The first systematic treatment of space curves was given by Clairault in 1751, 'Traité de courbes à double courbure.' Among the old authors are Lagrange, 'Mémoires présentés ... à l'Académie des sciences' (1806); de Saint-Venant, 'Journal de l'École Polytechnique.' The more important treatises and texts that give more or less complete representations of the theory are Bianchi, 'Lezioni di geom. diff.' (Pisa, 1855-86); translated into German by Lukat, Leipzig (1889); Darboux, 'Leçons sur la théorie générale des surfaces' (Paris 1887-96); Hoppe, 'Lehrbuch d. anal. Geom.' (Leipzig 1889); Joachimsthal, 'Anwendung der Differential- und Integralrechnung auf die allgemeine Theorie der Flächen und der Linien doppelter Krümmung' (Leipzig 1890); Laurent, 'Traité d'analyse,' 2, 7 (Paris); Salmon, 'Geometry of Three Dimensions,' 2, 7 (Paris); Salmon, 'Fleissiger' (Leipzig 1902); Scheller, 'Anwendung der Differential- und Integralrechnung auf die Kugel' (Leipzig 1890); Schell, 'Allgemeine Theorie der Curven doppelter Krümmung in rein geometrischer Darstellung' (Leipzig 1898).

CURWEN, John Spencer, English musical writer; b. Plaistow, Essex, 30 Sept. 1847. He is a son of John Curwen (q.v.), and has been editor of the Musical Herald from 1866. He was educated at the Royal Academy of Music, becoming president of the Tonic Sol-fa College in 1880, and has traveled in Europe and America investigating the subject of music in schools. He has published 'Studies in Worship Music'; 'Memorials of John Curwen'; 'The Boy's Voice'; 'School Music Abroad'; 'Music at the Queen's Accession.'

CUMBERLAND, James, American author; b. Owosso, Mich., 12 June 1878. On his father's side he is a descendant of Captain Marryat, the novelist. He studied at the University of Michigan; entered the journalistic field as assistant editor of the News-Tribune of Detroit, later becoming editor. In 1907 he resigned in order to devote himself exclusively to literary work. He is one of the foremost authorities on matters pertaining to the Northland of Canada. Each year he spends several months in the north, traveling far from civilization. He is the only American ever employed by the Dominion Government as a writer on exploration. His published works include 'The Courage of Captain Plum' (1908); 'The Wolf Hunters' (1906); 'The Great Lakes' (1909); 'The Gold Hunters' (1910); 'The Danger Trail' (1910); 'The Honor of the Big Snows' (1911); 'Philip Steele, of the Royal Mounted' (1911); 'The Valley of Silent Men' (1911); 'Flower of the North' (1912); 'Isobel' (1913); 'Kazan' (1914); 'God's Country and the Woman' (1915); 'The Hunted Woman' (1916); 'The Grizzly King' (1917); 'Baree, Son of Kazan' (1917); 'The Courage of Marge O'Doone' (1918).

CURZOLA, koor'dzo-lá, Austria, the most beautiful of the Dalmatian islands, in the Adriatic, stretching west to east about 25 miles, with an average breadth of four miles, lat. 43° 5' N. and long. 17° E., area 107 square miles. It is covered in many places with magnificent timber. The fisheries are very productive. It produces grain, wine and olives. The inhabitants are engaged chiefly in boatbuilding and fishing. There are several good harbors. Pop. 29,908. The principal towns are Curzola, of 2,157 inhabitants, and Blatta with 6,837 inhabitants. The island came under Austrian rule in 1815.

CURZON, George Nathaniel (ERAL CURZON OF KIRKLESTON), English statesman and administrator; b. Kedleston, 11 Jan. 1859. He was educated at Eton and Balliol College, Oxford;
became assistant private secretary to the Marquis of Salisbury in 1885 and next year was elected as a Member for the Soutport division of Lancashire, which he represented till 1898. He was under-secretary for India in 1892 and in 1895 became under-secretary of state for foreign affairs. In 1899 he was appointed viceroy of India, and at the same time created as a baron (in the Irish peerage) by the style of Baron Curzon of Kedleston. His object in accepting an Irish peerage was that he might be eligible to sit in the House of Commons during the lifetime of his father, Baron Scarsdale. His reign as viceroy of India was characterized by great vigor and he carried out some important reforms; but the partition of Bengal aroused considerable hostility among the natives. He was brought into conflict Lord Kitchener, then commander-in-chief in India, on a question affecting the civil control of military affairs, and as his views were not supported by the home government, he resigned 20 Aug. 1905. He was one of the leaders of the House of Lords in defending that House against the attacks of the Liberal party, but assisted materially in reconciling the House to the views of the Government. He was Chairman of the Committee of the Pantile Act (1912). In June 1915 he joined the Asquith coalition ministry as Lord Privy Seal. He holds a distinguished place as a geographer and author; was elected chancellor of Oxford University in 1907; was president of the Royal Geographical Society, 1911-14; and was created Earl Curzon in 1911. He married Mary Victoria, daughter of L. Z. Leiter, Chicago, in 1895, who died in 1906. He is the author of 'Russia in Central Asia' (1889); 'Persia and the Persian Question' (1893); 'Aspects of the Far East' (1904); 'The Lord Curzon in India' (1906); 'Principles and Methods of University Reform' (1909); 'Modern Parliamentary Eloquence' (1913); 'War Poems and Other Translations' (1913); 'Subjects of the Day' (1915).

CUSACK, Mary Frances, Irish writer; better known as the Nun of Kenmare: b. Dublin, 6 May 1820; d. 7 June 1899. Originally a Protestant, she became a Roman Catholic and joined the Poor Clares, one of the sisterhoods of Saint Francis, and for 23 years was a nun of the convent of the order at Kenmare. When in 1884 she established the Sisters of Peace, an order similar to the Poor Clares but with a wider range, not only did Leo XIII sanction the work, but she received the hearty support of Christians, both Catholic and Protestant, visited the United States in 1886. Among her many published books are 'Student's History of Ireland'; 'Woman's Work in Modern Society'; 'The Pilgrim's Way to Heaven'; 'Jesus and Jerusalem'; lives of Saint Patrick, Daniel O'Connell, etc. Consult 'The Nun of Kenmare: An Autobiography' (1888).

CUSACK, Thomas F., American Roman Catholic bishop: b. New York, 22 Feb. 1862; d. Albany, N.Y., 12 July 1918. His early years were spent in the East Side of New York and it was in that section that he spent most of his priestly career. He attended the public schools, and then attended the college of Saint Francis Xavier, where he received his preliminary training. He received his theological course at Saint Joseph's Seminary, TROY, N.Y. On 30 May 1885 he was ordained to the priesthood by the late Bishop McNinney of Albany. His first assignment was to Saint Teresa's, Rutgers street, New York. After five years as assistant there he was promoted to the pastorate of Saint Peter's, Rosendale. In 1897 he resigned his pastorate to organize the New York Apostolic Vicariate. On becoming superior of that band of missionary priests he was again designated assistant at Saint Teresa's. On 9 March 1904 he was appointed auxiliary bishop of New York and on 25 April of the same year he was consecrated titular bishop of Themiscyra by Cardinal Farley. At the same time he was appointed irremovable rector of Saint Stephen's, New York. Here he remained until his appointment to the see of Albany, which was made 5 July 1915. One of his first acts as Bishop of Albany was to organize a band of missioners to carry the faith in the outlying regions of the diocese where the Catholic Church was seldom heard of. He was the leading spirit in the organizing of the Catholic State Charities Society. During the Spanish-American War he was auxiliary chaplain at Chickamauga, where he worked night and day among the sick and was highly commended by the officers in charge. After the entry of America in the World War he placed the resources of his diocese at the disposal of the government, these included several hospitals, homes and a large country inn with 70 acres of land suitable for a convalescent hospital.

CUSCATLÁN, koos-kat-lán', Salvador, a department bounded on the north by the departments of Chalatenango and Cabañas, on the east by the same departments and San Vicente; on the south by San Vicente and La Paz, and on the west by the department of San Salvador. The greater part of its surface is covered by lofty mountain ranges separated by narrow valleys; toward the north and northeast, however, near the Cuscatlán rivers, there are comparatively level districts. The department was formed in 1835, and was
originally much more extensive than it is at present (that is, 1,078 square miles), including until 1855 all of the Chalatenango region, and until 1875 a portion of what is now Cabanas. It is an agricultural country, the chief products being coffee, sugar, indigo, rice, tobacco, starch, cheese and cereals. Twice each year the people gather from all parts, in Cojutepeque at the Feast of Saint John, 29 August, and at Suchitoto, 8 December, to exchange native products for foreign merchandise. The capital, Chachona, has a population of about 8,000, and is situated near the summit of an extinct volcano, 2,614 feet above sea-level. Its streets are narrow and crooked, but the suburbs are beautiful. It has a town-hall, hospital, public school, four churches, public baths, etc. There are 17 towns in the department, the more important being Suchitoto, San Pedro, Perulapán, Tenancingo, San Rafael and Guayabal. Pop. 72,000.

CUSCO-BARK, kooz'kō, or CUSCO-BARK, the bark of *Chinchona pubescens*, which comes from Cusco, in South America, and is extensively used as a preparative to a peculiar alkaloid which resembles cinchonine in its physical qualities, but differs from it in its chemical properties.

CUSCUS, kū'skūs, a marsupial native to the islands of the Australian group and New Guinea. It is generally about the size of a house cat; has a small head, large eyes and a dense coat of fur, often pure white irregularly flecked with black, though this is variable. There are several distinct species. The food of all seems to be generally leaves and fruits, together with birds and other small animals. They frequent only forests of large trees, often swinging themselves from bough to bough by their long prehensile tails. They belong to the family of the phalangers (q.v.).

CUSCATLAN, CUSCATLÁN, also C. DE LOS ANILLOS, the name of the central province of El Salvador, a republic in Central America, which extends from the Atlantic to the Pacific oceans, and is divided into 10 departments. It is hexagonal in form, and is bounded on the north by the department of La Libertad, on the south by the department of Sonsonate, on the east by the department of Morazán, and on the west by the department of San Miguel.

CUSHEW-BIRD, kū'shō, another name for the galeate curassow. See CURASSOW.

CUSHING, Caleb, American jurist and diplomatist: b. Salisbury, Mass., 17 Jan. 1800; d. Newburyport, Mass., 2 Jan. 1879. His intellectual abilities manifested themselves early. He entered Harvard College in 1817, and was graduated in 1818. He then studied law, was admitted to the bar at 22 and soon acquired an extensive practice, standing with Rufus Choate (q.v.) at the head of the Essex bar. He was a member of Congress 1835-43, and in the last-named year, having left the Whig party, was appointed by President Tyler first United States commissioner to China. He filled the post brilliantly, making a treaty so full and clear as to detail that it was the leading authority in settling disputes until 1860, when foreigners were allowed to enter Peking. He was an enthusiastic supporter of the Mexican War, raising a regiment and accompanying it to Mexico, for which he was promoted to the rank of brigadier-general. He was Attorney-General of the United States 1853-55, and a member of the Democratic convention in Charleston, S. C., in April 1860. During the Civil War period he was several times employed on confidential missions by President Lincoln and the heads of departments, and in 1868 was sent to Bogotá to settle a diplomatic difficulty, which he did successfully. In 1866 he was member of a commission to revise and codify the laws of Congress; he was appointed counsel before the Geneva Arbitration Tribunal 1871-72; and was Minister to Spain 1874-77. His legal decisions were distinguished both for sagacity and professional erudition. He filled a large place in the political history of his time. He published "Practical Principles of Political Economy" (1826); "History of Newburyport" (1826); "Historical and Political Review of the Late Revolution in France" (1833); "Reminiscences of Spain" (1833); "Growth and Territorial Progress of the United States" (1839); "Life of William Henry Harrison" (1840); "The Treaty of Washington" (1873).

CUSHING, Frank Hamilton, American ethnologist: b. Northeast, Pa., 22 July 1857; d. Washington, D. C., 10 April 1900. He became interested in Indian relics, and when 19 years old was made curator of the ethnological exhibit at the Centennial Exhibition in Philadelphia. Accompanying Powell's New Mexico expedition, he settled among the Zuñi Indians for the purpose of study. In 1881 he conducted excavations in Arizona, and in 1895 discovered archeological remains in Florida. He conducted the Pepper-Heard expedition to the Gulf coast of Florida in 1896 and published "Report on the Ancient Key Dwellers of Florida." In 1897 he became connected with the United States Bureau of Ethnology. Among his works are "The Willows" (1882); "My Adventures in Zuñi" (1883); "Manual Concepts" (1892); "Zuñi Folk Tales" (1902); "Studies of Ancient Pueblo Keramic Art, as Illustrative of Zuñi Culture and Growth" (1894); "Zuñi Breadstuff" (1885).

CUSHING, Harry Alonso, American educator: b. Lynn, Mass., 15 Sept. 1870. He was graduated at Amherst College 1891, and took graduate studies at Columbia University 1894-
CUSHING — CUSHMAN

96. He was admitted to the bar in 1901, and has since practised in New York. He was lecturer in history and constitutional law at Columbia 1903-07 and from 4 Feb. 1907 to 1909 professor of law. He has published ‘History of New York from Provincial to Commonwealth Government in Massachusetts’ (1896); ‘Voting Trusts, a Chapter in Recent Corporate History’ (1915).

CUSHING, Harvey (Williams), American surgeon: b. Cleveland, Ohio, 8 Apr. 1869. He was educated at Yale and Harvard universities, and in 1895 took up the practice of surgery. From 1902 to 1911 he was associate professor of surgery at Johns Hopkins University and in the latter year he became professor of surgery at Harvard. With Dr. George W. Crile he made an important contribution to the study of blood pressure in surgery. In 1913 he received an honorary fellowship from the Royal College of Surgeons. He is author of ‘Dr. Garth, the Kit-kat Poet, 1661-1718’ (1906) and ‘The Pituitary Body and its Disorders’ (1912).

CUSHING, Luther Stearns, American lawyer: b. Lunenburg, Mass., 22 June 1803; d. Boston, 13 Jan. 1889. He was the only graduate of the Harvard Law School in 1826. He was clerk of the Massachusetts house of representatives 1832-44, and reported the decisions of the State Supreme Court 1850-56, preparing 12 volumes of law reports for those years. He was lecturer on Roman law at the Harvard Law School 1848-56, but is best known for his ‘Manual of Parliamentary Practice’ (1844), which immediately became an authority in parliamentary assemblies throughout the English-speaking world, and remained so for half a century. Other of his works are ‘Treatise on Trustee Process’ (1837); ‘Treatise on Remedial Law’ (1837); ‘Reports of Controverted Election Cases in Massachusetts’ (1852); ‘Introduction Cases in Massachusetts’ (1852); ‘Introduction to the Study of Roman Civil Law’ (1854); ‘Lex Parliamentaria Americana’ (1856), and translations of several legal works from the French and German.

CUSHING, Thomas, American statesman: b. Boston, Mass., 24 March 1725; d. there, 28 Feb. 1788. He was graduated from Harvard 1744; was elected speaker of the Massachusetts assembly 1766-74, and was a member of the First and Second Continental Congresses 1774-75, being defeated for re-election because he opposed a declaration of independence. In England, he was accused of being the leader of the American Revolution and Dr. Johnson accused him of having aimed at an American crown. In 1783 he was lieutenant-governor of Massachusetts, and a member of the convention which ratified the Federal Constitution 1788. John Adams describes him as being exceedingly useful to the patriot leaders in obtaining valuable secret information.

CUSHING, William, American jurist: b. Scituate, Mass., 1 March 1732; d. there, 13 Sept. 1810. He was graduated at Harvard in 1751, became judge of probate in Maine in 1768, judge of the Massachusetts Superior Court in 1772 and chief justice in 1777. Washington appointed him one of the Justices of the Supreme Court of the United States in 1789, and in 1796 offered him the post of chief justice, which he declined.

He was one of the founders of the American Academy of Arts and Sciences in 1780.

CUSHING, William Barker, American naval officer: b. Delafield, Wis., 4 Nov. 1842; d. Washington, D. C., 17 Dec. 1874. He entered the navy as a volunteer officer in 1861, and was promoted to a lieutenantcy in the following year. His greatest exploit was performed in October 1864. For some time previous nothing had been able to cope with the Confederate ram Albemarle. She had successfully encountered a strong fleet of Federal gunboats and fought for several hours without sustaining material damage. Cushing volunteered to destroy the ram, and on the night of 27 October accomplished the feat. For this he received the thanks of Congress, and was made a lieutenant-commander, becoming a commander in 1872. See PLYMOUTH, N. C., ENGAGEMENT AT.

CUSHING, William Henry, Canadian statesman: b. Kenilworth, Ontario, 1852. He was educated in the public schools; after working on a farm for some years he went west to Calgary in 1883 and engaged in business, later becoming the head of an important manufacturing concern and the owner of extensive timber limits in British Columbia and Yukon. In 1905 he was elected Liberal member for Calgary in the Alberta legislature; and in the same year, when the government of Alberta was organized with Alexander C. Rutherford as Premier, Cushing became Minister of Public Works, retaining that position until 1910. He was the first Canadian to make ownership of telephones a part of government policy.

CUSHMAN, Allerton Seward, American chemist: b. Rome, Italy, 2 June 1867. He was educated at the Worcester Polytechnic Institute, at Freiberg and at Heidelberg. Harvard and Johns Hopkins universities. He was associate professor of chemistry at Bryn Mawr College in 1900-01, associate director of the Office of Public Roads, United States Department of Agriculture, for eight years, and then in 1910 founded and became director of the Institute of Industrial Research. He is author of ‘The Corrosion and Preservation of Iron and Steel’ (1910) and of the following bulletins: ‘The Useful Properties of Clay’ (1904); ‘The Decompositions of the Feldspars’ (1907); ‘The Use of Feldspathic Rocks as Founding Materials’ (1907), and also a bulletin of the Institute of Industrial Research, ‘The Preservation of the Exterior of Wooden Buildings’ (1911).

CUSHMAN, Charlotte Saunders, American actress: b. Boston, 23 July 1816; d. there, 18 Feb. 1876. She appeared first in opera in 1834, and as Lady Macbeth in 1835. Miss Cushman played sometimes in his own productions, but her name is identified with tragic parts. In 1844 she accompanied Macready on a tour through the northern States and afterward appeared in London, where she was well received in a range of characters that included Lady Macbeth, Rosalind, Meg Merrilies and Romeo — her sister Susan (1822-39) playing Juliet. In later years she acted with great success in many cities in the United States and was also prominent as a dramatic reader. In 1856 she went to Rome, where she lived for many years. Her last appearance on the stage in 1874, she was presented with a laurel wreath by a body of
minent citizens with William Cullen Bryant as spokesman. Consult Stebbins, ‘Charlotte Cushman: Her Letters and Memories of her Life’ (Boston, 1878); Clement, ‘Charlotte Cushman’ (London, 1888); Cook, ‘Hours with the Players’ (London 1881); Price, W. T., ‘A Life of Charlotte Cushman’ (New York 1844); Clapp, H. A., ‘Reminiscences of a Dramatic Critic’ (Boston 1902). She retired from the stage in 1875.

CUSHMAN, Robert, American colonist: b. Kent County, England, about 1590; d. England 1625. He was one of the Pilgrims who accompanied John Carver to Leyden in Holland. In 1617 he and Carver went to London and endeavored to secure a charter to settle in America and enjoy the privilege of absolute freedom of worship which the King finally granted in 1620. He returned to London and made arrangements for vessels to transport the Pilgrim colony to Leyden with the colonists’ financial agents. In 1620, he sailed for America with his son Thomas, in the ship Fortune, and arrived at New Plymouth 21 November. In 1623, with Edward Winslow, he obtained from Lord Sheffield a grant of territory on Cape Ann and with a new band of devout colonists made the first permanent settlement within the limits of Massachusetts Bay colony. During his brief visit to the Plymouth settlement in December 1621, he preached a sermon on the Sin and the Danger of Self-love, the first sermon delivered in America that was printed (London 1622). The original edition is of great rarity, only three copies being known to exist. The Charles Deane copy sold at auction in 1896 for $1,000. Reprints of it were published at Boston in 1724, 1790, 1870; at Plymouth 1888 and New York 1858.

CUSINS, Sir William George, English composer: b. London 1835; d. 1893. As a lad of 10 he sang in the Royal Chapel, and developing musical abilities, he was sent to Brussels, where he studied under the leading masters. He secured the most valuable scholarships in the Royal Academy of Music before he was 16 years of age, at which time he became organist to the queen. At the age of 32 he took charge of the Philharmonic Society, succeeding Sternadale Bennett, and took an important part in the musical development of England, being knighted for such service in 1892. His works include a Concerto in A Minor; a cantata: ‘Gideon,’ an oratorio; and a number of songs.

CUSK, kusk. Brosme bosome, a fish belonging to the cod family or Gadidae (Cuvier), characterized by an elongated body, a single dorsal fin extending the whole length of the back, fleshy ventral fins and one barbel at the chin.

CUSPARI A BARK, the bark of the Galipea Cusparia, and some other species, also called Angostura bark.

CUSSO, csus’ss, Hagenia abyssinica, a small Abyssinian tree of the rose family (Rosacea), having pinnate leaves and diecious flowers, which are imported into Europe and used as an anthelmintic.

CUST, Lionel, English art writer: b. London, 25 Jan. 1859. He was educated at Eton and Trinity College, Cambridge. Since 1901 he has been a surveyor of the king’s pictures and works of art. Among his published works are: ‘Artists Represented in Department of Prints and Drawings in British Museum’ (1893-96); ‘Albrecht Dürer’ (1897); ‘Lettres de la Société de Dilettanti’ (1869); ‘Sir Anthony Van Dyck’ (1900); ‘Van Dyck’s “Chatsworth” Sketch Book’ (1901); ‘Portraits of Mary Queen of Scots’ (1903); ‘The Bridgewater House Gallery’ (1904); ‘The Royal Collection of Paintings, Buckingham Palace’ (1905); ‘Eton College Portraits’ (1909); ‘Notes on Pictures in the Royal Collections’ (1911).
CUSTER MASSACRE—CUSTOM

Forks and Dinwiddie Court-House, and was brevetted brigadier-general United States army. After which at Appomattox he was brevetted major-general United States Army, and appointed major-general of volunteers. Assigned to duty in Texas, then appointed chief of cavalry till mustered out of the volunteer service, he asked permission to accept Juarez’s offer of the chief command of Mexican cavalry against Maximilian; refused leave of absence, he took the lieutenantcy of the Seventh cavalry, and joined it at Fort Riley, Kan., November 1866, under Hancock, who was succeeded by Sheridan in the summer of 1867. Custer shortly after saw his first Indian service; and closed a campaign against the Cheyennes in 1868 by the crushing victory of the Washita (q.v.), where 103 Indian warriors were killed, and the tribe forced to return to their reservation. He was stationed in Kentucky 1871–73. In the spring of 1873 he was sent to Dakota to make head against an Indian insurrection of the first order, organized by Sitting Bull and Crazy Horse, and comprising not only the Sioux but a mass of other tribes in Dakota, Montana, and Wyoming. They fought a number of battles, and opened up the Black Hills country. In the spring of 1876 Sheridan made ready for a decisive blow, sending three divisions under Crook, Terry and Gibbon to unite and crush Sitting Bull or the Yellow Cliff. Terry and Gibbon united without discovering the Indian army; Crook beat up Crazy Horse’s band, and after a sharp skirmish the whole Indian force of 5,000 or 6,000 moved to the Little Big Horn. They were discovered by Terry’s scouts, and Terry sent Custer in advance, with his cavalry regiment of 600 men in 11 companies, to bar their escape east; he was to wait for the main body at the junction of the Big Horn and Little Big Horn 26 June. Custer arrived there the night of the 24th; his scouts discovered the Indian village the next morning; imperfect information he supposed that they were only the 1,200 or 1,500 Pawnees he had known were marching to join Sitting Bull, and he resolved to surround and capture them all. The Indians were on the crest of the Little Big Horn; Custer kept five companies, 260 men in all, for a direct attack on the centre, gave four to Major Reno to assail their left (south), and two to Captain Benten to make a southern detour of two miles and come on their right rear, cutting off their retreat. The Indians had broken up their tents and were about to retreat, when they discovered how weak was the assailing force. The three divisions forded the river, and Custer rode for the heart of the Indian line. A rise across the stream masked the enemy, and many hundreds of whom lay in a ravine between it and the higher ridge beyond; and as Custer swept down, the savages rode against him and swarmed around to his rear. Outnumbered 20 to 1, the heroic band still fought their way up to the ridge, and after the surrender at a halt reached it, then a fresh band of 1,000 Cheyennes rose up, under Rain-in-the-Face, and not a soul was left alive. Meantime Reno had been repulsed and had taken refuge across the creek; and Benten never reached the neighborhood of the fight but surrendered at a halt on the east, where they held the Indians at bay till Terry arrived next morning. The bodies of the slain division were left as they lay, all horribly mutilated, except Custer’s. Forty-two Indians were killed. The battlefield has been marked with a small marble monument where each man fell. Custer wrote ‘My Life in the Wilderness’ (1874). His life has been written by Whitaker (1876). The general’s wife, Elizabeth B. Custer, who accompanied him on his campaigns on the frontier published, ‘Boots and Saddles, or Life with General Custer in Dakota’ (1885); ‘Tenting on the Plains’ (1887); ‘Following the Guidon’ (1891).

CUSTER MASSACRE. See CUSTER, GEORGE ARMSTRONG.

CUSTINE, kius-tin, Astolphe, Marquis de. French novelist and writer of travels: b. Niederwiller, Meurthe, France, 18 March 1790; d. near Pau, France, 29 Sept. 1857. He traveled in the British Isles, Switzerland and southern Italy (1811–22), and afterward in Spain and Russia. He published ‘Mémoires et voyages’ (1830); ‘La Russie en 1839’ (1843); a tragedy, ‘Beatrice Cenci’; and some romances, among them ‘Aloyysis, or the Monarch’s Counsel’; ‘Romuald, or the Vocation.’ His ‘Letters to Varnhagen von Ense and Rachel Varnhagen von Ense’ appeared in 1870.

CUSTIS, George Washington Parke, American writer: b. Mount Airy, Md., 30 April 1871; d. Arlington House, Fairfax County, Va., 10 Oct. 1857. He was a grandson of Martha Washington, his father being her son by her first husband. His daughter, Mary Randolph Custis, married Robert E. Lee, the Confederate general. He was adopted by George Washington, and wrote ‘Recollections of George Washington’ (1860), and several plays and orations.

CUSTOM is the legal term applied to unwritten law established by common consent and uniform practice from time immemorial. Something which, by its universality and antiquity, acquired the force and effect of law in the particular place or country in respect to the subject matter to which it relates; in other words such a usage as by common consent and uniform practice has become the law of the place or of the subject matter to which it has relation and which is therefore ruled by law by the court. Three axioms are founded on these definitions: (a) That custom is introduced by the people, under which name we understand the action or assemblage of persons of all descriptions of that country where they are collected. (b) That it derives its authority from express or tacit consent of the ruler. (c) That once introduced it has the force of law. Customs are general when as such they constitute a part of the common law and extend to the whole country, while particular customs are those which are confined to a particular district. As a rule, when a contract is made in relation to another, about which there is a well-established custom, it is presumed that such custom forms part of the contract and may be always referred to for the purpose of showing the intention of the parties in all those particulars which are not expressed in the contract. If, however, the meaning of the contract is certain and beyond doubt, no evidence of usage will be admitted to vary or contradict it. So that for a custom it must be certain, reasonable in itself, commencing from time immemorial, and continued without interruption. And a custom
which is unreasonable, uncertain, and which involves too much of arbitrary power, is void; consequently where a custom is opposed to a well-settled rule of law, and is calculated and intended to violate such law, the custom will not be allowed to have any effect. The true office of a usage or custom with respect to contracts of the United States is in New York. Although import duties are one of the chief sources of revenue there is no separate bureau of customs as there is in the case of internal revenue. Supervision by the government of importations begins at the country of origin, where the value of the shipment is certified before United States consular officers. The customs regulations prescribe the methods of entry of goods, of valuation and classification, in order that the proper tariff rates may be levied at the port of entry. At the customs house are collected the duties and storage, and warehouse space is provided for such goods as the importer does not wish to use at once, and on which duties are consequently deferred. The customs officers are stationed in each of the ports of entry. The staff at the larger of these ports comprises a collector, appraiser, naval officer, surveyor, gaugers and inspectors. In the smaller ports more than one office is often filled by one official.

The general customs procedure requires that each vessel carry a full manifest, or description of her cargo, giving names of the ports of origin and of the consignee. Revenue officers inspect this manifest before the vessel docks, and it is at once delivered to the collector of the port, who next issues a permit to transfer the cargo. The cargo is unloaded in presence of the collector or his representatives and the consignees may remove the merchandise with the exception of those packages which are kept for examination. The appraisers now make a valuation according to those goods examined and they furnish the collector with sufficient data to enable the latter to determine the rate of duty to which the goods are subject. If the importer has paid too little or too much an adjustment is made by his paying the additional sum, or in case he paid too much he receives a refund. If dissatisfaction is expressed at the appraisal a reappraisal may be ordered. Appeals from the second decision may be taken to the board of general appraisers, and in certain cases to the United States Court of Customs Appeals. Fines, penalties and forfeitures may be imposed for undervaluation, or in general for any attempt to evade the payment of duties according to the schedules fixed by law. In general the customs officials of the United States have little difficulty in their professional duties with those of other countries. However, the customs regulations in the United States provide greater remedies for errors or unjust exactions of any kind. See Customs Duties; Tariff Administration.

CUSTOM HOUSE is that law which has for its basis usage, and therefore may be abrogated by usage. It derives its whole authority from the silent assent of those who are affected by it. A usage cannot be sustained in opposition to well-established principles of law. To sustain a custom or usage, it must be shown that the order such usages would be extremely pernicious in its consequences, and would render vague and uncertain all the rules of law. A mere custom or usage is therefore without force in opposition to a positive law. Thus a usage for factors to pledge the goods of their principals is void, being against a general rule of law. So the usage for a master of a vessel to sell the cargo without necessity when the vessel is stranded; so of a custom, different from the law in a certain place, to re-enter a vessel for a forfeiture incurred by the non-payment of rent. And it is held that the custom and understanding of the merchants in a particular trade cannot be admitted to prove that the barter or exchange of a promissory note, endorsed without recourse, for cotton or any other species of merchandise, carries with it no implied warranty of the past or future solvency of the maker of the note. Where a transaction is within the statute against usury, the usage of trade as to such transaction cannot be received into evidence to show that it is not usurious. Known and settled usages, however, are respected by courts and juries, unless such usages are against the laws or policy of the country. Usage is evidence of the construction given to the law, and when it is established and uniform it regulates the acts and duties of those who act within its limits. Usage is a matter of fact, and not of opinion. A usage of trade must therefore be proved by instances, and cannot be supported by evidence of opinion merely. It is proved by witnesses testifying of its existence and uniformity from their personal knowledge obtained by observation. Customary or Common law was introduced into the United States based on English common law, which in its most comprehensive sense embraces general customs pervading the whole realm, particular customs prevailing only in certain places and particular laws which by degrees have been incorporated into the common law to a certain extent. In its more ordinary acceptation, however, the common law includes only general customs and particular laws, and not customs of particular places. In this manner in England Christianity was early recognized as a part of the customary or common law of the land, when a lord chief
justice ruled that "Christianity is parcel of the laws of England" and to cast obloquy upon its precepts is to speak in subversion of the law. Such restriction, however, was not intended to consider as reprehensible honest, sincere and conscientious disputes between learned men upon particular controverted points incident to its practice. In the United States an intermediate ground is maintained; the one best supported by both reason and authority is that acts conducive to the subversion of the Christian faith or which are calculated to bring into contempt or ridicule its tenets and symbols, and contumelious attacks upon its laws and institutions, are temporal offenses; not because Christianity is a part of the law, but for the reason that such acts tend to a breach of the law and so jeopardize the public welfare. See Customs.

CUSTOMS COURT. See United States Customs Court.

CUSTOMS DISTRICT. See District.

CUSTOMS DUTIES, the portion of a state's revenue derived from a tax on imports. In some countries, customs duties are imposed on certain exports also. The origin of the term is connected with the long conflict between the Crown and Parliament as to the right of taxation, although the practice it signifies goes back to the days of Greece and Rome. To meet the claims made by the House of Commons to the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exports and imports to which the Crown had acquired a right by custom (although it is certain that customs duties existed in England prior to the Norman Conquest), and after the power of Parliament over this branch of taxation had been fully established it retained its old name. This tax, which originally was a sort of premium of insurance for protection from robbery, after the excise came in force was always applicable distinctively to goods changing place. There were customs not only upon things leaving and things entering the British dominions, but also upon commodities transferred from one part of the country to another. In Scotland the duty on commodities imported into any town from a foreign country was called the great custom; and the duty charged by a burghal corporation on commodities coming within its walls from the country districts was called the small or petty customs. After 1707 the Scottish customs duties became the same as those of England. At present the term customs duties applies in the United Kingdom solely to the tax levied on commodities imported from abroad.

The tax on imports was, of old, a simple percentage, familiarly known as "tonnage and poundage," from the method to which it was levied on the tun of wine, or the pound ad valorum of other merchandise. These were subsidies granted first to the Crown, and then for the maintenance of the authority and dignity of the state. Thus they were a species of public revenue; and many complications arose by the alterations of successive governments. The belief also arose that customs duties might be utilized for fostering domestic industries and discouraging foreign competition. Frequently the duties were such as to act as a prohibition to importation, and they always added greatly to the selling price.

In 1825 the laws of the British customs were consolidated into about half a dozen statutes. Some idea of the confused and cumbersome condition of the customs system before that year may be gathered from the fact that the number of customs laws then was 443. A long list of customs duties remained until the free-trade legislation of 1846. One by one articles of food were exempted; and at present the whole British customs revenue is derived from spirits, wine, tobacco, coffee, tea and certain dried fruits. In modern times taxes upon exports have been discarded by most states, although several states of Latin-America are dependent on them for the bulk of their revenue. In the United States the number of dutiable articles is large, of the total imports the dutiable have about double the value of the free goods. The dutiable articles come under 386 paragraphs, which are again classed under schedules lettered from A to N. The free list comprises 271 paragraphs. For a discussion of the relative effects of a tariff for revenue and a protective tariff, specific and ad valorem duties, American practice contrasted with European, see Free Trade; Protection; Tariff; Taxation.

CUSTOZZA, koos-ôt'sâ, Italy, a village in the province of Verona, about 10 miles southwest of the city of Verona. It is noted as being the place where the Italians were twice defeated by the Austrians in 1848 and 1866. In 1879 a monument was erected to the fallen. Consult Mathes von Bilabruck, 'Taktische Studien über die Schlacht von Custoza im Jahre 1866' (Vienna 1891).

CUT GLASS. See Glass, Varieties of; Glass, Ornamentation of.

CUT-WORM, the caterpillar of an owlet moth of the tribe of Notia, and group Agrotisidae; and, loosely, many other grubs and worms living in the ground. It stays by day about the roots of plants, and comes forth at night to cut off their tender stems and leaves. Some of the moths fly by day, others only at night; the wings are nearly always kept closed; the thorax smooth and slightly convex; the antennæ of the males generally with two rows of tooth-like points on the under side; the fore legs are often spiny. They destroy whole fields of vegetables, and also asters, balsams and other ornamental plants. The caterpillars vary in length from one to two inches, and are dark ash gray, with brown head, and a pale dorsal stripe, with minute black dots; the chrysalis is a shining dark brown, and the moth appears from 20 July to the middle of August. The chrysalis is transformed in the ground, without a cocoon. The only effectual way to prevent their depredations is to open the earth daily at the foot of the growing plants and kill the worms, which are easily found. It is said that a manure of sea mud will protect a garden from these worms; some allow the cabbage plants by wrapping a walnut leaf or paper cone firmly around the root, secured by an earth embankment.

CUTANEOUS SENSATIONS. Those sensations experienced from the excitement solely of the organs of the skin. Although
psychologists have been in wide disagreement as to the seat of many specific sensations; it seems now to be definitely decided that sensations such as those of pressure, warmth, cold and pain. Other experiences formerly classified with these, as hardness, dryness, smoothness, etc., are regarded as being composite in character, including muscular sensations and partaking more of the character of perceptions.

In the study of cutaneous sensations the method employed is an *exploration* of the skin with various instruments, such as a pointed bit of wood or cork, a knitting needle, a fine broom splint or a bit of horse hair. When the skin is touched gently at different places in a small area, it is found that at some points the sensation of pressure is acute, at others dull. In the latter instance it is believed that the sensation is not from the point touched, but from some neighboring point. In the same way the skin is explored with hot and cold instruments and with sharp-pointed needles. It is found that there are many areas of the skin which are entirely insensible to the prick of a needle, and other points is exquisitely painful. An interesting fact is that in some areas of the skin sensations of cold are excited by the touch of a warm object. These are called *paradox sensations.* They are attributed to special nerve structures which always respond with the same sensation regardless of the exciting agency. It has been found that children generally have a much more delicate and accurate sense of touch than adults have. This is ascribed to the probable fact that the nerve structure conveying these sensations is complete in the child, and as there is a much smaller skin surface in the child, the nerve ends are, of course, closer together. Consult Angell, J., R., "Psychology" (New York 1908); Harvey, N. A., "Physiological Psychology" (Ypsilanti, Mich. 1911); Ladd, G. T., "Elements of Physiological Psychology" (New York 1900); Scripture, E. W., "Thinking, Feeling, Doing" (New York 1907); Wundt, W. M., "Principles of Psychological Psychology" (Titchener's translation, New York 1910).

CUTCH, käch, India, a principality controlled by Bombay, lying to the south of Sind, about 7,616 square miles, between the marshy tracts of the Rann of Cutch and the Gulf of Cutch. During the monsoon it is wholly inundated by water, the vast salt morass of the Rann separating it on the north and east from Sind and the Guicowar's dominions. It has a feudal system of government, the ruling power being confined to the dynasty of Jhariai Rajput, of which there are about 200 members. About one-third of the inhabitants are Mohammedans, the rest Hindus of various castes. Chief town is Bhuj. Pop. about 525,000.

CUTCH (Malay, *katchu, cachelu*), a commercial substance obtained from the *acacia catechu* and the bark of mangrove trees. Cutch is used in tanning and as a preservative for nets and sails. The wood is chopped, boiled and the cutch thus extracted. Large quantities are produced on the island of Borneo.

CUTCH, Gulf of, an inlet on the north border of the Arabian Sea, extending into the west coast of India about 100 miles, and forming an outlet for the salt marshes of Cutch in India. It is about 30 miles wide and 100 miles long and connects at its upper end with the Little Rann (or Rann) of Cutch, and through this with the great western desert, desert, desert. It is one of the great watercourses of India with the Ganges and the Brahmaputra. The summer winds are extremely hot and unendurable. Area, 10,000 square miles. Pop. 120,000.

CUTHERB BEDE. See BRADLEY, EDWARD.

CUTHERB, Saint, English anchorite, cenobite and bishop: b. about 633; d. Farne, Northumbria, 20 March 687. He is one of the three most eminent saints of the Church in England, the other two being Saint Edmund of Edmundsbury, and Saint Thomas à Becket, archbishop of Canterbury. The time and place and even the country of his birth are unknown, but the most trustworthy histories, that from 633 to 687. In his youth he entered the monastery of Melrose (the first Melrose), at that time within the limits of Northumbria, and after making his religious profession there was successively prior of that abbey, prior of Lindisfarne, bishop of Hexham and bishop of Lindisfarne, with intervals in which he withdrew from conversation with all men and lived a recluse hermit on the island of Farne. The fame of his sanctity, religious zeal and miracles was great in his lifetime, but grew steadily greater after his death, and many churches in England were dedicated to him. It is said that his body was found incorrupt when his tomb was opened 11 years after burial. When Norse corsairs threatened Lindisfarne in 875, the monks of Lindisfarne bore the remains of their saint to a place of safety inland, and for a time the body had no fixed resting place until deposited at Durham, where, enclosed in a splendid shrine, it remained till the Reformation, an object of veneration and the supposed instrument of incessant miracles. At the Reformation the shrine, with its costly ornamentation, went to increase the king's treasure, and the body of Cuthbert was buried under the pavement of the Durham Cathedral. The coffin was lifted in 1827 and the body, or rather the skeleton, of the saint, was found wrapped in five robes of embroidered silk; there were three coffins, one within another, namely, an outermost one, made in 1541, within that another, believed to date from 1104, and then the cista, in which the relics were deposited when the body was first interred in 688. His feast is observed on 20 March. His life has twice been written by the Venerable Bede and still earlier by a monk of Lindisfarne. Beside these are modern works, by Raine (Durham 1828); Eyre (London 1849; 3d ed., 1887), and Fryer (London 1880).

CUTHBERT, GA., the county-seat of Randolph County, on the Central of Georgia and the Georgia, Florida and Alabama railroads. The town is the trading centre of a fruit-growing and cotton-raising region, and has two colleges, the Andrew Female College opened in 1854, and the Bethel Military College for men. Other industries are farming, fertilizer manufacture, grist-milling, cotton-oil and gin-making.
The city owns its waterworks and electric-light plant. Pop. about 3,000.

**Cuticle** (Lat. *cuticula*, diminutive of *cutis*, "skin"), a thin, white, pellucid, insensible membrane, covering and protecting the true skin, with which it is connected by the hairs, blood-vessels, and inhaling vessels and the reticulum. See Skin; Anatomy.

**Cutlass** (Fr. *couteau*, "small knife" or "sword"), a short sword used by seamen. The blade was usually about 27 inches long, an inch wide and had a bowl-shaped guard on the hilt. It is a very effectual weapon in close contest; on account of its shortness it can be handled easily, and yet is long enough for defense.

**Cutlass-Fish.** See Scabbard-Fish.

**Cutler, Manasseh,** American Congregational clergyman: b. Killingly, Conn., 3 May 1742; d. Hamilton, Mass., 28 July 1823. He was graduated at Yale in 1765, became a lawyer in 1767, and Congregational minister in 1771 at Parish, Ipswich, now the town of Hamilton, Mass., and a chaplain in the Revolutionary army in 1776. After the war he helped form the Ohio Company, which settled Marietta in 1788, and had a leading part also in the formation of the State of Ohio, being credited with drafting the noted "Ordinance" of 1787. He was a member of Congress from Massachusetts 1800-05. He was also a botanist of distinction, describing 350 species of plants native of New England. Consult Cutler, W. P. and J. F., "Life Journals, and Correspondence of Manasseh Cutler" (Cincinnati 1888).

**Cutler, Timothy,** American clergyman: b. Charlestown, Mass., 1683; d. Boston, August 1765. He was graduated at Harvard in 1701; was a Congregational pastor at Stamford, Conn., 1710-19, when he became rector of Yale College. In 1722, convinced of the non-validity of Congregational ordinance, he became a believer in Episcopacy, and was dismissed by the trustees of Yale. Going to England, he was ordained by the bishop of Norwich in 1723, received the degree of D.D. from both Oxford and Cambridge and was appointed a missionary of the Society for the Propagation of the Gospel. Taking charge of Christ Church, Boston, Mass., 1723, he remained its rector until his death. He was throughout his later life one of the most influential of the colonial clergy. Some of his letters appear in Nichols, "Illustrations of the Literary History of the Eighteenth Century" (London 1817-58).

**Cutlery.** Cutlery broadly considered may include any article with a cutting edge. From a trade and makers definition, it comprises only pocket knives, table knives, razors and scissors. These are four distinct and separate trades, and although all four are often carried on by one firm, many manufacturers confine themselves to one branch only. Pocket knives generally include all kinds of spring knives, hunting knives, etc., and table knives include both steel and inlaid knives. In each of the four divisions of the cutlery trade, the process of manufacture is somewhat similar.

**Pocket Knives.** — In olden times the same man made the blades, ground and finished, and fitted them to the handles, which he also made. With the development of the factory system, each branch became divided into three separate trades, viz., forgers, grinders and cutlers or hafters. Taking the process of manufacture in spring knives as typical of all branches, and as followed in Sheffield, England, and elsewhere in the old established way and carried on by those firms who have maintained a reputation for quality, many methods have been introduced in different countries to substitute various machine processes for producing blades other than forging by hand, but nothing fails to equal the hand-forged article that has been produced. The steel, which should be converted from the finest brands of Swedish iron, is melted, cast into ingots, then hammered into bars and rolled in strips of width and thickness suitable for the sizes of blades required. The blade maker or forger takes one of these strips, cuts it into convenient lengths, heats to a warm red a portion of one end, sufficient for a blade, in a clean fire of small coke, roughly hammers out the required blade and chops off from the string of steel just enough for this and the tang (i.e., the part of the blade by which it is fastened into the haft). This process is called mooting, the workmen making as many moods as required for the quantity ordered, or for his day's work. He then reheats these moods, or blades, with a hammer on the various bosses fixed in his anvil, or stithy, works the tang into the required shape; the other end, the cutting portion of the blade, is then reheated, the nail mark put in on a boss for that purpose fixed in the anvil, the sides hammered flat, and edge of blade as thin as possible. This is all done at one heat, and is called smithing. It is this hammering from hot to cold that imparts the lasting cutting qualities, provided the blades are made of good steel. The blades then go back to the forger to be hardened and tempered. Each blade is heated separately and dipped in water, after which it is of a whitish gray color, having shaled — i.e., a thin outer surface has peed off. The blade is now quite brittle, and requires tempering; this is done by beating the steel plate over the same fire as used for forging. The degree of temper required is judged by the color and goes from a light straw to tawny yellow, reddish brown or blue according to the different styles of blades and purposes for which they are used, pen blades being generally left a straw color, and pockets a reddish brown. The blades are now ready for the grinder. This man sits on a horning,—a kind of wooden saddle,—partly under and in front of which between his legs runs a stone in a trough with sufficient water in the bottom to just catch the surface of the stone and keep it constantly wet. Grindstones vary in diameter according to the class of work to be done, and run from about 14 inches for small pen blades, to five and six for couriers' knives. In each of the four divisions of the cutlery trade, the process of manufacture is somewhat similar.
and covering, and works these into the knife. Springs are filed out of sheet steel, except in the case of the table knives, for which they are often forged by a spring forge; another separate trade for the workman. The spring forge also makes some kinds of scales, viz., those used for large pruning and sporting knives, and various articles other than blades that are put into knives. Generally, the scales are made by scale makers, another subsidiary trade, and the covering of stall, ivory, pearl, horn, bone or wood of various kinds comes from the cutters of these several materials. The cutter works to templates, or as he calls them "fitting things." This is the most complex and ingenious of the three branches in the trade; he has to bore and file each spring to his measure, harden, temper and finish the same, bore tang of blades, and fit to measure and shape the edges. The glazer places the blade in the finishing machine, and when the job is done, it is put on the rack to be glazed or polished, as required. For this, the handles are wrapped up in paper or anything else that will keep them clean, and the blades left open—not more than one at each end at once. The pocket blades are whitened, i.e., reground on a harder stone than that used for grading, then glazed, first on a rough and then on a finer glazer, and buffed to give a brighter finish,—if required polished they go from the fine glazer to a small wooden wheel bound with leather and dressed with crocus, and which runs much slower than glazer discs or glazers. With pen blades of any quality the sides are lapped instead of glazed, i.e., the wheel on which this is done is built with lead (run on in a mold) instead of leather; by this means a truer and better cutting edge is secured. The cheaper qualities of pen blades are finished on the glazers, either leather bound, or made of wood, without any covering, but blades so finished are inferior to those that are lapped. If polished the pen blades go from the glazer to the polish as in the case of the other blade, and then through the finishing machine. When the blades are wiped and greased, joints cleaned, and the knives then go to the whetter, who rubs the edges on a hone (oil stone) to remove the rough edge left by finishing. This is often done by women or girls, but the better work is always done by men. The whetter rubs the blade backwards and forwards on his stone at a slight angle so as to leave a thin white line called the kennel along the edge on either side of the blade. The knives are then wiped by women, joints oiled, wrapped up and put in boxes, and are ready for sale.

Table Knives.—The process of making these is similar to that of spring knives; though the workmen employed are entirely different. The trade comprises three branches of men, forgers, grinders and cutlers, as in spring knives. The men in one line of the cutlery trade never work at any other than the cutting, i.e., spring knife men in any of the three branches do not work at table knives, razors or scissors in the same branch; that is to say, a blade forger in the spring knife section does not make table knives, razors or scissors. The better table knives are made from Sheffield steel and are hand forged; this is too expensive for the greater part of the trade, so cast steel is used and forged with machines called goff hammers; cheaper blades still are filed out of sheet steel. The table knife requires a different edge from a pocket knife, which has a smooth stiff edge, but for cutting soft substances such as meat, a thin rough edge is wanted. This is only obtained in perfection from sheet steel, and though cast steel may answer fairly well for table knives, it is not sand and bore the scales, put on the covering after the necessary preparing, then nail the several parts together and get up the haft. This is done by different degrees of filing, and grinding on grades of wheels, the lengths about three and one-half inches thick. Shear steel is made by welding together several lengths of blister steel (i.e., iron simply converted into steel). When these come from the converting furnace they are cut into shorter lengths about three and one-half inches thick. Each piece will be about three and one-half inches wide by one and one-half inches thick. Six of these are put together in a clamp at one end; the other end heated, worked into a bar under a steam hammer; the same is done with the other end, and the whole reduced by hammering to a bar about one and one-half inches by one inch; this is called single shear. For double shear the same bar is bent over, bringing the two ends together, and put through the same process of hammering again. The bars are then rolled to the sizes required for forging. The forgers work double handed, one called the striker, the other the maker. They stand opposite each other, hammering at the same blade at the same time, striking alternately, the maker holding the blade with one hand, and using a hammer in the other, the striker using a two-handed hammer. When the maker is finishing each blade (smithing it) the striker will be hardening and tempering. In hand-forged blades, the cutting part of the blade only is made of steel; the tang (that part which goes in the handle) and the bolster (the thick part of blade where it joins the handle) are of iron, which is welded on to the steel by the forgers in process of making. The blades first being mooed (rough forged) for tang and bolster welded on, tanged, smithed, hardened and tempered, the table knife grinder grinds and finishes the blades right out before they are set in the haft by the cutter. After the handles are on and finished the blades are buffed again polishing the whole, and then whetted on a dry, fine sandstone. In a cheaper but less effective way this whetting is done on dry grindstones.

Razors.—These are made of cast steel of fine and hard quality, but not as tough as that used for spring knives, as they are required to stand no bending strain. They are mostly hand forged, but many are now stamped in dies under power hammers, which process is found more satisfactory for razors required to be hollow-ground, as they can be stamped hollow, but not on the flat sides, of which large quantities are made, the hand forging is more effective. The grinding of razors is done in the same manner as of spring knives, the blade being finished (glazed or polished) and etched if required, before
the fitter, called the setter-in, puts them in hafts. The hollow-grinding of razors is quite a fine art. Until a few years ago this was done on stones of various sizes down to some of not more than one-half inch in diameter. Emery wheels are now almost universally used for this purpose. Quite a variety of patent machines are now used for hollow-grinding. Razors are whetted on finer and harder stones than spring knives, and afterward stopped, wiped and done up in cases ready for use.

**Scissors.**—The best are hand forged, but good ones are also made from blanks stamped out of sheets of cast steel and moulded in dies. This is becoming the general process, and, provided the material is good, the result gives all that is required. In large sizes of scissors only the cutting edge is made of steel, which is welded on to iron; these are called "shot scissors." In common and cheaper qualities the blanks are cast, i.e., the metal is run into molds. The other processes of grinding, finishing and fitting scissors are somewhat similar to those described for knives.

The four trades described constitute what is technically included under the term of cutlery, but there are certain side lines to some of them which also come under that heading, for instance, some spring knife manufacturers will also make tea pruners, farriers' knives and some kinds of surgical knives; in other instances, each of these may be carried on as separate trades, but all will be included under the title of cutlery. See HARDWARE.

**American Practice.**—While the processes of the manufacture of cutlery in the United States are generally the same as in England, a very much larger part of the work is done by machinery. For nearly all grades of knives and razors the forging is done with a trip hammer, and, a relatively higher quality of steel being used, the results are comparable in excellence with the best hand-forged English blades. For cheap knives, the blades with tangs attached are blanked out of sheet steel and given their proper shape with dies in a hydraulic or other form of heavy power press, the operation being continuous, as the long strips of steel are fed into the machines in constant succession. Even the hardening and tempering are done automatically at the rate of 1,400 to 1,800 per hour. Most of the grinding also is done on automatic machines, and far more accurately than by hand-work however skilled. The handles are formed and finished without hand labor, leaving only the assembling of the parts to the handworker.

Some razor blades are hand-forged but the large majority are moulded in dies in heavy presses with a very great saving of time. By the use of heated presses the quality of the metal is preserved even more perfectly than in hand-forging.

In 1914, as determined by the special census of manufactures in that year there were in the United States 27 establishments, with 3,832 employees making table cutlery; 28 establishments, with 1,925 hands making plain and safety razors; 29 establishments, with 1,925 hands making shears and scissors; and 32 establishments, with 3,894 hands making pocket knives. Their combined capital was $22,670,000, and their yearly output was valued at $16,996,000.

Upon the outbreak of the European War the American cutlery trade experienced an enormously increased demand. Not only had a large proportion of the local trade in cheap cutlery been in the hands of German manufacturers, but these concerns had also had a practical monopoly of the cheap cutlery trade of Latin America. This was entirely cut off, and the demand shifted in part to American makers, and in part to English houses. As the war proceeded the cutlery factories of England were drained of many of their workers so that more and more of the demand has come upon American manufacturers. In 1917 the cutlery plants were doing from 30 to 50 per cent more work than in 1914, and supplying not only Latin America but also Australia. A comparison of the figures for the imports and exports of cutlery of the United States for the two years 1914 and 1917 indicate the great change which has taken place in this industry. In 1914 there were imported into the United States (chiefly from Germany, but in part from England, 16,297,764 pocket knives, valued at $1,288,037; razors to the value of $457,455; razors and shears, 594,017, valued at $759,487; and other cutlery valued at $355,535—a total value of $2,860,519. In that year the exports were valued at $1,147,995. In 1917 the imports were 52,936 pocket knives; 23,710 razors; and 83,614 scissors and shears—total value of $283,208. The exports for 1917 were razors to the value of $2,505,117; table cutlery to the value of $227,031; and other cutlery to the value of $2,769,483—a total of $5,901,631. See Consult Lloyd, W. H., "The Cutlery Trades" (London 1913); and Reports of the United States Bureau of Foreign and Domestic Commerce (Washington, monthly).

**Cutlips.** a fish, one of the suckers (Lagochil a lacera) of the lower Mississippi Valley, whose mouth has a lower lip divided into two lobes, so that the fish is sometimes known by the names, "hare-lip," "rabbit-mouth," "May-sucker," etc. Its upper surface is olive-brown in color, while the under parts are silvery. A long fissure concealed by the cheek entirely divides the lower and upper lips at the angles of the mouth. This fish whose appearance is most singular has no great commercial value.

**Cuttack,** kît-tük, India. (1) An executive district in the lieutenant-governorship of Bengal, province of Orissa; area 3,633 square miles. On the coast is extensively manufactured the best and whitest salt made in India. Pop. 1,937,671. (2) The capital of the district of Cuttack, on the Mahanuddy River, 220 miles south of Calcutta, is chiefly noted for filigree-work in gold and silver. A canal extends to False Point. It is the seat of Ravenshaw Coll. Pop. about 50,000. (3) The Cuttack Mehas or tributary states of Orissa, a group of about 20 small native states in the northwestern part of Orissa. They are subject to 21 rajahs, tributary to Great Britain and have an area of 1,387 square miles. Pop. 1,696,710, principally hill-men of various tribes.

**Cuttage,** the propagation of plants by means of slips or cuttings which are detached parts of roots, stems, leaves, etc. This form of asexual or bud-propagation is found in nature among willows, poplars and many other trees and shrubs, especially such as are readily
broken by wind and drop their twigs and branches into streams and ponds with muddy shores. Artificially, it is one of the oldest methods known and is of wide importance, ranking with graftage (q.v.) and seedage. The advantages of cuttage are that, with the rare exceptions due to bud variation, plants may be propagated true to variety or species in very great number, and the cost of production. In the United States it is propagated as small when compared with certain other methods such as division and layering, in which cases roots are developed before the removal of the parts which become new individuals. An idea of the scope of this practice may be obtained from the fact that, except in the production of new varieties which are obtained by means of seeds, the great majority of florists' perennial plants such as roses, carnations, violets, chrysanthemums, are so obtained, as are also many fruit plants such as gooseberries, currants, grapes and pineapples, though in the last instance other methods are also used to a large extent.

The methods for making the cuttings "strike" root are very various. Some species such as currant and gooseberry will "strike" root if placed in moist soil out of doors; others must be grown under glass, often with extra degrees of heat in the soil (bottom heat), in propagating boxes (glass-covered frames upon the greenhouse benches), and other devices, as well as specially favorable soils, etc. The methods of making the cuttings also differ widely with the species of plant and the part used, as the following classification will show:

**CUTTINGS.**

<table>

<td></td>
<td>Bulb, Scales.</td>
</tr>
</tbody>
</table>

As a general rule, to secure the best success with cuttings, a well-drained, sandy soil is necessary, and, in most cases, it is desirable to have bottom heat. Consult Fuller, 'The Propagation of Plants' (New York 1887); Bailey, 'The Nursery-Book' (New York 1896); id. article "Cuttage"; Cyclopedia of American Horticulture (New York 1900-02).

**CUTTER, Ephraim**, American physician: b. Woburn, Mass., 1 Sept. 1832; d. West Falmouth, Mass., 25 April 1917. He was graduated at Yale University in 1852; practised medicine in his native city till 1875, in Cambridge and Boston till 1881, when he removed to New York and began practice there. He has invented a large number of surgical instruments; contributed over 400 articles to literature on scientific subjects, including microscopic medicine, laryngology, chronic diseases and general medicine; and became a member of the Massachusetts Medical Society in 1856, and of the American Medical Association in 1871. He was a pioneer of American laryngology; he studied the morphology of raw beef from 1854 and discovered the tuberculosis cattle test in 1894.

**CUTTER, George Burton**, Canadian educator: b. Amherst, Nova Scotia, 11 April 1874. He graduated B.A. at Acadia University, Wolfville, Nova Scotia, in 1896 and at Yale in 1897 (B.D. 1903). Ordained to the Baptist ministry in 1897, he held pastorates successively at Montrose, New Haven, Conn., Corning, N. Y., and Columbus, Ohio. In 1910 he was appointed president of Acadia University, Wolfville, Nova Scotia, holding at the same time the chair of psychology of religion and pedagogy. He is the author of 'The Psychology of Alcoholism' (1907); 'Psychological Phenomena of Christianity' (1908); 'Three Thousand Years of Mental Healing' (1911).

**CUTTER, George Washington**, American poet: b. Massachusetts 1801; d. Washington, D. C., 24 Dec. 1865. He practised law in Kentucky until 1845; served as a captain in the Mexican War; became active in politics, and received a treasury clerkship. His poems are nearly all included in 'Buena Vista, and Other Poems' (1848); 'Song of Steam, and Other Poems' (1857); 'Poems, National and Patriotic (1857).

**CUTTER, a name given to two kinds of small vessels. The first is one of the supplemental small-boats of a merchant vessel for both rowing and sailing. The cutters used by yachtsmen and by pilots, and revenue cutters are built with especial reference to speed, and have a single mast, and a "single-stick" straight-running bowsprit that may be housed in-board in dirty weather. They are much like the sloop in rig. The hull of the cutter is very deep and narrow, being almost V-shaped, with an almost perpendicular rise from the floor to the bulwarks, and a keel heavily loaded with lead. In heavy weather, working to windward, the cutter shows to best advantage. (See YACHTS and YACHTING). A light sleigh with a single seat is called a cutter in some parts of the country. A revenue cutter is a light armed government vessel commissioned for the suppression of smuggling and the enforcement of customs regulations. See REVENUE CUTTER SERVICE, UNITED STATES.

**CUTTING, Mary Stewart Doubleday**, American author: b. New York, 27 June 1851. Early in life she had verses published in Lyriccott's Magazine. She married Charles Weed Cutting in 1875, wrote verse occasionally and finally drifted into the short-story field about 1894. She has published 'Little Stories of Married Life' (1902; 2d ed., 1909); 'Heart of Lynn' (1904); 'Little Stories of Courtship' (1905); 'More Stories of Married Life' (1906); 'The Suburban Whirl' (1907); 'The Wayfarers' (1909); 'Just for Two' (1909); 'The Unforeseen' (1910); 'The Lovers of Sanna' (1912); 'Refractory Husband' (1913); 'The Blossoming Rod' (1914).

**CUTTING, Robert Fulton**, American financier: b. New York, June 1852. He received his education at Columbia University, where he was graduated in 1871. Becoming interested in social problems and political reforms he was, in 1892, made president of the Association for Improving the Condition of the Poor in New York, and in 1884, of the New York Trade School Association. A member of the Citizens' Union and of the Bureau of Municipal Research, he contributed large sums to the political reform
work of both these bodies. He is chairman of
the board of the City and Suburban Homes
Company, trustee of the American Exchange
National Bank, the Mexican Telephone Com-
pany, and the American Museum of Natural
History. He wrote 'The Church and Society' (1912), the Kennedy lectures before the School of
Philanthropy, New York.

CUTTING, Starr Willard, American edu-
cator, b. West Brattleboro, Vt, 14 Oct 1858.
In 1881 he was graduated at Williams College
and from 1881 to 1886 served as principal of
the academy at Deerfield, Mass. He next pro-
cecut ed his studies at the universities of Leipzig,
Geneva and Johns Hopkins, and became con-
nect ed with the faculty of Chicago University.
In 1906 he was made head of the department
of Germanic languages and literatures at the
latter institution. He published 'Der Konjunktiv bei
Hartmann von Aue' (1894); 'The Modern
German Relatives *Da* and *Was*' (1904);
'Robert Wesselhoft, Jena Burschenschaft,
German Revolutionary and American Citizen'
(1911), and editions of German school texts.

CUTTING, a detached part of a plant used
for propagation. Cuttings may consist of the
growing wood of the stem, as in Verbena and
the tea roses; of the ripened wood, as with the
grape, the willow and most deciduous trees;
of the rootstock, as with Arum; the root, in
the case of the blackberry; the leaf, for example
in Begonia; or bulb-scales, as with the lily.
Propagation by cuttings is resorted to for many
different reasons. In many plants seeds are
hard to get, or when they are obtained, propa-
gation by seeds is long and expensive, while
propagation by cuttings is quick and cheap. For
example, the potato rarely sets seed. Again,
the willow will propagate itself under the most
untoward circumstances by means of cuttings,
while seedlings are of course much more tender.
Furthermore, seedlings of hybrid varieties or
of seed or bud sports will not in general breed
true and it is the rule among cuttings to be
accurate reproductions of the parent plant.
Moist soil is generally the most favorable
medium in which to plant cuttings. Consult
Lindley, 'Theory and Practice of Horticulture';
Burbridge, 'The Propagation and Improvement
of Cultivated Plants'; Henderson, F., 'Prac-
tical Floriculture.'

CUTTLE, Captain, a character in Dickens'
'Dombey and Son.' He is a retired merchant-
captain with a hook in place of a right hand.
He received and cared for Florence Dombey.
His favorite expression, 'When found, make a
note of,' was adopted as the motto of 'Notes
and Queries.'

CUTTLE-BONE, the dorsal plate of Sepia
officinalis, formerly employed in medicine as an
absorbent, but now used for polishing wood,
painting, varnishing, etc., for pounce and tooth-
powder and to supply cage birds with lime and
salts.

CUTTLEFISH, a common name for the
Cephalopods, but originally applied to a member
of the genus Sepia. In the United States it
is restricted to the octopods (q.v.). The cuttle-
fish proper, S. officinalis, measures from 6 to
10 inches in length, and its color varies from
pale-gray to dark-brown or neutral tints. The
body is oval, flattened from above downward,
and contained in a tough muscular sac (mantle),
which expands along the whole of either mar-
gin into a narrow fin. The integument consists
of a single layer of cells, lying upon connective
tissue, in which are included 'celaphores.' It is
also composed of cells charged with various colored pigmen-
trine granules. By expansion of the cell the pigment
is diffused, and by its contraction concentrated,
and the rapid flashes of changing color for
which the Cephalopoda as a whole are so
remarkable.

The head is broad, with a complex cartilage
which protects the central nervous system, and
the eyes bright green. The front of the head is
occupied entirely by the mouth, and the bases
of the arms, of which there are 10, 8 having
suckers on the extremity in 4 longitudinal
rows. The two remaining arms, known as 'ten-
tacles,' occupy the interspaces between the ven-
tral arms and those next to them. They are
twice as long as the others, and can be with-
drawn into pockets situated beneath the eyes
and carried in this position when not in use.
The mouth, situated in the centre of the roots
of the arms, is surrounded by a lip with seven
prominent angles, which bear small suckers in
some species.

On the lower side, between the muscular
and the body proper which contains the viscer-
a, is a hollow space, the 'branchial' or 'mantle-
cavity,' containing the siphon, the intestines,
kidneys, genital organs and gills. Respiration is
accomplished by rhythmic contractions of the
mantle, in consequence of which water enters at
one side, passes over the gills, and is ex-
cluded by the siphon; this takes place about 70
times in a minute. On the dorsal side of the
animal, immediately beneath the integument,
is a closed sac which contains the cuttle-bone.
Speaking generally, this may be said to be of an
elongated spoon or boat shape; it consists of a
horny lamina. Lying parallel to the terminal
portion of the intestine is the 'ink-bag,' a hol-
low gland opening near the anus, and furnishing
a deep-brown fluid, which is ejected by the ani-
mal when alarmed in order to conceal its retreat.
The pigment known as 'sepia' is prepared from
it. The heart is situated posteriorly, and con-
sists of a pear-shaped sac which receives on
one side a vein from the gills, dilated just before
its termination into a muscular constrictive
preventing the outflow of the fluid.

The nervous system consists of the three pairs
of ganglia common to the mollusks, concen-
trated round the esophagus.

Of the sense organs the eyes are the most
conspicuous. They occupy depressions in the
head cartilage.

The ears are a pair of small closed vesicles,
embedded in the head-cartilage, and supplied
by nerves which, though apparently springing
from the pedal ganglia, really have their origin
in the cerebral. A ciliated pit, usually consid-
ered olfactory, lies behind each eye. The sexes
are separate. The testis and ovary are both
single and situated in the middle part of the
body; the latter lies in the visceral sac or peri-
cardium above described, the former in an
almost closed diverticulum of it. The eggs have
a tough capsule, with a projection at one end
and a kind of handle at the other by which they
are attached in bunches to a twig of sea-
weed or other similar substance.

Cuttlefish are found in littoral regions or in
moderately deep water; ordinarily they rest
horizontally on or near the bottom, the fins gently undulating, the tentacles retracted, and the arms depressed. Progression may take place by means of the fins with considerable rapidity in either direction, the funnel being turned so that the stream of water issuing from it assists in propulsion. Rapid darting backward when the animal is alarmed are brought about either by the sudden ejection of water through the siphon, or by spreading out and reuniting the arms. See CEPHALOPODA; SQUID.

CUTTY STOOL, the stool of repentance, a seat formerly set apart in Scottish kirk, on which offenders against chastity were exhibited before the congregation and submitted to the minister's rebukes before they were readmitted to church privileges.

CUTTHYHUNK, Mass., the most southerly island in Buzzard's Bay. It was on this island that Bartholomew Gosnold landed, on 25 May 1602, and there established the first settlement of white men in that part of the world. He named the island after Queen Elizabeth, calling it Elizabeth Isle. The settlement did not continue a full month before it was abandoned, the colonists returning to England. It is now a place of summer resort. The United States Life-Saving Station was established there in 1889 and the house of the Massachusetts Humane Society in 1847. The site of Gosnold's fort was identified in 1797. The literature of the subject is now considerable. The publication in England of the "journals" of the voyage helped to pave the way for the later successful plantations of Pilgrims and Puritans. In celebration of the 300th anniversary of the initial settlement of white men in New England, a tower, built of pebbles and cement, with tablet in honor of Gosnold, was reared and dedicated with oratory and song in 1903, the speakers being Charles Francis Adams, Rev. Dr. Leonard, and William Elliot Griffis, whose library in Boston on Gosnold, in 1902, suggested the carrying out of the project. Consult New England Magazine (Boston 1897).

CUVIER, koo-vee-ay, Georges Chrétien Léopold Dagobert, BARON de, French naturalist and the founder of the science of comparative anatomy: b. Montbéliard, France, 23 August 1769; d. Paris, 13 May 1832. After finishing his education at Stuttgart he accepted the situation of tutor in a Protestant family in Normandy. The Abbé Texier, whom the troubles of the time had driven into exile from the capital, introduced him by letter to Jussieu and Geoffroy Saint-Hilaire. Several memoirs, written about this time, and transmitted to the latter, established his reputation and procured his admission to two or three of the learned societies in Paris. In 1806 he was appointed successor to Daubenton as professor of natural history at the Collège de France, and in 1802 succeeded Mertrud in the chair of comparative anatomy at the Garden of Plants. From that time he devoted himself steadily to the studies which have made him famous. His two principal works, "Comparative Anatomy" (1801–05) and the "Animal Kingdom" (1817), in which the whole animal kingdom is arranged according to the organization of the beings of which it consists, have raised him to the pinnacle of scientific fame, and established him as the first naturalist of his time in the world after Linnaeus, the celebrated Swedish botanist. His numerous memoirs and works on these subjects show a master-mind in the study of zoology; and extending the principles laid down in his comparative anatomy to the study of paleontology, he was enabled to render immense service to geology. Starting from the hypothesis that there is a correlation of forms in organized beings—that all the parts of each individual have mutual relations with each other, tending to produce one end, that of the existence of the being—that each living being has in its nature its own proper functions, and ought therefore to have forms appropriated for that function; and that consequently the analogous parts of all animals have received modifications of form which enable them to be recognized—he was able to ascertain from the inspection of a single fossil bone, not only the family to which it ought to belong, but the genus to which it must be referred. Even the very species of animal was thus identified, and the restoration of its external form as it might have lived and died became in his hands an object of certainty and precision. His "Animal Kingdom" has been frequently translated, and forms the basis of all arrangements followed at the present time. Cuvier filled many offices of great importance in the state; particularly those connected with educational institutions. Napoleon trusted him with much consideration; Louis XVIII and Charles X advanced him to honor; and Louis Philippe raised him to the rank of a peer of the realm. Consult Candolle, "Notice sur la vie et les travaux de G. Cuvier"; Lomon, "Mémoirs of Baron Cuvier" (1833); Lomenie, "G. Cuvier, par un homme de rien" (1841); Florens, "Cuvier; Histoire de les travaux" (1845); de Blainville, "Cuvier et Geoffroy Saint-Hilaire" (1890).

CUVILLIER-FLEURY, ku-vee-yay, fer-ra, Alfred Auguste, French author: b. Paris, 18 March 1802; d. there, 18 Oct. 1887. He was educated in the Collège Louis-le-Grand, became private secretary to Louis Bonaparte, ex-king of Holland, in 1819; tutor to the Duke of Aumale in 1827, and entered on the staff of the journal des Débats in 1834. He was a member of the Academy in 1866. Among his works are "Voyages et voyages" (1854); "Études, historiques et littéraires" (1854), "Nouvelles études" (1855); "Dernières études historiques et littéraires" (1859); "Historiens, poètes et romantiers" (1863); "Études et portraits" (1865). Consult the biography by the Duc d'Aumale in "Le livre du centenaire des débats," and Bertin's edition (1900) of his "Journal intime."

CUXHAVEN, kooz-hä-fen, Germany, fortified seaport at the mouth of the river Elbe, in a detached portion of territory belonging to Hamburg. The old harbor is one of the safest on the coast, has been much improved in recent years, and is often resorted to in cases of danger. Many passengers for foreign parts embark at Cuxhaven, and the harbor holds the greater importance. Here vessels generally take pilots to go up the river to Hamburg and other places. These pilots are privileged, and by their statutes are compelled always to keep pilot-vessels out at sea, with men ready to conduct any vessel which may demand assistance. It is
a free port, being outside the Zollverein, and the Hamburg-American Steamship Company have made it the point of arrival and departure of their mail service. Pop. 14,888.

CUYABA, koo-yah-bah, Brazil, the capital of the state of Mato Grosso, situated on the Cuyaba River, a part of the Paraguay River system. It has broad, well-paved streets and contains barracks, an arsenal and a military hospital. It was founded early in the 18th century by adventurers from São Paulo, in search of gold. The climate being somewhat more healthful than that of other portions of the state, it has retained a moderate degree of prosperity since the mining industry terminated. A military arsenal and barracks are located here. From Rio de Janeiro in a direct line the distance to Cuyaba is about 840 miles, but only one-third of the railroad has been completed which is to connect Cuyaba with the coast, through São Paulo. At the present time transportation is mainly by way of the Paraguay and La Plata rivers to Buenos Aires or Montevideo; thence by the Atlantic to the national capital—a total distance of about 3,720 miles. Pop. 14,507. See MATTO GROSSO.

CUYAHOGA (ké-a-hó'ga) FALLS, Ohio, village of Summit County, on the Baltimore and Ohio and the Cleveland, Akron and Columbus railroads, and the Cuyahoga River, 33 miles southeast of Cleveland. It has a public library, paper-bag works, wire nail factory, machine shops, rubber factory, flour mills, sewer pipe works, etc. The municipality owns the water supply system and the electric-lighting plant. Pop. 4,020.

CUYLER, John, American surgeon: b. Georgia, about 1810; d. Morristown, N. J., 26 April 1844. He entered the army as assistant surgeon in 1834, being among the first to pass the rigid examination instituted in 1833. He was actively engaged in the Creek War of 1838, and the Seminole War of 1840, and served with distinction during the Mexican War, receiving promotion as major and surgeon on 16 Feb. 1847. From 1848 to 1855 he served at West Point. As senior medical officer at Fort Monroe during the first years of the Civil War, his services were invaluable in organizing the medical department of the armies congre-gated there. He served afterward as medical inspector and acting medical inspector-general. He served on examining boards, and sought to uphold a high professional standard among army surgeons. He was promoted lieutenant-colonel and medical inspector in 1862, brevetted brigadier-general on 13 March 1863, and promoted colonel in 1876. After the war he was medical director of important departments until his retirement, 30 June 1882.

CUYLER, Theodore Ledyard, American clergyman: b. Aurora, N. Y., 10 Jan. 1822; d. Brooklyn, N. Y., 26 Feb. 1909. He was graduated at Princeton College in 1841 and at Princeton Theological Seminary in 1846. From 1846 to 1850 he was pastor of the First Avenue Presbyterian Church in Brooklyn, resigning to devote his time to literary and reform work. Dr. Cuyler's reputation as a preacher and writer was international. He wrote 'Newly Enlisted'; 'Christianity in the Home'; 'Cedar Crest' (1860); 'Heart Life' (1871); 'From the Nile to Nor-way' (1881); 'Stirring the Eagle's Nest' (1890); 'Beulah Land'; 'Mountain Tops with Jesus'; 'Our Christmas Tides' (1904), etc. Besides his published volumes he wrote some 5,000 articles in magazines, many of these having been reprinted in England. In 1902 he published his 'Recollections of a Long Life.'

CUYO, koo-yo, Philippines, a town and the capital of the province of Paragua, situated on the southwestern coast of the island of Cuyo, Cuyos group. The town is well built, and has an important trade. It is protected by a fort built on a land spit near the town. Pop. 8,500.

CUYOS ISLANDS, Philippines, group of 47 islands lying south of the island of Mindoro, and east of Palawan; total area, 63 square miles. The most important island of the group is Cuyo, 8 miles long; area, 20 square miles. The islands, with the exception of Cuyo, are infertile, and there is but little manufacturing; the chief industries are the gathering and preparation of edible birds' nests and trepang, and the cultivation of rice and coconut oil. By the Civil Government Act of 1902, these islands were made a part of the province of Paragua, Palawan.

CUYP, koip, or KUYP, Albert, Dutch artist: b. Dordrecht 1605; d. there 1691. He was a son of Jacob Cuyp (q.v.) and excelled in the painting of cattle, grazing or reposing, moonlight, wintry landscapes, still waters with ships, horse-markets, hunts, and cav- alry fights, and in rendering effects of warm golden sunlight he is without a rival. During his lifetime and long after, Albert's pictures, though in many respects equal to those of Claude, were held in little estimation. He is best represented in London—the National Gallery, Buckingham Palace, Bridgewater House, Wallace Collection, Dulwich College have specimens of his art, and a fine cattle piece is to be found in the Metropolitan Museum of New York. Consult Würzbach's Künstler-Lexikon (Leipzig 1906), and De Groot, 'Beschreibung und Verzeichniss der Werke holländischer Maler' (ib. 1908).

CUYP, the name of a family of Dutch artists: (1) Jacob Gerritsz, Dutch painter, commonly called the OLD CUYP; b. Dordrecht 1575; d. 1651. Jacob Cuypus father bred cows and sheep, battles and encampments, are clever, but his fame rests principally on his ex- cellent portraits which can be found at Berlin, Cologne, Frankfort, Amsterdam, Stockholm and Metz. His coloring is warm and trans- parent; his manner free and spirited. His portrayals of peasant groups are excellent. He was fond of introducing pet animals into his portraits. In one portrait of a family group, now in the Rothschild collection, an out-of- doors scene is represented with cows grazing here and there. These animals are depicted with the greatest accuracy. Cuyp was one of the four founders of the Guild of Saint Luke at Dordrecht. (2) BENJAMIN GERRITZ, half-brother of the above, b. Dordrecht 1607; d. 1652. In 1631 he became a member of the Guild. He painted historical and mythological scenes, in the Italian manner, with great force, crudity of color, but excellent in design and grouping. Some of his pictures are the 'Angels at the Tomb of Christ' (19) (The Depo- sition of the Shepherds) (Berlin); 'Episode in
the History of Cambyses (Paris). (3) Albert, the nephew of the former and the best known of his family: Dordrecht 1620; d. there 1691. He studied with his father and at first imitated him, but later developed a style of his own. In 1658, he married a wealthy widow, Cornelia Bosman, by whom he had one daughter. He sat in the high court of the province of Dordrecht, where he had considerable property, and was even considered as a candidate for the regency of Dordrecht in 1672. It is from this locality that his inspiration comes — every mood of nature is sensitively depicted in his many canvases; there are clear blue skies, pleasant meadows, quiet restful cows and horses; the people and costumes of the time — handled with sincere appreciation and fine skill in light and shade and perspective, and a homely, pleasant colour. His landscapes are to be found at Rotterdam, Amsterdam, Petrograd and Brussels; of his portraits the best are at Buckingham Palace, Bridgewater Gallery, Louvre and Dresden museums. An excellent picture is the ‘Night on the Banks of a River’ in the Grovesnor collection. Other well-known works are ‘View of Dordrecht’; ‘Riders with Boy and Herdsman’ (National Gallery); ‘Huntsman’; ‘Piper with Cows’ (Louvre). He painted a few allegorical subjects also, but these do not equal his other works in charm and facility. Consult Würzbach, ‘Niederländisches Künstler-Lexikon’, (Leipzig 1906) and De Groot, ‘Beschreibung und Verzeichniss der Werke holländischer Maler’, (ib. 1908). John Smith’s ‘Catalogue raisonné’ enumerates his works (9 vols., 1840).

CUYPERS, Peter, koi-pes, Dutch architect: b. Roermond 1827; d. 1903. He received his education at the Antwerp Academy. Becoming prominent in his chosen field he was commissioned to build the Royal Museum, Amsterdam, to restore the cathedral of Mainz and to construct several important churches. The foremost of these are Saint Jacob’s, The Hague, Saint Barbara’s, Breda, Saint Catharine’s, Eindhoven, the Sacred Heart, Amsterdam, and Saint Bonifacius, Utrecht. (ib. 1878). CUYPERS RANGE. See AROK ORK DISTRICTS.

CUYUNI, koo-yoo’ne, a river of South America, rises in Venezuela, flows first north, then east, through British Guiana, and into the Mazaruni. It has numerous rapids and falls; the above above the mouth. It is navigable for about 500 miles. Among its tributaries is the gold-bearing Yurauri.

CUZCO, kooz’ko, Peru, department in the southeastern part of the republic, bounded by the province of Loreto on the north, by Bolivia on the northeast and east, by Puno and Arequipa on the south, and by Apurimac, Ayacucho, and Junin on the west. Its area is 156,317 square miles. Within its limits are found nearly all varieties of temperature, with the corresponding products. The fertile valleys of the Valcamayo enjoy an Italian climate; toward the Bolivian frontier there are vast tropical forests, abounding in all the productions of the torrid zone; on the slopes of the Andes are plains covered with pasture or crops of cereals; and still higher up on the table-lands and peaks are large flocks of vicuñas and alpacas. In general, the easterly mountains have the characteristic of the upper Amazon country, while the southwest is extremely mountainous, with beautiful and healthful elevated plains or valleys, like that in which the city of Cuzco is situated. Pop. of the department, 438,646.

CUZCO, Peru, the most famous ancient city of South America. Situated in lat. 13° 31’ S. and lon. 73° 3’ W., Cuzco is on a plain 11,380 feet above the sea (compare Mount Washington, 6,288 feet, and Mont Blanc, 15,779 feet), and its climate is temperate; but in winter snow often falls. It was the chief town of the Inca tribe (q.v.). The writings left by Spanish conquerors and early chroniclers, upon which subsequent accounts have been based, not only preserved the Indian myths but also added some fanciful details in regard to the place, the inhabitants and their institutions. According to such myths and accounts, the founder of the city was Manco Capac, son of the sun-god; strong walls, we are told, surrounded it, and in its midst was a great square, from which started four roads binding together the empire of the four quarters of the world. ‘The tongue, ‘Tahuantinsuyu’), the first road leading to Puito, the modern Quito, the second over the Andes, the third to Chile and the fourth to the ocean. The temple of the sun, with the surrounding dwellings for priests and virgins of the sun, occupied a district of the city called ‘The Golden’. Five mighty walls enclosed that sacred place. The temple itself was circular in form. Its chief hall, dedicated to the sun-god, contained an image of the sun made of beaten gold; the door-posts were of gold; all the walls were covered with discs of the same metal; and the mummies of the Incas ranged beside the god were decked out with golden ornaments. A door encased in silver led to a chapel dedicated to the moon-goddess, sister and wife of the sun-god. Here the images and furnishings were of the white metal, and the mummies of the wives of the Incas were decorated with silver. A part of the site of the temple is now occupied by the church of S. Domingo. The Sachahuaman fortress overlooked the city from a hill 250 metres high. It had a triple wall, built of enormous stones. Through deep ravines on either side of the Sachahuaman hill flow the little rivers of Huatanay and Rodadero, the former passing beneath the houses on the west side of the square, down through the centre of a broad street, where it is crossed by numerous stone bridges, and eventually uniting with the Rodadero. The main part of the old city was built between these two rivers; and even to-day the houses there commonly show the massive masonry of the Inca architecture in their lower portions, though having a modern superstructure. Now, as formerly, the streets run at right angles. The government established by the Incas, though in form a despot theocracy, was relatively mild and patriarchal. Nowhere and never have there been chiefs of state so successful in monopolizing all power, all initiative. Accordingly, when the Spanish conqueror Pizarro captured Inca Atahualpa, the people were incapable of effective resistance. Atahualpa’s successors were Huayscar and Manco. The former was slain; the latter was induced by promises of friendship to lead the Spaniards into Cuzco (15 Nov. 1533). An enormous booty
was obtained by despoiling the temples and palaces. Besides gold and silver, the common soldiers received 200 slaves each, and the sacred sun-maidens were treated as a part of the loot. In 1536 the last of the Incas, Manco, besieged the city and succeeded in capturing the principal Spanish stronghold for a long time, though Pizarro founded Ciudad de los Reyes (Lima) 6 Jan. 1535. Extremely interesting are the remnants of the fortifications, temple, etc., some of which are constructed of huge masses of stone from 10 to 12 feet of irregular shape, yet made to fit exactly one into the other with minute accuracy, as in mosaics. Such works, constructed before 1370, are scarcely surpassed by any in the world in respect to their solidity and the skilful workmanship they attest. Among the public buildings are the Cabildo, the university, library and museum, etc. The city has suffered from lack of means of transportation and communication. Only in the last few years has it been made to connect it by railroad with the Titicaca region. It is regularly built and contains several handsome buildings, prominent among which are the cathedral, in the Corinthian style, and the convent of San Domingo. There are also hospitals, a university founded in 1612, a normal college and a museum. It has shrunked in trade as in population. Gold and silver work, leather, sugar, cotton, linen and wool are produced to a limited extent. The inhabitants at the time of the conquest numbered perhaps 100,000; a century ago about 50,000; at present about 20,000.

**CYANAMIDE.** See Electro-Chemical Industries.

**CYANIC ACID** is a thin, colorless liquid, stable only below 32° F., having an extremely pungent odor, somewhat resembling acetic acid, and a vapor irritating to the eyes; the liquid acid is blistering to the skin. It was discovered in 1824 by F. Wöhler. Cyanic acid is prepared by heating anhydrous cyanic acid nearly to redness in a current of carbonic acid gas (CO₂). The resulting vapors of cyanic acid are conducted into a condenser surrounded by a freezing mixture. Cyanic acid dissolves in ice-water without decomposing until a certain degree of concentration is reached. Kept at a temperature of 32° cyanic acid changes rapidly (in the course of an hour) into insoluble cyanic acid (CN₂O₂H₂). At a higher temperature the transformation into the cyanic acid is hastened. The composition of "cyanelone," the exact composition of which is not known, but it seems to be the same as that of cyanic acid. Cyanic acid unites with alkaloids to form cyanates. Prominent among these are potassium cyanate, useful as a reagent, and ammonium cyanate, interesting chiefly because it was the source of the first synthetic production of an organic substance from inorganic materials.

**CYANIDE INDUSTRY, The.** The products of the cyanide industry reported for 1914 come under cyanides of sodium, potassium, calcium, and ammonium; nitrites and hydrazines; yellow prussiate of potash, metallocyanides, yellow prussiate of soda, trisalates and potassium cyanate. Reports were received from six establishments recently that manufactured cyanides, not including cyanide blues, the total production for the year being 16,450,225 pounds, valued at $2,398,674. This output comprised 3,204,684 pounds of yellow prussiate of potash, valued at $451,092, and 13,245,541 pounds of other cyanides, designated as sodium cyanide, metallocyanides, yellow prussiate of soda, trisalates and potassium cyanate, valued at $377,440, using cyanide being named in the order of their importance in respect to quantity produced. While the production of the yellow prussiate has decreased by about 9 per cent since 1909, the output of other cyanides increased by 35 per cent. Of the six establishments reporting, two were located in New Jersey and one each in Massachusetts, New York, Ohio and Pennsylvania.

In addition, recently, 1,239,382 pounds of cyanide blues (iron ferrocyanides) reported as Prussian blue, valued at $387,077, were returned by 15 establishments engaged primarily in the manufacture of paints and pigments. Of these establishments, six were located in New York, four in New Jersey, four in Illinois and one in Massachusetts.

**CYANIC PRACTICE,** a term used to cover generally the diverse applications of the process of securing the precious metals from their ores through the use of potassium cyanide. While the process follows certain basic lines, the applications of it vary almost with every mine in which it has been put into practice. This article can give only the general outline of the process, and the interested reader must be referred to the voluminous mass of periodical literature to be found in the current mining magazines and the books suggested below. It should be noted in passing that cyanidation in the extraction of gold from ores has practically superseded the former processes of smelting, pan-amalgamation, bromination, chlorination and in large measure plate-amalgamation, as the most thorough, as well as economical method. In a number of plants, however, cyanidation has been abandoned for the newer method of flotation (q.v.).

The cyanide process is based on the fact that water containing only a very small percentage of potassium cyanide dissolves gold and silver, and that these metals may be recovered from this solution by precipitation with metallic zinc. In the treatment of gold and silver ores by this process the first operation is the crushing of the ore to such a degree of fineness that the cyanide solution may reach every particle of the precious metal present. Until very recently this crushing was done by stamp mills, and this is still the practice at many mines. The crushed material from the stamps was then separated into "slime" (the finer) and "sand" (the coarser). The slime was treated by agitation with the cyanide solution in a stirring apparatus, and the sand in a percolator. In the percolation process a much stronger solution of cyanide was required, and a much longer time was consumed. The approved progressive mines at present is to use the stamps only for the coarser crushing and to reduce this crushed material to the utmost fineness by further grinding in a tube-mill with quartz pebbles, yellow prussiate of iron, so that the powder shall all pass a 150-mesh screen. In many plants a solution of cyanide is fed into the material during the crushing. In this case it is usual to pass the crushed material over amalgamating plates of copper as it comes from the stamp: the mercury on the plates seizes the
Cyanide Process—Cyanogen

coarser particles of gold at a considerable saving of time and expense.

In the case of ordinary stamp-milled material the separation of the fine and the coarse is made by passing a water jet or jets of sufficient pressure through the V-shaped separator box. These jets are not strong enough to prevent the coarse material from sinking to the point of the V, but produce sufficient current to carry away the slime over the top of the box and into the collecting vat. This preparation is preliminary to the process of smelting with cyanide, but without such preparation the cyanide process is only a partial success.

The cyanide process proper consists of three operations: (1) Dissolving the precious metal; (2) precipitating the metal from the solution; (3) smelting the precipitate. In the first operation, if *sand* is to be treated by percolation, the material is filled into a tank and some lime or other alkali is scattered over the top and washed into the mass with water, which is then drained away. Then a *strong* cyanide solution, carrying one-fourth of 1 per cent of potassium cyanide, is run into the tank from the bottom and this is allowed to stand for a sufficient period—varying from 6 to 12 hours, according to the kind of ore and its degree of fineness. This area of surface is then drawn off and a weaker solution run in: and this is repeated several times, the proportion of cyanide being less each time, down to a proportion of one-tenth of 1 per cent, the last *washing* being with water. The entire operation requires from four to eight days.

In the treatment of slime, after it is carried over into the collecting tank it is allowed to settle partially, lime being added, after which it is allowed to settle completely. It is then mechanically agitated with more or less of the cyanide solution, according to the proposed after treatment. In what is known as the *decantation* process about four tons of the cyanide solution are used to one ton of slime. After agitation (in one hour or a dozen hours) the slime is left to settle, and then three tons of the clear cyanide solution containing probably three-fourths of the gold and silver present in the slime are decanted. Three tons of new cyanide solution are then added and agitated with the slime, which is again settled and again three tons of solution are drawn off. This procedure is repeated until 97 or 98 per cent of the gold and silver has been recovered. The alternative method of extracting the gold from solution is the filtration process. There are numerous variations of the filter, the ultimate object sought being to get the last drop possible of the gold-bearing cyanide solution out of the slime. Each type has its advocates, and none seems superior to the others.

Having secured by one means or another the solution containing the precious metals, the next step is precipitation. This is accomplished by passing the liquid upward through a mass of zinc which has been finely divided so as to present a large area of surface. This is secured by reducing the zinc to thin and narrow shavings or threads, or even to dust: the latter, however, has a dangerous tendency to explode. An improved form is known as *atomized* zinc, and this in some cases is mixed with atomized lead, or the zinc is alloyed with lead before atomizing. The double cyanide of gold (or silver) and potassium is apparently decomposed, the zinc taking the place of the precious metals in the combination. These metals in a finely divided condition fall to the bottom of the zinc-box, or adhere to the bottom of the V-shaped separator box. These jets are not strong enough to prevent the coarse material from sinking to the point of the V, but produce sufficient current to carry away the slime over the top of the box and into the collecting vat. This preparation is preliminary to the process of smelting with cyanide, but without such preparation the cyanide process is only a partial success.

The cyanide process was first employed on a commercial scale in 1889 at the Crown Mines at Karrangahake, New Zealand. In that year the world's consumption of cyanide amounted to about 50 tons. By 1905 the mining industry was consuming 10,000 tons annually. Previous to the outbreak of the war in Europe the larger part of the world's supply of cyanide was produced in Germany. The complete elimination of this source threw a large burden upon American manufacturers of cyanides, but the demand has been met, the principal raw material used being the refuse beet pulp of the beet sugar industry.

**Cyanide Process.** See Gold Mining.

**Cyanides.** See Hydrocyanic Acid.

**Cyanin, sī'ā-nīn,** or ANTHOCYANINE, the blue coloring-matter of certain flowers, as the violet and corn-flower. It is red in the presence of acids. It occurs in buds and other parts exposed to the light and has been considered a protection against injurious rays of light.

**Cyanite,** a native aluminum silicate, AlSiO₄, identical in composition with sillimanite and andalusite but very different in its physical properties. Its hardness varies on different faces from 4 to 7. Its specific gravity is 3.56 to 3.67. It is triclinic, the crystals usually being long-bladed, transparent or translucent, and of a beautiful sky-blue color in the centre. Stout crystals of grass-green color occur in North Carolina. The finest specimens come from Faido, Switzerland, occurring in paragonite schist. Cyanite abounds throughout the New England and Middle Atlantic States.

**Cyanogen,** sī'ā-nō'jēn, a colorless, poisonous gas which liquefies at —4° F. and at
—30° F. becomes crystalline. It burns with a peach-blossom-colored flame, forming CO₂ and nitrogen; water dissolves four volumes and also metallic hydroxides. It is very poisonous and smells like prussic acid. It polymerizes when heated. Cyanogen gas passed into strong aqueous hydrochloric acid is converted into oxamide. Hydrogen converts cyanogen into hydrocyanic acid, HCN. A solution of cyanogen in water turns dark and deposits azulenic acid, C₄H₄Na₂O₂, and the solution contains hydrocyanic acid, urea and oxalate and formate of ammonia. Cyanogen dissolves in an aqueous solution of potash, forming cyanide and isocyanate of potassium. It may be regarded as the nitral of oxalic acid. Dry ammonia gas and cyanogen combine, forming hydraulumin, C₃N₄H₄. Small quantities of cyanogen are formed during the distillation of coal. It can also be made by heating metallic cyanides or CN⁻ with Na₂O, or by the passing of induction sparks between carbon poles in an atmosphere of nitrogen.

CYANOMETER, sĭ-a-nôm′ē-tër ("measurer of blue"), the name of an instrument invented by Saussure for ascertaining the intensity of color in the sky. It consists of a circular piece of metal pasteboard, with a band divided by radii into 51 portions, each of which is painted with a shade of blue, beginning with the deepest, not distinguishable from black, and decreasing gradually to the lightest, not distinguishable from white. It is used in the open air and the observer holding it up between himself and that part of the air whose color he wishes to ascertain, and in such a position as to secure its being strongly illuminated without receiving the direct rays of the sun, turns it gradually round on its own plane till he perceives an exact similarity between the tint of the instrument and the tint of the sky. The number of that particular tint as marked on the instrument marks the intensity of color in the sky at that particular period.

