with sometimes a small jigger extending over the stern, and staysail rigged between the two masts. In addition, they carry a triangular riding-sail to assist in steadying them when at anchor. The larger ones are manned by from 15 to 30 men, provided with lines for deck-fishing as well as with set lines and trap-nets. Each carries its complement of boats. On arriving at a fishing-ground, a part of the crew throw their lines over from the deck, while others bait and put out the set-lines and the trap-nets from the smaller boats, and visit them at intervals to gather the fish, which are taken to the ‘skeg’ and then hauled aboard, taken up as packed in the hold until the ‘fare’ is completed. The captain usually keeps his boat anchored as long as the school which has been ‘struck’ remains. The fish may stay on one feeding-ground for four or five days, or perhaps disappear in four or five hours after the vessel has cast anchor. Then the set-lines and nets are taken up, the vessel weighs anchor, and search for another school begins.

In offshore fishing the trap-net is also used in addition to set-lines, and the larger boats occasionally use hand-lines, if the fish bite freely. A very large catch is made, with the set-lines and nets, and the boatmen go out every morning to take out the fish and bait the hooks, perhaps paying another visit in the evening. Upon the return of the men to the home settlement with their boatload of fish, the women and children join them in cleaning the fare, or ‘flakes,’ and drying. At times the fishing is so good that the men make three and four trips daily to the nets and lines, carrying home a good load on each trip. Then the women and children prepare the fish in order to save time.

The time required to cure the codfish varies from 4 to 10 days according to the weather. With a succession of sunny days, the fare will be thoroughly cured in less than a week, but the fish must be protected against rainy weather, in spite of the salt with which they are rubbed after being cleaned.

The ‘flakes’ are composed of platforms of boughs elevated from 6 to 10 feet above the ground upon scaffolding; and the fish are laid upon the boughs so closely together that at the distance the ‘flakes’ look as if they were covered with pieces of white canvas. Each fish is turned over at least once every 24 hours, in order to cure both sides thoroughly; and when the process is completed the fish is as stiff as a piece of board. No other ingredient except salt is required for the ordinary curing, although some of the cod prepared at the larger settlements are ground into fine particles after being dried, and mixed with a jam made of small berries. This is placed in jars and sold as a preventative of scurvy. The fares secured by the larger vessels remain in their holds until the cargo is completed. On arrival at Saint Johns, or the home port, the cargoes are sold, in a partly cured condition, to the merchants, who finish the curing. The fish are sold by the pound, the larger vessels selling at the greater price. The merchant, as he is known in Newfoundland, is the large dealer who exports the fish to the tropics and Europe. He buys from both the fishermen and the ‘planters.’ The latter are a sort of middlemen, and usually have ‘stations’ located at different points along the coast. These stations include general stores containing everything required by the fishermen. The people in the vicinity can go to the station and exchange their harvest for what they need at home and the outfit required for fishing, and, if anything is left to their credit, can obtain its equivalent in money. Many of them, however, are usually in debt to the planter, and, in a good year, the surplus remaining after obligations of that nature goes in payment of the debt of a previous season. The planters also buy schooner loads, and many of them own steamers and sailing vessels which make regular trips around the island, carrying the fish purchased by the planter to the general market at Saint Johns or one of the other large towns.

While the number of cod caught varies considerably according to the season, the average catch is from 1,250,000 to 1,700,000 quintals, the value, of course, depending on the price. Within the last two or three years the revenue from this source has aggregated about $3,000,000. The number of crews engaged in codfishing can only be estimated, owing to the variety of craft and the wide field of their operations. Authorities on the subject, however, estimate that fully 90,000 men are engaged in the fishery each year, and that a fleet of fully 1,000 two-masted vessels, sailing from the island alone, ply upon the nearby waters and on the Grand Banks. Practically all of these vessels are home-made, the wood for both hulls and spars being secured from forests in the interior, while the sails and rigging are imported chiefly from England. For a full account of the natural history of the
Cод-жир — это жир (oleum morrhue), полученный из печени коровы (Codius callarias) и других видов. В медицине он используется в качестве источника жира, особенно при дефиците жировых веществ, на долю которого приходится более 70% жировой массы. Этот жир используется при болезнях, например, при ожирении, и при лечении некоторых заболеваний.

COOZ, kò-dà’sé, Agostino, Italian engineer. b. near Ferrara 1792; d. Colombia, June 1859. He made several campaigns under Napoleon and afterward distinguished himself as an engineer in South America. He entered the Colombian service with the rank of lieutenant-colonel of artillery, and was employed in making charts and in preparing plans of defense. In 1831 he was appointed by Paez to prepare partial charts of the new republic of Venezuela. This work occupied nearly nine years, and was twice interrupted by military defensive expeditions, in which Codazzi took part. He was rewarded with the rank of colonel. He devoted the years 1838-39 to exploring the wilderness of Guiana and penetrating nearly to the sources of the Orinoco. The important additions to geography which were obtained from this expedition induced the Congress of Venezuela to furnish him means to make public the result of his labors. For this purpose he went to Paris, where his work appeared in 1841, entitled 'Resumen de la geografia de Venezuela' accompanied by an extensive chart of Venezuela. Codazzi afterward established a German colony in Venezuela. In 1848 he was employed by the government of Colombia in a topographical survey of that country and made surveys of the Isthmus of Panama.

COWDEN, William, New England colonist: b. Boston, Lincolnshire, England; d. Rhode Island, 1 Nov. 1678. He was one of the founders of the colony of Rhode Island. He arrived in Massachusetts in 1630, but not being able to agree with the authorities of the colony, he removed in 1638 to Aquidneck, or Rhode Island, where he founded a colony to be governed "by the laws of the Lord Jesus Christ." It was soon found necessary to abandon this vague scheme and in 1640 he himself was chosen governor and in 1647 aided in the formation of a regular body of laws. In 1649 he went to England and two years later was made governor of Aquidneck and Conanicut for life. His opponent succeeded in having him impeached and he was released and became a Quaker in 1666. He resumed his governorship in 1674. He published 'Demonstration of True Love unto the Rulers of Massachusetts' (1674). Consult 'William Coddington in Rhode Island Colonial Affairs' (No. 4 of the Rhode Island Historical Tracts, Providence 1878). He was unable to secure the reception of Rhode Island into the colonial confederacy. In 1674 and 1675 he was again elected governor.

CODE, a term now generally confined to jurisprudence, and used to designate a systematic compilation of law authorized by governmental authority to take the place of prior existing law. It is in this sense applied to the codes of Theodosius, Justinian and Napoleon. The word is used more generally in the United States as applied to a concise, comprehensive, systematic formation and re-enactment of the law, deduced from both its principal sources, the pre-existing statutes and the adjudications of courts as distinguished from compilation of statute law only. Codes such as here described have been adopted and are in use in many States. They are, in the most part, modeled upon the Code of Civil Procedure of New York. The purpose of a code is to simplify methods of legal procedure and to model and bring together, whether in a consolidated form or in the confused mass of laws, contradictions, repetitions and disorder which have grown up during a long period of time. Such a codification of law has always been deemed a most difficult task, and though many times agitated in England, it has never been earnestly undertaken, and is not likely to be for some time. The same causes which made such a codification necessary in the time of the Emperor Justinian exist to-day in many countries and in most of the States of the United States. While the Corpus Juris Civilis of Justinian's commission of 10 learned civilians, was the most important and complete of ancient codes up to that time, there had been other compilations under the empire. These compilations had been made by private lawyers, and formed the basis of the "Codex Gregorianus et Hermogenianus," which in turn were the models for the Imperial codes of Theodosius and Justinian.

The Codex Theodosianus was the work of a commission of 16, to whom, in 435 A.D., the Emperor Theodosius entrusted the task of collecting the edicts and constitutions. Published in 438 A.D., it was a work of great importance, and formed the masterpiece on which every later code was based. It was the initiative of a digest of the whole Roman law. In 528 the Emperor Justinian ordered a new collection to be made, and for this purpose appointed 10 commissioners with full power to make such changes and emendations as seemed necessary. But language of the constitution. They were authorized in their compilation to use the codes. Gregorian, Hermogenian and Theodosian and the constitutions, with the understanding that the new code was to supersede the sources from which it had been compiled. The Code us-
tinian was completed within 14 months, and was subsequently revised to take in new decisions and constitutions of the emperor. The original code was lost. The revised one, which has been preserved, was published in 534. It is divided into 12 books and each book into titles. The Civil Code of France, in force at the present day, takes its name from the great Napoleon. It was undertaken under the consulship of Napoleon I by the most eminent jurists of France, and was published in 1804. It is the most celebrated of modern codes. The Code Napoléon (under which name four other codes of commercial law, criminal law, penal law and the law of procedure, drawn up at the same time, are often included) was a code in the fullest and strictest meaning of the word, in that it was not merely a collection of the law, but was a complete and thorough statement of the law. The need of a codification of the laws of France had been urged by eminent jurists and statesmen for some time before Napoleon took the matter up and carried it through. Previous to the adoption of the Code Napoléon there had been some partial codes in France; such as the Code Henri, made by Brisson in the reign of Henry III, the Code Louis XIV, made by Chaussepierre, the ordinances from 1722 to 1740. There were several of these ordinances enacted in the reign of Louis XV. The Code Napoléon was made to bring about a codification of the confused condition of the laws of France for the purpose of shaping them into a homogeneous jurisprudence until the Revolution had cleared the way. By the consular decree, 12 Aug. 1800, a commission was constituted to compare the order which had been followed in the preparation of the projects for a civil code hitherto published, to determine the plan which the commissioners should think best to adopt, and to discuss the chief principles of civil legislation. Napoleon, on becoming consul, appointed a commission headed by M. Tronchet, and including Portalis, Bigot de Préameneu and Maleville, to review all previous efforts at codification and to draw up a new code. 800 commissioners reported a draft for a civil code, which was submitted to the Court of Cassation and other courts of appeal, and with the reports of the judges was finally brought before the Council of State, in which Napoleon (then first consul) presided in person and took part in the discussion as to the terms and scope of the code. The whole revision after much debate was finally adopted under the title of Les Cinquième Codex, consisting of the Civil Code, distinguished by the name Code Napoléon, the Code of Criminal Procedure, Penal Code, the Code of Civil Procedure and the Code of Commerce. The entire work was first published under the title Code Civil de France, but Napoleon subsequently had it published as the Code Napoléon, as he considered the code one of the crowning glories of his reign. The Code Napoléon consists of 28,800 articles. It has been said of this code that it is the product of Roman and customary law, together with the ordinances of the kings and the laws of the Revolution. Although political upheavals have caused some changes and modifications, the code remains virtually the same as when it left the hands of its framers. The extent of its influence upon the laws of other countries has been very great, as it formed the basis of the codes of the two Sicilies (1819), the Netherlands in 1837, the Swiss cantons from 1819 to 1855, Bolivia in 1843 and the Civil Code of the State of Louisiana.

Code Frédéric.—This is a revision of the Prussian laws, published by Frederick the Great 1749–51, and revised after 1780, but not in force until 1794, modernized. It is made up of various ancient laws, to obviate the difficulties of the Roman codes, the disputes of the commentators and the contradictions between Roman and German law. It has been subjected to many changes.

Codes in the United States.—The first important experiment with a code in the United States was made in Louisiana, which State, originally a French colony, afterward ceded to Spain, again returned to France, and subsequently acquired by the United States from France, has had many changes of law. After the United States acquired Louisiana there arose a strong demand for a code, owing to the great confusion of laws. In 1806–08 a code was adopted, but on the strength of the ancient laws when they conflicted with it. A complete civil code was adopted for the State in 1824, which had for its basis the Code Napoléon, although some provisions of the common law were injected into it.

The most important code ever undertaken in the United States is the one which was prepared for the State of New York many years ago under the guidance and supervision of David Dudley Field. This code, although published, and having formed the foundation for many of the codes adopted by the various States, was never accepted by the legislature of New York. As early as 1839 David Dudley Field advocated and urged the adoption of a code by that State. The revised constitution of New York (1846) ordered the appointment of two commissions: one to reduce into a system the whole law of the State, the other to revise and simplify the rules of pleading. Both commissions were appointed by the legislature in 1847. The commissioners to revise and simplify pleadings and practice made a report on 27 Feb. 1848, which contained an incomplete code of civil procedure and practice in the courts of record. This report was immediately adopted by the legislature, but the complete codes of civil and criminal procedure were never adopted. On 6 April 1857 the legislature created a new commission to prepare codes. The commissioners named were David Dudley Field, William Curtis Noyes and Alexander W. Bradford. After some eight years they reported a code — or rather three codes — which was never adopted, although reported favorably by the committees of several legislatures.

The code of civil procedure of the David Dudley Field commission formed the foundation, and was largely adopted in the codes of Ohio, Indiana, Missouri, Wisconsin, Iowa, Minnesota, Kansas, Nebraska, Nevada, California, Oregon, North Carolina, South Carolina, Washington, Montana, Alabama, the Dakotas, Wyoming, Utah and Arizona, and it is the basis of the present codes of civil and criminal procedure in the State of New York, which
are codes of practice and pleading, as distinguished from a code of substantive law. The principal feature of the Code of Civil Procedure as adopted by these States was the fusion of law and equity and the simplifying of the written pleadings.

LEWIS P. CLOVER.

CODE, International. A code of international law was published in 1910 by the International Code Publishing Company of New York, having the unusual page arrangement of parallel statements in three languages—English, French and Italian. The author is Jerome Internoscia of Montreal, a member of the bar of the province of Quebec, Canada.

For the ideas and rules which the work contains, Mr. Internoscia acknowledges his indebtedness to the laws, treaties and treatises that have been published in the three languages. By law of law, the Law of Nations, the International Law, which includes in itself all the other laws of mankind, he believes that the principles of the present international law are faulty, because they declare illegal the doing of anything that tends to improve the municipal law of nations. He believes that international law, as it is, disregards the fundamental principle of every sound law, namely, that there must be an authority to judge who is right and who is wrong. It does so because of the mistaken idea that, to be independent, a state must have nobody to judge its actions, although it may have many neighbors who for selfish ends deem themselves free to regard as wrong its good actions and, for that reason only, make war upon, and destroy or annex it. To become what it should be, the author contends, international law must be remodelled after the type of a perfect municipal law and attain the perfection of the law of nature. As in nature there is a supreme authority or force, so nations must have a supreme authority or force that will compel the different states to observe the law. The question, therefore, which the author propounds and aims to answer in this work is whether nations can and should create a supreme authority to enforce international law. His answer is that they can.

The ideal of peace, he finds in the aspiration toward a new organization of the Community of States, an organization in which all the controversies between state and state must, without exception, be solved by judicial means provided for that purpose—namely, an adequate body of laws, magistrates to apply them, punishments for infringers and a regular force sufficient to inflict the punishment that any state may incur.

About one-third of Mr. Internoscia's 'Code' contains innovations. First and most important of these is the abolition of war, which is replaced by the forced execution of judgments and, therefore, by an International Procedure, which, while having a scientific basis, he deems complete and eminently practical.

The first part of this 'Code,' treating of public international law, fixes the rights that states must recognize and respect and even protect in such a manner that the extent every nation expects its own citizens to do their duty in order to secure peace and happiness for all. A very marked change in the field of international criminal law is a crusade against capital punishment and against crime in general. This 'Code' is opposed to capital punishment, as it is to war, because these are nothing better than murder and manslaughter, permitted by some temporary law. Mr. Internoscia argues that no man can give back his body, so no law can give to a person the right to take away the life of another.

This 'Code' does not suggest the creation of a worldwide empire, or a confederation of all nations, because, in that condition would be free, and the central power would treat, not as belligerents but as rebels, the inhabitants of any portion who might fight for freedom of action.

The second part of this 'Code' is intended to solve all possible conflicts of the different laws, by fixing rules that are most reasonable and practicable. This part is divided into two books, the first for conflicts in civil law and the second for conflicts in commercial law. All questions of procedure and of jurisdiction—formalities, proof, judgment and executions—are treated in the third part of the 'Code.'

This is the largest code ever written. Most interesting and fundamental is the author's proposed system of courts of international jurisdic-tion. The novelty of their organization lies in the fact that they are adjuncts or offshoots of one great international tribunal. The judges of such courts are at the same time the clerks, under-secretaries, secretaries, judges and counsel of the international representatives who will constitute an international assembly, which will be the highest international legislature and court.

CODE OF KHAMMURABI. See HAMMURABI, CODE OF.

CODE NAPOLEON. See CODE.

CODEINE. CODEIN, CODEINA, or CODEIA (Gr. κώδεια, "poppy-head"), a vegetable alkaloid closely allied to morphine and constituting about 0.5 per cent of the weight of opium. Codeine has the formula C₁₇H₂₁NO₃, and is known to the chemist as methylmorphine, since it is derived from morphine by substituting methyl (CH₃) for one atom of the hydrogen that codeine may be prepared by adding calcium chloride to an aqueous extract of opium and evaporating to the point of crystallization. The hydrochlorides of morphine and codeine which are obtained in this manner are dissolved in water, and the morphine is precipitated by the addition of ammonia. Codeine hydrochloride remains in solution and may be obtained by evaporation and crystallization, and further purified by recrystallization from ether. Codeine acts as a strong base, and its solution reddens litmus paper, neutralizes acids and precipitates solutions of lead, iron and copper. From aqueous solution it is deposited in the form of tritmetic crystals, as indicated by the formula given above. Crystals free from water may be obtained by deposition from a solution in carbon disulphide. When treated with strong sulphuric acid and a small quantity of ferric chloride (FeCl₃), codeine compounds give an intense blue color. This reaction is of great value in testing for the presence of the alkaloid.

Codeine is used in medicine as a narcotic and hypnotic. Its properties are very similar to those of morphine, but by reason of the methyl
groups introduced it has more action on the spinal cord than morphine has. It thus does not cause sleep or relieve pain as readily as morphine, and causes more reflex excitability. It may even cause convulsions in children. It is valuable where a milder sedative than morphine is desired, as there is less euphoria produced and less likelihood of forming a habit. Its use is not free from danger, however, and very small doses have been known to prove fatal.

CODEX, with the ancients, the trunk of a tree stripped of the bark. Before the invention of paper, wooden tablets covered with wax, which were written on with the style and put together in the shape of a book, were called codex. The word was afterward retained, in times when paper was used for writing, to denote a large book. This important work, particularly old manuscripts of poets, historians, etc., which had been preserved, were called codices manuscripti. In like manner a collection of laws was called codex, with the adjective that bore the name of the sovereign under whom, or of the person by whom, it had been compiled, as Codex Gregorianus, Codex Theo- dosianus, Codex Carolinus. Codex rescriptus (Latin, a rewritten codex) is the name given to ancient manuscripts, which, in the Middle Ages, were used, after the original writing had been in a great measure effaced, for the copying of other works, generally ecclesiastical treatises. Thus the 'Institutions of Gaius,' discovered by Niebuhr at Verona in 1816, and published by Codex in 1821, is a codex rescriptus. Some skill is required to read the ancient letters under the others. The Greek name for codex rescriptus is palimpsest, now more frequently used. The biblical writings themselves have been sometimes effaced to make way for homilies and legends. One of the oldest manuscripts of the New Testament, designated by the letter C, is a codex rescriptus, on which the works of Ephraem Syrus have been written. (See Book; Bible; Palaeography; Palimpsest; Consult Scrivener, F. H. A., 'Introduction to the Textual Criticism of the New Testament' (London 1894); Gregory, 'Textkritik des neuen Testaments' (Leipzig 1900); Birt, 'Das antike Buchwesen.' Wattenbach, 'Paläographie' (Leipzig 1877-78).

CODEX ARGENTEUS. See Gothic Literature.

CODEX SINAITICUS, si-nā-its’-kōs, a very ancient and valuable manuscript of the Greek Septuagint version of the Old Testament (including the Apocrypha), the whole of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas, discovered in the monastery of Saint Catherine, on Mount Sinai, by the German scholar Tischendorf, 4 Feb. 1859, while traveling in the East by the desire of the Tsar Alexander II. When the discovery was made Tischendorf endeavored to persuade the monks to make a present of the manuscript to the Tsar, and although he was not immediately successful, he was allowed to take it to Saint Petersburg on loan. Ultimately, in 1889, the manuscript was formally presented to the Tsar. In 1859 Tischendorf published an account of the manuscript was published by the discoverer at Leipzig. It is written on parchment in four columns, in early uncial characters, and bears every mark of possessing great antiquity, perhaps being even older than the Vatican manuscript, which, before the discovery of the Sinaitic manuscript, was recognized as the oldest known manuscript of the Old and New Testaments. It is assigned by Tischendorf himself to the second half of the Old Testament in this manuscript is defective, but the New Testament is complete, not a word being wanting, which is the more remarkable, inasmuch as it is the only manuscript of the New Testament which is complete. From this circumstance, as well as from its great age, it acquires a value in relation to the text of the New Testament, which can scarcely be overestimated. Two gaps in the Old Testament part of the manuscript are curiously supplied by another manuscript which Tischendorf had discovered in the same monastery in 1844, and which he had brought to Germany and named Codex Friderico-Augustonius, in honor of the king of Saxony. From this coincidence, as well as the general resemblance of the two manuscripts, it is inferred that the last-named manuscript is really a part of the Codex Sinaiticus, which is generally believed to be the case. A splendid facsimile of the manuscript was published by Tischendorf under the patronage of the Tsar at Saint Petersburg, in four volumes folio, toward the end of 1862. This was followed in 1863-64 by two smaller editions of the New Testament part of it.

CODEX VATICANUS. See Bible.

CODICIL, an addition to, qualification of or change in a will. It must be in the same form as a will, and be executed and the same formalities. All the laws applying to wills apply to a codicil. A codicil properly executed is a republication of the will and makes the will speak from the date of the codicil. The will and codicil are read together as one instrument. There may be more than one codicil to a will; and where there are several, if the last one is properly executed, referring to a former paper in such a manner as to identify it, that paper, although not properly executed, may be read into the will. See Will.

CODMAN, John, American sea-captain and miscellaneous writer: b. Dorchester, Mass., 1814; d. Boston, 6 April 1900. He was the author of 'Sailor's Life and Sailor's Yarns' (1847); 'The Mormon Country' (1876); 'Round Trip by Way of Panama, etc.' (1879); 'Winter Sketches from the Saddle' (1888).

CODOGNO, kō-dôn’yō, Italy, a town in a fertile district between the Po and Adda, 15 miles southeast of Lodi. It has a large trade in Parmesan cheese and wheat, and carries on a number of manufactures. The French defeated the Austrians here in 1796. Pop. 10,033.

CODRINGTON, Sir Edward, English admiral: b. 27 April 1770; d. London, 28 April 1851. He entered the navy in 1789 and became captain in 1794. He served at the battle of Trafalgar, took part in the Walcheren expedition and was afterward actively employed both in the Peninsular War and the War of 1812. In 1825 he became vice-admiral. His name is principally famous in connection with the battle of Navarino, where he commanded the united squadrons that overthrew the Turkish fleet in 1827.
CODRINGTON, Sir William John, English military officer: b. 1804; d. 1884. He entered the army in 1821, commanded a brigade at the Alma and at Inkerman in the Crimean War, and in 1855 succeeded Sir James Simpson as commander-in-chief in the Crimea. He was elected to Parliament in 1857, was governor of Cape Colony in 1859-65, having reached the rank of general in 1863.

CODRUS, the 17th and last king of Athens. Tradition tells that during his reign Attica was attacked by the Dorian, or, according to some, by the inhabitants of the Peloponnesus, or the Thracians. The assails were so great that they retired without striking a blow. In honor of their patriotic monarch the Athenians abolished the royal dignity, substituting that of a responsible archon, esteeming no one worthy to be the successor of Codrus. They also used his name as a common term to express a man of distinguished excellence.

CODY, Henry John, Canadian preacher and educator: b. Embro, Ontario, 6 Dec. 1868. He was educated at Galt Collegiate Institute and Toronto University, where he graduated in 1889. He was ordained deacon in 1893 and priest the following year. After teaching in Ridley College, Saint Catharines, he became professor of Old Testament Exegesis and church history, Wycliffe College, Toronto, 1894-99, and afterward professor of systematic theology; was acting rector of Saint Paul’s Church, Toronto, 1899-1907, after which date he became rector. He became a canon of Saint Alban’s Cathedral, Toronto, in 1903, was an unsuccessful candidate for the bishopric of Toronto in 1909, and in the same year was appointed archdeacon of York. He was one of the founders of Havergal Ladies’ College, Toronto. Possessed of exceptional pulpit gifts and of wide learning, he is one of the outstanding men in the Low Church or evangelical school in his communion.

CODY, William Frederick, American scout, hunter and showman, best known as “Buffalo Bill”: b. Scott County, Iowa, 26 Feb. 1846; d. Denver, Colo., 10 Jan. 1917. His parents moved to the country about Fort Leavenworth, Kan., where in 1856 the father was stabbed by a white man, named Dunn, for expressing his hatred of slavery. The father never quite recovered from his wound and died in 1857. When still very young he was employed by the express companies as a rider to carry packages and valuables on horseback across the country, a most dangerous occupation. Soon he became known as a fearless and perfect rider, a keen scout, a reliable plainsman and hunter. When but little over 21 he attracted the notice of United States army officers, who were constantly in need of expert scouts who could be depended upon and who knew the habits and language of the red man. In 1868-69 he was made chief of scouts by General Sheridan, engaged in trapping and raiding the hostiles. Colonel John Schuyler Crosby, then adjutant under Sheridan, says of Cody:

“He carried despatches 100 miles for General Sheridan through terrific fire of hostile bands of Indians and returned with replies safely.”

This and his many personal encounters with the Indians, in some of which he saved the day for the troops, made him a noted man. He was the last of the six great scouts of America—Boone, Crockett, Carson, Bridger, “Wild Bill,” “Buffalo Bill.” He gained his name from his dexterity as a hunter, his record being 4,862 buffalo in one season—69 in one day. He continued actively engaged in frontier work for many years, killing the Cheyenne chief, “Yellow Hand,” in a celebrated personal encounter during the Sioux War of 1876. Early in the eighties he began the carrying out of a cherished idea—to gather about him some of the remaining elements which went to make up a frontier life and exhibit this unique existence in the Eastern States and in Europe. He accomplished this end, forming the exhibition called the “Wild West,” now known the world over. In this he gathered scores of Indians, some of whom were once his mortal foes; hundreds of “cow-boys”; the old “Deadwood coach,” used so many years to carry mail and passengers, and much other really valuable material. With this gigantic show he toured America and Europe for nearly 20 years, amassing a fortune which he invested in lands in Nebraska and Wyoming. In the latter State is a town named after him, on his land. In 1901 he became president of “The Cody Military College and International Academy of Rough Riders,” a school on his property in Wyoming where young men may learn to ride and become masters of themselves and their horses—a postgraduate school in manhood, as he termed it. In 1872 he was elected to the Nebraska legislature, later became judge-advocate-general of the Wyoming National Guard. On 3 June 1917 a last tribute was paid to the memory of “Buffalo Bill” by a vast assembly, when the body of the famous scout was placed in a vault blasted from solid rock on the top of Lookout Mountain, 20 miles from Denver. The vault was written “The Great Salt Lake Trail”; and is author of “The Life of Hon. William F. Cody” (1879); “Story of the Wild West and Campfire Chats” (1888); “The Adventures of Buffalo Bill” (1904); “True Tales of the Plains” (1908).

CODY, Wyo., village and county-seat of Park County, situated on the Shoshone River at the northwest terminus of the Chicago, Burlington and Quincy Railroad. It takes its name from its founder, Col. W. F. Cody (Buffalo Bill) and was incorporated in 1870. It is at the eastern entrance to Yellowstone Park, with which it is connected by a boulevard of 55 miles. Farming by irrigation and cattle and stock raising are the chief industries of the section. The town is well known to tourists. Pop. about 1,800.

COE, Edward Benton, American clergyman: b. Milford, Conn., 11 June 1842; d. New York, N. Y.; M. I. service; served at Yale 1862, studied at Union Theological Seminary 1862-63 and in France and Germany 1864-
67. From 1864 to 1879 he was Street professor of modern languages at Yale, and on 2 Oct. 1879 was ordained by the Classis of New York as one of the ministers of the Collegiate Reformed Dutch Church. He was pastor of the Fifth Avenue and West 48th Street Church till January 1899, when he became one of the two ministers without charge of a specific congregation. He published a number of sermons and a volume entitled 'Life Indeed' (1899).

COE, George Albert, American educator: b. Monroe County, N. Y., 26 March 1862. He was graduated at the University of Rochester in 1884; studied theology at Boston University and in Berlin; was professor of philosophy in the University of Southern California 1888-93; and Evans professor of philosophy in Northwestern University 1893-1909. Since 1919 he has been professor of practical theology in Union Theological Seminary, New York. He is a member of the Religious Education Society of America and was its president in 1909-10. He is the author of 'The Spiritual Life: Studies in the Science of Religion' (1901); 'The Religion of a Mature Mind' (1902); 'Education in Religion and Morals' (1904), and contributions to various philosophical and theological magazines.

COE, Wesley Roswell, American biologist: b. Middlefield, Conn., 11 Nov. 1869. He was educated at the Connecticut Agricultural College and at the Sheffield Scientific School of Yale University and at the universities of Würzburg and Naples. In 1892-95 he was assistant in biology at the Sheffield Scientific School, in 1896-1902 instructor, in 1902-06 assistant professor of comparative anatomy, and in 1909 professor of biology at Yale University. He accompanied the Harriman expedition to Alaska in 1899. He has published 'The Nemerteans' (1901), 'The Nemerteans of Porto Rico' (1901), 'The Nemerteans of the Hawaiian Islands' (1906), 'Echinoderms of Connecticut' (1912).

COEDUCATION, an educational institution for both sexes, located at Cedar Rapids, Iowa. It was organized in 1881, under the auspices of the Presbyterian Church, and reported at the end of 1915 that it had 55 professors and instructors, 738 students and 12,300 volumes in the library.

Cæcilian, or Cæcilian, sē-sil'yān, limbless amphibians, constituting a family, Cæcididae or Cæciliidae, and an order Apoda or Gymnophiona. They are remarkable for the entire absence of limbs, even the internal limb girdles having disappeared, and the bony roof to the temporal region of the skull. In the latter feature they simulate the extinct Stegocéphali, to which some zoologists believe them to be rather closely related, though the temporal roof is formed by different bones. The form is worm-like, and, notwithstanding that the number of vertebrae may exceed 200, the tail is very short. A series of annular scales, somewhat embedded in the skin, protect the body externally, and as a further adaptation to their burrowing habits the eyes are rendered nearly or quite useless by being buried beneath the skin, the depth of their position being compensated by the presence of a pair of nearly unique retractive sensory tentacles.

Some species are viviparous, others oviparous. In the case of the latter the female coils about the eggs and protects them until hatched. The young of many are noteworthy in the possession of external gills, while the respiration of the adults is pulmonary. Their food consists principally of earthworms and subterranean insect larvae.

Dr. Boulenger recognizes 17 genera and 40 species, but probably many remain undiscovered. None have been found except in a zone encircling the earth, chiefly within the limits of the tropics; South and Central American species are numerous; but none are certainly known from North America. Consult Boulenger, 'Proceedings of the Zoological Society of London' (1895); Sarasin, 'Forschungen auf Ceylon' (Vol. II, 1887-90).

COEDUCATION, a term meaning joint education, has come to be specifically applied to the instruction of both sexes as a single body in the same classes of the same educational institutions. Coeducation was first tried on a large scale in the United States and has reached its fullest development there. Indeed until recently it has been regarded as a peculiarly American system of education, but its economy and simplicity, and the difficulty of providing equal educational opportunities for girls by any other method, have led other countries, especially within the last decade, to adopt coeducation in some form or other. This tendency may be expected to show itself more clearly after the close of the great war. The general shortage of men, including of course men teachers, will create a demand for the training of women to fill their vacant places that cannot be resisted by boards of public education. Also the many countries which have recently adopted (or which will soon adopt) woman suffrage will be compelled by the pressure of public opinion backed by women's votes either to open their elementary and secondary schools and universities to girls, or to maintain at almost prohibitive cost equally good separate secondary schools and universities for girls. The impracticability of duplicating higher education have already brought about the admission of women to colleges and universities not only in the United States but elsewhere, and will undoubtedly make the secondary schools, and later the other countries coeducational as soon as the necessity of educating women is seriously faced.

In Great Britain all Scottish universities are frankly coeducational; all the newer English and Welsh universities are coeducational, such as London, Liverpool, Manchester, Birmingham, Sheffield, Leeds, Durham, Bristol, and the University of Wales. Oxford and Cambridge open their lectures and examinations, but not their degrees, to women, and various privately supported women's colleges in their immediate neighborhood prepare women for their examinations, but this last discrimination against women may be expected to disappear now that the votes of British women will directly influence grants to higher education. In Ireland, the National University of Ireland, the colleges of Dublin, Cork, Galway, and Queen's University, Belfast, are coeducational, and even Trinity College of the Catholic University of Dublin admits women to all lectures except those in divinity, engineering, and anatomy. All the universities of South Africa are co-educational. The four universities of India give
degrees and open many of their classes to women. In general it may be said that all British and colonial universities, except Oxford and Cambridge and a few native colleges and divinity schools, are open to women on the same terms as men. But with the exception of the elementary schools in Scotland which are coeducational, state-supported primary and secondary education in Great Britain is still conducted separately for boys and girls. Only small village board schools not attended by sufficient children to form two classes and a few experimental private schools are coeducational. But it is safe to predict that the whole question will be taken up afresh after the war and in all probability solved in the American way in as far as state-supported secondary schools are concerned. Coeducation is the prevailing system in the public schools and universities of the Dominion of Canada and Nova Scotia and New Brunswick, the only exception to university coeducation being the Catholic University of Ottawa. The same is true in the Commonwealth of Australia, New Zealand, Denmark, and Finland. In Norway women are admitted to the universities and coeducation is being extended to some of the "people's high schools." In all other civilized European countries, France, Italy, Spain, Sweden, Belgium, Holland, Switzerland, Greece, Germany, and Austria-Hungary, all the universities are open to women, except from a few unimportant exceptions such as theological and technical departments where few, if any, women wish to study. Before the Revolution, Russian universities were closed to women, but separate women's courses were maintained by the government in Petrograd and Moscow, and more or less consistently in the other university towns. By the law of 1912 girls were admitted to the so-called "higher elementary schools" and private persons or agencies were permitted to establish coeducational secondary schools, the principle of coeducation in the higher schools being thus for the first time publicly recognized. Complete coeducation of the sexes may be expected to be among the first results of the Russian Revolution. Outside of Russia, Great Britain and her colonies, Switzerland, and Germany, there are very few women studying in the universities. In most countries the preparation of girls for the universities is left entirely to private initiative. For example, even so enlightened a country as France in its higher secondary schools for girls (lycées and collèges) provided before the war no instruction in Latin which is required of all candidates for French university degrees. Since 1914, however, girls have been admitted to the higher classes of some of the boys' lycées and women teachers are of necessity teaching in the boys' lycées. Coeducational primary schools are also permitted in England and Wales. In Scotland there are not enough boys and girls of primary age to justify the appointment of two teachers. Coeducation is, therefore, fast becoming an educational question of the first importance in other countries as well as in the United States. In the United States, however, differs from all other countries in that its experience includes all kinds of coeducation, primary, secondary, and university, given to many thousands of boys and girls and men and women for nearly half a century. During this time coeducational schools and colleges have greatly increased, while separate schools and colleges have proportionally decreased and the whole question of coeducation has recently become an international issue of such importance as to justify a fresh look at the problem. Three generations of women have now been subjected to coeducation and sufficient time has elapsed for its results, whether good or ill, to make themselves felt. The statistics of American coeducational high schools will be of special interest because provision must be made by foreign countries within the next few years for the secondary education of girls, and more especially for the preparation of girls for the universities. Coeducation began in the United States as an almost accidental consequence of the endeavor of the American colonists to carry on the English educational tradition and provide their children with free education in a newly settled country. During the great school revival at the close of the Civil War, the American people were eager to establish schools for all, and one of the results of the movement was the founding of a large number of schools for negroes in the South. It was a fortunate circumstance for girls that the country was at that time sparsely settled; in most neighborhoods it was so difficult to secure pupils for even one grammar school and one high school that girls classes were admitted from the first to both. In the reorganization of lower and higher education that took place between 1865 and 1870 this same system, bringing with it the complete school coeducation of the sexes, was strengthened and enlarged in New England and the middle States and was extended to every part of the west. It was also introduced throughout the south both for whites and negroes. For more than 50 years this great American system of state-supported coeducational primary, grammar, and high schools has met with little criticism and has spread throughout the whole United States. In no part of the country, except in the conservative east, is any distinction made in elementary or secondary education between boys and girls. Only in the few large cities of the Atlantic seaboard, such as Boston, New York, Philadelphia, Baltimore, Charleston, and in some of the larger cities of the southern States are separate boys and girls' high schools included in the public school system—in almost every instance to the detriment of girls' education. The second fortunate, and in like manner almost accidental, factor in the education of American women was the occurrence of the Civil War at the formative period of the schools. It was the result of placing the elementary and secondary education of both boys and girls overwhelmingly in the hands of women teachers. This effect proved not to be temporary, but permanent, and true for United States, both north and south. The relative proportion of women teachers in the public schools has steadily increased from year to year. In 1880 women formed 57.2 per cent; in 1890, 65.5; in 1900, 70.1; in 1910, 78.9; in 1914, 80.2 of all teachers in the public schools. It is significant that the percentage of women
Coeducation. 201

teachers is highest (86.5) in the earlier settled North Atlantic Division (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania) where the public schools have been longest in operation. (Report of the United States Commissioner of Education, 1916, Vol. II, p. 29). Like coeducation, the teaching of boys by women in the public schools has been bitterly attacked, especially by German educational authorities, but some of the objections urged against it seem to be supported by experience. American men educated by American women are so far from being feminized thereby that it is generally admitted they can hold their own in competition with men of other countries in athletics, games, daring sports of all kinds, in business enterprise, invention, scientific research, and technical skill. Fifty years of experience in coeducational schools seems to prove conclusively that women teachers of first-class mental ability and training succeed better with boys, as well as with girls, than men teachers of second or third rate intelligence; and further, that while business and professional life offer to men so much greater rewards than the public schools, only such secondary school boys are left to teach in them in considerable numbers. The increase of women teachers is already manifesting itself in other countries and as in the United States is noticeable first in primary schools. For example, in 1916, women formed 85 per cent of all teachers in the elementary schools of Canada and Newfoundland, and 71.3 of all teachers in the primary schools of Norway. The great war now in progress will undoubtedly accelerate the falling percentage of men teachers in the United States and will create in Europe a much greater shortage of men public school teachers than existed in America after the Civil War. As in the United States, in 1865–70, an overwhelming increase in women teachers may be looked for in all the warring countries. It is probable the war will bring about similar results and that as one of the by-products of the present war coeducation will be introduced very generally into all state-supported schools, especially in the more expensive high schools for boys which prepare for the universities. Whenever women teachers are in the majority it is clear that they must receive the best possible training to teach the children of a nation, and their claim to be admitted to state-supported schools and universities becomes irresistible. In the United States coeducation spread from the public schools to the State universities of the west and from the State universities to the more conservative private university foundations of the eastern States. When most of the State universities in the west were founded they were in reality scarcely more than secondary schools supplemented in most cases by large preparatory departments. Girls were already being educated with boys in all the high schools of the west and many of them to the State universities would have been to break with tradition. Women were also firmly established as teachers in the secondary schools, and it was patent to all thoughtful men that they must be given opportunities for higher education, if only for the sake of the secondary education of the boys of the country. The coeducation of men and women in colleges, and at the same time the college education of women, began in Ohio, the earliest settled of the western States. In 1833, Oberlin Collegiate Institute (not chartered as a college until 1850) was opened, admitting from the beginning both men and women. It was the first institution for collegiate instruction in the United States where large numbers of men and women were educated together, and the uniformly favorable testimony of its faculty exerted great influence on the side of coeducation. In 1853, Dennison College, also in Ohio, was opened and admitted from the beginning men and women on equal terms. From this time on it became a custom for State universities as they were opened one after another in the west to admit women. The State universities of Utah, opened in 1850, Iowa, opened in 1856, Washington, opened in 1862, Kansas, opened in 1866, Minnesota, opened in 1868, and Nebraska, opened in 1871, were coeducational from the first. Indiana, opened as early as 1863, was coeducational as early as 1868. The University of Michigan, at this time the most important western university and the only western university well known in the east before the Civil War, opened its doors to women in 1870 and admitted them for the first time to instruction of true college grade. This step was taken against the wish of the faculty as a whole in response to public sentiment as is shown by the action of the Michigan legislature. The example of the University of Michigan was quickly followed by all the leading universities of the west. In the same year women were admitted to the State universities of Illinois and California; in 1873, the only remaining western State university closed to women, that of Ohio, admitted them. Wisconsin, which, since 1860, had given some instruction to women, became in 1874 unreservedly coeducational. All the State universities of the west, organized since 1871, have admitted women from the first. In the 23 States which, for convenience, are classified as western, there are now 23 State universities open to women. The College of Hawaii and Porto Rico University are also coeducational. The 16 States included in the South Atlantic and South Central Divisions by the United States Commissioner of Education are all southern in sympathy, admitted the claims of women more slowly, as was to be expected. Missouri, the most western, became coeducational as early as 1870, and the University of Texas and the University of Oklahoma were opened in 1883 and 1892 respectively, as coeducational institutions; Mississippi admitted women in 1882; Kentucky, in 1889; Alabama, in 1893; South Carolina, in 1894; North Carolina, in 1897 (but only women prepared to enter the junior and senior years); West Virginia in 1897; Delaware College, the one State college of Delaware, as recently as in 1914 opened an affiliated college for women, supported by the State legislature. The state-supported universities and colleges of Maine, New Hampshire, New York, New Jersey, Pennsylvania, and Florida are all still closed to women, but strenuous efforts, which may be expected ultimately to succeed, have been made at the last three sessions of the Virginia legislature to secure the admission of women to the University of Virginia, which is the most conservative and also one of the best of Southern universi-
ties. In the States enumerated earlier in this article as belonging to the North Atlantic Division all the State-supported colleges are open to women although these institutions are relatively unimportant as compared with the privately supported colleges in this section. This brief review of educational conditions in the United States shows conclusively that public opinion based on 48 years of experience has definitely settled the question of coeducation, i.e., the right of women to share equally with men the instruction given in schools, colleges and universities supported by the state. Whenever State agricultural, technical or mechanic arts institutions are not coeducational it is safe to conclude that women have not yet wished to be admitted to them. The few attempts that have been made to segregate men and women in State universities have failed. For example, a proposal made in 1907 to section the large elementary classes of the University of Wisconsin on the basis of sex rather than of ability, or alphabetically, was effectively disposed of by the 1909 act of the Wisconsin legislature depriving the board of regents of the power to introduce sex discrimination into the instruction of the university. It may be urged, however, that it has not been universally adopted in state-supported schools and universities under the compulsion of public opinion operating through public boards of education and State legislatures and not by reason of the genuine success of coeducation itself as a system of education. From this point of view the adoption of coeducation by privately endowed colleges and universities, especially by the older men’s colleges in the east which were founded long before women were allowed to teach, or even to study, in American schools, is more convincing. Moreover, the education of young people in school and college is carried on in private institutions to a much greater extent in the United States than in any other country except Great Britain. Our independent schools and colleges founded by private or denominational initiative and maintained by voluntary gifts were originally modeled on similar English foundations and have in the past reached a great development. Of the 569 univerities, colleges and seminaries enumerated by the United States Commissioner of Education (including six affiliated women’s colleges omitted from his tabulation) 473 are private foundations teaching 140,371 students as compared with 96 state or municipal institutions teaching 96,737. Of these 473 private colleges and universities, 19 are technical or industrial schools where women do not as yet wish to study, five are military schools, and 62 are colleges under the control of the Roman Catholic Church, which in the United States is opposed on principle to the coeducation of the sexes and is impervious to argument. Of the remaining 387 institutions of liberal arts, 62 are separate colleges for men, 56 are separate colleges for women, nine are colleges for women affiliated to a coeducational university, 226 are frankly coeducational, i.e., even of all private colleges of liberal arts where men study, only 20 per cent teach men separately from women, and nine, including some of the most important of these 62 separate men’s colleges, share their professors, and in some cases their endowments, with an affiliated woman’s college. All separate universities for men maintaining graduate schools of art and science of any importance except the University of Virginia and Princeton University, open their graduate schools to women. All university schools of medicine, pharmacy, theology either now admit women or will soon admit them. Of the 95 medical schools tabulated in the 1916 Report of the United States Commissioner of Education, 67 were coeducational, including four of the most important private medical schools—Harvard, Hopkins, Cornell, Rush, and the University of Pennsylvania. The private medical school of Tulane University admitted women in 1913; the private medical schools of Columbia, Yale, and Washington universities have announced that they will admit women, and the medical school of Harvard is expected to follow their example. Of 29 State university medical schools, 22 are coeducational. Professional schools of law in all State universities are either opened, or will be opened as soon as women have been admitted to study in them, and three of the most important private university law schools in the United States, Pennsylvania, Columbia and Harvard, are already open, or have announced that they will be opened as soon as women are admitted. Coeducation has steadily increased in favor from the beginning of the experiment on a large scale in 1870 until the present time when an insistent public opinion compels the universities to extend their invitation to men even in privately endowed universities. This public opinion is all-powerful in the case of public foundations and cannot be disregarded by private educational institutions dependent for support on private gifts. It has already compelled all the leading graduate and professional university schools to admit women and has established side by side with men’s undergraduate colleges co-ordinate, or affiliated, women’s colleges in eight privately supported men’s universities and colleges and in the State college of Delaware, all except one (Western Reserve), situated in the east of the United States. Separate colleges for men will continue to exist in the eastern States only as long as through their strongly developed dormitory and campus life the schools can attract private clubs. Their separate existence has in a sense compelled the foundation of the great women’s colleges in the east with the same highly organized social life and college traditions and customs. The extravagance of such duplication, however, has limited the spread of separate men’s and women’s colleges, which show even now a tendency to attract as students specially selected men and women whose parents are able to pay for the combination of high academic standards with a peculiarly attractive social life. Much of the culture and many of the priceless associations of college life are to be obtained only by residence in college halls. Coeducational colleges have not as yet succeeded in offering their students such a comprehensive college, and coeducational men’s and women’s colleges although the progress made in this direction within the last 10 years indicates that there is no reason why it cannot be organized both for men and women equally well in coeducational institutions, the arguments against the coeducation of the sexes in colleges have been met and answered by
experience. It was feared at first that co-
education would lower the standard of scholar-
ship on account of the supposed inferior quality of
women's minds. The unanimous experience of coeducational colleges goes to prove that the average academic achievement of women is slightly higher than the average standing of men, that women win proportionately more prizes given for scholarly excellence and obtain proportionately higher examination marks. Many explanations, of the greater academic success of women students have been suggested but the fact, however it be explained, remains. None of the serious difficulties have arisen that were feared from the association of men and women of marriageable age. The question of health has also been finally disposed of. Thousands of women have been working side by side with men in coeducational institutions for the past 48 years and undergoing exactly the same tests without a larger percentage of withdrawals on account of illness than men, or any appreciable bad effects on health after graduation. A statistical study (made in 1900 and privately printed by the Association of Collegiate Alumni) of 3,636 women graduating from college between 1870 and 1915 indicates evidence as to their length of life, present health, rate of marriage, number of children, number of living children, etc., as compared with their sisters and cousins who are not college graduates. A larger percentage of women graduates of coeducational colleges are married, and their average age of marriage seems to be a year earlier than that of graduates of separate colleges, but both these facts may be due to the difference in local customs between the east and the west. A college education, whether obtained in separate colleges for women or in coeducational colleges, justifies itself in many surprising and rather unexpected ways. College women as a whole seem to marry on an average two years later than their sisters who have not received a college education; but as they have on an average more children than their sisters, and succeed in bringing up a few more of the children born to them to be rather an advantage than otherwise, especially as they also seem to make slightly better marriages financially than their sisters. The four careful statistical studies that have been made of the after effects of college education on women indicate clearly that vitally important racial matters, such as the marriage rate, the number of children born per marriage, the health, the occupations of men and women, etc., are controlled not by the (from this point of view) relatively unimportant question of whether or not they have spent four years in college, but by the customs and ideals of the social and financial groups to which they and their families belong. It has been observed that in Hopkins and 15 colleges in the year 1915 only 6 percent of women students are married in the year 1915 in the college departments of these six college as compared to thousands studying in the college departments of the 156 coeducational colleges. The trend toward co-
education has become more marked since 1900. Only one separate college for men, Clark College, Massachusetts, with 141 students, has been opened since 1900. Of the 29 separate women's colleges only six have been founded since the year 1900,
COEDUCATION

four of the six being situated in the southern States, and three being under denominational control. Apart from Simmons College, which is more of a technical or vocational school than a liberal arts college, and should be classified rather with the nine technical schools for men omitted from these statistics, no men's colleges other five separate women's colleges is of any considerable academic standing and only 699 women students of college grade are studying in them. Of the nine separate affiliated women's colleges only four (affiliated to Tufts, Hobart, Richmond, and Delaware,) have been opened since the year 1900 and only very few women are studying in them. Since 1870 only one of the smaller eastern coeducational colleges (Wesleyan, with 454 men college students) has excluded women and become a separate men's college; only one small western college, Downer (now Milwaukee-Downer, with 198 women students) has excluded men and become a women's college, and only two (Western Reserve University, with 426 women, and Tufts, with 92 women) have segregated their women students in affiliated colleges; while on the other hand during the same period of time the number of private men's colleges have become coeducational, including the 1913 above mentioned colleges there were in 1915 only nine such affiliated colleges in the United States. Only one private university, Leland Stanford Junior, has limited the number of women undergraduates and only two other private foundations (Chicago University in Illinois and Colby College in Maine) make any attempt to segregate women students in certain elementary classes. Colby teaches its 155 women separately in the first two years of the college course but Chicago, which has been experimenting with segregation since 1902, has practically discarded it, and in April 1918, taught its great body of over 4,000 women separately from men in only 4 out of 52 classes offered to first and second year students. All other classes in the university were coeducational. In 1870, when coeducation was first generally adopted in State universities, coeducational colleges formed only 30.7 per cent of all colleges and universities in which men were studying. Since then the increase of coeducational colleges and the decrease of separate men's colleges have been extraordinarily rapid, as follows: 1870, percentage of coeducational colleges to whole number of liberal arts colleges open to men, 30.7; 1880, 51.3; 1890, 65.5; 1900, 70; 1910, 70.7, or (omitting Roman Catholic colleges) 80.7; 1915, 76.5, or (omitting Roman Catholic colleges) coeducational colleges formed 88.3 per cent of all liberal arts colleges open to men and 91 per cent of all such colleges open to women. (Consult college and university statistics published in Reports of the United States Commissioner of Education for the corresponding years, it being noted that military and technical colleges, and in some cases, when stated, Roman Catholic colleges, have been omitted in calculating these percentages). The 1915 statistics have been corrected throughout by the addition of the five affiliated women's colleges (College girls of Western Reserve University, Women's College in Brown University, Jackson College of Tufts College, William Smith College of Hobart College, Westhampton College of Rich- mond College, Women's College of Delaware State College) omitted by the Commissioner of Education and by the transfer of the six corresponding men's colleges from the group of coeducational colleges to the group of separate men's colleges. In 1915, 71 per cent of all men undergraduate students, and 79 per cent of all women undergraduate students were studying in coeducational colleges and universities. This cannot be explained by the fact that for financial reasons students prefer public universities, which offer education free of charge and are also with very few exceptions coeducational, because the greater number of men and women are still studying in private colleges and universities which offer the choice of a separate or coeducational college education. In 1915 women formed about 35 per cent of all graduate and undergraduate college students in the United States, but, if the students of Roman Catholic, military, and technical colleges be omitted, women studying in undergraduate coeducational colleges of liberal arts formed 42 per cent of the total number of men and women in coeducational colleges. In many coeducational colleges women now equal and sometimes exceed men, and their number are steadily increasing. In 1913 there were 79,483 undergraduate and 5,098 graduate women students, in all 84,681 women, studying in American colleges and universities. The United States is the only country in the world where many thousands of women are receiving a university education. This statistical study speaks for itself and shows clearly the overwhelming trend toward coeducation in the college education of both men and women. It shows also that the tendency toward coeducation has become even more marked since the year 1900, that is, after 30 years of successful trial of the system. In like manner the school statistics published by the United States Commissioner of Education prove that coeducation in primary and secondary schools has been equally successful. The common school system of the United States is uncompromisingly coeducational. No distinction between coeducational and separate schools is made by the United States Commissioner of Education in such public elementary schools, presumably because they are all coeducational. In 1915, of all children in elementary schools 91 per cent were in public elementary schools. Not only are practically all public elementary schools coeducational, but almost all privately supported elementary schools are coeducational. Public high schools also are almost entirely coeducational. In 1915 there were 11,674 public and 2,248 private high schools. Of the 11,674 public high schools all except 63 were coeducational and only 37,043 girls were studying in separate high schools for girls, as compared with 690,497 studying in coeducational high schools, i.e., only 5 per cent of the total number of girls studying in public high schools were in separate girls' high schools an altogether negligible quantity. In the 25 years from 1890 to 1915 the percentage of pupils studying in private high schools and college girls in public high schools has steadily decreased, as follows: in 1890, private high school pupils were 39.25 per cent of all high school pupils; in 1900, 17.59 per cent; in 1910, 11.57 per:
in 1915, 10.45 per cent. During these 25 years the number of public high schools has increased from 2,526 to 11,694, while private high schools have not even doubled themselves, increasing only from 1,632 to 2,248, and of all the boys and girls studying in high schools in 1915 only 10.45 per cent were studying in private high schools. The great increase of public high schools, which are practically coeducational, as compared with private high schools shows the success of high school coeducation in the United States. Moreover, 44 per cent of all private high schools are also coeducational and 42 per cent of the girls receiving a private high school education, and 45 per cent of the boys, are studying in these coeducational private high schools. In 1915 boys and girls in public and private separate high schools formed only 12 per cent of all pupils in public and private high schools. All the other 88 per cent were in public and private coeducational high schools. In the larger high schools, boys and girls are frequently separated in athletics, gymnastics, and social activities according to periods, but the few attempts that have been made to segregate them in separate classes have not succeeded. In vocational work especially when organized in special trade or vocational high schools boys and girls naturally tend to elect different vocational work in order to be fitted for the different occupations open to men and women, but during the present war girls are being trained to undertake men’s jobs and after the conclusion of peace the tendency will be to continue to give boys and girls the same vocational work in the high schools. The numbers of both boys and girls studying in high schools in the United States are increasing at a faster rate than the population. There are slightly more girls than boys studying both in public and private high schools, and more girls than boys complete the high school course and graduate. In 1915 girls formed 54.54 per cent of all high school pupils. The extraordinary success of elementary and secondary school education in the United States cannot fail to exert a profound influence on the development of the education of girls and women in all European countries. After the conclusion of the present war all other civilized countries must make adequate provision for the higher education of women who will greatly outnumber men in this generation and must consequently receive the best preparation for self-support and national service. As is shown by the experience of the United States, women in considerable numbers will be unable to obtain higher education unless like boys they can be prepared for admission to the universities in state-supported schools. The experience of the United States also shows that only comparatively few children of rich parents can afford to study in separate private schools, even if they wish to do so, of which there is no indication. Only 12 per cent of all girls and boys in the United States are studying in separate schools. The reason is to believe that within the next half century coeducation will become the universal system of school, college and professional education, not only in the United States, where it is now the prevailing system, but also in all other civilized countries.

COEHORN, koo-hörn, Menno, BARON VAN, Dutch engineer; b. near Leeuwarden, Friesland, 1641; d. The Hague, 17 March 1704. He studied at the University of Franeker and in his 16th year he entered the Dutch service as captain, and soon rose to the rank of a colonel. During the siege of Graves he made use for the first time of the small mortars, called in honor of their inventor coehorns, used for throwing grenades. In the war of 1689, against France, he again distinguished himself. His defense of Fort William, in 1692, which he himself had planned, against the attacks of Vauban, attracted much attention. Both commanders displayed all their talents. In the war of the Spanish Succession Coehorn was made general of the fort and succeeded in reducing six French strongholds. In 1702 he was published in Leeuwarden his new theory of fortification. In 1703 he directed several sieges. He fortified almost all the strong places in Holland. Bergen-on-Zoom he considered his masterwork. His system is different from that of Vauban. Vauban operated by means of neuvres, and by the skilful direction of his ordnance and his men saved both, and wearied and divided the forces of the enemy; Coehorn crushed by an overpowering mass of artillery and men, and sacrificed both for a rapid and powerful effect. Coehorn, De "Fortificacien" (New York 1800); Bonomer, "Essai générale de fortification" (Paris 1814); Cosseran de Villenoisy, "Essai historique sur la fortification" (1868).

CELE-SYRIA, se-'lé-sir-'tā (*Hollow Syria*), the ancient name of the large valley lying between the Lebanon and Anti-Lebanon mountain ranges in Syria. The valley is about 100 miles in length. Near its centre are the ruins of Baalbek, or Heliopolis, and near the ruins rise the rivers Orontes and Litany, which water and fertilize the plain. The name in the 2d century included all the country (except Judea and Phoenicia) extending from Seleucis to the confines of Egypt and Arabia. In Roman times it was again confined to the territory east of the Jordan, consisting of Perea, the Decapolis and the provinces which constituted the tetrarchy of Philip. In 47 B.C. Herod was delegated by the Romans as military head. Later in the Roman period 297 A.D., the term receded to the region between Taurus and Phoenicia. To-day it is used in the sense first noted. Consult Höfler, "Palastina der persischen und hellenistischen Zeit" (1903); Smith, "Historical Geography of the Holy Land" (11th ed., 1904); Leary, "Syria, the Land of Lebanon" (1913).

CELEBS IN SEARCH OF A WIFE, a moral tale by Hannah More, published 1808. This is the best known work of fiction by that prolific moralist. It was written after she had passed her 60th year, and was intended as an antidote to what she considered the deleterious influence of the romantic tales of that day.

CELENTERATA, se-ên-ter-'rá-ta, a phylum of animals distinguished from all
others by the following aggregate of characters: Its members consist of two layers of cells only, separated by a gelatinous layer, and exhibit a more or less pronounced radial symmetry. They possess peculiar nematocytes (q.v.) or stinging organs, which are developed from the cells of the outer and sometimes of the inner layer. Such cells are not certainly known in any other group. Sense organs responsive to light and to sound or changes in equilibrium may exist among the coelenterates, but none of the very simplest character. The differentiation of nerve and muscle cells is indicated, but is as yet very imperfectly developed. There is but one body cavity, which serves the purposes both of digestion and of circulation. All coelenterates are carnivorous. One opening serves the purposes both of the mouth and of the vent. The individuals may be free, in which case they are known as medusa or jelly-fishes, or fixed, as with the coral individuals and the sea-anemones, when they are known as polyps. An alternation between the polypoid and medusoid generations is common, with the polypoid generation asexual and the medusoid generation sexual. Either generations may be aborted of the one or the other, but it is not yet known which represents the original coelenterate condition. The asexual generations multiply by fission, or more commonly, by gemmation, and these processes also may occur in the sexual forms. The gemmation often results in the formation of colonies. Both polyps and meduses may be either separate or colonial. In the colonial forms a high degree of division of labor among the zooids is often found, with a corresponding differentiation of form. A chitinous or calcareous exoskeleton is often found. The coelenterates are classified as follows:

1. Hydrozoa.—The sexual cells discharge directly to the outside. The digestive pouch opens directly to the exterior and is not subdivided by bands of the inner body layer. Some of the species of Hydrozoa may have a stalked medusa.

2. Scyphozoa.—The sexual cells discharge into the digestive-circulatory pouch, which appears to open directly to the exterior, and is not subdivided by bands of the inner body layer. Filaments of the inner body layer may extend beyond the digestive pouch.

3. Anthozoa or Actinzoa.—The sexual cells discharge into the digestive-circulatory pouch, which opens into the outside through a tube lined with the outer body-layer, and is subdivided by bands of the inner body layer supporting this tube, the so-called mesentery. Radial symmetry is partly replaced by bilateral symmetry. Medusa are unknown.

The Ctenophora (q.v.) are often included among the Coelenterata, but they possess a more prominent layer and no nematocytes, and show affinities to the flatworms, so that they will be treated under a separate head.

The Hydrozoa include many jelly-fish, the common hydra and many other polyp-like forms, and certain so-called corals. The Scyphozoa include some polyps and many of the more familiar jelly-fishes. The Anthozoa include most corals, and the sea-pens and sea-anemones.

Fossil Coelenterata can be found even in the Lower Cambrian rocks. Not only the skeletons of the various calcareous forms, but the impressions of the circularly-digestive sac of the frail medusa, are found from a very early period. The graptolites (q.v.) have been associated with the Coelenterata by some writers, though others believe them to be Cnidaria. See ACTINOZOA; ALCOYANEA; CORD; COELENTERATE; GORGONIA; HYDRA; HYDROZOA; JELLY-FISH; POLYP; PORTUGUESE MAN-OF-WAR; SEA-ANEMONES; SEA-PEN; SIPHONOPHORA; ZOOHYTTES. COERCION. A term employed in political science to describe the means (principally non-judicial) for securing obedience to law.

State Coercion.—When the Southern States issued their ordinances of secession in 1860 to 1861, the action constituted an effort to nullify the action of the Federal government upon individuals, or to make the laws of the Federal government inopposition to that of the Federal government. The South believed that the Federal government was simply a compact between separate and sovereign political bodies, that the powers of the Federal government were held in trust for the States themselves, and that sovereignty therefore was not in the hands of the Federal government but in the hands of the people who had created these governments, not, however, as a mass, but rather as individual States. The South thought that under the Constitution the Federal government was given only certain specific powers which it did not possess under the Articles of Confederation (q.v.) and that the Constitution did not conflict with nor the Federal government supersede the sovereignty of the States.

There was considerable discussion of the right of the Federal government to coerce a State. In 1832–33, during the dispute over nullification (q.v.) in South Carolina, President Jackson said: 'To say that any State may at pleasure secede from the Union is to say that the United States are not a nation. Secession, like any other revolutionary act, may be morally justified by the extremity of oppression, but to call it a constitutional right is confounding the meaning of terms.' And again: 'The right of the people of a single State to absolve themselves at will and without the consent of the other States from their most solemn obligations, and hazard the liberties and happiness of the millions composing this Union, can not be acknowledged. Such authority is believed to be utterly repugnant to both sovereignty upon which the general government is constituted and to the objects which it is expressly formed to attain.' On the other hand he said: 'That a State or any great portion of the people, suffering under long and intolerable oppression and having tried all constitutional remedies without the hope of redress, may have a natural right, when their happiness can be not otherwise secured, and when they can do so without greater injury to others, to absolve themselves from their obligations to the
government and appeal to the last resort, needs not be denied."
(Richardson, J. D., 'Messages and Papers of the Presidents,' Vol. II, pp. 640-56). On 25 Nov. 1860 the New York Herald, an independent journal, said: "Coercion in any event is out of the question. A union held together by the bayonet would be nothing better than a military despotism."

And again: "Each State is organized as a complete government, holding the purse and wielding the sword, possessing the right to break the tie of the compact constitution, and to repel coercion from a nation with a like right to repel invasion. ... Coercion, if it were possible, is out of the question."

In his message of 3 Dec. 1860 President Buchanan declared that no State possessed the right to secede, but on the other hand he stated that the Constitution contained nothing which would grant the Federal government the right to coerce a State, and therefore he apparently had no right to prevent secession. (Richardson, 'Messages,' Vol. V, pp. 626-652). Buchanan based his position on an opinion given him by his Attorney-General, Jeremiah S. Black, 20 Nov. 1860, in which, among other things, the latter said that the Federal government had the right to "preserve itself in its whole vigor by repelling a direct and positive aggression upon its property or its officers," but that "an offensive war to compel a State to recognize the supremacy of the government of the United States would destroy the Union, immediately and completely."

(‘Opinions of the Attorney-Generals,’ Vol. IX, p. 516 et seq.). The seceding States held that there was no constitutional provision that met the case because a State could not be coerced; in his speech of 21 Jan. 1861, when resigning from the Senate, Jefferson Davis said: "If it be the purpose of gentlemen they may make war against a State which has withdrawn from the Union; but there are no laws of the United States to be executed within the limits of a seceded State. ... A State [in such condition] claims to be exempt from any power to execute the laws of the United States within her limits." (Congressional Globe, 30th Congress, 2d session, p. 487.). The Southerners made much of the fact that the Federal government did not provide for coercion of States but on the contrary omitted it from the Constitution. But the power of coercion was omitted because a government over people was established which had the right to enforce law on persons. The Northern statesmen insisted that no State could exist or act except under its obligations to the Federal Union; and that the power to coerce individuals could not be dissolved by any State. It would have been appropriate to provide for the coercion of States in a union of sovereignties where obligations might have been enforced suitably by war; but where the system established provided for a government immediately over men who were subject directly to the commands of that government, coercion was inappropriate. And finally, it conflicts with its duty as a member of the Union is illegal; officials who carry out unconstitutional legislation are not properly State officers; people cannot legally perform illegal acts. Lincoln and the Federal government insisted that they were dealing only with individuals. In his speech of 29 Dec. 1860 Lyman Trumbull said:

"If there is anybody in this Senate, or in this country, who ever talked of the United States declaring war against one of its States, or of coercing one of its States by the use of the army and navy, I know not who it is. I have never seen him. This phrase, 'coerce a State,' is a phrase calculated to mislead public minds and public sentiment. Nobody proposes to declare war against a State. That would admit at once that the State was out of the Union by its own voluntary act. Not so. Of course we cannot declare war against a State. Nobody proposes to coerce a State or to convict a State of treason. You cannot arraign a State for trial; you cannot convict it or punish it; but you can punish individuals." (Congressional Globe, 36th Congress, 2d Session, Pt. I, p. 156).

A reading of President Buchanan's message above mentioned shows that he entirely confused the power of the United States to coerce a recalcitrant State—a power it surely possesses—with its right to enforce the laws of the United States wherever they are applicable, and to use the armed force whenever it may be necessary to accomplish this end—a power which it undoubtedly possesses. Even the most strenuous opponent of secession would probably not have defended the right to apply coercion against a State as a corporate political entity. But the power to proceed against its citizens for violating the laws and to protect the public property was a very different thing, for the President is bound by oath to see that the laws are faithfully executed. President Lincoln in his inaugural address practically agreed with President Buchanan that the Federal government had no power to wage war against a State, as such, or to proceed against it by way of Federal execution, but he denied that, because it could not coerce a State, it could not defend the public property against attack or compel obedience to its laws by those subject to its jurisdiction. The Union, he said, was sovereign and it was intended to be perpetual, from which it followed that no State upon its mere motion could lawfully get out of the Union; that resolves and ordinances to that effect were legally void; and that acts of violence within any State or States against the authority of the United States are treasonous or revolutionary, according to circumstances. At the same time he announced his determination to hold, occupy and possess the property and places belonging to the government of the United States, and to carry into effect the duties and impose everywhere. No attempt was to be made to coerce any State as such, but only to compel obedience to the laws; and in his call for the militia it was stated that their services were to be employed in overcoming the resistance to the laws by combinations of persons too powerful to be suppressed by the ordinary course of judicial proceedings. (J. W. Garner, in Wiley and Rines, 'The United States;' Vol. VIII., p. 8.). For Lincoln's messages above mentioned, consult Richardson, 'Messages,' (Vol. VI, pp. 5-14); Nicolay and Hay, 'Life of Lincoln,' (Vol. III, pp. 327-344).

In his amnesty proclamation of 8 Dec. 1863 Lincoln offered to recognize the communities containing such combinations of individuals if they would again establish State governments in conformity with the Constitution. (Richardson, 'Messages,' Vol. VI, pp. 213-15; Nicolay and Hay, 'Complete Works of Abraham Lincoln,' Vol. II, pp. 442-44). Lincoln
and his supporters believed that the "loyal" element of the Southern States was large but that the functions of the State governments had been usurped by combinations of disloyal parties and that therefore the rights of the States had not been destroyed but simply suspended temporarily by the acts of the Confederate officials, who were not recognized.

Lincoln did not regard the acts of the Confederate authorities as legal or quasi-legal, and held that the existence of the States themselves was not affected by the disloyal acts of a portion of their inhabitants. These States therefore were simply out of their "proper practical relations" with the Federal government on account of the war. His plan was to restore to the people their former rights by pardon and amnesty upon promise of future loyalty, in order that they might begin the work of forming new State and local governments; but he believed that the preponderance of power in such State governments should be in the hands of the loyal element of the population.

(Nicolay and Hay, 'Complete Works,' Vol. II, pp. 622-75, and 'Life of Lincoln,' Vol. IX, pp. 567-589.) While the Union was still in the hands of the seceded States, the Reconstructed States were in the hands of the States of Virginia and Kentucky. Resolutions; State Rights; Sovereignty; Insurrection; Rebellion; War Power; Constitutional; Interposition.

Individual Coercion.—It is necessary for the proper conduct of government that sufficient physical force be provided to protect government officials in the exercise of their designated functions. Our laws define offenses that strike at the root of government; our judicial courts have authority to cause the arrest of offenders; and offenders should be tried and punished. If the regular processes be prevented by force the Federal and State courts have power to appoint temporary officers who may call for assistance on the "posse comitatus"—that is, all able-bodied men within their jurisdiction. If these forces be impotent the governor of the State may be requested to send aid, that he will be able to form the militia. The purpose of the militia is not to arrest this or that individual but to be part of regular organized resistance, wherefore they may be ordered or compelled to fire into rioters or mobs which may only have the appearance of creating a disturbance but which may never have committed any other offense. Individuals in such instances are regarded as outside the protection of the law and have no redress, being subject to dispersal so long as they maintain an attitude of resistance. If the militia be insufficient to protect the State against domestic violence then the President, acting with legislative request, has the right of the United States (Constitution, Art. IV, Sec. IV), who may, if necessary, use the militia of other States or regular troops or sailors. Sometimes these local disturbances (the Fire at Chicago in 1871) interfere with the execution of Federal laws, whereupon, without calling upon the States, the President may send militia or regulars on his own initiative. If the disturbances become especially violent, the habeas corpus may be suspended or martial law may be declared, in either of which cases a suspected person may be arrested and held without charge or trial for any length of time in the discretion of the proper authorities.

Coercion, in law, any application of physical or other force by which a person is compelled to do or refrain from doing something; intimidation. The legal effect of coercion depends upon its violence and other attendant circumstances. Where one commits a crime under coercion in the reasonable belief that he will be killed or seriously injured if he does not do so, his act is held to be excusable. Coercion may be indirect, as when applied to one's husband, wife, mother, father, brother, sister or other near relative, and in some cases such coercion may have the same effect as if applied to the person directly. Where a wife commits any crime except treason, homicide or perhaps highway robbery in the presence of her husband, she is usually presumed to have done so under his coercion, and is therefore not punishable. Coercion is a ground for invalidating a contract in a civil suit.

Corne, Louis Adolphe, American composer: b. Newark, N. J., 27 Feb. 1870. He was educated at Harvard University and at the Royal Academy of Music, Munich. He was musical director at Buffalo, N. Y., 1894-97; Columbia, 1897-99; New York, 1907-09. In 1910-15 he was professor of the history and science of music at the University of Wisconsin, and since 1915 he has been professor of music at Connecticut College. He is author of 'The Strikers' Art of Evolution of Modern Orchestration' (1908) and composer of 82 sheet music works, including 'Hiawatha,' symphonic poem (Munich 1893; Boston 1894); 'Jubilee March,' written for massed band performances at Chicago Exposition 1893; 'Woman of Marblehead,' grand opera (1905); 'Beloved America';
'Sakunila' (1904), and 'Zenobia,' grand opera (1905-06). The last named work was the first grand opera by a native of the United States to be performed in Europe.

COETHEN, ké'tén, Germany, a town in the duchy of Anhalt, in a fertile and attractive district on the Ziethe about 80 miles southwest of Berlin. It was the last stage of the former duchy of Anhalt-Cöthen. It consists of the old and the new town and several suburbs; has a fine Protestant cathedral church in the Gothic style, with old glass-paintings and a fine organ; the former ducal residence with library, picture-gallery and museum; a gymnasium, normal and several other schools. There are manufactures of machinery and metal goods, and various other industries. Beet-sugar is a stable article of commerce. The town dates back to the 10th century. Pop. about 23,000.

CEUR, kér, Jacques, French merchant and royal treasurer: b. Bourges toward the end of the 14th century; d. Chios, in the island of Scio, 25 Nov. 1456. His vast commercial enterprises, particularly in the Levant, earned for him the title of Rich of England. In 1427 he was a diplomatist and ambassador to Venice and Spain. In 1435 he was appointed master of the French mint, and afterward treasurer. His excellent management of affairs caused the king to ennoblement him, and to entrust him with high functions in the French provinces, and diplomatic missions in Italy. Ceur contributed 200,000 crowns to help the king in rescuing Normandy from the English. After the successful end of the war, his influence became so great as to give offense to envious persons, who after the death of the king's mistress, Agnes Sorel, charged him with having poisoned her, and caused him to be arrested (1451), and his vast property to be confiscated. Although the charge was proved to be groundless, he was detained in prison until 1455, when he effected his escape. Repairing to Rome, he was kindly received by Pope Nicholas V, and was enabled to gather the broken remains of his fortune. He had vainly claimed the clemency of Charles VII in favor of his family, which was under Louis XI only that his memory was exculpated from all charges, while a part of his property was afterward restored to his descendants. Consult Clément, 'Jacques Cœur et Charles VII' (Paris 1866).

CEUR D'ALENÉ, kér dé'-lān (Fr. 'awl-heart'). (1) A name given by the French voyagers, traditionally from the stinginess of a chief, to a tribe of Indians of the Salishan stock, though with a dialect widely different from the other members. Their own name is Skitswish, which Lewis and Clarke rendered Skitcomish. When found by Lewis and Clarke they occupied a considerable tract in northern Idaho and Washington, near the lake named after them. There were perhaps 2,000 of them, rather squalid and unadventurous, though cruel; they lived on roots, fish and small game, and did not visit the buffalo grounds. Father de Smet visited them in 1841, and the next year a Catholic mission was established among them, and they became Christians. They had regular dwellings and a mill; but they were hostile to the encroaching whites, and in 1858 the chief, Vincent, with a band of his warriors, joined in a war on them, which was only put down by General Wright after two sharp battles, at Four Lakes and Spokane Plains. In 1887 part of them were placed on a reservation in Idaho, and in 1872 the rest were removed to the Colville Reservation, between the Okanogan and Columbia rivers. (2) A lake in northern Idaho, situated among mountains of the same name. The rivers Cœur d'Alené and Saint Joseph flow into the lake at its southern end, and the Spokane River is its outlet at the north. It is about 30 miles long and from two to four miles wide. The region is a mining district, and has been the scene of serious labor troubles, especially in 1892 and 1893. (3) City and county seat of Kootenai County, Idaho, 33 miles east of Spokane, Wash., on the lake of the same name, and on the Northern Pacific and Chicago, Milwaukee and Saint Paul railroads. The city contains a college, a Catholic academy, two parks and the Old Fort Sherman military grounds. It manufactures lumber, ties, shingles, brick and trades in fruits and farm products. The town is popular as a centre of a fishing and hunting region.

CEUR DE LION, kér dé le'-ōn, a title given to several historical personages, as Richard I of England. The Cœurs de Lion were feudal barons of personal valor performed by him in the Holy Land; Louis VIII of France, frequently called Le Lion; and Bolasias I of Poland, also called "The Intrepid."

COFFEE, the seed of a small evergreen tree, which is cultivated in tropical countries, supposed to be native to Arabia, or it was early found in Arabia. The plant belongs to the genus Coffea, order Rubiaceae. In the wild state it grows to a height of from 6 to 30 feet, but in cultivation it is pruned and kept between 6 and 10 feet. The leaves are green, glossy on the upper side, and somewhat resemble those of the laurel, but less dry and thick. The flowers are white, fragrant and grow in clusters from the axils of the branches. The fruit, often called berries, grows in clusters of from 3 to 12, each with a short stem or sessile. The fruit when ripe resembles in appearance a dark red cherry, or a medium-sized cranberry. Each berry contains two seeds embedded in a yellowish, sweetish pulp, which, when ripe, is delicious.

The trees are raised from seed grown in nurseries, and when of a size to endure variations of temperature, usually in about six months' time, they are transplanted to the coffee orchard. They begin to bear when three years old, and yield fruit for about 20 years. Considerable space is left between the trees, and corn, bananas and plantain are grown among them, especially when young. The first year's crop is small, but when in full bearing a tree will yield from one to five pounds, according to location and variety. The regions best adapted to the growth of coffee are between the parallels of 15 north and 15 south latitude, and from 1,000 to 4,000 feet above sea-level. It is cultivated from lat. 25° N. to 30° S., in places where the temperature does not fall below 55° F. Moist and somewhat shady slopes are found most desirable. Little streams of water are conducted to the roots of the trees, which are kept very wet until the fruit is nearly ripe; then the water is turned off to keep the fruit from becoming too succulent. The fruit varies in size and color according to the altitude in which it grows; that from highlands is small and
green; that grown on lowland and near the coast is larger and of a yellowish tinge. The wild trees of Liberia, which grow in the lowlands, produce the largest fruit known, but it is of inferior quality. The coffee from the Far East can be distinguished by its large bean of a yellow color, while that of Central and South America is smaller and of greenish color. The fruit is harvested with great care, cloths being placed under the trees before shaking them. The fruit is then exposed to the sun to dry, and is afterwards husked, cracked, again, hulled, cleaned and sorted before it is ready for the market. In some places, especially Brazil, the bean is pulped by machinery as soon as it is taken from the tree, and thus the time necessary to get the coffee ready for market is shortened.

Some of the coffee-producing countries of the world to-day are Brazil, Colombia, the Philippines, Hawaii, Cuba, Porto Rico, Jamaica, Central America, and parts of Africa, Arabia, Japan, and the islands of the East Indies. Of all the countries bearing area than any other country; it produces more than two-thirds of all the coffee consumed in the world. Coffee planting in Brazil has been the most successful farming in the world. São Paulo is the greatest coffee producer, and 90 per cent of the beans is grown in the state of São Paulo. The coffee is exported directly from the farm to the port, where it is loaded. In 1913, Brazil produced 425,377,695 pounds of coffee, which is equal to about nine per cent of the world's production.

The average of the crops in Brazil for the past ten years has been about 400 pounds per acre. This is about twice the average of the United States of America, which is about 200 pounds per acre. The coffee is grown on the slopes of the mountains, where the temperature is about 70 degrees Fahrenheit. The winter months are the most favorable for the coffee plant. In the winter months, the temperature is about 50 degrees Fahrenheit, and the humidity is about 80 per cent. The winter months are the most favorable for the coffee plant. The coffee is usually harvested in the month of March, and is exported during the month of April.

In Porto Rico coffee of excellent quality is produced, and some of the orchards are increasing in size and number. However, the highest price of any on the Pacific Coast. The imports of coffee from Porto Rico and Hawaii have increased greatly within recent years. In 1914 the imports from Porto Rico were 2,793,052 pounds, as compared to 372,427 in 1894. In 1914 approximately 3,500,000 pounds of Hawaiian coffee was consumed in the United States. In the Philippines there are splendid orchards, especially in the southern islands of the archipelago known as the Sulu or Jolo group. On a large coffee estate of 40,000 acres in the Sulu Islands, the coffee is grown in the vicinity of Bongao, the capital of the island. The coffee is exported directly from the farm to the port, where it is loaded. In 1913, the Philippines produced 2,500,000 pounds of coffee, which is equal to about seven per cent of the world's production.

The United States leads the world in the consumption of coffee. It is estimated that the people of the United States consume 10 pounds per capita, which is about three times as much as they consumed 50 years ago. The yearly consumption in Great Britain declined steadily during the last half of the 19th century. This is attributed to the adulterations which at one time were extensively practiced. Probably few articles of food are so much adulterated as coffee. Substances of an entirely foreign nature are often palmed off as genuine coffee, or are offered as substitutes. Dandelion, parsnip, carrot and beet roots, beans, lupins, rice and various cereals, roasted and ground, have all been employed, and within recent years the manufacture of artificial coffee has been so great as to make it difficult to obtain genuine coffee in some parts of the world. Under the pressure of circumstances, the manufacturers of coffee have been forced to use these adulterants. In 1890, 18,000,000 pounds of various vegetable substances were annually sold as coffee.

In Medicine.—Many of the leading medical men of the day hold that the action of coffee on the body is due to two or three factors. If coffee is mixed with milk or cream, it gives a certain amount of coffee, but its action is usually due to the volatile oils, and to the caffeine contained. The volatile oil, like others in this class, stimulates peristalsis; but taken too often and in too large quantities the oil contributes to the causation of a certain amount of gastric indigestion. The more deli-
COFFEE-BUG—COFFER

cate the aroma of coffee the less the oil, and the better from this standpoint. The action of caffeine is much more complex.

So far as coffee-drinking is concerned, the action of caffeine is that of a cardiac stimulant, a nerve-muscle excitant, a diuretic and a cerebral excitant. It has no immediate action upon the sense of undue fullness in the blood vessels. It almost invariably causes a slight muscular tremor, which is noted in those who use their hands for fine work, as artists, for example. It causes an increased flow of urine, and tends to prevent sleep. Time, custom, usage, dose and the individual's reaction all modify these general laws; but these reactions occur, although none of them may be of sufficient grade to make the observer cognizant of the action. Thus many people are not kept awake by coffee. They have probably habituated themselves and require larger doses.

Hot coffee is one of the best heart tonics known, and it is sometimes administered in large quantities in cases of shock, opium poisoning, pneumonia, etc. Coffee is also valuable in many types of headache and in many cases of nausea. Its excessive use leads to great muscular irritability, gastritis, restlessness and sleeplessness. It is said by many modern men that the effects of coffee as a beverage are wholly bad. They say that the caffeine in the coffee, or in other vegetable substances—tea, coffee, kola, guarana and maté, or Paraguay tea—is a stimulant to the brain, nerves, heart and kidneys. In small doses it helps to resist fatigue, increases mental power and promotes excretion of urine. Large doses or continued use, however, tend to make a person nervous, to induce irritability of the heart, with considerable depression, and to upset the stomach. The mildest results of an overdose are a tendency to wakefulness, but there are recorded a number of deaths from heart-failure due to its employment in large doses. It is used largely as a heart-stimulant and diuretic, but its action is characterized by great variability. Individual susceptibility to it varies so greatly that what would be a poisonous dose to one person would scarcely affect another. The usual dose is half a grain to three grains.

History.—The early history of coffee is obscure; as an article of diet, its introduction is recent; to the Greeks and Romans it was wholly unknown. It was first introduced into Persia from Abyssinia, and next in the 15th century by a Mohammedan priest at Aden. From Aden it was carried to Mecca, where first the pilgrims or Hadjis, and then the rest of the people, began to use it. From Arabia it was taken to Cairo, Egypt, where in 1511 it was prohibited because it was believed to be an intoxicant and came within the class of things forbidden as food by the Koran. The Sultan Causon removed the prohibition, and coffee passed along the coast by way of Syria and around to Constantinople. Again it was supposed as one of the articles not to be used as food according to the Koran. Thus its use was sometimes forbidden, sometimes allowed, for many years. The Turks are now moderate coffee-drinkers.

Prior to the 18th century all the coffee used in the King's household was purchased for the ceiling, etc., from the Levant. In 1652 Edward, a merchant, in trade with Turkey, introduced coffee into England; in 1697 Van Horn introduced it into Batavia, and from there it was taken to France and the West Indian Islands. In 1754 Father Villaso, a Franciscan monk, took a plant to Rio de Janeiro and cultivated it in the garden of the monastery of Saint Anthony. This one plant was the means of introducing coffee into Brazil. See article Brazil.—Agriculture.

The great increase of the coffee trade in the United States within the past few years is shown in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>Total importation from Brazil</th>
<th>Total importation from Colombia</th>
</tr>
</thead>
<tbody>
<tr>
<td>1913</td>
<td>852,529,408 lbs.</td>
<td>625,002,905 lbs.</td>
</tr>
<tr>
<td>1914</td>
<td>1,091,011,813 lbs.</td>
<td>725,800,529 lbs.</td>

<tr>
<td>1915</td>
<td>1,228,761,526 lbs.</td>
<td>898,175,974 lbs.</td>
</tr>
</tbody>
</table>

The total coffee stocks in Europe on 31 July 1916 amounted to 3,555,000 bags, of which 2,877,000 bags came from Brazil and 678,000 bags from other sources. These stocks were distributed as follows: Havre, 2,376,000 bags; Marseilles, 255,000 bags; Bordeaux, 90,000 bags; England, 601,000 bags; and the Netherlands, 228,000 bags.

COFFEE-BUG, an insect (Lecanium coffeae), of the Coccus family (Coccidae), very destructive in coffee plantations.

COFFEE-HOUSE, a house of entertainment where persons are supplied with coffee and other refreshments. Such houses were formerly the chief resorts of every class for purposes of conversation and information, and the meeting-places of politicians, literary men, etc. Constantinople is believed to have been the first European capital in which such houses were instituted, the year of their establishment there being 1554 A.D. In 1650 the first one in England was opened in Oxford. Each particular house attracted a special coterie of visitors; and because newspapers had not yet come into vogue, these places became the centres of the spreading of news, political gossip, etc. They were patronized daily by the upper and middle class. They were suppressed by Charles II in 1675, but were soon allowed to be reopened. Consult Macaulay, 'History of England' (Vol. I, New York 1858).

COFFEE-NUT: COFFEE-TREE. See Kentucky Coffee-tree.

COFFER, in Modern as well as in Renaissance, Neoclassic and Classic architecture a recessed panel, usually octagonal or square. Such panels occurring in the ceilings or on the inner surfaces of cupolas, domes, barrel vaults and the like, were, in original Roman construction—as in the dome of the Pantheon, where the background was gilded, in the Basilica of Maxentius, etc.—a sinking in the solid masonry; but in modern work coffers are often produced in lath and plaster, or other thin and cheap material. Coffers are either plain, as are those in the ceiling of the
COFFER FISH — COFFIN

main room of the National City Bank, New York, or foliated, as those in the ceiling of the library of the Metropolitan Museum of Art, New York, the latter being ornamented with modified or conventionalized acanthus leaves.

COFFER FISH, or TRUNK FISH, a peculiar genus (Ostracion) of bony fishes in the small order Plectognaths, and in the suborder Scleroderms, which also includes the file-fishes. The body is enclosed in a firm box formed of hexagonal bony scales fitted into one another like a mosaic. The snout, the bases of the fins and the end of the tail are the only soft-skinned parts. Over a score of species are known from tropical and subtropical seas. The best known form is O. quadricornis from the tropical Atlantic.

COFFERDAM, a water-tight enclosure round a space where it is intended to find the pier, or a bridge, quay, etc., so constructed that the water may be pumped out of it and the masonry executed "in the dry." It is formed of one or more rows of piles (usually two), between which clay is rammed. The piles, generally driven close together, are grooved and tongued; but if the water be not very deep the piles are placed some distance apart, and boards let into the grooves. Of course great care must be taken that no water can enter at the joints or at the junction with the natural soil, and that the structure is sufficiently strong to resist the great pressure of water from without. If the bottom is of rock, and piles cannot be driven, cofferdams may be formed of two parallel stone walls, the intervening space filled up with clay. Iron caissons are also used instead. Sheet steel interlocking piling is also extensively used in this form of construction. Consult Fowler, "Ordinary Foundations, Including the Cofferdam Process for Piers" (New York 1905).

COFFEVILLE, Kan., city of Montgomery County, situated on the Verdigris River, and on the Missouri Pacific, Atchison, Topeka and Santa Fé and other railroads. It has a public library. The city carries on an extensive trade with Oklahoma and has strawboard, paper and flour mills, railroad shops, oil refineries, a flour mill, glass factories, oil-well, packing plant, a large oxide smelter, foundry, vitrified brick works and a roofing-tile factory. The United States census of manufactures for 1914 recorded 45 industrial establishments of factory grade, employing 628 persons, of whom 497 were wage earners, receiving $356,000 annually in wages. The capital invested aggregated $2,092,000, and the year's output was valued at $3,763,000. The value added by manufacture. Coffeyville was incorporated in 1871 and adopted the commission form of government in 1909. The waterworks and electric-light plant are owned and operated by the municipality. Pop. 16,000.

COFFIN, Charles Carleton, American naval officer; born in Boscowen, N. H., 26 July 1823; d. Brookline, 2 March 1896. He began life as a civil engineer, and afterward gave his attention to telegraphy. In 1851 he began to write for the Boston papers; and during the Civil War and the Austro-Prussian War of 1866 was war correspondent for the Boston Journal, writing under the signature of "Carleton." He was a member of the Massa-
gress. He published 'Observations with the Mural Circle, with Formulas, Tables and Discussions, 1845-49,' published in the observatory volumes for those years; 'The Compass' (1863); 'Navigation and Nautical Astronomy' (1863); 'Observations of the Total Eclipse of the Sun, August 1869' (1868).

COFFIN, Joshua, American antiquary: b. Newbury, Mass., 12 Oct. 1792; d. there, 24 June 1864. He was graduated at Dartmouth College in 1817, and was a teacher for many years. Whittier was one of his pupils, and addressed to him the poem 'To My Old Schoolmaster.' Coffin was an ardent abolitionist, being a founder and first recording secretary of the New England Anti-Slavery Society 1832. He compiled 'Sketch of the History of Newbury, Newburyport, and West Newbury, 1635-1845' (1845); 'List of Some of the Descendants of Mr. E. Woodman (of) Newbury, Mass., 1635' (1855); 'The Toppans of Toppan's Lane: Their Descendants and Relations' (1862); 'An Account of the Principal Slave Insurrections in the Two Centuries' (1860).

COFFIN, Levi, American philanthropist: b. near New Garden, N. C., 28 Oct. 1798; d. Avondale, Ohio, 16 Sept. 1877. He was a farmer's son, and early evinced interest in the negro's welfare. In 1826 he settled in Wayne County, Ind., where he kept a country store. Proving successful in business, he actively aided slaves to gain freedom, largely through the underground railroad. Thousands of escaping slaves were aided on their way to Canada by him. He opened a store in Cincinnati for the handling of 'free-labor goods' only. He helped found the Freedmen's Bureau in 1863, and after the Civil War was active in schemes to advance the welfare of the colored people. He was known popularly as 'President of the Underground Railroad.' He consulted his 'Reminiscences' (Cincinnati 1876).

COFFIN, Lorenzo S., American philanthropist: b. Alton, N. H., 1823. He studied a short time at Oberlin College and taught in Geauga Seminary, Chester, Ohio, where J. A. Garfield and Lucettia Garfield, née Randolph, were his pupils. He served with the Iowa infantry during the Civil War. He became a preacher after the war and in 1883-88 was preacher of the Iowa board of railroad commissioners. He founded a Railroad Temperance Association, and was one of the founders of a Home for Aged and Disabled Railroad Men near Chicago in 1893. He was president of the Iowa Anti-Saloon League and in 1907 was the Prohibition candidate for governor and in 1908 was the candidate of the United Christian party for Vice-President of the United States.

COFFIN, Robert Barry, American journalist and miscellaneous writer: b. Hudson, N. Y., 21 July 1826; d. Fordham, N. Y., 10 June 1888. He was on the staff of the Home Journal of New York (1858), and was also art critic of the Evening Post. His humorous sketches, which appeared in many periodicals over the pen-name 'BARRY GRAY,' have been extensively read. Among his publications are 'My Married Life at Hillsdale' (1865), 'Cakes and Ale at Woodbine' (1868); and 'The Home of Cooper' (1872).

COFFIN, William Anderson, American painter: b. Allegheny, Pa., 31 Jan. 1855. He was graduated at Yale 1874, studied art in the United States 1874-77, and then in Paris under Leon Bonnat 1877-82. He opened a studio in New York 1882, and has become well known as a painter of landscapes and figure pieces. In 1886 he won the Halagien prize of $200; was awarded a medal at the Paris Exposition 1889; received the Webb prize of the Society of American Artists 1891; and was gold medalist of the Philadelphia Art Club 1898. He was art critic of the New York Evening Post 1886-91, and of the New York Sun 1896-1900. In 1901 he was director of fine arts at the Pan-American Exposition in Buffalo, N. Y. At the Saint Louis Exposition (1904) he exhibited 'Sunrise in Winter' and 'Evening, Somerset Valley.' He is member of the Society of American Artists and of the Architectural League of New York; he won a silver medal, Charleston Exhibition (1902), and two silver medals at Saint Louis World's Fair (1904); was appointed member of a New York Advisory Board to the Art Department of the Panama-Pacific International Exposition, San Francisco (1915); appointed by French government (1915) attached honorario French commission to Panama-Pacific International Exposition (1915); member of honor of the Société des Artistes Français, Paris; and member of honor of the Société Nationale des Beaux-Arts, Paris; appointed chairman (1915) of the American Artists' Committee of One Hundred in charge of Relief Fund for the Families of American Artists. Among his best-known pictures are 'The Rain,' in the Metropolitan Museum; 'Une académie de peinture moderne'; 'An Examination;' (time of Louis XIII.); 'The Close of Day' (1881); 'The Hayfield' (1886); 'September,' in the National College, Washington, D. C.; 'A Maple in Blossom,' Municipal Gallery, Venice, Italy; 'At Break of Day,' Buffalo Free Arts Academy; 'October Morning,' and 'A Thunder Shower,' Brooklyn Institute of Art and Sciences.

COFFIN, a box or case designed to hold a corpse for interment or cremation. Coffins were used by the ancients mostly to receive the bodies of persons of some distinction. Among the Romans it was latterly the almost universal custom to consume the bodies with fire, and deposit the ashes in urns. Even at the present time coffins are not used in the East, either by Mohammedans or Christians. In Egypt coffins seem to have been used in ancient times universally. They were of stone, earthenware, glass, wood or a kind of pasteboard made by gluing cloth together. (See SARCOPHAGUS.) Coffins among Christians were probably introduced with the custom of burying. (See BURYING-PLACES.) The Plains Indians merely wrapped the body tightly in a buffalo hide or tribes constructed 'houses of the dead,' in which the corpse, fully dressed in his best, was placed. Maritime folk often bury their dead in canoes. See CREMATION.

COG-WHEEL, a wheel with cogs or teeth. See WHEEL-GEARING.

COGGESHALL, England, town, in the county of Essex, 42 miles northeast of London, on the left bank of the Blackwater. The place was once famous for the manufacture of a kind of haize, celebrated under the name of Coggeshall whites. It has manufactures of velvet,
silk and isinglass. Pop. of parish 2,365. The hamlet of Little Coggeshall is on the opposite side of the Blackwater, which is crossed here by an ancient bridge of three arches, said to have been built by King Stephen, who founded here also an abbey for Cistercians.

COGHETTI, có-gè’ti, Francesco, Italian painter: b. Bergamo, 4 Oct. 1804; d. Rome, 21 April 1875. He studied under Diotti di Casalimaggiore and Camuccini in Rome and was a profound student of Raphael. He settled in Rome and was for a number of years president of the Academy of San Luca. He is best known by his masterly frescoes in the basilician church at Savona. He adorned several Roman palaces with frescoes, and was knighted for his 'Condemnation of St Stephen.'

COGHLAN, kóg’lan, Charles Francis, American actor: b. Paris 1841; d. Galveston, Tex. 27 Nov. 1899. He was born of Irish parents, was educated for the bar in London, but went on the stage, making his American début in 1880 as Captain Absolute in 'The Rivals.' He took leading parts for many years, being a refined and capable impersonator of old school gentlemen. He wrote 'Jocelyn'; 'Lily Barter'; and other plays.

COGHLAN, Joseph Bullock, American naval officer: b. Frankfort, Ky., 8 Dec. 1844; d. New Rochelle, N. Y., 5 Dec. 1908. He was graduated in 1863 from the United States Naval Academy, and he at once saw service as ensign in the Civil War; in 1868 he rose to be lieutenant-commander, and later served successively on board the Richmond, Saugus, Monongahela and Indiana. In 1882 he was promoted commander, and in 1896 captain. As commander of the Raleigh of the Asiatic station from 1897, he took part in the battle of Manila Bay, 1 May 1898. On 2-3 May he commanded expeditions for the reduction of all Spanish batteries at the mouth of the bay, and on 7 July an expedition for the capture of Isle Grande, Sibuyan Bay, Luzon. He was commissioned rear-admiral in 1902 and appointed to command the Caribbean squadron of the North Atlantic fleet 1902-04; was appointed commandant of the New York navy yard, 1904, which important post he held for two years, retiring in December 1906.

COGHLAN, Rose, American actress: b. Peterborough, England, 1853. She is a sister of the late Charles Coghan, played soubrette parts at the Theætre Royal, Cheltenham, later becoming leading lady, went to London and traveled through the provinces in burlesque and comedy. She came to the United States in 1872 with Lydia Thompson, and soon after joined E. A. Sothern. She returned to England and supported Barry Sullivan and in 1880-89 was leading lady with Wallack. She has starred since then in various companies in the United States and England, became a naturalized citizen of the United States in 1902 and engaged in stock raising in Montana. Consult Strang, 'Famous Actresses of the Day in America' (Boston 1899).

COGHAN, Timothy Augustine, Australian statistician: b. Sydney, New South Wales, 9 June 1836. He was educated in his native city and in 1888 became assistant engineer for rivers and harbors. In 1886-1905 he was government statistician for New South Wales. He was also registrar of friendly societies 1886-1905, and chairman of the board of old age pensions 1901-05. He served on various royal commissions, was president of the conference of Australian and New Zealand statisticians to determine number of representatives in each state in the Federal Parliament and to arrange for uniformity in the census of 1901. In 1902 he was president of the Australian Society for the Advancement of Science. He has published 'Wealth and Progress of New South Wales'; 'Picturesque New South Wales'; 'The Seven Colonies of Australasia'; 'Discharge of Streams in Relation to Rainfall'; 'Childbirth: a Study in Statistics'; 'Notes on the Financial Aspect of Federation'; 'Report on the Eleventh Census of New South Wales'; 'Deaths of Women in Childbirth'; 'Child Measurement'; 'Decline in the Birthrate of Australia and New Zealand'; 'Statistical Account of Australia and New Zealand.'

COGNAC, kón-yák, in southwest France, in the department of Charente, on the Charente River, 22 miles west of Angoulême. It is situated on a hill crowned by an old castle. It contains a 12th century church, was a Huguenot stronghold, and suffered much in the religious wars of the 16th and 17th centuries. It is famous for the brandy which bears its name and which is exported to all parts of the world, chiefly to England, the north of Europe and America. Some English houses, established here in 1780, began the manufacture of this brandy and developed its enormous trade. Pop. 19,188.

COGNET, kón-yák, Leon, French historical and portrait painter: b. Paris, 20 Aug. 1794; d. there, 20 Nov. 1880. He studied under Guerin, obtained the Grand Prix de Rome in 1817 and became a member of the Institute in 1849. His first picture of note was 'Marius among the Ruins of Carthage' (1824), now in the Museum of Toulouse. His other works include 'The Massacre of the Innocents,' and his masterpiece, 'Tintoretto Painting the Portrait of His Dead Daughter' (1845) in the Bordeaux Museum. Of his portraits he mentioned the 'Maréchal Mousse,' 'Louis Philippe' and 'M. de Crillon.' He decorated several ceilings in the Louvre and the Halle de Godechaux in the Hôtel de Ville, Paris, and a chapel in the church of Madeleine. At first he painted in classical style, but later adopted the methods of the Romanticists. His pictures are careful in composition but lack imagination and strength of color. Many famous artists of a later day were pupils in his studio.

COGNIZANCE, an old term in common law signifying legal jurisdiction or acknowledgment of a fact entailing certain legal consequences. The term is used in the United States to signify a general sense of jurisdiction as in the phrase "to take cognizance of a cause of action." In pleading, cognizance signifies a formal acknowledgment of an act alleged. In former times cognizance of pleas was jurisdiction of causes, a privilege granted by the king to a city or town to set up a tribunal for the trial of suits. The term is also used in heraldry to signify some distinguishing mark as a crest or badge.
COGNOVIT, in law, a written confession given by the defendant that the action of the plaintiff is just, or that he has no available defense.

COGSWELL, Joseph Green, American librarian and bibliographer: b. Ipswich, Mass., 7 Sept. 1780; d. Cambridge, Mass., 26 Nov. 1878. He was graduated at Harvard in 1806 and practised law for a few years in Belford, Me. He was a tutor at Harvard 1813-15 and after four years of study in Europe he was made professor of geology and mineralogy and librarian at Harvard. In 1823, in connection with George Bancroft, he founded the famous Round Hill school at Northampton, Mass., the plan and methods of instruction being based on an examination of the best English and German systems of education. The school was discontinued in 1836. After a period of editorship of the New York Review, Cogswell, with John Jacob Astor, Fitz-Greene Halleck and Washington Irving, formulated the plan of the Astor Library. Cogswell was appointed its chief (1848), a place for which his remarkable attainments as a bibliographer eminently qualified him. He went abroad to purchase books and laid the foundation of the present collection with rare discrimination and economy. He presented it to his own fine collection of bibliographical works and prepared a catalogue of its contents. Advancing years caused his retirement in 1861. He was a frequent contributor to the leading reviews, such as the American Review, Backwoods and the Monthly Anthology. Consult Ticknor, Life of Joseph Green Cogswell as Sketched in his Letters (Cambridge, Mass., 1874).

COGSWELL, Mason Fitch, American physician: b. Canterbury, Conn., 28 Sept. 1761; d. Hartford, Conn., 10 Dec. 1830. He was adopted by Samuel Huntington, president of the Continental Congress and governor of Connecticut, and was graduated valedictorian at Yale 1780. He studied medicine with his brother James, at the soldiers' hospital in New York during the Revolution, and eventually became one of the best known surgeons in the country. He was the first in the United States to remove a cataract from the eye, and to tie the carotid artery (1800). Mainly through his influence the first deaf-mutes was founded in this country at Hartford, and his daughter Alice was its first pupil. He was also a founder of the Retreat for the Insane in the same city.

COHABITATION, the act of a man and woman in living together as husband and wife. It does not necessarily include the notion of sexual intercourse between the parties, but is commonly held, even in law, to do so, and this is always the case when the parties are unmarried. Applied to husband and wife it may mean only consortium. Cohabitation raises a legal presumption of marriage between the parties cohabiting which may be rebutted by other evidence. See MARRIAGE.

COHAN, George Michael, American comedian and playwright: b. Providence, R. I., 1878. When nine years old he appeared in 'Daniel Duryea,' and during a family tour of the country went with "The Four Cohans." They were among the greatest attractions on the vaudeville stage. From 1899 to 1914 George M. Cohan wrote and produced a great number of musical comedies, usually appearing himself in the principal part. These played included such successes as 'Little Johnny Jones'; 'The Governor's Son'; 'Forty-Five Minutes from Broadway'; 'George Washington, Jr.'; 'The Yankee Pedlar'; 'Get-Rich-Quick Wallingford'; 'Broadway'; 'Seven Keys to Baldpate.' In 1914 Mr. Cohan retired from the control of his several theatres in New York to devote himself exclusively to writing and composing.

COHEN, Alfred J. See DALE, ALLEN.

COHEN, Emil, German mineralogist: b. Jutland 1842; d. 1905. He was educated at Berlin and at Heidelberg and was assistant in mineralogy at the latter university in 1867-72. In 1872-73 he traveled in South Africa and after his return spent some years in preparing accounts of his exploration there. In 1878 he became professor of petrography at Strassburg, and in 1885 was appointed to the chair of mineralogy in Greifswald. He published 'Geognostisch-petrographische Skizzen aus Sudafrica' (1877); 'Externe Bemerkungen zu der Routenkarte einer Reise von Lyndenburg nach den Goldfeldern und von Lyndenburg nach der Delagoaost im ostlichen Sudafrica' (1875); 'Sammlung von Mikrophotographien zur Veranschaulichung der mikroskopischen Struktur von Mineralen und Gesteinen' (1883; 3d ed., 1899); 'Meteoritenkunde' (2d ed., 1903).

COHEN, Henri, French numismatist: b. Amsterdan, Holland, 1808; d. 1880. He was for several years curator of the numismatic collection in the National Library in Paris. He wrote several valuable works including 'Description générale des monnaies de la république romaine' (1857); 'Description historique des monnaies frappées sous l'empire romain' (7 vols., 1868; 2d ed., prepared by Peuardt, 1880 and seq.); 'Guide de l'amateur de livres à vignettes du XVIIe siècle' (1870; 5th ed., 1886). Cohen enjoyed also a reputation as a composer and writer on the theory of music.

COHEN, Henry, American rabbi: b. London, England, 7 April 1863. He was educated in London, was ordained rabbi in 1884 and held pastorates at Kingston, Jamaica, 1884-85, Woodville, Miss., 1885-88, and Galveston, Tex., since 1888. He is honorary vice-president of the Jewish Publication Society of America. He has published 'Six Hundred Talmudic Sayings' (1894; 2d ed., 1910); 'Prayer in Bible and Talmud' (1894); many pamphlets on historical and biblical subjects. He contributed nine articles to the 'Jewish Encyclopedia.'

COHEN, Hermann, German philosopher: b. Koswig 1842. He was educated at Breslau, Berlin and Halle, and in 1875 was appointed professor at Marburg. He is a prominent leader of the Neo-Kantian school and his interpretations of Kant's critical philosophy are of permanent value. He has done as much as anyone else to make Kant's writings popular with students. His writings include 'Kant's Theorie der Erfahrung' (1871; 2d ed., 1895); 'Kant's Begründung der Ethik' (1877); 'Platon's Ideenlehre und die Mathematik' (1879); 'Ein Bekenntniss und die Judenfrage' (1880); 'Kant's Begründung der Aesthetik' (1889); 'System der Philosophie' (1902-06); 'Kommentar zu Kant's Kritik' (1907); 'Religion und
COHEN—COHESION

COHEN, Jacob da Silva Solis, American physician: b. New York, 28 Feb. 1838. He was graduated M.D. at the University of Pennsylvania 1860, and in 1861 became assistant surgeon of the 26th Pennsylvania regiment, serving with the expedition to Port Royal and with the South Atlantic blockading squadron till January 1864, and subsequently acting assistant surgeon in army hospitals. In 1866 he settled in practice in Philadelphia, and has made a specialty of diseases of the throat and chest. He also accepted a professorship in the Philadelphia Polyclinic and College for Graduates in Medicine. He is now professor emeritus of diseases of throat and chest at Philadelphia Polyclinic and honorary professor of laryngology of Jefferson Medical College. He has written many important articles and books on these topics, of which are: 'Diseases of the Throat and Nasal Passages' (2d ed., 1879); 'The Throat and the Voice' (1880); 'Treatise on Inhalation'; 'Group in its Relations to Tracheotomy', and since 1880, 30 other special studies, which have been published in the New York Medical Journal, Philadelphia Medical News, etc.

COHEN, Katherine M., American artist: b. Philadelphia, 18 March 1859; d. Philadelphia, Pa., 14 Dec. 1914. Receiving her early training at private schools and at Ogontz, Pa., she displayed a taste for art which was developed by study at School of Design, Pennsylvania Academy of Fine Arts, Students' Art League under St. Gaudens, and six years in Paris schools. She was engaged in sculpture after 1880 and her chief works have been portraits and bas-reliefs, decorative works and paintings of figure and landscape. Among her principal successes have been Portrait of General Beaver for Smith Memorial, Fairmount Park; 'The Israelei'; 'Priscilla'; 'Rabbi-hen-Era'; 'Rommola'; 'Lorna Doone.'

COHEN, Mendes, American civil engineer: b. Baltimore, 4 May 1831; d. there, 13 Aug. 1915. Educated in private schools he soon displayed a bent toward engineering and engaged in practical study at the locomotive works of Ross Winans, Baltimore, 1847-51. His active service became continuous, first in the engineer corps of the Baltimore and Ohio Railroad 1851-55; then as assistant superintendent Hudson River Railroad 1855-61; and 1861-63, as president and superintendent Ohio and Mississippi Railroad (of Illinois). For some years he was engaged in the special service of the Philadelphia and Reading, and became comptroller and assistant to the president of the Lehigh Coal and Navigation Company. In 1894 he was appointed by President Cleveland as member of the board to examine and report a route for the Chesapeake and Delaware Ship Canal. In Baltimore he was long honored with important civic trusts.

COHEN, Solomon Solis, American physician: b. Philadelphia, 1 Sept. 1857. He was graduated from the Central High School in 1872 (with the degree of A.B.) and after some years of work as a bookkeeper and teacher studied medicine and was graduated from Jefferson Medical College in 1883. From 1888-1902 he was lecturer in, and since 1902 has been professor of clinical medicine at, Jefferson Medical College, and from 1889-1902 professor of clinical medicine and therapeutics at Philadelphia Polyclinic and College of Physicians in Medicine. He was president of the Philadelphia County Medical Society, 1898-99, and recorder of the American Association of Physicians, 1902-13. His published writings include 'Therapeutics of Tuberculosis; Aspects of Diagnosis'; and he has edited 'A System of Physiologic Therapeutics.' He has written many papers for scientific societies and encyclopedias and has been on the editorial staffs of a number of medical journals. He has written much verse, including translations from medieval Hebrew poets, published only in periodicals and anthologies. His most noted original poems are: 'I know that my Redeemer Liveth'; 'At the Gates of God'; 'When Love passed by'; 'Love called Me not away'; 'From Master in Master.' He was one of the founders and editors of the American Hebrew. Wrote an essay, 'A Menace to Freedom' (Arena 1898) in warning and protest against proposed seizure of the Philippines, and was a founder and vice-president of the Anti-Imperialistic League; is an ardent advocate of Single Tax and has published a number of papers, especially 'Tuberculosis: An Economic Problem,' to show relation between taxation and health; 'How to Keep Well'; 'Hygienic Abstracts of the Mosaic and Rabbinic Legislation.' He has written in favor of Zionism, and represented American Federation of Zionists in 3d Zionist Congress. He was a founder and trustee of Jewish Theological Seminary of America and is trustee of Gratz College.

COHERER, an electrical instrument, part of the receiver in Marconi's system of wireless telegraphy, consisting of a small glass tube about one and a half inches long, into which two silver plugs are tightly fitted. A small gap separates these plugs, and a mixture of nickel and silver filings is placed. See Electrical Terms; Telegraphy, Wireless.

COHESION, the force by which the various particles of the same material are kept in contact, forming one continuous mass. Its action is seen in a solid mass of matter, the parts of which cohere with a certain force which resists any mechanical action that would tend to separate them. In different bodies it is exerted with different degrees of strength, and it is measured by the force necessary to pull them asunder. Cohesion in liquids is very much weaker, the parts being disjoined with much more facility; and in substances existing in the gaseous form it is entirely overcome, the particles repelling instead of attracting each other.

Cohesion in bodies is weakened or overcome by two general causes—by the repulsion communicated by heat, or by the attraction which may be exerted by the particles of one body on those of another.

Heat communicated to a solid body always diminishes the force with which the attraction of aggregation or cohesion is exerted; if the heat be increased to a sufficient extent the cohesion is so far weakened that the body passes
into the liquid form; and if carried still farther, the attractive force is still more completely overcome and the body passes into the gaseous state. See GASES, GENERAL PROPERTIES OF.

The same effects are produced by the exertion of that attraction which unites the particles of one body with those of another. If a liquid be poured on a solid, it often happens that their mutual attraction is sufficiently powerful to overcome the cohesion of the solid; its particles are consequently disunited, to combine with those of the liquid, and it entirely disappears. This forms the process of solution (q.v.).

When these powers are withdrawn, cohesion resumes its force, but with results which are different, according to the circumstances under which this happens. When the attraction of aggregation is suddenly and forcibly exerted the particles are united, in general, indiscriminately, and according to no regular law. If a body which has been melted is suddenly cooled to a sufficient extent, it becomes solid and forms a mass of no regular structure or figure; or if its cohesion has been suspended by the chemical attraction exerted by another body toward it, and if this attraction suddenly ceases to operate, the force of cohesion is resumed, and the solid substance appears in the form of a powder. This latter case forms the chemical operation denominated precipitation (q.v.). But if the force of cohesion is exerted more slowly, the particles are united, not indiscriminately, but usually with regularity, so as to form masses of regular structure and figure, bounded by plane surfaces and determinate angles. This forms the operation of crystallization; and such masses are denominated crystals (q.v.). See STRENGTH OF MATERIALS.

COHESION FIGURES. When small drops of various liquids lighter than water, and slightly soluble in it, are allowed to fall on the surface of perfectly pure water, the drops form curious figures on account of the difference between the capillary tension of the air surfaces of the liquids. (See CAPILLARITY.) These are called cohesion figures. They were investigated by the late Mr. Tomlinson, the results of whose researches are published in various papers in the Philosophical Magazine since October, 1851. Grosote, for example, forms a disc which sails about on the surface with a rapidly quivering motion. The figures last for a short time, gradually disappearing as the drop becomes dissolved in the water. The slightest impurity in either liquid changes the figure by altering the superficial capillary tension of the liquid. Hence Mr. Tomlinson proposed to observe the figure as a test of the purity of certain essential oils.

COHN, Adolphe, American educator: b. Paris, France, 29 May 1851. He was graduated from the University of Paris in 1868 and served as a volunteer in the French army during the Franco-German War from July 1870 to February 1871. In 1873 he came to New York and taught languages for some years, when his ability secured him a tutorship in French at Columbia University in 1882, in which he served as instructor for two years. He was instructor at Harvard 1884-85, and assistant professor in French 1885-91. In 1891 he became professor of Romance languages and literature at Columbia, which position he still holds. He is a singularly successful teacher, and many of his pupils hold posts of prominence. He delivered the lecture on French literature in the Columbia University Lectures on Literature 1911. In addition to numerous contributions to literary periodicals, he has published 'Voltaire's Prose' (with Woodward, 1897); 'Le Sage's Gil Blas' (with Sanderson, 1899); 'Montaigne' (in 'French Classics for English Readers,' 1907). He is editor, with Curtis Hidden Page, of a series called 'French Classics for English Readers.'

COHN, Ferdinand Julius, German botanist: b. Breslau 1828; d. 1898. He was educated at the universities of Berlin and Breslau, began his connection with the latter institution in 1850 and was appointed full professor there in 1871. He made several invaluable contributions to our knowledge of the physiology and morphology of plants. He made very careful studies of the lowest forms of plant life, which greatly aided the study of bacteriology. He also made a microscopic analysis of the body. He wrote a very great number of papers on professional topics and the following works: 'Zur Naturgeschichte des Protococcus pluvialis' (1850); 'Untersuchungen über die Entwicklungsgeschichte der mikroskopischen Algen und Pilze' (1853); 'Die Wunder des Blutes' (1854); 'Anthrax' (1876); 'Neue Untersuchungen über Bakterien' (1872-75); 'Die Pflanze Vorträge aus dem Gebiete der Botanik' (2d ed., 1875-97). He also edited the Beiträge zur Biologie der Pflanzen und ihr Beziehungen zu Schlesien. Consult Cohn, Pauline, 'Ferdinand Cohn, Blätter der Erinnerung' (Breslau 1901).

COHN, Gustav, German economist: b. Marienwerder 1840. He received his education at Berlin and Jena. He made a tour of England in 1873 and there gathered material for his 'Untersuchungen über die englische Eisenbahnpolitik' (1874). He was made professor of political science at Göttingen in 1884 and in 1892 served on the Imperial Commission to investigate the business and credit of the Exchange. He has written 'System der Nationalökonomie' (1885, 1898; Eng. trans. in the 'Economic Studies' of Chicago University); 'Zur Geschichte und Politik des Verkehrswesens' (1900); 'Zur Politik des Deutschen Finanz-, Verkehrs- und Verwaltungswesens' (1905); 'Über die staatswissenschaftliche Vorbildung zum höheren Verwaltungsdienst in Preußen' (1900); and 'The Science of Finance' (tr. by Veblen, 1893).

COHNHEIM, kön'hüm, Julius Friedrich, German pathologist: b. Demmin, Pomerania, 1839; d. 1884. He studied medicine at Berlin and Würzburg and other universities and joined the pathological institute of La Charité, Berlin. He became professor of pathology at Kiel in 1868. From 1872 to 1873 he was professor at Breslau and from 1873 until his death was professor at Leipzig. Cohnheim was the first to demonstrate that pus is composed largely of white blood corpuscles. He published 'Untersuchungen über die embolischen Prozesse' (1872); 'Neue Untersuchungen über die Entzündung' (1873); 'Vorlesungen über allgemeine Pathologie' (1880); 'Die Tuberkulose vom Standpunkte der Infektionslehre' (1881). Consult biography by Kühne in 'Gesammelte Ab-
COHOBATION—COIMBRA

handlungen von J. F. Cohnheim' (Breslau 1885) and Ponick, 'Gedachtinissrede auf Cohnheim' (Breslau 1884).

COHOBATION, an operation in which a fluid is converted into vapor by heat, and is then condensed, but instead of being collected in a separate receiver, as in distillation, it is made to flow back into the heated vessel. It is employed to produce a change in the fluid by continued heating, but more frequently to subject some substance to the action of a fluid without either loss of the latter or the necessity of adding fresh quantities of it.

COHOES, kō-hōz', N. Y., city of Albany County, at the confluence of the Mohawk and Hudson rivers, near the debouching point of the State Barge Canal, and on the New York Central and the Delaware and Hudson railroads, nine miles north of Albany and opposite the northern part of the city of Troy. The Mohawk River has a fall of over 70 feet at this point, and supplies great power, making Cohoes a very important manufacturing community. The Mohawk River is crossed by a dam above the falls, and the water is supplied to the mills and factories by means of canals. The principal manufactures are hosiery and knit goods, foundry and machine shop products, paper boxes, lumber and planing mill products, patent medicines, saddlery and harness, printing and publishing, etc. The United States census of manufactures for 1914 recorded 106 industrial establishments of factory grade, employing 6,179 hands and earning $2,792,000 in wages. The capital invested aggregated $14,469,000, and the year's output was valued at $11,706,000; of this, $5,136,000 was the value added by manufacture. The city has fine public buildings, schools, churches, well-paved streets, a modern sewer system, municipal waterworks and filtration plant and is connected with Albany, Troy and other neighboring cities by electric street railways. Cohoes was first settled by the Dutch, and for some time a portion of the city was included in the Rensselaer Manor. It was chartered as a city in 1870. Pop. 25,000.

COHORT, a division of the Roman army, the tenth part of a legion, containing three maniples or six centuries. The number of men varied with that of the legion, the 10 cohorts always containing an equal number. When the legion numbered 4,000 men, the cohort consisted of 60 triarii, 120 principes, 120 hastati and 100 velites, in all 400 men. The centurion of the first century of the first maniple of the first cohort was the guardian of the eagle or colors of the legion, and hence the first cohort was always regarded as superior in dignity to the others.

COHOSH, kō-hōsh' (Cimicifuga racemosa), also called black snakeroot, is a plant belonging to the crowfoot family (Ranunculaceae). Besides this species there are about four others called cohosh, herb-christopher and rattle-snake herb, which are widely distributed from Nova Scotia and Anticosti, south to Georgia, west to Utah and northward to British Columbia. It is an erect perennial herb growing in the woods. The plant has powerful medicinal properties and is a valued remedy in rheumatism, epilepsy, etc. The blue cohosh (Caulophyllum thalictroides) is a powerful anti-spasmodic and emmenagogue. It is also a diaphoretic and diuretic, and has been used successfully in this country as an anthelmintic.

COIF (French coiffé) (1) the badge of sergeants-at-law, who are called sergeants of the coif, from the lawn coif which they wore under the hood when created. Sergeants of the law. (2) The cap worn by women of religious orders, usually white, and worn under the veil. (3) The name sometimes given to the small cap worn by monks who have the tonsure.

COIMBATORE, kō-im-bā-tōr', or COIMBETTOOR, British India, an inland district in the south of Madras presidency, with an area of 7,860 square miles. The country has on the west and south the Nilgiris and Anaimalais ranges, and on the north the Eastern Ghauts. On the east it is bounded by Salem and Trichinopoly. It is fertile, producing sugar, cotton, rice and tobacco; and well watered by several rivers. The climate is very malarious in some parts. The principal towns are Coimbatore, Erroad and Caroor. In 1799, on the death of Tipoo and the division of his territories, Coimbatore was ceded to the East India Company. Pop. 2,300,000.

COIMBATORE, British India, city and capital of the district of Coimbatore, situated at the foot of the Western Ghauts, on the river Noel, 305 miles southwest of Madras by rail. It has wide streets, is well built and well drained, has an agreeable climate and is suitable for the residence of Europeans than most Indian towns. Cotton-spinning, tanning and coffee-curing are among the industries. It suffered much in the wars waged with the British by the Mysore sovereigns, passing finally into British possession in 1799. Pop. 47,007.

COIMBRA, kō-em-brā', Portugal, capital of the province of Beira, on a hill above the Mondego River, here crossed by a stone bridge, 115 miles by rail north-northeast of Lisbon. Its streets are steep and narrow, its manufactures confined chiefly to earthenware and combs, and its interest consists mainly in its university associations. The place derives its name from the Roman Conimbriga, traces of which lie to the south; it was held by the Goths and from them passed to the Moors, from whom it was finally conquered in 1064 by Fernando the Great, aided by the gallant Cid. Coimbra was the capital of Portugal for about two centuries and a half from its creation into a kingdom in 1139, and many of the early kings are buried in and around the old town. Of the public buildings, the most noteworthy are the older of the two cathedrals, the church of San Salvador and the ruined convent of Santa Clara; across the river is the Quinta das Lagrimas, "House of Tears," where Inez de Castro was murdered. Pop. 18,424. The University of Coimbra, with the exception of the University of Lisbon (founded 1910), the only one in Portugal, was originally established at Lisbon in 1290, but was transferred here permanently in 1337. It has five faculties and some 1,400 students; attached to it are a museum, an observatory, a botanical garden, laboratory, hospitals and a large and valuable library.

COIMBRA, University of, a national university of Portugal and until 1910 the only university in that country. It was founded in
1290 by King Diniz at Lisbon. It was transferred to Coimbra in 1308, receiving at the same time a new charter. For the succeeding 80 years its seat was changed several times from Coimbra to Lisbon and back again to Coimbra. In 1380 it was settled at Lisbon, but in 1537 it was transferred again to Coimbra where it has since remained. Camoes was one of its members in 1537. It is the only continental university which has preserved the mediaeval academic dress. It has faculties of law, medicine, mathematics and philosophy, a library, hospitals, an observatory, museums and laboratories. There are about 1,400 students enrolled. Consult Braga, 'História da Universidade de Coimbra' (Lisbon 1892).

COIN, Spain, city in the province of Malaga, 18 miles west-southwest of the city of Malaga. Surrounded by vineyards and fruit groves, it consists of well-built houses, spacious and clean streets, three squares—in the centre of the largest square is a handsome fountain. The chief manufactures are linen and wooden fabrics, esparto mats, soap, paper, hempen sheets and oil. The exports are cattle, grain and fruits. In the neighboring hills are marble quarries and jasper of all colors. Pop. 13,000.

COIN, a piece of metal, circulating as money with an official certified impression as to weight, fineness and value. United States coin as described further on is nine-tenths fine; that of Great Britain eleven-twelfths fine. The place where coin is manufactured is called a mint and it is always a monopoly exercised by an established government. The mint of the United States was authorized by Act of Congress 1792, and its general operations began in 1793. At that time the appliances of coining were few and crude, the striking of coin being by the old screw hand-press and the annual output confined to narrow limits. It was not until 1836, when the mint was removed from Seventh street, Philadelphia, to more commodious quarters at Chestnut and Juniper streets, that improved appliances were introduced. At that time coin was coined the old-fashioned way, by Thonnelier, a Frenchman, who was introduced, and greatly facilitated the process of minting. Twenty years later this press was remodeled and much improved, continuing in use for 14 years, when it was superseded by the perfected machines now in use. The introduction of the steam coining-press inaugurated the improvements which have made the mint of the United States one of the finest equipped mints in the world. From 1836 to the present time the progress of the mint has been largely experimental. New and improved machinery has been added from time to time and improved scientific processes have been adopted. The humid assay process for determining the fineness of gold and silver was introduced in the year 1836. The platinum apparatus for the assay of gold was introduced in 1867. This was an English invention and a great improvement upon the method formerly in use. Automatic machines for the separation of coin blanks into "standard," "heavy," "light" and condemned "light" were introduced in 1877. Improved rolls for converting ingots into coin strips, as well as gas annealing furnaces, may be said to have completed the equipment of the mint.

The organization of the mint, under the original and subsequent Acts of Congress, and until 1873, provided for a director, located at the parent mint at Philadelphia, an assayer, melter and refiner, coiner and engraver, being designated as "operative officers." The director was subject to the orders of the Secretary of the Treasury. After the creation of branch mints and assay offices the heads of such institutions reported to the director at Philadelphia. By the Act of 1873 the mint was reorganized, with a bureau at Washington, where the director was located. The resident chief officer at the mint was that by Act designated as superintendent, ranking with the chief officers of the mints at San Francisco and at New Orleans and the chief of the assay office at New York. The chief officers of the branch mints and minor assay offices were designated as "assayers-in-charge," reporting to the director at Washington. The mint service is now under this reorganized form. The superintendents and the operative officers are appointed by the President and hold their official positions at his pleasure.

The processes of the mint can best be considered under the head of routine. The mint purchases at its counter all gold presented in value not less than $100, providing the deposit is not too base for commercial conversion into coin or fine bars. All deposits are made with the weigh clerk at the weigh room, who carefully weighs the same on the delicate balances, which are adjusted to show variations of one-hundredth of a Troy ounce. The weight is carefully recorded in the books of the weigh clerk and registrar of deposits, together with the description of the bullion and the name of the depositor, both officers being present and carefully noting the same. The deposit is then locked in a copper box and sent to the deposit melting room, where it is melted and cast in the form of a bar. From this bar the assayer cuts clips, weighing from 18 to 20 one-hundredths of an ounce, two clips being cut from the upper side at one end, the other from the under side at the other end. These clips are assayed separately to determine the homogeneity of the metal. This assay determines the proportions of fine metal in the bar, and upon this assay the money value is determined and the depositor is paid. The loss of weight by melting is carefully noted and recorded. A slight allowance is made after melting to the melter and refiner and the weight so established becomes the true weight. As soon as the fineness of a day's deposits is reported by the assayer, they are delivered to the melter and refiner, and by that officer sent to the refinery, where the silver is separated from the gold and the base metals eliminated wholly, only the precious metals being accounted for.

The next step in the conversion of bullion into coin is the assembling of the refined metal into "melts" of about 3,000 ounces to which sufficient copper is added to render the melted mass 900 parts fine, and to determine the fineness of United States gold and silver coin. When melted the metal is cast into ingots of the size proper for the production of the coin
required. This alloy is rigidly tested by assay, and if found standard within the legal tolerance it is so declared, and the ingots are delivered to the coiner for conversion into coin. They are first sent to the rings, 'broken down,' annealed and delivered at the finishing rolls, where they are converted into coin strips of the requisite thickness for coin blanks. The strips are then taken to the cutting machines, where they are converted into coin blanks which go to the selecting tables for the elimination of imperfect pieces and fragments. The accepted blanks are then sent to the adjusting room, where, if gold, each piece is weighed, the heavy pieces being reduced by filing and brought within the limit of legal tolerance. If the blanks be silver they are passed through automatic selecting machines which separate them into standards, heavies, lights, within tolerance and condemned lights. The blanks are next passed into a machine and "upset," or "milled," which process so raises the edge of the pieces as to protect the work on the stamped coin from abrasion. The blanks are then annealed, treated to a dilute sulphuric acid bath and cleansed and brightened, and when thoroughly dried are ready for the coining-process. These presses work automatically, the only hand action being to fill the feeding tubes. The pieces are automatically seized by conveyers and centred between the obverse and reverse dies within a collet a little exceeding the piece in diameter. The impact of the dies, brought together by the operation of a toggle joint, forces the metal to flow to the full diameter of the collet, which is grooved inside, and puts a fine reeding upon the edge of the coin. The finished coin is then automatically passed on and is followed by others, the delivery for large coins being at the rate of 80 or 90 per minute. Dimes are struck at the rate of 100 and 120 per minute.

The standard, heavy and light coins are then separately counted by gauge and made into drafts of $5,000 each, if gold, and drafts of $1,000 each of silver. As the standard weight of gold drafts of $5,000 is 268.75 troy ounces, the standard, heavy and light coins are mingled in due proportion to make that standard weight, no greater variation than one one-hundredths of an ounce being allowed. The standard weight of $1,000 in silver dollars is 859.375 ounces and of subsidiary silver 803.75 ounces, with a tolerance of two one-hundredths of an ounce. The perfected drafts are then weighed in the presence of the superintendent, enclosed in canvas bags and delivered to that officer. The mint balances are adjusted to the Troy pound (5,760 grains) which is the mint unit of weight. This weight is a duplicate of the Troy pound established by a royal commission in England in 1758, reconfirmed in 1859. It is kept in a safe in the Philadelphia mint. In order to secure an exact conformity in weight and fineness of United States coin, a fixed number of coins is taken from every delivery, scaled in the presence of the superintendent and the assayer, and deposited in a receptacle called "the pyx," each of the officers having a key, both keys being required to open the pyx. These reserved pieces await the assembling of the assay commission, annually appointed by the President to meet on the second Wednesday in February, when the pyx is opened and exhaustive tests of the weight and fineness of the contents are made.

Location and Equipment.—The principal mint of the United States is located on Spring Garden street, between 16th and 17th streets, Philadelphia. Other mints are at New Orleans, San Francisco and Denver. The equipment of the Philadelphia mint, which covers 58,000 square feet, consists of eight boilers of 1,200 horse-power capacity, for heating, ventilating and electric lighting. The transfer of power by shafting the machinery is chiefly accomplished by independent motors. The building is lighted by 4,000 incandescent and 16 arc lights. There are 51 telephones connecting the departments and various offices. A gas plant, capable of delivering upward of 20,000 cubic feet per hour, furnishes fuel for the melting, annealing and assaying furnaces. The ventilating is by fans operated by attached motors. The spacious melting department is equipped with 13 gas and 3 coal heated furnaces, with power topping machines. The coining department has 23 coining-presses with an average capacity of 110 pieces of finished coin, each, per minute; 10 milling or upsetting machines capable of an out-turn of an average of 500 milled blanks per minute; a full equipment of trams of break-down and finishing rolls; 8 strip annealing gas furnaces and 1 furnace for annealing blanks; 8 automatic presses for cutting blanks from coin strips; 6 automatic weighing machines for the separation of blanks into standards, heavy, light and condemned pieces, together with appliances for cleaning, whitening and drying blanks after annealing. The assaying department is equipped with every known appliance for determining the fineness of gold and silver, both by the platinum and the humid processes. The refinery operates largely the acid process of separating, but it has a plant for refining by electrolysis and the process has proved a success, considerably increasing the capacity of the refinery.

The engraving department provides all of the coin dies used in the mints of the United States. It has every facility for die-quenching, hubbing and annealing the steel from which dies are produced, as well as a geometric lathe for transferring designs. The department for the manufacture of medals of a national character is in charge of the engraver who provides the dies. The medal department is equipped with three hydraulic presses of the respective capacity for exerting a pressure of 1,100, 400 and 300 tons. These powerful presses are operated by electric motors. The machine shop has every appliance for the construction or the assembling and finishing of all machinery used in the mint. There are 20 steel-lined vaults for the storage of coin and bullion and for the use of the operative offices. One of these vaults is a floor-space of 5,200 square feet, with a storage capacity of 112,000,000 silver dollars. Another has a floor-space of 4,160 square feet. Six others have each a floor-space of 2,562 square feet. The basement vaults are built wholly underground, enclosing walls, with a free passageway around them. The doors are massive and provided with the finest locks procurable, to which time-locks are attached. More than 3,250,000 pounds of steel enter into the construction of these vaults. The vestibule is highly ornate, the cor-
COINAGE

The coinage process involves converting an authorized alloy of the money metals into the circulable coin of the country. The metal is alloyed and cast into ingots of sizes suitable to the production of the denomination of the coins required. Thus, for the double eagles, our largest coin, the ingot is cast 12 3/4 inches in length, 1 1/2 inches in width and half an inch in thickness. Such an ingot weighs about 80 ounces troy, of the approximate value of $1,498. The ingots for the eagle are cast 11 1/4 inches in length, 1 1/2 inches in width and half an inch in thickness. The weight of such an ingot is about 62 ounces troy. The half eagle requires an ingot 12 inches in length. 3/8 inch thick and 1 1/4 inches wide. Ingots are taken to the break-down rolls in drafts of about 50 ingots, where they are passed through the rolls several times, according as they prove more or less malleable. If passed through the rolls six times the dimensions of a double eagle ingot will be increased to 25 2/3 inches in length, 1 1/4 inches in width and 3/4 inch in thickness. The broken-down ingots are then sent to the annealing furnace, heated by gas fuel to about 1,500° F. and being laid singly upon a carrier traveling the whole length of the furnace, remain until the strips become a uniform cherry-red. They are then removed and plunged into a bath of cold water to remain until cool enough to handle. The strips are then wiped dry and passed on to the finishing rolls.

The next step will depend upon the condition of the metal. Should it retain indications of the hardness and springiness resulting to the break-down process, it is subjected to a second break-down. This is repeated four times. The strips are then taken to the finishing rolls or "rolls of precision." After being passed through these rolls four times the strips develop the required thickness and uniformity for the production of blanks. At this stage the double eagle strip attains a length of 47 3/4 inches, a width of 1 3/4 inches and is reduced to a thickness of 3/32 of an inch. For this purpose the strips are now cut in half by multiple shears and delivered at the cutting presses, where test planchets are cut from several strips and weighed to determine if the strip, when converted into planchets (coin blanks), approximates to standard weight. The cutting presses are automatic. The strip is seized by a grip and drawn under a steel punch working in a matrix cutting the planchets at the rate of 80 each minute. The planchets are next cleansed and sent to the selecting table where the imperfect pieces are separated from the perfect and the latter are sent to an adjusting room. The adjusting consists in the careful weighing of each blank separately to ascertain if it corresponds to the standard weight and tolerance, the latter being for double eagles and eagles 3/4 grain per piece, and 3/4 grain each for half eagles and quarter eagles. Pieces found in excess of legal weight and tolerance are reduced by filing the edges until they conform to the limit. Such pieces are placed by themselves and marked "heavies." Pieces a little less than the standard weight, but within the limit of legal tolerance, are placed in another receptacle and marked "lights." Those found of exact legal weight are placed in another receptacle and marked "standard." The planchets so adjusted are then taken to the milling machines by the operation of which a protecting edge is raised on each piece. This edge is to preserve the face of the coin from abrasion. When milled the planchets are conveyed to the cleaning room where they are annealed until of a cherry-red and then treated to a bath of dilute sulphuric acid, by which process they are thoroughly cleansed and brightened. The annealing of the planchets after the milling process having prepared them for the stamping, when cleansed and brightened they are washed in boiling water, dried by riddling in sawdust, when they are ready for the coining press. It will be understood that the descriptions of blanks, namely: "heavies," "lights" and "standards"—have been kept separate throughout the processes, and are never mingled until the coiner makes up the drafts of finished coin for bagging. The planchets therefore go to the presses by those divisions.

The coining press used in all first-class mints is a wonderful exhibition of mechanical skill. Its frame is of cast-iron of several tons' weight, with a central arch in which are placed the working parts. The frame combines stability and rigidity. The mechanism of the working parts is automatic. The setting of the dies is a work of precision and can be properly done only by a person, who, being a skilled mechanic, has reinforced his native ability by long experience. In order to set his dies properly he must take into account the condition of the metal to be stamped, whether it be soft and ductile or hard and brittle. Upon these qualities of the metal depends the distance apart of the dies at the moment of their impact. The blanks are fed into a vertical tube of equal
diameter, and when the press is in motion automatic fingers seize the bottom planchet by its periphery and carry it forward to a collar, a little larger than the piece to be stamped. The piece drops into the collar, and a toggle joint causes the dies to approach each other and exert a pressure of about 160 tons upon the soft planchet. The planchet, being ductile, is by this pressure made to fill the entire space within the collar, which is grooved, and imparts the rounding to the edge of the coin. The finished coin is automatically released and falls into a pan below, to be followed by other coins at the rate of 90 or 120 per minute. The first number relates to large gold coins and silver dollars, the latter to small gold and small silver coins. It should perhaps be stated here that while the essential processes in coining are the same in all modern mints, the routine is not uniform. In the mint of the United States the coin after stamping is returned to the adjusting room and each piece is weighed separately. The necessity for this arises out of the possibly defective rolling of the strip from which the blank is derived. The density of the metal varies somewhat, and there may be also defective sonority developed. To secure sonorous coin it is sometimes the practice to ring every piece (this relates to gold coin and silver dollars), and if any fail to give the proper tone they are rejected and sent to the melting pot. The pieces which stand the test are then returned to the coiner for conversion into uniform drafts for delivery to the superintendent or other officer authorized to receive and hold coined money of the government.

As a matter of law and regulation the coiner is required to make up gold coin into drafts of $5,000 of the uniform weight of 268.75 troy ounces. As the weight of the pieces separately weighed are not uniform, though all within the limit of legal tolerance, the coin is separated by the coiner into "heavies," "lights," and "standard." Gold coins may vary from one-fourth of a grain in the half and quarter eagles to one-half a grain in double eagles and eagles. The coiner takes "heavies," "lights," and "standards" in such proportions as will make drafts of 268.75 ounces and mingles them in the delivery pans. The drafts are then weighed, after counting the pieces in detail, and being found of the required weight, are set aside for final delivery. The drafts must not vary to exceed one hundredth of an ounce above or below the standard weight of $5,000, stated in the foregoing. Before delivery to the superintendent the latter takes a good number of pieces at random from the proposed delivery and carefully weighs them. If found within the legal limit of tolerance the delivery is accepted; but if the weight of any piece proves it outside of that limit the delivery is rejected, to be weighed, readjusted and recounted. It is proper to say that such a necessity seldom arises.

The practice now is to adjust all silver coins, excepting dimes. Dollars are made in drafts of $1,000 of the weight of 859.375 ounces. These drafts are constituted of "heavies," "lights" and "standards," and the only variation from that standard weight is two hundredths of an ounce. Subsidiary silver coin is delivered in drafts of $1,000, of a weight of 803.75 ounces, with an allowance of two one-hundredths of an ounce for half and quarter dollars, which are adjusted, and one one-hundredth of an ounce for dimes, which are not adjusted. It will be seen that all of the processes involved in the making money are works of precision, from the breaking down of the ingot to the issue of the perfect coin. All must be rigidly calculated, nothing can be left to chance. The presence of any of the base metals, as well as of the rare and valuable ones, may destroy the ingot for coining. Arsenic lead and antimony cause most of the unworkability of the money metals, but this disability is lessening through the process of advanced science.

Great advantages have been made in the processes involved in coining as conducted in modern times. The substitution of the coining press operated by power for the hand screw press of olden times practically revolutionized the business. The introduction of automatic weighing machines in the blanks into "heavies," "lights," "standards" and "condemned," has simplified the process of adjusting. In fact the silver coins, with the exception of dimes, are now separated by the automatic weighing machines, leaving the ingot in rolls for producing the coin strips from the ingot has made this new and rapid mode of selection possible. The draw-bench, made necessary to cure the defects of the rolls, has practically disappeared. Constant trying has produced rolls of such precision that the thickness of a coin strip can be regulated to the thousandths if required.

The automatic selecting machine in use at the mint of the United States at Philadelphia was invented and constructed by Seyesse, an Austrian, at Vienna. The blanks are fed into the machine through a vertical tube the size of the diameter of the blank. The feed is automatic and the pieces are conveyed into minute balances finely adjusted to grains, and by a complex and ingenious arrangement of parts are, according to weight, whether light, heavy, standard or condemned lights, shut into the conduits strictly according to their varying weights, and through these conduits, or ways, are delivered as will make the discharged end of the machine. The standard and the accepted light pieces are then ready for milling. The heavy pieces are adjusted by weighing on a delicate balance, and if found to exceed the legal tolerance are reduced by filing the edge of the piece. By this method the necessity for hand adjusting is minimized and the rapid production of coin greatly facilitated. Other automatic selecting machines are employed in the mints of foreign countries, but have not been found so satisfactory as the Austrian machine in this country.

One of the most difficult of the processes of coining has been the annealing process, because it is vital to the successful reduction of the ingot to the coin strip. Formerly the process was conducted in a furnace heated by wood fires. Much depended upon the fuel. Perfectly seasoned hard wood, preferably oak, was required for good work. In annealing gold strips in a wood furnace the strips were enclosed in metal cans, sealed to air tightness, and remained in the furnace about three-fourths of an hour. Silver strips were sometimes subjected to the heat for an hour or more.
In all annealing of strips in the wood-fire furnaces the strips were superposed unavoidably, and it was not always easy to determine when the draft reached a uniform cherry-redness. Delays and refractory metal were common with the old method of annealing. Besides, the method was the reverse of economical, owing to oxidation of the metal.

In substituting the gas annealing furnace for the wood-fire furnace the work of rolling the metal soon became a work of precision. A consideration of the work of annealing has also been included. The gas annealing furnace for strips has a heating chamber 10 feet in length, 17½ inches in width and 10 inches in depth. A score of hollow rolls, named conveyors, mounted on hollow shafts of cast-iron, are so ribbed as to divide the face into several parts conforming to the width of the strips. These ribs separate the strips and prevent superposition. The gas burners enter the heating chamber at the bottom and are in sections, in order to secure independence of the sections. A mixture of gas and air is injected along the whole length of the chamber. The strips are to be annealed are placed on the rolls at the entrance of the furnace, the rolls are rotated by worm wheels and the chambers expanded, and air is admitted to enter a hood at the discharge end of the furnace. In this hood the strips, now of a cherry-red, are met by a flame surcharged with gas to prevent oxidation. A spray of water is applied to the strips outside the hood to cool them before they reach the air. This prevents the oxidation of the copper with which the metal is alloyed.

The process described occupies about six minutes, instead of the hour or even more, by the wood-fire furnaces. The time required in annealing silver is about 20 or 25 minutes as to the larger denominations. Dimes, however, not being adjusted, and the coin strip being produced from the dollar ingot, require a more prolonged annealing. The improvement in annealing has made it possible to produce from the ingot strips as high as 83 to 96 per cent of standard blanks and blanks within the limit of tolerance, suitable for coining. This high percentage of good blanks is undoubtedly due to improved annealing and rolling. It is a higher percentage than that obtained when the defects in annealing and rolling were in part remedied by the draw-bench. As that machine is still employed in mints not strictly up to date, it may not be amiss to say, that in principle the draw-bench is a wire-drawing machine. As under the old mode of developing the ingot into the coin strip the ductility of the strip was not uniform, some parts being more refractory than others, and hence not reduced to a uniform thickness by the rolls, it was found necessary to pass the strips through a rigid die. The strips were then pointed so as to be firmly gripped by the nippers of the draw-bench which, retreating, drew the strip through the rigid die and gave it a uniform thickness, now imparted by rolls of precision without wasteful annealing. This improvement not only works a reduction of waste, but saves a delay between the finishing rolls and the cutting presses.

The largest gold pieces ever coined by the United States government are the 600 $50 pieces coined as souvenirs of the Panama-Pacific International Exposition. Up to 30 June 1915, the gold coinage of the United States was, in number of coins: Double eagles ($20) 120,757,306; eagles ($10) 51,122,910; half eagles ($5) 77,421,791; quarter eagles ($2.50) 17,260,490; $3 pieces 539,792; $1 (gold) 19,814,837. The silver coinage totals: Standard dollars 578,503,848; trade dollars 35,956,924; standard quarters 6,768,022; Columbian and other souvenier half dollars 5,110,000; quarter dollars 410,991,308; 20-cent pieces 1,355,000; dimes 733,837,547; half-dimes 97,604,383; 3-cent pieces 42,736,240; nickels 855,008,587. A 3-cent nickel piece and a 2-cent bronze piece have also been coined and a half-cent of copper. The cent has been coined in copper, nickel and for many years in bronze to the total of about 2,700,000,000. The total coinage of the country is in dollars $4,439,067,448.35. The principal foreign coins and their value in United States gold are: English, sovereign or pound sterling, $4.86; French and Swiss franc, $0.19; German mark, $0.23; Russian ruble, $0.51; Italian lira, $0.19; Swedish and Denmark crown, $0.27; Netherlands florin, $0.40; Spanish peseta, $0.19; Argentina, $0.90; Argentine, $0.36; Japanese yen, $0.50; Indian rupee, $0.32. See COIN and its cross-references. Consult 'Coinage Laws of the United States'; Hepburn, 'History of Coinage and Circulating Currency in the United States' (New York 1903).

JOHN H. LANDIS,
Former Superintendent of United States Mint,
Philadelphia.

COINS. See Currency.

COINS, Foreign, American Equivalent of.—As the monetary value of foreign coins is subject to frequent change, it is impossible to prepare a statement which would correctly specify the value of any particular coin at any future time. As such changes are correspondingly slight, however, the following list of the coins of all nations will always be comparatively correct, the values in the moneys of account of the United States having been corrected by the director of the mint, United States Treasury Department:

Argentina, Republic.—Gold coins: argentino ($4.824) and half argentino; silver coins: gold peso ($0.9056) and its divisions: paper peso ($0.4345).

Austria-Hungary.—By a law passed 2 April 1892, the monetary system of Austria-Hungary was reformed on a gold basis, with the crown as the unit. The gold coins issued under the old system are still in circulation, however. They are: gold: eight florins ($3.859), 4 florins, ducat ($2.827), and 4 ducats; silver: florin ($0.5032) and 2 florins. The coins under the new system are: gold: the 100 crown piece ($0.20), 20 crowns ($0.0432), 10 crowns ($0.023), silver: five crowns ($0.015), 2 crowns ($0.040), 1 crown ($0.008), nickel: twenty heller ($0.0045) and 10 heller; bronze: two heller, or 1 kreutzer ($0.0046), and 1 heller.

Belgium.—Belgium being a member of the Latin Union, its monetary unit is the franc ($0.193), and its coins the gold 10 and 20 franc pieces and the silver 5 francs.

Bolivia.—The boliviano ($0.3893) is the theoretical unit of Bolivia. In 1896 a monetary law was passed providing for the adoption of a gold standard. The unit of account is the gold peso of one-fifth of a pound sterling ($0.97) its coins, silver, are the boliviano, the 50, 20, and copper 10 and 5 centavos ($0.0011) pieces.

Brazil.—The mil reis ($0.546) is the monetary unit of Brazil. Its gold coins are 5, 10 and 20 milreis pieces; its silver coins, 1 and 2 milreis; nickel 1/10, 1/5, 1/2 and 1/5 milreis.

Bulgaria.—The monetary unit is the lev ($0.185) which is supposed to correspond to the franc of other double standard countries. In fact, however, it has been in circulation, the necessary gold coins being supplied by foreign 10 and 20 franc pieces. The silver coins are the 1, 2, and 5 levas pieces; the nickel coins are the 1, 2 and 5 stotinki ($0.0085), and there are copper coins of 1, 2, 5 and 10 stotinki.

Canada.—The gold dollar ($1) is the monetary unit. The silver coins are the 50, 25, 10 and 5 cent pieces. Penny (2 cents) and half penny pieces are in circulation.

Chile.—The value of the peso, the monetary unit, is
In Hongkong and Labuan, the "British Dollar" has the same legal value as the Mexican dollar.

Costa Rica.—The gold coin ($0.465) is the monetary unit. Other gold coins are the double condor ($0.9327) and the 5 and 5 peso pieces. The silver peso ($0.9327) and the 5 and 5 peso pieces. The silver peso ($0.9327) and the 5 and 5 peso pieces.

Cuba.—The gold coin ($0.465) is the national currency. Other gold coins are the double condor ($0.9327) and the 5 and 5 peso pieces. The silver peso ($0.9327) and the 5 and 5 peso pieces.

Florida.—The gold coin ($0.465) is the national currency. Other gold coins are the double condor ($0.9327) and the 5 and 5 peso pieces. The silver peso ($0.9327) and the 5 and 5 peso pieces.

Gold and silver.—The gold coin ($0.465) is the national currency. Other gold coins are the double condor ($0.9327) and the 5 and 5 peso pieces. The silver peso ($0.9327) and the 5 and 5 peso pieces.

In Brazil.—Although the United States gold dollar was adopted as the standard of value, the Mexican silver coin was the currency unit. The peso ($0.193) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Russia.—The ruble ($0.515) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Spain.—The peseta ($0.193) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Sweden and Norway.—The gold coin ($0.268) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Switzerland.—The gold coin ($0.268) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Turkey.—The piaster ($0.04) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Uruguay.—The peso ($0.134) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In Venezuela.—The bolivar ($0.193) is the national currency. Other gold coins are the 5, 5, 10, and 20 cent pieces. The silver coin is the 5, 5, 10, and 20 cent pieces.

In China.—The monetary system of China is in an extremely chaotic condition. The unit and coinage is divided into 20 cash, each cash is equal to one cent. The silver tael, or liang, varies in value in different parts of the country, as follows:

In Belgium.—The only official coin of Belgium is the gold coin ($1).
COIR, the outer coating of the coconut, often weighing from one to two pounds; when stripped off longitudinally it furnishes fibres from which are manufactured matting, bagging, sacks, ropes and cables. The general preparation is simple; after being soaked for some months in water the fibrous coats become soft; they are then beaten to remove the other substances with which they are mixed, which fall away like sawdust. The fibres thus cleaned are ready for being spun into long yarns, woven into sashcloth or twisted into cables. Cordage made of this material rots in fresh water and snaps in frost, but from the fact of its being strengthened by salt water, and its extreme buoyancy as compared with hemp cables, floating as it does in water, and also its great strength and elasticity, it is preferable in many respects to ropes of hemp. It has been proposed to employ it in the construction of deep-sea telegraph cables, as being much cheaper and lighter than gutta-percha.

COIRE, kwär, or CHUR, Switzerland, capital of the canton of the Grisons, on the rivers Plessur and Rhine, 74 miles from Zurich by rail, situated 1,950 feet above sea-level. It is of a triple city, and possesses many houses in the ancient style of architecture. The most remarkable buildings are the old Romanesque cathedral, partly dating from the 8th century, and the old Episcopal palace. Adjoining this is a lofty tower believed to be of Roman origin. Among modern buildings are a Protestant church, government buildings and a hospital. Not far from Coire the Rhine begins to be navigable for small vessels. Ruled by bishops in the Middle Ages, it entered the Swiss Confederation in 1498. Repeatedly in the hands of the Austrians, French and Swiss, in 1802 it was definitely united to the Swiss Republic. Pop. 14,485.

COIT, James Milnor, American educator: b. Harristburg, Pa., 31 Jan. 1845. He was graduated at Hobart College 1865, and was manager of the Cleveland Tube Works 1873-77. In 1876 he became master in natural sciences at Saint Paul's School, Concord, N. H., and was appointed acting head master there in 1904. He engaged in research work at the University of Munich in 1909, and later became head of the Coit School for American Boys in Munich. He is president of the American Red Cross Committee. He is a member of the leading scientific societies of the country and has published Manual of Chemical Arithmetic (1866); Treatise on the X-Rays and Their Relation to the Medical and Surgical Sciences (1897); Liquid Air (1899).

COIT, Stanton, American lecturer on ethics: b. Columbus, Ohio, 11 Aug. 1857. He was educated at Amherst and Columbia colleges and Berlin University, and has for many years lived and lectured in London, England, where he is chairman of the West London Ethical Society. In 1910 he was Labor candidate for Parliament from Wakefield. He was editor of the International Journal of Ethics 1893-1905, and has done much for the organization of the English ethical societies, especially in compiling The Message of Man, A Book of Ethical Scriptures (1902); an Ethical Hymn Book (1911); Religious Services (1911); and Social Worship (1913). He has published in German and Dutch, The Ethical Movement in Religion (1890); in English, German and Dutch, Neighborhood Guilds (1907); National Idealism and the Book of Common Prayer (1908); Woman in Church and State (1910); The Soul of America (1913); The Spiritual Nature of Man (1910).

COITUS, the act to permit fertilization of the female. In the higher animals this takes place by the insertion of the male organ— the penis—within the female organ—the vagina. In many lower animals male secretions—spermatozoa—simply mingle with or mechanically come in contact with the female ova. Thus in the fish the ova are deposited in a sort of a crude nest; the male, swimming above the nest, discharges the spermatozoa over them and impregnation of the egg takes place. In the human animal the process is quite complicated, and since much human happiness is bound up in a properly performed sexual act a correct knowledge of its physiology should be made available. The sexual act may be divided into three stages: (1) desire, (2) erection and excitement, and (3) ejaculation or orgasm. In the human being sexual desire is present from the moment of birth although it rarely enters into consciousness as such and is partially distributed into polymorphous trends to all parts of the body, being inextricably compounded with nutritional desires, with desires for movement, for urination, for defecation, etc., etc. In this phase of its evolution the primary instinct for reproduction has not obtained any conscious direction, nor found a proper object nor appropriate method. Every sense organ of the body seeks gratification to satisfy its own needs—these are pursued with much vigor by the child but are rarely directed toward an external object. In many children, perhaps most, genital manipulation causes local excitement, but this genital excitement is only a part of the general infantile reaction of reaching out for pleasurable sensations. Nevertheless the chief disturbances which later come to make the sexual act non-satisfying, or perverse in its trends, can be traced back to faulty adjustments of the values of these early infantile polymorphous trends. At one instance of many such faulty adjustments the perversion known as sodomy, in which the rectum is used as a substitute for a vagina, can often be traced back to severe constipations or diarrheas in infancy, worms or too many enemas, so that the rectum becomes the seat of an exaggerated series of pleasurable excitations, the retention of the memory of which may divert the adult interest away from the physiological goal, the vagina. For the most part, and in the adult whose sexual adaptation takes place in the prepubertal years, the infantile pleasurable trends just spoken of become harmonized, are largely put away by a complex series of repressions and remain latent sources of higher types of creative performance.

Thus in the more healthy types the reproductive function desire only reappears, and then more consciously, at about the time of puberty. Even then repression is constantly operative and that which is socially under a ban is diverted to other constructive activities, if that is now evoked by a series of changes, chief of vol. 7-15
which are physical, but also conditioned by the presence of the internal secretions of the testes and ovaries. By some it is thought that in the absence of these internal secretions the psychical associations, which may be denominated the love associations, are unable to bring about sexual excitement and its consequent erection and orgasms. This is true for most cases probably, as in eunuchs who have been castrated, but still it is known that it is not invariably so, since some castrated individuals are sexually very active. Furthermore, there are many individuals, who, with absolutely intact glands and healthy internal secretions, nevertheless are very impotent from various types of psychological blocking. Some are cured of this by proper psychotherapy. Thus all that can be said is that the physical and mental here as well as everywhere else in the body are interdependent one upon the other. There are innumerable pathways for the psychic stimuli which lead up to sexual desire. No two individuals are just alike in this regard. Sometimes the early infantile reflex trends determine certain odors as the specific stimuli for the bringing out of desire, with others eye stimuli, others sound stimuli, again touch stimuli, in others urinary or rectal stimuli are the essentials. These are all unconscious associations which have been built up from the earliest infantile period. In fact for some even intraterine stimuli are known to have determined certain abnormal trends in this difficult field of the reproductive instinct. Whatever the stimuli or series of stimuli, whether they come from the external world or arise within the body itself, the impressions are carried by certain nerve pathways down the spinal cord to reach the spinal centres, or reflex arc pathways, the integrity of which permits the second essential in the reproduction act, erection. Up to this point male and female act alike — save the influence of the menstrual cycle as a specific stimulus to desire in the female, largely masking in the majority of males. There is probably no more difficult subject of investigation and one in which so many variations may be found as to what shall determine sexual desire. Within its realm lie all the mysteries of "falling in love," the "choice of the partner," the happiness and sexual relations. Even the structure of society is intimately bound up in this the unconscious sexual life of the child. This is only just beginning to be understood as the preposterous taboo upon the mystery of sex is gradually being lifted and prudery and hypocrisy are giving way, very slowly, to honesty and real enlightenment.

(2) Erection. The physiological nervous mechanisms consist of nerve fibres which establish a complicated series of reflex arcs which acting upon the blood vessels of the corpora cavernosa of the penis bring about its erection. Two factors are prominent in this blood vessel control. There is an active dilatation of the small and medium sized blood vessels, so that from 8 to 10 times as much blood enters the penis, and secondly the return of this blood to the venous channels is partly prevented by the contraction of certain fibres of the ischio-cavernous or erector penis muscle which shut off the dorsal veins of the penis after passing down the spinal cord to the lumbar region are switched off, as it were, through cerebro-spinal nerves which make up the nerves right to the muscles of the penis.

The peripheral reflex paths, which carry impressions from the skin and mucus membrane of the genital regions, pass by way of the nervus dorsalis penis and the nervus pudendus comminis. The reflex action is augmented and thrown to the vegetative nerve fibres controlling the blood vessels. The spinal connections of this reflex path lie in the second sacral segment. A part of this vegetative reflex arc is made up of many fibres and carries stimuli from the seminal vessels, the bladder and rectum. These pass through the hypogastric arc and contribute to the vascular action. It may happen that the spinal connection of this series of fibres may be cut or diseased. This accident will not prevent erection but there will be no erotic sensations, the erection then only being seen rather than felt. Certain quack-remedy sellers and perverse panderers make use of this mentality trends deliberately to bring about prolonged erection with diminished feeling, thus endeavoring to "restore lost manhood," as they call it. These remedies and methods are extremely dangerous and bring about serious types of impotence. Certain surgical procedures such as passing cold sounds, prostatic massage, anal lavage, etc., also produce at times the most serious results, especially when carried out by ignorant quacks. Since such irregular so-called doctors are not licensed no legal redress can be obtained as a result of such malpractice.

As a result of certain diseases of the spinal cord — usually transverse lesions in the cervical or dorsal region, permanent erection — priapism — may take place. In other spinal cord injuries or diseases as in tabes dorsalis usually lying in or involving the lumbar and sacral segments loss of the power of erection may take place. Loss of this power, however, is chiefly due to psychogenic causes and can often be cured by appropriate psychotherapy. The obstinate cases are usually amenable to psychoanalysis, by which procedure the unconscious psychogenic roots of the difficulty are discovered. The mechanism of erection has at human marital relations. Even the structure of society is intimately bound up in this the unconscious sexual life of the child. This is only just beginning to be understood as the preposterous taboo upon the mystery of sex is gradually being lifted and prudery and hypocrisy are giving way, very slowly, to honesty and real enlightenment.

(3) Orgasm consists in the discharge in the male of the mixed secretion called the semen into the vagina accompanied by rhythmic contractions, followed by a sense of relief of tension and satisfaction. An analogous series of contractions takes place in the female, with a mucous discharge from the vaginal glands and movements of the uterus.

In the act of ejaculation, as in all motor activities, both the sympathetic and spinal systems come into action.

The reflex functions of the former come into play in that the summation of adequate stimuli (rubbing movement) acting upon the erect penis causes tetanic contraction of the smooth muscles of the three secretion-bear-
ing organs, the vas deferens, seminal vesicles and prostate. This causes the orgasm and empties the mixed secretions into the prostatic urethra. A secondary reflex of a somatic nature, present only in men, namely the contraction of the smooth muscle of the skin of the penis and of the erectile bodies. Nocturnal flow of semen during sleep or pollution may occur without sensory stimuli acting upon the individual and may yet be accompanied by the well-known feelings of passion. This may be called orgasm and is regularly accompanied by the manifestations of stimulation in the rest of the vegetative system (mydriasis, hyperhidrosis and tachycardia).

An enormous variation exists among men and women with reference to orgasm. The prevailing maladjustment in men is premature ejaculation; frigidity or delayed orgasm in the female. Failure of a satisfactory sexual rapport in married life is extremely frequent and is chiefly a result of faulty sexual education, largely induced by social customs. It may be said that the human being is sex-obsessed and it is the function of a rational sexual education to relegate the genital satisfactions to their proper role as but one of the sources of human happiness. The prevailing prudery of the Victorian period, while based upon rational sex-ethics, was a movement which overshot its mark and is in need of revision. A more sensible handling of the entire problem, and it is a highly complicated one, must be entered into before a pragmatic sexual ethics can be evolved. The scientific application of psychoanalysis has proved of inestimable value in evolving general principles of great practical aid in this difficult field of ethics. Consult Freud, 'Three Contributions to the Theory of Sex'; White, 'Mental Hygiene'; Jelliffe, 'Technique of Psychoanalysis'; Forel, 'Sexual Problem.'

SMITH ELY JELLIFFE.

COJUTEPEQUE, köö-hoo’ta-pə-ka, Central America, town in the republic of Salvador, capital of the department of Cuscatlán, and on the direct route between the town of San Salvador and San Vincente, and about 20 miles east of the former. There is a lake of the same name, 2,000 feet in diameter, the fish of which are often cast ashore dead in considerable quantities. It is situated north of the volcano Cojutepeque and near Lake Isopango. The city has considerable transit trade. For a few years after 1854, when San Salvador was destroyed by an earthquake, it was the capital of the republic. Pop. 10,000.

COKE, kök, Sir Edward, English jurist: b. Mileham, Norfolk, 1 Feb. 1552; d. Stoke Pogis, 3 Sept. 1634. He was educated at Trinity College, Cambridge. From the university he went to London and entered the Inner Temple. He pleaded his first cause in 1576 and the following year was appointed reader of Lyon's Inn, where his lectures were much frequented. His reputation and practice rapidly increased and he was placed in a situation of great avarice and affluence by a marriage with a coheirness of the Paston family. He was chosen recorder of the cities of Norwich and of Coventry; was engaged in all the great causes at Westminster Hall and in 1592 chosen one of the knights of the shire for his county and speaker of the House of Commons. In 1592 he became solicitor-general and soon afterward was appointed attorney-general. He acted the usual part of a Crown lawyer in all state prosecutions and one of the most important that fell under his management, as attorney-general, was that of Essex, which he conducted with great asperity. Soon after the accession of James I he was knighted. The celebrated trial of Sir Walter Raleigh followed, in which Coke displayed a degree of arrogance to the court and of rancor and insult toward the prisoner, which was universally condemned at the time, and is one of the greatest stains upon his character. On the discovery of the gunpowder plot he obtained great credit by the clearness and sagacity with which he stated the evidence. In 1606 he was appointed chief justice of the Common Pleas; and in 1613 became chief justice of the Court of King's Bench, a post of much less favor with James than his rival, Lord Bacon. He was, in fact, too wary and staunch a lawyer to commit himself on the subject of the prerogative; and as his temper was rough and his attachment to law truly professional, he could scarcely forbear involving himself with a court so notorious for arbitrary principles as was the English in the reign of James. The honorable zeal which he displayed in the execrable affair of Sir Thomas Overbury and in the prosecution of the king's wretched brother, Somerset and his countess, for that atrocious murder, made him enemies; and advantage was taken of a dispute in which he erroneously engaged with the Court of Chancery, to remove him, in 1616, both from the council and his post of chief justice. His real offense, however, was a refusal to favor the new favorite, Villiers, in some pecuniary matter. Coke was recalled to the council in 1617 and actively engaged in prosecutions for corruption in office and for offenses the punishment of which by exorbitant fines was designed as a means of replenishing an exhausted treasury. On the accession of Charles I he was nominated sheriff of Buckinghamshire, in order to prevent his being chosen member for the county, which, however, he represented in the Parliament which met in 1628. The remainder of his career was distinguished by his defense of the law against the attacks of the royal prerogative; he greatly distinguished himself by his strenuousness of griefs; vindicated the rights of the Commons to proceed against any individual, however exalted; openly named Buckingham as the cause of the misfortunes of the kingdom; and, finally sealed his services to that cause by proposing and framing the famous "Petition of
COKE

Rights, the most explicit declaration of English liberty which had up till that time appeared. This was the last of his public acts. His principal works are 'Reports,' from 1600 to 1615; 'Book of Entires' (1614); 'Institutes of the Laws of England,' in four parts; the first of which contains the commentary on Littleton's 'Tenures'; the second, a commentary on Magna Charta and other statutes; the third, the Ashburnam or joint superintendence; the fourth, an account of the jurisdiction of all the courts in the kingdom; 'A Treatise of Bail and Mainprise' (1636).