CYANOPHYCEAE, sĭ-an-ō-fī-sē-ē (Gr. "dark blue"), the lowest group (blue-green) of Algæ (q.v.). They are closely allied to the Bacteria (q.v.), and together with them are known as Schizomycetes. They do not appear to possess a nucleus. Their color is caused by the diffusion of phycocyanin, a blue pigment, throughout their cell-contents. In this group no sexual reproduction has been observed, the only reproductive means known to exist in it consisting of spores and hormogonia of a non-sexual character.

They may be either one-celled, filamentous, or of the nature of loose aggregates of cells in a gelatinous matrix. Oscillatoria is one of the unbranched filamentous forms. Some of the filamentous forms consist cells known as heterocysts, which lose their protoplasmic contents and become fixed to the sheath of the filament. The growth of the remaining cells forces the filament out of its sheath and produces what is known as false branching. Vegetative reproduction may take place by the breaking off of a part of a filament. Nestor forms balls of jelly containing twisted filaments.

The blue-green algae may grow on moist spots on the pond, salt marshes or even in springs the temperature of which is near the boiling point, but their favorite situation is shallow, warm, fresh water, as in lakes, or even reservoirs, where they often cause a disgusting stench in warm weather. Copper sulfate is a good treatment. The Red Sea receives its color from one of the Cyanophyceae. Consult Cooke, 'British Fresh Water Algae' (London 1881-83); id., 'Introduction to Fresh-Water Algae' (ib. 1902); Wolfe, 'Fresh-Water Algae of the United States' (Bethlehem, Pa., 1897).

CYANOSE, sĭ-a-nōs′, or CHALCANHTHE, kāl-kān′thē, native sulphate of copper (CuSO₄, 5H₂O), met with generally in stalactic or reniform masses, but sometimes in well-defined crystals. It is dark-blue, translucent, vitreous, brittle, readily soluble in water and with a most disagreeable metallic taste. Its hardness is 2.5, its specific weight 2.2-2.3. It has a conchoidal fracture. It is found in Chile, Cornwall and elsewhere. It crystalizes in the monoclinic series.

CYANOSIS, sĭ-a-nōs′is, a condition of diminished oxidation in the blood, causing lividity of the skin, blueness of the lips, symptoms of weakness and fainting. It may be a permanent affection, such as is seen in blue babies, in whom the venous blood obtains access to the arteries without passing through the lungs to be oxidized; or it may be a temporary condition due to choking, to excessive coughing as in false croup or in true diphtheria. It also results as a temporary condition in poisoning by means of a number of the newer drugs used for headaches and vague pains, such as acetanilid and the like. It may also result from coal-gas poisoning and a large variety of other forms of poisoning. Removal of the source, if possible, fresh air, oxygen, artificial respiration, are useful in the treatment of the condition. The congenital varieties are unmodifiable.

CYANOTRICHITE, See LETTISITE.

CYANURIC ACID (from "cyanogen" and "uric"), an organic acid having the formula

\[
\text{C₃N₄O₆H}_₄ \quad \text{and obtained by the}
\]

\[
\text{COH} \quad \text{HOC} \quad \text{COH}
\]

dry distillation of uric acid. It is a polymer of cyanic acid, CNOH, and may be obtained, along with another polymer of unknown molecular weight called camylene, by the spontaneous polymerization of cyanic acid. To obtain it in this way, potassium cyanide, CNOK, is treated with hydrochloric acid in the presence of ether and water, the mixture being well shaken. Potassium chloride and cyanic acid are formed, the latter polymerizing at once into the two compounds mentioned above, the cyanuric acid that is formed being taken up by the ether, from which it may afterward be recovered by evaporation. Cyanuric acid forms colorless efflorescent crystals which contain two molecules of water when deposited from solution in water. The hydrorous crystals have the form of rhombic prisms; but anhydrous crystals, octahedral in form, are also known. Cyanuric acid dissolves in hot nitric, hydrochloric or sul-
phoric acid, there being no decomposition unless the action is prolonged. When heated it becomes converted into cyanic acid, this reaction being one of the tests that are employed for its detection.

CYATHEA, a genus of arborescent ferns, family Cyatheaceae, characterized by having the spores, which are borne on the back of the frond, enclosed in a cup-shaped indiumus. There are many species scattered over the tropical regions of the world. *C. medullaris* is a fine New Zealand species of comparatively hardy character. The soft, purplish medullary substance in the centre of the trunk is an article of food somewhat resembling sago. This species and *C. dealbata*, from the same country, are cultivated as ornamental plants. *C. arbores* is a West Indian species.

CYATHOMETER, an apparatus for determining the level and volume of liquids in closed vessels. It is adapted to bottles and to stationary or movable vessels and is designed especially to prevent fraud in the retail trade in valuable liquids.

CYBELE, sib'ë-lé, a goddess of Asia Minor, like Isis, the symbol of the moon, and what is nearly connected with this, of the fruitfulness of the earth, for which reason she is confused with Rhea, whose worship originated in Crete, and in whom personified nature was revered. According to Diodorus, Cybele was the daughter of the Phrygian king Maon and his wife, Dindyma. At her birth her father, vexed that the child was not a boy, exposed her under Mount Cithaeron, but lions and panthers and afterward found and brought up by the wives of the herdsmen. She invented the flutes and drums, with which she cured the diseases of beasts and children, became intimate with Marsyas and fell violently in love with Atis. She was afterward recognized and received by her parents. Her father discovering her love for Atis had him seized and executed, and left his body unburied. The grief of Cybele on this occasion deranged her understanding, and she began a long search for Atis. In art her original statue was nothing but a dark quadrangular stone. Afterward she was represented as a matron, with a mural crown on her head in reference to the improved condition of men arising from agriculture and their union into cities. A common attribute of the goddess is the veil about her head, which refers to the mysterious and incomprehensible in nature. In her right hand she often holds a staff, as an emblem of her power; and in her left a Phrygian drum. Sometimes a few ears of corn she holds a thunderbolt; or a lion lies near her. These symbols are all allusions to the dominion and of the introduction of civilization by her means in the period of barbarism. Her cult was centralized at Phrygia, whence it found its way into Greece, as early as the latter half of the 6th century B.C., and was introduced at Rome by 204 B.C. The Romans she was known as the Great Idaean Mother of the Gods. Under the Roman empire, it became one of the three most important Roman cults and was of the last pagan worship to give way before Christianity. Consult Farnell, *Cults of the Greek States* (Vol. III, Oxford 1907).

CYCADACEAE. See Cycadales.

CYCADACEAE, sik-a-dà'tlés (from Cycas = Neo Lat. nom. pl. of Gr. *kikas*; the original name of the African cocoa-palm), a greater group of tropical and sub-tropical naked-seeded or gymnospermous plants, the cycads. The large pith of the thick palm-like trunk of certain species of the genus Cycas is the source of the sago starch of commerce, whence the common name, *sago palm.* The existing forms are only an ornate remnant of an ancient and varied alliance, the nearest living relative being the *Ginkgo,* or maidenhair tree.

At least two distinct Cycadalean types are recognizable; the cycads proper include all extant forms and have only a short fossil record, while the cycadeoids, now wholly extinct, were cosmopolitan throughout all of Mesozoic time. The first group is represented in the order Cycadaceae, to which all cycadaceous types were until recent years supposed to belong. The second group may be arbitrarily brought within the order Bennettitales, with far the broader relationships and an immensely varied history. But it appears that variants of both groups go back to the Carboniferous.

I. Cycadales.—The cycads are a primitive megaphyllous and composite type with wood structure like conifers (and Cordaites), certain frond and other characters of ferns, and the outward habit of a bush. The stem elongates by the slow growth of a terminal bud, with the unfolding of successive crowns of leaves or fronds spirally arranged in close order. As the leaves wilt down, there is formed from their bases an outer more or less persistent armor, which gives the stem a very characteristic appearance. For trunk-forming plants, the cycads are mostly small or even pygmy. They include tuberous to columnar sparse-branched forms, and vary in size from underground trunks a few centimeters in diameter, with fronds no more than a decimeter long, to moderately tall forest forms.

It was once suggested that *Cycas* (see Fig. 2), in which the so-called carpellary leaves alternate with the foliage leaves in armor formation, grew taller than forms bearing cones only. But such is not the fact. The Australian *Macrozamia Hopei* reaches a height of 60 feet, or nearly double that of any *Cycas,* and the Mexican *Dion spinulosum* is nearly as tall. Both these are columnar, rather than branched types. The most robust trunks may reach a meter in diameter, and the longest fronds a length of four meters. Several Central American and Peruvian species are epiphytic. Most of the cycads branch one or more times after reaching a certain age, and all are handsome and easily grown greenhouse plants. The Japanese gardeners display examples of their native species *Cycas revoluta,* upward of 300 years old, and as freely branched as screw pines. A pot-type is shown in Fig. 3. One of the most interesting of all species is the Cuban *Microcycas calocoma,* a slow-stemmed forest form about 30 feet high, also branched in a manner recalling the habitus of the screw pines. The
cycads are widely dispersed in tropical and subtropical regions, though seldom abundant. *Zamia floridan a* (Fig. 1) locally known as the "coontie," occurs in thickly set clumps as underbrush in the open pine woods of south Florida, while *Z. pumila* is found more sparsely among the denser forest growths of the hammocks.

The fern-like and subterranean stemmed *Stangeria paradoxa* is abundant both in the open grassy veldt and in the bush of Zululand. Similarly the low-growing *Macrozamia spiralis* and *Bowenia serrulata* together form a moderately close undergrowth in the *Eucalyptus* bush of southeastern Australia. Along the eastern mountain slopes of the Mexican state of Vera Cruz, the tall *Dion epiulosum* is in places the only large plant and may be said to form a cycad forest. But as a rule, the cycads now play a rather inconspicuous rôle in forest facies. (See *Geographic Distribution*). The stem consists finally in a thin zone of wood, cambium and bast, enclosing a large medulla and enveloped by a thick cortex, this being in the main the arrangement in all the gymnosperms and the dicotyls. But there is this difference; the cortex supports primarily the primitive outer investiture or armor of old foliar bases, which is quite persistent in some forms, but in others is more or less rapidly excised by the formation of successive layers of periderm, at first arising within the leaf-bases, and then in the cortex itself with the casting off of thin barks. Moreover, in *Cycas, Macrozamia* and *Encephalartos* the woody cylinder does not as in the other genera remain single. After a time the primary cambium becomes inactive, and there successively arise in the cortex secondary cambiums of diminishing power and regularity. From these are produced the so-called "anomalous wood zones," rarely increasing to a dozen and finding no parallel amongst modern plants. The principal features of this second or polyxylic trunk type are shown in Fig. 2, together with a medullar system of anastomosing cauline bundles. These also occur in the pith of *Encephalartos*. Both pith and cortex are traversed by anastomosing mucilage canals. The cortical bundle system is a complex one, varying greatly in the several genera, and including "girdle leaf traces" (cf. g. Fig. 5) of a primitive, partly concentric structure. The leaf traces are always double and the two branches may nearly girdle the stem. They are most nearly direct in their course from the woody cylinder through the cortex to the leaf base in *Zamia* and *Stangeria*. Complexity of the leaf traces begins even in the cotyledonary plate, but is partly a result of the thickness of cortex. The cycads, unlike all vascular cryptogams, send down a primary root which continues as a tap-root. In the case of such subterranean trunks as those of certain species of *Zamia* (Fig. 1), the tap-root remains prominent, and its lateral branches are relatively small, the trunk assuming a carrot-like form. But in most genera the root system comes to be quite filamentous, being largely made up of freely branching adventitious roots. In *Cycas* the rootlets come to the surface as a felt-like mass and bear numerous coralloid tubercles, recalling the nitrogen fixing tubercles of legumes. The leaves or fronds are usually of two kinds, scale...
Fig. 1. *Zamia floridana*. Miami, Florida, middle of November. (1, to right) ovulate plant with enlarged view of cone, section of the same showing seeds, megasporophyll bearing two seeds, and pinnae; (2) summit of staminate plant bearing five cones; (3) microsporophyll with enlarged view of triple group forming sorus. The entire plant is shown about one-tenth natural size. The staminate plant is about one-third natural size.

Fig. 2. *Cycas revoluta*, both columnar and branched stems. Ryūgoji Temple garden, near Fijiri, Japan.
EXTREME TYPES OF CYCADEOIDS

1 A Petrified Cycadoida from the Black Hills, weight over 300 pounds
2 Restoration of Climbing or Procumbent, Flowering Wirianidella from the Rhaet of Skone, by Nathorst. Both figures are about one-sixth natural size.
and foliage. There are also the fertile or carpellary leaves of Cycas. All appear in terminal rosettes in the order named, scale, foliage, and when present, carpellary leaves. The scale leaves are dry and aborted foliage leaves, and are present in all but certain species of Macrozamia. The elliptical to acuminate foliage leaves are bipinnate in Bowenia, and pinnate in all the other genera. Proliferation is direct in Dion and Macrozamia. In Cycas the rachis is straight, but the pinnules are cincturally rolled like those of ferns. Conversely in several other genera the pinnules lie straight along the once deflected rachis. The pinnules vary from broad forms of papery thinness in some Zamias to leathery and hard spinose types like Encephalartos. They vary much in size and form and are of dichotomous venation, except in Cycas, which has a single mid-vein. Those of Stangeria are very fern-like, and Cycas Micholitii is bilobately dichotomous, signal recall of the fossil Ginkgoid leaves, especially of the Rhatic. The anatomical structure is much as in certain conifers and the extinct Cordaites.

**Fructification.**—The living cycads are all dioecious. The microsporophylls are always organized into cones which may vary from a few on long to enormous forms exceeding in size the very largest ears of Indian corn, and bearing as many as 600 microsporophylls, these being the most massive to be seen in seed plants. In number the staminate cones vary from a few, or even a single subterminal cone, to over 100 laterally borne cones in the Australian Macrozamia Moorei. The sporangia are borne on the under side of the sporophyll and are structurally much like those of Angioperis among the Marattiacae. In certain genera there is an obscure grouping into sori. (See Fig. 1). The ovules, which are the largest known in the vegetable kingdom, are in the genus Cycas, doubtless the most primitive type among recent phanerogams, borne on the margins of modified leaves, emergent in regular series like the ordinary foliage leaves. In the other genera the megasporophylls each bear a single pair of ovules, and are organized into terminal, subterminal or lateral cones. These are of striking size in all the genera, and reach a length of nearly a meter with a weight of 90 pounds in some Australian Macrozamias. In various forms following development of a single cone, the stem is prolonged from a new lateral bud as a sympod. But cones truly lateral occur in both Macrozamia and Bowenia, often in some number. The seeds are often of large size. In Cycas, especially, the free seeds look much like large plums; but in cone-bearing forms there are strong impression faces. The seed coat is amphivasculiar—that is, with a seedstone separating an inner and outer bundle system. Cycas is platspermic, and the other genera have radio-symmetric seeds. There are from one to three cotyledons. Testal structures are closely analogous to those of Ginkgo and the Cordaitales. Even stronger is the resemblance to the seeds of the Paleozoic quasi-ferns, or Cycadophytes, if, as seems necessary, the apical testal division seen in these ancient seeds is regarded as primitive. The seeds of cycads, like those of Ginkgo, are edible. They even form for a considerable part of the year the main food of some of the native Australians—although it is said that as freshly gathered the seeds contain a poisonous principle. This is removed by maceration and drying.

**Fecundation.**—Among the various primitive characters of the cycads going to prove their descent from homosporous tree-ferns, easily the most recondite is the occurrence of motile multiciliate male cells of the coiled type, characteristic of all the Pteridophytes except the club mosses. These spermatozoids were doubtless common to all the cycadales and are present in Ginkgo, but are not known in any other phanerogams. The pollen grains are first drawn through the micropylar tube into the pollen chamber (by suction), after which the pollen tube ruptures the exine and enters the nucellar tissue, where it may branch. Meanwhile the spermatozoids (Figs. 6, 7) form from the generative cells and, after the rupture of the pollen tube, swim actively to the archegonium through a liquid medium, afforded in part by the tube and probably also by extrusion from the egg cell. The mature spermatozoids are the largest known in any plant (or animal), at least in Zamia floridana. In this species they are visible to the naked eye, and have been studied alive in sugar solutions. They are of nearly spherical top-shape, with a ciliated spiral running from the apex to the middle region, the movement is mainly by means of their cilia, but there is also ameboid motion of the spiral end (see Figs. 6 and 7). From this most primitive form of fecundation known in flowering plants it seems evident that not until the later stages of plant
evolution did the pollen tube begin to serve as a
direct means of transfer of the male cells as in
other phanerogams.

II. Bennettitaceae.—The record of the dis-
covery and segregation of this extinct group
from the cycads proper now forms one of
the most interesting chapters of paleontologic
research. The cycad, or more exactly speaking,
the cycadophytes type of foliage, characterizes
the vegetation of mid-geologic time. Of all
cycad-like plants in the Mesozoic faunas only
30 per cent are cycadalean. So universally and
in such variety of species do the leaf imprints
occur that the Mesozoic is often spoken of as
the *age of cycads.* But the actual proportion of
cycad and cycad-like plants in the Mesozoic
floras can only be surmised. The recovered
record consists largely in xerophyllous, low-
land or swamp types, and it has not yet been
ascertained whether there was a distinct cycad-
deous element in the contemporaneous upland
and plateau vegetation; although it is probable
that there was, and there is evidence that both
cycads and clypeoids were notable constitu-
ents in the Mesozoic vegetation of the Arctic
areas. Probably the species ran into the thou-
sands. At any rate, the dominance of clypeoid
plants in the fossil floras preceding the advent
of recognizable angiosperms in the lower Cre-
taceous has long been regarded as a fact of
deep evolutionary interest; though it is only
within the past 25 years that much headway
has been made in the study of the extensive
class of fossil material at hand. Previously the know-
ledge of the fossil cycads rested mainly on such
facts as could be gleaned from the study of the
dissociated leaves and occasional stem imprints.
The few petrified forms more recently uncovered
had not resulted in *restorations,* and it was
naturally supposed that the extinct types were
closely allied to modern forms. The names of the
leaf genera, Zamites, Otozamites, Cycadites,
Stangerites, etc., etc., indicate this supposed
affinity. But it is now known that even the
xerophyllous types, which are the more readily
conserved because of form and habitat, often
bore, despite their strictly cycad-like leaves,
flowers and fruits very unlike the cones of
even existing cycads. (See Fig. 8.) American re-
searches have mainly contributed to this result.
Especially the discovery of the remarkable
silicified trunks of the Black Hills of South
Dakota has given to the cycadeoids a trancen-
scented interest from both the paleontologic
and the botanical viewpoint. The cycadeoids
are, however, unique to North America. They
belong mainly to the genus Cycadeoidea and the
family Cycadeoideae, established nearly a cen-
tury since by the English geologist Buckland.
Various silicified stems with a higher level of leaf bases notably simulating the recent cycads
just described had been encountered in the

Classification and Geographic Distribution.
—The living cycads include a few over 100
species divided into two families, the Cycadeae,
with the single genus Cycas, and the Zamia,
including the other genera. The species are
nearly equally divided between the New and Old
World thermal tropics. There are four indigene-
ous Occidental genera: Zamia, with nearly
40 species, ranges over the mainland of
Florida, whereas two species occur, to Brazil, and
also over the West Indies; Ctenozamia, with
six species, and Dioon, with three, are mainly
Mexican and Central American; while the
monotypic Microcycas is Cuban. In the Orient
five genera occur: Cycas, with over 20 species,
is the most notable, and ranges over Australia,
the East Indies and Japan; Macrozamia, with
12 species, and the monotypic Borassia are both
strictly Australasian; while Encephalartos, with
20 species, and the monotypic Stangeria are
African. This represents a peculiarly balanced
distribution. No genus is common to both the
Oriental and Occident. Mexico, Africa and Aus-
tralia are the main centres of present day
cycads; and while Cycas is the only eastern
form extending into the northern, Zamia is the
only western form known to extend into the
southern hemisphere. There is, however, no
reason to believe the species are now under-
goings restriction. The eastern Andine base is
the portion of the cycad habitat least known.

Fossil Cycadaceae.—As in the case of vari-
ous unique types in the existing flora, the pres-
ent isolation of the cycads is connected with a
past history of great extent. The living forms
are only in the lateral branches of a varied
cycadalean group. The Cycadeae are ancient,
characteristic leaves of the Cycas type having
already been present in the Carboniferous limestone.
Undoubtedly petrified Cycas seeds occur in the Cretaceous of Vancouver Island.
The Zamias were already present in the Jurassic.
But they are always scantily present.
Modern looking cycads appear to occur as

so-called "dirt bed" of the oölite formation of the Isle of Portland. This lies just above the limestone there quarried. As the black earth of the "dirt bed" is stripped away, the cycadeoids, with more or less crushed terminal buds, are encountered quite in the original soil in which they grew. The stems are still being found and have been known to the quarrymen as "crow's nests" for several centuries, going back even to the time when the materials for the construction of Saint Paul's of London were quarried. Owing partly to the checked type of conservation, the Buckland specimens received little further study, and it was not until 50 years later that William Carruthers described an Isle of Wight trunk bearing ovulate cones.

Fig. 8.—Types of Cycadeoid fossilisation. Above (1, 2), imprints of associated fronds and fruits, from the Goodwanna, India. Below (3), surface of petrified Black Hills trunk showing similar ovulate cone. Cf. Fig. 10.

Certain Italian specimens had yielded incomplete results, and a splendid Galician trunk in the Zwinger Museum at Dresden, discovered as early as 1753, remained unstudied. Neither did an interesting series of American trunks from the "iron ore" beds of Maryland, first noted about 1860, receive merited attention. In fact, the ovulate cone being the most aberrant cycadeoid feature, with the foliage uncertain, the relationship to the cycad-leaved plants of the Mesozoic was obscured rather than cleared; and so the subject rested until the attention of American paleontologists was directed to the Black Hills of South Dakota, going back even to the Freeze Out Hills of Wyoming. Beginning with the species Cycadeoida dactotensis (Macbride 1893) nearly a score of valid species have been described from silicified types, often bearing conserved crowns of young leaves and the flower buds in various stages of growth. In one instance, that of the Cycadeoida Dartoni, perhaps the most remarkable fossil plant ever recovered, fully 500 of the mature ovulate cones are embedded in the armor. Over half are complete and show the seeds with the finely conserved dicotyledonous embryos. For a full account consult references, Wieland, 'American Fossil Cycads' (Vol. II). About the lower Cretaceous Black Hills rim and in the Freeze Out Hills upwards of 1,000 of the silicified cycadeoid trunks have been secured. These are now mainly included in the collections of the State University of Iowa, Yale University and the United States National Museum. The Yale collection includes a unique series of branched trunks and is unrivalled in extent and the variety of types included. These specimens have permitted the preparation of a unique series of polished surfaces and thin sections from which alone critical study is possible. These great accessions of new material have made possible a redintegration of the actual plant type represented by the genus Cycadeoida, now probably the best known of all extinct plants. Obviously Cycadeoida itself is a highly specialized form; but aside from its striking features it possesses an extreme interest as affording the indispensable structural key to the study of the cycadeoid casts and imprints. Moreover, the wider knowledge of this previously unknown group of plants for the first time brings within the range of scientific discussion the origin of the angiosperms. Curiously enough while some of the trunks of Cycadeoida weigh nearly 1,000 pounds, certain related forms like the Wielandiella of Natherst had much branched stems little thicker than a lead pencil. (See plate). In brief, these dissimilar but related forms together with the principal extinct cycadeaceous plants are the Cycadeoids, classified as the Bemettitaceae. It is next in order to consider Cycadeoida as the key to the group.

Organization of Cycadeoida.—In the Mesozoic forests in which they grow, the mature trunks of Cycadeoida, with their foliage, would have appeared to a beholder to differ little from modern cycads. Some of the low branched Dakotan trunks must have greatly resembled the Uganda Enecephalartos of Fig. 4. Only when in full fruit would essential differences have appeared to the eye. Vegetatively, the more copious fern-like chaff or ramement borne by the leaf bases forms the chief outer peculiarity. As in the cycad trunk, the divergence from other gymnosperms is mainly due to the retention of the old leaf bases, the horniness of the underlying cortical parenchyma and the presence of a relatively enormous medulla or pith. The woody cylinder is thus relatively reduced; it is also of somewhat simple structure and usually without growth rings. There is, however, a tendency to the formation of some growth rings in some of the silicified trunks, with development of a woody cylinder as heavy as in Cordaites and a correspondent reduction of both the medulla and cortical region; it being noteworthy that these variant features are paralleled by the existing Dian. In its simplest form the woody cylinder of the Cycadeoids (and cycads) consists in a regularly aligned lattice of anastomosing collateral bundles. The
meshes are formed by the leaf gaps. Each cylinder bundle is divided into a conspicuous xylem and phloem region separated by a well-marked cambium. The xylem or secondary wood tracheids are interspersed by occasional parenchyma cells. The "medullary rays" are abundant, deep and made up of sheets of oblong to squarish cells, often two cells thick. Next the pith, the spiral protoxylem first arises as more or less isolated strands, soon merging into the main body of scalariform secondary wood. While the scalariform pits of the mid-region of the tracheids tend to break up into a radial circular pitting of the Araucaria/lypox type, it may be said that in nearly all the species the main body of wood is characteristically scalariform. Only in one species is the circular pitting found to form a thin outer zone next to the cambium. Essentially this same variation is found in the wood of modern cycads, except that in the latter there is more development of pitted wood. The cycadeoids thus appear to have been a primitive scalariform type, while the cycads seem to advance toward a pitted condition. But this difference is partly the result of post-Cretaceous change. In both groups the phloem region agrees in a regular alternation of thin and thick walled elements. From the cylinder meshes, or leaf gaps, arise the leaf traces which are single and pass out directly to the leaf bases.

The leaves of the cycadeoids are in venation reminiscent of the Cordaites. As in that group and the cycads the bundles are mesarch. The inverted omega bundle pattern of the latter, as seen in the transverse petiolar sections, is somewhat unique, but varies in much the same manner as in the fossil forms, where the petiolar bundles are more simply aligned. In cycads the petioles have a prominent median ridge with pinnule insertion in two lateral furrows; but most fossil forms appear to have

![Fig. 9.—Section through summit of petrified (Cycadeoidea) trunk from Black Hills, cutting crown of young fronds, with single frond embedded in fine chaff or ramentum (several times enlarged). The pinnules of the (once pinnate) fronds are still folded, back to face, in two ranks.](image)

had a more or less pronounced median furrow, on the sides of which the pinnules were obliquely inserted. Prefoliation of the fossil types was direct, with pinnule growth somewhat preceding rachidal elongation as in the existing Macrozamia spiralis. See Fig. 9.

The flowers of a number of species of Cycadeoidea are known in various stages of growth from initial or minute forms a few millimeters in diameter to the mature ovulate cones or fruits. All the strobili, whatever the stage of growth, indicate more or less clearly an amphisorangiate condition; but there is conclusive evidence for both bisexual and monoeccious species, with a probability that certain others were dioecious. Briefly, the flower is a short lateral axillary shoot, always invested in a husk of hairy bracts (cf. figures 11-13). At the centre is an immature ovulate cone, enveloped by a staminate disc. The buds vary from a few centimeters long by a half centimeter in diameter, to forms 5 to 10 centimeters in diameter. (Fig. 11). The marvelously perfect silicification of the flowers is due to the protected position in which they grew packed in amongst the old leaf bases; but even so, the fossilization of such delicate organs as stamens and pollen must be regarded as fortuitous. In species where the peduncles elongated no fruits were left behind. The great number of fruits borne by various mature trunks is a striking feature, indicating in several of the
species monocarpy, or fruit growth for a single season only, followed by sterility and death. The stamens are as in the far more reduced amphipsporangiate flower of *Tunoba*, united into a campanulate disc, hypogynously inserted. The border of the campanula rises to nearly the height of the immature central cone and then splits into discrete sporophylls. Each of these then sends up two wing-like spurs and at the same time the rachidal tips turn inward and downward along the surface of the cone—that is, the component fronds of the flower-bud are of deflexed or conduplicate prefloration. The sporophyll spurs rise closely appressed each to each, forming instead of a rounded summit a spired dome inside the bract husk. The outer surface is toward the apex quite tomentose. Each stamen is once pinnate with the pinnules reduced and bearing two lateral rows of pendent bivalvate synangia, varying from a few to 10 or 12 to the row. As densely packed in the flower-bud, the synangia show strong appression faces (Figs. 12, 13), but are of essentially the same structure as in the existing tree ferns of the genus *Marattia*. The sporangia in two facing rows of 10 or 12 each resting in the synangial valves are often filled choke-full of well-conserved pollen. The grains are much like those of existing cycads, though tending to reach a slightly larger size. It is noteworthy that some of the discs are considerably reduced and that related forms of the Mexican Liassic have a nearly simple campanula. See series of Figs. 11-14.

The mature ovulate cone (Fig. 10) is of inverted pear shape and consists in a flattened to conical receptacle, bearing a closely interlocked series of sterile and fertile scales. At the periphery all the scales are sterile, but in all the central parts of the cone as to clearly seen in the transverse sections, the fertile scales are so distributed that each is surrounded by some regular number, as from five to six, or five to seven of the more flattened infertile scales. Each megasporophyll bears a single erect and terminal seed, generally from the size of a small grain of rye to a large grain of wheat, while the infertile scales rise about and overtop this seed, so that their expanded ends come to surround the micropylar tubes in a series of interlocking rosettes. The seeds are radiospermic, five to six angled like those of Palaeozoic rather than Mesozoic times, exalbuminous or
nearly so, and dicotyledonous. The testa is rather reduced, triple-layered with a middle stone one or two cells thick and non-vascular. These are the only known fossil dicotyledonous seeds, but the embryos are conserved in beautiful detail. In form and testal structure, including peculiarities of the micropylar tube, the Cycadeoidea seed presents certain striking approxi-

mations to the seeds of Gnetum gnemon and G. africanum, as proved by Emily M. Berridge and Mrs. Thoday.

The Williamsonian Tribe.—The boundaries of fossil groups are always obscure, or at least inferential. They change as discovery proceeds; but they are never settled. So, coexistent with the Cycadeoidea, and without sharp demarcation, stands the related and far greater group of dissociated fossil remains conveniently termed the Williamsonian Tribe. This tribe, taking the term in its very broadest sense, thus designates that dominant and varied but imperfectly known assemblage of Mesozoic plants, to which the silicified cycadeoids afford the structural key. These are, too, the proangiosperms, as they were with much foresight called by the French palaeobotanist, Saporta. Obviously, accessions of petrifed forms are few; but the discovery of related casts and imprints is only begun. The latter are in a sense the more important, since they in the end afford the chief evidence for the variety and extent of extinct cycadophytae, while the first attempt at the reconstitution of a Williamsonian cycadeoid was that of Zamites, or, as now called, Williamsonia gigas, by the English palaeobotanist, W. C. Williamson (1870). But his conclusions, based on the casts and imprints of stems, leaves and fruits from the Yorkshire coast, failed to convince contemporary botanists. With Cycadeoidea understood, it is found, however, that the Williamson restoration only lacked completeness. By far the best known member of the Williamsonian tribe is the Wielandiella from the Rhetic of Sweden, as skillfully studied and restored by A. G. Nathorst, and shown in the plate. This plant had a much branched, scendent or decumbent habit and bore very small perfect flowers with reduced discs. Because of great age and plastic features Wielandiella must be regarded as the most important cycadeoid; but unfortunately the stem structure remains unknown. The Pterophyllum Faugli of the French Carboniferous is one of the oldest and handomest of the leaf forms, while the Indian (and cosmopolitan) Dictyosamites had the significant feature of net-venation. The Williamsonians leave behind approximately the record of emergence and extinction indicated in the appended table. In order to keep the form simple (and more nearly correct), various types doubtless related, such for instance as the Carboniferous or Permian Plagiozamites, are omitted.

As far as fossil preservation goes, Pterophyllum and Zamites are the representative ancient lines, with Sphenozamites as a relative merely characterized by oddity of leaf form. And these old lines pass on to add their quota to the great Williamsonian group of the Rhetic, the period of most rapid evolution. Culmina-
tion occurs in the lower Jura; while extinction begins in the middle Jura and progresses steadily to the upper Cretaceous, where the Cycadeoidea also find their final representation in both Europe and America. *

Cycadeoid Relationships.—In comparing the stem and leaf structure of cycads and cycadeoids it is seen that the distinct differences generally have the nature of singularities accentuated by separation in time. The existing cycads go to the Jurassic. Then, doubtless, they still retained their ramentum and various older features. The main gap is due to the organization of the sporophylls into cones in the cycads, into flowers in the cycadeoids; and that this severance did not occur later than the Permian is an inference resting not merely on the general evidence, but on the cognate fact that the coniferous types also underwent much similar change in that age. The fossil trunks while these "girdle traces" may have a concentric structure, the only cycadeoid cortical traces which are concentric pertain to peduncles. Thirdly, there are sometimes found in the cycad pith vascular cone domes due to the nearly or

Fig. 14.—Views of the amphiborangiist flower bud of Cycadeoides colosciis. Partly diagrammatic (to left); but on the right the transversely cut summit, with longitudinal section of young seed cone (A), and microsporophyll (B). Nat. size.

Fig. 13.—Cycadeoides dacoderus Marsh. Longitudinal section (in the narrow direction) through a synangium, showing attachment to the sporophyll, the several layers of the synangial wall, its differentiation, the attachment of the sporangia, and the median sulcus between them. The basal buttressing of the outer wall is characteristic. Pollen grains shown enlarged. × 37.

The inceptively terminal position of the enormous cones. As the vegetative axis reasserts itself the peduncle bundle strands and cylinder are grown round by the main woody cylinder. No parallel can arise in the cycadeoids, where the peduncules are all lateral, as indeed they are in most cycads. Fourthly, peduncular centrifugal wood, the remnant of the old cryptogamic wood, and still present in some modern cycads, is entirely lost in the cycadeoids, notwithstanding their greater age. In fructification the cycads and cycadeoids at first sight appear utterly dissimilar. But on closer consideration important reciprocal relationships appear. There is an Indian form suggesting a staminate whorl, rather than a disc, while there is no question of the strobilar nature of the ovulate fruit, whether to be regarded as a cone, or as an inflorescence made up of secondary axes of sterile scales clustered about a central seed stem, somewhat after the manner of the Pandanus cone. Furthermore, diffuse strobilar types, or those with more leafy sporophylls, are in evidence in Mesozoic times in both coniferous and other gymnospermonous types. Also, it appears that in gymnosperms there are distinct gradations from carpellary leaves to cone scales, and that there is no impassable hiatus between cones, whorls of fertile leaves and discs. In cycads the microsporophylls are reduced to cone-scales, while the megasporophylls are in the carpellary stage. In the cycadeoids exactly the opposite, or complementary course of change went on; the seed is simple stalked (as in Araucaria), and the microsporophyll is frond-like. It has, too, that curious eared feature, which also appears primitively significant. Just as in various cycad cones both types of sporophylls have an eared or diceratoid character, so in the Cycadeoida microsporophyll the same feature recurs; and the further fact is there learned for the first time that the position or insertion of the spore in the so-called dorsal or ventral position may depend on the mode of preformation and reduction. Thus, owing solely to the manner in which the sporophylls of Cycadeoida are or

---

* Cycada, it has been said, "are to the vegetable kingdom what Dinosaurs are to the animal, each representing the culmination in Mesozoic times of the ruling dynasties in the life of their era." They are more. As the boundaries of the Williamsonian Tribe are extended, many climatic and paleophyte factors must come into view; while the bearing on the evolution of modern trees is incomparably clearer than in the case of ancient reptiles, where the myology always remains partly doubtful, and the mode of reproduction wholly obscure.
ganized into a disc, the symmetrical insertion on the superior surface, although of certain derivation from pendent Marattiod types.  And this evidence bears directly on the origin of the ovuliferous scale of conifers.  It can be readily seen that reduction of an eared megasporophyll, preternaturally deflexed, must lead to a complex ovuliferous scale simulating that of the modern conifers.  Finally, in the article on Araucaria it was pointed out that a certain parallel with Cycadeoides exists.  Aside from cycads, Araucaria must be considered the nearest relative, despite the floral parallel seen in the Tumboa disc and the seeds of Gnetum.  Fundamentally important is the fact that with the splitting up of the scalariform pits and loss of tracheidial end walls, vessels could arise, and that with medullar decrease and the development of storage tissue, essentially dicotyledonous wood structures like those seen in Magnolia, Drimys and Trochodendron would be reached.  Taken in conjunction with the floral plan, simulating that of Liriodendron and other Magnoliaceae, there is indicated a possible, if not even a probable, mode of angiosperm derivation.  Narrow indeed must have been the gap between upland and especially boreal cycadeoids and the true precursor or pro-angiosperms in early Mesozoic times.  The only alternative hypothesis to angiosperm derivation from within or near to the cycadeoid stock, is a far-reaching homoplasny and parallelism continuing throughout all post-Palaeozoic time.  See Cycadophyta; Paleobotany.

G. R. WIELAND, Yale University.

CYCADOFILICES.  See PTERIDOSPERMAE.

CYCADOPHYTA, a term of convenience for all cycad-leaved plants, introduced by A. G. Nathorst.  The great majority of such plants are extinct and of unknown fructification, but so far as discovered they are naked seeded or gymnospermous.  The supposed gymnosperm group Coniferophyta is now also used for the living and fossil plants with foliage like that of pines, Araucarias, etc.  See Cycadales; Paleobotany.

CYCADS.—CYCLOID

CYCADS. See Cycadales.

CYCADALES, sik'ə-dəl'z, or KYKLADES, the ancient and likewise the modern name given to the principal group of islands in the Grecian Archipelago, now belonging to the kingdom of Greece and forming into a separate province. The largest islands of the group are Andros, Paros, Mykonos, Tenos, Naxos, Melos and Thera or Santorin. They are situated between lat. 36° and 38° N. and long. 24° and 26° 30' E. They are generally mountainous and evidently of volcanic formation. They produce southern fruits and large quantities of marble, limestone, slate, gneiss, marble and eruptive rocks. Wine, brandy, hides and tobacco are exported. Hermopolis is the principal trade centre and capital. Pop. about 130,378.

CYCLAMEN, sik'la-men, a genus of perennial herbs of the natural order Primulaceae. There are about a dozen species, mostly natives of the Caucasus and the Mediterranean region, and characterized by flattish turpentine-like leaves, long petioled, more or less rounded or heart-shaped leaves and solitary, single flowers with reflexed petals of great range of color. The best-known species grown in America is C. latifolium, popularly known as C. persicum. It has produced a very large number of horticultural varieties, including some double forms, and is probably the most satisfactory window gardening plant, because of the profusion of its blossoms during many months and also because of the simplicity of its culture. The seeds are sown in early winter and kept steadily growing until the following winter, when they should commence to blossom; that is, from 12 to 15 months. The roots must not be allowed to dry up like other bulbous roots. The plants do not stand the heat of American summers and are therefore less popular as garden flowers than in Europe. The name sow-bread is sometimes given to the species chiefly cultivated in the United States, because the roots are fond of the acid tubers. The root is a drastic cathartic and is occasionally used in medicine.

CYCLE (Gr. κύκλος, Lat. cyclus, a circle) is used for every uniformly returning succession of the same events. On such successions or cycles of years rests all chronology, particularly the calendar. A period of 360 years is called a solar cycle and serves to show the day of the week falling on the first day of January in every year. The lunar cycle is a period of 19 years, after which the new moon falls again on the same day of the month. Besides these two cycles, which are indispensable for the calculations of the calendar, there are some others, several of them known by the names of periods. In China a cycle covers a period of 60 years; hence the poet, Moore, may have had in mind a definite length of time when he used the expression, "A cycle of Cathays."* CYCLE. See INTERNAL COMBUSTION ENGINE.

CYCLOID, the curve traced by any given point in the circumference of a circle which is rolled in its own plane upon a straight line. The rolling circle is called the generating circle and the chosen point the tracing point. The straight line is called the base of the cycloid, and the two points on the base where the curve begins and ends are the cusps. The cycloid is commonly illustrated by reference to a wagon-wheel moving along a perfectly smooth road. Each point in the outer circumference of the tire of the wheel describes a cycloid during its transit from contact with the road at one point (or cusp) to the position where it is again in contact with the road. The base of the cycloid is obviously equal to the circumference of the generating circle, as it is measured off there-with. The length of the cycloid curve is four times the diameter of the generating circle. The area included between the cycloid and its base is three times the area of its generating circle. If the cycloid be inverted, so that its concave side is uppermost, a ball under the impulse of gravity alone, rolling down the curve from any point in the curve, will reach the lowest point, or vertex, in the same time that it would if started at any other point in the curve. For this reason the cycloid is called the isochronal or isochronous curve. It is also known as the curve of swiftest descent, because the rolling ball will reach the vertex in the least time by following the cycloid than if it moved along any other path, even a straight line. The involute of a semi-cycloid, starting from the vertex, is a similar cycloid (Fig. 2). This fact coupled with the isochronal character of the curve, led the horologists to adapt the cycloid to the clock, aiming by means of a pendulum swinging always in the same time, no matter what the length of the arc, to gain a timekeeping device that would not vary. The plan failed through unavoidable friction. The curve of the cycloid is now chiefly of use in the arts in the shaping of the teeth of cog-wheels, the cycloid exhibiting less friction than any other form.

Several other curves are usually grouped with the cycloid as if related to it. Construc-
tively they are, mathematically they are not. The epicycloid is the curve traced by a point in the circumference of a circle which is rolled around on the outer side of a fixed circle. The hypocycloid is the curve traced by a point in the circumference of a circle rolling around on the inner side of a fixed curve. It is evident that the functions of these two curves cannot resemble or bear any relation to those of the cycloid. The curves known as *trochoids* are more nearly related, as they are assumed to be generated by points connected with the generating circle of the cycloid. The prolate trochoid is traced by a point in a radius of the generating circle of the cycloid. The curvate trochoid is traced by a point outside of the generating circle supposed to be on one of the radii extended. (See **Epi**cycloid; **Hy**pocycloid; Trochoid). Consult Proctor, R. A., *Treatise on the Cycloid, and All Forms of Cycloidal Curves* (London 1878).

**CYCLOID FISHES**, an order of fishes, according to the arrangement of Agassiz, having spiny, round or oval scales, as the salmon and herring. The scales are formed of concentric layers, not covered with enamel and not spinous on the margins; they are generally imbricated, but are sometimes placed side by side without overlapping. It corresponds roughly to the modern *Phylostomi*, consisting of those fishes which retain the duct from the air-bladder to the esophagus.

**CYCLOMETER**, an invention for measuring and recording the distance traveled by wheeled vehicles, extensively used in cycling. Its most important application is in railroading. The apparatus is connected with the wheels of a car, and by recording the number of revolutions tells on a sheet of paper inside the car the number of miles traveled. It is purely automatic, and in addition, by an attachment of extreme beauty and ingenuity, every inequality in the road-bed of a railroad is detected and located.

**CYCLONE** (Gr. *whirling*., *revolving*), a term originally applied to the violent rotary tempests of the tropical and sub-tropical regions, called by the West Indies hurricanes; in Senegal, tornadoes; at the Cape of Good Hope, trovados; in the Chinese Sea, typhoons; and on the west coast of Central America, papagallos. The diameter of rotation of such storms is from 200 to 300 miles and sometimes exceeds 500, and the velocity of the wind, according to Humboldt, is sometimes as much as from 200 to 300 miles an hour. The centre of the storm often advances 30 miles an hour. Since the discovery of the rotatory course of winds even at a distance from the tropics the term cyclone has, however, been applied to any system of winds blowing round a centre of low pressure, and a cyclone is distinguished from an anti-cyclone, which is a system of winds with a centre of high pressure. These two systems are always in proximity to each other, though their centres may be, and usually are, very wide apart.

In the cyclone there is a gradual rise of barometric pressure from the centre to the circumference, in the anti-cyclone a gradual fall; in consequence of this the tendency of the winds in a cyclone is toward the centre; in an anti-cyclone it is from the centre; a cyclonic system travels in a certain direction from the region where it originates till it is dissipated or destroyed; an anti-cyclonic system generally remains in the region where it is formed, its centre only shifting about within comparatively narrow limits; the isobaric lines of a cyclone, especially near the centres, are almost circular, those of the anti-cyclone extremely irregular, and the atmospheric gradient (that is, the rate of increase or decrease of pressure) is usually greater in the former than in the latter. While the general tendency of the winds is toward the centre of the cyclone, their actual course is not directly toward that space, but spirally round it, the lines of rotation being nearly the same as those of the isobaric curves. The direction of rotation is stated in *Buys-Ballot's Law of the Winds,* which in one of its forms is: *Stand with your back to the wind, and the barometer is lower, in the northern hemisphere, on your left hand than on your right; in the southern hemisphere, on your right hand than on your left.* This is due to the rotation of the earth, which has a greater linear velocity at the equator than at the poles, so that the centrifugal flow of dense, dry air to the equator has a westward motion, while the northeasterly flow of light, moist air is deflected to the east. These are important differences in the weather accompanying cyclones and anti-cyclones, but these are so much modified by local circumstances that it is impossible to enter upon them here. Almost the only general observation that can be made on this head is that the air in a region over which an anti-cyclone hovers, especially near the centre, is very dry, and either clear or almost free from clouds. The great cyclonic area of the United States is the central Mississippi Valley, notably in Kansas. Cyclones are less common apparently on the east side of the river and less violent, but occur with some frequency as far east as the Alleghanies. See **METEOROLOGY**.

**CYCLOPEAN WORKS**, in ancient architecture, masonry constructed with large blocks of stone unhewn and un cemented, said to be the works of a fabulous race of giants in Greece (q.v.). Some of these works were the walls of Argos, Tiryns and Mycenae. Similar walls are to be found in various parts of Greece, Italy and Sicily, at Persepolis and elsewhere in Asia, and at Cuzco, Peru. The earliest form consists of huge piles of rock, irregularly built, the spaces filled up with smaller stones. Later, the stones were hewn to fit one another, and polygonal masonry developed. Consult Petit-Radél, *Recherches sur les monuments cyclopes* (Paris 1841); Middleton, *Grecian Remains in Italy* (London 1812).

**CYCLOPES**, *sklo-pës*, a race of giants in the mythology of Greece. The earlier mythology of Hesiod makes them the sons of Uranus and Ge (Heaven and Earth). They belonged to the Titans, were three in number—Arges, Steropes and Bronzes—and had only one eye situated in the middle of their forehead. They were cast into Tartarus by their father, and again by Cronus, but being released by Zeus provided him with thunderbolts, and became his ministers. They were slain by Apollo, having furnished him with thunderbolts to kill Asclepius. Wholly different from these are the sons of Neptune, of whom Polyphemus (q.v.)
was the chief. They are described in the 'Odyssey' (ix, 106 et seq.) as uncouth, one-eyed giants, subjects of the gigantic Titan Aegaeon, living on cattle. According to Homer they resided on the west side of Sicily. A later tradition describes the Cyclopes as the servants and assistants of Hephaistus (Vulcan), engaged in making the armor and metal ornaments for gods and mortals, and in building the house of the gods; they were associated with a Thracian tribe of giants, who according to tradition built the stone works known as cyclopean (q.v.). They were named from their king, Cyclops.

**Cyclops**, st'klops, a genus of small freshwater crustaceans, type of a family, *Cyclopidae*, in the order *Copepoda* (q.v.). They are popularly included under the wide title of *water-fleas.* Various species are common as active swimmers in fresh-water pools or slow-flowing brooks, and a few forms have been recorded from the sea. The head-region is not distinct from the first ring of the thorax; there is a pear-shaped segmented body and a long abdomen; both pairs of antennae are long, and in the male the anterior pair forms claspers. There is no heart, the fifth pair of limbs is rudimentary and the second pair of antennae are without an exopodite. The average length of the commonest species is from two to three millimeters; the males are generally smaller than the females. A very marked feature, to which the name refers, is the single medium eye, usually bright crimson and sparkling like a gem; and not less noticeable are the two large egg-bags carried by the females. They eat both animal and vegetable matter, and are very prolific.

**Cyclorama**, a painted conception of a scene arranged in a circular room, so as to afford the visitor a single comprehensive view. Battles have been thus presented in the United States in the form of circular panoramas, as that of Gettysburg. See Panorama.

**Cyclostomi**, st'klo'so-me (Gr. *cround-mouthed*), one of the five primary divisions or classes of the craniate *Vertebrata*, also called *Agnatha*, *Marsipobranchii*, etc. Excluding the doubtful extinct ostracodermes, the cyclostomes have an imperfect, embryonic brain case, no lower jaw, no paired limbs or their supporting girdles, no ribs and no scales. They have a large number of gill pouches, which have a skeleton not homologous with that of the true fishes. The nostril is single, and the rudiments of the pineal and parietal eyes are remarkably perfect. There is no trace of a swim-bladder. The mouth is armed with a peculiar rasping apparatus. The skeleton is purely cartilaginous and the notochord persists in living forms. There are many remarkable structural specializations in the representatives of the three or four subdivisions, and the peculiarities of the living forms make it almost impossible to indicate how they are survivals of an once extensive group of fish-like animals; but only a single species of fossil can be referred to here with any certainty. The following may be indicated as orders: *Cyclostome*, with the vertebral column well developed and the brain case well developed; no external skeleton or no paired limbs; with a large diphercial fin supported by rays; the skull a cartilaginous capsule, with prominent ear sacs, and a large median nasal sac with a circle of cirri about its orifice; this group is represented by a single species (*Palaeospondylus gunni*), from the Devonian rocks of Scotland, and by various others, having the internal skeleton entirely unossified, with a persistent notochord and no vertebrae; body eel-like with a caudal fin; the mouth a sectorial disc, with the rasping end of a piston-like tongue appearing at its centre; the nasal sac median and its diverticulum is a tube penetrating the palate; and seven pairs of pouch-like gill slits, which communicate with a common respiratory tube distinct from the esophagus; represented by the single family *Petromyzonidae*, with the principal genera *Petromyzon* (lamprey, q.v.), *Lampetra*, *Mordacia* and *Geotria*; and *Hyperotretia*, like the last in the characters enumerated except that the nasal diverticulum (*hypophysis*) perforates the palate and opens into the mouth and there is no separate internal respiratory tube. There are two families of this group, the *Bdellostomidae*, with 6 to 14 gill pouches on each side opening separately at the surface; and the *Myxineidae*, with the single genus *Myxine* (hag fishes, q.v.), in which the six pairs of gill pouches have a single common external opening on each side. Professor Cope has added the great extinct group *Ostracophori* (q.v.).

**Cydias**, sid't-as, Greek painter: b. the island of Cythnos, one of the Cyclades. Horns, the orator, purchased his painting of the Argonauts for 144,000 sestertii (nearly $7,200). This same piece was afterward transferred by Agrippa to the portico of Neptune at Rome.

**Cydnus**, a river of Cilicia, rising in the Taurus and flowing through Tarsus into the Mediterranean Sea. The mouth of the Cydnus is often choked with sand and other alluvial deposits. It was on this river that Cleopatra made her voyage to meet Antony.

**Cydonia** (named, it is believed, from a place called Kydon, in the island of Crete, of which this fruit is a native); a genus of fruit trees, order *Pomacea*. It has leathery calyx lobes and many-seeded cells in its fruit. *C. vulgaris* is the quince; *C. japonica* is an ornamental shrub. See Quince.

**Cygnus**, sig'nus ("the Swan"), one of Ptolemy's northern constellations. It includes the double star Albiero or β Cygni, the components of which are differently colored, one of them being orange and the other blue. The motions of the double star, 61 Cygni, have been carefully observed, and it has been estimated that the pair together weigh about one-third as much as our sun. It is nine light-years away from us, and so is the nearest star to us except a Centauri. A new star, at present of the 15th magnitude, was discovered by Schmidt at Athens in 1876.

**Cyliner.** A cylindrical surface is a ruled surface generated by a line moving while parallel to a given line. A cylinder is the solid intercepted by a closed cylindrical surface and two parallel planes. A circular cylinder is formed by two parallel circular surfaces, called the superior base and the inferior base, and a convex surface terminated by them. There is a distinction between rectangular cylinders and oblique cylinders. In the first case, the axis, that is, the straight line joining the centres of the two opposite bases, is perpendicular to them;
in the second, the axis forms an oblique angle with each base. The cubic contents of a cylinder are equal to the product of the base by the altitude, or the perpendicular distance between the bases. Archimedes found that the volume of a sphere whose diameter is equal to the height and also to the diameter of the base of the cylinder, is equal to two-thirds of the cubic contents of the cylinder. A right circular cylinder may be generated by the revolution of a rectangle about one of its sides.

CYLINDER SNAKE, one of a family of small burrowing snakes (Ilyosidae) allied to the Typhlopidae and shield snakes, and retaining vestiges of pelvis and hind limbs, the latter showing in claw-like spurs protruding between the scales on each side of the vent. The form is cylindrical, the scales small, polished and hardly larger on the belly than elsewhere, and the colors bright. The few species are scattered over the Malay Islands and Indo-China, where the common "red snake" reaches a length of two and one-half feet, and occur in Ceylon and South America. A beautiful species in tropical South America is one of those called "coral snake," and is coral red with black rings. On account of its beauty, perfectly harmless nature, and for cooling purposes this snake is said to be sometimes worn as a necklace by the native women.

CYLINDRICAL LENS. See LENS.

CYLON, an Athenian leader, the son-in-law of Theagenes of Megara, who, with the intent to make himself tyrant of Athens, occupied the Acropolis, and being reduced by a blockade, was put to death by Megacles, in violation of his oath to spare him. A war with Megara resulted.

CYMA, s'f'ma, in architecture, a wavy molding of the profile of which is made up of a curve of contrary flexure, either concave at top and convex at bottom or the reverse. In the first case it is called a cyma recta; in the second a cyma reversa. It is a member of the cornice, standing below the abacus or corona. See MOLDING.

CYMBALS, among the ancients, musical instruments, consisting of two hollow basins of brass, which emitted a ringing sound when struck together. The instruments which are now used in military music, and have been borrowed from the East, have taken their rise from these. In the modern orchestra there are three ways of using them: the most common is to hold the pair one in each hand and strike them so that they graze slightly, obtaining excellent effects in piano and pianissimo; (2) to strike a single one with the drumstick after the manner of a gong; (3) to use a roll with the drumsticks, which is rather rare. They were used in the worship of Cybele, Bacchus, Juno and other deities.

CYMBELINE, s'mb'by-l'n or s'mb'by-l'n, or CYMBEL. Born in the last century; d. about 43 A.D. Not much is known of his career. He was, as is shown by his coins, the son of King Tasciovanus, who ruled in Verulamium. Suetonius calls him rex Britannorum. He was doubtless one of those kings who followed the career of Marcus Augustus. In later years he became involved in troubles with his son Adminius, whom he expelled from Britain, and who, having sought help from Gaius, instigated the expedition that was sent against Britain under Aulus Plautius. Cunobelinus died at this time and his sons Caractacus and Togodumnus inherited his kingdom. Shakespeare's play of 'Cymbeline' was written about 1609. A few statements about Cymbeline and his sons the dramatist took from Holinshed's 'Chronicle,' but the story of Imogen forms the ninth novel of the second day of Boccaccio's 'Decameron.' These two stories Shakespeare has interwoven, and the atmosphere of the two is not dissimilar. Consult Evans, J., 'Coins of the Ancient Britons'; Rhy, 'Celtic Britain'; Mommsen, 'Römische Geschichte' (Vol. 5).

CYMBELINE. 'The Tragedy of Cymbeline' is the last play in the Shakespeare folio of 1623. Its classification there among the tragedies is surprising, since the editors of the folio made no other such positive error of definition. One would expect to find this play in the list of comedies beside 'The Winter's Tale,' which in style and structure it most closely resembles. It is likely that the early editors were influenced by the title. The subject of 'Cymbeline' with the two tragedies based on early British history, 'King Lear' and 'Macbeth.' In fact, however, the play is ill named, for its eponymous hero is dramatically less important than either Posthumus, Iachimo or Pisanio, to say nothing of Imogen, and the vital portion of the story belongs not to history or even fable, but to pure fiction. From Holinshed's account (first printed, 1578) of the authentic King Cymbeline, or Cunobelinus, and his sons Shakespeare adapted certain points in his drama, and from another passage in Holinshed he derived the outline of the battle in Act V; but the real kernel of the play—the story of Imogen, Posthumus, Iachimo and Pisanio—is totally unhistoric. It is a refashioning of one of the imaginative tales in Boccaccio's 'Decameron.' (ii, 9). Current folk lore and fairy tales, again, offered a third source of inspiration, from which the dramatist drew in his treatment of the wicked stepmother and the romantic adventures of the children. (Fidelia). Much of the play's charm is due to the 'Gothic' diversity of atmosphere and incident which it acquires from the masterly blending of these varied elements. Testimony of language, metre and feeling connects 'Cymbeline' with 'The Winter's Tale' and 'The Tempest' in the latest group of Shakespeare's works, and points to 1610 as probably the date of composition. External evidence for this date is present in a manuscript book of notes on plays witnessed by Dr. Simon Forman, who died in 1611. He gives a detailed analysis of the plot of 'Cymbeline,' which it appears from the dates of other entries in his book that he must have seen acted either in 1610 or in 1611. Recently it has been suggested that the play may have been influenced in its structure and atmosphere by the 'Philaster' of Beaumont and Fletcher. Consult Thorndike, A. H., 'The Influence of Beaumont and Fletcher on Shakespeare' (1901), and the arguments advanced against the suggestion in C. M. Gayley's 'Beaumont, the Dramatist' (1918). In 1633 'Cymbeline' was performed before King Charles I, and, as Sir Henry Herbert
records, was "well liked by the king." It was rewritten at least four times to adapt it to the changing taste of later days. Garrick's version was extremely popular both in England and in colonial America, where it was performed (e.g., at Philadelphia) as early as 1767. Garrick, Kemble, Kean and Macready—four great actors of strikingly different personality—were all successively familiar in the part of Postumus, and they carried the play triumphantly through the period between the middle of the 18th and the middle of the 19th century. In 1857 Henry Irving played Pisanio to the Imogen of Helen Faucit; 40 years later, in 1896, he played Iachimo to Ellen Terry's Imogen. The two actresses just named are the most distinguished recorded interpreters of Imogen, the greatest role in the play; and Miss Faucit (Lady Martin) contributed also the finest literary discussion of the part ("On Some of Shakespeare's Female Characters," 1886). Hazlitt's praise of Imogen is well known: "Of all Shakespeare's women she is perhaps the most tender and the most artless."  

TUCKER BROOKE, 
Assistant Professor of English, Yale University.

CYME, an ancient city of Æolia, which, although styled by Strabo the largest and noblest of Æolian cities, is of little historical importance. The father of Hesiod lived here before he migrated to Ascara in Boeotia.

CYME, sim, in botany, a mode of definite inbreeding of plants. In sim (or karyd) a termiates in a flower and a number of secondary axes rise from the primary, each of these terminating in a flower, while from these secondary axes others may rise terminating in the same way and so on. All the flower-stalks rise to nearly the same height, so that they resemble a compressed panicle. The central or terminal flowers bear first.

CYMRI, km'ri', or KYMRY, a branch of the Celtic family of nations which appears to have succeeded the Gaels in the great migration of the Celts westward, and to have driven the Gelic branch to the west (into Ireland and the Isle of Man) and to the north (into the Highlands of Scotland), while they themselves occupied the southern parts of Great Britain. At a later period (during the 5th and subsequent centuries) they were themselves driven out of the Lowlands of Great Britain by the invasions of German tribes and compelled to take refuge in the mountainous regions of Wales, Cornwall and the northwest of England. A part of them also crossed over into Gaul and settled in Brittany. Wales may now be regarded as the chief seat of the Cymri (a name which the Welsh still give to themselves), as it is still the chief place where the Cymric dialect of the Celtic language is spoken. A variety of this dialect, called the Cornish, was at one time spoken also in Cornwall, and another variety called the Armorican, is still spoken in some parts of Brittany. On account of the similarity of the name the Cymri have been identified both with the Cumbric and the identification in both cases, especially the latter, is doubtful. The origin of the name is unknown. See WALES.

CYNÆGISUS, sin-ē-j'rūs, Athenian hero, son of Euphorion and brother of Æschylus. The story is told that at the battle of Marathon he lost his hands in attempting to prevent a Persian ship from being pushed off, and then seized the gunwale with his teeth.

CYNARA, a small genus of the family Asteraceae, in many respects like the thistle. The two best-known species are the artichoke (C. scolymus) and the cardoon (C. cardunculus). Both are hardy perennials, found wild in southern Europe and northern Africa. The flowers are sometimes used to curdle milk. See ARTICHOKE; CARDON.

CYNEWULF, km't-wulf, Anglo-Saxon religious poet. His name is only known from runes in the poems attributed to him, namely: 'Elenē' (Helena), the legend of the discovery of the true cross; 'Juliana,' the story of the martyr of that name; and 'Crist' (Christ), a long poem incomplete at the beginning, the 'Fates of the Apostles' and 'Andreas, or the Legend of Saint Andrew.' The name Cynewulf also occurs as the solution of one of the metrical riddles in the Anglo-Saxon collection. Other poems, the 'Andrew,' the 'Wanderer,' the 'Sea-farer,' etc., have been ascribed to him without sufficient grounds. In the epilogue to Elenē, there is an account of his life, which may or may not be authentic. Cynewulf probably lived in the first half of the 9th century. From his poems we may gather that he belonged to the Earlier period of his life as a wandering minstrel, devoting the latter to the composition of the religious poems connected with his name. Editions and translations of his works are by Gollance, 'Chrisi' (Gloucester 1874) and Cook (Boston 1900); Strunk, 'Juliana' (ib. 1905); Root, 'The Legend of Saint Andrew' (New York 1889); Hall, L. H., 'The Elenē: Trans. into English Prose' (ib. 1904); 'Legend of Saint Juliana' (Princeton 1906); and translation into English prose complete, by C. W. Kennedy, 'The Poems of Cynewulf' (New York 1910). Consult also Grein, 'Bibliothek der angelsächsischen Poesie' (revised by Wülker, Göttingen 1883–98).

CYNICS, a school of philosophers founded by Antisthenes, pupil of Socrates, about 380 B.C. Opinions differed as to the origin of the name. It is possible that it may have been derived from the gymnasium called Cynosarges (q.v.), where Aristippus first delivered his lectures; or from the Greek word dog (Klōw), either as a term of contempt for their uncivilized habits, or from their adoption of the dog as a common symbol. This philosophy was a development of the eudaimonistic teaching of Socrates, i.e., that happiness or well-being is the necessary result of virtue alone. Virtue was insight, or the knowledge of the good. One-sided interpretations of this theory led on the one hand to the Cynic philosophy, the precursor of the Stoic, and on the other to the Cyrenaic (q.v.), which was superseded by the Epicurean. The doctrine of virtue as taught by Antisthenes declares it to be the only intelligent conduct of life, not because of the results it brings about, but through itself. This virtue is in itself happiness, and to acquire it man must be governed by social or political events. It is attainable through freedom from wants and the curtailing of all desires, except the most fundamental and necessary. Therefore all things must be put to the test of natural and not human institutions to determine their worth. The Cynics
CYNIPIDÆ—CYNOSCEPHALEÆ

forced themselves to despise all the good things of civilization and recognized none of its laws and morals. They soon degenerated and their philosophy lost its idealism in an animalism which they mistook for naturalness. They believed that there was one and only one God, but this monotheism was not clearly defined nor deeply felt. It was rather a logical outgrowth of the desire for simplicity. They had some respect for mental training, as the only thing which would free men from the slavery of [missing text]. In spite of this, and however this philosophy is interesting as a mark of the disposition of the time; an indication of the disintegration of Greek society into individuals. Its very cosmopolitanism was negative; it consisted of denial of allegiance to any civilized community rather than a belief in world-citizenship. To the Cynic philosophy, despite its obscenity of thought and its incomplete vision, we owe two great ideas: the responsibility of the individual as a moral unit; and the sinfulness of the body. In these, with better insight and maturer psychology, the Stoics built their saner philosophy. Besides the founder, the most famous of the Cynics were Diogenes of Sinope (412-323 B.C.), Chrysippus of Rhodes (about 335 B.C.) with his wife, Hipparchia, Menippus (about 60 B.C.) and Zeno (qq.v.); and in the later Roman period, Demetrius, Cænomaus and Demonax. (See Socrates; Smyrnaics; Stoics; Epicureans.)

W., 'Fragmenta philosophorum Graecorum' (Paris 1867).

ROSE BOOCEVER,
Editorial Staff of The Americanist.

CYNIPIDÆ, the gall-flies (q.v.), a family of insects belonging to the order Hymenoptera, the sub-order Petiolata and section Parasitica. They are a kind of small flies remarkable for their extremely minute head and large, elevated thorax. The females are provided with an ovipositor by which they make holes where they deposit their eggs in different parts of plants, thus producing those excrescences which are known as galls.

CYNOSCEPHALUS, si-nō-sef’-a-lūs (Gr. "doghead") a genus of monkeys including the various species of baboon (q.v.).

CYNODICUS, si-nō-di-ku’s, a genus of primitive Canidae (see Dogs, Fossil) of the Oligocene Epoch in Europe and America, a collateral ancestor of the modern dog family. It was of weasel-like proportions, with long tail, small brain, civet-like teeth and other primitive characters. Most of the species were small.

CYNODON DACTYLON, CAPRIOLOLA DACTYLON, BERMUDA or BAHAMA GRASS, a low, creeping, perennial grass found in most warm and tropical countries, where from its drought-resisting capacity it is used as a common pasture grass. It has delicate leaves and upright, leathery flowering branches which bear three to seven slender divergent spikes. Three of the four species are Australian. In the United States it is dispersed from Pennsylvania to Florida and westward to Texas and California, being hardy from Philadelphia southward. It grows freely on poor, sandy soils, but the heavy, loamy good soil it will grow one or two feet high. It will grow on almost any soil, if not too wet. Its root-stock runs readily, thus making it a valuable grass for binding drifting sands and for bold landscapes, like to wash. Being insensible to heat and drought it soon makes a fine sod equally useful for grazing or for a lawn. It is also used for hay and is in bloom from April to October. It will not grow in the shade and it is easily injured by low temperatures, turning brown with the first frosts. It rarely bears seed, except in the extreme Southern States. The usual method of propagation is to chop up the roots, sow them broadcast and plow in, shallow. Once introduced it is hard to get rid of, but it has been eradicated by constantly plowing the land every week or so, or growing oats, followed by cowpeas in rows, which could be cultivated. Its rhizome is used in medicine as a substitute for sarsaparilla. The plants are a favorite food of the wild goat, hence the name Caprillo.

CYNOGLOSSUM, bound’s-tongue, a genus of plants of the family Boraginaceae consisting of about 50 species of coarse herbs of wide distribution in temperate climates. The flowers form scorpion racemes, as in the allied comfrey and forget-me-not, and are blue in color. Seven species are found in America, the best known being bound’s-tongue, C. officinale. This species is found in waste places from Quebec to Minnesota, and south to Kansas and North Carolina. It has a disagreeable smell like that of mice, and was at one time used as a remedy for scrofula. It is a troublesome weed, native in Europe and Asia. Another well-known species is C. virginicum, wild comfrey, which grows from New Brunswick south to Florida, and west to Louisiana.

CYNOMORIUM, a genus of parasitic flowering plants, the best-known representative of which is Cynomorium coccineum, a fungus-like plant, found in the Mediterranean region. It was long known as Fungus melitensis, and enjoyed the highest reputation as a stycic, besides being used as an astringent in dysentery and other maladies. These uses, however, depended on the doctrine of signatures alone, its scarlet color and blood-like juice being interpreted as providential indications of its curative destination for all injuries or diseases accompanied by bleeding. It was jealously guarded by the Knights of Malta.

CYNOSARGES, si-nō-sär’jēz, in ancient Athens, originally the name of a sanctuary of Hercules and a gymnasium in the east of the city, afterward extended to the suburb of Athens surrounding the gymnasium for the use of those who were not of pure Athenian blood. It was in this gymnasium that Antisthenes, the founder of the Cynics, taught. Consult Wellier, 'Athens and Its Monuments.'

Cynoscephale, si-nōséf’-a-lē (Gr. signifying dog’s heads), the name of a range of hills near Scopus in the neighborhood of Jerusalem, where for two battles fought there in ancient times.

CYNOSCEPHALUS, si-nō-sef’-a-lūs (Gr. "doghead") a genus of monkeys including the various species of baboon (q.v.).

CYNODICUS, si-nō-di-ku’s, a genus of primitive Canidae (see Dogs, Fossil) of the Oligocene Epoch in Europe and America, a collateral ancestor of the modern dog family. It was of weasel-like proportions, with long tail, small brain, civet-like teeth and other primitive characters. Most of the species were small.

CYNODON DACTYLON, CAPRIOLOLA DACTYLON, BERMUDA or BAHAMA GRASS, a low, creeping, perennial grass found in most warm and tropical countries, where from its drought-resisting capacity it is used as a common pasture grass. It has delicate leaves and upright, leathery flowering branches which bear three to seven slender divergent spikes. Three of the four species are Australian. In the United States it is dispersed from Pennsylvania to Florida and westward to Texas and California, being hardy from Philadelphia southward. It grows freely on poor, sandy soils, but the heavy, loamy good soil it will grow one or two feet high. It will grow on almost any soil, if not too wet. Its root-stock runs readily, thus making it a valuable grass for binding drifting sands and for bold landscapes, like to wash. Being insensible to heat and drought it soon makes a fine sod equally useful for grazing or for a lawn. It is also used for hay and is in bloom from April to October. It will not grow in the shade and it is easily injured by low temperatures, turning brown with the first frosts. It rarely bears seed, except in the extreme Southern States. The usual method of propagation is to chop up the roots, sow them broadcast and plow in, shallow. Once introduced it is hard to get rid of, but it has been eradicated by constantly plowing the land every week or so, or growing oats, followed by cowpeas in rows, which could be cultivated. Its rhizome is used in medicine as a substitute for sarsaparilla. The plants are a favorite food of the wild goat, hence the name Caprillo.

CYNOGLOSSUM, bound’s-tongue, a genus of plants of the family Boraginaceae consisting of about 50 species of coarse herbs of wide distribution in temperate climates. The flowers form scorpion racemes, as in the allied comfrey and forget-me-not, and are blue in color. Seven species are found in America, the best known being bound’s-tongue, C. officinale. This species is found in waste places from Quebec to Minnesota, and south to Kansas and North Carolina. It has a disagreeable smell like that of mice, and was at one time used as a remedy for scrofula. It is a troublesome weed, native in Europe and Asia. Another well-known species is C. virginicum, wild comfrey, which grows from New Brunswick south to Florida, and west to Louisiana.

CYNOMORIUM, a genus of parasitic flowering plants, the best-known representative of which is Cynomorium coccineum, a fungus-like plant, found in the Mediterranean region. It was long known as Fungus melitensis, and enjoyed the highest reputation as a stycic, besides being used as an astringent in dysentery and other maladies. These uses, however, depended on the doctrine of signatures alone, its scarlet color and blood-like juice being interpreted as providential indications of its curative destination for all injuries or diseases accompanied by bleeding. It was jealously guarded by the Knights of Malta.

CYNOSARGES, si-nō-sär’jēz, in ancient Athens, originally the name of a sanctuary of Hercules and a gymnasium in the east of the city, afterward extended to the suburb of Athens surrounding the gymnasium for the use of those who were not of pure Athenian blood. It was in this gymnasium that Antisthenes, the founder of the Cynics, taught. Consult Wellier, 'Athens and Its Monuments.'

Cynoscephale, si-nōséf’-a-lē (Gr. signifying dog’s heads), the name of a range of hills near Scopus in the neighborhood of Jerusalem, where for two battles fought there in ancient times.
The first was 364 B.C., between the Thetans and Alexander of Pharos, in which Pelopidas was slain; and the second, 197 B.C., in which the last Philip of Macedon was defeated by the Roman consul Flamininus.

**Cynosure**, sin'-ōr, or sīn'-ā-šār, or **Cynosura**, an old name for the constellation of the Little Bear or Ursa Minor, which contains the pole star in the tip of the tail. Cynosure, in a figurative sense, is hence used as equivalent to something which attracts general attention or draws all eyes toward it, as the pole star attracts the attention of the mariner. The word literally means dog's tail.

**Cynosurus**, a genus of grasses. See **Dog's-tail Grass.**

**Cynthia**, the moon; a surname of Artemis or Diana, the moon goddess. In mythology Mount Cynthia, on the island of Delos, is said to have been the birthplace of Diana.

**Cynthiana**, Ky. city, county-seat of Harrison County, on the south fork of the South Licking River and on the Louisville and Nashville Railroad, 33 miles northeast of Lexington. It is a trade centre for farming and stock raising, and is the seat of Harrison Female College. It has carriage, plow and cigar factories, distilleries (noted for their Bourbon whiskey), good schools, public library, two national banks and several newspapers. During the Civil War, Gen. John Morgan with 1,800 men captured Cynthiana and defeated the Union cavalry of about 500 men under General Hobson. On the following day (12 June 1864) the Union army sent reinforcements to the number of 5,400 men under General Burnbridge which defeated Morgan's army. The Union army lost 414 men, the Confederates about 600. Pop. about 3,500.

**Cynthius**, surname of Apollo, the sun god, from Mount Cynthia, on the island of Delos, at the foot of which he had a temple, and on which he was born. Diana, his sister, is called Cynthiana.

**Cyperaceae**, si-pēr-ā'sē-ē, a family of monocotyledonous grass-like plants including more than 2,000 species. These herbaceous plants generally grow in moist places on the margins of lakes and streams, with a cylindrical or triangular culm with or without joints; the leaves are sheathing. The family comprises the genera *Carex*, *Scirpus*, *Cyperus*, *Schoenus* and others.

**Cyperus**, si-pē'rus, a genus of perennial herbs of the family **Cyperaceae** (q.v.). The numerous species, which are natives of tropical and temperate climates, are characterized by having rootstocks or tubers, grass-like leaves, simple stems sparsely leafy below, perfect flowers in small compressed spikes which are arranged in compound umbels with numerous more or less attenuated bracts, the form of the inflorescence having suggested the popular names umbrella plant and umbrella pinn, which are perhaps most frequently given to *C. alternifolius*. This species is a very popular window garden and greenhouse plant, native of Madagascar. It is readily propagated by means of seed or by division of the larger plants, and is easily cultivated in any good soil kept moist. It does best in a moist atmosphere. Many of the species are troublesome weeds in cultivated fields; some are useful for food, their underground parts being starchy and mucilaginous; the tubers of others are used in perfumery. The chufa (*C. esculenta*) is valued in the Southern States for its roots by which the hog and swine thrive well. Papyrus (q.v.) is the product of *C. papyrus*. Some species have been used in medicine but are now rarely employed.

**Cy-près, sē-prè (Old Norman French for *as near as possible*), the principle in the American and English law whereby a gift legal in form, which cannot be administered exactly as the testator specified, or which is not definitely specified, may be applied *as nearly as possible* according to the intention of the donor. Cy-près is a doctrine of the early common law, by which, if gifts were made for charitable uses that were illegal or could not be carried into effect, the king, as general supervisor of charities, or the chancellor acting for him, could devote them to such other charitable purposes, *"cy-près or as near as possible*" as intended in the original gift. This power does not exist in the United States; the majority of cases wherein the cy-près doctrine is applied comes under charitable bequests on gifts for the advancement of education. In the United States it is held that the courts cannot make valid charities which are uncertain, but where charitable trusts have once been in part administered as directed by the testator, such action will prevent the trust from being defeated by change of circumstances. Where only a general charitable intention is expressed, as, relief of the poor, aid for the injured, under the cy-près doctrine the court may direct the disposal of the gift to some form of charity *"as nearly as possible*" like that mentioned or indicated by the testamentary gift of the testator. The laws based on the cy-près doctrine vary in different States. For instance, in the case affecting a Universalist Convention of Alabama, it was ruled that the doctrine of cy-près is not recognized in Alabama, as being based on the prerogative power of the king of England, recognized and administered by the English Court of Chancery with reference to trusts. The doctrine of cy-près is recognized in New Jersey but cannot be applied where the donor himself has directed what disposition shall be made of the trust property in the event of a failure of the charitable use to which he has directed it to be devoted. In a case affecting the Presbytery of Jersey City, N. J., a trust, which is declared for public worship and instruction for the benefit of an indefinite number of persons according to the Presbyterian faith and polity, is enforceable either exactly or, under the doctrine of cy-près, approximately. For further ways in which the cy-près doctrine is applied compare ESTATE; **Fee-Tail**.

**Cypress, the popular name for members of the genus *Cupressus* and for certain species of the related genera *Thujodendron* and *Chamaecyparis*. There are about a dozen species of *Cupressus*, which are trees or sometimes shrubs with small aromatic, evergreen opposite leaves and tiny monoeocious solitary flowers, the pistillate developing into a hard, globular cone containing numerous seeds which mature in the second season. The best-known species is probably the common European cypress (*C. semperv-
CYPRESS VINE, Ipomaea quamoclit. See Ipomoea.

CYPRIAN, sl'pri-an, Saint (Thaddeus Cæcilius Cyprianus), African bishop, martyr and one of the fathers of the Church: b. about 200; d. Carthage, 14 Sept. 258. He was of patrician parentage and inherited a large estate. Having received the highest education he professed rhetoric with eminent success in Carthage and in his school held disputations with representatives of the schools of philosophy and with believers in the Christian religion, with the result that he applied for admission in the Church. Shortly after being baptized (246) he was ordained priest and then was elected by the Christians of Carthage to be their bishop (248). In the persecutions of the Christians by Decius (249-51) he prudently withdrew from Carthage and lived in retirement, but on the accession of Gallus (251-53) he returned to his see. There had been lively controversies among the churches over the question of readmission to the Christian communion of those who in times of persecution had renounced the religion of Christ. Minor and churches in Africa, among them the church of Carthage, had in synods and in the letters addressed by their bishops to other bishops, strongly condemned the practice of some churches, among them that of Rome, in accepting as valid the baptism conferred by heretics. On the question of readmitting the lapsi to communion Cyprian favored leniency: he would readmit the fallen on proof of sincere repentance. But he would not acknowledge the validity of baptism conferred by a heretical minister. On this point he was at variance with the tradition and practice of the Catholic Church, and in support of his view he sent to Pope Stephen the acts of a synod of Carthage in which the invalidity of baptism conferred by heretics was declared. Pope Stephen replied that the tradition of the Church was opposed to this and bade Cyprian not to innovate, but to recognize as true and valid baptism administered by heretics if given in the name of the Trinity. Firmilian, a contemporary, states that Stephen threatened Cyprian with excommunication. To the threat the bishop of Carthage replied with great heat, but in the entire controversy on rebaptism he never calls the authority of the Pontiff in question, although he laments what he calls the injustice of the decision. In this controversy the final decision of the Roman Catholic Church was in favor of Stephen: that decision was rendered in the Council of Arles (314) and in that of Nice (325). He did much to relieve and strengthen his episcopate. Under him seven councils were held, the last in 256. In the reign of Valerian a new persecution of the Christians was decreed, and Cyprian being arrested and brought before the pro-consul refused to sacrifice to the gods and was banished and finally beheaded. His feast day in the Roman calendar is 16 September, which day he shares with Pope Saint Cornelius. His writings include 'Unity of the Church'; 'Dress of Virgins'; 'Lapsed'; the 'Lord's Prayer'; the 'Vanity of Idols'; 'Against the Jews.' His work have been edited by E. G. (3 vols., Vienna 1869-71); there is an English translation in 'Ante-Nicene Fathers', Vol. V.

**CYPRIE—CYPRUS**

**CYPRIE**, bluish variety of vesuvianite, so-called because the bluish tint is due to the presence of a small quantity of copper (cyprine copper). The hue varies from pale blue to green according to the amount of copper present.

**CYPRIE, an extensive family of** fresh-water, teleost fishes, distributed, in about 1,300 species, over the whole world except South America, Madagascar and Australasia. Most of the fresh-water fishes of the northern hemisphere belong to this family, and most of them are small, especially the American minnows, daces, chubs and shiners (qq.v.). Large examples are found in Europe and Asia, such as the carp, the Indian mahseer and catla, and a few others, described elsewhere by name. See *Fish*.

**CYPRIE, a** family of fishes, order *Teleostei*, sub-order *Haploïd*. Although the dentition of the family resembles that of the carp the jaws are protocleithral, and the ventral fins, if present, have five to seven rays. The maxillaries do not enter into the formation of the mouth, the dorsal and anal fins lack spines, the scales are cycloid or have erect spines. The frontals meet the supraoccipital. *Fundulus* and *Anaboleps* (q.v.), the fish with eyes divided into portions for vision in air and for vision in water, are important genera.

**CYPRIE, a genus of plants of the family *Orchidaceae*. The genus has about 40 species, 10 of them occurring in North America, and known generally as lady's-slippers. In medicine the term is applied to the rhizomes and rootlets of several species of *Cypripedium*. The root contains a volatile oil and tannic and gallic acids, and is used as a mild antispasmodic, for much the same purposes as valerian.

**CYPRIE, a fresh-water crustacean, typical of the *Cypriidea*, of the order *Ostracoda*. It is somewhat water flea, and has an unsegmented body, seven pairs of appendages, a rudimentary abdomen and a bivalve shell enclosing all. The shell is dainty and elastic; the posterior antennae bear a long tuft of bristles on the second joint; the seta of the maxillae have a small gill-appendage; and the posterior limbs are very irregular. *C. pubera*, the largest form, measures about one-tenth of an inch. Some species, including *C. fusca* and *C. pubera*, reproduce by parthenogenesis in summer and autumn, the males being transient; while others, notably the *C. ovum*, the males are found throughout the year, and parthenogenesis seems not to occur. The eggs are usually laid in masses on stones and water-plants. The adults are said to be able to survive desiccation, and this is true of the eggs. Some species are very abundant as fossils in fresh-water strata.

**CYPRIE, an island under British protectorate, lying south of Asia Minor, and the most eastern in the Mediterranean, near the mouth of the Bay or Gulf of Iskanderum. It is the third largest island in the Mediterranean, and, stretching from southwest to northeast, is about 148 miles long, with a width varying from 9 to 12 miles at a narrowest point in the north. Area 3,584 square miles. The main physical features of Cyprus consist of a range of mountains running along a large part of the northern coast, and a range parallel to it occupying a considerable part of the island on the south, with a broad tract of plain, called the Messaria, between, extending on either side to the sea. The second range culminates in Mount Troodos (6,406 feet). Cyprus is deficient in water, its streams being chiefly mountain torrents, which dry up in summer. The climate is in general healthy, excepting in various places during the heats of summer, which, causing a rapid evaporation, give rise to malarial fever. The forests were formerly very extensive, and in ancient times yielded wood much valued by the Phoenicians for ship-building, but owing to indiscriminate cutting, the depredations of goats, etc., they now cover a comparatively small area, with the result that the fertility of much of the soil has been impaired. The forests are now under government supervision, and are being cleared and other trees are being planted. Although about one-third of the cultivable land is under cultivation, agriculture is in a rather backward state. The chief products in 1914 were: wheat, 1,937,000 bushels; barley, 1,950,000 bushels; vetches, 195,000 bushels; oats, 412,000 bushels. The cultivation of the vine and the production of wine is increasing, most of it being sent to Egypt and France. Much mischief is sometimes done by locusts, but measures have been taken, under the supervision of the government by which their numbers have been greatly diminished in recent years. The extensive pasture lands of the island support numbers of sheep and goats. Cyprus possesses much mineral wealth, and in early times was celebrated for its copper, a metal the English name of which can be traced to that of this island. The copper is again being worked, as are also quarries of sandstone, marble, granite, limestone, etc. Salt in large quantities is obtained from works at Limasol and Larnaca. The cotton is of some importance. In addition to wine the chief articles of export are carobs, cotton, silk cocoons, cereals, raisins, skins, wool, cheese and fruits. The imports in 1914 were valued at £806,744, with exports of about the same value. Ships entered and cleared (1914) 581,959 tons. The revenue (1914–15) was £290,110 and expenditure £316,411. There were 628 elementary schools (1914–15) with a total enrolment of 36,661. A complete system of justice has been established. Roads and telegraphs have been constructed throughout the island, and there is a short railroad. Cables connect it with Syria and Egypt. About one-fourth of the people are Mohammedans, the rest are mostly members of the Greek Church.

The Phoenicians established themselves in Cyprus about 1100 or 1200 B.C. Greek colonists followed later; and for a time it was under Assyria. The Phoenicians introduced the religion of Astarte, which afterward passed into that of the Greek goddess Aphrodite (Venus). Amasis brought the island under the Egyptian yoke, 550 B.C. In 525 B.C. it was subdued by Cambyses and annexed to the Persian Empire, but it again became a dependency of Egypt under Ptolemy Soter toward the end of the
4th century B.C. In this condition it remained till the year 57 B.C., when it was made a Roman province. After the division of the Roman world, Cyrene continued subject to the Eastern Empire. In 1182 Isaac Comnenus, a prince of the imperial family of Constantinople, made himself independent, but the island was wrested from him in 1191, during the third Crusade, by Richard I of England, who afterward bestowed it upon Guy de Lusignan, who, on renouncing his claim to the title of king of Jerusalem. After the extinction of the legitimate male line of Lusignan, James, an illegitimate descendant, became the ruler. His wife was a Venetian (Catharine Cornaro), and as she had no children, at his death the Venetians took advantage of this circumstance to make themselves masters of the island (1489). They enjoyed the undisturbed possession of it till 1571, when, in the reign of Selim II, notwithstanding a brave resistance on the part of Marco Antonio Bragadin, who defended Famagusta 11 months, it was conquered by the Turks and annexed to the Ottoman Empire. In 1830 it was taken by the viceroy of Egypt, but was retaken by the Turks in 1840, and retained by them till 1867. It was ceded to Great Britain by the Convention of Constantinople, concluded during the negotiations consequent on the Russo-Turkish War of 1877-78. It nominally formed a part of the Turkish dominions, the agreement being that it should be administered by Great Britain as long as Russia should retain possession of Batum and Kars. Great Britain was also bound to pay a subsidy to the Porte, which amounts annually to £2,898. It was not paid directly, however, but retained as an offset to British claims against Turkey.

The arrangement came to an end on 5 Nov. 1914, when, as a result of Turkey's entry into the Great European War on the side of the Central Powers, Great Britain annexed the island. Nearly a twelvemonth after, on 20 Oct. 1915, it was officially announced that, as an inducement for Greece to enter the war on the side of the Entente, Great Britain had offered to cede to her the island of Cyprus. This offer was, however, declined for the time being and accordingly it lapsed. The island is governed by a high commissioner, assisted by an executive council of six, and a legislative assembly of 18 members. Six of the last named are office-holders and 12 elective for a term of five years, three by the Mohammedan and nine by the non-Mohammedan population. The island is divided into six districts, each presided over by a commissioner, and each having a district court. In recent years a vast quantity of interesting archaeological remains have been found in Cyprus. Pop. 274,108 (56,428 Ottoman Turks and 214,480 Christians of the Cypriote Church). The capital is Nicosia (pop. 10,325).

CYPSELEDÆ.—See SWIFTS.

CYRANO DE BERGERAC, sê-rä-nô de bârzh'rak, by Edmond Rostand, was first acted in Paris 28 Dec. 1897. The hero, always the central figure and usually the speaker, was a man of mark in his day (1620-55) as a gasconnading soldier, intrepid and indefatigable duellist, a facile poet, talented musician and writer of vaticulous fancy. Report attributes to him an abnormally large nose, disfigured by sabre cuts. This nose is a mainspring of the action in Rostand's play. Cyrano twice talks of it at length. He loves his cousin, the précieuse Roxane. He feels that his deformity must render any suit of his hopeless if not impossible; he takes it as the task of his romantic self-abnegation to secure for Roxane the fulfilment of her love for Chrétien de Neuvil and to defeat the evil designs on her of Count de Guiche and his com- placent follower, M. de Valert. Roxane, the willing dupe of her affection, is carried away by verses inspired by Cyrano as Chrétien's, attributes the valor and magnanimity of one to the other, and discovers her error only years later as a widow at the bedside of the assassinated Cyrano, who is dying as he has lived (in her service, and has her kiss an unstained soldier's plume as his late reward. The time of the action is 1640 and after; the scene at Paris and near Arras; the form Alexandrine verse of singular suppleness and polish, with lyrics attributed to Curi and Oubrerie. Notwithstanding the temerity of his time. It was Rostand's fourth play, his first notable success. Thanks in large part to the genius of the actor Coquelin the performance became a triumph historical in the annals of the Comédie Française. There had been no such success. It was a sensation. The Night of Hernani (1830). The play was speedily translated into many tongues and acted in many lands with success, notably in America. Among many editions may be noted that with an introduction by John A. (New York 1899). There is a translation by Helen P. (New York 1899). Consult James, H. (in Cornell Magazine, Vol. LXXXIV, p. 477). For the historical background see Platow, "Die Personen von Rostand's Cyrano de Bergerac in der Geschichte und in der Dichtung" (Berliner 1902); and for a study of the character of Cyrano, Schmidt, Erich, "Charakteristik" (2d series, Berlin 1901).

BENJAMIN W. WELLS.

CYRENAICA, sîr-e-nä'ka, anciently a Greek state in the north of Africa, between Marmarica on the east and the Regio Syritic on the west, and extending in its widest limits from the Phoenicuor Aerae at the head of the Gulf of Sirte to the Chersonesus Magna or north headland of the Gulf of Platea, or even to the Catabathmus Magnus, but the part possessed and cultivated by the Greek colonists actually occupied more than the elevated district in the north, now called Jebel Akdar, along with the adjacent coast. It comprised five cities (Pentapolis) — (1) Hesperides-Berenice (Benzæ); (2) Barca (Merj); (3) Cyrene (Ain Shahat-Grenna); (4) Apollonia (Marza Sarsa); (5) Teucheira (reproducing) — probably later times two more important towns were added, Ptolenaeum (Tolmeita) and Darnis-Zarine (Derna). During the most flourishing period of the history of the city of Cyrene that town held in nominal subjection the whole of Cyrenaica, or the country lying between Carthage on the west, Egypt on the east and Phazania (Fessan) on the south, with the Mediterranean for its northern boundary. Cyrenaica remained independent at first as a monarchy under a dynasty of kings, the successors of Battus (the Libyan title of the kings of Cyrene; the actual name of the founder seems to have been Aristoteles), who led the first colony to Cyrene; afterward as a republic, until it was subdued by
Ptolemy, the son of Lagus, and annexed to Egypt 321 or 322 B.C. By the will of the last king of Cyrenaica belonging to the Ptolemaic dynasty, it was left to the Romans, 95 B.C., who, about 20 years later, erected it along with Crete into a Roman province. Under Constantine it was separated from Crete and made a province by itself. Under Diocletian, Cyrenaica was separated from Crete and made a distinct province under the name of Libya Superior. As the Roman Empire declined the attacks of the native Libyan tribes became more frequent and formidable. The wars caused by their inroads and by plagues, earthquakes and locusts reduced the population and enterprise considerably. The country became overrun by the Arabs eventually and was under Ottoman rule. It is at present, however, not used to the best of its capacity and resources. Together with Tripoli it was annexed to Italy in November 1911 and formed into one province (August 1915), bounded on the west by Tunis and Algeria, on the east by Egypt and on the south and southwest by the Sahara. The area is about 400,000 square miles and the population about 1,000,000, mostly Berbers and Jews. The province consists of Tripolitania (capital Tripoli; pop. 73,000) and Cyrenaica (capital Benghazi; pop. 58,000). The coast is practically all of the trade passes. The chief exports are esparto fibre, skins and hides, ostrich feathers and sponges. Each district has its governor, appointed by the king on the nomination of the Ministry of Colonies in accord with the minister himself. These governors hold the rank of lieutenant-generals. (See CYRENE.)

Consult Gottschick, A. F., 'Geschichte der Gründung und Blüte der hellenistischen Staaten in Kyrenaika' (1838); Hildebrand, G., 'Cyrene' (1904); Haimann, 'La Cirenaica' (1882); Beechey, F. W., 'Proceedings of Expedition to Explore North Coast of Africa' (1828).

CYRENAICS, or CYRENIANS, a sect of ancient philosophers, whose founder was a disciple of Socrates, being Aristippus, a native of Cyrene, in Africa, after which city his followers were called. His life was virtuous and filled with the approval of all. The chief successors of Aristippus were Theodorus, Hegesias and Anniceris, each of whom became the founder of a sect known respectively as the Theodoran, Hegesian and Annicerian schools. Hegesias taught that pleasure is a fundamental part of life, and recommended it as a proper goal. As cynicism was the forerunner of stoicism, so cyrenaicism paved the way for epicureanism, which constitutes its chief merit. (See ETHICS; HEDONISM; UTILITARIANISM.)

Consult Watson, 'Hedonistic Theories from Aristippus to Spinoza' (Glasgow 1895).

CYRENE, sē-rē'ne, in Greek mythology, the daughter of Peneus, who was carried by her lover, Apollo, into Africa and gave name to that part of Cyrenaica (q.v.). By Apollo she became the mother of Aristæus.

CYRENE, in ancient times a celebrated city and the capital of Cyrenaica, in Africa, about 10 miles from the north coast, founded by Battus and a body of Dorian colonists, 631 B.C. The Battæae were driven out in 450 B.C. and varying forms of government succeeded, both republican and tyrannical. Alexander received its submission in 331 B.C., but it soon afterward fell under the sway of the Ptolemies. Its commerce with Egypt and Greece was extensive in classical times. Explorations and excavations were made in 1821-22 and in 1851. In 1910 the Archæological Institute of America undertook excavations at Cyrene. Numerous interesting remains have been discovered here, including a bath, two temples (supposed to be of the Roman period), and a magnificent necropolis, containing grottoes, façades and monuments of various kinds. In one of the grottoes are several curious paintings. A group of Ptolemaic buildings, 3,000 terra cottas, fine sculptures, an acropolis, Greek and Roman walls were discovered by the American expedition, whose work was suspended because of the Italian-Turkish War. Cyrene was the birthplace of Aristippus, Carneades the philosopher, Eratosthenes and Callimachus the grammarian. (See CYRENAICA.)