COKE, Thomas, first bishop of the Methodist Episcopal Church in the United States. b. Brecon, South Wales, 9 Sept. 1747; d. at sea, 2 May 1814. He was educated at Oxford and entered the ministry of the Established Church obtained a curacy at South Petherton. Sympathizing strongly with the Methodists, he sought an interview with Wesley, which resulted in his joining that society and being appointed to London. He rendered valuable assistance to Wesley in procuring what was called the deed of declaration, which provided for the settlement of the Methodist chapels in the connection and restricted the conference to 100 of the preachers and their successors forever. He was appointed president of the Irish conference in 1782. Wesley set apart Coke by ordination as superintendent of the Methodist Church in America and gave him authority to ordain Francis Asbury as joint superintendent. In 1784 he arrived in New York and exceeded his instructions by ordaining a bishop. As such they were duly accredited, to Wesley's annoyance, as the joint bishops of the Church in America. In company with Asbury he traveled, visiting the different conferences, until June 1785, when he returned to England and visited Wales, Scotland and Ireland. Subsequently he returned to America. The first mission which he established was in the West Indies, in 1786; whence, after visiting the several islands, he went to South Carolina and engaged again in the regular work of the episcopacy. After traveling through the States, he embarked from Philadelphia for England in 1787. He revisited the West Indies and other American missions again and again, crossing the Atlantic 18 times in all. He was a prolific author and published 'Commentary on the Holy Scripture' (1803-07); 'Life of Wesley' (1792); 'History of the West Indies' (1808); etc.

COKE. Introduction.—One of the most important fuels of to-day is coke. It has influenced to a greater extent than any other one fuel the immense advances made in the iron and steel industry of the present time. The immense production of pig iron is due in a great measure to its peculiar adaptability to the smelting requirements of the blast furnace. Its manufacture has influenced many millions of dollars invested in the development of its by-products, and from these by-products have been developed, especially in Continental Europe, new industries. Modern war has fought with high explosives would be impossible without the by-products of the coke ovens. Tar is the raw material in the aniline dye and briquette industry, and it contains benzene, a better than others of great importance, from the gas, light, fuel and oils are obtained, and from the ammonia sulphate, the anhydrous ammonia and aqua ammonia utilized to such a large extent in refrigerator plants. The present is an "era of coke," as well as of iron, steel and electricity, for without this invaluable fuel, the others would hardly have been possible.

Definition.—Coke is the solid residue remaining from the dry distillation of bituminous coal. It consists chiefly of carbon with the mineral matter and pyrites of the coal; the rest of the small proportion of the volatile components of the coal as the degree of heat employed has failed to dislodge. There are two types of coke—furnace coke and gas coke. The former is produced at a high temperature gained as rapidly as possible in order to form a hard crust on the outside of the coke fragments to retain as much as possible the carbon vapors from the interior. The coal selected for this operation has a low content of volatile resinic matters, and the retort in which it is made is packed closely with the coal, so as to leave little empty space. In the manufacture of gas coke the valued product is the gas, and the coal chosen has a high content of volatile resinous and the retort is loosely and only partially filled. Gas coke averages: Carbon, 84.4 per cent; hydrogen, 0.2 per cent; nitrogen and oxygen, 6.3 per cent; sulphur, 0.8 per cent; and ash, 8.3 per cent. Furnace coke averages: Carbon, 90 to 92 per cent; ash, 6 to 9 per cent; volatile matter, 0.3 to 1.3 per cent; moisture, 0.2 to 0.7 per cent. Coke differs in porosity and specific gravity to some extent according to the type of retort in which it is made. Coke from a vertical retort will show 40 per cent pores and a specific gravity of 1.08; that from a horizontal retort a porosity of 46 per cent and a specific gravity of 0.91. The heating value of coke is about 14,400 B.T.U. The basic analysis on which most coke is now bought and sold is as follows: Fixed carbon, 85.5 per cent; ash, 12 per cent; volatile matter, 1.0 per cent; sulphur, 1.1 per cent. Moisture is deducted, the payment being on the dry coke. By volume the coke is estimated at 50 per cent porosity and the standard specific gravity is 1.89 for the solid coke substance.

Discovery and History.—Coke is reported to have been an article of commerce in the Chinese province of Huan in some 2,000 years ago. The process seems to have been adapted from the charcoal industry that flourished extensively in the Middle Ages. Coke was made in Germany in 1584, at the Hohenbuerchen mines in the Harz, by Duke Julius von Braunschweig-Luneburg, and about the same time the master of the Anhalt mint, Daniel Stumpf, made a similar discovery. It appears that in both instances the coke was designed for use as a smokeless fuel, rather than for iron smelting, a use that developed later. England was granted a patent for the "de-sulphurizing" of bituminous coal to the dean of York in 1590, and in 1619 Dud Dudley, an ironmaster of Worcestershire, was successful in making coke. Up to this time coke had been made in the same way as charcoal, namely, by burning in a mound or *meiler,* the coal lumps being so piled as to leave draught openings and the whole covered with coal dust or earth. This primitive method gave place to a pit dug in the ground, or sometimes in an enclosure, into which the coal was piled, and later
into a covered structure known as the "bee-hive oven," so-called from its shape. Such an oven was patented by Sir William St. John and others in England in the year 1620, particular mention being made of the use of the coke so made in manufacturing iron or steel. The bee-hive oven did not come into extended use in England until about 1735, when Abraham Darby was using them at Boulton and Broadhead, Shropshire, with coke, an example soon followed by others. This innovation was hastened by the increasing scarcity of wood for charcoal, which was the fuel first used for iron smelting. In France, Gabriel Jars, who had visited the English iron-works, is reported to have introduced the use of coke at the iron-works in Sainbel. In Germany, Prince Wilhelm Heinrich made coke in closed muffin-ovens of peculiar design, at Sulzbach near Saarbruecken, in 1767, and with it made, it is stated, the first coke-smelted iron on the Continent, at the Fischbacher furnace, near Sulzbach.

Beehive ovens of the English type were built in rows or batteries, both for convenience in operation and to save the heat radiated from one to another, instead of to the atmosphere. Later, modifications were made in the design of the oven, to improve its thermal efficiency and to cheapen the operation. These gave rise to the elongated shape instead of the round or square section, and the retort type of oven was thus gradually developed. The Belgian oven is typical of this form. In it the cocking chamber was from 20 to 30 feet or more in length, 5 feet 6 inches wide, and 5 feet high; the air was admitted by movable doors at either end, and the coke was removed by a pushing ram which forced out the coked mass as in the present form of by-product oven. This oven was heated by the gas from the coal, which burned in vertical or horizontal flues built into the walls separating adjacent ovens, air being supplied by ducts from the top, and draught from a stack located at one end of a battery of such ovens, connected with them all by an underground flue. Ovens of this general type were constructed by Ruxholt, Coppée and Smet about 1837-60. In 1856, however, Knab was experimenting with a closed retort oven, externally heated, from which the coal and coke were distributed to both coke and by-products at Commency, France. A modification of this general type was built by Carvès, and later, by Hueusener, who built a plant at Gelsenkirchen, Westphalia, in 1881. At the same time, an experimental plant of 10 ovens was built at Watten- scheid, Germany, by Otto, the two last mentioned being of the true by-product type. Thus, while the origin of the by-product oven may be conceded to the French experiments of Knab, the development was due to Germany. The Watten-scheid experiments gave rise to the type of oven known as the Otto-Hoffman, since widely extended, particularly in Germany. The modification of the Knab-Carvès oven by Simon, known as the Simon-Carvès oven was of the by-product type and was further developed by Carvès and Simons, the latter obtaining a patent for the oven known as the Semet-Solvay.

In the United States the beginning of the development of the coke industry dates about 1810-15; since the first American coke was forced into its manufacture so was America. The Pennsylvania Society for the Promo-

tion of Internal Improvements about this time sent an expert to England to study developments in the mother country in the person of W. Strickland. This occurred about 1825.

Mixtures of charcoal and coke were tried, and in 1835 in Pennsylvania a premium of a gold medal was offered to the person who would manufacture in the United States the greatest quantity of blast furnace coke during the year, using no other fuel than bituminous coal or coke, the quantity to be not less than 20 tons. Results were not satisfactory, probably due to the poor quality of the coke, possibly through selecting a poor coking coal or in the method of blast furnace practice.

The first coke ovens in the Connellsville region were built in 1841, but not until 1856 was its use augmented to any great extent; at this time there were established in Pennsylvania alone 21 furnaces in blast or coke. A gradual increase in its successful use was made during the period from the use of Connellsville coke up to the year 1880. At this point the growth was extremely rapid, and its effect of increasing the iron output of the world of vital importance.

Methods of Manufacture.—Coal was first coked in heaps or mounds in the open air, following the methods of the charcoal burners, and although resulting in a first-class quality of coke was extremely wasteful. It consisted in arranging rectangular heaps or mounds with longitudinal, transverse and vertical flues to obtain a draft, sufficient wood having been distributed in the mass of coking material. The mounds were ignited and the fire allowed to spread to the whole mass. After the gaseous matters had been expelled, the mound was partially smothered by fine coal dust, the final operation consisting of the application of a small quantity of water, which permeated the whole mass. The application of the water tended to develop a coke with few cells and under proper management a low moisture. The yield of coke was in the neighborhood of 55 to 60 per cent, the loss being 40 to 45 per cent of the coal.

The second advance in manufacture was that of enclosing the mound in a furnace, thus utilizing to some extent the heat passing off from the coal. This form of manufacture was termed the "Bee Hive Oven," and finally resulting in having a series of ovens, utilizing the heat on three sides of the oven and the heat of the escaping gases, to assist in coking. There was also a development in this form of oven which endeavored to throw down the solid constituents of the escaping gas in the form of tar, but the methods were, comparatively speaking, very crude, and resulted in saving but little of the 40 per cent unaccounted for.

About 1881-82 two forms of ovens appeared, which, since that date, have been developed to such an extent that but 10 to 15 per cent of the calorific efficiency of the coal is lost. In America to-day there are two standard types of ovens, the blast furnace and the by-product, both of which are described in a following paragraph.

Chemical and Physical Qualities.—These two qualities of the coke do not seem to hold much if any relation to each other. However, the coke may have a fairly good analysis chemically and yet, if its physical qualities are below
The by-product oven of to-day requires in its management a large amount of chemical and metallurgical skill.

The distillate from tar has many new uses besides the well-known one of creosoting railroad ties. The expansion of the American dyestuff industry, due to the failure of the European supply, and the immense increase in munition manufacture has made a new market for tar distillates.

Another branch of the by-product industry is the recovery of oils of the aromatic series from the gases. Of the 10,000 cubic feet of gas produced from a ton of coal, 6,500 cubic feet are required in the coking process. This gas contains on an average 0.75 per cent of benzene (benzol) and its homologues. The heat value of this gas is affected only slightly by the removal of the benzene. By washing gas with petroleum or coal tar oil, a benzolized oil containing 2 to 3 per cent of benzene is produced, and by distillation of crude benzene light oil is obtained.

From the oil which is with the pitch (the result of the distillation of crude coal tar) is obtained anthracene, another important base of dyestuffs. From creosote oil are obtained naphthalene, carbolic acid and other homologues. Carbolic acid is the base of picric acid, which is the main ingredient of the latest high explosives, as English Lyddite, French Melinite, the Japanese Shimose powder and our own Maximitite.

The by-product ovens are the leading producers of ammonia in the country, and this crude product forms the raw material for refined ammonia products, and also furnishes a supply for the manufacture of soda by the ammonia process. Ammonia is also being used for the manufacture of explosives and for the production of the refined aqua ammoniac which is largely consumed in refrigerator machines, either as aqua ammonia or anhydro ammonia. As sulphate of ammonia it is used for the manufacture of fertilizer. The consumption of fertilizer is increasing in this country, especially in the South, and sulphate of ammonia is regarded as a most valuable form of plant food. Commercially speaking, therefore, the by-product oven cannot have a healthier growth than is justified by the demand of the industries that consume its by-products.

The Beehive Oven.—The type of this oven is as shown in illustration. It is 12 to 13 feet in diameter, with a 7 to 8 feet height of dome above floor level, lined with siliceous brick backed with concrete or masonry. The charging hole is on top, and the oven door slightly higher than the level of the charge.

Various systems have been established to utilize the waste gases and heat of the coking operation, either by surrounding the furnace with ducts, or utilizing the heat in an adjoining plant. All these steps in the progress of development tend toward the by-product oven, but more particularly is it true when it is the aim to save the by-products.

At the close of 1905 practically 89 per cent
of the coke in the United States was manufactured in beehive ovens, due to the non-available market for the by-products. In 1915 the beehive ovens made only 66 per cent of the whole. The cost of erecting a beehive oven is very small in comparison with that of a by-product oven, hence the commercial policy of replacing the beehive oven with a by-product oven only as fast as the market conditions demand the by-products.

The By-product Coke Oven.—The by-product coke ovens are of two types: the waste heat oven adopted where the gas produced is not in demand by local industries and the regenerative oven built in localities where the surplus gas can be sold. Coals not available in the beehive ovens can be coked in the by-product ovens and specific grades of coke can be produced by skillful mixing of different kinds of coal. The yield of coke in a by-product oven is commonly 75.3 per cent of the coal consumed as against 64.7 per cent in the beehive oven. If the larger yield had been obtained for the coal coked in the beehive ovens also, the country would have been the richer by 4,253,218 tons of coal, wholly wasted in the process, to say nothing of the value of the by-products recovered. The coal consumed in the by-product ovens is a mixture of high volatile or gas coal— from Kentucky, the Kanawha or Mahanoy field of Virginia or from southwestern Pennsylvania— with the low volatile or smokeless coal from the Pocahontas and New River fields of West Virginia, or from central Pennsylvania. It is not uncommon to find West Virginia coal at the coke ovens of Wisconsin and Minnesota. A representative plant of 100 ovens has been selected for description as applying the principles underlying by-product oven practice to-day in the United States.

The ovens are arranged in two groups or batteries of 50 ovens each. Each oven is an air tight retort, consisting of a rectangular chamber 43 feet 6 inches long, 17 inches wide and 6 feet 6 inches high. The ovens are placed side by side and are supported on a steel structure, consisting of light I-beams, running the length of the battery, which rest on cross girders supported by steel columns. The construction allows the brick work to be inspected at all points. The primary object, however, is the uniform distribution of fuel gas to the combustion chambers for heating the oven retorts. The retorts are separated by hollow walls, which are divided into 10 compartments, each compartment containing four, preferably vertical, flues. Alongside this chamber, and directly under the vertical flues, are 10 combustion chambers. The gas supply to each of the chambers is controlled independently, and a uniform heat is maintained throughout the entire length of the chamber. The heat is conducted through an opening in the wall between the air and combustion chambers. The air is heated to 1800° F. by a pair of regenerators, placed together under the centre of the battery and running its entire length. A vertical flue connects the air from the retort to the regenerator to the air-chamber under the oven.

The well-known Siemens principle is used in operating the air generators, with reversals every 30 minutes. The fuel gas is reversed at the same time as the air by means of a suitable valve; but the gas is not regenerated. The gas unites with the hot air in five combustion chambers, ascends through the vertical flues to a horizontal flue above, through which it passes and descends through the five chambers in the other end of the oven, thence through the air chamber and vertical flue connection to the regenerator and through the reversing valves to the stack. The regenerators are built entirely independent of the oven structure, so that their expansion does not affect the oven brickwork.

Coal Handling.—A steel coal storage bin of a capacity equivalent to about two days' coal consumption is placed between the batteries. The coal is elevated to the bin from a hopper placed under the coal receiving track, by a belt or other type of conveyor. A coal lorry of eight tons' capacity runs on a track on the top of the batteries and under the coal bin. The lorry consists of a long narrow bin with eight spouts in the bottom through which the coal is run into the oven retort through holes in the top of it and is leveled by means of a bar worked through a small opening in the doors at the ends of the oven. The lorry is operated by an electric motor and receives coal from the coal bin by storage bin, under which it passes. A very dense metallurgical coke can be produced, and the output of an oven largely increased by compressing the coal into a mold slightly smaller than the retort and charging the mass through the oven door.

Coke Handling.—Upon the completion of the coking process, the oven doors are raised and the mass of six tons of coke is pushed upon a movable platform by means of a ram. The pushing ram, as well as the machine on which it is mounted, are operated by electric motors. The coke after being pushed upon the platform is quenched with a spray of water and allowed to cool. The platform is then tilted by an electric motor, and the coke slides off into cars, which run on a track at the back of the machine. At some ovens the coke is discharged into cars and there quenched, or the cars are run off to a quenching station.

Gas Mains.—The gas distilled from the coal during the coking process is conducted to the condensing house by two independent systems of mains. These mains run on top of the battery the entire length—one on each side. Each oven is connected to each main by a vertical pipe and valve. During the first part of the process, the rich gas is taken off through the rich gas main. The valve to this main is then closed and the balance of the gas is taken off through the poor gas main. When the coking is completed, the valve to the poor gas main is closed, disconnecting the oven from both mains.

Condensing Plant.—The gas leaving the coke ovens is divided into two fractions, viz., the first fraction of "rich" gas, which comes out as illuminating gas, and the second fraction or "poor" gas, which is used for heating the ovens. The cooling of the gas and the removal of the tar and ammonia are done in the usual apparatus, hence it is not necessary to discuss it here in detail. Both the rich and poor gases are treated in the same manner.

The rich gas when freed of tar and ammonia leaves the condensing plant and passes into the purifying plant, and from there into a large gas holder for illuminating gas, from which it goes
COKE

into the city. The poor gas, after being treated in the same manner as the rich gas, leaves the ammonia washers and passes through two benzol scrubbers. Here it is mixed with producer gas, when necessary, and carried to the ovens for heating.

The tar oil by which the gas is washed runs first from a tank through the second benzol scrubber into another tank. From here it is supplied by a pump into the first benzol scrubber. The tar-oil enters the tank with about 5 per cent of benzol, and finally leaves the washer with about 15 per cent of benzol. It is collected in another tank. From here it is fed by a pump into a still, in which the benzol is reduced again to about 5 per cent. The exhausted oil collects in another tank. From here it is taken by a pump through the oil cooler in order to be again supplied to a tank for a new absorption.

A small additional plant is needed, by which a small percentage of the oil is revived, in order to keep it active for benzol absorption. This consists of a simple tar still and condenser with a water-cooling chamber. The benzol is freed from most of the naphthalene and other hydrocarbons incidentally absorbed. The presence of an excessive percentage of them in the tar-oil would interfere with a complete benzol absorption. It is unnecessary to describe here the details of the benzol distilling plant. A great number of these are in operation in connection with German by-product plants.

Coke Oven Brick.—Under construction the principal feature of an oven is in the brick used. The term silica brick is now being used, and probably will be the standard coke oven brick of the future. It has been determined that the fusible point of a silica-alumina brick reaches the lowest temperature at 60 per cent silica and 40 per cent alumina, but if the silica is increased up to say 90 per cent, an infusable brick of the highest quality is the result.

For all classes of work, a good high grade plastic No. 2 fire clay, with possibly a small amount of flint clay, should be used. This will make a creamy, sticky slip, which will make an excellent joint. The joints are always weak spots, and are therefore a necessary evil. The brick should always be dipped into the mortar, which should be of the consistency of cream, and rubbed on each other to make a good tight contact.

Coking Coals.—There are three principal coal areas sections in the United States supplying good coking coal. The Connellsville section in Pennsylvania was the first developed, and it is reported that this supply is fast disappearing. The second section is that of the Pocahontas field in West Virginia, and the third is in Colorado. As the good coking coal fields disappear, so will the by-product ovens come into use, for it is possible to coke a coal in a by-product oven that it is practically impossible to coke in the beehive type.

Production.—In 1915, according to the reports of the United States Geological Survey, there were in the United States in active operation 48,985 coke ovens of the beehive type and 5,982 by-product ovens. There were also 44,125 beehive ovens and 286 by-product ovens idle; and 537 beehive and 1,191 by-product ovens building. During the year 5,553 ovens were abandoned. The quantity of coke produced in that year was 41,381,150 tons, valued at $105,503,686, about the usual average production, but an increase of about 20 per cent over the production of 1914. The beehive ovens consumed 42,278,516 tons of coal, producing 27,508,225 tons of coke, valued at $56,945,543, an average value of $2.07 per ton. The by-product ovens consumed 19,534,952 tons of coal, producing 14,072,955 tons of coke, valued at $48,558,325, an average value of $3.45 per ton.

Among the coke-making States Pennsylvania ranked first, producing 22,530,567 tons of beehive coke, and 4,307,726 tons of by-product coke. Virginia ranked second in the production of beehive coke, with 1,250,235 tons, followed by Alabama with 1,001,479 tons. Indiana was second in by-product coke, with 2,768,099 tons and followed by Alabama with 2,070,334 tons and Illinois with 1,866,908 tons.

About two-thirds of the entire output of coke in the United States is made in Pennsylvania, and 72 per cent of the Pennsylvania output is made in the Connellsville district, with its 37 upper ovens. In Connellsville in 1915 there were 21,343 ovens active; in Lower Connellsville, 16,037 ovens; and in Upper Connellsville, 2,552 ovens; and 605 more were under construction.

The value of the by-products of the coke industry in 1915 was $29,824,579, an increase of more than $12,000,000 over the previous high record mark of 1914. The greater part of this increase was in benzol and benzol products, which in 1914 were valued at $997,007, and in 1915 at over $7,000,000. Previous to 1914 the demand for these products had been small and the prices low, the market being supplied almost wholly by the coke ovens of Germany. But the shutting off of this source by the war created an imperative demand at almost any price for the raw material for dyestuffs and high explosives, the products of the distillation of coal, and the by-product coke ovens became of unwonted importance. Among the more valuable by-products of the coke industry in 1915 may be mentioned the following: Gas, illuminating and fuel, 213,667,614,000 cubic feet, valued at $8,624,899; ammonia, anhydrous and liquor, a value of $9,867,475; tar, 138,414,601 gallons, valued at $3,554,384; benzol, 2,516,483 gallons, valued at $1,428,323; toluol, 623,506 gallons, valued at $1,529,803; crude light oils, 13,082,678 gallons, valued at $4,304,281. The yield of coke in the different plants ranged from 1,340 to 1,550 pounds per ton of coal consumed, and the tar production ranged from 5.5 to 13 gallons per ton. The recovery of ammonia reckoned as anhydrous was from 4.33 to 6 pounds per ton, equivalent to from 13.5 to 25 pounds of ammonia sulphate.

Consumption.—The consumption of coke in the United States in 1915 amounted to 40,394,445 tons, of which 53,222 tons were imported, and the remainder of domestic origin. About 36,700,000 tons (91 per cent) were used in blast furnaces; 1,665,000 tons (4 per cent) in foundries; and 1,974,000 tons for domestic purposes. The exports of coke for 1915 amounted to 895,509 tons, of which about 74 per cent went to Canada and 18 per cent to Mexico.

COKE OVEN GAS ENGINE—COLOBNE

Availed himself of his assistance in the financial administration of the kingdom. Mazarin rewarded him in 1654 with the office of secretary to the queen, and recommended him for a knighthood at his death in 1660. Louis XIV made Colbert comptroller-general of finances. His task was to remedy the evils which the feeble and stormy reign of Louis XIII, the splendid but arbitrary measures of Richelieu, the troubles of the Fronde and the confused state of the finances under Mazarin had occasioned. He found fraud, disorder and corruption prevailing everywhere. Burdens, privileges and exemptions were multiplied without measure; the state was the prey of the farmers-general of the state revenues and at the same time maintained only by their aid. The revenues were anticipated for two years, and the treasury empty. He began with establishing a council of finances and a chamber of justice. For the purpose of alleviating the public burdens he endeavored to lower the interest of the public debt; and in order to mitigate the odium of this measure consented to a considerable diminution of the taxes, and the remission of all arrears up to 1656. He abolished many useless offices, retracted burdensome privileges, diminished salaries, and by a better distribution and collection of the taxes was able to reduce them almost one-half. Notwithstanding the expenses of nearly 10 years' war, and the prodigality of a luxurious king, Colbert succeeded in 22 years in adding to the revenues more than 26,000,000 livres, and making an equal diminution of the public burdens. At his death in 1683 the revenue actually received amounted to 116,000,000 livres. To his talents, activity and broad views the development and rapid progress of industry and commerce in France were largely due. He constructed the Canal of Languedoc; formed the plan of that of Burgundy; granted premiums on goods exported and imported; regulated tolls; established insurance offices and made uniform laws for the regulation of commerce. He was appointed Minister of Marine in 1669. Under his administration naval schools were established, and order was introduced into all branches of the marine. He was the creator of the French navy, to which he added, in three years, a fleet of over 100 vessels, 87 frigates of which were 60 ships of the line and 40 frigates. By the advice of Colbert Louis XIV caused the civil and criminal legislation to be improved, and the arts and sciences encouraged. Under the protection and in the house of the Minister (1663) the Academy of Inscriptions was founded. Three years afterward he founded the Academy of Sciences, and in 1671 the Academy of Architecture. The Academy of Painting received a new organization. He enlarged the Royal Library and the Garden of Plants, and built an observatory in which he employed Huygens and Cassini. He began the measurements of the meridian in France, and sent men of science to Cayenne. After having conferred the greatest benefits upon his country he died, out of favor with the king, and dreading the exhaustion of the treasury by the new war Louis was resolved upon making against Holland. Consult Gourdaut, 'Colbert, Ministre de Louis XIV.'

COLOBNE, Sir John, English soldier and administrator: b. 1778; d. 1863. He was educated at Christ's Hospital and Winchester
COLBURN—COLBY COLLEGE

College, entered the army in 1794, was present at the battle of Corunna and saw service under Washington on the Peninsula and at Waterloo. From 1828-35 he was lieutenant-governor of Upper Canada, and founded Upper Canada College. His endowment of the Crown rectories was regarded by Durham as a predisposing cause of the Rebellion of 1837. He was created Lord Seaton in 1839, and was subsequently governor of the Ionian Islands, and commander-in-chief in Ireland.

COLBURN, kôl'burn, Warren, American mathematician: b. Dedham, Mass., 1 March 1793; d. Lowell, Mass., 13 Sept. 1833. He first worked at a machinist's trade, but developed a taste for mathematics, and was graduated at Harvard (1820). He devised important improvements in machinery, and for many years was a popular lecturer on the science. He is best known for his 'First Lessons in Intellectual Arithmetic' (Boston 1821) which he had planned while a student at Harvard. He also published a 'Sequel' to the arithmetic (rev. ed., 1833), and an 'Algebra' (1827).

COLBURN, Zerah, American engineer: b. Saratoga, N. Y., 1832; d. Massachusetts, 4 May 1870. In 1854, he started in New York, the Railroad Advocate. He visited Europe in 1857, and in 1858 began writing for the London Engineer, of which he shortly became editor. He began the publication of Engineering in London 1866 but in 1870 he returned to the United States, where he finally committed suicide. He wrote 'The Locomotive Engine' (1851), and a number of valuable technical papers.

COLBY, Albert Ladd, American metallurgist: b. New York, 26 June 1860. He was educated at the College of the City of New York and at the Columbia School of Mines. He has been engaged in steel metallurgy since 1886, was secretary of the Association of American Steel Manufacturers 1897-1905, was iron and steel commissioner at the Saint Louis Exposition of 1904. He has published 'American Standard Specifications for Steel' (1902); 'Reinforced Concrete in Europe' (1909), also several technical papers.

COLBY, Charles Carroll, Canadian statesman: b. Derby, Vt., 1827; d. 1907. He was graduated at Dartmouth College in 1847, was admitted to the Quebec bar in 1855 and practised for several years at Stanstead. Later he abandoned law and engaged in industrial and mining pursuits. In 1867 he was elected to the House of Assembly from Stanstead and continued to represent that constituency until 1891. In 1889-91 he was president of the Privy Council under the premiership of Sir John A. Macdonald. He was an able debater and a consistent advocate of the protective policy adopted in 1878. He published 'Parliamentary Government in Canada' (1886).

COLBY, Charles William, Canadian educator and author: b. Stanstead, Quebec province, 25 March 1867. He was educated at Stanfield College, McGill University (graduated 1885) and was appointed lecturer in English language and history at McGill University 1893-95, and was Kingsford professor of history 1895-1910. He is the author of 'Sources of History' (1899); 'Canadian Types of the Old Regime' (1908); 'The Fighting Ghost of Lincoln and the Wartime' (1911).

COLBY, Everett, American public official: b. Milwaukee, Wis., 1874. He was graduated at Brown University in 1897 and was admitted to the New York bar in 1899. In 1903-05 he was a member of the New Jersey House of Assembly and in 1906-09 was a member of the New Jersey Senate, despite the opposition of the "machine" politicians of his party. In 1913 the Progressive party chose him as its candidate for governor of New Jersey.

COLBY, Frank Moore, American writer: b. Washington, D. C., 10 Feb. 1865. He was graduated at Columbia University 1888, and took graduate studies in political science there. He taught history at Amherst College 1890-91; was lecturer in history at Columbia 1891-95; professor of economics in New York University 1895-1900, when he became an editorial writer on the Commercial Advertiser. He has done a large amount of editorial work on Johnson's 'Cyclopedia'; the 'International Cyclopaedia,' and 'International Year Book,' editing the latter from its foundation in 1901. He was first editor and editor of the 'New International Year Book' since 1907, and was one of the editors of the first edition of the 'New International Encyclopaedia' (1902-03); and of the second edition (1913-15). His other literary work comprises editorial writing for the New York Commercial Advertiser; the "Book of the Month" in the North American Review 1913, as well as critical articles for the Bookman and other magazines, and 'Outlines of General History' (1900); 'Imaginary Obligations' (1904); and 'Constrained Attitudes' (1910). He is best known, perhaps, as the author of the two works last mentioned.

COLBY, Harrison Gray Otis, American naval officer: b. New Bedford, Mass., 28 Jan. 1846. He was graduated at the United States Naval Academy in 1867. He was promoted through various grades to captain in 1902; served on the Dakotah during the Civil War and was commander of the Hannibal and the second district coast defense, also selecting proper vessels for the government in 1901; was in charge during the Spanish-American War. He retired with the rank of rear-admiral, 28 Jan. 1908. He was executive officer of the yacht America in the race for the Queen's Cup with the Cambria and other yachts.

COLBY, Thomas Frederick, English engineer: b. 1784; d. 1852. He is the inventor of the "compensation bar" used in base measurements. For over 45 years he was connected with the British Ordnance Survey. In 1824 he planned and for 22 years thereafter supervised the survey of Ireland. Consult Portlock, 'Memoirs of the Life of General Colby' (London 1869).

COLBY COLLEGE, coeducational institution in Waterville, Me.; founded in 1818, under the auspices of the Baptist Church. It was chartered by the legislature of Massachusetts in 1813 and was known as The Maine Literary Institute. In 1821 its name was changed to Waterville College. In 1867 the name was changed to Colby University, in honor of Gardiner Colby, whose gifts
to the college amounted to $200,000. The name was changed to Colby College in 1889. The principal college buildings include Memorial Hall, the Chapel, Hall, Ford Hall, North College and South College. It offers courses leading to the B.A. degree, without requiring Greek for entrance, and courses leading to the B.S. degree. Men and women are admitted on equal terms and pursue the same studies. After the first year's work, the courses are nearly all elective. The average number of students, each year, is 425. In the library are 50,000 bound volumes and about 21,000 pamphlets. The college is endowed about $500,000, and the property is valued at $500,000.

COLCHAGUA, kól'chá-gwá, Chile, a province bounded on the north by the provinces of Santiago and O'Higgins, south by the province of Curicó, on the east by Argentina and west by the Pacific. It has an area of 3,851 square miles. The Andes traverse its eastern part while the coast range crosses its eastern half. The section between the two ranges is of great fertility, is well watered and well cultivated. Cattle raising is the principal industry. Corn, wheat, oats and beans are raised also in great quantities. A branch of the Santiago-Valdivia Railway. The population in 1914 was 159,930, or 41.53 to the square mile. The capital is San Fernando.

COLCHESTER, kól'chês-tér, England, parliamentary and municipal borough and river port of Essex, on the Colne, 52 miles northeast of London by rail. It is partially encircled by a wall built during the Roman period, and among relics of the past it contains a castle whose enormously thick walls date from the time of William Rufus, a picturesque, ivy-grown ruin of St. Botolph's priory, while in the church of the Holy Trinity is a Saxon doorway. The most important modern structure is the spacious and handsome town hall, completed in 1902. Colchester was known to the early Britons and the Romans as Camulodunum, or the Saxons as Colchester. It has a large oyster-fishing trade, exports of corn and malt, iron manufactures, and boot and shoe factories. It is the headquarters of a military district, with cavalry and artillery barracks. In 1648 Colchester stood a memorable siege of 11 weeks against the Parliamentary forces, who eventually starved out the Royalist garrison and hung the leaders. The borough returns a member to the House of Commons. Pop. 43,452. Consult Cutts, 'Colchester' in 'Historic Town Series' (1889).

COLCHESTER, Vt., town in Chittenden County, comprising the village of Winooski, two miles from Burlington, on the Central Vermont Railroad. It contains a public library and has cotton and woolen mills, machine shops, brick works, a butter factory, lumber and cider mills and screen works. Pop. 6,450.

COLCHICINE, a vegetable alkaloid obtained from plants of the genus Colchicum (principally from the roots and seeds) by successive extraction with hot alcohol, water and chloroform, and subsequent repeated crystallization from all three of these solvents. It is a yellowish-white powder, with the probable formula COC₆H₁₁N₂O₅. It acts as a weak base, but most of its compounds are decomposed by water. Preparations of colchicine are used in medicine for the treatment of gout. It is very actively poisonous, half a grain having proved fatal. It causes gastro-intestinal inflammation. No adequate antidote is known.

COLCHICUM, kól'chí-kúm, a genus of herbs of the family Liliaceae. About 30 species, natives of the Mediterranean region, have been described. They are nearly all autumn-blooming perennial plants which produce their leaves in spring from corms. The perianth, which resembles but is much larger than that of the crocus, is long and tubular, and varies in color from white to purple (in one species yellow). The leaves, which are broad and long in proportion to the size of the plants, die in early summer, and the flowers appear when nature is preparing for the winter. For this reason the autumn-blooming species are very popular in gardens. They are of easiest culture, the bulbs being planted in late summer and protected in severe climates with a winter mulch of litter or straw, which is removed in the spring. Beds once planted will need no further attention for several years, when they should be dug up, the corms divided and set in fresh soil in a sunny position. The plants of some species are very acid and are reputed poisonous, and when cattie have access to them are said to produce injuries of various kinds. The corms and the seeds have been used in medicine for gout and rheumatism. C. autumnale, the best-known species, is popularly known as meadow saffron and autumn crocus, names also given to other species.

In medicine the corm and seeds of Colchicum autumnale are used. Colchicum has in medicine but one use; that is, in attacks of acute gout. These it cuts short, relieving the pain and shortening the attack better than any other drug. The reasons for this are at present unknown, and the remedy is one of the few now remaining in modern medicine that are still used on empirical grounds only. Poisoning by this drug is not uncommon. The symptoms are those of an acid gastro-enteric poison, with great pain, nausea, vomiting and diarrhea. There is marked depression of the pulse and of the respiration, and death is due to shock and collapse. Washing of the stomach is the first indication for treatment, notwithstanding the self-conservative vomiting. Castor oil, heat, alcohol and mucilaginous drinks are indicated.

COLCHIS, kól'kís, or COLCHOS, the ancient name of a region at the eastern extremity of the Black Sea, resting on the Caucasus, and corresponding more or less to the Russian province of Kutais. It is famous in Greek mythology as being the destination of the Argonauts. The people were celebrated for frugality and industry, and from their dark complexion, crispy hair, language and customs, Herodotus is of opinion that they were of Egyptian origin. The country abounded, according to Strabo, in all kinds of fruits and material for shipbuilding. Linen was an important branch of manufacture, and wool of fine quality and in great quantity was produced. It was fruitful in poisonous herbs. In the 15th century it was subdivided into several principalities, and is now comprised in the Russian government of Trans-Caucasus.
COLCOTHAR, red oxide of iron, ferric oxide, Fe₂O₃. The reddish brown powder that remains in the retorts when ferrous sulphate is distilled in the manufacture of Nordhausen sulphuric acid. It is used for polishing glass, and also as a pigment, under the name of "Indian red." When in the finest state of subdivision it is known as "rouge." Colcothar is used for polishing by jewelers and others. Colcothar was the caput mortuum vitrioli of the alchemists.

COLD. 1. In physics and physiology, a relative want of heat. Since there are no determinate boundaries between cold and heat, it is a mere arbitrary distinction to call the degrees of the thermometer below the freezing-point degrees of cold. When the atmosphere, or any substance which comes in contact with the body, is at a lower temperature than the skin, it absorbs heat from the body, and is called cold. The physiological action of cold on the animal organism requires a brief notice. All animals (the warm-blooded animals to the greatest extent) have a certain power of maintaining the heat of the body in defiance of external cold. This power is mainly due to a peculiar physiological tetris to combustion, in which carbon and hydrogen taken into the system in food are made to unite with oxygen derived from the air by respiration. If the combustible materials are not duly furnished, or if the supply of oxygen be deficient (as in various diseased conditions), there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hibernating animals) be lowered about 30° below its normal standard (which in birds ranges from 100° to 112°, and in mammals from 96° to 102°), the death of the animal is the result. The symptoms indicating that an animal or a man is suffering from a depression of the temperature of the body are: (1) Retardation of the circulation of the blood, causing lividity of the skin, which is followed by pallor, in consequence of the blood being almost entirely driven from the surface through the contracting of the vessels; (2) a peculiar torpor of the muscular and nervous systems at the same time, manifesting itself in an indisposition to make any effort or exertion, and in intense sleepiness. The respiratory movements become slower and the loss of heat goes on, therefore, with increasing rapidity, till the fatal limit is reached and death supervenes. In hibernating animals (the marmot, dormouse, bat, etc.), the power of generating heat within their own bodies is very slight, their temperature following that of the external air, so that it may be brought down nearly to the freezing-point. Great or prolonged atmospheric cold is one of the most powerful depressing agents, and is a fruitful cause of disease and even of death. Whenever the temperature of the atmosphere is suddenly reduced, and particularly when it is reduced below the freezing-point, a considerable addition takes place to the mortality of the region. The effects of cold are, in ordinary circumstances, most apparent among the aged and the very young, and among those suffering from chronic disease.

2. In medicine, cold, as well as heat, is frequently employed for its therapeutic value. Cold is one of the most valuable means of obtaining lowered temperature. Cold sponging, ice-packs, alcohol vaporization, are useful in most fevers, are indispensable in sunstroke and very refreshing and soothing mental and physical vigor. Cold applied to an inflamed area diminishes the blood-tension by contracting the blood vessels, and thus tends to limit inflammation. Cold applied to the skin, as by a wet pack, or as a shower, is a tonic, increasing metabolism, augmenting the action of the kidneys, and improving mental and physical vigor. Cold applied as iced drinks, or cracked ice itself, is one of the best agents in nausea and gastric distress. Cold by means of ether or ethyl chloride spray is an excellent local anesthetic for the treatment of local boils, felon, ulcers, etc., and is also used frequently in the extraction of teeth.

Catching cold is a term of wide popular use, and signifies an affection which is little treated of in medical literature, although an affection widespread and unpleasant. Catching cold is a process of disturbed equilibrium of the blood vessels. It is usually due to excessive evaporation from the skin caused by drafts of air, to which is added contraction of the blood vessels of the periphery of the body with consequent engorgement and congestion in some internal organ. Keeping quiet, taking hot foot-baths, or hot drinks, sweating, etc., are measures that tend to bring the blood to the contracted areas, and away from the congested areas, with consequent good results. If, however, the disturbance becomes marked, if the exposure has been excessive, the congestion in an area becomes so serious that its local functions are diminished or aborted, and the congested blood vessels become over-distended and paralytic result. Then an inflammatory reaction may ensue; the reduced vitality of the part encourages the multiplication of the ever-ready bacteria, and an acute diseased process may result. It may be a simple acute inflammation of the kidney; or if the pneumococcus is present in the lung, a pneumonia; or it may be a bronchitis. Taking cold is therefore a distinct process that predisposes to more severe affections. In most cases the secondary reaction of taking cold manifests itself in the mucous membrane of the air-passages, and running from the nose, some degree of cough, general malaise, languor and muscular and joint pains are the results. Secondary infection, frequently a very serious, is produced by superimposed influenza bacillus (if the condition be not primarily induced by that organism) results in the "grippe," following which bronchitis and pneumonia are very frequent.

No cold in the head, no general cold should be neglected. Rest in bed, cathartics, hot drinks and medical advice are desirable.

For cold in physics, see HEAT; THERMODYNAMICS; GAS, LIQUEFIED.

COLD CREAM, a cooling ointment made according to various recipes, one of which consists in melting four ounces of white wax in one pound of almond oil by means of a gentle heat, mixing gradually with a pint of rose-water in a warm mortar. Another recipe is: Take two parts of spermatic oil, two parts of white wax and three parts of almond oil; melt together, and then add rose-water. This ointment cools the skin, rendering it soft and pliable, and is successfully applied for the cure of chapped hands.

COLD HARBOR, Battle of. One of the most desperate battles of the Civil War, fought
1 and 3 June 1864, at Cold Harbor, Va. By a series of bloody assaults and flank movements, beginning at the Wilderness 5 May 1864, General Grant had, at the end of the month, forced General Lee to join the main army at Richmond, and confronted him on the line of the Totopotomoy. On 31 May his army was along the road from near Hanover Court House to Cold Harbor; the Sixth corps about six miles southeast of the courthouse; to its left, in the center, Sheridan's; and to the right, the Fifth corps, these near Bethesda Church. The Eighteenth corps was at White House, on the Pamunkey, where it had just arrived from the Army of the James. Gen. J. H. Wilson's cavalry division was on the right of Grant's line, and Sheridan, with the two cavalry divisions of Torbert and Gregg, on the left. On the 31st Sheridan, after a severe fight, occupied Cold Harbor, but was so hard pressed by the Confederate cavalry division of Fitzhugh Lee and Clingman's brigade of infantry, and his position so exposed, that he fell back at night; but receiving an order from General Meade that the place must be held at all hazards, he returned. At 9 A.M. on the 1st Lee's position was so difficult of access that Grant determined again to extend by his left on Lee's right, and in view of this extension, Cold Harbor was an important point, as there the roads centered from Bethesda Church, on the right, White House, New Bridge and all the bridges across the Chickahominy above and below New Bridge. Grant extended in that direction by transferring from his right. At 11 A.M. on the night of 31 May, Gen. H. G. Wright's Sixth corps was ordered from its position on the right to march along the rear of the army to Cold Harbor, 15 miles distant, and to be there by daylight on 1 June to support Sheridan, who, it was believed, would be heavily attacked at daybreak; but it was nine o'clock before he arrived, and Sheridan meanwhile had repulsed two determined attacks of Kershaw's division. At 3 P.M. 31 May the Eighteenth corps, Gen. W. F. Smith, was ordered by General Grant to march from White House and form on the right of the Sixth. By a mistake in the order given it, it was late in the afternoon of 1 June, when it reached its position. Opposing the two corps were the Confederate divisions of Generals Hoke, Kershaw, Fickett and Field, their main entrenched line about 1,400 yards distant; the interval between mostly open ground. About 300 to 400 yards in advance of the main line was a line of rifle-pits. It was necessary to take this position before General Lee could concentrate on that flank and thus cover this road to Richmond. Between 5 and 6 P.M. Wright and Smith assaulted, and under heavy artillery and musketry fire Smith carried the advanced Confederate works and held them, and returned. Wright, on the advanced line and breaking the left of Hoke, took part of the main line, some of which he held, the Confederates falling back to a new line. The loss in the two corps left by the assault was about 400. On the night of the 1st Sheridan had been ordered to attack on Wright's left, but received the order too late to execute it. On the morning of the 2d he advanced Gregg's division to Sumner's Bridge, on the Chickahominy, attacked a force of infantry, cavalry and artillery, posted near the bridge, carried their advanced position, and held it until Hancock's corps arrived. Hancock's Second corps moved after dark of the 1st from the extreme right, under Meade's order to march with all speed to join White House. The break of the 2d, and take position on his left, extending the line if possible to the Chickahominy. By an error of Hancock's engineer a wrong road was taken, and it was after seven o'clock when his head column arrived. Then under heavy skirmishing he formed line across the road from Cold Harbor to Dispatch Station. It had been the intention to attack the Confederate line early in the morning. Smith declared that the idea "was simply preposterous," Hancock's men were in an exhausted condition, and the attack was suspended until 5 P.M., and then deferred until 4:30 A.M. 3 June. At this time Grant's line was held on the right by Gen. J. H. Wilson's cavalry from the Pamunkey to Bethesda Church. Warren's Fifth corps, which had not moved, stretched from Bethesda Church about three miles to Beulah Church. Burnside's Ninth corps had been ordered to withdraw from the extreme right and form in Warren's rear to support his right. The Ninth Corps was on the left of the Fifth, a wide interval between them; the Sixth and Second corps were on the left of the Eighteenth. Lee had observed that Grant was transferring the right of his army, by successive movements, to the south; and not proposing that Grant should take the initiative in attack, took it himself. On the morning of 2 June he ordered Early with three divisions to attack Grant's right flank and drive it down in front of the Confederate line. Early found Burnside in the act of withdrawing from near Sydnor's Mill, to take position in Warren's rear, attacked and captured the skirmish line, which had been left in the works, and fell upon his rear division, by which, with the assistance of the other divisions, Early was checked, but not before he had got in the rear of a part of Warren's skirmish line, from which he took many prisoners. Warren repulsed Rode's division, which had attacked his front, and at night both sides were on their lines. The Union losses on 1 and 2 June were over 5,000 killed and wounded. Meanwhile Lee closed in to the right and formed his lines in front of Grant's left, his right on the Chickahominy, near Alexander's Bridge, his left extending a little west of north in the direction of the Totopotomoy. A. P. Hill's corps was on the right; Longstreet's, commanded by R. H. Anderson, in the centre; and Early's on the left, cavalry covering both flanks of the infantry. The line included the ground on which was fought the battle of Gaines' Mill, June 1862, and covered all the roads to Richmond, being about six miles from the main exterior fortifications of the city and but half that distance from its most advanced works. Grant's whole line, from the cavalry on the right to the Second, Sixth and Eighteenth corps, supported by the Fifth and Ninth. No reconnaissance had been made in front, where the Confederate works were so constructed as to give a cross-fire upon assaultig columns. At the signal the assault was made at 4:30 A.M.
COLD LIGHT—COLD STORAGE

On the left Barlow's and Gibbons' divisions of the Second corps leaped their works and, under a severe fire of artillery and musketry, drove in the lines of a strong defense. The Ninth crossed the main line, but the latter was soon retaken and, in 20 minutes from the time the signal was given, the Second corps was repulsed with a loss of 3,000 men, including many of its magnificent corps. The divisions were enveloped by a cross-fire of artillery and musketry, and desisted from further effort after a loss of about 1,000 men. In less than an hour the three corps had lost nearly 5,000 in killed and wounded. Warren, on the right, reported that he could not advance unless the troops on his left advanced at the same time. Wright said that if he advanced without a corresponding advance of Smith on his right he would be taken in flank and reverse, and he was waiting for Smith and Hancock to move, and Smith said he could not move unless Wright covered his left flank. General Meade ordered another assault, each corps to go forward without regard to those on the right or left, but it was not made, Hancock would not take the responsibility. Smith had all he could do in holding his own; Wright, also Hancock, merely transmitted the order to brigade and regimental commanders without enforcing it; and the men contented themselves with their sheltered positions, without an effort to advance. Meade gave a third order for an advance of the entire line. Smith positively refused to obey, as it meant but a wanton waste of life to attempt it. Wright and Hancock merely transmitted the order, and again the men complied with it only by renewing fire from their positions. Grant got the opinion of his corps commanders that further assault was inadvisable, and at 1.30 a.m. orders were given to entrench "with a view to moving against the enemy's works by regular approaches." Farther to the right Burnside with the Ninth corps and Warren with the Fifth, who were to support the main assault, attacked Early in the morning, occupied some of the positions taken from him on the 2d, entrenched close up to Early's main line, and were about to assault, when they received orders to suspend attack. They had fought sharply during the morning, the Fifth corps losing about 500 killed and wounded, the Ninth corps about 800. Wilson's cavalry had a sharp engagement at Hawes' Shop, driving the enemy with some loss, and attacking the left and rear of Heath's division; but failing to connect with Burnside, they withdrew to Hawes' Shop. The losses of the Army of the Potomac for the entire day of 3 June was about 7,000 killed and wounded. All night of the 3d both armies were entrenching; no pickets could be thrown out, so close were the lines, between which lay many wounded. Some of the wounded, in the night, were carried away by constant and heavy skirmishing; an assault gave no promise of success; and on the night of the 12th Grant withdrew to cross James River. Grant had 103,000 present for duty at Cold Harbor. His loss (1-12 June) was 1,843 killed; 9,077 wounded; 1,816 missing; an aggregate of 12,738. Lee had not under his command more than 65,000 men. His loss cannot be accurately given, but probably did not exceed 2,000 killed and wounded. General Grant, in his Personal Memoirs, says: "I have always regretted that the last assault on Cold Harbor was ever made. No advantage whatever was gained to compensate for the heavy loss we sustained." Consult Official Records (Vol. XXX) for a full account. Walker, F. A., "History of the Second Army Corps"; Humphreys, A. A., "The Virginia Campaign of 1864-65" (New York 1885); Penny-Packer, J. R., "Life of General Meade"; Battles and Leaders of the Civil War (New York 1887).

E. A. CARMAN.

COLD LIGHT, a term applied to the illumination produced by a machine, invented by C. F. Dussaud, wherein several incandescent lamps rapidly succeed one another. The underlying principle of the machine is a wheel which carries on its circumference a number of tungsten lamps. When the wheel is rotated each lamp is illuminated at a particular point and again cut off from the current supply, but one lamp being illuminated at one time, then the rotation is rapid the effect on the observer is that of a continuous source of light. The short period during which a lamp is lighted allows but little development of heat, hence the term cold light. The apparatus is in connection with a moving picture machine, because it allows the latter to be run at any speed and even to be stopped without danger of igniting the film.

COLD SPRING, N. Y., a village of Suffolk County, on Cold Spring Harbor, and on the Long Island Railroad. It was formerly a whaling port. It is now a summer resort, and has a fish hatchery, laboratories of the Brooklyn Institute and an experimental station of the Carnegie Institute, Washington. Pop. about 800.

COLD STORAGE, a method now generally employed for preserving perishable articles of food by the use of machines which reduce the temperature of the air. The same method is used extensively for preserving articles other than food which are destructible by high temperature. Refrigeration is often called ice-making, but in a cold-storage building the area kept at a certain temperature by the frozen liquid is small compared with that kept at a proper temperature by ammonia and other substances for ice production even at a time into common use more rapidly than air treated according to the cold-storage method, unless
electricity or steam be excepted. It is now indispensable in connection with some of the largest business enterprises, which, without it, would soon cease to exist. One of the most important uses of cold storage is in the transportation of beef, fruit and vegetables, etc., from place to place and from one country to another, especially from the United States and South America to Europe.

The extensive systems employed in breweries, provision depots, dairies and distilleries have familiarized the public with the use of cold air; and no modern hotel or apartment house on a large scale is constructed without a plant for producing it by some process. It is as much a portion of the mechanical equipment as the elevator motor, or the lighting and heating apparatus. It is also being introduced for cooling purposes in theatres and other auditoriums; it maintains a pleasant temperature during the heated term in the hospital ward, and several companies have been formed to distribute it in cities through mains, as water and gas are supplied to the residence. In some of the largest packing-houses of Kansas City and Chicago, not a pound of ice is used in a year for preservation purposes, although every department where the products of the beef, sheep and pork are stored any length of time is required to be at a temperature near or below the freezing point. Plants are now being made in this country to generate cold air for butter and buttery factories, ice-cream factories, chemical works, sugar refineries, molasses factories, paraffine works, oil refiners, starch factories, chocolate factories, morgues, office buildings, skating rinks, steel-tempering plants, blast-furnaces, laundry’s, glue works, dry-plate works, dynamite-works, paint factories, soap factories, fur storage, India-rubber works and plants for seasoning lumber — a list including some of the country’s most important industries.

While an extensive variety of machinery is being manufactured for refrigeration under a score of patents, the aim of all the inventors is the same — to perfect the most economical process to remove the heat from a certain temperature level to a higher level, discharging it at this point. With one 40-ton coal, a cold-air engine F. 5 H. P. of power has been produced, the quantity varying according to the process employed. In the United States the refrigerating machines use anhydrous ammonia as the agent for generating low temperatures, mostly in conjunction with brine made from chloride of calcium and water. The ammonia is circulated through a series of pipes in which it evaporates. Then, in its gaseous form, it is pumped by the machine into the condensers and liquefied. The brine-cooler consists of a double pipe-coil. A small quantity of ammonia is injected through a needle valve, which allows a very fine stream to pass into the space between two pipes, running in a coil approximately 300 feet long surrounding a pipe containing the brine. The condenser is fitted with an inlet and an outlet to the machine. The gas is forced thence into other coils, called the ammonia condensers, which have water circulating over them. It is now in a heated condition from the compression. The water running through the coils carries off the gas, and at the same time condenses it into liquid anhydrous ammonia. In this form the ammonia is conducted to a receiving tank, and from there it again passes through the needle-valve into the brine-cooler, going through the same circuit again and again. The brine-cooler represents the apparatus where the brine and ammonia systems are in conjunction, the brine being pumped through the cooler, and from there through coils of pipe in the room in which it is desired to reduce the temperature. This is sometimes to 20° F. for freezing fish, sometimes to 32° F. for preserving meat, and often to 50° F. for preserving fruits and other perishables. The temperature is easily adjusted to the required degree by controlling the brine-flow in the piping. By lessening or increasing the flow in a single pipe, a wide range of temperature can be produced. Thus the same room can be used either for freezing the articles it contains, or merely for chilling them.

The capacity of a refrigerating machine is based upon the weight of ammonia in the gaseous form which it can discharge in 24 hours, each pound of gas representing a certain quantity of heat absorbed. This capacity is the refrigeration which would be accomplished by the use of one ton of ice. Such a quantity will lower the temperature of 28,400 pounds of water 10 degrees. Therefore, if a "one-ton" machine is employed, it will lower 28,400 pounds of water by 10 degrees or 197½ pounds of water to the extent of one degree a minute. Tests made of the York type machines of this capacity show that one will keep the "curing" department of a packing-house containing 12,000 cubic feet of space, at a temperature of 40° F. or 1,500 cubic feet at zero. In other words, it is sufficient to keep 10 beehives or 25 hogs chilled at the former temperature. As a single plant used in the large packing-houses and breweries may represent 500 tons capacity, it will be seen that the cold storage compartments are maintained on a very elaborate scale, a single one containing thousands of carcases. The horse power required for one of these large machines aggregates 625. The air-compressors are built in various sizes, and are known as single and double acting. A recent invention, the Westinghouse-Leblanc refrigeration machine, represents a new process that is now being introduced, which involves the use of oil, and reduces the temperature of from 35° F. to 50° F.

In large cold-storage warehouses the floors are not over eight or nine feet high. The pipe is attached to the walls, and in wide rooms to the sides of posts running through the middle of the room, so that an equal temperature can be maintained in all portions. In others, like fish-freezing rooms, the pipes are even used as shelves to hold the tins filled with fish, which are frozen into bricks and piled away in another compartment. Poultry and game are also kept in a frozen state, and the meat remains almost as hard as stone while in the cold room. Butter also is kept at a temperature near zero, which is said to preserve the flavor contained in its volatile oil, so that it is equal to fresh butter. Eggs are preserved sometimes from two to six months, but require particular care. The air in the room should be neither too moist nor too dry, and the chamber should be neither without ventilation to escape carbonic acid, as then the eggs would lose in weight on account of their liability to evaporate through the shell. Eggs, butter and milk are also liable to
be tainted by any smell arising from the woodwork, or articles stored in the neighborhood, and will be kept air tight and ar

anged with this point in view.

The above, it may be said, have been problems for the cold-storage experts to solve by practical experiments; but food products can be stored in small individual houses, with as little difficulty as any other articles.

In the preservation of meat, from the time that the beef, sheep, or hog is killed, it is kept in cold storage or "chill" rooms, until the time that it is taken from the refrigerator to be prepared for the table. The "chill" rooms are used to take the animal heat out of the meat, and reduce its temperature from about 98° F. to cold-storage temperature, that is, from 32° F. to 40° F. For this purpose the meat is hung on rails in rooms which have chambers in the upper part over the rails for ammonia or brine piping, which reduces the temperature to a point near freezing before the meat is put in. After the meat is put in, the animal heat still contains raises the temperature in the room, but this is again gradually lowered, in the course of 24 to 48 hours, to the proper degree for refrigeration. This length of time is required in order to chill the meat thoroughly. Should it become chilled on the outside and remain warm in the centre, the centre part of the meat would be spoiled. From the "chill" room the meat is run into the cold-storage rooms and hung on rails, where it is kept until such time as it is to be shipped. The choicest pieces are kept at least four weeks in cold storage, as the quality is thus improved, and, if the rooms are kept clean, these pieces will taste better than meat which has been recently slaughtered. For this reason, not only slaughter-houses, but depots of packers and other buildings where meat is kept in cold storage, even to small butcher establishments, are preferably cooled by refrigerating machinery, owing to its drying and cleanliness.

In some of the large hotels refrigerators cooled by machinery are even placed close to the ovens or ranges where the viands are prepared for consumption, the refrigeration being maintained at the proper standard despite the outside atmosphere. High temperature is also the rule in candy factories, but manufacturers of chocolate candy have been using refrigerating machinery for some time. They are forced to do this, as the compound is apt to become soft in hot weather, which, of course, would spoil the appearance of the goods for the market. The arrangement of the refrigerating piping for chocolate factories has been made in various ways. In some instances a large refrigerator is cooled in the centre of the workroom with the piping inside of it, this refrigerator being of such length that endless belting carrying tins with chocolate enters it on one side and brings them out chilled on the other. In other workrooms the wires of pipe coils are simply placed along the ceiling, and the cold air coming down chills the confectionery as it is made by the employees in the same room. The chocolate is then stored in refrigerators, apart from the workroom, and there properly packed at a low temperature. After it has come out, it can be sent out, and ordinarily will keep for an indefinite length of time.

One of the most interesting applications of cold storage, however, and one which has become very extensive, is for preserving furs and pelts, where they are kept at a temperature of not over 20° F. to keep the moths from destroying them. These rooms have a very interesting appearance, as among the trunks, boxes and drawers of clothing there appear figures of furred animals and other stuffed animals in threatening attitudes, put away through the hot season by their owners and taken out in the fall. Sometimes furs are left in storage continuously for several years, yet at the end of the time they are invariably found in perfect condition. Many of the trust companies in the larger cities have such cold storage compartments. In these fur and clothing rooms, where valuable carpets and rugs are also stored, the air is generally cooled outside of the room and circulated through it by means of fans.

The cold storage building erected by the United States government at Manila is probably unexcelled in scientific construction. It has a storage capacity for 1,200 tons of beef, 200 tons of mutton, 50 tons of butter, 100 tons of potatoes and 100 tons of bacon; or, in other words, sufficient food to feed an army of 10,000 men for three months. In addition to the ordinary freezing apparatus it has an ice plant with a daily output of 14,000 pounds of ice, and a 2,400 pound lifting capacity, as well as most of the other appliances in the building are operated by electricity. Connecting with the elevator is an overhead tracking system extending four miles, and the mechanism is so complete that a ship landing at a near-by pier has only to open her hatches and her cargo is transported to the storage almost automatically. The power in the building is furnished by three 200-horsepower engines. Consult Levev, 'Refrigeration Memoranda,' (1906); Macintire, 'Mechanical Refrigeration' (1914); Cooper, M., 'Practical Cold Storage' (1914).

COLD WAVE, a term commonly used in the United States to denote a fall of at least 20° in temperature in 24 hours, bringing the temperature below the freezing point. It is due to steady winds from the northwest that bring with them the chill conditions of the great west Canadian plains. This chill seems due to anti-cyclonic conditions which bring down to the surface the cold air of the upper atmosphere, and cause it to flow out over its southern and eastern United States. Cold wave is a term first used by the United States Weather Bureau in 1872. On account of the comparative shallowness of the cold wave it seldom rises to a height much above 3,000 feet above sea-level. Spread like a great sheet over the earth, it moves onward steadily and surely so that the weather bureau is generally able to forecast its movements 24 hours ahead of its arrival in any given district. As it proceeds onward the cold wave forgets the earth above it. Popularly the cold wave is known in the United States and Canada (where it originates) as northers and along the Spanish coast of the Gulf of Mexico as el norte.

COLDEN, köl'den, Cadwallader, American scientist and colonial official: b. Dunse, Scotland, 17 Feb., 1708; d. New York, 8 Sept., 1776. He was graduated from the University of Edinburgh in 1705, and emigrated to the American colonies in 1708. He devoted
himself to botany and astronomy and also to public affairs, becoming surveyor-general of New York and president of the council. He sided with the Crown in the contest over the Stamp Act. Among his correspondents were Franklin and Linnaeus, and he wrote 'Cause of Gravitation' and 'History of the Five Indian Nations'.

COLDEN, Cadwallader David, American lawyer and nephew of Cadwallader Colden, the naturalist: b. near Flushing, L. I., 4 April 1769; d. Jersey City, N. J., 7 Feb. 1834. He studied law and began practice in New York in 1791, where he soon attained high rank in his profession. He was a member of the legislature and mayor of New York (1818), a member of Congress (1821), and of the State senate (1824–27). He was an earnest advocate of the system of internal improvements that was an important political issue early in the 19th century and of public education. He wrote 'Life of Robert Fulton' (1817); 'Vindication of the Steamboat Right Granted by New York State' (1819); 'Memoir of the Celebration of the Completion of the New York Canals' (1825).

COLDSTREAM, Scotland, town in Berwickshire, 13 miles southwest of Berwick, situated on the northern bank of the Tweed, which is here crossed by a bridge (erected by Sleaton in 1766) that unites the two kingdoms, and forms a well-frequented thoroughfare. The ford of Coldstream was a favorite point with the invading armies of England and Scotland when they passed alternately into each other's country. The Coldstream Guards, the second oldest regiment in the British army, was embodied here by General Monk (1659–60). Pop. 1,375.

COLDSTREAM GUARDS, a regiment in the Foot Guards of Royal Household Brigade, the oldest in the British army except the First Foot, now called the Royal Scots. Raised in 1660 by General Monk at Coldstream, it was at first called 'Monk's Regiment,' but when Parliament consented to give a brigade of guards to Charles II, this corps, under the name of Coldstream Guards, was included in it. It has seen service of importance in which Great Britain has been engaged since its organization and its military record is looked upon as one of the most brilliant in the British army.

COLDWATER, Mich., city and county-seat of Branch County. It is in the southern tier of counties, 153 miles east of Chicago and 126 miles west-southwest of Detroit, on the Coldwater River and the Lake Shore and Michigan Southern Railway. Coldwater was first settled in 1830 by Hugh Campbell. It became a borough in 1837 and a city in 1862. It is governed by a mayor and a common council of eight members, four members of which are elected yearly for a term of two years. The city has three banks, churches of all denominations, is in the centre of a rich farming community, has cement, shoe, wagon, milling and other industries, and owns and controls its waterworks and electric-light plant. It contains the Bromo-Hygeta Mineral Wells. Pop. 5,915.

COLE, Alfred Dodge, American physicist: b. Rutland, Vt., 18 Dec. 1861. He was graduated at Brown University in 1884. He also studied at Johns Hopkins, Harvard, Berlin, Cornell and Chicago universities. He was instructor in chemistry and physics 1885–87, acting professor 1887–88, and professor 1888–1901 at Denison University. In 1901–07 he was professor of physics at Ohio State University, in 1907–08 at Vassar College, and since 1908 professor of physics and head of the department at Ohio State University. In 1901–07 he was a trustee of Denison University and again after 1911. He is the author of various researches on electric oscillations, electric waves, capillary electrometer, impact excitation, infra-red radiation, etc., in Physical Review and other periodicals.

COLE, Asahel N., American agriculturist and editor: b. 1821; d. Welesville, N. Y., 14 July 1899. He figured prominently as a Republican in the party's early days, and in 1852 he founded the Genesee Valley Free Press, the pioneer Republican paper. He was noted as an agriculturist, and known as the father of subsurface irrigation.

COLE, Frank Nelson, American mathematician: b. Ashland, Mass., 20 Sept. 1861. He was graduated at Harvard in 1883 and had taught mathematics there in 1885–87 and became instructor and assistant professor of mathematics at the University of Michigan in 1888–95. In the latter year he became professor of mathematics at Columbia University. He became secretary of the American Mathematical Society in 1895 and editor of its Bulletin in 1897.

COLE, George Vicat, English landscape artist: b. Portsmouth, Eng., 1838; d. London, 6 April 1893. He was a pupil of his father, George Cole (1810–83), a landscape painter also, who was especially noted for his studies from nature in Surrey, and became a royal academician in 1880.

COLE, George Watson, American bibliographer: b. Warren, Conn., 6 Sept. 1850. He was educated at Phillips Academy, Andover, Mass., and was admitted to bar 1876. He practised until 1885 when he became cataloguer of the Fitchburg Public Library. In 1891–95 he was librarian of the Free Public Library, Jersey City, N. J. He resigned to devote himself to bibliographical work. Since 1915 he has been librarian of the private library of Henry E. Huntington of New York. He is the inventor of a size card for measuring books in accordance with the standard adopted by the American Library Association, which is in general use. He has published 'Catalogue of Americana' in the Library of E. Dwight Church, New York (5 vols., 1907); 'Bermuda in Periodical Literature' (Boston 1907); 'Catalogue of English Literature and Miscellanea' in the E. Dwight Church Library (2 vols., 1909); 'First Folio of Shakespeare' (1909); 'Book-Collectors as Benefactors of Public Libraries' (1915); also articles in periodicals on bibliography, libraries and library economy.

COLE, Grenville Arthur James, English geologist: b. London, 21 Oct. 1859. He was educated at the City of London School and the Royal School of Mines, and has been professor of geology at the Royal College of Science for Ireland since 1890. He has published 'Aids in Practical Geology' (1891); 'The Gypsy Road' (1894); 'Open Air Studies' (1895);
COLE—COLEBROOK

'A As We Ride' (with Blanche Cole, 1902); 'The Changelufh Earth' (1911); 'Rocks and their Origins' (1912); 'The Growth of Europe' (1914); 'Ireland, the Land and the Landscape' (1915).

COLE, King, a legendary British king, described as a "merry old soul," fond of his pipe, and the "Bowl," and fond of his "fiddlers three." Colchester is said to have been his residence. Tradition says that he took Camulodunum from the Romans and named it the "Camp of Cole," which became Colchester. Another tradition says that Helena, the daughter of King Cole, was the mother of the Emperor Constantine.

COLE, Thomas, American landscape painter: b. Bolton-le-Moor, England, 1 Feb. 1801; d. Catskill, N.Y., 11 Feb. 1848. In 1819 his father and family emigrated to America. Here Cole began work as a wood engraver in Philadelphia, while his family went on to the West. In 1820 he followed them to Steubenville, Ohio, where he spent two years. He helped his father's wallpaper business by mixing colors and making printing patterns. He no longer had always been lighted in natural scenery and he was greatly interested in the surrounding landscape. His attention turned to painting and after a while he left home and after some wandering he came to New York in 1825. Here after a winter's work he sold some pictures, which enabled him to make a trip up the Hudson, already famous for its picturesque and romantic scenery. On his return he sold three pictures to Colonel Trumbull, William Dunlap and A. B. Durand, and this introduction gave him a definite position in American landscape painting, where he soon became a leader. In 1829, feeling a need for study of the recognized masters of landscape he went abroad. He went first to England and then to Italy. For almost four years he painted earnestly and studied the works of the painters whom he admired. He did not, however, attach himself to any one master nor did he copy any paintings; he received impressions on art and formed ideas but did not labor for advance in any particular kind of technical skill. The results of his tour were natural. Before leaving America he had had a clear idea of the presentation of nature as he saw it. While he was abroad his mind turned more to a rendering of thoughts and ideas. On his return to America he painted the series of pictures called 'The Course of Empire' and some years afterward another series called 'The Voyage of Life,' besides a number of other pictures in which his conceptions and ideas found almost allegorical expression. He also painted many purely American landscapes which became widely known, but the ideal nature he sought to think his greatest and most representative work. The general estimate, however, has been different; these ideal works have been neglected and Cole's chief work has been found in his purely American landscape. Cole will always be thought of as the leader of those earlier artists who devoted themselves to a presentation of the natural beauty of their country with a genius and a skill that delighted their own day and gave delight and pleasure in the present as one of the most characteristic things in American painting. Cole was the leader and representative of the first group of American landscape painters, often loosely called the "Hudson River School." The latter part of his life he worked at Catskill, N.Y. There is no recent life of Cole. 'The Life and Works of Thomas Cole' by L. L. Noble, written shortly after Cole's death, gives a valuable but contemporary view.

COLE, Timothy, American engraver: b. London, England, 1852. He came to America in 1857 and was rendered penniless by the Chicago fire in 1871. He studied under Bond and Chandler and in 1875 entered the employ of the "Century Magazine" (then "Scribner's Monthly"). In 1883 he was sent to Europe to engrave pictures by the old masters. His first series "The Old Italian Masters" was finished in 1892. The Dutch and Flemish series followed in 1896 and the English in 1900. The 'Old Spanish Masters' was begun in 1902 and completed in 1907. The French series followed in 1910. Since 1914 he has been engaged on the old masters in American public and private galleries. He has received first-class medals at every exposition since 1893; is a member of the American Society of Arts and Letters. In 1914 he was appointed librarian of the University. His art is steady at the head of living wood engravers. He is most effective in his use of the white line and in reproducing textures; his results in general are produced by conservative methods of engraving, from which he has gained breadth and power and appreciation of light and of the personality of his subject. Consult Weitenkampf, "American Graphic Art" (New York 1912). He wrote "Notes on Old Italian Masters" (1892-92): "Monograph on the Lives of Dutch Masters" (1892-96); "Notes to English Masters" (1897-1901).

COLE, William Morse, American teacher: b. Boston, Mass., 10 Feb. 1866. He was graduated at Harvard in 1890, and was instructor in political economy there 1890-93. From 1894 to 1898 he was a university extension lecturer and secretary of the Massachusetts commission on the unemployed. From 1898 to 1908 he taught English in Massachusetts high schools and accounting in Harvard University. Since 1908 he has been assistant professor and associate professor of accounting at Harvard. He is the author of 'An Old Man's Romance' (1895), under the pseudonym of 'Christopher Craigie': 'Accounts: Their Construction & Interpretation' (1908); 'The American Hope' (1910); 'Accounting and Auditing' (1910); 'Cost Accounting for Institutions' (1913); 'Accounts' (revised and enlarged, 1915); 'Problems in the Principles of Accounting' (1915).

COLEBROOK, Henry Thomas, English Sanskrit scholar: b. London, 13 June 1765; d. there, 10 March 1837. In 1782 his father's influence procured him a writership in the Bengal service. His duties as revenue officer at Tirhut led him to make a minute study of the state of husbandry in Bengal; his legal functions led to his study of Sanskrit; and he began in 1794 publishing essays on Indian religion, poetry and science in the 'Asiatic Researches' of the Asiatic Society of Calcutta. His removal in 1795 to the magistracy of Mirzapur gave him the opportunity of cultivating the acquaintance of the learned men of the neighboring Sanskrit college at Benares, and with this advantage he brought out his
COLEMAN—COLEMANITE

'Digest of Hindu Law on Contracts and Successions' (1798). A mission to Nagpur (1799-1801) interrupted his work and on his return he was appointed a judge of the new Court of Appeals (1802), became a lecturer in Sanskrit at the college of Fort William. Yet he continued during this busy period to publish the first (and only) volume of his 'Sanskrit Grammar' (1802), based on Saunfānina and the native commentators, to write his famous articles on the Vedas and on the sect of Jains, besides many other valuable essays for 'Asiatic Researches,' and also to supplement his 'Digest by 'Two Treatises on the Hindu Law of Inheritance' (1810). He became blind in his later years. His 'Life' was published by his son in 1873. Colebrook is noteworthy as the first great Sanskrit scholar in Europe.

COLEMAN, Arthur Philemon, Canadian educator: b. Lachute, Quebec, 4 April 1852. He was educated at Victoria University and at the University of Breslau. After some years of scientific work he became professor of geology and natural history in Victoria University; in 1891 professor of assaying and metallurgy in the School of Practical Science, Toronto; and from 1901 professor of geology, Toronto University. He was geologist for the Ontario bureau of mines from 1893-1909.

COLEMAN, Caryl, American ecclesiologist: b. Buffalo, N. Y., 1847. He was educated privately and at Canisius College, Buffalo. From 1872 to 1874 he was a teacher in Buffalo, N. Y., and in 1875-76 studied ecclesiology in Europe, prosecuting these studies further in England and Belgium in 1888. In 1889 he opened the church department of Tiffany & Company and directed it for 10 years. He founded the Church Glass and Decorating Company, of which he has since been president, and was appointed American representative of John Hardman & Company of Birmingham, England. He has written 'Symbolism in Religious Art' (1903); 'A Mark of Honor' (1903); 'The Sacred Cippus' (1903); 'A Day with Mary' (1908). He was a contributor to Ressel Sturgis' 'Dictionary of Architecture' and to 'The Catholic Encyclopedia' and has contributed articles, both historical and literary, to the 'Architectural Record' and other periodicals.

COLEMAN, John, American clergyman: b. Baltimore, Md., 11 Feb. 1803; d. Saint Louis, Mo., 16 Sept. 1869. Until 1834 he was a Methodist. He entered the Protestant Episcopal ministry in 1836 and for 20 years was rector of Trinity Church, Philadelphia. He edited the religious paper Banner of the Cross (Philadelphia); and also edited Faber's 'Difficulties of Romanism'; and Wilmer's 'Episcopal Manual.'

COLEMAN, Leighton, American Protestant Episcopal bishop: b. Philadelphia, 3 May 1837; d. Wilmington, Del., 14 Dec. 1907. He was educated at the General Theological Seminary in 1861, was ordained to the Episcopal ministry in 1862, and after holding important rectorships was consecrated bishop of Delaware in 1888. He wrote 'A History of the Lehigh Valley' (1878); 'The Church in America' (1895); 'The Church in the United States' (1901).

COLEMAN, Lyman, American clergyman and scholar: b. Middlefield, Mass., 14 June 1796; d. Easton, Pa., 16 March 1882. He graduated at Yale 1817; taught in Hartfort, Conn., 1817-20; was tutor at Yale 1820-24, when he took up theology at the same time. He was pastor of the Congregational church in Belchertown, Mass., for seven years, when he again took up teaching. He studied in Germany 1842-43, where he formed a friendship with Weidner, and, returning, taught German at Prince ton and Amherst 1845-46. In 1856 he traveled extensively through the Orient. He was professor of Latin and Greek in Lafayette College from 1851 to 1868, when he was transferred to the chair of Latin, which he held until his death. His writings, which were highly praised and regarded in their day, are 'Antiquities of the Christian Church' (1841), translated from the German; 'The Apostolical and Primitive Church' (1844); 'Historical Geography of the Bible' (1850); 'Ancient Christianity' (1852); 'Historical Text-Book and Atlas of Biblical Geography' (1854; rev. ed., 1859); 'Prelacy and Ritualism' (1869); and 'Genealogy of the Lyman Family in Great Britain and America' (1872).

COLEMAN, William Tell, American pioneer: b. Cynthia, Ky., 29 Feb. 1824; d. San Francisco, Cal., 22 Nov. 1893. In 1849 he made the overland trip to California and opened several stores for the sale of mining supplies. When in 1851 the famous Vigilance Committee of San Francisco was formed to rid the city of its formidable criminal element, Coleman became one of the most active members. In 1856 the committee was revived in consequence of the murder of James King; an editor; Coleman took charge of the trials, resisted official pressure against interfering with "the people," directed the execution of Casey and the other murderers and carefully avoided any clash with the United States authorities. From 1857 to 1864 he directed his business from New York, aided in suppressing the draft riot and contributed liberally to patriotic benefactions. In 1877-78, at the request of the citizens of San Francisco, he organized the Committee of Safety, to fight Dennis Kearney and his "sling-shot" mob, and in this was highly successful. In 1888 his firm failed with liabilities of $2,000,000, but in 1892 he personally paid off his entire indebtedness.

COLEMAN, Canada, town in the Macleod district, on the Old Man River and on the Canadian Pacific Railway, 10 miles from Crow's Nest Pass. It is a coal and coke centre, these industries giving employment to about 1,000 men. The town has waterworks, an electricty-lighting plant and banking facilities. Fishing and hunting in the vicinity are both good. Pop. 1,557.

COLEMAN, Tex., city and county-seat of Coleman County, 120 miles southwest of Fort Worth, on the Gulf, Colorado and Santa Fé Railroad. Beef, cotton and grain are important articles of trade. There are brickworks and nearby are deposits of coal and oil gas. The city owns the waterworks and electric-lighting plant. Pop. 3,046.

COLEMANITE, a hydrous borate of calcium, 2 CaO, 3 B₂O₃·H₂O. The most common
source of borax and boracic acid in the United States. Principal deposits are in California.

**COLENO, John William**, English clergyman, bishop of Natal: b. Saint Austell, Cornwall, 24 Jan. 1814; d. Bishopstown, Natal, 20 June 1883. He was educated at Saint John's College, Cambridge; was assistant-master at Harrow 1838–42; resided at Saint John's College 1842–46, when he was preferred to the rectory of Pornscott Saint Mary, Norfolk, and on 22 Nov. 1853 was appointed the first bishop of Natal. His numerous writings extended over a wide field. His treatises on arithmetic and algebra have become textbooks in schools and universities. In 1853 he published a collection of *Prose Sermons*; in 1855 'Ten Weeks in Natal'; and in 1861 a *Commentary on Saint Paul's Epistle to the Romans*. In the following year public attention was widely attracted by the first part of his work on *The Pentateuch and Book of Joshua Critically Exposed*, in which the historical accuracy and Mosaic authorship of those books were called in question. This work was condemned as heretical by slight majorities in both Houses of Convocation of the province of Canterbury in 1864, and Coleno was declared to be deposed from his see by his metropolitan, the bishop of Cape Town. The deposition was, however, declared null and void on appeal to the Privy Council in March 1865. Notwithstanding this decision the prelates forming the council of the Colonial Bishops' Fund refused to pay him his income and he appealed to the Court of Chancery. The master of the rolls delivered judgment on 6 Oct. 1866, ordering the payment in future of his income, with all arrears and interest, but declaring that if his accusers had refused payment on the ground of heretical teaching he should have felt it his duty to try that issue, an offer which they declined to accept. One of the results of this ecclesiastical quarrel was that the Anglican community of the Cape was divided into two hostile parties; Coleno still remained the only bishop of the Church of England in Natal, but the Rev. W. K. Macrorie was consecrated bishop of Maritzburg for the Church of that province on 25 June 1869. About the close of 1874 Coleno visited England, and during this visit he pleaded before the Secretary for the Colonies and other members of the government the cause of Langalibalele, a Zulu chief, who had been dispossessed of his territory and imprisoned at Cape Town. From that time forward the humane bishop was foremost in advocating the cause of the aborigines against the oppression of the Boers and the encroaching policy of the Cape officials supported by the captive Cetewayo (see ZULULAND) appealed to Coleno to place his case before the English people, and it was mainly owing to the bishop's efforts that the Zulu king was allowed to go to England to plead his own case with the ministry. In the meantime Coleno continued his literary labors. *The New Bible Commentary by the Bishops and Other Clergy of the Anglican Church Critically Examined* was published in 1871, the seventh and last part of his work on the Pentateuch and *A Life of Bishop Colenso* in 1873. Consult Cox, *Life of Bishop Colenso* (1888).

**COLEPTERA** (Gr. kolébs, a sheath, and τροπός, a wing), an order of insects, the species of which are commonly known by the name of beetles. The insects which constitute the order Coleoptera may be characterized as having four wings, of which the two superior are not suited to flight, but form a covering and protection to the two inferior, and are of a hard and horny or parchment-like nature and when closed their inner margins, which are straight, touch and form a longitudinal suture. The inferior wings, when not in use, are folded transversely under the superior and are membranous. The appendages of the mouth are well adapted for cutting and the metamorphosis is complete. See **BEETLE**.

**COLER, Alwin Gustav Edmund von**, German army surgeon: b. Groningen 1831; d. 1901. He studied medicine in Berlin, entered the Prussian army in 1856, became surgeon-general in 1874 and chief surgeon of the general staff in 1889. He introduced several important reforms and improvements in military hygiene, established the corps of sanitary officers and introduced antiseptics into military surgical practice. He also took a part in formulating the medical regulations for the German army, which have since been adopted by all civilized armies. In 1892 Coler was appointed professor at the University of Berlin. He published *Sanitätsherbst über die deutschen Heere im Kriege 1870–71*; *Veröffentlichungen aus dem Gebiete des Militärsanitatswesens* (1892); *Die transportable Lazarettsbaracke* (with Langenbeck and Werner, 1890).

**COLER, Bird Sim**, American politician: b. Illinois 1868. He removed to New York, and with his father established the stock-broking firm of W. N. Coler & Company. He became active in Democratic municipal and State politics, was elected comptroller in the first administration of Greater New York under the new city charter (1897–1902) and was Democratic candidate for governor of the State in 1902. In 1905 he was elected president of the borough of Brooklyn on the municipal ownership platform. He has written *Municipal Government, as Illustrated by the Charter, Finances, and Public Charities of New York* (1900); *Socialism in the Schools* (1911); *Two and Two Make Four* (1912).

**COLBRAINE, kül-rán**, Ireland, town in the county of Londonderry, situated on both sides of the river Bann, about four miles from its mouth, and 61½ miles northwest of Belfast by rail. It has long been celebrated for its fine linens. Its trade, chiefly in agricultural produce and provisions, is considerable; there is a large distillery, and it has a valuable salmon fishery. Pop. 7,785.

**COLERIDGE, Hartley**, English poet: b. Clevedon, near Bristol, 19 Sept. 1796; d. Rydal, Westmoreland, 6 Jan. 1849. He was the eldest son of S. T. Coleridge (q.v.), and upon the elder Coleridge taking up his residence in the Lake district, Hartley and his brother Derwent were placed as day scholars under the charge of a clergyman at Ambleside. In 1815 he became a student at Merton College, Oxford, and having inherited his father's conversational talents, was soon in great request at the wine parties and other festivities of the undergrad-
COLEOPTERA
uates. An unfortunate propensity was thus formed for drinking, which proved even more ruinous than his father's craving for opium. He obtained a fellowship at St Peter's, and thus forfeited it on account of his intemperance before the close of his probationary year. He then left Oxford and resided for two years in London, contributing occasionally to the London Magazine, in which his first sonnets appeared. His friends induced him against his will to settle at Ambleside for the reception of pupils, but this scheme, as might have been expected, failed. He continued, however, to reside in the Lake country, and during this period enjoyed the friendship and good offices of Wordsworth, who had taken a paternal interest in him from a child. He likewise employed himself extensively in study and literary composition, contributing to Blackwood's Magazine, and producing a volume of 'Poems' and 'Worthies of Yorkshire and Lancashire.' Many of his sonnets will rank with the finest in the English language, while the charming vivacity of his biographies leaves only room for regret that he had not accomplished more as a prose writer. In 1839 he wrote a life of Massinger for an edition of his works published by Moxon. He was buried in Grasmere churchyard, adjoining the spot where Wordsworth was laid a few months afterward. A memoir, with a collection of poems written by him in his later years, was published after his death by his brother Derwent.

COLERIDGE, Henry Nelson, English writer: b. Ottery Saint Mary, 25 Oct. 1798; d. 26 Jan. 1843. He was a nephew of S. T. Coleridge (q.v.) and was educated at Eton and King's College, Cambridge. Having accompanied, in 1825, his uncle, the bishop of Barbados, on a voyage to that island, on his return he published an account of his sojourn, under the title of 'Six Months in the West Indies.' He was called to the bar in 1836, and shortly afterward married his cousin Sara, only daughter of Samuel Taylor, and sister to Hartley Coleridge. In 1830 he published an 'Introduction to the Study of the Greek Classic Poets,' and after his uncle's death set himself to the task of committing to writing the reminiscences of Coleridge's conversation, which were published under the title of 'Specimens of the Table-talk of the late Samuel Taylor Coleridge.' He was his uncle's literary executor and edited his posthumous writings including three volumes of 'Literary Remains,' published in 1836 and 1838, and 'Confessions of an Inquiring Spirit,' in 1840.

COLERIDGE, Herbert, English philologist: b. Hampstead, England, 7 Oct. 1830; d. London, 23 April 1861. He was a son of Henry Nelson Coleridge (q.v.), and was one of the original planners of the dictionary outlined by the Philological Society and which in subsequent years has expanded into the 'New English Dictionary on Historical Principles,' now being issued from the Clarendon Press, Oxford.

COLERIDGE, John Duke Coleridge, 1st Baron, Lord Chief Justice of England: b. London, 3 Dec. 1820; d. 14 June 1894. He was the eldest son of Sir John Taylor Coleridge (q.v.), judge of which was a nephew of Samuel Taylor Coleridge. He was educated at Eton and Balliol College, Oxford, and was called to the bar at the Middle Temple in 1846. In 1855 he was appointed to the recordership of Portsmouth; from 1865 till 1873 represented Exeter in the House of Commons as a Liberal, and in 1868 he became solicitor-general under Mr. Gladstone, being knighted at the same time. Three years later he became attorney-general, and in 1873 he was appointed chief justice of the Court of Common Pleas. In the same year he was raised to the peerage as Baron Coleridge of Ottery Saint Mary, and in 1880 succeeded Sir Alexander Cockburn as Lord Chief Justice of England. Lord Coleridge distinguished himself very highly when acting as chief counsel for the Tichborne family in the famous trial of 1871–72. He was the first lord chief justice who was granted the office with the present title, instead of the older one of lord chief justice of the Court of Queen's Bench.

COLERIDGE, Sir John Taylor, English jurist and author, a nephew of the poet, Samuel Taylor Coleridge: b. Tiverton, England, 1790; d. Ottery Saint Mary, 11 Feb. 1876. He was educated at Oxford, and was called to the bar of the Middle Temple in 1819. In 1825 he was appointed justice of the King's Bench, and was sworn of the Privy Council in 1858. He was, for a time, editor of the Quarterly Review. As a literary critic he took high rank, and besides editing an edition of 'Blackstone's Commentaries' (1825) published 'Public School Education' (1860); 'Life of John Keble' (1869).

COLERIDGE, Samuel Taylor, English poet and critic: b. Ottery Saint Mary, near Exeter, in Devonshire, England, 21 Oct. 1772; d. Highgate, London, 25 July 1834. It is customary to divide Coleridge's life into three periods, according to the prevailing interest of each; most of his poetry was written before the close of 1798; from that year till 1818 he was chiefly interested in criticism; and the last 16 years of his life were given mainly to metaphysical studies. As in the case of De Quincey, the first part of his life usually receives by far the more attention, and the interest of the last period resolves itself into an account of his writings.

He was the son of the Rev. John Coleridge, vicar of Ottery Saint Mary, a man inclined to mysticism and transcendentalism, but also a pretty successful school teacher, and his second wife, Anne Bowden, a competent woman of much common-sense. Coleridge, the youngest of 10 by this marriage, was the precocious one of the family and was regarded as a prodigy for his early attainments. His amusements were reading and dreaming and he early showed a marked liking for mysterious and spiritual things. In 1782, after schooling at his native place, he was sent to Christ's Hospital for eight years, where he was subjected to a rigorous intellectual discipline at the hands of the Rev. James Boyer, of whose methods he spoke with respect in 'Biographical Literature.' As a schoolboy, and in fact throughout life, he left a tradition, preserved by Lamb, of his intellectual and spiritual attainments. At Jesus College, Cambridge, which he entered in 1791 with a view to taking orders, he gained some distinction as a writer of Latin and Greek, read a great deal, particularly in the philosophers Berkeley and Hartley, and absorbed and
advocated the doctrines of the French Revolution. This last brought him such notoriety that, in the fall of 1785, he ran away incognito to London, and enlisted in a company of dragoons, but weary of this experiment, obtained his release the following spring. The following summer he tramped about in England and Wales, made the acquaintance of Southey (q.v.), with whom he devised the "Pantisocracy" scheme for a social settlement on the banks of the Susquehanna, became engaged to Sarah Fricker, the sister of Southey's fiancée, and definitely terminated his university career. The year was an active and somewhat critical one. It was followed by his addresses on political subjects "Conciones ad Populum, or Addresses to the People" (1795), which preached liberty, praised revolutionary doctrines and condemned government. By his marriage (1795), his editorial venture on the "Watchman" (March to May 1796), in which he tried to expound true opinions on such subjects as the principles of the French Revolution, Godwin's ideas and the like, he made a more permanent settlement in Nether Stowey, Somerset, in 1797, where he came in contact with Wordsworth, a new and important period in his literary life was ushered in.

The meeting with Wordsworth had important results in English literature, for it led, in 1798, to the publication of the "Lyrical Ballads," which Coleridge's own contribution to this volume, designed by its authors to change poetic taste, was his masterly "The Ancient Mariner." The year practically marks the end of his poetic production, though the famous "Christabel" was not finished till two years later, and remained unpublished till 1816. Coleridge had previously written many poems; many of these were published in 1796 and 1797, under the title "Poems on Various Subjects," and he had also tried his hand at several dramas. Aside from the masterly "Ancient Mariner," "Christabel" and "Kubla Khan," on which, together with a few others, his fame as a poet rests, the poems are chiefly interesting as showing the tenor of Coleridge's mind. In substance they are what is generally termed romantic, and are almost always treated with a view to express some unuttered and unutterable idea that might be called accumulative, in that they progress by the piling up of a great number of images, and in many respects they imitate the epithetical manner of Gray, but are less successful and less restrained. The great poems named are, of course, among the most original in the language. 1797-98 was the poet's golden year.

The middle period of Coleridge's life is marked by great desertion. It opened with much promise. After a journey to Germany (September 1798 to September 1799), in company with Wordsworth, he returned to England, where his first work was his brilliant translation of Schiller's "Wallenstein," usually regarded as one of the masterpieces of English translation. The following year he wrote a number of able articles for the "Morning Post" condemning, on the one hand, the policy of Pitt, and, with equal zeal for the cause of liberty, the aggressions of Bonaparte. The imputation of Robespierre that he and growing restlessness caused him to go to Malta in 1804. It is known that at this period he was taking opium; whether strictly for the alleviation of pain, or whether to opium was due to the cause of his failing health, is not definitely known. He made the acquaintance of the drug nearly 10 years before and the severest of his critics, Mr. Robertson, maintains that all his most brilliant poems were written under its influence, instance the "Ancient Mariner," in some uncertainty, except for the fact that for a matter of 12 years he was, except at rare intervals, incapacitated from doing sustained work. From 1804 to 1816 he lived in great depression. A residence of two years and a half at Malta, where he was secretary to Governor Sir Alexander Ball, was of no benefit to his health, and on the whole he showed a weakening of purpose, as was natural to a man of weak will when removed from the guiding influence of friends. On his return his life was desultory and nomadic and he found himself in hard circumstances. Gradually becoming estranged from his friends and family, he finally separated from his wife, and in 1810 left the Lake region for good. The following year he lived at Hammersmith, London, and at Calne, in Wilts, with an old friend, John Morgan, by whom he was treated with the utmost kindness. Early in 1816, however, the Morgans, owing to loss of property, were obliged to give up the task, and, moreover, Coleridge, to whom the six years had been the most fruitful of his life, felt obliged to take some more energetic measures to redeem himself. Accordingly, in April 1816, he left London and for some months with Dr. Gillman, in Highgate, London, where his health might be watched with care and firmness, and here he remained the rest of his life.

Up to 1818, as has been said, Coleridge was chiefly interested in criticism, but his work was, naturally, of a desultory nature. His first public utterances, after the articles in the "Morning Post," were a series of 18 lectures on "Poetry and the Fine Arts," delivered at the Royal Institution in London, from January to May 1808. He had had an interest in the printed word for some years, and, in 1815 and 1816, he edited Coleridge's "Literary Remains." Three courses in the winter of 1811-12, chiefly on Shakespeare and Milton, had a better fate, and, from accounts, must have made a great impression. These courses were recast into two which were badly delivered at Bristol in the winter of 1813-14. In 1818, Coleridge closed his career as a lecturer with a course on the history of literature, which added much to his reputation. These various talks were published for the first time in 1838, in Vols. 1 and 2 of Coleridge's "Literary Remains." In their present shape they are fragmentary; some are pretty complete, others merely marginal jottings, and others exist only in name.

Considered as a whole, these lectures attempted to define poetry, to describe the course of literature, to extol an unprecedented height the name and fame of Shakespeare and to give his readers material for a sound critical judgment. Concerning the last of these points he said, for example, in the 1813 course of "The Nativity" that he did not define a form best fitted to render them impressive at the time, and remembered afterwards, rules and
principles of sound judgment, with a kind and degree of connected information such as the hearers cannot generally be supposed likely to form, collect and arrange for themselves by their own unassisted studies, & he added, "I hope to satisfy many an ingenious mind, seriously interested in its own development and cultivation, how moderate a number of volumes, if only they be judiciously chosen, will suffice for conveying to their possessors the knowledge of the mind, education, and instruction I mean. That is, in addition to those which he studies for specific and professional purposes. Among the many great names which he chose to illustrate this oft-repeated idea, Shakespeare, in all the courses of lectures, occupied the chief place. His chief thesis, that Shakespeare is a poet of consummate poetical power and that his judgment is equal to his genius, he illustrated and illuminated with copious analysis and criticism, chiefly by running interpretation of the different plays and by pregnant statements of the fundamental differences in dramatic interest in the different types of play. Generally speaking his point of view is that of a man interested in theatrical matters, the reason and the imagination, rather than outward situation, intelligence, fancy or wit. More narrowly, it is the criticism of a man who gloried in the superiority of the literature of his own country, but who, like Wieland, the reason and the imagination, rather than outward situation, intelligence, fancy or wit. More narrowly, it is the criticism of a man who gloried in the superiority of the literature of his own country, but who, like Wieland, acknowledged the universal, impersonal spirit of Shakespeare; or the distinctions between the witty, the droll, the odd, the humorous, etc., as illustrated by Rabelais, Swift, Sterne and others. This idea of drawing fundamental distinctions has had a great influence on succeeding criticism.

Even more characteristic of the Coleridge of this period was the series of essays called 'The Friend. This he intended to issue in January 1810, but the purpose of the work was not to be realized until the middle of the year. He began its publication in March 1810. He attempted to publish it himself as a weekly periodical from the Lake district, but his practical mismanagement was such that it barely came out ten times and the volume came to an end with the 27th number, long before he had reached his main point. The work was reissued in 1818 with additions. The plan of the periodical, as well as Coleridge's conduct of it, foredoomed it to failure. Without regard to the work of his predecessors in the essay field, he attempted to treat philosophical questions and inflicted them on his readers with little variety and much diffuseness. The volume as it stands to-day contains three main parts dealing with special subjects: (1) for the individual as an individual, the principles of political knowledge and the grounds of morals and religion and the discipline of the mind requisite for the understanding of the same; (2) the arts and the sciences in a lighter vein entitled 'Landing Places.' In spite, however, of the total lack of adaptation of the subjects to the tastes of his readers and to the periodical form, and his own unbusinesslike ways, the book as it now stands is regarded as containing much of Coleridge's spirit and work, his best flashes of insight, and is, in particular, replete with those famous distinctions, like that between reason and understanding, truth and veracity, which have proved stimulating to the minds of successive generations. Much of its value lies in its point of view, which is that of an idealist who believes that motives are more important than results and that right thinking on all questions is better than action directed by mere prudence; and it lies also in his persistent purpose. More important than 'The Friend' indeed his most valuable work, is the 'Biographia Literaria.' This he projected and in a measure composed in 1815, but the happy results of his change to Gillman's home probably allow him to improve the form of the book for its publication in 1817. His specific purpose, characteristically enunciated after the book was well under way, was to give voice to miscellaneous reflections suggested by particular events, to state his views on politics, religion, philosophy, poetry and criticism, and to settle, on principle, the controversy that had grown up about the 'Lyrical Ballads.' On the philosophical side, the book amounts to an exposition of the materialist views of the origin of ideas, and it is notable for its digressions and distinctions, as that important one, which he borrowed largely from Schelling, between the objective facts of the world and a self-sustaining and self-regulating consciousness, independent and indestructible. The critical ideas, brought out most vigorously in his classic criticism of Wordsworth, are more important, and are among the most influential ever enunciated by any English critic. Abandoning the form of preceding English critics, and eschewing the oracular dogmatism of contemporary reviewers, such as Jeffrey, he rested his critical case on (1) a theory of poetry deduced, not from authority, but from philosophy, logic, psychology, and what he called "the nature of man"; (2) on the actual phenomena as presented by the actual vogue of an author, a complete, rather than a partial, view of an author's production, the interpretation of his meaning, and an analysis of the qualities of his style; and (3) in a wholly impressionistic way, on a feeling for what is good in poetry — which last, indeed, is really his ultimate test. As far as can be seen by a comparison with such earlier critics as Dryden, Addison and Johnson, he pushed it to a further degree than his distinguished predecessors his dependence on a theory of art and on philosophy, his reliance on analysis of qualities and his personal feeling for what is good; and he is practically original among English critics up to his time in taking into account as necessary points of departure the vogue of an author and his purpose. He differs from such contemporary critics as Hazlitt and Coleridge, in the latter usually lays chief stress on what might be termed the intellectual contribution of an author. The 'Biographia Literaria' is a work of two parts. The first part of the 'Biographia Literaria' deal for the most part for Coleridge's intellectual experiences and the influences to which he was subject.

The remaining literary work of this period is of less importance. It comprises some desultory and comparative studies like the "Coarse in 1808 and 1811, chiefly against Bona-
COLO RIDGE — COLES

parte, the recasting and acting (1813) with some success of his drama 'Remorse' and the writing of the pastoral play 'Zapolya' (1817), "C. pleased to point out "all the critical benches of infidelity to point out any one important truth, any one efficient practical direction or warning, which did not pre-exist (and for the most part in a sounder, more intelligible, and more comprehensive form) in the Bible," and "A lay sermon addressed to the higher and middle classes on the existing distresses and discontent's (1817), an earnest and eloquent appeal to his readers to live by reason and wisdom and to refer conduct to ultimate principles.

The last named titles anticipate the chief subject of the so-called last period of Coleridge's career — his interest in theology and metaphysics. His writings on those subjects are embraced in three chief titles — 'Aids to Reflection' (1825), 'On the Constitution of the Church and State' (1830) and the posthumous 'Confessions of an Enquiring Spirit' (1840, written between 1824 and 1834). Though these writings probably did more than anything else to give the author's to give him the great reputation which he had in the contemporary and succeeding generation, they add little to our knowledge of the great principles which dominated Coleridge's intellectual life. The 'Aids to Reflection,' his most important spiritual work, is a series of aphorisms designed to help the reader to think and feel rightly, that is, in an orthodox, Anglican way, on spiritual matters. In his own words, he aimed "to direct the reader's attention to the value and science of words — to establish the distinct characters of prudence, morality, and religion — to substantiate and set forth at large the momentous distinction between reason and understanding — to exhibit a full and consistent scheme of the Christian Dispensation, and more largely of all the peculiar doctrines of the Christian Faith."

His point of view is characteristically theoretical, introspective and mystical, rather than objective and historical, and his exposition is, as usual, fragmentary and unsystematic. "On the Constitution of the Church and State," a more regularly sustained thesis, contains much the same premises, and is a piece of special pleading, ostensibly designed to show the people of England how to think and vote rightly on the question of Catholic emancipation. It is substantially an argument in favor of the national Church. The 'Confessions' is one of the most striking expressions of a well-known doctrine of the 19th century that the Bible, the only sufficient rule of faith and practice, is nevertheless not to be taken literally but in what Arnold later called a literary way and Coleridge here called "according to reason." The demonstration of truth is internal, not dogmatic. To this period also belongs Coleridge's 'Table Talk,' published after his death from the notes made by H. N. Coleridge between 1822 and 1834, and containing a rich and varied array of observations, chiefly philosophic in character, from the most brilliant talker of the time.

Critics of Coleridge are pretty well united in calling him one of the great sources of intellectual stimulus of his generation. His supporters, like Mill, point out the fundamental fact of his vast influence in stimulating the mind of his contemporaries. His detractors, like J. M. Robertson, lay stress on his desultory habits of mind, his weakness of character and his vast plagiarism, 'unparalleled in literary history' (1816), a challenge which is probably 'so keenly and genuinely desired to find fundamental principles and sanctions for belief and action that he did not mind where he got his principles so long as they impressed him. Setting aside the objections of his work (aside from his poetry) is, as it stands, remarkable for its avoidance of history in all its forms, of science as we know the term and for its confinement to the fields of philosophy, metaphysics, theology and criticism. In these fields it is almost wholly introspective, it consists of an examination of the contents of his mind and is noteworthy for an almost complete lack of sense for external fact. Within these limits, few writers have scattered broadcast so many stimulating ideas; his apothegms and pregnant sayings are enormous in number, as well as recurrent. Added to this is an acute logical sense for detecting flaws in the arguments of opposing views, a feeling for axiomatics which other men leave to the authors, and an ability to make his desultory and essentially a monologue, is often marked by grandeur and charm. See A N C I E N T MARINER, THE; CHRISTABEL; KÖBLAI KHAN.

W I L L I A M T. BREWSTER,
Professor of English, Columbia University.

CO LERIDGE, Stephen, English author and artist: b. 31 May 1854. He is a graduate of Trinity College, Cambridge. He has exhibited pictures at Birmingham, Leeds and elsewhere, is honorary secretary of the National Anti-vivisection Society and has published 'Demetrius' (1887); 'The Sanctity of Con-fession' (1890); 'Gloria' (1903); 'Songs of Desideria' (1907); 'New Poems' (1911); 'Memories' (1913); 'A Morning in My Li-brary' (1914).

CO LERIDGE-TAYLOR, Samuel, British composer: b. 15 Aug. 1875; d. 1 Sept. 1912. His father was a native of Sierra Leone and his mother an Englishwoman. He studied music under Villiers Stanford, and set three sections of Longfellow's poem 'Hiawatha' as a cantata. Among other of his compositions was 'The Atone-ment,' and oratorio, and 'The Blind Girl of Castel-Caillé.'

COLES, Abraham, American prose writer and poet: b. Scotch Plains, N. J., 26 Dec. 1813; d. Monterey, Cal., 3 May 1891. In 1835 he was graduated from the Medical College, Philadelphia. He published 13 original transla-
COLES—COLFAX 249
tions of the celebrated hymn 'Dies Irae' (1859); 'Old Gems in New Settings' (1866); 'The Microcosm' and 'The Light of the World' (1884). He also made metrical versions of many of the psalms.

COLES, Edward, American political leader; b. Albemarle County, Va., 15 Dec. 1786; d. Philadelphia, Pa., 7 July 1868. He was graduated from William and Mary College in 1804, and was Mason's Privy Councillor from 1810 to 1816, and in 1817 was sent on a diplomatic mission to Russia. Shortly after his return to the United States he removed to Illinois; while living in Virginia he had owned slaves, but took them with him and liberated them, and soon became prominently identified with the anti-slavery party in Illinois. In 1822 he was elected governor of the State, holding that office till 1826. During his administration an attempt was made to amend the State constitution in favor of slavery, but under his leadership, the anti-slavery party carried on a vigorous campaign in opposition to the proposed amendment and decisively defeated it. After 1833 he lived in Philadelphia. Consult Washburne, 'Sketch of Edward Coles.'

COLET, kôl, John, English divine, founder of Saint Paul's School, London: b. London 1466; d. there, 16 Sept. 1519. His father, Sir Henry Colet, was twice lord mayor of London. About 1493 he set out to make a continental tour, and became acquainted with several of the most eminent men of the time, among them Erasmus and Budæus. While on the Continent he studied Greek, canon and civil law and the writings of the fathers. In 1496 he returned to England, and in the following year he was ordained, took up his residence in Oxford and lectured in Latin on Saint Paul's Epistle to the Romans. He was an ardent advocate of the new learning and an admirable Bible scholar. Erasmus was one of his audience at a later series of lectures on the First Epistle to the Corinthians, and from this time (1498) the two became warm personal friends. In 1505 Colet was appointed dean of Saint Paul's. With Sir Thomas More and others he urgently advocated the reform of certain ecclesiastical abuses, but it is a mistake to suppose that he held anything in common with the spirit of the Protestant Reformation for which his work helped to a very considerable degree to pave the way. Saint Paul's School was founded and endowed by him in 1512, the earliest school in England in which Greek was a regular part of the curriculum. His writings are not numerous, but give good evidence of his learning and piety. In 1567-76 J. H. Lupton produced an edition of those of Colet's works not published during the 16th and 17th centuries. The best modern biography is that by Lupton, J. H. (1887 and 1909); Sebohm, F. 'Three Oxford Reformers: Erasmus, Colet and More' (London 1887).

COLET, kôl-a, Louise Révoil, French poet and novelist: b. Aix, France, 15 Sept. 1810; d. Paris, 8 March 1876. She was the wife of H. J. de Croll, commander of the Conservatory (1809-31). She went to Paris with him in 1835 and the following year she published her first book of poems, 'Fleurs du Midi.' She was a very beautiful woman, passionate in her expression of thought, and gifted with wonderful faculties of expres-
sion and depth of feeling. Her salon became one of the noted literary centres of Paris. She went the way of her day and her liaisons with noted men became notorious. Four times, 1843, 1852 and 1855, poems of hers were crowned by the French Academy. She was a graceful lyrist and often struck the chord of deep passion with effect. Of her verses, poured forth with marvelous facility, 'The Woman's Poem' is perhaps her best after the four offered to the Academy. Among her other poetical works are 'Poésies' (1842); 'Ce qui est dans le cœur des femmes' (1852); 'Les convictions' (1853); 'Les sautes du siècle' (1854); and among her best known prose works are 'La jeunesse de Mirabeau' (1841); 'Les cœurs brûlés' (1843); 'Deux mois d'émotion' (1843); 'Filles et Saintes' (1844); 'Madame du Châtelet' (1854); 'Naples sous Garibaldi' (1861); 'Histoire d'un soldat,' one of her best stories. Her dramatic pieces include 'La Jeunesse de Goethe' (1839); 'Julius Cæsar,' and 'Charlotte Corday.'

COLEY, William Bradley, American surgeon: b. Westport, Conn., 12 Jan. 1862. He was graduated at Yale in 1882, and at Harvard Medical School in 1885. He has practised as physician since 1888, is attending surgeon at the General Memorial Hospital and the Hospital for Ruptured and Crippled, and also professor of clinical surgery at the Cornell University Medical School. He is author of the article on 'Cancer' in Twentieth Century Practice of Medicine (1897); article on 'Hernia' in Dennis' System of Surgery (1896); in Warren and Gould's International Textbook of Surgery (1898); in Progressive Medicine since 1898, and in Keene's Surgery (1907).

COLFAX, Schuyler, American statesman: b. New York, 23 March 1823; d. Mankato, Minn., 13 Jan. 1885. He removed in 1836 to Indiana, where in 1845 he acquired a newspaper at South Bend, which he made the most influential Whig journal in the district. He was a delegate to the Whig conventions of 1848 and 1852; was elected to Congress in 1854 by the newly formed Republican party and re-elected until 1869, being thrice chosen speaker; and in 1868 he was elected Vice-President of the United States, in Grant's first term. Impeached, unjustly, as he and his friends claimed, in the Crédit Mobilier charges of 1873, he spent the remainder of his life in political retirement, making public appearances only on the lecture platform. He was the founder of the Daughters of Rebekah branch of American Odd Fellowship.

COLFAX, Iowa, city in Jasper County, 22 miles east of Des Moines, on the Chicago, Rock Island and Pacific Railroad. The city has noted mineral springs and a public library. Coal mining and the bottling of spring water are the chief industries. The waterworks are municipally owned. Pop. 2,524.

COLFAX, Wash., city, county-seat of Whitman County. It is situated on the Palouse River, the line of the Oregon Railroad and Navigation Company, and 80 miles south of Spokane. It is a trade centre for the products of the fertile, surrounding country; grains, lumber, fruits and live stock are the chief exports. Manufactures are increasing. The
waterworks are owned by the city. It contains a hospital and fine courthouse. Pop. 2,783.

COLGATE, Austen, American manufacturer: b. Orange, N. J., 12 Aug. 1863. He was graduated at Yale University in 1886. Immediately afterward he entered the firm of Colgate and Company; in 1890 was admitted to partnership, and became vice-president of the company upon its incorporation. He took a great interest in political events, gained a place in the councils of the Republican party, and has taken part in all important campaigns of recent years. In 1906 he was elected member of the New Jersey assembly and served in 1906-08 and 1909. Governor Fort appointed him chief of staff and his personal aide. He was also made Deputy Adjutant-General of the New Jersey National Guard, with the rank of colonel. In 1911 he was elected to the New Jersey senate, and was re-elected in 1914.

COLGATE, James Boorman, American financier and philanthropist: b. New York, 4 March 1818; d. Yonkers, N. Y., 7 Feb. 1904. He was for some years a member of the dry goods firm of Colgate & Abbe in New York, and in 1856 entered into partnership with J. B. Trevor as dealers in stocks and securities. To Colgate University (q.v.) he gave several buildings and an endowment of $1,000,000 called the Dodge Memorial Fund, and also gave to other institutions. For several years he was president of the New York Gold Exchange, of which he was one of the founders.

COLGATE, Samuel, American manufacturer, brother of James B. Colgate (q.v.): b. New York, 22 March 1822; d. Orange, N. J., 23 April 1897. He was a son of William Colgate, founder of the soap and perfumery house of Colgate & Company. Samuel Colgate succeeded his father as head of the firm, and continued his father's generous benefactions to religious, educational and charitable enterprises. With his brother he erected Colgate Academy building in Hamilton, N. Y., at a cost of $20,000, and in recognition of their gifts to Madison University, in the same place, the name of that institution was changed to Colgate University (q.v.). He bequeathed to Colgate University a collection of rare reports and literature, numbering 40,000 titles, in several languages, made during the many years he was president of the New York Baptist Education Society.

COLGATE, William, American manufacturer: b. Kent, England, 25 Jan. 1783; d. New York, 25 March 1857. He came to America in 1795 and to New York in 1804, and became apprentice to a soap-boiler. In 1806 he established himself as soapmaker at 6 Dutch street, New York, and for half a century followed this business with an industry and intelligence that commanded the largest success. He was one of the leading members of the Baptist denomination in New York and was distinguished for his zeal and liberality in all its missionary and educational enterprises.

COLGATE UNIVERSITY, an educational institution at Hamilton, N. Y., founded 1819 by the Baptist Education Society of the State of New York. The first building of this institution was the Hamilton Literary and Theological Institution. It was changed to Madison University in 1846. In 1890 the name was again changed to Colgate University. The university consists of two distinct institutions, a college and a theological seminary under the same corporate management. The theological courses of three years lead to the degree of Bachelor of Divinity and Master of Arts. The college offers courses leading to the degrees of Bachelor of Arts and Bachelor of Science, provision being made for graduate work for the corresponding master's degrees. The campus of the University comprises 220 acres, on which are 15 university buildings. The faculty numbers 50 and the students 400. There are 75,000 volumes in the library. Endowment of the University is about $2,500,000; value of grounds and buildings about $1,000,000.

COLIC, in pathology, a painful affection of the intestines, especially of the large bowel or colon, whence the name. The pain is due to spasmodic and irregular contractions of the colon, and is felt chiefly in the region of the navel. It is of a severe twisting character, and comes on in paroxysms, occasionally so severe that the patient rolls and twists about, usually doubled up, and grasping the abdomen, and not seldom groaning or crying. Constipation of the bowels usually accompanies colic, and the pain may give rise to vomiting. Often, however, severe colicky pains are the forerunner of looseness of the bowels, caused by some food which has disagreed. The pain may be caused by wind, the discharge of which affords great relief. There is no fever with the attack, but the pulse is usually lowered, and the face pale and anxious-looking. In this respect colic differs from inflammatory attacks in the bowels. Pressure on the abdomen generally gives relief in cases of colic, but in cases of inflammation the patient cannot endure pressure. Whether the attack be one of colic or not may readily be learned from the attitude of the sufferer and the fact of his excreting or avoiding pressure. Treatment consists in applying hot cloths or bags of hot salt across the abdomen. Doses of medicine, such as castor-oil, should also be administered, and a large glass of cold water at a gentle warmth will probably bring relief. In the case of an adult patient 30 drops of laudanum may be given along with the castor-oil, or shortly after it. Magnesia and dill-water are also used as remedies for colic in young children. What is called biliary or renal colic is caused by the passage of gall-stones or kidney stones toward the bowel or bladder respectively. It occurs oftener in women than in men.

COLIGNY, kō-lēn-yā, Gaspard de, French soldier: b. Châtillon-sur-Loing, 16 Feb. 1517; d. Paris, 24 Aug. 1572. After a brilliant military career he was made in 1552 admiral of France. He was distinguished for valor in battle, for strict discipline and for his conquests over the Spaniards, in particular for his defense of Saint Quentin. When Saint Quentin was taken by storm, the admiral was made prisoner. After the death of Henry II, the intrigues of Catharine de Medici induced him to place himself at the head of the Calvinists against the Guises. He formed so powerful a party that the Catholic religion in France seemed to be in danger. Condé was more ambitious, more prompt, active; Coligny more considerate, prudent and more fit to be the leader of a party; equally unfortunate in war with Condé, but skilled in
remedying even what appeared irretrievable losses, he was more to be feared after a defeat than his enemies after a victory. The first battle between the Huguenots and Catholics (1562, at Dreux) was lost to the admiral, but he saved his army. When the Duke of Guise was murdered at the siege of Orleans, he was accused of being author of the murder. The civil war recommenced with increased fury in 1567. Coligny and Condé encountered the Constable Montmorency at Saint Denis. This indecisive action was followed by the battle of Jarnac in 1569, which was fatal to the Calvinists. Condé fell and the whole burden of command devolved on Coligny. An advantageous peace seemingly put a stop to this contest in 1570. Coligny appeared at court, and was, with his adherents, loaded with favors. Charles IX gave him 300 trances as an indemnification for his injuries, together with a seat in the council. From all sides he was warned not to trust to these caresses. As the admiral was leaving the Louvre, 22 Aug. 1572, his right hand and left arm were wounded by a shot from a warmen. One Maurean had fired at him from a building belonging to the monastery of Saint Germain l'Auxerrois, according to the plan of Catharine de Medici, probably with the knowledge of the Duke of Guise. Charles testified the deepest sorrow, caused search to be made for the assassin and said to Coligny, 'My father, you have the wounds, but I the pain.'

This he said at the moment when the massacre of the Protestants was already prepared. The slaughter began on the night of Saint Bartholomew's, 24 Aug. 1572. The Duke of Guise hastened with a numerous suite to the house of the admiral. One Bemme, or Besme, entered with his drawn sword into the chamber of the old man, pierced him with several stabs and threw the body out of the window into the courtyard. See CONDE, LOUIS I DE BOURBON.

COLLIDÉ. See MOUSSEBED.

COLIMA, ko-lé'má, Mexico, state in the southwest of the United States of Mexico. It includes the four desert islands, Socorro, Rosa Partida, San Benedicto and Clarion, which form the Revillagigedo group. The northern section, known as Los Altos, is occupied by the slopes of the Colima volcanoes. The Armeria River flows through the state, and the Coahuayama is on the boundary. There are two lakes, Cuyutlán and Alcuazague. The climate, except in the mountainous region, is hot and unhealthy. Rainfall is abundant and malaria prevails. Salt, silver, gold, sulphur and copper are found; about 170 species of trees, including fruit, and trees, the parts of which are useful for tanning, dyeing, clothing, food, and medicine. The chief products are coffee, cacao, tobacco, rice, cotton, indigo, sugarcane, cereal and leguminous plants. The principal industries are agriculture, stock-raising and working in the salt sections. Much of the trade is with the other states of Mexico, especially those close to the coast, but it has a growing trade with Germany, Hawaii and the United States cities on the Pacific. Exports are rice, coffee, rubber, fruits, cabinet and dye woods, corn, hides and skins and minerals. Imports include tobacco, wines, liquors, machinery, cotton stuffs, wines and liquors, glassware, firearms and ammunition. The Pacific Mail, Red Line, Izaquirre and the Sinaloa and Durango Railway Company's steamers connect the port of Manzanillo with other ports, foreign and domestic.

COLIMA, Mexico, capital of the state of Colima. It is situated in the middle of a region which is irrigated by the Colima River. It is generally well built and has fine plazas and a number of pretentious buildings, among which are the government building, the San Juan Hospital, the city hall, cathedral, theatre, the station of the Mexican Northern Railway, and the market. It has an electric-lighting system, a street-car line, etc. The town has connections by rail and water with the port, Manzanillo, and is the seat of considerable trade. Colima was founded in 1523 by Gonzalo de Sandoval. About 40 miles to the northeast of the town is the volcano of Colima, nearly 13,000 feet high, which is constantly in a state of eruption. Pop. 25,148.

COLIN, Jean Lambert Alphonse, French general and military historian: b. 1864; d. 1 Jan. 1918. Educated for the army, he entered the artillery and had attained the rank of captain when, in 1898, he published Études sur la Campagne de 1796-97 en Italie. This anonymous essay on Napoleon's first campaign immediately attracted the attention of military historians and critics by its mastery of style, of narration, exactitude and criticism. The work became a classic and at once superseded all previously-written accounts of that campaign. Captain Colin was soon attached to the historical section of the French general staff and for several years a number of important works by him were published. 'The Military Education of Napoleon' (1900) threw the first clear and full light on Napoleon's early studies and on the sources of his theory and practice in war. This was followed by a series of brilliant histories, 'Les Campagnes du Maréchal de Saxe'; 'Louis XV et les Jacobites'; 'Projets de Debarkement en Angleterre'; and 'La Campagne de 1805 en Allemagne,' which is regarded as a standard work on the campaign of Ulm and Austerlitz. Colin meanwhile also published monographs on 'Hannibal in Gaul' (1904); 'Tactics and Discipline in the Armies of the Revolution' (1902); and 'L'Infanterie au XVIIIe siècle La France,' a record of the progress of tactics from Marlborough to Napoleon. In 1911 he published 'Les Transformations de la Guerre,' which appeared in an English translation under the title of 'France and the next War' (London 1914). 'Les Grandes Batailles de l'Histoire' (1914) aimed at showing how the procedure of great military leaders is fundamentally always the same. His last work was a volume on Napoleon in the series 'Les Grands Hommes de la Guerre,' a concise account of Napoleon's wars and battles. Colin at times had thoughts of leaving the army and devoting himself entirely to literature. He had planned a series of volumes on military history intended for popular reading. At the outbreak of the war General Joffre employed him on the general staff of the army. He commanded the artillery of a large division at the Marne and that of an army corps at Verdun. In 1916 he was sent to Macedonia as brigadier-general and there commanded a brigade of artillery at the side of a British heavy battery. He was in command of an infantry division when he received
COLIN CLOUT — COLLARS AND CUFFS

his death wounds. It is said that no European officer of our time equalled Colin in his mastery of the strategy and tactics of the great commanders.

COLIN CLOUT, a satire by John Skelton. It was a vigorous pre-Reformation protest against the clergy's lack of learning and piety. Edmund Spenser adopted "Colin Clout" as his nom-de-plume. Colin Clout is also the name of a shepherd in 'The Shepherd's Week,' a pastoral poem by Gay.

COLISEUM, more properly COLOSSEUM, a gigantic ruin in Rome, the greatest amphitheatre which Roman magnificence ever erected. It was commenced by Vespasian (reigned 69-79 A.D.), and practically finished by Titus about the year 80 A.D., who dedicated it with shows in which 5,000 animals were killed. It was built to furnish a place for amusements for the Roman people; such as gladiatorial combats, fights with wild beasts and less harmless athletic sports. In the early days of Christianity it was the scene of the martyrdom of a number of Christians. It is said to have held 100,000 spectators, of whom about 87,000 were seated. For the greater part it consists of travertine, is elliptical in shape, 1,680 feet in circumference and 157 feet high, and has three rows of columns, one above the other: the lower is of the Doric, the second the Ionic and the highest the Corinthian order. The diameter of the arena from side to side was 182 feet, from end to end 285 feet. Down to the 6th century this monument of ancient glory remained almost uninjured, when Theodoric, king of the Goths, caused material to be taken from it for the construction of various buildings; afterward Pope Paul II took all the stones from it, which were used for the construction of the palace of Saint Mark, and in later times some other palaces were erected from its fragments.

COLLAR-BONE. See CLAVICLE.

COLLARD, Charles François Thomas, Belgian sociologist and author: b. Louvain, 22 Oct. 1882. He was educated at the Collège Saint-Luc, and at the universities of Louvain, Berlin, Bonn and Zürich. He studied law, became a deputy justice of the peace and deputy royal prosecutor at Louvain and later deputy royal prosecutor at Brussels. He traveled in Germany, Holland, Italy and Switzerland and was secretary to the Congress of Administrative Sciences at Brussels in 1910. He also served as recorder or secretary to the Congress of the International Union of Penal Law at Brussels 1910; the International Congress of Children's Courts at Paris 1911, and the Congress for the Protection of Former Convicts and Wayward Children, Antwerp 1911. He is a member of the International Union of Penal Law, the Society of Political Economy of Brussels and the General Society of Prison of France. He has published "L'Education protectrice de l'enfance en Prusse" (1908); "Les tribunaux spéciaux pour enfants" (1911); "L'Institution et l'organisation des tribunaux spéciaux pour enfants" (1911); "Notice et traditions anciennes sur la 13 Juillet 1907, sur le contrat de travail en Hollande" (1908). He is a member of the editorial staff of "Revue de droit pénal et de criminologie," and has contributed articles on sociology and economics to "The Catholic Encyclopedia," "La Réforme Sociale," "Revue sociale Catholique," "Revue pratique de droit industriel," "Jugendwohlfahrt," etc.

COLLARED LIZARD, one of the iguanid lizards of the genus Crotophysis. Its habitat is in the open country of the southwestern United States from the Ozark Mountains to California. The name is derived from the double black collar around the neck of the species Crotophysis collaris. This species is entirely insectivorous, can run rapidly and often on its hind legs alone. Another well-known species is the leopard lizard (Crotophysis wilsheimi), which is noted for its fierce disposition. It feeds on leaves, insects, young rodentian rodents and smaller lizards even of its own species. In the breeding season both male and female undergo a change of color. Consult Dittmers, 'The Reptile Book' (New York 1907).

COLLARS AND CUFFS, Manufacture of. The collar trade, a distinct and important branch of the "gent's furnishings" industry, originated at Troy, N. Y., about 1825, when the wife of a blacksmith conceived the idea of making the first detachable collar. Prior to that time shirts had always been made with the collars and cuffs attached to the shirt. The detachable collar soon became extremely popular, and, in 1829, Rev. Ebenezer Brown, who had retired from the Methodist ministry to establish a dry goods store in Troy, opened a small collar factory.

As this branch of Mr. Brown's business increased very rapidly it was not long before he had several imitators. Somewhat prior to 1834 Montague & Granger erected a still larger factory and opened another establishment. About a year later Independence Stark began to make collars in quantities and, about 1837, he opened an establishment for the laundering of collars, both his own and other manufacturer's make. This was the first "Troy Laundry," a name which is now known from one end of the land to the other. In these days, collars were known as "String Collars," because they were then tied around the neck by means of a string attached to the collar. They were worn with the old-fashioned stock tie.

The manufacture of detachable cuffs began in 1845. When in 1851 Nathaniel Wheeler, of the firm of Wheeler & Wilson, attempted to introduce his new sewing machine into the collar and cuff business, the makers laughed at him for his presumption in declaring that his invention would enable them to produce as good collars and cuffs at a cheaper cost than any human agency could sew them. Among all the Troy manufacturers only one, Jefferon Gardner, was willing to give the machine a trial. His experience was so satisfactory that within 12 months the other factories were supplied with similar machines, and one of the manufacturers, W. O. Edson, of the firm of Bennett & Edson, was operating them by means of steam power.

The second great invention to which the amazing growth of the collar-and-cuff industry is so largely due was the introduction of the butt-and-sew sewing machine, in 1875.

A single collar will often pass through 25 different operations, each of which requires the attention of an expert in his particular line of the trade. The designing of patterns is also ex-
COLLATION—COLLEGE

Collation, the name given to the restricted meal, sometimes permitted on fast days, usually food to the amount of about eight ounces or one-fourth of an ordinary meal.

Collect (Collecta) in ecclesiastical language means a collection, as of alms, taken up during the church service; this is of apostolic origin, and Saint Paul mentions the collection for the saints taken up on the first day of the week. Used in still another meaning it signified what collect still does in English, a brief prayer pronounced by the priest in celebrating mass after the Gloria.

Collectivism, a plan of social organization in which the means of production and distribution in a community would belong to the people collectively. The term is also applied to the theory that society should be organized collectively. In the collectivist commonwealth the people cooperatively organized would have full control of production and distribution. Collectivism does not involve the abolition of all private property, but only of productive property in the means of production. Collectivism is disapproved by Socialists as the natural successor to the present social system, and is the form of organization which they seek to establish; hence the term collectivism is often used as synonymous with Socialism (q.v.).

Collector of the Port. See Customs.

Colleen Bawn, kôl'ên bân, The, a noted play by Dion Boucicault. It was based on Gerald Griffin's novel The Collegians (1828) and was first played 10 Sept. 1860. The novel was republished in 1861 as Colleen Bawn or the Collegian's Wife.

College (Latin, collegium), in its primary sense, a body of colleagues, a corporation or society of persons invested with certain powers and rights, performing certain duties or engaged in some common employment. In Great Britain and America some societies of physicians are called colleges. So, also, there are colleges of surgeons, a college of heralds, etc. Colleges of these kinds are usually incorporated or established by the supreme power of the state. The most familiar application of the term college in English is to a society of persons engaged in the pursuits of literature or science, including both professors and students. At first the students of the universities had no common bond of union, except that of study and discipline, and were lodged where they could find it convenient. Then hostels or boarding-houses were provided (principally by the religious orders, for the benefit of those of their own fraternity), in which the scholars lived under a certain superintendence. Charitable persons subsequently endowed these hostels that poor scholars might have a lodgings. The colleges of Oxford and Cambridge are academical institutions of this kind, each endowed with revenues of its own, and having fellows, students and tutors, who live together under a head, in particular buildings. Each college is regulated by laws framed by its founder, with such modifications as have been deemed necessary to introduce from time to time. According to these laws, the head (variously styled master, principal, warden, rector, etc.), is either chosen by the fellows from their own number, or appointed by the Crown or other authority. The fellows are graduates who receive special emoluments for a term of years, and are generally elected to the position on account of special scholarship; while the scholars, admitted as undergraduates, are either chosen from particular localities, schools, etc., or elected according to merit after free competition. There are also a number of ordinary students, all as a rule members belonging to the college. The undergraduates receive their instruction chiefly from tutors, who are generally resident fellows. The colleges are subordinate to the university, and it is the university that confers degrees,
and institutes and carries out the necessary examinations. Generally speaking, the term college implies an institution inferior to a university, and the term high school to a college; but in Scotland, Ireland, Germany and elsewhere there are no colleges such as those of Oxford and Cambridge, and the college or colleges in Scotland and Ireland are simply edifices in which the teaching is carried on. Some modern colleges are called university colleges, either because equipped similarly to a university, or because connected with a university, and able to train students for degrees to be obtained from that university. Institutions for teaching theology are often called colleges, and some schools that train pupils for the universities, or give a good secondary education, are also so called. In American usage college commonly indicates the stage of instruction intermediate between the high school and the university.

In France there are university colleges or facultés in all large towns, besides lycées, corresponding to what are called, in Germany, gymnasiums. Other institutions of a similar kind, that is, schools for secondary education, are called collèges communaux. These are public establishments aided by the communes, and subject to the direction of the public authorities. Besides these, there is the Collège de France, which derives the name of a university. It was instituted in 1529 by Francis I, and here numerous professors, among whom there are always some of the most distinguished men, lecture gratuitously. See AMERICAN COLLEGE; AMERICAN UNIVERSITY; CAMBRIDGE, UNIVERSITY OF; and articles on different colleges and universities.

COLLEGE, The American. See AMERICAN COLLEGE, THE.

COLLEGE OF THE CITY OF NEW YORK. The, originally entitled the Free Academy, was established in 1848 by the Board of Education of New York city. In 1854 the legislature of the State passed a law endowing the institution with collegiate powers and privileges; and in 1866 the name was changed to that of "The College of the City of New York." The college is supported by the city and is open only to residents of the city, to whom instruction and the use of textbooks and apparatus are entirely free. It thus stands in the same relation to the city as the American State university to the State, being the uppermost member in the scheme of public instruction. About two-thirds of its students are drawn from the high schools of New York, and the remainder from the preparatory department of the college itself and from private schools. The requirements for admission and for the degree are the same as those of any American college. The degrees conferred are Bachelor of Arts and Bachelor of Science only, i.e., the college has no professional schools and no graduate department. None but male students are admitted, and the use of textbooks and apparatus is entirely free to all public school teachers of the city, whether male or female. From the time of its foundation to the year 1907 the institution was located at the corner of Lexington avenue and 23d street. In 1907 it removed to the old Edenside school building which had been erected for its use on the crest of Washington Heights and which form, by virtue of their commanding position and their architectural beauty, one of the most dignified and pleasant sights of the city. The number of students in attendance in October 1917 was 9,439, distributed as follows: Regular students (candidates for the bachelor's degree), day session, 1,623 and evening session, 791; in extension and correspondence courses (given in the Municipal Building to employees of the city) 250; preparatory department, 1,900.

COLLEGE DRAMATICS. The co-operation of the arts of the theatre with the arts and aims of pedagogy—an alliance which has the profoundest roots—may be summed up in a few words. Most religious and worshipful in its origin, the primitive theatre becomes, in some sort, a moving picture aid to the teacher in his character of mystic; then, because his public craves yet more reality, history repeatedly gives us the view of the teacher-actor-dramatist evolving into the instructor of ethics (as distinct from mysticism), in a theatre within the Church or within the School. At this point both Church and School consent; while the secular dramatists and actors, taking the general public with them into a freer and often richer air of art, round out the humanities. Yet, observing that conservative educationists in all ages have been inclined to frown upon the theatre either as a frivolous amusement or a dangerous one, nevertheless in some form or another, high or base according to the times, toleration or lack of it, the mind of energetic youth has quite as stubbornly inclined the lyrical performances. And youth has ever prevailed. Thus we must constantly view the union of the academy and the theatre from two standpoints: first, the pedagogic, and then the distinctly theatrical. Oftentimes, as in ancient Greece, recitative or oratorical exercises have taken the place of a fuller expression of the dramatic instinct, but only as alternatives and palliatives. The plays of Æschylus, Sophocles and Euripides were used in the schools; and Plato in 'The Republic' refers to their influence. It is noteworthy that even he objected, on moral grounds, to the use of such masterpieces. But, of course, Time is not with Plato in this respect.

The Roman schools used plays as textbooks, and probably gave performances. Down the Middle Ages, the dramatic records are few and negligible. We have no evidence of a school theatre during this period till the 10th century, when Hrotsvitha, the Benedectine abbess in Saxony, wrote comedies after the manner of Terence, understood to have been performed in her convent school. But till the latter part of the 16th century plays and playing were mainly a matter of the Latin and western Europe for the purpose of Latin teaching. Even in this we see the beginnings of a development. Old form plays paved the way for the Neo-Latin plays of the schoolmen, until the Reformers made itself felt. At this time we have a survival in the Latin play of the Westminster School. Then, Latin falling out of general use, school plays came to be written in the vernacular. Italy, Holland, France, Germany and England were all exponents of school and university drama. Dutch scholars (led by Erasmus) gave the drama what was perhaps
the warmest welcome in the schools. France introduced Ravinius Textor, who, through the school drama, is said to have been the first Continental playwright to influence the English stage. At this period into it, for example, contributed Rastell's 'Tale of the Nature of the Four Elements'; the 17th, Samuel Shaw's 'Dramatized Rhetoric'; the 18th, a 'History of England,' by John Holmes, for the performance of his 'Gentlemen of the Public Grammar, the Alp,' played in Buchanan's school theatre, and writes his love and praise of his master in 

Essay 1—215 (Hazlitt edition). German school drama, more religious and probably more spectacular than that of other countries, became widely popular with the people. Schmidt tells us that the aim of the school drama was 'to gain a mastery of the Latin language, to develop the pupil's oratorical powers, to picture vividly moral truths, to interest the pupils, parents and townpeople, to help pay the teacher's salary and sometimes to develop a knowledge and love of the dramatic arts.'

Many illustrious youths took part in these plays all over western Europe. In England, one of the most famous was John Heath, Tactus, the sense of feeling, in a school drama on the Five Senses. Francis Bacon was a famous dramaturg of school shows at school and of masques at court; whence, doubtless, he drew for his essay on 'Masques and Triumphs.' Since then many a college man, pleading with cold authority, has leaned heavily on the words of his incomparable Elizabethan prototype: 'In modern states play-acting is esteemed but a toy, except when it is too satirical and biting; but among the ancients it was used as a means of educating men's minds to virtue.' And, again, 'school drama: 'It is a thing indeed, if practised professionally, of low repute; but if it be made a part of discipline, it is of excellent use. I mean stage playing; an art which strengthens the memory, regulates the tone and effect of the voice and pronunciation, teaches a decent carriage of the countenance and gesture, gives not a little assurance in speaking and acting. Thus even Euripides speaks indirectly to us today through the frigid Seneca, through the pre-Shakespearean dramatists, by Shakespeare himself. For this, a debt is due to the schools and universities. Again, the first English comedy, 'Roister Doister,' was a free adaptation from Plautus by Nicholas Udall, sometime master of Eton and of Westminster, whose work rose and developed in the schools. It was originally performed at Eton by the scholars. Consult A. W. Ward's 'History of English Dramatic Literature'; Boas' 'University Drama'; and the same author's 'University Plays' ('Cambridge History of English Literature,' Vol. VI); E. K. Chamber's 'The Mediaeval Stage'; by 17th century the academic drama passed out almost completely, although since that time occasional attempts have been made to revive the old spirit. These, however, have represented a tradition rather than a native genius. During the later and less virile period of school drama, when there was little joy in either the school or its drama, some amazing textbook compendiums in dialogue form passed into academic currency as plays. The 16th century, for example, contributed Rastell's 'Tale of the Nature of the Four Elements'; the 17th, Samuel Shaw's 'Dramatized Rhetoric'; the 18th, a 'History of England,' by John Holmes, for the performance of his 'Gentlemen of the Public Grammar, the Alp,' at Holt in Norfolk. The least formidable of such works was the 'Scholos Ludus, or Gate of Tongues Unlocked,' by John Amos Comenius. No English edition of the book is known, which is not to be regretted, for even this, the top of all these pseudo-plays, is of a most forbidding texture in the original. But Comenius was a theorist with an open vision for all that; and, with Daniel G. Morhof of those times, another worthy reformer, a staunch believer that 'schooling can be advanced by the acting of plays.'

In the 19th century, the neglect of the theatre by the universities opened the door to the wildest burlesques and other vagaries by the students themselves; these impertinences being ignored by dignitaries, the theatre, till the advent of scholarship, the serious theatre was stubbornly opposed by prejudice. The experience of Oxford and of Harvard amateurs will serve to illustrate the state of the university world during this period. For the amusing details of these and other similar bodies—all details that often have an earnest purpose behind them—consult 'The Oxford Amateurs'; the Harvard 'Hasty Pudding Club Theatricals'; the pamphlet on 'The Fight for the Stage'; the entertaining article on the 'Men Who Took Female Parts in Oxford [and Cambridge] University Plays'; 'Rise and Development of [American] College Musical Comedies'; 'College Folk [American], and other articles and books listed below. It is interesting to note that The Hasty Pudding Club is the oldest dramatic organization in the United States, having been established in 1795. Now, in these early years of the 20th century, the world-wide Renaissance of the legitimate being looked at. Not the least use of the school and university playing in the vernacular in England was the contribution it made to the rise of the modern drama through the influence of classical traditions and imitations. Thus even Euripides speaks indirectly to us today through the frigid Seneca, through the pre-Shakespearean dramatists, by Shakespeare himself. For this, a debt is due to the schools and universities. Again, the first English comedy, 'Roister Doister,' was a free adaptation from Plautus by Nicholas Udall, sometime master of Eton and of Westminster, whose work rose and developed in the schools. It was originally performed at Eton by the scholars. Consult A. W. Ward's 'History of English Dramatic Literature'; Boas' 'University Drama'; and the same author's 'University Plays' ('Cambridge History of English Literature,' Vol. VI); E. K. Chamber's 'The Mediaeval Stage'; by 17th century the academic drama passed out almost completely, although since that time occasional attempts have been made to revive the old spirit. These, however, have represented a tradition rather than a native genius. During the later and less virile period of

At Harvard, Yale, the University of California, at Stanford and other universities, an excellent training is given, and many fine experi-
ments are made in all the arts dramatic. Classes are held on the technique of dramatizing prominent historical events and literature. The Harvard Dramatic Club produces plays by Harvard graduates and undergraduates with the co-operation of a professional stage director of standing. Competitions are held, for the best prize of which is a production at the Castle Square Theatre. Several of these prize winners have already become known to playgoers. Some years ago the interior of Sanders Theatre,—the academic theatre of the university,—was remodeled into a replica of an Elizabethan Theatre under the supervision of Professors Baker and Langford Warren (the latter representing the architectural department of the university), for the performance of Mr. Forbes Robertson's 'Hamlet' on the occasion of that distinguished actor's first representation of the part in America. Professor Baker also devised and directed, in co-operation with his students, the MacDowell pageant of Peterborough, N. H. A dramatic workshop with Waterbury and Bridgeport. In 1899, four years after a talk on the drama by Mr. Joseph Jefferson in the Art School, 2 May 1895, Professor Phelps suggested the formation of the association, and two plays were produced at the Hyperion Theatre. The plays were a success, and the undergraduates were thereafter allowed to maintain an organization. Different in kind from the Harvard Hasty Pudding and the Princeton Triangle clubs in having a serious purpose, the Yale Dramatic Association was founded in the belief that the university is the natural cradle for the fostering of a better drama and for the encouragement of the new art of the theatre. Up to the year 1908, the Association took short Easter trips to such nearby towns as Hartford, Waterbury and Bridgeport. In 1908 the policy was changed and a long Christmas tour, the first of many such enterprises, was undertaken. In 1910 the Dramatic Association was incorporated. Perhaps the most outstanding event in its history was the presentation by Miss Maude Adams at the Grand Theatre, of 'What Every Woman Knows,' April 1909. The entire gate receipts of the play were generously contributed to the building fund for the Yale Theatre. This proposed theatre is to cost $250,000; of which amount about $20,000 has been collected. The plays already performed include 'Iphigenia in Tauris'; 'Troilus and Cressida'; 'An Ideal Husband'; 'Harold'; 'Treasure Island'; 'Major Barbara'; 'Her Husband's Wife'; and 'The Legend of Leonora.' On 21 Oct. 1916, the Yale-New Haven Pageant was produced on the wide field of the Bowl, with more than 7,000 students, citizens and school children as actors, before an audience of nearly 70,000 people. The pageant visualized, step by step, the progress of Yale for 200 years. The production was in the hands of Mr. Francis Hartman Markoe, a Yale graduate who had also studied at Magdalen College, and was the author of 'The Book of the Oxford Pageant.' On the scholastic side, too, Yale is eminently modern and practical, offering courses in contemporary drama, and in modern dramatic technique, in addition to the usual historical courses.

At the University of California the new era in dramatic work began with the dedication of the Greek Theatre in 1903. Under the leadership of Prof. C. M. Gayley of the department of music, the university was given so much scope and wise guidance that this university has become one of the chief dramatic centres of the nation. All productions are under the supervision of the musical and dramatic committee. The chief play-producing body, the English Club, is a student organization which in the spring and autumn of each year gives some noteworthy performance in the Greek Theatre. The plays, since 1903, have included 'King Shudrakas'; 'The Little Clay Cart,' from India; 'Abraham and Isaac' (A.D. 1316); 'Thersites' (A.D. 1539); Jonson's 'The Hue and Cry after Cupid'; Pinnero's 'The Cabinet Minister'; Henry Van Dyke's 'The House of Rimmon'; Dekker's 'The Shoemaker's Run'; 'The Imaginary Invalid', and 'Paolo and Francesca'; Shaw's 'Caesar and Cleopatra'; Schiller's 'Mary Stuart'; Alfrede Noyes's 'Sherwood'; Ibsen's 'The Vikings at Heligoland'; Sudermann's 'Teja'; Yeats's 'The Countess Cathleen'; Bulwer-Lytton's 'Richelieu'; Lawrence Houseman and Granville Barker's 'Prunella'; four of Shakespeare's comedies and his 'Henry V.' For the Shakespearean Tercentenary in 1916 a dignified production of 'King Lear' was presented by the students in the Greek Theatre, "without the usual stage settings and 'business.'"

Stanford University dramatics date from the founding of the university in 1891. A few years later, an organization called the Sword and Sandals was founded for promoting the drama, and with a view to presenting a good standard or current play each year. This Society still exists as the mainspring of dramatic enterprise in the university, and their plays have changed from the Greek classics to 'Seven Keys to Baldpate'; some of the more successful of these being 'The Great Divide'; 'Only Way'; 'Men and Women'; 'The Man from Home,' and, in 1917, 'Justice.' There are six other organizations for the production of plays given throughout the year, including a women's society, the 'Masquers,' and the junior class, which specializes on original opera. All dramatic enterprise is governed by the dramatic council, composed of the presidents of the various student organizations concerned, faculty representatives, the student stage-managers and the professional director.

At Princeton University, the famous Triangle Club devotes itself entirely to light comedy; and each year presents an original musical comedy, produced entirely by the undergraduates. They write the book, the music, the lyrics and plan the entire production. The Triangle Club usually takes an extended trip during the Christmas vacation, presenting plays in many of the larger cities under the auspices of the alumni associations. The Princeton Dramatic Association devotes itself to the presentation of plays of a more serious type under the direction of the faculty of the English department, and is the author of 'Dr. Faustus' and 'The Jew of Malta'; Masinger's 'New Way to Pay Old Debts'; Beau-
College Dramatics 387

mont and Fletcher's 'Knight of the Burning Pestle', Shakespeare's 'Henry the Fourth', and 'Comedy of Errors'; Ben Jonson's 'The Silent Woman'; Ibsen's 'Pillars of Society'; Bernard Shaw's 'Candida' and Molière's 'Les Femmes Savantes.'

At the University of Pennsylvania, in Philadelphia, the most prominent dramatic event of the year is the Easter week production of the Mask and Wig Club. For 30 successive years the club has staged a new play in the nature of an extravaganza or a burlesque, the book and music being written entirely by its members. About 100 undergraduates usually take part. Other dramatic events are the round of French, German, Italian, Old English and Greek plays by the various departments. In May, 1916, 'The Comedy of Errors' was presented by the Philomathean Society in a specially constructed theatre modeled after the old Globe Theatre in London.

This was one of the principal features of the Shakespeare Tercentenary celebrations in Philadelphia in 1916. In the spring of 1915 a company of eight actors gave a fine production of 'Iphigenia in Tauris' and 'The Trojan Women' before an audience of more than 10,000 people. In June, 1916 a production of Verdi's 'Aida' was attended by people from all over the country. This is said to have been the most magnificent open-air operatic event ever given in America.

Brown University has a reputation for good acting and shows enthusiasm in the cultivation of audiences beyond the usual academic circles. The Sock and Buskin Society gives spring and autumn productions of modern classical plays, and aims in particular to keep alive the best of the old comedies in English, and good farces.

The University of Vermont has for some years carried on the interest in dramatics with purely amateur undertakings, and with open-air performances under the strict supervision of the university. A club for men and another for women present old English comedies, Shakespeare and the modern drama, in both separate and combined productions. In addition, there are modern language clubs read and produce plays.

At Dartmouth College the dramatic renaissance has gathered up the best available talent among expositors and critics in New England. No college in the country has shown more energy in the way of dramatic art than Dartmouth. On the practical side the professional coach was dispensed with, and the full responsibility for productions given over to the Dramatic Association of the undergraduates. Within a year the Association had a repertoire of 22 plays, not including those produced during the summer session. Every class of play, from Maeterlinckian gossamers to vaudeville sketches and Broadway melodramas, were presented.

The women's colleges of the United States are in no way behind the men's in their interest in the subject. At Vassar College, the Philathlean Society aims to interest and instruct its members in dramatic art; and all students are admitted on payment of dues. Five plays by the different societies, called the Hall Plays, are given each year: Three major and two minor. The three major plays for the year 1915-16 are typical selections: 'The Melting Pot,' 'Deirdre of the Sorrows' and 'The Tempest.' The Idler

Club of Radcliffe College gives six productions each year, mainly the works of modern dramatists of the advanced school. Only one of these six productions is open to the general public; but the final play of the year, usually presented out of doors, is repeated at Commencement. All the productions are staged, costumed, lighted, etc., by the girls themselves. A recent development is the competition for original plays, and the production of all that reach a given standard. Smith College is active—particularly on the literary side—and has lent the weight of its patronage to the one Municipal Theatre in the United States, at Northampton. At Wellesley College dramatic events fall into major and minor classes. The former include the senior play given in June, and the two society plays usually performed in December. The minor events are the less formal plays of the year given by the "Barnswallows," a social organization which includes the entire college. The Bryn Mawr College has a tradition of acting that stands among the best of college work. Every year each class undertakes a production. The sophomores and the seniors are usually responsible for a modern comedy; and the vaudeville "Freshman Show" and "Banzer Show" are annual events. The plays are performed entirely by the students; and no men are admitted, except to the Gle Club's operas and the May-Day celebrations. The Gle Club in 1915-16 staged 'The Mikado.' Once in four years the college unites in a May-Day Celebration of an elaborate nature which has attracted wide attention in Europe, as well as in America (consult 'Bryn Mawr May Day Revels,' in the New York Outlook, 6 Aug. 1910). For the first time in its history, 1916-17, Bryn Mawr opened a course in dramatic exposition. Dramatics plays a large part in the college life of Goucher College (formerly the Women's College), Baltimore, Md. This is one of the few colleges in the country with a fully equipped theatre (the seating capacity 1,100). There is a "Senior Play," usually Shakespearean; but, on occasion, it is a play by Molière or Sophocles, or a modern writer,—given by the senior class after six months' rehearsal. The college literary society, Agora, has a dramatic department and presents plays with simplified scenery three or four times a year. Stress is laid, not upon costumes and accessories, but upon the elocution and acting of these works, which are deemed to be highly educational. This Society also presents each year a 16th century Christmas festivity, with Morris dances, sword play and a Nativity play; and, in the spring, an outdoor performance of a masque, with folk dancing, etc. The classes also give class plays. For nearly all the plays the students themselves make costumes, scenery and properties.

In the Middle West, the interest in dramatic work in colleges and universities is almost unbounded. Ohio University offers a new opportunity to higher learning in the "Old North West," finds that no department of the university evokes a broader and deeper concern than the school of oratory, of which the Players Club is the outgrowth. There is a class giving a full knowledge of stage technique, with a view toward preparing young high school teachers and others for the demand for trained stage directors in the schools.
Oberlin College, Ohio, ever since its foundation in 1833 has held consistently that the fine arts are essential factors in a liberal education, and the drama came into its own here somewhat more thoroughly than in the majority of American colleges. Actual work is required for the Oberlin degree and, in keeping with this fact, plans have been drafted for an even more fully equipped theatre than the college has at present. Greek, Shakespearean and modern plays are presented with completeness and integrity. Every detail, even to the most approved electrical equipment, is carried through by the undergraduates; some of these students having had professional training in the scenic studios of New York and elsewhere.

Through the enthusiasm of Prof. Philip D. Sherman, the head of the department of English, Oberlin is kept directly in touch with the most advanced movements in the world's theatres; and all touring art-theatre companies are encouraged to make a stand here.

Butterfield College, Indianapolis, within the last three years has developed a sound taste for theatricals, and particularly for opera, under the auspices of the I. T. S. Club, a secret order, now a chapter of Duzer Du. In the spring of 1919, Butler, DePauw University and Allegheny College united in what is hoped will be a movement for a national dramatic fraternity.

The department of English at the University of Minnesota, under the leadership of Prof. Richard Burton, is in close touch with the three undergraduate dramatic clubs of the university. These present a number of *worth while* plays during the college year. A professional trainer is employed; and the college sends out over the State, as part of the extension work, several good plays yearly. This work is recognized to be so vital that the actors are excused from examinations because of it. In 1915 this university opened a little theatre on the campus. It seats 300. Playwriting is taught in class, and the product of the students tried out in the theatre.

At the University of Nebraska in 1915 a department of drama was organized which has shown extraordinary vitality, and is somewhat unique in its methods. Forty public productions were given in its own theatre and on the road. When expert in their work in this department the students are elevated to another company, the University Players. This is operated on the plan of a stock company, and a new play is shown every month at the Temple Theatre. The most successful of these plays are taken on the road for trips of from 2 to 10 days. Each branch of dramatic work has its group of students; and an original play, with music written entirely by the undergraduates, is produced every year. Nothing is more notable in the intellectual life of the Northwest than the theatre craftsmanship of the University of North Dakota, under the guidance of Prof. Frederick H. Borch of the English Department. Two original contributions to the movement toward a new drama are claimed by this center: The first, a plan of communal authorship, by which a masque, *Shakespeare, the Playmaker,* was designed and written by a group of undergraduates; and second, the establishment in 1914 of a new form of the open-air theatre, the Bankside Theatre.—a narrow stream running between the sunken stage and the amphitheatre; the desired effect of distance being gained, while the acoustic properties are intensified by the frontage of water. The communal masque has been published in book form by the university. The dramatic movement at North Dakota has had an all round steady growth of 10 years. The Jack and Buskin Society is the focal point of the work and supplements the university courses. They have also an indoor theatre on modern lines, "The Little Playhouse."

In the colleges and universities of the Southern States the new movement has begun, as it invariably begins everywhere, with masques and pageants, many of these being carried out on a grand scale; the Shakespearean Tercentenary celebrations in the spring of 1916 serving to initiate many Southern institutions into various forms of community drama. Perhaps the most conspicuous of the kinds were those of Greensboro College, N. C., and of the University of North Carolina. The universities of Texas, of Tennessee and of Georgia are rapidly growing centres of modern dramatic art on the scale of the great Northern academies.

At Columbia University, New York, as in some few other universities, emphasis is laid on straight theory rather than on theory-in-practice. The proximity of Columbia to the Metropolitan theatrical centre is deemed an important argument against this particular university maintaining a theatre of its own. However, the department of public speaking does, in part, supply the lack of a students' theatre. The dramatic publications of this university are of special interest to students of the theatre, and Prof. Brander Matthews' theatrical museum is one of the sights of New York.

(Consult Townsend, George, 'Classic Plays in Holi-day Season,' 1910). As the amateur stage increases in strength and in credit, this work promises to become a still more important feature of university life and work (consult MacKay, Percy, 'Civic Theatre,' and a plea for the propagandist play in 'Amateur Acting at Ox ford and Elsewhere' by the Hon. and Rev. James Adderley in the Oxford and Cambridge Review, 1908. The University Theatre Association Plan, by Mr. Charles D. Coburn, is a plea from the professional standpoint). We may venture to speculate that it is only a question of a few years for the modern university to make the arts of the theatre and other fine arts as much a part of the curriculum as, say, medical or agricultural science.

**Bibliography.—** *College Plays: The Drama League of America publishes a very useful descriptive list of plays* (American, American Indian, Oriental, Classical, English, French and German) *for college and high school production, prepared by the League's committee on plays for secondary schools and colleges, and the committee on plays for schools and colleges of the National Council of the Teachers of English. There is also a "Secondary Schools and Collegiate Department." The Drama Quarterly, by the organ of the League, gives many complete plays. It also appears many other periodicals, consult also *Poet Lore* and other periodicals. The list of plays under *Amateur Theatricals* will prove useful. Drummond, A. H., "Fifty
COLLEGE ENTRANCE REQUIREMENTS

one-act plays for School or College Dramatic Work with Notes on each Play1 (in Quarterly Journal of Public Speaking, Chicago 1915); Dithridge, Rachel L., 'High School Plays' (Quarterly Journal of Public Speaking, Chicago 1915); Morris, E. B., 'College Comedies' (Philadelphia 1911); McFadden, Elizabeth A., 'Winner of Prize Play at Harvard' and Davis, Lillian, E., 'A Selected List of Plays for Amateurs and Students of Expression in Schools and Colleges; with notes' (Cincinnati 1908); a series of 'Standard Plays for Amateurs in Girls' Schools and Colleges' illustrated by many costume plates, edited by Elsie Fogerty (of Bedford College, London); Barbee, Miss Lindsey, (Ed. The Crescent; National organ of the Gamma Phi Beta); 'In the College Days; Twenty monologues of College Life and Folks' (Chicago).

DUNCAN MACDOUGALL, Formerly Lecturer on Public Speaking at Saint Andrew's College, University of Australia; and Lecturer for the Department of Education, New York.

COLLEGE ENTRANCE REQUIREMENTS. A term among the institutions of higher learning covering the moral, physical and intellectual qualifications deemed requisite for the enrolment of a student in a particular course or department. The physical requirement is generally not more than a statement of good character from some responsible person in behalf of the candidate. The physical requirements are usually the attainment of the minimum age of 17 years (variable in different institutions, and waived often in case of exceptional students who have attained the intellectual requirement at an earlier age); and soundness of body and mind. The intellectual requirement embodies the main problem of college admission.

It includes the satisfactory completion of a group of studies based on the work at a school of recognized standing. For convenience, this academic work is divided into units, each of which expresses about one-fourth of a year's work in a preparatory or high school. Thus the subject of plane geometry is estimated at one unit, and four books of Caesar at the same value. The number of units for entrance varies usually from 14 to 16. The subjects for admission are divided into two groups: (1) Specified subjects; (2) elective subjects. From two to three years' study of English is usually specified; algebra, plane geometry and a year or more of foreign language. The full quota of units is made up of electives, which include studies in history, science, mathematics, language, economics, music, drawing, and the manual and industrial subjects. The admission to technical courses specified some previous scientific knowledge also. The requirements are most diverse, some institutions admitting students by examination only (such as Bryn Mawr, Columbia, Harvard, Haverford, Princeton, Radcliffe, Stevens, Yale); others by presentation of certificate from a recognized secondary school; some on probation upon the recommendation of high school principals. The great majority of colleges admit students on certificates, a system which in many instances
COLLEGE ENTRANCE REQUIREMENTS

includes an intelligent inspection of the schools from which certificates are acceptable. Students are usually admitted to college under one of three general classifications: (1) Regular students who have fully met the requirements and are candidates for a degree; (2) conditioned students in whose case the requirement was not met in accordance with the regulations of the college; and (3) special students for whom the requirements were met but who are not candidates for a degree. There is a general tendency at present to restrict the admission of special students, as many of these in the past have made use of this means of entering college life to enjoy its pleasures without any commensurate exertion on their part. The purpose of making a standard for entrance are (1) to eliminate the unfit; (2) to keep the secondary schools vital and purposeful.

The history of college entrance requirements dates back to Harvard 1642, where a speaking knowledge of Latin, ability to make Latin verses, and a thorough grammatical education in Greek were the only requirements. These remained unchanged until 1734, and even then were modified only a very little, when a knowledge of the rules of Latin prosody was substituted for a speaking knowledge of Latin. In 1745 Yale added common arithmetic and the other colleges soon followed its example. With the establishment of the academy as the dominant secondary school in place of the old Latin grammar school, there came the enlargement of the curricula of both schools and admission requirements. Geography was added in 1807; geometry, history, algebra and foreign languages followed in its wake. As late as 1897, however, 402 of the 432 colleges in the United States required Latin and 316 Greek. Since then the expansion has been along the lines of English and sciences. There is at present much diversity in requirements for entrance.

Until a comparatively recent time, examinations for entrance were general. But with the widening of the college and high school curricula the competitive system and the absorption of the academies into the public school system, the old division between the secondary schools and colleges tended to break down. In 1870 Michigan began the system of accrediting schools (adopted from the Prussian State system) from which pupils might be admitted to colleges without further examination. This plan has been adopted by all of the colleges and universities except a few of the more conservative ones, listed above. The certifying body varies. Sometimes it is the college or university itself; New York, Minnesota and elsewhere certification is controlled by the State. The admission by certificate from schools does not include those students from non-accredited schools, nor those prepared by private tutors. The argument for the certifying system is that it brings a closer union between school and college; that it lifts the high school standard; that it equalizes instruction in high schools for students not preparing for college; that the evil of cramming for examinations is obviated and the student studies the subject per se; that the record of four years' work is a fairer test than examinations taken under strange conditions; that it secures a better grade of pupils than the examination system. Those in favor of the examination argue that they raise the standard of work in secondary schools; keep the college up to a high standard of admission; that they really test the student's proficiency; that even though conducted under strange and unusual conditions, they do not rate the student unfairly; that the privilege of certification is abused by principals; that competent inspection of secondary schools being difficult and costly, poor schools often remain on the list; and lastly, that examination procures a better type of student for the college. All of these arguments are matters of opinion, and remain to be proved.

One of the most effective and far-reaching movements in this whole field is the work of the College Entrance Examination Board, an association of colleges and professional people for the purpose of establishing: (1) A fair degree of flexibility in high school and college curricula and college entrance requirements; (2) uniformity in standards of high school and college; (3) adequate and uniform administration of policies. The first effort grew out of a conference of New England colleges in 1879, since when it has enlarged its work and scope considerably. Various local college entrance examination boards have been formed, centralized under the National Conference Committee on Standards of Colleges and Secondary Schools, composed of delegates from the various boards, and the United States Commissioner of Education. This committee publishes a statement of the ground which should be covered by secondary schools and arranges for an impartial marking of examination papers. Its report for the year 1915-16 shows the excellent progress of the accredited school system of admission. A modified plan, which involves both certification and examination, was adopted as an alternative by Harvard in 1911, by Princeton and Yale in 1915. In June 1916, the examinations prepared by the College Entrance Examination Board were adopted as the standard of admission for all colleges represented on the Board. The advantages of this centralization are: (1) That the papers embody a wider range of preparatory training; and (2) it gives the university a much wider distribution of its examination papers. The new method will go into effect at Mount Holyoke, Smith, Vassar and Wellesley in 1919.

COLLEGE DE FRANCE—COLLEGES FOR TEACHERS

COLLEGE DE FRANCE, kôl-lash de frâns, a celebrated institution founded by Francis I between 1518 and 1545, originally a Collège de Trois Langues or a college in which would be taught Greek, Hebrew and Latin, is a most eminent national institution, now giving instruction over a very wide field of literature, history and science. The University of Paris at various times sought to gain control over it but it managed to maintain its independence and its activity has been continued since its foundation. It is distinguished for its freedom of teaching and its encouragement of scientific research. It is under the charge of the Minister of Public Instruction. It is independent of the University of France, is under the direct supervision of the Minister of Public Instruction and is supported by the government. As in the Sorbonne, the lectures are gratuitous, and for the most part are designed to attract auditors older than ordinary university students. No examinations are held, and no diplomas are given. The college comprises two faculties, one literary, one scientific; each has about 20 professors. Among the professors have been some of the most distinguished scholars and scientists; Poncelet, Monge, Laplace, Fourier, Poisson, Legendre, A. de Condorcet, Delsarte, Jean Baptiste Siméon Chardin in Paris, Saint-Hilaire, Lamarck, Gassendi, Sylvestre de Sacy, Renan, Michelet, Rollin and others.

COLLEGE FRATERNITIES. See GREEK LETTER SOCIETIES.

COLLEGE OF WOOSTER, The, at Wooster, Ohio, was chartered in 1866 as The University of Wooster and was renamed in 1914. It was founded by the Presbyterian Synod of Ohio, which elects its governing board of trustees. The 100-acre, hill-top campus is of unusual beauty. The buildings, because of the burning of the original building in 1901, are all modern and cost over a million dollars. The productive endowment is about a million and a quarter. The library has 43,000 volumes. In the four college classes are 299 men and 218 women. Students in the academy number 178. The teaching staff numbers 51; the graduates to date number 1,367.

COLLEGES, Land Grant, colleges established and maintained in whole or in part by the Land Grant Act of 2 July 1862. Justin S. Morrill, a representative from Vermont, introduced in Congress the first bill asking that grants of government land be donated for the purpose of aiding in the education of the people, in scientific and technical subjects. This bill, introduced in the lower House 14 Dec. 1857, authorized the establishment of colleges of agriculture and mechanical arts in all States, and provided for the support of said colleges, 20,000 acres of land for each senator and representative. The bill passed both Houses but was vetoed by President Buchanan. In December 1861 Mr. Morrill introduced a new bill, bestowing 30,000 acres of land for each member of Congress for the establishment and maintenance of industrial colleges. Ben Wade, of Ohio, introduced the bill in the Senate. The House committee on public lands made an adverse report, but the bill passed both Houses and was approved by President Lincoln 2 July 1862. This act gave to the cause of industrial education 30,000 acres of land for each senator and representative in Congress to which the States were entitled by apportionment of the census of 1860, or in all, about 13,000,000 acres of land for educational purposes. The act was entitled "An act donating public lands to the several States and Territories who may provide colleges for the benefit of agriculture and mechanical arts." The object of the act is expressed as follows: "The endowment, support and maintenance of at least one college where the leading objects shall be, without excluding other scientific and classical studies, the leading objects, including military tactics, to teach such branches of learning as are related to agriculture and mechanic arts, in such manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." In 1889 Mr. Morrill and others began to form plans to secure another appropriation, and Mr. Morrill introduced another bill in Congress, providing that there shall be appropriated annually to each State, out of the funds arising from the sale of public lands, the sum of $15,000 for the year ending 30 June 1890, and an annual increase by the additional sum of $1,000 to such appropriation for 10 years following 30 June 1890; that appropriation shall become $25,000, at which figure it shall remain fixed. The bill passed both Houses and was approved by President Harrison 30 Aug. 1890. The act says that this appropriation shall be applied "only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural and economic science, with special reference to their application to the industries of life, and to the facilities for such instruction." Provision was made at this time for separate institutions for white and colored students in such States as desired to make this arrangement.