CYRIACUS, or CIRIACO DE' PIZZICOLLI, Italian antiquarian: b. Ancona 1391; d. about 1449. He had a passion for travel and to gratify it engaged in the life of a merchant. He became an ardent student of ten classics and on his travels engaged in the study of the monuments and remains of the past. He visited Egypt, Greece, the Ægean Islands, everywhere purchasing manuscripts, coins and objects of art and copying inscriptions and describing walls, buildings and other remains of the classic past. His collections were scattered soon after his death and but fragments of his notes and drawings remain. He was not thoroughly learned and made many mistakes, but his zeal was unspiring and to him we owe our knowledge of many monuments which have since disappeared. Consult Jahn, "Cyriacus von Ancona und Albrecht Dürer," (in Aus der Altertumswissenschaft, Bonn 1865), and Sandys, "History of Classical Scholarship" (Vol. II, Cambridge 1906).

CYRIL, sīr'il, Saint, patriarch of Alexandria, and one of the fathers of the Church: b. Alexandria 376; d. there, June 444. He was educated in the desert 65 miles south of Alexandria by the Cenobitic monks of Nitria. He was a hermit of Alexandria and the desert God who succeeded his uncle Theophilus in that station, till his death. He was a very zealous champion of orthodoxy and a fiery adversary of Nestorius, Eutyches and all the heresiarchs and heresies of his time. So incorrupte was his zeal for orthodoxy and for the exterminaion of dissent from the creed of Nicea, Chalcedon and Constantinople, that it has brought down upon him the animadversion of some modern Church historians and has given
material for historical novels in which imagination fills in what was lacking in the portrait of Saint Cyril drawn by his contemporary adversaries. Among modern Protestant writers, Dean Milman in his 'History of Latin Christianity' presses against him charges of barbarity, persecution and bloodshed, on account of which Cyril, though styled saint, must be esteemed 'one of the worst heretics against the spirit of the government' as charged with having closed the churches of the Novations and seized their church property; with having with an armed rabble wrecked the synagogues and driven the Jews in thousands out of the city; with having excited such tumults that the authority of the governor of Egypt, Orestes, was for a time defied. The murder of the illustrious Hypatia, neo-platonic philosopher and adversary of the Christian Church, is not alleged to have been instigated by him, but it is regarded as the inevitable sequel to his violent acts and speeches; and the perpetrators of it were, it is alleged on the authority of contemporaries, 'officers of his Church.' It is further charged that he was attended at Ephesus, on the occasion of the council of the Church held there in 431, by a rabble of followers, presumably to overawe the fathers over whom he himself presided: in that council he procured the condemnation of Nestorius, followed by deprivation and banishment by the emperor. The works of Cyril, in the edition published at Paris in 1848 (7 vols.), consist of commentaries, treatises, homilies and epistles. Critical editions of certain of his works have appeared, among them his commentaries on Luke (1859); John (1872); Minor Prophets (1868); Five Books Against Nestorius (1881); 'Scholia on the Incarnation' (London 1897). Cyril holds high rank among the Church fathers as a theologian. Consult the biography by Kopalik (Mayence 1881).

**Cyril of Jerusalem**

Cyril of Jerusalem, Saint, Greek father of the Church; b. Jerusalem about 315; d. there, 18 March 359. After his ordination to the priesthood in 345 his special office was to instruct the catechumens, both those who were to be prepared for admission to the Christian communion through baptism and those who at baptism were to be inducted into knowledge of the mysteries of the Christian religion, especially the mystery of the Eucharist. This occupation led to his writing his book of 'Catecheses,' one of the most interesting monuments of the ecclesiastical literature of that time. He was made bishop of Jerusalem in 350. Twice he was deposed and sent into exile by imperial decree because of his unflinching zeal for the creed of Nicea as against the Arian party, first in the reign of Constantine II and then under Valens. On the accession of Theodosius in 379, he was restored to his see and there remained till his death. At the Ecumenical Council of Constantinople (381) he was received with acclamations by the fathers as a confessor of the faith who had gladly suffered persecution. In the matter of 'Catecheses,' or catechetical lectures, are 23 in number, of which 18 are for the instruction of catechumens in the stage of preparation for baptism, while the remaining five, called the 'Catecheses Mystagogiae,' treat, as their title imports, of the mysteries of the Christian religion. The work, translated into English, is one of the volumes of the Oxford 'Library of the Fathers.' Consult the edition of Cyril's works published by A. A. Trottée (Paris 1720; Venice 1761), in the 'Migne Patrologia Graeca' (Vol. XXXIII), and by G. C. Reisch and J. Rupp (2 vols., Munich 1848-60; Eng. trans. by E. Gifford in 'The Nicene and Post-Nicene Fathers' (New York 1894). For his biography, Delacroix, 'Saint Cyrille de Jérusalem, sa vie et ses œuvres' (Paris 1890), and Mader, 'Der heiligen Cyrilrus' (Einsiedel 1901).

**Cyrilla**

Cyrilla, a genus of shrubs consisting of one variable species, *C. racemiflora*, of the natural order *Cyrillaceae.* The shrubs are found from the Carolinas westward to Texas and southward to Brazil. They are almost evergreen, and have attractive bright green leaves and white flowers in racemes. Popularly they are known as leatherwood and are sometimes seen in ornamental plantings as far north as New York, which is about the limit of their hardiness. They succeed best in moist, sandy soil and partial shade.

**Cyrillic alphabet**

The story of whose invention by Cyril (820-69), apostle to the Slavs, whether true or false, forms an interesting episode in ecclesiastical annals, is still a debatable form of letters as to its precise origin and history. Its reputed inventor was originally a monk called Constantine, who with his brother Methodius led in Thessalonica an ascetic life, when in 859 he was sent to the Chazars, a Tartar tribe on the northern shores of the Black Sea. His work was to counteract Jewish and Mohammedan influences on the people. After a partial success, he returned to Constantinople, living as before with his brother, until sent by the emperor as a missionary among the South Slav tribes, which had been subjected to Roman and Greek propaganda. In his labors among them he founded a Slavic literature by translating into their language portions of the Scriptures and important liturgical books. For this purpose he is said to have invented a new form of alphabet or to have modified the more ancient Glagolitic, which received the name Cyrillic, and was adopted by most of the Eastern Slavs, Bulgarian, Bosnian, Russian, Serbian, etc. It was, however, adapted in various ways in those countries. Succeeding also in Slavic lands outside of the Greek Empire, he and his brother were called to Rome by Nicholas I (858) whose successor approved their work and wished them to organize independent new churches in the Slav provinces. But Constantine, assuming the name of Cyril, preferred to remain in Rome as a simple monk and died a year later. Methodius continued his efforts until his death in 885. In reference to the Cyrillic alphabet, a Bulgarian monk of the next generation in 855 mentions Cyril as author, and gives 38 as the number of its letters which were later increased to 40. His 'Catecheses,' or catechetical lectures, are 23 in number, of which 18 are for the instruction of catechumens in the stage of preparation for baptism, while the remaining five, called the 'Catecheses Mystagogiae,' treat, as their title imports, of the mysteries of the Christian religion. The work, translated into English, is becoming of minor account, while
the Cyrillic has developed into one of the three dominant alphabets of the world, to use Isaac Taylor’s expression. While the phonetic basis of the language is nearer some Bulgarian dialects, German and Latin words were included in Moravia, which appear to have modified the vocabulary. The three alphabets of the Slavonians express their religious dependence: Latin was adopted for those who held Latin services; Cyrillic, the Greek uncial, was used by orthodox Slavs for their liturgy; Glagolitic survives in the Catholic liturgy and in Montenegro, the Roman Church permitting its employment. A modern version of the Cyrillic was made for Russia by Peter the Great. The earliest dated Slavonic writing is a Cyrillic inscription of Tsar Samuel of Bulgaria (966). It is the theory of Brückner that Cyril invented Cyrillic first, but "degraded" it into Glagolitic to conceal its Greek origin from the Latin clergy, as the entire purpose of his mission was hostility to Rome; in orthodox lands such capture was not necessary.

A. S. ISAAES.

CYRILLUS and METHODIUS, apostles of the Slavs. They were brothers and natives of Thessalonica. Cyril was the name adopted as a monk by Constantine, b. 827. For his learning he was named "the philosopher." The Khazars, a Tartar people, having about the year 860 asked the Emperor Michael III to send them Christian missionaries, Cyril was sent and made many converts. The Bulgarians of Thrace and Moesia were evangelized by Methodius, who baptized their king, Bogoris, in 864. The brothers then turned to the countries on the March and Danube. They prepared a Slav translation of the Scriptures and chief liturgical books (which became the foundation of the literature of the Slavs), and by their services in the mother-tongue won the hearts of the people from the Roman missionaries. The two brothers were summoned to Rome to explain their conduct in conducting services in the vernacular, and Cyril died there in 869. Methodius, who in the same year was consecrated bishop of the Moravians, completed the evangelization of the Slavs. Called to Rome in 879 to justify his celebration of the mass in the native tongue, he succeeded in gaining the approval of Pope John VIII, and (according to most probable accounts) died on the March, 6 April 885. Bohemia and Moravia celebrated the millenary festival of their two apostles on 5 July 1883. Both brothers are recognized as saints by the Roman Catholic Church and as holy fathers of the Eastern Orthodox Church on 9 March; in the Greek Church 11 May. The Cyrillic alphabet modified out of the Greek by Cyril, superseded the more ancient Slavonic alphabet over a wide area. The history of Cyril and Methodius is still very obscure. Consult Bondwetsch, N., ‘Cyril and Method’ (Erlangen 1885); Ginzel, ‘Geschichte der Slawenapostel Cyril und Method’ (Vienna 1857); Dümmler and Miklosich, ‘Die Legende vom Heiligen Cyril’ (ib. 1870); Goetz, ‘Geschichte der Slawenapostel Constantin (Cyrillus) und Methodius’ (Gotha 1897); Miklosich, ‘Cyrillus’ (Vienna 1870); Maclear, ‘Conversion of the Slavs’ (London 1879); ‘Acta Sanctorum,’ edited by J. Boland (March, II, pp. 12-25, October, XI, pp. 168-171) contains some original source notes.

CYRUS THE GREAT, king of Persia: b. about 600; d. 529 B.C. The ancient original authorities for the facts of his life are Herodotus and Ctesias, but their accounts are interspersed with many highly colored legends. His lineage we have from a famous cuneiform cylinder prepared under his own authority. It is now in the British Museum. In it Cyrus establishes his royal claim through his father, Cambyses, back to Teispes, the son of Achemenides and founder of the Achemenian dynasty. The ancestral home was Anzan, supposed to be a district of Media. It is also certain, however, that Cyrus was a Persian. According to Herodotus he was the son of Cambyses, a distinguished Persian, and of Mandane, daughter of the Median king Astyages. He founded the Persian monarchy. A short time before his birth the soothsayers at the court of Astyages divined from a dream of his that his future grandson was to de-throne him. Upon this he gave orders that Cyrus should be destroyed immediately after his birth. For this purpose he was exposed to a herdsmen, who, moved with compassion, brought him up, and named him Cyrus. His courage and spirit betrayed his descent to the king. The Magi having succeeded in quieting the uneasiness which the discovery occasioned him, he sent Cyrus to his parents in Persia, with marks of his favor. Whether this legend is true or not, it is certain that the beginning of Cyrus’s career was the conquest of his grandfather about 559 B.C. by Astyages, king of Media and Persia. In 546 he conquered Creusa, the rich and powerful king of Lydia, and in 539 took Babylon, which did not offer much resistance, being torn by internal dissensions. He also subdued Phoenicia and Palestine, to which he caused the Jews to return from the Babylonish captivity. While Asia, from the Hellespont to the Indies, was under his dominion, he engaged in a war against the Massagetae—a people of Scythia, northeast of the Caspian Sea, beyond the Araxes, then ruled by a queen named Tomyris. In the first battle he conquered by stratagem, but in the second was defeated, and was himself slain (529 B.C.). The stories related by Xenophon in the ‘Cyropedia’ (professing to be an account of the life and character of Cyrus), that he received a splendid education at the court of Astyages, inherited his kingdom and ruled like a genuine philosopher, are mere romance. Xenophon’s design being to represent the model of a king. Romance takes to be historical truth, and in this way perhaps to exhibit to his countrymen the advantages of a monarchy. The chief points in which the account of Ctesias differs from that of Herodotus are that Ctesias does not make Cyrus any relation of Astyages, that after the conquest of Media
Cyrus married Amytis, the daughter of Astyages, and honored the latter as a father, and that he met his death in a battle with a nation called the Derbices, who were assisted by the Indians. Ctesias also mentions certain wars of Cyrus, and has been called Prodotus, and gives a somewhat different account of the war with Cresus, king of Lydia. Within a few years Cyrus founded a mighty state, which proves that he must have been possessed of great gifts as a warrior and statesman. His nobility of character and his excellence of government were exemplified in the success and prosperity of his states. He died a natural death. He destroyed no town nor did he put to death captives. He died while he was on a campaign against the Persians in Asia Minor. His memory was cherished as "the father of the people," by the Jews he was considered their liberator, and his greatness as a ruler and legislator was acknowledged by the Greeks. His claim to be styled Cyrus the Great, as history has known him, is amply justified and remains unchallenged. He built a city and palace in his native district, which was called after his tribe Pasargadæ (now Murghab), and here his body was laid to rest. Consult Amiand, 'Cyrus, roi de Perse' (Paris 1887); Duncker, 'History of Antiquity' (English trans., London 1881); Geiger and Kuhn, 'Grundzüge der iranischen Philologie' (Strassburg, 1897); Horn, 'Daniel, Darius the Median, Cyrus the Great' (Pittsburgh 1901); Lessmann, 'Die Kyrosaage in Europa' (Charlottenburg 1906).

CYRUS THE YOUNGER, King of Persia: b. about 424 B.C.; d. 401 B.C. He was the second son of Darius Notus, or Ochus, and a 15th of the line. He was given supreme power over all the provinces of Asia Minor. His ambition early displayed itself; and when, after his father's death (404 B.C.), his elder brother, Artaxerxes Mnemon, ascended the throne, Cyrus formed a conspiracy against him, which was, however, discovered. Cyrus was arrested by his brother and condemned to death, but at the intercession of his mother Parysatis, was released and made governor of Asia Minor. Here Cyrus assembled a numerous army to make war upon Artaxerxes and dethrone him. Being informed of his brother's design, Artaxerxes marched against him with a much larger army. In the plains of Cunaxa, in the province of Babylon, the two armies encountered each other (401 B.C.). In the battle that ensued the troops of Cyrus were at first victorious, but the fruits of the victory were lost through the death of Cyrus himself in the battle. An account of the life of Cyrus is contained in the opening book of Xenophon's 'Anabasis,' which gives a detailed account of the retreat of the Greek auxiliaries of Cyrus from the interior of Persia to the coast of the Black Sea. Another account by Ephorus is preserved in Diodorus. Excerpts from Ctesias by Photius also throw light on the career of Cyrus, as also the life of Artaxerxes by Plutarch. The character of Cyrus is highly praised by Xenophon, and it appears that he was certainly his brother's superior in energy and as a statesman and general. The fate of the empire would probably have been very different had he ascended the throne. See Persia.

CYSTADENOMA. See TUMOR, Intermediate.

CYSTICERCUS, sis-ti-ser'kus, a larval stage of the tapeworm, sometimes found in the human body in the form of small-sized tumors and which may be distributed in a variety of situations. The tumors may range from the size of a pea to that of a hazelnut and may exist singly or may be multiple. They are found chiefly in the subcutaneous layers of the body, frequently in the extremities and are sometimes subcutaneous. Occasionally they involve the brain and other organs, as the liver, kidneys, spleen, etc. Frequently they give rise to no symptoms whatever, but when occurring in an important situation or leading to treatment of the tumor, they should be removed.

CYSTINURIA, a condition in which large amounts of cystin are found in the urine. It is a very rare condition and is usually associated with excessive intestinal putrefaction. Sometimes cystin calculi result because of the excess of this acid in the urine.

CYSTITIS, an inflammation of the urinary bladder, usually resulting in pain and increased desire to urinate, in cloudy or bloody and there is usually an excess of mucus and pus found. The pain is situated over the pubic bone and may extend to the back, and there may be some associated fever with chills, if the inflammation is severe. Cystitis is most frequently due to an infection from without, usually the result of passing an unclean catheter. It may also result from urethritis and is a very common condition in old men in whom the prostate gland is enlarged. It may also result from the presence of a stone in the bladder. Treatment is often difficult, requiring skilled medical attendance; but sitz-baths and hot applications to the abdomen are of service, and abstinence from peppery or alcoholic foods is advisable. See BLADDER, DISEASES OF.

CYSTOIDEA, an order of extinct echinoderms. They are spherical animals, pedunculate or sessile, enclosed by polygonal calcareous plates. They have a mouth above; the arms are rudimentary. Buch first elucidated their structure and affinities in an essay published at Berlin, in 1845, and gave them the name of Cystidea in place of Spharoines, which was their original appellation. Now Cystidea has become Cystoida. They range from the upper Cambrian to the Silurian, being especially prominent in the Balz Limestone.

CYSTOPTERIS, bladder-fern, a genus of delicate flacid polypodaceous ferns. They are found in moist, cool localities. C. fragilis (the brittle fern) is found in this country, as is the very rare C. montana. The brittle fern has a wide range, being found within the Arctic circle to Chile, South Africa and Australasia. They have dot-like spots covered by hood-like indusia. C. bulbifera, which is covered by blublets, is found in the northern Appalachians.

CYSTS, circumscribed tumors containing more or less fluid substance, or occasional gases, cut off from the neighboring tissues by a distinct limiting wall. See TUMORS.

CYTASE, a ferment or enzyme that exerts a kind of digestive action upon the cell-walls of plants, rendering them soluble in water. It
occurs in the hyphae of certain parasitic fungi, and also in the germinating seeds of certain plants in which the reserve food-material is normally stored up in masses of stony hardness. It dissolves cellulose, but has no effect upon lignin, and is destroyed by exposure to a temperature of 150°F. The chemical nature of cytose is not yet established, and it may prove to be a mixture of several enzymes instead of a single substance of definite composition.

Cytherea, si-thēr'ē-ə, a genus of Entomostraca, order Ostracoda, family Cytheridae. The eye is single, the inferior antenne setigerous, but without a tuft or pencil of tiny filaments; three pairs of feet are enclosed within the shell, and no heart is present.

Cytherea, si-thēr'ē-ə (from Cytherea, a name for Venus), a genus of conchiferous mollusks belonging to the family Veneridae. The shell is like that of the genus Venus. There are three cardinal teeth and an anterior one beneath the tunic. The cytheraeas are in all seas; about 176 recent species are known and 200 fossil, the latter ranging from the Oolite down.

Cytsine, si't-sīn (C₆H₁₅N₄O). When the ripe seeds of laburnum are powdered, extracted with acetic acidulated water, the fluid treated successively with lead acetate and tannic acid, and the precipitate, before it becomes resinsous mixed with lead oxide, then dried and exhausted with alcohol, crude cytine is obtained on evaporation, and after proper purification it forms a brilliant crystalline mass. It is very soluble in water and alcohol, but insoluble in ether, benzol and chloroform, has a bitter taste, but no odor. It is a very powerful base, decomposing the salts of ammonia and the metals even in the cold. It combines with the strong acids, but the salts are all deliquescent except the nitrate, which readily in splendid, thick, transparent, colorless, monoclinic prisms. It can be sublimed without decomposition by careful heating in a current of hydrogen. The poisonous properties of laburnum are well known. The toxicological effects are due to this alkaloid, which in doses of from 0.1 to 0.5 of a grain is fatal in a few minutes to ordinary small animals.

Cytisus, si't-sūs, a genus of low shrubs or small trees of the natural order Leguminosae. There are about 40 species, natives mostly of Europe, western Asia and northern Africa. They are characterized by small, deciduous or evergreen trifoliate leaves, yellow, purple or white flowers in terminal or axillary racemes or heads, and few- to many-seeded pods. Several species with long twiggy branches are called broom; others are popularly known as laburnum and others by the genus name. A good many are cultivated for ornament either in shrubberies or in greenhouses, where some, especially C. canariensis, are known as genistae and are very popular about Easter time. In Europe several species are valued as forage plants, but in America they have not met the expectations of experimenters. The laburnum is poisonous. See BROOM; GENISTA; LABURNUM.

CytoDE, sf'tōd, a piece or bit of protoplasm without a nucleus. In this respect it differs from a cell. The monera of Haeckel are cytoles which have not yet reached a cell stage. As yet no definite nucleus has been discovered in the bacteria or the cyanophyceae, so that these seem to be cytoles.

Cytology, the science which deals with the structure, development and functions of the cell; of the multiplication of cells and of the relations of cells to organs and tissues. It is distinguished from histology in that histology deals with tissues, while cytology deals rather with the cells of which tissues are composed. A sharp distinction cannot be made between cytology and morphology, although in general it may be said that cytology is concerned more with individual cells than with organs. Cytology may be called "oil immersion" morphology because microscopes with very high magnifying powers are required for cytological studies. The terms, cytology and morphology, are used very indiscriminately by many botanists and zoologists. During the past 20 years, most botanical studies with such titles as "The Mor-

![Figure 1](attachment:image.png)
Cells without nuclei were reported frequently about 40 years ago, but at present no animal cells without nuclei are known. Numerous cases of non-nucleate cells were reported by the older botanists, but as lenses and methods of preparation have improved, nuclei have been demonstrated only until the only doubtful cases now known to the botanist are the bacteria. The blue-green algae were long thought to have no nuclei, but nuclei have now been demonstrated in several genera and are doubtless present throughout the group.

![Cells Undergoing Nuclear Division](image)

**Fig. 2.** Cells undergoing nuclear division: 1 an early and 2 a later stage in the division of the nucleus in a cell of the root tip of the common onion, 3 and 4, the corresponding stages in epidermal cells of the Salamander. In 2 and 4 the V-shaped chromosomes, which are regarded as the physical basis of heredity, are clearly seen. Highly magnified.

Most cells are too small to be seen without a microscope, cells which are visible to the naked eye being rather exceptional. The egg of a bird consists of a single cell, as do the eggs of all animals and plants. The largest plant cells are the internodal cells of the stonewort, Chara, which reach a length of two inches. The largest egg cell described for any plant is that of Dicotylus, a plant related to the sago palm; this cell reaches a length of about one-fourth of an inch.

The most usual shape of free cells is the spherical, and cells forming a part of a tissue are usually more or less rectangular in form.

When first formed, the cells of the individual animal or plant are very much alike, but as one examines cells farther and farther from the regions where active cell multiplication is taking place, it is seen that the originally similar cells are becoming very unlike. In the higher plants the outer cells become differentiated into protective tissue, the innermost into conductive tissue, others into assimilative tissue and still others become reproductive cells. In higher animals similar differentiations take place, cells which finally become so different, as those which form nerves, muscle, glands and even the teeth, having been practically alike in the beginning. Among the unicellular organisms there is often a remarkable differentiation and division of labor, the single cell performing the functions of locomotion, secretion for locomotion, digestion, assimilation, etc. Such differentiation and the causes which lead to it are among the most important of cytological problems.

It is a remarkable fact that while undergoing nuclear division, the cells of animals and plants strikingly resemble one another, even in the behavior of the most minute constituents of the nucleus and protoplasm. (Fig. 2). This must mean that animals have been derived from plants or that structures of amazing similarity have arisen independently in animals and plants.

**Fertilization.** One of the most important problems of cytology is the problem of fertilization and attendant phenomena. While new individuals, even in the more highly organized plants and animals, may arise occasionally without fertilization (by parthenogenesis, chemical stimulus, vegetable multiplication, etc.), such cases are so rare that fertilization is assumed to occur unless its absence is definitely established. To the cytologist, fertilization consists in the union of definitely organized male and female elements. The cytological details of fertilization are essentially alike in plants and animals. (Fig. 3). Fertilization, both in plants and in animals, is preceded by a reduction in the number of chromosomes, so that the number of chromosomes found in the male nucleus or in the female nucleus is just one-half the number which is found in the body cells of a given plant or animal. Consequently, when the two sexual nuclei fuse during fertilization, the number of chromosomes which characterizes the body cells is restored. The complicated details of the processes by which this reduction in the number of chromosomes is effected are essentially alike in animals and plants. The closing paragraphs of this article show that the chromosome contributions of the two parents are not quite so identical as stated above, and that the differences are effective in determining the sex of the offspring. Those cytologists who have investigated most thoroughly the phenomena of fertilization have come to the conclusion that heredity is referable to a definite cytological basis.

![Fertilization](image)

**Fig. 3.** Fertilization. 1, the egg (oosphere) of a Lily, showing the male and female nuclei about to unite; 2, the egg of a slow-worm, the male and female nuclei about to unite; 3, polar body. (2, after Sorotta.) Highly magnified.

**Cytology** 376

---
A Cytological View of Heredity.—Almost without exception, cytologists believe that chromatin is the physical basis of heredity. The reasons for this belief are, briefly, as follows: The male and female parents are equally potent in transmitting characters to offspring; an equal amount of chromatin and an equal number of chromosomes are contributed by each parent; nothing but chromatin is contributed equally by the two parents. (Fig. 4). There is usually a great difference in size between the male and female germ cells. The sperm cell (spermatozoan) of the ostrich is almost invisible to the naked eye, while the egg is as large as a coconut, and such differences in size are usual both in plants and animals. The egg contains a large amount of protoplasm and various foodstuffs, while the male cell contains very little protoplasm or foodstuffs and in many cases even that little is left outside at the time of fertilization, only the nucleus entering the egg. Hence, protoplasm and foodstuffs do not transmit hereditary characters. While the male nucleus is usually the smaller at the time of its entrance into the egg, it increases in size so that, at the time of fusion, the sex nuclei are alike in size. (See Fig. 3). Investigators of this subject are usually tempted into speculative philosophy. Philosophizing over the facts is commendable, but the wild philosophizing in advance of the facts which has attended this subject has been of little value, except as it has stimulated investigation.

The organization of embryos and mature organisms from eggs is a cytological problem which has not yet been solved. The visible stages in development have been observed and described ad infinitum. Both experimental cytology dealing largely with living material, and anatomical studies of thin sections, stained so as to show the most minute details of structure, are contributing to the solution of the problem, but the fundamental causes underlying the phenomena are still unknown and seem as difficult of solution as the problem of the origin of life. The eggs of the sunflower and the willow, like the eggs of all flowering plants, are too small to be examined with the naked eye, but even when examined with the aid of modern technique and the most powerful microscopes, they present no essential differences in external appearance or internal structure, and yet one always develops into a sunflower, and the other into a willow. Within the fertilized egg are all the potentialities of the adult, even to the color of the flower or the markings on the wings of the butterfly. Some have believed that each part of the adult comes from a certain predetermined part of the fertilized egg. This is called the theory of germinal localization. Others have made experiments to show that this theory is not true. Most botanists and zoologists accept, as a working hypothesis, that chromatin is the physical basis of heredity, an hypothesis which assumes that there is no pre localization in the protoplasm of the egg. The problem of organization is so bound up with that of heredity that much of the literature of the subject will be found in treatises on heredity.

At present, the determination of sex is receiving a great deal of attention from students of both animal and plant cytology. In various animals it has been shown that the chromosome contributions of the two parents are not identical. In the grasshopper, all the eggs have six chromosomes; but, in the male, two of the four sperms developed from each sperm-mother-cell have six chromosomes and the other two have only five. Eggs fertilized by sperms containing six chromosomes produce females, while those fertilized by sperms with only five chromosomes produce males. Similar results have been recorded for other animals. The problem in plants is much more difficult because the separation of the sexes is not so prevalent and because cases are rare in which the four sperms formed from one mother-cell remain together for any length of time. However, some progress is being made and it seems probable that differences in the chromosome contributions of the two parents are responsible for the determination of sex in plants.

If these conclusions are well founded, no amount of feeding or fasting on the part of the female could affect the sex of the offspring in animals; and culture media applied to the female would be equally futile in plants.

It has become increasingly evident that not only spermatogenesis, oogenesis, fertilization and development of the embryo, are cell problems; but also that mutation, Mendelism, genetics and other phases of the great problem of heredity must find their basis in the individual cell. Plant physiologists are also turning more and more to the individual cell as the unit of physiological activity.

Bibliography.—Cytology is too recent a subject to have given rise to many textbooks, most of the literature being in the form of articles in leading botanical and zoological journals. Probably the most important book on the subject is Prof. E. B. Wilson's 'The Cell in Development and Inheritance.' The following headings of chapters in Professor Wilson's treatise indicate quite accurately the subject matter of cytology as presented in the few universities which offer courses in this subject: (1) General sketch of the cell; (2) Cell division; (3) The germ cells; (4) Fertilization of the ovum; (5) Reduction of chromosomes, oogenesis and spermatogenesis; (6) Some problems of cell organization; (7) Some aspects of cell chemistry and cell physiology; (8) Cell division and development; (9) The physiology of the phagosome. This book contains a very complete bibliography. Other books on the subject are Hertwig's 'The Cell' and Häcker's 'Praxis und Theorie der Zellen-und Befruchtungsliehe.' All volumes cited above are by zoologists; no similar books have been written by botanists. A part of the subject is covered
by Professor Strasburger's book on 'Reduktion, Sch mitung, Spindbildung, Centrenom und Gilienbildung im Pilze' (Zellen- und Gewebelerle,)' by the same author, published in 1913 as the second volume of the fourth part of the third section of 'Kultur der Gegenwart,' is the latest authoritative treatise of plant cytology. The chief scientific journals in which the great majority of cytological investigations are published are (Botanical), Annals of Botany, Botanical Gazette, Jahrbücher für wissenschaftliche Botanik, Berichte der Deutschen Botanischen Gesellschaft, Flora, and Annales des Sciences Naturelles Botanique (Zoological), Journal of Morphology, La Cellule, Anatomische Anzeiger, Archives de Biologie, Sitzungsbericht der Gesellschaft für Morphologie und Physiologie München, and Bulletin Acad. Roy. de Belgique.

CHARLES JOSEPH CHERMBELAIN, Professor of Cytology and Morphology, University of Chicago.

CYTOPLASM, the protoplasmic contents of the cell outside of the nucleus. See Cell; Cytology.

CYZICUS, Asia Minor, a peninsula 70 miles southwest of Constantinople. It projects into the Sea of Marmora, and is connected with the mainland by a narrow isthmus, but was once an island and the site of the ancient town of same name, which stood on its south extremity, and of which some remains, including a fine amphitheatre and the foundations of a splendid temple of Hadrian, are still seen. The peninsula, which stretches east to west for 18 miles, with a breadth of about 9 miles, is very beautiful and picturesque. Its mountains, called by the Turks Kafu-Dagh, rise to a height of about 2,500 feet. Consult Hasluck, 'Cyzicus' (Cambridge 1913).

CZACKI, chât'skê, Tadeusz, Count, Polish statesman: b. Poryck, Volhynia, 1765; d. 1813. In early youth he was employed in the Superior Court of Justice at Warsaw and in 1788 he was appointed to the Treasury Commission of the Deputies. He was deeply interested in the economic and educational development of Poland, and to this end traveled throughout the country, inspecting and mapping its river system. On the second partition of Poland his property was confiscated and he fought for a time at Cracow. Paul I restored him his estates and for the rest of Czacki's life he devoted himself to the extension of education among his countrymen. Alexander I looked with favor on his efforts and appointed him inspector of schools in Volhynia, Podolia and Kiev. Of his own resources he gave over 500,000 thalers to the cause of education, and also donated a library of 4,000 manuscripts, 12,000 works in Polish and 80,000 miscellaneous works. He founded the famous gymnasium of Kremenchug, long the intellectual centre of Poland. In 1807 Count Czacki was accused of stirring up political discontent among his countrymen, but he ably defended himself before Alexander I, who appointed him deputy curator of public instruction in Poland. His works, mainly archaeological and historical, were published in three volumes (Posen 1843). His most important work is 'On Lithuanian and Polish Laws' (2 vols., Warsaw 1800; 3d ed., Cracow 1861).

CZAJKOWSKI, chi-cal'ski, Michal, Polish novelist: b. near Berditchew, in the Ukraine, 1808; d. 1886. In 1831 he was obliged to flee to Paris because of his participation in an insurrection against Russia. In 1832 he was arrested, exiled to Siberia, and sent on a secret mission to Turkey in 1840 and he embraced the faith of Islam in 1851. He became commander of a body of troops known as the Cossacks of the Sultan and fought with distinction against the Russians in 1853-54. He returned to Russia in 1873 under a decree of amnesty. An accusation of treason was made against him in 1886 and in consequence he committed suicide. His stories of Cossack life were very popular, and several were reprinted in German, French and English translations.

CZAR, zár, ZAR, or TSAR, tsár, the ordinary title of the emperors of Russia, derived from the Old Slavonic cesar, king or emperor, which, although long held to be derived from the Roman title Cæsar, is almost certainly of Tartar or Mongol origin and is a survival of Asiatic dominion in Russia, as may be judged from the fact that there were czars of Georgia and other khanates, evidence of the non-imperial content of the term. In the beginning of the 10th century the Bulgars under Simeon assumed this title, which remained attached to the Bulgarian crown. In 1346 it was adopted by Stephen Dushan, king of Serbia. Among the Russians the Byzantine emperors were so called, as were also the khanate of the Mongols that ruled in Russia. Ivan III, grand prince of Moscow, held the title, and Ivan IV caused himself to be crowned as czar in 1547. With the conquest of Little Russia and Smolensk the rulers of Russia assumed the title of Czar of All the Russians. In 1721 the Senate and clergy conferred on Peter I, in the name of the nation, the title Emperor of Russia, for which in Russia the Latin word imperator is used. But among the Russians the common designation of the emperor is czar, or, as it is more properly spelled, tsar. See RUSSIA.

CZARNIEKI, or CZARNIEKI, chár-vez'kê, Stefan, Polish general: b. 1599; d. 1665. He fought brilliantly in the war against Charles X of Sweden in 1655-60, and was hailed as the liberator of his country. In 1661 he defeated the Cossacks in the great battles. He was sent on an expedition to the Crimea, seeking an alliance with the Tartars, but died as the result of fatigue and exposure incurred on the journey.

CZARTORYSKI, chär-to-ré'ski, Adam George, Prince, Polish statesman and patriot: b. Warsaw, 14 Jan. 1770; d. Paris, 16 July 1861. He was the son of Prince Adam Casimir Czartoryski, the head of an ancient Polish house. His education was completed at the University of Edinburgh and in London. After the partition of his country in 1795 he was sent as a hostage to Saint Petersburg. There he formed a close friendship with Prince Alexander, who on his elevation to the throne appointed him assistant to the Minister of Foreign Affairs and curator of all the educational establishments in Poland. On 11 April 1805 he signed in name of Russia the Treaty of Alliance with Great Britain. While curator of the University of Vilna he used his influence to keep alive a spirit of nationality among the Poles, and when some of the students were arrested for sedition and sent to Siberia, he resigned his office. On the
outbreak of the Polish revolution of 1830 he showed himself active on behalf of his country, and was chosen president of the provisional government (18 December). On 30 Jan. 1831 he became the head of the national government, and gave up the half of his property to the service of his country. On the appointment of Krówkiewski to the dictatorship Czartoryski resigned his post as president of the Senate. In the last days of the struggle for freedom he served as a common soldier in the corps of General Romarino. Thenceforth he lived at Paris, ceaselessly having in mind his fellow-countrymen. He was excluded from the amnesty of 1831, and his estates in Poland were confiscated. In 1848 he liberated all the serfs on his estates in Galicia, and during the Crimean War endeavored to induce England and France to identify the cause of Poland with that of Turkey. Alexander II offered him an amnesty which he refused. Consult his Mémoires et correspondance avec l'empereur Alexandre Premier (Paris 1887; Eng. trans., London, 1893); Zaleski, 'Life of Adam Czartoryski' (Paris 1881); Gadon, 'Prince Adam Czartoryski' (Cracow 1900). See POLAND.

CZASLAU, châs'law, Bohemia. (1) Town, capital of a circle or district of the same name; located in a fertile plain, 45 miles east-southeast of Prague; and is memorable for the defeat which the Austrians sustained from Frederick the Great in 1742. The church Saint Peter and Saint Paul has the loftiest steeple in Bohemia, and contains the remains of the celebrated Hussite leader, John Ziska. Alcohol, beer, beet sugar and pressed yeast are the principal manufactures. Pop. 9,122; mostly Czechs. (2) The circle or district is well wooded and fertile, yielding excellent crops of corn and flax; and large quantities of minerals, especially iron. Area, 233 square miles. Pop. 61,664.

CZECH LANGUAGE. See BOHEMIAN LANGUAGE.

CZECH LITERATURE. The uncontestable earliest document in the Czech language dates from the year 973 A.D. It was a hymn sung at the installation of Bishop Dietmar at Prague, beginning with the phrase: 'Gospodi postavi, Ego adjungavit.' When Czech literature had its resurrection, about the year 1800, and enthusiastic followers of the ardent movement everywhere searched for hidden records of the past, a number of MSS. turned up that were hailed with more or less plausibility as evidence of the ancient character of Czech letters. Some of these, it is now admitted by overwhelming authority among the Bohemian philologists themselves, were clever literary forgeries. The one MS. that aroused the greatest interest for many years was the so-called Königinton collection of poetry. It was alleged to have been discovered, in 1817, in an ancient deanery church of the small Bohemian town of Králové Dvůr (or Königin- hoř), and contained lyrical fragments, some of them charming, like 'Kytléce' (The Nosegay), which are subsequently translated, purporting to date from a very early age. However spurious this MS. may be, there are still some moot points about it quite unexplained. The authenticity of another of these MSS., the one of Grünberg, and a third one, of Saint Vitus, has likewise been assailed. But some of them, no doubt, are genuine enough, such as a fragment of the Gospel of Saint John; which seems to have been written in the time of the Slavic apostles, Methodius and Cyril, in the 10th century. And it must further be borne in mind that during the 150 years of ruthless-Austrian oppression, about 1620-1774, it was the object of the Court of Vienna to wipe out, if possible, every vestige of separate Bohemian nationality and religious and literary life. The Jesuit, Konig, alone is recorded as having destroyed some 60,000 Czech books. One must therefore feel many of them priceless and unique, in pursuance of this object. However, so far as susceptible proof is concerned, it is known that, aside from early folk songs, legends, etc., not distinctly traceable, poetry of no despicable order had penetrated Bohemia as early as the reigns of Wenceslas I and Ottokar II, about 1250, knighthood and its chivalrous lays drifting in space, though most of it either in German or Latin. But we know of an adaptation in Czech of the 'Alexandrines' of Roland (Paris, 1510); also of similar adaptations or translations in Czech of the Artus cycle, of the 'Tristan' version by Godefrey of Strassburg, and of 'Tandarias a Floriella' (in the 14th century). Next we find the rhymed encyclopaedia, translated to Dalmir, but in reality the production of an unknown Bohemian knight, about 1334; also a Bohemian history in verse, and the tale 'Tkadleček,' written in excellent Czech prose, some time before 1400. Didactic and satirical original ditties in Czech or serious poems also flourished, such as the 'Novák Rada' (New Counsel), very popular in Bohemia (1394) and written by Smil Fláška, of Pardubitz, as also the 'Quarrel between Body and Soul' and some other spirited dialogues, as well as allegorical poems, such as the 'Anticladiančán,' after Alans of Ryssel; also hymns, religious poems, legends, such as that of Saint Catharine, translations of psalms, mystery plays, such as 'Mastíčká,' about 1520. The monks of the Abbey of Šázava were distinguished in this way. Translations of portions of the Sacred Scriptures followed each other rapidly; the Lives of the Saints, mostly translated from the Latin, were collected in the reign of Charles IV, who was not only Emperor, but the Holy Roman Empire, but also bequeathed the Kingdom of Bohemia and a Czech and most enlightened monarch of his time. This collection made at his bidding was called the Passional. The foundation of the University of Prague, in 1348, gave a strong impetus to Bohemian science and letters. One of its first graduates, Thomas of Strýný, wrote his theological disquisitions in Czech, whereas up to then the clerical Czech chroniclers and theologians had written in Latin, such as Kosmas of Prague (d. 1125). The oldest chronicle, 'Czech Chronicle,' is the work of the priest Pulkawa of Radomis (d. 1380). Marco Polo's Travels also were put into Czech at this time, and later those of Mandeville, described by Laurentius of Březová. Andrew of Duba, about 1375, wrote commentaries on the Laws of Bohemia. Then came one of the most important turns in Bohemian history, the advent and final death as a martyr (died at the stake, 6 July 1415, at the Church Council of Constance) of Ján Hus. This reformer was not only endeavoring to cleanse and popularize
the Church of Rome and its teachings, but he, as did Luther for the Germans a century later, likewise did much to make the common vernacular a more vigorous and an apier instrument in diffusing knowledge. The war of religious propaganda; the so-called Hussite War, that followed the death of this great and good man, brought, nevertheless, much turmoil and injury to Bohemia and eventually to the Czech cause. In 1487 the first printing press was put up at Prague, and a full translation, in Czech, of the whole Bible was published there the following year. Before this, however, many cheap hand-written pamphlets in behalf of Hus and the equally inexpensive "Postilles" and the "Net of Faith" of the Moravian brother, Peter Cheliničky, and similar fugitive publications on religious topics had circulated throughout Bohemia. Next we see, toward the end of the Middle Ages, a group of Czech historians and annalists who claim attention. There is Bartos Psák, who is also known as Bartholomew the Scribe, and who recorded faithfully and in detail the shining political events of his day, more particularly the period from 1524-37; so does, slightly later, Sixt of Ottersdorf, of the years 1546-47; and Martin Kühn does the like for the last half of the 16th century. In his Chronik, Chronicles, writes often with reckless disregard of the truth, but in his account of the Thirty Years' War, especially 1618-20, he writes as an eye witness and most interestingly. Prokop Logáč has given, a faithful "History of the House of Rosenberg," toward the end of the 16th century, a graphic survey of the life and manners of the Bohemian nobility and of their political relations with the Council of Vienna. Charles of Zerottin, b. 1504 at Brandis, a Czech nobleman, spent his whole life traveling and seeking adventures, and his correspondence is replete with the political gossip floating about in the countries and courts he visited. His writings are, therefore, most entertaining and many of his historical anecdotes delightful, but rather un-critical. He was in the service of Henry IV of France and died finally an exile from Bohemia. Wenceslas Vratslav, b. 1576, went to the Sultan's court at Constantinople with the Austrian ambassador, and shared his imprisonment there. His accounts of the Turks of those days are very amusing and graphic. Christopher Harant, another Czech noble, was likewise a great traveler, to the Holy Land, the Orient, Hungary, etc., and particularly in the campaigns against the Turks. His writings are interesting and one of the main participants. Paul Skala, b. 1583 at Saaz, belonged to the burgher class. He wrote a "Chronology of the Church," a mere compilation, however. Lastly must be mentioned the voluminous writings of Ján Amos Komenský (or Comenius), during the period both before and during the Thirty Years' War; those were mostly pedagogical or religious in tenor. His most pretentious book is "Labyrinths and Veils" (The Labyrinth of the World), of 1623. And then comes that long and unhappy period in the annals of Czech literature when it, together with the entire literature of Bohemia, came near being entirely obliterated, when it was suppressed and tabooed by the Austrian tyrants in Vienna. Toward the last quarter of the 18th century only do we see traces of a new life springing up. The Emperor Joseph II, an enlightened ruler, permitted the establishment of a Bohemian Society of Sciences. He also established a professorship of the Czech language at the University of Vienna, and later one at the University of Prague. Those were the beginnings of a literary resurrection for the Czech tongue as an idiom more than a mere rustic vehicle of intercourse and of Czech literature to boot. First in this new and amazingly fruitful period must be mentioned Joseph Dobrovský, b. 1753, d. 1829, the man chiefly instrumental in this process. He was a deeply learned philologist, scholar, not only of Bohemian but of all Slavic languages. His main work, a masterly grammar of Czech, he wrote in German, as he did nearly all his books, in his Vokabulārius, a Czech Dictionary, and in his Bohemian Language and its Older Literature, which followed some time after, in 1792, he himself rewrote in Czech, in 1818. And when the regular publication of the Journal of the Museum of the Bohemian Kingdom was proposed, in 1827, he insisted it should appear solely in German. He was also a Jesuit priest and was by no means stirred by enthusiasm in his life work of fashioning the Czech anew for the struggle for existence. On the contrary, he remained thoroughly dispassionate and on the whole disapproved of his countrymen's burning desire to look upon the whole task chiefly from the viewpoint of nationalism. For all that, Dobrovský it was who dug out the Czech language from the quagmire where it had been submerged so long and brought it to vigorous life again. Joseph Jängmann, b. 1773, in his painstaking and wonderfully copious "History of Bohemian Literature," written all in Czech, as Czech now becomes once more the medium of thought for the Czechs, undertook a gigantic task in gathering in the strand left of casual Czech writings during the past, especially the 150 years preceding. His dictionary, containing even many obsolete Czech words that he again included in the vocabulary, is unsurpassed in many respects even to-day. John Kollar, (1793-1852), b. in Moravia, a Slovak village in northern Hungary, was for many years the pastor of the Protestant church in Pest; he advocated the literary unity of all Slav races. Later he held the chair of Slavic archeology at the University of Prague, and he was the author of "A Daughter of Slavé" ("Slavé Deera"), a book of sonnets. Paul J. Safafik (1785-1861) was also of North Hungarian and Slovak origin, professor of Slavic philology at Prague, later librarian at the University that was but politically persecuted by the Austrian government until 1859, two years before his death, and died in complete impenetrability. He wrote "Tatranská Músa s Lirovú Slovanskô," when only 19; also lyrics and a number of translations from the German and the Greek, and a history (in German) of
Slavic language and literature. This last named is a great work, full of original research on Slavic philology, dividing all the Slavs living into two great groups, Slavonic and Finno-Ugrian. In the latter work he wrote in Czech is his 'Slavonic Antiquities' ('Starozinnosty Slovenske'). Francis Palacky (b. 1798, d. 1876) from Hodslavice, Moravia. His monumental labor was his 'History of Bohemia.' This work is a phenomenal and one of the great historical works of the world, and Palacky was busied with it until his death, adding, revising, reshaping. At first he wrote it only in German, but later on also in Czech. It made Palacky recognized among all Czechs as their greatest living man. He became, in 1827, editor of the Journal of the Museum of the Bohemian Kingdom, a periodical still flourishing and which Mortill, an Englishman and Slavologue, terms a 'Mine of Slavic Lore.' For his history he obtained a b. by traveling to the libraries of Dresden, Munich, Vienna, Italy, much original material. From 1861-76 he was the recognized leader of the National Party of Bohemia. He also wrote in (German) 'Die Vorläufer des böhm. Geschichtsschreibers;' 'Zur böhm. Geschichtsschreibung' etc. Wenceslas Hanka (1791-1801), the alleged discoverer of the much-contested MS. of Koniginof, was the author of a collection of poems, 'Czech lyric,' some Slavic philological works and many translations. Ladislav Čelakovsky wrote two volumes of pleasing lyrics 'Echoes of Russian Song' and 'Echoes of Bohemian Song,' full of Slav myths and ancient legends, and one entitled 'Hundred-Leaved Rose.' Charles Ignác Mácha (b. 10 Nov. 1810), died in 1836, in utter misery. He was one of the earliest Bohemian novelists of mark. His poetry was strongly imbued with the Byronic spirit, and Walter Scott formed his style of narrative. His chief work 'Mai' (May), a lyrical epic, and his group of tales, like 'The Gypsies,' survive him. Svatojánek Čech, b. in Ustredek, Bohemia, in 1846, was successively editor and contributor of the periodicals 'Pokrok,' 'Svetožišťe,' 'Slovenska pravda,' 'Ditičná písnička,' 'Arabesky,' etc. Many judges consider him the equal of the best. Thomas G. Masaryk, b. in Göding, Moravia, 1850, is a writer on sociological and political subjects. His writings, however, are nearly all in German; even his most sensational book, 'Selbstmord soziale Massenerscheinung,' was translated in Czech only many years after its first appearance. His other chief works are 'Ueber den Hypnotismus,' 'Ueber das Studium dicht. Werke,' 'Grundzüge einer konkreten Logik.' For many years he filled a chair in the Ces. P. University and was a great political radical leader of the Czech people. At the outbreak of the great European War he fled to foreign parts, and was condemned to death for treason, in contumaciam. In 1918 he undertook a trip for the cause of the Czech people to the United States. Jan Rubeš is the author of 'Ja jsem Čech a kdo je vic' (a Czech patriotic song became a sort of war hymn). Joseph V. Kamaryt (1797-1833) is the author of 'Píseň vesněnčanů;' 'Boleslav;' 'Jablonsky;' '1813-81;' J. Chmelensky and V. Střílč are all poets of deeply nationalistic tendencies. Other contributors of distinction are the following: Bohumír Havlasa (1852-77), author of 'Still Waters;' Aloyš Jirásek, b. 1851, the author of 'At the Court of the Voyerová;' and 'In Foreign Service.' Sophia Podlipská (1831-97), Jan Neruda, 'Tales of Old Prague;' Gustav Pfeiger-Moravsky (1833-95), vivid tales; Jan Holý, a Slovak (1785-1849), author of 'Svatopluk,' an epic of the ancient glorious ruler of Moravia; J. E. Volel (1802-71), 'Sword and Chalice,' a historical novel of the days of Ziska; Jaroslav Kalina (1816-47), a satirist and humorist; Jan P. Koubeck (1805-54); Joseph J. Langer (1806-45), Aloys A. Smilovský (1833-85), dramatic and lyric writings, both of exceptional quality; Joseph G. Stankovský (1844-79), 'King and Bishop;' 'The Patriots of the Booth;' Karel Sabina (1814-77), one of the founders of the romantic novel in Bohemia, with Walter Scott as his model; Prokop Choloušek (1819-64); Adalbert Hlinka (p. 1845); Francis Prášek (1843-78); Jan P. Koubeck, writer of many historical novels. Mrs. Bozena Nemcova deserves a word by herself. Her village tales have often been compared with those of Berthold Auerbach for their charm, but they are far more genuine.' Her master-piece, 'Babička,' (Grandmother), has been translated into many languages. Emil Zibr busied himself with the long-neglected subject of Bohemian folklore, publishing his results in 'Česky Lid' (The Bohemian People), of which he is the editor. His efforts are being admirably seconded by Čelakovský, Susil and Erben. 'Jaroslav Vrchlický' (pen name for Emil Frida), born 1853, is one of the greatest living Bohemian writers. Of his many works, his 'Rok v Jih' (A Year in the South) and his 'Panti k Eldoradó' (Pilgrimages to Eldorado) may be mentioned. He is also fertile as a dramatist. 'Brothers,' and 'Drahomira' (both tragedies founded on events in Bohemian history) deserve especial mention. He has likewise published many translations from the works of foreign, particularly early Italian, poets. His 'Moderni Basnici Angličtů' (Modern English Poets) is a volume of these. J. V. Šladek (b. 1845) has admirably translated Byron in metric form, also Coleridge and some Shakespearean plays. Julius Zeyer and Adolph Heydük are both poets and novelists of some distinction. Jacob Arab (b. 1840) in his 'Romanetta,' a volume of short novels possessing a distinctive flavor of their own, is very original. Eliška Krásnohorská (b. 1847) and Karolina Světla (b. 1830), belong to the best women writers of modern Bohemia. The latter's admirable sketches from life are unsurpassed in realism and depth of feeling. Her novel 'Gold in the Furnace' is certainly very good; and so is her 'Isabella.' Her real name is Johanna Múžák. Jaroslav Vlček is also worth noting among the better novelists. Among Bohemian historians of the day must also be mentioned V. Křizek (1833-81), who has written a synthetic account of the Slav peoples; Constantine Jiríček (b. 1854), 'History of the Bulgarians;' Joseph Perwol (1842-92), 'Mutuality among the Slavs;' Beda Duk (1815-90), author of 'History of Moravia;'
CZECHS

Vincent Brandl (b. 1834), K. V. Zap (1812–72), 'Bohemian-Moravian Chronicle'; M. Kolár, J. Havelačka.

The drama has only begun to flourish in Bohemian literature the past 40 years, and especially since the erection of a National Czech theatre in Prague. Among the first dramatists was Joseph K. Tyl (1808–56), who wrote numerous plays. In one of them occurs the song 'Kde je domov můj?' ('Where is my home?') , now the national air of Bohemia. Wenceslas Klíčera (1792–1859) wrote more than 50 comedies and tragedies and greatly aided the development of a Czech stage, though none of his plays are above the mediocrite. Count Zdenko Kolovrat (1836–92) wrote several clever comedies. Of writers on scientific topics Jan Presl, professor of natural history in Prague, wrote much on this theme. Charles Jaromír Erben (b. 1810; d. 1870) as archivist of Prague devoted his life to editing the works of earlier writers. He edited and published a new edition of the selected works of Jan Hrad; also of Stittý's books on 'General Christian Matters,' the travel books of Harent of Poličí, the Chronicle of Bartos, and of many other minor authors. Joseph Jirůrek (1825–88) in his works deals mainly with Slavic, especially with Czech, literature. Jireček's 'Rákovet' is perhaps the best book on Bohemian literature extant. Of other historians, not mentioned here, Anton Gindely (1828–92), wrote authoritatively on the period of the Thirty Years War, on the reign and court of Rudolf II, and on the Moravian Brothers. Wenceslas Tomek is the author of a monumental work, 'Déjepis Mesta Prahy' (History of Prague), a colossal work, full of erudition, and of glimpses of Bohemian history in general. Joseph Kalousek (b. 1838; d. 1907) in his 'České Stati Pravo,' gives an account of the ancient Bohemian constitution. A. Goll (b. 1846), has written a history of the Moravian Brothers and a monograph on early relations between Bohemia and Prussia. Prof. Karel Tietmänn (b. 1820; d. 1901), and Anton Rezek (b. 1853), wrote exhaustively of Bohemian history since the accession of the Hapsburgs (1526) and ending with the Battle of the White Mountains. In philology Prof. Ignace Gebauer has published the important 'Historical Grammar of the Bohemian Language.' Dr. Vaclav Flajšans has also published a similar work. Very valuable for Bohemian early literature and philology are also the labors of Adolphus Patera, head librarian of the Bohemian Museum in Prague.

WOLF VON SCHERRAND,
Author of 'Austria-Hungary and the Polyglot Empire,' etc.

CZECHS and CZECHO-SLOVAKS, an ethnic group of the great Slavonic family of races. Of the former, about 7,000,000 inhabit Bohemia, Moravia and Austrian Silesia, while about 3,000,000 Slovaks live under Hungarian rule. The approximate total of 10,000,000 Czechs and Czecho-Slovaks must be accepted with some reserve. The last official census, 1910, shows a total of 8,404,000. Prominent Bohemians claim that the official figures are inaccurate and that the total stands nearer to 11,000,000. In 1526 the Czechs by popular choice invited the Hapsburgs to the Bohemian throne under pledges to respect the ancient privileges and liberties. The continual encroachments of successive Hapsburg monarchs upon the constitutional rights enjoyed by Bohemia since the 7th century reduced the country from a province by 1620 and had almost exterminated Czech nationality by persecution and confiscation. Many thousands were driven into exile; German was introduced as the official language and the Czech spirit rigorously suppressed. It was in the country districts and village communities, however, that the national language and aspirations were cultivated, and early in the 19th century a number of Czech writers inspired their countrymen to revive the smoldering embers of national consciousness. The European upheaval in 1848 strengthened the Czech movement; it assumed a political shape with the establishment of a Czech language press which found its first expression in a protest and a revolt against Germany's Central-European imperialism. Czech representatives were summoned to attend the German revolutionary Parliament at Frankfort; they refused, and convoked a Pan-Slav congress at Prague instead, at which Czechs, Poles and Jugo-Slavs formulated plans for unification. The dream came to naught; hopes of union were still further removed by the Ausgleich or Dualist Settlement of 1867, by which the Slovaks were separated from the Czechs and handed over to Hungary. By the same instrument the Czechs were compelled to send representatives to the Parliament in Vienna, which for years they had refused to do. They entered it under protest, still asserting the inalienable rights of the Bohemian Crown. Being in a hopeless minority, they were unable to exert any influence on foreign or domestic policy. The Austrian government never ceased its systematic coercion of the Czech minority, yet their national aspirations grew stronger under repression and broke into flame with the European War. A stringent policy was adopted in Bohemia; during the first 18 months of the war upwards of 1,000 Czech civilians were executed in Bohemia for political offenses. The Czech-Slovak population was covered by the operations of the Imperial secret police. Women, girls and old men were crowded—e.g., F., 'Württembergs d. alten böhm. Geschichtschreiber' (Prague 1889); Pupin, A. N., and Spasovič, V. D., 'Geschichte d. slavischen Literatur' (ib. 1887); Šafářík, P. J., 'Gesch. d. slav. Spr. u. Lit.' (Vienna 1869); Tiefdrümk, K., 'Historic Liter.
French Foreign Legion. In the Austrian Parliament the leader of the Czech nationalists, Herr Suk, declaimed on 30 May 1917 that his party would strive for the union of all the branches of the Czech-Slavs into a democratic state.

Meanwhile, the Slovak movement was energetically supported in the United States, France and England by the propaganda of Prof. Thomas G. Masaryk, its foremost representative and exponent. As organizer and president of the Czech-Slovak National Committee, he lectured in London, Paris and New York, enlisting Allied sympathy on behalf of the oppressed Slavs in the Dual Monarchy. In June 1918 the British government accorded official recognition to the Czechoslovak National Council as the representative of the Czechoslovak nation and its aspirations. Similar recognition had already been extended by France, Russia and Italy. The celebration of Kossovo Day in New York on 17 June 1918 evoked a letter of sympathy from President Wilson, addressed to Dr. Axson, National Secretary of the American Red Cross. During the summer of 1918, large bodies of Czechoslovak troops operating with the Allies in France and Italy; about 14,000 landed in Vladivostok, and proceeded along the Siberian Railway with the Russian White Guards to oppose the Soviet or Bolshevik government. By the end of June 1918 a number of towns on the railway for a distance of over 1,300 miles. Together with the White Guards they established a new Siberian central government at Novo Nikolaevsk, making the four government at the time controlling Siberia. (See Bohemia, Russia, Slavs, War, European). Consult the publications of the Bohemian National Alliance of America, Chicago; the Czech National Alliance in Great Britain, London; Baker M., 'Pictures from Bohemia' (Chicago 1894); Balch E., 'Our Slavic Fellow Citizens' (New York 1910); Czerny, T., 'Bohemia under Hapsburg Misrule' (London 1915); Gayda, V., 'Modern Austria: Its Racial and Social Problems' (London 1915); Monroe, W. S., 'Bohemia and the Czechs' (Boston 1910), and the writings of R. W. Seton-Watson.

CZEGLED, tse'gled, Hungary, large market town, in the county of Pest, part of Kecskemet, on a plain between the Danube and Thess, 46 miles southeast of Budapest. The land in the vicinity is well cultivated and produces large quantities of grain and common red wine. Grain is ground in local mills. It is a large military post for cavalry. Pop. 33,942, mostly Magyars.

ČZERMAK, čer'mak, John Nepomuk, German physician and physician: b. Prague, 17 June 1828; d. Leipzig, 16 Sept. 1873. He studied at Vienna, Breslau and Würzburg and was appointed lecturer on physiology and microscopic anatomy at Prague; and later professor of zoology and comparative anatomy at Prague. The latter post was vacated (1856-58), and at Pest (1858-60). In 1865 he became professor of physiology at Jena and from 1869 till his death filled a similar position at Leipzig. He was the inventor and introducer of the laryngoscope and rhinoscope and one of the Rumanian surgical treatment of diseases of the epiglottis and throat. His work on 'The Laryngoscope' has been translated and published in several languages. His biography was published by Springer in 'Gesammelte Schriften' (2 vols., Leipzig 1879) and 'Populäre physiologische Vorträge' (1869).

ČZERNIGOV, chér'ne-gôf, Russia, a province; area 20,232 square miles, bounded on the north by the province of Mohilef, on the east by Arel and Kuris, south by Poltava and west by Kief and Minsk. The surface, with the exception of a hilly district along the Dnieper, is flat and the soil fertile. The Dnieper flows along its west frontier and the Desna passes through its centre. It has numerous lakes, though none are of great extent. All kinds of grain grow in abundance, but the crops often suffer from hosts of locusts. Hemp, flax, tobacco and the opium poppy grow well and the forests furnish timber and fuel. The chief mineral products are salt petre, porcelain-earth, chalk and a little iron. The interior trade is almost confined to the four principal fairs which are held in Nijni-Novgorod. The chief exports are cattle, corn, brandy, honey, wax and potash. Pop., almost all belonging to the Greek Church, 3,131,500.

ČZERNIGOV, Russia, town, capital of the province of the same name situated on the right bank of the Desna, 80 miles north-northeast of Kiev. It is a place of great antiquity and contains numerous buildings of antiquarian interest. It is the seat of an archbishop and has many churches—one of them, Saint Sophia, supposed to have been founded in the 3rd century. There are three monasteries, a gymnasium and an orphan hospital. Important annual fairs are held here. Pop. about 36,000.

ČZERNIN, chér' nin, Count Ottokar von und zu Chudenitz und Morzin, Austro-Hungarian statesman: b. Dimokar, Bohemia, 27 Aug. 1875. For six years preceding the outbreak of the European War he served as Austro-Hungarian Minister to Rumania. On his appointment to that diplomatic post the Hungarian press raised a chorus of disapproval and Count Tisza, the Premier, even went to Vienna and protested to the Emperor Francis Joseph against the appointment. But Count Czernin was strongly supported by the late heir-apparent, the late Archduke Francis Ferdinand (q.v.), and was duly accredited to Rumania. The reason for his unpopularity in Hungary was that, both as politician and author, he had striven to range the German and Slav elements of the Dual Monarchy as against the Magyars. When Rumania declared war on Austria-Hungary on 27 Aug. 1916, another violent outcry arose in Hungary against Count Czernin for his failure to bring Rumania into the war on the Austro-German side. He had said all during the crisis that Rumania would either maintain a benevolent neutrality or else join the Central powers. It was charged against him that while he was still in Bucharest, Rumanian troops had become of foreign territory (Transylvania) for 24 hours before either Vienna or Berlin knew that Rumania intended war. Already in 1914-15 Count Czernin had held out to Rumanian statesmen a prospect of liberal concessions by Hungary to the Rumanians of Transylvania, for which he was violently denounced by the Hungarian press. Nevertheless, on the removal of Baron Burian
Serbia as a vassal state from the Turks, to take part in a comprehensive scheme of rebellion; but Milosh betrayed him to the pasha of Belgrade, who caused him to be assassinated. A feud between the families of Milosh and George ensued. See Serbia; Early History.

Czerny, Karl, Austrian pianist and composer: b. Vienna, 21 Feb. 1791; d. there, 15 July 1857; son of a teacher of the piano forte, Wenzel Czerny, who was his first instructor. He then studied under Beethoven and Clementi and made rapid progress. At the age of 15 he began giving concerts and lessons and was enthusiastically received in the musical world. He was the author of an immense number of pieces, which, from their brilliancy, were at one time extremely popular. His exercises for the piano forte are still valuable. They include ‘Die Schule der Geläufigkeit’ (Op. 299); ‘Tägliche Studien’ (Op. 337); ‘Die Schule des Virtuosen’ (Op. 365); ‘Die Schule der Fingerfertigkeit’ and many others. Among his pupils were Liszt, Döhler, Thalberg, Jaeckle and Kullak.

Czerny, or Tcherney, a Slavonic prefix sometimes signifying black, and sometimes tributary, appearing in many geographical names, as Czernigov, Czernowitz. It corresponds in the former meaning to Turkish Kara, Czerny George and Karageorge being interchangeable.

Zolgosz, chółgós, Leon, American assassin: b. Detroit, Mich., 1873; d. Auburn, 29 Oct. 1901. He was of Polish-German ancestry; worked at various trades in the United States and became affiliated with anarchists. On 6 Sept. 1901, while President McKinley was holding a public reception at the Pan-American Exposition in Buffalo, N. Y., Zolgosz shot him twice. On 14 September the President died; on 23 September Zolgosz was brought to trial; on the 26th was sentenced to death, and was executed in the prison at Auburn, N. Y. See McKinley, William.

Czuczor, tsoošár, Gergely, Hungarian poet and philologist: b. Andod, 17 Dec. 1800; d. Pest, 9 Sept. 1866. He was a Benedictine monk, and the etymologist of the first collection of his ‘Poetical Works’ (1836) brought him stern animadversion from his superiors. From 1825 to 1835, he was professor in the gymnasium at Raab and Kecskemét. He left the latter to accept a post as second secretary and keeper of the archives of the Hungarian Academy. Under these auspices he began the edition of the great lexicon of the Hungarian language published in six volumes 1861–74, of which four volumes were edited by him. His works are not scientifically accurate, because of his ignorance of comparative philology. He is best remembered for his poems, a later edition of which appeared at Pest in 1858. His two fine hero-ballads, ‘The Battle of Augsburg’ (1824) and ‘The Diet of Arad’ (1828) brought him instant celebrity. In 1848 he published ‘Riadó’, a passionate appeal to Hungarian national sentiment, and was imprisoned for it. Among his prose works are legends and translations of Latin authors and a ‘Life of Washington.’
D

the fourth letter of the English alphabet and the third consonant, is a sonant dental corresponding to the mute dental T. It holds the same place in the alphabets of the Phoenician, Syrian, Chaldee, Hebrew, Samaritan, Greek and Latin, and in those of all the modern European languages, except the Russian and the two or three others which retain the Cyrillic alphabet; in these the symbol of delta is the fifth letter. The most ancient forms of the symbol D in the languages of Phoenicia, Palestine, etc., are anterior with the vertex pointing to the left, for example, ∆, △, and the most ancient Greek form was the same angular figure reversed, \( \gamma \) (changed afterward to \( \Delta \)). In some ancient Greek inscriptions in Hellen itself and in the Greek colonies the angular form of the primitive delta \( (\Delta) \) is rounded to the form D, and this form was adopted by the Latins, who got it from the Greeks which settled in Campania, now the province of Caserta. For the later history of the letter see to ALPHABET. The sound of D is produced by pressing the end of the tongue against the upper gums and then forcing the vocalized breath into the mouth. The point of contact of the tip of the tongue with the gums in articulating the sound of D in English pronunciation is a little higher above the insertion of the teeth than when the D of those speaking other languages is sounded, and the same is to be said of the production of the sound of T. Hence the English sound is alveolar rather than dental. The letter D in very many English words represents an element in the speech of our early language ancestors which became for the Greeks theta \( (\theta, \theta') \), for the Latins \( f \), for the Germans \( f \), for example, Eng. deer, Gr. \( \delta \), Lat. ferus, Ger. tier. More curious is the change of the Greek name Odysseus to the form Ulysses in Latin; and within the Latin language itself the change of oler to odor, and from dactria to lacrima, to arbiter to arbitier. In many words in English d is intercalated or appended for phonetic reasons, for example, Old English thanor becomes thunder, Old English sawe becomes sword, Norman English jomisse becomes jaundice; on the other hand the \( d \) is dropped out of some words, for example, Old English woodbind becomes woodbine; godish, gash; godspel, gospel.

D is the Latin numerical symbol for 500. The ancient Romans represented a thousand by the symbol \( \omega \) (later written \( \omega \)), and they took one-half of that symbol to express half a thousand, 500. The symbol D with a horizontal stroke over it (\( \ddot{D} \)) stood for 5,000. In Roman personal names D stood for the preposition Decimus; thus D. Junius Brutus.

As an initial D is used:
1. In chronology, (1) for Domini, genit. sing. of Latin. Dominus = Lord, as A.D. = Anno Domini = in the year of our Lord. (2) for died.
2. In music, as an abbreviation for Dissonius, Desmus, Desira, etc.
3. In university degrees, etc., for Doctor, as M.D. = Doctor of Medicine; D.C.L. = Doctor of Civil Law; D.D. = Doctor of Divinity; D.Sc. = Doctor of Science, etc.
4. In English titles, for duke.
5. For Latin Deus = God and Divus = Divine.

D as a symbol is used:  
1. In chemistry, didymium.
2. In music, for the second note of the normal scale of C corresponding to the Italian re, or for any symbol or key on a keyboard corresponding to this note. It is also used for the keys having this note for a key note.
3. In biblical criticism, for the Beza manuscript of the Greek New Testament.
4. In commerce, for English penny or pence, as 's. d.' pounds, shillings and pence, being the initial of Latin denarius.

DAAB, dâ'e, Ludvig, Norwegian historian: b. Aremark, near Frederikshald, 7 Dec. 1834; d. Christiania, May 1893. He was for 20 years an active member of the Storting; was several times minister in the various Radical cabinets; and won several gold medals with his historical essays on ancient Norway. His best-known works are 'Norwegian Village Legends' (1870-72); 'Norway's Saints' (1879); and 'The Migrations of the Norsemen to Holland and England' (1880).

DAB, a popular name given to several species of flatfish (Pleuronectide), which are found on European sea-coasts. The species known as dabs are Pleuronectes Cimanda; the long rough dab, Hippoglossoides limbata, and the smearable or lemon sole, Glyptocephalus Microcephalus. See FLATFISH.

DABAIBA (also written Dababye, d'Ahaib, etc.), a region lying south of the Gulf of Darien, of which the boundaries were never exactly defined. Spanish adventurers in the 16th century learned, as a matter of common report, that they might find there, or at least by exploring in that general direction, a temple lined with gold; and in this half-true story told by the Indians of Darien we probably have the earliest form of the Eldorado myth. Balboa, when governor on the Isthmus, organized a Dabaiba expedition which he led in person (1513). One hundred and sixty men in two brigantines proceeded up the Atrato River, but
made little headway against the hostile natives. Governor Pedrarias Davila (June 1515) sent 200 men under Luis Carillo and Balboa on the same errand. Attacked by Indians on the Atrato, one-half of the soldiers were killed, and the survivors took nothing but news of shameful defeat back to the coast. It seemed that “the mysterious dominion so mysteriously defended must hold great treasure, and in the inflamed minds of the Christians the savage pantheon of Dabaiba had risen into a lofty edifice glittering with gold and gems, and situated in a region of so rich and beautiful beyond comparison.” (H. H. Bancroft)

Subsequently an expedition of 160 men under Tabria and Birues, with light brigantines and canoes, tempted fate upon the river. The savages on this occasion enjoyed more than their usual measure of supernatural protection, for “the divinity of the golden temple” sent a flood which uprooted trees, overturned one of the vessels and drowned both leaders. Even Francisco Pizarro, who was of the party, shared the sensation of fear inspired by these events to such a degree that he declined to assume command and continue the quest. Peter Martyr speaks of four attempts to gain the golden temple, one expedition attaining a distance up the river of 80 leagues; but “a wonderful mishap” overthrew and killed people always overcome the armed and armored. Francisco César, captain of infantry, starting from San Sebastian in 1536, with 80 foot-soldiers and 20 horse penetrated a short way into the mountains, returning with treasure valued at 30,000 castellanos. Pedro de Heredia in the same year led 210 mail-clad men into the sierra, but came back empty-handed. César, repeating his experiment, secured treasure amounting to 40,000 ducats. Next, Badillo led 350 men from Cartagena to explore the same region in 1537. The expedition lasted more than a year, and was a complete failure. One-half of the soldiers died; Badillo was ruined and disgraced; César, who accompanied him, lost his life. Such luring by occasional gains, such varied and dire misfortunes seemed the work of enchantment; but a realistic explanation is not far to seek. We know that the territory southeast of the Gulf of Urabá or Darien was subject to a cacique named Babaye; his name is still given to a valley in the department of Antioquia in the department Antioquia; and a spur of the Western Cordillera in Colombia. This mountain range for years was an insuperable barrier preventing the isthmian Spaniards from extending their domain overland toward the south. Accord to their eager search was fruitless, though the temple actually was in existence. The Indian stories described, accurately enough, the splendors of the Inca empire, of Curi-cancha and Cuzco (see those titles). But the adventurous could not realize, and the Indians themselves probably did not know, how far away the famous temple at Cuzco really was. The facts in the case, the accent of truth in the Indians’ accounts, sustained the explorers’ confidence year after year; but confident search in a region far remote from the object sought is naturally baffling. Long before the report of Pizarro’s discoveries in Peru reached the iathamus, a fixed belief had taken possession of the minds of the Spaniards that a kingdom more desirable than any they had dreamed with gold-adorned palaces and the hearth of the continent.

The attributes of elusiveness and mystery had become an indispensable part of the conception; therefore the true accounts of the wonderful Temple of the Sun did not exactly tally with the “glittering phantom” of their imagination. After Quesada (see Colombia), starting from Santa Marta, in the upper valley of the Magdalena River, the region of Colombian uplands which lay beyond Dabaiba, naturally the golden temple was sought still further inland; and thus the headwaters of the Orinoco and the Amazon were discovered. Bancroft and other writers following his prodigal have suggested that an ancient building in the Cenu Valley, near which were found tombs containing gold and gems, may have been the temple of Dabaiba. It is quite impossible, however, to accept this conjecture, for the reason that colonists of San Sebastián came upon the Cenu building at an early date, and, if it had been the real object of their search, they would have been able, with the assistance of the natives, to identify it beyond question. See ELORDO.

MARRION WILCOX.

DABB, or PALM-LIZARD, an agamoid lizard (Uromastix acanthinurus), common in the sandy deserts of northern Africa.

DABCHICK (Podicipes fluviatilis), a bird of the family Podicipedidae and one of the smallest of the grebes, distinguished by the absence of cephalic crests. The total length slightly exceeds nine inches; the back is brownish black; the belly has silvery gray mixed with the dusky color, but is whiter and more silky in winter; the bill bluish in summer, dull yellow in winter. It ranges and breeds throughout tropical and temperate Europe, Asia and Africa. See GREBES.

DABLOM, dâ’blon’, Claude, Jesuit missionary: b. Dieppe, France, February 1618; d. Quebec, 3 May 1697. In 1639 he entered the Society of Jesus and in 1655 was sent to Canada. With Chaumonot he was sent to establish a mission among the Iroquois at Onondaga. He endured great hardships on his journey to and from this mission. In 1661, with Druillettes, he journeyed overland to Hudson Bay to discover an outlet to the China Sea and to establish a mission among the inhabitants of that region. With Allouez and Marquette he was on Lake Superior in 1668 and was the first to inform the world of the rich copper mines of the region. Dablon appointed Marquette to undertake the expedition which resulted in the discovery of the upper Mississippi. In connection with this discovery he drew attention to the feasibility of passing from Lake Erie to Florida by cutting a canal through only half a league of prairie to pass from the end of the Lake of the Illinois (Michigan) to the River of Saint Louis (the Illinois). This project after more than 230 years was revived in 1907. Dablon founded Sault Sainte Marie and in 1670 was appointed general of all the Canadian missions, retaining this position until 1688. He was again appointed in 1686 and remained in office until 1693. His contributions to the Jesuit Relations are of great value for his descriptions of places and peoples and his clear and comprehensive narration of events. Consult Campbell, 'Pioneers and Priests of North America' (New York 1908).
DABNEY — DACE

DABNEY, Charles William, American college president: b. Hampden-Sydney, Va., 19 June 1855. He is a son of R. L. Dabney (q.v.). He was graduated at Hampden-Sydney College in 1873, and at the University of Virginia in 1877; and for two years studied in Berlin and Gottingen. He was professor of chemistry in the University of North Carolina, and State chemist, and later director of the North Carolina Agricultural Experiment Station at Raleigh, and an executive officer of the Cotton Centennial Exposition, New Orleans, 1884-85, and 1893. He was prominent in establishing the North Carolina College of Agricultural and Mechanical Arts, Raleigh; assistant Secretary of Agriculture of the United States, 1893-97; president of the University of Tennessee, 1887-1904; and president of the University of Cincinnati after 1904. He discovered phosphate and tin-ore deposits in North Carolina. He has published, among other works, 'Washington's Interest in Education' (1899); 'History of Agricultural Education' (1899); 'Agriculture and Education' (1899); 'A National University' (1897); 'The Problem in the South' (1903); 'Educational Principles in the South' (1904); 'The Relation of Agriculture to Other Sciences' (1904); 'The Meaning of the Solid South' (1909); 'The South Renationalized by Education' (1911).

DABNEY, Julia Parker, American artist and author: b. Fayal, Azores, about 1850. She was educated at Teneriffe, Canary Islands, and in Boston. She published 'Little Daughter of the Sun' (1905); 'The Meaning of the Solid South' (1909); 'The South Renationalized by Education' (1911).

DABNEY, Richard Heath, American historian: b. Memphis, Tenn., 29 March 1860. He is a son of Virginians Dabney (q.v.). He was graduated at the University of Virginia in 1881, afterward studying and taking the doctor's degree at Heidelberg, 1885. He was professor of history in Indiana University, 1886-89; and assistant professor, 1889-96; associate professor, 1896-97; and professor of history 1897-1899 in the University of Virginia. In 1905 he became dean of the department of graduate studies there. He has published 'The Causes of the French Revolution' (1888); 'John Randolph: A Character Sketch' (1888); and numerous magazine articles and pamphlets.

DABNEY, Robert Lewis, American Presbyterian clergyman: b. Louisa County, Va., 5 March 1820; d. 1898. He was a professor in Union Theological Seminary, Virginia, 1853-83, and from 1883 was professor of philosophy in the University of Texas. During the Civil War he was a major in the Confederate army and in 1862 was Gen. Stonewall Jackson's chief of staff. He published 'Life of General Thomas J. Jackson' (1864); 'Defense of Virginia and the South' (1868); 'Sacred Rhetoric' (1866); 'Sermons' (1879); 'Domestic and Polemical' (1879); and 'Collected Discussions' (1891).

DABNEY, Virginius, American author: b. Elkmont, Va., 15 Feb. 1835. His publication of 'The Story of Don Miff, as Told by his Friend, John Bouche Whacker, a Symphony of Life' (1886), reached its fourth edition in six months. He also published 'Gold That Did not Glitter.'

DABOIA, dë-boi'â, the generic name of a venomous serpent of the East Indies, known also as Russell's viper.

DACA, dák'a, or DHAKA, dhâ-kâ, India, a division of eastern Bengal and Assam, extending from the Gâro Hills to the sea. It is one of the richest divisions in India, and although containing a good deal of jungle and unoccupied land, produces such quantities of rice as to be called the granary of Bengal. The surface is an uninterrupted flat, and is intersected by three great water systems, the Brahmaputra, the Padma and the Meghna. The periodic inundations give rise to an extraordinary fertility. Dacca was at one time celebrated for its hand-woven muslins, which are of singular delicacy and beauty. This branch of industry, however, is now carried on to a very small extent. The fineness of the yarn or thread used in the making of these muslins is not equal to that in some fabrics of European manufacture, but in durability and delicacy the Dacca muslins excel other muslins. The finest or 'royal muslin' used to be worth about $5 a yard. For the most delicate varieties only yarns are used that are one years old. Pop. about 11,000,000.

DACCA, India, city, capital of the district of the same name, and for 80 years, during the 17th century, the capital of Bengal. It is the largest city in eastern Bengal, and is situated on the river called the Boor Ganga (Old Ganges), at the distance of about 130 miles northeast of Calcutta. In this city and vicinity, the celebrated Dacca muslins are manufactured; jute works have been established in recent years and boat building is carried on. It has an extensive manufacture of shell bracelets, much worn by the Hindoo women. The city was formerly much more important (in 1801 having a population of 200,000), and exhibited a degree of splendor to which it has now no pretensions, as the magnificent ruins of bridges, causeways, caravanseries, palaces, gardens, etc., sufficiently prove. Destructive tornadoes visited the city in 1888 and 1902. Dacca is considered one of the healthiest and most pleasant places in Bengal. A teaching and residential university was founded here in 1914. Pop. 168,551.

DACE, a name rather loosely applied to various species of small fresh-water fishes of the minnow family (Cyprinidae), but especially to members of the genus Leuciscus, of which 22 North American species are discriminated; others belong to Rhinichthys, Notropis and Semotilus, those of the latter being also called chubs and roach. <i>Tenis vomer</i>, the horned dace, is one of the best known and largest species, and abounds in the small brooks of the eastern half of the United States. As in many of the other species, the upper surface of the head of the male is ornamented during the breeding season with cutaneous tubercles. Because of their abundance the dace are im-
important as furnishing food for larger fishes, and some of the larger species are much sought by juvenile anglers. The European dace (Leuciscus lewiscus) is common in British rivers, as well as in those of France, Germany and Italy. It prefers deep, clear streams and swims in shoals. See CYPRINIDÆ.

DACH, dāch, Simon, German lyricist: b. Memel, 29 July 1605; d. Königsberg, 15 April 1667. He was professor of poetry, and 1656–57 was rector of the University of Königsberg. His numerous hymns and songs are found in various collections, his hymns especially in the 'Scriptural Arias' of Heinrich Albert. His 'Anne of Taras', a Low-German lay for the wedding of his friend Parson Portius with Anna Neander, became a popular favorite; his 'Praise of Friendship' seems to belong to a better age; and his spiritual songs 'In Thy Control, O Lord,' 'Be Comforted, my Soul,' etc., are hardly surpassed by any compositions of his day.

D'ACHE, Caran, kā-rǎn dāsh. See Pouzé, EMMANUEL.

DACHSHUND, dǎkh’shoot (Ger. dachst, badger; hund, dog), a breed of small German hounds with very long, cylindrical-shaped bodies; short, crooked legs; large heads; long pendant ears; and short, stiff, smooth hair. In color these dogs are black-and-tan, or tan with black ears, the former being the characteristic coloring of the best sort. They were originally used in Germany to hunt badgers, and sometimes even in fox-hunting. Though slow in movement, they are possessors of a keen scent, and great power of endurance, rendering them valuable as hunting-dogs when suitably trained. They are much used by sportsmen on the continent of Europe, but their usefulness is impaired by the difficulty of keeping them under proper command. The dachshund is akin to the old English turnspit, and a similar dog is depicted on the ancient Egyptian monuments.

DACIA, dǎs’i-a, in ancient times, a district of uncertain limits to the north of the Danube, inhabited by the Daci or Gete, afterward a Roman province. It comprised that region now known as Moldavia, Wallachia and portions of Transylvania and Hungary. For a long time the Daci were formidable enemies of the Romans, and during the reign of the Emperor Domitian obtained so great an advantage that the emperor was compelled to accede to a disgraceful peace. To wipe off this stain Trajan, the second emperor after Domitian, in the year 100 A.D. invaded the Dacian territory, and forced the Dacian king, Decelalus, to accept humiliating terms of peace. These he soon broke; and Trajan entering Dacia a second time, again subdued it, and then erected it into a Roman province. The Romans remained masters of this province till the reign of the Emperor Aurelian, when, in 274 A.D., they withdrew from the region to the north of the Danube, and assigned to the Roman colonists of Dacia a territory on the south of the Danube lying between the Black and Lower Muresa, which was hence called Dacia Aureliani. The former Dacia was now successively overrun by the Goths, Huns, Gepide and Avarae. Since that time the history of this country, which then lost the name of Dacia, is to be sought for in that of the provinces of which it formerly consisted.

DACIA, a Hamburg-Amerika liner originally employed in the cotton trade between Galveston and Hamburg. Just before the outbreak of the European War she entered Port Arthur, Tex., and remained in obscurity there until, at the end of the year (1914), the announcement was made that she had been sold to Mr. Breigung, an American citizen of German extraction. It was also stated that the vessel, which was named Margaret, was to carry a cargo of cotton direct to Bremen, sailing under the American flag. The British, French and Russian governments would not admit the transfer of the vessel to American registry on the grounds that such transfer was not valid in accordance with international law. It was further objected that this transfer would, if allowed, serve as a precedent on which might be decided the fortunes of a large number of German liners interned not only in the United States, but in many other neutral countries. On 21 Jan. 1915 the British Ambassador in Washington gave notice that his government was unable to agree to the transfer and that, if the Dacia (or Margaret) should attempt to sail to sea and were captured, she would be brought before a prize court. If, however, the cargo consisted solely of cotton owned by American citizens, the British government would guarantee the purchase of the cargo at the price which would be realized by the shippers if it had arrived at its foreign destination; or, if preferred, the government would undertake to forward the cotton to Rotterdam without further expense to the shippers. The United States Treasury Department decided to insure the cargo, but refused to insure the vessel. Clearance papers were issued on 22 January from Galveston for Rotterdam; after coaling at Norfolk, Va., the ship sailed on 12 Feb. 1915. On 28 February she was arrested in the Channel by a French warship and taken into Brest. On 5 July 1915 the Dacia's cargo was declared a prize, and to be sold at Havre 27 July. The validity of the seizure was confirmed by the prize court on 4 August.

DACIER, dàs’ēr, André, French philologist: b. Castres, Upper Languedoc, 13 April 1651; d. 18 Sept. 1722. He studied at Saumur under Tanneguy Lefèvre, whose daughter Anne was associated in his studies. After the death of Lefèvre, in 1672, he went to Paris, and in 1683 he married the daughter of his former teacher. In 1695 Dacier was elected a member of the Academy of Inscriptions and of the French Academy; of the latter he was afterward perpetual secretary. The care of the cabinet in the Louvre was entrusted to him. Besides editions of 'Pompeius Festus' and the 'Œuvres d'Horace', en langue française, with the 'Nouveaux éclaircissements sur les Œuvres d'Horace' (1681–89), and 'Nouvelle traduction d'Horace' with critical annotations, he prepared translations of 'Marcus Antoninus,' 'Epictetus,' and 'Aristotle's Art of Poetry, with Annotations.' In general, he is erudite and mediocre in his writings.

DACIER, Anne Lefèvre, French classical scholar: b. Saumur, March 1654; d. Paris, 17 Aug. 1720. She was wife of the preceding, and early displayed her learning by an edition of 'Callimachus.' Her learned works were
not interrupted by her marriage, which took place in 1833. In her 'Considérations sur les causes de la corruption du goût' she defended Homer with the acuteness of a profound commentator, and Lamotte replied with a great deal of wit and elegance; on which account it was said Lamotte wrote like an ingenious woman, Madame Dacier like a learned man. In her 'Hymne à Thétis', she showed little mercy to Hardouin, who had written a satirical eulogy of this poet. On this occasion she was said to have uttered more invectives against the reviler of Homer than the poet himself had placed in the mouths of all his heroes. She translated Aurelianus De Oris, Deyys Cretensis, Entropius and Florus for the Delphic Classics. She translated 'Terence' and three pieces of 'Plautus', in the prologue of which she treated of the origin, the cultivation and changes of dramatic poetry with acuteness. Her translation of the 'Plautus' and the 'Clouds' of Aristophanes deserves indulgence as the first translation of the Greek comic poet. Her translation of Anacreon and Sappho, with a defense of the latter, met with success. Equally estimable for her character and her talents was as many admirers by her virtue, constancy and equanimity, as by her works. She was a member of several learned academies.

DACITE, a volcanic rock of the diorite family, of porphyritic or compact texture, having crystals of plagioclase felspar and quartz and biotite in a glassy or finely crystalline-ground mass. The name is derived from the old province of Dacia, now part of Hungary. Dacites grade into andesites by a lessening of the amount of silica, and differ from rhyolites and trachytes in containing plagioclase rather than orthoclase. A typical dacite shows a felspar analysis of the constituent acids and bases in about these proportions: SiO₂ 67.2; Al₂O₃ 17.0; Fe₂O₃ 4.5; FeO 12; CaO 4.5; MgO 1.5; Na₂O 3.7; K₂O 1.6. Dacites are found at Lassen's Peak in the Yellowstone Park; in the Eureka District, Nev., and elsewhere in the western United States. See DIABASE; DIONITE.

DACOITS, bands of robbers in the East, especially in Burma, India, where for years they were the terror of the country until the annexation of Burma by the British in 1886.

DA COSTA, Isaac. See COSTA, ISAAC DA.

DA COSTA, Jacob Mendes, American physician; b. Sant Tomas, W. I., 7 Feb. 1833; d. Villanova, Pa., 11 Sept. 1900. He was descended from an ancient Portuguese family long resident in Saint Thomas, W. I. He received his early education at Dresden and other places in Europe. He was graduated at Jefferson Medical College in 1852. He afterward studied in Paris and Vienna and on his return to America began to practise in Philadelphia. He specialized in clinical medicine and pathology. In 1863 he became lecturer in Jefferson Medical College, in 1872 professor of the theory and practice of medicine there, and in 1891 professor emeritus. His method of teaching and ability as a lecturer attracted general notice, and he became known as one of the greatest clinical teachers of his time. In 1895 he was chosen president of the College of Physicians and Surgeons in Philadelphia. He wrote 'Harvey and His Discovery' (Philadelphia 1879); 'Modern Medicine' (ib. 1872); 'The Physicists of the Last Century' (ib. 1857); 'The Scholar in Medicine' (Boston 1891); 'Medical Diagnosis' (9th ed., Philadelphia and London 1900), his greatest work, which has been translated into several languages, etc.

DACROCYSTIS, dák-ró-sys-tis, an inflammation in the tear-sac. It may result only in the sub-acute swelling of the tear-sac, or it may become purulent, very much inflamed, swollen and painful and finally discharge pus. Prompt evacuation by surgical means is the safest and best treatment.

DACRYDIUM, a genus of tall trees, mostly Australian, of the natural order Taxaceae, nearly related to the genera Podocarpus and Taxodium, important timber and ornamental trees. Several species are of wide utility in ship- and house-building and furniture-making, especially for carved furniture; others yield edible fruits (drupes) and seeds. A kind of beer is made from the young twigs of some species. The most valued species are probably D. kirkii, D. supressum, and D. franklinii, the so-called huon-pine, which is really a yew. They often attain heights of 100 feet and diameters of four feet or more.

DACRYOMA, a disease of the lachrymal duct of the eye, by which the tears are prevented from passing into the nose, and consequently run over the eyelid.

DACTYL, in Greek and Roman verificiation, a foot consisting of one long followed by two short syllables. In the following line, for example,

Titryo | tu patu | laco recu | basa sub | tegmine | fugi,

the first, second, third and fifth feet are dactyls. In modern hexameter verse a dactyl is represented by one accented and two unaccented syllables. The word is derived from the Greek daktulos, a finger, because a finger has one long and two short joints. See VERSIFICATION.

DACTYLIOMANCY (Greek daktulios, a ring, and manteia, divination), the pretended art of divining by means of finger rings.

DACTYLIS, or ORCHARD-GRASS, a monotypic genus of the grass family (Gramineae) native of Europe and Asia. It is naturalized in America, and cultivated as a fodder plant. The flowers are in rounded compound spikelets at the end of a one-sided panicle. The fruit is loosely enveloped in the glume. The common orchard grass (D. glomerata) is often met with in fields and waste places. It is a coarse grass, relished by cattle in its wild state, and especially acceptable in its cultivated state. It grows from New Brunswick south to South Carolina, westward to Kansas and north to Manitoba. It is sometimes called cockfoot-grass. Its tendency to grow in clumps can be overcome by rolling. It yields two good crops a year. See GRASSES.

DACTYLITIS, etymologically, an inflammation of the finger, but generally restricted to an osteomyelitis of the phalanges or metatarsal or metacarpal bones. This may be either tuberculous or syphilitic. In tuberculous form the bone slowly enlarges, the skin becomes reddish, softening takes place, and pus is discharged through a short cavity which leads to dead bone. In its treatment care should be paid to the general condition of the patient. General up-building, by cod-liver oil and other,
DADAYAG, dā-da-yāg’, the name of a Philippine tribe of the Malayan race, who live in the Cagayan mountains in Luzon. The Dadayags are said to have been cannibals. Their speech differs in some respects from that of any other of the 47 tribes of the Malaysians.

DADDY-LONG-LEGS, a name sometimes substituted for the more appropriate term “crane-fly,” to designate the small British dipterous insect of the family Tipulidae, some groups of which are harmless, and dance in the twilight air, while others are injurious to growing crops. They are true flies, though having long legs. In America the name daddy-long-legs is applied only to the harvest-spider, of the family Phalangidae, which is not a fly. The body is very small when compared with the great length of the legs, which contain over 50 joints each. The legs are thought to be organs of sense as well as of locomotion. This harvest-man lives on small insects and is entirely harmless to man.

DADO, dā-do, an architectural term for the middle part of a pedestal, that is to say, the solid rectangular part between the plinth and the cornice; also called the die. In the interior of houses it is applied to a skirting of wood a few feet high round the lower part of the walls, or an imitation of this in wall-paper or painting.

DADUCHUS (Lat.-Gr., dadouchos), literally a torch-bearer, an epithet applied to any ancient divinity or other personage when represented as bearing a torch or flambeau. The Daduchi were those participants in the celebration of the Eleusinia at Athens, who carried the sacred torches.

DÆDALION, dē-dal’-iôn, the son of Lucifer, changed, according to the Greek legend, by Apollo into a falcon, when in grief over the death of his son Philonis, killed by Diana, he leaned against the head of Mount Parnassus.

DÆDALUS, dē-da-lūs or dē-da-lūs, mythical Greek sculptor, the scene of most of whose labors is placed in Crete. According to the common accounts Dædalus lived three generations before the Trojan War, was distinguished for his talents in architecture, sculpture and engraving, and as the inventor of many instruments; for instance, the axe, the saw, the plumb, the auger; also of glue and masts and yards for ships. As a sculptor he wrought mostly in wood, and was the first who made the eyes of his statues open. He built the famous labyrinth and a temple of Artemis Britomartis in Crete; and executed for Pasiphaë the notorious wooden cow. Being imprisoned with his son Icarus, he invented wings for flying. The wings were fastened on with wax, and Icarus fell so high that the heat of the sun melted the wax, and the wings dropped off, leaving him to fall into the sea, whence the Icarian sea is said to have received its name. Dædalus himself reached Sicily, on the southern coast of which a place was called, after him, Dædalum. Philologists suppose that Dædalus is not really a proper name, but the common appellation of all the first architects, metalurgists and sculptors in Grecian antiquity, being derived from or akin to the Greek daidal-lein, “to work with skill.” The mythical Dædalus is sometimes confused with Dædalus of Sicyle. Consult Kühner, ‘Dædalus’ (Leipzig 1886).

DÆDALUS OF SYCION, Greek sculptor who lived about 400 B.C. He is said to have been the pupil, and some authorities say the son, of Patrocles. The trophy or stack of armor erected at Olympia, in remembrance of the victory over the Lacedaemonians by Dædalus, Other works credited to him are ‘Two Boys using the Strigil’; ‘Cowering’ or ‘Crouching Venus’; and a number of portrait statues of victors in the Olympic games.