The Act of 4 March 1907 amended the Act of 1890 by increasing the yearly appropriation and extending the conditions for its use. The benefits of the Act of 1862 or of later acts in lieu of it are received by 48 States, and 53 institutions are thereby aided as follows: 43 States, two in Massachusetts and Missouri and one colored and one white institution in Mississippi, South Carolina and Virginia each. The appropriation is now fixed at $30,000 to each of the 48 States and the two in Hawaii and Porto Rico, and aids 69 institutions; 17 States maintain special colleges for colored students, which receive aid from this fund.

The reports for the year ending 30 June 1914 received by the commissioner of education from the presidents of the land grant colleges show that the States have received 10,931,267 acres of land, of which 910,586 acres remain unsold. The invested funds from the sale of the land and other sources of revenue give their schools and colleges a total annual income of approximately $38,559,397.

The total number of students in the agricultural and mechanical departments was 115,054. For information in detail about each land grant college, consult Report of Committee of Education (Vol. II, Washington 1915).

COLLEGES FOR TEACHERS, or colleges in which are special departments for the study of the history of education, psychology as applied to teaching, pedagogy, and all subjects bearing upon methods of instruction.
To the English schoolmaster, Richard Mulcaster, is given the credit of being one of the first, if not the first, to propose a college for the training of teachers. He classified his chief reasons for desiring the establishment of such a school under four heads: (1) Importance of the work, it will make or mar the State; (2) The great numbers who are to teach and be taught; (3) Need of the profession of teaching, professors must be trained; (4) That teachers may be men of wisdom and learning and able to present subjects, in economizing time and that they may attain staidness of demeanor.

Instruction in the science and art of teaching was included in the university scheme that was proposed for Columbia College in 1838, but then without avail. Again President Barnard urged upon the trustees of the same college in 1881 and 1882 the same plan, which he had now worked out more fully. The next step forward was the organization in New York, in 1888, of Teachers' College, which was chartered the following year. While this college was organized outside of the Columbia system, it was still under the control, in great part, of Columbia men, and was loosely affiliated with the college. The institution began its career in 1898, when Teachers' College was made an integral part of the educational system of Columbia University. The president of Columbia is president also of the college, and the university professors of philosophy and education and of psychology are members of its faculty, while the college is represented in the university council by its dean and an elected representative.

The college, however, continues its own separate organization, having its own independent board of trustees, which is charged with the sole financial responsibility of its management.

Teachers' College is the professional school of Columbia University for the study of education and the training of teachers, ranking with the schools of law, medicine, and applied science. The university accepts courses in education as part of the requirement for the degrees of A.B., A.M., and Ph.D.; while graduate students who prefer to devote their entire time to professional study may become candidates for the higher diploma of the college. The college diploma is conferred upon students who have successfully completed some one of the general courses, and a departmental diploma upon those who have fitted themselves for particular branches of school work. Undergraduate students of Columbia and Barnard colleges may, if they desire, obtain the diploma of Teachers' College at the same time that they receive the degree of Bachelor of Arts. The Horace Mann school, fully equipped with kindergarten, elementary and secondary classes, is maintained by Teachers' College as a school of observation and practice.

The undergraduate courses: Secondary course leading to the degree of A.B. and the college diploma; general course leading to the college diploma in elementary teaching; general course leading to the college diploma in kindergarten teaching. Then there are several courses leading to the college diploma in art, domestic art, domestic science and manual training. Candidates for the first of these courses must be either college graduates or candidates for the degree of A.B. in Columbia University. There is a combined course of study prescribed for the degree of A.B. in Columbia University and the diploma of Teachers' College. Graduate work is also well developed. The Extension Department, which was established in 1892, shows when it has increased wonderfully in importance, it offers afternoon and evening courses for those whose occupation prevents them taking the regular course of study. The Sperry School and the Horace Mann high, elementary and kindergarten schools are regarded as presenting subjects, in economizing time and that they may attain staidness of demeanor.

The college possesses an educational library of over 60,000 volumes, an extensive educational museum and a residential building, Whittier Hall, presented to it in 1909. In the following year the School of Household Arts, costing over $500,000, was opened. In 1918 the college buildings and grounds were valued at about $4,000,000. It had 230 instructors and 4,853 students, in its college and related work. For the year 1898-99 the teaching staff counted more than 60 persons.

New York University School of Pedagogy, established in 1890, aims to furnish graduate work equal in range to other professional schools. The school is an organic part of the university in the broadest sense. More definitely, its aim is declared to be to furnish thorough and complete professional training for teachers. The plan of the school places it upon the same basis as that of the best schools of law, medicine and theology. The work is of distinctly university grade, and graduates of colleges and normal schools, and others of equal experience and maturity, may find in this school opportunity for the thorough study of higher pedagogy. In 1899-99, the instruction was distributed in four major and eight minor courses, namely, history of education; physiological and experimental psychology; analytical psychology; history of philosophy; physiological pedagogies; elements of pedagogy; comparative study of national school systems; aesthetics in relation to education; sociology in relation to education; institutes of pedagogy, ethics, school organization, management and administration. Special facilities for research are offered to the seminaries. The degree of Master of Pedagogy is conferred upon candidates who have completed five of the foregoing courses, three of them majors; the degree of Doctor of Pedagogy upon candidates who have completed the four major and five of the minor courses.

Clark University, opened in 1889, has given much attention to education from the first, and the subject has now been made a sub-department in the department of psychology, in which a minor may be taken for the degree of Doctor of Philosophy. The work is intended to meet the needs of those intending to teach some other specialty than education, but who wish a general survey of the history, philosophy, methods and recent advances in the field of university, professional and technical education, and of those who desire to become professors of pedagogy, or heads of instruction in normal schools, superintendents, or professional experts in the work of education. Great stress is placed on original investigation. The president, Dr. G. Stanley Hall, has been the leader of the child study movement in the United States. The Pedagogical Seminary is the organ of the educational department of
the university. It is an international record of educational research and literature, institutions and progress, and is devoted to the interests of education of all grades.

The department of pedagogy in the University of Chicago has as its primary aim to train competent specialists for the broad and scientific treatment of educational problems. The courses fall under three heads: Psychology and related work, educational theory and the best methods of teaching the various branches. Stress is laid upon the relation of pedagogy to other subjects, and courses are offered in the proper departments in which the methodology of such subjects is employed.

The University of Chicago has also established a college for teachers on a somewhat novel plan. This institution, which was founded in October 1898, is an outgrowth of the class study department of the extension division of the university. It is a "downtown" college, and aims to provide instruction of high grade for busy people; or, more definitely, "for any and all persons qualified to do the work, who are so engaged by other imperative duties as to make continuous attendance at the regular college attendance at the university impracticable." The work of the college is of the same grade as that of the other colleges of the university. See CHICAGO, UNIVERSITY OF.

The University of Wisconsin school of education is an expansion of the former department of education. The four main lines of instruction are the history, the philosophy, the science and the practice of education. The school aims to afford practical instruction to intending teachers, professors, principals and superintendents, and to those students who desire to pursue studies and investigations in the science of education.

COLLEGES FOR WOMEN. Three types of the collegiate education for women in the United States prevail. The first in time and in popularity is known as coeducation; the second, as to date, has been the college, and the third, as co-ordination in education. Under the first form, men and women are educated together under identical conditions; under the second, women are educated by colleges founded and administered for them as women; under the third, there are established in the same university two colleges, one for men and one for women. The third form is subject, however, to considerable variations in administration.

The first college founded for both men and women was Oberlin. Its charter was granted in 1834. The college was the result of the philanthropic and missionary movements of the first decades of the last century. The town and the Institute, as the college was called for about a score of years, were closely allied. In the first circular published regarding the institution, it was said that among its great objects was the extending of the benefits of the most useful education to "both sexes." The elevation of female character was also noted as a purpose. The giving of a college education to both men and women together was not a primary thought. The primary thought was to offer the best education to women. The conditions obliged the giving of the education to both sexes upon equal terms. In the first year of the college, 40 women were enrolled. Few of them were fitted, however, to pursue college studies. A preparatory department was formed. In 1837 four women offered themselves as candidates for college rank. Their classification was more or less irregular. At the commencement of 1841 three women received a degree, the first women to receive a degree in arts in the United States. For about a score of years Oberlin alone received women into its classes on the same terms, substantially, as those on which it received men.

The second step in the education of men and women together was taken 20 years after the beginning was made at Oberlin in another Ohio town. Antioch College, in Yellow Springs, was founded by Horace Mann in 1852. In his inaugural address Horace Mann declared himself heartily in favor of what is now known as coeducation. He affirmed that coeducation is the only method to be pursued, at least for many years, on the ground of its relative inexpensiveness. He believed that social intercourse between young men and women would prove advantageous to each, preventing manners from becoming rude and sentiments coarse. He believed that the privilege of forming attachments is less under academic than under ordinary social conditions.

The beginning thus made in two Ohio colleges advanced rapidly. Its chief field of growth lay in the universities founded by the various States. In 1850 Iowa, in 1866 Kansas, in 1868 Minnesota, in 1871 Nebraska, founded universities for both men and women. The University of Indiana, founded in 1820, was in 1868 opened to women. The universities of Michigan, of Illinois, of California, of Missouri, were open to women in 1870, and the Ohio State University three years after. In 1874 Wisconsin adopted complete coeducation. At the present time every State university, excepting three or four, is open to women.

The older parts of the country approached the question of the education of women through the establishment of new colleges for them. It was easier to found colleges for women than to adjust colleges already organized for men, whose conditions and traditions were established, to the admission of women. Yet Middlebury, Colby and other colleges were opened to them; and Boston University, Bates in Maine, and Cornell in New York were coeducational either in the beginning or soon after. The founders of the four more eminent colleges for women in the seventh and eighth decades of the 19th century were moved by the same purpose. They desired to establish institutions which should give to women an education as good as the older colleges were giving to men. The purposes of Matthew Vassar, of Sophia Smith, of Henry F. Durant, the founder of Wellesley, and of Dr. Joseph K. Taylor, the founder of Bryn Mawr, were alike slow in fruition. In the year 1845, at the age of 53, Matthew Vassar decided to devote a large portion of his estate to some benevolent purpose. It was not until 20 years after that Vassar College was opened to students. In the year that Vassar received its acts of incorporation Sophia Smith began to think of the establishing of a college for women. The college was incorporated in 1871 and opened for students in 1875. In 1884 Henry F. Durant, the only son, determined to use a part of his estate
in philanthropy. In 1870 the institution was incorporated as the Wellesley Female Seminary; three years after the name was changed to Wellesley College, and in 1877 the college was authorized to grant degrees. For many years Dr. Joseph W. Taylor considered the question of devoting his estate to the education of women.

Some of these endeavors for the higher education of women help was derived from a foundation laid at Elmira in the year 1855. But the foundation was not adequate for offering the training which women were desirous of receiving. Its chief value, therefore, lay in the incentive it gave rather than in its actual educational achievement.

The general purpose and conditions under which all these foundations were laid are well indicated in an address given by Matthew Vassar to the trustees of his college in June 1864 at the time when the question of the election of professors was being discussed.

"It is my hope—it was my only hope and desire—indeed, it has been the main incentive to which I have already alluded, or may hereafter do, or hope to do, to inaugurate a new era in the history and life of woman. The attempt you are to aid me in making falls wholly of its point if it be not an advance, and a decided advance. I wish to give one sex all the advantages too long monopolized by the other. Ours is, and is to be, an institution for women—not men. In all its labors, positions, rewards and hopes, the idea is the development and exposition, and the marshaling to the front and the preference of women—of their powers on every side, demonstrative of their equality with men—demonstrative, indeed, of such capacities as in certain fixed directions surpass those of men. This, I conceive, may be fully accomplished within the rational limits of true womanliness, and without the slightest hazard to the attractiveness of her character. We are indeed already defeated before we commence if such development be in the least dangerous to the decrement of her sex. We are not the less defeated if it be hazardous for her to avail herself of her highest educated powers when that point is gained. We are defeated if we start upon the assumption that she has no powers, whereas she may derive, or imitate, from the other sex. We are defeated if we recognize the idea that she may not, with every propriety, contribute to the world the benefits of matured faculties which education evokes. We are especially defeated if we fail to express, by our acts, our practical belief in her pre-eminent powers as an instructor of her own sex."

The third type of the collegiate education of women is known as co-ordination. It represents the inclusion in, or the alliance of, a college for women with a college for men. Certain communities, in their desire to promote the education of women, and in their unwillingness to duplicate educational equipment, have established colleges for women as an annex to, or as inseparable with, a college for men. This method represents the English tradition. Girton, at Cambridge, existed nine years before the foundation of the Society for the Collegiate Instruction of Women, in 1879. The more conspicuous of these colleges are Radcliffe, affiliated with Harvard; Barnard, affiliated with Columbia; the Woman's College of Brown University, the College for Women of Western Reserve University of Cleveland, and the H. Sophia Newcomb College, affiliated with Tulane University. The intramural administration of these colleges differs from each other. In Radcliffe, Barnard and Brown at least, the larger part of the instruction is given by members of the faculty of the co-educational college for men. In the College for Women of Western Reserve University a distinct faculty is established which is co-ordinate with the faculty of the college for men—Adelbert—of the same university.

Colleges of each of these three types have special advantages, and are subject to special disadvantages. Each apparently has come to occupy a permanent place in American education. Coeducation, however, is by far the more popular. About nine-tenths of all colleges are coeducational institutions. The number of degrees conferred on women in all American colleges in the last year was about 4,000. The more common degrees are A.B., Ph.B., B.L. and B.S., of which A.B. is conferred on about five-eighths of all candidates. CHARLES F. THWING, President of Western Reserve University, Cleveland.

COLLEGEVILLE, Minn., village in Stearns County, on the Great Northern Railroad, nine miles northwest of Saint Cloud. Saint John's Abbey and Saint John's University, in charge of members of the order of Saint Benedict, are the chief institutions of the village. The university was opened in 1857. The number of students is greater than the number of inhabitants of the village. Pop. 606.

COLLEGEVILLE, Pa., borough in Montgomery County. It is situated on the Perkimon River, the Philadelphia and Reading Railroad, and is 27 miles northwest of Philadelphia. Ursinus College, established in 1870, is an institution belonging to the German Reformed Church. The manufactures are iron machinery, boiler-making and hot water heaters. Pop. 621.

COLLEGIATE ATHLETICS. See Educational Athletics.

COLLES, kölz, Christopher, American philosopher and adventurer: b. Ireland about 1738; d. New York 1821. In 1765 he set out, a wanderer from his native land, and we find him in Philadelphia in 1772, delivering illustrated lectures upon pneumatics. He is said to have been the first to build a steam engine in this country. In April 1774 he proposed to erect a reservoir for the purpose of conveying water through the several streets of the city of New York. His proposals were "read and referred." In 1775 he delivered lectures on gunnery, and was further employed in giving instruction to the artillery department of the American army in the principles of projectiles. Colles was the first who suggested canals and improvements to connect Lake Ontario with the Hudson. According to the records of the assembly of New York, in November 1784 he presented a memorial on the subject, and in April following a favorable report was made thereon. In 1808 Colles published in Cambridge, Mass., a book of roads through New York.
COLLIE, the domestic sheep-tending dog developed in Scotland, and for a long time bred there exclusively, but now known in all parts of the world. It is one of the most beautiful, and perhaps the most intelligent of all dogs, and many anecdotes are told illustrative of its sagacity. Collies have for hundreds of years aided the Scotch shepherds in caring for their flocks, under all conditions and in all sorts of weather. To meet the inclemency of storms days and cold nights, these dogs have acquired an outer coat of thick, rough hair, black or black-and-tan in color. It has an undercoat so close and soft that, even when it is parted, one can scarcely see the dog's skin. The chief points of these dogs are long, sharp heads; bright, keen eyes, set rather close together; small ears, drooping at the tips; a full ruff of hair around the neck; strong, wiry frames; and rounded feet. Their intelligence is remarkable—almost human; and their affection so constant that they have been known to die of grief after the death of a master.

The collie measures from 22 to 24 inches at the shoulder and weighs generally from 45 to 60 pounds. He is as alert as a fox and as fleet as a greyhound. In fact, no dog, except the greyhound, can excel him in speed and grace of movement, and it is safe to state that no dog is so faithful and trustworthy a companion to man, for the collie gives implicit obedience and unflinching loyalty to his master, and will yield his life rather than desert his master's charge. This is what makes him invaluable as a sheep-dog. Detailed information in regard to the collie may be found in most books relating to dogs (q.v.), and special books treating of him from the point of view of both the shepherd and the fancier are accessible. Consult Lee, 'Collie or Sheep-Dog'; and Wickham, 'Practical Training of the Shepherd Dog.'

COLLIER, Arthur, English philosopher: b. Langford, Magna, Wiltshire, 12 Oct. 1680; d. there, 1732. He was educated at Pembroke and Balliol colleges, Oxford, and in 1704 became rector of Langford, a living which had belonged successively to his great-grandfather, grandfather, father and himself, and which he retained till his death. In 1703 he published a work entitled 'Clavis Universalis,' in which he maintained both the non-existence and the impossibility of the existence of any objects external to the mind. Berkeley had three years before advanced his theory of the negation of an external world, but the two philosophers appear to have had no knowledge of each other, and it is certain that Collier meditated upon his opinion for 10 years before promulgating it. Though they developed simultaneously the first systematic scheme of absolute idealism, and though Collier was inferior to his contemporary rather in the graces of composition than in acuteness or method, yet the 'Clavis Universalis' attracted not the slightest attention in England. In Germany a copious and able abstract of its contents was given in 1717, in a supplemental volume of the 'Acta Eruditorum,' and it was quoted by Wolf, Bihfinger and other critics. In 1756 a complete translation of it into German was rendered accessible in Germany, Collier has enjoyed among the thinkers of that country high repute for talent and originality, and the best comparative view of his doctrines and those of Berkeley is that given by Tennemann. Other publications of Collier were the 'Specimen of True Philosophy' (1730); and 'Logology' (1732). In religion he was an Arian, and at the same time a high churchman on grounds which his associates could not understand.

COLLIER, H. Price, American writer: b. 25 May 1860; d. 3 May 1913. He was educated at Harvard. Entering the Unitarian ministry, he was for nine years in charge of churches in Hingham, Mass., and elsewhere, and during the Spanish-American War served as a naval officer. For two years he was European editor of the Forum, and wrote a volume on 'Driving' (1903) in Macmillan's 'Sportsman's Library.' But he attained celebrity as the writer of essays on national characteristics, which were marked by much insight and real literary quality. He has published 'Essays'; 'Mr. Picket Pin and His Friends'; 'America and the Americans from a French Point of View' (1906); 'The Oxford and the English, from an American Point of View' (1909); 'The West in the East from an American Point of View' (1911); and 'Germany and the Germans from an American Point of View' (1913). At the time of his death he was preparing a similar discussion of Norway and Sweden.

COLLIER, Henry Watkins, American jurist: b. Lunenberg County, Va., 17 Jan. 1801; d. Bailey's Springs, Lauderdale County, Ala., 28 Aug. 1855. He was educated in the Abbeville District, S. C., where his father settled in 1801, and which he removed with the family to Madison County, Ala., in 1818, and studied law in Murfreesboro, Tenn., and at Huntsville, Ala., where he was admitted to the bar and began practice. In 1823 he settled in Tuscaloosa, where he was elected district judge in 1827. In 1836 he was appointed associate justice of the Supreme Court of Alabama, in 1837 was made chief justice, and held that office till 1849, when he was elected, without opposition, governor of the State. His support was sought both by the Southern Rights and the Union parties; but he favored neither side of the question that then agitated the Southern States, and in 1851 was renominated and elected without a regular nomination. When his second term expired he retired to private life.

COLLIER, Jeremy, English bishop: b. Stow Quy, Cambridgeshire, 23 Sept. 1650; d. London, 26 April 1726. He was educated at Caius College, Cambridge, entered the Anglican Church in 1677 and was rector of Ampthor, Suffolk, in 1679. The revolution of 1688 found him a most zealous opponent; and he not only refused to take the oaths to the government of William and Mary, but came boldly forward in defense of his non-juring principles, and subjected himself to repeated imprisonment for writings and other overt acts, which a more tyrannical government might easily have contrived into treason. His political writings have almost been forgotten; but he wrote two other works, which have preserved his name, and prove him to have been a writer of distinguished ability. The one entitled 'Essays Upon Several Moral Subjects' (1697) is distinguished by learning and wit, and an easy flowing style; the other, entitled 'Short View of the
Immorality and Profaneness of the English Stage
(1698), is unquestionably a masterpiece, and is still perhaps the best work written on the subject. It enjoyed great popularity notwithstanding the fierce opposition it encountered especially from Congreve and Vanbrugh, and is said to have had the effect of greatly purifying both the sentiments and the language of the theatre. The only other work of Collier deserving of special notice is his 'Ecclesiastical History of Britain to the End of the Reign of Charles II' (1708 and 1714). It cost him many years of labor and displays much ability, but is strongly tainted with his non-juring views. In 1713 he was consecrated bishop among the non-jurors. Consult 'The Ecclesiastical History,' edited by Lathbury (London 1852).

COLLIER, John Payne, Shakespearean critic: b. London, 11 Jan. 1789; d. Maidenhead, 17 Sept. 1883. He wrote many critical articles in periodicals, published in 1820 his 'Poetical Biography,' and thenceforward continued his editions of poems and plays, notably those of the less-known Elizabethan writers. His best work, 'History of English Dramatic Poetry' appeared in 1831. He took great interest in and edited many publications for the Camden, Percy and Shakespeare societies, and completed in 1844 an eight-volume edition of Shakespeare. In 1852 he professed to have discovered, on the margins of a copy of the second folio Shakespeare, bought from a second-hand bookseller, manuscript notes and emendations written in a 17th century hand. When these notes and emendations were published they became the subject of eager discussion by the critics, the best of whom were not disposed to set a high value on them, and it appears that an examination of the volume convinced the British Museum authorities that the marginal notes were forgeries. Collier published a weak and inconclusive reply, in which he maintained their genuineness, and thenceforward he maintained complete silence on the matter. He continued to produce editions of English writers, among them Spenser (1862), and also critical and autobiographical works. Of his later publications the most important is 'An Old Man's Diary' (1872).

COLLIER, William, American actor: b. 1868. He made his debut in a children's company in 1879. He was a member of Augustin Daly's company in 1883-88. He starred in 'On the Quiet' in 1901-02, and 'The Dictator,' in which he achieved a great London success in 1905, and in which he toured Australia the following year. His later appearances were in 'A Lucky Star' (1909); 'Bunty Pulls the Strings' (1912-13); 'A Little Water on the Side' (1914). He is partner author of the following plays in which he also played roles: 'I'll Be Hanged If I Do' (1910); 'Take My Advice' (1911); 'Never Say Die' (1912). He is sole author of 'Caught in the Rain' (1906) and 'The Patriot' (1908). He has become widely known as a comedian.

COLLIER, William Miller, American diplomat: b. Lodi, N. Y., 11 Nov. 1867. He was graduated at Hamilton College in 1889, spent one year in the Columbia College Law School and was admitted to the bar in 1892. He was in bankruptcy for the Northern District of New York in 1898-99 and president of the New York State Civil Service Commission 1899-1903 and lecturer on the law of bankruptcy at the New York Law School 1903-05. In 1904 he was appointed special assistant attorney-general of the United States Department of Commerce and Labor. From 1905 to 1909 he was United States Minister to Spain. In the latter year he became general legal counsel and diplomatic agent for various American corporations in Europe, with offices at Auburn, N. Y., and Paris, France. He is author of 'The Colliers and Bankruptcy' (1898); 'Colliers Annotated Rules in Bankruptcy' (1899); 'Collier on Civil Service Law' (1901); 'The Trusts' (1900); 'At the Court of His Catholic Majesty' (1911).

COLLIMATION, Line of. In a measuring telescope there is placed at the focus of the eyepiece a system of spider-threads. In a transit instrument there are several vertical and two horizontal "wires," as shown in the diagram. In spite of numerous experiments in a search for something more durable than spider-thrads, "wires" are still almost universally made of this frail material. Quartz fibre and finely drawn platinum wire have at times been employed, but it is found that the fineness and evenness of threads from chosen varieties of spiders exceeds anything that can be produced by artificial means. In smaller instruments the wires are frequently fine lines drawn on a glass plate.

In taking an observation the time at which the star passes through the objects in the object-glass is determined. By taking the mean of these times, we obtain what is called the time for the "wire," an imaginary wire which would, if the adjustments were perfect, coincide with the middle vertical wire. The mean of these observations gives a better result than its vertical wire. The line of collimation is defined to be the straight line that joins the centre of the object-glass with the point of this imaginary vertical wire midway between the two horizontal wires. A definition similar to that here given applies in
other cases, in the case of the mural circle, for example, and in the case of instruments for terrestrial surveying. The proper adjustment of the line of collimation of these instruments is one of the most important of the adjustments.

In the case of the transit instrument, for instance, in observing the passage of a star, what is noted is practically the instant, according to the observatory clock, when the line joining the star and its image coincides with the line of collimation. The following is one of the conditions to be satisfied when the instrument is in perfect adjustment. The line of collimation must be perpendicular to the geometrical axis on which the telescope revolves, and will then describe a great circle. The framework that carries the spider-lines admits of several small movements for their adjustment. After the adjustment has been carefully made, however, there always remains a slight error, which is determined and allowed for in calculations under the name of the collimation error. Adjustments and corrections are similarly made in the other telescopes for measuring.

When the central wire has been fully adjusted and placed in the meridian by the observation of stars, it is usual with larger instruments to facilitate its future adjustment by the use of Collimators. These are telescopes mounted horizontally on piers, one north and one south of the instrument, and so arranged that when the latter is horizontal it will point directly into one of the collimator telescopes, which are made of the same aperture as that of the instrument itself. At the focus of each lens a spider thread is placed, which is thus viewed through the collimator exactly as if it were at an infinite distance away. Having adjusted the collimator threads in the meridian, the middle thread of the instrument can at any future time be placed upon them in a few seconds, thus saving a great deal of time. Sometimes the collimator lenses are made of a very long focus, even so great as a few hundred feet. The wires, or artificial stars, are then placed upon piers in so-called Collimator Houses, or Mire Houses, one north and one south of the meridian house, and a few feet distant from it.

Collin, Louis Joseph Raphael, lo-szhé-zaf râ-fâ-ti kôl-lâ, French figure and portrait painter: b. Paris 1850; d. there, 21 Oct. 1916. He studied under Bouguereau and Cabanel, obtained a second-class medal in the Paris Salon in 1873 and the medal of the Legion of Honor in 1884. In 1902 he was appointed professor at the Ecole des Beaux-Arts. He is perhaps best known for such works as the decorations in the Sorbonne and the ceilings of the Odéon and the Opéra Comique, Paris. He also decorated several ceilings in the United States. The most noted of his easel pictures are those of nudes in the open air, such as an ‘Idyll’ (Arras); ‘Daphne and Chloe’ (Alençon); ‘Floral’ (Luxembourg 1886); ‘Eveil et Primrose’ (Bucharest 1894), and many others in private collections, including the Anderson collection, New York. He was also a successful painter, illustrator and painter on canvas. His work is in the classical style of his masters, Bouguereau and Cabanel.

Collin D’Harleville, dâr-lê-vil, Jean François, French dramatist: b. Mévéinois, near Maintenon, 30 May 1755; d. 24 Feb. 1806. He studied law but soon abandoned this field to devote himself to literature. He worked a genuine vein of comedy, yet never slighted the moral side of conduct, and some of his plays still keep the stage. Notable among his works are ‘The Old Bachelor,’ his masterpiece (1793); ‘Castles in Spain’ (1800); ‘L’Inconstant’ (1780); ‘L’Optimiste’ (1788); ‘M. de Crac dans son petit castel’ (1791). He was an original member of the Institute. His theatrical works were edited by Moland (1876) and Thierry (1882). Consult Andrieux’ memoir of Collin in his complete edition of the latter (Paris 1822).

Collingswood, N. J., borough in Camden County, on Cooper River and on the Pennsylvania Railroad, adjoining Camden. It is well laid out and well built, has few industries, except manufactories of wall paper and wagons, but does a large trade in the agricultural products of the surrounding district. Pop. 4,795.

Collingswood, Cuthbert, Lord, English admiral: b. Newcastle-upon-Tyne, 26 Sept. 1750; d. at sea near Minorca, 7 March 1810. He entered the royal navy in 1761, gradually rose in service and became a close friend of Nelson. In 1799 he was made rear-admiral of the white. His most distinguished service was the part he bore in the great victory of Trafalgar, in which his gallant manner of bringing his ship, the Royal Sovereign, into action, and the skill and resolution with which he fought her, excited the personal admiration of Nelson himself, upon whose fall the command of the fleet devolved upon Collingswood as senior officer. He was promoted to be vice-admiral of the red, continued in his command of the fleet and was elevated to the peerage with the title of Baron Collingswood. A monument has been erected to him at Tynemouth. His ‘Memoirs and Correspondence’ was published by his son-in-law (2 vols., 1828).

Collingwood, William Gershon, English writer and artist: b. 1854. He was educated at Liverpool College and University College, Oxford. He first studied at the Royal Academy in 1880, while from 1881 to 1890 he was secretary to John Ruskin. He has published ‘Life of Ruskin’; ‘Thorstein of the Mere’; ‘The Bondwoman’; ‘Coniston Tales’; ‘The Lake Counties’; ‘Scandinavian Britain,’ etc.

Collingwood, Canada, port of entry and county-seat of Simcoe County, Ontario, on Georgian Bay, Lake Huron and the Grand Trunk Railway, 95 miles northwest of Toronto. It is an important commercial port, the terminus
COLLINS

of steamship lines to Owen Sound, Sault Sainte Marie, Fort William, Duluth and other ports of the Great Lakes, and has a large trade in lumber, grain, products, iron ore, etc. It is the seat of the United States and has tan-neries, breweries, flour mills, sash, blind and pump factories, and is lighted by gas and elec-tricity. Pop. 7,090.

COLLINS, Anthony, English theologian: b. Cheston, Middlesex, 21 June 1676; d. London, 13 Dec. 1729. He was educated at Eton and Cambridge, and devoted himself to general literature. During the years 1703-04 a correspondence was carried on between him and Locke who regarded him as having 'as much of the love of truth for truth's sake as he had ever met with in anybody.' Among his numerous writings, all published anonymously, the one most commonly associated with his name is entitled 'A Discourse on Freethinking.' It attracted considerable notice at the time, and was answered, among others, by Bentley, under the assumed name of Phileleutherus Lipsiensis. Another work, entitled 'Philosophical Inquiry Concerning Liberty and Necessity,' was answered by Samuel Clarke. He also wrote 'Essay Concerning the Cause of Human Reason' (1707); 'Pietysta in Perfection' (1709); 'Discourse of Freethinking' (1713); 'Historical and Critical Essays on the Thirty-Nine Articles' (1724); 'Defence of the Divine Attributes' (1725); 'Grounds and Reasons of the Christian Religion' (1724); 'A literal Scheme of Prophecy'; 'A Letter to the Rev. Dr. Rogers on Occasion of His Eight Sermons on the Necessity of Revelation and the Truth of Christianity' (1727). His benevolent and tolerant spirit gained the respect of many who widely differed from him on theological questions. Consult Stephens, 'English Thought in the Eighteenth Century' (1881).

COLLINS, Arthur, English theatre manager: b. London 1863. In 1881 he was appren-ticed to a scenic artist, Henry Emden, at the Theatre Royal, Drury Lane. He was stage manager there in 1887-96 and in 1897 leased the Drury Lane and formed a managing company with himself as director. He produced 'Hearts and Trumps' (1899); 'Ben Hur' (1902); 'The Prodigal Son' (1905); 'The Bondman' (1906); 'The Sins of Society' (1907); 'Marriages of Mayfair' (1908); 'The Whip' (1909); 'Everywoman' (1912).

COLLINS, Frank Shipley, American botanist: b. Charlestown, Mass., 6 Feb. 1848. He was graduated at the Malden High School 1863. He was engaged in commercial pursuits from 1864 to 1912. He has been a student of botany for many years and is a member of many botanical societies. He is the author of 'Flora of Middlesex County' (1888); 'A Green Algae of North America' (in 'Tufts College Studies,' 1909); 'Phylothea Boreali Americana' (1894-1913); and contributions to botanical journals.

COLLINS, John Churton, English author and educator: b. Bourton-on-the-Water, Gloucestershire, 26 March 1848; d. Lowestoft, England, 12 Sept. 1908. He was educated at King Edward's School, Birmingham, and Balliol College, Oxford, whence he was graduated in 1872. He engaged in journalism, education and in public lecturing, especially pleasing, both in his writings and lectures, for the study of literature as distinct from philology. In 1904 he became professor of English literature at the University of Birmingham. Among his publications are 'Biyon' (1898); 'The Scotsman' (1899); 'The Salt of the Earth' (1890); 'The Irishman' (1891); 'The Study of English Literature' (1891); 'The Illustrations of Tennyson' (1891); 'Dean Swift, a Biographical and Critical Study' (1893); 'Poems and Studies' (1895); 'Ephemera Critica' (1901); 'Studies in Shakespeare' (1904); 'In Memoriam, Maud and Princess' (1902); More's 'Utopia' (1904); 'Matthew Arnold's 'Merope'; A Treasury of Minor British Poetry,' etc., and is also general editor of the series 'Shakes-peare for Schools' and 'British Classics for Schools.' In his works on Tennyson he revealed, in early English poets, some of the sources of his inspiration.

COLLINS, Joseph William, American ich-thyologist: b. Isleboro, Me., 8 Aug. 1839; d. 1904. His boyhood was spent on fishing schooners and he was entirely self-taught. He made the statistical inquiry into New England fisheries for the 10th United States census, 1879-80, and for the United States Fish Commission, with which he remained connected until 1892. He was an official of the International Fisheries Expositions at Berlin, 1880; London, 1883; chief of the Fish and Fisheries Department at the Chicago World's Fair, 1893; and organized the section of Naval Architecture in the United States National Museum, and he was curator of the department for almost 10 years. He was a contributor to the 'Century Dictionary'; edited the 'Fishing Gazette,' 1893-94; and wrote many papers and reports on his specialty.

COLLINS, Mabel, See COOK, MABEL COL- LINS.

COLLINS, Mortimer, English man of let-ters: b. Plymouth, England, 29 June 1827; d. Knowl Hill, 28 July 1876. His father, who was a solicitor, published a volume of verse and seems to have been a good mathematician. His mother was connected with the Mortimers of Dorset. While at school, the boy wrote verses and prose for local newspapers, and began to contribute to 'Fraser's and Punch.' At the age of 22 he married, and settled at Guernsey as mathematical master of Queen Elizabeth's College. This position, which interfered with his literary work, he resigned in the year after the appearance of his first volume of poems, 'Idyls and Rhymes.' During the next 10 years he edited several provincial newspapers and contributed extensively to the London press. A strong Tory in politics, he was accounted one of the best at political squibs. His lyrics and epigrams in the 'Oxford' were especially well received. In 1860 a collection of 'Summer Songs' and in 1865 his first novel, 'Who is the Heir?' By 1862 he was settled at Knowl Hill, Berkshire, some 30 miles from London, where he passed the rest of his life in unremitting industry. He wrote numerous novels, reviews, sketches of travel and an enormous amount of verse. 'The Marquis and the Mer-
The Secret of Long Life (1871), a collection of essays, including a notable one on laziness, ran through several editions. Collins was a "well-made man, over six feet in height, with a handsome face and well-shaped head." Among his numerous friends were Edmund Yates and R. D. Blackmore. His first wife died in 1867. The next year he married Frances Cotton, who collaborated with him in fiction and published on her own account a novel called a "Broken Lily" (1882). Consult More蒂mer Collins; His Letters and Friendships (2 vols., London 1887), a scrappy but interesting biography by his widow. To Pen Sketches by a Vanished Hand from the Papers of the Late Mortimer Collins (London 1879) Tom Taylor prefixed a memoir. For some of his best pieces, consult also "Thoughts in my Garden" (London 1885), collected and edited by E. Yates, and "Attic Salt" (1880), a selection of Collins's epigrams, by F. Kerslake.

WILLIAM L. CROSS, Professor of English, Yale University.

COLLINS, Thomas Wharton, American jurist: b. New Orleans, La., 23 June 1812; d. 3 Nov. 1879. He became a printer, then an editor, studied law, was admitted to the bar in 1833, was reporter and clerk of the State senate in 1834, and was clerk of the United States Court in 1836-38, district attorney for the Orleans district in 1840-42, judge of the City Court in 1842-46, a member of the Constitutional Convention in 1852, and in 1856 was elected judge of the first District Court of New Orleans. At the close of the war he resumed the practice of law in New Orleans, and in 1867 was made judge of the seventh District Court, which office he held until the court was abolished when he returned to legal practice. For some of his best pieces, consult also "Thoughts in my Garden," collected and edited by E. Yates, and "Attic Salt" (1880), a selection of Collins's epigrams, by F. Kerslake.

COLLINS, Thomas Wharton, American jurist: b. New Orleans, La., 23 June 1812; d. 3 Nov. 1879. He became a printer, then an editor, studied law, was admitted to the bar in 1833, was reporter and clerk of the State senate in 1834, and was clerk of the United States Court in 1836-38, district attorney for the Orleans district in 1840-42, judge of the City Court in 1842-46, a member of the Constitutional Convention in 1852, and in 1856 was elected judge of the first District Court of New Orleans. At the close of the war he resumed the practice of law in New Orleans, and in 1867 was made judge of the seventh District Court, which office he held until the court was abolished when he returned to legal practice. For some of his best pieces, consult also "Thoughts in my Garden," collected and edited by E. Yates, and "Attic Salt" (1880), a selection of Collins's epigrams, by F. Kerslake.

William, English painter of landscapes and domestic scenes: b. London, 8 Sept. 1788; d. there, 17 Feb. 1847. His picture of the Young Piper, exhibited in 1811, was purchased for 80 guineas, and in 1813 he at once raised himself to a position of eminence by his "Sale of the Pet Lamb," so well known by engravings. In 1820 he was elected a Royal Academician. For his picture of the Young Piper's Departure, painted in 1826, he received 350 guineas. Other noted works of his are "Rustic Hospitality," "Sunday Morning," and "Happy as a King." Two sacred pictures, "Our Saviour with the Doctors in the Temple" and "The Two Disciples at Emmaus," were exhibited in 1840 and 1841, but were unsuccessful. He visited Italy 1836-38; also visiting the Shetland Isles (1842) and illustrating Scott's novel "The Pirate." He was the father of Wilkie Collins, the novelist, whose memoir of his father was published in 1848.

COLLINS, Sir William Job, English surgeon: b. London, 9 May 1859. His medical training was obtained at Saint Bartholomew's Hospital, London, and he has since held various professional positions of importance. He was elected to the London medical faculties of Saint Pancras in 1892, 1895, 1898, 1901 and 1904, and contested that electorate for Parliament 1895 and the University of London in 1900. He has published "Specificity and Evolution in Dis-
case" (1844); 'Pathology of Cataract' (1897); 'Sponza' (1889); 'Rationalism in Medicine' (1890); 'The Man v. the Microbe' (1903); 'Physic and Metaphysic' (1905); 'Sir Samuel Romilly's Life and Work' (1908); 'The Chadwick School of Thought' (1913); 'The Etymology of the European Conflagration' (1915), etc. He was created K.C.V.O. in 1914.

COLLINS, William Wilkie, English novelist: b. London, 8 Jan. 1824; d. there, 23 Sept. 1889. The eldest son of William Collins (q.v.), the landscape and portrait painter, he also bore the name of David Wilkie, the distinguished academician. Among his friends and in letters he was always known as Wilkie Collins. Educated privately, he passed two years (1836-38) with his father in Italy, where he became greatly interested in Italian art, scenery and history. In 1841 he obtained a clerkship in a London firm of tea-merchants with a view to a business career. After five years of this, he began the study of law, and was called to the bar in 1851. While thus hesitating between law and business, he had shown for some time a bent toward art and literature. For landscape especially he possessed talent. His first book to be printed was a memoir (1848) of his father's life. He had written long before this, 'Antonina, or the Fall of Rome,' an historical romance of the Bulwer-Lytton type. It was given to the public in 1850. The next year he published an account of a summer in southwest England under the title 'Rambles beyond Railways.' Both books were well received. He now met Dickens, and at once became a man of letters. Thereafter the two novelists lived on terms of the most delightful friendship. They frequently collaborated on novels, and Collins contributed largely to Dickens's 'Household Words' and 'All the Year Round.' The new influence upon Collins—Dickens in place of Bulwer-Lytton—was at once manifest in 'Basil' (1852), which dealt realistically with contemporary life in London. From history his descent was quick to a clerk and a linendraper's daughter. Then followed 'Hide and Seek' (1854), 'The Dead Secret' (1857) and numerous short stories like the chief ones of which are 'The Dead Secret' (1856). In this early work Collins sometimes displayed great skill in concentrating attention upon a dominant motif which engrossed the reader as well as himself. In his view, the novel was a twin sister of the drama. But he first discovered his extraordinary talent in 'The Woman in White' (1860), which nobody left unread. It was absolutely a new type, depending in no wise upon the interest in character nor in adventure or incident as such, but upon the adroit manipulation of incident for first concealing and then revealing a secret. Collins is the father of the detective story. His first great success was repeated in 'The Moonstone' (1868). In other novels of the period one finds only his plot to a distinct didactic purpose. This is particularly true of 'No Name' (1862), 'Armadale' (1865), 'Man and Wife' (1870) and 'The New Mag- dalen' (1873), all of which are among the most distinguished novels of the time. In 1874, Collins visited the United States, where he gave readings from 'The Frozen Deep' and other stories which he had just written. Several of his novels, dramatized either by himself or by others, were popular on the stage both in England and in the United States. He was buried at Kensal Green. Notable appreciations of Collins have been written by Swinburne, 'Studies in Prose and Poetry' (London 1894); Quilter, 'Contemporary Review' (April 1888); and Lang, 'Contemporary Review' for January 1890.

WILBUR L. CROSS, Professor of English, Yale University.

COLLINSVILLE, Ill., city in Madison County, 10 miles east of East Saint Louis, on the Vandalia Railroad. It contains a hospital and a tuberculosis colony. It is a busy coal-mining centre and has zinc works, lead smelters and knitting and flour mills. Collinsville was settled in 1800 and incorporated in 1830. The government, under charter of 1872, is vested in a mayor, chosen for two years, and a council of one chamber. The city owns its waterworks. Pop. 7,478.

COLLISION, in navigation, the shock of two ships coming into violent contact, whereby one or both may suffer more or less injury. Of 104 major shipping disasters over the past half century, 24 occurred through collision, with a total loss of 6,615 lives, or 23 per cent of shipping disasters and over 23 per cent of lives lost. In order to avoid accident, it is the practice of the great transatlantic lines trading between England and America to choose each definite lanes of travel, which are rigidly adhered to. The American rules in regard to the prevention of collisions are based upon the same principles as the English, with which they are substantially identical. The leading doctrines of English law on this subject are thus stated by Lord Stowell: "In the first place, collision may happen without blame being imputable to either party, as where the loss is occasioned by a storm or any other vis major, in which case the misfortune must be borne by the parties equally in whose hands it happens to lie. Secondly, a misfortune of this kind may arise where both parties are to blame—where there has been a want of due diligence or skill on both sides; in such case the loss must be apportioned between them, and if both are guilty of the fault of both of them. Thirdly, it may happen by the misconduct of the suffering party only, and then the rule is that the sufferer must bear his own burden. Lastly, it may have been the fault of the ship which ran the other down, and in that case the injured party would be entitled to an entire compensation from the other. In a court of common law the same rule holds in the first, third and fourth cases; but in the second (where both parties are to blame) the rule is, that if the negligence of both substantially contributed to the mishap, neither has an action against the other; but if one of them, by exercising ordinary care, might have avoided the consequence of the other's negligence, the former is liable for any injury sustained by the latter." In pursuance of the Merchant Shipping Amendment Act (1862), orders were issued in 1863, 1879, 1884 and 1885, giving regulations for preventing collisions. These contain rules concerning lights and fog-signals, and sailing and steering rules. With respect to lights it is enacted that steamers shall, when under way, carry a white mast-head light, on the starboard side a green and on the
COLLITZ—COLLODION

漕 a red light; when towing other vessels they must carry two mast-head lights, placed vertically. Sailing vessels shall carry only the side lights; fishing and other open boats are not required to carry side lights, but may use a lantern with a red slide on the one side and a green slide on the other, and such lantern must be exhibited in sufficient time to prevent collision, and so that the green light shall not be seen on the port side nor the red light on the starboard side. Ships at anchor in a roadstead must exhibit a white light where it can be seen, not more than 20 feet above the hull, in a globular lantern eight inches in diameter, showing at a distance of a mile all round. The sailing and steering rules demand that if two sailing ships are approaching each other on, or nearly so, the helms of both must be put to port, so that each may pass on the port side of the other; in crossing so as to involve risk of collision the sailing ship with the wind on the port side shall keep out of the way of the ship with wind on the starboard, but if they have both the wind on the same side the ship which is to windward shall keep out of the way of the one that has it to leeward. If a steamship and a sailing ship are approaching so as to involve collision, the latter must keep out of the way of the former. The rules for two steamships passing or crossing are nearly the same as for sailing ships. If one vessel is overtaking another she must keep out of the way of the last-named vessel. When, according to the rules, one of the ships keeps out of the other's way, that other shall generally be understood to keep her course. See NAVIGATION LAWS; RULES OF THE ROAD.

COLLITZ, Hermann, American philologist: b. Bleckede, Hanover, 4 Feb. 1855. He was educated at Lüneburg, Göttingen and Berlin. In 1883-86 he was assistant librarian, and in 1885-86 instructor in Sanskrit and comparative philology, at the University of Halle. In 1886 he became associate professor of German, and in 1892 professor of comparative philology and German, at Bryn Mawr. In 1907 he was appointed professor of Germanic philology at Johns Hopkins University. His early work was principally in the field of comparative philology in general, and in the Greek dialects; his later work has been mainly confined to German philology. His works include 'Die Verwandtschaftsverhältnisse der griechischen Dialetke' (1885); 'Die neueste Sprachforschung' (1886); 'Das schwache Präteritum und seine Vorgeschichte' (1912). He is editor of 'Sammlung der griechischen Dialetkenschriften' (4 vols., 1884-1915); 'Bauers Waldeck Dialect Dictionary' (Leipzig 1902); 'Hesperia' (1912-15); coeditor of 'Modern Language Notes' (1902-13). He is a frequent contributor to philological journals.

COLLITZ, Klara Hechtenburg, American philologist: b. Rheydt, Rheinish Prussia, 1863. She was educated at Neuwied am Rhein, at Lausanne, London, Oxford and Heidelberg, specialized in classics. She married Hermann Collitz (q.v.) in 1904. In 1895-96 she was lecturer in French philology at Victoria College, Belfast, Ireland, in 1897-99 in charge of Germanic philology at Smith College, and lectured in Germanic philology to women students at Oxford in 1901-04. She is author of 'Das Fremdwort bei Grimmelshausen' (1901); 'Der Briefstil im 17. Jahrhundert' (1903); 'Fremdwörterbuch des 17. Jahrhunderts' (1904). She edited 'Selections from Early German Literature' (1910); 'Selections from Classical German Literature' (1914). She is also a frequent contributor to philological journals.

COLLODION (Gr. κόλλαδος, 'like glue'), a solution, in mixed alcohol, and ether, of soluble pyroxylene (or 'gun-cotton'). It is colorless and highly inflammable. The gun-cotton that is used in its manufacture is commonly prepared by the action of a mixture of nitric and sulphuric acids upon cotton-wool that has been first boiled in a solution of sodium carbonate (to remove all greasy and resinous matters) and afterward thoroughly washed and dried. The following procedure is followed in the subsequent operations: Three fluid ounces of strong nitric acid are poured slowly into two fluid ounces of water, and nine fluid ounces of strong sulphuric acid are added, stirring constantly. When the mixture has cooled to about 140° F., 100 grains of the prepared cotton-wool are added in tufts weighting two to each. At the end of 8 or 10 minutes the acid is poured off and the cotton is subjected to gentle pressure to expel the greater part of the fluid that its fibres have retained. The cotton is next thoroughly washed with water and a weak solution of sodium carbonate until the acid has been entirely eliminated, after which it is allowed to dry. The product is 'soluble gun-cotton.' It does not differ materially, in appearance, from the original of the operations to which it has been subjected have been correctly carried out, it will be found that the cotton has become soluble in a mixture of equal parts of alcohol and ether. Commercial collodion contains 100 to 120 grains of gun-cotton to 10 ounces of ether and 5 ounces of alcohol, a further 5 ounces of alcohol being added after the salts have been dissolved. Before the advent of the dry-plate process, collodion was greatly used in photography for the preparation of sensitive plates; and at present it is used to some extent in this way, especially in certain branches of photo-engraving. In the preparation of these plates the collodion is first iodized and brominized by the addition of the iodide and bromide of cadmium or of ammonium, or a mixture of both, and the addition of a few drops of nitric acid, and is then poured over a carefully cleansed glass plate. The volatile solvent evaporates rapidly, leaving a film of iodized gun-cotton upon the glass. Immediately before the exposure is made the coated plate is immersed in a solution of nitrate of silver, with the result that a deposit of iodide and bromide of silver, sensitive to light, is formed in the guncotton layer. The plate is next exposed in the camera, and afterward developed by a ferrous sulphate solution in water. Collodion is used in the place of adhesive plaster, in the case of trivial injuries, to afford protection from the air, and from pyogenic and other external irritants. It may be applied to the injured spot it quickly dries, leaving a tough, elastic coating which is impermeable to moisture. It was first employed in surgery by Dr. J. Parker Maynard, of Boston, Mass., in 1847. In this application it is often medicated in various ways, one of the best-
known examples being blistering colloidion, which contains cantharides, and is applied to the skin for the purpose of producing a blister. Medicated colloidion is also largely used in chiroprapy.

**COLOID CHEMISTRY** had its beginning in the discovery by Thomas Graham in 1860-61 of aqueous solutions of various substances did not act in the same way when subjected to diffusion through parchment membranes such as used in osmosis experiments. He noted that in the case of substances which formed crystals when the water was evaporated from their solutions, the aqueous solution passed through the membrane unchanged; whereas in the case of substances which did not so crystallize, but formed amorphous solids, the water alone passed through the membrane, leaving the substance on the farther side, proving that these latter substances had not been in true solution, but in suspension. This discovery led Graham to divide all soluble substances into two classes, the crystalloids, like salt, sugar, alum, etc., and the colloids, like gelatine, gum arabic, raw albumen, etc. The conclusion reached by Graham was that the colloid molecules were constituted by grouping together the smaller crystalloid molecules, and that the difference in diffusibility was explainable on the relative size of the molecules.

For some years the newly opened field of research was not cultivated, but interest in Graham's discoveries was revived in 1900 by Hardy, who attempted a classification of the colloids into reversible and irreversible groups. Later, investigators made experimental inquiries as to the electrical constitution of the colloids, and the ultramicroscope confirmed the supposition that the colloids did not form true solutions, but mixtures. Since then researches have been many, particularly by the German scientists, and the development of the chemistry of the colloids has been rapid. The literature of the branch of chemistry now numbers hundreds of professional papers and several substantial volumes.

The practical applications of colloid chemistry have been many, particularly in the dyeing and printing industries, the manufacture of soaps, casein and albumen products and gelatine photographic films; the study of enzymes, ferments and soils; the purification of drinking waters and of sewage; and in the investigation of many important bacterial and biological problems, such as the reactions of toxins and antitoxins, and the applications of immunochemistry. Consult Burton, E. F., 'The Physical Properties of Colloid Solutions' (London 1910); Stewart, A. W., 'Chemistry and Its Borderland' (London 1914); Taylor, W. W. Jr., 'The Chemistry of the Colloids' (New York 1915); Zsigmondy, R., 'Colloids and the Ultramicroscope' (Alexander's translation, New York 1909).

**COLOIDS** (Gr. κόλλωδος, "glue-like") consists of albumen and silic acid, which, when combined with water in certain proportions, exhibit a gelatinous consistency. The word does not imply that there is any chemical resemblance among the bodies to which it is applied, the distinction between colloids and non-colloids being wholly physical. The term "colloid" was proposed by Thomas Graham, in 1861, to designate substances that are practically incapable of diffusion through porous membranes. Substances such as salt, sugar and the mineral acids, which diffuse readily through such membranes, were called by him "crystalloids." Colloids and their properties are of special interest to students of biology, since the cells of all living organisms are made up of a mixture of chemical substances known as protoplasm, the structure of which is due to colloids. As Matthews has said, the cell is not a single room in which all of the chemical processes occur in a higglety-pigglety manner, but is rather a well-organized chemical factory with different chemical processes occurring in different regions and in which substances are being elaborated as fast as they are required. This division of labor is made possible by the colloidal nature of the protoplasm. This colloidal structure is due to the fact that the organic substances of which it is in part composed have very large molecules. According to the theory of Brownian movements, these colloidal particles are the bearers of electrical charges, the opposite electrical charge being in the water which lies around the colloidal particles. There are electro-negative and electro-positive colloids. They are usually very small, varying from 1 to 100,000ths of an inch in diameter. The metal colloids are all electro-negative, since they send out, in the presence of water, positive ion charges to the water. It is due to the electrical reactions taking place in colloidal substances that the phenomena of life are largely possible. Energy is thus transmuted and made available for the life processes. In this transforming process certain substances termed enzymes accelerate these electrical reactions and hence are essential to the life processes. Consult Matthews, 'Physiological Chemistry'; Bayliss, 'Principles of General Physiology.'

**CLOLLOP MONDAY**, the Monday after Quinquagesima Sunday and preceding Shrove Tuesday. It was so named because on that day the faithful ceased eating flesh meat or"collops."

**CLOLLOPHANITE** (Gr. κόλλωδα, "glue") + φασμα, "to appear" = "glue-like") is a native amorphous phosphate of calcium, somewhat resembling opal in structure, and having the formula Ca₅P₂O₇·H₂O. It is found principally on the island of Samboro, in Greece, in a little phosphoric acid that it contains being derived from the guano deposits there. Collophanite is white or nearly so, with a specific gravity of 2.7 and a hardness of from 2 to 2.5. The name is given on account of the glue-like appearance of the mineral.

**COLOQUIES OF ERASMUS, The**. The 'Colloques of Erasmus' (Erasmii Colloquia) has probably been the focus for more bitter criticism than any book of its size ever published, and it is by far the best known work of its author, the only one generally read down to our time. It
was condemned by the Sorbonne as dangerous to morals in 1526; Luther in his 'Table Talk' declared, "If I die, I will forbid my children to read his Colloquies," and Saint Ignatius of Loyola denounced it by name to his community. It was eventually placed on the Index by the Church. Yet its author was the dear personal friend of Sir Thomas More, as also of Pope Hadrian VI, like himself a native of the Low Countries, and after his death he was offered the cardinalate by Pope Paul III, one of the great reforming popes, refusing it for reasons of health.

The Colloquia is a bitter satire on religious and other abuses, in which good and evil are sadly confused, and one is as likely to come in for condemnation as the other. It is brilliant but cynical; it is extremely clever, but utterly unsympathetic toward the mental and spiritual limitations of human nature. Like most pure satire, it was calculated to do even more evil through emberment than good through correction. It was a typical example of destructive criticism. A reflection on human nature worthy of Rochefoucauld is that in spite of all this book was so popular from the very beginning, though even its author deprecated "the caprice of fortune" which had made, as he confessed quite candidly in later years, a book full of foolish things, bad Latin and Sodoms so much read.

The Colloquia is one of the great humanistic contributions to the literature called out by the Reformation movement, and its vivid vigorous Latinity has made it the favorite handbook of many a teacher who utterly distills and content. Erasmus wrote Latin not as a dead but as a living language. His satiric humor has done the rest. The Colloquia remains one of the books that no educated man cares to confess that he does not know. As a mirror of the foolishness of mankind in many ways, it is too essentially true to nature ever to lack interest. While it satirizes man's credulity in matters religious, it does not fail to hold up for ridicule his overwrought desire to make money which so often leads him into equally foolish credulity, and shows that the promise of the transmutation of base metal into gold catches his fancy and runs away with it just as does any other superstition. The reader and the spirit are bitingly satirized. It is a commentary on the morning paper. Consult 'Erasmiara' (University of Geneva Press, Geneva, 1897-1901); Seeborn, 'The Oxford Reformers, John Colet, Erasmus and Thomas More' (London 1887). A number of editions of the Colloquia in English have been issued in England and America. Bailey's translation is usually chosen.

JAMES J. WAlSI.

COLLOQ D'HERBOIS, kō-1 dār-bwa, Jean Marie, French revolution leader; b. Paris 1750; d. Cayenne, South America, 8 Jan. 1796. He was an actor, who adopted the name of D'Herbois. On the breaking out of the French Revolution he zealously espoused the views of the Jacobins, and published his 'Almanach du Père Goriot,' which gave him much influence with the most violent revolutionists. After the events of 10 August he became a member of the municipal council of Paris, and a few days after the horrors of September was chosen deputy to the National Assembly. He afterward became an active leader of the Mountain against the Girondists. He was sent by Robespierre along with Fouche to Lyons, in 1793, with almost unlimited powers and was guilty of the most flagrant enormities. Declaring that he found the guillotine too tedious and formal, he introduced the method of executing wholesale by the sword and by death. On his return from Paris he became a determined opponent of Robespierre, and being chosen president of the convention (19 July 1794), contributed powerfully to his fall. A few weeks later his own downfall followed. On the motion of Merlin he was expelled from the assembly and banished to Cayenne. Consult Morse-Stephens, 'The French Revolution' (London 1891); and 'Statesmen and Orators of the French Revolution' (Oxford 1892).

COLLUSION, kōl-ū-zhōn (Lat. collusio, s, playing together in the sense of to reconcile), a secret agreement between opposing litigants to obtain a particular judicial decision on a preconcerted statement of facts, whether true or false, to the injury of a third party. Collusion, when proved to exist, nullifies the judgment obtained through it. It is therefore broad in meaning and generally includes cases where two parties get together to defraud another or to defeat the aims and provisions of the law. If a husband and wife, for instance, mutually agree to institute divorce proceedings without just cause, the law would consider their act as collusion.

COLLYER, kōl-ār, Robert, American clergyman; b. Keighley, Yorkshire, England 8 Dec. 1823; d. 30 Nov. 1912. He came to the United States in 1849, being then a Wesleyan preacher and a blacksmith. His license as a Methodist minister was revoked partly for his preaching against slavery. In 1859 he became a Unitarian, and preached some years in Chicago, where he founded Unity Church in 1860 and was its pastor in 1860-64. He was the pastor of the church of the Messiah, New York, in September 1879, and pastor emeritus in 1896. Included in his publications are 'Nature and Life' (1864); 'The Life That Now Is' (1871); 'The Simple Truth' (1879); 'A History of the Town and Parish of Boston' (England, 1886, written with Horsefall Turner); 'Talks to Young Men' (1888); 'Things New and Old' (1893); 'A Man in Earnest' and 'Clear Grit' (1914), a collection of lectures, addresses and poems, edited by Haynes Holmes. Consult Holmes, J. H., 'Life and Letters of Robert Collyer' (1917).

COLLYRIANS, kōl-lir-īanz (Gr. kol-lyridia, little cakes), a sect toward the close of the 4th century, so denominated from the little cakes which they offered to the Virgin Mary. The sect was composed of people who, out of an extravagant devotion to the Virgin, met on a certain day of the year to celebrate a solemn feast and to render divine honors to her as to a goddess, eating the cakes which they offered in her name. It is said that the members of this sect were not native Arabs, but immigrants from Thrace and Scythia. While pagans they had been accustomed to offer similar cakes to Venus or Astarte.
COLMAN, Benjamin, American clergyman: b Boston, Mass., 19 Oct. 1673; d. there, 29 Aug. 1747. He graduated at Harvard in 1692, began preaching, sailed for England 1695, was captured by a French privateer, and after a short imprisonment reached England. He received ordination in London, and returned to take charge of the Brattle Street Church, Bos- ton, retaining with this society until his death. He was for many years one of the leading clergymen of New England, exerting a strong influence on civil affairs that frequently drew censure upon him. He procured considerable benefactions for Harvard and Yale, and was offered, but declined, the presidency of the former, in 1724. His collected sermons were printed at Boston 1707-22, and his 'Life' was written by his son-in-law, Rev. E. Turell (1749).

COLMAN, George (The Elder), English dramatist: b. Florence 1732; d. London, 14 Aug. 1794. He wrote in 1760-61 the comedies of 'Polly Honeycomb' and the 'Jealous Wife,' 'The Clandestine Marriage' (1766) we owe to him and Garrick. This was left unfinished and was never and ascertained which of the authors most credit is due for that admirable comedy. 'The Royal Merchant' (1767), the 'Oxonian in Town' (1767), and other pieces followed the foregoing. In 1777 he purchased the little theatre in the Haymarket and continued in the personal superintendence of it till the year 1790.

COLMAN, George (The Younger), English dramatist, son of the preceding b. London, 21 Oct. 1762; d. there, 17 Oct. 1836. He was educated at Westminster School, Christ Church, Oxford, and Aberdeen University; was entered as a student in the Temple, but early abandoned legal studies for dramatic and general literature. He assisted his father as director of the Haymarket Theatre and succeeded him as its patentee. After selling his interest in the theatre he was appointed examiner of plays in 1824, the duties of which he performed with a severe, not to say ridiculous, purism, hardly to have been expected in a man who wrote with almost licentious freedom for himself. Most of his dramas were well received, and some of them still keep the stage; as 'John Bull'; the 'Heir-at-law'; 'Poor Gentleman' and 'Love Laughs at Locksmiths.'

COLMAN, Norman J., American office holder: b. Richfield Springs, N. Y., 16 May 1827; d. 1911. He settled in Saint Louis, Mo., and adopted the legal profession. He served in the Union army during the Civil War as lieutenant-colonel of volunteers. In 1865 he established an agricultural paper, 'Colman's Rural World,' which he continued to edit to the close of his life. In 1874 he was elected lieutenant-governor, and was Commissioner of Agriculture in President Cleveland's first administration 1885-89. Shortly before his term of office ended, Congress enacted the law raising the Department of Agriculture to the rank of an executive department, with its chief a Cabinet officer, 11 Feb. 1889.

COLMAN, Samuel, American artist: b. Portland, Me., 4 March 1832. He studied art for many years in Paris, Madrid, Dresden and London. He is a landscape painter, working both in oil and water colors. His principal pictures are 'The Ships of the Western Plains,' now in the possession of the Union League Club; 'England 1695,' was made at Venice in the Metropolitan Museum of Art, and the 'Mosque of Side Bou Hac, Tlemcen Algeria' in the New York Library. He has traveled extensively in Europe, Africa, Mexico, California and the Canadian Rocky Mountains, and was made a member of the National Academy of Design in 1861, receiving a full membership in 1864. He was one of the founders and first president of the American Water Color Society, also one of the founders of the Society of American Artists. He has been engaged for many years in an investigation of polar force in relation to angular magnitude, beauty and proportional form. This has resulted in a book, 'Nature's Harmonic Unity' (1913). Consult his biog- raphy by Koehler, in American Art Review (1880), and Isham, 'History of American Painting' (1905).

COLMAR. See Kolmar.

COLNE, coln, England, municipal borough in the county of Lancaster, and 34½ miles north of Manchester by rail. The most remarkable edifice is the Piece Hall, in the Elizabethan style. The chief manufactures are cotton goods. Colne was one of the earliest seats of the woolen and cotton manufacture in Eng- land, but woollens—the trade in which goes back to the 14th century—are no longer made there. Limestone and slate are quarried in the neighborhood. It is a place of great antiquity at which important discoveries of Roman coins have been made. Pop. 25,689.

COLOCASIA. See Cocco.

COLOCOLO, k(o-)ko-lo'ko'em, a wildcat (Felis colocolo) found in Guiana and Chile. It is somewhat larger than the domestic cat, is whitish-gray in color, with elongated black markings on the back and sides. In appearance it is much like the ocelot of Mexico and Central America, which enters so largely into the mythology and legendary history of the native races of Mexico and Guatemala. One of the highest orders of knighthood and nobility among the Aztecs was named after this native tiger or ocelot, the hide of which the knight wore as his special insignia of knighth- hood. The colocolo's pelt was used along the northeastern coast of South America by warriors as a distinction of rank much as the ocelot was in Mexico. The Minitaris dressed themselves in the hide of a wolf when going into battle just as the Central American tribes dressed themselves in that of the ocelot.

COLOCYNTH, kõ'õ-sinth, the fruit of Citrullus colocynthis, deprived of its rind. The plant, one of the Cucurbitaceae, or melon family, is widely distributed over waste lands in Asia and Africa. It is also extensively culti- vated. It is collected when the fruit is nearly ripe and peeled while fresh. The fruit subse- quently contracts somewhat, is whitish in lustre and very porous and light. As found in the market colocynth occurs as light, yellowish white balls, from one to three inches in diameter, that are very porous and fragile. It contains a large number of whitish seeds in six compartments. On breaking, the fruit splits irregularly, although there may be a
tendency to decuss in threes. The active principles are a bitter glucoside, colchicin (CaH6O6, Walz). Colchicum is an active drastic purgative and is rarely administered alone because of its harsh action, but in small doses in combination with other drugs, it is widely used as a laxative and purge. The compound extract, made of colchicum, aloes, scammony, soap and cardamom, is widely employed in other preparations. Colchicum is recommended as a rectal cathartic in doses of one-eighth to one-half grain. Colocynthis can be given in doses up to five grains.

COLOGNE, Köln (German, Köln), Germany, a strongly fortified city of Prussia, in the Rhine province, on the left bank of the Rhine. It stands upon the river in the form of a crescent, and is connected with Deutz, on the opposite side and forming part of it, by a bridge of boats and an iron bridge. Till recently it was surrounded by fortifications dating from the Middle Ages, but these have been cleared away, their site built upon and a wider circuit of works constructed. Until the middle of the 19th century a great part of the city bore the impress of the Middle Ages, the streets being dark, narrow and filthy; but now the municipality has paid great attention to the appearance and sanitary condition of the town generally by opening up thoroughfares, widening and paving the streets, etc.

The principal buildings are the townhouse, a remarkably fine Gothic building, partly of the 14th century; the Gürenzich (1441–52), a splendid Gothic building, used for public festivities, and also accommodating the exchange; the Tempelhaus, a fine Romanesque building of the 12th or 13th century, occupied as the Chamber of Commerce; the government buildings, courthouse, post-office, Imperial bank and railway station. But the object of greatest interest in the town is the cathedral, begun 1248, one of the finest and purest Gothic monuments in Europe. It is in the form of a cross; its entire length is 490 feet; its breadth, 231 feet; the roof rests on 100 columns, of which the four centre ones are 30 feet in circumference. The choir was long the only part finished; it is 161 feet high, and, with its pillars, arches, chapels and its superb painted glass windows, presents one of the finest sights conceivable. In 1842 the completion of this magnificent edifice was begun, after designs by Zwiller; the works were vigorously prosecuted from that time onward, and were completed in 1880. The two western towers are each 511 feet high, and are among the highest edifices in the world. The other remarkable churches are those of Saint Peter, in which is an altar-piece of the crucifixion of that saint, by Rubens, who presented it to this church, in which he was baptized; Saint Mary, on the capitol, occupying the site of the capitol of the ancient Roman city, and dating from about the year 1000, with some good stained glass windows; the Apostles' church, in the Neumarkt, built about the year 1200, a perfect specimen of the Romanesque style, having a singularly elegant and picturesque effect; the church of Saint Ursula, filled with the bones of the 11,000 British soldiers, who, according to the legend, were destroyed here on their return to Britain, under the guidance of Saint Ursula; the church of the Jesuits, Maria Himmelsfahrt, dating from 1636, overloaded with gorgeous decorations of marble sculpture, etc.; and Saint Gereon's which, like the church of Saint Ursula, is lined with bones, not, however, of virgins, but of the Theban legion of martyrs, sable and golden, according to tradition, during the reign of Diocletian; this is one of the finest and oldest churches in the city.

The city contains several gymnasias and other high-class institutions; a technical school; an observatory and botanical garden; a normal school, a public library, a theatre, several hospitals, a school of design, a museum, etc. The manufactures are very extensive and varied, embracing sugar, chocolate, tobacco and cigars, glue, liquors, mineral waters, starch, vinegar, soap, candles, velvet, silk, woolen and cotton goods, India-rubber, and gutta-percha wares, machinery and metal goods, etc., and the celebrated eau de Cologne, of which there are a great many different manufacturers. Its commerce is considerable; it has a good harbor and an extensive railway communication with the interior of Germany and with Belgium and Holland. It is the principal entrepôt of the corn, wine and oil trade on the river, and has active commercial relations with the Netherlands, Germany, Belgium and Switzerland.

Cologne is of ancient origin, and was originally called Oppidum Ubiorum, being the chief town of the Ubii, a German nation. The Romans made it a colony 51 a.d., and called it Colonia Agrippina. It was annexed to the German Empire in 870, and became one of the most powerful and wealthy cities of the Hanseatic league, its population then amounting to 150,000. As early as the 11th century Cologne carried on an extensive trade with foreign countries, including England, in the produce of the country—wine, corn, flour, malt, beer, etc. The arts and sciences also flourished, and its university was one of the most famous in Germany. Intestine divisions, and other causes, finally effected its ruin, and in 1792 it did not seem to be a free city. It was taken by the French in 1794, ceded to them by the Treaty of Lunéville in 1801, and restored to Prussia in 1814. Duns Scotus died in Cologne in 1308, and was interred in the chapel of the cathedral. The said bens was born here in 1577, in the same house in which Mary de Medici died, in 1642. Pop. 516,527. Consult Heldmann, 'Der Kölnzgau und die Civitas Köln' (Halle 1900).

COLOGNE, Eau de. See EAU.

COLOGNE EARTH, a kind of ochre, of a transparent deep-brown color, especially valuable in water-color painting and distemper work. Unfortunately it is not very permanent when washed. In the paint trade it generally goes by the name of Vandyke brown. In oil it is a very slow drier and should be ground in strong boiled oil. It is an earthy variety of limonite or partially fossilized peat.

COLOGNE YELLOW, a pigment consisting of chromate of lead and sulphate of lead in varying proportions. It is prepared by precipitating a mixture of lead chromate and lead sulphate with a mixture of potassium bichromate and sulphuric acid. A cheaper form of much paler hue and less covering power is made by mixing finely powdered sulphate of
lime into a solution of potassium chromate and precipitating with neutral acetate of lead.

**COLOMB, kö-lö'm**, Sir John Charles Ready, English military writer: b. 1 May 1838; d. 27 May 1909. He was educated at the Royal Naval College and entered the Royal Marine Artillery in 1854, retiring in 1869 with the rank of captain. He was a member of Parliament for Bow and Bromley 1886–92, and for Great Yarmouth 1895–1906, and was created K.C.M.G. in 1888. He has published 'Protection of Commerce in War' (1867); 'Imperial Strategy' (1868); 'The Distribution of Our War Forces' (1869); 'Colonial Defense and Colonial Opinions' (1873); 'The Defense of Great and Greater Britain' (1879); 'Naval Intelligence and Protection of Commerce' (1881); 'The Use and Application of Marine Forces' (1883); 'Imperial Federation: Naval and Military' (1886); 'British Defense' (1900); 'British Dangers'; 'Our Ships, Colonies, and Commerce in War' (1902).

**COLOMB, Philip Howard**, British admiral: b. Galloway, Scotland, 1831; d. 1896. In 1864 he entered the navy and saw much service against pirates in the Persian Gulf. In the Danish war of 1864, the Arctic relief expedition of 1854, in the attack on Sveaborg 1855 and in the suppression of the slave trade 1866-70. He became rear-admiral in 1887 and vice-admiral in 1892. He perfected the system of flash signals adopted by the British navy in 1867 and revised the evolutions for steam warships. He made a particular study of maritime collisions and many of his recommendations were adopted in the code of marine regulations put forth by the Washington Conference of 1889. His book, 'Naval Warfare' (1891; 3d ed., 1900) showed the vast importance of the command of the sea, and had the same theme as the works of the American officer, A. T. Mahan. He also wrote 'Slave-Catching in the Indian Ocean' (1873) and 'Memoirs of Sir Astley Cooper Key' (1898).

**COLOMBIA.** This novel by Prosper Mérimée is one of the gems of French romantic literature, and is considered as the author's best work. It combines all the qualities of his other works, precision, skilful selection of the most expressive details and self-effacement of the author's personality; it has, besides, a glow of fiery passion intensified by its own restraint, but this may be due at least in part to the nature of the subject. Colombia is Corsica itself with its ideas and customs as rugged and savage as its shores and landscapes. Since the days of the Romans, the vendetta or law of revenge has remained the first law of the land and the basis of its ethical system. It is personified in the heroine, Colombia, whose thirst for revenge against those whom she believes responsible for her father's death overcomes the scruples of her brother, a young officer who had partly forgotten his native manners during a few years' residence on the Continent and in the Army. A phlegmatic English colonel and his romantic daughter furnish the needed contrast to the intense Corsican girl and her more civilized brother. The careful handling of the plot, the dramatic situations in the story, the vivid touches of local color and a style combining tenderness and epic grandeur make this short novel a literary masterpiece. There are a number of equally good translations of Colombia in English. Consult Taine in his preface to 'Letters to an Unknown'; and Sainte-Beuve, 'Portraits Contemporains,' (Vol. III).

**LOUIS A. LOISEAUX.**

**COLOMBES, kö-lö'm**, France, town in the department of the Seine, three miles northwest of Paris, of which it is a part. It has oil refineries and manufactories of woolens, oil, vinegar, gelatin, starch and surveying and measuring instruments. Pop. 22,862.

**COLOMBIA.** Physical Features, Flora and Fauna.—The republic of Colombia is bounded on the north and northwest by the Caribbean Sea and the republic of Panama; on the east by Venezuela and Brazil; on the south by Brazil, Peru and Ecuador; on the west by the Pacific Ocean. Its area cannot be stated precisely. The estimate in the latest census is 461,666 square miles; in the pamphlet entitled Latin America' (Washington, 1895). The boundary lines between it and four of the neighboring countries are in dispute.

The Andes of Colombia are divided into three ranges—the Cordillera Oriental, Cordillera Central and Cordillera Occidental—each with intervening uplands of great extent, which are habitable and fertile, but as yet rather inaccessible. Of the three ranges mentioned, the Western Cordillera is the least impressive; the Central Cordillera has the greatest number of snow-clad summits. There are four river systems in the republic: (1) the western system, comprising the streams which flow from the western Cordillera into the Pacific Ocean; (2) the river Cauca and its affluents; (3) the Magdalena River with its affluents; (4) the streams of the eastern slope of the eastern Cordillera. Of special interest is the Atrato River, which is not included in any of the foregoing systems. This navigable stream flows to the Gulf of Darien near the disputed Panama—Colombia boundary. As Mr. Eder has written, when discussing the topography of this country. Colombia presents three main divisions for study, namely the coast regions, the low-lying eastern territory, and, between the two, the great Andean valleys, plateaux and mountains. The eastern region is subdivided into a northern part, where the llanos or open wild pastures are found, and a southern part, of impenetrable forests, the selva sparsely populated, except by savages, and much of it still but imperfectly explored. Besides the three main Cordilleras, the other mountain systems of Colombia comprise the great mountain block called the Sierra Nevada of Santa Marta in the northern part of the country near the Caribbean Sea; far to the south a line of worn-down ancient mountains separating the Amazon basin from the Orinoco system; and the Baudo Range which runs along by the Pacific Coast from the mouth of the San Juan River to the Isthmus of Panama, and belongs to the Andes (NEw WORLD. AMERICA), while the true Western Cordillera of the Andes, running northward a little farther from the Pacific Coast, is separated from the Baudo Mountains by valleys through one of which the San Juan River flows into the Pacific while in the other the Atrato takes its course toward the Atlantic. On the Pacific slopes of
the Western Cordillera the rainfall is excessive and the vegetation is luxuriant, while the eastern slopes are comparatively arid. Near the border of Ecuador are the twin snow peaks of Chirripó (16,912 feet) and Cerro Chirripó (17,076 feet). With these exceptions the height of the Western Cordillera is in general not above 12,000 feet; and on the other hand it is as a rule not below 6,000. There are, however, a few low passes, the most remarkable of which is the valley of the Patía, a precipitous gorge, 1,676 feet deep. Here the Patía River has forced its way through the Andes and empties into the Pacific. Near the southern end of the continent there are other examples of rivers cutting the Cordillera from east to west, rather than from west to east; nevertheless the gorge of the Patía is decidedly noteworthy, and it will be referred to later. The Central Cordillera’s high plateaux, in the regions of Pasto and Popayán, are well adapted to agriculture, and towns of some importance are located there, at no great distance from groups of volcanoes, some of which are perpetually emitting smoky clouds from their snowy caps. Dominating Cauca Valley, north of Popayán, is one of the highest mountains in Colombia, Huila (17,700 feet). Thence northward the Central Cordillera has a nearly constant altitude of about 12,000 feet. There are several passes, but through none have roads been built north of the pass near Popayán till near Quindio. For the bulk of travel and traffic between the Cauca and Magdalena valleys, there is still available only the old Spanish highway. Near the Quindío are the snow-crowned Tolima (18,400 feet), Ruiz and Herveo (18,300 feet), and Santa Isabel (16,700 feet). North of these high mountains, the Central Cordillera, widens out and here we find the important mineral region, Antioquia. The Eastern Cordillera (of Cretaceous and Tertiary formation), which broadens out into the great tableland or savannah of Bogotá, also has high peaks, such as those of the Sierra Nevada de Chita and Cocuí (16,800 feet). From whatever point of view we examine Colombia—whether scientifically, historically, politically, or economically, whether we are investigating the habits and customs of its people or its trade routes, markets and industries—we find the mountains an ever-present, a predominant factor. The immense tropical forests have been scarcely less an impediment. The effects of the extreme ruggedness of the second in size of the West Indian Islands should be studied in this connection. See the article on Santo Domingo.

Climate. The coast and some interior valleys are intensely hot and insalubrious. On the elevated plateaux the temperature is that of perpetual spring. The lowest average temperature in any inhabited part of the mountainous country is 20° F. The peaks of the Cordilleras are covered with snow always. In spite of the equatorial situation of Colombia, the Andes make temperature merely a question of altitude. At Bogotá the thermometer ranges from 55° to 70° F. Alternating periods of dry weather and rainy weather, each generally of three months’ duration, are Colombia’s “summer” and “winter.”

Flora and Fauna.—Vast tracts of forest remain to be explored. It is assumed that rare botanical treasures will be found in their recesses; and with good reason, since the known varieties of Colombian flora are of exceptional interest. Building, cabinet and dye-woods are plentiful; the rubber-tree, the cinchona, wax-palms, cedars, balsam of tolu, lignum vitae, copaiba and mahogany flourish. The aloe, the sarsaparilla and other medicinal plants grow in abundance. Wild animals of the intertropical or higher regions are the puma, bear (two species), jaguar, sloth, armadillo, tapir, deer, cavy, opossum and 17 distinct species of monkeys. Serpents are not found at a greater height than about 5,000 feet above the sea, though they are very numerous in the lowlands. Characteristic birds are parrots (many varieties), parakeets, cockatoos, lorries, cranes, storks and condor.

Political Divisions and Population.—The republic of Colombia consists of 14 departments, 2 intendancies and 7 commissaries. These with their areas, populations and capitals were in 1912 as follows:

Total: 440,846, 5,064,308
Of the 5,000,000 inhabitants 10 per cent are pure whites, 5 per cent pure blacks, 40 to 45 per cent aborigines, 30 per cent Cholos (descendants of Europeans and aborigines), and 10 to 15 per cent mulattoes. The urban population, in the 12 cities of 19,000 or more inhabitants, may be placed at 500,000; or about 600,000 if we include towns of 6,000. The estimate made by Professor Sievers is, for the inhabitants of such cities and towns, 10 to 12 per cent of the entire population.

History.—In 1508 the Spanish Crown granted to Ojeda the district between Cape Vela and the Gulf of Darien, and to Nicuesa the country from the Gulf of Darien to Cape Gracias a Dios. The two territories were united in 1514. Balboa’s discovery of the “Southern Sea” was followed by the removal of colonists to the Pacific Coast and the founding of the city of Panamá. Starting from Santa María 6 Aug. 1536, Gonzalo Jiménez de Quesada led 700 infantry and 80 horsemen into the mountains of New Granada (now Colombia), and took the Indian capital Bogotá. Colonies were established in the valleys and plains and the city of Quito was founded in 1534. The city of Medina was founded in 1670 by Fray Alonso Ronquillo of the order of Preaching Friars. In 1719 the natives destroyed the Spanish colonies on the Pacific slope. New Granada became a viceroyalty in 1740, having been administered previously as a simple presidency, except in 1718-19. In 1810 an insurrection against the government of Spain began. In 1819 New Granada and Venezuela were united, Ecuador joining the union two years later. The country thus formed was called the republic of Colombia. The efforts of Spain to retain these colonies ceased in 1824. Six years later the Colombian union was dissolved, Venezuela and Ecuador having withdrawn; and the republic of New Granada was established in 1831, its territory corresponding to that of the present republic of Colombia. New Granada was at first divided into five departments, namely: Boyacá, Cauca, Cundinamarca, the Isthmus and Magdalena. Lack of cohesion caused a civil war in 1840; Panamá and Veragua unsuccessfully sought independence in 1841. From 1849 to 1857 the Liberal party controlled the government. In 1853 the right was granted to the departments to elect their own governments by popular vote, and the powers of the provincial legislative bodies were increased. New political divisions were organized soon afterward. These, claimed, and taught the older departments to claim, the privileges of semi-independent states. A civil war, beginning in 1859, resulted in a triumph for the Liberal (States’ Rights) party. Under the constitution of 1863 the name Colombia was reverted to, the official title being United States of Colombia. Nine sovereign states were formed, each authorized to maintain its own military forces without restriction, and to nullify the federal laws. Insurrections prevented steady progress until a reasonable degree of federal control was asserted. In 1880, Rafael Nuñez became President. His influence, constitutional or otherwise, could not prevent the right to use its forces for the suppression of insurrections in the several states. A national (government) bank was incorporated; diplomatic relations were established with Spain; the question of the boundary between Colombia and Venezuela was submitted to arbitration. Nuñez held the same office, which he made important, again in 1884 and 1886. In 1891 he was elected for the fourth time, but allowed Vice-President Caro to assume his duties instead.

A new constitution was adopted in 1886. By this the states were reduced to departments, with governors appointed by the President of the republic, and legislative assemblies elected by the people. The President’s term of office was extended from two to six years. Colombia passed from the extreme of a loose federation to a centralized republic. Subsequent revolutions have shown the desire of the Liberals to return to the old irresponsible. In 1892 subsidies were granted for the construction of several important railways, and new cable lines along the coast and telegraph lines in the interior were authorized. Two years later a law was passed providing for the currency of gold and the redemption of the paper currency. Very little progress was made, however; on the contrary, the means of communication and transportation, as well as the medium of exchange, displayed a tendency to go from bad to worse. The result of 1899 was that of 45 days, but a civil war which broke out 17 Oct. 1899 proved to be more ruinous than any preceding conflict. The Liberals attempted, by force of arms, to drive the Conservatives from power. An issue which, in a republic, should be settled at the polls, cost the lives of about 50,000 soldiers, while among the wretched non-combatants the number of deaths from privation and disease was vastly greater. As usual, the department of Panamá was a centre of disturbance. American marines were landed to guard the stations and railway at Colón and Panamá, in accordance with the treaty of 1846 between the United States and New Granada, by the terms of which the United States guaranteed the neutrality of the isthmus and assumed the obligation to protect free transit between the ports mentioned. Toward the end of 1902 the flame of civil war finally went out. The government was almost destitute of money; it could neither pay its debt nor meet current expenses. Congressional elections were held throughout the country. The most important matter to come before Congress was the question of ratifying a convention establishing the Panama Canal. The treaty was ratified by the Secretary of State of the United States of America and the Chargé d’affaires of Colombia, for the construction of a ship canal to connect the Atlantic and Pacific oceans. The French Panama Company, formed in 1881, had suspended operations in 1889, and in 1891 a new company had been organized, securing a concession for 10 years, which term was subsequently extended by six years. The board of this company had offered (4 Jan. 1902) to sell all its property and rights to the United States for $40,000,000. The Panamá route had been approved by the Isthmian Canal Commission of the United States. After a long discussion in the Senate of the United States, the convention was submitted to the Colombian Congress, the constitution prohibiting any treaty that ratified by both Houses is requisite for the validity of such an agreement as that relating to the Panama Canal. The convention, commonly known as the Hay-Herrán treaty, was defeated at Bogotá, 24 members of the Senate voting on 12 Aug. 1903 to reject it. A counter-
proposition prepared by a commission (29 August) was debated for a while, but not adopted. The adjournment of the Colombia Congress was followed almost immediately by the outbreak of a carefully planned "Separatist" movement in Panama. Independence was proclaimed 3 November and Colombian army and navy officers in the principal city of that department were imprisoned. A failed attempt to form an American warships was ordered to the Isthmus; marines landed at Colón; and the Colombian troops withdrew from that town. On 6 November the government of the United States entered into relations with the government of the republic of Panamá, and on 13 November M. Philippe Bonau-Varilla was formally received by President Roosevelt as minister of the new country. At that time hostile demonstrations against the Colombian government occurred at Bogotá, and another revolution seemed imminent.

While political factions have continued to resort to arms for the settlement of differences of opinion within the nation's boundaries, the beginning of an era of well-educated people has begun to make itself felt in the disputes with neighboring republics touching the location of those boundaries. Arbitration has repeatedly taken the place of foreign wars. An agreement was made 13 Dec. 1894 for submitting to arbitration the question as to the southern line between Colombia and Ecuador and Peru. President Loubet of France acted as arbitrator of the boundary dispute with Costa Rica, rendering a decision 11 Sept. 1900.

In recognition of difficult questions that had arisen, and in anticipation of those that might arise out of Panama's secession from Colombia and the creation of the Panama Canal Zone, Secretary Taft effected (17 Aug. 1907) an agreement between representatives of Colombia, Panama and the United States. This agreement was general in its scope, and particular applications of its main principle were observed, both in the determination of the limits of Panama and Colombia and the settlement of the debts of the former nation. In 1909, following prolonged negotiations between Colombia and Panama reached an advanced stage, and at the beginning of 1909, when a treaty between the United States, Panama and Colombia was signed. Hostility was manifested in Colombia to that portion of the treaty which exonerated the United States and Panama from the charge of injustice to Colombia in the manner and manner of Panama's secession. Thereupon President Reyes tendered his resignation, and his successor, President Valencia, advocated the reference to The Hague of that question and also of the question as to indemnity for the alienation of Colombia's most famous and valuable departments. The following year (1910) saw a riotous demonstration of the anti-American feeling in Bogotá, for which an apology was offered to the Minister of the United States. On 20 July the centennial anniversary of Colombia's independence was celebrated. In 1911 territory claimed by Colombia as a portion of her southern department was occupied by Peruvian troops. A battle was fought there, and the Colombians were defeated. In 1913 the proposed development of the petroleum industry in Colombia by a British syndicate aroused opposition in the United States. The liberality of the terms was construed as the grant of a monopoly, and the proposals were withdrawn. For an explanatory reference to Colombian oil-field activities see "Mining and Finance." On 4 Nov. 1913 the Congress at Bogotá adopted a resolution affirming Colombia's isthmian rights, 10 years having passed since the severe loss had been sustained. Don José Vicente Concha (clerical-conservative) became President in 1914. During that year there was "no little satisfaction at the prospect of receiving, under a pending treaty, $25,000,000 (from the United States) and of acquiring special privileges in respect to the Panama Canal. Taking advantage of the presumably more favorable spirit which the treaty had created in Colombia, an American 'scientific mission' was sent to spend eight years and $400,000 exploring the country." But in 1915, when the proposed treaty was under consideration by the Senate of the United States, its provision for the payment just named, coupled with apology for the methods employed in securing the Canal Zone privileges and obligations, made favorable action by that body entirely impossible. However, in the following year (18 Feb. 1916), the Senate of the United States, by a vote of 55 to 18, ratified a plan to pay Colombia $15,000,000 in return for her acknowledgment of the American government's right to the Canal Zone. In Colombia's national budget for 1915-1916 the estimated expenditures were more than 25 per cent in excess of the estimated receipts.

The government.—Some of the amendments to the constitution adopted by Legislative Act number 3 of 1910 were: The legislature shall in no case prescribe the penalty of capital punishment; new emissions of paper money of compulsory circulation are absolutely prohibited; and the Congress shall annually elect two designates, a first and a second, who shall exercise the executive power in that order in case of a vacancy in the presidency. The Senate shall be composed of as many members as correspond to the population of the republic in the ratio of one for each 120,000 inhabitants and two substitutes shall be elected for each senator. The Chamber of Representatives shall be composed of one representative for each 50,000 inhabitants. The President of the republic is elected by direct vote, for a term of four years. In case of foreign war or civil disturbance he, with the signature of all the ministers, may declare public order disturbed and the republic or any part thereof to be in a state of siege. By such a declaration the government has, in addition to the powers conferred by the laws, such powers as govern war between nations pursuant to the accepted rules of international law.

The old doctrine of the sovereignty of departments has been reflected in favor of the centralized system. The brief sketch which follows shows the leading provisions of the constitution adopted in 1886 and transformed by amendments in more recent years.

The executive and the judiciary. (Contrast: CHILE—Government.) Appointed by the President and freely removable by him are the ministers of state and government, foreign relations, hacienda or exchequer (in charge of government revenue and treasury (in charge of disbursements), war,
public works and education. These ministers are also responsible to the legislature. Naturally, then, frequent shifts and changes in the ministry and the rule "and rarely," says Mr. James Bryce, are not uncommon in office long enough to build up his department or carry out his own policies. The governors of departments (the main political divisions of the republic) are appointed by the President and retain office by reason of his favor and the return, designate and control both the prefects of the provinces (the main subdivisions of departments) and the alcaldes of the municipalities; and thus, mediate or immediately, officials throughout the country are dominated by the central executive at Bogotá. The only provision made for home rule is found in the limited powers of the departmental assemblies and municipal boards, both elected by popular vote. The revenues of the departments are inadequate to support efficient local administration. Departments and municipalities (with the exception of a few large cities that have special sources of revenue) levy what little they can by indirect taxes, often of an unwise and harmful character. This helps to explain the hesitancy of the departments increases and emphasizes their dependence upon the national government, which has at least its revenue from customs duties, mines, stamped paper, etc. so all power is centralized at Bogotá.

Sessions of the Senate and House of Representatives, forming the Congress, are held annually. Presidents have exercised the right, instead of having elections for Congress, of convoking a National Assembly, the membership of which has been appointed by the departmental assemblies, upon which pressure can be somewhat more readily exerted by the executive than upon a direct vote at honestly conducted polls. The distinction between a Congress and a National Assembly is somewhat hard for the foreigner to grasp, especially as the constitution makes no provision for the latter body; but it is held that the right of the sovereign people to assemble is inherent and substantial to the constitution itself. It was stated in the preamble of the executive decree convoking such an assembly in 1905 that the basis for an act of such transcendent importance must be sought, not in the constitution but in the supreme law of necessity. Such an assembly can, indeed, amend the constitution without the more deliberate proceedings which that instrument prescribe. The constitution may be amended only by a legislative act first discussed and approved by the Congress in the usual manner, and in like manner considered at the next succeeding annual session and thereat approved by both chambers, after second and third hearings, by an absolute majority of the whole membership of each of the chambers.

The Judiciary and the Codes.—The Supreme Court has nine members, four elected by the Senate and five by the House of Representatives. In each case the term is five years, and appointed by the President of the republic. The Supreme Court magistrates appoint, as judges of the Superior Courts, the nominees of the departmental assemblies. Municipal judges, however, are elected by the local boards. The Commercial and Maritime-Commercial codes are chiefly based on Spanish law, though the influence of French law is not to be overlooked. The same influence strongly affects the Penal Code, and the Civil Code is founded on the Code Napoléon. The title "doctor" is bestowed upon lawyers of promience or university training.

Education and Religion.—Colombia has long claimed to be the most literate country in Latin America. The best of her scholars and writers have been holders of oratories in the mother country as inferior only to those of Spain among the peoples using the Castilian tongue. But in spite of this distinction, it is only lately that the nation has come to realize the importance of educating the mass. Now, however, the direction of the educational system of the whole republic is in the hands of the Minister of Public Instruction. In 1916 there were in Colombia 5,137 primary schools and 5,733 teachers with 325,750 pupils. Most of the secondary schools are as yet entrusted to the corporations of the Catholic Church, which is by law the established religion of the republic; and as such are financially assisted in the work of education by the national treasury. In 1916 there were 200 higher secondary schools with 29,138 pupils; and in addition to these, 43 art and trade schools with 2,380 pupils; and several higher colleges and universities.

Of these the oldest is the University of Bogotá, founded in 1572, which with the School of Mines at Medellín are national institutions. Several of the political departments maintain universities. Among these are the universities at Medellín, Cartagena, Popayán and Pasto. In the 28 provinces there were, in 1914, nearly 2,000 students. There are also schools of mines at Pasto and Medellín where pupils are graduated as engineers. The amount devoted to education in Colombia is being increased from year to year. The amount expended for this purpose in 1914 was 3,445,225 pesos, the greater part of which came from the treasuries of the various departments. There are numerous libraries and museums throughout the country and a national museum, national library and academy of arts. The University of Cartagena, department of Bolivar, comprises five "schools," devoted to philosophy and letters, science, medicine and the natural sciences, law and political science and mathematics and civil engineering. A school of mines is maintained by the national government at Medellín, capital of the department of Antioquia. According to the report of the director of education 266 primary schools, public and private, gave instruction, in the department of Cartagena, in 1916 to about 12,250 students, with an average attendance of 8,039. Primary education is free, but not compulsory. The private schools are generally superior in instruction to the primary public educational institutions and are attended by children of the upper classes. In Colombia there are four Catholic archbishops: of Bogotá, Cartagena, Medellín and Popayán, the first of which has four suffragans, and each of the others two, among which is that of Panamá, attached to Cartagena.

Agriculture.—Agriculture is the principal industry of Colombia and is especially favored by soil and climate. The low and torrid regions (coast and valleys produce coffee,) sugar cane, bananas, cacao, yucca, cotton, tobacco, indigo,
vanilla, rice and many kinds of tropical fruits. The temperate middle region of the Andes is suited to the cultivation of wheat, barley, corn, etc., but these grains are not raised in large quantities owing to the lack of means of transportation. The rubber tree and copaiba grow wild and are tapped. The cattle raising industry is important in the great plains of the southeast and cattle hides are an important export. The total number of cattle in the republic is about 7,000,000. There are some excellent horses and mules of Andalusian stock. The government has adopted measures to make experiments in irrigation of tropical lands and to place artisanal wells at various points on the plains. A recent law covers this project and provides for the establishment of schools of tropical agriculture and a central bacteriological institute. Coffee is Colombia's most important article of export, is grown principally in the Medellin district and the Cauca Valley. Colombian coffee commands a high price and finds a ready market in Europe and the United States. The New Cali Railway will stimulate the industry in the Cauca Valley. Much of the rubber shipped abroad is of the uncultivated variety, but in the Astrato Valley and elsewhere the tree is under cultivation. The production in 1915 increased 100 per cent over that of the preceding year, and the industry is still in its infancy. The Sinú and Astrato valleys abound in fibrous plants, such as fique and pita, and on the banks of the Magdalena River plants of the agave family and a species of henequen, called locally "plantanillo," grow in great numbers. These various plants produce an excellent grade of fibre which is used throughout the country for making rope, rugs, hammocks, etc. The manner of separating and cleaning the fibre is crude and primitive, the plants being flagellated until the fibres separate, when they are put in the sun to dry. The introduction of machinery for separating the fibre economically should create a thriving industry. Ipéca is an important agricultural export. In 1915 there was a large increase in the tonnage and value of shipments of this commodity. The plant grows wild in the Sinú Valley and a small toll is assessed by the government on all ipéca gathered on public lands.

The cacao is enjoyed locally and in the departments of Santander, but the district of Ambalema produces the best grade and the greatest quantity of tobacco. The larger part of it is used locally for manufacturing cigars and cigarettes, although the exports have been important during some years. There was less tobacco grown than usual in 1915 owing to the expected curtailment of the market abroad. The invoiced price of exported tobacco early in 1915 was six cents a pound, which increased to eighth cents in November.

The elimination of Germany from the market in 1915 left the exporters of tagua or ivory nuts in this district with quantities on hand that could not be disposed of elsewhere. It was now in the neglect in shipping the nuts according to size, which has prevented the Colombian exporters from selling greater quantities in the United States. The prevailing local price of tagua during the year was $40 a ton. Land for agricultural and other purposes is generally well watered, but the scarcity of labor is one of the greatest difficulties in developing the country. There are many varieties of hardwood, but only cedar and mahogany are exported to any extent.

Commerce.—The tonnage of Colombia's imports in the last normal year before the European War, 1913, was given as 28,535,800, exports in the same year reaching the sum of $34,315,800. After Brazil, Colombia exports more coffee than any other country. It is estimated that the annual exports amount to 1,000,000 bags of 60 kilos each (132 pounds), produced by 125,000,000 coffee plants. As these plants are valued at 30 cents apiece, they represent an investment of $37,500,000. The exports of coffee in 1915 were valued at more than half of the total exports, being $16,247,672 out of a total of $31,579,131. The United States consumes the bulk of Colombian coffee, importing 91,830,513 pounds of Colombia's total exportation of 136,215,413 pounds in 1914, and taking 111,077,449 pounds out of the exports of 149,111,674 pounds in 1915. Other items in the export list are: Bananas, tagua, hides, leaf tobacco, rubber, gold, "Panama" hats and platinum. Imports from the United States valued at $7,629,500, and exports to the United States $18,861,800. In the same year, the imports from Great Britain were valued at $5,837,940, and exports to Great Britain, $5,560,000; imports from Germany, $4,012,100; and exports to Germany, $2,216,200; imports from France, $4,408,600 and exports to France, $797,000. Colombia imported from the United States, Great Britain, Germany, France, Belgium, Italy and other countries in normal years, before the outbreak of hostilities in Europe, articles of the following classes: Textiles, foodstuffs, metals, cars and carriages, materials for arts, drugs and chemicals, fuel and lighting, agricultural and mining implements, electrical supplies, paper and cardboard, wines and liquors, arms and munitions, etc. In domestic commerce many articles appear which are manufactured in the country on a very small scale, partially supplying home consumption. Exports from the United States to Colombia were valued at $8,980,177 in 1915. Exports to the United States from Colombia in 1916 increased over $9,000,000, according to the declared returns received from the consulates at Barranquilla. The exports for 1915 were $18,656,662 and for 1916 they were $27,759,081. Large increases are shown in the shipments of bananas, coffee, gold bullion and hides. The increase in exports of platinum is especially large. In 1916, coffee to the value of $16,610,666 was exported as compared with $12,633,899; hides and skins valued at $3,632,359, as compared with $2,122,595; gold bullion, $2,009,079 against $905,441 in 1915; bananas, $1,667,213 against $863,485; platinum, $1,456,648 against $304,302 in 1915. Rubber, sugar, tanning extract and ivory nuts figured in the exports to the extent of about $250,000 each.

Manufactures and Mining.—According to government statistics Colombia in 1916 had 121 manufacturing plants, in which was invested a total capital of $12,400,000. The capital invested by the government is not complete, as several well-known factories are not represented. There are two plants (sugar and oil) of over $1,000,000 capital. Three textile factories and one electric plant have capitalizations of over $500,000 each, and 10 enterprises (4 textile mills, 2
match factories, 1 flour mill, 1 cement plant, 1 chocolate factory, and 1 tanning extract plant, are capitalized between $200,000 and $500,000 each. Twelve factories have capitalization between $100,000 and $200,000; 15 between $50,000 and $100,000; 50 between $10,000 and $50,000; and 28 less than $10,000. The principal manufacturing centres are Bogotá, Medellín, Barranquilla and Cartagena. Bogotá has 40 plants with a combined capital of $3,013,000; Medellín has 30 with a capital of $2,580,600; Barranquilla, 18 with $1,370,000 capital; and Cartagena, 12 with a total capital of $2,993,000. In the Cartagena factories are included a sugar mill at Sincen, some 20 miles distant, which is capitalized at $2,000,000. With the exception of sugar, the exports of which in 1915 amounted to $96,265, practically none of the products of these manufacturing industries are exported. In fact their output, except in a few articles, is not sufficient to meet the domestic demand. For instance, with 7 large and 14 small textile mills in the country, the imports of drills, sheetings and other goods amounted to $3,434,883 in 1915. The manufacture of Panama hats is an almost entirely decentralized industry, which occupies many individuals and families in the small communities of the interior. The 1915 production of hats was valued at about $1,000,000, exports having amounted to $966,846. The industry suffered greatly in the early part of 1915 through the curtailment of the purchasing power of the buyers and the decreased demand from the United States. Declared exports of Panama hats at American consulates amounted to $566,683 as against $1,080,508 for 1914, a decrease of $513,825, or almost 50 per cent. The wages paid male laborers in Colombian factories are $0.50 to $1 per day, the average being about $0.60. Women receive $0.25 to $0.35 daily. In the coast towns most factories work only eight hours, but in the interior 10 hours is the rule. Shipbuilding is an important industry in Cartagena in normal years, but in 1915 there was a noticeable decrease in the number of vessels constructed. The ships built here are for the coastwise trade and consist of small skiffs and schooners, sometimes equipped with motor power engines which are being more and more manufactured in the United States.

Mineral Resources.—Gold which has been and continues to be the most important mineral product of Colombia is found both in lodes in the mountains and as grains and dust in the alluvial deposits of the river valleys. The principal gold area is between the Magdalena and the Pacific Coast, and south of the point where the Cauca joins the Magdalena. The province of Antioquia is the most important area of production, which centres around Medellín. In 1912 the exportation of gold was $6,634,914. The rapid growth of platinum production since 1907, when only 245 troy ounces of the metal were exported, can be realized from the fact that in 1915 the shipments amounted to 11,946 troy ounces and were valued at $404,888. This entire amount came from the Choco and was panned out of the gravels of the small streams. The area of the platinum producing zone is small, beginning near the mouth of the Condo River and extending a short way up the river. Of the river systems the Atrato and Nequé, a longitudinal distance of about 90 miles. The strip is not much more than 30 miles wide.

An American company was formed during the latter part of 1915 to exploit platinum-bearing lands and to dredge a section of the San Juan River. Silver is mined to a certain extent, the normal output fluctuating but running between $400,000 and $700,000 annually. Copper is pretty generally distributed, being found especially along the mountains adjoining the Magdalena Valley, from the Ecuadorian boundary to the mountains of Santa Marta on the coast. Iron ore in large quantities occurs in various parts of the country but is especially important in Cundinamarca. Extensive coal deposits have been discovered and seem to be scattered over many parts of the country. The principal beds now worked are near Amaga in Antioquia. Coal mines do not come under the provisions of the Mining Code in regard to filing of claims. The government controls the coal in its unoccupied lands, and it may be worked only by contract with the government, but owners of lands containing coal may work their mines independently. Oil has been found in various parts of the country, and in the departments of Caquetá, Cauca and Barranquilla. Sulphur, salt, emeralds, lime, nitre, chalk, marble, asphaltium, alum, magnesia, amethysts, lead, tin, manganese, mercury and cinnabar are found in various parts of the country.

Banking and Finance.—The principal banks of the capital city are the Banco de Bogotá, Banco de Colombia, Banco del Comercio, Banco Central y C. Schloss y Cía.; those of Cartagena are the Banco de la Reserva, Banco de Cartagena, Banco Industrial y Pombo Hermanos; those of Barranquilla are the Banco Comercial de Barranquilla and Alzamora, Palacio y Cía.; those of Medellín are the Banco Aleman-Antioqueño and Restrepo y Cía. The circulating medium was only paper, having approximately the value of one cent American gold per peso in 1914. It is both gold and paper. The theoretical unit was the peso of 1.5976 grammes of gold .9166 fine, divided into 100 centavos and a law was passed designed to fix its value at one-fifth of a pound sterling, which would be the actual value of such a coin. For official payments and judicial liquidations the legally established value of the paper peso in relation to the pound sterling and in the proportion of £1 as the equivalent of 500 paper pesos. Mr. Joseph T. Cosby wrote in 1915 as follows: "Since then the actual par of exchange is 10,000 per cent, when quotations vary from this par they are considered as at either a discount or a premium, as the case may be. For instance, if the commercial quotation for demand draft on London is expressed as 10,500 per cent, this would represent a premium over par of 5 per cent, since £1 would cost 1025 pesos instead of 500 pesos, the par at 10,000 per cent. American and English gold coin circulates freely in Colombia. The shipments of Colombia's export products are usually financed through the banks and credits were, to a large extent, canceled soon after the war in Europe began, exchange rates advancing to 11½ per cent above normal. At that rate, $100, currency of the United States, cost 11,150 Colombian paper pesos. The method of quoting exchange rates in Colombia is as follows: Madrid, 500 pesetas, 9,550 per cent = 9,550 pesos paper; New York, 100 dol-
lars, 10,250 per cent = 10,250 pesos paper; Paris, 500 francs, 9,950 per cent = 9,950 pesos paper; Berlin, 400 marks, 9,850 per cent = 9,850 pesos paper; London, 230, 10,000 per cent = 10,000 pesos paper. A coinage law was promulgated by the President in the Diario Oficial of 19 Dec. 1916. Under this law the government will coin gold, silver and nickel pieces, and will recoin foreign pieces standardizing in value the money in use throughout the country. The government is authorized (1917) to coin gold pieces of established weight and fineness in the mints of Bogotá and Medellín, when gold is needed in circulation, and when individuals present gold for coinage, the work is to be done at cost price; to complete the mint at Bogotá, and to arrange with the departmental government of Antioquia for the purchase or lease of the mint at Medellín to be enlarged and put into shape to coin an adequate amount of money. An appropriation of $50,000 annually for coinage purposes is to be included in the next budget and in succeeding budgets until the amount of $200,000 is reached. The funds of the conversion board and the principal government and national silver pieces coined before 1911 and foreign silver coins now in circulation in Colombia. The Colombian government recently authorized the exchange of gold notes for the old paper money in circulation. The Diario Oficial announced that the exchange would be made in Bogotá by the conversion board, through the exchange office, during the period from 1 March to 19 Dec. 1917. Three comprehensive pamphlets dealing with the financial and economic situation of Colombia, with her public works, etc., were submitted by the Colombian delegates to the First Pan American Financial Conference and are embodied in the report of proceedings (Washington 1915). Attention was invited especially to the geographical location of the Republic of Colombia, its relation to the Panama Canal and the proximity of the principal Colombian ports to both entrances of the canal. This being visualized, it is at once self-evident that the hostility to the future given by the United States by the construction of the canal makes it imperative in the interests both of the United States and of Colombia that the two countries should establish the greatest intimacy. The Colombian committee also expressed a belief that it is in the interest of all the American republics, whose future commerce will pass through the Panama Canal, and especially essential to the United States, that adequate harbor accommodations and facilities for transhipment and storage should be installed at the Colombian ports of Santa Marta, Cartagena and Buenaventura. To assure the proper development of these ports it is also felt that the sanitation system should be perfected. In addition, the attention of the conference was called to the possibilities of railway constructions which would stimulate the development of the rich natural resources of the country, and build up a traffic which would find its way to the markets of the world through the ports mentioned. The suggestion was offered that, if American capital should go to this country, which is larger than Germany and France together, or larger than all the coast States of the United States, including Ohio and West Virginia, it could take advantage of the greatest and best classes of business and also obtain the contracts for the construction of the most important industries of the country, as the English did in Argentina from 1860 to 1880. Interesting statements made by the Colombian committee are the following: In the order of their importance, the workable mines are, first, those of gold, silver, iron, copper, platinum and emeralds; second, petroleum (found in large fields both near the coast and in the interior); third, coal, which "is to be had in every part of the republic." Platinum and emeralds are not found elsewhere in paying quantities except in Russia. In eastern Colombia there are immense plains well adapted to the cattle-raising industry, and communication with that region might be secured by means of a railway along the Patía River, which has carved its way through the mountains, as we have said above, and empties into the Pacific Ocean, a two days' journey from the Panama Canal. No convincing evidence is at hand as to the feasibility of this plan. Customs duties yield about 75 per cent of the total yearly revenues of the government and the output of the two or three Colombian products liable to duty is so small that it need not be taken into account.

The foreign debt for loans, subventions and guarantees of interest on railways is payable in London and amounts to £3,923,720 or $19,051,479, only $3,75 per capita. Law 69 of 1909 gave the control of the currency to a board of three persons, called the Junta de Conversión, the paramount duty of the board being to collect a conversion fund in gold coin with which to guarantee the paper money in circulation; and it appears that about 50 per cent of the gold value of the paper money (in the proportion £1 = 500 paper pesos, for official payments, etc., as above) had been collected (1917). The banks doing business in Bogotá have a total capital of $4,350,000. The law does not allow banking institutions to issue notes. In 1913 the exports were larger by $5,780,000 than the imports, so that the liabilities assumed in the first six months of 1914 were not based on credit alone; and for that reason it was not found necessary, when the European War broke out, to grant a moratorium either in favor of the banks or of private business men.

Transportation and Communication.—About 700 miles of railway were in operation (1917). These railways belonged to different companies. As the commerce of the interior is carried on the river systems, with railways as their auxiliaries, the lines of the latter are short. Important in this respect are the following rivers: Magdalena (navigable for over 900 miles), Cauca, Nachi, Cesar, Lebrij and Sogamoso. Steamers ascend the Magdalena to La Dorada, 592 miles from Barranquilla, while smaller boats carry on traffic far into the interior up the tributaries. About 50 steamers (1918) plied regularly on these waters. The only way of reaching the national capital from the Caribbean coast is up the Magdalena and thence over the mountains, partly by highway and partly by railway. The chief ports are (on the Caribbean side) Barranquilla, Cartagena, Santa Marta and Riohacha, and, on the Pacific, Buenaventura. The government had under consideration (1917) a survey by the British Board of Trade to connect Barranquilla with Málaga or Magdalena on the Pacific Coast, with
COLOMBO — COLÓN

A view of establishing a new port there with modern facili ties. He explored and cut his way on the Venezuelan frontier are Cucuta and Arauca. The ports are in communication with European and American countries. There were, before the European War, seven lines of mail steamers (three British and the others French, Spanish, Italian and German), and the trade between the United States and Colombia was furnished by The United Fruit Company, weekly sailings, American; Hamburg American Line, weekly sailings, German; Panama Railroad Company, weekly sailings, and the police strength in 1914 is given at 2,328 men. Vessels of the navy consist of a few cruisers and gunboats, tugs and troopships. There are no modern or really valuable ships.

COLOMBO, Mateo Reald, Italian anatomist: b. Cremona; d. Rome 1559 (date disputed by some authorities). He devoted himself to the practice of pharmacy, then studied surgery and anatomy at Padua under Vesalius, whose assistant and friend he became and Leonis. He resided some time in Venice and was called in 1542 to fill the chair left temporarily vacant by Vesalius, who had gone to Germany. When Vesalius left Padua definitively in 1543 to go to Spain, Colombo was his successor, and met with great success. In 1546 he wrote to Pope Paul III at the call of Paul IV, to Rome. While Colombo perpetuated some of the errors of Vesalius, and introduced some anew, he was an able anatomist. He made more human dissections than any of his predecessors and introduced the practice of vivisection on the dog and the swine. He discovered numerous facts in anatomy, among which was the pulmonary circulation, which he found out by his vivisections independently of Sylvester. His researches are to be found in his 'De re Anatomica Libri XV' (Venice 1559).

COLOMBO, Ceylon, the capital, seaport on the southwest coast, near the mouth of the Kelani River, and about 70 miles southwest of Kandy, the principal place on the island. It is a handsome town, and a pleasant resort. It is surrounded by the walls of most of the houses, which are very beautifully situated, especially those near the sea. There are several bazaars or market-places. The public buildings comprise the government offices, government house, hall of the Supreme Court, the valuable museum, etc. Some of the noted buildings are an old Dutch church, Presbyterian, Anglican and Roman Catholic churches, hotels, orphan asylum, military hospital and barracks, the town-hall, the railway station, the Colombo Royal College, Saint Thomas' College and Wesley College. The Moors have two handsome mosques with minarets; the Hindus also have their temples, rudely sculptured. Water is brought from a distance of 30 miles to the town and there are extensive gas-works. The harbor was formerly capable of receiving small vessels only, and large ships had to cast anchor upward of a mile from the shore, exposed to the southwest monsoon; but breakwaters now give complete shelter and Colombo is the regular winter station for the large steamers bound for Bombay, Madras, Calcutta, the Straits, China, Australia, etc. It is the chief port of Ceylon, its exports and imports including the great bulk of the goods sent from and brought to the island. Colombo is one of the most important coal stations for British and foreign steamers on the Australian and East Asiatic routes. It is connected by rail with Kandy, Galle and the north of the island. It is the seat of a United States consulate. The natives are mostly artisans and laborers, while the Europeans are either owners of large plantations or merchants. It was occupied by the Portuguese in 1517 and named in honor of Christopher Columbus. It was taken by the British in 1656 and by the British in 1796. Pop. 213,396.

COLÓN, sometimes called ASPINWALL, Panama, city of 20,000 inhabitants on the northern side of the Isthmus of Panama, connected with the city of Panama by a railway 49 miles in length. During the civil war in 1865 it was partly burned, but has been rebuilt. It stands
geographically within the Canal Zone, upon an island which divides an inlet of the sea into the ports called Manzanillo and Limón Bay. American marines and sailors were landed there during the revolutions which began in 1885, 1899 and 1903, in accordance with the treaty by which the United States guaranteed 1904-07 to serve from interruption free transit across the isthmus. It is the northern terminus of the Panama Railway and the Panama Canal. Practically all of the land in the city is owned by the Panama Railroad, under its original franchise from the United States of Colombia, and as the United States now owns the Panama Railroad it has thus become the owner of the land, but cannot sell it. Adjacent to Colón, on Limón Bay and practically forming a part of the city, is the American city of Cristobal, where are located the great cold-storage plant of the Isthmian Canal Commission and the shops of the Panama Railroad. The deep but exposed harbor of Colón, in Limón Bay, is inferior to that of Portobelo, 20 miles to the east, but has been improved by a long breakwater from Toro Point, erected by the Canal Commission. Steamships can come alongside the piers and the docking equipments are modern, including cranes and other apparatus. Colón was formerly either the terminus or a port of call for about a dozen lines of steamships. The city has served as an entrepôt for much of the commerce between Atlantic and Pacific ports, but has lost much of its steamship business to the new and better equipped port of Cristobal. In 1915 the number of steamships entering the port of Colón was 103 (275,410 tons) as compared with 667 (2,120,704 tons) in 1914. In addition 131 sailing vessels, of 4,536 tons, entered this port. The imports into Colón for the year 1915 were valued at $3,892,534. Of this amount, a value of $2,833,439 was taken from the United States and a value of $740,155 from Great Britain and other countries. These exports are not available except those for exports going to the United States, furnished by the American consulate. The value of these exports for 1915 was $509,583. Of this total the larger items were: coffee, $122,903; cacao, $313,305; lignite and coking coal, $794; tagua (ivory) nuts, $56,420; turtle shells, $29,778; cocoa, $17,850; and hides, $15,202. The prevalence of war in Europe has served to revolutionize the foreign trade of Colón, and the above figures must be regarded as indicating only a passing condition. Colón consists largely of unattractive frame houses and small shops, but many of the newer houses, including the modern municipal building and the principal public schools, are of concrete. Following the great fire of April 15, which destroyed 20 blocks in the business section of Colón, this part of the city is being rebuilt with substantial concrete structures in modern style. Under the treaty of 1903 the cities of Colón and Panama, with their municipal governments, are under the jurisdiction of the United States in all matters relating to sanitation and quarantine. Formerly Colón was a notoriously unhealthful place, but the unsanitary conditions were remedied. A prosectorial and sanitary service was established. Unlike Panama, Colón is not an old city, having been founded in 1850 by the build-

ERS of the Panama Railroad, which was completed in 1885. For a time it was called Aspinwall, in honor of William H. Aspinwall, one of the builders of the railroad, but subsequently the name was changed by statute to Colón, in honor of Christopher Columbus, who sailed into Limón Bay in 1503 to preside over the gift of Empress Eugenie in 1870, stands near the mouth of the old (French) canal in the present city of Cristobal. When the Canal Commission undertook its work, the population of Colón was probably not much over 3,000, consisting largely of Jamaican negroes and of natives of mixed Spanish, Indian and negro blood. The census of 1911 returned a population of 17,748; estimated by the Isthmian Business Directory at 20,000 in 1915.

Colón, Venezuela, a federal territory embracing the Venezuelan islands in the Caribbean Sea, except those belonging to the state of Rivas. The islands forming the territory are Blanquilla, Los Hermanos, Frailes, Sola, Testigos, Venados, Esmeraldas, Caracas, Pichudas, Chimanas, Borrachita, Arapos, Monos, Pirritu, Farallón, Ocumare, Oropina, Pilar del Arroyo, Los Monjes and several smaller ones. The natural products are phosphate of lime, guano, lime, woods and fish. Large quantities of the plant called orchila are exported for industrial purposes. There are silver deposits in Los Roques. Gran Roque is the capital. Nearly all of the islands are uninhabited. The territory is directly dependent upon the national government and, like the territory of Amazonas, is governed by special laws.

Colón, that part of the large intestine which extends from the cæcum to the rectum, the greater part of the large intestine. It consists of three divisions, the ascending colon on the right side of the abdomen, the transverse colon, which passes horizontally from right to left just beneath and behind the liver and stomach which causes it to bend slightly in its course, and the descending colon which passes down on the left side of the abdomen to the left iliac fossa where it joins the sigmoid flexure which extends into the rectum. The structure of the colon in colitis is $122,903; cacao, $313,305; lignite and coking coal, $794; tagua (ivory) nuts, $56,420; turtle shells, $29,778; cocoa, $17,850; and hides, $15,202. The prevalence of war in Europe has served to revolutionize the foreign trade of Colón, and the above figures must be regarded as indicating only a passing condition. Colón consists largely of unattractive frame houses and small shops, but many of the newer houses, including the modern municipal building and the principal public schools, are of concrete. Following the great fire of April 15, which destroyed 20 blocks in the business section of Colón, this part of the city is being rebuilt with substantial concrete structures in modern style. Under the treaty of 1903 the cities of Colón and Panama, with their municipal governments, are under the jurisdiction of the United States in all matters relating to sanitation and quarantine. The prevalence of war in Europe has served to revolutionize the foreign trade of Colón, and the above figures must be regarded as indicating only a passing condition. Colón consists largely of unattractive frame houses and small shops, but many of the newer houses, including the modern municipal building and the principal public schools, are of concrete. Following the great fire of April 15, which destroyed 20 blocks in the business section of Colón, this part of the city is being rebuilt with substantial concrete structures in modern style. Under the treaty of 1903 the cities of Colón and Panama, with their municipal governments, are under the jurisdiction of the United States in all matters relating to sanitation and quarantine. Formerly Colón was a notoriously unhealthful place, but the unsanitary conditions were remedied. A prosectorial and sanitary service was established. Unlike Panama, Colón is not an old city, having been founded in 1850 by the build-
a constant mixing and kneading process. Absorption from the colon is slow and consists of a variable amount of nutrient material which was not absorbed by the small intestine and of a considerable quantity of water. The excretory function is of more importance. The waste matter from the small intestine reaches here; the addition of many decomposition products while a large amount of water is absorbed by the colon, leaving the excretory products in the form of feces. A secretion of mucus aids in the passage of the intestinal material and perhaps interferes with the excessive propagation of bacteria. Consult Howell, 'A Text-Book of Physiology'; Starling, 'Human Physiology.'

COLON BACILLUS, a very common bacterium (Bacillus coli communis), of the intestinal canal of many animals, including man, in which place it seems to serve some useful function in the breaking down of food-stuffs, although, for lower animals at least, it is not indispensable for proper digestive processes. It is a short motile bacillus and closely resembles the typhoid organism, from which it is separated only by careful bacteriological test. While a normal aliment of the intestines of man, it may, in abnormal situations be a cause of disease processes. Its presence or absence in potable waters is of service in determining the presence of contamination of a water supply by animal fecal matter. See TYPHOID BACILLUS.

COLONEL, kér'nél (Fr. colonel; Sp. coronel; fr. Lat. columna), a military officer intermediate in rank between a lieutenant-colonel and a general officer. When a regiment is a tactical and administrative unit it is commanded by a colonel, but in the present British infantry of the line the regiment is a mere aggregate of separate battalions, and colonels are either staff officers or commanders of brigades. In the British army, artillery and engineers, and in the armies of most other countries the colonel has active command over bodies of troops. The regiments of the British and Continental armies have besides their active commanding officers, if the regiment is a fighting unit, or in place of these otherwise honorary colonels, who are general officers or princes of the blood and receive the emoluments of the position in addition to those of their regular rank. In Germany officers ranking between generals of infantry, cavalry and artillery, and general field-marshal are called colonel-generals.

COLONIA INDEPENDENCIA, en"dá-pán-dán'se-a, Venezuela, in the Altgració district of the old state of Miranda, about 70 miles from Caracas. Its area is 555 square kilometers; its altitude 5,400 feet above sea-level. Taguaca is its principal town, and its agricultural products are coffee, sugarcane, yucca and cacao. There are extensive forests and two rivers. The colony was founded in 1874.

COLONIAL, or COMPOUND, ANIMALS, organisms which cannot be fairly regarded as unities, but consist of numerous more or less similar individuals united in a common life. Among the usually single-celled simplest animals or Protozoa, large colonies not frequently occur, and are of not a little importance as suggestions of the bridge between the single-celled and many-celled animals. Such colonies arise when the original cell, instead of reproducing discontinuously, retains its daughter-cells in union with itself or with another, much like the segments of the egg-cell of a higher animal. By sacrifice of individuality at the time of reproduction, a new and higher unity is formed. In the same way a simple cup-shaped sponge, by continuous budding, forms a colony of similar forms, which may possess more or less distinct individuality. The common fresh-water Hydra is an example and perhaps a true colony, which remain for a while connected with the parent organism and make it temporarily colonial.

Many marine hyroids retain their polyps permanently as constituents of such a complex organism, and, as a differentiation of these into nutritive and reproductive, and often into still other kinds, takes place, a higher order of more complex individuality arises; the polyp life is in part subordinated to the colony life. Among the most perfectly organized of such colonies are the floating Siphonophora (such as the Portuguese man-of-war), in which five or six perfectly differentiated and specialized kinds of zooids act together in mutual interdependence to support the whole. Here the zooids are incapable of performing any but the one function, or set of functions, to which they are adapted, and consequently cannot sustain independent life. This is one way of approaching the questions of individuality and of organization of the higher Metazoa. Among the higher animals that occur in colonial form are Polypoda, Ascidia and Chatopoda. See COMPARATIVE ANATOMY.

For social communities or colonies composed of numerous free individuals, all working together for mutual benefit, and how new colonies are founded, see ANT; BEE; WASP; TERMITES, etc.

COLONIAL BOUNDARIES. See Boundaries of the United States.

COLONIAL DAMES OF AMERICA, The National Society of. An ancestral and patriotic organization of American women, founded 19 May 1892, and the Colonial Society from each of the 13 original States, one society from the District of Columbia and one associate society from each of the non-colonial States. The objects of the National Society are: To preserve colonial history, traditions, manuscripts, records, relics and buildings; to perpetuate the brave deeds and glorious memory of the colonists, and to encourage patriotic. To be eligible to membership a woman must be descended from some worthy ancestor who rendered valuable service to the colonies and who became a resident of America previous to 1750. Memberships are obtained only upon invitation from those already enrolled, and must be procured through admittance into the Colonial Society of the ancestral State, where the service of the ancestor was rendered. The work of the Society has been patriotic. During the Cuban war nurses and supplies for the sick were supplied; at the close of the war a splendid monument, in Arlington Cemetery, Washington, D. C., to the memory of the soldiers who gave up their lives in the late war with Spain, was erected by the Society "in the
name of the Women of the Nation.* One of the most valuable and interesting collections of colonial relics and furnishings is under the control of the New York Society at the old Van Cortlandt manor house in Van Cortlandt Park. Churches and colonial houses of historical importance have been restored; historical sites marked with tablets; prizes awarded for essays on patriotic and historical subjects to pupils of public schools and colleges. A complete list of the soldiers and sailors who fell in the Culpeper expedition form the contents of a Register Book compiled by the Society. Great credit is due this organization for preserving many historical places which otherwise might have been destroyed. The Society numbers (1918) 9,000 members. It holds a biennial council in Washington, D. C.

COLONIAL GOVERNMENT. Proprietary. The 16th and 17th centuries constituted a period of growth and change in the English government and the proprietary colony was one of its results. When the English began their colonization enterprises the monarchy had to a great extent thrown off the evil influences of the feudalistic system, but its organization had not been brought to a state that would permit it entirely to dispense with feudalistic precedents. Hence the monarchy granted to individuals or groups of individuals extraordinary privileges in the hope and expectation that extraordinary returns would accrue to the government. Under the grant of 1584 by Queen Elizabeth to Sir Walter Raleigh, after a royalty of one-fifth of the gold and silver found had been paid to the Crown, the rights of the Crown amounted to little or nothing unless Raleigh or his assigns should *robe or spoile by sea or by lande or do any acte of unjust or unlawfull hostilitie to any of our subjects.* Power was given to Raleigh to castigate, correct, and rule ... as well in causes capital or criminal, as civil, both marine and other, ... according to such statutes, laws and ordinances as shall bee by him ... devised or established.9 The early grants were made to individuals but when these showed themselves incapable of producing results without outside assistance, those aiding the enterprises were included in the grants. The chartered company was an established fact in the commercial world and accordingly, when companies were chartered and the new Virginia charters of 1606 and 1612 full control of the colony was in effect given to the company, the stockholders choosing the supreme council from among their own members and the power to legislate and govern the colony being made entirely independent of the king. The quorum of the courts manage affairs in England while the governor looked after company interests in the colony. For a time harmony prevailed in the colony but abuses of power and position by the governor, the growth of settlements and the lack of any voice in the government led the colonists to demand a representative assembly, which convened at Jamestown 30 June 1619. Moreover the patents in England began to quarrel among themselves, whereupon in 1624 the Crown canceled the charter of the Virginia Company and appropriated to itself the fruits of the labor of private individuals, thus establishing the first royal province in the country.

In 1632, therefore, when granting to Lord Baltimore the province of Maryland, the Crown returned to the practice of making individual grants and endeavored to reproduce in America the County Palatinate of Europe. Upon Baltimore and his heirs was conferred absolute proprietaryship of the soil. The governmental powers bestowed are involved in some obscurity. On the one hand, the proprietor was given all the powers possessed, then or previously, by the bishop of Durham. Of itself, this was a very comprehensive grant, for the authority exercised in this northern palatinate by the dignitary mentioned was little short of absolute. The effect of the grant was materially lessened, however, by subsequent clauses in the charter which imposed large limitations. Thus the laws and ordinances of the colony must not be repugnant to the laws of England; the laws must receive the consent of the freemen of the province; and no interpretation of the charter involving any impairment of the allegiance due the king should be permitted. Still it may be said that the independent powers of the proprietor were very extensive. They included the making of war and peace, the appointment of all officers, the enforcement of martial law, the pardoning of offenses, and the granting of titles of nobility. An interesting provision was that no tax should be levied by the Crown on any person or on any goods in the colony. The proprietor possessed full power to determine the colony's government. Baltimore planned the government to consist of a governor, a council, appointed by the proprietor, and a primary assembly in which any Freeman of the province might be present to speak and vote. With the growth of population the holding of a primary assembly became impracticable and in 1639 the assembly was made up mainly on the representative principle, with the hundred as the electoral area. In 1647 the assembly was divided into two chambers, the lower consisting of the elective burgesses, the upper of the councillors together with persons specially summoned by the proprietor. The suffrage, at first restricted, was broadened until the colony came to be rather more democratic than Virginia. Likewise the system of land tenure, originally aristocratic in character, based on the principle of large semi-feudal estates, was modified until Maryland, as compared with all the other southern colonies, became a region of numerous small freeholders.
In 1639 the province of Maine was granted to Sir Ferdinando Gorges, but this grant proved abortive. In March 1663 eight men received from Charles II a grant to Carolina in the hope that it might furnish a refuge for the remnant of the freemen of Pennsylvania. The proprietary might furlough them without the material interests of those concerned. The proprietaries could enact and publish any laws deemed necessary, with the assent, advice and approbation of the freemen of the colony; they were also empowered to elect and appoint civil judges, magistrates and officers; to make war and in cases of necessity to exercise martial law; to enjoy customs and subsidies, imposed, with the consent of the freemen, on goods loaded and unloaded. In 1669 a new charter was granted and in order that the colony might have a settled form of government Shaftesbury drafted a code of laws in which he was aided by the famous John Locke (q.v.), who in 1669 promulgated his "Grand Model," or "Fundamental Constitutions," the chief provisions of which were as follows:

"The eldest of the eight proprietors was always to be president, and at his decease was to be succeeded by the eldest of the seven survivors. This president was to sit as president of the palatinate court of which he and three more of the proprietors were to be quorum, and had the management of the execution of all the powers in the charter. This palatinate's court was to stand in room of the king and give their assent or disallow any laws made by the legislature of the colony. The palatinate was to have power to nominate and appoint the governor, who, after obtaining the royal approbation, became the representative in parliament, and to act agreeably to his instructions. Besides a governor, two other branches, somewhat similar to the old Saxon constitution, were to be established—an upper and lower House of Assembly; which three branches were to be called a parliament. The upper House of Assembly was to consist of the seven deputies, seven of the oldest land-graves and caciques and seven chosen by the Assembly. As in the other provinces, the lower House was to be composed of the representatives from the different counties and towns. Several officers were also to be appointed, such as an admiral, a secretary, a chief justice, a surveyor, a treasurer, a marshal, and register; and besides these each county was to have a sheriff and four justices of the peace. Three clergymen were also to be elected, called baccari, caciques, and land-graves; the first to possess 12, the second 24, and the third 48,000 acres of land, and their possessions were to be inalienable. Military officers were also to be nominated, and all inhabitants from 16 to 60 years of age, as in times of feudal government, when summoned by the governor and grand council, were to appear under arms, and, in time of war, to take the field."

This code was only partially put into operation; from the first the settlers regarded it with horror as a revival of feudalistic institutions and a hindrance to the progress of pure democracy and made war upon it with the result that a popular assembly was secured in North Carolina in 1677 and a few years later in South Carolina; while the "Grand Model" was nearly wholly abrogated by the proprietaries in 1693. Disputes over legislation and discontent occasioned by corrupt and oppressive conduct of some of the officials led the colonists to send an agent to London, where, after a hearing in 1720, legal process was taken for vacating the charter. The right to the administration of affairs was assumed by the Crown.

On the other hand, when the later colonies of Pennsylvania and New Jersey were founded an effort was made to merge the democratic institutions into the proprietary system. By his charter Penn (q.v.) was created "true and absolute lord" of Pennsylvania and given ample power of government, but "the advice and consent of the freemen of the province" was to be given to the admission of laws. To the Crown was reserved the right of veto and to Parliament the levying of duties and taxes. Penn formed the delegates of the freemen into a council of three members from each county who were to hold their seats for three years, one being chosen each year, and an assembly of 36 members, six from each county, to be chosen annually. The governor and council were to possess jointly the right of proposing laws. Every freeman had the right of voting and holding office, the only restrictions being the necessity of a belief in God and abstinence from labor on the Lord's Day. Trial by jury was established and murder and treason alone were punishable with death. Primogeniture, with a trifling reservation, was abrogated. In 1701 a charter of privileges was framed by Penn and accepted by the assembly, the chief provisions of which were as follows: Each county was to elect annually five representatives in the assembly, who should choose its officers, prepare bills and make laws; all cases relating to property were to be decided by courts of justice and not by governor and council; no law contrary to the charter could be enacted without the consent of the governor and six-sevenths of the assembly; and the proprietors and their heirs were pledged not to destroy the liberties granted by the charter. The qualification of voters was fixed at a property of 50 acres, and in lieu of that about $166 in personal property.

In spite of every attempt to avoid a conflict of interest, it was inevitable that the proprietor must choose either one of two capacities in which he could act conscientiously—as a life tenant of certain material interests, or as a trustee for the interests of the colonists. It is true that Penn in his "holy experiment" endeavored to inject democratic features in his proprietary plan of government, but even in his case the natural conflict of interest resulted in a serious wrangle between him and his colonists; and the granting of increased governmental rights only served to aggravate the economic grievances. The settlers could not be convinced that the proprietary interests did not conflict with the interests of the colony; they would prefer to pay their quit-rents as a tax for the support of their own colonial government rather than to pay them to the proprietor in the character of a private debt. The parent government, too, regarded the proprietorships as objectionable since great difficulty was experienced in enforcing royal commands, while in the case of the acts of trade and navigation the interests of the proprietors might seriously conflict with those of the parent government. Hence the colonies gradually became royal provinces with the exception of Pennsylvania and Maryland, which were under proprietary governments at the outbreak of the Revolution. The proprietors of the former and the people in the colony had caused almost an open rupture, and it is probable that within a short time the government would have undergone a radical change, even had not the Revolution decided the nature of the government. In both prov-
inces, when Imperial questions were at issue, English legislation had come into a more effective control.

COLONIAL SYSTEM. See Colonies and Colonization.

COLONIAL WARS, Society of. The Society of Colonial Wars in the State of New York was incorporated 18 Oct. 1892. It is a patriotic organization for perpetuating the names and valor of those participating in the wars of the American colonial history. To be eligible it is necessary to have a line of descent from an ancestor: (1) Who served as a military or naval officer, or as a soldier, sailor or marine, or as privateer, under authority of the colonies which afterward formed the United States, or in the forces of Great Britain which participated with those of the said colonies in any wars in which the said colonies were engaged, or in which they enrolled men, from the settlement of Jamestown, 13 May 1607, to the battle of Lexington, 19 April 1775; or (2) who held office in one of the colonial governments of the dates above mentioned, either as (a) director-general, vice-director-general or member of the council, in the colony of New Netherland; (b) governor, lieutenant or deputy governor, lord proprietor, or the governing council, in the colony of New York, New Jersey, Virginia, Pennsylvania and Delaware; (c) lord proprietor, governor, deputy governor or a member of the council, in Maryland and the Carolinas; (d) governor, deputy governor, governor's assistant or commissioner to the United Colonies of New England, or body of assistants in any of the New England colonies. Membership is hereditary in the male line. The insignia of the Society is a badge pendant by and gold, black and red silk ribbon bordered with white and edged with red, a nine-pointed white star bordered with red on one side and gold on the other, on a field of blue, pendant from the crown. The flag of the Society bears a red Saint George cross on a white field.

There are more than 25 co-ordinate State societies united in the general society, with a membership approaching 5,000. In New York *business courts* are held in March and November; a *general court*, for the annual election of officers, in December. At these courts papers are read dealing with the colonial period. An annual banquet is held in honor of the founding of New Amsterdam. A *general assembly* of the general society meets once in three years at such time and place as the preceding assembly designated. These general assemblies are composed of the members of the general council, together with five delegates chosen by each of the State societies.

The Society has erected commemorative bronze tablets at Fort Oswego and Ticonderoga, and one of marble to General Forbes. An oil portrait of General Bouquet has been presented to the city of Philadelphia, and a portrait of Washington is in Independence Hall. Many members of the Society participated actively, either in the army or the navy, during the Spanish-American War, many thousands of dollars being contributed by the several State societies, from Maine to California, in equipping State regiments, caring for the sick and wounded, and for hospital supplies, flags, band instruments, etc. The yearbooks of the Society contain valuable historical and genealogical data.

COLONIAL WARS IN AMERICA. A résumé of the colonial wars in America must of necessity omit many local disturbances which were of importance historically and which the student can find graphically described in many of the volumes included in the bibliography at the close of this article. Some of the most important are here chronologically presented.

1607. Jamestown, Va.—Although Capt. Drayton and a sailor were severely wounded by arrows tipped with deer's-horn and sharp stones, the night the English landed in Virginia, the first real conflict in American colonial history came two weeks after the Jamestown settlement, at the end of May 1607, 200 Indians being repulsed by the settlers under Capt. Edward-Maria Wingfield; English casualties two killed, Capt. Drayton mortally wounded. From this encounter to the battle of Lexington (q.v.), 19 April 1775, scarcely a generation in the several colonies reached manhood without knowing the horrors of war.

1620. Plymouth Mass.—The Pilgrims of New England had their first encounter with the dusky Nausite tribe, whose arrows were headed with harts' horn, eagle's-claws and brass, 8 Dec. 1620, and for over half a century the warfare continued with exacerbations of varying ferocity.
1622. Virginia.—Two years later their kinspeople of Jamestown escaped annihilation by the warning of a converted Indian. On 22 March at midday 547 men, women and children were shot by the savages, among the scattered hamlets along both banks of the river.

1633-37. Pequot War.—The Pequot Indians, in 1633, killed several English traders who came to their Connecticut River territory; 1634 found the Pequots at war with the Narragansett tribe, and hostile to the Dutch as well. Then the New England colonists prepared for the inevitable encounter. Saccasus ruled as Pequot chief. About this time John Oldham and two young lads were slain by the savages at Block Island. Governor Endicott promptly sent a force which destroyed a major part of this band. The Pequots then tried to enlist the co-operation of the Narragansets, but this failed, owing to the influence exerted by Roger Williams over this tribe. The murder of 30 men and women followed. Connecticut, in May 1637, placed John Mason in command of troops contributed by Massachusetts and Plymouth. Under Capt. John Underhill, allies being Mohegans, Uncas their sachem, and 400 Narragansetts and Nyantics. The desperate battle of Pequot Hill, Groton, Conn., was fought 26 May 1637. Mason says: "Most courageously these Pequots behaved themselves; but, such a dreadful Terror did the Almighty let fall upon their Spirits that they would fly from us and run into the very Flames, where many of them perished." Nearly 800 Indians were slain in an hour; only two English were killed and 20 wounded. Activities ceased in August and the next year a treaty was concluded between the colonies and the tribes.

1642-47. Ingle's Rebellion.—Indians began to molest Europeans in Maryland in 1642 and following these attacks came Ingle's Rebellion, July 1643, aided by Clayborne, and which caused internal discords in the colony until peace was declared between contending parties in 1643.

1643-47. Kieft's War.—Kieft was appointed governor of New Netherland in 1638. In the winter of 1643 he made war on the Mohawks, causing an outburst of hostilities among the Algonquin tribes. Massacres and confiscations continued through the winter and following summer. John Underhill of Connecticut commanded the troops and successfully routed the Long Island tribes. In March 1644, Underhill, with 150 Dutch soldiers, landed at Greenwich, Conn., attacked an Indian village of 700, slew 180 in an hour, then set fire to the village, causing the death of 500 Indians by fire and sword. Kieft proclaimed a public thanksgiving for this victory. Nearly all Dutch farms and 1,000 Indians had been destroyed. In October Peter Stuyvesant succeeded Kieft in 1647 and peace was established.

1644. Virginia.—On Holy Thursday, 1644, Opechancanough and his warriors killed 500 white settlers in Virginia. Vigorous measures were taken by the settlers. Indians were dispersed, their villages and the Powhatan confederacy (embracing nearly 50 petty tribes) destroyed, their chief captured and shot.

1648-56. New Sweden.—In April 1638 Peter Minuit, with his colony of Swedes, reached Delaware Bay. The colony was unusually prosperous, while Dutch interests there waned. Disputes arose as to titles of land; in 1648 the Dutch tried to erect a fort on the Schuylkill, but were repulsed by the Swedes. Continued friction, between the two races resulted, although Stuyvesant of New Netherland and Frantz of New Sweden agreed to be, and for three years were allies. First one side would capture a fort, then the other; until, in 1656, after discussion by the States-General and Sweden (which came to naught), the city of Amsterdam bought the West India Company's interest on the South River (Delaware), and the colony of New Amstel was launched, while the authority of New Netherland's ceased.

1660. Bacon's Rebellion. See Bacon's Rebellion.

1664-73. New Netherland.—England seized New Netherland, 8 Sept. 1664, and war was formally declared in March 1665. England suffered greatly at the hands of Holland in 1666, but continued to hold her American conquests. On 6 Oct. 1667 a Dutch fleet of 22 vessels, with 1,600 men, arrived off Staten Island and on the 9th anchored off the fort. The Dutch commander, Evertsen, at length opened fire, which the fort returned, but it then surrendered and the Dutch flag was raised.

1666. French and Iroquois.—The French waged war with the Iroquois and other tribes for 60 years, coming down from Canada, invading and destroying their villages. As a result, peaceful white settlers suffered from Indian retaliation.

1675. King Philip's War.—John Sassamon or Sausaman, secretary and interpreter of the Wampanoags' chief (he had been a pupil of the apostle Eliot) heard of a plot to exterminate the English and reported it to the Plymouth authorities. King Philip, second son of Massasoit, who had been chief sachem of tribes between the Charles River and Narragansett Bay, was summoned and examined by the authorities. Learning of the informer, he caused his death, 20 Jan. 1675. His slayers were, in turn, executed by the authorities. Then followed a series of Indian retaliations; eight or nine whites were killed at Swansy; in June companies from Massachusetts and Plymouth drove Pokanokets from Mount Hope; Philip fled to Nipmucks, who killed Captain Hutchinson and 16 others; Brookfield was burned; Deerfield and Northfield attacked; Captain Beers and 20 men from Hadley slain; Captain Lathrop and 80 men killed at Bloody Brook, near Deerfield, which was then burned; and Springfield and Hatfield were attacked. War continued through the summer. In October, Peter Stuyvesant succeeded Kieft in 1647 and peace was established.
North Hampton, Andover and Bridgewater, make an appalling list of horrors. War was actively waged by Canonchet, son of Miantonomo, until his capture by Captain Dennison and the Connecticut troops, and subsequent death at the hands of Mohegans. King Philip was killed at Bristol 12 August and the war was at an end.

1680. Port Royal, S. C. — The Spaniards from Florida attacked the Scotch settlement at Port Royal, S. C., in 1680, completely destroying it. A force of 400 men was raised to retaliate, but this plan was forbidden by the proprietors, inasmuch as the colonists were supposed to be not wholly blameless.

1687—89. French and Senecas: Montreal. — The French waged war with Senecas 1687, defeating them. Indians then destroyed Port Frontenac. In 1689 the Iroquois attacked Montreal, causing great devastation and loss of about 1,000 French.

1689—91. Leisler’s Rebellion. — See Leisler’s Rebellion.

1690. First Intercolonial War: King William’s War: Quebec. — War between England and France was declared in 1691. The French in Canada planned an attack on Boston and New York. They came down from Canada with Indian allies; attacked Schenectady 8 Feb. 1690; Salmon Falls, 27 March; horrible massacres ensued and the colonies were aroused. March 19 the General Court of Massachusetts proposed a congress, at which measures for their protection should be arranged. The several colonial bodies were notified. Representatives from Massachusetts, Plymouth, Connecticut and New York met at New York. On 1 May they signed an agreement to send 855 men for the support of Albany and, by the help of Almighty God, subduing the French and Indian Enemies. Attempts to conquer Acadia and so move on Quebec, together with a plan to secure Montreal via Lake Champlain, followed. Acadia and Port Royal were captured by New England men under Sir William Phips; then the force pressed on to Quebec, but not securing the desired support of Maj. Fitz John Winthrop, their object was not accomplished.

1696. Frontenac’s Expedition. — Frontenac’s expedition against Iroquois, Oneida and Onondaga tribes, occurred in 1696, when he was 74 years of age. The tribes were humbled by him but not subdued.

1702-10. Second Intercolonial War: Queen Anne’s War. — War was declared 15 May 1702. In August 1706 the French and Indians attacked Wells, Saco and Casco. Deerfield and Lancaster also suffered. In May 1704 Col. Benjamin Church, with troops, sailed from Boston, against Acadian settlements. In 1705 French and Indians destroyed Petit Havre and Saint John’s, N. F. In 1709 Haverhill was attacked by French and Indians; 16 Oct. 1710, Port Royal was captured by the English under Nicholson, and renamed Annapolis, in honor of the Queen. Varying degrees of Indian hostility were experienced along the coast to the Kennebec River, until 1725, when peace prevailed.

1703—15. Southern Wars: Charlestown. — On 15 Jan. 1703, a battle was fought between Carolina troops under Colonel Moore and the Spanish forces under Don Juan Mexia, and 800 of the latter were killed. In August 1706, Charlestown was attacked by a Spanish fleet, with small loss to either side.

1711. Tuscarora War. — On 22 Sept. 1711, Tuscaroras and Corees slaughtered inhabitants along the Roanoke River and Menomino Sound. During several days they killed the whites along Albemarle Sound. Col. John Barnwell, with South Carolina troops and Indian allies, guided an expedition which made several attempts to drive them away; finally captured 800 in a fort; fought a severe battle 28 Jan. 1712, and killed 400 warriors. The remaining hostile Tuscaroras migrated to Oneida Lake, joining the Iroquois confederacy.

1714—15. Yemassee War. — The Yemassee War was instigated, so it is claimed, by the Spaniards. A series of Indian outbreaks occurred in 1714-15, in one encounter 400 South Carolinians being killed. The Yemassee were driven out of Carolina into Florida, but disastrous warfare continued, hundreds suffering brutally at the hands of savages.

1739—48. War with Spaniards in Florida: War of Jenkins’ Ear: Carthagena. — The English South Sea Company, under the Treaty of Utrecht, was permitted to supply slaves to Spanish colonies. A smuggling-trade developed, which a Spanish fleet (guarda costa) tried to discourage. England and her colonies heard of terrible severities imposed by Spaniards on suspects captured. Runaway slaves from South Carolina made their way to Florida, were well received, protected and given grants of land by the Spaniards, who declined to return slaves. In 1738 Ogilthorpe, appointed military commander of Georgia and South Carolina, returned from England with a regiment. The same year, Captain Jenkins, skipper of the ship Rebecca, was examined in the House of Commons. He described how, having unjustly accused him of smuggling, the Spaniards first hung him at the yardarm, then lowered him, and cut off his hand, telling him to take it to his king. Public clamor caused Walpole to declare war 23 Oct. 1739. An English fleet under Admiral Vernon visited the Isthmus of Darien, and captured Porto Bello. Ogilthorpe, having persuaded a treaty with the Creek Indians, called on them and South Carolina for aid. Although an expedition captured Port Ficulata (thus preserving navigation of Saint John’s River, and preventing Spaniards communicating with posts at Saint Mark’s and Pensacola), Ogilthorpe found the 1,200 men under his command unable to make any impression on Saint Augustine, and gave up the siege of that place after heavy loss to his Highland regiment, to the desertion of Indians and some Carolina troops. In the spring of 1741 Admiral Vernon, co-operating with land forces under General Wentworth, failed in an assault on Carthagena. A fleet under Commodore Anson secured several valuable Spanish prizes. The Peruvian town of Paita was destroyed. In 1742 a Spanish fleet of 56 vessels, carrying 7,000 or 8,000 men, fitted out at Havana, and appeared off the Georgia coast at the end of June. Its attempts to capture the island of Amelia were foiled and Frederica were frustrated by General Ogilthorpe on 7 July 1743, and the Spaniards lost heavily at the battle of Bloody Marsh; 24 July
Oglethorpe proclaimed a general thanksgiving for the end of the invasion.

The following reproduction of the governor’s speech to the general assembly of his majesty’s colony of New York is of interest. In 1747, a war was introduced from the only known copy, in possession of the New York Historical Society, and bears upon this period of martial activity, giving an idea of the style of appeal from king to colonists.

Gentlemen: His Majesty having been called upon, by reciprocal Ideas, to declare his own, and the Massachusetts, Command of the forces (some 4,000 men) was given to William Pepperell, who left Boston in April 1745, Commodore Warren, commanding in the West Indies, furnishing ships of convoy. Five assaults were made on an island battery protecting the harbor before the French surrendered, 17 June. For this success Pepperell was made a baronet. An expedition the following year, successful and Louisburg was returned to the French by the Treaty of Aix-la-Chapelle, 7 Oct. 1748.

1754. Great Meadows.—In December 1753 George Washington, under a request from Governor Dinwiddie of Virginia to the French commander of Forts Vengaro (confluence of French Creek and Allegheny River, now Franklin, Pa.) and Le Beul (west fork of French Creek, now Waterford, Pa.) that he retire from territory claimed by the English; request was refused. Governor Dinwiddie then ordered a fort constructed at the forks of the Ohio, and white work in progress the French appeared and the English retired. A regiment organized under Col. Joshua Fry, from Washington and in command of sixty men with 150 men. On 28 May 1754, when near Great Meadows, the French were met in a glen. In ensuing hostilities the French commander, Jumonville, was killed and those under him captured. Washington retired to Great Meadows and threw up entrenchments, awaiting Colonel Fry’s force, which finally arrived. Colonel Fry had died suddenly. Washington made a second advance, which proved ineffectual against a French force of 700, and he retired with the honors of war, 3 July 1754.

The same month Benjamin Franklin, Thomas Penn and others assembled at Albany by request of the “Lords of Trade” (a standing committee of England’s privy council), hoping to make an agreement with the chiefs of the Six Nations for protection in the event of further hostilities. The treaty was unaniomously approved at this congress, but the several assemblies failed to ratify it. Had his plan been adopted, it is said, the several colonies would have been united and strong enough to withstand attacks from enemies without England’s assistance and the later pretext for unjust taxation. Thus the Revolutionary struggle might have been averted.

1755–63. Seven Years’ War: French and Indian Wars: Braddock’s Defeat.—The English government, in 1755, placed General Braddock over a force intended to drive the French from the Ohio Valley. Washington was on his staff. Braddock planned the capture of Fort Duquesne, at the confluence of the Allegheny and Monongahela rivers. Untrained in methods of frontier warfare, having to spend his classic march 2 (April 9 to July), Braddock scotched at the employment of scouts as he approached the immediate vicinity of the enemy, with the result that when his command was attacked it was completely defeated. About 1,600 men killed or wounded and he himself died from a wound received in the onslaug. His papers were captured by the French, who found therein all the English plans.

1755. Battle of Lake George.—At a council of war, called by General Johnson at early
morning 8 Sept. 1755, it was proposed to send 500 men to Fort Edward. The noted Indian King Hendrick, when consulted about this number, said: "If they are to fight they are too few; if to be killed, they are too many." The force was doubled. Johnson then proposed dividing it, so that in a period of several arrows, handed one of them to Johnson, requesting that he break it, which the general did; Hendrick then placed three arrows in the general's hand, saying: "Put them together and you can't break them; take them one by one and you will break them easily." This argument was conclusive. Col. Ephraim Williams led; Lieutenant-Colonel Whiting had the second division; King Hendrick, with 250 Mohawks, was in advance of the provincials. Rocky Brook was reached; here the enemy was in ambush; but for friendly warning from Senecas, the troops would have perished. Colonel Williams and King Hendrick lost their lives; General Johnson was wounded; Lieutenant-Colonel Whiting conducted a successful retreat, followed by the French and Indian allies. Lieutenant-Colonel Cole, with 300 men, came from Lake George; a brilliant dash was made on the enemy, driving them and capturing Baron Dieskau. Colonel Montcalm advanced from Fort Edward, where the firing had been heard, with 250 men; discovered 300 Indians resting at Rocky Point; slew most of them. Among 500 lost by the French was Le Gardeur de Saint Pierre, whom Washington had met the year before at Great Meadows.

1756-57. Forts Oswego, Ontario, George and William Henry,—England declared war against France 18 May 1756. Governor Shirley was commander-in-chief of colonial forces; Marquis de Montcalm general of French. Shirley slowly matured plans of attack on Crown Point and Fort Duquesne; meanwhile Montcalm destroyed three forts, Oswego, Ontario, and George. This activity of the enemy cost Shirley his position, the Earl of Loudon taking his place. General Abercrombie second in command. In 1757 Montcalm attacked Fort William Henry, at the head of Lake George, garrisoned by 2,264 regulars. Colonel Montcalm marched from Fort Edward to Crown Point and advanced to within 10 miles of Quebec at the west point of the Isle of Orleans, and at Point Levi. The lower town was destroyed; confinements occurring in the upper town from red-hot balls and shells. Wolfe crossed from the Isle of Orleans to the north branch of the Saint Lawrence 9 July, camping below the Montmorency; 18 July he made a successful reconnoitre. His attack on redoubts at the ford was unsuccessful, with a loss of 400 men and two vessels. While ill, and waiting the arrival of General Amherst, he called a council of war; and it was decided to draw Montcalm into the open field. Camp was broken and the troops moved to Point Levi. De Bourgoinville, with 1,500 French, guarded the north shore to prevent landing. The English admiral deceived the French by moving his vessels below the real landing-place (Wolfe's Cove, near Cape Diamond). Ascent was made to the Plains of Abraham; the memorable battle was fought. Wolfe and Montcalm both dying from wounds their lives lasted; and the garrison surrendered 17 September to General Townshend.

Fort Niagara.—Soldiers under Prideaux landed 1 July 1759, within six miles of Fort Niagara. A sally was made 11 July. Prideaux was killed by a bursting shell 19 July; Amherst appointed General Gage to succeed him; until his arrival General Johnson carried on a siege; the fort surrendered 25 July.

Presqu'Isle: Venango: LeBeuf: Ticonderoga.—Colonel Bouquet captured with ease Presqu'Isle, Venango and LeBeuf. General Amherst had 11,000 men for an attack on Ticonderoga, which he took late in July (the French having withdrawn), only losing 75 men in a skirmish. He also took Crown Point. The English now fortified these places.

1759-60. Cherokee War.—While the above events were transpiring trouble arose with the Cherokees, who had accompanied Colonel Forbes against Fr. a skirmish in which Lord Howe was killed, and finally had to retreat. He lost about 2,000 men. Lieut.-Col. John Bradstreet proposed an attack on Fort Frontenac (now Kingston, Can-ada): Abercrombie consented and gave him 3,000 men. This was successful toward the close of August; Bradstreet captured quantities of stores, ammunition and cannon.

DuQueene.—Early in July General Forbes left Philadelphia en route to Fort Duquesne, with Cherokee Ponies; Colonel Washington at Raystown; in September Colonel Washington joined Forbes; late in November Fort Duquesne was in possession of colonial forces, receiving the name of Pittsburgh in honor of the elder William Pitt.
Cherokees, demanding surrender of the murderers; he received 22 Indian hostages as security for peace, and retired from the field owing to disease and insubordination in his command. The Cherokees attempted to take Fort Prince George, at the head of the Savannah. Hostages were placed in irons through fear of an effort to release them; one of them wounded a soldier, and his friends promptly killed all the Indians. This enraged the Cherokees, and war-parties went out in every direction and laid siege to the fort; the South Carolina assembly offered £25 for each Indian scalp, and voted to raise 1,000 men. General Amherst sent 1,000 Scotch Highlanders under Colonel Montgomery, who raised the blockade at Fort Prince George, and met Indians in June 1760. Victory was claimed by both sides. Montgomery retired to Charlestown, prepared to return north, by order of General Amherst. Lieutenant-Governor Bull now ordered 400 regulars for frontier protection. Upper Cherokees besieged Fort Loudon so successfully that the garrison lived on horse-flesh until it surrendered under promise of protection to the settlement; the promise was broken, many lives were lost, and many more were wounded. In June 1761 the Highland regiment returned and defeated the Cherokees with great slaughter. They sued for peace, which eventually was concluded.

1760. Quebec.—The delay caused in rebuilding and strengthening Ticonderoga and Crown Point prevented Amherst from moving on Montreal. The French had time to rally under De Levos, who succeeded Montcalm, and planned retaking Quebec. The plan was put in operation 17 April 1760. De Levos with 10,000 men went down the river to Quebec, where Murray was in control. De Levos camped three miles from the city. On 28 April an attack was made, in which Murray lost 1,000 men and a train of artillery. The French loss was estimated at 300. De Levos built trenches about the city, preparing for a long siege. Swanton arrived 15 May and destroyed all the French ships at Quebec. The siege was raised 17 May and on 18 Sept. 1760, the English flag was raised in Montreal.

1762. Martinique: Havana.—General Robert Monckton sailed from New York late in 1761 with two line-of-battle ships, 100 transports and 12,000 regulars and colonials; in February 1762 he captured Martinique; next, Fort Royal, Saint Pierre, Saint Vincent, Grenada and Saint Lucia surrendered; the French fleet was destroyed; on 12 Aug. 1762, Havana was captured by forces under the Duke of Albermarle, after a fierce struggle of 44 days, and 4,000 French killed.

1763-64. Pontiac's War.—Pontiac, chief of the Ottawas, posed as friend of the English after their victories; in secret he was plotting against them with Algonquins, Wyandots, Senecas and others. He planned simultaneous attacks on Western posts in the spring of 1763. Major Gladwin, commanding at Detroit, was forewarned, and when Pontiac and his 60 chiefs appeared on 6 May, they found the garrison under arms. The fort was unsuccessfully attacked by the two forces; the relief came from Fort Niagara. Captain Eciyuer at Fort Pitt (Pittsburg, Pa.) was also prepared. At the first attack, 22 June, the Indians were repulsed. The second attack, 26 July, lasted four days, and the Indians were defeated. General Amherst sent Colonel Bouquet with 500 men to its relief; while en route, 25 miles east of the fort, he fought a stiff battle with Indians at Bushy Run, coming off victorious. In September 1764 Colonel Bouquet, at the head of the Delaware and Shawnees returned 200 captive whites. This border war had caused much distress, and the following forts had been lost before Sir William Johnson and Readstreet successfully treated with 2,000 representatives of the Ottawas, Ojibways, Iroquois and Wyandots at Fort Niagara, and Pontiac's war was over:

May 16, 1763, Fort Sandusky.
May 25, Fort Saint Joseph (at the mouth of Saint Joseph River, Mich.),
May 31, Fort Onatonan (on the Wabash, Lafayette, Ind.),
June 2, Fort Michillimackinac (Mackinaw, Mich.),
June 9, Fort Vincennes (Venango County), and forts at Carlisle and Bedford, Pa.

1774. Lord Dunmore's War.—When Lord Dunmore was made governor of Virginia in 1774, dissension as to boundary lines arose between Virginia and Pennsylvania, as well as to ways and means of dealing with Indians. Virginia wished to possess their lands; Pennsylvania desired their trade; as whites encroached more and more on lands, Indians became angered; outrages followed, perpetrated by Shawnees, Mingos, Cherokees, Wyandots and Delaware. In the spring of 1774 a ruffian borderer, Greathouse, killed nine kinmen of the Iroquois Logan. This caused continued hostilities until the battle of Great Kanawha, or battle of Point Pleasant, in October. The effect of this battle kept the northwest Indians submissive during the early years of the Revolution, and at the same time permitted settlement of the Kentucky regions.

BIBLIOGRAPHY.

1607.—Fiske, John, 'Old Virginia and Her Neighbors' (Ch. 3, p. 95).

1622.—Brown, A., 'First Republic in America' (pp. 406, 475, 495, 500); Campbell, C., 'History of the Colony and Ancient Dominion of Virginia.'

The Greek colony was formed in a natural way by the swarming off of surplus population, and was usually independent from the beginning. The bond between the mother state and the colony was sentimental, not political, and the former seldom expected any advantage from the founding of the colony save relief from the pressure of population. The Roman colonies formed part of an elaborate scheme for extending Roman dominion. They were instituted by the state, and were its chief instrument in confirming its conquests. In their origin they were little more than garrisons in conquered, forfeited places, where land was allotted to the soldiers instead of pay and provisions.

When the discovery of America occurred, Europe was not overpopulated, and there was for a long time little spontaneous outflow of substantial elements to create new communities. The conquest of large and industrious populations, settled upon rich lands, tempted the cupidities of rulers, and gave rise to the conception of the colony as a present, an estate to be mined or worked by the state or its favorites for purposes of revenue. Says Seeley: "A native population reduced to servitude, in some parts driven to compulsory labor by cajicues turned into state officials, in other parts exterminated by overwork and then replaced by an imperious mother country drawing from the colony a steady revenue and ruling it through an artful mechanism of division, by which the settlers were held in check by the priesthood, and by a serf population treated paternalistically, that it might be available for that purpose; such was the typical colonial system."

The exploitation of subject populations by such means as tribute, serfdom, forced labor on public works and government plantations, or the maintenance of Crown or company monopolies, has come to be generally recognized as short-sighted, and no longer commends itself to enlightened nations. The old, harsh policy has, moreover, become more difficult with every step toward popular government in the dependent country, and every increase in the power of public opinion.

Entirely different from the type just described is the settlement colony, which grows up in desirable temperate regions sparsely peopled by savages. Although the love of adventure, the crusading spirit and the desire to escape political, religious or racial oppression are by no means to be overlooked, it is chiefly the economic motive that leads to the founding of settlement colonies. A weary population enjoying rapid industrial expansion yields few colonists, but a clogged labor market, a narrowing circle of opportunities and a darkening prospect stimulate large numbers to face the unknown in the hope of bettering their condition. Not only is a population stimulated to its utmost capacity, provided it remains in vitalizing touch with the mother country, but the mixture of races results frequently in a beneficial crossing of stocks, and the severe struggle in a new and untamed environment accelerates the improvement of the race by natural selection. The growth of numbers, changing constantly the relation between population and opportunities, carries a colony through well-defined stages. First come of natural wealth, hunting, trapping and mining; then follows pastoralism; then agriculture, to...
which in time is added manufacturing. During the earlier stages, when the colony is complementary to the mother country, each finds in the other a convenient vent for its surplus products. The volume of exchanges is relatively large, and their trade reaches its maximum with prosperity. But as time goes on and wealth accumulates, the colony, acquiring home manufactures and home markets, becomes an integral, self-sufficing community, and evinces a growing disposition to assert its independence of the mother country, formerly its complement, but now its competitor.

The granting of large entails estates may lend a colony a semi-feudal character. But if the land system is popular, landed property will be diffused, the proceeds of labor will go to the producer and the colony will contain few persons living on incomes derived exclusively from ownership. Moreover, being more favorable to production than to consumption, the colony will draw to itself adult males from the industry without causing the population of the mother country to decrease, but will attract few members of the less active classes. Since the reward of industry is greater than in older societies, and the community is but little differentiated, economically or socially, manhood rather than property controls the body politic, the temper is individualistic and liberty-loving and the conditions favor the germination and rooting of democratic ideas. Despite its social and political radicalism, the colonial society is conservative in its moral and religious ideals. Unless non-economic motives have presided over the beginnings of the colony, the pursuit of wealth is the chief interest of the settlers, and there is little room for speculative thought. The lack of cities, of intercourse and of leisure is unfavorable to the cultivation of the sciences or the fine arts. During the early life of the colony the preoccupation with private affairs leaves little margin for public life. If the mother country is wise enough to establish security without interference and to allow the private interests, the administration of affairs of general concern is turned over to it without regret. A dependence upon the richer and riper culture of the parent state may indeed cause injury and retard the development of the colony, but in the meantime the colony is ready for self-government. Lands thickly peopled by non-European races, and tropical regions where the climate is such that white men will not settle there with their families, do not develop into settlement colonies. Unfit to serve as an outlet for the surplus population of the temperate zone, they can be legitimately utilized by the more advanced races only as a field for the employment of commercial or industrial capital.