DÆMONELIX, a scientific name provisionally given to an extraordinary formation apparently fossiliferous, extending over a large area in northeastern Nebraska and eastern Wyoming. The soft sandstone of this region has undergone excessive erosion, leaving fantastic figures, some of them 40 feet high. The fossils of which the term is derived are of various shapes, including gigantic pillars, lower cake-like forms, and columns appearing like fingers and cigars. Those particularly exciting scientific inquiry are spiral and twisted, giving rise to the local name ‘Devil’s Corkscrew.’ These in some cases resemble huge hop-poles with definite vines running up spirally, or screws with exactly cut threads. In other cases the corkscrew is closely imitated, leaving the spiral without the central pole. They penetrate the fossil bone, and are found in the same beds. So far as the tests have gone, the composing material is found to contain cellular, non-vascular, parenchymatous tissue—a fibre distinguishing it from its stony matrix, and not to be referred to animal but rather to plant origin, and pointing to an algae. It has been suggested that they are merely well-preserved rodent burrows. See Barbour, E. H., ‘Nature, Structure and Phylogeny of Demonelix’ (Bulletin of the Geological Society of America, Vol. VII, 1897); Peterson, ‘Investigations of New Rodents and Discussion of the Origin of Demonelix’ (Carnegie Museum Memoirs, Vol. II, Pittsburgh 1905).

DAENDELIS, dá’n’dëlis, Hermann Wilhelm, Dutch general: b. Hattem Gelderland 1752; d. Africa, June 1818. He took part in revolutionary disturbances in Holland in 1787, and in consequence compelled to seek refuge in France. In the campaign of 1793 he rendered important service to Dumouriez, and was elevated to the rank of a general of brigade. In 1806 he took service under the emperor Napoleon, and from 1808 to 1811 he was government-general of the Dutch East Indian possessions, and published ‘Staat der Nederlandsche Oost-Indische Bezittingen’ (1808-11). On the overthrow of Napoleon, the new king of Holland, William I, entrusted Daendels with the task of quelling the Dutch colonies on the coast of Africa, and there he died.

DAËT, dā’ët, Philippines. (1) City of Luzon, in the province of Ambos Camarines, situated between the Dät River and one of its branches. It is a radiating point of several roads, a port of entry. It was the capital of the
Daffodil — Daghestan

Spanish province of Camarines Norte. There are gold mines in the vicinity and the ruins of an old Spanish fort. Pop. about 15,000. (2) A river which enters the sea near the town of the same name (see HAUREK.)

Daffodil (corrupted from the Latin *nupho*adesmus), the English name of those species of *Narcissus* which have a large bell-shaped corona. The common daffodil (*N. pseudo-narcissus*) is a native of England and of nearly all parts of Europe, growing in woods and hedges and often cultivated in gardens, while it is also found in the Alps. In gardens many varieties of it are among the most esteemed of early flowers. See NARCISSUS.

Dafao, John Wesley, Canadian journalist: b. Bangor, Ontario, 8 March 1866. He received his education at Arnprior high and public schools and after serving as a school-teacher, joined the *Montreal Star* in March 1883, and was its Parliamentary correspondent at Ottawa.

In December 1885 he resigned from the *Star* and accepted the editorship of the newly-founded *Edmonton Journal* of Ottawa. In May 1886 he went west and was on the editorial staff of the *Manitoba Free Press* up to March 1892, when he was called to Montreal to accept the chief editorship of the *Daily Herald*, the leading English Liberal organ in the province of Quebec. He remained with the *Herald* until August 1895, when he became a member of the staff of the *Star* and was for six years editor of its weekly edition. Since 1901 he has been editor-in-chief of the *Manitoba Free Press*. He has published *Fortunes of a Manitoban* (1891); *Western Canada* (1907); *The Imperial Press Conference* (1909).

Dagami, dâ-gâ'mê, Philippines, town in the province of Leyte, on the Mayra River, 16 miles south-southwest of Tacloban. Pop. 25,000.

Dâge, dâ'ge, Eduard, German historical painter: b. Berlin, 10 April 1805; d. there, 6 June 1883. He was the first, in Germany, to translate Rembrandt and Rubens to Berlin, at the Berlin Academy. After the Berlin Academy, he was professor at the University of Berlin, 1839-1850. He was a member of the Academy of Berlin, and in 1870 he was elected a member of the Royal Society of Sciences at Berlin. His *The Old Sa-rastani* and *The Discovery of Painting* hang in the National Gallery at Berlin. Among his other works are many altar-pieces for churches: the *Parce* and *Woman and Child* in the Raczyński Gallery in Berlin; *Initiation of a Nun*; *Shelter at the Altar*; *Charitable Monk*; *Roman Woman and Child.*

Daggery-Moth, a common name given to both *Acoronyctella* and *Apatelea*, genera of nocturnal moths, which feed upon the leaves of orchard trees and small fruits. *Acoronyctella* has fore wings with dagger-like black marks. *Apatelea* has gray fore wings margined with black. The caterpillars of the former are covered with a protective wax, the caterpillars of the latter are of a velvety black color and is beautiful. It forms its cocoon by wrapping itself in leaves bound with a silken thread.

Daggers, short-bladed weapons for stabbing. There are still extant flint daggers not less than 5,000 years old. Homer makes mention of the dagger. Primitive nations use daggers made of wood, bone, antelors' sharp horns, etc. The *cudellus*, or *cousel*, of the 11th century was used by Saxon and Norman foot soldiers for piercing the links of the *bambrek* (see HAUREK.) in the crossbow shot; the *misericorde* ("Dagger of Mercy"), used by the knights in dealing the "coup de grace," had a triangular blade and hung by a chain from the knight's right breast. It bore a very short sword in the plate armor period (see PLATE ARMOR), with a thin, sharp blade that could penetrate between the junctures of the armor parts. In the reign of Richard II of England (14th century) everybody wore a dagger, even the ladies carried a *baselard* attached to the girdle. The long Continental poinard followed. A dagger that was called *anelace* was worn by civilians in the 14th and 15th centuries; the brasses of that period display it. The left-handed dagger (*main gauche*) was in use in the 16th century; it was to ward off the opponent's sword thrusts while the right hand was offensively wielding the sword. The "knight" dagger, with its heavy blade and long handle, had a guard consisting of two round lobes, whence the name "knight." It was used from the 14th century till the reign of Charles I in England. The *dague à rouelle*, with its disc-shaped guard, belongs to the 15th century. The "eared" dagger (of Oriental origin) had two ear-shaped flat lobes serving as pommel. To the 15th century also belongs the "extangue" dagger, having a short blade and wide groove and flat hilt. It developed, in Italy, into the *cinquefoil* dagger, so called from its "five-fingered" breadth of blade at the hilt end.

The more modern Italian *stiletto* has a slender, short, but thick, tapering blade. But daggers have been used less and less in more recent times and remain now in warfare, but with the maritime flotilla (midshipsmen) carried as a side-arm (dirk). The dirk is still carried in the stocking of the Scotsman as a show feature of former days. See also JAPANESE AND ORIENTAL ARM AND ARMOUR.

Bibliography.—Age has been remarkable for his genre pictures of small size. His chief works are found in the churches of Rostock and Sigmaringen, and in the chapel of the Château at Berlin. His *The Old Sarastani* and *The Discovery of Painting* hang in the National Gallery at Berlin. Among his other works are many altar-pieces for churches: the *Parce* and *Woman and Child* in the Raczyński Gallery in Berlin; *Initiation of a Nun*; *Shelter at the Altar*; *Charitable Monk*; *Roman Woman and Child.*

Daggett, Mary Stewart, American writer: b. Morristown, Ohio, 30 May 1856. She was graduated at Steubenville Seminary 1873. In 1888 she removed to California. Columbia Hill, Pasadena, San Gabriel Valley, has been her home for 25 years. She has written widely. Some of her works have been called "artistic novels." She has given much of her time to writing and her environment influences much of her writing. Mrs. Daggett has published the following novels: *Mariposilla* (1895); *The Broad Aisle* (1899); *The Higher Court* (1912); *The Yellow Angel* (1914) also short stories.

DageStan, da-gä's-tan', Russia, province in the Caucasus, stretching from the Black sea to the west side of the Caspian Sea; area, 11,471 square miles. It is very largely in the region of the Caucasus Mountains, some of the peaks rising to 14,000 feet, and its climate is in the main rigorous. Its fertile and cultivated valleys produce good crops of grain, silk, cotton, flax and
tobacco. It was a province of Persia until 1812. Pop. 689,300 (mainly Lesghians, and Mohammedan in faith).

**DAGNAN-BOUVERET,** dansk-yan boov-ray, Pascal Adolphe Jean, French painter: b. Paris, July 7, 1852. He was a pupil of Gérome, and recipient in 1874 of the second Grand Prize of Rome. He soon broke with the style of Gérome and showed the influence of Bastien-Lepage. His picture his the death of Manon Lescaut, which took the medal of the third class at the Salon of 1878, showed him to be in possession of an original and particularly individual style of painting. A Wedding Party at the Photographer's, exhibited in the Salon of 1879, was much admired for composition and technique. But this style was too close to caricature and was soon abandoned. In the Salon of 1880 he displayed a much more serious talent. His picture, 'An Incident,' which took the medal of the first class that year, remains one of his masterpieces, being greatly admired for the truth of its types and expressions. These early works ranked him among the most keen painters of our modern masters, 'The Blessing of a Young Couple before Marriage' (1882) bore the stamp of extraordinary poetical feeling which his later paintings—illustrating, for the most part, the life, customs and costumes of Brittany—have served to accentuate. In his 'Hamlet and the Grave Diggers' the artist is himself represented as the moody Danish prince. Among his best-known works are 'The Consecrated Bread,' in the Luxembourg; 'The Virgin'; 'The Bretons at the Pardon' (1886); 'The Breton Peasant' (1888); 'The Cemetery of Seby Kerib'; 'The Conscripts'; 'The Lord's Supper' (1890), a very great work; 'The Horses at the Watering Trough'; two portraits of de la Rochegaille and Gustave Courtois; 'Spanish Dancer' (1909); 'Marguerite au Sabat' (1912). Very much for individuality, he resembles the great masters in the touching simplicity of his feeling, and the idealism which is evolved from and illuminates his strong realism. See Strahan, 'History of French Painting' (1899); Van Dyke, 'Modern French Painting' (1896).

**DAGO,** dag, or DAGDEN, Russia, an island included in the government of Estonia. It is situated to the southwest of the entrance of the Gulf of Finland, and has productive fisheries. The soil is mostly poor, and the coast rocky. The inhabitants include many Swedes. The country belonged to Denmark, but was acquired by Sweden in 1645 and annexed to Russia in 1721. Pop. about 16,000.

**DAGOBA,** in Buddhist countries and those which at one time held the Buddhist faith, a massive temple building containing relics. The word is said to be derived from dā, dāw, or dāw, a relic, and geba or garba, the womb. They are built of brick or stone, are circular in form, and are erected on natural or artificial mounds, while the stone or brick structure itself sometimes rises to an immense height. The contents of a dagoba usually consist of stone or metallic vessels of various shapes and sizes. One of the articles is usually a silver casket, with a gold casket, often highly wrought with chased work on the surface and set with precious stones, and this second casket is either enclosed in the first or lying beside it with the rest of the objects. Some of the smaller articles, such as pearls, gold, buttons, rings, beads, etc., are sometimes contained in these caskets, which are in some cases scratched on the surface with a peculiar character. These dagobas are held in the highest veneration by the Buddhists, and a common method of veneration is to walk around them, repeating prayers. Some remarkable dagobas are to be seen at Anuradhapura, in Ceylon.

**DAGOBERT I,** da-gob'ert or da-go-bär, king of the Franks: b. about 600; d. Epinay 638. In 628 he succeeded his father, Clothaire II, who had acquired the divided members of the Frankish Empire. He waged war with success against the Slavonians, Gassons and Bretons; but stained the splendor of his victories by cruelty, violence and licentiousness. He deserves praise for his improvement of the laws of the Franks. He was buried in Saint Denis, which he had founded.

**DAGON,** a deity of the Philistines, whose image is generally believed to have been in the form of a triton or merman, with the upper part human and the extremities, from the waist downward, in the shape of the tail of a fish. From this latter supposition the name is derived from the Hebrew dāg, a fish. Dagon and his temple are mentioned in Scripture more especially in 1 Sam. v. 4. Another derivation takes the origin of the word from a Semitic root dāgan, meaning grain, and thus makes the god a patron of agriculture. The same name is used of a god of Babylon at Gazo and Ashdod and he was probably worshipped at other places than Phoenicia, as the testimony of place names and names of several kings indicate. Milton alludes to him in describing the infernal senate in 'Paradise Lost.'

**DAGUERRE,** da-gar, Louis Jacque Mandé, French inventor: b. Cormeilles, Seine-et-Oise, 18 Nov., 1819; d. Petit-Brie, near Paris, 10 July, 1851. He was at first a scene-painter at Paris, and while engaged in painting panoramic views, he discovered a method of representing moonlight, day and night, changes of season and so on, by the aid of illumination of a large transparent canvas painted on both sides. (See Diorama.) The pictures were first exhibited in Paris in 1822. On 19 Aug., 1839 his successful completion of photographic printing was announced to the Academy by Arago. As early as 1814 Nicéphore Niepce had directed his attention to photography, and in 1827 he had delivered pictures on metal to the Royal Society. In 1826 he had been joined by Daguerre, and on 14 Dec. 1829 a formal agreement was made between them. Niepce died 5 July, 1833, and had apparently before his death given up the hope of succeeding with a plate sensitized by iodine. Daguerre, however, persevered, and at length produced the method which has been since called daguerreotype. In 1839 the discovery was published and Daguerre received a pension of 6000 francs and the decoration of the Legion of Honor. He published several works describing his inventions. See Daguerrotype Process.

**DAGUERREOTYPE PROCESS.** This is one of the earliest methods known for fixing the image afforded by the camera,
and thus producing permanent pictures, or "photographs." As practised by Daguerre (q.v.), the process consisted in securing on the plate to the action of iodine vapor until a sufficient coating of iodide of silver was produced upon it, the image in the camera being then exposed upon it for a time varying from three minutes to an hour or more, according to the nature of the subject and the intensity of the light. The plate was then submitted to the action of the vapor of mercury, which condensed most upon the parts where the light had acted most, and in this way greatly increased the distinctness of the image. The plate, after development by mercury vapor in this way, was immersed in a solution of hypo-sulphite of soda, which dissolved those parts of the iodide that had not been affected by light, and thus rendered the picture permanent. Daguerre made the details of his process public in 1839, and for this he was awarded a pension by the French government. Important improvements in the method were soon made. In December 1839, before the first French photograph by the iodine process had been received in the United States, Dr. Paul Beck Goddard of Philadelphia discovered that iodine could be advantageously replaced by bromine, an element discovered by Balard 13 years before. By the use of bromine, the sensitivity of the plate was increased so greatly that Dr. Goddard obtained some practically instantaneous views. Early in 1840 Robert Cornelius, of Philadelphia, fitted up a room exclusively for portraiture, and this was the first photographic studio in the world. The expensive silver plates were afterward replaced by plates of copper that had been heavily electrified with silver, and a method of toning the pictures by the use of chloride of gold was also devised. Daguerre was associated in his experimental work with Niepce, who had previously discovered the bitumen process (q.v.) of taking photographs; and many authorities maintain that Daguerre took unfair advantage of his partner, and published, as his own, processes for which Niepce should have had equal credit. However this may be, it is certain that Niepce died in 1833, some years before Daguerre produced any pictures by the method that now bears his name; and it would appear that Daguerre is at least entitled to the sole credit for the discovery of mercury as a developing agent. The way in which this discovery came about is of deep interest, and was cited by Professor Liebig as one of the finest examples of the inductive method of reasoning. Daguerre had discovered that iodide of silver is affected by light, and he had repeatedly iodized silver plates and exposed them in his camera, with the result that feeble images were obtained. He was filled with hope that some way might be found to intensify these images, but he worked for years without success, and Niepce died with a feeling of regret that they had wasted so much time upon a method that was apparently incapable of yielding the results that they sought. On one occasion, after the death of Niepce, Daguerre removed one of his old plates from the closet in which it had been stored, and was about to repolish it and use it over again in a new experiment, when he observed that the view to which it had been previously exposed, and which showed but faintly when he had put the plate away, was now strong and clear. Without disturbing anything in the closet, he prepared a new plate, sensitized and exposed it as before, and placed the two plates in the after plate, each at a similar time. The same intensification of the image was observed. He concluded that the developing agent that he had sought so indefatigably was present in his closet, but he had no idea what it could be. To identify it, he prepared and exposed in the after plate, each time leaving the plate where the first one had stood, but each time removing one article from the closet. The pictures still developed, even when the last thing had been apparently removed. He found, however, that some mercury had been spilled in the closet, and being driven to the conclusion that this was the mysterious agent sought, he tried it, and his mercury development process was the result.

DAGUN, a god worshipped in Pegu, Burma. According to Hindu mythology, when Klikaikal destroyed the world, Dagun reconstructed it. The similarity of name to Dagun, the national god of the Philistines mentioned in 16 Judges v, 23 is obvious.

DAGUPÁN, dâ-goo-pán', Philippine, a town in the province of Pangasinan, Luzon, situated on the Lingayen River where it enters the gulf of the same name. 30 miles northwest of Manila, on the Manila and Dagupán Railroad. It is an important road centre, and has a large trade. It was one of the strongholds of the Filipino insurgents and the point where most of the filibustering expeditions landed. Soon after hostilities between the United States and the insurgents opened, the American military authorities were unanimous in the opinion that Dagupán should be made a base of operations, but sufficient troops were lacking till November 1899, when an expedition left Manila for this place under command of General Wheaton. A landing from the transports, supported by a number of naval vessels, was made at Lingayen, a suburb of Dagupán, which has a sheltered harbor and had hastily constructed earthworks. The works were shelled, but there was no response from shore. As the American troops were being landed in steam launches a long line of insurgents suddenly appeared among the sand dunes and fired on the troops. The Americans returned the fire, completed their landing and drove the insurgents out of Dagupán, and then started on a march to the east and south in the expectation of surrounding Aguinaldo at Tarlac, where he had established his headquarters. Pop. 20,357.

DAHABIEH, dâ-hä-bâ'ë', an Egyptian barge-like boat, the forerunner of the European and American house-boat, used on the Nile for conveyance of travelers. It varies considerably in size, has one or two masts, with a very long slanting yard on each mast supporting a triangular or lateen sail, and affords good accommodation for passengers. Seats on the fore and aft decks are used by rowers when needed. Wealthy travelers often hire one of these vessels for a trip up and down the river, the voyage to the First Cataract and back, under the most favorable conditions in seven weeks, and three weeks more if prolonged to the Second Cataract. Their use, however, has largely superseded by pleasure steamers.
DAHL—DAHLIA

DAHL, Johann Christian Clausen, Norwegian landscape painter. b. Bergen, Norway, 24 Feb. 1778; d. Dresden, 14 Oct. 1857. His talent displayed itself early and he studied at the Academy of Copenhagen 1811-18. He then went to Dresden, where from 1821 onward he was professor of painting in the Art Academy. Among his works are: 'Marine Landscape,' 'Winter Landscape,' and 'Kronberg by Moonlight.' (in Schiefer Castle near Gotha). He was a prolific painter and his works are found in many European galleries. Consult Aubert, 'Maleren Professor Dahl' (1892-94).

DAHLAK, dâ-lâk, a group of three islands with many smaller rocks, in the Red Sea, off the coast of Massowah. They are famous since Roman times for their pearl-fisheries. They carry on a trade with the Arabian coast. They are a dependency of Italy. The main island is Dahlak-el-Kehir, 32 miles long and 18 wide. The entire area of the group is about 450 square miles. The population is made up of Nubians and Arabs who number about 1,500.

DAHLGREN, Fredrik August, Swedish poet and dramatist. b. Nordmark, 20 Aug. 1816; d. 1895. He wrote many dialect songs and ballads, collections of which were published in three volumes (1876). These have attained an extraordinary degree of popularity. Of his dramas many have been very successful; his 'Vermöandigare,' a musical drama (1846), had more than 100 consecutive representations. He translated a great many dramas from foreign languages, and wrote a history of the Swedish stage.

DAHLGREN, John Adolf, American naval commander. b. Philadelphia, Pa., 13 Nov. 1809; d. Washington, D. C., 12 July 1870. In 1826 he entered the navy of the United States as a midshipman, in 1837 was advanced to the rank of lieutenant, and in 1855 to that of commander. From the year 1847 he was employed on ordnance duty, and invented the cannon which is now called after him Dahlgren guns, besides contriving a more effective method of arming gunboats with 12- to 24-pounder howitzers, throwing canister-shot and shrapnel-shells. At the outbreak of the Civil War he was commander of the naval station at Washington; in July 1862 he undertook the supreme command of the South Atlantic squadron; and after the death of Admiral Foote in 1863 was appointed rear-admiral of the fleet stationed before Charleston. He led a successful expedition up the Saint John's River in 1864, assisted Sherman in the capture of Savannah and in 1866 was given command of the South Pacific squadron. He served as chief of the ordnance bureau 1868-70 and just before his death was placed in charge of the navy yard at Washington. He is the author of 'Thirty-Two Pound Practice for Ranges' (1850); 'Systems of Boat Armament in the United States Navy' (1852); 'Naval Percussion Locks and Primers' (1852); 'Ordnance Memoranda' (1853); and 'Shells and Shell Producers' (1850); 'Notes on Maritime and International Law' (1877). Consult Mrs. Dahlgren, 'Memoir of John A. Dahlgren' (1882).

DAHLGREN, Karl Fredrik, Swedish poet and humorist. b. Stens-Bruck, East Gothland, 20 June 1791; d. Stockholm, 2 May 1844. He excelled in descriptions of nature and in the idyllic burlesque. Many of his songs and ballads have a permanent place in the treasury of Swedish popular songs. For years he published a 'Muses Almanac,' containing his stories and comic sketches. His novel 'Nahum Fredrik Bergström's Krönica' (1831) is a work of distinguished merit. At sea? (1822); 'Winter Landscape' and 'Kronberg by Moonlight' (in Schiefer Castle near Gotha). He was a prolific painter and his works are found in many European galleries. Consult Aubert, 'Maleren Professor Dahl' (1892-94).

DAHLGREN GUN (named from Rear-Admiral John A. Dahlgren), a gun in which the front portion is materially lightened and the metal transferred to the rear, giving the 'bottle-shape,' which caused some surprise on its first appearance in Europe. They were in use in the Civil War, but are now obsolete.

DAHLIA, a genus of perennial herbs of the family Asteraceae, closely related to the genera Bidens, Coreopsis and Cosmos (q.v.), which are distinguished by technical characters. Indeed, Cosmos diversifolius, or black cosmos, is well known to American gardeners as 'Black and Dahlia.' The true dahlia, formerly confused as to nomenclature, only about 10 well-authenticated species being recognized out of a large number of synonyms. With few exceptions (Central American species) they are natives of Mexico. Six species are cultivated, but only two of these (D. rosea and D. juaeretli) are of wide horticultural importance. The former has given rise to several thousand horticultural varieties since 1814, when well-marked double varieties first appeared; the latter, which was introduced about 1879, has produced a considerable number popularly known as cactus dahlias. There are also many single varieties. Considering the short time the dahlias have been in cultivation (since 1879) they have attained a very high rank as a garden plant, being numbered among a dozen plants to have special societies and exhibitions, both in Europe and America. Besides the cactus forms, which are less formal than the earlier double varieties, there are many forms and shades varying in color from white to yellow and deep red, but deficient in the shades of blue. The plants may be propagated by seeds for obtaining new varieties, by division of the underground parts, or
DAHLIN—DAHOMEY 398

commercially by cuttings. They succeed well in almost any good soil, the tubers or the young plants being set in beds as soon as danger from frost is past. When frost has killed the tops in the autumn the plants are dug and the tubers stored in a cool, dry cellar until spring, or until they are needed for obtaining cuttings, when they are placed on greenhouse benches and forced. Few pests attack the plants. Consult Peacock, 'The Dahlia,' and other literature mentioned in article "Dahlia" by Bailey in 'Cyclopedia of American Horticulture.' See also 'The Dahlia, a Talk About,' Cornell University Experiment Station Bulletin 128.

DAHLIN, dā'lin, a white substance, also called inulin, obtained from the pounded tubers of the dahlia. The juice is pressed from the tubers, clarified by standing, mixed with an equal bulk of strong alcohol, filtered, and then with two other volumes of alcohol. Inulin precipitates, and is washed and dried. It is a white starchy powder, with distinct crystalline character; it has no taste or smell, is hygroscopic, but sparingly soluble in water, until it passes into an amorphous modification. The tubers are pounded and distilled with water yield a strongly smelling, sweetish ethereal oil, which is heavier than water, but becomes butyric and semicrystalline in it. The tubers also contain a fixed oil and salts of organic acids. The coloring matter of the purple dahlia is very sensitive to acids, which turn it red, and to alkalies, which turn it green. When extracted by water or alcohol, and paper steeped in it, it forms Georgina paper, and is used as a chemical test instead of red and blue litmus paper.

DAHLMANN, dāl'man, Friedrich Christian, German historian; b. Wismar, 13 May 1785; d. Bonn, Prussia, 5 Dec. 1860. He studied at Copenhagen and Halle; in 1812 was appointed professor extraordinary of history at Kiel, and in 1829 accepted a call to fill the chair of political science in the University of Göttingen. There he continued his historical studies, but did not on that account altogether abandon the domain of politics. He contributed in great measure to the establishment of the constitution of Hanover in 1833, and was a vigorous advocate of liberal principles. In 1842 he was appointed to the chair of history in the University of Bonn, where he gave himself up entirely to literary pursuits. The revolution of 1848 recalled him to public life. He was sent as a deputy to the Diet of the confederation, had a share in elaborating the constitution called that of the 'Seven-teen,' and became one of the chiefs of the constitutional or parliamentary party. He was afterward a member of the Prussian Chamber of Deputies, in which he set himself to withstand the reactionary movement which followed the troubled period of 1848-49; but finally renounced politics entirely, and devoted the remainder of his life to literature. He left a large number of works, all characterized by great depth, an accurate understanding of the events relating to them, and an independent judgment. Among these are his 'Quellenkunde der deutschen Geschichte' (1830); 'Geschichte Dänemark' (1840-43); 'Geschichte der englischen Revolution' (1844); and 'Geschichte der französischen Revolution' (1845). Consult Nasse, 'F. C. Dahlmann, (Kiel 1889, Springer); 'F. C. Dahlmann' (Leipzig 1870-72).

DAHLONEGA, dā-lōn'gŏ-ga, Ga., county-seat of Lumpkin County, about 20 miles north by west of Gainesville, on one of the branches of the Chattahoochee River, among the foothills south of the Blue Ridge Mountains. It is the seat of the North Georgia Agricultural College, a department of the Atlanta State University. The town is the centre of the richest gold mining region east of the Mississippi River. The town was first settled in 1831 by gold miners. It was incorporated in the following year and is governed by a mayor, five aldermen. The principal industries are those connected with the mining and refining of gold. Until the Civil War a United States branch mint was situated here. The Cherokee Indians called the place Dah-lo-ne-ga, meaning 'yellow money.' Pop. 820.

DAHLSTJERNÅ, dāl'-shēr'nā, Gunnar, Swedish poet; b. Öhr, Dalsland, 7 Sept. 1661; d. Pomerania, 7 Sept. 1709. His father was a clergyman named Eurelius. The son's versatility as surveys, cartographer and poet, has earned him a title of nobility. He was born in 1702. He received his degree at Upsala in 1677 and in 1687 refused the offer of a professorship at Leipzig. From 1681 he was in the land surveying department of Sweden of which he was appointed director in 1699. During his long journeys in Sweden, Livonia and Pomerania, he composed the patriotic poems on which his fame rests. Chief of these are: 'Kunga Skald' an elegy on the death of his master Charles XI (1697); and the spirited 'Goth's Battle Song' (1701).

DAHN, dän, Felix, German historian and novelist; b. Hamburg, 9 Feb. 1834; d. 1912. At the universities of Munich and Berlin, where he was educated, he made special studies in history and jurisprudence. In 1857 he was appointed privadozent at the former institution, becoming professor of law there five years later. In 1863 he removed to Würzburg in a similar capacity, to Königsberg in 1872, and lastly to the University of Breslau in 1888. His historical works include 'Die Könige der Germanen' (9 vols., 1851-1902); 'Urgeschichte der germanischen und romanischen Völker' (4 vols., 1881-90). He also wrote 'Das Kriegsrecht' (1870); 'Handelsrechtliche Vorträge' (1875); 'Deutsches Privatrecht' (1878); 'Die Vernunft im Recht' (1879); 'Die Landnot der Germanen' (1889), all in law and jurisprudence. In poetry, he published 'Markgraf Rüdiger von Bechelaren' (1875) and 'Die Staatskunst der Frauen' (1877); in fiction, 'Ein Kampf um Rom' (1876); 'Odhins Trost' (1880); 'Pelicetas' (1883); 'Fredigundis' (1885); 'Attria' (1888); 'Stilliche' (1900); 'Sigwalt und Sigrid' (1898); 'Herrzog Ernst von Schwaben' (1902) and 'Die Germanen' (1905). A collection of his literary works appeared (21 vols., 1898; continued 1903-).

DAHOMEY, dā-hō'mē or -mā (native name of the people, Dama or Dahome), West Africa, formerly a dependence of the colonies of French West Africa, bounded on the east by the British possessions of Nigeria and Lagos, on the south by the Gulf of Guinea, on the west by Togoland (German), and on the north by the French military possessions; area about 42,000 square miles, having been increased in 1900 by territory in the north, adjacent to
the Niger. The coast line is only about 70 miles in length, but opens out northward into a wide hinterland. About midway on the coast lagoon is the port of Whydah, whence a road extends inland to Abomey, a distance of 65 miles. Dense forests and dismal swamps cover nearly two-thirds of this distance, but from the Great Swamp of Agrémé vast undulating plains rise for many miles in the direction of the Kong Mountains. The Avon and Denham lagoons reach 150 miles to the rivers, which, wired and fenced, are landlocked. The soil is extremely fertile. Among native trees are the baobab and the coconut palm. Groves of oil-palms encircle each town, and palm-oil is made in large quantities. Maize, beans and peas, as well as cassava, yams, sweet potatoes, limes, oranges, pineapples and other tropical fruits grow in luxuriance; cotton, sugar and spices of all kinds are also grown, and sheep, goats, swine and poultry are raised, though not in large numbers.

In 1911 the exports, which consisted chiefly of liquors, tobacco, machinery and cotton goods, were valued at $3,904,905; and the exports, which were chiefly maize, copra, kola nuts, rubber, palm-oil and palm kernels, $4,391,660. Some iron manufactured in the country, and guns, weapons and tools are forged from native iron. There are few roads in the country, but in recent years they have been greatly improved. A new metalled road (310 miles in length) for motor traffic runs from Savé to the Niger. In 1902 a railway was constructed from the port of Kotonou into the interior to Savé (156 miles). The line is intended to run to Chauro (400 miles). The gauge is a metre. A metre gauge railway has also been constructed from Porto Novo to Pobé (50 miles) along the Lagos frontier. A telegraph line connects that port with Abomey, the Niger and the Senegal. There were 1,389 miles of telegraph and 70 of telephone line in 1916. The currency consists of cowrie shells and French, English and American coins. The colony is administered by a lieutenant-governor with an administrative council. The seat of government is Porto Novo, the chief business centre, which has about 30,000 inhabitants. At Kotonou is a wireless station, and there is regular steamship communication with Europe. Dahomey was an absolute monarchy previous to the French occupation. There was a standing army estimated at over 15,000, consisting partly of female warriors or Amazons, who were distinguished by superior physique and high skill in the use of weapons. The natives are full-blooded Guinea Negroes, or Nigerians of the coast. The Dahomans are tall, very long-headed, but not so black as the tribes of Senegal. In their own tongues, the imports of the Ewe language, common in this part of the Slave Coast, they are called Fon or Fawin. Their religion is purely fetish, and the sacrifice of human beings, a widespread custom in former times, is still supposed to be practised. In spite of a low standard of morality and warlike attributes and usages, the Dahomans are polite in their intercourse. The activity of missionaries has thus far been attended with little success, except in the case of the dervishes, who are indefatigable in their efforts to spread the gospel of Islam. The population is estimated in 1911 at 902,000. Whites numbered less than 500. The kingdom of Dahomey arose in the 17th century around the city of Abomey as a nucleus. By successive conquests the kings extended their rule to the highlands of the Mahè on the north and to the Slave Coast on the south. There the towns of Whydah and Atacora were founded, and succeeded in obtaining control of a large part of the slave trade, which was then actively carried on by the English, the French and Portuguese. With the cessation of the slave trade the prosperity of the country came to an end. France saw fit to take control on the coast in the second half of the 19th century. Between 1878 and 1885 it obtained possession of Kotonu, Porto Novo and Grand Popo, and after a bloody contest in 1890 forced King Behanzin to acknowledge its title to the coast region. War broke out again in 1892 and resulted in the taking of Abomey, the deposition of Behanzin, since retained a prisoner at Fort-de-France, Martinique, and the establishment of a virtual French protectorate. Since then the French have been actively engaged in extending their authority over the region to the north, so as to bring Dahomey into touch with their possessions in the Sudan. In 1897-98 they concluded treaties with the Germans and the English and in every way they now worked to turn Dahomey into a French colony.

DAIBUTSU, dī-boots'oo, the name given in Japan to a gigantic statue of Buddha. The largest Daibutsu in the empire is found at Nara. It is 53 feet high and supposed to date from the 8th century. The image is shrined in a pagoda. At Kamakura is a bronze Daibutsu over 49'4 feet in height. The bases, which are four feet long, are made of gold.

DAILLE, dá-yá', Jean, French Protestant theologian: b. Châtelherault, 6 Jan. 1594; d. Charenton, near Paris, 15 April 1670. He became pastor in 1625 of the church at Saumur, and in 1626 of that of Charenton at Paris, where he passed the remainder of his life. He was one of the ablest and most learned divines of his day, and did essential service to the Protestant cause by several works, among which the most celebrated is entitled 'Traité de l'emploi des SS. Pères pour le jugement des différendes de la religion' (1632). It was also published in Latin and translated into English, and in both forms has had a very extensive circulation both in England and on the Continent. It aims to show that the authority of the fathers has been far too much overvalued, and that the ignorance or inaccuracy apparent in almost all their works unfitted them for the establishment of any doctrine, not clearly laid down in Scripture. He also wrote distinct treatises on several of the leading points of controversy between Protestants and Roman Catholics.

DAIMIRI, di-mér-é, Spain, town in the province of Ciudad Real, about 20 miles east-northeast of the city of that name on the Azuer River. It is well built; the principal
edifices are two parish churches, the one Gothic, the other Doric, and both surmounted by towers. The manufactures consist chiefly of linen and woolen fabrics and lace, soap, liquors and bricks. Pop. 15,940.

DAIMIÓS, dî-mè-ô, a class of feudal lords formerly existing in Japan, but now deprived of their privileges and jurisdiction. As long as their feudal possessions remained to them, they exercised in their own domains the rights of petty rulers, and 18 of them were to all intents and purposes independent; a circumstance which greatly limited the power of the Mikado, and formed a hindrance to the career of progress and reform on which Japan had entered. In order to centralize the power of the government, a decree was issued on 12 Aug. 1871 by which the daimíos were deprived of all rights of sovereignty, their districts incorporated with the Imperial territories, and their troops handed over to the Imperial government. At the same time a new constitution and organization were given to the state. A deliberative assembly, consisting of two chambers, was created, to which deputies were sent by the former feudal governments or districts of the daimíos (Han); and the daimíos themselves were made official governors of these districts which they previously held as feudal rulers, and were placed upon a salary hereditary in their families. Their salaries now equal one-tenth of their former income. See SAMURAI.

DAIMLER ENGINE. See Internal Combustion Engine.

DAIQUIRI, dâ-ê-ke-reê', Cuba, town 15½ miles southeast of Santiago, on the southern coast, noted for the successful landing of the American army of invasion (excepting Kent's division), 22 June 1898. See UNITED STATES—The War With Spain.

DAIRCCELL, Saint, said to have lived in Kerry, Ireland, in the 7th century. The legend is that he was the illegitimate son of a husbandman, and that the mother sought to kill the child at birth. A fluttering white dove, which seemed to descend from heaven, stayed her hand, and saved the life of the babe.

DAIRY CATTLE. See CATTLE.

DAIRY CHEMISTRY. See Agricultural Chemistry.

DAIRY FARMING. See Farm Management.

DAIRY INDUSTRY, American. Compared with other farming and agricultural industries in the United States, dairying is of considerable import and shows great development during the last two or three decades; in fact each decade far outstrips the preceding in every line of the industry. According to government statistics, the leading dairy States are New York, Wisconsin, Pennsylvania, Illinois, Iowa, Ohio, Minnesota, Michigan, California, Indiana, Massachusetts and Missouri. Butter is made extensively in all these States, but Wisconsin, New York, Michigan, Ohio and Pennsylvania are the heaviest producers of cheese, the varieties including many imitations of foreign cheese. Dairy farms are developing rapidly in sections where wheat and other general crops have become unprofitable. Recently the industry has made great progress in the Pacific Coast States and in the Southern States. It has been proved that cows can be kept and good butter and cheese can be made in almost any district where suitable forage fodder can be produced. It is often possible to grow more abundant and better fodder crops than are furnished by the natural grasses. Well or cistern water may take the place of the flowing spring. Favorable freight rates and fast refrigerator-car transportation lines have the effect of placing the distant dairyman near the markets where grains can be purchased and his products can be disposed of to the best advantage. Dairying seems to be the one branch of agriculture least affected by conditions of soil and climate.

Dairying has advantages over many other kinds of farming. It improves the land instead of wearing it out, because the products of the dairy which leave the farm permanently are not rich in plant food, as is the case with field crops, and it provides fertilizer in the form of manure, which is of immense value for enriching poor soil. It furnishes a profitable way of using certain farm products, such as grass and straw, that otherwise would be valueless. It provides cheap by-products such as skimmed milk, buttermilk and whey, which can be made into human food or very profitably fed to calves and other animals. It can be combined with other forms of agriculture. Perhaps best of all, it engages the farmer in paying work for the entire year. For these reasons the general appearance of any section where dairying is extensively followed shows thrift and progress. The growth of the dairy industry is sometimes checked temporarily by unfavorable economic conditions, such as high cost of feeds and high prices of beef.

The United States census for 1910 and estimates for 1917, made by the Dairy Division, United States Department of Agriculture, give the following dairy statistics:

<table>
<thead>
<tr>
<th>Cows on farms and ranges (1910)</th>
<th>21,801,000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cows in towns and cities (1910, est.)</td>
<td>1,000,000</td>
</tr>
<tr>
<td>Total cows in the United States (1910)</td>
<td>22,801,000</td>
</tr>
</tbody>
</table>

Census report for 1910:

| Total milk produced in the United States, gallons (1910) | 7,466,406,384 |
| Butter made on farms, pounds (1910) | 904,650,610 |
| Butter made in factories, pounds (1910) | 627,145,865 |
| Total butter made, pounds | 1,621,796,475 |
| Cheese made on farms, pounds (1910) | 9,405,864 |
| Cheese made in factories, pounds (1910) | 311,175,730 |
| Total cheese made, pounds | 330,581,594 |
| Total dairy products factories, 1910 | 8,479 |
| Total dairy products factories, 1914 | 7,982 |
| Average yield of milk per cow in United States, gallons (1910) | 362 |

Dairy Division estimates for 1917:

<table>
<thead>
<tr>
<th>Number of cows required to supply the various dairy products:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cows</td>
</tr>
<tr>
<td>Butter (at 177 pounds, per cow, per year)</td>
</tr>
<tr>
<td>Cheese (at 271 pounds, per cow, per year)</td>
</tr>
<tr>
<td>Ice cream</td>
</tr>
<tr>
<td>Condensed milk</td>
</tr>
<tr>
<td>Milk for dairy calves</td>
</tr>
<tr>
<td>Total dairy cows on farms, est.</td>
</tr>
</tbody>
</table>

The number of cows in towns and cities is estimated at about 1,500,000.
The aggregate annual value of dairy products is estimated to exceed $500,000,000 for the year 1900, while in 1910 the value, exclusive of home consumption, was $656,301,246. Exports of dairy products, with the exception of cheese and condensed milk, have always been small. Exports of cheese gradually increased from about 5,000,000 pounds in 1850 to 150,000,000 in 1880, when they amounted to one-half of the production. From that date they gradually declined until 1915, when they again reached the low ebb of 1850. War orders for cheese commenced in 1915 and by 1917 exports reached 66,000,000 pounds. Exports of condensed milk have not been a very important item in our foreign trade in dairy products. In 1910 they amounted to about 13,333,333 pounds. The war caused a very great increase, however, and in 1916, exports totaled about 160,000,000, and in 1917 about 260,000,000 pounds. The demands of foreign markets differ somewhat from domestic requirements, but the fact that butter and cheese which will satisfy foreign tastes can be supplied from this country has been proved many times by the experience of exporters as well as by trial shipments made by the Department of Agriculture. There are great possibilities for American dairy products in other countries, and these will be developed as soon as our production is permanently in excess of our needs. The annual exports of butter have exceeded 25,000,000 pounds but twice since 1900, and those of cheese had not reached 50,000,000 since 1900, except for the years 1915 and 1917, due to conditions arising from the European War.

The quantities and values of imports, exports, and re-exports of dairy products for the years 1910, 1912, 1914, 1916 and 1917 are as follows:

See Milk and Cream Tables for 1916 and 1917 re-export figures.
The best and most profitable breed of dairy cattle has as yet never been agreed upon. Each of the dairy breeds has strong claims to highest merit and each has its enthusiastic advocates. The latter are often influenced by conditions which have no economic importance. The breeds differ markedly in such characteristics as size, color and disposition, as well as in quantity and quality of milk. As a general rule, when a large amount of milk is given, it is low in fat-content or "richness." The data shown in the following table regarding several leading dairy breeds of cattle have been compiled from Advanced Registry records.

The figures of production and composition of milk are averages based on the number of cows given.

There is a wide variation in the milk production among cows of the same breed. Yields of milk above 30,000 pounds a year have been produced and the world's record of butterfat production at present is 1,205.09 pounds. The records of milk and butterfat production were all made by pure-bred cows.

The great majority of dairy cows throughout the country are "grades," that is, some of their ancestors are pure bred and some are not. As producers of milk, individual grade cows can be selected that will equal pure breeds, but the latter are more satisfactory for breeding purposes. A grade Holstein cow in Michigan, in 1917, gave 9,139 pounds of milk containing 288 pounds of butterfat, equivalent to 351 pounds of butter. The total feed cost of the year was $73.39 and the total value of her products was as follows:

- 351 pounds of butter @ 40 cents per lb. $140.40
- 7,736 pounds of skim milk @ 40 cents per cwt. 30.94
- 1,405 pounds of buttermilk @ 25 cents per cwt. 2.75

Total $174.09

The income over cost of feed was $100.70, while the feed cost of one pound of butter was $0.209.

The average dairy cow in the United States produces about 4,000 pounds of milk, containing about 160 pounds of butterfat, equivalent to 188 pounds of butter.

- 188 pounds of butter @ 40 cents per lb. $75.20
- 3,360 pounds of skim milk @ 40 cents per cwt. 13.44
- 480 pounds of buttermilk @ 25 cents per cwt. 1.20

Total $89.84

The cost of feed for such a cow would be about $60 and the income over cost of feed about $29.84, as compared with $100.70 for the grade cow previously mentioned.

Milk of the cow is secreted in the mammary glands known as the udder. Wing thus well describes the udder of a good cow: "It should be large and well developed; it should occupy the whole space between the hind legs, extending well up between the thighs and well forward upon the belly. It should be held firmly against the wall of the abdomen. It should be level or nearly so on the bottom, and the four quarters should be as nearly as possible equally developed and each furnished with a cylindrical perpendicularly test of moderate length. The whole organ should diminish rapidly in size, as the milk is withdrawn. The hair upon the udder should be fairly abundant, fine and soft, and abundantly supplied with brownish dandruff." As milk is a product of the blood, the importance of an ample blood supply to the udder, a vigorous constitution, and a strong circulation is readily seen. It is highly important to withdraw the milk from the udder regularly, quietly and completely, if the flow is to be maintained.

Van Slyke gives the average of 5,552 American analyses of cows' milk, expressed in percentages, as follows:

In the composition of milk of different cows varies between wide limits. The same may be true of the product of any individual cow from day to day. The New York Agricultural Experiment Station is authority for the above averages of analyses of milks from cows of different breeds.

Koenig gives variations of milk constituents in about 500 samples, expressed in percentages, as follows:

In some instances American analyses have shown even wider variations.

The most variable constituent of milk is fat. By the "richness" of milk is judged and the commercial value is determined. Milk fat is a complex mixture containing several glycerine compounds. It is present in the form of minute globules suspended in the remaining or watery portion called the serum. The globules average about one ten-thousandth of an inch in diameter and are plainly visible under a high-power microscope. About 150,000,000 of them are contained in a single drop of milk. Some conditions affecting fat-content of milk have been mentioned. A few others are important. From about the middle to the last of the period of lactation, the fat in milk increases slightly. The percentage of fat increases gradually from the first to the last of any milking; the first milk drawn contains about 1 per cent fat and the last as high as 9 or 10 per cent. It is popularly supposed that the feed given a cow has a decided influence on the quality of her milk. As a matter of fact, the milk of a cow in normal condition is little affected by the feed, except that certain feeds may give it a strong flavor. Feed has a much greater influence upon the quantity of milk than its quality.

Casein and albumin are protein or nitrogen constituents of milk. The former is coagulated by rennet or acid, the latter by heat. Coagulated casein or "curds" enters largely into the composition of cheese. Casein is said to be in a state of "pseudosolution" in milk. Milk sugar or lactose is in solution in milk. When separated it resembles powdered sugar. It is less sweet than cane sugar and is used to a considerable extent in druggists' preparations and in certain proprietary foods. The mineral matter in milk, called ash or salts, is the part remaining when milk is evaporated to dryness and burned. It includes phosphorus, potassium, calcium, chloride, magnesium, sodium, sulphur and iron. Certain gases and other constituents are present in milk in minute quantities.

**Different Grades of Milk (Magnified 500 Times)**

- **a. Skinned milk.**
- **b. Milk.**
- **c. Cream.**
- **d. Colostrum.**

The first milk given after parturition is called colostrum. It differs in composition from normal milk, and is fit only for food for the newly born calf.
The only precise method of determining the quality of milk is by a complete gravimetric analysis, but for practical purposes the knowledge of the specific gravity of milk and its fat content is usually sufficient. The specific gravity can be ascertained quickly by the use of a lactometer, and the fat content can be quite accurately determined by the use of the Babcock test. For test purposes, a definite amount of milk is mixed with sulphuric acid in a special bottle having a graduated neck. This is whirled rapidly in a machine and the fat is separated from the rest of the mixture by centrifugal force. By the addition of water heated to about 130° F the fat is brought up into the neck of the bottle, where its exact percentage can be read. Simple tests have been devised for determining the acidity of milk, and whether or not it has been heated.

Milk is a very delicate product and is subject to taints and changes in great number. It readily absorbs strong odors with which it comes in contact, and objectionable flavors are easily imparted to it when the cows are allowed to eat certain foods within a few hours before milking. Inadequate drainage and krafted weed are well known; rape and green rye are said to produce bad flavors in the milk when they are fed in certain conditions. Flavors due to the causes named are most noticeable when the milk is first drawn from the udder, and may be largely reduced by aeration or the exposure of milk to the air.

When held, milk undergoes many kinds of changes. The most common is souring, but it may become slimy or "ropy," curdle without souring, "soap," turn to red, blue or other color, develop peculiar or excitable odors, form poisonous products, or become altered in other ways. Most of these changes are directly due to bacteria, but some are caused by enzymes or unorganized fermentations.

Bacteria are found in milk an exceptionally favorable medium for growth. They enter milk in so many ways that it is a practical impossibility to produce milk which is germ-free. But the character and number of the bacteria that get into milk and their development are largely controlled by the conditions that exist in the success or failure of all operations with milk and its products. Many species of bacteria found in milk are perfectly harmless. Some are essential to certain dairy operations, for example, when it is desired to ripen cream to make butter, lactic acid bacteria are needed; they produce lactic acid from milk sugar and cause the milk or cream to sour. Other species have their peculiar effects in the ripening processes of the various forms of cheese. Numerous varieties of bacteria are objectionable and some are dangerous. The latter include pathogenic bacteria and other forms that may be the direct or indirect cause of disease to the consumer. Well authenticated cases are on record of typhoid fever, diphtheria and other disease germs being carried by milk, and there seems to be proof that tuberculosis is sometimes spread in this manner.

Bacteria are introduced into milk from many sources. As secreted, milk is probably sterile, but it becomes contaminated in the teat and the cow, so that milk as it leaves the udder always has a few bacteria. In some cows this number may run into the hundreds of thousands per cubic centimeter, although more often the count is in the hundreds. After leaving the udder it is subject to external contamination, the source of which from the standpoint of numbers is unsterilized utensils. The next important source of contamination is manure. Stable air ordinarily plays little or no part in introducing large numbers of bacteria into milk. It is possible that the amount of milk mixed with sulphuric acid in a special bottle having a graduated neck. This is whirled rapidly in a machine and the fat is separated from the rest of the mixture by centrifugal force. By the addition of water heated to about 130° F the fat is brought up into the neck of the bottle, where its exact percentage can be read. Simple tests have been devised for determining the acidity of milk, and whether or not it has been heated.

High bacterial counts in milk are most frequently due to growth of the organisms in the milk if it is not promptly cooled at least to 50° F. Bacteria multiply rapidly at temperatures above 50° F. and in general the higher the temperature the faster they grow up to 100° F. Milk immediately after production should therefore be cooled quickly and kept cold.

**Pasteurization.**—Since pathogenic bacteria may be present in milk it is a common practice to heat it to temperatures above 140° F. This process is known as pasteurization. From a sanitary standpoint pasteurization is of greatest value when market milk is under consideration. The pasteurization of milk, when the process is properly performed, destroys the organisms which cause typhoid fever, diphtheria, septic sore throat and dysentery, and offers protection against the food-and-mouth disease. From a sanitary standpoint, pasteurization is of value because it increases the keeping quality of milk and prevents financial losses by souring. As practised at present, pasteurization destroys about 99 percent of the bacteria present in milk, including all disease-producing organisms.

Three processes are commonly used in this country: the first is known as the flash, or continuous process; the second as the holder or holding process; and the third as pasteurization in the bottle. The flash process consists in heating the milk rapidly, usually to 160° F. or above and then cooling quickly. The heating in this process requires only from 30 seconds to one minute. In the holder process the milk is heated to from 145° to 150° F., and held for 30 minutes before being cooled. This is the most commonly used process and is superior to the flash process in every way. Pasteurization in the bottle is one of the latest developments in the process to be used on a practical scale. In this process the milk is bottled, then heated in the bottles to from 145° to 150° F., then held for 30 minutes before being cooled. In any method of pasteurization the milk after heating is cooled as rapidly as possible to 50° F., and lower when possible.

The temperature recommended for pasteurization is 145° F. for a period of 30 minutes. This temperature and period of holding is the most desirable (1) because it is high enough to destroy many pathogenic bacteria, (2) because it leaves in the milk a maximum number of lactic-acid-producing bacteria which cause the milk to sour in a more or less normal
manner, although the souring is delayed; (3) because the milk does not undergo any appreciable chemical change; (4) because it has little or no effect on the flavor of the cream; (5) because of the economic advantage of not having to heat the milk to higher temperatures, thereby saving in heating and consequently in cooling.

Cream is pasteurized by the same method as milk, and usually the flavor of the cream is somewhat reduced. This is particularly true in high-temperature pasteurization. The early objections to pasteurization have been shown by scientific investigation not to be valid, so that pasteurization of milk and cream is now extensively and in fact very generally practised. It is even compulsory in a large number of cities.

Milk should be produced and handled in such a manner as to keep bacterial contamination as low as possible and prevent subsequent disease. The practical way of accomplishing this is to observe the utmost cleanliness in all stages of production, to cool the milk at least 50°F. promptly after it is drawn and to hold it continuously at such low temperature. All persons handling or directing operations are the most dangerous of all forms ever found in milk, special care should be taken to exclude them. For this purpose, it is necessary to give close attention to the health of the animals and all persons having to do with the herd or the milk. Some serious outbreaks of disease have been due to the handling of milk by persons suffering only mildly with a contagious disease such as typhoid fever or who have been exposed to the disease. Dairy cows should be examined at least twice every year by a competent veterinarian; some of the best dairies have examinations more often. The milk of a cow suspected of being out of condition or not in good health should not be used. Many bacteria that enter milk are carried by small particles of matter such as manure, dust, dirt, hairs, etc. Of course, these are most abundant in ill-kept barns, where milkers as well as the cows and their surroundings are allowed to be unclean. Barns should be kept thoroughly clean and free from piling of hay, straw, bedding and the like. Any dust-catching ledges, projections and corners is possible. Allow no dusty, dusty, or dirty litter, or strong-smelling material in the stable. Harsh, soapy, or strong-smelling materials should be used only in the last few feet of the stable. Use lead plaster daily in gutter and on floor.

Dairy cattle should be kept in a stable, preferably without cellar or storage loft, and where no other animals are housed.

The stable should be light (4 square feet of glass per cow) and dry, with at least 300 cubic feet of air space per animal. It should have air inlets and outlets, so arranged as to give good ventilation without drafts on the cows.

The floor should be tight and constructed preferably of cement; walls and ceilings should be tight, clean, free from dampness and cracks. It is essential to have a few dust-catching ledges, projections and corners as possible.

Milk utensils should be made of metal, and all joints smoothly oiled. Never allow utensils to become rusty or rough inside. Use them only for handling, storing or delivering milk.

To clean dairy utensils, use only pure water. First rinse the utensils in warm water. Then wash inside and out in hot water in which a cleaning material is dissolved and rinse again. Sterilize with boiling water or steam. Then keep inverted in pure air and sun, if possible, until wanted for use.

Milk should be promptly removed from the stable, strained, cooled and cold-stored. It should be handled in a room or in a basement, well fitted for the purpose—clean and light. A good form of strainer is provided with a double thickness of sterile cheese-cloth filled between with pure white sterile cotton. The cloth and cotton should be changed as often as they commence to show dirt near the lower surface of the strainer. The usual cooling device consists of an apparatus made of thin metal and so arranged that cold water is on one side while the milk is being cooled passes over the other. With certain forms of coolers, it is found entirely practical to reduce the temperature of the milk quickly to within 2 to 4 degrees of the temperature of the water. After cooling, milk should be placed in cans or jars, as may be required and held at a low temperature continuously until used. When milk is to be used for butter and cheese making it is also necessary for it to be held at low temperatures to prevent undesirable fermentations.

Items that need to be kept in mind and conditions which should be observed in the management of a first-class dairy are summarized in "Twovery Dairy Suggestions issued by the United States Department of Agriculture, as follows:

1. Have the herds examined at least twice a year by a skilled veterinarian. Promptly remove all animals suspected of being in bad health. Never add an animal to the herd until certain it is free from disease. The usual procedure is to test the milk of the new animal and if it is free from disease, the animal is then allowed to join the herd.

2. Never allow a cow to be excited by fast driving, abuse, loud talking, or unnecessary disturbance; do not expose her to cold or storms more than necessary.

3. Keep the entire body of the cow daily; hair in the region of the udder should be kept short by clipping.

4. Do not allow any strong-flavored food, like garlic, cabbage or turnips, to be eaten except immediately after milking. Changes in feed should be made gradually.

5. Provide fresh pure water in abundance, easy of access and not too cold.

The Stable

10. Have a light, clean, well-ventilated and screened milk room, located so as to be free from dust and odors.

11. Milk utensils should be made of metal, and all joints smoothly oiled. Never allow utensils to become rusty or rough inside. Use them only for handling, storing or delivering milk.

12. To clean dairy utensils, use only pure water. First rinse the utensils in warm water. Then wash inside and out in hot water in which a cleaning material is dissolved and rinse again. Sterilize with boiling water or steam. Then keep inverted in pure air and sun, if possible, until wanted for use.

Milk and Handling Milk

13. Use no dry, dusty, or smoky hay previous to milking.

14. Thoroughly wash the hands immediately before milking, and milk with dry hands. The hands should be washed with soap and water, and then rinsed. Then, dry the hands in the same manner as before.

15. Wipe the udder and surrounding parts with a clean cloth immediately before milking, and milk with dry hands. Do not use soap or other cleansing substances. If the hands are in the same manner as before.

16. In milking by hand, be quick, clean and thorough. Commence the milking at the same hour every morning and evening. Do not rub the udder or friction the udder after the milk is removed.

17. If any part of the milk is bloody, stringy, or unnatural in appearance, or if by accident dirt gets into the milk, the whole should be rejected.
18. Do not fill cans in the stable. Remove the milk of each cow at once from the stable to milk room. Strain immediately through cotton flannel or cotton. Cool to 50° F. as soon as strained. Store at 50° or lower. Never mix warm milk with that which has been cooled, and do not allow milk to freeze.

No cow suffering from any disease, or who has recently exposed to a contagious disease, must remain away from the cows and the milk.

The successful management of a dairy requires great intelligence, patience and persistence, and no person should expect to succeed in this business unless he has a decided liking for it. Of course the matter requiring first attention is the location of the farm. The elevation and conformation of the land should be such that good air and drainage would obtain. There should be an abundant supply of pure water. For this purpose a well-protected spring or deep well is best, and care should be taken to have it located distant from buildings and other possible sources of contamination. Barns and dairy buildings should stand on elevated ground, and they should be isolated from other structures. It is well to store all forage in a building separate from the cow stable. By a system of overhead tracks and suspended cars, feed can be easily brought to the herd and manure economically removed. Unless the manure can be spread at once upon the land, it should be stored under a roof. The stable should be planned to facilitate the work of caring for the herd. Light and fresh air are necessary and should be admitted in abundance. It is generally advised that there be allowed the space of two cubic feet of space for every pound of live weight. Where the winters are not too cold and expense of construction must be kept low, the cows may be allowed to stand on the ground, the floor of the barn being made from hard-packed clay or earth. Better floors are made from planks treated with tar and laid close together. A cement floor is the best, but because of its hardness an abundance of bedding must be used. The stalls should be from 3½ to 4 feet wide and just long enough for the manure gutter to be immediately back of the last foot of the cow standing. Many devices for tying cows have been proposed, but one of the most satisfactory is the stanchion attached above and below by a few links of chain, so as to allow some freedom of motion in all directions. A separate feeding-box for each animal is objectionable because of the difficulty of keeping it clean. At many of the best dairies the cows are fed on the floor, a long shallow trough in front of the stalls being constructed for this purpose. Provision should be made for frequent access to water. Milk cows should be allowed to go out doors every pleasant day for exercise.

The selection of cows for a dairy herd, regardless of the breed chosen, should be based upon individual merit. Small and unprofitable producers as well as unhealthy cows and those of weak constitution should be avoided, and when they are found in the herd advantage should be taken of the first opportunity to dispose of them. It is well said "the bull is half the herd." When calves are to be raised, as is the case in many dairies, the influence of the bull upon the development of the herd is readily seen. If possible a bull of proved excellence should be used. It is always well to give special attention to the breeding of the bull and attach considerable importance to the performances of his dam and grand-dams. The quantity of milk given by each cow at each test, should be recorded at least one day each month for the purpose of showing which animals of the herd are profitable and which are not. The time for breeding cows depends upon the requirements for milk. Formerly it was a general practice in dairies not supplying milk for retail sale to have cows calve in the spring and be "dry" throughout the winter. At present, however, a large number of dairies are operated most profitably during the winter for the purpose of supplying milk for butter and cheese making, as well as for consumption in towns and cities.

Feeding for best results is a subject which requires much study and experience. Especially is this the case where winter dairying is practised. In the first place feed should be wholesome and palatable. Then care should be taken to have the nitrogenous and non-nitrogenous components properly proportioned. Just what feeds will be used depends largely upon local conditions, cost, availability, etc. The following rules given in Farmers' Bulletin 743 may be followed in most cases. The practical feeder will study carefully the needs of each individual animal in the herd.

1. Under most circumstances the cow should be fed all the roughage that she will eat up clean, adjusting the grain ration to the milk production. Only when the cow tends to become overfat should the quantity of roughage be restricted.

2. A grain mixture should be fed in the proportion of 1 pound to each 3 pints or pounds of milk produced daily by the cow, except in the case of a cow producing a flow of 40 pounds or more, when the ration can be 1 pound to each 3½ or 4 pounds of milk. An even better rule is 1 pound of grain each day for every pound of butter-fat produced during the week by the cow.

3. Feed all the cow will respond to in milk production. When she begins to put on flesh, cut down the grain.

Milk is a food of great value. Next to bread and water it is used more commonly than any other article of food or drink. It contains, in easily digestible form, the four kinds of nutrients required by the body — protein, fats, carbohydrates and mineral matter. It contains more nutritive matter than can be obtained at the same cost in any other animal food. Jordan has shown the economy of using milk in the family dietary. The increased use of good wholesome milk is strongly recommended. Skimmed milk also contains considerable food value and could well be used as a human food much more than is the present custom. The average amount of milk consumed daily in cities and towns is about 0.7 pint per capita, and to supply this there must be within easy reach one cow for about every 12 persons. Many cows are kept within corporate limits and their product is delivered twice daily — often "warm from the cow." For best results it should be cooled, as this is often used before any considerable change takes place. Most of the milk supply of small and medium-sized towns and a large portion of the milk used in cities is taken from the dairy to the consumer by teams, and the general rule is
to serve in the morning the product of the same morning and the previous evening.

The bulk of milk used in large cities is transported by special trains, and sometimes these originate as far as 200 to 300 miles from their destination. Train milk is from 12 to 72 hours old when delivered to the consumer. Most of it is either 24 or 36 hours old. Pretzel makers have learned that milk so long delayed must receive good care, and it often happens that this milk is finally delivered in better condition than milk not so old but neglected. The receipts of milk in New York City are more than 2,700,000 quarts daily, and practically all is brought by trains. Milk usually is transported in heavy tin cans holding $\frac{8}{2}, 20, 32$ or 40 quarts. In recent years bottles have come into general use. Some concerns maintain bottling stations near the producing farms, and their product is shipped in glass jars which are packed in cracked ice during hot weather. Much milk is bottled in the cities before delivery.

Farmers lately have received 5 to 7 cents per quart for their milk. City retail prices range from $\frac{10}{2}$ to 14 cents per quart. Most of this milk is delivered promptly after it reaches the city. When it must be held before delivery a clean cold place must be provided for this purpose.

Much is being done by State and municipal governments to improve market milk, but the greatest influence to this end that can be produced is a determined demand on the part of the consumers for pure milk and a willingness to pay for it. Medical milk commissions in some cities are entitled to credit for good results already obtained. Some concerns produce a special grade of milk. It is their aim to produce milk in a scientific manner and to take every reasonable measure to insure its purity. One of them operates in 16 different cities and conducts dairies which are models in cleanliness and management. The same company has developed a large trade in "modified milk," which is milk altered in its composition according to the peculiar requirements of infants and invalids, and specially prepared upon physicians' prescriptions for forms of fermented milk used as a beverage. It is produced with the aid of yeast. Bulgarian milk is a sour milk ripened by a bacterium, Bacterium bulgaricum. This organism is able to produce a high percentage of acid, and the Bulgarian milk is therefore usually of a higher acidity than normally soured milk. Bulgarian milk has become rather popular since Metchnikoff suggested that it may be beneficial to health and therefore possibly a means by which prolong life. Bulgarian milk is often sold under various names, such as Farmilac, Yougert, Morilac, etc. Ice cream is rapidly becoming one of the more important dairy products. It is estimated that the ice cream output in the United States for the year 1917 amounted to 210,000,000 gallons. This at $1 per gallon represents an industry of $210,000,000. Ice creams are known under different names, such as plain ice cream, parfaits, mousse, etc. No classification has up to this time been accepted officially. It has been customary to distinguish between two classes of ice cream. Philadelphia, an ice cream made without the addition of eggs, and Neapolitan, an ice cream containing eggs.

DAIRY PRODUCTS. The dairy industry is one of the most important branches of farming in this country, both from the standpoint of production of food for human consumption and, also, that of soil fertility. The size of this industry is indicated by the fact that, on 1 Jan. 1917, there were 22,788,000 milch cows in the United States, having a farm valuation of $1,358,435,000. The following are the States which had more than 1,000,000 cows in 1917: Wisconsin, 1,750,000; New York, 1,539,000; Iowa, 1,405,000; Minnesota, 1,302,000; Texas, 1,175,000; Illinois, 1,057,000. The amount of milk produced on farms in 1909 was 8,813,699,474 gallons, and the total value of the dairy products was reported as $596,413,463. The following table shows the amounts and value of the different manufactured dairy products for the year 1914:

New York leads all the States in the production of milk for direct consumption. Wisconsin produced the most butter, followed by Minnesota, Iowa and California. In the production of cheese, Wisconsin leads, followed by New York, Pennsylvania and Michigan. For condensed milk, the leading States are Wisconsin, Illinois and New York.

For many years the dairy industry has increased steadily and quite rapidly. This growth is the more significant in view of the fact that, during recent years, there has been a decided decrease in the raising of cattle for beef. This general tendency toward an increase in the raising of dairy cattle at the expense of other kinds is, doubtless, due to certain fundamental economic principles: (1) A given amount of feed consumed by a dairy cow will produce a much greater amount of human food (milk, butter or cheese) than would be produced if it were used for the production of beef, mutton or pork; (2) the sale of milk, butter or cheese removes very little fertility from the farm, and the means for converting certain farm products, such as hay, corn, stover, straw, etc., into more salable products; (3) it is easier to maintain the fertility of the soil where stable manure is available than where it is not; (4) labor on a dairy farm is more constant throughout the year than in most other lines of farming. This makes it possible for the dairyman to use both man and team labor economically, and provide a nearly uniform income throughout the year, instead of having it concentrated into a few months, as in grain or fruit-growing. It is significant that the dairy industry has reached its greatest development in those sections of the country which, for the farmed longest and where the types of farming have become most permanent and also that there is a marked tendency toward greater development of this industry in the newer sections. This may be interpreted as meaning that the dairy cow grows in importance with the increase of population, need for human food and the development of a permanent type of farming. During recent years, the number of dairy cows has increased in all sections except the New England and Middle Atlantic States, where the industry was already well developed. The market for our dairy products is chiefly domestic, a very small percentage going into export trade. Milk—Milk is produced by the females of all species of mammals as food for their young. In nature the mother produces more milk than the quantity of milk needed to feed her young, but, in the case of the cow, the function of milk secretion has been developed by means of artificial breeding and selection far beyond the needs of the young calf in order that it may be available for human food. In appearance cow’s milk is a yellowish white, slightly viscous, opaque fluid, having a pleasant, sweetish taste. Milk is a true secretion, the fat, casein, lactose, etc., being made by the activity of the cells in the mammary gland.

The analysis of several thousand samples of cow’s milk shows the average composition to be as follows: water, 87.17 per cent; milk-fat, 3.69 per cent; casein, 3.02 per cent; albumin, 0.53 per cent; milk-sugar, 4.88 per cent; and ash, 0.71 per cent. The constituents of milk, less the water, are usually called the milk solids or total solids, and the total solids without the fat, the solids-not-fat. The entire milk, less the fat, is called the milk serum, or skim-milk.

Some of the constituents of milk are in true solution; some are simply held in suspension, while others are partly in solution and partly in suspension. Van Slyke states this condition as follows:

Milk constituents partly in solution and partly in suspension:
(a) Sugar
(b) Citric acid
(c) Potassium
(d) Sodium
(e) Chloride

Milk constituents entirely in suspension or colloidal solution:
(a) Albumin
(b) Inorganic phosphates
(c) Calcium
(d) Magnesium

The constituents of milk vary considerably in percentage, being influenced by the breed, period of lactation, individuality and certain other minor conditions. The greatest variation occurs in the per cent of fat. The influence of breed upon this constituent and the total solids as compiled by Wing from a large number of analyses by American experiment stations is as follows:

<table>

Babcock gives the following substances as constituting the proteins of milk: Casein, 3.0 per cent; albumin, 0.6 per cent; lactoglobulin, galactin, and fibrin (trace), 0.2 per cent; a total of 3.8 per cent. Likewise the mineral matter or ash is made up of many distinct substances as shown by Babcock:

- Potassium oxide: 0.175
- Sodium oxide: 0.070
- Calcium oxide: 0.140
- Magnesium oxide: 0.017
- Iron oxide: 0.001
- Sulphur trioxide: 0.027
- Phosphoric pentoxide: 0.170
- Chlorine: 0.100

Colostrum is the milk which a cow produces immediately after parturition. It is quite different in appearance and composition from normal milk, having a reddish yellow color and a viscous, almost slimy, consistency. Richmond gives its composition as follows: Water, 71.69; fat, 3.37; albuminoids: casein, 4.83, albumen, 13.85; sugar, 2.48; and ash, 1.78 per cent. Colostrum acts as a purgative to the newly-born calf, and should not be used for human food under four or five days after calving, by which time it becomes normal milk.

Until recent years, it was supposed that the composition of milk could be decidedly changed by the feed which the cow consumed, but later investigation has established the fact that the feed has but slight, if any, influence on the relative amounts of the various constituents. Certain feeds, however, may affect the quality of the milk fat; for example, linseed or gluten meal makes an oily, soft fat, while cotton seed meal and wheat bran make a hard fat. The fat exists in milk in the form of minute globules which are held in their spherical form by the surface tension of the liquid fat and the viscous nature of the milk serum. Since the value of milk is largely proportional to its per cent of fat, it is often necessary to determine its fat content. This may be done by chemical analysis but this method involves cost of time and expense and the method generally used in commercial work in this country is that devised by Dr. S. M. Babcock, of the University of Wisconsin, and known as the "Babcock Test" for milk-fat. This test is based on the principle of liberating the fat globules by dissolving the casein with strong sulphuric acid, and the separation of the fat by centrifugal force—the fat being lighter than the other elements in the milk. Briefly, the method of making the Babcock Test is as follows: (1) Secure an accurate sample of the milk to be tested; (2) measure out 17.6 cubic centimeters, and place it in the test bottle; (3) add 17.5 cubic centimeters of sulphuric acid, and mix thoroughly by rotating the test bottle; (4) place bottles in centrifuge and whirl at proper speed for five minutes; (5) add hot water to bottom of neck and whirl two minutes; (6) add hot water to bring fat up to graduated scale and whirl one minute; (7) place test bottles in water bath at 135°-140° F. for five minutes; (8) read amount of fat column, including meniscus both at top and bottom of column.

Milk is heavier than water, the average specific gravity of normal milk being 1.032, with variations between 1.029 and 1.035. The specific gravity of milk may be determined by an instrument called a "lactometer." Taken in connection with the "Babcock Test," the lactometer reading makes it possible to determine both the total solids and the solids-not-fat in any given sample of milk. There are a number of formulae which may be used for this purpose. Babcock's modified form is as follows:

\[ \frac{1}{2}L + 0.2F + 0.14 = S. n. F. \]

in which L stands for the lactometer reading and F for the per cent of fat. The total solids may be obtained by adding the solids-not-fat to the fat reading.

Milk is a delicate substance and very susceptible to undesirable flavors and odors. These may be either of two types: (a) those which are absorbed from feed eaten on the farm or from outside sources, or (b) those resulting from the action of microorganisms, especially bacteria, in the milk itself. If it is exposed to strong odors, such as foul stable air, cabbage, gasoline, etc., they will be absorbed very quickly. If placed in an ice-chest with such foods as pineapple or strawberries, it will be quickly tainted and have a disagreeable flavor. Disagreeable as these absorbed troubles may sometimes be, they are not so serious as those resulting from the growth of bacteria. The former decrease after removal from the source of contamination, while those resulting from bacterial action continue to increase in intensity as the milk grows older. It is highly desirable that milk should reach the consumer in as nearly as possible the condition in which it leaves the udder of the healthy cow. This means that much care must be exercised in its production and handling to prevent contamination. Bacteria gets into milk chiefly from the following sources: the interior of the cow's udder, the milk uteruses, the surface of the cow's body, the atmosphere of the stable and milk house, and the hands and clothing of the milker. If
the udder is free from disease, it is not a serious source of contamination, since its germ content rarely exceeds a few hundred per cubic centimetre. If, however, the udder is diseased, it may be a very serious source of infection. To secure milk with a low bacteria content those parts of the cow's body around the udder should be as clean as possible at milking time. The stable air should be free from dust, the milker's hands should be clean, and he should wear a clean suit. In many cases the utensils are the worst source of trouble, and great care should be taken to see that they are properly constructed and thoroughly washed and well sterilized either with boiling water or steam.

As soon as produced, milk should be cooled to a temperature which will prevent the rapid development of the bacteria in it. Bacteria grow very rapidly at temperatures above 70° F., but more and more slowly as the temperature is reduced below that point; at 50° or below, growth is relatively slow, hence for best results, milk should be held at these low temperatures. Dairy products from cows, government-inspected milk for the purpose of reducing the bacteria content and destroying any disease germs which may be present has become a common practice. Pasteurization consists of heating the milk to a temperature sufficient to kill all pathogenic organisms and a large percentage of the other forms, and then immediate cooling to prevent the rapid growth of those that remain. A temperature of 145° F. maintained for 30 minutes is believed to be sufficient to destroy all disease organisms.

The average per capita consumption of milk is about one-half pint per day. Large quantities, therefore, are required to supply the needs of the large cities. New York city alone consuming about 2,000,000 quarts daily. The problem of getting this vast amount of milk to the consumer in the city is a serious one for, as the cities have increased in size, it has been necessary to go farther away for the necessary supply of milk. At present, New York city obtains part of its milk supply from farms more than 200 miles from the city by rail and about 100 miles by railroad transportation of 10 to 12 hours, after which it must be taken to the city plant, pasteurized, cooled and bottled before ready for delivery. As a result this milk is frequently 24 to 36 hours old when delivered to the consumer. Because of the great rapidity with which bacteria grow, the injection of this long period of time between production and consumption has greatly increased the problem of a satisfactory city milk supply and has changed the methods of production and handling on the farm, during transportation and in the city.

Grades or Classes of Milk.—The present tendency is toward the division of milk and cream into grades, primarily upon its sanitary quality. The grades established in New York city will illustrate the general divisions into which market milk is placed: (1) Grade "A"—For infants and children. Raw: Cows tuberculin tested and free from all diseases; bacteria not exceeding 300 for milk and 150,000 for cream when delivered to consumer or at any time prior to such delivery; employees free from all communicable diseases or disease germs; delivered to consumer within 36 hours after production. Pasteurized: Cows healthy, as determined by physical examination at least once each year; bacteria content not to exceed 200,000 for milk and 150,000 for cream when delivered to consumer or at any time after pasteurization; employees free from communicable disease or disease germs; delivered to consumer within 36 hours after pasteurization; (2) Grade "B"—For adults (pasteurized). Cows in good health as determined by physical examination at least once each year; must not contain more than 1,500,000 bacteria before pasteurization and not more than 100,000 for milk and 500,000 for cream when delivered to consumer or at any time after pasteurization; employees free from communicable disease or disease germs; milk delivered to consumer within 48 hours after pasteurization, and cream within 72 hours; (3) Grade "C"—For cooking and manufacturing purposes. Milk or cream not conforming to all the requirements of the subdivisions of Grade A or Grade B, and which has been pasteurized, according to the regulations of the Board of Health, or boiled for at least two minutes. This milk must come from healthy cows, as determined by physical examination at least once each year; bacteria content must not be excessive; milk delivered to consumers in cans only, within 48 hours and cream within 72 hours after pasteurization. Same requirements as to health of employees as for Grades A and B. In addition to these requirements certain other regulations must be observed for each grade. In the case of each of these grades, the container must bear a distinct label, approved by the Board of Health, indicating the grade and no other statement or designating mark.

Certified milk is milk produced under the supervision and in conformity with the requirements of a medical milk commission appointed by the local county medical society. This milk must conform with very rigid regulations laid down by the commission, which insures this grade of milk being of a very high standard of composition and sanitary excellence.

Butter.—Butter is the fat of milk which has been separated from most of the other constituents by the process of churning. In modern dairy practice the cream is removed from the milk by centrifugal force, by means of the cream separator, this being possible because of the fact that the fat globules are lighter than the other constituents of the milk and are thrown out as the milk passes through the rapidly revolving bowl of the separator.

Bulletin 149 of the United States Department of Agriculture gives the following composition for butter:

### Average Composition of Butter by Classes

There are two common types of butter, known as sweet cream and sour cream butter. The sweet cream butter is made from cream in which lactic acid has not been allowed to develop. It has a mild flavor which is desired by many persons, and may be made from either raw or pasteurized cream. Sour cream butter is made from cream in which lactic acid has been allowed to develop, resulting in a product with a slightly higher pH value. This is the standard type of butter in America and in most countries of Europe. The production of good butter of uniform quality and high flavor requires the use of cream which has been produced and handled with care, cleanliness being a first essential in the making of good butter. After the clean, sweet cream is obtained, the next step is the development of the proper degree of acid or the "ripening" process. This is brought about by the action of certain forms of bacteria commonly known as the lactic acid bacteria (Bact. lactis acidum), which work on the milk-sugar, changing it into lactic acid. It is during this ripening process that the characteristic flavors and odors of the butter are developed, the final flavor depending upon the kind and degree of ripening and the degree to which the fermentation is allowed to develop. The finest qualities of the butter may be lost by the over-ripening of the cream. Cream may be ripened by the action of the lactic acid bacteria normally occurring in it or the process may be hastened by the use of a "starter," which is a pure culture of the lactic bacteria grown in skim milk or buttermilk. In many factories the cream is pasteurized before the starter is added, thus destroying most of the miscellaneous bacteria in the cream and making it possible to more completely control the nature of the ripening process. The purpose of churning is to remove the butter-fat from the milk serum and bring the fat globules into compact form. This is done by placing the cream in a churn of such form that when it is revolved slowly the cream is thoroughly agitated, thus bringing the minute fat globules in contact with each other and causing them to adhere as a result of the coagulation. The ease with which cream will churn is influenced by many factors, but chiefly by the richness of the cream, the temperature and the speed of the churn. When a sufficient number of fat globules have coalesced to form visible granules, the butter has "coagulated." The churning process may be controlled to give granules of any desired size. After the churning has been completed, the buttermilk is drawn off and the butter washed with cold water to insure the further removal of the buttermilk and to firm or harden the butter-fat, so it can be more easily handled. The wash water is then removed, the desired amount of salt added and the butter worked enough to give an even distribution and thorough incorporation of the salt. It is now ready to be packed in tubs or made into prunts, depending upon the market to which it is to be sent. The butter markets recognize certain fairly definite grades known as extras, firsts, seconds and thirds.

**DEFINITION OF GRADES—** *Extras* shall be a standard grade of average fancy quality in the season when offered under the various classifications. Ninety per cent shall conform to the following standard; the balance shall not grade below Firsts:

- **Flavor:** Must be sweet, fresh and clean for the season when offered if creamery, or sweet, fresh and reasonably clean if renovated or ladles. *Body:* Must be firm and may be slightly mottled. *Color:* Not higher than natural grass, nor lighter than light straw, but should not be streaked or mottled. *Salt:* Medium salted. *Package:* Sound, good, uniform and clean.

- **Firsts** shall have flavor. This grade shall be clean and must be good butter for the season when made and offered, under the various classifications. Ninety per cent shall conform to the following standard; the balance shall not grade below Seconds:

- **Flavor:** Must be reasonably sweet, reasonably clean and fresh if creamery or renovated, and reasonably sweet if lades. *Body:* Must be firm and fairly uniform. *Color:* Reasonably uniform, neither very high nor very light. *Salt:* May be reasonably high, light or medium. *Package:* Sound, good, uniform and clean.

- **Seconds** shall be a grade next below Firsts. **Flavor:** Must be reasonably good. *Body:* If creamery, must be solid boring. If ladles or renovated, must be 90 per cent solid boring. *Color:* Uniform and strong on tops and sides. *Body:* Not required to draw a full trier. *Color:* May be irregular or mottled. *Salt:* High, light or irregular. *Package:* Any kind of package mentioned at time of sale.

In grading any given lot of butter, it is scored on the basis of the following numerical values:

Process or renovated butter is made from butter of very poor quality by subjecting it to certain methods of cleaning and clarifying. The butter-fat is melted and cleaned by washing, aerating and other processes. This clarified butter-fat has very little taste or odor and must be reconstituted to make it resemble genuine butter. For this purpose it may be mixed
with milk, skim milk, buttermilk or cream and renchurned and worked to get the desired texture and flavor. In 1916 there were 23 factories operating under Federal license. These plants produced 27,542,015 pounds of rennovated butter during the year, of which 635,038 pounds were exported.

Cheese.—Cheese is a product made from milk by the coagulation of the casein and the expulsion of a portion of the moisture. The finished cheese contains most of the milk-fat, the casein and a part of the milk-sugar and salts. In the process of making, a small per cent of the fat, most of the albumin, milk-sugar and a small part of the mineral matter are washed out with the larger part of the original water, in the form of whey. The chief purpose of making cheese is to bring the nutrients of the milk into a concentrated form so they will keep longer and develop the special flavors characteristic of the different types of cheeses. A great variety of cheeses are found on the markets of this country and Europe, the variety being much greater in Europe than here. Although the number is increasing here, the Department of Agriculture gives a list of more than 100 kinds of cheese, with the methods of making and chemical composition of each. Cheeses may be divided into two general groups, based on the method used for coagulating the casein, the *acid or *cheese acids and the rennet-curd cheeses. In the first group the casein is coagulated by the formation of lactic acid in the milk. This may result from the growth of the lactic acid bacteria normal to the milk or by the addition of a *starter. The cheese in this group is made without any ripening process. There are but few varieties. In the second group the coagulation is caused by the action of rennet, which is added to the milk while it is fresh and has but little acid. This group contains the varieties which are of greatest commercial value. At one end of this group are the so-called *hard, while at the other end are the *soft varieties. Between these extremes there are many kinds which blend into each other by imperceptible degrees, the chief differences being due to the degree of moisture they contain and the nature of the micro-organisms causing the ripening processes. The most important of the cheeses is the one known as the American or Cheddar cheese. Its composition depends upon the quality of the milk and the method of making. Extended studies by the New York Experiment Station show the following composition for Cheddar cheese made from normal milk:

<table>

It will be seen that the yield of cheese increases with the per cent of fat in the milk, the increase, however, being not directly proportional to the increase in fat because the casein does not increase as rapidly as the fat. The quality of the cheese which can be made from any given lot of milk depends very largely upon the care it has received. Clean milk is the first essential for successful cheese making, and great care should be used not to take in milk having high acidity or bad flavors or odors or showing visible dirt. Any of these conditions indicate the presence of one or more types of bacteria which will injure the quality of the finished product. After milk of good quality has been obtained, the first step is to develop the proper degree of acidity. This may be done by allowing the milk to stand at a temperature favorable to the growth of the lactic acid bacteria, or the process may be hastened by using an artificial starter, as in the making of butter. As soon as the desired degree of acidity has developed, the rennet should be added. The amount to be used, as given by Publow, depends on (1) the strength of the extract; (2) the temperature of the milk; (3) the acidity of the milk; (4) the composition of the milk; (5) the kind of cheese to be made, and (6) the temperature of curing. In general, an amount sufficient to coagulate the milk fit for cutting in 25 to 35 minutes should be used; generally from 2½ to 4 ounces for 1,000 pounds of milk will suffice.

When the milk is well coagulated, small wire knives designed for the purpose are used to cut it into small cubes to facilitate the escape. It is important that the expulsion of the whey and the firming of the curd should be carefully controlled, which is done by stirring the curd and by the application of heat. When the little cubes of curd have contracted to slightly less than one-half their original size and are firm and rubber-like, the whey is drawn off from the vat. As soon as the whey is sufficiently removed the curd is piled along either side of the vat and allowed to drain thoroughly; after it is well matted it is cut into strips which may be piled to any desired depth to hasten the further removal of the whey. This cheddaring process is continued till the curd shows the desired texture and the whey from the curd has the required degree of acidity. The curd is now *milled by running it through a machine which cuts it into small, even sized pieces in order to further assist in the escape of the whey and make the salting process easier. The curd is then spread over the bottom of the vat, the salt sprinkled over the surface and the curd is stirred to insure the even distribution of the salt to the surface of each piece. The

The differences in composition are due chiefly to the variations in fat and casein in the milk.

The yield of cheese from milk is directly influenced by the per cent of fat it contains. This is shown by the following table;
chief purpose of the salt is to improve the flavor of the finished cheese; it may also assist in the removal of whey and the control of acid development. It is now ready to be put into proper form for marketing by placing the loose pieces of curd in metal hoops and subjecting to sufficient pressure to cause the pieces of curd to adhere to each other firmly. American Cheddar cheese is placed upon the market in a number of forms or styles as is indicated by the following table:*

Cheese of the Cheddar type requires considerable time for the development of the characteristic flavor. When first made the texture is tough and rubbery, and there is little cheese flavor or aroma, but in the course of a few months chemical and biological changes take place which give the cheese a soft, smooth texture and its characteristic aroma and flavor. Not all the changes occurring during this ripening process are well understood, but it is known that they are largely the result of bacterial action and that the Bact. lactis acid and B. bulgaricus types are important agents. This kind of cheese is commonly eaten at from three months to one year of age, depending upon the amount of flavor desired by the consumer. The following score card shows the method of judging the quality of this type of cheese:

There are several groups of cheddar cheese from which the micro-organisms which cause the ripening. One of these groups contains the Roquefort, Gorgonzola and Stilton in which a species of Penicillium mold plays a very important part in the ripening and development of the characteristic flavor. In these cheeses, the mold grows all through the interior and produces a rather strong, pungent flavor. Another type is represented by the Camembert, originating in France, but now made also in this country. This is a soft cheese in which the ripening is brought about by the combined action of molds and bacteria. A species of Penicillium grows upon the surface, producing enzymes which work into the curd, changing it to a soft creamy, semi-fluid texture. At the same time, Oidium lactis develops on the surface and this, together with the lactic bacteria growing inside the cheese, is largely responsible for the final flavor. Certain other species probably play a minor part in the ripening process. Still another group contains the Cottage, Cream, Neufchatel and others. These are soft cheeses which undergo no special type of ripening, but depend chiefly upon the amount of cream contained for their richness and flavor.

**Ice Cream.—** The manufacture and consumption of ice creams has experienced a great variety of products; the chief characteristic of which is that they are eaten in a frozen condition. Most of these are made from milk or cream with the addition of sugar and some flavoring materials, frequently a small amount of "filler" being used. These products vary widely in the per cent of butter-fat and the flavoring materials used. The classification for this class of dairy products given by the Iowa Experiment Station (Iowa Bulletin 123) is: Plain ice creams, nut ice creams, fruit ice creams, biskie ice creams, parfait, mousse, puddings, sundaes, laclos, ice, including sherbets and punches.

The following score card for judging ice cream has been prepared by the Wisconsin Experiment Station: Flavor, 40; body and texture, 20; bacteria, 20; fat, 10; appearance and color, 5; package, 5.

**Fermented Milk Drinks.**—Within recent years several forms of milk drinks which have undergone a lactic acid fermentation have come to be extensively used for human consumption. These various forms of buttermilk are all rich in food nutrients since they are made from some form of milk, but they are chiefly valuable as an aid to digestion and in the treatment of certain forms of intestinal disorders. They are found on the market under a variety of trade names such as kefirs, buttermilk, zoolak, matzoon, yogurt, leben, etc. All these products are the result of changes caused by the action of certain types of micro-organisms. In some of them, as in common buttermilk, the fermentation is caused by the action of the common lactic acid bacteria (B. lactis) in splitting up the milk sugar and forming lactic acid. Normally from 0.6 to 0.8 per cent of acid is formed. This type of buttermilk may result as a by-product of the ordinary process of butter-making or it may be made artificially by inoculating milk with a "starter" of lactic acid bacteria. After the milk is coagulated, it is churned to give it a smooth creamy consistency, then held at a low temperature to prevent further bacterial growth or deterioration in flavor. Most of the commercial fermented milks are made with cultures of B. bulgaricus, a type of lactic acid organism originally introduced from Bulgaria, but which has recently been found to be common in milk in this country. A culture of B. bulgaricus is added to either skimmed or partly skimmed milk from which the miscellaneous flora of the raw milk has first been eliminated by pasteurization. In this way, a more uniform product of high quality can be secured. After standing at the proper temperature until coagulated, the milk is churned in order to secure the desired smooth,
Creamy texture and then bottled and kept cold until needed for use. The B. bulgaricus is capable of producing a much higher percentage of acidity than is Bact. lactis acid, 2 to 3 per cent being not uncommon. It also gives a flavor which is preferred by many persons. Another type of product is represented by the kumiss and kefir in which there is an alcoholic as well as a lactic fermentation, the former being caused by the action of certain species of yeasts, which may develop 1 or more per cent of alcohol. Carbonic acid gas is also developed, causing these products to be decidedly effervescent.

Condensed Milk.—Some of the difficult problems in handling market milk are due to the facts: first, that it is bulky and, therefore, expensive to handle and transport; second, under normal conditions its life is not more than two or three days; and, third, its production is not constant throughout the year, resulting in periods of shortage and surplus. To overcome these difficulties large amounts of milk are now being condensed. This method was first used in America by Gail Borden in 1856, his first plant being in Connecticut. At first the industry grew very slowly, but it received a big development when Borden's patent expired, and it has become very rapid and it now represents one of the important branches of the dairy industry. In 1914 the output of condensed milk in the United States amounted to 875,507,438 pounds, with a money value of $85,870,409. In general there are two kinds of condensed milk, known as sweetened and unsweetened. The first is made by condensing about 2 1/2 to 3 parts of milk to one part of finished product and the addition of about 40 per cent of cane sugar. In the second 2 to 2 1/2 parts of milk are condensed to one part and no sugar is added. The removal of water is accomplished by heating the milk in partial vacuum, the milk usually being heated to 160° F. or higher in an open tank before being run into the vacuum pan. In the sweetened product the sugar is added to the milk in this open heating tank. The condensing is usually done under a pressure of about 25 inches and at a temperature of 130° to 160° F. This makes it possible to remove the water rapidly without imparting very much cooked flavor to the finished product. When it has reached the desired degree of concentration it is removed from the vacuum pan and run into suitable containers for marketing. That which is designed for household use is put into hermetically sealed tin cans, while for the wholesale trade milk cans or barrels may be used. While the sweetened condensed milk is not sterile it will keep for considerable lengths of time because of the inhibiting effect of the high concentration of the milk solids and the added cane sugar, upon the growth of the few microorganisms it contains. The unsweetened product is sterilized after the cans are sealed by treatment in a steam sterilizer, where it is subjected to pressure and a temperature well above the boiling point for from one to two hours. After being taken from the sterilizer the cans may be filled with carbon dioxide or potassium bicarbonate and shaken violently, for the purpose of breaking up any particles of curd which may have formed and to give the milk a smooth creamy consistency. Richmond gives the composition of the different kinds of condensed milk as follows:

(Made from skim-milk)

Considerable quantities of both the sweetened and unsweetened condensed milk are used for household purposes, especially in hot climates where fresh milk cannot be easily secured. Large amounts are used in the army and navy and for other official purposes. The milk is put in bulk is used for manufacturing purposes, chiefly by bakers, candy and ice cream makers.

**Powdered Milk.—** Powdered milk is made by the more complete removal of moisture than in the case of condensed milk. The objects sought by this process are similar to those for which condensed milk is made; namely, reduction in volume and cost of transportation and an increase in keeping quality. Two distinctly different methods are in use for making powdered milk. In one the partly condensed milk is dried on the surface of a heated revolving drum, and in the other it is sprayed or atomized into a current of heated air. In the former method the dried milk is scraped from the surface of the drum by means of knives, then ground into flour. In the latter method the moisture escapes as the minute particles of milk fall through the hot air, and the finished product collects on the floor of the drying chamber in the form of a very fine powder. Powdered milk is made from milk with different percentages of fat and also from skim-milk.

Powdered milk is not entirely sterile, but since it normally contains not more than 3 to 5 per cent of moisture bacteria cannot grow in it. If properly protected against moisture it will keep for a long time. Its chief uses are for cooking and for the making of candies and ice cream, for which purpose its small bulk and excellent keeping quality make it especially valuable. By the reincorporation of the proper amount of water powdered milk may be made to resemble normal fresh milk.

**Malted Milk.—** Is made from whole milk and the liquid obtained from a mash of ground barley, malt and wheat flour. Small amounts of sodium chloride, sodium bicarbonate, or potassium bicarbonate may be added. This product is then dried until it contains not more than 3 1/2 per cent of moisture. Its keeping properties are similar to those of powdered milk. Malted milk is largely used in the arti-
DAIS, dàs, a platform or raised floor at the upper end of an ancient dining hall, where the high table stood; also a seat with a high wainscot back, and sometimes with a canopy, for those who sat at the high table. The word is also sometimes applied to the high table itself.

DAISY (from d'ay's eye', in allusion to the appearance of the flower), a name applied to many plants of the Aster family, especially to those in which the heads are surrounded by white rays. The daisy proper is Bellis perennis, native of Europe, often grown, in its double forms, for its handsome flowers. In America the name daisy is most often applied to Chrysanthemum leucanthemum, known also as ox-eye daisy, a native of Europe but naturalized as a weed in eastern North America. The wild asters are sometimes known as daisies and various species of Erigeron are known by the same name.

DAISY MILLER. To know this novel by Henry James in all its forms, from the straightforward first telling of the story in the Cornhill Magazine in 1878 to its revision in the New York edition of 1909, including the preface to the latter and the reworking of the former as a comedy (printed in the Atlantic Monthly in 1883), is to know the matter and the manner of its author as well as any one book or group of books can indicate the changing style and spirit of an author. Although refused by the first publisher of the Aster family, as unjustified by the latter's output in England and America. It was, Mr. James says, "promptly pirated in Boston—a sweet tribute I hadn't yet received and was never again to know. Only that the most prosperous child of my invention," although essentially dramatic in its quality as a story, it lost its character when rewritten as a play, and "Daisy Miller: A Comedy" was the first of a line of failures which marked the playwright's of this dramatic storyteller. As a character, too, Daisy Miller was one of the first of a long line—the successful line of those "international young ladies" who represent over a third of the feminine interest in Mr. James' stories. Like Charlotte Verper and Maggie, Julia Bride, Isabel Archer, Miss Gunton, Pandora Day, and dozens of others, she was young America sketched on a background of Europe, where neither the glare of her moneybags nor the shadow of her newness could obscure her real inwardness. Whether she was altogether fine like Isabel Archer in 'The Portrait of a Lady,' exquisitely, unmorally superior like Charlotte Verper in 'The Golden Bowl,' or naively, tragically vulgar, made up of "charming little parts that didn't match and that made no ensemble," like Daisy Miller, she was always a type that Henry James drew with vigor, truth and affection. For anyone interested in the contrast in the "early" and the "later" manner of James, a parallel reading of "Daisy Miller" and the last published edition of 'The Portrait of a Lady' will well repay study. Artistically and the simpler diction and form of the original is as much better suited to the tale as it would be less well suited to the more intricate psychology of 'The Awkward Age,' 'The Ambassador,' or 'The Golden Bowl.'