The commercial type of the investment colony is best seen in the early establishments of Portugal, Holland and England, for trade with the East Indian and African peoples. When colonial enterprise is dominated by the commercial motive, penetration of the interior of the country is not required. Trade is conducted from the decks of merchantmen, from hulks anchored at the mouth of streams or from fortified stations situated on the sea coast or on the banks of navigable rivers. Settlers and traders in such a land have little motive to extend political control over large inland regions. A chartered commercial company has at first no occasion to clash with the natives. Its armament is chiefly directed against envious rivals, eager to share in its lucrative trade. Later, when in its eagerness for an exorbitant profit, it attempts to dictate to the natives or limit their production of the staples of trade, it comes to blows with them, and squanders its resources in fruitless wars. The earlier commercial colony was valued as a source of tropical products, such as sugar, coffee and spices, which could be resold in Europe at a large advance. Since the advent of machine industry, however, the commercial colony is valued rather as a market for surplus manufactures.

The chief means of relieving the superabundance of capital that threatens to lower the rate of profits in the advanced countries is the application of capital in the industrial development of the more backward regions. Tropical lands under native systems are almost invariably under-exploited from the point of view of modern industry. The lands are largely untouched, and even the area under intensive native cultivation, lacking as it does the best facilities for irrigation, tillage and transportation, produces by no means the value it might yield. Owing to ignorance, to unstable conditions or to the lack of accumulation of capital, the industry is almost wholly deprived of the aid given by large applications of capital. Under these circumstances it is possible for the more civilized peoples, without in any way exploiting the native populations, without depriving them of their earnings or their patrimony, to apply capital and directive skill in such a manner as to reap a generous profit.

The example of Mexico and of certain countries of South America shows that backward regions may be developed by capital invested under the protection of local governments, and that no adequate reason exists for administering these countries from a distance. In other cases, however, a rapacious and unstable native rule paralyzes industry, and the utilization of natural resources is impossible until a responsible and equitable government has been instituted. It is necessary for some civilized power to suppress tribal and local warfare, to stamp out brigandage and a fractional administration of justice and a rational system of taxation. When order and stability have thus been assured, the next step is the investment of development capital in the form of harbors, railways, highways, telegraphs, improved natural waterways and irrigation works. As the means of communication are perfected, there follows naturally the employment of capital in the opening of mines, the clearing of forests, the clearing of plantations, and, possibly, the establishment of factories. The development of a tropical region by the aid of capital from abroad requires the presence of a small body of white men in the capacity of officials, traders, planters and superintendents, representing in the main the less advanced population the superior power and intelligence of the civilized peoples.

The extension of modern forms of agricultural exploitation into climates where white men cannot endure heavy field-work creates special problems and sets up labor. Successful enterprise requires an abundant supply of suitable and reliable labor, and
this can come only from the natives or from other colored races. In the old plantation colony the problem was solved by enslaving the local population, or by kidnapping negroes from Africa. Owing partly to the racial inequality of employer and employee, and partly to the character of tropical agriculture, which cannot bear interruption, especially at harvest-time, there is a strong tendency in all planting colonies to compel the specific performance of the labor contract. Under the indentured labor system in the British colonies strikes are unlawful, and refusal to work can be punished; on the other hand, the government closely supervises the terms of the labor contract, suppresses all obnoxious features and provides machinery for compelling the fulfillment of its provisions by the employer.

If the welfare of the colony is the first desideratum, the degree of control exercised by the mother country over the internal affairs of a settlement colony will be moderate at the beginning, and will tend constantly to diminish. The prosperity of the English colonies in America was largely due to the salutary neglect of the mother country. They revolted when she sought a stricter control to make them subserve her economic interests. The home government, even with the best of intentions, is likely through sheer ignorance to press upon the colony institutions ill-adapted to local conditions. On the other hand, during the early life of the colony, the settlers, preoccupied with private affairs, have little leisure for the study of the problems of administration and government. Their political life is unduly dominated by selfish, special interests, and there is danger that the first comers may monopolize or waste the natural wealth which ought to be reserved for later arrivals. As impartial umpire and as custodian of the interests of the future, the home government may exercise a supervisory control which will diminish as the colonial society grows in mass, stability and variety of interests. In the final stage of political connection, the colony is granted autonomy in all save external affairs, or even becomes with the mother-state a member in a federal empire. On the other hand, this gradual ripening off the parent stem is by no means the normal course of a tropical colony, where there are two unmingling elements in the population—a colored race and an incoming European race. In the West Indies, for example, self-government means the rule of the one race or the other. There is either the domination of a large native population by a permanently resident European caste, cut off from the moral and political conditions which have produced European standards, or else the subjects of the major element to the uneducated and politically inefficient majority race. Here, the home government presents itself as a power superior to local prejudices and able to override the antagonistic class or race interests which otherwise might wreck the prosperity of the colony. For these reasons the system of self-government now enjoyed by the colonies of Canada and Australasia is not likely soon to be extended to the remaining 500,000,000 human beings in existing colonies, dependencies and protectorates.

The method of direct administration—

*Includes feudatory states of India, whose area is 731,944 square miles; population, about 70,000,000; also, since the annexation in 1914, Egypt, area, 363,181 square miles, population, 11,300,000.
of personal influence, prevent misrule, suppress obnoxious practices and introduce gradually the standards of civilized administration. Commercial and industrial development proceeds apace, while the local population is better safeguarded against exploitation. The present century has seen a marked increase of political dependency. Strong nations have evidenced a growing disposition to police and place under orderly administration all regions where potential wealth exists, in order to make safe and profitable the improvement of such resources by means of the capital and skill of their citizens. The investment motive is likely to become in the future even more imperative than now, and the increasing speed of communication favors the permanence of the colonial relation where once it is established. In fact, in the more advanced nations and larger share of attention is devoted to colonial affairs and problems. See Colony.

COLONIZATION SOCIETY OF AMERICA. An association to colonize free negroes in Africa or elsewhere. The idea was evolved by friends of negro advancement and opponents of slavery. Dr. Samuel Hopkins, of Newport, R. I., in 1770 suggested the Christianizing and civilizing of Africa as consisting of emancipation here by providing a place to which free negroes could go; and this was proposed by Jefferson during the Revolution. But about 1800 it was taken up by the slaveholding interests, for exactly the opposite purpose — to strengthen their system by deporting the free negroes, who made the slave discontented and were considered otherwise objectionable. Virginia tried repeatedly to obtain a national grant for colonizing purposes, and failing this, in 1806 enacted that any slave thereafter freed should leave the State within a year or be again reduced to slavery; and in 1816 the petition to Congress was renewed, to force some national action. On the first of January the society above was organized. The president (Judge Bushrod Washington), all the managers and all but a small minority of the vice-presidents, were slave holders; its constitution professed no purpose to benefit the blacks, and its allusion to the blacks with distinguished that it had any. Support was asked for it in the North on the ground of its civilizing Africa and leading to gradual emancipation; in the South, on the ground of its contributing to the continuance and strengthening of slavery, augmenting the value of slave property and providing an overflow for the excess of slaves beyond profitable employment. This impossible "straddled" of purposes ruined its chance of accomplishing much; though a number of the best Northern philanthropists, and their Southern peers like Birney, clinging to it for some years and hoped for good from it. A great many State branches were organized and vigorous public appeals made for it. Charles Carroll, James Madison, Henry Clay and Latrobe the architect were its presidents. In 1830 a colony of a few hundred was sent to Sherbro Island, West Africa, with tools and arms, and in 1822 another was sent to Liberia, with sincere hopes. But the perpetual vilification of the free negroes by the managers, advocates and organs of the Society, their anxiety to do nothing to antagonize the slaveholders and their advocacy of the severest "black laws" to force the freedmen into desiring deportation as a refuge, alienated the anti-slavery element, who felt that they were being used as cats'-paws of the slave interest. Even Daniel Webster in 1825 refused to join it, "on that ground, though in 1822 he favored it. By 1830 the Tappans, Gerrit Smith, Birney, Lundy, Garrison and others had withdrawn from it, and the last-named was openly denouncing it. In 1833 he went to England to expose this anti-slavery people there, and they united in a public protest against it. A similar society was organized there, but accomplished nothing. The American society maintained its organization event after the War, though its problem was altered, as well as the Southern attitude toward it. An effort a few years since to promote a large negro emigration to Kansas or Oklahoma was met with strong objection from Southern employers of labor. Consult Wilson, 'Rise and Fall of the Slave Power in America' (Vol. I, Chap. 15); Alexander, 'History of Colonization on the West Coast of Africa' (Philadelphia 1846); Birney, 'Letter on Colonization' (New York 1834); Jay, 'Inquiry into the Character and Tendency of the American Colonization and Anti-slavery Societies' (ib. 1834).

COLONNA, kö-lön'na, Aegidius de, Italian scholastic theologian: b. 1247; d. 1316. He was prior-general of the Augustine order and an ardent realist and disciple of Saint Thomas Aquinas, under whom he studied at Paris.

COLONNA, Fabio, Italian botanist: b. Naples 1567; d. there about 1650. He published several botanical works and is classed as the founder of genera in botany.

COLONNA, Fabrizio, fä-brēz'ë-ô, Italian general: d. Naples 1520. He was the cousin of Prospero Colonna (q.v.) and father of Vittoria, served in the army of Charles VII of France in 1494; in that of Frederick, king of Naples, in 1497; and afterward in that of Ferdinand the Catholic, by whom he was made marquis and constable of Naples in 1507. Subsequently he served in the papal army under Julius II. In 1512 he was made prisoner at the battle of Ravenna by Alfonso d'Este, Duke of Ferrara, who treated him with the utmost respect and kept him prisoner before the Council. To show his gratitude he tried to reconcile Alfonso with the Pope and gave him a safe conduct to come to Rome, but Julius kept him prisoner and attacked his states. Colonna, indignant at this breach of faith, rescued Alfonso
from the papal troops and reconducted him to Ferrara.

**COLONNA, Marco Antonio**, Italian commander: b. 1535; d. 1 Aug. 1584. He commanded the papal forces at the battle of Lepanto and was subsequently viceroy of Sicily.

**COLONNA, Ottone. See Martin V, Pope.**

**COLONNA, Pompeo, pòm-pé' è, Italian ecclesiastic, nephew of Prospero Colonna (q.v.): d. 1532. He was a restless and intriguing Roman cardinal who quarreled in succession with the popes Julius II, Leo X and Clement VII, and had paid in all the troubles of the court of Rome. When Clement VII was the prisoner of the Constable de Bourbon, Pompeo exerted his influence for his liberation. He at length became viceroy of Naples.**

**COLONNA, Prospero, Italian general: b. 1452; d. 1523. On the invasion of Italy by Charles VIII he took part with that prince, owing to his enmity against the Orsini family. He shortly afterward, however, abandoned the French cause and bore arms in the Spanish interest. Among his most noted victories were those gained at Vicenza over the Venetians, 1513, and near Milan, 1522. He also took Milan from the French in 1521, and Genoa in 1522. In 1523 he defended Milan successfully against Admiral Bonivent.**

**COLONNA, Vittoria, Marquise of Pesca-**
cara, Italian poet: b. Marino at Marino castle near Naples 1490; d. Rome, 13 Feb. 1547. She was the daughter of Fabrizio Colonna (q.v.) and when four years old was betrothed to a boy of the same age, Fernando d'Avales, son of the Marchese di Pescara. At 17 they were married. After her husband's death in the battle of Pavia (1525) Vittoria found her chief consolation in solitude and the cultivation of her poetical genius. For seven years she resided at Naples and Ischia, then removed to the convent of Orvieto and afterward to that of Viterbo. In her later days she left the convent and resided in Rome. Her earlier poems were chiefly devoted to the memory of her husband. Among her later verse the 'Rime Spirituali' (1548) is remarkable for truth of sentiment and enlightened piety. Her work is of importance on account of the influence it had on the literary movement in Italy in the 16th century and consequently on that of succeeding centuries. In her day she was called 'Vittoria the Divine,' and the first edition of her works published in 1538 bore the significant title 'Rime della divina Vittoria Colonna.' Since then many editions of her works have been issued both in Italy and in foreign countries. She was the friend of Michelangelo, who wrote several poems to her, and of many of the noted characters of her day. Consult Campori, 'Vittoria Colonna' (1878); Mrs. Roscoe, 'Vittoria Colonna, Her Life and Poems' (1868).

**COLONNA, village in the papal states, which gave its name to one of the most powerful and celebrated aristocratic Roman families. During the Middle Ages the family played an important part in the affairs of Europe, became allied to the greatest houses of Italy, Spain and Germany, and furnished many celebrated warriors, popes and cardinals.**

**COLONNA, Cape. See Sunium.**

**COLONNA PALACE (lt. palazzo Co-**

**Lonna), a handsome and interesting structure at the foot of the Quirinal, belonging to the family from whom it is named, but occupied of late years by the French embassy. It was commenced by Pope Martin V in the 15th century and was the residence of Julius II and of Cardinal Borromeo. It contains a picture gallery, open to the public every day except holidays, which in point of size and architecture ranks with the finest in Rome. The ceiling of the great hall, supported by hands of giallo antico, is covered with frescoes illustrative of the history of the Colonnas, the central subject being the battle of Lepanto. The collection of paintings, formerly numbering 1,362 pieces, has been greatly reduced by division among branches of the family, but still embraces many magnificent works by Titian, Guido, Salvador Rosa, Guercino, Paul Veronese, Giulio Romano, Holbein and Jassar artists. Almost equally celebrated as the picture gallery are the Colonna gardens, which extend below the palace in terraces up the west slope of the Quirinal. They are planted with box, ilex, laur- el, etc., and have long rows of straw houses in which the lemon is brought to rich perfection. There are some colossal ruins in the garden, supposed to belong to the temple of the sun erected by Aurelian, and to the baths of Constantine.**

**COLONNADE, a range of columns. If the columns are four in number it is tetrastyle; if six in number, hexastyle; when there are eight, octastyle; when 10, decaestyle, and so on according to the Greek numerals. When a colonna- de is in front of a building it is called a portico; when surrounding a building, a peristyle, and when double or more, polystyle. The colonnade is, moreover, designated according to the nature of the intercolumniations introduced as follows: Pycnostyle, when the space between the columns is one diameter and a half of the column; systyle, when it is of two diameters; cuscyle, when of two diameters and a quarter; diastyle, when three, and ariste, or equal, when four or more. A colonnade differs from an arcade in this respect, that the columns of the former support straight architraves instead of arches.**

**COLONNE, kò-lōn', Jules Jude ("Édouard"), French conductor and violinist: b. Bordeaux, 1838; d. 1910. He studied at the Paris Conservatory, where he was a pupil of Sauzay, Elwart and Ambrose Thomas. He was awarded the prize in harmony and the first violin prize by the conservatory. He became first violinist at the opera-house, but soon re- signed to undertake a series of Sunday concerts at the Odéon. He introduced the works of Tschaikowsky, Grieg, Wagner and Raff to the Parisians. He was an admirer of Berlioz, whose music he did much to make popular. He visited the United States in 1904.**

**COLONSA, kòl'son-sä, and ORONSA, or'-son-sä, two islands off the west coast of Argyle, Scotland, united at low water, and at high water only about 100 yards apart; united length about 12 miles; breadth varying from one to three miles. Colonsay is more in the latter, and has a diversified surface with fine rock and other scenery and beautiful sandy beaches. On Oronsay are the imposing ruins of an extensive priory and near it a fine sculptured cross. Cat-
tle and sheep are reared and fishing is carried on. Visitors land at Scalasaig pier, on the island of Colonsay. The islands are named after Saint Columba and Saint Oran.

**Colonus**, kō-lō′nəs, an eminence near Athens, to which Ædipus retired during his banishment to Thebes, and from which Sophocles gave the title to *Ædipus Colonus* to one of his finest tragedies. According to Ptolemy, there were two places at Athens known as Equestris and Aegoreus Colonus.

**Colonus**, in civil law, a Freeman of inferior rank, corresponding with the Saxon *ceorl* and the German rural slaves. It has been held probable that many of the ceorls were descended from the *coli* taken into Saxon by the Romans. The names of the *coli* and their families were all recorded in the archives of the colony or district, from which fact they were also known as *ceorli*. The *coli*.

**Colony**, a settlement formed in one country by the inhabitants of another. Colonies may either be formed in dependence on the mother country or in independence. In the latter case the name of colony is retained only in a historical sense. The motives which led to the formation of colonies and the manner of their formation are various. The lust of territory; the requirements of commerce; the desire of increasing wealth, combined with the love of adventure; the necessity of relieving the pressure of redundant population; political dissensions; the convenience of removing to a distance persons likely to disturb the peace of the state, and especially the apparent ease with which a numerous criminal class may be got rid of by expatriations, are among the chief motives which have influenced colonization. Colonization is only a more formal development of the migratory tendency; and a colony may be considered as an organized and permanent migration.

**Colonies among the Ancients.**—Among ancient nations the principal promoters of colonization in the more formal sense were the Phoenicians, the Greeks and the Romans, and the greatest colonizers in modern times have been the English and the Spaniards, next to whom may be reckoned the Portuguese, the Dutch and the French. The Phoenician colonies, extending along the shores and throughout the islands of the Mediterranean, were mainly commercial. The most famous of them was Carthage, itself a great colonizing state. From the distance that divided the daughter communities from the mother states, and the slowness of communication, many of them must have been practically independent from a very early period; but this was not the case with the colonies of Carthage, which wielded powerful armies and maintained great fleets, both for commerce and for conquest. The Greek colonies were widely spread, being numerous in Asia Minor, the Balkan Peninsula and the islands and coasts of the Mediterranean, in South Italy and Sicily. They were commonly independent and frequently soon surpassed the mother states in power and importance. Con- stant rivalry increased the number of colonies. The colonies were all originally Greek colonies. Greek civilization was largely based upon and highly favorable to individual liberty, and the independence of spirit which it fostered made political dissension a frequent cause of colonization. A still more pressing one was the limited extent of the Greek territories and the inviting character of those by which they were surrounded. Rome was a state which left nothing to the individual. Its colonies were chiefly military and while the empire lasted were all in strict subordination. As the Roman power declined the remains of them amalgamated with the peoples among whom they were placed and contributed largely to the homogeneous growth of modern civilization.

**Portugal.**—Before America and the way by sea to the East Indies were discovered, the states of Europe in the Middle Ages, with the exception of the Genoese and the Venetians had no foreign colonies. The intercourse and wars of the Portuguese with the Moors, then more advanced in civilization than most of the European nations, served to incite their rivalry and stimulate them to maritime enterprise, and they became the pioneers of Europe in maritime discovery. The chief of the chief names in this connection is that of Henry the Navigator, son of John I of Portugal. The Portuguese in 1419 discovered Madeira; in 1434 the Azores; in 1436 Bartolomeu Diaz doubled the Cape of Good Hope; and on 20 May 1498, Vasco da Gama landed near Calicut on the Malabar coast, after a voyage round the south of Africa. The Moors had previously been in possession of the inland trade of India and it was not without a struggle that the Portuguese succeeded in establishing settlements on the coast of Malabar. The first Portuguese colonies were formed of garrisons placed along the coasts of the continents and islands they visited for the security of their commerce, as Mozambique, Sofala and Melinda on the east coast of Africa, Ormuz and Muscat, in the Persian Gulf; Goa, Diu and Damao, on the Malabar coast of India. Goa became the capital of their Indian dominions. Colonies were established in Ceylon in 1505; in the Moluccas in 1510; Java, Sumatra, Celebes and Borneo were also colonized, though the settlements there did not attain so great importance. The direction taken by the Portuguese navigators made them miss the next coast to Brazil which was discovered by Cabral in May 1500, a few months after Pinçon, and was colonized by the Portuguese about 1530. The splendid colonial empire of which the foundations were thus laid was not destined to last. As in the case of Spain, the energy of the Portuguese was tampered by climatic and other conditions, and this, together with a despotic colonial policy, had weakened the power of Portugal before she fell in 1580 under the domination of Spain. The colonial possessions of Portugal were afterward assailed by the Dutch as enemies of the Spaniards, and when she recovered her independence in 1640, many of them were irretrievably lost. Brazil declared its independence in 1822. The colonial possessions of Portugal are now mostly in Africa, the whole of her possessions in that continent embracing an area of 793,980 square miles. See Portugal.

**Spain.**—Soon after the Portuguese the Spaniards made their way to America. On 12 Oct. 1492, Columbus discovered the island of San Salvador. Haiti, or San Domingo, named by Columbus Española, was discovered in the course of the same voyage, December
COLONY

1492, and immediately colonized. Porto Rico and Jamaica were colonized in 1509; Cuba in 1511. On the mainland a Spanish settlement was effected in Colombia (New Granada) in 1511. Mexico was colonized in 1519; Ecuador, Venezuela, New Granada, Peru and Chili were occupied and subdued between 1524 and 1541; and Spain was raised to the first rank among the colonizing powers of Europe. The Spaniards regarded their new possessions as vassal states and extended their religion, considered the conversion of the natives as the great end which Heaven had assigned to them. Others were inspired by the love of glory or the passion for gain and scuped at no means by which it was possible to gratify their wishes. Owing to the degraded character of many of the first colonists, who were often mere adventurers and released criminals, the first settlements suffered much from internal strife and confusion. After many dissensions the government of the colonies, in its fundamental traits, was settled in 1532, during the reign of the Emperor Charles V. A council of the Indies in Europe, viceroy, at first two, and afterwards four, appointed by the emperor, as captains-general in America, were the heads of the administration. Cities were founded, at first along the coasts, for the sake of commerce and as military posts; afterward also in the interior. The most celebrated were the ports of Vera Cruz, Cumaná, Porto Bello, Cartagena, Valencia, Caracas; Acapulco and Panamá on the coast of the Pacific; Lima, Concepción and Buenos Aires. The whole ecclesiastical discipline of the mother country was transferred to the colonies, except that in them the Church was much more independent of the king. The intercourse with Spain was confined at first to the single port of Seville, afterward to that of Cadiz, from which two squadrons started annually. Thus, although commerce was not expressly granted by law to a society, it remained nevertheless entirely in the hands of a few individuals. Spain took possession of the Philippine Islands in 1565 and a regular intercourse was maintained from 1572 by the South Sea galleons between Acapulco and Manila; but owing to the great restrictions on commerce those islands, notwithstanding their advantageous situation, were an expense to Spain. From this it appears that the issue of most of the colonizing powers of Europe in respect to the formation of new states; the most unfortunate of all in regard to the retention of her possessions. The causes of the loss of her colonies differed from those which prevailed in the case of the Portuguese. European wars and the decline of her home power were the most important, but they did not so often lead to the colonies falling under other powers, as in the case of Portugal. They more frequently led to the loss of the territory and the opportunity for declarations of independence on the part of the colonies themselves. Thus were formed the republics of Mexico, of Central America, of Venezuela, New Granada, of Ecuador; Peru, the United Provinces of the River Plate, etc.; but as the weak government of the mother country served to promote this early defection, few of the states formed in this unfortunate school have yet attained the repose of settled government. War correction began in Cuba in 1895, and after Spain had in vain endeavored to suppress it the United States interfered. War followed, with the result that after a brief struggle not only Cuba, but also Porto Rico and the Philippine Islands were lost to Spain. See SPAIN.

The Netherlands.—The Dutch, during the struggle for independence, first became the formidable rivals of the Portuguese, then subject to the Spanish yoke. They had already for some time carried on a trade in East India merchandise, between Lisbon and the coast of Europe, but their intercourse with Lisbon was prohibited by Philip II in 1584. The prohibition was revived in 1594 with the utmost severity, and a number of Dutch vessels in the harbor were seized. Excluded from the European trade in the productions of India, they resolved to import directly from India the articles which were refused to them in Europe. Companies were formed, which were united into one by a charter granted 20 March 1602, to the Dutch East India Company, established in 1595. This charter, which was renewed afterward at different times, conferred not only the monopoly of the East India trade, but also sovereign powers over the territories which the company should make, and the colonies which it should establish in India. An entirely new colonial policy was thus introduced, which, instead of political or ecclesiastical aggrandizement, contemplated mere trade as its main object. The Dutch colonies in the East Indies were thus commercial colonies; and the islands of the Malay Archipelago, being more easily defended than the continent of India, became the principal object of the Dutch. This was undoubtedly the chief cause of their colonies being so long in a flourishing condition, as they required only the domination of the sea to maintain them. In 1619 the newly built Batavia was made the capital of the Dutch East Indies. About the middle of the 17th century the power of the Dutch reached its highest point. They effected the establishment of a colony at the Cape of Good Hope in 1652, which afforded an excellent bulwark for their East India possessions, and took Goeram from the Portuguese after a long and sanguinary struggle in 1658. All the Dutch colonies in the East Indies were under the governor-general of Batavia. In 1621 the Dutch also established a West India Company, which at first made extensive conquests in Brazil, but soon lost them entirely (1624–62). Their settlements on some of the smaller West India Islands, as San Eustatia, Curacoa, Saba and San Martin (1632–49), were more permanent. On the continent Surinam, Paramaribo, Essequebo and Berbice were in the hands of the Dutch in 1667. In North America the Netherlands held the valley of the Hudson and pushed south at the expense of the Swedes, winning the present State of New Jersey and Delaware, only to lose them to England. The decline of the Dutch colonial power, partly caused by European wars and partly by the successful rivalry of the English, continued from the end of the 17th century till the French Revolution. On that occasion, the commerce and the colonial importance of Holland somewhat revived and though many of her colonies were lost the value of the remainder was enhanced by improved administration. The Dutch still possess the extensive colonial possessions in the East Indies, including
Java, Sumatra, parts of Borneo, the Moluccas and part of New Guinea; several small islands in the West Indies and Surinam. See NETHERLANDS.

Great Britain.—No colonizing power has had a career of such uniform prosperity as Great Britain. The freedom of her institutions and the practical enterprise and self-reliance of her people peculiarly fitted her for the work of colonization and it has steadily advanced with her equally in peace and in war. Her insular situation freeing her from the ambition of direct territorial aggrandizement and giving her the command of the seas enabled her in every war to strike her opponents of colonial possessions which were not unfrequently retained as the price of peace. The only break in a career of prosperity which has resulted in the formation of an empire greater in extent of territory and of population than any other known to history was the revolt of her American colonies, which resulted in the formation of a state destined ultimately to rival Great Britain herself in political and commercial importance and in the freedom of its institutions. This state, first a result of the war of 1798 with Spain, itself entered on a policy of colonial expansion.

The English made their appearance as a colonial power nearly at the same time with the Dutch, but at first with far inferior success. After many fruitless attempts to find a north-east or northwest passage to the East Indies, English vessels found their way round the Cape of Good Hope to the East Indies in 1591. In 1600 Elizabeth granted a charter to the East India Company. Its commerce with India, however, was not at first important. It established only single factories on the continent, and at the beginning of the 18th century the possessions of the English in the East were limited almost exclusively to Madras, Calcutta and Bencoolen. The ruin of the Mogul empire in India, which commenced in internal disturbances after the death of Aurungzebe (1707), and was completed by the incursions of Nadir Shah (1739), afforded the opportunity for the growth of British power, as the British and French were compelled to interfere in the contentions of the native princes and governors. The success of the Dutch at Du plex, appeared at first likely to maintain the superiority; but the British succeeded in acquiring the ascendency in the Carnatic; and in the middle of the 18th century they greatly extended their dominions under Clive. By the destruction of Pondicherry they secured their superiority on the coast of Coromandel; and the victory of Clive at Plassey, 23 June 1757, laid the foundation of their exclusive sovereignty in India. By the Treaty of Allahabad, 1756, 21 June 1755, Bengal and Oude, with the conquests of Nadir Shah, was divided between the British by the titular Great Mogul; and the fall of the empire of Mysore, the dominions of Hydra Ali and Tipoo Sahib, may be considered as completely establishing the British supremacy in India. The Maharratas, with whom the British waged war at intervals from 1775 to 1818, and the Sikhs, subdued in 1849, were the last formidable enemies of the company. With the exception of a few dependent states the British territory in India, throughout the whole of India, and this vast territory was still under the government of a chartered mercantile company, exercising many of the most important functions of an independent sovereignty. On the suppression of the Indian mutiny (1857–58) this state of things was deemed too hazardous to last and the government of India was transferred to the Crown by act of Parliament in 1858. Ceylon was first occupied in 1795–96. The discoveries of the Cabots, following soon after the voyages of Columbus, gave the English Crown a claim to North America, which in the reign of Elizabeth led to colonization on a large scale. In 1606 James I divided the territory claimed by England into two parts — South Virginia, extending from Cape Fear to the Potomac; and North Virginia, from the mouth of the Hudson to Newfoundland. Two companies were formed for the colonization of America — the London Company, to which was granted South Virginia; and the Plymouth Company, to which was granted North Virginia. The region between the Potomac and the Hudson was neutral ground. The London Company in 1607 founded the commonwealth of Virginia by building Jamestown on the James River, so called in honor of the king. A House of Burgesses, the successful result of the war of 1689, was first time on 19 June 1619, and thus was constituted the beginning of representative government in the British colonies of America. In 1614 Capt. John Smith, having examined the coast from the Penobscot to Cape Cod, named the country here New England. The next permanent settlement on the North American coast was effected in this district by the body of Puritans, known as the Pilgrim Fathers, who sailed from England 6 Sept. 1620, in the Mayflower, and arrived 9 November in Massachusetts Bay. The government of this colony was that of a religious oligarchy. Another colony was established in New Hampshire in 1623, and in the same year Maine, which had previously been colonized by the French, received its first permanent English settlement. New Jersey was colonized in 1634. Connecticut was colonized in 1635 by emigrants from Massachusetts. Rhode Island was settled in 1636. Samuel Champlain, the French navigator, was the first European who entered the region now forming the State of New York (1609). In the same year Henry Hudson, an Englishman in the service of the Dutch East India Company, discovered the river to which his name has been given, where Dutch settlements were effected and gradually spread. The English, who claimed this territory as included in the Scottish possessions of James, Duke of York (James II), to whom Charles II had made a grant of the province. In 1670 the charter of the Hudson's Bay Company was granted, by which the mouth of Hudson Bay and whose waters discharge into Hudson Bay — a territory as large as the whole of Europe—was declared to be the property of the company, the rights to which were only finally extinguished in 1869. In 1681 the province of Pennsylvania was granted to William Penn, who colonized it with Quakers, and founded Pennsylvania in 1682. The first settlement in Maryland was made in 1631 by a party from Virginia. In 1633 a colony of Rhineland Dutch was received into Great Britain. The country south of Virginia was permanently settled in 1670 by a party of
English colonists who landed at Port Royal and afterward removed to Charleston. The colony was called Carolina. Georgia, originally a part of Carolina, was granted by George II, after whom it was named, to a colony from England in 1732.

Colonies were early established in the West Indies, including Barbados, half of Saint Christopher's (1625) and soon after many smaller islands. Yet the West India possessions did not become important as plantations until the sugarcane was introduced into Barbados in 1641 and into Jamaica in 1660. This island had been taken from the Spaniards in 1655. The cultivation of coffee was introduced into the West India Islands in 1732. Newfoundland was taken possession of by the English in 1583, and colonized in 1621 and 1633.

Canada was surrendered by France to Great Britain at the Peace of Paris in 1763 (see section on French colonies below). In 1764 began the dispute between Great Britain and its North American colonies, on the question whether the former had the right to impose taxes on the colonies when they were not represented in the British Parliament; and on 19 April 1775 commenced the war which terminated with the acknowledgment of the independence of the 13 provinces. Though the United States thus entered on their independent career, Canada still remains as a great and flourishing state embracing large portions of the land surface of the globe, and a rather larger proportion of its population. The whole of the British colonial possessions have been grouped in about 40 administrative divisions and they are situated in every quarter of the globe. See GREAT BRITAIN.

According to their governmental relations with the Crown the colonies are arranged under three heads: (1) Crown colonies, in which the Crown has the entire control of legislation, while the administration is in the hands of public officers under the control of the home government; (2) colonies possessing representative institutions, but not responsible government, in which the Crown has no more than a veto on legislation, but the home government retains the control of public officers; (3) colonies possessing representative institutions and responsible government, in which the Crown has only a veto on legislation, and the home government has no control over any officer except the governor. All colonies are, however, disabled from such acts of independent sovereignty as the initiative in war, alliances and diplomacy generally.

France.—France was somewhat late of entering fully upon a colonial career, being retarded by internal dissensions and religious wars. Between 1627 and 1636 Pierre Belain d'Esambuc colonized Saint Christopher's, Guadeloupe and Martinique. Champlain was the pioneer of the French in the exploration of the North American continent, where they soon had considerable possessions, including Canada—in which they had settlements as early as 1604-05, and where Champlain founded Quebec in 1608—and Louisiana, colonized in 1699. Commercial companies were then deemed essential in colonizing, and a West India Company and an East India Company were established by Colbert in 1664. He purchased on several West India Islands, as Martinique, Guadeloupe, Saint Lucia, Grenada and others, settlements already formed by private persons, and sent out colonists in 1664 to Cayenne. But the settlements in part of San Domingo, by the buccaneers, became of more importance than those effected by the government. The West India Company's colonies lasted only 10 years. The East India Company, after fruitless attempts to form a colony in Madagascar, founded Pondicherry on the Coromandel coast in 1668. This became the capital of extensive French possessions in the East Indies. The French also acquired Bourbon (Réunion) in 1649 and the Isle de France (Mauritius) in 1715. At the beginning of the 18th century France had attained an important position as a colonial power. In North America her settlements extended from Canada to California, particularly along the Great Lakes and the Mississippi River, embracing many districts which have since become of the highest importance. Nova Scotia was established as a British colony in 1643. The Guinea Coast settlements date from the 17th century. Extensive spheres of influence have been recently acquired, being partly developed by chartered companies.

In Europe Great Britain has only two possessions of the nature of colonies, acquired for military reasons: Gibraltar in 1704; Malta and Gozo, 1800.

It is estimated that the existing British colonies and dependencies embrace fully one-fifth of the land surface of the globe, and a rather larger proportion of its population. The whole of the British colonial possessions have been grouped in about 40 administrative divisions and they are situated in every quarter of the globe. See GREAT BRITAIN.
long and gallantly maintained, and more than once seemed to promise a different issue. The North American colonies were partly lost by conquest and partly suffered to fall into decay. Of the rest, Great Britain possessed several which were taken by Great Britain and finally ceded to her. Canada was finally ceded to England in 1763; Louisiana, after being surrendered to Spain, to prevent it from falling into the hands of the English, was sold by Napoleon to the United States in 1803. At the general pacification of 1815 France recovered some remains of her colonial possessions, and since then she has acquired extensive regions beyond sea, some of them highly valuable. She occupied in 1830 and began in 1833 to colonize Algeria, a country whose irregular and lawless government had exposed her as well as other European states to frequent annoyance. Tunis, Senegambia, great tracts of the Sahara, Sudan and Congo regions, the islands of Madagascar and Réunion are all comprised in France’s African possessions, while in Asia she possesses a large portion of the Indo-Chinese Peninsula, and in America French Guiana. Some of the French colonies are represented in the National Assembly by members chosen for the purpose. See FRANCE—COLONIES.

DENMARK; UNITED STATES; SWEDEN.—Denmark established an East India Company in 1618 with a view to enter on the colonial trade; and other companies were afterward formed. In the same year, the colony of Tranquebar was founded on the Coromandel coast. Its success was fluctuating, like that of the companies managed to form it, and at last, in 1845, it was sold to the East India Company. Saint Thomas in the West Indies was settled by the Danes in 1672; Saint John and some of the smaller islands in the same group (the Virgin Islands) were also occupied by them. The island of Santa Cruz was purchased from France in 1733. By a treaty signed 4 August 1916, the West India islands belonging to Denmark passed into possession of the United States at the purchase price of $25,000,000. Formal transfer took place on 31 March 1917, and the islands are now called the Virgin Islands of the United States. Sweden established an East India Company in 1741. She acquired the island of Saint Bartholomew from France in 1785, but restored it in 1878, and has now no colonies.

GERMANY.—A German historian of the colonial movement dates his story from the end of the Crusades, while another, not to be outdone in the national virtue of thoroughness, seek its origins in pre-Christian annals. For practical purposes, the German colonial movement, as we know it to-day, is barely over 30 years old. There were genuine if tentative efforts at colonization as early as the 17th century, when the Great Elector of Brandenburg established settlements on the west coast of Africa. Earlier still the Hanseatic Towns would have traded with foreign territories had they been able. The 19th century, however, was one of the most eventful in Germany’s and Germany’s dreams of world-conquest and colonization were dispelled when Frederick William I of Prussia (1713-40), more concerned to assure his sovereignty at home, abandoned the Great Elector’s settlements. The new policy was shared by Frederick the Great (1740-86), who considered all distant possessions a burden to the state and a village on the frontier worth a principality 250 miles away. Nearly a century and a half was to pass before the colonial question again seriously engaged German politics. Germans are in the habit of dating the modern movement from 1874, when Great Britain annexed the Fiji Islands, in which German trade had long flourished. This incident, however, was in no way connected with the German spirit, but about this time the explorer, Gustav Nachtigal (1834-85), visited various parts of Africa, carrying presents to native chiefs from the German Emperor, though he made no attempt to acquire territory. At this time while great portions of Africa were being brought into the British sphere of influence there was no appreciation of colonial aims in Germany, and all the nation’s effort was directed toward developing at home the advantages which had followed from the successful war with France. It was only in 1883 that the first colonial society, the Kolonial Verein, came upon the scene. Up to then there was no systematic colonial enterprise and no organized colonial policy in Germany. It was the Bismarck, who governed since 1871, who gave to Germany her earliest colonial possession. In 1882, by treaties with native chiefs, he acquired land in the Bay of Angra Pequena, on the southwest coast of Africa, and he pressed the home government to support his claim. For a time nothing was done, until the claims of Herr Luderitz were disputed by agents of the British Crown. Luderitz’s appeal for protection roused Bismarck’s interest, and he formally annexed Luderitzland. This gave Germany the coastline extending from the Orange River to Cape Frio, exclusive of Walvis Bay. What happened in Southwest Africa happened, too, in the Northwest. German claims to territory on the Cameroon River led likewise to disputes, and here also Bismarck cut the Gordian knot instead of waiting for it to be unraveled. In the Pacific German settlements had been established since 1880 for trading purposes on the north coast of New Guinea, as well as the New Britain Islands, the German flag was hoisted in the winter of 1884. These two new acquisitions were promptly renamed, the one being called Kaiser Wilhelm’s Land and the other Bismarck Archipelago. The following year saw fresh annexations in East Africa, to develop which a wealthy company was formed, and in the Pacific the Marshall Islands and part of the Solomon group were also acquired. The treaties under which Germany declared a protectorate over the East African regions were concluded by Dr. Karl Peters, an ardent colonial pioneer, who entirely subordinated means to ends. Each of these annexations served as a starting point for large extensions of territory, so that after two years of diligent search and salvage amongst the still unregarded regions of the African continent and the Pacific, Germany found itself in possession of a colonial empire having an area of 377,000 square miles and a population of 1,750,000. Bismarck never had great faith in colonies, his policy being consolidation at home, and he only gave his consent to the expansionist policy when he knew the country to be behind him, his successor, was hostile to the colonial movement.
and it was not until he fell that the traditions of colonial expansion were revived under Prussia. It is then that the Caroline Islands were annexed in 1899, also the Pelew and Marianne groups. In the same year the Samoan Islands were brought under the German flag; already in 1897 Kiao Chau had been wrested from China. The total area of German colonial possessions in 1914 was 1,027,820 square miles, with a white population of 24,389 and a native population of 12,041,603. In the course of the European War one after another of her colonies became lost to Germany. Togo was taken by combined British and French forces on 7 Aug. 1914. Cameroon was conquered by French and English troops on 18 Feb. 1916. South West Africa fell to the South African forces of General Botha on 9 July 1915 and is administered by the Government of the Union of South Africa. East Africa was occupied during the war by British, Belgian and Portuguese forces and was finally conquered in 1917. Kiao Chau fell to combined Japanese and British forces on 7 Nov. 1914. In 1918 all German colonial possessions except those captured by the Japanese shortly after the outbreak of the war in 1914 and were handed over to the Australian forces. The islands south of the equator are administered by Australia, those north of the equator by Japan, and Samoa by New Zealand. German colonial administration has not been happy in its methods nor yet in its officials. The principle laid down by Bismarck was soon departed from: the trader, having obtained protection, went back to his plantation, his compound, his stores; he certainly was not urged to play any part in the government of his colony; gradually the whole system of Prussian bureaucracy was introduced in each of the colonies, large and small. The secret of the administrative order that reigns at home is "system," and it was taken for granted that if sufficient "system" were introduced into the government of the colonies the same results would follow. Furthermore, far too little regard was paid to native customs and traditions of life. Instead of studying native law systematically and regulating administration in each colony according to its peculiar traditions, all colonies alike were governed according to set Prussian legal maxims interpreted in a bureaucratic spirit by jurists with little experience of human nature, and none at all of native usages. The choice of officials was also unfortunate in a majority of cases; the colonies being regarded as relief institutions for the benefit of men who had failed at home. It was declared from the throne in 1888 that it must be a solemn duty of the Empire to "win the Dark Continent for Christian civilization." Not much Christian civilization, or civilization of any kind, was carried to the colonies. Stories of slavery, violence, cruelty, illegality and lust, committed both by officials and planters, were reported only too frequently by missionaries and clean-handed men in the colonial service, who could not see these things and be silent. The use of force by the German Empire in the Ruhr against the native was constantly advocated with a daring frankness. In South West Africa the Hereros were decimated by the armed forces of Germany. General von Trotha wrote in his proc-

Colonization of 2 Oct. 1904: "The Herero people must leave the land. If it refuses I shall compel it with the guns. Within the German frontier, every Herero, with or without weapon, with or without cattle, will be shot. I shall take charge of no more women and children, but shall drive them back to their people or let them be shot at. The leader of the German People's party in the Ruhr said before that body on 24 March 1906 that "The legal position of the blacks is miserable in the extreme. The honor of the German name suffers under this absolutely arbitrary system. We have lost the sympathy of the black race." The Great War has brought about the loss to Germany of its colonial possessions acquired within the memory of the majority of men living. On the colonial record of Germany as on many other records of that nation must be written in large letters the word failure.

Italy.—Italy has also shown the same ambition, and has established the colony of Eritrea on the African side of the Red Sea, between it and Abyssinia, in Somaliland; and as a result of the war with Turkey in 1912 acquired Tripoli.

The colonial policy of paternalistic countries as Spain, Portugal and France naturally differed from that of commercial and industrial nations like England and Holland. In the former the expense and risk of colonizing was borne by the government, who retained direct control over the colonies and their productions; but in the latter the work, being too much for individual enterprise, was entrusted to companies, whose charters conferred on them not only exclusive privileges in regard to trade, but also extensive powers of conquest and administration. In respect to trade a very exclusive and jealous policy long prevailed, but since the adoption of a free-trade policy in Great Britain the whole trade of her colonies has been thrown open without reserve, as far as the privileges of the mother country are concerned, to the competition of foreign nations. Other countries, while not following her commercial policy entirely, are relaxed more or less the stringency of the regulations affecting their colonial trade. See America, Colonization and Discovery; Canada—Era of Early Discoveries; Colonies and Colonization; Imperialism.

**COLOPHON** (Gr. Kolophon, "summit"), an ancient Ionian (Greek) city of Asia Minor situated at a short distance from the coast and about 15 miles north of Ephesus. Its inhabitants were removed by Lysimachus after the death of Alexander the Great. Colophon was one of the places that claimed to be the birthplace of Homer. It was the native city of Mimnermus and other poets. Its site was discovered at 1887 by the German explorer Schuchardt and Wolters. Proverbially Colophon came to mean "a finishing stroke" because of the many instances in which the city's cavalry carried the day. The word took this proverbial meaning in Latin and was used by early printers as the imprint at the close of a volume; commonly used before the introduction of the title page. See next article.

**COLOPHON, köl'ō-fən**, an inscription at the *Finis* of a book, giving the printer's name and date and place of printing; in the early days of printing nearly all books had colophons. Usually they are ludicrous in the extravagant claims the printers made for the unapproachable excellence of their handiwork; but some are modest and dignified, while a few are pathetic, showing the hard struggle made by masters of the noble craft for a bare subsistence.

**COLOPHONIUM.** See Rosin.

**COLOPHONY, a name formerly used for common rosin (q.v.), but now found only in books.**

**COLOQUINTIDA.** See Colocythis.

**COLOR.** Color may be studied objectively as a wave phenomenon (see LIGHT), in its psycho-physiological aspect as a retinal stimulus (see Vision), or, subjectively, as an appearance or ocular sensation; this last is the viewpoint of the present article.

Isaac Newton ('Philosophical Transactions,' No. 80, 1672) was the first to show that white light (sunlight or daylight) may be resolved into elemental colored lights or rays which cannot be further decomposed, but which, on being superposed form white light. The question whether sunlight contains these colors in the form of a mixture analogous to a mixture of, say, nitrogen and oxygen gases in the air or is a compound, as water is of hydrogen and oxygen, belongs to physics. Newton adopted the first point of view; at the present time the second is gaining favor. The elemental lights, distinguished visibly by their colors, are seen in the sparkle of a diamond, in soap-bubbles, in a film of oil on water, by looking at one's eyelashes through nearly closed lids, and in many other phenomena discussed in physical optics under the names dispersion, interference, absorption, polarization, fluorescence, diffraction, refraction. They are called spectrum colors or "colored light"—and are monochromatic, i.e., they consist of single colors (colored lights or rays) that are elemental in the sense in which this term is used in chemistry. We are accustomed to think of the spectrum as having only six colors: red (R), orange (O), yellow (Y), green (G), blue (B), violet (V); Newton named a seventh, indigo, situated between B and V. But the number of colors is enormously great; Aubert ('Physiologie der Netzhaut,' 1865) estimated the solar spectrum to contain about a thousand distinguishable hues, of which, according to Rood ('Modern Chromatics,' 1881) 2,000,000 tints and shades can be distinguished. However, these differences cannot be seen in situ in the spectrum because the color areas are too small. Luckiesh ('Color and its Applications,' 1915) states that 55 distinctly different hues have been seen in a single spectrum.

**Color Sensation.**—Color is a sensation produced through the excitation of the retina by rays of light. Thus black (BK), black and white (W) are color sensations, although BK is due to B alone and W to complete, stimulus. The infra-red rays—below the red end of the spectrum—and the ultra-violet—beyond the violet end—are invisible. Heat is the principal effect of the infra-red and chemical action, as on a photographic plate, that of the ultra-violet rays. To the physicist all of these visible and invisible emanations are regarded as electromagnetic waves differing essentially in wave length alone. All have chemical and thermal effects but only some give to the eye the sensation called color. Although none of the spectral colors can be resolved into others, some can be imitated to the eye by combinations of others. Combinations of R and V produce purples which are not in the spectrum at all; such compounds are nevertheless resolvable into their constituents by spectroscopy. Two colors not distinguishable to the eye may have quite different compositions. For example, a solution of potassium dichromate and one of potassium dichromate and neodymium ammonium nitrate in suitable proportions impress the eye as having precisely the same yellow color; but whereas a mercury arc light will look yellow on being viewed through the first solution, it will look brilliant green through the second. No one can be monochromatic, yet it is possible in many cases to match spectral colors by means of pigments. Color to the eye is therefore not color in the sense of being one definite constituent of white light. Since color is entirely subjective it must be influenced by personal idiosyncrasy; indeed some people are color-blind and cannot, for instance, tell red from green. (See Vision.) On the other hand, santonin poisoning produces, in otherwise normal people, a pathological condition called chromopsia, in which the sun and the sky are yellow. In short, the eye is unable to analyze color in the way that the ear can detect the component tones in a chord.

**Color Constants.**—Artists speak of cold, warm, advancing, and retiring colors. By warm are meant red, orange and yellow of the purest shades; by cold are meant green, blue, violet, indigo, purple. If the latter tend to advance, the former tend to recede; but there is a tendency toward them; it has no connection with heat, but is suggested rather by the luminous glow of sunlight. An advancing color
COLOR

The reader may easily experiment with the excellent colored coated-papers suitable for the purpose, various colors of which can be obtained in black, white and in 18 spectral hues, with two tints and two shades of each. Color has three characteristics: hue, purity or saturation, and luminosity or brightness. Hue is color per se, such as blue, pink, black, etc.; purity depends on freedom from admixture with white; only monochromatic colors are saturated. Luminosity depends on the amount of light given by the color. A tint is a departure from a normal or dominant spectral hue in regard to purity, i.e., tints are whiter than the arbitrarily selected normal. A shade is darker than the normal and may be produced by decreased illumination or by the addition of black. It must be clearly understood that luminosity does not affect purity; a tint cannot be made to look as saturated as its normal merely by decreasing the illumination, thus pink never looks red in a subdued light. A compound color can be defined accurately only in terms of the characteristics of its monochromatic components. But every color, simple or compound, except purple, can be matched so far as the eye is concerned by a tint or a shade of some simple spectrum hue.

Color constants are measured with a spectrophotometer, which is a combination of a spectroscope with a photometer. The spectroscope produces an ordinary white-light spectrum, one narrow transverse band of which can be passed through the photometer; at the same time white light of any intensity is superposed on this colored band. The colored light which is to be examined—in the case of a colored surface the light reflected by it—also passes through the photometer and forms a field next to the combination of spectral ray and white light. By selecting the proper hue of the spectrascope, controlling the added white and adjusting the result until it matches in color and brightness the light to be examined, we can determine hue, saturation and luminosity. Descriptions of instruments and full references are given by Luckiesh. The following are typical results; they will vary with the reflection coefficient of the surface, i.e., with the relative amount of white light it reflects. The wave lengths of the hues are expressed in microns; 1 micron = 0.001 millimeter. The columns headed "per cent white" give the amount of white light which had to be added to the normal spectrum hue to reduce its saturation.

These results are color matches rather than color analyses. They show, for example, that highly colored butter, manila paper, chrome yellow paint, the nitrogen and tungsten lamp and the carbon arc light are all of about the same hue and differ only in purity and brightness, i.e., they are tints and shades of one another. As the three observers did not use identical light sources in their experiments, the purities in the tables are relative. The following values from Hunter ('Color,' p. 17) give a rough idea of the luminosity of, or the amount of white light reflected by, various pigments in terms of white paper as a standard.

### Pigments

<table>

</tbody>
</table>

On comparison with the first table it is seen that although vermilion is very pure, very nearly saturated, it reflects comparatively little light. The two sets of numbers are quite independent and express two different characteristics of color.

### Color Analysis

Analysis of a compound color is used here to mean separation into spectral components. For example, French ultramarine is a fair match to what is regarded as the typical spectral blue of wave length 0.472 microns; both give rise to the same sensation and are therefore physiologically identical, yet the spectrum ray is monochromatic and the pigment decidedly complex. If the light reflected from a colored surface is analyzed spectroscopically it is found to contain all the spectrum hues in varying intensity.

The following diagrams, adopted from Luckiesh, give spectroscopic analyses of certain pigments. Vertical distances indicate the relative intensities with which the wave lengths along the base are reflected and correspond to luminosities in the absorption spectra. The area under a curve measures the luminous value of the pigment itself. White is a horizontal line at greatest height because it reflects all colors equally; black reflects none and therefore is chosen as the base. Gray would be some intermediate horizontal line. No analyses of mixed pigments are as yet available, but it is hoped to predict the exact form of the resultant curve. However, we can arrive at approximate results. According to the diagrams a surface painted
with cadmium yellow will look intensely yellow when illuminated with monochromatic yellow light, orange in orange light, red in red and green in green, but in blue or violet light it will be grayish. French ultramarine will be violet, blue, green in corresponding illuminations but grayish in yellow, orange, red. The only color which cadmium yellow and ultramarine both reflect is green, the others being largely but not entirely absorbed. The green produced by a mixture of these two pigments although far from being monochromatic is much more nearly so than the pigments themselves. But its luminosity has been considerably reduced by absorption; in fact a mixture of monochromatic blue and yellow pigments would be black be-

place and on the remainder reflected after absorption. Ogden Rood found that non-monochromatic yellow light looked bright green on Prussian blue and white on ultramarine. The Prussian blue had evidently absorbed all but the green component that must evidently have been in the yellow, while, as will be seen later, the ultramarine had absorbed all but the monochromatic yellow component. In the first case green was the dominant hue reflected, in the second case it was yellow plus blue. This shows that the parts played by absorption and reflection are difficult to predict.

Additive Combinations.—Combinations of colors are always combinations of spectral lights whether they are made additively by direct superposition of the components or subtractively by absorption as in a mixture of powders or solutions. When red and green spectrum rays are thrown upon a white surface both colors are simultaneously reflected to the eye and give the sensation of yellow; on the other hand a mixture of red and green paints will in certain proportions give a gray which may be reddish or greenish, but never yellow, because together they subtract from the white light (daylight, etc.) which illuminates them all colors except those whose combination impresses the eye as gray. Such apparently contradictory results have been the source of many absurd controversial theories of color. There are facts about color and theories of the psychophysiological processes of color perception but no theories of color other than chemical theories of molecular grouping.

Colors may be added in several interesting ways. Fine lines alternately red and green or blue and yellow, etc., ruled close together on white paper and examined from a distance through the large end of opera glasses so that the individual lines are not distinguishable give the eye the simultaneous sensations whose effect is quite different from that of the corresponding pigment mixtures. This method was used by Miles as early as 1839. It may be performed also by painting one end of a pack of papers with one color and the opposite end with another and then reversing alternate papers; or otherwise by stippling points of different hues on a white surface, or by using the color-wheel described later. Artists often employ the stippling process with beautiful results because the surface so treated fluctuates in hue according as one or another of the components momentarily predominates by reason of the varying degrees of fatigue of the color nerves in the retina. It has been found experimentally that all hues can be produced by suitable combinations of three physiological primaries: monochromatic red, green, blue (or violet). Thus red plus green in different proportions produce additively all the hues from red through orange, yellow — green; red plus blue give violet, red — violet — blue — violet — blue — blue plus green produce blue — green — green — blue; red plus green plus blue in certain proportions give white, in others they reproduce colors obtained from pairs of the primaries. This is the first of a series of phenomena that can be accounted for only by studying the subjective effect of color. It is strikingly illustrated by the Lumiére, Joly and Ives-Cros processes of color photography (see
COLOR PHOTOGRAFHY), in all of which three photographs taken through red, green and blue filters are dyed with these respective colors and then presented simultaneously to the eye. Ives and Cros used three separate filter screens, Joly ruled a single one with lines alternately red, blue, green, and Lumière formed the screen directly on the sensitized plate by spreading it with a thin paste containing potato starch grains, some of which were stained red, some green and some blue.

The reasons for the facts in the above group are unknown. But by assuming a certain functioning of the retina we can form a theory which will correlate them. Like every theory this is outside of the region of fact and non-fact and is simply a mechanistic formula by means of which a whole class of phenomena can be stated in terms of a selected few. The Young-Helmholtz method of explaining color vision (see Vision) hypothesizes the existence of three sets of nerves in the retina: one is strongly stimulated by the red-orange end of the spectrum and less by the rest, another by the yellow-green region and less by the ends and the third by the violet-blue end and rapidly less as we approach the red end. It is then assumed that when all three sets of nerves are acted on in about the same degree the sensation of white is produced because it is a fact that red plus green plus blue does produce white. Consider now the superposition of yellow and blue lights; according to the theory yellow stimulates red and green because red plus green equals yellow. Therefore yellow plus blue equals red plus green plus blue equals white. This does not tell why yellow and blue cause white but it enables us to predict it without experiment. If however it can be shown directly or indirectly that the eye really does contain such nerves the Young-Helmholtz theory at once enters the realm of fact. It may be interesting to note that the whitening of linen and cotton fabrics by bluing in the laundry consists in adding hardly perceptible traces of indigo or Prussian blue to the ivory yellow tint to which they revert after being washed; it is essentially not a bleaching process.

Maxwell’s color wheel affords a simple and interesting method of experimenting with additive combinations. It owes its present form and use to J. C. Maxwell although it was known to the astronomer Ptolemy in the 2d century and was rediscovered by the Dutch physicist Musschenbroek in the 18th. A smooth, stiff pasteboard disc graduated at its circumference into 25, 50 or 100 parts is mounted on the shaft of a small electric motor which can be operated by a single dry-cell. A circular piece of paper painted, for instance, half vermilion and half ultramarine is pasted over the shaft against the disc and a small wooden sleeve is then forced on so that paper and disc may turn with the axle when the motor runs. When the painted disc turns red and green are presented alternately to the eye and if the alternation is rapid enough and the place of the other before the retinal impression of the latter has vanished then both stimuli act at the same time. The resultant color will be yellowish: not pure yellow, because the eye's sensitivity is not equally distributed. Maxwell introduced single-colored discs, each perforated at the centre and slit along a radius; two or more such discs can be slipped over one another and adjusted to expose to view sectors of any desired angle. They may be cut out of the Bradley colored coated-papers;

![](https://example.com/maxwell-wheel.png)

A complete set will consist of the following colors: red, orange, yellow, green, blue, violet, black, white and neutral gray and should be made in two sizes, one about twice the diameter of the other. Dividers, into one leg of which a needle sharpened to a chisel edge is set, form a convenient instrument for cutting circles. If the motor is small the discs should not be much more than two inches in diameter, otherwise air resistance will retard the rotation enough to produce flicker. This resistance varies as the fourth or fifth power of the diameter depending upon whether the speed is low or high, and is therefore 16 to 32 times as much for a four-inch disc as for one half the size. The discs must be put together so that the radial edges do not catch the wind.

Very instructive experiments may be made by putting together a colored disc with a black, a white or a gray one. The brightness or luminosity of a color may be diminished by rotating black with it; this produces a shade such as would be seen in lessened illumination but does not reduce the hue or the saturation. The saturation may be lowered by using a white disc; the resulting colors are tints. But if a neutral gray and a colored disc of equal luminosities are rotated simultaneously the saturation will be lowered without change of hue or brightness. In short, black absorbs all colors and therefore changes only the amount of light reflected from the composite disc; white reflects all and, in effect, adds the physiological primaries to the disc; gray may be regarded as a mixture of black and white (or also, as will be seen presently, of other pairs) and is thus more luminous than black and more saturated than white. Ogden Rood succeeded in matching almost 500 colors with combinations formed of seven discs painted with the following watercolor pigments, the numbers in parentheses being the wave lengths, in microns, of the corresponding spectral hues: matt white (zinc oxide), matt black (thiophthal black), vermilion (0.644), mineral orange (0.614), light chrome yellow (0.585), emerald green (0.521), artificial ultramarine (0.425). His formulas are given in the 'Standard Dictionary' under spectrum. The wave lengths in nanometers of Bradley's colors are: red, 0.657; orange, 0.608; yellow, 0.579; green,
COLOR

0.516; blue, 0.409; violet, 0.421. Consult also Bradley, Milton, 'Elementary Color' (1895).

Some pigments produce gray which must be regarded as a shade of white, or so to say, as a dark white, due to the comparatively low luminosity of the pigments; the corresponding spectral hues, being monochromatic and of greater brightness, produce real white. Two colors whose addition produces white are called physiological complements; their number is unlimited. Physiological complements depend of course upon the source of illumination, for if the subdued white which they produce in daylight be examined in some other illuminant it will partake of its color. Additive combinations in general tend toward white; if actual lights are superposed the luminosity of the resultant equals the sum of the luminosities of the components, but on the color wheel the resultant has a luminosity equal to the average (weighted mean) brightness of the sectors.

When the eye is stimulated to fatigue by any hue, say red, its complement is subjectively called up because the eye then sees all the constituents of white except red. Now since red and green make white, and all the spectral hues together also make white, white minus red equals green; that is, green is complementary to red.

Subtractive Combinations.—When two pigments are mixed each subtracts from white light those elements it cannot reflect. The resultant hue is therefore never identical with the corresponding additive mixture and is usually entirely different. It was known to antiquity that any color may be fairly matched in hue although not in purity by proper mixtures of yellow, blue, red. These are the pigment primaries and to them white and black must be added to lighten or darken the hues to be produced. The production of all colors by combinations of the subtractive primaries is beautifully illustrated in the three-color process of printing in ink reasonably faithfully copies of paintings (see illustrations accompanying the article, Process). A mixture of yellow, blue and red in about equal intensities gives the effect of black because they absorb practically all the constituents of white light. If this black is spread thinly as a tint it becomes gray. In general, mixtures of pigments tend toward blackness on account of the absorption of color and thus of light.

Pigment primaries have complementsaries; thus red and green, purple and yellow, blue and orange are complements and produce black or gray according to the density of the mixture. This gray is to be regarded as a tint of black, that of additive complements as a shade of white. The difference between the grays is of the utmost importance and is by no means a verbal quibble. A small amount of a color added to its complement dulls or grays the latter; such grayed hues are among our most beautiful colors and are used with wonderful effect, for instance in textile fabrics and pottery. Unusually handsome charts illustrating pigment mixtures have been prepared by commercial firms of Boston and New York.

Contrast and Harmony.—The effect which two colors have in modifying each other’s hue when they are placed in juxtaposition has been determined with reasonable certainty. It can be studied by putting colored strips of paper next to each other or by placing a small piece on a larger one. The general result of such experiments is that each color becomes tinged with the complement of the other, or rather is moved nearer the complement. The diagram above was invented by Rood for predicting these changes. Diametrically opposite colors are physiologically complementary. If yellow and red are placed side by side the hue of each shifts around the circle toward the complement of the other, i.e., yellow becomes greenish, red becomes more violet or less red. In the case of red and blue, the red becomes tinged with orange and the blue looks greenish, the complements intensify each other. Whether or not these effects are agreeable depends on idiosyncrasy and circumstance. Red makes yellow look greenish; this may be pleasant or not — or neither — in; say, a wallpaper design. But a sallow-complexioned woman does not wear a red dress unless she wants to look bilious; green clothing would make her look ruddier unless some of the green were reflected to her face, in which case red would have been better. The question is not quite as simple as Rood’s circle, for the influence of the complement is not evident when two equal areas are separated by any third color; furthermore, a small area has no noticeable effect on a much larger one. Chevreul, Rood, Church, Bruere and others have found from examinations of paintings, ornaments, etc., of generally accepted beauty that the following pairs and triads are considered to be harmonious and pleasing:

- Good pairs: red, blue; red, blue — green; orange, green — blue; yellow, violet; yellow, black.
- Good triads: red, yellow, blue; red, yellow, green — blue; orange, green, violet; white, yellow, violet.
COLOR IN ANIMALS—COLOR-BLINDNESS

The following are to be regarded as bad:

Bad pairs: green, blue; yellow, green; violet, red; violet, blue; crimson, orange; orange, yellow.

It will be seen on comparing these combinations with the diagram that colors which do not go well together, e.g., green and blue, are adjacent in the circle while good pairs and trichromy, yellow, green, are separated. Tints, shades and grays, being less colorful or vivid, form less offensive combinations and are easier to harmonize. By generalizing the foregoing results we arrive at some of the various methods of harmonizing colors; they show rather how to avoid discord than to produce beauty.

_Harmony by Contrast:_ use of complements in pure hues, tints, shades or grays. An example of this is the use of red (figurine, chimney, etc.) in a green landscape.

_Monochromatic Harmony:_ tints, shades and grays of a single hue as in the different greens of a landscape. This includes harmony by variation or gradation. Ruskin in 'Elements of Drawing' says: "The victorious beauty of the rose as compared with other flowers depends wholly upon the delicacy and quality of its color-graduations."

_Harmony of Analogous Colors:_ tints, shades or grays of components which are side by side or close together in the color circle, for instance in autumn leaves which contain various tones of yellow, orange, red, brown and intermediate colors. The effect is usually not pleasing when the warm hues are employed yet the beauty of green trees, blue sky and blue-green water furnishes a striking exception to the rule.

Chevreul, director of the Gobelins tapestry works, published in 1839 a great many rules or laws of harmony which are merely detailed developments of those above. Unfortunately all such results as these are debatable, for the question of a good or bad combination depends on the individual's training and susceptibility; if he has been taught either explicitly or by his environment that a color is bad he is likely to believe it. Association also is not without influence; "loud" clothes are considered incompatible with dignity and gaudy wallpaper is regarded as "cheap," Southern or Oriental. In consequence of this we have the strange fact that brightly colored things more often than not cost less than those more delicately colored although so far as color and design are concerned the difference in cost of production is negligible. If the prices of, say, wallpapers were reversed—the cheaper being made the more costly—it is safe to predict that a noticeable reversal of taste would take place. Other important factors which determine the beauty of a color scheme are texture, surface, quantity, composition and design; thus silks, on account of their lustre, may be handsomer than cottons, but the same hues in crayon, because of their lack of shine, may be better than in oils. Moreover, the difficulty with rules of taste is that they tend to tramel it. Many interesting illustrations of actual color schemes are shown in Vanderpoel's "Color Problems."

Strong contrast in colored signs and signals is not desirable in relation to legibility as might be expected. Observations on advertisements led to the following results which are arranged in the order of decreasing legibility; it is possible that they are influenced somewhat by personal equation (Scientific American Sup. 2 Feb. 1913): Black on yellow, green on white, red on white, blue on white, white on blue, black on white, yellow on black, white on red, white on green, white on black, black on green, red on green. (See _Painting; Pigment_). Consult, besides the references given above, Jorgensen, 'The Mastery of Color' (2 vols., with 22 colored plates, showing about 3,000 colors, Milwaukee 1900); Shilling and Lang's _The Language of Color_ (New York 1918); Ridgway, 'Color Standards and Color Nomenclature' (with 53 colored plates and 1,115 named colors, Washington, D. C., 1912).

R. F. Diebel,
Assistant Professor of Mechanics, Stevens Institute of Technology, Hoboken, N. J.

COLOR IN ANIMALS. See _Coloration Protective._

COLOR-BLINDNESS, _Achromatopsia,_ popularly known as _Daltonism,_ a singular affection, producing an inability to distinguish one color from another or to say, in rare cases to discern color at all, the eye perceiving only light and shade, or black and white. Although recognized for centuries, its modern study dates from the time when the famous English chemist, Dr. Dalton, brought it into notice by publishing in 1794 an account of his own case as marked by this peculiarity. More recently, Dr. George Wilson of Edinburgh also examined minutely into this phenomenon, and collected many striking instances. From the result of these investigations it would appear that color-blindness is much more common among men than among women, and that of the former 1 in 20 is unable to discern the nicer shades of color, and 1 in 50 to distinguish certain primary colors from one another. The colors most liable to be confounded are red and brown with green, purple and green with blue, red with black, light hues of all sorts with white, and dark shades with black. Color-blindness is frequently congenital or acquired. The latter is believed to be an affection of the optic nerve and retina, may result from disease or accident and may be caused by the excessive use of tobacco, alcohol or other drugs. It sometimes happens that persons having contracted color-blindness may be able to distinguish colors accurately when they are near at hand, while they are not able to do so when they are at a distance. Congenital color-blindness is frequently hereditary and generally exists in both eyes. Sometimes it exists only in a slight degree, at others it is found in a marked degree, while in others it is complete; generally, however, it is only partial; that is, the person affected fails to distinguish properly one or two of the fundamental colors, red, green and blue. Based on these known facts and on extended investigations and experiments, several theories have been advanced to account for and explain color-blindness. One of these, the Hering theory, maintains that the retina contains three pairs of visual materials, namely, white-black, red-green and blue-yellow. According to this theory color-blindness results from one or more of these materials being absent or reduced. On the other hand, maintains that there exist in every normal person three primary
perceptions, red, green and violet, in the absence of any one of which the sense of color is defective; and the resulting missing color seems to be composed from the others. This theory is based partially on the fact that the most common forms of color-blindness are green, red and red-green blindness. Various tests have been arranged for the detection of color-blindness, the best of which are those devised by Professor Holmgren of Upsala, Sweden. They consist of skeins of wool of certain "test colors," including various tints and shades of the same colors. These the person under examination is required to match.

Very stringent laws have been passed in most modern civilized countries to prevent color-blind people from occupying positions where their defective vision might endanger the lives of others. Sweden was one of the first countries to make laws for the protection of the traveling public against the danger arising from the employment of people affected with color-blindness in the railway service. As early as 1877 a law was passed in Sweden requiring that one light rush in and rushes out again with the same velocity; the entering and issuing rays interfere, and the effect of the interference is that vibration takes place; but the effects of the vibrations are stopped, and instead of having propagated waves we have a single vibration of one wave now rise and fall, each in its own place; they pause, therefore, in the interior of the film and impress their form upon it.

On looking through a film obtained by the Lippman method it appears like an ordinary negative; its color effect is obtained only when viewed by reflected light, different portions of the plate reflecting different colors according to the light-waves by which it had been impressed. In order that the interference colors may be seen so that they are true to nature, the plate must be viewed by vertical incidence, which is inconvenient. They may be projected by an arrangement devised for the purpose.

In 1861 Professor Maxwell showed at a lecture at the Royal Institution that by taking photographs of a colored ribbon through three solutions colored to represent the primary colors, and then projecting these photographs so that their images were superposed, a colored image of the ribbon was given, which was faulty, however, from lack of photographic materials more sensitive to the less refrangible rays. In 1873 Professor Vogel announced that dyes would influence the distribution of color-sensitivity in plates.

On these facts are based the process of Ives, brought out in 1892. In his process three negatives are obtained through color-filters; from these positive transparencies are made (in monochrome), which are placed in a special viewing instrument. Each in combination with its properly adjusted color-screen, these being then combined, the images are seen in the original colors of nature.

For a proper understanding of the method developed by F. E. Ives, see Color Printing.

The next development in this method was the introduction of the process worked out by Professor Joly in 1894. This differs considerably from the Ives method in the manner of working, but in principle it is very similar. Only one negative, A slide is so arranged that mercury can be allowed to flow into a space back of the plate after the plate has been placed in the slide. After exposure, the mercury is allowed to flow out and the plate is then developed in the usual way.

The materials on the finished plate are the same as those on an ordinary negative, but a difference exists in the structure of the deposit, by which it is enabled to reflect portions of it which correspond to the natural colors of the object from which the picture was taken.

The reason for the formation of this structure as formulated by Lippman is that the light waves, as they pass through a plate as ordinarily arranged, impress the plate more or less strongly, and thus leave a deposit of different intensities of the image, but on the passage they leave no record of their own forms. Each ray of light of a certain color has a certain structure; it is made up of waves which have a certain wave-length. If there be a mirror behind the plate, the light, says Lippman, is reflected back on itself; one light rises in and rushes out again with the same velocity; the entering and issuing rays interfere, and the effect of the interference is that vibration takes place; but the effects of the vibrations are stopped, and instead of having propagated waves we have a single vibration of one wave now rise and fall, each in its own place; they pause, therefore, in the interior of the film and impress their form upon it.
COLOR PHOTOGRAPHY

screen similarly ruled with parallel lines of red, green and violet, the image is seen in its original colors. These mounted positives are usually viewed as lantern-slides but are some what marred by the obtrusiveness of the lines when seen too closely.

To go back to the underlying principle of the three-color process—the "filtering" out of certain rays in taking the different plates—it is understood that the primary colors from which white light is formed are now set down as a particular shade of red, a particular green and a particular blue-violet. The primary pig-

mentary colors, it may be added, are red, yellow and blue, as has always been taught. If we obtain three negatives from an object, each taken through a color-filter or screen adjusted for the red, the green and the blue-violet respectively, these plates will present negative images of the object in the negative values of the colors named. When from each of these negatives there is produced a positive in the complementary color, and these positives are placed in accurate registration, there results a reproduction of the original object in the colors of nature. The ordinary photographic plate is not sensitive to all the rays. If the addition of certain colored substances, chiefly aniline compounds, be made to the emulsion, these apparently combine with the haloid sil-

ver salt to form an organic compound of silver which is sensitive to the light reflected from various colors according to the particular dye employed; and in this way it is possible to obtain a color picture. The light reflected from the object will be of a shade corresponding to the effect of this is to convert the deposit of silver into one of Prussian blue. When dry, this plate should be varnished, preferably with a solution of celluloid.

The remaining two positives, the pink and the yellow, are produced by modifications of the carbon process. A celluloid film coated with an emulsion of silver bromide in soft and soluble gelatin is employed. This is sensitized by immersion in a photographic solution of a compound of ammonium bichromate, and, when dry, printed in contact with the two other negatives, care being taken to place the celluloid side next the film side of the negative. The necessary exposure varies from 1 to 10 minutes, according to the light, and should be gauged by means of the fraction tint actinometer. The silver bromide takes no part in the formation of the image, its functions being to afford some guide in the exposure and development by giving a faintly visible image, and to assist in the more rapid disintegration of the gelatin in the warm water used for the development. The water used should be one of temperature of from 90° to 100° F., as in the carbon process, and when all the soluble portions which have not been acted upon by light are removed, the silver bromide is dissolved out by a solution of hyposulphite, leaving the almost invisible pho-

tographic image in relief in clear gelatin. The positive thus obtained from the negative taken through the green filter is then immersed in a dye-bath of a pinkish-red color, and that from the negative taken from the blue-violet filter in one of a yellow color, and they are stained to the required depth, comparing the result, by holding in approximate position, occasion-

ally with the blue positive, without touching each other. It is usually better to over-

stain these positives and then wash down in water to the required depth of color.

The blue positive may be obtained in similar manner upon a thin celluloid support, using a weak solution of methylene blue as the stain, and this method is preferred by some workers.

The advantage, however, rests with the prusi-

sate process, in that a positive is produced of the maximum sharpness in actual contact, without the necessity for the inter-

position of the celluloid, this being more essential in the case of the blue print, which forms the foundation of the finish slide, for however slight the diffusion may be, it must necessarily be more apparent if it exists in each of the three monochromes.

In the three plate process recommended by Messrs. Lumière the three stained positives are produced upon a mica support. The mica has the great advantage of rigidity, but the still greater disadvantage of frequently failing to retain the gelatin film, which will sometimes float off, even in the bichromate sensitizing solution.

But all these methods have proved commercially useful only as assisting the production of tricolor printing plates. For producing actual color photographs to be handled in the ordinary way, they have been commercial failures.

It has remained for Frederick E. Ives to perfect and market a satisfactory photograph in natural colors, produced wholly by mechanical means. He first obtained three impressions of a picture on glass, in such manner that when superimposed and backed by a light they gave the effect of a single picture in colors and could be seen on a screen with a lantern. It will be understood that one of the three impressions of this composite picture represented the yellow, one the red and one the blue rays. Having demonstrated the practicability of thus rendering the triplate visual, Mr. Ives next set himself the task of producing the three color plates in the camera at one exposure. This was the supreme task, the successful accomplishment of which crowns him as the perfecter of the art of color photography. Three plates must be arranged in one camera with such filters and light effects that one plate should reject the red and blue rays, gathering the yellow only; one plate reject the yellow and blue, gathering only the red; and one reject the red and yellow, gathering the blue. He terms the Triplate process. Three glass dry plates are set up in a special holder. The camera is provided with a thin glass plate set at 45 degrees as a reflector and color filter. The blue plate is placed in the bottom of the camera and receives its light by reflection on exposure. The other two plates are placed vertically at the back of the camera, receiving the rest of the light, reflected and filtered for color. One of the vertical plates has to be placed in reverse, but this proyes no disadvantage. The combination is such that the desired three negative plates are obtained at the one exposure. To reproduce for use and exhibition, prints from these three color-printed negatives are made on sheets of celluloid coated with gelatine. These sheets are stained with dyes, cemented together and mounted between two sheets of glass, forming one transparent photograph of superb beauty, in natural colors, that is viewed by being held to the light. The negatives produced by the original exposure, if treated in a different way, may be used to make three-color plates for ordinary tricolor printing. See Color Printing; Photography.

A method of printing silk fabrics by color photography, due to Messrs. Valette at Péret, of the Manufacture Nationale des Gobelins, France, presents results which appear to be interesting in the sense that the process makes possible the production on silk fabrics of decorative effects the perfection of which does not seem to have been hitherto attained by printing. The method is of course borrowed from color photography, and consists in making three successive impressions—blue, yellow and red—from three selected photographs on prepared plates. The fabric is rendered sensitive by the aid of mixtures of alkaline phenols and diazo sulphites, products which possess the property of giving coloring matters only through the influence of light. The process, which is needed in superposing the three impressions is secured by carrying out the work on a special frame, the fabric having been previously provided with metallic eyelets to avoid tearing it. The development of the colors is accomplished with better regularity by exposing to electric light. The method is recommended by its authors as more especially applicable in the treating of articles de luxe of the sort that cannot well be printed by machine.

COLOR IN PLANTS. The prevailing color of vegetation is green, owing to the presence of chlorophyll in all external tissues not turned to wood or bark. This is a green substance produced in and necessary to all the growing parts of plants exposed to sunlight; but the flowers and fruits of many families as well as the whole form of seaweeds, lichens and fungi, often exhibit brilliant hues; and some lowly groups, as the molds, etc., are white, or nearly so, because they do not contain chlorophyll. Chlorophyll is green because, as the spectroscope shows, it absorbs the red and blue rays in the sunlight, and leaves only the remainder of the visible rays of the spectrum to come to our eyes, and these, in combination, affect us with a sense of green. The red and blue rays stopped by the chlorophyll are the ones useful to the plant, for it is only their vibrations that are able to break up the carbon dioxide breathed in by the plant-leaves, and to separate its constituents into sustenance (carbon) and waste (oxygen). Chlorophyll, then, is not a true pigment, although it produces the most universal color in nature.

Many leaves and other surfaces of plants do contain, however, a true, reddish pigment, sometimes so abundantly as to redden a whole part or even an entire plant, as is seen in seaweeds. The excessive development of the property by artificial cultivation gives the gardener such gay vegetables as red cabbage, the gaudy foliage-plants, and such shrubs or trees as the copper-beech. This red pigment is erythrophyll (or anthocyan), and when dissolved out in hot water it shows a beautiful rose tint. It appears strongly in leaf-buds as they begin to shoot forth in spring, and in the earliest of the growing twigs that in March gave a ruddy tone to thicket in advance of the leafing. Several explanations of its supposed usefulness to the plant have been offered, while others treat it as merely a chemical incident of no particular utility.

The same sort of red reappears in the rich colors that beautify our woods in autumn, when there also becomes strongly manifest in the "turning" leaves another coloring-matter, the
COLOR PRINTING

bright yellow pigment, **anthophyll**, which is always present in plants, but in very minute quantity. These reds and yellows show themselves plainly in the fall because stimulated by chemical reactions as the chlorophyll disappears with the slow decay of the leaf; and their presence seems to have little if any utility in the economy of the plant.

Turning now to the variegated and often vivid coloring of flowers and fruits, we enter the domain of the relation between plants and insects. The blossoms of primaveral vegetation seem to have been virtually colorless, and this condition persists in those, like the grasses, etc., which are fertilized by means of the wind. Night-blooming flowers, and those growing in shaded places, are usually white—the most conspicuous hue in a dusky light. Most flowers, however, are now more or less brilliant in color, and there is evidence that this is a characteristic that has been gradually acquired, along with other characteristics, the effect of which is to increase the likelihood of the flowers being visited by insects, and thus obtaining an exchange of pollen with other plants of the same kind. Colored flowers become conspicuous amid green leaves, and, aided by insects as signers of the presence of the sweet food (nectar) that insects seek and must have. Many simply constructed blossoms have only a uniform tint, as the plain yellow of the evening primrose; but more, probably have a complicated structure and are varicolored, especially in a striped way on the inside of the corolla. It is found that in these cases the lines of color lead straight to the nectary and thus indicate the pathway for the insect to follow. The benefit to the plant is, of course, that by following that route the insect is sure to deliver any pollen it may have brought, and will be dusted with more for delivery to the next blossom visited.

**Ernest Ingersoll.**

**COLOR PRINTING,** the art of reproducing pictures, designs, letterpress, etc., by any of the processes of printing, in two or more colors. It may be divided into—(1) primitive color printing, as Japanese brushwork from color blocks; (2) chromolithographic printing, in which colors are superimposed by lithographic processes (see Lithography); (3) set printing in colors (see Proofing); and (4) typographic color printing, done from type or relief plates, by typographic mechanisms. As a subdivision of typographic color printing, the tricolor process of reproducing in natural colors by photo-engraving forms practically an art by itself.

**Japanese Color Printing.**—The modern survival of primitive color printing is found in the brushwork from color blocks produced by the Japanese and Chinese. These are sold for a small price in the shops of Eastern cities. They represent the combined work of an artist, engraver and printer. The artist makes a brush drawing on paper of local manufacture produced from rice or bark fibres, laying on the color in masses as the chlorophyll disappears with the slow decay of the leaf; and their presence seems to have little if any utility in the economy of the plant.

As a subdivision of typographic color printing, the tricolor process of reproducing in natural colors by photo-engraving forms practically an art by itself.