DAK, dàk, or DAWK, a Hindoo word used in India for the mail or post; a relay of men, as for carrying letters, dispatches, etc., or travelers in palanquins. The route is divided into stages and each bearer or set of bearers serves only for a single stage. A dak-bunglow is a house at the end of the stage designed for those who journey by palanquin.

DAKAR, dà-kàr', Senegal, a port furnishing one of the best harbors on the west coast of Africa. It is situated near Cape Verde. There is a railroad between the port and the capital, Saint Louis. Dakar is a fortified military port. Pop. about 25,000.

DAKOTA, or DAKOTAH, a tribe of North American Indians, constituting at one time an important element in the great Sioux group. They were reported numerous in the 17th and 18th centuries and roamed over extensive hunting grounds in parts of the present States of North Dakota and South Dakota. The tribe consisted of six sub-tribes: (1) San-tee; (2) Sisseton; (3) Yankton; (4) Wahpeton; (5) Yanktonnai; (6) Teton. These sub-tribes were divided into bands or groups; as, the Teton, Blackfoot, and other groups. The Dakotas were fond of war and when not fighting against outsiders would sometimes fight among themselves. In 1658 they had 30 towns on the Mississippi, the Missouri and Saint Croix. The old war spirit has not died out; in 1862 a portion of the tribe attacked the whites and killed about 1,200. In 1890-91 the whites feared another uprising when the ghost-dance took place at the Pine Ridge agency. The Dakotas are located in the United States, chiefly in North and South Dakota, Nebraska and Montana. There are about 900 in Canada and in the United States about 25,623. See INDIAN SCHOOLS; RESERVATIONS, INDIAN; SIOUAN.

DAKOTA. States of the United States. See NORTH DAKOTA; SOUTH DAKOTA.

DAKOTA RIVER. See JAMES RIVER.

DAKOTA STAGE, one of the formations of the Lower Cretaceous series in the United States. The rocks, mostly conglomerates, clays and sandstones, cover a vast area extending over the Great Plains from Texas northward into Canada. Their origin is still a matter of speculation, since they are not marine; and in Texas lie unconformably upon the Comanche limestone. Near the Rocky Mountains the Dakota beds are much tilted, hardened and eroded. West of the Rocky Mountain uplift the Dakota rocks are more fine-grained and include beds of coal or lignite of workable thickness. In much of the Rocky Mountain region the Dakota rests conformably upon Comanchean and even Jurassic strata. The exact equivalent of the Dakota stage along the eastern border of the United States is the Herman Formation in the lower cross timber sand of Georgia and Mississippi is probably equivalent to the Dakota. See CRETACEOUS SYSTEM.
DAKOTA WESLEYAN UNIVERSITY—DALCHO 418

DAKOTA WESLEYAN UNIVERSITY. A charter for an institution to be known as Dakota University was obtained in 1883, as the result of a resolution of the Dakota Mission Conference held at Parker the year before. This resolution had provided for the appointment of a committee to investigate various offers of land and money for the object of establishing a school under the auspices of the Mission Conference. During the years 1883 and 1884 a stock company was formed, university lots were granted to the city of Mitchell, lots were sold, and in this way and by subscriptions, money was raised to begin the construction of a college building. In April 1885 a new company was organized and a new charter obtained which provided for the establishment of an institution of learning of high grade at Mitchell. S. Dak., whose course of instruction should become and be a full university course. Provision was made also for the establishment of a preparatory department and of a normal school. The latter shall be deemed by the board of directors in localities where suitable aid shall be offered for that purpose. The university and all of its departments were to be under the control of the Methodist Episcopal Church. On 9 March 1888 the college building was completely destroyed by fire. Other quarters were, however, provided for the classes and the work continued without serious interruption. During the following year a new building was erected, the present college hall. More recently Graham Hall, the President's House and Science Hall have been added. These buildings are all constructed of Sioux Falls granite. They are modern and well adapted to their purposes. Since the construction of the present buildings the resources of the institution have been quite generously equipped. The total resources of the institution besides campus, buildings and equipment are approximately $300,000. The library contains 40,000 volumes and increases by 1000 at present. The attendance for the last school year is 360.

DAKSHA, dák'shá, in Hindu mythology, a priest to whom Siva, his son-in-law, gave a ram's head after he had cut off Daksha's head in anger, because he did not invite the god to his grand sacrifice.

DAL, dál, Vladimir Ivanovitch, Russian lexicographer; b. Lugansk, govt. Ekaterinoslav, 1801; d. Moscow, 3 Nov. 1872. Of Danish parentage, he studied medicine at Dorpat (now Yuriev), and as military doctor took part in the Turkish and Polish campaigns of 1828–31. He was attached to the governor-general's staff in Orenburg for some years, and later accompanied the expedition to Khiva in 1839. Liberated from official duties, Dal made a tour of observation and research throughout the Russian Empire, collecting ethnographical data, folklore and some 30,000 proverbs, sayings and idioms, published between 1862 and 1879. His most valuable work was an "Explanatory Dictionary of the Living Russian Languages" (in 4 vols., Moscow 1861–68). His stories vividly reflect the characteristics of the people. A collected edition of his works was issued in St Petersburg in 1860–61. His "Handbook of Botany" appeared in 1849.

DAL, a Swedish word signifying, like the German Thal, valley, as in Dalecarlia.

DALAGUETE, dā-lā-gə-tē, Philippines, a town on the southeast coast of Cebu, 44 miles southwest of the town of Cebu. It was founded in 1711. Pop. 21,825.

DALBERG, dall'burg, Karl Theodor, Baron von, Prince and Archbishop of Mayence, chancellor of the empire, and elector: b. 1744; d. Ratisbon, 10 Feb. 1817. Having made his academic studies in the universities of Göttingen and Heidelberg, he devoted himself to the study of canon law and entered the ecclesiastical state. In 1772 he was made, by the Elector Archbishop of Mayence, privy counsel and governor of Erfurt. His administration was directed purely to the welfare of the people and he earned the reputation of a wise and capable man of affairs. He continued in the service of the elector and at the death of his patron he succeeded him as archbishop, elector and arch-chancellor of the empire (1802). In 1804 the Pope, Pius VII, went to Paris for the occasion of the crowning of Napoleon. Archbishop Dalberg was invited by Napoleon to Paris for the purpose of inducing Pope Pius to approve a proposed readjustment of ecclesiastical affairs in Germany. The archbishop served well the interests of the French emperor and later had his reward when the readjustment was effected, for, though he had to give up the archiepiscopal see of Mayence and his dignities in the empire, he was more than recompensed by being made metropolitan of Ratisbon, while Aschaffenburg, Wetzlar and Ratisbon were erected, on his behalf, into a princeedom. Further his purely ecclesiastical jurisdiction was enlarged by being made to extend over such parts of the ecclesiastical jurisdiction of Mayence, Cologne and Treves as lie on the right bank of the Rhine. But of all these dignities and powers, except the archbishopric of Ratisbon, he was deprived after the fall of Napoleon. He was a man of learning, a lover and patron of art and the intimate friend of Goethe, Schiller, Winckelmann, and the great contemporary lights of German literature. He was author of several works on philosophy and aesthetics (much consulted by scholars), and he took a lively interest in natural history, mineralogy, chemistry and agriculture. Consult Beaulet-Marconnay, "Karl von Dahlberg und seine Zeit" (2 vols., 1879); and Kramer, "Life of Karl von Dahlberg" (Leipzig 1821).

DALBERGIA, a genus of fine tropical forest trees and climbing shrubs, natural order Leguminosae, some species of which yield excellent timber. D. latifolia (the blackwood, or East Indian rosewood) is a magnificent tree, furnishing one of the most valuable furniture woods. D. sissoo gives a hard, durable wood, called sissoo, much employed in India for railroad sleepers, house- and ship-building, etc. Similar forms are found in Brazil.

under Frederick the Great, had retired to England for his health, and at his death Frederick came to Baltimore, Md., at the invitation of his uncle, who had removed to that place a few years before. Here he received a classical education, and then studied medicine, giving special attention to botany. He then entered the medical department of the army, and was stationed at Fort Johnson, Charleston harbor, but, in consequence of some difficulty with his brother officers, resigned in 1779, and practised in Charleston, where he was active in establishing a botanical garden. About 1807 he left his practice and became one of the editors of the Charleston Courier, a daily Federal newspaper. He began to be interested in theological studies in 1811, and in 1818 was ordained a priest of the Protestant Episcopal Church. In 1819 he became assistant at Saint Michael's, Charleston, where he remained until his death. He published 'Evidence of the Divinity of Our Saviour' (Charleston 1820); 'Historical Account of the Protestant Episcopal Church in South Carolina' (1820); and 'Ahiman Rezon' (1822).

DALCROZE, dal'kro-zh, Emile Jacques, Swiss composer and originator of eurythmics: b. Vienna, 6 July 1865. He lived in Geneva from 1873 to 1910. While pursuing the study of literature at the University of Geneva, he also attended the conservatory. Later he studied with Fuchs, Graedener and Bruckner at the Vienna Conservatory, and also with Delibes in Paris. In 1892 he became professor of harmony and solfeggio at the Conservatory of Geneva. It was here that he first conceived his idea of laying special stress on rhythm. He began by insisting on his pupils beating the time with their hands. Gradually the feet and the entire body were called into play, thus co-ordinating the music with elaborate and graceful rhythmic movement. He had developed his ideas to a considerable extent when he succeeded in interesting the French psychologist Edouard Claparède, and together with him he elaborated a special terminology and reduced his practice to a system. When his request to have his system introduced as a regular course into the conservatory was refused, he resigned and left Geneva. At Heilerau, near Dresden, he established in 1910 a special school for eurythmics, of which he was thereafter the director. The fame of this institution spread rapidly, so that within three years the system found its way into many schools of Germany, France, Russia and England. In 1913 it was introduced into Bryn Mawr College, and two special schools were established in New York and Chicago respectively. He has written two operas, 'Janie' (1893) and 'Sancho Panza' (1897); 'La Veillée' and 'Poème Alpestre,' for solo, chorus and orchestra; a violin concerto and some excellent songs.

DALE, David, Scottish manufacturer: b. Stewarton, Ayrshire, 6 Jan. 1739; d. Glasgow, 17 March 1806. He commenced life as a weaver, and having made the acquaintance of Sir Richard Arkwright a partnership was entered into between them for the erection of cotton-mills on the Clyde, and the settlement was in consequence formed. He had also extensive shares in other spinning factories established under his superintendence in various parts of Scotland, and was head partner in a large manufacturing firm in Glasgow, besides acting there as agent for the Royal Bank of Scotland. In 1799 he retired from business, and disposed of the works at New Lanark to a company of English capitalists, who entrusted the management of them to the celebrated Robert Owen (q.v.), who afterward married Mr. Dale's eldest daughter. He was the founder and pastor of a small religious sect called 'Dalites,' or 'Old Independents.'

DALE, Richard, American naval officer: b. 1756; d. 1826. At the beginning of the Revolutionary War he joined the English service, but the next year returned to the United States and entered the navy, serving under John Barry and later as first lieutenant to Paul Jones. He distinguished himself in the engagement between the Bon Homme Richard and the Serapis. He was several times a prisoner. He became captain after the war, and in 1801 commanded a squadron sent against Tripoli. He resigned the following year and the remainder of his life was spent in retirement.

DALE, Robert William, English Congregational clergyman: b. London, 1 Dec. 1829; d. 13 March 1893. He was for many years one of the foremost of non-conformist leaders in England. In 1868-69 he was chairman of the Congregational Union and for seven years was editor of The Congregationalist. In 1877 delivered a series of lectures on preaching at Yale University, being the first Englishman appointed to the Lyman Beecher lectureship. Among his more important writings are 'The Atonement' (1875); 'Lectures on Preaching' (1877); 'The Epistle to the Ephesians: its Doctrine and Ethics' (1882); 'The Life of Christ and the Five Gospels' (1890); 'Fellowship of Christ' (1891). He was a versatile and powerful speaker and exercised an extended influence, both in the United States and England.

DALE, Sir Thomas, Colonial governor of Virginia: d. Musulipatam, India, 1619. The date of his birth is unknown. He served with the English troops in the Netherlands and in 1606 was knighted by James I. The London Company sent him to Virginia in 1611 with supplies. In the absence of the governor-general, Lord de la Warr, Dale acted as governor from May to August 1611, when he was succeeded by Sir Thomas Gates, but he was in control again in 1614-16. His administration was noted for its severity. He placed the colony under martial law and republished a code of law known as 'Dale's Code.' He defeated the Indians and founded the settlements of Henrico and Bermuda Hundred. He returned to England in
DALE—DALHOUSSIE COLLEGE AND UNIVERSITY

1616, was sent with an East India Company fleet against the Dutch in 1618 and defeated a Dutch fleet near the present Batavia in November 1618. Consult Brown, 'The Genesis of the United States' (Boston 1890); id., 'The First Republic in America' (ib. 1898); Bruce, 'Economic History of Virginia' (New York 1907). The laws above referred to may be found in Force, 'Tracts and Other Papers Relating to the Colonies in America' (Vol. III, Washington 1836-46).

DALE, Thomas Nelson, American geologist: b. New York, 25 Nov. 1845. In 1885 he joined the United States Geological Survey, of which he became director in 1892. From 1893 to 1901 he was instructor in geology and botany at Williams College. He is author of 'The Scientific Spirit Applied to Living Subjects' (1913); also various bulletins, reports and papers on geological subjects.

D'ALAMBERT, da'lambar', the assumed name of Jean le Ron, French mathematician and philosopher: b. 1717; d. 1783. He was the natural son of Chevalier DESTOUCHES and MADAME de TENCIN. As an infant he was left on the portico of the chapel of Saint Jean le Ron, and was brought up by friends toward his support and had him educated by the Jansenists at the College Mazarin, where he was especially brilliant in mathematics, physics and astronomy. At the age of 22 he published a work on the integral calculus and two years later a work on the refraction of solid bodies. His 'Dynamics' (1743) is an epoch in mechan- ical philosophy. In it is elaborated his famous principle, "The impressed forces are equivalent to the effective force." He was elected to the Académie des Sciences in 1741 and 1742. He entered the French Academy in 1754, becoming the perpetual secretary of the latter in 1772. From 1751 to 1758 he was associated with Diderot in editing the 'Encyclopédie.' To it he contributed the general introduction, sketching in broad outline the evolution of the arts and science. He was invited by Frederick II to become president of the Berlin Academy, and by Catharine II of Russia he was offered 100,000 francs a year as tutor to her son. Because of his desire to live simply, he refused both offer. In his last years he was closeted with Mile. de l'Esprinasse, and her death in 1776 was a shock from which he never recovered. D'Alembert ranks among the greatest geometers of his century, and holds a high place also in literature and philosophy. His great service to letters was his exposure of the evils of patronage and his fostering the independence of his class from social and political power. Consult Bertrand, 'D'Alembert' (Paris 1889); Corneille, 'Éloge de D'Alembert' (delivered before the Academy, 1784); Tallentyre, 'D'Alembert the Thinker,' in his 'Friends of Voltaire' (London 1906). There is a partial edition of D'Alembert's Works' by Bossange (Paris 1821).

DALÉN, (Nils) Gustaf, Swedish engineer: b. Stockholm 1869. He was educated at the Government Engineering Institution and the Zurich Polytechnicum. An eminent consulting engineer, he was employed by the Swedish Carbide and Acetone Company in 1905, and later by the Swedish Gas-Accumulator Company. He invented a method for dissolving acetone in acetone which is used for automatic lighting in unmanned lighthouses and for railway signals, and he improved hot-air turbines, air compressors and milking machines. In 1912 he received the Nobel prize in physics and in 1913 was elected to the Royal Swedish Academy of Science. He wrote technical papers and a book, 'Chemische Technologie de Papiere' (1911).

DALHOUSSIE, George Ramsay, 9th Earl of, English soldier and administrator: b. 1770; d. 1838. He saw service at Martinique, in the Irish Rebellion of 1798, in Egypt and in the Peninsular War, and was present at the battle of Waterloo. In 1815 he was raised to a peerage of the United Kingdom. George Ramsay. He was lieutenant-governor of Nova Scotia, 1816-20, and founded Dalhousie College (q.v.), Halifax. His term as governor-in-chief of Canada, 1820-28, was marked by conflicts with Papineau and the Lower Canada assembly. He was instrumental in founding the Quebec Literary and Historical Society, and in raising a monument to the joint memories of Montcalm and Wolfe.

DALHOUSSIE, James Andrew Ramsay, 10th Earl and 1st Marquis of, British statesman: b. near Edinburgh 1777; d. at Alloa 19 Dec. 1860. After filling the offices of vice-president (1843) and president of the board of trade (1844), he was appointed governor-general of India (1847). In the administration of Indian affairs he showed marked ability, establishing railway lines, telegraphs, irrigation works, etc. Under his rule was annexed the Punjab, Oude, Berar and other native states, as well as Pegu in Burma, to the British Empire. His policy of annexation—especially where it was brought about through the natural and legal heirs in native states adjoining the British dominion, has been severely criticized; but that aside, he is regarded as one of the greatest of the Indian provincials. He was created a marquis in 1849.

DALHOUSSIE, New Brunswick, capital of Restigouche County, and a port of entry. It is situated on Chaleur Bay and the estuary of Restigouche River. The chief industries are fishing and trading in lumber, salmon and lobsters. Pop. 1,650.

DALHOUSSIE COLLEGE AND UNIVERSITY, an institution of learning located at Halifax, N. S. It was founded in 1818 by the Rt. Hon. George Ramsay (q.v.), 9th earl of Dalhousie, whose last public act in Nova Scotia was the laying of the cornerstone of the old building, 22 May 1850, but it was not until 13 Jan. 1821 that the 'quill to the Governors of Dalhousie College at Halifax' became a law. The purpose of the college as originally stated was 'for the education of youth in the higher branches of science and literature,' and 'to be open to all occupations and sects of religion.' It was to be modeled after Edinburgh University. The first name of Dalhousie was the 'College of Halifax,' but in 1821 the legislature granted $1,000 to the new college and named it after its founder. The original endowment, about $10,000, was derived from funds collected at the port of Castine, Me., during its occupation in 1814 by Sir John Sherbrooke, then lieutenant-governor of Nova Scotia. In 1841 university powers were granted to the college. The early
DALICHODACTYLY — DALL

history of Dalhousie is a brave struggle for existence. Two attempts were made to unite it with King's College (q.v.), but both proved failures. It does not carry the doors until 1834 and closed them against at 1843. From 1844 to 1863 Dalhousie ceased to operate as a college, and the governors either allowed the funds to accumulate or managed it as a high school. In 1863 the college was reorganized, with a staff of six professors, a tutor in modern languages and about 60 students. The governing bodies of the institution are (1) the board of governors, the supreme governing body; appointments to it are made by the governor-in-council on the nomination of the board. The governors have the management of the funds and the property of the college; the power of appointing the president, professors and other officials, and of determining their duties and salaries, and the general oversight of the work of the university. (2) The senate, consisting of the presidents and professors. To this body are entrusted, by statute, the internal regulations of the university, subject to the approval of the governors. All degrees are conferred by the senate. (3) Electrical faculties of arts and sciences, law, medicine and dentistry. These are committees of the senate for the supervision of the teaching of the university, the preparation of regulations governing the courses of study and the recommendation of suitable candidates for prizes, scholarships, diplomas and degrees. In addition to the courses in the liberal arts and in pure science and engineering, the university has schools of Law, Medicine and Dentistry. In affiliation with the Halifax Conservatory of Music it gives courses for the diploma of Licentiate of Music and the degree of Bachelor of Music. In affiliation with the Nova Scotia College of Pharmacy it gives courses leading to the degree of Bachelor of Pharmacy. The university is well equipped for its work and is constantly enlarging its sphere of usefulness. It has a large student body and admits students of either sex. The first site of the college was on the Grand Parade. In 1837 the college was removed to Carleton street, where the present buildings still are. In 1911 the Arts and Science departments were removed to the Studley estate, a beautiful site of 42 acres on the outskirts of the city, near the North West Arm. This was made possible by the results of a canvass for funds for building and endowment in 1912 which brought in $400,000. The buildings already erected on the new site are the Science Building, the cornerstone of which was laid by H. R. H. the Duke of Connaught, governor-general of Canada, and the Macdonald Qenological Library, the style of architecture chosen being 18th century Georgian. Many generous gifts have been made to Dalhousie, notably those of the late George Munro of New York, from 1879 to 1884, amounting to about $350,000, which did much to put the institution on its solid financial basis. Alexander McLeod, Sir William Young, John P. Mott, Dr. D. A. Campbell, Joseph Matheson and John Macnab have also made large gifts. Dalhousie University was put on the list of the Accepted Institutions of the Carnegie Foundation. It is the chief institution of learning in eastern Canada, and draws students not only from all over the Dominion but also from Newfoundland and the West Indies. It is noted for the number of its graduates who have attained eminence in educational and professional life. It is non-sectarian, and is supported entirely by voluntary endowment.

DALIN, dä-lén', Olof von, Swedish historian and poet: b. Vinberg, Holland, 29 Aug. 1708; d. Drottningenholm, 12 Aug. 1763. He studied at Lund, visited Stockholm, where he received a minor public office in 1733, and began to publish the weekly Svenska Argus in 1733 which appeared anonymously. This was followed by 'Tankar öfver Critiquer' ('Thoughts About Critics') in 1736; 'The Story of the Horse and Aprilwerk,' a series of political satires (1738); and 'Svenska Friheten' ('Swedish Liberty,' 1742). He then received a series of offices, first as tutor to the crown prince (1751); secretary of the Swedish Academy of Literature (1753). He endured a short period of political exile in 1755-56 during which he wrote his most famous work, 'Svenska Rikets historia' ('History of the Swedish Kingdom'), which was published in three volumes (1746-62). He was ennobled in 1751, was made privy councillor in 1753 and remained at court as royal historiographer until his death. Besides the works already mentioned, he wrote several minor dramatic works and numerous poems, epigrams, etc. His style is characterized by great vigor and spirit. The best edition of his poetical works appeared at Stockholm (1782-83).

DALLETH, Scotland, a market town seven miles southeast of Edinburgh. It has a corn market, a large and commodious market hall, erected in 1854; manufactories of carpets, brushes and bricks, besides iron foundries and tanneries. There are large coal mines near by. Much truck gardening to Edinburgh is carried on in the neighboring country. Dalkeith arose around an ancient castle, which was long a stronghold. It was successively held by the Grahams, the Douglasses, the Earls of Morton and the Earls of Bucheleuch. The castle is on the site of the old castle, is a large square structure overhangs the North Esk. Three times English rulers have occupied the palace on visits to Scotland. Pop. 7,019.

DALL, Caroline Wells Healey, American author: b. Boston, Mass., 22 June 1822; d. 1912. She lectured frequently on theological subjects and on questions associated with the amelioration of conditions affecting woman and was a founder of the Social Science Association. For many years she conducted a class in literature and morals at her home in Washington. With Mrs. Pauline Wright Davis, she founded Una, a journal devoted to woman's rights and the pioneer publication of its kind in Boston. The writings of Mrs. Dall are devoted chiefly to a discussion of the rights of woman, and her work 'The College, the Market and the Court or Woman's Relation to Education, Employment and Citizenship' (1867), is a widely known contribution to that subject. She was an industrious literary worker, and wrote many other books, among which are 'Essays and Sketches' (1849); 'Woman's Right to Labor' (1860); 'Egypt's Place in History' (1865); 'Patty
Gray's Journey to the Cotton Islands," and "What We Really Know About Shakespeare" (1885); "Nazareth" (1903); "Fog Bells" (1905).

DALLAS, William Healey, American naturalist: b. Boston, 21 Aug. 1845. He was a special student in natural sciences under Louis Agassiz. In 1865-66 he accompanied the International Telegraph Expedition to Alaska, and from 1871 to 1884 he was on the United States Coast Survey of Alaska. In 1880 he became honorary curator of the United States National Museum, and in 1893 professor of invertebrate paleontology at the Wagner Institute of Science, Philadelphia. In 1884-1905 he was paleontologist to the United States Geological Survey. He has received many honorary degrees, including that of LL.D. from George Washington University in 1915. His publications number some hundred titles, mostly on scientific subjects. He wrote works on the natural history of Alaska, such as "Alaska and Its Resources" (1870); "Reports of the Mollusca of the Blake Expedition" (1880-90); "Mollusca of the Southwestern Coast of the United States" (1891).

DALLAS, Alexander James, American statesman: b. Island of Jamaica, 21 June 1759; d. Trenton, N. J., 14 Jan. 1817. He was educated at Edinburgh, studied law in London and settled in Philadelphia in 1783. He became eminent at the bar, and was United States district attorney in Pennsylvania from 1810 to 1814. He was Secretary of the Treasury under Madison from 1814 to 1816 and in this capacity recommended to Congress the incorporation of a new United States Bank. For a short time he was Minister to London from 1819 to 1823. He originated a definite financial policy for the treasury and left it with a surplus of $20,000,000 within two years after he had found it bankrupt. He published "Reports of Cases Ruled and Adjudged by the Courts of the United States and of Pennsylvania before and since the Revolution" (4 vols., 1790-1807); "Address to the Society of Constitutional Republicans" (1805); "Exposition of the Causes and Character of the War of 1812-15" (1815). Consult "Life and Writings of Alexander J. Dallas" (2 vols., 1842) by his son, George M. Dallas (Philadelphia 1871).

DALLAS, George Mifflin, American diplomatist: b. Philadelphia, Pa., 10 July 1792; d. there, 31 Dec. 1864. He was the son of A. J. Dallas (q.v.). In 1813 he was admitted to the bar, and soon after entered the diplomatic service. In 1817 he was elected a United States Senator from Pennsylvania; was United States Minister to Russia 1837-39, and in 1844 was elected Vice-President of the United States. In 1846 his casting vote as president of the Senate repealed the protective tariff of 1842, though he had previously been considered a Protectionist. His course on this question aroused much indignation in Pennsylvania. He was United States Minister to Great Britain from 1856 to 1861. His principal published writings were posthumous, and included a "Series of Letters from London" (1889), and a "Life of A. J. Dallas" (1871).

DALLAS, Ga., town, county-seat of Paulding County; on the Southern and Seaboard Air Line railroads; about 34 miles northwest of Atlanta. There are cotton, yarn, hosiery mills, and several gold mines. New Hope Church, four miles from Dallas, was the scene of a sharp conflict between the armies of General Sherman and General Johnston on 25-26 May 1864. Pop. 1,259.

DALLAS, Ga., Battle Lines at: After the Confederate evacuation of Dalton (see DALLAS, Ga., MILITARY OPERATIONS AT), 12 May 1864, and the battle of Resaca, 14-15 May, Gen. Joseph E. Johnston's army retreated by way of Calhoun and Adairsville to Cassville, where General Johnston prepared to make a stand, and General Sherman closed in on that point; but Johnston abandoned Cassville during the night of the 19th, and next day crossed to the south side of the Etowah. Sherman occupied Cassville and Kingston, and prepared for another advance. As Johnston held the line of the railroad at Allatoona Pass and other points in advance of Marietta, Sherman concluded to turn those positions by moving from Kingston to Marietta by way of Dallas, a small town about 25 miles south of Kingston and 20 miles west of Marietta, and the converging point of many roads. On the 25th there was heavy fighting, but on the same day the Confederate cavalry discovered it, and Johnston divined its intention and prepared to check it by marching to Dallas and covering the roads leading to it.

On the 25th as the advance of Hooker's (Twentieth) corps nears Dallas it was discovered that Hood's Confederate corps held the cross roads at New Hope Church, four miles northeast of Dallas. Hooker concentrated his corps and attacked Hood late in the evening and was repulsed with 1,386 killed, wounded, and about 60 missing. Hood's loss was less than 400. During the night and early next day the rest of the army moved up on the right and left of Hooker and entrenched, McPherson's two corps, on the right, holding Dallas.

Sherman gradually extended to the left, skirmishing heavily all along the line, and on the evening of the 27th T. J. Wood's division of the Fourth corps attacked the extreme right of the Confederate army near Pickett's Mill and, after a most gallant effort, was repulsed with a loss of 1,224 killed and wounded and 318 missing. The Confederates reported a loss of 85 killed and 363 wounded. This engagement was a little over two miles northeast of New Hope Church.

There was now heavy skirmishing all along the line, some seven miles in length, and Sherman, still extending to the left, ordered McPherson, who was entrenched at Dallas, to close in on Hooker at New Hope Church, that Hooker might extend to the left; but McPherson deferred the movement until next day (28th), and was getting ready to make it when he was attacked. The Confederates made a desperate effort to seize his works, but were repulsed with a loss of some 390 killed and wounded. McPherson's loss was over 400, of whom 325 were killed and wounded and 54 missing in the Fifteenth corps, which bore the brunt of the assault. This was the battle of Dallas.

Sherman continued his movement to the left; McPherson left Dallas 1 June, and closed in on Hooker at New Hope Church; Hooker went to the left; all the wagon roads leading to Allatoona and Ackworth were secured. Allatoona.
toona was seized, also the railroad back to the Etowah, and 4 June Sherman was preparing to attack the Atlanta, and the little town of Brownsville, when he found that he had abandoned all his works and fallen back to Kenesaw Mountain; whereupon Sherman moved to the railroad to Ackworth and Big Shanty, and the first stage of the campaign for Atlanta ended. The Union loss in the battles and constant skirmishing was about 3,600 killed and wounded. Johnston reports the Confederate loss at 2,005 killed and wounded. The first stage of the campaign (June 31) cost the Union army 9,299 killed, wounded and missing; Johnston reports the Confederate loss for the same period at 5,807 killed and wounded. Consult 'Official Records' Vol. XXXVIII; Van-Horne, 'History of the Army of the Cumberland' (Vol. II); Sherman, 'Memoirs' (Vol. II).

E. A. CARMAN.

DALLAS, Ore., city, county-seat of Polk County; situated on La Creole Creek and the Southern Pacific and other railroads; about 70 miles southwest of Portland. The industries are dependent upon the production of the fertile Willamette Valley, in which Dallas is situated. Flour mills, sash and door factories, sawmills, organs, leather and woolen factories and tanneries constitute some of the industries. Sandstone quarries in the vicinity furnish excellent stone. The industrial interests are promoted by good water power. Dallas was settled in 1849 and in 1891 was chartered as a city. It contains a Carnegie library. Pop. 2,124.

DALLAS, Tex., city, county-seat Dallas County, 270 miles north of the Gulf of Mexico on the Trinity River, navigable to that point, and on nine steam and five electric interurban railroads. The steam railroads are the Missouri, Kansas and Texas Railway; Missouri, Oklahoma and Gulf Railway; Houston, Texas Central Railway; Texas and Pacific Railway; Texas and New Orleans Railway; Gulf, Colorado and Santa Fé Railway; St. Louis and San Francisco Railway, and the St. Louis Southwestern Railway. The interurban railway lines are the Texas Traction Company to Denison, north 77 miles; Southern Traction Company to Waco, south 97 miles, and to Corsicana, southeast 56 miles; Northern Texas Traction Company to Mt. Worth, west 30 miles, and to Cleburne, southwest 67 miles. Dallas has a new union (steam) terminal station, opened to the public in 1916, representing an investment in building and grounds of over $6,500,000, and a new electric interurban station representing an investment in building and grounds amounting to $1,600,000.

Commerce, Industries.—Dallas is the centre of the famous black lands of the Southwest, the principal products of which are cotton, corn, wheat, oats, truck and fruit. As the largest inland cotton market in the world the Dallas Cotton Exchange handles 1,500,000 bales of cotton in a normal year. The 1914 census gave the number of factories as 412, capital invested $23,408,000, with a total output of $42,559,789. Dallas leads in the manufacture of cotton ginning machinery and in saddlery and harness. Other important industries are flour mills, portland cement plants, oil refineries, iron and metal works, brewery, packing houses, cotton seed oil mills, cotton compresses, grain elevators, etc.

The largest wholesale jobbing and distributing centre, of the Southwest is the Cotton Exchange. The cotton manufacturers, that in a normal year do $262,000,000 business, Dallas is the distributing centre for automobiles of the Southwest, with large factories having assembling plants here, and in the sale and distribution of agricultural implements is second only to Kansas City. Dallas ranks 28th in postal receipts in the United States, is seventh in express business, sixth in telegraph business. It is the Southwestern headquarters for all classes of insurance business and is the home of the 11th District of the Federal Reserve Banking System, with 686 banks, whose capital and surplus amount to $49,972,500. There are 10 banks in the city of Dallas, whose resources on 1 Jan. 1918 amounted to $36,662,549, with deposits amounting to $80,143,274. The State Fair of Texas is the most successful institution of its kind in the world. It is unique in its organization, never having received State or Federal aid. All of its receipts are devoted to paying the expense of the annual fair and to making improvements upon its 162 acres of ground. It is the property of the city, being turned over to the city for park purposes with the exception of one month in the year during the annual fair. The plant was worth (1918) $2,200,000. As high as 1,004,400 admissions have been made during the two weeks of the fair. The permanent buildings are built of reinforced concrete and are The Coliseum, 150x200 ft., seating capacity 5,000; Textile and Fine Arts Building, 125x125 ft.; Exposition Building, 280x375 ft.; Ladies' Rest Cottage; Live Stock Pavilion, 124x192 ft.—cattle and swine barns are of reinforced concrete steel, with steel pens for the swine; Vehicle and Implement Building, 200x550; Grand Stand, 60x300; Automobile Building, 148x296. There are 19 individual and permanent exhibit buildings owned and erected by exhibitors.

Public Buildings, Etc.—Dallas is the convection city of the Southwest, with ample hotel facilities, unsurpassed by any city of its size. The Adolphus Hotel, the largest addition to the city, 23 stories high, costing $1,600,000, with an addition or annex costing $1,000,000; and adequate convention halls. Notable among public buildings are the city hall, courthouse, public library, the cathedrals of the Sacred Heart and of Saint Matthew's, the city hospitals and Saint Paul's and the Baptist Memorial sanitarium. One of the longest concrete viaducts in the world connects the city proper with Oak Cliff, a residential section of the city on the west side; this was built at a cost of $657,466. Much activity has been displayed in recent years in street paving and the development of a comprehensive system of boulevards, under a city plan. On 1 Jan. 1918 Dallas had 160 miles of paved streets, with 325 miles of cement sidewalks. The parks of the city, tastefully laid out, now cover 400 acres, and with public playgrounds are being developed to cover eventually 3,500 acres easily accessible.

Government.—Dallas enjoys the commission form of government, having been one of the first cities to adopt this plan. The property in the city is assessed for taxation at $136,971,975, the city tax rate being $1.95, and the State and county tax rate being $1.10.
Schools, Churches.—An important, educational centre, the principal educational institutions are the Southern Methodist University, with cash assets of $3,000,000 and 660 acres of ground, which opened in 1915 with 800 students; Dallas University (Catholic institution for boys), an investment in building and grounds amounting to $500,000; the Baylor Medical College and 53 private schools. There are 3 high schools and 29 ward schools in Dallas, the city having an investment in buildings, grounds and equipment of $2,000,000. The scholastic population of Dallas is 27,229. Dallas has 154 places of worship, of all denominations.

Climate.—The following are the average or normal temperatures in degrees Fahrenheit at Dallas as shown in the Special Bulletin No. 5, United States Department of Agriculture Weather Bureau: January, 46.3; February, 50.9; March, 57.3; April, 67.7; May, 73.4; June, 81.4; July, 84.4; August, 82.5; September, 76.8; October, 66.4; November, 55.5; December, 53.9, and January, 45.6; July, 93.1. The relative humidity, as it affects evaporation, is a potent factor in keeping the human organism cool. At Dallas the average humidity for the year at 7 a.m., 90th meridian time, is 80 per cent, and the average at 2 p.m. is about 43 per cent for July, 53 per cent for August and 54 per cent for September. Maximum or highest temperature recorded at the local office of the United States Weather Bureau since it was established in Dallas October 1913 was 102° on 30 July 1914. The temperature for the year of 1915 did not go as high as 100°. There is generally a cool, fresh and invigorating southerly breeze from off the Gulf of Mexico throughout the summer months that adds much to the comfort of the inhabitants of Dallas, and when this is taken into consideration with the records of the temperature and humidity it can readily be seen why sun-strokes are almost unknown in this section of the country.

Population.—In 1885 the population of Dallas was 10,918; (1900) 42,485; (1910) 92,104; July 1917 the government estimate was 129,632 and the Chamber of Commerce and Manufacturers’ Association estimate 1 Jan. 1918 (which includes suburbs not included in government estimate), 147,000.

G. S. Maxwell, Secretary of Dallas Chamber of Commerce and Manufacturers’ Association.

DALLES, The, or DALLES CITY, Oreg., county-seat of Wasco County; on the Oregon-Washington Railroad. It is about 30 miles northeast of Mount Hood, and on the portion of the Columbia River (on the Washington State boundary line) where the scenery is noted for grandeur. The Dalles contains Saint Mary’s Academy, a Carnegie library and a hospital. It is situated in a sheep and cattle-raising section, but its livestock is chiefly made up of cattle and wool, live stock, grain and fruit. Fruits grow here in the Columbia Valley. Its chief industries are flour and gist milling and wool scouring, box factories, salmon and fruit canneries, lumber yards, and fishing sheds, etc. Its military post at Fort Dalles was established in 1838, and about the same time a mission was opened by the Methodist Church. The railroad station is known by the name of Dalles and the local name often used is Dalles City; but the name of the postoffice is The Dalles. It was incorporated in 1838. The government is administered by a mayor, elected annually, and a municipal council. The waterworks are owned by the city. Pop. 4,880.

DALLIN, Cyrus Edwin, American sculptor: b. Springville, Utah, 22 Nov. 1861. In his native West he came into close contact with Indian life, in the realistic and impressive portrayal of which he excels all other myths. He studied under Truman Bartlett in Boston and under Chapu in Paris, where Buffalo Bill’s Wild West Show inspired his first equestrian statue, the ‘Signal for Peace’ (1890), which received a gold medal at the Chicago Exposition of 1893, and is now in Lincoln Park in that city; this was followed in 1899 by ‘The Medcine Man’ (Fairmount Park, Philadelphia), considered one of the most notable products of American sculpture. His other works include the marble statue of Sir Isaac Newton in the Congressional Library at Washington; ‘Don Quixote,’ which received a gold medal at the Saint Louis Exposition of 1904; the monument to the pioneers in Salt Lake City, and ‘Peace or War’ (Redskin’s Prayer) (1909). Consult Brush and Pencil, Vol. V, and Taft, ‘History of American Sculpture’ (New York 1903).

DALLINGER, William Henry, English scientist and clergyman: b. Devonport, England, 5 July 1842. He entered the Wesleyan ministry in 1861 and after being minister at Liverpool 12 years was governor of Wesley College, Sheffield, 1880-88. His microscopical researches began in 1870. He became fellow of the Royal Society in 1880, has been Rede lecturer at the University of Cambridge, lecturer at Oxford and at the Royal Institution and was president of the Royal Microscopical Society 1883-88. He has published ‘Minute Forms of Life’ (1885); ‘The Origin of Life’ (1878); ‘The Creator and What We May Know of the Method of Creation’ (1887); ‘Princ of Carpenter’s The Microscope and Its Revelations’ (1891).

DALMAN, däl’män, Gustaf Hermann, German Lutheran scholar: b. Niesky in Silesia, 9 June 1855. He was educated among the Moravians and was graduated from their theological school at Gnadenfeld. Here he was professor of the Old Testament and practical theology 1881-87. In 1887 he left the Moravians and joined the Lutherans and the same year received the degree of Ph.D. at Leipzig University. For the next 15 years he was a professor and finally the director of the Institute Delitzschianum at Leipzig. Beginning with 1890 he has been associate professor of Old Testament Exegesis in the University of Leipzig. Since 1902 he has been on furlough and has been serving as director of the German Evangelical Archeological Institute in Palestine. He has been a voluminous writer, his writings covering quite a wide range in the various fields of theology. Several of his works have been translated into English. His most important work is ‘Theology and Judaism’ (German, 1898; English, 1901); ‘The Words of Jesus considered in the light of Post-biblical Writings and the Aramaic Language’ (Edinburgh 1902). He has been a profound student of the Aramaic, and issued a
grammer of the language in 1894. It has not been translated into English.

DALMANUTHA. A place mentioned in the New Testament (Mark viii, 10.). Rendell Haslam states that the name is a corruption from the Syriac. Other writers think Megiddo is meant. W. M. Thompson located it on the sea of Galilee, one mile north of Jarmuk, at a site now known as Ed-Delemiyak. Sir W. Wilson and H. B. Tristram suggest that the site is one and a half miles from Migdol.

DALMATIA. A crownland of Austria-Hungary forming part of the kingdom of Croatia-Slavonia-Dalmatia and situated along the eastern Adriatic coast. It is bounded to the north by Croatia, to the east by Bosnia-Herzegovina, to the south by Montenegro. The area is 4,956 square miles. There are about 500 islets of which about 50 are of appreciable size and importance, belonging naturally to Dalmatia and known generally under the name of Dalmatian Archipelago. The largest (exceeding 172,000 acres) is Cres, next in order, the largest, two islets are Braza, Lessina, Curzola, Meledo, Lissa, Solta and Lagosta. The numerous channels, straits, gulfs, bays, fjords and the hills and rocks of the mainland branching from the mountain range of the Dinaric Alps, give the country a most picturesque aspect. The Gulf of Cattaro, which is in the extreme south of Dalmatia, is one of the finest harbours in Europe. The principal rivers are Neretva, Zrmanja, Krka and Cetina, but there are many rivulets and brooks whose course is interrupted by frequent cascades of incomparable beauty. The climate is moderate as the thermometer never shows below zero (C) in winter and the heat in summer is tempered by many winds. The most important towns are Dubrovnik (Ragusa) Zadar (Zara), Shibenik (Senbenico), Blato and Kotor (Cattaro). By a recent census the population of Dalmatia was computed to 645,666 consisting chiefly of Serbo-Croatians (about 95 per cent). According to the same census there were 510,669 inhabitants speaking Serbo-Croatian language, 3,065 persons speaking other tongues and 18,025 speaking Italian. Serbo-Croatian is the official language but the use of Italian, which is known to the majority of urban population, is also permitted. Notwithstanding the dearth of water and forests the vegetation of Dalmatia is very diverse. The rich forests were cut down by the Venetians for the construction of their mighty fleets. The fields sown with cereals all description cover 11 per cent of the entire area. The chief products of Dalmatia are wine, oil, exceptionally good quality, and olive oil. Agriculture is very popular and prosperous in the islands but the most usual industries and manufactures are almost totally absent. Shipbuilding, wine and oil-pressing are the principal industries. Cattle and horses are very scarce while sheep and goats are numerous and of good breed. Asphalt, lignite and salt are mined. The ports of Dalmatia are very active as the bulk of the Austro-Hungarian foreign commerce is conducted through them. There arrive about 20,000 merchant vessels every year. Olive oil, maraschino cordial, fish, meat, honey, wine and asphalt are exported. Cereals are a principal item of import. The ways of communication in the interior of the country are wholly inadequate chiefly on account of the rocky configuration of the soil, despite the good lesson which Napoleon I taught the inhabitants while he ruled the Illyrian provinces. There are about 145 miles of railway. Dalmatian waters teem with many varieties of delicious fish and fishing constitutes one of the most important sources of the inhabitants of the coast. Sar-dines and tunny-fish are caught in enormous quantities.

Education is obligatory between the ages of 6 and 12 and there is hardly a village to be found without at least one primary school. There are two theological seminaries at Zara and many secondary, naval, commercial and professional schools and agricultural colleges, all of which are supported by the Imperial Government. At Ragusa and Cattaro there are naval colleges which supply officers for the mercantile marine. In 1911 there were 488 elementary schools with 58,000 enrolled pupils.

Prior to the Roman invasion of Dalmatia the country was populated by the Illyrians against whom a Roman legion, under the leadership of Consul Orful in the year 156 B.C., but the definite subjugation of that province was effected by Augustus on the occasion of pacification of the Pannonians A.D. 6. The Illyrians were occupying themselves chiefly with cattle raising, agriculture and seafaring. Dalmatian pirates are notorious in the history of navigation in the Adriatic. The language and customs of the Dalmatians soon gave way to the Latin, and Dlocletian, born in Dalmatia, was elected the first Latin pontiff in the 3rd cent. ('Palatinus'). The ruins of the imperial palace are still to be seen in that town. Upon the fall of the Roman Empire in 395 Dalmatia was apportioned to its eastern part only to be conquered, about a century later, by the Ostrogoth kings. In the course of the 6th century the Avars took hold of Dalmatia but had soon to yield it to the irresistible invasions of the Serbians who divided the entire province in several counties with Belgrade (Zara Vecchia) as the centre. The influence of Venice was felt in Dalmatia early in the 10th century, but it was only in 1104 that Doge Dominico Minieli succeeded in defeating the Hungarian king, Koloman, who had effected a union with the Croatians and proclaimed himself king of Croatia-Dalmatia. The citre of Belgrade was demolished by the Venetians. After the fall of the Republic of Venice (1797) Austria, by virtue of the Treaty of Campo Formio obtained sovereign rights over Dalmatia but had soon (1805) to cede it to Napoleon who incorporated that province, which is of his famous Illyrian Kingdom. The little Republic of Dubrovnik (Ragusa) retained its autonomy until 1808 but Napoleon abolished it in that same year. By the Treaty of Vienna (1815) Dalmatia was again given to Austria. In 1869, when the Austrian Government introduced in Dalmatia universal conscription, a rebellion took place in Krivoshita and Bocca di Cattaro and the Austrians suffered great losses in men and provisions. However the year 1861 saw a fresh insurrection which lasted until 1862, when it was put down with great cruelty by the Imperial army. Emperor Francis Joseph I, by his acts of 26 Feb. 1861 and 1 Jan. 1868, granted charters whereby Dalmatia forms part of the Trince Kingdom of
Croatia-Slavonia-Dalmatia whose King is the sovereign of Austria-Hungary. The head of the government in Zagreb bears the title of Ban of Croatia, Slavonia, and Dalmatia. In the Imperial Parliament in Vienna Dalmatia is represented by 11 deputies elected by universal suffrage of whom nine are Croatians and two Serbians. The principal instrument of the public local government is the Diet (Sabor). Its powers, organization and functions are defined by the constitution of the country. The seat of the local administration is in Zadar (Zara) and the executive authority is vested in the person of the governor appointed by the Austrian emperor. He is the chief of the provincial administration of the state, of the board of education, the public finances and the postal and telegraph services.

Chief of Slavonic Division, New York Public Library.

DALMATIAN DOG. See Dog.

DALMATIC (Dalmatica), an ecclesiastical vestment, open at each side below the insertion of the sleeves, which are wide. It is the principal vestment worn by the deacon in the Roman Catholic Church when ministering at the Mass, or in processions and in other functions. It is also worn by the subdiaconate the chasuble, by bishops, when they celebrate the Mass pontifically; and it is a part of the vesture of a king both in England and in continental European countries. It is commonly of silk; its color varies according to directions of the ritual. The dalmatic was originally a long undergarment of white Dalmatian wool, but little different from the Roman tunic, and not till the fourth century was it a distinctively ecclesiastical garment. At first it was worn only by the Roman deacons, but later its use extended throughout the whole Church. So, too, the use of the dalmatic as part of the solemn attire of bishops was at first restricted to the Pope, but afterward was conceded to all bishops. In the Greek Church a vestment answering to the dalmatic, called stoichoiron, is worn by deacons in solemn functions, and in the same Church, the celebrating priest wears the stoichoiron under the chasuble; but in this case the garment is always white. The two stripes, usually on the dalmatic, were originally purple, that is, a shade near scarlet, and were probably a survival of the later use of the tunic of senators. See Costume, Ecclesiastical.

DALMELLINGTON, Scotland, village of Ayrshire, terminus of a branch line of the Glasgow and South-Western railway, 15 miles northeast of Ayr. It is a coal mining and stone quarrying centre, and was an important during the Covenanting period. Pop. 1,550.

DALMORÉS, dál-mó-rés', Charles, French operatic singer; b. Nancy, 31 Dec. 1871. With the object of training as a violinist he entered the Conservatoire de Nancy. An accident to his arm obliged him to renounce the violin, and he then became a violinist and he took up the study of the horn, which he also studied at Paris. In 1888-94 he was engaged on the Lamoureux orchestra, becoming also a skilled cellist. In 1894 he removed to Lyons as teacher of the horn at the conservatory there. Dauphin here trained his voice and in 1899 he made a successful début as singer at Rouen. In 1906 he was engaged as tenor by Hammerstein at the Manhattan Opera House, New York, where he won fame which spread to Europe and brought many tempting offers from Catholic opera houses. In 1910 he became first tenor of the Chicago Opera Company. His principal rôles are Nicias in 'Thais'; Julian in 'Louise'; Vinicius in 'Quo Vadis'; Samson in 'Samson and Delilah' and Herod in 'Salome'.

DALNY, daalni, or TAIREN, but now generally Dairen, city and free port 20 miles north of Port Arthur belonging to Japan. It is situated on the Liao-tung Peninsula, which extends south into the Gulf of Fechil, China. It was intended for the eastern terminus of the Siberian Railway and was established as a commercial seaport by edict of the Tsar of Russia, dated 30 July 1899, and was thrown open to the commerce of all nations in December 1901. During the Russo-Japanese War it was occupied by the Japanese troops under Oka, 30 May 1904, following on the battle of Kin-chow. With the leased territory of Kwantung, the southern part of the Liao-tung Peninsula, it fell to Japan as the spoil of war under the Treaty of Portsmouth; and the lease from China, originally for 25 years, was extended to 99 years by treaty in March 1913. Dalny again became a free port in 1906. The harbor, in which vessels drawing 30 feet can enter at low water, is one of the finest and deepest in the Pacific, is ice-free all the year, and the surface of the bay is sufficient for all the shipping of China. It is protected by a breakwater 1,000 yards in length. The railway lines connect Port Arthur and Dalny with Mukden, Harbin and the East China railway system. The population is about 36,000. The area of the leased territory extends to 1,250 square miles, with a population of 522,489.

DALRYMPLE, Alexander, Scottish hydrographer; b. Hailes, near Edinburgh, 24 July 1737; d. London, 19 June 1808. In 1732 he went to India in the service of the East India Company and while there made hydrography his particular study. In 1783 he obtained the appointment of hydrographer to the admiralty, as well as to the East India Company. His most important publications are 'Discoveries in the South Pacific Ocean'; 'A Collection of South Sea Voyages'; 'A Relation of Expeditions from Fort Marlborough to the Islands of the West Coast of Sumatra'; 'A Collection of Voyages in the South Atlantic Ocean'; 'A Memoir of a
DALRYMPLE—DALTON

Map of the Land Round the North Pole; 'Journal of the Expeditions to the North of California'; 'The Oriental Repository.' He was also the author of many historical and political tracts.

DALRYMPLE, Sir David, Lord Hailes, Scottish lawyer and antiquarian: b. Edinburgh, 27 Oct. 1726; d. 29 Nov. 1792. In 1766 he was made a judge of the session with the title of Lord Hailes, and later a lord of judicature. He published 'Annals of Scotland' (1786) and other works on Scottish history, both ecclesiastical, biographical and political, antiquities. He is mentioned in Boswell's 'Life of Johnson' as an intimate friend and correspondent of Johnson.

DALRYMPLE, James, 1st Viscount Stair, Scottish lawyer and statesman: b. Ayrshire, May 1619; d. Edinburgh, 25 Nov. 1695. In the Civil War he sided with Parliament, but soon relinquished that party and became professor of philosophy at Glasgow. He then adopted law as a profession, and in 1670 was made president of the Court of Sessions. He was adverse to the severe measures adopted against the Covenanters; having excited the enmity of the Duke of York, lost his appointments and retired to Holland in 1682. Here he became a favorite with the Prince of Orange, who, after the revolution, created him Viscount Stair. Stair wrote 'The Institutes of the Laws of Scotland' (still a standard authority); 'Philosophia nova experimentalis'; 'Vindication of the Divine Perfections'; 'An Apology for His Own Conduct.' Scott has made Dalrymple's daughter, Janet, the heroine of the 'Bride of Lammermoor.' Consult Mackey, 'Memoirs of Sir James Dalrymple, First Viscount Stair' (Edinburg 1873).

DALRYMPLE, John, 1st Earl of Stair, Scottish statesman: b. 1648; d. 8 Jan. 1707. He was son of James Dalrymple (q.v.). He was called to the Scottish bar in 1672, and his eloquence and ability soon gained him a leading place in his profession, as later in the Scottish Parliament. He became Lord Advocate (1687). Under Charles II he suffered imprisonment twice for not sufficiently enforcing the persecuting acts, but held office in Scotland under James II. He was largely instrumental in carrying out the 1688 revolution in Scotland, and for some time acted as the king's representative in that country, but his undoubted services have been somewhat discounted by his connection with the massacre of Glencoe in 1692. He assisted largely in bringing about the union between England and Scotland. Under Anne he was privy councillor for Scotland (1702). He succeeded his father as viscount in 1695 and in 1703 was created earl.

DALRYMPLE, John, 2nd Earl of Stair, Scottish general: b. Edinburgh 20 July 1673; d. there, 9 May 1747. He entered the Cameron Regiment in 1692, and in 1701 was appointed lieutenant-colonel of the Scots regiment of foot guards. In 1707 he succeeded to the earldom and became one of the Scottish representatives in Parliament, but still continued his military life, and distinguished himself in the campaigns of Marlborough, and more particularly at the battles of Oudenarde, Malplaquet and Ramillies. On the accession of George I he was appointed a privy councillor, and went on a diplomatic mission to France, where he attracted much notice by the splendor of his retinue, and also displayed great skill and address. He returned in 1720, and for the next 20 years he took an active interest in agricultural pursuits. In 1742, on the dissolution of Walpole's administration, he entered public life and was sent as ambassador to Holland. He served later under George II at Dettingen, and was made commander-in-chief of the army of Great Britain. Consult Graham, 'Annals and Correspondence of the Viscount and Second Earls of Stair.'

DALSGAARD, Dansgaard, Christen, Danish artist: b. Krabbeholm, Jutland, 30 Oct. 1824; d. 1907. He studied at the Copenhagen Academy. He was made professor of drawing at the Academy of Sorø in 1862, and was elected to the Copenhagen Academy in 1872. His impressive delineations of Danish peasant life, showing a keen sense of observation and imbued with sincere sentiment, have justly caused him to be esteemed one of the typical masters of Denmark. Especially noteworthy are: 'Christmas Morning'; 'Jutland Peasants Going to Church'; 'Having Excited the Enmity of the Duke of York'; 'Seizure for Debt'; 'One of the Wise Virgins'; 'Ansgar and Odebir Baptizing Mother and Child'; and 'The Farewell.'

DALTON, John, English chemist and physicist: b. Eaglesfield, near Cockermouth, Cumberland, 6 Sept. 1766; d. Manchester, 27 July 1844. He was educated at the Quakers' school in his native town and from 1781–93 was assistant at a boarding school at Kendal. Here he showed such a decided turn for mathematics that he obtained the position of professor of mathematics and natural philosophy in New College, Mosley Street, Manchester, in 1793. The same year he published his early meteorological observations and essays. In 1799, on the removal of New College to York, he resigned his chair, but continued to give private lessons in the same branches. In 1808 he commenced the publication of his 'New System of Chemical Philosophy,' which, containing his brilliant discovery of the atomic theory, produced an important revolution in the science, gave him a very high place among philosophical chemists, and spread his fame over Europe. He pursued diligently research in mixed gases, force of steam, elasticity of vapors and the effect of heat on gases and other important chemical actions. The Royal Society of London in 1826 admitted him a member, and unanimously awarded to him the first of two gold medals intended for those who had made the greatest discoveries in science. He was also elected member of the Institute of France, of the Royal Academies of Science of Berlin and Munich, and of the Natural History Society of Moscow. His papers were published in the Memoirs of the Literary and Philosophical Society of Manchester (of which he was president), in the Philosophical Transactions, in Nicholson's Philosophical Journal, and Thomson's Annals of Philosophy. His 'Meteorological Essays and Observations' were published in 1793. Consult 'Life,' by Lonsdale (1874); Roscoe and Harden, 'New View of the Origin of Dalton's Atomic Theory' (1896).

York, 11 Feb. 1889. He was graduated at Harvard in 1844 and at Harvard Medical School in 1847. He was successively professor of physiology at the University of Buffalo, at the Vermont Medical School, at the Long Island College Hospital, and at the New York College of Physicians and Surgeons, of which he became president in 1883. He served as an army surgeon throughout the Civil War. His published works include 'Human Physiology' (1859); 'Physiology and Hygiene for Schools, Families and Colleges' (1868); 'The Experimential Method of Medicine' (1862); 'Topographical Anatomy of the Brain' (1885).

DALTON, Ga., city and county-seat of Whitfield County; on the Southern and the Nashville, Chattanooga & Saint Louis railroads; 100 miles northwest of Atlanta. It is a health resort, and the seat of Dalton Female College. Iron, manganese and limestone are found in great quantities in its vicinity and the city has a large trade in cotton, grain and fruit. It has canning factories, cotton compresses, flour mills, marble works, agricultural implement factories, car factory, a chair factory, lumber mills, etc. Dalton was settled in 1835 and was incorporated the same year. In 1863-64 it was a Confederate headquarters of Joseph E. Johnson defending the approaches to Atlanta and was the scene of considerable military activity. The government is vested in a mayor elected biennially, three commissioners and a board of aldermen. The municipality owns the waterworks, gas and electric-lighting plants. Pop. 5,324.

DALTON, Ga., Military Operations at (23-25 Feb. 1864, and 8-12 May 1864, including engagements at Buzzard's Roost Gap, Dug Gap, Rocky Face Ridge and Varnell Station). Dalton is in the northwestern part of Georgia, where the Chattanooga and Atlanta Railroad is intersected by that from Cleveland, Tenn. By rail it is 38 miles southeast of Chattanooga. When General Bragg was supposed definitely to have abandoned Chattanooga, 9 Sept. 1863, General Halleck ordered Generals Wright and Logan to occupy Dalton, and there Bragg retreated after his defeat at Lookout Mountain and Missionary Ridge, 24-25 Nov. 1863. In February 1864 General Grant ordered General Thomas to seize the town. Thomas moved, reported that he could not carry the position, and the effort was abandoned. His movement cost the Union army about 300 killed and wounded, and the Confederates about 200.

Dalton, the first objective point of Sherman's Atlanta campaign, was held 30 April 1864, by Gen. J. E. Johnston, with 54,400 men. The approaches to the place were difficult, and it was practically impregnable. Early in May Sherman concentrated his grand army in and around Chattanooga for his Atlanta campaign. It was made up of the armies of the Cumberland, Tennessee and Ohio, commanded respectively by Gen. Geo. H. Thomas, J. B. McPherson and J. M. Schofield, aggregating 98,797 men and 254 guns. The Army of the Cumberland had about 60,000 men, the Armies of the Ohio 25,000, and the Army of the Ohio 14,000. On 6 May the Army of the Cumberland was at and near Ringgold, the Army of the Tennessee at Gordon's Mill, on the Chickamauga, and the Army of the Ohio near Red Clay, on the Georgia line, north of Dalton. The four corps of Thomas and Schofield were ordered to move on Dalton in front, while McPherson with two corps moved through Snake Creek Gap. On the 7th McPherson was ordered to march from Gordon's Mills through the Gap to Resaca, 18 miles south of Dalton. He marched by way of Ship's Gap and Villanow, pushed through Snake Creek Gap, a wild defile, nearly six miles long, 15 miles south of Buzzard's Roost, and on the morning of the 9th drove back Grigby's Kentucky cavalry brigade, and marched to within a mile of Resaca, then held by two brigades under General Cantey. Finding the place too strong to be assaulted, McPherson fell back to a strong position at the end of the Gap. Meanwhile Thomas and Schofield had pressed forward. Thomas drove the Confederates in his front full through Buzzard's Roost Gap, and Schofield closed down on Thomas' left. On the 8th there was heavy skirmishing between Thomas and the Confederate divisions of Stewart and Bate at Buzzard's Roost and about six miles farther south a determined assault.

The road from Lafayette to Dalton passes through a cleft in the palisade, which had been deepened and widened, hence known as Dug Gap. Geary's division attacked this gap. Skirmishers were thrown out who drove those of the enemy from the foot of the ridge and up the road nearly to the summit, when two brigades were formed in double lines on either side of the road. The Confederates were driven clear to the summit. The position of the Gap could not be carried, and an assault on the perpendicular palisade south of it was ordered, where it was broken by a few clefts through which four or five men could move abreast. The men charged, a few reached the summit, but killed or captured, and the assault failed. After a short breathing-spell another effort was repulsed with much loss. Still another attempt was made by a single regiment, but it also failed.
DALTON — DALZELL

Everywhere the assault was repulsed, and the Federals withdrew after a loss of 306 killed and wounded, and 1,131 captured or missing. It is doubtful if the Confederates lost more than half this loss. (Official Records, 3 Vol. XXXVIII; Van Horne, History of the Army of the Cumberland.)

Daly, Arnold, American actor: b. Brooklyn, N.Y., 4 Oct. 1875. In 1892 he made his début in 'The Jolly Squire.' Thereafter he appeared in many successful plays and in 1903 produced his first six or seven years he appeared exclusively in Shaw's dramas (Mrs. Warren's Profession) (1904); 'You Never Can Tell' (1904); 'Arms and the Man,' etc. In 1913 he appeared in Birmingham's 'General John Regan.'

Daly, Charles Patrick, American jurist and author: b. New York, 31 Oct. 1816; d. 19 Sept. 1899. He had a distinguished judicial career in his native city, becoming justice of the Court of Common Pleas in 1844, first judge of the court in 1857 and chief justice in 1871, retiring on account of age in 1886. He was president of the American Geographical Society from its inception until his death. His works include 'First Settlement of Jews in North America'; 'What We Know of Maps and Map Drawing Before Mercator'; 'A History of Physical Geography'; 'Historical Sketch of the Judicial Tribunals of New York.'

Daly, John Augustin, American dramatist and theatrical proprietor: b. Plymouth, N.C., 20 July 1833; d. Paris, 7 June 1889. In 1869 he opened his Fifth Avenue Theatre on 26th Street, New York; and after its destruction by fire in 1873 he opened its successor on 28th Street. In 1879 he opened Daly's Theatre on Broadway. Among his original plays are 'Divorce'; 'Pique'; 'Horizon'; 'Under the Gaslight.' He also wrote: 'Peg Woffington, a Tribute to the Actress and the Woman.'

Daly, Joseph Francis, American lawyer: b. Plymouth, N.C., 3 Dec. 1840; d. Yonkers, N.Y., 7 Aug. 1916. He studied law in New York and was admitted to the bar in 1862. He was a judge of the Court of Common Pleas 1870-96 and chief justice of the same court in 1896. He became a justice of the State Supreme Court in 1896 and is now a justice of the United States Court of Appeals and by President McKinley commissioner to revise the laws of Porto Rico. He was a member of the American Bar Association, the New York State Bar Association and the New York City Bar Association. He was one of the founders of the Players' Club and was its vice-president for a time. He was also a member of the Catholic Club, of which he was president 1894-99; and of many other societies.

Dalyell, or Dalzell, Thomas, Scottish soldier: b. about 1597; d. 23 Aug. 1648. He was taken prisoner fighting on the loyalist side at Worcester and afterward escaped to Russia, where he was made a general. Returning to England at the Restoration, he was made commander-in-chief of the forces in Scotland and made himself notorious for his ferocity against the Covenanters.

Dalyell, John, American lawyer: b. New York, 19 April 1845. He removed with his parents to Pittsburgh in 1847, was educated at Yale and after studying law was admitted to the bar in 1847. He has practised his profession.
in Pittsburgh; was attorney for the Pennsylvania Railroad Company for its western lines for many years and for many other corporations. He has been a Republican member of the 50th-62d Congress inclusive, for many years ranking member of Committee on Ways and Means; participated in the making of the Dingey and Payne tariff bills; member of Committee on Rules during speakerships of Reed, Henderson and Cannon; first elected chairman of that committee when committee was made elective; regent of Smithsonian Institution; and delegate to National Republican conventions of 1904 and 1908, and in each member of sub-committee of Committee on Resolutions that reported the platform.

**DAMA**, dâ’mâ, a genus of the deer family (Cervidae), comprising the common fallow deer (Dama vulgaris) and the Persian fallow deer (D. mesopotamica). The name is also given to a species of large gazelle (Gasella dama) found in the Sudan. It is closely allied to the moor (q.v.), which is often regarded as but a sub-species, but has no dark stripe on the flanks. Closely allied to it also is the aoul of Somaliland.

**DAMAGES**, the indemnity recoverable by a person who has sustained an injury, either in his person, property or relative rights, through the act or default of another; also, the sum claimed as such indemnity by a plaintiff in his complaint. Compensatory damages are damages allowed as a recompense for the injury actually received. Consequential damages are those which, though directly, are not immediately, consequential upon the act or default complained of. Exemplary, vindictive or punitive damages are, in legal contemplation, synonymous terms. Exemplary damages would seem to mean such damages as would be a good round compensation, and an adequate remedy for the injury sustained and such as might serve for a wholesome example to others in like cases.

Where injuries are maliciously, wantonly or recklessly inflicted, the right of the jury to award punitive damages is said to be as old as the common law; but it is not, in some cases, as old as the common law. In England as early as 1763, it was declared that the jury had done right in giving punitive damages. (Hackle v. Monck, 2 Wil. 285.) And now, both in England and in the United States, the doctrine of punitive damages seems to be well settled and the right of the jury to give such damages in a proper case cannot be shaken in any of the States by anything short of legislative enactments.

General damages are those which necessarily and by implication of law result from the default or act complained of. Special damages are such as arise directly, but not necessarily, from the wrongful act or default complained of. Parties entering into an agreement may estimate beforehand the amount of damages to result from a breach of the agreement and may prescribe in the agreement itself the sum to be paid by either of the parties to the other by way of damages in such breach. Such damages are called liquidated damages when sanctioned by the law. If, however, the agreement is such that the law refuses to adopt it, then the damages agreed upon will be regarded as a penalty, or as in the nature of a penalty. General damages need not be alleged in the complaint of the person injured, nor is it necessary that any specific or direct proof of damage be shown in order to enable the party injured to recover. The legal presumption of injury in cases where it arises is sufficient to maintain the action. Whether special damage be the gist of the action, or only collateral to it, must be peculiarly established in the complaint, as the plaintiff will not be permitted otherwise to go into evidence of it at the trial, because the defendant cannot also be prepared to answer it.

To constitute a right to recover damages, the party claiming damages must have sustained a loss; the party against whom they are claimed must be chargeable with a wrong; the loss must be the natural and proximate cause of the wrong. Where there is no loss there is no right to damages, properly so called. A sum in which the wrong-doer is mulcted simply as a punishment for his wrong and irrespective of any loss caused thereby, is a "fine" or a "penalty," rather than damages. Damages are based on the idea of a loss to be compensated, a damage to be made good. It is not necessary, however, that this loss should always be distinct and definite, capable of exact description, or of measurement in money. A sufficient loss may appear, from the case itself, to sustain an action. The law in many cases presumes a loss where a wilful wrong is proved; and such damages are also awarded for injured feelings, bodily pain, grief of mind, injury to reputation and for other sufferings which cannot be made the subjects of exact proof and computation in respect to the amount of loss sustained. **DAMAN**, dâ’mân, or **DAMÃO**, India, a seaport town in Hindustan, at the mouth of the Gulf of Cambay, on the Damanganga or river of Daman, 100 miles north from Bombay. It belongs to the Portuguese, who sacked it in 1531, retook it in 1558, and have kept possession of it ever since. It carries on some cotton weaving, fishing, ship building and several salt works. Pop. about 6,000. The Portuguese district here of the same name possesses valuable teak forests. It has an area of 100 square miles. Pop. about 32,700.

**DAMAN**, dâ’mân, the Syrian name for the coney of Scripture. See **CONY**; **HYRAX**.

**DAMANHUR**, dâ’mân-hoor, Egypt, town of Lower Egypt, capital of the province of Beheirah, an important railway centre and seat of cotton manufacture. Pop. 46,555.

See **DHAMAR**.

**DAMARALAND**. See German South West Africa.
1. Damascus, dâm'-sên, Saint John (Jo-annès Damascenus, John of Damascus), an illustrious theologian of the Greek Church in the 8th century A.D. Born about 676; d. about 755. He was a pupil of Cosmas and in 730 was persecuted for his active opposition to the Iconoclast heresy. The last of the Greek Fathers, he was the first to reduce to system the Church teaching on heresy and to generalize the decrees of the General Councils concerning matters of faith, in the third part of his work 'The Fountain of Knowledge.' In the first part, 'Points of Philosophy,' he makes application to theology of Aristotle's Dialectica; the second part consists of a reproduction of Epiphanius' work 'On Heresies,' with additional notices of heresies condemned by the Church after Epiphanius' time; the third and most valuable part is the 'Precise Exposition of the Orthodox Belief.' In medieval times the 'Precise Exposition,' translated into Latin in the 12th century, gave direction to the theological views and speculations of the schoolmen; it influenced also the trend of Arabian philosophy; and hence Damascenus has been denounced by the Schoolmen. The 'Prince of Greek hymnodists,' the English titles of three of his most famous hymns are the well-known 'Come, ye faithful, raise the strain'; 'The Day of Resurrection,' and 'Those eternal bowers.' Many other treatises are extant which bear his name as author, but of most of these the authenticity is doubtful. No contemporary account of his life has come down to us; the earliest biographical notice of him that we have dates from the 10th century, and that is unworthy of credit. The epithet 'Chrysorrhoas,' that is, gold-streaming, bestowed upon him in his lifetime, testifies to his reputation for eloquence. He is recognized as a saint both in the Greek and the Latin Church.

2. Damascus, da-mash'-tüs, a philosopher, so called from his supposed native place Damasc, lived in the beginning of the 6th century. He is known as one of the most distinguished teachers of the Neoplatonic philosophy. In Alexandria he studied rhetoric under Theon and mathematics under Ammonius; and afterward in Athens his teachers were Zenodotus and Marinus, the successors of the more celebrated Porphyry. Numerous fragments of his writings remain, one of which is entitled 'Doubts and Solutions Respecting the First Principles.' It is so mystical as to be almost unintelligible, but it is important to the history of philosophy from its frequent notices of earlier philosophers. It was edited by Ruelle (Paris 1889).

3. Damascus (native name Dimishk-es-Shâm, Syria), a celebrated city, capital of the Turkish vilayet of Syria, finely situated on a plain, at the eastern base of the Anti-Libanus range and supposed to be the most ancient city in the world. It is six miles in circumference, and is surrounded by a dilapidated wall pierced by seven gates. Damascus, from the beauty of its surroundings, is called the 'Pearl of the Desert.' The plain on which the city stands is of great extent, and is covered with the most beautiful verdure and the most luxuriant growths. It is watered by the waters of the Barada (the Ahanah of the Old Testament), forming a grove of more than 50 miles in circuit, rich in fruits, including oranges, lemons, citrons, pomegranates, mulberries, figs, plums, walnuts, pears and apples. So plentiful and cheap are fruit and foodstuffs, that it is almost a proverb that you can set out for breakfast in Damascus for nothing.* Its interior by no means corresponds with its environs. The streets are narrow and crooked, paved with basalt, and have a gloomy and dilapidated appearance. They are the general seat of the various divisions—that in the middle devoted to cattle and riders being the lowest, and of the same width as the other two. In most parts of the city the fronts of the houses are built with mud, and pierced by a very few small grated windows, with red painted shutters. They are low, with flat-arched doors, resembling those of stables, while a dunghill and pool of putrid water almost invariably stand before each door. In many of them, however, a singular contrast is presented between the dull, prison-like outer walls of gray mud and the riches within. These are of a quadrangular form, enclosing a court paved with marble, ornamented with beautiful trees and flowering bushes, and having copious fountains playing in the centre. The lower rooms, on the stylets of the house, are raised above its area, and open in front— their roofs and walls highly ornamented with figures of flowers and inscriptions, and a variety of arabesque devices. The furniture, also, is of the most splendid description. The best and wealthiest part of the city is the Moslem quarter, where the streets are wider and cleaner, the houses higher and better built, and the supply of water much more abundant than in any other part of the town. The Christian and Jewish quarters are the most miserable.

Among the places most worthy of notice in Damascus are the bazaars. They are merely long streets—the principal one about one and a half miles in length—covered in with high wood-work and lined with shops, stalls, stores and cafes. The shops are narrow and go only a short way back. There is a separate bazaar for almost every commodity exposed to sale, and all of them are patrolled by multitudes of confectioners and dealers in ices and cooled sherbets. In the midst of the Great Khan, said to be one of the most magnificent structures of its kind in the world. It is an immense cupola, supported on granite pillars and built in part of alternate layers of black and white marble. Its gate is one of the finest specimens of Moorish architecture to be seen in the world. In this building, and in 30 inferior khans, purchases and sales are daily conducted by the merchants, who have their counting-houses near them. There are some 200 mosques: the principal, a magnificent edifice, was destroyed by fire 14 Oct. 1893. The interior was completely gutted and except for the long lines of Gothic columns and capitals, all is modern. There are three Latin monasteries in Damascus—those of the Franciscans, Capuchins and Lazarists. In the principal Roman Catholic churches form part of the monastic buildings; there are, besides, a number of detached churches belonging to different sects in various parts of the city. Besides the more remarkable architectural objects mentioned, there are an extensive citadel, the castle of the Crusaders, and a serai or palace, in which the pasha resides. The most interesting locality in the city is, perhaps, what is called Straight Street,* mentioned
in connection with the conversion of the apostle Paul. It is the most important, largest and busiest street in Damascus; has a corrugated roof; is one mile in length, and runs from east to west. It is the present site of the Bazaar of Damascus, to which Ananias went, is still pointed out, as well as that of Ananias.

Damascus was formerly a great emporium of trade between Europe and the East; its transport trade declined with the opening of the Suez Canal; it is still a large buyer and still imports English cottons and other goods. It is also a place of considerable manufacturing industry. There are a number of manufactory of silk, damasks, cotton and other fabrics; numerous cotton-printing and dyeing establishments, tobacco factories, copper and iron foundries and glass works. The manufacture of Damascus blades, for which the city was once so celebrated, no longer exists. Saddles and bridles, rich and highly finished, fine cabinet work and elegant jewelry, are among the manufactures of Damascus. Fruit is an article of export. Damascus is one of the holy cities of Islam and here the pilgrims assemble on their journey to, and separate on their return from Mecca. The tomb of Fatima, daughter and only child of Mohammed, is an object of special veneration. Buckle, the historian of civilization, is buried in the Protestant cemetery.

Damascus to-day is perhaps the most thoroughly Oriental in all its features and characteristics of any city in existence. Of its origin nothing is certain. There is, however, abundant evidence of its great antiquity, as it is mentioned in Gen. xiv, 15, as existing 1913 B.C., and appears even then to have been a place of note. At subsequent periods it fell successively under the power of the Israelites under David, the Persians, Greeks and Romans, attaining great eminence under the last. In 1516 it fell into the hands of the Turks. A Protestant mission and schools have long been in operation here. Beirut is the seaport of Damascus, and is reached by a road 70 miles long. There are three railroads entering the city, the main line running to Beirut. Gas, electricity and street cars have been introduced. Pop. estimated at about 250,000, of whom perhaps 25,000 are Christians, 200,000 Jews. 

‘Five Years in Damascus’ (London 1870); Macintosh, ‘Damascus and Its People’ (London 1882); and articles by A. Fordin in Nat. Geog. Mag., January 1911, and R. Hichens in the Century, February 1910.

**DAMASCUS BLADES**. Swords or scimitars anciently made at Damascus, Syria. These famous weapons, used among nations little skilled in the metallurgic arts, long before the Christian era, and made familiar to European nations from the time of the crusades, long defied all attempts at imitation. It appears that the Indian woots or carbonized iron was in ancient times exported from the region of Golconda in Hindustan (where, as well as in Persia, it is still manufactured by the original rude process), and at Damascus was converted into weapons. These were particularly distinguished for their keen edge, capable of severing heavy iron bars or cutting through a leaf of gossamer paper; and for the peculiar Takedy appearance of the steel, which was covered with delicate black, white and silvery veins, parallel to each other or interlaced. The Damascus appearance may be given to iron by welding together bars of different degrees of hardness, drawing them down, and repeating the process several times (see **DAMASCUS IRON**). Karsten suggests that by the use of bars of good steel the best Oriental blades may have been fashioned in this way. The ‘mosaic’ process differed from the other by cutting the bar into short lengths and fusing these pieces, the cut surfaces always being placed so as to face outward. Blades of great excellence were thus produced, but still inferior to the genuine Damascus. It was not till after the investigations of General Anossoff in the first half of the 19th century that successful reproductions were obtained. These researches led to the establishment of works at Zlatoosk in the Ural Mountains, where Anossoff manufactured Damascus steel by processes of his own invention. According to his best method 11 pounds of iron were melted in the crucible with one-twelfth as much graphite and one thirty-second part of scales of iron. All his sword blades were tempered in boiling grease. The process of bringing out the watered appearance was accomplished by the use of a dilute acid, which acts more upon the ground than upon the lines. The Zlatoosk weapons proved to be of properties similar to those of the old Damascus blades. General Anossoff with one of them cut through floating gauze. Bones and nails may be clef without injury to blades tempered for such use, and other steel tempered to the same point may be nicked by them without causing a gap. Their elasticity is so great that one may put his foot upon the end of the blade and bend it to a right angle, when it will fly back perfectly unchanged. General Anossoff died in 1851, and his successors at the works failed to produce the remarkable blades for which the establishment had become celebrated.

**DAMASCUS IRON**, or **DAMASCUS TWIST**, iron produced by the following method, which is supposed to be similar to the process anciently followed in making the blades of the celebrated Damascus blades (q.v.). Twenty-five alternate bars of iron and mild steel, each about two feet long, two inches wide and one-quarter inch thick are united by welding; the fagot being drawn into a bar three-eighths inch square, is cut into lengths of five or six feet. One of these pieces is heated to redness, and one end is held firmly in a vise, while the other is twisted by a wrench or tongs, which shortens the rod to half its length and makes it cylindrical. If two of these twisted pieces are to be welded together, they are turned in diverse directions, one to the right and the other to the left; these are laid parallel to each other, welded and flattened. If three rods are used, the outside rods turn in a direction the opposite of the middle one, and this produces the handsomest figure. By these operations the alternations of iron and steel change places at each half revolution of the square rod, composed of 25 laminae, the external layers winding round the interior ones; thus forming, when drawn into a ribbon, irregular eccentric oval or circles. The fineness of the Damascus depends upon the number and thickness of the alternations.

**DAMASK**, a textile fabric, the ground of which is bright and glossy, with vines, flowers
and figures interwoven. At first it was made only of silk, but afterward of linen and woolen. Across the Mediterranean and the Atlantic, this kind of weaving was derived from the Babylonians; according to others, invented at a later period by the inhabitants of Damascus, from which latter place it is known to have derived its name. The true damasks are of a single color. In modern times the English and Dutch first made damask; and Europe was supplied, as late as the 17th century, from Italy alone, chiefly from Genoa. But the French soon imitated it, and now surpass the Italians. Damask is made in great quantities in Germany, especially the Upper Lusatia. Dunfermline is the chief seat of the manufacture of damask linen in Scotland, and Lisburn and Ardoyno in Ireland.

To trace the origin of the art of weaving, or to ascertain the name of the artisan whose necessities led him to devise the crude appliances capable of being used in the production of even the very coarsest woven material, would be a hopeless task indeed, separated, as we are, from a period so exceedingly remote by the impenetrable gloom and obscurity which must ever envelope the events of times centuries ago. And yet we are safe in assuming that the ability to produce woven fabrics by means of a loom, no matter how elementary in construction, far antedates all written history, carrying us back to those early ages when the first rays of the sun of progress were faintly discernible above the horizon of time, awakening within our humble ancestors the desire for those things, which when obtained served to lighten their toil, and at the same time form part of the foundations of the noble structure to which successive generations have contributed their share, and which we call civilization.

Coming down to a later period, however, we are enabled to gather authentic information regarding the degree of progress made in the art of weaving. Trustworthy records dating as far back as 2000 B.C. reveal the fact that the weavers of ancient Egypt were far advanced with the production of plain woven fabrics, many excellently preserved fragments of fine linen, which were taken from the mummy cases of that period, testifying not only to the reverence with which they regarded the embalmed remains of their illustrious dead, but also to their skill and proficiency as weavers.

In the Bible also we find numerous references to the products of the loom. Job speaks of his days as being swifter than a weaver's shuttle (Job vii, 16). We also read that the draperies of the tabernacle and the veil of the temple were woven fabrics, richly embroidered with various colors. These allusions to the art of weaving, and others too numerous to mention, are scattered profusely throughout the pages of the sacred volume; while heathen writers of antiquity frequently allude to weaving as an art which was held in the highest esteem, and which furnished a favorite occupation for people representing every grade of society, from those who dwelt in the marble halls of princes down to the occupants of the most humble dwellings.

Nor was skill in weaving confined to one locality or people; an art so essential to the comfort and welfare of humanity at large must speedily have become the common property of widely separated races; consequently we find that the Babylonian weavers of the year 1000 B.C. were celebrated for the richness and quality of their woven fabrics; while at the same period the patient industry of the Chinese were producing fabrics of the finest texture on looms of the most primitive description.

From this it is obvious that the ancient races were familiar with the principles of fabric construction and that they were able to produce a considerable variety of elementary weaves by using different varieties and counts of yarn in combination with each other; yet there is nothing to show that they were acquainted with any form of loom, the mechanism of which made possible the production of complex or ornamental designs, such for example as could easily have been woven on the draw loom of a later period, or by its successor, the highly improved Jacquard power loom of the 20th century. This obvious drawback, however, they endeavored to overcome by means similar to those employed by modern manufacturers of textiles, who, in order to meet the demand for showy and inexpensive fabrics of a certain description, are accustomed to arrange either the warp or filling in the form of a series of stripes of contrasting colors, arranged together or else by changing the color of both warp and filling at such intervals as a previously devised pattern indicates, are enabled to produce an extensive variety of checkered patterns.

Designs of this character the weaver of ancient times found no difficulty in creating, but any large ornate or floral patterns with which he was familiar were obtained either by printing, or the skill of the embroiderer, or when considered desirable, a combination of both added to the woven material after it had passed from his hands, and which as a result cannot be classed with those fabrics which, produced entirely on the loom, are valuable on account of the elaborate nature of the designs with which they are embellished, as much as by the costliness of the materials employed in their construction.

It will thus be seen that a loom which could only be used in the production of a comparatively restricted variety of designs was sure to be superseded sooner or later by one of a more highly developed type, which would allow the decorative instinct of the early textile artist greater opportunity to express the ideas suggesting themselves to him.

In due time a loom capable of accomplishing these results was invented, probably in China, where, like so many other relics of the long forgotten past, it may be seen in operation at the present day, although since consigned to the rubbish heap in all progressive countries.

From China the draw loom, as it came to be called, found its way to other parts of the globe. But it remained for the weavers of the ancient city of Damascus, the capital of Syria, to develop the possibilities of the new loom to the utmost extent, with the result that in time they established a large manufacturing and export trade in the beautiful silken fabric which soon became widely known as damask, taking its name from that of the city to which for centuries it brought wealth and renown, and in the manufacture of which the Damascene excelled all competitors.

Stated as briefly as possible, it may be said that the draw loom tie-up was a com-
pound arrangement, one part of the harness being controlled by a lad known as the draw-boy, the other part controlled by shafts for the purpose of subdividing the warp, so as to form the fine ground weave peculiar to damask fabrics. Just as the weaver was about to throw the shuttle across the loom, the warp, of which there may have been five, six, seven or more ends to each mail, according to the quality of damask desired, was raised en masse by the draw-boy in accordance with the requirements of a previously painted pattern, all the remaining warp being left on the shutter. The shuttle would thus have passed under the warp raised and over the warp left down without interlacing or forming cloth, had it not been for the supplementary arrangement of harness shafts, through which the entire warp was drawn, for the purpose of enabling every end to be used separately.

For each pick one of these shafts would be raised and one depressed, the others remaining undisturbed, the shaft which had been raised lifting every eighth end from among the mass of warp, the shaft which had been depressed carrying down with it every eighth end from the mass of warp raised, while the shafts which remained in a neutral position were so constructed as to permit the lifting of one portion of the warp and the sinking of the remainder as called for by the design, without interfering with the shed or passage of the shuttle. By this means the pattern was formed and the warp and filling were interwoven so as to produce an eighth shaft satin or any similar weave required.

During the wars of the Crusades the draw loom, along with many other things oriental, found its way into various European countries, thereby aiding greatly the development of weaving as applied to silk damask, brocade, velvet and other fabrics; the great artists of the Middle Ages not considering it beneath their dignity to supply the necessary designs for these rich textiles. For centuries, however, the draw loom remained practically the same as when first introduced, but in the year 1704 a Frenchman named Simbol devised a method by means of which the draw-boy was enabled to raise the warp while standing at the side of the loom, instead of the top, as had been the custom previously.

In England also, during the 17th and 18th centuries, patents were taken out for several devices intended to render the services of the draw-boy unnecessary; these, however, soon passed from public view, but the draw-boy remained, toiling away at his monotonous task for many a day after the mortal remains of Jacquard had crumbled to dust.

In the United States the manufacture of the finer grades of silk and cotton damask and upholstery fabrics in general is of comparatively recent origin, the vast majority of looms devoted to this industry being located in Philadelphia, with lesser numbers scattered throughout New York State, New Jersey, Connecticut and Virginia.

The damask business in its infancy, but mighty oaks from little acorns grow, and to-day the manufacture of upholstery goods is one of the most important industries of the country, which, with allied trades, such as yarn-spinning, dyeing and the manufacture of textile machinery, provides the means of livelihood for tens of thousands of operatives, and at the same time is a standing monument to the business enterprise of the American manufacturer. Nor have we by any means reached the limits of our development in this direction; the remarkable inventive ingenuity of the American artisan, which in many other branches of business has practically placed him beyond the reach of competition, will not be likely to fail him when applied to the weaving industry.

William Laird Turner,
Teacher of Jacquard Designing, Philadelphia Textile School.

DAMASKERING, the art of inlaying iron or steel with other metals, especially gold and silver. It is also known as damascene work. This art is of great antiquity. Herodotus mentions a dish so ornamented; and the shields of some of the forces of the Samnites who fought against Rome were damaskeened. This method of ornamentation was formerly much used in Damascus and is found in modern Persian objects of art. The most beautiful specimens are produced by cutting into the metal with a graver and other tools, engraving on steel, and afterward filling up the incisions with a pretty thick gold or silver wire. The cuttings should be made in a dovetail form, so that the wire which is inlaid may adhere the more strongly. An inferior style of damaskering can be produced by the electrolyte process. The pattern is etched on the steel, and gold or silver deposited in the etched lines.

DAMASKIN, Yoam, or DAMASCENUS. See JOHN OF DAMASCUS.

DAMASUS, the name of two popes. 1. SAINT DAMASUS I was of the Hispanic race; b. Rome, about 304; d. 364. From an early age he was employed as an inferior minister in the service of the Roman see. He was elected to the papacy (366); but as his election was displeasing to a strong faction in the city they set up a rival Pope, Ursinus. In a riot between the supporters of the two claimants of the papal chair in the Liberna a Frenchman was killed in the presence of the Pope, representing papal authority, by the church of Santa Maria Maggiore, 137 persons, men and women, lost their lives; and Ammianus Marcellinus, the pagan historian, whose testimony is naturally hostile, declares that the ardor of the rivals to seize the empty popcy seat surpassed the ordinary measure of human ambition. But ecclesiastical writers of the time make no mention of the 137 persons said to have lost their lives on this occasion, and its authenticity rests on the narrative of Ammianus alone. Prudentius, the magistrate, who restored tranquility to the city, is said to have remarked to the successful Pope, "Make me bishop of the city of Rome and I will straightway be a Christian." Damasus was on terms of intimate friendship with Saint Jerome, who was his secretary and counsellor, and it was at his pressing instance that Jerome made a new revision and translation of the sacred Scriptures. In his pontificate the Emperor Valentinian I, 370 A.D., enacted a law designed to correct a grave abuse which had arisen in the Church—the custom of priests and monks receiving from wealthy penitents, especially women, gifts and legacies for themselves. Valentinian's law now made such gifts and bequests void; further it forbade ecclesiastics and monks to frequent the houses of widows and virgins.
under severe penalties. It is said that Pope Damasus himself suggested this law to the emperor, as a means of correcting the abuse at which it was aimed. His feast is observed 11 December. 2. DAMASUS II: b. Bavaria; d. Palestrina, 9 Aug. 1048. At an early age he was ordained a priest. Later he was consecrated bishop and received the appointment to the see of Brixen. In 1047 he was elected Pope, but lived only 23 days after being raised to the pontificate.

DAMBUL, dám-bool', DAMBOOL, or DAMBULLA, a village in the island of Ceylon, at the junction of four lines of road, 70 miles northeast of Colombo. It takes its name from the rock Dambul, a large mass of gneiss and mica schist which rises 550 feet above the surrounding plain, and contains a number of caves, one of them with a long inscription relating to the government of Ceylon in the 12th century, and another with a colossal statue of Buddha hewn out of the rock. The priests of Buddha still officiate in these cave temples.

DAME (Lat. domina, mistress), a title of honor which long distinguished high-born ladies from the wives of citizens and of the commonly in general, and which still is the legal title in Great Britain of a baronet's or a knight's wife. In consequence of the greater courtesy shown toward women of higher rank, arose the custom of prefixing the word ma to dame, as a special proof of veneration and homage. Hence, too, the Virgin-mother was called in France Notre Dame (our lady, as if no single Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called madame; and this was also the sole title of the wife of the king's eldest brother. In England, the word dame, though not much used, is now applied to married women of all classes. It is also applied particularly to the mistress of a small elementary school or boarding-house at boys' schools. Madame is shortened into madam, a usual form of address for ladies in general, but still also a word of honor, applicable, in particular cases, to majesty itself.

DAME AUX CAMÉLIA. See Lady of the Camélias.

DAMES OF THE REVOLUTION, an American society organized in 1896, and composed of women above the age of 18 years, of proved descent from ancestors who, either as military, naval or marine officers, or officials in the service of any one of the 13 original colonies or States, assisted in establishing American independence during the War of the Revolution, or between 19 April 1775, when the hostilities began, and 19 April 1783, when they ceased.

DAME'S VIOLET. The genus Hesperis, of the natural order Crucifera, or mustard family, the only American representative of which is H. matronalis. The genus belongs to Europe and Asia, and the American plants have entire leaves. The pale purple flowers, sweet-scented at night, are found in fields and on roadsides in southern New England, westward to Kansas, and also in North Carolina. Other common names, mostly from England, where it is a very common flower, are Queen's or dame's gillyflower; night-scented gillyflower; damask violet, etc. The flower is extremely cultivated, and the plant in various forms is found in all tints from purple to white.

DAMIANA, dā-mé-a'nā, a drug derived from the leaves of South American, Mexican and Central American species of Turnera, especially Turnera diffusa. The botanical relationships of the various species are not well known. The chemical components consist of volatile oil, resin and bitter principles, and the drug, therefore, acts as the aromatic bitters. It was formerly supposed to have aphrodisiac properties. It is widely used in many reputable quack remedies that are practically worthless.

DAMIANI, dā-mé-a'nē, or DAMIANUS, Petrus, Saint, one of the fathers of the Church: b. Ravenna 1007; d. Faenza, 23 Feb. 1072. In infancy he was abandoned by his mother and then treated humanely by one of his brothers who gave him shelter, but another brother, Damianus, undertook his guardianship and gave him a good education. In gratitude, Petrus assumed the name Petrus Damiani, Damianus' father. For some years he vacillated between Ravenna, but at the age of 30 joined a community of hermits and 1041 was elected to be their abbot. The renown of his piety, sanctity and wisdom having spread widely, brought to his cell people high and low to entreat his prayers or his counsel, and popes and emperors did not disdain to solicit his advice. Made cardinal and bishop of Ostia, 1057, he prevailed on Benedict X, irregularly elected by the dominant faction of the Roman nobility, to resign 1058, and 1062 he issued his famous letter to Gregory II to forego his claims to the Roman see. He was an intensely zealous advocate of the reform of the Church and correction of the flagrant abuses which were widespread among the clergy in his time. In his manifesta, well styled by him 'Liber Gomorrah' (Book of Gomorra), he exposes, without regard to the dignity held by the offenders, the vices and the unspeakable enormities by which they brought discredit on the Christian profession. Had not the interests of religion been at stake, such outspokenness would have been inexcusable and an offense against public morality. Another of his works bears the title, 'De Correctione Episcopi et Pape' (of correcting a bishop and a Pope). All his life he practised the utmost austerities of the hermit. By decree of Pope Leo XII his name was added to the roll of Doctors of the Church, and 23 February was appointed as his feast-day. For his works consult Migne, 'Patrologia Latina' (cxlvi, cxxiv); and for biography L. Guerrier, 'H. Petri Damiani'.

DAMIANISTS, or ANGELISTS, disciples of Damian, the monophysite patriarch of Alexandria, in the 6th century. They professed a belief in only one nature in Christ. The Council of Chalcedon, in the 5th century, had condemned the heresy held by the Damianists in the 6th century. It is also given to the Sisters of Saint Clare, a Franciscan order of nuns, which had its first convent at Saint Damiano, Assisi.

DAMIANUS, famous rhetorician of Ephesus in the 2nd century, mentioned by Philostratus in his 'Lives of the Sophists.' He was
a pupil of Ælius Aristides and of Adrianus, whose methods he taught.

DAMİEN, dà-mián, De Veuster, Joseph, Belgian missionary: b. near Louvain, Belgium, 3 Jan. 1840; d. Molokai, Hawaiian Islands, 10 Aug. 1889. He was educated at the University of Louvain; joined the Order of the Sacred Hearts of Jesus and Mary in 1863 and soon after was sent by his superiors as missionary to Hawaii. In 1873 he requested to be attached as chaplain to the Molokai leper colony. Here he found his life work. He at once set about improving the housing conditions of the settlement, the food supply and the water, which was none too good. He founded schools, built a church, partly with his own hands, and instituted religious worship among these unfortunate. About five years before his death he noticed the incipient stages of the fever disease in his own body. Year by year the time until his death he identified himself fully with the other colonists, beginning his sermons usually with the address, "We Lepers." Consult Pamphile, 'Life and Letters of Father Damien' (1889); Stevenson, Robert Louis, 'Open Letter to the Rev. Dr. H. and Stoddard, 'The Lepers of Molokai' (1889).

DAMIETTA, dà-mí-ê-tà, Egypt, town in Lower Egypt, on one of the principal branches of the Nile, 12 miles north of Cairo: lat. 31° 25' N.; long. 31° 5' E. It is irregularly built, and contains some fine mosques, bazaars and marble baths. Damietta was at one time a very important place, with 80,000 population, and carried on an extensive foreign trade, but is now eclipsed by Alexandria. The weaving of cotton fabrics is the principal industry. Rice, fish and fruit are exported. A bar at the mouth of the Nile prevents large vessels from reaching the town, compelling them to land and unload by means of small craft of from 30 to 60 tons burden. A military school and cotton-factory were established here by Mehemet Ali. In 1219 Count William of Holland, with his fleet of 12 ships, manned chiefly by men of Haarlem, by means of a high platform built on their masts and a scuttle let down the tree-like tower, broke the great chain between this and the mainland and captured the city. In commemoration of this event, the city of Haarlem bears on its shield a cross and a sword between four stars, with the motto Virtus Vitam Vivunt (Courage conquers Life). In a carillon of bells, nightly at nine o'clock, sounds out the "Damiette." The ancient town of Damietta (Tamiródhis) stood about five miles nearer the sea, or farther north. The danger to which it was exposed, however, from its position on the shores, induced the Egyptian caliphs to change its position, and to remove it to where the modern town now stands about the year 1251. The present town contains many ancient columns and blocks, supposed to have been brought from the old city. It is the terminus of a railway from Cairo. Pop. 29,354.

DAMMAR, dàm-mär, a resin derived from various plants, principally Agathis dammara and A. australis, both members of the pine family, or the trees themselves. These are natives of Molucca and the East India Islands, also of the Philippines and New Zealand. Dammar is exuded from the main stems and also from the roots of the plants. Fossil dammar is called kauri (q.v.). In some regions, notably in the mountains of Sumatra, the resin bursts forth in profusion from spontaneous fissures. In other regions artificial incisions are made in the trees, with a yield of resin correspondingly greater. Dammar comes into the market in large masses, or small pieces. It is yellowish, transparent when in small pieces, smooth and brittle, breaking with a clear green fracture and is readily reduced to powder. It is intermediate in hardness between colophonium and copal. Chemically it contains traces of ethereal oil, dammarolic acid and two resins. It is widely used in the manufacture of varnishes. The same name is applied in commerce to the resin of other and unrelated trees. Thus the dammar of shipyards is obtained from a species of Conarium, an amyricideous tree, while black dammar is a kind of pitch derived from the same genus. Shorea robusta, a coniferous tree of Borneo and the Philippines, yields resin used in Indian dockyards, and sometimes also called dammar. Dammar is also occasionally confused with kinds of copal; thus, the resin of Vateria indica (Dipteracae) is sometimes known as dammar or piny dammar, of which the piny varnish of India is compounded. One of the Australian species, A. robusta, has been grown in some parts of California with fair success.

DAMMARA. A genus of coniferous trees now known as Agathis. See DAMMAR; KAURI.

DAMMODOO, a river in British India, which rises in the district of Ramghur and flows through Bengal, east, southeast and south a distance of 350 miles. Rich deposits of coal and iron are found in its valley.

DAMOCLES, a native of Syracuse, and one of the courtiers and flatterers of the tyrant Dionysius the Elder. His name has become proverbial in contempt and unkind anecdote related of him as illustrative of the uncertainty of human greatness and felicity. He had been extolling the grandeur and happiness of Dionysius, whereupon the latter invited
him to a magnificent banquet, where he would be regaled with regal fare and royal honors. In the midst of the entertainment, however, Damocles happened to look upward, and perceived a naked sword suspended over his head by a single hair. The sight of this filled him with astonishment and taught him at what a sacrifice of mental peace and personal security the enjoyments and splendors of royalty may be purchased.

DÁMODAR, dā-mōˈdār, a river of Bengal, in India, which after a southeast course flows into the Hugs, just above the James and Mary Sands and below Calcutta. A little below the mouth of its chief tributary, the Barakhar, which it receives from the north, the Dámodar becomes navigable. The valleys of these two streams contain the coal-fields which produce about four fifths of the whole amount of coal mined in British India. Length about 350 miles.

DAMON AND PHINTIAS (not PÝTH-IAS), two illustrious Syracusans, celebrated as models of constant friendship. Phintias had been unjustly condemned to death by Dionysius the Younger, tyrant of Sicily, but obtained permission to arrange his affairs in a neighboring place on condition that his friend should remain as a pledge of his return. Damon surrendered himself at the prison, ready to suffer death instead of Phintias if he did not return at a fixed time. Unexpected impediments detained him. Damon, still fully convinced of the faithfulness of his friend, was on the way to the place of execution, and the people began to murmur and to pity his credulity; when Phintias suddenly rushed through the crowd into the arms of his friend. While they demanded each to die for the other, Dionysius himself approached, pardoned them and entreated them to admit him, a third in their friendship. Schiller has described this adventure in an excellent ballad, 'Die Burgschaft,' and it is the subject of a popular English drama.

DAMPER, a plate in an air-draft or flue, for the purpose of controlling the fire by regulating the area of the passage for the ingress or egress of air as the case may be. Dampers are of various forms. They are to the air-pipe or flue what the valve or faucet is to the duct for steam or liquids. The dampers of furnaces are either in the door of the ash-pit, to regulate the ingress of air, or in the course of or on top of the chimney, to close the egress of the volatile results of combustion. In the latter form they are used in almost all metallurgic furnaces.

In locomotive engines, a kind of iron venezian-blind, fixed to the smoke-box end of the boiler in front of the tubes; it is shut down when the engine is standing, and thus stops the draught and economizes fuel, but it is opened when the engine is running.

In pianofortes, certain movable parts, which are so arranged as to press upon the wires and check their vibration whenever the finger leaves the keyboard. Perfect damping is difficult to obtain, but when efficient it enhances brilliance of execution and distinctness of harmony in a composition.

DAMPIER, damˈpər, Alfred, Anglo-Australian dramatist: b. London, 26 Feb. 1847. He began as an actor at Stratford-on-Avon and in 1873 he acted Mephistopheles in his own version of Goethe's 'Faust.' He visited the United States, Canada and South Africa. Returning to London he produced several of his own plays. From there he went to Australia and took over the Alexandra Theatre and renamed it the Australia. Many of his plays were produced, himself and his wife acting leading roles in them. Later on his son and his daughter also played leading roles in their father's productions. Among his dramas are 'The Bush King,' 'Waratha,' 'Under the Southern Cross,' and 'Robbery Under Arms.' Some of his numerous dramatic pieces were written in collaboration with Garnet Walch and W. L. Lincoln.

DAMPIER, William, English navigator: b. East Coker, Somerset, June 1652; d. London, March 1715. In 1673 he served in the Dutch War and subsequently engaged in a band of privateers, as they called themselves, although in reality pirates, with whom he roved on the Peruvian coasts. Dampier, wishing to obtain some knowledge of the northern coast of Mexico, joined the Dutch East India Company, and cruised in the hopes of meeting the annual royal Manila ship, which, however, escaped them. Swan and Dampier were resolved to steer for the East Indies and they accordingly crossed the Pacific and after various adventures Dampier and others were left ashore on Nicobar Island. After making several trading voyages in the Eastern seas he entered as a gunner in the fort at Bengoolen. Upon this coast he remained until 1691, when he found means to return home. In 1697 he published as a result of his voyage round the world, which had a great success and was supplemented by a second volume in 1699. He now obtained command of a ship in the king's service fitted out for a voyage of discovery. In this he made important explorations on the coasts of Australia and New Guinea, giving his name to Dampier Archipelago and Strait. His last two trips around the world 1703-07 and 1708-11 were commercial enterprises. Dampier's writings include 'A Voyage Round the World' (1697); 'A Discourse of Winds' (1699); 'Voyage of the Voyage to the South Sea' (1707); 'Voyages to the Bay of Campeachy' (1720). They bear all the marks of fidelity; and the nautical remarks display much professional and even philosophical knowledge. His observations on natural objects are also extremely clear and particular.

DAMPIER, the name of several places in Australasia: (1) Dampier Archipelago, a cluster of about 20 small rocky islands off the northwest coast of Australia, in lat. 21° S., and long. 117° E., divided by the Mermaid Strait in two groups; in the east is Rosemary, the largest island. (2) Dampier Island, off the northeast coast of New Guinea, with a volcano about 5,250 feet high. (3) Dampier's Land, a peninsula of western Australia, fertile and well watered, lying between King Charles and the Indian Ocean. (4) Dampier Strait, separating Neupommmern (off Papau) from Rock Island. (5) Dampier Strait, separating the island of Waigu from the northwest extremity of New Guinea, the safest and easiest passage between the Indian and Pacific oceans. It is 70 miles long and 35 miles wide.
DAMPROSC, Walter Johannes, American musician; b. Breslau, Prussia, 30 Jan. 1852. He is a son of Leopold Damrosch (q.v.), and has been a resident in the United States since 1871. He inherited the musical talent of his father, and succeeded him in his enterprises. In 1884, he founded the Damrosch Opera Company for the production of Wagner. Since 1903 he has been director of the New York Symphony Orchestra, which he also reorganized. He is the special exponent of the Wagnerian school of music, and has conducted operatic performances in all the large cities, proving himself to be the most acceptable leader. His compositions include an opera founded on Hawthorne's novel of 'The Scarlet Letter,' with which he toured the United States (1894); 'Manila Te Deum,' a sonata produced in New York (1899); 'Cyrano de Bergerac,' an opera in four acts (1913); and the incidental music for 'Medea' and 'Iphigenia' for the Greek Theatre at Berkeley, Calif., in 1915. In 1914, Columbia University conferred on him the degree of doctor of music.

DAMS. To dam (originally, to stop up) is to obstruct or restrain the flow of a liquid. In engineering, a dam is a barrier to contain or keep back a body of water. Dams vary in structure as widely as the physical character of their sites, the purposes for which they are constructed, and the materials used. Every dam is, in a sense, a special adaptation, and may only be classified by referring it to some more or less varying type.

The art of dam building is coeval with civilization when the river from the mountains, spreading itself in the arid plain, was diverted for irrigation. The gardens and the waterwheels of Damascus are back of history. The Nile Valley, the Euphrates-Tigris plain, the Oxus and Jaxartes, and much of India, developed civilization in the application of the water to the land, and this will be the history of their restoration. It was a time of mighty endeavor in hydraulic engineering, little understood in humid lands, demanding a high social organization and a closely knit state. Cyrus drained the Euphrates from the Euphrates and empire fell and rose. Lake Moeris regulated the floods of the Nile in the days of Joseph, and its operation is credited with the seven lean years and the seven lean years by some antiquarians; and Bahr Jussuf (meaning, the water carter) still leads to the Fayum Basin. Modern Egypt has built the barrage across the Rosetta and Damietta mouths of the Nile for the continuous irrigation of the delta, and the dam at Assuan puts under service more than 6,000,000 acres of new lands; nearly doubling agricultural Egypt.

The old Hindu ancients turned the flow of formidable rivers into irrigation canals, and as a rock-fill with long paved slope and an apron down stream, it serves the engineers of India to-day. The ancient tanks of India are natural depressions closed at a bank and embanked, sometimes of great height and miles in length, formed probably by basket carriage and consolidated by trumping. The Veranum Tank, still in use has a water area of 35 square miles held by a dam of clayey earth 12 miles long.

The protection of lands and embankments, levees or dykes, belongs to primitive times. Along the Yellow River...
DAMS

("China's Sorrow") the Chinese built levees in double line with cross-banks, so that the failure of the front line at any point by undercutting or other cause would only inundate the check immediately in front and of no more consequence. The people of northern Italy were embanked in remote times and the history of these works is of great interest.

The basket-work dam of moderate height on alluvial streams was long since devised, and from this there has evolved the modern bank protection of braided willow mattress in use on Western rivers. The primitive neighborhood grinding-mill led the head-race up-stream to a dam of simple type.

The utilities widen in approaching the modern era. The stream flow of the growing season no longer suffices for the needs of irrigation and the surplus is impounded for larger areas and the time of need. The uncertain navigation of natural streams no longer satisfies commerce, and the systems of extensive storage and feed-water developments, and this again, with steam navigation, gives way to the direct improvement and the canalization of rivers by means of fixed or movable dams. Great cities need a water supply, a demand now universal, and often extraordinary structures are required. Industries develop with the water power, the turbine makes higher heads available and changes the problem of dam construction for power purposes; and finally comes the electric generator and distant transmission of power to satisfy further demands.

The United States contains water power capable of enormous development, in fact, more than tenfold all the power now in use. Next to the land itself the running streams are the most valuable economic asset. The future may well see an era of dam and reservoir building, in the humid as well as in the arid regions, for the better equalization of the flow of streams, in the interest of navigation, the reclamation of alluvial lands, the development of water power and the creation of fisheries. The acre of water may be made even more valuable than the acre of land.

Embankments. Embankments for restraining are widely applied and have special names: as levees and dykes for protecting lands, banks forming canals, coffer-dams, reservoir embankments and the embankment with spillway adjunct for impounding water, the latter being called a dam.

The levee is built of the alluvium of river bottoms to restrain flood overflows. It is given sufficient freeboard above the greatest known flood, the top width is usually greater than the height and the side slopes are very flat, sometimes as low as five or six to one. The site is cleared of all humus and other vegetable matter and well broken, so as to bond the embankment to the natural ground, and all such material is excluded in forming the embankment. A "muck-ditch" is made when deemed necessary, and "back-shovel" or other water-tight material is puddled in and carried up into the embankment as a core.

Many hundreds of miles of levees have been built along the Mississippi River and its tributaries, some of them of very large proportions. When built according to the best practice, well seasoned and turfed over, failures are very rare, though floods often stand against them for weeks and the material is comparatively mobile when saturated. Failures have been due to insufficient height and the chopping effect of waves, but especially to lack of maintenance and of dyke bank. These levees were of clay burrowed through at the turf line when its removal was omitted, and the board fences built in the levee to intercept this pest, decayed and weakened the levee. In northern latitudes the muskrat has also been a nuisance, as in the embankments of reservoir systems, as for the head-waters of the Mississippi River built for the purpose of increasing the low water flow.

Canals frequently skirt the sides of valleys or contour slopes, partially in excavation with part or full bank on the lower side. The material for forming such banks is generally far superior to that available for levee construction. The slopes are usually flat, from two to three on one, and a water-tight core or face is added in permeable ground, or the entire prism may be given a core of clay. Support of the embankment is liable to be serious. Sheet piling has been driven in such banks, but this divides the bank and is not now considered good practice. The unwatering of navigable canals in the winter time is a serious practice, as it subjects the inner face to frost action.

Canals are carried across water courses and valleys on supporting embankments, sometimes of great magnitude. Such embankments are given easy slopes and care exercised in forming a water-tight prism above, so as to avoid saturation and the resulting instability.

Ditches for irrigation and hydraulic mining sometimes reach the dignity of large canals, requiring care in the formation of banks. The soil of their location is usually of fine till with an admixture of adobe, and such channels generally "seal" quickly with the fine sediment carried in the flowing water of certain seasons. The embankment used as a coffer-dam usually encloses some large site, as for the construction of a canal lock or for rock excavation in the dry, and is of a temporary character. Suitable material may be dumped from a trestle, the mass of material formed in water by dumping from a height being usually insufficient. In a notable case a rock channel in the Saint Mary's River, a heavy embankment more than a mile long was formed of dredged material to a maximum height of 30 feet, and rock, estimated as wet excavation, was taken out in the dry at large profit. No great care was taken in this embankment, except to provide suitable material and sufficient mass.

The reservoir embankment proper is usually for a storage or distributing reservoir, as for a municipal water supply. Such reservoirs are often 30 feet deep and the embankments are formed with great care from selected material placed in thin layers, watered and rolled. The inner face is lined and protected by a face-wall, a pavement of brick, stone pitching, or even riprap in some large storage reservoirs. The height of the embankment varies with the supporting ground.

Earth Dams.—The impounding embankment, or earth dam, is usually carried across some drainage line between steep valley slopes, so as to make a reservoir in the valley expands above, and generally seeks to store a large proportion of the run-off. An ample spillway on
an independent site is provided to carry the extreme flow of the valley when the reservoir is full.

Earth dams are made of carefully selected material, preferably gravel containing enough clay to make a water-tight puddle. Too much clay is to be avoided: it may range from 5 to 30 per cent of the remainder, according to the kind of material. The water slope being more or less saturated should be much flatter than the dry slope, the approved practice being a slope of three horizontal to one vertical. The earth is built up in shallow layers which are thoroughly compacted by rolling, trampling by horses or solidified with water.

Earth dams fall usually within four classes: (1) The homogeneous bank of earth; (2) the bank of earth with puddle core; (3) the bank of earth with a core of masonry or sheet piling; (4) the bank of earth puddled on the water slope.

The object of the masonry core is chiefly to cut off water seeping through, not to resist the hydrostatic pressure. The thickness of the core walls at the water level is usually one-seventh to one-sixth of the head in the reservoir.

Earth-dams have failed by over-topping from insufficient spillways or deficient freeboard, from saturation and sloughing of the rear slopes, and from cutting out around pipes carried through the base. Embankments subject to water action should have slopes much in excess of the so-called "natural" or dry slope. Present practice tends to an impermeable upstream face and upper toe wall or intercept to a safe depth with good drainage behind, thus developing the full stability of the material. Pipe lines through made banks are to be avoided, and in any location great care is needed to prevent seepage along the pipe line. The minimum thickness at the top is 10 feet, and 30 feet is regarded as a safe maximum.

The hydraulic-filled dam is probably a departure in the right direction. Dams of large section are filled by water carriage or by dump-6-inch layers, packed by steam rollers. The upstream face is covered with heavy concrete slabs. The reservoir holds 66,500,000,000 gallons.

The Gatun Dam (Canal Zone) is 7,700 feet long, 115 feet high, 100 feet wide at the top and 2,019 feet at the base. It contains 21,146,000 cubic yards of earth. The hydraulic fill has a base 1,200 feet wide.

The Lahontan Dam (Nevada) is an earth fill of gravel and silt built up in 4-inch layers. It is 1,300 feet long and 124 feet high. The thickness at the bottom is 623 feet, and at the top 20 feet. On the water side it has a facing of riprap 24 inches deep.

The San Leandro Dam (California) is 500 feet long and 125 feet high. It is 28 feet thick at the top and 1,700 feet at the base. About one-third of the material was sluiced in by the hydraulic method.

The Tabeaud Dam (California) has a length of 636 feet and a height of 120 feet. It is 20 feet thick at the top and 620 feet at the base.
It is built of red gravelly clay in 6-inch layers, which were sprinkled and rolled, trampled by horses and grooved lengthwise by cartwheels. The up-stream side is puddled and covered with a loose rock fill.

The Arrowhead Dam (California) is the second highest earth dam in the world—222 feet. It is 850 feet long, is 20 feet wide at the top and 950 feet at the base. It has a core wall of 80 feet high, 20 feet thick at the base and 10 feet at the top. The earth was dumped dry and hydraulic into place.

The Calaveras Dam, an adjunct of the San Francisco water supply, built 1913-16, is the highest earth dam on record. It is 1,260 feet long, with a maximum height of 240 feet above bed rock. It is 25 feet thick at the top and 1,132 feet at the base. The material was sluiced in, the centre being the finest clay and silt deposited in still water to simulate lacustrine clay. It was washed out of borrow pits down an open channel, the clay content varying from 20 to 50 per cent, the remainder being sand and gravel. The flowing material was raised to the dam by mud pumps.

Timber Dams.—The timber dam across flowing streams, too, is well-nigh universal in the pioneer development of the country. Timber was plentiful and its use was relatively wide-spread, and has been so ever since. Wooden wheels with horizontal axes utilized moderate heads, and these were limited by the height of banks, so as to avoid excessive flowage with sufficient pond so that the flow of the dry season could be used in the daylight hours.

Such dams were usually built for heads of 6 to 16 feet, though the Connecticut River Dam at Holyoke had a height of 30 feet. This dam was gradually undermined by the erosive action of the water falling over it, as it had no apron. Better heads were often produced by a dam at the head of some rapid, with a race leading down stream.

Timber dams were built in a great variety of forms, much depending on the character of the site and the material available. A common type was the crib or "coar-woork" structure with the pockets filled with stone, having a broad base, and the up-stream side and banked with earth, the down-stream side rising on the down-stream side, the spillway and apron dropping in steps. Piling was sometimes driven, capped and sheeted to an apex like the roof of a house, the spaces between piling being filled with stone and the up-stream toe banked with earth. Frame dams were also built, a sheeting of timbers supported by triangular frames resting on muddsills; the up-stream slope was flat, usually two to one, the toe being covered by a bank of earth. Log dams were cribbed up and sheeted up-stream like frame dams.

Dams were built of piling and sheeting alone, driven into the river bed.

Timber dams have lasted well where the height has not been excessive, the timbers have been easily renewed when decayed or worn out, and they have been exempt from wholesale failure with disastrous results. Most of the failures on record have been due to lack of a proper apron, the water running over gradually cutting away the top and undermining the bank. They will always be used in timber regions for manufacturing lumber and with sluiceways for driving logs. No material equals timber in resisting water shock and vibration, and its use will be preferred by many. Under water, timber is everlasting, and it will always be a useful material to the engineer.

A large proportion of the small water powers have been abandoned, and with the development of the turbine higher heads have been sought. The electric transmission has greatly enlarged the water-power field, and this has accentuated the tendency toward higher dams and larger units. In recent years Portland cement has become cheap and available, and was well-suited to the universal in the pioneer development of the country. Timber was plentiful and its use was widely familiar. Wooden wheels with horizontal axes utilized moderate heads, and these were also limited by the height of banks, so as to avoid excessive flowage with sufficient pond so that the flow of the dry season could be used in the daylight hours.

Some notable examples of the tim ber dam are: The New-Harford dam, 232 feet long and 21 feet high with a width at the bottom of 68 feet. The timbers are 9 to 12 inches thick and 6 feet apart, the spaces between being filled with stone. Both faces are panned with oak, and the up-stream side has a long graded earth surface. This dam has stood a fresher of water at 10 feet deep flowing over the top of the dam.

The Columbia Dam across the Susquehanna River is 560 feet long and 16 feet high, with a width at the bottom of 16 feet wide at the top and 30 feet at the bottom. It has withstood many severe ice freshets since it was built, in 1875.

The Canyon Ferry Dam (Montana) is 488 feet long and 29 feet high. It is built of timber cribs filled with stone. The downstream face is constructed in two long slopes, the lower one flatter. These slopes take the place of an apron. The up-stream slope is panned and protected by a gravel fill covered with riprap.

Masonry Dams—Masonry dams are built after three general types: (1) gravity dams, in which the weight of the material of which the dam is built is dependent on the pressure of the impounded water, (2) arch dams, in which the principle of the arch is opposed to the water pressure, (3) hollow dams, in which the water face of the dam is supported by a series of buttresses. In the third class belong the "multiple arch" dams, in which the small arches are sprung from the buttresses, in conjunction with the Upon completion of the structure.

The first requisite in masonry dam construction is an exploration of the site. Where there is an earth cover, borings are made to discover
The location and quality of the necessary rock formation, and exposed rock, is searched for existing seams. After diversion works to turn outside the stream while the dam is built, a trench is dug down to the rock, large enough to accommodate the base of the dam, and room for carryag on the work. The rock surface is cleaned of earth with wire brooms; large seams are filled with concrete, and small seams are grouted under pressure—up to 200 pounds per square inch. Grooves are cut in the rock for the toe of the dam, and if the structure is a high one, additional grooves are cut to ensure against the dam's sliding on its foundation.

The former practice of building the two faces of cut stone and filling between with rubble masonry has been largely superseded by cyclopene masonry, in which great masses of rock are placed by the derrick, and the filling out to the faces done with concrete. With present-day machinery cyclopene masonry can be laid four times as fast as rubble masonry. As a result, the use of the proportion of the cost is reduced from 50 to 35 per cent of the mass, and its quality is improved about 25 per cent.

Many timber dams have been rebuilt in masonry, including the great dam at Holyoke before referred to. Modern practice in power plants combines a number of turbines on a horizontal shaft connected direct to the electric generator, and this demands that the floor of the forebay and of the generator room shall be above the back-water of the floods, and that the turbines discharge into the tail bay through draft tubes. Recent practice at Keokuk, Iowa, and the Cedars of the Saint Lawrence has installed very large single turbine units of the vertical type and has thus simplified power development. The exacting demands of electrical service require uninterrupted power, or that the head should be sufficient to give effective results in flood time. These conditions have increased the height of dams to about twice the flood range, with low-water heads of 20 to 40 feet. Some over-fall dams have, however, been carried up to 60 feet.

The approved form for an over-fall dam is a masonry dam, of course, a curved crest with a reverse curve extending downwards to the bottom. The crest and upper slant should be worked out as a gravity curve for the maximum flood, thus avoiding the tendency of the structure to shatter, which has been credited as the source of tremor and vibration. The flashboards is a common error, and failure to remove these in floods has caused such vibrations of the confined air as to shake off the tops of dams, in one concrete dam for one-third the height. A high and well-formed roll-way dam may be called a speed-generator, and in high water the horse power turned into velocity is tremendous; and this is not dissipated by wave action for some distance down-stream. The beds and banks must therefore be defended, and a well-shaped, high, robust heel is not always safe, as shown in the failure of the 60-foot dam at Austin, Tex., where the downstream toe was undermined by reason of the omission of proper detent gates.

Footings without rock bottom, in reach, green, or exposed, are undermined by the discharge of the current below from erosion. For such situations the "tumble-bay" dam is best adapted, in which the force of the falling water is dissipated within the confines of the structure. In dams of this type, the sheet of water is an ideal fall, being well ventilated behind, into the pool or bay which has a depth of one-half to two-thirds the height of the fall, and the water escapes from the bay over a breast wall or roll-way with little or no destructive energy. Some recent designs show an A-shaped plan of dam with a triangular tumble-bay closed by a low roll-way, with a bridge of reinforced concrete spanning the roll-way between piers. The bottom of the bay is a heavy bed of concrete defended by a timber floor beneath the sheet of falling water. The dam on rock across the Mississippi River opposite Keokuk, at the foot of the Des Moines Rapids, for a head of 35 feet is of the roll-way type divided into panels by piers fitted for "stop locks" on the crest.

High dams without rock foundations will, in many situations, require foundations of bearing piles and a libon of reinforced concrete, the latter of which has naturally a broad base which is an element of security. Further security may be had by sealing the river bed with silt or clay puddle for some distance up stream, depending upon its character and the head. Nature will perform this service in time, if a blow-out does not meantime occur, as streams generally carry sediment at some season.

The problem in such foundations is one of percolation around and beneath. The history of the barrage across the two outlets of the Nile, near the head of the delta, is instructive in this connection. A masonry structure was built upon strata of the most mobile character, and has been put in successful operation by sealing the bed upstream with impermeable material for a distance of 20 times the head on the dam.

This experience should assure the practicability of founding a dam on any site.

Movable Dams.—In the improvement and canalization of rivers the dams are usually of moderate height, and when of the ordinary type are called "fixed" dams. The purpose of canalization is to maintain the ordinary pool level as high as the adjacent lands will permit without interfering unduly with the flood regimen, and for this end several types of movable dams have been devised. These are an important part of dam work and a great development is to be expected in this country. Movable dams are of two general classes: (1) automatic dams, and (2) those operated by external power. In the first group belong the eight types classified as follows: in the second are the bridge dams; shutter and wicket dams; roller dams; frame dams; and curtain dams.

The original of the automatic types is the bear-trap first used on the Lekah, River navigation. This consisted of a timber platform at or near the level of the stream-bed, with two leaves overlapping. The top leaf was hinged at its upstream edge to the floor of the dam, and the under leaf similarly hinged at its downstream edge. By introducing water through regulating sluice these leaves rose with the head of water above until they reached the proper height, in the form of a flat A dam. The use of these dams for navigation disappeared for a time, but continued to be used in localities as an...
logs and then flushing the same down the stream. As thus used the bear-trap has been variously altered and made as long as 60 feet, beyond which trouble has occurred from the warping or twisting of the leaves. Various designs have been proposed for waterway purposes. The most notable application is the so-called *Chicago* bear-trap, 160 feet long, installed at Lockport, Ill., as a part of the *controlling works* of the Chicago Drainage Canal. This is made of metal, is hinged at the top angle, the upper-leaf dropping in front of a breast-wall. It has a range of 15 feet and is so counter-weighted and controlled that the depth flowing over is practically uniform at any elevation, and it is easily manoeuvred by one man. The other modifications of the bear-trap are the DuBois dam, in which the two leaves are hinged at the apex, and the downstream leaf hinged to the foundation, the upstream leaf sliding; the Carro dam, in which the leaves are hinged at the apex, and both slide in links on the foundation; the Girard dam, in which the leaves are hinged at the apex, and the downstream leaf in two parts hinged at its middle, folding up stream; the Parker dam, in which the leaves are hinged at the apex, and the upstream leaf in two sections, hinged at its middle, and protected by an idler leaf sliding on the foundation; the Lang dam, claimed to be an improvement on the Parker, in which the upper part of the latter's upstream leaf is omitted, and the lower part hinged to the idler; and the Marshall dam, in which the hinge joining the leaves is near the middle of the water leaf, on its downstream side, and the downstream leaf is in two parts, hinged at the middle, forming a salient angle pointing down stream; the upstream part of the downstream leaf is constantly horizontal, and its lower part is parallel with the water leaf, forming an exceedingly flexible dam, managed entirely without chains or stops.

Bridge dams consist of a permanent bridge with the openings between the piers closed by some form of gates supported directly upon the piers. The type is an evolution from the old *stop-plank* used in mill practice, set vertically or horizontally. If vertically it is called a needle dam. The "needle" is a piece of light wood, rectangular, and shaped into a handle at top. These are placed in juxtaposition against a sill on the floor of the pass or on the weir and against a girder above water level. The needles are usually designed for one man to handle, and their application is thus limited to needles 4½ inches square, and about 16 feet long, weighing about 100 pounds. It is properly an auxiliary in some other type of movable dam for the purpose of regulating pool level in moderate flows of water. A needle dam has been built, however, on the Big Sandy River in which the needles are 12 inches square and 18 feet long, and weigh 803 pounds. They are handled by a derrick mounted on a boat.

The shutter or wicket dam is thus far the favorite for river work. This consists of shutters several feet in width and of the length desired set side by side, the lower edge resting against a sill and supported by a prop behind, the shutter tipping automatically and falling to the river-bed when the depth over top exceeds a certain limit. The shutters are raised by means of a windlass from a service bridge or boat. This type of dam is used on the Ohio and Great Kanawha rivers. The dams on the Ohio improvement are mostly of Chanoine wickets in their navigable passes, with pool regulating weirs of bear-trap type. The length of these wickets varies from 9 feet 9 inches for the lowest weirs to 18 feet for the highest pass.

The wickets are 3 feet 9 inches in width, set with 3-inch openings between which they are closed by pieces of scantling in time of low water. The vertical height of the bear-trap dams varies from 9 feet to 15 feet. The usual width of the navigable passes is 600 to 700 feet, and of the bear-trap dams 91 to 94 feet, with extremes of 52 feet and 120 feet.

Roller dams are formed by a massive cylinder having a diameter equal to the desired height. Opening the dam is accomplished by rolling the cylinder bodily up inclined tracks laid at both ends of the dam. In a roller dam recently built at Schweinfurt, Germany, the cylinder is 13 feet 6 inches in diameter, and closes an opening 59 feet across.

Frame dams are essentially bridge dams, in which the bridge itself is movable. In its simplest form it consists of a series of A-shaped frames set closely side by side. These are arranged to drop down sideways nesting one another. They are united by a chain connecting the peaks of the A-frames.

Curtain dams have an operating bridge with a series of frames hinged to the bridge at the top. These can be lowered till the other end abuts against a stop on the dam floor. The actual closure is effected by curtains of horizontal bars of wood hinged together on their upstream side, the lower bars being heavier. A rolling *shoe* of iron is attached to the lowest bar, and an endless chain passes around the curtain at its centre. The curtain is rolled up by a windlass operating the chain. At the Port Villex Dam across the Seine 90 miles below Paris is the original curtain dam, 700 feet long and 10 feet 6 inches high.

The Tainter gate has been much used for closing passes and chutes and has been built in sections 20 feet long and for a depth of 10 to 12 feet. This is a sector of a cylinder against the water, the centre of motion and support being below the centre of figure, so that the water pressure shall nearly balance the weight and assist in raising the gate. Some dams have been built for power purposes in which the flood flow is practically controlled by Tainter gates.
1 Shoshone Dam, Cody, Wyoming, 328 feet high
2 Arrowrock Dam, Boise, Idaho, 351 feet high

Two of the highest dams in the world
The reverse Tainter or rigid bear-trap is a sector of a cylinder in the form of an inverted trough, having one side straight, and the other curved to the radius of the straight side. The free edge of the straight side is hinged to the dam floor, so that the whole structure can rotate, sliding into a well in the floor. The curved side and ends of the "trough" make an approximately watertight contact with the masonry. Water from above the dam can be admitted to the under side of the sector, raising it until the water pressure balances the weight of the gate. The river flows over the crest, and down the straight side. This type is in use at the power plant of the sanitary district of Chicago and is under construction in the Genesee River at Rochester, N. Y.

Under this classification belong also the butterfly dam in the Chicago Drainage Canal, the only structure of its kind. The swinging leaf is 184 feet long and 30 feet high, and weighs 710 tons. It consists of a girder faced with steel plates on both sides. It is pivoted at the centre, and so as to swing into the line of the flowing stream when open. The maximum pressure against the bottom pivot when the dam is closed is 1,888 tons; on the top pivot 670 tons. The dam is operated by releasing the lockbar blocking the downstream end, and then opening several shutters in the end that swings up stream: the pressure thus reduced on that end, the pressure on the other end swings the dam open— with some mechanical aid.

Rock-fill Dams.—Hydraulic mining on the Pacific slope developed the rock-fill dam, and it has been utilized for irrigation works. Originally this dam consisted of a dump of loose rock in a canyon or other rock-bound site, taking its natural slope down stream, the upper slope being hand-laid and steeper and faced with redwood or other planking and calking.

Later a sheet of metal was substituted for the planking, and the construction was varied by setting the metal sheet vertically in the heart of the dam. The metal sheet was coated and sometimes enclosed in asphaltic concrete. Such dams had an independent spillway.

These dams have been carried to considerable heights, several exceeding 100 feet, the highest being the Lower Ottay, near San Diego, Cal., 161 feet above rock and 130 feet above natural surface. It is 565 feet long, 20 feet wide at the top and 282 feet at the base. Settlement has occurred in most of these dams, causing apprehension, but no serious disaster has occurred.

A dam of this character was undertaken in Goose-neck canyon on the south fork of the South Platte, some 50 miles southwesterly from Denver. In order to avoid settlement, the rock was dropped into place from a height of about 100 feet, as experience in the spoil-banks of the Chicago Drainage Canal had shown such consolidation from this cause that blasting was reported to in opening up a rock-fill dam. The downstream slope was to be flattened and the hand-laid stone up stream was to be filled with lean concrete, and faced with a metal sheet. When this dam had reached a height of 50 to 60 feet it was overtopped by an unprecedented flood and washed away. The experience was valuable in showing that a mound of granite rock thus consolidated was nearly watertight, under a head of 50 feet of water. (The facing was not carried up.) This experience suggested that a filling of finer material grading to adobe at the face would have made a successful structure without the intervention of wall or metal sheet. The site was later occupied by a high masonry dam.

The Castlewood Dam (Colorado) is a rock-fill dam 600 feet long and 92 feet high. It is 8 feet wide at the crest, and 225 feet at the base, and has a facing of rubble laid in cement on both slopes.

The Pecos Valley Dam is a rock-fill, 1,686 feet long and 52 feet high. It is 14 feet wide at the top and 115 feet at the bottom, with an earth backing for 162 feet on the water slope. The earth fill is faced with riprap one foot thick.

The Morena Dam (California) is 520 feet long, with a maximum height of 287 feet. The water slope is 9 horizontal. 10 vertical, of masonry behind which was placed loose rock by hand 54 feet wide at the base and 16 feet at the crest. The loose rock-fill was dumped behind this, forming a total base of 357 feet. The water face was finished with reinforced concrete slabs 12 inches thick.

Experience in this class of construction also suggests the flatter slope down stream and the water-tight skin at the upper face, rather than a core or intercept in the heart of the dam. Dams which depend on a timber or metal sheet for tightness cannot be regarded as permanent structures, and a lack of care in maintenance invites destruction. They are, however, useful expedients in the early development of remote regions.

Metal Dams.—Metal dams are often proposed, and a few examples have been executed in steel. Steel is perhaps more perishable than timber, and its failure from growing weakness and lack of care is likely to be more complete and disastrous. It is adapted to much greater heights, but is to be regarded as an expedient for a few years until something better is justified.

Prominent examples of the steel dam are:

The Ash Fork Dam (Arizona), 184 feet long and 46 feet high. It is of open front design, the deck being supported on 24 triangular bents set 8 feet between centres on a concrete foundation. The water face is of steel plates which are riveted to 20-inch I-beams which form the upstream members of the bent. The deck plates are 3/16 of an inch thick, and are curved to a radius of 7½ feet (flatwise), the concave side being up stream. The deck makes an angle of 45 degrees with the horizontal.
The Redridge Dam (Michigan) is of the same general construction as the Ash Fork Dam. It is 464 feet long and 74 feet high. The face members of the bents vary from 15-inch I-beams on the low bents to 24-inch I-beams on the high ones; and 36 60-inch I-beams for the middle section. The illustration shows a combination of steel and concrete. The dam is faced with a reinforced concrete deck, in a small dam erected at Theresa, N.Y.

High Masonry Dams.—The high masonry dam is comparatively recent, originating in South Germany almost three centuries ago, but its rational design began with the Furenos Dam in France less than a half century ago. The examples are not yet numerous, but the better quality of masonry for hydraulic construction and the greatly reduced cost, together with the more enlightened demand for the conservation of water for irrigation, water supply, water power, navigation and fisheries, combined with the greater security and permanence, promises an era of high masonry dams.

The approved cross-section has a thickness at top of 8 to 10 per cent of the height, a curved batter down stream and a slightly curved batter up stream, the conditions being that the locus of strain shall not pass outside the middle third, and that the greatest pressure in the masonry shall not exceed safe working limits, the latter being governed by the quality of the masonry. The construction is massive random rubble work with an avoidance of continuous beds and joints, the upstream face with a mixture of roughly dressed beds and joints, the downstream face of selected stone. The top of the dam is usually finished as a roadway with parapet walls, and the spillway is constructed on an independent foundation. The illustration shows a concrete spillway with a valley span above the reservoir.

Among the notable masonry dams of the gravity type may be instanced the following:

The Assuan Dam, across the Nile, in Egypt, is the largest masonry dam in the world. It is built of granite rubble, is 6,400 feet long, and has a maximum height of 112 feet. Its mass contains 1,179,000 cubic yards of solid masonry.

The Assokan, or Olive Bridge, Dam (New York city water supply), across the Esopus Creek, is 1,000 feet long, with a series of cove walls and embankment — 4,600 feet in all. Its maximum height is 251 feet. It is of cyclopean masonry faced with concrete blocks. The masonry mass has a content of 488,200 cubic yards.

The Tansa Dam, in India (water supply of Bombay), is of rubble masonry, 8,800 feet long and 118 feet high, with a mass of 408,500 cubic yards.

The Waldeck Dam across the river Eder, in Germany, is of rubble masonry. It is 900 feet long, 160 feet high and has a content of 392,400 cubic yards.

The Poona Dam, in India, is of rubble masonry, 5,136 feet long and 108 feet high, with a mass of 362,000 cubic yards.

The Roosevelt Dam, in Arizona (built 1905-11), is of rubble masonry with concrete in vertical joints. It is 680 feet long and 260 feet high. It is 158 feet wide at the base and 16 feet at the top. Its content is 344,000 cubic yards.

The Maurer Dam, in Germany (built 1904-13), is of rubble masonry, 918 feet long and 208 feet high. It has a mass of 332,000 cubic yards.

The Lake Cheesman Dam, of the Denver water supply, is one of the very high masonry dams carrying a free head of water second only to the Arrowrock Dam. It is 700 feet long on the crest, with a maximum height of 225 feet. It is built on a curve, the radius of which is 400 feet. It is of granite rubble, with a mass of 103,000 cubic yards.

Of all-concrete dams of the gravity type, the following are examples:

The Arrowrock Dam, over the Boise River, in Idaho (built 1912-16), is of concrete with...
1 Assouan Dam, Egypt, looking down stream
2 San Roque Dam, Providence, Arizona
The Keokuk Dam on the Mississippi is a massive earth dam 4,049 feet long, with a maximum height of 53 feet. It is 29 feet wide at the top and 42 feet at the bottom. The spillway section is 4,278 feet in length and a height of 36 feet, allowing for a head of 11 feet over the crest. The deck of the dam above the spillway is supported on 119 arches, 36 feet from centre to centre, on 6-foot piers. From this deck are operated the steel gates (11 feet by 32 feet) which close the spillway openings. In building this dam concrete was poured 40 feet deep per day—a 15-foot lift, then 5 hours for setting, followed by the 25-foot lift.

The Barcelona (Spain) Dam, completed in 1916, is the largest dam in Europe, is of concrete and was built by American engineers. Its maximum height is 330 feet and its length on the crest is 700 feet. The thickness at the base is 230 feet and at the crest 14 feet. The dam holds an artificial lake 4,000 feet long and 334 miles wide, designed to irrigate 100 square miles of arid country and also furnish 20,000 electric horse power, later to be increased to 40,000 horse power.

Notable examples of the arch type of dam are the following:

The old Bear Valley Dam (built in 1884) surpassed in boldness of design all dams previously built. It was of granite ashlar facing with rubble filling, set in Portland cement. It was 450 feet long and arched to a radius of 335 feet. Its maximum height was 64 feet and it was 20 feet thick at the base and 3.2 feet at the crest. Notwithstanding the severe criticism it received, it stood unimpaired until submerged in 1915 behind the new dam.

The Barossa Dam, in Australia (built 1899-1903), is of cyclopean masonry. It has a maximum height of 135 feet and is 42 feet thick at the base and 4½ feet at the crest.

An arch dam of remarkable design was recently built across Crowley Creek, in Oregon. It is of gravel concrete, without reinforcement, 170 feet long with a maximum height of 65 feet. It is 5.2 feet thick at the base and 3.2 feet at the crest. For the upper 30 feet the faces are parallel, the slight batter being below this section on the downstream side.

The Shoshone and Pathfinder dams, in Wyoming, depend in part upon their arch form for stability. The Shoshone Dam (built 1905-10) is of rubble masonry, arched to a radius of 150 feet. It is 200 feet long, with a maximum height of 328 feet. It is 108 feet thick at the base and 10 feet at the crest. The Pathfinder Dam, across the North Platte...
River (built 1906–10), is of masonry, arched to a radius of 150 feet. It has a maximum height of 210 feet and is 94 feet thick at the base and 11 feet at the crest. The buttresses are 16 inches thick at the top and 31 inches at the bottom. A rock foundation not being available, the buttresses were built on a thick mattress of concrete.

Among the more recent hollow dams are:

Douglas or La Prele Dam, in Wyoming, built 1908–09, an open front dam of the Ambursten type, 300 feet long and 135 feet maximum height. The deck is at an angle of 40 degrees with the horizontal and is 12 inches thick at the top and 54 inches at the bottom. The supporting buttresses are 18 feet between centres, 12 inches thick at the top and 40 inches at the bottom, 10 feet deep at the crest and 20 feet at the base. The material is reinforced concrete. The whole batter is on the water face.

Jordan River Dam, on Vancouver’s Island, is of reinforced concrete, 756 feet long and 126 feet high. The buttresses are 7¾ feet deep at the crest and 148 feet at the base. They are placed 18 feet between centres and are 12 inches thick at the top and 42 inches at the bottom. The deck (cast after the buttresses were built) is 15 inches thick at the top and 35 inches at the bottom.

The Three Miles Falls Dam, in Oregon (built 1914), is a multiple-arch dam, curved to a radius of 1,200 feet, and 24 feet in height. It is composed of 40 arches sprung from the buttresses as piers with a radius of 18 feet. The buttresses are placed 20 feet from centre to centre, 2 feet wide at the crest and 34 feet at the base. They are 12 inches thick at the top and 24 inches at the bottom.

The Big Bear Valley Dam, in California (built 1914–16), is 363 feet long and 92 feet high. It is a multiple-arch dam, consisting of 10 arches of 30½ feet chord, sprung from buttresses 22 feet deep at the crest and 111 feet at the base. The buttresses are 18 inches thick at the top and 54 inches at the bottom.

The Mathis Dam, at Taliulah Falls, Ga., is 650 feet long and 90 feet high, of reinforced concrete. The deck is 18 inches thick at the top and 39 inches at the bottom, and is supported by buttresses 16 feet deep at the crest and 148 feet at the base. The buttresses are changed its lower course to the sea. All the factors in flood flow will sometime conjoin, and a work that is to last through the centuries must recognize all the possibilities.

Adjuncts in the way of gates, sluices and movable structures are much favored by some designers, especially where they serve to lessen cost. Such provisions should not be carried to a point where their failure to operate or be operated will produce damages amounting to a disaster.

The location of service pipes and outlets through or beneath dams is shown by experience to be a source of danger, and the best practice now seeks an independent location. The tendency is now to avoid the long race for power purposes, to build the dam at the foot rather than the head of the rapids or descent, and to make the power station and forebay a part of the structure, taking the water directly from the pool.

Outside of the main elements of a structure on which safety and permanency depend, many devices and constructions are permissible, as
failure in these results in only temporary loss and inconvenience.

General Remarks.—Dam building is still in the evolutionary stage, and the resources of engineering therefor are still developing. Modern practice includes the construction in the body of the dam of a more or less complete drainage system to collect any water leaking in from the reservoir. In the Kensico Dam there are also thermophones to give warning of unusual changes of temperature. The Wachusett Dam (diagrams on another page) was the first in which ice pressure was taken into account in calculating the cross-section. The engineers estimated it at 47,000 pounds per lineal foot for ice 12 inches thick at full reservoir. In the Arrowrock Dam there is a system of inspection galleries, of which the control chambers form a part. These give access to the body of the dam at several elevations, the lowest being 230 feet below normal high water in the reservoir.

So far as general designs are concerned, the type structures would seem to be well defined, but even here peculiar conditions, requiring elasticity in treatment, and financial limitations often blight the proper solution. A dam when once built assimilates so closely to natural resources, is so fully identified with the public welfare, and the failure is so disastrous, that its construction becomes a matter of solicitude above that of any other engineering work. Of 28 failures of dams investigated, 12 were found to be due to faulty construction, although the dimensions were correct; 11 were due to insufficient spillway—these were mainly earthen dams, and high water overtopped them; 4 were due to faulty foundation and 1 to percolation along pipe-lines. See IRRIGATION; RESERVOIR; WATER-WORKS; WATER POWER.

Richard Fitriss.

DAMSEL-FLY, sometimes, though rarely, used as a popular name for the common dragon-fly, or mosquito-hawk, of the neuropterous family Libellulidae or Odonata. Damselfly is the English equivalent for the French demoiselle (fly) which is applied only to the genus Atrion and its immediate allies. This is a very small dragon-fly, not half as large as Libellula. Its metallic greenish-blue color and slender delicate form produce a beautiful effect in the sunshine and suggest the name. See DRAGON-FLY.

DAMSON, a variety of plum (q.v.).

DAN (Heb. ‘judgment’), one of the sons of Jacob by his concubine, Bilhah. Like the other sons of Jacob, Dan became head of one of the 12 tribes of Israel. The tribe numbered 62,700 adult males. The territory assigned them in Canaan lay on the coast, but living in the immediate neighborhood of the hardy and well-equipped Philistines—for the district lay partly within the Philistine territory—the available land proved somewhat too narrow for the Danites, and they were pushed back into the more mountainous regions where they encroached on the boundaries of Judah. The tribe also possessed an isolated portion of territory in the extreme north of Canaan, containing the town of Laish or Dan, which gave rise to the prophecy of Micah, ‘from Dan to Beersheba.’ This town was in later times selected by Jeroboam as one of the two centres of his idolatrous worship, but a species of idolatry had been maintained there from the earliest times of the settlement in connection with the image of Micah. The most notable person connected with the tribe was Samson. Consult Schmidt, N., ‘The Messages of the Poets’ (1911).

DAN RIVER, river rising in the Blue Ridge Mountains in Patrick County, Va. It flows south into North Carolina and receives the boundary four times; it meets the Shenandoah River at Roanoke River. It is about 175 miles long and drains an area of 3,500 square miles. The United States government has made the channel navigable for boats of light draught as far as Madison.

DANA, Charles Anderson, American journalist: b. Hinsdale, N. H., 8 Aug. 1819; d. Glen Cove, L. I., 17 Oct. 1897. He was educated at Harvard and in 1842 was a member of the Brook Farm Community, in Roxbury, Mass., remaining there only two years. He edited The Harbinger (1844-47), his associates being George Ripley, Parke Godwin and John S. Dwight. In 1847 he became managing editor of the New York Tribune, with which he remained until 1861. In 1855, with George Ripley, he projected and edited Appleton's 'American Encyclopedia' in 16 volumes, completed in 1863, and revised in 1873-77. He also edited several other works, among them the popular 'Household Book of Poetry' (1857); 'Life of Grant' (1868); 'Art of Newspaper Making' (1885); 'Lincoln and His Cabinet' (1891); 'Lincoln's Receptions' (1897). From 1862 to 1865 he was in the service of the United States government, during the last two years as assistant Secretary of War under President Lincoln. About the beginning of 1866 he became editor of the Chicago Republican, a daily paper. In 1868 he purchased an interest in the New York Sun, also a daily, of which he was editor and chief proprietor until his death. He was a man of forcible character and impressed his personality upon his paper. His literary judgments and perceptions were keen and his own writing exhibited a perfect mastery of English style. Under his management the Sun became noted for the literary quality of its editorials. In his later years, however, his intense political partisanship became very marked and greatly diminished the weight of his influence in journalism.

DANA, Charles Loomis, American physician: b. Woodstock, Vt., 25 March 1852. He was educated at Dartmouth and at the New York College of Physicians and Surgeons. He served as professor of physiology in the New York Woman's Medical College in 1880-86, of
nervous and mental disease at the New York Postgraduate Medical School in 1884-90, and of nervous diseases in Dartmouth Medical College in 1891. Four years later he became professor of nervous diseases in Bellevue Hospital Medical College. He was also an editor of the Journal of Comparative Medicine and associate editor of the Medical Record. He is author of a 'Text-Book of Nervous Diseases' (1881), and many monographs on nervous and mental diseases.

DANA, Edward Salisbury, American mineralogist, b. New Haven, Conn., 16 Nov. 1840. He was graduated from Yale in 1870 and has been a member of the faculty at that institution from 1874, since 1890 has been professor of physics. He received the degree of D.Ph. at Yale in 1876, and spent some time at the universities of Heidelberg and Vienna, After 1875 he edited the American Journal of Science. He is a member of the National Academy of Science. He has published 'A Text-Book of General Geology' (1877), 'Text Book of Mechanics' (1881), 'Minerals, and How to Study Them' (1885), 'Sixth Edition of James D. Dana's System of Mineralogy' (1882); and many papers on mineral and other scientific subjects.

DANA, Francis, American jurist and diplomat, b. Charlestown, Mass., 13 June 1743; d. 25 April 1811. He was a son of Richard Dana (q.v.), was graduated at Harvard in 1762, and admitted to the bar in 1767. In 1774 he was sent to Europe on a confidential mission to Benjamin Franklin, carrying letters from Warren, Quincy and other patriots. He returned the next year and reported to General Washington that the colonies need expect nothing of Great Britain. In 1777 he was elected a member of the Congress that formed the Confederation, and filled various offices during the Revolutionary War. In 1781 he was made Minister to Russia, and after his return was again elected to Congress. In November 1791 he was appointed chief justice of Massachusetts for a term of 15 years. He was one of the founders of the American Academy of Arts and Sciences.

DANA, Francis, American lawyer and author, b. Singapore, East India, 4 March 1816; d. New York, 14 April 1895. He was educated at Saint Paul's School, Concord, N. H., and the Harvard Law School, and engaged in active law practice in New York. Besides contributing short stories to periodicals has published 'Lesions of the Yam-mish', 'The Decoy', etc.

DANA, James Dwight, American mineralogist, b. Utica, N. Y., 12 Feb. 1813; d. New Haven, Conn., 14 April 1895. He showed an interest in science from his early youth, and this was encouraged by Pay Edgerton, his teacher in the Utica High School. In 1830 he matriculated at Yale, where he studied under the elder Dana, whose reputation had attracted him. After devoting three years to the study of mathematics, the classics and natural science, he received an appointment as instructor in mathematics to midshipmen in the United States navy, and was engaged on this duty. From 1836 to 1838 he assisted Professor Silliman in his chemical laboratory at Yale, and there wrote his first important work, 'The System of Mineralogy...'

From 1839 to 1841 he acted as mineralogist and geologist to the United States' exploring expeditions sent out under Capt. Charles Wilkes to investigate the Pacific Ocean and its natural history. During the next 13 years he worked up the material which he had collected during this expedition into many scientific articles. This labor ruined his health. In 1844 he returned to New Haven, where he married the daughter of Professor Silliman, and in the latter resigned in 1850. Dwight was appointed Silliman professor of natural history and geology at Yale, and held this chair till 1852, when he retired. In 1846 he became joint editor with Professor Silliman of the American Journal of Science and Arts, and after the death of his teacher he became the chief editor. Dana had a keen, analytic, imaginative mind. His speculations concerning the formations of continents, mountains, volcanoes and other major features of the earth's crust are possessed of the utmost value. He was a member of many of the great learned societies of the world; and was president of the American Association for the Advancement of Science in 1834; and of the Geological Society of America, 1834. He received the Wollaston medal of The Geological Society of London in 1874 and the Copley medal of the Royal Society of London in 1877. He published 214 books and papers. Of these the most important are those which record the results of the Wilkes expedition as to geology, zoophytes (with 220 new species), and enstases (with 658 new species), and his 'System of Mineralogy' (1837, with many later editions), 'Manual of Geology' (1842, 1846, 1865); 'Manual of Mineralogy' (1848); later 'Manual of Mineralogy and Lithology' (4th ed., 1887); 'Corals and Coral Islands' (1872; 2d ed., 1890); 'Characteristics of Volcanos' (1890). Consult Gilman, D. C., 'Life of J. D. Dana' (1884).

DANA, John Coen, American librarian, b. Woodstock, Vt., 19 Aug. 1816. He graduated at Dartmouth College 1838, and admitted to New York bar 1882. He was librarian of the Public Library, Denver, Colo., 1889-97; of the City Library Association of Springfield, Mass., 1889-91, and has since been at the head of the India Club. He has been secretary and director of the Newark Museum Association which has its home in the public library building and is largely the outcome of the library's activities since 1901; member of the Century Association of New York. He has written 'A Library Primer' (1859); 'Notes on Bookbinding for Libraries' (1908) and several chapters in 'Modern American Library Economy,' and with Henry W. Kent, edited 'Literature of Libraries in the Seventeenth and Eighteenth Centuries' (6 vols., 1846-47). With C. L. Dana he compiled 'Horace: The Roman Poet Presented to Modern Readers' (1908), a selection of versions of the Odes; and published 'Cops: The Hostess of the Inn' (1909), a version of the pseudo-Virgilian poem.

DANA, Marvin, American, writer, b. Cornwall, Vt., 2 March 1807. His published works include 'Memoir of Captain Cook,' 'Other Poems,' 'History of General Custer,' 'History of the Mormons,' 'Wars of the Century,' 'Studies in Criminology,' 'A Brief Universal History,' etc.
2 DANA, Richard Henry, American lawyer: b. Cambridge, Mass., 3 Jan. 1851. In 1874 he was graduated at Harvard University and three years later from the law school there. In 1878-79 he helped organize the charities department of the city of Boston and in 1884 drew up the bill subsequently passed by the Massachusetts legislature as the Civil Service Reform Act. In 1888 he drafted the New Ballot Act, which also became law, and has since been referred to as the Massachusetts Ballot. In 1889-92 he served as editor of the Civil Service Record. His published works are "Double Taxation in Massachusetts" (1893); introduction and notes to the speeches in " Stirring Times in the States" (1901); and "The Boyhood of a Son" (1910); introduction and concluding chapter to "Two Years Before the Mast" (1911); "The Corrupt Practices Act" (1905); "Australian Ballot System of Massachusetts" (1911); "Trent: An Aftermath" (1912), etc.

3 DANA, William Parsons, American marine artist: b. Boston, Mass., 18 Feb. 1833. He studied in Paris under Picot and Le Poitevin, became a member of the National Academy in 1863 and obtained a third class medal at the Paris Exhibition of 1878 for his "Gathering Seaweed," Other comedies: "Admiral," "The Burning Wreck," "Heartsease." One of his most noted pictures is the "Chase of the Frigate Constitution" in the Metropolitan Museum, New York. He was elected to the National Academy of Design in 1897.

DANAE, dànä', in Greek mythology, daughter of Acrisius, king of Argos. She was shut up by her father in a brazen tower, because an oracle had declared that a son of his daughter should put him to death. But Zeus, inflamed with passion for the charming virgin, transformed himself into a golden shower, and descended through the apex of the tower into the embraces of her. When Acrisius discovered that his daughter had become a mother he expelled her with her child, in a chest, to the violence of the waves. But the sea-goddesses, anxious for the preservation of the son of Jove, commanded the billows to bear the box safely to Serriphas, one of the Cyclades. Polydectes, or rather Dictys, the governor of the island, received her, and educated the child, which he named Perseus. She eventually accompanied her son to Argos where she accidentally killed Acrisius at Larissa. The story has been much used in literature and painting, especially in paintings by Rembrandt at the Hermitage of Saint Petersburg; Correggio at the Palazzo Borghese at Rome and Titian at the Museo Nazionale at Naples.

DANAI, See Danaus.

DANAIS, dà'ñē-às, a genus belonging to the group Nymphalidae (by some placed in Papilionidae), the largest family of common butterflies, comprising about 2500 species, of which the majority are tropical and subtropical insects, widely scattered over the globe. D. (now usually called Anosta erippus or
archippus) is prevalent in all parts of the United States. Its wings are varied with yellow, black and white bands and it occurs frequently in summer along country roads, in pastures, and wherever the milkweed, its favorite food, grows. It is known as the milkweed butterfly (q.v.). The chrysalis is well known for its beauty of green and gold. The caterpillar is marked with yellow and black bands. Danaus is a famous globe-traveler, having spread by some unknown means from continents to islands of the ocean, and to Australia. Very beautiful species abound in India. In New Holland it was found that the natives, who called it "bug-gong moth," valued it highly for food. By means of smothered fires they were able to suffocate and collect the "moths" in large quantities, after which the appendages were removed and the bodies were made into oily cakes. The South American species, which are distasteful to most of their enemies, are the object of mimicry by edible species.

DANAKIL, dā-nā-kēl' (singular DANKALI), the Arabic and now general name for the numerous nomad and fisher tribes inhabiting the coast of the northeast Arab from Massowah south to Tajurrah Bay, and from there south-west to Shoa. They belong to the Ethiopic Hamites, and are well built and slender, with features indicating an intermixture of Arab blood. In a country of waterless plains, they are generally nomads, living partly by caravan traffic and the slave trade, but mostly on the milk of their flocks.

DANAO, Philippines, (1) town on the east coast of the island of Cebu, four miles north of Compostela, and 18 miles north of the town of Cebu. The productions of the interior are important for exports, but the anchorage at Danao is not good enough to encourage steamers to load at this port. The road along the coast is in a good condition. Pop. 15,483. (2) Danao, a hamlet, is on the west coast of South Antique, Panay, four miles north of Dao. (3) A lake in West Leyte, south of Panagua crater. (4) A mountain peak on the island of Luzon. (5) A river in the northeast of Negros Occidental, rising in the crater of Solitary, flows east into a small bay on the north shore of which is situated Escalante.

DANAUS, in Greek mythology, the son of Belus and twin-brother of Ægyptus, originally ruler of Libya. Fearing his brother, he fled to Argos with his 50 daughters, the Danaides, and here he was chosen king, in place of Gelanor. The 50 sons of Ægyptus followed him, and under the pretense of friendship sought the hands of his daughters in marriage. Danaus consented, but on the bridal night he gave his daughters each a dagger, and urged them to murder their bridesgrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her husband, Lynceus, to escape. The fable states that in the under-world the Danaides were compelled, as a punishment for their crime, to pour water forever into a vessel full of holes. From Danaus, the Argives were called Danai.

DANBURY, Conn., city in Fairfield County in the southwestern part of the State. This is one of two county-seats. It has railroads to New York, New Haven, Bridgeport, Hartford, Pittsfield, Poughkeepsie and Litchfield. These are all branches of the New York, New Haven and Hartford road. A right of way has been secured for extending the Westchester and Northern Railroad from White Plains to Danbury by way of Ridgefield. An electric railway connects Danbury with Bethel. Electric roads connect with Ridgeport and Golden's Bridge. Danbury is 62 miles northeast of New York and 63 miles west of Hartford. It is the centre of a picturesque mountainous country. The town is noted for its beautiful drives and healthful climate. Lake Reservoir, a small pleasure and resort surrounded by scattered residences, is about two miles west of the city. Danbury has public waterworks capable of supplying a city of 50,000 and was one of the first towns to establish a modern filtration system of sewage disposal. The place was settled in 1684 by families from Norwalk and was called Falquioque, the Indian name, until 1702 when the general assembly granted a patent for a town under the name now used. In 1855 the southern part of the town was separated and incorporated under the name of Bethel. A city charter was obtained in 1890. Danbury is one of the leading felt manufacturing cities of the United States, making 75 per cent of the stiff hats, besides soft hats and hats in the rough. Thirty-four factories are engaged in this industry, which began in 1780. In the manufacture of fur hats, two mills producing silk used in their manufacture, three making hat cases. There are foundries and machine shops, a paper mill, two silver plating companies, two electric supply firms, a lime kiln, undergarment and silk factories; a loom making company, two savings banks, two national banks, 10 churches, a library, State normal school, high school, graded public and private schools. The United States census of manufactures for 1914 recorded for Danbury 124 industrial establishments of factory grade, employing 5,933 persons; of whom 5,290 were wage earners, receiving annually $2,963,000 in wages. The capital invested aggregated $7,689,000, and the year's output was valued at $10,852,000; of this, $4,700 was the value added by manufacture. The Danbury News with daily and weekly editions was established in 1870 by James Montgomery Bailey, known as the "Danbury News Man." He was the author of humorous articles and several books including a history of Danbury. Julius H. Seeley, former president of Amherst College, and P. T. Barnum, the showman, were born in that part of Danbury that is now the town of Bethel. The town was destroyed by the British in 1777, when General Wooster was killed defending the place. Wooster Square and Wooster Cemetery were named in his honor. Among the public buildings are the courthouse, city hall, hospital, almshouse, new post-office and new armory. The agricultural fair held here every year has an average attendance of about 60,000. The famous Danbury Hatters' Case in which the Supreme Court of the United States held that labor unions came under the Sherman Act originated in this city. Pop. 22,000. Consult Bailey's History of Danbury 1684-1896 (New York 1896).

DANBY, Frank (Mrs. Julia Frankau), English author: b. 30 July 1864. She was edu-
DANCE OF DEATH — DANCING

DANCE OF DEATH, a grotesque allegorical representation in which the figure of Death is usually the lead, followed by dancers of all ages and conditions. It was frequently drawn by artists of the Middle Ages for cemeteries and cloisters. These representations were common in Germany, and also in France, where they received the name of Danse Macabre. This term is supposed by some to be derived from the Arabic magabarr, a cemetery, but much more probably from the Chorea Machabaeorum, or dance of the Maccabees, a kind of dramatic representation performed in the Middle Ages, in which the seven martyred brothers mentioned in the second book of Maccabees (Apocrypha) would appear to have been introduced. A Dance of Death was painted on the walls of the churchyard of the Innocents at Paris, about the middle of the 15th century, which the chapter of Saint Paul's in London, caused to be copied, to adorn the walls of its monastery. Gabriel Peignot, in the Recherches sur les danses des morts et sur l'origine des cartes à jouer (Dijon and Paris 1820), investigated the origin of the Dance of Death in France. It is supposed that the skeletons, by the fact which old chronicles relate, that those who were attacked by the plague ran from their houses, making violent efforts to restore their rapidly declining strength by all kinds of morbid movements. The most remarkable Dance of Death was painted, in fresco, on the walls of the churchyard in the suburb of Saint John at Basel, which was injured, in early times, by being washed over, and is now entirely destroyed. This piece has been ascribed to Hans Holbein (q.v.), but it has been long since been proved that it existed 60 years before his birth. It was painted at Basel in the year 1431, by an unknown artist, in commemoration of the plague, which prevailed there at that time. It represented Death as summoning to the dance Glaphyr, but the Saint Paul's in London and the emperor down to the beggar, and was explained by edifying rhymes. That piece contained about 60 figures as large as life. Besides being ascribed to Holbein, as was before stated, it has also been ascribed to a painter named Glaphyr but with no foundation. Holbein perhaps conceived, from this picture, the idea of his Dance of Death, the original drawings of which are at Saint Petersburg. Very fine engravings of these are in the Œuvres de Jean Holbein, par Chrét. de Mèche (Vol. I, Basel 1780). Consult Goethe, Die Göttin und seine Vorbilder (Strassburg 1897); Seelmann, Die Todtenänze des Mittelalters (Norden 1893).

DANCE, Saint Vitus. See CHOREA.

DANCING, a form of exercise or amusement in which one or more persons make a series of graceful movements in measured steps in accord with music. Aristotle ranked dancing with poetry, and Pindar applies the name of The Dancers to even Apollo. Dancing corresponds to a universal primitive instinct in man, and is practised by the South Sea Islanders, the Forest Indians of Brazil, the Zulus, the negroes of central Africa and the native Australians, exactly as it was in the earlier stages of every civilized modern race. Fierce war-dances were practised by savage warriors, as the North American Indian braves, who brought on a frantic mechanical intoxication capable of carrying them to victory. The Zulu war-dance is a tambourine dance for war, and the Mandan Indians dance the buffalo-dance to bring game when supplies of food are low. The rain doctors of central Africa dance mystic dances to bring rain; and the wives of the Gold Coast negroes dance a battle-dance to give their absent husbands courage in battle.

The art of dancing dates back to the early Egyptians, who ascribe that invention to their god, Thoth. Among the ancient Jews, Miriam danced to a sound of trumpets, itself an act of worship, and David danced in procession before the Ark of God. Religious processions went with song and dance to the temples; the Cretan chorus moving in measured pace sang hymns to the Greek god, Apollo, and one of the Muses (Terpsichore) was the special patronness of the art. The Phrygian Consu was a child of Cybele, and the festivals of Rhea Silvia at Rome were also accompanied with wild dances, while during the early festival of Mars the Salian priests sang and danced, beating their shields. The Spartans practised dancing as a gymnastic exercise and made it compulsory on all children from the age of five. The Romans in general considered it disgraceful for a free citizen to dance except in connection with religious rites, but willingly witnessed the performances of professional dancers like the Almé of modern Egypt, and the Bayadère, or Nautch girls, of India. The early Christians practised choral dances, which came into discredit with the love-feasts or Agape. A survival of religious dancing is still seen even within the pale of Christendom, we Pontius; the Comus Christi octave a ballet is danced every evening by boys from 12 to 17 years of age, wearing plumed hats and in the dress of pages of Philip III's time.

The Puritan ancestors saw deadly sin in promiscuous dancing. Father Mariana tells us that the famous saraband worked mere mischief.
DANCING DISEASE

than the plague. The fandango was hotly condemned by the clergy, but when danced before the Sacred College, who wished to see it before passing judgment, it was declared that they gave it their unanimous approval. Many of the
medieval dances were solemn and stately in character like the danses basses, which were danced to psalm tunes at the court of Charles IX of France. It is said that the whole august Court was present at a ball given in 1560
by King Philip II of Spain. The galhard and volta were introduced into France from Italy by Catharine de Medicis. Dancing reached its height during the reign of Louis XIV, who was himself an enthusiastic dancer in the court ballets.
The minuet was a favorite in France for a century; and then came the quadrille or contra
danse, often connected erroneously with the English country-dance; the Ecosaise was first
introduced in 1705; the galop was introduced from Germany; the cotillon was fashionable
under Charles X; polka was first danced at the Odéon in 1840 by a dancing master from
Prague; the polka trombante or schottisch, was of Bohemian origin and was first brought out
in 1838; the lamba was introduced by Laborde in 1861; and the waltz, originally Bavarian,
and now modified from its original form, promises to retain its supremacy.

Characteristic of particular races or merely of classes of people are such forms of the dance as the Scotch reel, Highland fling and straths
dey, the Irish jig, the negro breakdowns, sall
ors' hornpipe, step-dances, the can-can, morris
dances, etc.

A ballet is a theatrical exhibition composed of dancing, posturing and pantomimic action. The Roman pantomimes bore a strong resemblance to the modern ballet d'action. In an entertain
ment given to celebrate the victory of Actium, the "Trachiniae" of Sophocles, and an
erotic interlude founded on the myth of Leda, were performed and a dumb show, the dancers
represented Pyndes and Batyllus taking the leading parts; and the whole wound up with a Pyrrhic war
dance. Some tradition of this form of entertain
ment doubtless suggested the courtly dances which became fashionable in the early days of the Renaissance. The first on record was that given by Bergonzo di Botta, at Tortona, to celebrate the marriage of the Duke of Milan in 1489. This was famous throughout the civilized
world. From that time great events, such as
royal marriages and births, were celebrated by
grand productions of ballet on which enormous
sums of money were lavished. These ballets were frequently historical in subject, treating of the
sieg of Troy, the conquests of Alexander and
similar events. There were also mytholog
ical, poetical, moral and fantastic ballets on
such subjects as the Judgement of Paris, the Sea
sons, Truth, the Diversions of the Carnival, etc.
All these were in five acts, each of which consisted of 3, 6, 9 or 12 entries, and in all of them singing and recitation mingled with the dancing.

Catharine de Medicis introduced the ballet into France, and encouraged dances by females that would now be deemed highly improper, to distrack the attention of her son, Henry III, from state affairs. Henry IV was a great sup
porter of the ballet, no fewer than 80 grand entertainments being given by him between 1589
and 1610. Louis XIII and Louis XIV carried
their love of ballet to an extreme length, and themselves danced publicly. In 1661 the latter
founded an Academy of the Dance, with Qui
naux as his judge that they gave it their unanimous approval. Many of the

DANCING DISEASE

in 1697 De la Motte introduced more changes into the ballet, chiefly in the direction of more interesting subjects, and about the same time comic ballets were invented by Danchet; but no important alterations were made till the advent of Jean Georges Noverre in 1749. The dancers wore masks, huge wigs and headresses and hoops. The mask finally disappeared in 1761. Huitberto the form of the ballet had remained practically unchanged, each act being performed, by different dancers, and generally in different styles of dancing. Noverre invented the ballet d'action, and revived the art of pantomime. Dancing became a more dramatic art, and the most intricate plots were represented by pantomime alone. The principles of Noverre were carried to great perfection by Vincenzo Galloetti in Copenhagen, and by his successor, Bournon
ville. Under the Directory a form of grand ballet was revived, in which patriotic songs were a feature.

The history of the ballet since Noverre's time is a history of dancers rather than of dancing. In England, this class of entertainment was never more than an exotic, and has practically no history. The word ballet is first used in English by Dryden (1667), and the earliest attempt at a descriptive ballet seems to have been "The Tavern Bilkers," played at Drury Lane in 1702. Within the last few years an important revival of the ballet has taken place in Italy, where the famous "Excelsior," by the Chevalier Luigi Manzotti, Massignana, Amor, etc., have furnished magnificent examples of the ballet d'action.

Skirt-dancing, so called on account of the voluminous skirts made of sheer or flimsy ma
terial, which are worn by the dancers and play so important a part in their dances, has become a science and a popular attraction on the stage. The dancers, by the clever manipulation of their draperies and assisted by light effects, assume such forms as flowers; the rose, calla lily, pansies, pinks; butterflies of different colors and flags of various nationalities; all to the accom
paniment of music. Among the most celebrated dancers were Amelia Glover, Loie Fuller, the inventor of the serpentine dance, Papinta and Anna Held. In 1911 the "negroid and animal" dances began by the introduction of the turkey trot in San Francisco. Variations of it known as prairie bear, Texas Tommy, etc., soon followed and spread rapidly over Europe and America. Even more popular was the Argen

DANIEL FROHMAN
chorea (qq.v.), occasionally prevalent in Germany and Italy during the Middle Ages. In the last-mentioned country the disease was ascribed to the bite of a spider called the tarantu-laca, hence known as tarantism; but as scarcely any of those affected with it had any consciousness of being bitten by a spider or any other insect, and as it has been in every instance chiefly propagated by suggestion, like chorea, there is every reason to conclude that it had a laugh (qq.v.) origin. In 1724, during the celebration of the festival of St. John, at Aix-la-Chapelle, the streets became crowded with men and women, of all ranks and ages, who commenced dancing in a wild and frantic manner, many losing entire control over themselves, and continuing to dance until dropping down from fatigue, and some, in a moment of frenzy, dash- ing out their brains against walls. The mania spread to Cologne, Metz and Strassburg, and gave rise to much imposture, prophesy and disorder. At the beginning of the 17th century the epidemic began to decline and is generally known now in Europe only as a nervous affection in individual cases. Similar outbreaks, however, are common in some Oriental countries and are known to occur in Europe in connection with religious fanaticisms. Consult Hecker, 'The Dancing Mania of the Middle Ages,' (3d ed., London, 1859).

DANCING FAUN, a frolicsome sylvan creature, half-human, half-goat, corresponding to the Greek Satyr, only gayer and less hideous than his brother; often used in ancient comedy as the very embodiment of humor and mischief. Poets, painters and sculptors of every age have loved to depict the faun in the madness of dancing. A bronze representation was found in a house at Pompeii in 1853.

DANCING TERMS: Balancer—set to partners; chaîne anglaise—the top and bottom couples right and left; chaîne anglaise double—the right and left double; chaîne des dames—the ladies' chain; chaîne des dames double—the ladies' chain double, which is performed by all the ladies commencing at the same time; chaîne ezé—right and left; chaîne croisée—gentlemen change place with partners and back again; démise chaîne anglaise—the four opposite persons right and left; demie promenade—all eight half promenade; demie moulinet—the ladies all advance to the center, giving hands, and return to places; la grande chaîne—all eight chassees quite round, ladies starting to their left and gentlemen to their right, giving alternately right and left hands; la grande ronde—all join hands and advance and retire twice; pas d'allemande—the gentlemen turn the partners under their arms; traverse—the two opposite persons change places; vis-à-vis—the opposite partner.

DANCLA, dán-kla, Jean Baptiste Charles, French musical composer and violinist: b. Bagneres de Bigorre, 19 Dec. 1813; d. 1907. He was a pupil at the Conservatory of Paris, where he took the first prize for the violin in 1833, at the age of 15, becoming professor there in 1857. He displayed remarkable facility as a composer, among his works being: a 'Method of the Violin,' in which are solos, fantasias and airs for that instrument; symphonies, trios and quartettes for stringed instruments; 'Christopher Columbus,' a dramatic scene for an or- chestra; a volume of 'Notes and Souvenirs' (1893).

DANCOURL, dän-koor, Florent Carton, French actor and playwright; b. Fontainebleau, Nov. 1661; d. Courcelles-le-Roi, France, 6 Dec. 1725. Although he portrayed characters in high comedy, he succeeded best as an author in low comedy. He displayed much ingenuity and wit in introducing upon the stage amusing subjects of real occurrence in his time. Louis XIV was very fond of humorous pieces, and Dancourt often used to read his productions to the king before they were played. Among his dramas are 'Le chevalier à la mode' (1687); 'Les bourgeois de qualité' (1700); 'Les trois cousins' (1700). His daughters, Manon and Mimi, became noted actresses in the Théâtre Français. His works were collected (12 vols., 1700), and selected plays were published by Sarcey, F., in 'Théâtre Choisi.'

DANDELION, a common and well-known plant, Taraxacum taraxacum, belonging to the chicory family. It yields a milky juice, which in the form of extract is used medicinally as a diuretic and alterative. It contains a bitter crystalline principle called taraxacin. Its root has been used to adulterate coffee in a similar way to chicory, and is used to adulterate chicory itself. The blanched leaves are eaten as a salad. In America it is a common article of food in the spring of the year, boiled and eaten as "greens." It has a naked, hollow stalk, with a single bright yellow flower-head. The seed is furnished with a fine white pappus, by means of which it is carried far and wide by the wind. The leaves are lanceolate and sinuous, rising from a taproot in the form of a rosette. The plant is probably native in certain parts of America, but is found as a weed in all parts of the civilized world.

DANDIE DINMONT. See Dog.

DANDOLO, dän'-dō-lō, Andrea, doge of Venice and Italian historian: b. about 1310; d. September 1354. He became doge in 1343. He carried on a war against the Turks with great success, and greatly extended Venetian commerce by opening a trading connection with Egypt. The jealousy entertained by the Genoese of this new trade produced a war between the two states, which gave rise to a correspondence between the doge and Petrarch, who exhort him to peace. To Andrea Dandolo is ascribed the compilation of the sixth book of Venetian statutes; but he is most distinguished for his 'Chronicles of Venice,' written in Latin, and comprehending the history of the republic from its commencement to 1342. It is praised for its impartiality and for its judicial use of authentic documents, and was first published by Muratori in his collection of original Italian historians.

DANDOLO, Enrico, doge of Venice: b. Venice about 1108; d. Constantinople 14 June 1205. He was chosen to office in 1192, at the advanced age of 84. He had a defect of sight approaching nearly to blindness; but neither that circumstance nor his age impaired the vigor of his administration, the events of his government being, during the last years of the Venetian greatness. On the formation of the league for the fourth Crusade, under Baldwin, Earl of Flanders, Dandolo induced the
Senate to join in it, and by this policy the first hostilities of the armament were directed against Zara, which had revoluted from Venice, and thereby greatly extended the Venetian boundaries, gaining possession in the Ionian Sea, Phrygia, Morea, Epirus and the island of Crete (by purchase). On the storming of Constantinople the aged doge, it is said, was the first who mounted the walls. When the Crusaders proceeded to the election of a new emperor of the city Dandolo was first nominated; but in consequence of his age and the incompatible character of doge, he declined, and the choice ultimately fell on Baldwin. In the sharing of the Imperial dominions Venice obtained a full moiety and Dandolo was solemnly invested with the title of Despot of Romania.

**DANDRUFF**, a condition of scaliness in the head, attended with desquamation or scaling of the superficial layers of epidermis. It may simply indicate a dry and unhealthy skin, or it may be the result of several distinct skin diseases, chief of which is pityriasis. There is usually a slight amount of itching, and on scratching the head large quantities of minute scales are detached and fall on the clothing. Dandruff also occurs from seborrhoea, in which case it is due more to a mild inflammation of the sebaceous follicles of the skin. The sebaceous matter from the glands dries and forms scales. One of the general results arising from dandruff is a gradual loss of hair. The treatment consists in better hygiene of the head, shampooing and careful stimulation by appropriate tonics. Many of the so-called hair tonics are valueless. Vigorous rubbing of the scalp, with periodical shampooing, is one of the best means of combating this condition, but medical advice should always be sought as to the exact cause of the dandruff. See Hair.

**DANE, Nathan**, American jurist: b. Ipswich, Mass., 27 Dec. 1752; d. Beverly, 15 Feb. 1835. He was graduated from Harvard in 1778, studied law in Salem, Mass., and began practising in the adjoining town of Beverly in 1782, where he lived until his death. In 1812 he was chosen an elector of President of the United States; in 1814 he was a member of the Hartford Convention; and in 1820 he was a member of the convention for revising the constitution of Massachusetts. While he was a delegate from Massachusetts to the Continental Congress in 1786, the best method of providing for the government of the vast territory owned by the Confederacy north and west of the Ohio River came into consideration. It was determined to do this by an ordinance which should establish with much detail not only the foundation of that government, but the leading principles which should prevail in the systems of law and public policy to be in force there. The drafting of this instrument was entrusted to Dane, and it was adopted by Congress without a single alteration, 13 July 1787. The name of the "Northwest Territory" was given to it; and it comprehended all the territory at that time belonging to the Confederacy north and west of the Ohio River. In 1793 this ordinance was incorporated in the Constitution of the United States, a few months afterward, extended to all the States of the Union, by making it a part of that Constitution. His "Abridgment and Digest of American Law" appeared in 1823-29. In 1839 he gave to the law school in Harvard University $10,000 (adding $5,000 more in 1831) for the foundation of the Dane professorship of law.

**DANE, The Great.** See Dog.

**DANE BROC, dän'-ë-bröç, the Danish national flag (broc simply meaning cloth), which was carried at the head of the army, like the oriflamme of France. It is red with a white cross in the centre, and, as the legend has it, fell from heaven, as an omen of victory, when the pious Danes under Waldemar II were besieging the pagan town of Reval. In memory of this auspicious event the king founded the order of the Dane Broc, which fell into disuse, however, at a later period. In 1671, under Christian V, and again under Frederick IV, it was revived. It may be conferred upon all ranks, and may be awarded for military or civil services. The decoration consists of a white enamelled gold cross, suspended by a white ribbon with a red border.

**DANEFF, Stojan**, Bulgarian statesman: b. Shumla 1858. He was educated in Bohemia and at the universities of Paris and Heidelberg, became member of the Commission of Codification after the Russo-Turkish War, in 1901 became Minister of Education. In 1902-03 he was Prime Minister and Minister of Foreign Affairs, and again for a few days in 1911. He became president of the Sobranje in the same year and in 1912 was one of a commission of three in the negotiations with Turkey over the armistice. In December 1912 he was again on a commission of three who went to London for the Balkan-Turkish Peace Conference, in which he bore a leading part. He was the Bulgarian signatory to the Peace of London between the Balkan States and Turkey concluded 30 May 1913.

**DANEGELD, dän'-gél, or DANEGELT (A.-S. Dene, Danes; gild, geld, payment), an annual ancient tax of the Anglo-Saxons, to maintain forces to resist the Danes. It was first paid in 991, when Edward the Confessor was in the retreat of the invaders, which had reached as far as Maldon. The tax was continued until the time of Stephen, as one of the rights of the Crown. It was not actually repealed until Henry II's time (1163).

**DANELAGH, dän'-lák, the ancient name of a strip of territory extending along the east coast of England from the Thames to the Tweed, ceded by Alfred the Great to Guthrun, king of the Danes, after the battle of Ethandune. This name (Danelagh or Dane-law) it retained till the Norman conquest, and its inhabitants were governed by a modification of Danish law and not by English law. King Canute, to prevent any changes in the laws, had them gathered together and taught to the people.**

**DANEHOWER, dän'-n̩-hwär, John Wilson, American Arctic explorer:** b. Chicago, Ill., 30 Sept. 1849; d. Annapolis, Md., 20 April 1887. He was a graduate of the U.S. Naval Academy in 1870, and took part in a surveying expedition to the northern Pacific on the Portsmouth. He joined the Jeannette expedition, which started from Havre, France, went to San Francisco, and thence sailed, 8 July 1879,
for the Arctic Ocean, via Bering Strait. The vessel was lost in the ice and the crew after dragging their boats over the frozen deep for 95 days reached the open sea. A terrible storm separated the boats and none ever was heard of except the one in which Lieut. Dansenower had embarked. It reached Lena Delta, 17 Sept. 1881, and he arrived in the United States in June 1882. He wrote 'The Narrative of the Jeannette.'

DANES ISLAND, a place made noted by Andrée, the Arctic explorer, who, on 11 July 1897, started from this island on his fatal polar expedition. It is a small island off the east coast of the Spitsbergen group and to the northwest.

DANENWERK, då'nê-vérk (Danes' work), an ancient wall from 30 to 40 feet high and of an equal thickness, constructed of earth, stone and wood, about the middle of the 10th century, seemingly as a protection against the Saxons. It extended along the southern frontier of Schleswig for a distance of nearly 10 miles, and being defended by a series of forts the Danes relied upon it to check the approach of the German troops during the Schleswig-Holstein war of 1864. It was soon discovered that their army was too small to withstand a line, and the position was abandoned. The wall was soon after leveled to the ground.

DANHAUSER, Joseph, Austrian painter: b. Vienna, 18 Aug. 1805; d. 4 May 1845. He turned his attention at first to historical painting and living for some time at Venice, fell under the influence of the works of Titian and Paolo Veronese, and followed religious painting for a while, later becoming a genre painter, which better suited his talent. Among his historical pictures is 'Etienne the Fortunate Offerer the Crown of Hungary to the Virgin' (1832). An altar piece in the cathedral at Erlau, representing the martyrdom of Saint John, and an 'Abraham Driving Away Hagar and Ishmael' are noted among his religious pictures. He is perhaps best known by his hunting scenes depicting the manners and customs of Austrian life. Of these there are several in the Imperial Museum at Vienna. Many of his works have been popularized by engraving, such as 'Cured without knowing it'; 'The Oculist'; 'The Prodigal'; 'Reading the Will'; 'Soup at the Convent'; 'Wine, Women, and Song'; 'Judge and Lawyer'; and 'The Evening Festival,' his last work.

DANICHICH, dân'-é-chich, Dyuro (Serbian Dujo Danichić), Serbian philologist: b. Neusatz, 1825; d. 1882. Educated at Neusatz, Pressburg and Buda-Pesth, he came to Vienna in 1845 where he met the famous Serbian scholar Vuk Sântovic-Krajčić, and dedicated all his efforts to the study of Serbian and other Slavonic languages. In 1855 Danichich came to Belgrade to take the chair of Comparative Slavonic philology at the City College. He also became librarian of the Serbian National Library. All his activity tended to the Serbian Academy of Sciences. In 1865 he lost his chair in the Belgrade City College, through certain intrigue, but was immediately invited to Agram to take the secretariaship of the South-Slav Academy of Sciences, which position he accepted. He died in Paris in the second year of this king (vii), the first year of Darius the Mede (ix), the first year of Cyrus, according to the Greek, or third, according to the Hebrew (x), and again in the same first year, according to the Greek and Theodotion (xi). The historical character of this new, master of magicians and statesman, holding
high positions at the court of Chaldean, Median and Persian kings in the course of 70 years, is made doubtful by certain peculiarities of statement that cannot altogether be due to errors of transcription but seem to reveal a serious want of familiarity on the part of the author or authors with the period in which the hero's career is laid. Thus there is no evidence that Jerusalem was captured by Nebuchadnezzar in 606 B.C., and he was not then king. No son of his by the name of Belshazzar sat upon the throne of Babylon. Bil-buruz, the son of Nabonid, the last king of Babylon, seems to have been mistakenly supposed to be a king and a son of Nebuchadnezzar. History knows no Darius the Mede, son of Xerxes, and immediate successor of the last Babylonian king. Darius Hystaspes seems to have been meant, but he was the father of Xerxes, and not his son, and the successor of Gaumata, not of Belshazzar.

In Ezekiel xiv, 14, 20, Noah, Daniel and Job are mentioned as examples of righteousness; but it is declared that even they could only save themselves if they were in a country that had sinned and against which destruction by famine, wild beasts, sword or pestilence had been decreed. In Ezekiel xxviii, 11f, the prince of Tyre is charged with the sin of the sinner, and his divinity is denied, but it is admitted that he is wiser than Daniel, and that there is no secret that can be hidden from him. If these passages were written by Ezekiel in 592 and 586 B.C., it would be difficult to avoid the conclusion that Daniel was already at that time a figure belonging to antiquity like Noah and Job. But some scholars consider them either as interpolations or as parts of a late work showing acquaintance with the book of Daniel in its earliest form. The version of the Achikar story discovered in the Elephantine papyri indicates that already in the century following the downfall of the Assyrian empire narratives began to circulate concerning grand viziers of kings like Sennacherib and Esarhaddon, and that Daniel was included in this collection. The Tobit story shows how easily a popular figure of this kind could be appropriated. On the other hand, the career of a Nehemiah suggests the possibility of a nucleus of historic fact even where the extant documents are not of such a nature as to warrant a marked degree of confidence. It is perhaps significant that the name Daniel occurs in Ezra viii, 2, and Neh. x, 6, in lists which also contain the names of Mishael, Azariah and Hananiah. For literature see Daniel, Book of.

NATHANIEL SCHMIDT.

DANIEL, Anthony, French Jesuit missionary in North America: b. Dieppe 1601; d. 4 July 1648. In company with Champlain he came to Quebec in 1633 and was soon after transferred to the mission among the Huron Indians. He was shot during an attack upon the town of Saint Joseph by a band of hostile Iroquois. Consult Parkman, The Jesuits in New America (Boston 1867).

DANIEL, John Moncure, American journalist: b. Virginia 1825; d. 1865. He became a member of the staff of the Richmond Examiner in which capacity his free speech obliged him to engage in several duels. He was appointed Minister to Sardinia in 1853, but his indiscreet action in several matters seriously impaired his influence as a diplomatist. During the Civil War he served in the Confederate army for a time, but being wounded, retired, resuming his editorship of the Examiner. He attacked in its columns the president and treasurer of the Confederate, and in consequence was obliged to fight the period in which he was a prominent figure. Several works were published by his brother (New York 1868).

DANIEL, John Warwick, American politician: b. Lynchburg, Va., 5 Sept. 1842; d. there, 29 June 1910. He served in the Confederate army during the Civil War; subsequently studied law and entered upon the practice of his profession. He was a member of the Virginia legislature 1866-72 and 1873-81; and was defeated for governor of his State in 1881. He was a member of Congress 1885-87; entered the national Senate in the year last named and was re-elected at the expiration of his term. He published 'Attachments Under the Code of Virginia'; 'Negotiable Instruments'; 'The Character of Stonewall Jackson' (1869); 'Speeches and Orations' (1911).

DANIEL, Hermann Adalbert, German author and hymnologist: b. Köthen, 18 Nov. 1812; d. Leipzig, 13 Sept. 1871. In 1835 he received the degree of Ph.D. from the University of Halle, and for nearly 20 years occupied an inferior position in that university. In 1854 he became professor, and continued to serve until 1870, when he resigned and retired to Dresden. He was the author of geographical, scholastic and liturgical works. His most noted work was the great collection of hymns: 'Thebaurus Hymnologicus sive Hymnarii, canctorum, sequentiarum, circum annum M.D. usititarum, collectio amplissima' (5 vols., Halle 1841-43). Sets are now quite scarce and sell for a good price.

DANIEL, Samuel, English historian and poet: b. Taunton, England 1562; d. Beckington, Somerset, 14 Oct. 1619. As an historical poet Lucan seems to have been his pattern. He bestowed much labor on the poem in eight books 'History of the Civil Wars between the Houses of York and Lancaster.' Daniel contributed much to the improvement of the poetical diction of England. His stanzas, formed with a careful attention to the Italian octave, have more dignity and euphony than most verses of this sort in English literature in the first half of the 17th century. He is not wanting in rhetorical beauty and force. He was also the author of some poetical epistles, pastorals, 57 sonnets and a few tragedies. The first seem to have excited much attention. During the reign of Queen Elizabeth he wrote a sketch of the history of England till the time of Edward III, a work learned and clear, but unsuitable for publication and containing useful and acute views. His complete works were edited by Grosart (3 vols., London 1885-96).

DANIEL, Book of. In the Greek Bible and its daughter versions, as well as in the Syriac Peshitta, the Latin Vulgate and most modern translations, the book forms a separate position among the Prophets; but in the Hebrew Bible its place is among the Hagiographa, near the end of the collection. The earliest testimony of the latter arrangement is found in the Babylonian Talmud 'Baba bathra' 14b. Though it is uncertain at what time the prophetic rolls
in the Alexandrian synagogue were arranged in a definite order. The inclusion of Daniel can scarcely have been a late innovation, since Jews and Christians alike who used the Greek Bible in the 1st century a.d. appear to have considered him as a prophet and made no distinction between his book and those of other prophets; Josephus regarded him as one of the greatest of the prophets. ‘Antiquities’ x, 266, and obviously included his book among the 13 prophets. ‘Ag. Apion’ i, 40, and he was referred to in Matt. xxiv, 15, as ‘Daniel the prophet.’ It is, therefore, probable that the book was relegated to the third division of the canon in the 2d century a.d. The reason may have been its powerful influence in fanning the Messianic hope and the use of it by the Christians.

The Massoretic text differs from all early versions, with the doubtful exceptions of the Syriac Peshita and Aquila, in excluding the deuto-canonical parts, and especially from the oldest Greek version in many other respects. There is a tendency at present to assume that the prayer of Azariah, the hymn of the three friends, and the stories of Bel and the Dragon were translated from an Aramaic original. But it is also widely recognized that these sections are likely to be later additions in the original, though earlier than the Greek version. The oldest testimony to the text is unquestionably this Greek version for which the Church substituted Theodotion’s. The latter seems to have had for its foundation a version of which traces are already found in the 1st century a.d. There is no valid reason for questioning that the old Greek translation was a fairly faithful, though not very elegant, rendering of the text current about 100 B.C. This text itself was not free from additions and transpositions; but its most important characteristic was the apparent absence in it of many later embellishments of the Massoretic text. Thus the image of gold was 6 cubits high, and not 60 (iii, 1), and the enemies who secured the edict from the king, spied upon Daniel, had him punished, and were themselves thrown into the lions’ den together with their families (vi) were the two facts made up from incidents, and not all the rulers of the empire. The only manuscript extant of the old Greek version was published by Magistris in 1772, and by Cozza in 1877; a valuable Syriac translation of it made by Paul of Tella in 617 A.D. was published by Bugatti in 1788, and by Ceriani in 1874. The Old Latin, Coptic, Ethiopic, Arabic, Georgian, Armenian and Slavonic versions were made from Theodotion, the Syriac Peshita and the Latin Vulgate from a Hebrew-Aramaic text nearer the Massoretic.