**Japanese Color Printing.**—The modern survival of primitive color printing is found in the brushwork from color blocks produced by the Japanese and Chinese. These are sold for a small price in the shops of Eastern cities. They represent the combined work of an artist, engraver and printer. The artist makes a brush drawing on paper of local manufacture produced from rice or bark fibres, laying on the color in masses as the chlorophyll disappears with the slow decay of the leaf; and their presence seems to have little if any utility in the economy of the plant.
COLOR PRINTING

Description of the Three-Color Process.—The "three-color process" and the "tri-chromatic process" are the names given to an indirect process of color photography and color printing which has been successfully developed in various applications. The first modern suggestion of such a process was made by Prof. James Clerk Maxwell, in 1851 or before, and the process was later developed and elaborated by Louis Dupuis Duhamon and Charles Cros in 1869, but the results obtained experimentally were unpromising, and owing probably to this fact and also to the existence of a general prejudice against the idea of color photography by any but a "direct" process, the subject received but little further attention until F. E. Ives, in 1888, stated a new and definite principle of photographic color selection, and gave a successful public demonstration at the Franklin Institute, in Philadelphia. This was followed by a great revival of interest and active experiment, and the commercial development of the process in various applications. The first step in this process is the production of three photographic negatives, each having in terms of spectrum red, green and blue-violet lights, those being the only spectrum colors which will by admixture in various proportions reproduce all other colors without material degradation of purity. Such sets of negatives are made by exposing color-sensitive photographic plates in the camera through selective "color screens." Formerly a special red sensitive plate was exposed through a red or orange screen, a green sensitive plate through a green screen, and an ordinary plate through an ultra violet screen. Following Ives, most authorities now recommend the use of only one kind of plate, sensitive to all colors, in order to ensure uniformity of gradation and density in the three images with simultaneous development. The equalization of the exposures, also an important element of success, is best accomplished by the use of special cameras, which form the three images simultaneously, from one point of view. Several such cameras designed by Ives, identical in size and perspective, side by side upon one plate, at one exposure, thus making the negative process as simple as it is in monochrome photography.

From the photographic negatives thus obtained, which record the colors only by differences of density and gradation in the separate images, colored pictures can be made by two synthesis methods, one "positive" and the other "negative." In the method of positive synthesis, red, green and blue-violet lights, in terms of which the three negatives have recorded all the colors of the objects photographed, are used to illuminate three positive "black and white" images made from the negatives, and these three images are then optically blended to form a single image, in which the colors mix to reproduce color values from end light and shade of the objects photographed. Such optical synthesis is effected either with three magic lanterns or their optical equivalent, or with an instrument called a photochromoscope, which is used like a stereoscope to reproduce the stereoscopic photochromoscope of Ives, the reproduction is so perfect that the objects themselves seem to stand before the eyes. In the method of negative synthesis, positive color prints are made from the three negative images, and superposed in white light, or upon a white surface. It is an interesting fact that the colors used in printing are not the red, green and blue of the spectroscope; they are the complementary colors, a peacock blue, a crimson pink and yellow, commonly but incorrectly called "blue," "red" and "yellow." This is because the printing process makes and mixes shadows instead of lights, being complementary to the method of reproducing colors in the photochromoscope.

The negative made through a red screen must print a positive, uncolored in its high lights and peacock-blue in its shades. The negative made through a green screen must print a positive, uncolored in its high lights and crimson-pink in its shades. The negative made through a blue screen must print a positive, uncolored in its high lights and yellow in its shades. It is also important that these colors be perfectly transparent. When these prints are superposed, equal parts of all three colors form blacks and grays, and the pure colors, red, green and blue-violet, appear where yellow is superposed on crimson-pink, peacock-blue and crimson-pink on peacock-blue. Unlike the method of positive synthesis, no method of negative synthesis fulfills all theoretical requirements in ordinary white light, and if the process is employed to reproduce as difficult a test as the spectrum itself, it must fail to do full justice either to gradation of hues and luminosity values or else to purity of color. The degradation of purity of color resulting when the analysis perfectly differentiates all hue and luminosity values, as in the original method of Ives, is not so considerable as to appear objectionable when perfectly transparent and correct printing colors are employed; on the other hand colors showing diffuse absorption in the spectrum are often pretty correctly reproduced with an analysis in the negative process which, while favoring brilliancy of color in the reproduction, would fail to secure a passable representation of the spectrum. Consequently, authorities, having different opinions as to what qualities are most desirable in a reproduction, must and do disagree as to what is the best principle of color selection for negative synthesis.

This difference of opinion is particularly justifiable in connection with the half-tone trichromatic process, thus far the most important commercial development of three-color photography, because the subjects most often reproduced have colors showing diffuse absorption in the spectrum, and the best reasonably permanent printing inks thus far obtainable are neither correct in hue nor of sufficient purity and transparency to fulfill their theoretical functions.

The first half-tone trichromatic process prints were made by Ives in 1881, but the process was not developed commercially until reinvented and patented by Albert, Duhamon and Kurtz, more than 10 years later. In this process, half-tone blocks are made from the negatives, and printed in the type press, with the peacock-blue, crimson-pink and yellow inks. In order to prevent the production of an offensive moiré pattern, the lines of the half-tone blocks are disposed at different colors. Owing to the complications of the process, and the theoretical imperfections of materials and means necessarily employed in its commercial operation, the printing plates are
COLORADO, kół-ó-rá'do, the “Centennial State” (admission to the Union planned for 4 July 1876, consummated 1 August), is bounded north by Wyoming and western Nebraska, south by New Mexico and western Oklahoma, east by Kansas and Nebraska, and west by Utah. Capital, Denver. Area, 103,925 square miles (260 of it water). Pop. 799,024.

Topography.—Eastern Colorado, one-third the total area, is the westernmost portion of the great treeless plains that continue the Kansas prairies. Near the abrupt rock walls of the mountains, they rise in low sharp-sided foothills, called “hog-backs,” composed of an extensive series of fresh water and marine formations (remnants of the junction of sedimentary with primary rock). The remainder of the State belongs entirely to the Rocky Mountain system. The Front Range connects the plains with the main range of the system. The western portions fall in minor slopes toward the Pacific. Colorado contains the greatest mass of high land in the United States, if not on the continent.

The main mass of the Rockies crosses Colorado in two principal lines of elevation. The eastern, or more recent line, is composed of the Medicine Bow Range, which extends into Wyoming; the Front Range, the one first encountered by the early immigrants and still crossed by the main line of transmontane travel, the Sangre de Cristo and the Culebra. The western, or main line, is composed of the Park Range from the north and the Sawatch Range, which is a continuation of the Medicine Bow of the Wyoming. West of these main lines lies a complicated series of broken ranges and plateaus, parallel, lateral and oblique, but with a general trend northwest and southeast. Of these the principal ones are the Roan or Book, north of the grand River in the extreme west, the Uncompahgre parallel to the Gunnison River on the south; the San Miguel further south; the San Juan to the east; and the Elk near the centre obliquely to the Sawatch (incorrectly spelled Sagebrush). The Elk is a very notable range about 30 miles long, geologically interesting from the extraordinary displacement of strata, with a number of lofty and rugged summits; Castle Peak, 14,259 feet; Maroon, 14,003 feet; Snow Mass, etc.

The best-known peaks in the State, Long’s (14,271) and Pikes (14,108), noted landmarks of the immigrant trail, are in Front Range, which also contains Audubon, Arapahoe, James, Rosalie, Grays (14,341), Torreys (14,336) and Evans (14,330). The loftiest range, as a whole, is the Sawatch, a granite mass over 13,000 feet high for many miles together and from 15 to 20 miles wide. Its peaks are Harvard (14,375), Princeton (14,196), Yale (14,187), and others. After a depression of 18 miles, the range rises in the Mountain of the Holy Cross, where a deep ravine and a transverse fissure outline a gigantic cross in the snow. The highest point in the State is Mount Massive (14,424).

The great passes are far higher than any mountain summits east of the Rockies. There are several over 10,000 feet above sea-level: Alpine (13,550), Cottonwood (13,500), Argentine (13,286), Marshall (10841), Tennessee (10,418) and Fremont (11,313).

Lying between the two parallel elevations...
are four great parks which are separated from each other by cross ranges. By far the largest is San Luis Park, which extends into New Mexico and has an altitude of about 7,000 feet and lies between the Sangre de Cristo and Culebra ranges on the east and the Sawatch on the west side as more nearly level than the plains. It is nearly the size of Massachusetts. It is drained by the Rio Grande through the southern centre, while the mountain streams of the north flow into the San Luis Lake, the largest lake in Colorado. North of San Luis Park is South Park, between Front and Mosquito ranges, 8,000 to 12,000 feet high, and about the size of Rhode Island. Further north is Middle Park, still more elevated and somewhat larger. Lying between Medicine Bow and Park ranges is North Park, the second in size. There are many smaller parks, the most famous of which are Monument Park and the Garden of the Gods near Colorado Springs; in the latter "rise towers and pinnacles consisting of the vertical strata of the white Dakota sandstone and of the red conglomerate sandstone of the Laramie sandstone and serve as examples of erosion of steeply upward strata of varying consistency. Lower white ridges of Jurassic gypsum or Cretaceous limestone afford sharp contrast in color when compared with the red sandstone."  

River Systems.—The main Rocky Mountains must obviously be the greatest of American watersheds and chief source of river systems, except Minnesota; they contain the continental divide between the waters flowing to the Atlantic and those flowing to the Pacific. One part of it is the southern boundary of North Park, the streams of which flow north to the Platte-Missouri-Atlantic system, those south of it feed the Grand-Colorado-Pacific; another is between Creede and Ouray, separating the headwaters of the Rio Grande from those of the Gunnison and Uncompahgre of the Colorado system. The eastern plains are divided between the two great systems of the Arkansas and the South Platte; the former occupies more than one-half their area in the State, the southern portion; the South Platte, the larger portion of the northern half; between the two drain into the Republican River, an affluent of the Kansas. The South Platte rises in South Park; the Arkansas in the mountains west of it, Leadville lying on one of its head creeks. Except for these and the Rio Grande in San Luis Park, the mountain section is almost entirely drained by the Colorado River system; the Yampa (or Bear) and the White, in the northwest, flowing to the Green; the Grand through the centre, with its chief affluent the Gunnison from the south; and the Dolores in the southwest.  

Of equal fame with the giant peaks and even greater beauty are the stupendous mountain canyons through which its rivers cut their way. Western Colorado forms the eastern edge of that Major Powell has called the Plateau Province for all the wonders and beauties of this remarkable region are found in Colorado. There are the terraced platforms, ending in rock faces dropping sheer upon other platforms hundreds of feet below, and ending in vertical gorges from 100 feet to 1 mile deep; the sand-laden currents with a steep fall have cut their channels through countless strata of brilliantly variegated sedimentary rock; here are barren mesas, and cool grassy forested levels and slopes above the plane of perpetual drought where the mountains bar off the vapors; rock headlands around curves or junctions of streams or gulies, fantastically carved in striking likeness to the work of human architects. The canyon of the Grand, the Black Canyon of the Gunnison, the Royal Gorge, a part of the Grand Canyon of the Arkansas, are famed for their beauty and their grandeur.  

Climate and Rainfall.—The dry, cool, thin air of mountainous Colorado makes its accessible eastern portions, especially the parks, widely famed as sanatoriums for patients with asthmatic or pulmonary diseases. Colorado Springs, the Rocky Mountain Saratoga, is built up by Eastern invalids. The summer days are sometimes hot, but the dry air and bare rocks cause so rapid a radiation that the nights are always cool and dewless. There is little severe winter cold, zero being rare; the frost season is short, and the snows, seldom deep, soon melt, except on the mountains. For the leading places is about 28°F.; the July 72° to 74°F. The average rainfall is 14.8 inches, fairly even through the State, though naturally much heavier on the higher levels, varying from nearly 30 inches at Pikes Peak to 12 inches at Las Animas in the Arkansas plains. Hence, agriculture can be carried on without irrigation in many mountain regions, though better with it.  

Surface, Farming, Stock Raising and Irrigation.—There are about 16,000 square miles of forested land in the State, the trees being mostly conifers, with cottonwoods along the eastern streams. Of the 40,000 square miles of plain and parks, about one-third is arable, the rest being grazing-ground, to which, however, must be added many thousand square miles of grassy mountain slope. The pasturage in many parts lasts through the winter; and the plains are covered with gorgeous wild flowers. The soil of the plains is mostly sandy loam, with some clay. Along the water-courses the soil is rich, but the rainfall is not sufficient, and irrigation is needed; but is scarcely feasible there except along a few large streams, or near the mountains. A Bitter Creek promises to extend largely the area farmed. But there is an estimated irrigable area of 4,800,000 acres, or 7,500 square miles, in the State; and in recent years an immense amount of energy has been turned to utilizing its possibilities. Irrigation is one of the outstanding enterprises of Colorado. In 1889, 890,735 acres were under irrigation, but in 1910 there were 2,792,032 acres, an increase of 200 per cent in acreage irrigated. Colorado stands first in the arid region in irrigated area. In 1911 of the 83 counties of the State more than half of the farms are irrigated. Three and one-half million acres are devoted to dry farming, the 1915 income of which was $25,902,354. Sixteen million acres are devoted to stock raising, a very important industry, has developed in the San Luis Valley where field-peas grow luxuriantly. In addition to the large government enterprises, there are 9,065 independent enterprises with a total ditch mileage of 22,570 miles. Of this amount over one-third is in a solid block along the South Platte, at the north-east corner of the mountains in the State; the

#### Summary

- The estimated population of Colorado is 962,060.
- The largest cities include Denver, Colorado Springs, and Fort Collins.
- The major agricultural crops are wheat, corn, and barley.
- The key mineral resources are coal, copper, lead, zinc, and silver.
next greatest, nearly a fifth of the whole, in San Luis Park. There are lines along the South Platte and Arkansas blocks on the Grand in Colorado County on the Gunnison, Delta and Montrose, and again in Gunnison County; scattered sections on the White and Yampa, along the southern Arkansas tributaries, and indeed in every quarter of the State. In 1910 there were 434 wells used for irrigation purposes, an increase of 39 per cent in 10 years.

Colorado has become a great farraing State, producing not only large quantities, but an excellent quality, of the staple products. The production for 1915 is as follows:

*Tons.

The largest individual product of the irrigated farm is the sugar beet. There were 15 factories operated during 1916, with a substantial increase in 1917. Over $25,000,000 are invested in these factories.

Orchard, small fruits and grapes amounting to $5,078,654 were marketed in 1909. Most of the fruit-raising is in Delta, Mesa and Montrose counties, on the Grand and Gunnison, in Boulder County, on the South Platte, and in Fremont County, on the upper Arkansas. A valuable crop on the Arkansas is that of muskmelons, including the famed Rocky Ford cantaloupes.

Stock raising has increased with the production of feed, or vice-versa. The livestock industry of Colorado is characterized by a marked increase during the last decade. In 1915 there were 296,308 horses valued at $20,031,314; 22,284 mules valued at $1,959,800; 1,332,479 ranch cattle valued at $39,230,241; 1,010,598 dairy cattle valued at $5,786,281; 1,823,491 sheep valued at $4,573,120. All other animals were valued at more than $2,000,000. This was full valuation for the purpose of taxation. The number and value of all cattle and sheep have had a remarkable increase, yet the quality has improved more rapidly than the quantity. Many of the stockmen have devoted much time and attention to improving the quality of their stock.

Dairy and poultry products are in great demand. In 1910 there were 69 butter, cheese and condensed milk establishments.

Geology and Mining.—The main ranges, particularly the east range, have a core of schist and gneiss with an occasional area of granite. These main ranges are flanked on all sides with sedimentary rocks. In many cases, these rocks show practically all the geological epochs from Cambrian Quartzite to the Quaternary, while again the most recent is found resting on the most ancient. There are large areas of pure volcanic rock, such as the San Juan Range in the southwest and the Spanish Peaks, near Walsenburg. The prairie land is so completely clothed with soil that it is difficult to follow the geological skeleton, but it is probable that all of the larger periods are represented in its formation. Great coal deposits are found in the upper Cretaceous, and most of the metallic deposits are found in igneous formations.

Colorado leads the Western States in mineral production. Total output (1903) $65,284,009; (1904) $68,870,280; (1905) $89,309,861; (1909) $59,189,974. The output (1909) from the State's mineral resources was as follows: gold, $21,846,600; silver, $4,600,100; lead, $2,522,036; zinc, $2,173,063; copper, $1,493,132; clay products, $2,049,024.

In 1915 there were some striking changes in the value of metals mined: gold, $22,425,518; silver, $3,517,972; lead, $3,223,583; copper, $1,233,405; zinc, $13,660,040; tungsten, $3,100,000. The production of zinc worth $6,000,000 in 1906 and more than $13,000,000 in 1916 places Colorado as the fourth State in the production of this metal. Boulder County is noted for its tungsten. Colorado's production of the precious and semi-precious metals in 1916 reached a total value of $49,200,675, an increase of 13 per cent over the figures of 1915. This mineral wealth was secured from 2,609,243 tons of ore raised from 825 deep mines, and from 27 placer workings. Lake County, which includes Leadville and the surrounding districts, held its former record of a much larger yield than any other portion of the State, with the single exception of gold, in which it was surpassed by Teller County, which includes the famous Cripple Creek district.

The total yield was distributed as follows: gold (39 per cent), $926,500 fine ounces, valued at $19,153,821; zinc (37 per cent), 134,285,463 pounds, $17,994,252; silver (10 per cent), 7,656,444 fine ounces, valued at $5,038,006; lead (9 per cent), 70,914,087 pounds, $4,893,072; copper (4 per cent), 8,624,081 pounds, $2,121,524. Nearly the entire output was smelted in the 10 smelting plants of the State, and these plants also handled a considerable quantity of ore from Idaho, South Dakota, Oklahoma and Kentucky and from Canada also.

Iron sulphides are mined at Creede and other places from which sulphur is obtained in paying quantities. Uranium and vanadium are found in large quantities. There is a vast quantity of oil shales in the northwest. The output of silver is steadily increasing. About three-fourths of the silver is from lead ores, and Colorado's lead production is one-sixth of that of the whole country. Lead is not only sold as a raw material, but is a most valuable flux for smelting gold and silver ores, therefore large quantities are imported from other states. The mines of Cripple Creek and Leadville are among the best equipped in the country. Cripple Creek is the leading gold-producing section in the State and Leadville leads in the production of silver, lead, copper and zinc.

As a coal-producing State Colorado ranks ninth. Its greatest production was in 1910 when 12,104,887 tons were mined. The normal production averages 10,000,000 tons per year, about one-half coming from Las Animas County in the central part of the State.

Marble, fuller's earth, talc, pumice, sand, cement shales (the finest in the world), limestone and abrasive, petroleum and natural gas are valuable and abundant minerals. The Florence oil fields produce the finest oils in the world.

Manufactures.—The chief industries of
Colorado could be predicted from a glance at its raw materials — precious metals, copper and lead, coal and iron, wood, cattle and grain. These mean smelting, rolling and steel and railroad work, lumber manufacture, meat-packing, flouring-mills and breweries. In 1909 there were 2,034 manufacturing establishments in the State; in 1916 there were 2,350; the capital invested amounted to $162,668,000; there were 28,002 wage earners, whose wages aggregated $25,500,000; the cost of materials used was $80,491,000; and the value of the products was $130,044,000. The latest information, for the year 1916, on manufactures in Colorado places the number of manufacturing establishments at 2,350 and laborers engaged in manufacturing 35,000, capital invested $189,000,000, the value of the product produced $150,000,000 and amount paid for labor and salaries $30,350,000, and the material used cost $95,000,000. The prospect for manufacturers in Colorado, particularly in Denver, is better than ever before in the history of the State.

Railroads.—Colorado has about 5,814 miles of main track of steam roads valued for purposes of taxation at $79,400,000; besides well-developed electric systems, not only in cities, but between mining camps. A number of great trunk lines cross the State; while short lines pierce the heart of its mountain districts, giving the best transportation service of any State along the Rocky Mountains. The chief systems are the Union Pacific, the Missouri Pacific, the Atchison, Topeka and Santa Fe, the Denver and Rio Grande, the Rock Island, the Colorado and Southern, the Colorado Midland, the Rio Grande Western, the Burlington, the Denver and Northwestern (the Moffat Railroad). Within the past few years two important branch lines have been built from Denver, connecting with the Burlington and the Northwestern systems.

Finances.—In 1908 the assessed valuation was $1,250,807,000, and the gross floating and bonded debt in 1916 was $4,620,607.66. Assets, taxes due and sinking fund, $2,623,318.34, net debt, $1,397,289.32. There were in Colorado, 1 Nov. 1916, 121 National banks, 196 State banks and trust companies, 5 savings banks and 31 private banks, with a combined capital of $20,013,000 and a total deposit of $1,087,471,000, an increase of 35 per cent in capital and 50 per cent in deposits since 1907.

Churches.—There are about 700 churches and 1,000 Sunday schools in the State. The Methodists, Presbyterians, Roman Catholics, Baptists, Congregationalists and Disciples of Christ are the strongest denominations, while the Episcopalians, Lutherans and other denominations have many churches throughout the State. The various denominations are very aggressive both in spiritual and secular affairs. The Jews are a very important element in the growth and development of the State; they number not less than 10,000.

Education.—The organization of the school system, the efficiency of teachers and the equipment of schools in Colorado puts the States that lead in educational affairs. In 1916 there were 267,241 children of school age. Of these 178,811 were enrolled in the public schools, while many were in private schools. There are 2,953 schoolhouses and 6,982 schoolrooms in the State with a valuation of $11,220,853, for the support of which a tax of $8,176,886 was collected. Teachers' salaries amount to $4,402,242. The total expenditure for all purposes was $7,110,587. The institutions of higher learning are the University of Colorado (1874, M.E.), the pioneer institution of higher learning in the Rocky Mountains, with (1916) 225 professors and instructors, 1,436 students, 3,163 graduates; Colorado College (1874, Congregational), 48 professors and instructors, 710 students, 940 graduates; University of Colorado (1877, State), 200 professors and instructors, 2,009 students, 2,861 graduates; College of Sacred Heart (transferred from Las Vegas, N. M., in 1884, Jesuit). The State supports the School of Mines at Golden, ranking among the best in the world, and the State Teachers College at Greeley, with 63 teachers, 644 students above the Training School, and 1,200 students in the summer school and 2,000 graduates. An aggressive growing State Normal School is maintained at Gunnison. The College of Agriculture and Mechanic Arts at Fort Collins has a large student body doing excellent work. Its experiment station has attracted attention as a result of increased crop by its work in the breeding of animals and plants. The University of Colorado maintains a medical school. There are many private schools in Denver, Boulder, Cañon City, Leadville and other cities of the State. In Denver the Baptists maintain the only women's college (Colorado Women's College) in the Rocky Mountains. The Westminster University of Denver (Presbyterian) is in the process of organization.

Charitable Institutions.—The State maintains an asylum at Pueblo, a State prison at Cañon City and a reformatory in Buena Vista, all under the control of the Board of Corrections, consisting of three members. There is a Soldiers' and Sailors' Home at Monte Vista. The counties and cities have organizations for the care of the poor. The prisoners in the State Prison and Reformatory are employed in purely institutional labor on the inside and in roadmaking and farming on the outside. The indeterminate sentence with maximum and minimum periods is used. An Industrial School for male juvenile offenders at Golden, where the inmates are not confined or marked with penal badges, and an Industrial School for girls at Morrison are among the best institutions of the kind in the world.

State Government.—The State constitution, which was largely modeled after that of Illinois, was ratified 1 July 1876. Colorado was admitted to the Union by proclamation of the President 1 Aug. 1876. A few important amendments have been made to the constitution. The most important are the one that provides optional home rule for certain cities and the one that gives women the right of suffrage. The suffrage amendment was voted 18 Aug. 1914, and women have full right to hold office. In the State the office of superintendent of public instruction and in many counties the office of county superintendent of schools are conceded to the females. Experience has shown that the women and the men to believe that other positions are successfully filled by the women, even more so than the educational offices, and there is now a tendency to elect women to such offices as county clerk, county treasurer, and even county judge, and the women are asking for

the office of secretary of State, State auditor, etc.

Executive.—E elective executive officers hold office for two years. The governor (salary $5,500) may veto any bill and specific items in an appropriation bill. In either case the veto may be overridden by a two-thirds vote of each house. Three boards of great importance have been voluntarily organized — The Tax Commission, The State Public Utilities Commission and The Industrial Commission. Each of these boards is composed of three members appointed by the governor and confirmed by the Senate for a period of six years. The salaries of The Tax Commissioners are $3,500 each; of the members of the other boards, $4,000 each. The duties of The Tax Commission are the assessment of corporations, supervision of assessment and the collection of taxes in counties, making the State tax levy, acting on all petitions for abatements, rebates or refunds of taxes. The Industrial Commission has charge of the State Compensation Insurance Fund and it is its duty to inquire into and supervise the enforcement of law as far as respects relations between employer and employee, of the laws relating to child labor, laundries, factories, inspection, employment of females, employment offices and bureaus, mining — both coal and metallic ores, fire escapes and means of egress from places of employment and all other laws protecting the life, health and safety of employees. The Public Utilities Commission has supervisory power over all public utilities, whether privately or municipally owned, including automobile lines in competition with railroads. It has power to fix the rates and to pass upon the service rendered.

Legislative.—The general assembly meets biennially; the 35 senators are elected for four years and the 65 representatives are elected for two years. The constitution limits the total membership of the two houses to 100 members.

Judiciary.—The Supreme Court consists of seven members, elected for ten years. The court is divided into three departments. The chief justice, who is the judge having the shortest term to serve, providing he has been elected for the full term, presides in each department. Constitutional questions must be heard by the full bench unless questions may be. There is no appeal from the decisions of a department. The district judges are elected for six years and the county judges for four years.

Militia.—The National Guard, a part of the militia of the State, consists of one regiment of Infantry, one squadron of Cavalry, one battalion of Field Artillery, one company of Signal Corps, one Hospital Corps, two companies of Engineer Corps. The complete organization contains 1,500 men.

Publications and Divisions.—The first (Territorial) census, that of 1860, showed 34,277 people; 1870, 39,804; 1880, 194,327; 1890, 412,198. The census of 1900 showed a population of 539,700; of 1910, 799,024; 1916 (government estimate), 975,190. Of the total population of the State in 1915, 473,136, or 48.3 per cent, are native whites of native parentage, and 181,428, or 22.7 per cent are native whites of foreign or mixed parentage, 126,851 are foreign born whites and 11,453 are negroes. There is very little change in percentages over the census of 1900. Thirty-four and nine-tenths per cent were born in Colorado; foreign born were from Germany, Italy, Russia, Austria, Sweden, England, Canada, Ireland, Scotland, Denmark and Mexico, the largest percentage being from Germany. There are 154,164 foreigners reported.

There are 63 counties in the State, as follows, with their county seats:

</table>

In 1900 there were 27 places in Colorado of over 2,000 people; 17 of over 3,000; and 8 of over 4,000. The urban population of the State had so grown by 1916 that 34 incorporated places were over 2,000 in population; 21 over 3,000, and 16 over 4,000. The metropolis is Denver (q.v.), on the east flank of the Rocky Mountains, north of the center, with 133,869 inhabitants in 1900 and 213,381 in 1910, more than doubling in 20 years; it is at the head of the Rocky Mountain trade, and chief United States market for ranching, prospecting, and mohangeering supplies. Pueblo with 44,395, and Colorado Springs with 29,078, are on the same front line of the mountains; the former a mining emporium; the latter the great sawmill of the West. Leadville 7,503, is the head of a great mining district on the upper Arkansas west of South Park; Cripple Creek, 6,206, is the centre of its rich mining region, west of Colorado Springs; Boulder, 9,339, in the mountains northwest of Denver, is a sawmill with medicina springs, also a manufacturing town; Trinidad, 10,204, in the extreme south, is the southernmost of the front towns, below Pueblo; Greeley, with a population of 8,179, is the chief city of Weld County. Colorado towns are growing so rapidly and have developed so many suburbs that even the figures of the census give a very inadequate idea of their population or importance.

History.—Colorado (Sp., pp. of verb Colar, to color; color; colloquially used for red-colored) was named either from the river of that name or from the varied colors of the landscapes. Its territory is composed of three portions: one from the Louisiana Purchase; one from the Texas Cession; and the third from the Mexican Cession of 1848. The south-
COLORADO

West portion was, in prehistoric times, inhabited by the Pueblos (the Cliff Dwellers). A few of the followers of De Soto and Coronado seem to have been present in the territory of the State about 1541. It was explored in the southwest by Escalante in 1776, and its eastern mountain and plain regions by Zebulon Pike (1806) and Stephen H. Long (1820). Later John C. Fremont, led by Kit Carson, penetrated many parts of the Rocky Mountain region. Gold had been discovered in small quantities many times from 1806 to 1857 but the discoveries of 1858, near the confluence of Cherry Creek with the Platte, brought a large number of prospectors into the State. People from Georgia, Kansas, Missouri and other Eastern States came in large numbers. Prospectors from Kansas and Georgia built Montana on the Platte near where Denver now stands; other towns followed; Adams, Saint Charles Town (now Denver), Golden, etc.

The discoveries of George A. Jackson at Idaho Springs on the south fork of Clear Creek and by J. H. Gregory on the north fork at Central City brought immigrants by the thousands and a political organization was formed without regard to the territorial government of Kansas, of which Colorado was then a part. It was but a step from making laws for a mining camp to making laws for a whole district, from city building to State building. This step was soon taken. In 1859 delegates met and adopted a constitution for the State of Jefferson with an area somewhat larger than that of Colorado. The opposition to a State led to a second convention which, under the fiction of erecting a territory, established a new State and called it the "Territory of Jefferson." The convention adopted by the first convention was ratified but never went into effect. The constitution adopted by the second convention was almost unanimously ratified 24 Oct. 1859, on which day a full complement of State officers was elected. R. W. Steele, who was elected governor, continued in office until 1861, when he surrendered his office to William Gilpin, first governor of the Territory of Colorado.

Colorado was anxious for statehood, but it was not until party necessity compelled the majority party of Congress to turn to the West for more senators, that the enabling act was passed. The Constitutional Convention (in session 20 Dec. 1863 to 14 March 1864) adopted a Constitution.

Politics. — Colorado was admitted as a Republican State, but has since undergone repeated changes in its political faith. It left the Republican ranks on the "money issue," but the improved methods of handling silver ore made silver smelting more profitable at the later ruling prices than it was in 1860. In recent years the tendency of the State is to be Democratic.

Bibliography. — Hubert Howe Bancroft's "Works (Vol. XXV); Smiley, 'History of Denver'; Hall, 'History of Colorado.'

FRANK H. H. ROBERTS, Professor of History, University of Denver; and President of New Mexico Normal University.

COLORADO, Tex., city and county-seat of Mitchell County, 260 miles by rail southwest of Dallas, on the Texas and Pacific Railroad and on the Colorado River. It is a cotton-growing and fruit-growing town. It has cotton gins and salt works and there is a trade in gravel and sand. The city owns the waterworks. Pop. 1,840.

COLORADO, University of, a coeducational institution at Boulder, Colo., supported by the income from a state fund and by state appropriations made biennially by the legislature. It was incorporated in 1861 by the Territorial legislature; when Colorado became a State in 1876, the constitution provided that the "University at Boulder" should become the State University, thus giving it the advantage of the lands appropriated by the national Congress for such institutions. The University was opened in September 1877, with two departments, the normal and the preparatory. In 1878 a College of Liberal Arts was established. The normal and preparatory departments have been discontinued. In addition to the College of Liberal Arts the University now comprises the following: Colleges of commerce, education, engineering, law, social and home service, medicine, law, and the graduate school, the training school for nurses, summer session and the university extension division. In 1915-16 there were 1,413 students enrolled in the regular academic

department, 697 in the summer session and 445 in correspondence and study classes of the extension division, a total, excluding duplications, of 2,453. The library numbers 96,701 bound volumes, 25,000 pamphlets and 1,800 maps.

COLORADO AGRICULTURAL COLLEGE, a coeducational institution at Fort Collins, Colo., providing instruction in agriculture, mechanical engineering, veterinary science, etc., a four years' course leading to the degree of B.S. Its gross income is about $210,000. It includes a school of veterinary medicine, requiring three years to gain a degree of D.V.S. The library contains about 55,000 volumes. The attendance is about 650 in collegiate grade. It also conducts a school of agriculture of secondary grade with an attendance of 370, and a conservatory of music with an attendance of over 100. The activities of the college are divided into education, research and extension. It was opened in 1879, and received a grant of 90,000 acres of land under the act of Congress of 1887. In 1889 there were 89 instructors and over 1,100 students in all departments.

COLORADO CITY, Colo., city in El Paso County, 75 miles south of Denver, on the Denver and Rio Grande and the Colorado Midland railways. The city has a Carnegie library, railroad repair shops, gold-reduction works and an iron foundry. In 1913 the commission form of government was adopted. Pop. 4,333.

COLORADO COLLEGE, a coeducational non-sectarian institution in Colorado Springs, organized in 1874. It offers full collegiate courses and confers the degrees of A.B. and B.S. It has departments of engineering, forestry and of business administration and banking. It has 14 large stone buildings, costing $1,000,000 with their equipment. The library contains 70,000 volumes and 40,000 pamphlets. The endowment of the college is $1,040,000. In 1916 it had 710 students and 56 instructors. It has a system of exchange instructors with Harvard University.

COLORADO DESERT. See Desert.

COLORADO PLATEAU, an extensive plateau region lying west of the southern Rocky Mountains, and east of the southern Pikes Peak Mountains. It includes parts of the States of Utah, Colorado, Arizona and New Mexico. The plateau consists chiefly of Paleozoic and Mesozoic rocks with some Tertiary gravel and lava flows. The rocks are nearly flat lying, but are cut by great north and south faults, of which the best known are the Hurricane and Grand Wash. These faults, together with the Vermilion and other cliffs, divide the plateau into several separate units of differing elevations, varying from 6,000 to 10,000 feet above sea level. These are trenched by the Grand Canyon and its tributaries. The lower parts of the area are desert, the higher parts rather well forested. The plateau has little mineral wealth and is sparsely populated.

COLORADO RIVER, one of the chief streams of Texas. Rises in the high table-lands of Bexar, near the line of New Mexico, about lat. 32° 30' N. and long. 102° W., it flows southeast, receiving in its upper course the Conca, the San Saba and the Lano on the south, and the Pecan from the north, and empties into Matagorda Bay. Austin, Bastrop and Columbus are on its banks, and Matagorda near its mouth. For most of its course it flows through a fertile region, and has an average width of 250 feet. It is a clear stream; its name, meaning red, was originally applied to the Brazos, north and east, but the two were interchanged. The Colorado is some 1,900 miles long, and navigable to Austin or further.

COLORADO RIVER, or COLORADO OF THE WEST, a great river of the United States and Mexico, formed at about lat. 38° N. and long. 110° W., by the junction of the Green and Grand rivers. The Green River rises in the Rocky Mountains in the west of Wyoming, receiving in its southwestern course the waters of the Bear, the White, the Uintah and San Rafael. From Flaming Gorge, a point in the northwest of Colorado, where the Uintah Mountains rise, the Green River cleaves its way rapidly through canyons, the walls of which tower up to a height of nearly 1,500 feet. The Grand River rises in the Rocky Mountains, west of Denver, Colo., receiving in its southwestern course the South Fork or Gunnison, the San Miguel and Dolores rivers. At its junction the Colorado flows southwest through Utah, joined on the east by the San Juan, on the west by the Dirty Devil and Escalante; southwest through the north of Arizona, till its waters are increased by the Colorado Chiquito, or Little Colorado of Arizona. Near the inflow of this tributary is the Marble Canyon, 3,600 feet deep and about one-third the length of the greater canyon below.

From the mouth of the Little Colorado the river bends west and for more than 240 miles flows through the wonderful Grand Canyon. The successive divisions of the canyon are known as the Kaibab section, the Kanab section, the Uinkaret section and the Sheavwitz section. The walls of this water-worn trench are often vertical, or nearly so, for a distance of thousands of feet at a time; sometimes they slope steeply, or constitute magnificent terraces. The cliffs or rock-walls attain a height of from 4,000 to 7,000 feet above the stream. For heights of particular points, see Grand Canyon. There are frequent whirlpools and waterfalls. Below the canyon the valley opens, and there is much fertile bottom-land on one or both sides of the river. Numerous tributaries pierce the high plateau on either side, the whole presenting a strangely intersected topography. Escaping from the Grand Canyon, the river flows southwest to the borders of Nevada, receiving from the west the Paria, Tapeat, the Kanat (of Arizona) and the Virgen (of Nevada).

Above Calvillo, Nev., the Colorado, with its tributaries, again bores its way through deep canyons, the sides of which, in some places, present walls of solid rock nearly 7,000 feet high. The plateaus at the top of these rock masses, generally treeless, are again surmounted by terraces, 1,000 feet or more high. These lower and higher terraces are both piled with massive ruins, once the walled towns and cities of a race said to be represented by the present Moqui Indians in the northeastern part of the Nahuas of Mexico. Below Calvillo the river is again shut in by the last of the canyons, the Black Canyon, 25 miles long, and from 1,000 to 1,500 feet high. Shortly after receiving the Virgin River, the river runs southerly, severing Arizona and Sonora.
on the east from Nevada, California and Lower California on the west, and receiving on the east Bill Williams' Fork and the Gila. After absorbing the latter the river sweeps round in a westerly direction for 7 or 8 miles, and soon expands to a width of 1,200 feet. Thence it pursues a tortuous course of 180 miles, the last portion being through Mexican territory, to its mouth in the Gulf of California. There is a vast delta or flood plain formed by the waters from rock erosion. From the sources of the Green River the Colorado measures a total length of about 2,000 miles. It is navigable for steamers as far as Callville, 612 miles from its mouth, and can be made so, it is thought, to the foot of the Grand Canyon, 57 miles higher. The first attempt to navigate the upper part of the Colorado was made in 1891. In 1893 the steamers were proved navigable for 130 miles between Green River and Cataract Canyon.

The investigation of geologists dispelled the theory once held that the Grand Canyon was a faulted structure. It is now evident that a long period of erosion through plateaus successively uplifted has produced this remarkable gorge. At the bottom of the canyon throughout a considerable part of its course the Archean system is laid bare. The Algolian beds with their high coloring give brilliancy to that portion of the canyon where they can be traced. The Cambrian beds are found above the Algolian, but in places rest directly on the Archean. The thickness of the Cambrian (here known as the Tonto formation) is in places 1,000 feet. The upper part of the caving walls consists of carboniferous formations (Red Wall formation below, Aubrey limestone and sandstone above). It has been estimated that all the Eocene, Cretaceous, Jurassic and perhaps Triassic beds and the greater part of the Permian were worn away from the plateau region during the period of erosion. The Marble Canyon platform, like that of the Grand Canyon, consists of carboniferous strata with a considerable number of Permian remnants scattered over it.

In 1540 the Colorado was visited by a detachment of Coronado's expedition and another of friars. The friars gave the first description of the Grand Canyon as seen by white men. About the same time Fernando Alarcon ascended the stream in boats for a long distance. Catholic missionaries subsequently traveled through these regions. For about 300 years, nothing was known concerning the Colorado. Much light was thrown on the subject by the investigations of Ives in 1846. In 1889 Powell explored the region and made the descent through the whole course of canyons to the mouth of the Rio Virgen, a distance of more than 1,000 miles. Dutton made geological studies of the Grand Canyon in 1875. In 1889 the canyons were explored by a party of engineers sent out to make surveys.

Bibliography.—Powell, "Exploration of the Colorado River" (1875); David, W. M., "An Expedition to the Grand Cañon of the Colorado"; Dutton, "Monograph II. U. S. Geol. Survey" (1882); James, G. W., "In and Around the Grand Canyon" (1902); id., "The Grand Cañon, Arizona" (1911).

COLORADO SPRINGS. Colo., city and county-seat of El Paso County, on the Denver and Rio Grande, the Denver T. and G., the Santa Fe, Rock Island and Missouri Pacific and the Colorado Mountain railroads. It is situated on a plain at an elevation of 6,000 feet, near Pikes Peak, and has a world-wide reputation as a health and pleasure resort. Colorado Springs is the chief city in the development of the Cripple Creek gold mines, which are 30 miles distant on the opposite side of Pikes Peak. A great deal of wealth flows into Colorado Springs, whose population has almost doubled in the past 15 years, and whose bank deposits have increased 600 per cent in the same period. The city has a great variety of manufactures, chief among them being pottery and tiles, ore refineries and reduction works. The United States census of manufactures for 1914 records 75 industrial establishments of factories and employing 462 persons, of whom 538 were wage earners, receiving annually $401,000 in wages. The capital invested aggregated $2,090,000, and the year's output was valued at $1,908,000. Of this, $1,010,000 was produced by manufacture. The city boasts a handsome opera-house and five clubs, one occupying an edifice worth $80,000, 17 fine school buildings, Colorado College (q.v.), one of the oldest institutions of its kind in the State, with over 500 students. The State institution for the education of the blind and mute, sanatoriums, church edifices, 2 hospitals, and 6 trunk lines, 28 miles of electric railway and a modern telephone system. The city was one of the first to adopt the commission form of government. Colorado Springs has a water supply costing over $1,000,000 and a sewerage system perfected at an expense of $10,000,000. Pop. 32,000.

COLORADO STAGE. The rocks of the Colorado, one of the lower divisions of the upper Cretaceous series, are chiefly of marine origin and cover a great area, having been laid down in an interior sea that stretched from northern New Mexico, where it opened into what was then the Gulf of Mexico, to the Arctic Ocean. This sea at about the latitude of Duluth, Minn., was over 1,000 miles wide. The Colorado is separated into two sub-stages, the lower, or Fort Benton, clays, shales and limestones, and the upper, or Niobrara, shales, sandstones, chalk and chalky marls. The Colorado Stage is of interest because of its marking the time when more of North America was under water than at any other time since the Carboniferous Epoch, and because of the beds of chalk in South Dakota, Kansas, Arkansas, Texas and Mexico. See CHALK; CRETACEOUS SERIES.

COLORATION, Protective. The color of plants and animals is primarily due to the reflection of light, and is dependent in some cases on the pigment in the tissues of the plant, and in the skin, scales, hair or feathers of animals, and in others to structural surfaces which by diffraction give color. Plants are colored green by chlorophyll, so are caterpillars from eating plants. The "chromatic function" is that adaptation of color of the skin of the frog, chameleon, squid, fish or

2 Garden of the Gods
crustacean, which rapidly changes so as to simulate the tints of the objects on which they rest. In most animals the coloration is due to pigment-cells (see Chromatophores), which are more or less ramified, and which, under the stimulus of the prevailing color of the habitat, cause the animal to simulate in hue the ground, or tree, or sea-bottom. In most animals the coloration is permanent, in a few it changes with the change of color of the immediate surroundings of the animal, as in the chameleon, the insects, fish, and birds, where the variety of colors is almost endless, it has been found that even the most striking colors are aids to concealment of the identity of the wearer and thus are its protection.

Pigment in Animals.—That this is primarily due to the action of light is proved by the fact that cave animals, or those living in darkness, are white or bleached out, so that the pigment cells become degenerate, the pigment losing its more or less dark color, while in insects the colors are either optical or natural; the pigments, when present, are formed in the cellular layer of the skin (hypodermin). These colors tend to fade after death, but when enclosed and preserved in air-tight sacs, such as the scales of the fish, the wings, and wing covers of beetles, they remain bright for a longer time, though eventually fading when dried specimens are exposed to the light. It has been shown that red, yellow, brown and black colors in the scales of certain butterflies are always due to pigments, while in a few cases greens, blues, violets, purples and whites are due to pigments in the scales themselves. Mayer finds that the pigments of the American silkworm moth (Telca polyphemus) are derived from the blood of the chrysalis. He has artificially produced several kinds of pigments from the blood, which are similar in color to various markings on the wings of the moth, and has found that chemical reagents have the same effects on their manufactured products as on similar pigments in the wings of the living moth.

Origin of Spots, Bands or Stripes.—The marks of the caterpillar, the stripes of the zebra, of many African antelopes and of the tiger are supposed by some writers to be due to the direct effects of light and shade, to shadows cast in jungle-grass or in forests. As proofs of this they instance the experiments of Steinau, who glued strips of black paper to the skins of frogs which were kept in the dark; when they were exposed to the light, only the uncovered parts of their skins returned to a lighter hue, while the covered parts remained dark. The reflected green light in the case of frogs turning green when among leaves is by these writers believed to act directly upon the pigment cells. When the bottom of the vessel is covered with felt or with a wire net, the frogs become but rather their green color when a green branch is introduced into the vessel containing them. Again those caterpillars living among pine needles are green, striped with white, yellow and red, exactly harmonizing with the red and yellow or white portions of each cluster of needles; this is ascribed to the direct reflection of different shades of light on the moist skin of the caterpillar. In other caterpillars the longitudinal lines are broken up into spots, and if the process is carried on farther the spotting becomes transverse. Eyelike spots on certain caterpillars have been observed to be gradually formed at successive molts from what were originally continuous lines or stripes. It thus appears that the wonderful variety of color and markings in animals is primarily due to the direct result of the environment, bringing about different results in animals of different groups and exposed to different environments. An alternative theory which has received widespread acceptance is that proposed by Abbott and Thayer upon his observations covering many years, namely, that color in animals is based upon its ability to conceal them in their usual haunts. Obviously this theory works in excellently with the Darwinian theory of Natural Selection. The individuals whose accidental or inherited colorings most effectively concealed them would be those most certain to escape attack and destruction, and survive as parents to reproduce in their progeny the peculiar colors which proved most protective. In this way, it is argued, the coloring of wild animals has eventually come to reflect the colors prevailing in their native environments. The Thayer theory develops upon a basis of the obliteration of relief by the merging of the color from darkest on the upper side, which is best lighted from the sky, to lightest on the under side, which is naturally darkened by the shadow. The result is a flat tint conveying no suggestion of solidity. Upon this primary basis, obliteration of outline is accomplished by (1) a color system which is practically a picturing of the salient features of the background against which the animal is most likely to be seen; and (2) a coach scheme which, though striking in tone, by its very boldness baffles recognition of the true form. (The theory is set forth in great detail in the book by G. H. Thayer, noted below). (For coloration due to changes of temperature see Seasonal Dimorphism under Dimorphism). General Protective Resemblance.—Cases in illustration are the white animals of the Arctic regions, where extreme cold and dryness have turned the hair of the polar bear and the feathers of the snowy owl white to species; the individual ptarmigan, ermine, hare, fox, etc., turn white in winter, but of a russet hue in summer, due to the differing light reflected from the ground in summer and the snow in winter. The ptarmigan, grouse, prairie chicken and the like, which build open nests, are protectively colored, while the conspicuously marked kingfisher, parrot, etc., build a nest which conceals the sitting bird.

The under side of the wings of certain butterflies, such as the species of Polygonia, Vanessa antiopa and the East Indian Valima, are assimilated in color, together with their often ragged outlines, to dead and tattered leaves; when the butterfly is resting on the ground or in bushes among the dead leaves, it is difficult to distinguish. On the other hand the upper side of the wings are conspicuously marked with reddish hues and conspicuous bars. In the light of the Thayer theory these markings, although consisting of harmless bits of color in harmony with the environment, and thus afford practical concealment. Certain moths, when resting on the lichen-covered bark of trees, are wonderfully similar
to the surroundings, and are thus protected from the attacks of birds or lizards. In the Arctic regions and in Labrador certain butterflies and moths are of the color of lichen-covered rocks, so much so that when at rest they are difficult to detect.

Special Protective Resemblances.—The most striking examples are the measuring-worms, or geometrid caterpillars, which, when holding themselves out straight and stiff, resemble twigs, not only in shape, but in color and markings; and still more wonderful are those species whose bodies are provided with tubercles which in shape resemble the leaf-bud and other excrescences in the back of the twigs. How to account for the origin of such protuberances is a puzzle. The stick-insect is another example, though not common with us, and supposed to be well protected from the bills of birds, yet in the East Indian Archipelago they are said to be the principal food of one kind of bird. Another example is the famous leaf-insect (Phyllium) of Java, in which the wings are very broad, thin and marked with veins like the mid-rib and side-ribs of a leaf. Such instances as these are cited as buttresses to the Thayer theory of concealment.

Recognition Marks.—By Waller and others the stripes of the African antelopes, the upturned white tail of the rabbit and hare, and the bars and other conspicuous markings of birds that fly in flocks, are regarded by some as recognition marks, but others consider that this is rather fanciful and that they are protective alone.

Warning Colors.—Certain animals, of which the skunk affords an example, are so marked as to be easily distinguished by their enemies, which, knowing by experience their offensive nature, pass them by. Hence the conspicuous stripes of the different species of these animals in the New World. There are many cases of brightly colored caterpillars which are avoided by birds and lizards which greedily devour green ones. The conspicuous red, blue and purple spots and stripes are advertisement of their inedibility. In Nicaragua, Belt observed that while ducks and fowls fed on ordinary green frogs, a small species greenish mottled with red and blue was avoided. On offering one to ducks and fowls they all refused to eat it, except one young duck, which took the frog in its mouth, only to drop it, going about jerking its head as if the taste of the frog was nauseous. Although these striking markings are supposed to be the result of natural selection, Eising's theory that the abundant secretion of pigment is the cause of the distastefulness seems better grounded. Indeed a large number of cases of protective mimicry seem due to the direct action of light and shade in bringing about the varied hues of the pigment—moreover the range of primary colors is not very great, and the hues are apparently due to the action of the environment, so that we need not, in most cases at least, invoke the somewhat fanciful hypothesis of Wallace. Poultou and others have pointed to the varied hues of the pigment as one of the main causes of this resemblance. As Eising claims, the abundant secretion of pigment has caused the insects to be inedible, rather than that the bad taste has caused the production of bright colors as an advertisement or warning signal.

Insects Attracted Rather by the Odors of Flowers than Their Colors.—It has been argued by Lubbock and others that the colors of flowers have no connection with the visits of insects, but that they are attracted by the odor of the nectar. He finds that any flower is freely visited if it be nectariferous, no matter how colorless or inconspicuous it may be. Many gay flowers are wholly avoided by insects, but on placing nectar at the base of such flowers insects were at once attracted. It appears from Plateau's observations that color is not a primary factor in attracting insects to flowers. Though bright blossoms are undoubtedly seen by insects from a distance, when they once reach the flower it is a matter of indifference to them what their color is—blue, red, yellow, green or white—if they differ from one another in no other respect. Consult Beddard, F. E., 'Animal Colour' (New York 1895); Newbigin, 'Animal Concolour' (London 1898); Poulton, E. B., 'The Colors of Animals' (New York 1895); Thayer, G. H., 'Concealing Coloration in the Animal Kingdom' (New York 1899); Wallace, A. R., 'Natural Selection and Traffic in the Animal Kingdom' (New York 1895); also works by Lubbock, Plateau, Coste, Urech, Eimer, Hopkins, Weismann, Tenneck.

COLORIMETER, an instrument for measuring the depth of color in a liquid by comparison with a standard liquid. They are of three general types, based upon the three variables in the intensity of colored solutions: (1) the quantity of coloring matter required to make the match; (2) the volume of the solvent in which it is held; (3) the thickness of the solution through which the light passes before it reaches the observer's eye. These principles are applied (1) when two solutions are brought to agreement in color by the addition of coloring matter; (2) when the match is effected by dilution of one of the two solutions; (3) when the solutions are made to match by changing the thickness through which the light is forced to pass. The form most commonly in use is of the second type. It consists of two long, narrow glass tubes placed side by side on a stand. The standard liquid and the one in question are poured, in equal quantities, one into each tube; and water is then added to the darker till its tint becomes the same as the other. The amount of water used is a measure of the depth of color in the liquid. A white colorimeter is the principal exponent of the third class. It consists of two hollow wedges of glass placed side by side, and arranged so that one may slide up and down on a bar upon which is marked a scale. The solution to be measured is placed in one of the wedges and the standard solution in the other. Both are viewed through a horizontal slit. The wedge containing the standard is raised or lowered until the color is matched, and the scale is read.

Another type of colorimeter is employed to measure or test the colored light reflected from opaque bodies. The Ives colorimeter is of this type. It consists of a hollow box about 3
COLORING.—COLORING MATTERS

by 4 inches and 20 inches long, with a viewing lens at one end, a diaphragm, and at the far end a screen. The field of view is divided by means of a diaphragm so that the light to be tested appears in the upper half while the lower half is lighted by a mixture of red, green and blue-violet lights, which can be adjusted as the case may require, and the analysis is read on the three color scales. A new (1912) precision colorimeter constructed for the United States Bureau of Standards measures the wave length of the color which is to be tested. The instrument is so arranged that colored rays taken from a spectrum are mixed with white light to match the unknown hue; or, in the case of purples, the rays from the spectrum are mixed with the unknown to make white light. The instrument is operated through the use of a Lummer-Brodhun photometer cube.

COLORING, one of the essential parts of painting—namely, that part which relates to colors. Besides a knowledge of the art of preparing and mixing colors, and the mechanical process from the beginning to the finishing of a picture, which in the various kinds of painting varies according to the materials of each, coloring comprehends the knowledge of the laws of light and colors, and all the rules deducible from the observation of their effects in nature, for the use of the artist. This subject has been treated by Leonardo da Vinci in his work on painting; Lomazzo and Gérard Lairesse in books on the same subject; Mengs in his "Praktischer Unterricht"; Goethe in his "Farbenlehre"; etc. The skill of the painter presupposes a natural ability founded on superior sensibility—namely, the ability to image forth, and to express with characteristic truth, the peculiar substance and color of any object under the influences of the light and air. With the limited range of pigment colors at his disposal, bounded at one end by the dead white of a piece of white paper, many degrees darker than local tones, and at the other end by a flat black many degrees lighter than a piece of black velvet, the artist's work becomes practically a translation from nature, instead of an imitation. For if the colors of nature were reproduced faithfully, her effects would be lost through the limited scale of expression available. The skill of the artist is exhibited in so adapting his translations of local colorings that the effects of nature are virtually reproduced in colors so correct relatively to the other colors of the painting that they are recognized as eminently truthful. To make this translation successful, accurate attention to the relative values of the local tones and tints is requisite. By local tones we understand the natural color of an object as it appears on the spot where it stands, or from the spot where the spectator is supposed to be stationed. In works of art the natural color of an object appears always as a local tone, because every object must be regarded from only one point of view, conformably to which the natural color is modified according to the supposed distance. By tints we understand, in a more restricted sense, the gradations of the clear and obscure which lights and shadows produce. All other colors which are not tints have been called shades. In no object of art do these modifications and shades exist in greater delicacy and diversity than in the human face, which is consequently the most difficult subject for a painter. Coloring, in as far as it relates to the light and character of flesh (the naked body), is called carnation (q.v.). If, in addition to the skilful translation of the natural colors, local tones and tints of its original, the artist also expresses in his work through his colors the whole of the substance of which the object consists, the coloring is called true. But to truth should be joined beauty, which is attained by the harmonious union of all the tones of the painting into one dominant tone. The coloring must conform to and promote the object of the painting as a work of art, and by the harmony of the colors and lights, as well as by the truth of the local colors, and of the individual parts of the subject, constitute one beautiful whole. In the choice of lights and the distribution of colors the artist should aim not only at clearness of representation, but at the same time at the production of a pleasing harmony, which should aid the general impression of the work. Consequently harmony and color are comprised in the idea of correct, beautiful coloring. We often see pictures in which the colors are true to nature but which have little merit and are deficient in a harmonious union of excellences.

COLORING MATTERS. This name is often used to include every substance, organic or inorganic, which is the cause of color in another, but in practice it is restricted to the natural coloring matters of vegetables and animals, and to the dyes that are used for coloring fabrics. The reason of this restriction probably is that these coloring matters are distinctly different from the tissues or fluids which contain them, whereas the color of a mineral is not in general due to a separable body, but is peculiar to the mineral itself. It is impossible, for instance, to take away the blue color of a copper compound, or the green or yellow of one of chromium. In the mineral world the analogy to the coloring of plants is found rather in rocks; for example, in a sandstone colored red by a part of the coloring matter, where the coloring matter may be removed without the rock mass being destroyed.

The organic coloring matters derived from vegetables are both important from their uses in the arts and interesting from their character and decompositions. They may be divided into two classes, those which exist ready formed in the plant, and those which are obtained by the spontaneous or artificial decomposition of some principle in the plant. Of those belonging to the first class, chlorophyll, the green coloring matter of leaves, and the different colors in flowers, are the most obvious. Those, however, which are used in the arts are not at first sight apparent, being contained in the seed, bark, stem or roots, from which they can be extracted by water, alcohol, ether, dilute alkalis, etc. The second class includes bodies which result by oxidation or other chemical change from some usually colorless matter, and which the name "chromogens," color-producer, has been given; and, indeed, the question has been raised whether all coloring matters, even in plants, have not been produced from prior chromogens. Although coloring matters have been subjected to numberless investigations, comparatively little is known about their real constitution.

Coloring matters are generally odorless, with a
COLORS—COLORS IN ART AND SYMBOLISM

rough taste, soluble, some in water, others in alcohol. Indigo and alizarin can be subdued but most are decomposed by a comparatively slight elevation of temperature. They all consist of carbon, hydrogen and oxygen, to which in some cases nitrogen is added. Some exhibit a weak acid tendency, combining with the oxides of lead, copper and especially tin, iron and aluminium, in insoluble colored compounds called "lakes." Some have the power of attaching themselves permanently to different vegetable and animal fibres, as silk, wool, cotton and linen; others are unable to give a color which will not redissolve in water; in such cases the fibre is mordanted, that is, treated with one of the metallic oxides just mentioned, and then, when immersed in the color, the insoluble lake is precipitated in the fibre. Many coloring matters are liable to change by exposure to daylight; they are also affected by a number of chemical reagents—certain blues, for example, are turned green by alkalis, and red by acids; they are destroyed by nitric acid, bleached by chlorine, decolorized, but not destroyed, by sulphuric acid, and by sulphurous acid, sulphuretted hydrogen, etc.

Of the vegetable coloring matters the yellows are the most abundant, and different shades are obtained from different plants: futsic, turmeric, quercitron, Persian berries, morindin, saffron, arnott, purre, chrysophanic acid and others; of the blues, indigo and litmus are the most familiar; and of the reds and purples, madder, logwood, Brazil-wood, safflower and a few more. Most of these colors require complicated operations to separate them in the pure state.

The only green coloring matter known, of no importance as a dye, but indispensable to the life of the plant, is chlorophyll. It was formerly supposed to be a simple substance. It was obtained from an alcoholic extract of leaves by adding lime, then decomposing the lime-chlorophyll compound with an acid, and agitating with ether, from which the chlorophyll was got by evaporation. But by another process it was found that it could be separated into two bodies, one yellow, the other blue; and by the application of the spectroscope, Stokes showed that chlorophyll contains four coloring matters, two yellow and two green, differing in optical properties. By further study in the same direction Mr. Sorby thinks he has proved that besides the greens there are four or five distinct yellow coloring matters, to which he has given special names. It is quite obvious, if this be so, that our knowledge of the nature of chlorophyll is just beginning, for each coloring matter will become an object of chemical and physiological investigation, and not till then will it be possible to say how chlorophyll is produced and acts in a plant. Experiments have been recently made to elucidate precisely the fading of chlorophyll when exposed to light, a change which is accompanied by altered spectrum bands, but in their present state they are too inconclusive to be detailed here.

The chief animal colors are those of the blood, the bile, the urine, the retina, of the muscle and of the skin. The blood's coloring matter is the well-known hemoglobin, while the pigments of the bile, bilimbin and its oxidation product, biliverdin, are derived from the blood pigments. Biliprinin and fuscin, bilicy-

anin, bilipurpurin and bilixanthin, are other bile pigments. They may be regarded as various products of oxidation and reduction of the initial bile pigment, the name applied to the urinary pigments. Its exact composition is by no means definitely understood. In the retina there are a number of pigments or chromophenes. They are mostly lipochromes, or fatty pigments, and have been named rhodophone, chlorophone and xanthophone, these being red, green and yellow respectively. There is a further black pigment in the eye, fuscin, allied to the melamins of the skin and hair. The muscle pigments are identical with the blood pigments. The skin pigments belong to a group known as the melamins. It is undecided whether these are iron pigments or not.

The artificial coloring matters may be divided into two classes, those which exist ready formed in nature, as many of the common red and brown earths, or which are formed by the mechanical mixture of such naturally existing colors, and those which do not exist in nature, but are produced by chemical operations. The latter are either destroyed, or of very short duration, and examples of the first class being afforded by Scheele's, Guignet's and other greens, artificial ultramarine, smalt and many others, and of the latter by Prussian blue and especially by the aniline colors. The artificial colors are more particularly described in the articles COAL-TAR COLORS; DYES; PIGMENTS.

COLORS, in the army, the flags carried by each dismounted regiment. The corresponding flags of mounted units are called standards. They differ from colors in size alone. Each British infantry battalion (formerly regiment) except rifles carries two colors, one as the first color, and the regimental or second color; neither of these is now carried into battle. They are carried by subalterns and formerly were guarded by the respective chief non-commissioned officers of the company or the color-sergeants. At present there are no color-sergeants. Each United States regiment or separate battalion carries the national and the regimental color or standard, the latter of the corps color, bearing the regiment's number; these are carried by non-commissioned officers, the color-sergeants, and guarded by two privates. In the navy the term colors is applied only to the national flag.

COLORS. See COAL-TAR COLORS.

COLORS IN ART AND SYMBOLISM.

When a connoisseur examines an Oriental rug he takes into consideration the symbolic intent of the color scheme as well as of the motifs depicted. He remembers that, to the Mohammedan, green is a sacred color and must not be trodden on. Collectors of Chinese ceramics in examining examples claimed to belong to a certain reign in the Ch'ing Dynasty have to bear in mind that yellow was for some time in that Dynasty an Imperial color and its use strictly forbidden except for the Imperial court. Hence any other than the finest art work appears on such a piece of porcelain containing yellow in its decorative composition proves it to have belonged to some other period. But while symbolism generally originated in the East its antiquity in and among the European peoples dates very far back. And the arts, both profane and ecclesiastical, have
used colors with symbolical intent almost universally.

White.—As symbol of innocence and purity white has been adopted over a large portion of the globe even during prehistoric days. In pagan times we find it as symbol also of light, and the Druids in white robes sacrificed white oxen to the sun; the white men of the Egyptians wore white tiara. The Romans dedicated white to Jupiter (god of light), and on the first day of January the consul, robed in white and mounted on a white horse, rode up to the Capitol to celebrate the triumph of Jupiter over the spirits of evil; the priests of Jupiter wore white vestments and the victims sacrificed to that god were white. The Greek priests sang sacred chants in white robes. In antiquity white was dedicated to the dead and was sign of mourning, and this remains so to this day with the Persians, Chinese and Indian Mohammedans. In old biblical lore white vestments were symbolical of the soul’s regeneration and a recompense of the elected. Early Christian artists dressed the Virgin Mary draped in white and Jesus was pictured in white robes after the Resurrection. The dead were swathed in white and Pythagoras called the practice a happy presage of immortality. Aaron, the Jewish high priest, was commanded to wear a white garb in the sanctuary. In Christian art, white being considered emblem of innocence and purity, lilies are found in pictures of the Immaculate Conception; it was for the same reason that some monks and nuns of the Christian Church wore white robes. The Magi were robed in white. In Christian iconography white is represented by the diamond or by silver as emblems of light, innocence, virginity, faith, joy and love. But white roses opposed to red ones signified death, rest, killing of inordinate desires.

Black.—In pagan antiquity black represented the underworld. Black, as “the negation of colors” is symbolic of death, darkness and evil, also of falsehood and error. The Illuminators of the Middle Ages represented Christ draped in black while wrestling with the Spirit of Evil, and in the 12th century, in Byzantine art, the Virgin Mary often has a black complexion. Symbolic of woe, Black for mourning and mortuary color is a very ancient tradition. Georgius writes:

Black is the third of the four sacred or canonical colors, and is used by the Roman Church (and formerly by the Eastern Church too) on penitential days. Black has also been considered as signifying counsel and antiquity, but in heraldry it is symbolic of prudence, wisdom and constancy in adversity and love. White and black in combination signify in Christian art purity of life and mourning or humiliation, as adopted by the Dominican and Carmelite orders. Black and yellow in combination were symbolical of the devil and his hosts. To the Moors black designates grief, obscurity and contempt.

Violet.—The Roman Catholic Church considered violet and black so closely allied as to use them indiscriminately for one another on days of mourning and fasting. Violet clothing was worn by cardinals and old women and was acknowledged as an emblem of old age.

Purple.—To the Tyrians (whence came the purple dye) and Romans a purple robe or band of purple signified authority; it became the Roman symbol of majesty, and its use was allowed only for royalty and for persons in high office or for priests.

Blue.—Eusebius tells us blue was the color of the clothing of the gods, especially of Juno (Queen of the Heavens). In Christian art light blue (sky-blue) symbolizes divinity, eternity and human mortality, hence was used as a mortuary color. The coffins of the young were covered with blue cloth and the mortal blue cloth was of this color; a red and a blue pall, one over the other, signified divine love, raising the soul to immortality. The baldachin, as emblem of heaven (“canopy of heaven”) was blue beneath, and church ceilings (from the Latin caelestis, “heaven”) were generally painted blue and powdered with gold stars. Blue signifies likewise piety and sincerity, also consolation. The Jewish high priests wore it about their garments as significant of divine contemplation, and the church cope and chasuble were frequently of this color. It is no longer a vestment of the father of the angel. As an angel’s garment in art blue is symbolic of faith and fidelity. In tradition and art the Virgin Mary wore a mantle of blue, in which case it symbolized modesty. This color when worn at the celebration of the Mass signifies humanity and expiation. In heraldry blue (azure) is symbol of chastity, loyalty, fidelity, good reputation. Blue to the Persian signifies air, to the Mongolian authority and power.

Red.—In symbolism red signifies life, love, passion, fire, heat. It is the color of blood and hence represented anger, war and incarnation. Red lions, foxes, squirrels were sun and fire symbols. In Christian art red represents opposite attributes; it is sign of burning zeal for the faith, of energy and courage, also of cruelty and guilt of bloodshed. The Israelites stained their door posts with red as a sign that the Avenging Angel should allow life to its dwellers. Red is the prominent color in Passion Week and on Good Friday. Rose-color signifies divine wisdom with the Buddhist and Mohammedan. In modern times red is symbol of revolution and anarchy. Red flowers are love signs.

Yellow.—This color very generally signifies envy, hate, quarrelsomeness. In Christian art yellow was symbol of the sun, also of the goodness of God, of marriage and initiation, faith and fruitfulness. In Christian iconography we find the illuminators and miniature artists of the Middle Ages depicted Saint Peter in a yellow robe as faithful guardian of the Church. Yellow has been symbol of treason, hence in France the doors of traitors were daubed with yellow and Judas is often found clothed in yellow in pictures. In some countries the Jews, for betrayal of the Lord, were enforced to wear yellow clothing. In Spain the executioner wears yellow or red, the former indicating treason of the victim and red its punishment. In heraldry yellow is symbol of love, constancy and wisdom, or in opposition, inconstancy, jealousy and adultery. The Japanese consider golden yellow symbol of the sun, riches, joy, etc., hence their chrysanthemum fête. Yellow was a Chinese symbol of royalty, rank or office under royalty, hence the gift of the “yellow jacket” as insignia showing high regard of the Imperial court.
COLORS OF FLOWERS—COLOSSIANS

Green.—To the ancient Egyptians this color was symbol of hope, growth, joy of spring. In the Middle Ages green became symbol of unripeness, as green youth, also of poison, hence dragons and snakes were painted green. Green was supposed to be good for the eyes, and Theophrastus wrote that emeralds were mounted in rings for persons with bad sight to be looked at by them. To the Mohammedan green is a sacred color and symbol of immortality. In modern times green has come to signify envy.

Brown.—With the ancient Egyptians brown was dedicated to Typhon and in olden times was generally a sign of mourning. Compound ed of red and black, this color has been also symbol of treason and evil deeds. In monastic robes it signified renunciation. The Moors considered it emblem of evil, and in Christian art, brown, the color of the dead leaf, symbolized spiritual death.

Gold.—In Christian art, when used as a background, gold meant majesty of the subject depicted; it was also used for the nimbi of saints as "glory." Gold signifies purity, dignity, wisdom and glory.

Orange.—With the Buddhists and Mohammedans orange is the color symbolizing sorrow.

COLOSSAE, kō-lōs′ē, an ancient city in Phrygia, situated on the Lycus, a branch of the Maeander. Colossae had disappeared by the Middle Ages, and it is uncertain whether it was supposed by Herodotus to be the town of Chone in its neighborhood, or whether Chone was Colossae with only a change of name. It was first mentioned by Herodotus, Xenæus passed through it on his march to Sardis, 481 B.C., and it was a place of considerable mercantile importance in the time of the Roman Empire. One of Paul's epistles was addressed to the Colossians, from which it is known that Colossae was the site of one of the early Christian churches. Consult Ramsay, 'Cities and Bishoprics of Phrygia' (Vol. I, 1895).

COLOSSAL CAVERN, The. A large cave discovered in 1895, the entrance to which is about one and a half miles distant from the entrance to the Mammoth Cave, of Kentucky. On account of its immense size and the varied character of its formations, the Colossal Cavern is a most worthy rival of the Mammoth Cave. The Louisville and Nashville Railroad Company purchased the Cavern in 1896; acquired the land under which its course was found to run, and widened narrow passageways, smoothed rough places, built stairways and did many other things to make exploration easy. There are four separate entrances to the Cavern, only one of which (an artificial entrance) is used by visitors. Among the attractions of the Cavern are Colossal Dome, 135 feet high, which is the most symmetrical as well as one of the largest domes known; Vaughn's Dome, 78 feet in height, which is approached through a magnificent canyon, about 300 feet in length; the Twin Pits, 65 feet deep; the Lover's Gallery, 400 feet long; the Ruins of Carhage, 400 feet long and 100 feet wide; Pulpit Rock, and Dining Room.

COLOSSEUM. See ColsiSEUM.

COLOSSIANS, Epistle to the. An epistle of the Apostle Paul addressed to the "Saints and faithful brethren who are at Colossae." Colossae, though 100 miles east of Ephesus and less important than the adjacent Laodicea (Col. ii, 1) and Hierapolis (iv, 13) in the Lycus Valley, yet lying like them on the great trunk road which joined the Ægean with Syria, was in living communication with "all the [Roman] world" (Col. i, 6). Paul the apostle may have passed that way from the upper country to Ephesus (Acts xix, 1) but none of his future disciples saw his face in that region (Col. ii, 1). It was rather through his two years daily reasoning in the school of Tyrannus that all they that dwelt in Asia heard the word of the Lord, both Jews and Greeks (Acts xix, 9). Epaphras, finding his heart with Paul and Colossae (Col. iv, 12) to the provincial capital, became Paul's "fellow-servant and faithful minister of Christ on his behalf" (Col. i, 5-7; iv, 12) and the founder of the churches in Laodicea and Hierapolis. Two other Colossians, Philemon and Archippus, are named fellow-workers and the latter is exhorted to fulfil his ministry received from the Lord (Phil. i, 14). Two house-churches are mentioned, one in the house of Apphia at Colosses (Phil. 2) and another in that of Nymphas in Laodicea (Col. iv, 15). The membership of the churches included slaves and their well-to-do owners (Col. iii, 22; iv, 1; iii, 11; Phil. 15). The content of Paul's gospel to this Gentile population (Col. i, 27) may be divined from his contemporary first Corinthian epistle, in which his characteristic stress is laid upon the transcendent and cosmic rank of Christ, as sole divine agent in all creation (I Cor. viii, 6) and upon his unique redemptive function through his incarnation, death and resurrection (I Cor. xv, 1-4; i, 23-24; 30; vi, 11). The apostle's foreboding that after his departure from Asia some of his own converts would "speak perverse things to draw away the disciples after them" (Acts xx, 30) was to be realized in Colossae. His failure to visit the valley churches a natural local jealousy toward Epaphras and scant regard for his teaching ability, gave an ambitious leader (note singular number in ii, 4, 8, 16, 18) an opportunity to promulgate an alleged higher type of doctrine, with syncretistic elements of ultimate Jewish (ii, 14, 11, 16, and perhaps Grecian) (i, 8, 23; i, 26; ii, 4), Phrygian (ii, 12) and Oriental (i, 16) origin. The new teaching, harmonizing with the inherited prepossessions of Gentiles but newly won to the Christian faith, and addressed not to the common herd but to persons flattered as possessed of superior intelligence, made a headway which Paul's unlearned sponsors found themselves powerless to arrest. They felt that no less potent a reasoner than he of the school of Tyrannus, now unfortunately a prisoner in distant Rome, could cope with the subtle and minister propaganda, which takes the bold venture of an arduous and per chance futile journey all the way to the imperial capital. He finds the apostle still among
the living and prepared to meet the dire emergency in the valley churches. Tychicus, possibly an abler representative than Epaphras, is armed with oral instructions and dispatched with a circular letter (our so-called Ephesians*) to "the churches of Asia" (1 Cor. xvii, 9), to write a letter to the Colossian church dealing with the heresy, and a personal letter to Philemon, together with a "living epistle" (2 Cor. iii, 2) in the person of the latter's converted runaway slave, Onesimus (Col. iv. 7-9; Eph. vi, 21; Phil. 10-16). Paul's method in refuting the false teaching at Colosse is to renew his earlier emphasis upon the transcendence and immanence of the crucified and risen Christ Jesus (Col. i, 15-17) as taught in the school of Tymannus (1 Cor. xv, 1-4; vii, 6; iii, 23). He whom they have "received as Lord" (Col. ii, 6) is One who is before all things, through whom and unto whom all things have been created, and in whom all things consist (i, 15-17), who therefore is all, and in all (iii, 11) and in them, the hope of glory (i, 27). After the opening salutation, thanking for their Christian graces of faith, love and hope, and prayer for their deeper spiritual knowledge and for life rather than the indwelling Christ, he sets forth in the doctrinal section (i, 13-ii, 3) the pre-eminence of Christ as Redeemer from sin, unique revealer of God, creative agent and sustainer of the universe, including every rank of intermediate beings (i, 13-17); and as crucified and risen Head of the Church, the sole divine mediator for restoring harmony in heaven and earth, through the Gospel divinely entrusted to Paul for them and all Gentiles of every class and condition (i, 18-ii, 3). The polemical section following (ii, 4-ii, 4) contrasts the sufficiency of Christ's gospel with the insufficiency of the false teaching. Cleaving to Christ and his gospel, they are to accept no false human philosophy as a substitute (i, 4-8); for in him dwells the whole living omnipotent Deity, as in no lesser being, to meet every human need (ii, 9-10); to raise them with himself from the corruption and death of sin to the life of obedience, to put an end to the works of God and the powers of evil (ii, 11-16). The new ceremonialism is shadow: but Christ is substance; his worship of angels a fiction of the imagination, replacing personal and vitalizing union with Christ, the Living Head; its ascetic rules a pitiful substitute for ethical death and victorious life with Christ over the power of the flesh (ii, 20-iii, 4). The hortatory application follows: Put off the old nature: put on Christ (iii, 5-iv, 6). United to Christ they are to reproduce His own death to the world and its vices (iii, 5-11), His life of love and joyous service to God and man (iii, 12-17); in their homes they are to incarnate His spirit (iii, 18-iv, 1) and live His life of divine service for the extension of His gospel (iv, 2-6). The personal conclusion (iv, 7-18) contains a reference to Tychicus and Onesimus, salutations, instructions as to exchange of epistles with the Laodicities and the autograph signature.

Bibliography. Critical discussions of the problems of authorship, vocabulary, style, relation to Ephesians and the Colossian heresy may be found in the New Testament "Introductions" of Zahn (Eng. tr., 1909); J. Moffatt (1911), B. Weiss (1897), H. J. Holtzmann (1892), Jülicher (Eng. tr., 1904); W. Sanday's article in Smith's "Bible Dictionary" (2d ed., 1893) and detailed exegesis in the commentaries of J. B. Lightfoot (1875), H. von Soden (1893), A. S. Peake (1903), Haupt (Meyer 1897).

MARCUS D. BUELL,
Professor of New Testament Greek and Exegesis, School of Theology, Boston University.

COLOSSUS, kō-lōs′ús, in sculpture, a statue of enormous magnitude, from which our adjective colossal is derived. The people of the East from the most ancient times have been celebrated for colossal sculpture. The pagodas of China and of India and the excavated caverns of the East abound with colossi of every description. The Asiatics, the Egyptians, and in particular, the Greeks, have excelled in these works. The celebrated colossus of Rhodes was reckoned one of the seven wonders of the world. It was raised by the Rhodians in honor of Apollo. Strabo, Pliny and other ancient authors who lived at the time that the colossus of Rhodes is said to have been in existence have given its height as 70 cubits, or about 105 feet. Other authors who flourished since its destruction report its height at 80 cubits. The statue stood at the entrance of the harbor of Rhodes, but there is no authority for the statement that it bestowed the harbor mouth and that the Rhodian vessels could pass under its legs. Of other colossal statues of ancient times the most celebrated are the Olympian Zeus and the Athena of the Parthenon, both the work of Phidias. The virgin goddess was represented in a noble attitude, 20 cubits or 39 feet in height, erect, clothed in a tunic reaching to the feet. In her hand she brandished a spear, and at her feet lay her buckler and a dragon of admirable execution, supposed to represent Erychthius. The statue of Zeus was 60 feet high. The earliest colossus recorded to have been sculptured in Rome was the statue of Jupiter Capitolinus, which Spurius Carvilius placed in the capitol after his victory over the Samnites.

Among modern works of this nature are the colossus of San Carlo Borromeo at Arona in the Milanese territory; the four colossal statues at Paris in front of the façade of the palace of the Chamber of Deputies, representing four of the greatest French legislators; and a statue of Germania, 34 feet high, on a pedestal over 81 feet high, erected near Rüdesheim in commemoration of the unification of the German Empire. In the United States a figure of Liberty Enlightening the World, 151 feet high on a pedestal 155 feet high, has been erected in New York, overlooking the harbor and serving as a beacon. It was the work of the French sculptor Bartholdi, and was constructed mainly through the efforts of a French-American Union formed in 1874. In 1880 it was presented by France to the United States, and six years later it was placed on its present site, Bedloe's Island.

The statue of Charles IV of Spain at the head of the Paseo de la Reforma in the City of Mexico is the largest equestrian statue on the American continent and the second largest in the world.
COLOSTRUM—COLTON

COLOSTRUM, the name given to the first milk yielded after the birth of the young. It differs from ordinary milk in appearance and composition. It contains a larger percentage of ash and total solids than ordinary milk; and a greater proportion of albumin to casein, but less sugar of milk. There are also minute fat granules known as colostrum bodies and which are believed to be the dëbris of the cells of the mammary gland. Colostrum has a purgative effect upon the new-born infant and removes the meconium from the fecal intestine. Colostrum gradually assumes the characteristics of normal milk within a few days after parturition.

COLOQUHOUN, ko-hoon', Archibald Ross, British colonial administrator, explorer and author: b. off Cape of Good Hope, March 1848; d. 18 Dec. 1915. He entered the Indian Public Works Department in 1871, and was a member of the mission to Siam in 1879. In 1881-82 he explored the proposed railway route between Burmah and China, and was deputy-commissioner of Upper Burmah 1885-89. He was administrator of Masconland 1900-02. In 1895 he visited America to explore the Nicaragua and Panama Canal routes. He had traveled extensively and was the author of numerous works, including 'Among the Shans' (1885); 'The Key of the Pacific' (1895); 'China in Transition' (1898); 'The Mastery of the Pacific' (1902); 'Germany and Sea Power' (1909).

COLOQUHOUN, John, Scottish writer on sport: b. Edinburgh 1805; d. 1885. He was educated at the university of his native city. In 1840 he published 'The Moor and the Loch,' an extremely diverting account of his adventures as a sportsman. The volume was immensely popular and an autobiographical preface was added to the fourth edition (1878). Other works by him are 'Rocks and Rivers' (1849); 'Salmon Casts and Stray Shots' (1853); 'Sporting Days' (1865).

COLOQUHOUN, Patrick, English magistrate and advocate of police reform: b. Dumfriesshire 1745; d. 1820. He went to Virginia at an early age and there became a successful merchant. In 1766 he returned to Glasgow, became prominent in public affairs of 1798, he established the Glasgow Chamber of Commerce in 1782, the oldest institution of the kind in Great Britain. In 1789 he removed to London, where in 1795 he issued his 'Treatise on the Police of the Metropolis,' in which he advocated a complete reform of the London police system. Many of his recommendations were adopted subsequently by the authorities. In 1798, having come into notice through the inauguration of important municipal reforms, he was appointed magistrate at Westminster. Other works by him are 'System of Education for the Laboring People' (1806); 'On Indigence' (1806); 'On the Population, Wealth, Power and Resources of the British Empire' (1814, 2d ed., 1815).

COQUIETT, Alfred Holt, son of Walter T. and Matilda C. (White) Coquett. American legislator: b. Walton County, Ga., 20 April 1824; d. Washington, D. C., 26 March 1894. He was graduated at the College of New Jersey in 1844 and settled in his native State as a lawyer. He served in the Mexican War, and was elected to Congress in 1852 as a Democrat. Upon the outbreak of the Civil War he entered the Confederate army as a captain and rose rapidly to the rank of major general. He was governor of Georgia from 1867 to 1868, and United States senator in 1882 and in 1888.

COQUIETT, Walter T., American lawyer: b. Halifax County, Va., 27 Dec. 1799; d. Macon, Ga., 7 May 1855. He was educated at Princeton; was admitted to the bar in 1820; became a district judge in the first court ever held in Columbus, Ga. He was a successful lawyer, and in criminal practice was without a rival in his State. He was a member of the Georgia State senate 1834, 1837; a representative in Congress 1839-42; a United States senator 1843-55, and a member of the Nashville Convention 1850.

COLT, LeBaron Bradford, American jurist: b. Dedham, Mass., 25 June 1846. He was graduated at Yale in 1868 and two years later from the Columbia Law School. He practised law in Chicago and Providence, R. I., and from 1879 to 1881 was a member of the Rhode Island House of Representatives. In 1881 he became United States district judge for Rhode Island, and in 1884 was made United States circuit judge for the first judicial circuit. He retired from this office in 1913 when he was elected to the United States Senate for the term 1913-19.