One part (i, 1-ii, 4a; vii-xii) of the proto-canonical book is in Hebrew, another part (ii, 4b-vii, 28) in Aramaic. The Hebrew is of a late type; the Aramaic is not Mesopotamian or Babylonian, but the Judean dialect. Various theories have been put forward to explain the bilingual character. Some have thought that the author began his work in Hebrew, but changed into Aramaic to reproduce the words of the Chaldeans in the dialect they spoke, or he supposed that the Hebrew and the text returned to the Hebrew to conceal the sacred tongue what was meant only for the wise men of his own people. Corrodi, ‘Kritische Geschichte des Chiliasmus’ (1781), suggested that the whole book was originally written in Hebrew, but that the author himself translated some parts into Aramaic; Lenormant, Bevan, Haupt, Barton, Prince, Rüessler and G. Jahn thought that, a part of the original having been lost, the Aramaic translation was substituted for it. Huet, ‘Demonstratio evangelica’ (1679), Marti, Buhl, Wright, Charles and Buttenwieser have expressed the view that the whole book was originally written in Aramaic, but that either the beginning and the end were translated into Hebrew or the original was used for certain missings parts of the Hebrew translation. Spinoza, ‘Tractatus theologico-politicus’ (1670), supposed that the Aramaic parts were written by Chaldaean chroniclers. Eichhorn (‘Allgemeine Bibliothek,’ 1878), considered ii, 4b-vii as an earlier Aramaic work, while he assumed that the remainder was written in Hebrew. This view has been revived by Meinhold, Strack, Dalman, Torrey, Sellin, Kent and Schmidt. Most of these students look upon i-ii, 4a as a translation from the Aramaic and vii as an Aramaic version. It seems more probable that the story of Daniel in the Apocrypha that this was a late addition to this work in the same language, and that the author of the visions, who affected the use of Hebrew, wrote i-ii, 4a as an introduction to take the place of some other exordium.

In earlier times the unity of the book was generally accepted, the only apparent exception being Josephus who speaks of several books written by Daniel, ‘Antiquities’ x, 267. Even the deuto-canonical sections were widely regarded as a part of the original, and Jerome’s attitude, and the ascription of xiv to ‘the prophet Habakkuk.’ Until the 17th century the entire Hebrew-Aramaic text seems to have been assigned to the same author. But Spinoza distinguished between the stories which he did not ascribe to Daniel, and the visions. A similar view was taken by Isaac Newton (1732) and Isaac Beausobre (1742), while Edward Wells, A Help to the Understanding of Daniel (1716), suggested that chapter i was written after Daniel’s time. J. D. Michaelis (1751) regarded the book as an independent section; Eichhorn (1879) regarded ii-vi as a work later than the exile but earlier than the Maccabean age when i, vii-xii were written; and Bertholdt (1888) considered the book as a compilation of at least seven distinct pamphlets, the visions from the days of Antiochus IV, and the stories earlier. Volney, ‘Recherches nouvelles sur l’histoire ancienne’ (1814), thought of several authors living after Antiochus IV, one of them in the Roman period. Lagarde (‘Geschichte der Anseige,’ 1891), maintained that vi was written in 69 A.D., and that Josephus did not have in his copy either vii or ix-xii. Hertlein has developed the theory more fully, assigning ii, vi, ix-xii to the year 70 A.D. Barton (1898) suggested, in addition to the introductory chapter, nine independent pamphlets need explaining, or four different authors between 168 and 164 B.C. Views similar to that of Eichhorn have been expressed by Meinhold (1884), Strack, Wildeboer, Torrey, Kent, Sellin and Schmidt. Meinhold assigned ii-vi to the 3d century a.d., vii-xii to the Maccabean period, and Torrey called special attention to the fact that no event later than the reign of Ptolemy III seems to be alluded to in ii, and dated the
story-book c. 242 B.C. It seems necessary to assume several literary strata, such as (1) the 3rd century Aramaic story book in which iii appears to have been a later insertion; (2) Daniel’s vision in Aramaic (vii), added to the story-book soon after 168 B.C.; (3) the visions in Hebrew (viii-xii) and the introduction in 165 B.C.; (4) the prayer in ix, 4-19, as pointed out by Gall, among the latest compositions, and (5), the deuto-canonical parts written in Aramaic before the end of the 2nd century. Even strong defenders of the traditional view, like Zöckler (1869), Myrerberg (Bibelforsknar, 1894), Thompson (1897), and Wright (1906) have looked upon them as a corruption or an expansion of the original text.

Among scholars maintaining the unity of the book it has generally been held until recent times that both the Hebrew and the Aramaic parts were written by Daniel. This opinion has been defended, with learning and acuteness, by Hengstenberg, Hävernick, Pusey, Keil, Aubelen, Heberlync, Cornely, Wright and Wilson. Certain peculiarities, however, aroused doubts and questions already in antiquity, and in the last century many learned and Catholic scholars have been led to assign it as a whole to a later age. The Talmudic statement that Daniel was written by the men of the great synagogue "Baba bathra" 15a, still remains obscure, but some kind of editorial activity is probably meant. Celsus (c. 178 A.D.) obviously did not believe in the story of Daniel in the lions’ den or that it was told by the prophet himself, Origen, c. Celsum vii, 53, 57; and even among Christians there seem to have been some doubts on this point in the time of Hippolytus. The 3rd century was forced to the conclusion that the author lived in the time of Antiochus IV. His opinions, set forth in the 12th book of his lost "Treatise against the Christians," were frequently quoted, sometimes with approval, by Jerome, who rejected the main thesis, but remarked, "If this is said concerning Antiochus, what harm can it do to our religion?" Isidore of Seville (d. 632) declared that Daniel and Ezra were more or less written at the same time, Origen vii, 2. According to Maldonatus (1611), some Manicheans (Paulicians) and Anabaptists rejected the authenticity of Daniel; Tiziano was accused at Coira in 1547 of regarding some parts of the Prophets as spurious, Comba, "I nostri protestanti" (II, 487, f. 1897). Uriel da Costa in 1624 maintained, in a lost work, that the book was written by some Pharisee in the Maccabean period. Hobbes, "Leviathan" (1651), only threw out the hint that Daniel and other early books may have received their present form after the exile, perhaps through Ezra. But Anthony Collins, "The Scheme of Literal Prophecy Considered" (1727), presented a solid array of arguments for a Maccabean origin of the book; full justice has not yet been done to the scientific character of his researches. (1771) regarded the work as made up of unconnected fragments written by an author living in the Maccabean age to which extensive additions and changes were subsequently made. Bleek (Thol. Zeitschrift, 1822) urged against Eichhorn and Berthold the Maccabean character of the book and the Maccabean origin of all its contents. This has become the view of a great majority of critics. Like Volney, Hovet, "Le

Christianisme et ses origines" (1878), thought of the Roman period, and he supposed that the author depicted Herod the Great under the guise of Antiochus IV. Among those who reject the unity, the visions are as a rule assigned to the Maccabean period, Lagarde and Hertzfeld being the chief exceptions.

The leading arguments for a later origin of the entire composition are, (1) the Maccabean date of the visions of Daniel are (1) the position of the book in the Hebrew canon; (2) the omission of Daniel’s name in Ecclesiasticus xlix; (3) the occurrence of Persian and Greek words and later forms of names; (4) the mention of the Chaldeans as a distinctly cles; (5) the reflection upon the 70 years’ exile; (6) the use of the West Aramaic; (7) the absence of any acquaintance with the book before the 2nd century B.C.; (8) later theological ideas; (9) the peculiar survey of history, involving seemingly erroneous ideas of the earlier period, remarkable familiarity with Antiochus IV and his immediate successors, but a mistaken notion as to the end of this king’s reign; and (10) the apparent significance of the image, the four beasts, as such, the Jewish and Catholic scholars have been led to assign it as a whole to a later age. The Talmudic statement that Daniel was written by the men of the great synagogue "Baba bathra" 15a, still remains obscure, but some kind of editorial activity is probably meant. Celsus (c. 178 A.D.) obviously did not believe in the story of Daniel in the lions’ den or that it was told by the prophet himself, Origen, c. Celsum vii, 53, 57; and even among Christians there seem to have been some doubts on this point in the time of Hippolytus. The 3rd century was forced to the conclusion that the author lived in the time of Antiochus IV. His opinions, set forth in the 12th book of his lost "Treatise against the Christians," were frequently quoted, sometimes with approval, by Jerome, who rejected the main thesis, but remarked, "If this is said concerning Antiochus, what harm can it do to our religion?" Isidore of Seville (d. 632) declared that Daniel and Ezra were more or less written at the same time, Origen vii, 2. According to Maldonatus (1611), some Manicheans (Paulicians) and Anabaptists rejected the authenticity of Daniel; Tiziano was accused at Coira in 1547 of regarding some parts of the Prophets as spurious, Comba, "I nostri protestanti" (II, 487, f. 1897). Uriel da Costa in 1624 maintained, in a lost work, that the book was written by some Pharisee in the Maccabean period. Hobbes, "Leviathan" (1651), only threw out the hint that Daniel and other early books may have received their present form after the exile, perhaps through Ezra. But Anthony Collins, "The Scheme of Literal Prophecy Considered" (1727), presented a solid array of arguments for a Maccabean origin of the book; full justice has not yet been done to the scientific character of his researches. (1771) regarded the work as made up of unconnected fragments written by an author living in the Maccabean age to which extensive additions and changes were subsequently made. Bleek (Thol. Zeitschrift, 1822) urged against Eichhorn and Berthold the Maccabean character of the book and the Maccabean origin of all its contents. This has become the view of a great majority of critics. Like Volney, Hovet, "Le
in the third year of Jehoiakim. Belshazzar (Bel-shar-uzzur) was not a son of Nebuchadnezzar, but of Nabonid, and there is no evidence that he had ever ruled over Babylon; but he is mentioned together with his father, commanded an army and may have been killed defending a part of the city after Babylon had been delivered over to Cyrus. History knows nothing of a Darius the Mede. He was for many centuries identified with Cyaxares, son of Astyages, known only through Xenophon’s *Cyrilopedia.* Xenophon nowhere suggests that Cyaxares had the name of Darius, or was made king of Babylon. He speaks of the part taken by Gobryas in the occupation of Babylon, and this has been verified by the inscriptions (cp. Scheil, *Revue d’assyriologie*, p. 165, 1914). But he is not said to have been made king of Babylon, or to have taken the name Darius, and he is distinctly declared to be a native Babylonian. Winckler, ‘*Altorientalische Forschungen*’ II, 226, 1889, assumed that Cambyses was Darius the Mede, and that he was made king of Babylon by his father in 538 B.C., and the suggestion has been carried out more fully by Böttflwer (*Journal of Theological Studies*, 1915). But it is not yet certain whether it was in 538 or 530 that Cambyses was king of Babylon. Darius the Mede, son of Xerxes, seems to be a reflection of Darius Hystaspis, father of Xerxes, as was seen by Marianus Scotus in the 13th century. It has even been placed by Lagauc (*Revue biblique*, 1896) that his name may not have occurred at all in the original text. In xi, 1, the Greek has Cyrus; ix, 1, looks like a late editorial superscription; and in v, 30, the Greek reads, *the kingdom was taken away from the Chaldeans and given to the Medes and the Persians.* It is not distinctly stated in xi, 2, that there would be only four Persian kings; from the biblical books the author is likely to have known of others, and it is not probable that vii, 6, refers to Persia. Of the four kingdoms there have been six different interpretations. They have been held to be: I, Those of (1) Babylonia, (2) Media and Persia, (3) Alexander and (4) the Seleucids (Porphyry and many modern scholars); II, those of (1) Babylonia, (2) Media and Persia, (3) Alexander and his successors (Ephraim, the annotator of the Syriac text in the Paris polyglot, and many modern scholars); III, those of (1) Babylonia, (2) Media and Persia, (3) Alexander and his successors and (4) Rome (Hippolytus, Jerome, Theodoret and many modern scholars); IV, those of (1) Babylonia, (2) Media and Persia, (3) Alexander and his successors, and (4) Rome and Islam (Jephth the Karait, Ibn Ezra, Saadia the Italian, Rashi and others); V, those of (1) Babylonia, (2) Media and Persia, (3) Alexander and his successors, and (4) Rome and the Papacy (Paulicians, Albigenes, Fraticelli, Luther and others); and VI, those of (1) Babylonians, (2) Medians and Persians, (3) Alexander and his successors, and (4) Rome and 10 kings, each growing up within the Roman Empire (Mede, Rome, Antiochus and others). The first is most probable, but the second also recognizes Antiochus IV as the little horn. Against the third must be urged the impossibility of fitting the description to the career of Vespasian, and the difficulty of removing it from the earlier book and viii from the latter. It was clearly the desire to find references to contemporary events that caused a search for the Moslem world powers, the ecclesiastical empire of Rome, and the 10-kingdoms confederacy of the European states. The one ‘like a son of man’ was long understood as the Messiah. As in the explanation the place of the man-like figure is taken by the saints of the Most High, many interpreters understood Israel to be meant. It is probable that the figure represents Michael, who stands for the Jewish people, as Schmidt has suggested, with the approval of Bertholot, Marti, Porter and Kent. In ix the 70 years are explained as 70 weeks of years. The feoff is evidently Jer. xxx. 18; the *anointed prince* in vs. 25, as was seen by Hippolytus, is Joshua ben Jozadak; the cessation of the legitimate high priesthood in 171 B.C. seems to be intended in vs. 26; and the desecration of the temple by Antiochus IV in 166 by the erection of an altar and image of Baal Shamen *(Zeus Olympus)* is clearly meant in vs. 27. In Talmudic times Agrippa II was looked upon as the *anointed prince.* Christians naturally saw a reference to the death of Christ. Many students, counting backward from the death of Jesus, assumed that the period meant is 450 to 445 B.C., and that the last week extended from the Crucifixion to the destruction of Jerusalem in 70 A.D. Already Julius Hilarius (397) objected to starting the 490-year period 100 years after Daniel and insisted upon the last week being seven years ending 164 B.C. Most modern scholars divide the weeks of years into six from 586 to 537, 62 from 537 to 171, and 1 from 171 to 164. The second period should be 434 years, and is, therefore, 66 years too short. Lacking a fixed period before the Babylonian Era, both Demetrius and Josephus made this period several decades too long, as Schürer has pointed out (*Geschichte des jüdischen Volkes,* IV, (1909). Cornill has suggested that the author may have counted 12 generations of high priests, giving each an average of 40 years.

It is assumed by many scholars that the author of the stories derived his material partly from biblical sources, partly from legends of foreign origin. The figure of Daniel, extant in post-exilic tradition, seems to have been enriched by reminiscences of Joseph, who also was carried away to a strange land, falsely accused, distinguished as an interpreter of dreams and exalted to be a ruler of the country; of Moses, who was educated at a foreign court, excelled the native magicians and uttered prophecies of doom against a powerful king; of Jeremiah, who was rescued from certain death in a den; of Nehemiah, who held a high position at the Persian court, and possibly of Mordecai, who was exalted by Xerxes. The tale of Achikar, supposed to have been a vizier of several Assyrian kings, was read by the Jews of Elephantine in the 5th century, and may have been known in Palestine. Stories of huge idols, of religious festivals, of Belshazzar’s death at the time of a feast, of the devices of the tyrants, of punishment by fire, and of lions kept for the hunt in cages or enclosures, may have become a part of Palestinian folk-lore. The conception of successive ages, represented by different metals, as in Hesiod, the use as symbols of
various animals and monsters so frequently found among the sculptures and paintings of the pagan world, and a vision of myths like that of Marduk and Tiamat and other conflicts of heavenly beings, and even speculation on significant numbers, may have been due to foreign contact. The stories were eminently suited to inspire emigration of Jews in the midst of a terrible persecution, while the visions created a keen expectation of the immediate end of the foreign tyranny and the founding of an imperishable Jewish kingdom. In every later crisis the book has tended to foster the same eschatological mood. The succession of four empires to be followed by the kingdom of heaven became a deeply rooted idea. It dominated the conception of history until the 16th century when the division into ancient, medieval and modern history began to be advocated. The faith that surveyed the passing of empires and looked with intense longing for the kingdom of heaven on earth gave to this book a power which it still possesses to kindle fresh hopes for the overthrowing of oppressive world-powers and the establishment of a nobler order of things.

The book was written by Hippolytus, Ephraim, Jerome, Theodoret, Albertus Magnus, Thomas Angulii (c. 1310, wrongly ascribed to Thomas Aquinas), Nicolaus Lyranus; Abu Ali al-Japhet, Rashi, Ibn Ezra, Saadia the Italian (c. 1190, wrongly ascribed to Saadia Gaon); Melanchthon, Ecolampadius, Calvin; Pererus, Junius, Polanus, Piscator, Maldonatus, Sanctius, Alcazar, Grotius, Calmet, Mede, Wintle; Bertholdt, Rosenmüller, Hävernick, Hitzig, Pusey, Ewald, Kell, Aubelen, Reuss, Zückler, Trochon, Knabenbauer, Meinhold, Bevan, Behmann, Slowe, Thompson, Farrar, Prince, Driver, Marti, Porter, Buhl and Charles.

Introductions by Eichhorn, Jahn, De Wette, Bleek, Glaire, Herbst, Kuenen, Vatke, Rieth, Strack, Wildeboer, Conelry, Kaulen, Cornell, Bischoff, Selin, Chater, Gigot, Bennett, Moore, McFadayn, Creelman, Hengstenberg, E. D., 'Studies in Daniel' (1917); Buttenwieser, M., in Journal of Biblical Literature (1917).

NATHANIEL SCHMIDT, Professor of Semitic Languages and Literatures, Cornell University.
'Animated Nature,' etc., and from 1814 to 1825 was engaged in making sketches for 'A Voyage round Great Britain.'

DANIELS, Cora Lynn, American author: b. Lowell, Mass., March 1852; married Joseph H. Daniels 1871. She has written much for the press and has published in book form: 'Sardia' (1892); 'As it is to Be: Psychical Philosophy' (1892-1900); 'The Nurse'; 'Omar Khayyam'; 'The Bronze Buddha' (1899); 'Encyclopedia of Superstition of the World' (1901). Mrs. Daniels' recent work has been trade letters to the press from Europe and many poems, soon to be collected into a volume.

DANIELS, Fred Harris, American mechanical engineer: b. Hanover Centre, N. H., 16 June 1853; d. 30 Aug. 1913. He was educated at the Worcester Polytechnic Institute and made a special study of iron and steel manufactures during a tour in Europe. In 1873 he became connected with Washburn, Moen and Company and was at one time general superintendent. He remained as chief engineer when this firm was reorganized as the American Steel and Wire Company in 1899 and after the merger with the United States Steel Corporation in 1901 he was made chairman of the board of engineers. He owned over 150 patents relating to the iron and steel industry, especially the manufacture of wire rods.

DANIELS, Josephus, American public official: b. Washington, N. C., 18 May 1862. He received an academic education at the Wilson Collegiate Institute and at the age of 18 became editor of the Wilson (N. C.) Advance. In 1885 he was admitted to the bar but did not practise. In 1887-93 he was State printer for North Carolina, and chief clerk of the Department of the Interior from 1893 to 1895. In 1885 he became editor of the Raleigh (N. C.) State Chronicle, which journal he consolidated in 1894 in the North Carolinian, with a weekly edition known as the News and Observer, of which he has since been editor. He took an active interest in politics, both State and national, and in 1912 was publicity manager for the Wilson forces. He served as member of the Democratic National Committee after 1896. He became Secretary of the Navy in President Wilson's Cabinet and in this post greatly improved the condition of the enlisted personnel of the navy, established courses for the instruction of the men in various trades, and banished alcoholic liquors from the officers' mess. His advocacy of a greater navy did much to bring the United States naval forces to a high point of efficiency on its entrance into the great conflict in April 1917.

DANIELS, William Haven, American author: b. Franklin, Mass., 18 May 1836. After studies at Wesleyan University and travel in Europe, in 1865 he became librarian in Northwestern University, and in 1868-69 was professor of rhetoric in Illinois Wesleyan University. From 1869 to 1876 he served in the Methodist ministry. He published: 'That Boy: Who Shall Have Him?' (1871); 'The Temperance Reform and its Great Reformers' (1878); 'A Soldier's Diary'; 'His Words, Work and Workers' (1879); 'Illustrated History of Methodism in the United States' (1880); 'A Short History of the People Called Methodists' (1882).
Danish Language

The principal changes from Umordisk are: (1) dropping unaccented vowels, (2) introducing vowel harmony (i-and u-, and mon- and un- assimilation of consonants). Toward the close of this period the dialectic differences establish two groups: Norwegian-Icelandic (western group) and Danish-Swedish (eastern group). In the eastern group there are fewer cases of u-umlaut, not as many assimilations, the simplicity of verb inflections is much fuller advanced, the passive ends in s, while in the western group it ends in sk. The differences, however, are still unimportant, and the Scandianvians themselves consider their language as one (Danish tongue). Generally speaking, the western group has preserved the more primitive forms. As an example of old Danish from this period may be cited the inscription on one of the 200 runestones found in Denmark, the smaller Jellinge-stone: "Gorm konunger gerd kumble p Φ si æft pyrwi kodin sima", Danish: "King Gorm made this mound [with runestone], after his wife, Tyra Danedeb".

Danish in the Middle Ages (1050-1500).—It is only after the introduction of Christianity (a. 1050) that any literature is made possible. The monks brought with them the art of writing, and literary activity in the Middle Ages is especially connected with the churches and monasteries. The Latin alphabet was introduced, but sometimes, especially in Iceland, characters denoting peculiar Scandinavian sounds were added. The Norwegian-Icelandic literature from the earlier Middle Ages stands, both as to extent, age and value, far above the Danish and Swedish, and the language of the oldest Norwegian-Icelandic manuscripts varies only a little from the Runic language of about 1000 and has greater linguistic interest. The earliest preserved Danish manuscripts date from the close of the 13th century. From 1050-1250 Danish language is known only from rare Runic inscriptions and from late manuscripts with Danish names. The oldest manuscripts with Danish words contain the old Provincial Laws. They show that the separation from the original common Scandinavian idiom, already indicated, was not yet so strongly apparent. Old Danish (1050) was an old Scandinavian dialect, middle Danish (1300) is an independent language which has diverged far from the original idiom and also from the western Scandinavian language, and now in, on the point of parting company with Swedish. In the Middle Ages (and later) Danish was spoken also in Sleswick and in Scania, Halland and Blekinge (now belonging to Sweden). There were three groups of popular dialects, those of Scania, Zealand and Jutland. But already the earlier manuscripts show a tendency toward creating a uniform Danish literary language, and this is gradually developing essentially from the Zealand dialect. In this period some of the changes to be noticed are: A large number of Latin, German words are introduced, especially in the 14th and 15th centuries, when the Hanseatic League controlled the commerce of Denmark, and also the political influence from Germany was very considerable. Most of these words have been retained and are later considered pure Danish. Many German derivational endings were adopted and often added to native words. Of German prefixes adopted were be-, for-, und-. The declension of nouns, adjectives and pronouns was greatly simplified. Instead of the original four cases only two, nominative and genitive, were ordinarily used (in pronouns also in the objective form), to show the syntactical connection, becomes more fixed. Already from the 10th century the monophongization of original diphthongs was observed in the eastern group of Scandinavian languages (Danish and Swedish). Stein became sten, daaund-dödr, leysa-lösa. The language of Norway, on the other hand, with the dialects spoken in the countries settled from or belonging to Norway, Iceland, the Faroe Islands, Greenland, the islands north and west of Scotland, retained the old diphthong. In the western part of the 15th century the Danish language began to substitute voiced stops (medial) for voiceless stops (tenues or hard consonants) after a long vowel at the end of a word or a syllable. The Swedish retained the old voiced g, ð, v, Swedish rike= D. righe, S. ða-ta=D. ladbe, S. drapa=D. dråwe. About 1300 also the glottal catch, so peculiar to Danish pronunciation, was introduced. The earlier Danish lu (retained in Swedish) is changed into y.

Danish (1500-1650).—With the 15th century a new period in the history of the Danish language takes its beginning. With the introduction of the art of printing (1482) many books were brought into circulation. The most important work of the Danish Reformation is Christian III's Bible, translated by Christian Pedersen and others. In this translation the authors made an effort to establish a consistent orthography and to avoid double forms. It has had great influence on the literary, particularly the church, language of later times. Of other works marked by their comparatively pure Danish may be noted A. S. Vedel's translation of Saxo (1575), Klaus Lyskander's (1558-1623), 'Danske Kongers Sigtebog', a kind of genealogy of the Inscriptions, now the Basis down to Holberg (1684-1754) produced few works written in good Danish. Best known are Thomas Kingo's hymns and the works of the Norwegian preacher and poet Petter Dass. Of the greatest linguistic importance is Christian V's "Danish Law" (1683). During the humanistic ascendency, the literature was strongly marked by Latin-German influence. Almost all the learned men of the period wrote in Latin. Many Latin and High German words were adopted. But already the earlier manuscripts show a tendency toward creating a uniform Danish literary language, and this is gradually developing essentially from the Zealand dialect. In this period some of the changes to be noticed are: A large number of Latin, German words are introduced, especially in the 14th and 15th centuries, when the Hanseatic League controlled the commerce of Denmark, and also the political influence from Germany was very considerable. Most of these words have been retained and are later considered pure Danish. Many German derivational endings were adopted and often added to native words. The earlier Danish lu (retained in Swedish) is changed into y.
Danish Literature

Gum Danian1 by Sven Aagesen and 'Gesta Danorum' (in 16 books) by Saxo. In spite of their Latin form they reflect the national aspirations of Absalon and the great Valdemars. Saxo completed his work about 1200. It is the greatest intellectual effort and the most important work of mediæval Denmark. The oldest books written in Danish are the Provincial Laws. The Scanian Law is from Valdemar the Victorious. In Danish are also medical works written by Henrik Harpестreng (d. 1244). In the 15th century appeared Peder Laale's Proverbs in Latin and Danish. Toward the close of the Middle Ages we have the Danish Rhyme Chronicle, the first Danic book printed (1495). The kings are introduced in chronological order, and each relates his own story, which includes even his death and burial. But more important than the written literature is the Danish ballad. In the Middle Ages, the popular ballad boulsau spread all over Scandi-navian countries, and especially in Denmark from the grand age of the Valdemars. Denmark alone has over 500 original ballads, while the variants number several thousand. The first printed collection (of 100 ballads) appeared in 1591 and was edited by A. S. Vedel. Before his time ladies of the nobility had copied many of them. But they continued to enjoy a vigorous life on the lips of the people until they finally were collected in the 19th century. The main critical edition is by Svend Grundtvig (5 vols.); this edition was continued by Axel Otrik (d. 1917) who published three additional volumes and also a selection of ballads with an excellent introduction. The popular ballad originated among the nobility or higher classes in connection with the dance, introduced into the Scandinavian countries in the 12th century. In the ballads may be traced many relics of old, mythological beliefs and there may be found many themes of former ages, so they, in manner, preserve the consciousment of the spiritual life of past ages and the national renaissance of times that follow. But they also paint pictures of the life of chivalry, of the doings of the common people, of moral aspects and customs. In vigorous descriptions they show us life when not 'the monk' but 'the knight' was the centre of attraction. They supply the lack of a more complete national history and poetic activity. There are songs of magic and miracle, the relics of historical persons and numerous ballads of chivalry.

Modern Denmark.—The revolution in the mode and view of life which characterizes the transition from the Middle Ages to the Modern period has been treated fully by the Danish Professor Troels-Lund in his great work, ' Dagligt Liv Norden.' In Denmark the religious life was mostly affected. The time of the Reformation signifies principally opposition to the Catholic church and to the old type of thinking. The religious liberation spread rapidly from Germany to the Scandinavian countries, while the effects of the renaissance came later. The literature of the Reformation

---

1 Gum Danian is a term used in early Danish literature, referring to the early history and myths that form the basis of Scandinavian folklore and epic.
Danish Literature

period (16th century) shows very little originality, but has its great national significance by being written in the principal condition for having an independent literature. After the struggle about the new creed, it looked as if a really liberal view would win in all lines. New science arose, the educational system was improved, the University of Copenhagen (founded 1479) was re-established in 1537, much work was done to have the history of Denmark written, the higher classes, including the court and the nobility, took much interest in art and science. But soon all interest centred in the establishment of the "pure" Lutheran doctrine, theology itself became learned and made use, as the other sciences, of the Latin language; censorship was established and checked all free literary development. It became Holberg's great mission to raise the people by making them acquainted with the progress made by the leading countries of Europe.

In the age of Reformation proper, Kristiern Pedersen (1483-1564), called "the father of Danish literature," was the most prominent of the leaders. His use of the Zealand dialect became the foundation of the literary language of the country. His translation of the New Testament was published in 1529, and the translation of Christian III's Bible (1530) is in the main his work. He also published a free adaptation of a book by Luther on how children should be kept in school. Hans Tausen (1494-1561) by his eloquence and with his pen contributed most to the reformation in Denmark. Peder Palladius (1503-60), Zealand's first evangelical bishop (superintendent), edited a number of books in Danish and Latin to advance the cause of general education and morality. His most important work is his Vistatsbog, a collection of addresses delivered on his professional visits through his bishopric. It gives a vivid picture both of the able and imperious bishop himself and of the times. Povel Helgesen was the first to oppose the sale of indulgences, even anticipating Luther himself, but later attacked the Lutherans for going too far in their attack on the Roman church. They called him Povel "Turncoat." His polemical writings show the excellent style of this great humanist. His Sochies is the only official theological work of importance from that time. Hymn writers were Hans Kristensen Sten and Hans Thomesen, who published (1569) the first authorized hymn-book, which contained the best of the earlier hymns and very good contributions by himself.

The Period of Learning (1560-1700).

The majority of the writers of this period had no longer any use for the people and the vernacular. They returned to "the language of the gods," Latin, and subtle theological discourses, and treatises now succeeded the religious revival of the people. Melanchton's disciple, Niels Hemmingsen (1513-1600), is the greatest theologian of the time. He published a number of highly valued commentaries on the New Testament, and also wrote several books for the use of pastors. His fame spread over the whole of Europe and he received the cognomen "The Teacher of Denmark." With his De lege naturae he became the forerunner of the founders of "natural law," Grotius and Putendorf. Because his views differed from the established orthodoxy he was dismissed from the university. Jesper Broelmundt (1583-1629) was the most learned theologian of Denmark in the 17th century and the orthodox leader who exercised a decisive influence on his epoch. On his Universæ Theologicae Schæma is based his reputation in the whole Lutheran church, while his Danish "Postil," translated into several languages, has been popular down to our days. It was a time characterized by trials of witches, bigotry and superstition, and both theologians and scientists showed the prejudices of the times. A number of men with much book learning brought together a wealth of material in various sciences without much critical elaboration. Within the field of empirical sciences, especially medicine and astronomy, Denmark had at this time several men of world renown. Tyge Brahe (1546-1601), a member of one of the oldest noble families, was an astronomer. Kaspar Bartholin and his son Thomas (1610-80) were great anatomists. Ole Botch, also a physician, excelled in chemistry and Latin. Simon Plovning, interested in botany, established (1644) the Domus Anatomica in Copenhagen. Most famous, perhaps, was Niels Steensen (Nicolaus Steno, 1638-86), who made great discoveries in anatomy and founded the science of geology. Ole Römer, the astronomer, gained for himself great celebrity by his scientific discoveries. His calculation of the velocity of light (1675) marked a new area in scientific research. Of interest is the fact that men and women of the old Danish nobility distinguished themselves in science and literature. Holger Rosenkrans was considered one of the best theologians of the time. Noble ladies made collections of popular ballads, many of them were learned and devoted to studies. Noblemen were liberal patrons of the arts and sciences. ArildHuifeldt published in ten volumes a chronicle of the Danish kingdom. Under the influence of German-Dutch renaissance and also, after absolutism was established (1660), of French classicism, what was of Danish native origin was more or less despised. But there also flowed through the period a national and to some extent a popular current, which was not very strong but of great interest as a continuation of the great popular created by the Reformation. Anders S. Vedel (1542-1616) published his excellent translation of Saxon in 1575 and his selection of Danish ballads in 1591. Of Norwegian writers who after the Reformation and until 1814 belonged to Danish literature, Peder Clausson Friis translated "Snorre" and wrote his "Description of Norway," both works printed after his death. Anders Arreboe (1587-1637) translated the Psalms of David and wrote "Hexameron," partly in hexameters and partly in alexandrines, according to the rules laid down by Opitz in his "Prosodia Germania." The poem is a free imitation of the French poem by Bartas, but many parts are original. Peder Syv published the first Danish grammar (1683) and Pontoppidan also wrote a Danish grammar in Latin. Ole Worm, with his "Monumenta Danica" (1643), is the founder of Danish runology and archeology, and awakened an interest in the study of the early Scandinavians (Norwegian-Icelandic) literature. Mathias Møth
left in manuscript rich collections which were used in the compilation of a voluminous Danish dictionary. The most important Danish prose writer of the period are, besides Christian IV, "Danish Ludvig Holberg" and a translation of "Seneca" and Leonore Christine's "Jammersminde," in which this daughter of Christian IV in simple and touching language describes her long sufferings in prison. Anders Bording (1619-72) enjoyed a great reputation as a poet and possessed great skill in versification. The Norwegian Petter Dass (1647-1708), for many years pastor in Nordland in the north of Norway, wrote in lively newness with tuneful rhyme his "Nordlands Trompet" in glorification of the scenery and life of his beloved native region. He turned the catechism and Bible into verse adapted to singing, in plain and simple language. He gained an immense popularity. Bishop Thomas Kingo (1634-1708) is the greatest poet of the hymn period, beginning. In one of the greatest psalmists. Many of his hymns still remain unsurpassed. In this field he showed that "the spirit of the Danes can rise as high toward heaven as that of other nations."* Ludwig Holberg (1684-1754) is by far the most prominent figure of the next period. After years of study and travel, he became a professor at the University of Copenhagen. He was strongly influenced by English and French ideas (especially by Locke and Bayle), but also national and independent in his conception and application of what he had learned. He was well equipped for the writing he had chosen for himself. He attacks the worthless traditions of the past and exposes to the light the dark sides of his times, but he also builds up by creating a rich and many-sided literature in his country in all the fields within reach of his far-seeing and clear intelligence. His literary production is enormous and embraces history, philosophy, poems, satires and comedies. In more than 300 Danish "Epistles" he discusses all burning questions. His lively prose created a rich literary language out of the hitherto uncultivated Danish tongue. This was also his aim of which he was fully conscious in the "Danish language." But he had also an ethical object in view. He wanted to inculcate his own tolerant views, his own healthy common sense. He became in truth the intellectual father of posterity. Holberg incorporated Denmark and Norway with contemporary Europe and left to the "twin nations," as an imperishable inheritance, a modern literature, a modern stage, and a modern prose. In the age of Holberg lived H. A. Brorson who wrote his fervent and deep religious feeling which he published religious and a description of Denmark. The poems of Ambrosius Stub show that love of nature still lived in Danish hearts. H. Gram started the critical study of history. J. Langebek edited a series of historical sources. *The Academy of Sciences* and "The Society for the Study of the Fatherland's Language and History" were established. One great philologist, Jens Hoysgaard, lived at this time, but was only appreciated after his death. The latter half of the century (1750-1800) is called the "Age of Enlightenment," characterized by the crossing of many new ideas and influences. English influence was shown when the Norwegian Tullin wrote his much admired "Maidagen" in imitation of Thomson's "Seasons." Another Norwegian Nordahl Bruns's tragedy "Zarine" fashioned after the French model. The French influence was in the main the ruling influence, until a third Norwegian published his immortal travesty "Love without Stockings," which drowned it and all that class of plays in laughter. The principal author of the period is the Danish genius Johannes Ewald (1743-1871) owed much to German impulses, but broke with the old forms and in an epoch-making manner showed the way back to the early and heroic age of the Scandinavians. Interessing on account of his wit and elegant language is the "poet of the graces" Jens Baggesen who belongs to the transition period between the old and the new of the 19th century. P. A. Heiberg's comedies are also to be mentioned. In one of the number of periodicals. The most important are Snoedurf's "Den patriotiske Tilskuer," Rahbek and Pram's "Minerva" and Rahbeck's "Den danske Tilskuer." The thing of importance was to preach, to moralize, to publish. In the religious field, the idea of the so-called Rationalism whose representative was Balthelm, while Bishop Balfe is the orthodox leader. The typical and influential writer in this age of "enlightenment" is, without comparison, K. L. Rahbek (1760-1830), influenced by the ideas of the French revolution. This influence appears even stronger in P. A. Heiberg and Malte Brun who ventured to discuss also political questions and are sent into exile. With the 19th century came a new spirit and a new literature. The romantic movement introduces the golden age of Danish literature. The first and most prominent name we meet is that of Adam Oehlenschläger (1779-1850), who almost at once was able to shape the new ideas to the national needs and created a peculiar Danish romanticism. He produced one work after another which crushed all opposition of the old school and established his fame on a firm basis. After his epoch-making "Digte" (1803) he chanted the praise of the "home spirit" and in 1805 and 1807 he published his first great tragedy "Hakon Jarl!"; Grundtvig (1783-1872), the greatest national leader in Denmark, was prominent as a vigorous writer and "skald," a scholar, a preacher, a leader in church and education. Men of great talent, but less national and more influenced by German romanticism were Schack Staffeldt, Ingemann and Hauch. In the twenties, J. L. Heiberg (1791-1860) made an attack on the formlessness of the romanticists (Nordt) and the "Danish style" in its artistic form. In this he was supported by Henrik Hertz (1798-1870). Through both his literary and critical writings Heiberg exerted the greatest influence. The most prominent writers close to Heiberg were Hertz who handles a great variety of subjects with mastery skill, and his mother, Thomasin Gyllembourg, who writes about the higher circles in the capital with fine taste and keen psychological insight, and Christian Winther (1796-1870) who in his songs and love reached higher than any before him. The only Danish writer known throughout the world, H. C. Andersen, and F. Paludan-Müller, one of the best by his depth of thought and fine
form, were also originally of Heiberg's school. More independent positions have Steen St. Blicher who in pathetic and humorous tales gave a masterly description of the byland villagers, Poul M. Möller, a professor of philosophy, whose comparatively few poems are marked by an original and choice style, while a fresh humor is shown particularly in his unfinished "Students' Eventyr," and Emil Aarestrup whose glowing poems show a marked individuality. In the forty years of the literature has a political errand. The poems of Ploug advocate the close union of the Scandinavian countries, sing the praises of the Constitution (1849) and the heroes and deeds of the First Sleswick war. Goldschmidt makes in his weekly 'Corsaren' scathing attacks on absolutism. The most popular writer of this time was J. C. Hostrup (1818-92) whose comedies are superior to Heiberg's in humor and knowledge of real life. Between 1850-70 a number of talents, though no great genius, appears. Kaulund and Richardt gain much new popularity by their lyrics, Bergsøe, H. F. Ewgard and Carl Eft and later writers of stories. With the famous lectures of Georg Brandes (1871) a new period begins, that of Realism. While the old writers still continue in the old ways and some of the younger also associate themselves with them, the most prominent follow the lead of Brandes. The literature is filled with modern ideas and the style is new. In fiery poems Drachmann presents the revolutionary movements of the times, Schandorph introduces without any romantic embellishment his characters from country and city. J. P. Jacobsen from his view of life based on modern science paints his colorful pictures of the past and the present. As others of the same school may be mentioned Gjellerup and Pontoppidan who shared the Nobel literary prize of 1917, H. Bang, G. Wied, Karl Larsen. In the eighties the French Beaudelaire and symbolists exerted great influence on lyric poets who then became known, S. Michaelis, S. Clausson, J. Jørgensen, Stuckenberg and later H. Rode. Later this influence disappeared as in the poets V. Rørdam, L. C. Nielsen, J. Aakjaer. Among authors who have written stories of real life in new fields may be mentioned J. Knudsen, Skjoldborg and especially J. V. Jensen who is characterized by originality, great imagination and mastery of style.

In the 19th century Denmark produced a number of scholars of the highest rank. The greatest thinker this country has is Sören A. Kierkegaard (1813-55) whose theological and philosophical writings have exerted great influence. As noted writers on philosophical subjects may, in addition, be mentioned: Sibbern, R. Nielsen, Brøchner, Hoffding, Kromann. Great historians are Allen, C. Paludan-Müller, Holm, A. D. Jørgensen, Erslev, Steenstrup, Troels Hansen. Great names among poets are such names as Jørgensen, Rask, Westergaard, Madvig, Verner, V. Thomsen, Wimmer, Nyrop. Famous scientists are Oersted, Schou, Warming, Forchhammer, Schödte, Steenstrup, J. Thomsen, Zeuthen, J. Thomsen.

M., 'Bidrag til den danske Letteries Historie' (5 vols., 1872, 2d ed.); Hansen, P., 'Illustreret dansk Letterie historie' (3d ed. by Carl Petersen now nearing completion); Erslev, 'Almindelig Fortfatter-lexicon' (1843-53; Supplement 1858-68); Briicka, 'Dansk biographisk Lexikon' (19 vols.); shorter works by Müller, 'Winkelhorn' (translated by R. B. Anderson 1894), Levin and Clausen, Röning, Karl Mortensen; Rosenberg: 'Nordboernes Aandsliv' (1885), valuable works on different authors and periods by J. Paludan, Georg Brandes, F. Röning, K. Arenzten V. Vedel, V. Andersen, Gisling Borrn, Head of the Department of Scandinavian Languages and Literature, University of Minnesota.

**Danish Sound Dues, maritime taxes** prior to 1857 imposed by Denmark on all vessels passing through the sounds connecting the North and the Baltic seas, based according to Danish interpretation, "upon immemorial prescription, sanctioned by a long succession of treaties with foreign powers." Contending that navigation of straits connecting open seas was free to all, the United States in 1826 had obtained a provisional 10-year treaty that "neither the vessels of the United States nor their cargoes shall, when they pass the Sound or the Belts, pay higher or other duties than those which are or may be paid by (the) other nation." In 1855 prior to the renewal of the treaty for the fourth time the United States emphasized the fact that it would not pay for the privilege of using the maritime highway connecting two seas, but was willing to contribute its share for the maintenance of the lights, buoys and pilot establishments. These aids to navigation were adjudged at $393,011 by the treaty of 1857 with Denmark.

**Danish West Indies.** See *Virgin Islands.*

**Danites, dán'its, a former secret society of the Mormon Church, for militant action against its enemies. It was organized by Joseph Smith at Kirtland, Ohio, 30 March 1836, by a "covenant" to avenge any further expulsion of the Missouri Mormons by mobs; on the basis of a "revelation" of 6 Aug. 1833, justifying any Mormon in "rewarding this enemy according to his works." The first name chosen was Daughters of Zion, from Micah iv, 13; this not seeming graphic, it was changed to Destroying Angels, or Flying Angels, the former used for many years; then the Big Pan (Rev. xv, 7 or Luke iii, 17); then Brothers of Gideon; finally Sons of Dan, turned by outsiders into Danites, from Gen. xlix, 17. A constitution was adopted, giving the executive power to the president of the Church and his counselors, and the legislative power to the same, with the generals and colonels of the society; this legislature to have power to "administer punishments to the guilty in accordance with the offense." The oath taken by the members was to obey the Prophet and First President of the Church in all things, the supreme God; to "stare at my brethren and others, and uphold the presidency, right or wrong"; and invoking terrible punishments for revealing the secrets of the society. The Mormons have usually denied that the society existed, or if so that it was countenanced by the Church; and Smith's Nauvoo council denied its existence there. Brigham Young, however, boasted of its existence in Salt Lake City. Its actions, from the nature of the case, can only be inferred. It is usually credited with all the deeds of blood.
charged against the Mormons, including the Mountain Meadows massacre (q.v.). The name was adopted by the Douglas Democrats to the administration (Buchanan) Democrats in the Lincoln-Douglas senatorial Illinois campaign of 1858, as an insinuation that they were Buchanan's tools in upholding the Utah Rebellion. Consul for France, 'Utah and the Mormons' (New York, 1854).

**DANNECKER, dán'nèk-ər, Johann Heinrich, German sculptor:** b. Waldenbach, near Stuttgart, 15 Oct. 1758; d. Stuttgart, 8 Dec. 1841. At the Karlsschule he devoted himself so successfully to sculpture that a statue of Milo of Crotona, executed in his 17th year, excited great admiration. On leaving he was appointed court sculptor, and three years after visited Paris and Rome. In the latter city he executed a Ceres and Bacchus, which procured his admission into the academies of Bologna and Milan. In 1790 he returned to Württemberg, and became professor of the fine arts at Stuttgart. From this period he continued his professional labors with most brilliant success, and was patronized by the most distinguished personalities of Germany. His acknowledged masterpiece is a statue of Christ, which occupied him during eight years, and the prototype of which is said to have been suggested to him in a dream. His 'Ariadne seated on the Panther' is a splendid work, and in the opinion of some critics is superior as a work of art to his 'Christ.' As a sculptor he occupies an intermediate place between Canova and Thorwaldsen, having blended in the happiest manner the spirited conception of the former with the latter's great anatomical skill, careful execution, and nice appreciation of nature. His ability to delineate character has made his busts famous. Among these are 'Schiller' at Weimar, and kings Frederick and William at Württemberg. Consult Radcliffe, 'Schools and Masters of Sculpture' (1894).

**DANEMORA, N. Y., village in Clinton County on Chagrin Ford; 12 miles west of Plattsburg. Here is located one of the State prisons called Clinton State Prison. The iron ore found in the vicinity is of an excellent quality. Pop. 1,146.

**DANEMORA, dän-nè- moo'rä, Sweden, a straggling village and mining field, 12,250 square meters in extent, having the same name, 24 miles northeast of Upsala, in the district of Upsala. It is celebrated for its iron mines, the second richest in Sweden, which have been worked uninterruptedly for upward of three centuries, and produce the finest iron in the world. The mine has been sunk more than 100 fathoms, and as part of the workings runs under the lake, great trouble is sometimes experienced in keeping out the water. The ore consists of 86 to 90 per cent magnetic oxide of iron, 7 to 12 per cent silica, and traces of manganese, lime, magnesia and alumina, the earthy matters being in the proportion to form a fusible slag without further addition. It is almost free from sulphur and phosphorus, and as the charcoal fuel employed in smelting is also free from impurities, the Danemora iron enjoys the highest reputation, and is in great demand for conversion into steel.

**DANNREUTHER, dän'roi-tehr, Edward, English pianist and conductor:** b. Strassburg, Germany, 4 Nov. 1844; d. 12 Feb. 1905. He was educated at Cincinnati, Ohio, studied music at Leipzig under Moscheles, and in 1863 went to London and lectured to the Incorporated Society of Musicians in England. He was well known in London as a teacher of music and as a performer of Chopin and Beethoven. He conducted the first Wagner concerts in London 1873-74, and has published 'Musical Ornamentation'; 'Richard Wagner: His Tendencies and Theories'; 'The Music of the Future'; 'On Conducting,' and also the sixth volume of the Garigan Series on Music, 'The Romantic Period' (London 1905).

**D'ANNUNZIO, dä-noon'zyô, Gabriel, Italian novelist, dramatist and poet:** b. 1864. See D'ANNUNZIO, GABRIEL D'.

**DANTAN, dän-tân, Antoine Laurent, DANTAN THE ELDER,** French sculptor: b. Saint Cloud, 9 Dec. 1798; d. there, 31 May 1878. He was a pupil of Bosio, taking the second grand prize of Rome for sculpture in 1823 and the first prize in 1828, the latter for a 'Death of Hercules.' Yielding himself, at first, entirely to the influence of the antique in his art, he afterward found a more original style. He obtained the decoration of the Legion of Honor in 1843, and secured a medal of the third class at the Exposition in 1855. Among his works are 'Young Bather and Dog' (1835), which took a medal of the first class, 1833; 'Drunkenness of Silenus' (1836); a bronze 'Young Girl in the Garden' and 'Tambourine' (1838); Statue of Louis Joseph de Bourbon; 'Statue of the Maréchal de Villars'; 'Bust of the Dauphin of Prince.' A monumental 'Juvelal des Urins' was ordered for the Hotel de Ville in Paris in 1838, and 'The Angel Raphael' for the Madeleine in 1839. 'Duquesne' was made for Dieppe in 1844, and a 'Saint Christopher' for the church of La Villette in 1846. He was the author of many statues decorating the monuments of Paris, the churches of Saint Gervais, Sainte Clotilde, Saint Laurent, the Tower of Saint Jacques, the belfry of Saint Germain l'Auxerrois and the new Louvre, besides busts for the museum at Versailles, the senate and the Comédie Française.

**DANTAN, Jean Pierre (called DANTAN THE YOUNGER,** French sculptor: b. Paris 26 Dec. 1800; d. Baden, 6 Sept. 1869. He was a brother of A. L. Dantan (q.v.). He achieved great reputation for his diverting caricatures of prominent men, such as Paganini, Rossini, Victor Hugo, Frederic Soulle, Balzac, Alexandre Dumas, Frederic Le Maitre and of himself which were exhibited at the Dantan Museum in Paris, but his popularity as a caricaturist injured to some extent his fame as a serious artist. Among his works are statues of Boieldieu, at Rouen; Philibert Delorme, at the Louvre; and busts of Adelaide Kemble, Rose Cheri, Canrobert, Jean Bart, Pleyel, Rossini, Thalberg, Duke of Wellington and Lord Brougham.

**DANTAN, Joseph Edouard, French painter:** b. Paris, 26 Aug. 1848; d. Villerville, 1897. He was a son of J. P. Dantan (q.v.). He was a pupil of Pils, but soon abandoned historical and religious for genre painting. Among his works are 'The Holy Trinity'; 'An Episode of the Destruction of Pompeii' (1869); 'A Monk Carving a Christian Effigy' (1869); 'Cyclops at the feet of Ophmalus' (1874); 'The Nymph Salmacis and the Young Hermaphrodite' (1876); 'Vocation of the Apostles Peter and Andrew' (1877); 'The Corner of a Stu-
dio' (1880), in the Luxembourg; 'Breakfast of the Model' (1881); 'Interior at Villerville' (1883); 'The Studios' (1884); 'The Widow' (1885); 'Modeling from Nature' (1887).

**DANTE (orig. DURANTE) ALIGHIERI, dàn'tā aīlīgyā're, Italian poet:** b. Florence, May 20, 1265, d. Ravenna, Italy, 14 Sept. 1321. He was of a family belonging to the lower nobility and of mixed descent, the Alighieri, or Alighieri, being originally Teutonic. He lost his father in early life, but his mother watched carefully over his education, which was confided to the eminent philosopher and statesman, Brunetto Latini. He is said to have studied at Bologna, Padua, Naples, and even Paris and Oxford, but we have no means of confirming the statement in any measure. What is tolerably certain is that he had mastered the learning of that age. He was a musician and painter, a theologian and linguist of no mean order. Many of his biographers state that it was in 1274, when nine years of age, that he saw for the first time, and ever afterward devoted to, his beloved Beatrice Portinari. Others assert that that event took place shortly before her death, in 1290, three years after she had married a noble Florentine, Simone Bardi. His love for her awakened in him a new life; all the powers of his soul were to be henceforth devoted to immortalize her, and we can watch the struggles of his spirit in that record he has left us of his early years, the Vita Nuova.

About the period when Dante reached the age of manhood the Guelphs (the Papal or Church party) were predominant in Florence, whence they were aided by Pope and Charles, king of Naples, driven the Ghibellines (the imperial or state party). At Arezzo, on the other hand, the Ghibellines had succeeded in exiling the Guelphs, who implored the assistance of their Florentine friends. A war was declared between the two cities, which was terminated in June 1289 by the battle of Campaldino, in which the Ghibellines were defeated. Dante was there fighting bravely and contributed not a little to the victory of the Guelphs. In 1291 he married Gemma dei Dotti, a daughter of one of the most powerful families of the state, and which belonged to the Guelph faction. By this lady he had seven children, the youngest, Beatrice, being born about 1301. In 1293 a revolution broke out in the city, headed by Giano della Bella, whereby the priors of the trades took the power into their own hands and made nobility a disqualification for holding office. The following year, however, Giano della Bella was deprived of power and the nobles disagreeing among themselves and splitting into two factions, the Bianchi and the Neri (the White and the Black), the streets of Florence were continually the scenes of sanguinary fights. In order to check the excesses of the greater nobles, a number of the lesser nobility, Dante among them, threw in their lot with the citizens' party. In one of these battles, in 1297, Dante had his name inscribed in the books of the physicians and apothecaries, and in June 1300 was nominated a prior of the trades, one of the highest offices in the state. Although leagued by marriage to the Guelph side, Dante was not a partisan of any party, and on one occasion, when roused by some fresh act of atrocity he proposed and carried a law to the effect that the heads of the Bianchi and Neri parties should be temporarily banished. It appears that the Bianchi and Neri were originally Guelphs, but the latter were the extreme Papal party, and the former lean towards conciliation with the Ghibellines. Dante's sympathies were with the Bianchi and on the too hasty return of one of the exiles, Guido Cavalcanti, a friend of the poet's, and one of the Bianchi, Dante was charged with undue partiality in permitting him to remain in the city. The Neri wrote to the Pope that the Bianchi were making common cause with the Ghibellines and Boniface VIII sent Charles of Naples to occupy the town and keep down the turbulent spirit of the Florentines. The Neri were forth allowed, however, to commit the greatest excesses unchecked by Charles: many of their rivals were slain in the open street and their houses burned to the ground; among others that of Dante, who had been sent to Rome by his party to try to influence the pope on their behalf. Taking advantage of his absence, his enemies obtained a decree of banishment against him, together with the heads of his party and he was further condemned to pay a fine of 8,000 florins or have his goods confiscated (January 1302). Two months later a second sentence was launched against him and several of his friends: they were condemned to be burned alive for malversation, peculation and usury. The fine he refused to pay, as it would imply a confession of guilt.

From this time forth the life of the poet becomes semi-mythical. We find some traces of him first at Arezzo, then at Siena, then at Verona. He himself says, "Through almost all parts where this language (the Italian) is spoken, a wanderer, well nigh a beggar, I have traveled, showing against my will the wounds of fortune." His sympathies now lay entirely with the Ghibelline party. The expedition of the emperor, Henry VII, into Italy (1310) raised the hopes of Dante to the highest pitch. He wrote the emperor that famous letter advising him first of all to crush the hydra, Florence, as being the cause of all the misfortunes of Italy. Henry, however, spent his time in foolish inactivity till his death in 1312. This event Dante is said to have visited Paris; but according to Balbo he spent the year 1313-14 in Pisa and Lucca and then took refuge with Can Grande della Scala at Verona, where he remained till 1318. In 1316 Florence sent a decree permitting the exiles to return on conditions of fine and penance, which Dante indignantly refused. In 1320 we find him at Ravenna staying with his friend Guido Novello da Polenta. In the following year, on his return from an embassy to Venice, his wanderings and sufferings were ended by death. He was buried in the church of the Minorites, under a monument built by his friend Guido Novello, on which was an epitaph written by Dante himself. Such, imperfectly sketched, was the career of the greatest of the troubadours. The sense of the nothingness of earthly honors and prosperity possible only to the rich, and a knowledge of man possible only to the poor. In his youth living amid the excitement of the tented field and penning sonnets to his adored Beatrice; in his old age compelled to climb the stranger's toilsome stairs and eat the bitter bread of others. Out of his misfortunes the
world found her rich account; the apocalypse of the Middle Ages, the 'Divina Commedia,' was begun and finished in his year of exile. Of this grand poem we can give only a very brief analysis. It is divided into three parts: Hell, Purgatory and Heaven. Each part is subdivided into 33 cantos, in addition to the years of our Saviour's life, the extra canto in the first part being introductory. Dante dreams that he had reached the half-way point in his path of life, at the entrance of an obscure forest. He would advance, but three horrible beasts bar the way; they are the Sins. Virgil offers himself as his guide. Dante accepts and then takes place that wondrous journey in the "world of souls." Virgil tells him he can only accompany him through hell and Purgatory; but that Beatrice shall conduct him through those happy spheres, the portals of which a pagan may not enter. Now begin the peregri- nations of the Florentine through the regions of the damned, over the entrance of which is written the awful words—"All hope abandon ye who enter here." The most significant and best-loved part of the poem is the singular diversity of the chastisements; the rapidity with which Dante passes in review the great criminals of history; the intensity with which he paints, at a single dash, so to speak, their distinct features; the grace of certain episodes (the adventure of Francesca da Rimini, the death of Ugolino and that of Manfred), attest the vigor of imagination never surpassed, if ever equaled. From Hell (which the poet places in the centre of the earth) he ascends to Purgatory, a solitary mountain, rising from the ocean on the side of the globe opposite to us. This mountain is divided into terraces and its top is the terrestrial paradise, the first abode of man. In Purgatory there are still scenes of pain and suffering; but these punishments are only temporary. The poet hesitates when he comes to a path filled with a sheath of flame; but Virgil speaks: "Between Beatrice and thee there is but that wall." Dante at once plunges into the heart of this flaming cavern, and have now reached the earthly paradise and behold Beatrice surrounded by a scene of surpassing magnificence; noble forests, whose trees are gently moved by celestial zephyrs; the melodious songs of birds to which the murmuring of the sea, the stars, the sun, the moon, and the planets, give harmonious reply; meadows of the freshest green and groves of deepest shade. From this enchanting region Dante ascends faster than tongue or pen can tell, into the celestial paradise. This realm consists of 10 heavens or circles. Dante roams at first over the seven plads, the moon, Mercury, Venus, the Sun, Mars, Jupiter and Saturn; then he enters the eighth sphere, and at last into the empyrean. Each of these globes has its inhabitants, who are souls or spirits. Arrived at the eighth sphere, he looks down upon our globe; but the earth appears so abject that he smiles with pity upon it. Beatrice calls his attention to a nobler scene. "See the glorious company which surrounds the triumphant Redeemer." The eyes of the poet cannot sustain the scene, so he leaves. In the ninth sphere Dante feels himself in the presence of the Divine essence, hid from his sight by three hierarchies of angels. He sees the souls of the blessed on thrones in a vast amphitheatre, whose steps and circles widen into infinity. Beatrice takes her place upon her throne of glory; from that sublime height she smiles benignantly down upon the poet; then turns toward him who is the source of life and light. Thus ends the Divine trilogy, the noblest effort of the Middle Ages.

The name "Commedia" is derived from Dante's idea concerning the forms of eloquence, which were in his opinion tragic, comic and elegiac, as he relates in his work "De vulgari Eloquio," which was first written in Latin. What he called tragedy was a piece commencing with happy and peaceful scenes and ending itself with the events of a painful and terrible character, and what he called comedy was a piece which, beginning unpleasantly, terminated happily. The qualifying word divina was, however, added by others. We may mention the opinion maintained in 1753, by Bottari, that Dante made use of the "Vision of Alberico" a monk who lived in the 12th century, in a monastery on Monte Cassino, in Naples. There have been many such visions from the earliest ages of Christianity; as, for instance, the "Vision of Tiberius," which Matthew Paris mentions in his "History of England" (in the year 1196), and which resembled Dante's poem much more than the "Vision of Alberico," published by Cancellieri in 1814 at Rome, with observations and explanations intorno alla Questione sopra la Originalità della Divina Commedia di Dante). It is possible that Dante here and there may have borrowed a thought or image from those visions; but this is no fault: the recollections of great men are sparks which serve to kindle mighty flames.

There is no poet who bears so distinctly the impress of his age, and yet rises so high above it, as Dante. The Italians justly regard him as the creator of their poetical language, and the father of their poetry, which, regulated and controlled by his genius, at once assumed a purer and far nobler form than it had previously worn. The terzina first reached its perfection in the time of Dante, on which account he has been erroneously regarded as the inventor of it.

Florence soon recognized that she had lost her noblest son. In 1350 a sum of 10 golden florins was ordered to be paid by the hands of Giovanni Boccaccio to Dante's daughter, Beatrice, a nun in the convent of Santa Chiara at Ravenna. In 1373 an annual sum was granted for public lectures, to explain the "Divine Comedy" in the churches, and Boccaccio was one of the first lecturers. A monument was voted for if Ravenna would give up the now sacred remains, which that city refused, and has repeatedly refused to do. In May 1865 all Italy assembled at Florence to render homage to the seer who prophesied so speedily and so confidently her unity; and the following year a colossal statue of the poet was erected on the Piazza della Croce.

The best editions of the "Divina Commedia" are those of Lombardi (1791), frequently reprinted with valuable improvements, of Viviani (1823), of Bianchi (5th ed., Florence 1857), of Karl Witte (Berlin 1862), etc. In 1821 Luigi Fantoni published an edition of the "Divina Commedia," stated to have been printed from a manuscript in the handwriting of Boccaccio. In 1869 the "Vernon Dante" was published in London by Lord Vernon in three large volumes folio. It contains the text of the "Inferno," and, in Italian, an explanation of everything in the
text regarding which any reader might have the least difficulty, together with an immense mass of information — biographical, topographical, historical, etc., relating to the life and times of Dante. A large number of maps, plans, and illustrative plates. Dante’s complete works appeared at Venice in 1757–58, published by Zatta (in 5 vols. 4to). His lyric poems, sonnets and canzonets, of which some are beautiful, others dull and heavy, were written at different periods of his life. We have yet to mention his ‘Banquet’ (Il Convito) — a prose work worthy, says Bouterwek, to stand by the side of the best works of antiquity. It contains the substance of all his knowledge and experience, and thus illustrates his poetry and his life. The most popular English translation of the ‘Divina Commedia’ is that by Cary in blank verse (1814). Longfellow executed a faithful poetic version (1867); and that by Dean Plumptre in the original metre deserves mention. Other English translations are Boyd’s (1785), Wright’s (1833), Pollock’s (1854), Parsons-Norton’s (1891–92). The German translations are numerous, and are highly praised for faithfulness and force. The translation by Kannegiesser is in the measure and rhyme of the original; that of Philalethes (Ed. John of Saxony) has a deservedly wide reputation. The French have four or five translations, including one by Lamennais, but that graceful and feminine tongue is incapable of doing anything like justice to the manly thoughts of Dante.

In one respect Dante stands unrivalled by any man, as he, we might almost say, created the language, which he elevated at once to its highest perfection. Before him very little was written in Italian, Latin being the literary language; but no one attempted to use the lingua volgare for the purposes of dignified composition. The poet, indeed, thought it necessary to excuse himself for having written in Italian after having attempted to compose his poem in Latin. Thus he is to be regarded as the founder of Italian literature. One of the strangest productions of Dante is his ‘De Monarchia.’ He labors in this work to prove that the emperor ought to have universal authority, and draws his arguments from the sacred Scriptures and the Commentaries of the Guelphs and Ghibellines, which in this book appear very often with equal authority. The dialectics of the schoolmen are here exhibited in a most characteristic way. The ‘De Monarchia’ is valuable as a source of information respecting the great struggle of the Guelphs and Ghibellines, and its influence upon the Christian world at that time. This struggle was a part of the great convulsion attending the separation of the civil power from the ecclesiastical, with which in the earliest ages it is always united. On the whole, Dante's works are important chiefly in three respects — as the productions of one of the greatest men that ever lived, as one of the keys to the history of his time, and as exhibiting the state of learning, theology and politics in that age. To understand Dante it is necessary to know the history of his life, and a large number of maps, plans, and illustrative plates. Dante was an exile, deprived of home and happiness. The personal appearance and character of the man are thus described by Boccaccio: "Our poet was of middle height; his face was long, his nose aquiline, his jaw large, and his upper lip protruding somewhat beyond the upper. His hair was dark, his hair and beard thick, crisp, and black, and his countenance sad and pensive. His gait was grave and gentlemanlike, and his bearing, in public or private, wonderfully composed and polished. His food and meat and drink he was most temperate. Seldom did he speak unless spoken to, though he was most eloquent. In his youth he delighted in music and singing, and was intimate with all the musicians and singers of the day. He was of marvelous capacity and the most tenacious memory; inclined to solitude and fond of study when he had time for it." See Vita Nuova; Divina Commedia.

W., ‘Dante: an Essay’ (1879); Rossetti, M. F., ‘A Shadow of Dante’ (1871); Lowell, A. Among My Books (2d Series 1876); Moore, ‘Textual Criticism of the Divina Commedia’ (1889); Scartazzini, ‘Dante in Germania’ (1881–83); Symonds, ‘Introduction to the Study of Dante’ (1890); Butler, ‘Dante: His Times and His Work’ (1895); Botta, ‘Introduction to the Study of Dante’ (1887); Creighton, ‘Historical Essays and Reviews’ (1902); Moore, ‘Dante and Aquinas’ (London 1913); Tonnbee, ‘Dante in English Literature’ (New York 1909); Fletcher, ‘Dante Alighieri’ (ib. 1914).

DANTON, dahn-tohn, George Jacques, French revolutionist: b. Arcis-sur-Aube, 26 Oct. 1759; d. Paris, 5 April 1794. He played a very important part during the first years of the French Revolution, of which he was an active and zealous promoter. His external appearance was striking, his stature was colossal, his frame athletic, his features harsh, large and disagreeable; his voice shook the dome of the chamber of the assembly, and the passion of his vehemence and his imagination was as gigantic as his person. These qualities contributed to extend his influence and he became one of the founders of the club of the Cordeliers. After the capture of Louis XVI at Varennes he took the lead in the meeting of the Champ-de-Mars which demanded the dethronement of the king. He is said to have had a share in organizing and conducting the attack on the Tuileries (10 Aug. 1792); a few days afterward he was appointed Minister of Justice. He also became a member of the provisional executive council and usurped the appointment of officers in the army and departments. Money flowed from all sides into the hands of the minister, and was as profusely squandered on his tools as possible. He endeavored by the terror and proscription to annihilate all hope of resistance on the part of the Royalists. The invasion of Champagne by the Prussians 2 September spread consternation through the capital. The ministers, the most distinguished deputies and even Robespierre himself now relied upon Danton, and never was his splendid courage and audacity more strik-
DANTZIC

DANTZIC, DANTSC, or DANOZ, dant'sik, Germany, city and port of Prussia, capital of the province of West Prussia, 253 miles northeast of Berlin; on an arm of the Vistula (now cut off by a dam from the river), about three miles above its mouth, and on the Motlawa, several arms of which traverse the town. It is one of the most important seaports under the Prussian monarchy, as well as one of its chief commercial entrepôts. It is nearly circular in form and ranks as a fortress of the first class. The fortifications on the north and west side gave place about 1896 to streets and public gardens, those on the east and south being retained and strengthened. Provision is also made for laying water conduits in the surrounding country under water. It is entered by four gates, has nine suburbs, and is divided into five parts—the Old, New and Low town, the Speicher (granaries), an island, and Langgarten. The last is the more modern part of the town and is regular and well built.

The principal edifice is the Dom, or cathedral, begun in 1343, but not finished till 1503. It is 300 feet long by 142 feet broad, and its vaulted roof, 98 feet above the pavement, is supported by 26 slender brick pillars. It possesses a fine brass font and a curious astronomical clock, which has long ceased to move, but its chief attraction is a painting of the 'Last Judgment,' attributed to John Van Eyck. The other buildings and institutions deserving of notice are the town-house, the church of Saint Catharine, the oldest in Dantzig, and the exchange, an imposing Gothic edifice, built in 1379. Many of the modern public buildings are models of architecture. It is the seat of the provincial government and contains the various offices connected therewith; and is also the seat of the States consulate. It is governed by a municipal council of 63 members, effectively controlled by a smaller executive council. It has excellent water supply and sewerage systems; owns the gas and electric plants, and is well served by the post office. Many educational and charitable institutions. The industrial establishments include several shipyards, works for artillery and firearms, iron foundries, machine shops, steel works, breweries, distilleries, works producing the liqueur called Danzig, flour-mills, saw-mills, paper-mills, rope, wire, oil, chemical, soap and glass works. Although losing as a shipping centre in favor of ports more favorably situated, it is developing rapidly in manufacturing industries. A considerable part of the trade is in products in transit. Among imports the chief are coal, iron, cured herring, salt, tallow and lard, petroleum, rice, coffee and some breadstuffs. The chief exports are timber, beet-sugar, grain and seeds, oil-seeds, flour, spirits and molasses. Dantzig has a great trade in grain, especially wheat, rye and barley, for the warehousing of which there are immense granaries on the island of Speicher. The wheat, which is chiefly Polish, is remarkable both for the quality of the grain and the character of the flour which it yields. There is considerable trade at Dantzig in amber, which is manufactured into various ornamental articles. The proper port of Dantzig is Neufahrwasser, at the mouth of the Vistula (now known as the dead Vistula), and connected with it by an artificial channel. Here a free port has recently been established. By dredging and otherwise, various obstructions to navigation have been removed and vessels of large size come up close to the town. The history of Dantzig reaches back to the times of historical obscurity. As early as 970 there was a town here. In 1271 it was taken by Mestwin, and in 1294 by the Poles. In the 14th century it fell into the hands of the Teutonic Knights, under whose sway the town increased and its commerce became considerable. In 1358 the city joined the Hanseatic League; in 1454 it fell into the hands of the Poles, who granted it important privileges. After enduring many vicissitudes of fortune, on the second partition of Poland, in 1793, it came into possi-
session of Prussia. It was besieged, bombarded and taken by the French in 1807 and retaken by the Prussians in 1814. Pop. 170,337.

**DANUBE** (ancient, *DANUBIUS*; German, *Donau*; Hungarian, *Duna*), the second river of Europe, originating in two small streams, the Brege and the Brigach, rising on the east slope of the Schwarzwald, a mountainous region of southwest Germany (the Black Forest), in the Grand-duchy of Baden, at an elevation of 2,850 feet above sea-level, and unifying at Donaueschingen. Its general course is from west to east, and it flows into the Black Sea by four different outlets, called respectively the Kilia, Stamboul, Sulina and the Edrillis or Saint George's mouths. The Sulina mouth or channel is the deepest. The extent of the basin of the Danube is about 300,000 square miles, and its total length is about 1,875 miles. The Danube basin comprises portions of Austria-Hungary, Germany, Serbia, Bosnia, Rumania and Bulgaria. From its source it flows northeast to Ratisbon, in Bavaria, whence it takes a south-east course, by Vienna and Pressburg, to Wartegg, in Hungary. Here the course is changed as to nearly due south of the point where it receives the waters of the Drave, near Esseg, in Slavonia; thence it flows southeast to Belgrade, on the north boundary of Serbia, and for some distance it forms the boundary between Serbia and Austria. The course continues in an easterly direction to Orsova (the Iron Gate), where it changes to southeast, then again nearly east, forming for a long distance the boundary line between Rumania and Bulgaria. At Silistra, in Bulgaria, it turns more to the north, through Rumania to Galatz, then southeast between Rumania and Bessarabia, in Russia, and finally into the Black Sea.

The great basin of the Danube has been divided into four minor basins. The first consists of a vast plateau 1,600 feet above sea-level, 150 miles in length and 125 miles broad, surrounded by mountains, and comprising a portion of the principality of Hohenzollern, part of the kingdom of Württemberg and the greater part of the principality of Bavaria. This tract is by far the most fertile and most populous through which the Danube passes on its course. The principal branches within this space are the Isar and Lech. A canal connecting the Altmühl with the Regnart, an affluent of the Main, gives access to the Rhine.

The second basin belongs to the empire of Austria, having Vienna nearly in its centre, and comprising the archduchy of Austria, Hungary as far east as Wartzen, and Styria. It is very irregular and is bounded by very high mountains. The soil is rich in mineral products and the climate one of the best in Europe. The principal branches in this basin are the March or Morava and the Enns—the former from the left and the latter from the right. The Danube here passes through a succession of the most picturesque scenery.

The third basin of the Danube comprises Hungary east of Wartzen and the crowland of Transylvania, and consists of an immense plain, almost undulating, and barren, with only 394 feet above the sea-level. It is intersected by large rivers with marly banks, and interspersed with stagnant pools, saline and sandy wastes. It comprises about one-half of the entire basin of the Danube. The marshes cover a space 3,053 square miles. The principal branches in this basin are the Save, the Drave and the Morava. From Budapest to Belgrade the river passes through an immense plain covered with sand and alluvium, through which it is constantly forming new channels and filling up the former ones. Below Moldava it passes for 60 miles through a succession of rapids and shallows interspersed with rocks and sandbanks, where it has cut a passage for itself through the cross chains of hills which connect the Carpathian Mountains with the Alps; and between Drenkova in Hungary and Kladova in Serbia, the navigation is partially interrupted by three great rapids, the principal or last and lowest of which is the famous Iron Gate, where the stream rushes through a narrow channel between stupendous rocks, ending with a series of whirlpools, eddies and smaller falls. By the removal of various obstructions vessels drawing nine feet have long been able to pass at certain seasons; and by works carried out in 1890-96, and extending over some 50 miles, a permanent waterway has been established.

The fourth basin comprises Rumania, a portion of Bessarabia and Bulgaria. This tract is flat, inundated and marshy along the banks of the river; dry and mountainous on the borders of the basin. The principal branches in this basin are the Aluta, Sereith and Prunae. The lower part of its course the Danube increases in width from 1,400 to 2,100 yards; and in one part it forms an expanse of water like a sea and is studded with islands. Excepting between Drenkova and Kladova, the Danube may be said to be navigable for steamers from Ulm to the sea, although in some places navigation is rendered difficult by shallows and sandbanks, intersected by narrow and intricate channels. The outlets of the Danube are separated from each other by several low islands covered with weeds and trees. The greater part of the ships bound up the river enter it by the Sulina mouth. The Danube has 60 navigable tributaries, and its volume of water is nearly equal to that of all the rivers that empty themselves into the Black Sea taken together. Its rapidity is in many places above Orsova so great as to render navigation difficult, but below that point its current is less rapid. A number of steamers now ply on the river between its principal towns. The principal towns on the banks of the Danube are Ulm, in Württemberg; Regensburg (Ratisbon) and Passau, in Bavaria; Linz and Vienna, in Austria; Pressburg, Budapest and Peterwaldin, in Hungary; Belgrade, in Serbia; Widin, Nicopolis, Rustchuck and Sibria, in Bulgaria; Braslaw and Galatz, in Rumania.

Under the terms of the Peace of Paris in 1856, the Danube was declared free to the ships of all nations; and at the Berlin Congress of 1878 it was agreed that no ships of war should navigate below the Iron Gate.

**DANUBE NAVIGATION COMMISSION**

An international commission, constituted in 1856, when at the Peace of Paris the navigation of the river was declared free to all nations. It was composed of delegates of all the great powers, to whom a reportative of Russia was added in 1878. It was appointed on the express condition that it should dissolve in 1858, but such was its usefulness that it was informally continued till 1866, when the Conference of Paris formally prolonged its powers for five
years. In 1871 the Conference of London continued the commission for 12 years, and in 1883 a second London conference extended its existence for 21 years. It exercises almost sovereign power on the mouths of the Danube, where it has conducted great engineering works; it has its own flag, uniform and revenue, and has raised loans, made laws and maintained its own small army of police. Its jurisdiction, originally limited to the river between Isaktha and the sea, was extended at the Congress of Berlin (1878) as far as Galatz, and afterward to the Iron Gate; but in the last-named portion of the stream its powers are new. It is attached to the Ottoman Empire, and is under the delegation to the Riverain Commission of the states on the bank, or on appeal from its decisions.

**DANVERS, Mass., town in Essex County, on the Boston and Maine Railroad, five miles northwest of Salem. It was a portion of Salem till 1756, and the Salem village parish where the witchcraft excitement broke out and 10 of the inhabitants were tried and hanged, is included in the present Danvers. It is the seat of Peabody Institute, founded by George Peabody, a resident of the place, who in 1852 donated $200,000 for the promotion of knowledge and morality among the inhabitants. It is also the seat of the Danvers State Hospital, Essex County Agricultural College, the Danvers Historical Society and Saint John's Roman Catholic Preparatory College. Danvers has extensive manufacture of shoes, bricks and carpets, and has foundries, rolling mills, tanneries, municipal water works and electric lighting plants, churches, high school, weekly newspapers, public library, a national bank and good public and private schools. Samuel Holton, Israel Putnam and Grenville Mellen Dodge were born at Danvers, which also contains the home of Whittier and Mount Burnett, frequented by Hawthorne. Pop. 9,407.

**DANVILLE, Ill., city, county-seat of Vermilion County, on the Vermilion River, and the Wabash, Chicago and Eastern Illinois and the Cleveland, Cincinnati, Chicago and Saint Louis railroads; 125 miles south of Chicago. It has a National Soldiers' Home for disabled veterans, with over 2,500 inmates. Its chief industry is coal mining; production of coal varies extensively on the bluffs of the river. Other important industries are flour and lumber mills, marble, zinc, smelting, boiler and iron works, glass and hardware factories and railroad and machine shops. There are many churches, 13 public schools, a high school, a number of new public buildings, including post office and government building, courthouse, city hall, public library, chamber of commerce, Y. M. C. A., Elks' club house and six fire departments, four national banks, two State banks and daily papers. Bank clearings 1915, $26,602,812.47. The city is governed by a mayor and 14 aldermen. Pop. 35,000.

**DANVILLE, Ind., town and county-seat of Hendricks County; situated on the Cleveland, Cincinnati, Chicago and Saint Louis Railroad, about 20 miles west of Indianapolis. The manufactures include lumber, flour and the principal industries. It is the site of the Central Normal College, a private institution, and has a Carnegie library. Pop. 1,640.

**DANVILLE, Ky., city, county-seat of Boyle County, on Dick's River and the Cincinnati Southern Railroad, 42 miles south of Frankfort. It is a stock-raising centre and the noted seat of several educational institutions, among them the Danville Theological Seminary, the Southern Collegiate Institute, Center College, the Caldwell Female Institute and also the State Asylum and School for Deaf-mutes. It has churches, public schools, municipal waterworks, three national banks and weekly newspapers. Danville was settled in 1781 and became a strong political centre, the seat of nine historical conventions. Here the separation from Virginia was discussed and the first State constitution framed, which selected Frankfort as the capital. Danville received a charter of incorporation in 1789. James G. Birney and Theodore O'Hara were born in Danville. Pop. 5,420.

**DANVILLE, Pa., borough and county-seat of Montour County; on the Susquehanna River, and on the Pennsylvania, the Lackawanna and the Philadelphia and Reading railroads; 14 miles northwest of Philadelphia. Danville is in a district abounding with iron ore, limestone and anthracite coal, and contains the first establishment erected in the United States for the manufacture of railroad iron. It still ranks among the most extensive iron manufacturing centres in the country. There are blast furnaces, iron foundries, rolling-mills, stove works, silk and knitting mills, municipal waterworks and electric lighting plant, churches, two national banks, the Danville Institute, a State asylum for the insane, hospital, public library and opera house. First settled in 1776 and laid out in 1792 as Dan's Town, named after the son of the first settler, Danville developed after the discovery of iron on Montour Ridge and the opening of the Pennsylvania Canal in 1832. It was incorporated in 1849. Pop. 7,517.

**DANVILLE, Va., city and county-seat of Pittsylvania County, on the Dan River, 140 miles southeast of Richmond, on the Danville and Western and the Southern railroads. One of the oldest cities in the South; incorporated as a town in 1792. For a short time during the last days of the Southern Confederacy it was the seat of government. It is located in the famous and picturesque Piedmont section of Virginia, on a gradual slope extending from the river to an altitude of 600 feet above the sea. The river furnishes power for the cotton-mills, flour-mills, foundry, ice factory and electric light plant; and further development of its water power has been made about three miles up the river, at an estimated cost of $2,000,000. Danville is the largest loose tobacco market in the world, her average annual sales being 50,000,000 pounds. The surrounding country is well adapted to grain, fruits and tobacco. The improvements in public utilities within the past few years include larger water mains in the down-town district (16-inch) and additional fire engines at a cost of $23,000; Main street repaved with Belgian block and Mack brick, $100,000; Craghead street, same material, $24,500, and several other less important streets paved with cobble. Further extension of the sewerage system from time to time as the growth of the city requires; new electric-light plant owned by city, with new $5,000 incandescent machine, furnishing lights for streets, business and dwelling houses; electric railway system rebuilt at a cost of about $350,000, first-
class equipment, double track on Main street, about eight miles of track, new power-house, with double set of dynamos and engines. The Southern Bell Telephone and Telegraph Company has expended about $30,000 in improvements, and the growth of their business has been such as to require additional accommodations. Danville is the seat of Roanoke Female College (Baptist), established 1859, Randolph Macon Institute for Young Ladies (Methodist), founded in 1833, and Danville Military Institute established in 1870. The climate of the city is mild and pleasing, the streets well shaded and paved, and as a residential city it is excelled by few locations in the South. There are many new public buildings, churches and schools; a general hospital recently enlarged and fitted with the latest improvements, seven banks—one national, five State and one private and two daily newspapers. Under the new constitution of the State the municipal government is administered by a mayor, elected quadrennially, and a city council, composed of two branches having different numbers, which controls appointments to most of the administrative offices. The waterworks, electric light and gas plants are owned and operated by the municipality. Pop. 19,020.

DANZIG. See DANTZIC.

DAPHNE, daughter of river-god Peneus. See LAUREL, IN ART AND SYMBOLISM.

DAPHNE, a famous grove near Antioch, planted by Seleucus Nicator, who erected a temple there and dedicated it to Apollo and Diana. It was a place of pagan pilgrimage noted for its license, until the spread of Christianity caused its abandonment. Julian sought to revive its splendors but the temple was burned and the site was soon after abandoned. Its probable site is the modern Bét-el-Mâ, where the vegetation is luxurious, but ancient remains are few. A graphic description of this grove is given in 'Bib. Hur.' For Daphne in Egypt see TAHANNEH.

DAPHNE, a genus of plants belonging to the Thymelaeaceae or mezereon family. The genus has about 80 species, natives of Europe and Asia. The single American species is the spurge or lady laurel found in northern New England and New York as a fugitive from cultivation. The berries are poisonous and the flowers of many are very fragrant. These plants are common in temperate climates in Europe and Asia, and are valuable commercially. From the bark of some species fibres are obtained, and most of the paper used in central Asia is made from some species of the daphne. The inner bark of D. lagetta, when cut into thin pieces after maceration, assumes a beautiful net-like appearance, whence it has received the name of 'lace bark.' The bark of the spurge-laural is used in decoction as a diaphoretic in cutaneous and syphilitic affections. Paper and ropes are made from the bark of a species common in Madagascar.

DAPHNENPHORIA, one of the most ancient and important of the Greek festivals observed in honor of Apollo. See GREEK FESTIVALS.

DAPHNIA, a minute entomostracan crustacean of somewhat globular shape, which swarms in millions in ponds and ditches, and is important as a food for tadpoles, fish-fry and other small aquatic creatures. It is useful in an aquarium, but care must be taken that it does not multiply unduly.

DAPHNIN, a glucoside having the formula CaH₂₉O₅ + 2H₂O, and occurring in the bark and blossoms of certain species of plants belonging to the genus *Daphne*. It is slightly soluble in cold water, from which it crystallizes in rectangular prisms containing two molecules of water. It is insoluble in ether, but readily dissolves in boiling alcohol. It reduces Fehling's solution slowly, and by X. action of emulsin or of dilute acids it is converted into glucose and a substance called daphnatin, or di-oxy-cumarin.

DAPHNIS, in fabulous history, the son of Hermes (Mercury) by a nymph, educated among the nymphs, and celebrated in the Sicilian traditions as the author of lycoris poetry, and also as a performer on the shepherd's pipe. He pastured his flocks upon Mount Etna. The nymph Echeneis, who loved the youth, threatened him with blindness if he should love another; but being intoxicated by the daughter of a Sicilian prince, he forgot the warning, and thus brought upon himself the threatened punishment. Some say that he died of grief; others that the nymph transformed him into a stone. All the nymphs bewailed his death, and Hermes raised him to the heavens. On the spot where he died flowed a fountain, at which the Sicilians afterward performed yearly sacrifices. Consult Prescott, 'A Study of the Daphnis Myth,' in 'Harvard Studies in Classical Philology,' Vol. XX.

DAPHNIS AND CHLOE. This Greek prose pastoral romance, attributed to one Longus, about whom nothing is known, may have been written in the 2d or early in the 3d century A.D. Despite many marks of decadence, it is by far the most delightful of the Greek romances. Daphnis, a boy, and Chloe, a girl, are exposed by their respective parents, are found and adopted by shepherds; and their fortunes are followed through the years of their love for each other as it grows with the ripening seasons,—to the happy end, where they are re-united by their parents, and married. The charm of the story lies in the children's naive courtship and in the rich and exquisite scenery of their rural life, both the action and the setting being such as a sophisticated urban imagination frames for idealized dwellers in the Golden Age. The book appeals to every sense in a succession of lovely idyls.

It pleased the Renaissance, and has pleased the centuries since. The *editor princeps* was printed in 1598 (Florence); but in 1599 Jacques Amyot had already translated *Daphnis and Chloe* into a French classic (often reprinted), from which in 1587 Angel Day made a wretched English paraphrase (reprinted London 1890 with introduction by Joseph Jacobs). Both versions gave Robert Greene material for his 'Pandosto' (1588), in which in turn became the chief source of Shakespeare's 'The Winter's Tale' (1611); Shakespeare seems to have taken several details directly from Day. How much Allan Ramsay's 'The Gentle Shepherd' (1725) owes to 'Daphnis and Chloe' is not certain; its theme is much the same, as is that of Bernardin de Saint-Pierre's
PAUL et Virginie' (1789). An enlarged re-
cension of Amyot's translation was published
in 1810 by Paul Louis Courier, who in 1807 had
found in a Florentine manuscript — and in 1809
had transcribed and then blotted — a portion
missing from all other manuscripts. Of Pierre-
Paul Didot the elder (1720-1807), who is thought to
have appeared in the French version published by
Didot and one other in Annibai Caro's Italian
version, published by Renouard, both Paris
1800. The most useful and accessible English
translation is that by J. G. Thornley (first
published in 1657), revised and augmented by
J. M. Edmonds, 'Loeb Classical Library' (Lon-
don and New York 1916).

SAMUEL LEE WOLFF.

DAPITAN, dā-pĕ'tăn, Philippines, a prov-
ince in the northwestern part of the island of
Mindanao. Numerous rivers are navigable
for the native boats, and these are the chief means
of communication in the province. Hemp, cot-
ton, sugar, etc., are cultivated for domestic con-
sumption; the forests, particularly the ebony,
are valuable. There is some export trade in
gum, cinchona, etc. Pop. 91,389.

DAR-EL-BEIDA, dār-eł-bē'da', or CASA-
BLANCA, Morocco, the largest seaport in the
country, situated on the west coast. About
one-fourth of the entire trade of the country
passes through it. It is surrounded by walls.
Wool and leather form the chief items of ex-
port. The Portuguese founded it in 1468. It
was the scene of the revolt of 1907 against
French control of Moroccan ports. Pop. 25,000,
including 5,000 Christians.

DAR-ES-SALAAM, dār'e-sa-lām', East
Africa, a growing city, formerly the capital of
German East Africa, situated on the coast a
few miles south of Zanzibar. The harbor is
good and the city has a number of churches and
substantial public buildings. It has telegraphic
connection with Zanzibar, Kilwa and Tanga.
Coral, rubber and ivory are exported. Pop.
about 24,000, including 500 Europeans and about
5000 number of Arabs.

DARBHANGA, dār-bān'gā, India, (1) a
district in the Patna division of Bengal. In the
rainy season the district becomes inundated by
the overflow of the rivers Kamlā and Little
Bāghmati. Area 3,348 square miles; pop. under
3,000,000. (2) A town of the same name is the
capital of the district. It is situated on the
Little Bāghmati, and is the residence of the
maharaja of Darbhanga. The chief exports
are oil-seeds and timber. Pop. 62,628.

D'ARBLAY, dār'bē' (MADAME), Frances
Burney, English novelist, daughter of Charles
Burney: b. King's Lynn, Norfolk, 13 June 1752;
d. Bath, England, 6 Jan. 1840. When Frances
was eight years old the Burneys removed to
London, where at the musical assemblies given
by her father she saw much of fashionable life.
This she depicted with much humor in her first
novel, 'Evelina.' After she had published 'Evel-
inas Progress through theFullPath of the World' (1778), she became the favorite of the
literary men of the day, especially Dr. Johnson.
Her second novel, 'Cecilia' (1782), was no less
admired. In 1786 she was made second keeper
of the robes to Queen Charlotte, a distinction
she had the previous year, and resigned in 1791. While visi-
ting her sister at Mickleham she made the ac-
quaintance of her future husband, General
D'Arlay, a French army officer, whom she
married in 1793. Her other books are 'Camilla'
(1795) and 'The Wanderer, or Female Diffi-
culties' (1814). Her play, 'Edwy and Elvina,'
was performed in 1795 and had little success,
though having Mrs. Siddons and Kemble in the
leading roles. Her 'Diary and Letters,' edited
by her niece (1842-46), surpass in modern esti-
imation the rest of her writings. The record
begins with 'Evelina.' The success of her first
effort, the dinings, dinners and compliments that
followed, are recorded with a naive garrulous-
ness perfectly consistent with simplicity and
sincerity. She also wrote memoirs of her father
(1832). 'Evelina' and 'Cecilia' were published
with introductions by Annie R. Ellis (London
1881-82). A new edition of the 'Letters and
Diaries' in six volumes appeared in London in
1904-05. The 'Early Diary, 1768-1778' (2 vols.,
New York 1907) was edited by A. R. Ellis.
Consult Dobson, 'Fanny Burney, Madame
D'Arlay' (New York 1900); P. G., 'Fanny
Burney at the Court of Queen Charlotte' (13.
1912); and Macaulay, T. B., 'Essays.'

DARBOY, dār-bō, Georges, archbishop of Paris: b. Fayl-Billot, department of Haut
He was admitted to the priesthood 1836, and
began regular parish work; but in 1839 became
professor, first of philosophy, then of dogmatic
theology in the ecclesiastical seminary of Lan-
gres. Removing to Paris in 1846 he was for a
while attached to the College of Henry IV and
was also editor of the journal 'Moniteur Cath-
ilique; in 1854 he was appointed vicar-general
of the archbishop of Paris and inspector of re-
ligious instruction in the schools of the diocese,
that is, superintendent of the Christian doctrine
work in the diocese. In 1859 he was consecrated
bishop of Nancy, and in 1863 was appointed
successor to Archbishop Sibour of Paris, who
had been slain by an assassin. He was a strenu-
ous upholder of episcopal independence and
became involved with Rome through his efforts
to suppress the jurisdiction of the Jesuits and
other religious orders in his diocese. Plus IX
refused him the cardinal's hat and was him-
self for his liberalism. In the Vatican Council
he was one of the leaders of the minority who op-
posed the declaration of papal infallibility on
the ground that such a declaration was in-
opportune; but after the definition he was one
of the first among its former opponents to make
submission. In the siege of Paris by the German
armies he won universal approval for his de-
vote labor in relieving the wounded and succor-
ing the distressed; and when the Com-
munists, known to be his mortal foes, came into
control of the city, he refused to seek safety
outside the walls. Arrested by the Commune
and held as a hostage, he with other hostages
was fusilled to death in the yard of the prison
of La Roquette. The end came while he was in
(1786) was made second keeper of the robes to Queen Charlotte, a distinction she had the previous year, and resigned in 1791. While visiting her sister at Mickleham she made the acquaintance of her future husband, General D'Arblay, a French army officer, whom she married in 1793. Her other books are 'Camilla' (1795) and 'The Wanderer, or Female Difficulties' (1814). Her play, 'Edwy and Elvina,' was performed in 1795 and had little success, though having Mrs. Siddons and Kemble in the leading roles. Her 'Diary and Letters,' edited by her niece (1842-46), surpass in modern estimation the rest of her writings. The record begins with 'Evelina.' The success of her first effort, the dinings, dinners and compliments that followed, are recorded with a naive garrulousness perfectly consistent with simplicity and sincerity. She also wrote memoirs of her father (1832). 'Evelina' and 'Cecilia' were published with introductions by Annie R. Ellis (London 1881-82). A new edition of the 'Letters and Diaries' in six volumes appeared in London in 1904-05. The 'Early Diary, 1768-1778' (2 vols., New York 1907) was edited by A. R. Ellis. Consult Dobson, 'Fanny Burney, Madame D'Arblay' (New York 1900); P. G., 'Fanny Burney at the Court of Queen Charlotte' (13. 1912); and Macaulay, T. B., 'Essays.'

DARBOY, dār-bō, Georges, archbishop of Paris: b. Fayl-Billot, department of Haut Marne, 16 Jan. 1813; d. Paris, 25 May 1871. He was admitted to the priesthood 1836, and began regular parish work; but in 1839 became professor, first of philosophy, then of dogmatic theology in the ecclesiastical seminary of Langres. Removing to Paris in 1846 he was for a while attached to the College of Henry IV and was also editor of the journal 'Moniteur Catholique; in 1854 he was appointed vicar-general of the archbishop of Paris and inspector of religious instruction in the schools of the diocese, that is, superintendent of the Christian doctrine work in the diocese. In 1859 he was consecrated bishop of Nancy, and in 1863 was appointed successor to Archbishop Sibour of Paris, who had been slain by an assassin. He was a strenuous upholder of episcopal independence and became involved with Rome through his efforts to suppress the jurisdiction of the Jesuits and other religious orders in his diocese. Plus IX refused him the cardinal's hat and was himself for his liberalism. In the Vatican Council he was one of the leaders of the minority who opposed the declaration of papal infallibility on the ground that such a declaration was inopportune; but after the definition he was one of the first among its former opponents to make submission. In the siege of Paris by the German armies he won universal approval for his devoted labors in relieving the wounded and succoring the distressed; and when the Communists, known to be his mortal foes, came into control of the city, he refused to seek safety outside the walls. Arrested by the Commune and held as a hostage, he with other hostages was fusilled to death in the yard of the prison of La Roquette. The end came while he was in the attitude of blessing his assassins and invoking forgiveness to them. His body was recovered with difficulty and was buried with imposing ceremony at the public expense on 7 June 1871. It was not a mere accident or coincidence that he was the author of a 'Life of St. Thomas a Becket' (1855), a book written by the archbishop of Canterbury, who was slain by assassins before the high altar of his cathedral
church 700 years before; within 23 years he had seen his two nearest predecessors, archbishops of Paris, murdered, one by an individual assassin, the other (Affre) by the insurgent populace. In addition to his scholarly work, 'The Life of Saint Thomas à Becket,' he wrote a new translation of 'Dionysius the Areopagite,' and also a translation of the 'Imitation of Christ'; 'Women of the Bible' (8th ed., 1876); 'Holy Women' (4th ed., 1877). Consult the biography by Foulon (Paris 1889) and Guillermin (ib. 1888).

DARBY, John Nelson, founder of the Brethren: b. London 1800; d. 1882. In 1819 he was graduated at Trinity College, Dublin and was called to the Irish bar in 1825. He left the Church of Ireland because of conscientious scruples, believing that denominational distinctions and a regular ministry should be discarded. He formed an association in Dublin in 1828. Another was organized soon after in Plymouth, and the fact that Providence Chapel was the first regular place of meeting gave the name Plymouth Brethren to the sect in 1830. Darby labored as an evangelist in England and on the Continent until his death in January 1882. He preached in English, French and German, and for many years edited the Christian Witness, the official organ of the Brethren. His collected writings were published in 32 volumes (London 1857–83).

DARBY, Pa., borough of Delaware County, on the Darby River, the Baltimore and Ohio and the Philadelphia, Baltimore and Washington railroads, five miles southwest of Philadelphia. It has silk, cotton, woolen and worsted mills and manufactures filters, tanks and tools. It was also a public library which dates from 1743, a Friends (Quaker) meeting house and cemetery established in early Colonial times. The borough was first settled about 1660. Pop. 6,305.

DARBY AND JOAN, the names of a married couple traditionally reported to have lived in the West Riding of Yorkshire in the 18th century, remarkable for their long and happy life together. A ballad entitled 'The Happy Old Couple,' by Henry Woodfall, former apprentice to the printer John Darby, commemorates their excellencies. Humdrum, uneventful married life is sometimes referred to as a "Darby and Joan" existence.

DARBYTONES, a name often applied to the Plymouth Brethren (q.v.) from their principal founder, John Nelson Darby (1800–82), of whose collected writings 32 volumes have appeared (London 1857–83). Consult his 'Personal Recollections' (ib. 1881).

DARBYSHIRE, Alfred, English architect: b. Salford, Lancashire, 20 June 1839; d. 5 July 1908. He began the practice of his profession in 1862 at Manchester and designed many buildings of importance there and elsewhere. His principal literary works are 'Experiences of an Architect, Professional, Artistic, and Theatrical'; 'A Book of Old Manchester and Salford.'

DARCE, dàr-sà', Jean, French physician and anatomist: b. Bourg en Bresse, 23 Apr. 1725; d. Paris 13 Feb. 1801. He accompanied the celebrated Montesquieu to Paris in 1742, and remained with him till his death as a literary assistant. He afterward devoted himself to chemistry, especially to technical chemistry, was appointed professor of chemistry in the College of France, and regent of the medical faculty. Darce made many experiments with a view to the improvement of the manufacture of porcelain. He also tried the effect of fire on the various kinds of earths, and demonstrated the volatility of the diamond. In 1776 he published a memoir on the geology of the Pyrenees. He succeeded Maquere as a member of the Academy of Sciences and director of the manufactuy of Sévres. He was afterward appointed inspector general of the assay of coin and inspector of the Gobelins manufacture. He made several important chemical discoveries, and contributed much to the present improved state of the science. A fusible alloy of lead, bismuth and tin is named after him. He published several works describing his discoveries.

DARCET, Jean Pierre Joseph, French chemist: b. Paris, 31 Aug. 1777; d. there, 2 Aug. 1844. He was a son of Jean Darcet (q.v.). He began his chemical studies early with his father and with Vauquelin. In his 24th year he was made assayer of the mint, and from that time devoted his time chiefly to chemistry in its application to the arts. Being employed by the government in the manufacture of gunpowder, he rendered its preparation much by new processes. He greatly assisted in extending the manufacture of soda artificially, succeeded in producing alum equal in quality to that of Italy, brought the art of stereotyping to greater perfection, facilitated the preparation of sulfurous acid, investigated the best alloys for cannon, for cymbals and tam-tams and for statues, etc. Among his other discoveries were the extraction of soda from chestnuts, the preparation of sugar from the same material and the extraction of jelly from bones by means of an acid. He also made another discovery of the means of protection against the fine dust of quicksilver, which had been so injurious to the gilders. Darcet's discovery completely attained the object and gained him the prize of 3,000 francs which Ravrio had offered for this discovery.

DARDANELLES (ancient HELLESPONT), a narrow channel in the Turkish dominions, which connects the Sea of Marmora with the Ægean Sea and separates Europe from Asia. It is about 42 miles in length, varying in breadth from 1,400 yards to five miles. There is always a rapid current in the channel, the volume and velocity of which is much increased by the prevailing winds, which blow in the same direction with the stream for at least 10 months in the year. The modern name of this strait is derived from the castles, called the Dardanelles, built on its banks, at its southwest entrance; its ancient name, Hellespont, from Helle, daughter of Athamas, king of Thebes, who was said to have drowned herself here in the Hellespont on his great expedition against Greece, in 480 B.C.-crossed this strait by means of two bridges of boats, constructed in the neighborhood of Sestos and Abydos. It is also renowned as the scene of the death of Leander, who, it is said, used to swim across from Abydos to Abydos at the narrowest part of the strait (but yet about a mile in width), to visit Hero of Sestos on the European side. This feat of swimming the channel was also performed by Lord Byron, who achieved it in 1 hour and 10 minutes. To protect Constantinople, coast batteries have
been built since 1867, on both the Asiatic and the European side. These batteries have latterly been supplied with ordnance of recent type, such as the guns made by Krupp, and strengthened under German supervision. In 1776 the Turkish defenses were almost in ruins. Warned by the condition of the batteries when a Russian squadron appeared before the castles, the Turkish government ordered the defenses repaired; but they were again allowed to become dilapidated until 1807. In that year a British squadron passed the Dardanelles and appeared before Constantinople, which until then had never seen an enemy's fleet. In 1854, during the Crimean War, the castles and other defenses of Constantinople were again put in repair. It had long been recognized that the Turks had a right to prevent any foreign ship of war from passing the Dardanelles, and in 1841 a treaty was signed between the five great European powers and the Porte, in which it was laid down that this was not to be permitted. The treaty was confirmed in 1856, the Sultan, however, retaining the right to permit certain vessels belonging to foreign governments to pass. By the Berlin treaty of 1878 the duty was again imposed on all foreign ships of war and the passage of any foreign ship of war. This arrangement was modified in 1891, when Russia secured right of passage for her volunteer fleet.³³ For the Allied campaign in the Dardanelles, see War, European.

DARDANUS, där'da-nüs, in mythology, the progenitor of the Trojans, and so of the Romans, and the son of Zeus and Electra, the daughter of Atlas. He emigrated from Samothrace (according to some accounts, from Arcadia, or Crete) and settled in Phrygia in the company of his brother Aeneas, afterward called Troas. Here he built a city, which, from him, was called Dardanum, or Dardanus, and introduced the worship of Athena (Minerva).

DARDISTAN, där'dis-tän, the name given to a region of central Asia, bordering on Bal-tistan, the northwest portion of Cashmere. This country, which consists of lofty mountains, is but little known, and its limits are variously given; but its interest depends mainly on the fact that its inhabitants, the Dards, are an Aryan people, speaking a Sanskrit tongue mixed with Persian words. They have been called "Stray Aryans in Tibet," and are Moslems converted from Buddhism at a comparatively recent period. The rajah of Cashmere is constantly endeavoring to subject them completely to his authority. The chief districts are Hasora, Gilgit and Tassin; some authorities also include Chitral in Dardistan.

DARE, Virginia, first child of English parents in the New World: b. Roanoke, August 1807, and named after the district of Virginia. She was the granddaughter of John White, who was governor of the colony sent by Sir Walter Raleigh to found an agricultural state, which sailed from Plymouth, 26 April 1587, and reached the shores of Virginia in July of the same year. White's daughter was married to Mr. Dare, who was one of the assistants of the governor. Virginia was born about a month after the arrival of the expedition.

DARPOUR, därpōor, or DARPOOR (Country of the Fur, a tribe of negroes), a region of central Africa, occupying a large portion of the area between Abyssinia and Bornou and forming part of the Egyptian Sudan. It may be considered as lying between lat. 10° and 16° N. and long. 22° and 28° E.; area 150,000 square miles. On the east it borders on Kordofan; on the west, Wadai; on the north, the desert; while the regions to the south are occupied by barbarous nations. The most important physical feature is the Djebel Marrah, a chain of mountains near the centre of the country, of a crescent form, lying north and south and reaching the height of 6,000 feet. Some of the peaks are extinct volcanoes. There are other subordinate chains and elevated masses. There seem to be no permanent streams, the water-courses being filled only temporarily. The country belongs mainly to the Nile basin, partly to that of Lake Chad. Large portions of it are barren or are covered with verdure only in the rainy season. The inhabitants are of various races, some of them of the negro type, others having little of the negro character, and a considerable number being Arabs. The Fur or For, who give name to the country, inhabit the mountainous central parts and are a brownish-black color with negro features. Mohammedanism is the prevailing religion, to it is due what little civilization the people possess; but the natives are still semi-barbarous. Their occupation is chiefly agriculture. A few of the mechanical arts are carried on, and in particular the people manufacture a considerable variety of articles, including cotton goods, pottery, leather, lance-heads, etc. Their houses are rudely constructed of clay and reeds, and with scanty accomodation. Among the exports the most important are camels, ivory, the horns, teeth and hide of the rhinoceros and hippopotamus, ostrich feathers, gum and copper. The imports comprise beads, glass, arms, light cloths of different kinds, silks, shoes and other manufactured articles. Darfur was an independent kingdom till annexed by Egypt in 1874. During the ascendancy of the Mahdi and his successor it was independent; but it is now recognized as within the "sphere of influence" of Great Britain. In 1898 it was made a part of the Anglo-Egyptian Sudan. The hereditary sultan manages the internal affairs. The capital is El Fasher. Pop. 4,000,000.

DARGAN, Edmund Spawn, American jurist: b. Montgomery County, S. C., 15 April 1805; d. Mobile, Ala., November 1879. He was the son of a Baptist minister of Irish descent, at whose death he was left without means. By his own exertions, he obtained a fair knowledge of English, Latin and Greek, although he was at work on a farm until he was 23 years old. He read law, was admitted to the bar in 1829, went to Alabama and taught three months in Washington, Autauga County. He was elected a justice of the peace and filled the office for several years, meanwhile engaging in the practice of law. In 1833 he removed to Montgomery and in 1841 was elected to the bench of the Circuit Court of the Mobile district and removed to Mobile. He resigned the office of judge in 1842 and in 1844 was elected to the State senate. He was also mayor of Mobile the same year. He resigned from the senate the following year and was elected a member of the United States Congress, where he served from December 1845 to March 1847. On the question of the northwest boundary of Oregon he made an able
speech and offered some valuable amendments to the resolution of notice. He was the first to propose the line of adjustment finally adopted on the settlement of the question with the British government. He declined a renomination and in 1847 was elected to fill a vacancy in the Supreme Court of Alabama. In 1849, by the resignation of Justice Collier, he became a justice of the supreme court of Alabama and resumed the practice of law in Mobile. In 1861 he was a delegate to the State convention and voted for the ordinance of secession. He also served for one term as a representative in the Confederate Congress.

D'ARGENSON, dár-zhán-sôh, Marc Pierre, Comte, French statesman: b. 1696; d. Paris 1764. He was the younger son of the Marquis d'Argenson (1652-1721), who created the secret police and established the lettres de cachet. He became War Minister in 1743, at a time when the political existence of France was imperiled and by his vigor and lucky choice of generals changed the fortunes of the war in the course of a single year. After the peace of Aix-la-Chapelle (1748), he devoted himself to the improvement of the military system and in 1751 established the École Militaire. He was an ardent advocate of the Abolition of Slavery. D'Alembert dedicated to him their Encyclopédie and to Voltaire, whose fellow-student he had been, he furnished materials, gracefully acknowledged in the dedication, for his Siècle de Louis XIV. In 1757 he was banished to his estate by the machinations of Madame Pompadour; but on her death he returned to Paris.

DARGOMYZHSKY, dár'go-mízh'ské, Alexander Sergeyevich, Russian composer: b. Tula 1813; d. Saint Petersburg 1869. Having made his preliminary studies in Moscow, which he exhibited with great precocity, he removed to Saint Petersburg in 1835 and thereafter made his home in that city. He had previously met Glinka, and helped him in producing The Life of the Tsar, in the course of which he had gained a sound knowledge of and training in orchestration. At the capital he soon became known by his opera, Esmeralda (1839) in which he followed the traditions of Rossini and Auber, both of whom were then at the pinnacle of their fame. In 1842, Esmeralda was produced at Moscow. It was followed in 1855 by Russalka, which at length brought him fame. In 1867 he was made president of the Russian Musical Society and during his later years his home became the centre of the modern Russian school, which looked for inspiration to Schumann, Berlioz, Wagner and Liszt. He next wrote the opera, 'The Stone Guest,' to Pushkin's tale of the same name, but did not live to complete it. Four years after his death it was produced with great success. He composed also fantasies for orchestra, notably 'Finnish Fantaisie'; 'Bala-Yaza'; and 'Kazakhoch'; and several ballads. His later years were also devoted to the training of promising singers, of which he practically created a national school of Consult Cuviller and the École de Musique en Russie (Paris 1880) and Pougin, Essai historique sur la musique en Russie (Turin 1897).

DARIC, dâr'rik, properly DARICUS (Gr. δαρίκος), an ancient Persian coin of pure gold, specimens of which are still preserved in several European collections, bearing on one side the image of a kneeling archer, on the other that of the lion with the head of a royal palla. It was known to the Greeks, Romans and Jews; the latter used it after the Babylonian captivity, under the reign of the Persians, and called it adarokon or darmermon (mentioned in the first book of Chronicles, by Esdras, the priest); it was equal to 20 silver drachmae, or 16 shillings 3 pence; 3,000 being equal (according to Xenophon) to 10 talents. Its name is variously derived from that of King Darius Hystaspes, who regulated the Persian currency, and from several Persian words meaning king, palace and bow. The so-called silver darics were not designated by this name in antiquity.

DARIEN, Ga., city, county-seat of McIntosh County, on the Altamaha River and the Georgia Coast and Piedmont Railroad, about 65 miles southwest of Savannah and about 10 miles from the ocean. It exports large quantities of pine lumber, crosssets, handles, rice, fish and garden produce. Settled in 1736, Darien was incorporated as a town in 1816 and was chartered as a city in 1818. It is governed by a board of five aldermen selected by the grand jury. It is one of the five being chosen mayor. The waterworks are owned by the city. Pop. 1,391.

DARIEN (Sp. dâ-ré-'än), The Colony of, established by the Spaniards on the Gulf of Urabá (see Darien, Gulf of), in the first decade of the 16th century, was the centre from which exploring expeditions were sent out until Panamá was founded in 1519. A notary of Triana, named Bastidas, sailed along the Caribbean coast of the isthmus in 1501, Balboa being one of his companions. At the end of 1502 and beginning of 1503 Columbus carefully examined the region immediately west of this gulf. In 1508 the king granted to Nicuesa the territory from the Gulf of Darien to Cape Gracias a Dios; to Ojeda, the territory from the Gulf of Darien to Cape de la Vela. The dividing line was more precisely fixed by the grantees, who agreed that it should be the Attrato River. (See Darien, Gulf of). In that event the only permanent settlements were made near this river and the gulf into which it flows. Ojeda first landed at Cartagena (1500), where his expedition endured great hardships. Removing thence to the eastern side of the Gulf of Urabá, he built the fort called San Sebastian, which he entrusted to Francisco Pizarro, and then returned to the West Indies. Pizarro, Balboa and all who remained alive set sail for Cartagena once more. There they were met by Enrico, with re-enforcements from San Domingo, and after some hesitation, crossed the gulf to the western shore, where the colony of Santa Maria de la Antigua del Darien was established in 1510. Balboa gained ascendency by recommending the selection of this place (which he had visited with Bastidas) and became the leading spirit in the undertakings which followed—the expedition to Dahuiba, the crossing of the isthmus, and the establishment of a thin line on the isthmus. Nicuesa's expedition, though it started under brighter auspices, resulted in a lamentable failure. Its courtly leader, after losing nearly all his followers near Cape Nombre de Dios, was forced to put to sea in a boat that could not
DARIEN — DARIEN SCHEME

outlive a single storm — practically condemned to death by the authorities at Darien, whom he had offended. In 1514 Pedrarias Davila superseded Balboa as governor. Five years later Panamá was founded; the capital was established on the Pacific coast; exploration northward and southward began along the shores of the newly-discovered ocean; the isthmian traffic sought and found an easier route, better harbors and a less deadly climate at a distance from the Gulf of Urabá. Darien was abandoned. Consejo Anderson, Dr. C. L. G. Old Panama and Castilla del Oro. See Central America.

DARIEN, Gulf of, also called The Gulf of Urabá, an extension of the Caribbean Sea forming a wedge-shaped indentation in the northern coast of Colombia; of great width between Colón and Cartagena, but narrowing toward the south until it becomes an estuary of the Atrato River. A distinction to be commented on the ground of convenience is that which would restrict the name of Urabá to the southern portion which is about 7 miles wide by 30 long. Some of the earliest Spanish settlements, at the beginning of the 16th century, were located on the Gulf of Urabá (see Darien, the Colony of); the region has not prospered, however, owing to the lack of good harbors; to the extremely unhealthy, hot and damp climate of the coast at this point; and the diversion of traffic to Colón via the Panama Canal.

DARIEN, Isthmus of, the neck of land uniting South and Central America; more specifically, the lower portion which is narrowed between the gulf of Urabá and San Miguel, while its prolongation on the northwest, between the Caribbean Sea and the Gulf of Panamá, is called the Isthmus of Panamá, now traversed by an interoceanic canal, known as the Panama Canal (q.v.). It is traversed by the Cordillera de Baudó. Its principal rivers are the Tuira (also called Darien), which rises in the heights of Aspaves, receives the waters of a number of tributaries and flows into the Gulf of San Miguel, and the Atrato, which comes out of the department of Caucá and empties into the Gulf of Urabá. In regard to the climate on the coast, see Darien, Gulf of. A Colombian official publication says: "The interior of the Isthmus of Darien is very sickly and only the negroes and Indian half-breeds can stand its excessively rainy climate, hot and damp, and its atmosphere, which the marshes make malarious. Though about the Darien cordillera the temperature is milder, it cannot be said that the region is salubrious, and it will never be until the great woods and groves shall have disappeared." The woods in question, especially in South Darien, are of excellent quality and colossal growth, constituting a source of wealth. Gold is obtained from the rivers Balsas and Magdalena, which is pouring into the Gulf of Urabá, on the banks of which Balboa and others founded in 1510 the town of Antigua del Darien (see Darien, the Colony); (2) the Tuira River (see Darien, Isthmus of).

DARIEN SCHEME, a celebrated financial project, conceived and set afloat by William Paterson (q.v.), a Scotchman, toward the close of the 17th century. On his original and ostensible design of establishing an East India trade in Scotland he ingratiated the nation; the plan had the consent of planning an emporium on each side of the Isthmus of Darien or Panama for the trade of the opposite continents. According to his idea the manufactures of Europe were to be sent to the Gulf of Darien and thence conveyed by land across the ridge of mountains that intersect the isthmus, where they were to be exchanged for the produce of South America and of Asia; and thus, to use his own emphatic language, he would wrest the keys of the world from Spain. In order to attract encouragement and support he proposed to render his settlement a free port and to banish all distinction of party, religion or nation. Now Scotland was at this time very poor and Paterson went to London to procure subscriptions, which soon ran up to the amount of $1,500,000. But the scheme was first excited by the East India Company and the West India merchants, soon spread over the whole English nation and the English subscriptions were withdrawn. Yet Paterson himself was not to be easily intimidated; and Scotland indignant at the opposition which the plan had met with in England, avowedly because it would be beneficial to the Scotch, immediately subscribed $2,000,000, although at that time there was not above $4,000,000 of cash in the kingdom. Only a little more than half of the subscriptions, however, were ever paid up. Besides this sum, $1,500,000 was subscribed at Hamburg, which, however, was withdrawn in consequence of the threatening memorial presented by the English resident to the senate of that city. The Scotch, nevertheless, persisted in their scheme; five large vessels, laden with merchandise, military stores and provisions, with a colony of 1,200 persons, sailed for the Isthmus of Darien, which they reached after a voyage of about five months.

The settlement was very judiciously formed at Acta, a place at an equal distance between Porto Bello and Cartagena. Here is a secure andcapacious harbor, formed by a peninsula which the colonists fortified and named Fort Saint Andrew. To the settlement they gave the name of New Caledonia. For eight months the colony bore up against accumulated misfortunes and persecutions, but at the end of this period those who survived were compelled by disease and famine to abandon their settlement and return to Europe. Before this circumstance was known two other expeditions sailed from Scotland and the information of the abandonment of the first colony only served to arouse the Scotch nation to more determined perseverance in the plant. When the second expedition arrived they found the huts burned and the forts demolished; famine and disease assailed them; they were attacked by the Spaniards from Panama — these they repulsed, but a larger force coming from Cartagena obliged them to the plan in condition that they could not embark with their effects for Europe; few, however, of these survived to return to Scotland.
In order to pave the way for a better understanding between the two countries the lords commissioners for England agreed in 1706 to purchase the shares of the particular members of the Dutch East Company. A full account of the Darién expedition is to be found in the second volume of Sir John Dalrymple's 'Memoirs of Great Britain and Ireland.' The best recent authority on the subject is John Hill Burton, 'History of Scotland' and 'Darién Papers.' Catherine Dalrymple, Sir Walter Scott's 'Tales of a Grandfather' for a most interesting but rather one-sided narrative.

**D. A. RIMINI, Francesca, da-ré-mé-né, an Italian lady of the 13th century, the daughter of Guido da Polenta of Ravenna. She was married to Giovanni Malatesta da Rimini, a cripple, but loved his brother Paolo. Giovanna surprised the lovers at one of their meetings and killed them both (about 1285). Their story is told in Dante's 'Inferno' and is the subject of Leigh Hunt's poem 'The Story of Rimini,' and of the dramas 'Francesca da Rimini' by D'Annunzio and 'Paolo and Francesca' by Stephen Phillips. Fuseli made the story the subject of a well-known painting.

**DARIO, Rubén, Nicaraguan poet:** b. 1867; d. Leon, Nicaragua, 7 Feb. 1916. He was of mixed Indian and Spanish blood, and the blending of these two strains produced in him a literary temperament very different from that of Spanish writers born and educated in Spain. Dario had much in common with the Mexican Indian poets Altamirano and Ramirez and the novelist and dramatist Mateos, all three of whom were noted orators. In him the fervid aboriginal blood predominated over the Spanish; and in the days of his literary activity he became the voice of the native-born crying out 'America for the Americans.' At this time his vision was foreshortened to such an extent that, if he did not actually hate the people of non-Latin tongue occupying the territory to the north of Spanish America, he found little place for them in the American policy of which he had made himself the mouthpiece. But he eventually came under the influence of Santos Chocano (q.v.), who had already begun to see what was happening at the fountains of the two mothers of the Latin races.

Dario was a man of wonderful adaptability, which enabled him to gather his experiences, his sentiments and his information from the most varied and incongruous sources, to weigh and judge them and to select from them, instinctively, those that fitted into his program. Soon he began to blow on his trumpet almost as loudly as Santos Chocano had done, announcing himself as the herald of the natural unity of all the races living on the American continents. This was done in the face of a host of writers of lesser talent who could see nothing good in the United States or in the people of English tongue. Yet Dario never became the poetical champion of English-speaking America, as that Santos Chocano long has been. His was more of a borrowed sentiment, for his interests, education and associations had always been and continued to remain Latin.

Leaving home quite early in his career Dario went to America where he attracted attention through his dashing literary innovations, his poetical fervor, the beauty of his style and the vividness of his imagination. Soon his became a name to conjure by in Argentina, where a very active school of younger writers gathered about the prophet of Americanism in literature. Dario began to be called. All of Latin-America began to pay attention to the new voice; Dario's poems began to appear in high class Spanish magazines in Madrid and translations of them in the periodicals of Paris. The young poet was appointed Nicaragua's Minister to Madrid and he became a sort of literary lion in the Spanish capital, where the younger literary set, especially the Latin-Americans resident in Europe, gathered about him as they had done in Argentina. From Madrid Dario went to Paris, where he continued to be the literary leader of Latin-America. As editor of La Revista Mundial he exercised a strong literary influence apart from his poetical efforts. Shortly after the outbreak of the European War Dario, broken down in health, visited New York, where he read an 'Ode to Peace' before the students and faculty of Columbia University. From there he went to Guatemala, where he was enthusiastically received. But, unable to stand the fatigue of public receptions, he was hurried to Nicaragua in a dying condition.

Although not 50 years old at the time of his death Dario had been, for a quarter of a century, the foremost literary figure in Latin-America. His genius was naturally cosmopolitan, and his long residence in Argentina, Madrid and Paris largely accentuated this cosmopolitanism. Literary and scientific reciprocity between all the countries of the Western hemisphere he saw coming in the not distant future, and he was clear-sighted enough to see that Latin-America was destined to get more out of it than English-speaking America. In Poe, Whitman, Longfellow and Hawthorne he recognized spirits kindred to those of Latin-America yet different; and from all of them he borrowed forms of metre and inspiration, and from them he learned to remodel the conventional Spanish rhythm and to give it new forms and greater life and variety. But though he carried the flag of reform yet few Spanish poets have been truer and more fervid interpreters of Latin life and culture than Dario, who had drunk deeply at the fountains of the two mothers of the Latin races.

Dario's first noted success, 'Azul,' a volume composed of fervid verse and passionate prose, published in Valparaíso, Chile, in 1885, brought him into almost instant notice. Here he worships at the shrine of beauty and elegance and he turns his back upon the excesses of the naturalistic school with all its crudeness and ugliness. He preached the beauty of language and the musical quality of words; and his strongly poetical and sensitive nature enabled him to exemplify in his own work his new gospel, which the poets of Latin-America and not a few in Spain are still preaching. 'Proses Profanas' (1896) shows a great improvement in Dario's power and art, for in the meantime he had been in Spain in an official capacity and had made his entrée into Spanish literature, and in Paris, where he had become a well-known figure in literary circles and had imbued himself with the French literary spirit. 'Proses Profanas,' in which Dario attempts many innovations and

John Hubert Corryn, Editorial Staff of The Americas.

DARIUS, da-rǐŭs, the name of several Persian kings, or, according to some writers, the royal title itself. Among the most distinguished individuals of this name are:

1. Darius I, fourth king of Persia: b. about 558 B.C.; d. 485 B.C. He joined the conspiracy against the False Smerdis, who had possessed himself of the Persian throne. After the conspirators had succeeded in getting rid of the usurper, they agreed to meet early the next morning, on horseback, and to appoint him king whose horse should neigh first after sunrise. The groom of a Darius, apprised of this project, led his master’s horse in the night with a mare to the appointed place, and, in consequence of this stratagem, the horse of Darius neighed first the next morning. Darius was therefore saluted king, and the nation approved the choice. His reign was marked by many important events. The city of Babylon revolted, partly on account of burdensome impositions of tribute and partly because the royal residence, under Cyrus, had been transferred thence to Susa. Darius besieged the city six years without success, and was on the point of abandoning the siege when Zopyrus, one of his generals, by a heroic sacrifice, placed the city in his possession. After the subjection of Babylon Darius undertook an expedition, with an army of 700,000 men, against the Scythisans on the Danube, who entered him so far into their inhospitable country by their pretended flight, that he succeeded with difficulty in extricating himself and his army, after suffering great losses. Leaving a part of his forces in the command of Megabyzas in Thrace, to conquer that country and Macedonia, he returned with the remainder to Asia, to recruit at Sardis. In the year 501 B.C. a disturbance at Naxos, in which the Persians had taken part, occasioned a revolt of the Ionian cities, which the Athenians endeavored to promote, but which was suppressed by the capture and punishment of Miletus in 496. To revenge himself upon the Athenians, Darius sent Mardonius with an army, by the way of Thrace and Macedonia, against Greece, and prepared a fleet to make a descent upon its coasts. But his ships were scattered and destroyed by a storm in doubling Mount Athos and the army was almost entirely cut to pieces by the Thracians. Darius, however, collected another army of 500,000 men and fitted out a second fleet of 600 ships. Naxos was conquered, and Eretria, in Euboea, sacked. Thence the army under Datis and Artaphernes proceeded to Attica and was led by Hippias to the plains of Marathon. The Athenians had in vain besought assistance from their neighbors, and was obliged to depend upon their own resources alone. They marched forth, 10,000 strong, under the command of Miltiades, to meet the Persian army, and animated by the reflection that they were fighting for freedom and their country, obtained a complete victory (490 B.C.). This prince did much to improve the internal administration of his kingdom. In the year 508 B.C. he sent his admiral, Scylax, to explore the river Indus, and he encouraged commerce and arts by useful institutions and laws. Inquiries on the great rock of Behistun give an account of the events of his reign. They have been compiled by Tolman, ‘The Behistun Inscription of King Darius’ (Nashville 1908).

2. Darius II, king of Persia (surnamed Nothos, or the Bastard, by the Greeks). d. 404 B.C. He was an illegitimate son of Artaxerxes I (Longimanus). He ascended the throne in 423 and suppressed several rebellions of his satraps; but Amyrtæus succeeded in maintaining himself in independent possession of Egypt, which had revolted in 414. His son Cyrus is familiar to us through Xenophon’s ‘Anabasis.’

3. Darius III, king of Persia (surnamed Codomannus). He was the great-grandson of Darius II, and the 12th and last king of Persia. He ascended the throne 330 B.C., after which his kingdom had been weakened by luxury and the tyranny of the satraps under his predecessors and could not resist the attacks of a powerful invader. Such was Alexander of Macedon, and the army sent against him by Darius was totally routed on the banks of the Granicus, in Asia Minor. Darius then advanced with 400,000 soldiers to the plains of Mesopotamia. The Grecian mercenaries advised him to await the enemy here, as the level country would enable him to draw out his forces to advantage; but Darius hastened forward to meet Alexander in the mountainous Cilicia. Darius was a second time totally routed, near the Issus 333 B.C. He himself escaped, under cover of the night, to the mountains. His mother, his wife, and three of his children fell into the hands of the conqueror, who treated them with great generosity. Darius was so far from being discouraged by these defeats that he wrote a haughty letter to Alexander, in which he offered him a ransom for the prisoners, and invited him to engage, or, if he did not choose that, granted him permission to retire into Macedonia. Alexander then laid siege to Tyre, on which Darius wrote him another letter, offering him not only the title of king, which he had before refused to do, but also 10,000 talents ransom and all the countries of Asia as far as the Euphrates, together with his daughter, Statira, in marriage. These propositions, however, were unavailing. Alexander subjected Egypt and the two armies met between Capharnaum and Gaugamela, and after a bloody engagement Darius was compelled to seek safety in flight (331 B.C.). Alexander took possession of his capital, Susa, captured Persepolis and reduced all Persia. Darius fled to the northern provinces, where he was seized by Bessus, one of his satraps, and afterward murdered. Consult Justi, ‘Grundriss der iranischen Philologie’ (Strassburg 1897).

DARJEELING, British India, town and capital of the district of Darjeeling, in Bengal, at over 7,000 feet elevation in the Himalayas. The Rajah of Sikkim ceded it to the British in 1835 and by the latter it has been converted into a sanitary station, being equipped with a modern sanitarium, botanical gardens, bazaars, etc. It is the summer
DARK AGES—DARLING

residence of the lieutenant-governor of Bengal, and has become a popular health resort. Tea is extensively grown nearby. Pop. 17,053.

DARK AGES, The, a period supposed to extend from the fall of the Roman Empire, 475 A.D., to the revival of literature on the discovery of the Pandects at Amalfi in 1137. Not to draw the limits too finely, say 700 years (450 to 1150). The Middle Ages may be extended to about 1550, covering from 10 to 11 centuries.

DARK AND BLOODY GROUND, The, a name frequently applied to the State of Kentucky. It is said to be a translation of the Indian words "Kain-tuk-e,8;" though some authorities claim that they signify "At the head of the river." The epithet was originally bestowed because the region was the scene of many sanguinary conflicts between the redmen of the northern and southern tribes. Later the constant feuds between white settlers and the aborigines rendered the phrase peculiarly appropriate to this locality.

DARK DAY, a name frequently used in this country in connection with 12 May 1780, but applied also to days on which similar phenomena have been discerned. On the date mentioned the atmosphere in New England was so opaque as to cause in some places cessation from outdoor labor. Birds and domestic fowls acted as during an eclipse. The darkness began at 10 and lasted until midnight, causing a feeling of alarm by its unprecedented nature. There appears to have been an absence of clouds for the most part, though light rain occurred. Though known as the Black Friday of New England, the area covered by darkness also extended west of that section. Two dark days are recorded as occurring in America earlier than the Black Friday, one in 1716 and another in 1762. The Dark Days of Canada were 16 Oct. 1785 and 3 July 1814. On the latter date the darkness extended over a tract estimated to be about 300 miles in length and 200 in breadth, in the region of the Saint Lawrence River and Gulf. There were showers of hail and very dark ashes and the atmosphere was of a deep yellow color. The characteristic features seemed to point to volcanic action as an origin rather than to forest fires. These two causes have in recent years received much attention in their relation to the obscuring and tinting of the atmosphere over immense areas. The smoke from great forest fires in the northwestern States and in Canada was in 1881 carried south or southeast to almost incredible distances, and in June 1903 extensive fires in the forests of New England and of the Adirondacks caused a yellowish haze that extended far from its source. After the volcanic eruptions of Mount Soufrière and Mount Pelée in May 1902 vast quantities of volcanic dust were borne seaward, more or less obscuring the daylight by their persistence in the atmosphere. The volcanic dust from Krakatoa is believed to have encircled the entire earth and to have affected the color of the atmosphere for months. In countries situated like Egypt a marked obscurity of the sun is noticeable, caused in part by the fine sand brought by winds from the desert.

DARK HORSE, a phrase used in racing concerning a horse when its power of performance or chances of success are not generally known. The expression has been transferred to fields of human competition, and is frequently used in politics, especially in reference to candidates for nomination in a convention when they are unexpectedly brought forward or draw a following that had not been anticipated.

DARKE, William, American soldier: b. Pennsylvania 1736; d. Jefferson County, Va. 26 Nov. 1801. At 19 he served with the Virginians in the battle of Braddock's defeat, and afterward in the war of the American Revolution. At Saint Clair's defeat he commanded the left wing of the army and made two gallant and successful charges with the bayonet in the second of which his youngest son, Capt. Joseph Darke, fell mortally wounded (4 Nov. 1791). He was repeatedly a member of the Virginia legislature, and, as member of the convention of 1788, voted for the Federal Constitution.

DARLASTON, England, town in Staffordshire, included in the parliamentary borough of Wednesbury. It is an irregular, straggling place, in which there are blast furnaces and iron manufactures. In the vicinity there is abundant coal and iron. Pop. 17,197.

DARLEY, Felix Octavius Carr, American artist: b. Philadelphia, Pa., 23 June 1822; d. Claymont, Del., 27 March 1888. His illustrating of literary masterpieces gave pleasure to thousands and made him famous. His best work comprises his drawings to accompany the text of "Rip Van Winkle;" "Sleepy Hollow;" "Courtship of Miles Standish;" "Scarlet Letter;" "Evangeline;" the novels of Cooper, Dickens, and others, besides many special pictures. His book "Sketches Abroad with Pen and Pencil" (1868) is well known. His color paintings of incidents in American history are full of spirit and his bank-note vignettes are also worthy of mention. Consult F. Weitenkampf "American Graphic Art" (New York 1912).

DARLEY, George, English poet and critic: b. Dublin 1795; d. London 1846. He was graduated at Trinity College, Dublin, in 1811, went to London in 1825, and became attached to the Literary Gazette and Athenaeum journals, in which his criticisms of poetry and the fine arts made him well known. He was the author of "Labour of Idleness" (1826); "Sylvia" (1827), and miscellaneous works of a mingled philosophical and poetic character.

DARLING, Flora Adams, American novelist: b. Lancaster, N. H., 1840; d. 6 Jan. 1910. She married Edward Darling, a Confederate officer, killed in the Civil War. She was one of the founders of the society of Daughters of the Revolution and was prominent in that and other patriotic organizations. She published: "A Wayward, Winning Woman" (1890); "Was It a True, Talented?" (1890); "The Bourbon Lily;" "Mrs. Darling's Letters, or Memories of the War" (1894); "A Social Diplomat" (1898); "History D. A. R. and D. R. Societies of Patriotic Organizations" (1901); "The Senator's Daughter," etc.

DARLING, Grace Edwina, English heroine: b. Bramborough, England, 24 Nov. 1815; d. 20 Oct. 1842. She was the daughter of the keeper of the Longstone Lighthouse. The event which made her famous occurred on 7 Sept. 1838. The steamer Forfarshire was wrecked near the lighthouse, and at daylight William
DARJEELING, INDIA, SHOWING THE HIMALAYA MOUNTAINS
Darling described the wreck from Longstone, but, accustomed to scenes of danger as he was, shrank from attempting to reach the steamer through a boiling sea in a boat. His daughter, who could see, by the aid of a glass, the sufferers clinging to the wreck, implored him to let her accompany him in the endeavor to relieve them. A late hour was consorted; and father and daughter reached the wreck, and found nine sufferers, whom they succeeded in bringing to the lighthouse. The news of the heroic deed soon spread, and a purse of $3,500 was quickly subscribed and presented to the brave girl.

**DARLING** (so called from Sir Ralph Darling, a governor of New South Wales), a name of several applications in Australia. (1) The Darling River, a river rising in southeast Queensland, is formed by the junction of several streams, and flows through New South Wales in a southwesterly and southward direction till it joins the Murray at Wentworth on the border of Victoria. It has a drainage basin of about 200,000 square miles, mainly arid, except for a strip on either bank. (2) Darling district pastoral district about 90,000 square miles in extent, in the southwest of New South Wales, and watered by the Darling and the Murray. (3) The Darling Downs are a rich table-land west of Brisbane in Queensland, forming excellent pasture and arable land. It is well watered, and measures about 6,000 square miles. (4) The Darling Range, granite mountains in western Australia, running in a northerly direction parallel with the coast from Point D'Entrecasteaux for nearly 250 miles. Its highest peaks do not exceed 1,500 feet.

**DARLINGTON, James Henry,** American Protestant Episcopal bishop: b. Brooklyn, N. Y., 9 June 1856. He was graduated at New York University in 1877 and three years later at the Princeton Theological Seminary. In 1882 he became assistant, and from 1883 to 1905 was rector of Christ Church, Brooklyn. On 26 April 1905 he was consecrated first bishop of Harrisburg. In 1902-03 he was lecturer at New York University and from 1910 to 1915 served as chaplain of the Masonic Grand Lodge of Pennsylvania. He has published "The Hymnal of the Church," "In Memoriam," "Little Rhymes for Little People," and is the author of "Pastor and People" (1902) and sermons on various subjects.

**DARLINGTON,** England, a municipal and parliamentary borough in Durham County nine miles west-southwest of Stockton-on-Tees. It is well built, chiefly of brick, and nearly in the form of a square, and has among its public buildings an ancient Gothic church with a lofty spire, founded in 1160, and restored in 1865. The wooden manufacture is carried on to a considerable extent; there are important iron and steel manufactures; also the locomotive works of the North Eastern Railway are located here. The town is on the old Stockton and Darlington Railroad, which was the first line in England. The early steam-engines were used. The borough returns one member to the House of Commons. Pop. 55,631.

**DARLINGTON, S. C.,** town, county-seat of Darlington County, on the Atlantic Coast Line Railroad, about 70 miles northeast of Columbia. It is in an agricultural region, and is a trade centre for tobacco, cotton, corn, and other products. The manufactures are chiefly cotton goods, tobacco, cottonseed oil, and fertilizers. Pop. 3,789.

**DARLINGTONIA,** a genus of pitcher-plants, belonging to the family Sarraceniaceae. *D. californica* grows in the northern part of California, chiefly in the district around Mount Shasta. It is found in bogs and marshes on the slopes of mountains. It entraps insects, which are attracted to the curious pitcher or hood at the extremity of the tubular leaves; and, once inside, the insects are prevented by the fine hairs which grow from the lip, from retreating. Sometimes the pitchers at their base are filled to the depth of four or five inches with insect remains. The larva of a small moth *Xanthophora semimicra* preys on the plant, and that of a diterous insect, *Sarcoptaga sarracenia*, feeds on the dead insects which it encloses. See Carnivorous Plants.

**DARLEMSTETER, Agnes Mary Frances Robinson,** English poet: b. Leamington, England, 27 Feb. 1857. She has attained great proficiency in Greek studies, her verse showing the influence of Helene Schliemann. Before she married James Darlemsteter (q.v.), the Orientalist, who died in 1894, and in 1901 she married Emile Duclaux, director of the Pasteur Institute in Paris. Her writings include "The Handful of Honey suckle" (1878); "The Crowned Hippolytus, from Euripides" (1881); "Arden," a novel (1883); "Emily Bronte" (1883); "The New Arcadia and Other Poems" (1884); "An Italian Garden" (1886); "The End of the Middle Ages: Essays and Questions in History" (1888); "So Dorn: A Garden Play" (1888); "Lyrics" (1891); "Retrospect" (1893); "Life of Renan" (1897); "A Medival Garland" (1897); "Collected Poems" (1901) "The Return to Nature" (1904); "The French Ideal" (1911); "Twentieth Century French Writers" (1914); "The American Church, Brooklyn, Marguerites du Temps Passé" (1892); "Froissart" (1897); "Grands Écrivains d'Outre-manche" (1901); "La Vie de Emile Duclaux" (1907); "Madame de Sévigné" (1814).

**DARMSTETTER, James,** French Orientalist: b. Château-Salins, 28 March 1849; d. Maisons-Lafitte, near Paris, 19 Oct., 1899. He was of Jewish parentage; received his education at The Lycée Bonaparte, Paris; and became professor of Zend at the École des Hautes Études. In 1893 he became professor of Iranian languages and literature at the Collège de France. In 1886 he went to India where he spent several years at philological research, and became fellow of Bombay University. He succeeded Renan as secretary of the Société Asiatique de France and edited a prominent journal, *La Revue de Paris.* Besides works of strict scholarship on the Oriental literature, as "Ormazd and Ahriman" (1877); "Iranian Studies" (1883); "Origins of Persian Poetry," he wrote many essays on miscellaneous subjects and translated into French and English translation of some of his "Selected Essays." He translated with Mills the "Zend-Avesta" for the "Sacred Books of the East" series, published by the University of Oxford and edited by Max Müller.

**DARMSTADT, darmštát, Germany, capital of the Grand Duchy of Hesse, near the
DARMSTÄDTER BANK — DARLEY

Darm River, 15 miles south of Frankfurt. It consists of an old and a new town. The former, which is the business part of the town, is very poorly built; the houses are old, and the streets narrow and gloomy. The new town is laid out with considerable regularity, and has handsome squares and houses. Among the remarkable buildings are the old palace, with a library of 564,000 volumes and 4,000 MSS.; a picture gallery with some good examples of the early German and Dutch masters. The chef-d'oeuvre is the 'Bannhof' or the 'Bourse' by Holbein the Younger. It has a museum of natural history, the Roman Catholic church, patterned after the Pantheon, the Stadtkirche, and the Rathaus, or town-hall, built in 1580. Other notable features include the new palace, the palace of Prince Henry, the new town-hall, theatre, and the Herringgarten, a fine public garden and park. Darmstadt has some iron foundries, breweries, and other manufactures, and its industries are increasing, but it depends more to combine the scattered capital on either trade or manufactures. The chief articles of manufacture are machinery, carpets, hats, tobacco, chemicals, scientific instruments, playing cards, and beer. It owns its own electric and gas plants, and its schools, and charitable institutions numerous for its population. Justus von Liebig, the scientist, was born here in 1803. Darmstadt appears as Darmstadt in the 11th century. It acquired municipal rights in 1330 and became in 1507 the capital of Hessia. In 1688 it was burned by the French in 1688 and 1693, but attained great prosperity toward the end of the 18th century. Consult Zernin and Wörner: 'Darmstadt und seine Umgebung' (Zurich 1890). Pop. 87,089.

DARMSTÄDTER BANK, The. The Darmstadt Bank was established at Darmstadt in 1853 as the Bank für Handel und Industrie, but it is from 1850 that its important activities began. Its initial authorized capital was 25,000,000 florins (say 42,750,000 marks), of which 10,000,000 florins were issued at first. While devoted to the general banking business, its policy has always aimed at maintaining the liquidity of its resources and at avoiding as much as possible of long-term engagements. The deposit business was not systematically encouraged, as the utilization of its own means was held to give greater stability to the institution and to its financial activities. In many respects its policy coincided with that of the A. Schaalhausen'scher Bankverein. Its charter was modified after that of the Crédit Mobilier, providing "for the issue of such bank obligations as, secured indirectly by the newly created industrial enterprises, were institutions of numerous small capitals for the launching of large enterprises." Up to a very recent period the Darmstadt Bank has been exclusively an institution for the promotion of industry, and relatively unimportant as a bank for the emission of state, communal, and railway securities. In the promotion of industrial enterprises, largely through stock issues, the bank from the outset retained large blocks of the shares issued — a source of incidental financial losses more than counterbalanced by the control given to the institution through board memberships, in addition to actual dividends. In 1900 the bank decided to foster the deposit business, there being (1908) 31 deposit offices, of which 16 were in Berlin. From its beginning certain operations were carried on abroad, particularly in Italy, Belgium, and Austria-Hungary, joining with the Rothschild agency, and taking part in railway finance operations in the last named. Commandites, to promote foreign business relations, were early established, but without uniform success, as being in advance of their time. As early as 1854 a commandite was formed in New York by G. von Baur & Co., and in 1857 and 1867 in Paris and Vienna respectively. In 1908 the whole number of commandites was 4; branches, 7; establishments, 5; and agencies 5; all these in Germany. Through subsidiary, banks or connections, the Darmstadt Bank has direct representation in the Netherlands, China, Japan, Italy, Belgium, London and Bulgaria; and through communities of interest, stock ownership, board representation, etc., either active or silent, with the most important actions with every portion of the German Empire and every foreign land. Board representation is maintained in 92 important industrial corporations, many interested in international trade. In 1909 the capital of the Darmstadt Bank was 154,000,000 marks; surplus, 30,250,000 marks. The capital control of the Darmstadt Bank group amounted (in 1908) to 297,437,490 marks, of which 255,730,000 marks constitute the capital and 41,657,490 marks the surplus. Consult 'Die deutsche Grossbanken und ihre Konzentration' by Riesser, Dr. J. (1909); 'Germany's Economic Forces' (1913); 'Report on Co-operation in American Export Trade' (Washington 1916).

DARNEL, the popular name for Lolium temulentum, which some suppose to be the Inflat. litorum of Virgii and the Zizanie (ares) of Scripture. It was believed by the ancients to be poisonous and narcotic. It is common in waste places and fields in America from New Brunswick to Georgia and northwestern to Michigan. It is remarkably abundant on the Pacific Coast and is generally regarded as a weed. It has been naturalized from Europe. It has been shown that its poisonous properties are due to a peculiar fungus that almost always infects the seed.

DARLEY, Henry Stuart, Lord, husband of the Scottish queen, Mary Stuart; b. England 1546; d. Edinburgh, 10 Feb. 1567. His father, the Earl of Lennox, was descended from a branch of the house of Stuart; his mother, Margaret Douglas, was the daughter of Margaret of England, sister of Henry VIII. Darley, though devoid of real merit, had, by his personal attractions, won Mary's heart; but it was an unfortunate match; and ere long gave rise first to coolness, then to open quarrel, and finally to deadly hate. Darley thought, or affected to think, that her regard for David Rizzio was of a kind which no husband ought to tolerate. He leagued with a body of conspirators, who, on 9 March 1566, dragged Rizzio from the queen's presence, and murdered him under circumstances of horrid barbarity. About the end of that year Darley was seized with smallpox. He was detained by the queen to an isolated house called Kirk of Field, which stood at some distance from Holyrood.
dwellings, which belonged to a retainer of Bothwell, the rapidly rising favorite, was blown into the air by a gust of wind. The king and his page were found in a field at a distance of 80 yards from the house, quite free from any mark which such an explosion would cause. Previous to this tragedy a son had been born of the marriage, who afterward united the Scotch and English crowns under the name and title of James I of England and VI of Scotland.

DARROW, Clarence S., American lawyer: b. Kinsman, Ohio, 18 April 1857. He was educated in the public schools of Ohio and was admitted to the bar in 1875. For a time he was attorney for the Northwestern Railway. He has been identified with many prominent cases of recent years, notably in suits against monopolies, including protracted litigation against combine in Chicago. He was chief counsel for the anthracite miners in the anthracite coal strike arbitration at Scranton and Philadelphia in 1902-03, was counsel in the Debs strike case and in a large number of labor injunction and labor conspiracy cases on the side of labor. In 1902 he was elected member of the Illinois legislature, and is active in politics as an Independent Democrat. He was counsel for the McNamara brothers in the Los Angeles Times case in 1911 and was indicted for alleged bribery of a juror and a talesman in connection with that case, but was acquitted after a trial which lasted three months. He defended Moyer, Haywood and Pettibone when they were tried for the murder of Governor Steunenburg of Idaho. Formerly he was a member of the law firm of Darrow, Masters and Wilson, Chicago, and is at present member of the firm of Darrow and Sissman.

DART, a javelin, a short missile weapon thrown by the hand, or impelled by the breath, through a tube. Dart-heads are usually made of iron, but among savage nations flints, sea-shells, fish-bones, and other hard substances have been employed; and among some of the aboriginal inhabitants of the United States and Africa, the dart was merely a sharp-pointed stick, the end of which was carbonized by fire. The weapon is always very simple in its construction, and is usually three to five feet long.

DART MOTH, a name applied to the genus Agrotis, a night-flying moth of destructive habits, the caterpillar of which is widely known as the cut-worm (q.v.). A European species is the winter dart moth which destroys wheat. The American group includes several species, most of which appear about midsummer.

DARTER, a name given to water birds of a small family (Ankingidae), found in the southern United States, in Africa, Asia and Australia. The American species (Plotos anhinga), also called the snake-bird and water-turkey, is especially common in Florida, and extends northward to North Carolina and Illinois. In appearance and habits the darter resembles the cormorant, especially in the structure of the feet, wings and tail; the bill and neck are like those of the heron, the neck, owing to a peculiar anatomical mechanism, being remarkably flexible. The general color of the body is dark glossy green with silvery gray markings; wings and tail bluish-black. The tail is rather long and consists of 12 narrowly wedge-shaped quills. Their haunts are in low swampy localities, by the side of ditches and dikes. They usually perch on trees whose branches dip into the water. They are the best fresh-water divers known, and drop into the water with such surprising skill that the large body makes scarcely any noise, and but little ripple on entering the water. When swimming, its body is submerged, and the only part visible is the long neck, writhing about like an aquatic serpent, from which peculiarity its name of snake-bird. Its food consists of small fish, shrimps, young reptiles, leeches, etc. The quantity of fish it can consume is enormous; but, like other birds feeding on fish and flesh, it can remain several days without food with impunity. It captures fish, not by diving upon them from above, but by pursuing them under water and spearing them with its closed beak. A bulky nest of sticks, roots, etc., is placed in a tree and receives three or four white, chalky eggs.

DARTERS, small fresh-water fishes forming a sub-family of the Percida (q.v.), from the typical members of which they are distinguished by having the pseudobranchiae (pectoral gills) impalpable or nearly so, the gill-cover smooth, the skull less perfectly ossified, etc. They have been described as perches reduced in size and compacted. The Etheostomatinae are peculiar to North America, where 15 genera and about 80 species occur, mostly in rocky rivers and clear mountain brooks too small to be occupied by other fishes. They are among the smallest of fishes, some of the species being less than two inches, and the largest—the so-called log-perch (Percina caprodes) of the Great Lake region and Mississippi Valley—only six to eight inches long. The typical and largest genus is Etheostoma. The darters spend most of their time resting on their fins on the bottom, hiding beneath stones or burying themselves in the sand, leaving only the eyes uncovered. Owing to the protective resemblance of their well-marked bottoms to the bottom, they are difficult to distinguish. When disturbed, most of the species dart for a short distance with the greatest rapidity, and again settle on the bottom in the same place. These little fishes are among the most interesting inhabitants of our fresh waters, and a valuable account of their habits will be found in a paper by Jordan and Copeland in the American Naturalist for 1870.

DARTFORD, England, market-town of Kent, in the narrow valley of the Darent River, two miles above its entrance into the Thames, and 17 miles east-southeast of London. Edward III here founded an Augustinian nunnery (1355); Saint Edmund's chantry was a great place of pilgrimage; and at Dartford Wat Tyler began his rebellion (1381). Spelman built here the first paper-mill in England (1590). There is considerable manufacturing, chief of which are locomotives and machinery, cotton goods, gunpowder, paper and corn meal, oil and chemicals. Pop. 23,609.

DARTMOOR, an extensive, rugged, mountainous tract in England, in the western part of Devonshire. It is called the "Forest of Dartmoor," but at present having no appearance of a forest, except what is afforded by some dwarf oaks, intermixed with ash and willow,
reaching from Brent south to Okehampton near 22 miles, a breadth of about 12 miles, and occupying about 140,000 acres. In the centre of the moor there is an extensive swamp in which the rivers Dart, Teign, Taw, Yealm, Erme and a great number of smaller streams have their source. Cattle and sheep are fed on this improved grass during the summer months. In the winter the storms from the Atlantic sweep over it and it would be difficult to imagine a more desolate-looking place. Several of the rugged granite hills (here called "tors") are of considerable height, Yes Tor rising 2050 feet above the plain. The district is noted as being the site of a prison built in 1809 for the custody of the French prisoners of war. At one time it contained 10,000 inmates. It is now fitted up for the reception of convicts. Experiments made in cultivating the moor by convict labor have turned out successful. The quarries to the west of the prison also give employment to convict labor. The large kaolin-works and a meteorological observatory are at Lee Moor. Dartmoor offers considerable attraction to the tourist and naturalist. Druidical and other aboriginal remains may be traced, especially Gray Wethers, which is thought to have been a Druidical temple. The dolmens, cairns and other indications of an ancient town are found at Drewsteignton. Since 1837 Dartmoor has been part of the duchy of Cornwall.

DARTMOOR MASSACRE. The, 6 April 1815. During the War of 1812 the American naval prisoners of the British, with impressed American seamen discharged from British vessels, were collected at Dartmoor military prison. On 31 March 1815 they numbered 5,693, including about 1,000 negroes. They had heard of the Peace of Ghent, 24 Dec. 1814, and expected immediate release; but the British government refused to let them go on parole or take any steps till the treaty was ratified by the Senate, 17 Feb. 1815. It took several weeks for the American agent to secure ships for their transportation home and the men grew very impatient. On 4 April the dishonest food contractor attempted to work off some hard work on them in place of soft bread and was forced to yield by the commandant, Capt. T. G. Shortland, suspected them of a design to break jail. This was the reverse of truth in general, as they would lose their chance of going on the cartel; but a few had made reckless threats of the sort and the commandant was very uneasy. About 6 P.M. of the 6th he discovered a hole from one of the five prisons to the barrack yard near the gun- racks. Others had been begun, apparently for pastime. Some prisoners were outside the guard railing noisily pelting each other with turf, and many more near the breach (and the gambling tables), though the signal for return to prisons had sounded; altogether he was convinced of a plot, and rang the alarm bell to collect the officers and have the men ready. This luckless precaution brought back a crowd just going to quarters; just then a prisoner burst through the grate (and the gambling table), and the other pressed through to the prison market square; and after attempts at persuasion, Shortland ordered a charge which drove part of the prisoners in. Those near the gate, however, booted and taunted the soldierly, who fired a volley over their heads; the crowd gave a louder and threw stones, and the soldiers, probably without orders, fired a direct volley which killed and wounded a large number. Then, losing their heads, they followed the throng of prisoners struggling frantically to get within the prison doors, shooting them down as they went, some even going up to the doors and firing in; while others ran up to the walls and fired into the fleeing knots below. Finally the captain, a lieutenant and the hospital surgeon (the other officers being at dinner) succeeded in stopping the murder and caring for the wounded—about 60, 30 seriously, besides seven killed outright. The affair was examined by a joint commission, Charles King for the United States and F. S. Larpent for Great Britain, who agreed in exonerating Shortland, justifying the first firing, blaming the subsequent and pronouncing the culprits undiscoverable. The British government provided for the families of the killed, pensioned the disabled and promoted Shortland. Consultation on 'The Prisoners' Memoirs; or Dartmoor Prison'; Cobb, 'A Green Hand's First Cruise, Together with Five Months in Dartmoor.'

DARTMOUTH, Canada, a town on the Chebucto River, one mile east of Halifax Harbor, on the Intercolonial Railway. It was founded by British settlers in 1750, and was for a number of years the centre of a whale-fishing industry which was established by a colony of Nantucket Quakers after the American Revolution. It is connected by ferry with Halifax, and has iron founders, shipbuilding and repairing, fish cannery, rolling mills, cordage manufactory and sugar refining. Pop. 5,058.

DARTMOUTH COLLEGE, a seat of learning in Hanover, N. H., which received its charter in 1769 and opened its doors the following year under the presidency of Eleazer Wheelock, D.D. It grew out of an earlier school established by Eleazer Wheelock in Lebanon, Conn., and was interested in the education of Indian children. The idea of this school had been suggested to him by his success in educating a young Mohegan Indian, Samson Occom, who became a remarkable preacher. Other pupils from several Indian tribes were afterward received and the school became an object of public attention and interest. In 1754 a farmer named Joshua Moor gave a house and two acres of land for the purposes of the institution, which was from this time known as Moor's Indian Charity School. Occom, accompanied by the Rev. Nathaniel Whittaker, visited England to collect funds; a sum of over $50,000 was subscribed and a board of trustees was there organized, of which Lord Dartmouth, one of the subscribers, was made president. The school was so much resorted to by the native tribes that Dr. Wheelock determined to transfer to some place near to them. Many offers of situations were extended to him, but he selected the town of Hanover, on the Connecticut River, in the western part of the State of New Hampshire, and grants of about 44,000 acres of land were made. The town was chartered by Governor Wentworth under the name of a college, with all the privileges and immunities of any university within the British realm, and was called Dartmouth College in
1 Wilson Library
2 Faculty Avenue
honor of the Earl of Dartmouth. Moor’s school soon afterward obtained an independent charter and remained as an academical or preparatory college until 1849. It maintained a legal existence until 1915, when by a decree of the court it was consolidated with the college. In 1770 Dr. Wheelock removed his family and school, consisting of 18 whites and 6 Indians, from Lebanon to the wilderness of Hanover, where the whole colony lived in log huts. In 1771 the first class of four students was graduated. President Wheelock retained his office till his death in 1779, and was succeeded by his son, John Wheelock, who, in 1782, was sent by the trustees to Europe to promote the interests of the college; and through introductions by General Washington, Dr. Franklin and John Adams he obtained considerable sums of money, philosophical instruments and other valuable donations. William, Prince of Orange, was one of the donors. Wheelock returned in 1784, and after a presidency of 36 years was removed from the office by the trustees, in 1815. This act, which had its origin in a local religious controversy, led to a conflict with the legislature of the State; that body claimed the right to amend a charter of which it was the guardian, and in 1816 passed acts creating a new corporation, in which the property was vested, and charging the acts of the college to Dartmouth University. The old trustees began a suit for the recovery of the college property. (See DARTMOUTH COLLEGE CASE). Wheelock, who was succeeded as president of the college by Francis Brown, was raised to the presidency of the university, in February 1817, by the trustees of that institution, but died within two months. He was succeeded by William Allen, D.D., and in 1819 the College Case was decided in favor of the college, when the university disbanded.

Dartmouth College still remains an institution for men only. It comprises, besides the regular classical department, the medical school, founded in 1798; the Chandler School of Science, established in 1851, by the trustees, on the receipt of a bequest of $30,000 from Abbie Chandler, who left it, with its dean in trust for the establishment and support of a permanent department or school of instruction in the college, in the practical and useful arts of life. The course in this school, leading to the degree of bachelor of science, covered four years and included courses in general science, political science, modern languages, mathematics and history, was incorporated into the college in 1893 and is now known as the Chandler scientific course. Another department is the Thayer School of Civil Engineering, founded in 1867 by Sylvanus Thayer, a graduate of Dartmouth. This is a graduate school, comprising a two years’ course in civil engineering. The government of this school is vested in a board of five overseers, of whom one is the president of Dartmouth College. In 1900 the trustees established the School of Administration and Finance, according to the terms of the Amos Tuck Endowment Fund, the gift of $300,000 by Mr. Edward Tuck, of the class of 1882, as a memorial to his father, of the class of 1833. This school is post-graduate in nature and is established in interest of college men who desire to engage in affairs rather than enter the professions. The report of the college for 1915 gives the following statistics: Officers of administration and instruction, 130; number of students, 1,468; volumes in library, 125,000, and 20,000 pamphlets; the value of the college plant, $2,000,000, with $750,000 additional invested in dormitories; the value of the endowments, $4,000,000.

DARTMOUTH COLLEGE CASE, The. The Dartmouth College Case is the name by which is commonly known the action entitled Trustees of Dartmouth College v. Woodward, which is repeated in volume four of Wheaton’s United States Supreme Court Reports. Perhaps no decision ever rendered in any tribunal has attracted more attention or exerted a greater influence over the legislative and judicial history of our land than has the decision in this case, which arose as follows:

In the year 1769 the Rev. Eleazar Wheelock, aided financially and politically by friends in England and America, conspicuous among whom was the Earl of Dartmouth, and with the assistance of the Province of New Hampshire, given in the form of extensive land grants, founded Dartmouth College under a charter from King George III of England. This charter vested the control of the institution in a board of trustees, who were designated by Mr. Wheelock to manage the same, and under the management of those trustees so incorporated and their successors the college grew and prospered until the year 1816, when the State legislature passed an act amending its charter by which they curtailed the power of its trustees, changed its name to Dartmouth University and made it a State institution subject to State control. For protection against this infringement of their powers, the trustees had recourse to the courts in the now famous case above named.

In the State tribunals the decision went against the college trustees and an appeal was taken to the Supreme Court of the United States, the appeal being based upon the theory that the charter granting the control of the college to the trustees was a contract, that under Section X of Article I of the Federal Constitution no State can pass an act impairing the obligation of any contract, and that the State legislature violated the contract of the charter of Dartmouth College.

It should be remembered that in 1819 when the case came up for final hearing, the popular views of the scope and effect of the National Constitution were far from harmonious. All then regarded that instrument as the greatest existing governmental compact, but the Republican party then in power demanded that it be so strictly construed as to preserve unimpaired the rights and powers of the States. On the other hand, there then presided over the Federal Supreme Bench, in the person of John Marshall, one of the midnight appointees of John Adams, the last President of that Federalist party which demanded so liberal a construction of the instrument as to give the country a strong national government. Of the section of the Constitution invoked, we may safely say with Ordranaux that “Drafted at a time when commerce was in its infancy; when public credit was depreciated to the lowest ebb; and confidence in monetary transactions almost destroyed, it was manifestly introduced as a
barrier against the tide of repudiation which threatened to overwhelm both public and private credit. The framers of the Constitution never intended that clause to be given the interpretation urged in this case. Before a court presided over by the jurist who has been truthfully said to have "found the Constitution a skeleton and clothed it with flesh and blood." Therefore, when it was clearly shown, as it was in the celebrated case of Daniel v. Collin, that the trustees, that this case came fairly within the provisions of that section, in principle, the court, guided by John Marshall, held that the act of the New Hampshire legislature was void because it impaired the obligation of a contract.

Justice Duvall alone dissented.

This decision has perhaps been more severely criticized and has perhaps given rise to more strenuous efforts to escape its consequences than has any other decision of the tribunal which has rendered or the decisions of the supreme court. It gave assurance that capital invested in chartered business and charitable ventures would be forever protected from legislative interference, it also invited political corruption by saying in effect that the legislature could make a corporation whose power was to be regulated by its own charter, it could make that corporation able to coerce or control the government. It made possible the mechanical and industrial achievements of the 19th century in this country, but it also made possible the limitless corruption which has attended those achievements and which has frequently, by virtue of this decision, stripped the government of very important powers.

But the correctness of a judicial decision is not to be gauged by its influence for weal or woe. Rather should that be determined by its conformity to the Constitution, the statutes and the judicial precedents upon which it rests and the approval given it by later decisions. Judged by this test we must hold that Marshall and his colleagues decided well in the Dartmouth College Case. The Supreme Court of the United States had early laid down the rule that there are certain vital principles of republican government which will overrule a flagrant and apparent abuse of legislative grant or legislative power, whether made in the form of a charter of incorporation or in any other form, conveyed to private citizens that which the legislature had power to contract away, the grant so made was a contract and no succeeding legislature could rescind the same without following the same rules which govern the rescission of private contracts. But if there is any doubt that such was the understanding of the chief justice who wrote the opinion of the court in that case, the same will be removed by a consideration of certain later decisions in which he participated.

In the year 1821 the court over which he presided decided that Congress had power to incorporate a lottery to do business beyond the limits of the District of Columbia, yet, where no mention was made thereof in the charter, it would not be presumed that Congress had done so and had thereby deprived the States of their power to regulate lotteries by preventing the sale of tickets within their boundaries.

In the year 1810 a charter had been granted to the Providence Bank of Providence, yet, in that case the state government could not contract away its legislative power. And in the case of Providence Bank v. Billings, the court decided that while a State might, through its legislature, grant immunity from taxation, it could not be presumed to have done so, and that, in the absence of any agreement to the contrary, it might tax a franchise which it had itself granted.

But the effect of the Dartmouth College decision was not fully understood at the time of its rendition and the States eagerly availed themselves of a suggestion found in the decision itself to the effect that if they wished the right to amend, alter or repeal charters granted by them they must expressly reserve that power. Such a reservation being a part of the charter itself, the Constitution or the general laws of the State, has been held to have the effect of placing the State legislature back on the same platform of power and control over the charter containing it, as it would have had the constitutional restriction never existed. Yet the later decisions hold that this reserve power must be reasonably exercised.
The alterations must be made in good faith and consistent with the objects and scope of the act of incorporation. Sheer oppression and fraud cannot be inflicted under the guise of amendment or alteration. This power cannot be so employed as to defeat or substantially impair the object of the grant or any right which has become vested under it. Where this power has been reserved, a State may tax property which it has forever exempted from taxation, but the taxes must not be greater than those imposed upon other property. It can regulate the charges of common carriers, but no such legislation must amount to the taking of private property for public purposes without due process of law. We thus see that not only was the Dartmouth College decision as moderate as any of the later cases which have been said to have practically overruled it, but that even where reservations in charters have obviated the effect of that decision the later courts have reached a similar conclusion by a different chain of logic.

S. V. Wright, Attorney, San Luis Obispo, Cal.

DARTON, Nelson Horatio, American geologist: b. Brooklyn, N. Y., Dec. 16, 1816. He received a common school education and became an analytical chemist and geologist. In 1886 he became geologist to the United States Geological Survey, from which in 1910 he was transferred to the Geology of the Federal Bureau of Mines of the Geological Survey. In 1912 he again became geologist to the United States Geological Survey. His chemical researches were on sugar refining, tannic acid and water analysis; the latter led to the elimination of 300 polluted pump wells in Brooklyn. He is a specialist in geology of underground waters, and much of his later work consists of government reports on artistic conditions and structural materials. He edited the Survey's first bibliography of North American geology from 1732 to 1891 in 'Survey Bulletin 127' (1906), and has published many articles in magazines and scientific journals.

D'ARUSMONT, dár-rôz-mô, Madame Frances (maiden name FANNY WRIGHT), American philanthropist and author: b. Dunlee, Scotland, Oct. 1811; d. Cincinnati, Ohio, Oct. 20, 1876. She married M. d'Arusmont in 1838, but the marriage was not a congenial one and her later years were spent in the United States. She lectured extensively on social, religious and political questions. Among her works are 'Views on Society and Method in America' (1858); 'Altorf,' a tragedy (1819); 'Lectures on Free Inquiry' (1836).

DARWAR, dár’war, or DHARWAR, India, (1) town and fortress in the presidency of Bombay, 285 miles southeast of Bombay city, capital of a district of the same name. The town exports cotton and rice. It is connected by railroad with Goa, the Portuguese colony, and with other places. Pop. (1911) 30,289. (2) The district of Darwar has an area of 4,632 square miles. The soil is sandy and favorable to the cultivation of cotton. The climate is about the healthiest in the Bombay presidency. Pop. about 1,100,000.

DARWEN (till 1889 OVER DARWEN), England, a municipal borough in the northeast of Lancashire, four miles south of Blackburn. The staple manufacture is cotton. The other manufactures are paper, iron castings, machinery, earthenware, etc. Coal and stone are abundant in the neighborhood. Water, gas, electric lighting and trams are municipally owned. Pop. 40,322.

DARWIN, Charles Robert, English naturalist: b. Shrewsbury, 12 Feb. 1809; d. Down, Kent, 19 April 1882. His father, Robert Waring Darwin, was a distinguished botanist of that town, the son of a still more distinguished father, Erasmus Darwin (q.v.). He was educated at Shrewsbury School, and at the universities of Edinburgh and Cambridge. He early devoted himself to botany and natural history, and in 1831 was appointed naturalist to H.M.S. Beagle, then about to sail on an extended surveying expedition. He served without salary and paid a portion of his expenses on condition of having at his own disposal such collections of specimens as he might make during the voyage. The vessel sailed in December 1831 and did not return till October 1836, after having circumnavigated the globe. Darwin came home with rich stores of knowledge, part of which he soon gave to the public in such works as his Journal of Researches into the Natural History... (1839), of the countries visited; the Zoology of the voyage of H.M.S. Beagle (1840–42); Structure and Distribution of Coral Reefs (1842); Volcanic Islands (1844); Geological Observations (1844–46). Although known among naturalists as a of remarkable ability, to the general public his name was not familiar, when all at once it attained a celebrity second to none by the publication in 1859 of The Origin of Species by Means of Natural Selection. This work, scouted and derided though it was at first in certain quarters, may be said to have worked nothing less than a revolution in biological science. In it for the first time was given a full exposition of the theory of evolution as applied to plants and animals, the origin of species being explained on the hypothesis of natural selection. The central idea of the work is that all forms of organic life are derived from a small number of primitive types, and that all the vast variety of vegetable and animal organisms now existing, or having formerly existed, have owed their origin to the slow and gradual operation of the modifying influence of local or special causes transmitted hereditarily; such forms as best suit any particular time and locality being selected and adapted by the action of natural laws for that time and locality. The theory of evolution was warmly taken up by some of the ablest men of science, and now there are few who have not
in whole or in part given their adherence to the principle. The rest of his works are largely based on the material he had accumulated for the elaboration of the great theory. (See Darwin, Charles) The main ones were: (1) The Origin of Species (1859), (2) The Expression of the Emotions in Man and Animals (1872), (3) Insectivorous Plants (1875), (4) Cross and Self-Fertilization (1876), (5) Different Forms of Flowers (1877), (6) The Power of Movement in Plants (1880), (7) The Formation of Vegetable Mould (1881), (8) The last dealing exhaustively with the common earthworm. Darwin was buried in Westminster Abbey. Consult Life and Letters of Charles Darwin (1887) by his son, Francis Darwin; More Letters of Charles Darwin (1905); and volumes published on the occasion of his centenary (1899), Foundations of the Origin of Species; Fifty Years of Darwinism (by American authors); and Darwin and Modern Science (by foreign authors).

DARWIN, Erasmus, English physician and poet: b. near Newark, Nottinghamshire, 12 Dec. 1731; d. near Derby, 18 April 1802. Settling at Stockfield he acquired a great reputation and an extensive practice. His son, Robert, was the father of the famous Charles Darwin. Erasmus Darwin's name is chiefly remembered for his poem of The Botanic Garden, which is comprised in two parts. The first treatise of the Economy of Vegetation (1792), the second of the Loves of the Plants (first published in 1799). It was received with much favor; but a very ingenious parody, entitled The Loves of the Triangles, published in the Anti-Jacobin (and written either by Canning or Frère), greatly damaged its popularity. In 1794 Dr. Darwin published the first volume of Zoology, or the Laws of Organic Life; the second volume, completing the work, appeared two years afterward. In 1799 he published Phytologia, or the Philosophy of Agriculture and Gardening.

DARWIN, Sir Francis, English botanist: b. Down, Kent, 16 Aug. 1848. He is the son of Charles Robert Darwin (q.v.); was educated at Trinity College, Cambridge, and studied medicine at Saint George's Hospital in London. He did not practice medicine but assisted his father in his work at Down and was later made reader in botany at Trinity College. His works include Life and Letters of Charles Darwin (1887); Charles Darwin (1892); Practical Physiology of Plants (with E. H. Acton, 1894); Elements of Botany (1895); More Letters of Charles Darwin (with Seward, 1903); and Foundations of the Origin of Species (1909). He was knighted in 1913.

DARWIN, Sir George Howard, English scientist: b. Down, Kent, 9 July 1845; d. 7 Dec. 1912. He was the eldest son of Charles Robert Darwin (q.v.); was educated at Cambridge, studied law and was admitted to the bar but did not practise. He was a fellow of Trinity College, Cambridge, 1868-78; was a member of the expedition to Sicily to observe the eclipse in 1870-71; and was appointed Plumian professor of astronomy and experimental philosophy at Cambridge in 1883. Among his writings are Small Deflections of the Plumb Line due to the Moon over South Sea (1866); Tides and Kindred Phenomena in the Solar System (1898); Scientific Papers (1907), etc. He was created K. C. B. in 1905.

Darwinian Theory, the explanation of the working of natural selection in effecting specific changes in plants and animals. Darwinism must not be confused with Evolutionism. The term Darwinism is applied to one particular interpretation of the mechanism of the universe, and is summarized in Darwin's great work, The Origin of Species by Means of Natural Selection. Whatever may be the future development of our evolutionary ideas, the epoch-making importance of the Darwinian theory will be unaltered.

Outline of Origin of Species. To gain an insight into the means of modification, Darwin begins with a study of the variation of plants and animals under domestication. Those who admit the unity of domestic races should be cautious in denying the unity of the wild ones. Domestic races all exhibit adaptations to man's taste or fancy, rather than to the good. The key to this is man's power of selection. Nature gives successive variations, man accumulates these, so making for himself useful breeds, and often (for example, in sheep, cattle, roses, dahlias) profoundly modifies their character even in a single human lifetime; so that in all the characteristics to which he pays attention they may differ more than the distinct species of the same genera. Unconscious selection, which results from everyone trying to possess and breed the best animals, is even more important than conscious selection. Two flocks of Leicester sheep kept equally pure appear quite different varieties after 50 years. Such slowly accumulated change explains why we know so little of the origin of domestic races; and its absence in regions inhabited by uncivilized man explains why these yield no plants worth immediate culture. Human selection is facilitated (1) by the keeping of large numbers, since variations will be more frequent; and (2) by preventing free intercrossing. Some species vary more than others.

Variation under Nature. No two blades of grass are alike, and far more marked differences often occur, several strains or varieties sometimes existing in the same species. Between these strains, and even between forms which systematic botanists and zoologists rank as true species, perfectly intermediate forms may occur. No agreement about the definition of species (the amount of difference necessary to give any two forms specific rank) has ever been reached. It is an interesting fact, however, that closely allied species often differ in their chromosome number. Individual differences are of the highest importance as the first steps toward the slightest varieties worth recording; these in turn toward more distinct and permanent varieties; these varieties again toward sub-species; and in the next stage to species, though extinction may often arrest the process. The species which present most varieties are those which have the greatest geographical range or the widest diffusion in their own territory, or which possess the greatest number of individuals.
Struggle for Existence.—All organic beings tend to increase with extreme rapidity, so that if they were not kept down the earth would soon be overwhelmed by the progeny of a single pair of individuals. Since organisms are reproducing themselves so rapidly, and not all their offspring can escape their enemies, get food and live, much less leave progeny in turn, there must in every case be a struggle for existence, either of one individual with another of the same species, or with the individuals of distinct species, or with the physical conditions of life; often with all these at once, and that more or less intensely throughout the whole duration of life. The checks which prevent increase are more obscure and vary in each case. In all cases the amount of food gives the limit. The youngest organisms generally suffer most. The stock of game on an estate depends chiefly on the destruction of vermin. Climate is important and periodic seasons of extreme cold and drought seem the most effective of all checks. Epidemics too may occur, especially where numbers have inordinately increased. The struggle for life is most severe among individuals and varieties of the same species and among species of the same genus. Specific differences are more than generic and varietal than either. Rudimentary organs and secondary sexual characters are variable. Zebra-like stripes on horses or wood-pigeons' markings on fantails, tumblers, etc., may be explained as revisions toward their ancient progenitors.

Natural Selection.—The natural process which results in the preservation of favorable variations and the elimination of injurious ones is termed by Darwin "Natural Selection," or less figuratively by Spencer, the "Survival of the Fittest." No country can be named where the native inhabitants are perfectly adapted to their conditions and competitors, for as some foreigners have taken firm possession in every country, we may safely conclude that the natives might have been modified with advantage to resist them. Human selection acts only for man's own good on mere external and visible characters, and irregularly throughout a short period; natural selection acts for the good of the being itself, on the whole machinery of its whole life, and incessantly on the species throughout almost infinite time. It leads to the improvement of each creature in relation to its organic and inorganic conditions of life, and consequently in most cases to what must be regarded as an advance in organization. The circumstances favorable to the production of new forms are great variability, large numbers of individuals, the complex effects of intercrossing, isolation in small areas, also extension over continents, especially if these vary in altitude or climate, and considerable lapse of time. Rare species are shown to be in process of extinction. The divergence of character in domestic breeds, largely due to the fact that "fanciers do not, and will not, admire a medium standard, but like extremes," applies throughout nature from the circumstance that the more diversified the descendants from any one species become in structure, constitution and habits, by so much will they be better enabled to seize on means of subsistence which others are ill adapted to, and so to increase in numbers. A carnivorous animal which has reached the maximum numbers its territory can support, cannot succeed in increasing unless its varying descendants seize places hitherto occupied by other animals. This must hold equally true of all species and is separately demonstrated for plants. The greatest amount of life can be supported by help of proportionally great diversification of structure; hence in small areas where competition is severe the inhabitants are extremely varied.

Sexual Selection.—Not merely do individuals struggle for existence, but the males struggle for the females and the most vigorous tend to leave most progeny. Several weapons offensive and defensive, like the cock's spurs, the stag's horns or the lion's mane, are used in this struggle, and the most useful variations are those which are transmitted. Just as man can in a short time give beauty to his domestic birds, so there is no reason to doubt that female birds, in thousands of generations by selecting, as they are observed to do, the most melodious or beautiful males, might produce a marked result, and many sexual differences are thus explained.

Laws of Variation.—The same laws appear to have acted in producing the lesser differences between varieties of the same species, and the greater differences between species of the same genus. Specific differences are more than generic and varietal than either. Rudimentary organs and secondary sexual characters are variable. Zebra-like stripes on horses or wood-pigeons' markings on fantails, tumblers, etc., may be explained as revisions toward their ancient progenitors.

Geological Succession of Organic Beings.—The most ancient forms differ widely from those now living, yet frequently present characters intermediate between groups now widely divergent and resemble the embryos of the more recent and more highly specialized animals belonging to the same classes. These and the important law of the succession of the same types within the same areas during the later geological periods, and most notably between the Tertiary Period and the present time, cease to be mysteries and become at once thoroughly intelligible on the principle of inheritance and on that alone. Darwin's belief that the distinctness of birds from all other vertebrates was to be accounted for by the extinction of a long line of progenitors connecting them with reptiles, was in 1859 a mere assumption, but in 1862 the long-tailed and palpebil reptilian bird Archaeopteryx was discovered, while in 1875 the researches of Marsh brought to light certain cretaceous birds, one with teeth set in a groove, the other with teeth in sockets and with bi-concave vertebrae. Besides these reptilian birds, bird-like reptiles have similarly been forthcoming, and the hypothesis of Darwin is thus admirably verified.

Geographical Distribution.—Neither the similarity or the dissimilarity of the inhabitants of various regions, whether of land or sea, can be accounted for by identity or differences of climate or other physical conditions; but both are related in the most striking degree to the absence or presence of barriers to migration between those regions.

Morphological Arguments.—The physiological and distributary variations are not less dis-
in groups subordinated under other groups, individuals under varieties, and these again under species, species under genera; genera under sub-families, families and orders, and all under a few grand classes. The nature of all these relationships established by naturalists receives a simple and natural explanation on the view of the common descent of allied forms with modification through variation and natural selection, no other explanation ever having been attempted. The element of descent is already used in linking all the sexes, ages, forms and varieties of the same species, widely though these may differ from each other in structure.

The members of the same class, independently of their habits of life, resemble one another in their general plan of organization. Thus the hand of man, the digging-paw of the mole, the leg of the horse, the paddle of the porpoise and the wing of the bat, are all constructed on the same pattern, bone corresponding to bone. This conformity to type is powerfully suggestive of true relationship, of inheritance from a common ancestor; and admixture of species; exchange of parts, explained in terms of the evolutionary theory, thus strengthening that theory.

**Serial Homology** is that unity of type which is found on comparing the different parts and organs in the same individual. The complex and varied jaws and legs of a lobster, or the different leaves, sepals, petals, stamens and pistils of a flower are all found to be modifications of a simple leaf-organ respectively. Not only are such metamorphoses apparent on comparison but they can be actually observed during the development of each individual. So closely do the embryos of the most distinct species belonging to the same class resemble each other; that even Von Baer was unable to decide whether two unlabeled specimens were lizards, birds or mammals. The process of development goes from the general to the special; thus there is generally an advance in organization. In particular conditions degeneration may occur. All these facts are explained on the principle of successive slight variations not necessarily or generally supervening very early in life and inherited at a corresponding period; hence it is in the highest degree probable that most embryonic stages show us more or less completely the progenitor of the group in its adult state; and embryology thus rises greatly in interest. Darwin points out that the theory of evolution by natural selection is no more incomical to religion than is that of gravitation, to which the same objection was raised. Since the researches of the last two decades on heredity (q.v.) have brought to light the fact that variations are not in general infinitesimal, but are in general rather of the nature of mutations, the discussion of natural selection has entered on a new stage. The periods which were formerly believed to be essential for the differentiation of a species have been shown to be far too large. On the other hand, the problem how a series of what are apparently arbitrary jumps can lead to the development of such a perfectly adapted organism as a whale is exceedingly difficult to explain, more particularly as it appears that the number of mutations of which an organism is capable, though great, is predetermined in the chromosomes (q.v.) of its cells. This fact has led certain biologists to have recourse to the theory of the inheritance of acquired characteristics, which, indeed, was not foreign to the views of Darwin. This point of evidence, however, seems to oppose this theory. See EoTOL <THEORIES OF HEREDITY; GENETICS.

**DARWINIAN TUBERCLE**, a small raised portion, or tubercle, that may appear on the pinna of the ear. It is said to be present in a number of the primates and by many scientists has been regarded as an evidence of degeneracy in mankind. Different forms of Darwinian tubercles are described by anthropologists, but they have no real special significance.

**DAS KÄTCHEN VON HELBRONN** ("Katie of Helbronn"). This romantic drama by Bernt Heinrich von Kleist, first produced in 1810, long remained one of the favorites in German theatrical repertory. It is the most romantic work of its author, himself perhaps the most romantic of Germany's poet-dramatists, and is a representative product of 'Storm and Stress' in individual and national life. Goethe, who was director of the theatre at Weimar when it was written, refused, at first, to present it, calling it "a jumble of sense and nonsense," and an abstract criticism of the play simply justifies his judgment. Yet the work has undeniable charm and merit in spite of its faults, or perhaps because of them, since its very exaggeration, in situation, characterization and poetic fervor is what has given it its vogue. The quick shifts from darkness to light, from verse to prose, the contrast between the luminous Kathchen who sacrifices everything for love and her wicked rival Kunigunde are typical of Kleist, both of his work and of his life. He himself called "Käthchen von Helbronn," the obverse of "Penthesilea," the Amazon-feminist heroine of an earlier play, her opposite pole, a creature as powerful through submission as Penthesilea is through action. It is as a type like Griselda that Käthchen survives, not as a story, for the tale of her blind devotion to Graf Wetter von Strahl, of the intrigue and mystery and treachery that bar her path and edged emergence as a lost Kaisers-tochter are too well-worn for distinction.

**Edith J. R. Isaacs.**

**DASHEEN**, a plant of the genus *Colocasia* of the Arum family. The plants are cultivated for their starchy roots which are cooked and eaten much like the common potato. In recent
years they have been introduced and grown extensively in the southern United States. They thrive in regions too warm and in soil too wet for the growth of the potato.

**DASHEIL, Robert Laurencen**, American clergyman and educator: b. Salisbury, Md., 25 June 1825; d. Newark, N. J., 8 March 1880. He was graduated from Dickinson College in 1846. He was a Methodist pastor in Baltimore, Md., Newark, N. J., Jersey City, N. J., and Orange, N. J. From 1868 to 1871 he was president of Dickinson College. From 1872 until his death he was secretary of the Board of Foreign Missions of the Methodist Episcopal Church. He represented his conference in the General Conferences of 1872 and 1876. His pulpit ability was noteworthy.

**DASHKOFF, dăsh’kôf, Princess Ekata-erina Romanovna**, Russian scholar: b. Petrograd 22 March 1743; d. Moscow 16 Jan. 1810. She married Prince Dashkoff when only 15 years old, but was left a widow three years after. She was an intimate friend of the Empress Catherine II, and one of the heads of the conspiracy formed against Peter III, the success of which secured the throne to Catherine. Soon afterward, quarreling with Catherine, she obtained permission to travel, and visited Germany, England, France and Italy, making the acquaintance of many eminent men. On her return the princess was appointed director of the Academy of Arts and Sciences; and in 1783, president of the Russian Academy, established at her own suggestion in imitation of the French Académie. Besides writing several comedies and occasional papers, the Princess Dashkoff was mainly instrumental in inducing the Russian Academy to draw up a dictionary of the Russian language, and herself executed part of the work. On the death of Catherine she was removed from office and retired to Moscow. Consult her autobiography (trans. by Mrs. W. Bradford, London 1840.)

**DASS, Peder, or Petter**, Norwegian poet: b. Nord-Herøy, parish of Alstaahoog, Nordland, 1647; d. Aug. 1708. He studied at the University of Copenhagen, became pastor of the parish of Alstaahoog in 1689 and grew rich from commerce and fisheries, buying for himself the royal domain of Vefsen. He became the most popular poet in Norway, leaving 127 poems of which only 24 are now extant, his masterpiece being a descriptive poem: 'The Trumpet of the Nordland,' written in the Dano-Norwegian dialect. His works were collected by Eriksen (Christiania 1873–77).

**DASSY, or DASSIE**, the name given in South Africa to the rock-rabbit (Procavia capensis), the Dutch name for which is klipdas. The name dassy is merely a diminutive in local use, especially in Cape Colony. See HYrax.

**DASYPROCTA**, a genus of agoutis (Dasyproctidae), a familiar group of rodent mammals inhabiting Central and South America, and some of the West India Islands. The agoutis are a little larger than the common rabbit, have a rabbit-like head, but with short ears, hooped, pig-like claws, and are swift-footed. They live in the woodland, and search for food by night in the open country. See ACUTR.

**DASYURE, dâs’i-r, a marsupial native to Australasia; and belonging to the family Dasyuridae. Dasyures are the survivors of the fossil forms found in Tertiary strata in South America, and elsewhere; and are allied to the opossum. The hind and fore legs are about equal in length, and the toes are furnished with claws; the long hairy tails are not prehensile. The teeth are fitted for tearing flesh, and there are eight upper incisors. There is no coccm. The pouch is often rudimentary, and in Myrme-ocabus is absent. The dasyures are chiefly strong, fierce creatures of enormous size, whose deprehensions have caused heavy losses in farming and ranching districts, so that the colonists of Australasia, more especially those of Tasmania, have nearly exterminated them, by persistent effort. Amongst them we find the Tasmanian zebra-wolf (Thylacinus cynocephalus), a wolf-like creature, rather smaller than the common wolf, with short fur, a long smooth tail and rounded ears. Its color is brownish, and it is barred at the hinder portion of the back and the roots of the tail, with dark stripes. It prowls about by night, making raids upon unguarded sheep-folds. By day, it skulks in caverns among the rocks. Another foe to the foxes is the Tasmanian Devil (Sarcophilus harrisii). This creature, in外观 resembles a hog, is prodigious in appearance like a bear, is ponderous, powerful, dark-colored, and covered with a coat of long fur. It sleeps by day; and, like the zebra-wolf, seeks its prey by night. It is very strong and ferocious; but despite this, has been successfully put down by the colonists; in fact, it has been nearly exterminated. Another species is the Australian "native cat," a spotted creature, almost as large as a house-cat. It belongs to the genus Dasyurus, in which are also several other and smaller species. Perhaps the most interesting of the small Dasyures, is the banded ant-eater (Myrmecobius fasciatus) found in western and southern Australia. It is a reddish brown in color, banded posteriorly with white; is about the size of a squirrel, and has a long protrusible tongue for gathering its insect food. It is considered as a practically unmodified representative of certain extinct marsupials found in the Secondary rocks of Europe. It lives in sandy plains, where it finds food in plenty. Other species, small as rats and mice, and living chiefly on insects, birds, eggs, and fruits, are found in the genus Phascogale, and allied genera; and the jerboa-like creature (Antechinomyys laniger) constitutes another genus, of a single species. It is native to Queensland and New South Wales, but is very rare. See MARSUPIES.

**DATA**, Psychological Value of. In applied psychology the use of data is fundamental. Data are necessary for the purpose of getting averages upon which may be based deductions whereby action may be foreseen and properly estimated. In educational psychology the collection of data has been very extensive. It is not only used for the purpose of finding averages, but for the purpose of finding frequency distribution, and measuring variability and relationship. On such data are founded systems of measurement for mental ability. The selections of men from the ranks of the soldiers for officers' training camps is based on the results so obtained. In business psychology
the same results are used to promote efficiency founded on known ability. In the psychology of religion, data are the basis for what has been done. So far the data are comparatively slight as compared with the data of educational psychology.

DATA OF ETHICS. A book written by Herbert Spencer first issued in 1870. Many subsequent editions have appeared. It teaches the evolutionary idea of ethics. By some writers Spencer's ethics are even called materialistic. He approaches his subject from the physical, biological, physiological and sociological standpoint. He largely ignores the Christian view of a divine authority instructing the judgment, followed by action in complete freedom of choice by the human will.

DATARIA, an office of the Curia Romana (q.v.) from which are sent forth certain classes of papal documents, as dispensations and appointments to Church benefices. The word had its origin in the formula of subscription of letters, for example, Data Kalendis Martis, given (or sent) 1 March; that is, the date of the document; and it is the duty of the Dataria to guard against possible errors of either dating or addressing documents, or in the tenor of the documents themselves.

DATE. See EPOCH; CHRONOLOGY; CALENDAR.

DATE LINE. See INTERNATIONAL DATE LINE.

DATE or DATE PALM (Phoenix dactylifera), a tall tree of the natural order Palmaeae. It is most notable for its fruit, which is an important part of the daily food of the natives of western Asia and northern Africa, where the tree is indigenous and from whence large quantities of dried dates (the fruit) are exported to other countries. The tree is also cultivated in some other warm countries, including China, Italy, France, Spain and parts of the United States—Florida, New Mexico, Arizona and California, in the last three of which a promising industry seems to be becoming started. The tree, which attains a height of 100 feet, and bears fruit for one or two centuries, is, like other palms, useful in many ways; nearly all its parts are used for something. Date seeds are roasted and used as a substitute for coffee, or ground, and pressed for oil and the pomace used for stock food. The leaves are used for matting, baskets, thatch, etc.; the terminal bud as a vegetable; wood for fence making and other purposes where great strain is not expected; the fibre of the bark for making rope; but the fruit, which contains proteids, gum and pectin, and is particularly rich in sugar, is the most important part. It is one of the principal sources of wealth in the countries where the date is indigenous. It is believed that the date palms of the Pacific coast are the ones referred to in biblical writings, and at the present time the leaves of this palm are largely used upon Palm Sunday among Christians living where the trees abound. The leaves were also symbolic of victory, beauty, etc., among the ancient Greeks and Jews.

Since the male and female flowers are borne on separate trees, enough specimens of staminate flowering trees must be planted to fertilize the blossoms on the others which alone produce fruit. Since the plants obtained from seeds are of unknown sex until they flower, and since the proportion of inferior seeds to those that produce superior fruit is usually large, the date is propagated by means of suckers, since these retain the characteristics of the parent. The young plants are set in sunny situations, in almost any kind of soil where water is within reach of the roots or can be supplied by irrigation. The sandy, alkaline soils of deserts seem more satisfactory than the richer soils necessary for the growth of general crops. The trees are very difficult to make grow after transplanting, because they demand much attention especially as to watering. A loss of 50 per cent is not uncommon even with the best of attention. The surviving trees should commence to bear when about eight years old. The fruit is borne in clusters which hang from the thick crown of large pinnate leaves. Individual fruits range from 300 to 500 pounds or more of fruit in a season. The fruit is eaten both fresh and dried and is divided into soft and dry dates. They vary in color, quality and size.

DATE-PLUM, a common name for plants of the genus Diospyros, of the ebony family (Ebenaceae). The genus has about 190 species and is most abundantly represented in Asia. In the United States two species are known, the most common being the persimmon (q.v.), D. virginiana. The common date-plum or pashmina, also called the European lotus and the date of Trebizond (D. lotus), is a tree 18 to 30 feet high, with oblong shining leaves and small reddish-white flowers, a native of the coasts of the Caspian Sea, northern Africa, etc., but cultivated and naturalized in the south of England. Its fruit is of the size of a cherry, and in favorable climates larger, yellow, sweet and astrignent. It is eaten when overripe, like the medlar, or is used for preserves. This fruit has been supposed by some to be the lotus (q.v.) of the Lotophagus. D. mabola is a true tree in Mauritius. D. kaki, the Japanese persimmon, is a native of Japan, and occasionally is kept in greenhouses in France and England. The sweetmeat called figues-caques is made from this fruit in France. The fruit of some other species is also edible, as, for example, that of D. decandra of Cochin-China. See EBBON; PERSIMMON.

DATE-SHELL, or DATE FISH, a bivalve shell or its inhabitant of the genus Pholus, a kind of mollusk. They bore holes in clay, peat, and soft rocks and in some instances on hard stone, as in columns from the Temple of Serapis, which were brought from Africa to Italy. Species of the date-shell are found in the Mediterranean and its arms, on the coast of California and in a few places on the west shore of the Pacific. Some are edible.

DATHA, American cacique. He governed the province of Chiquita, on the east coast of Florida, visited by Lucas Vasquez de Ayallon, auditor of San Domingo, in 1520. He was a giant, and Helps, in his 'Spanish Conquests in America,' says: 'His gigantic stature had been artificially produced, for it is said that the Indians of those parts had a method of elongating the bones of children when very young. a practice which they applied to those of royal race.'
DATIA. See Duttezaah.

DATISCIN, da-ts'in, a substance yielded by the bastard hemp, *Datisca cannabina*, a common plant in gardens, indigenous to the Punjab, and largely used in the south of Europe and in Asia for dyeing yellow. It can be extracted from the leaves and roots by exhausting with alcohol, concentrating, adding water, filtering from a resin, crystallizing and purifying the glucoside so obtained. When pure it forms colorless silky needles, which are readily soluble in alcohol, sparingly in ether and in water, and have a bitter taste. It has feeble acid properties, and gives yellow compounds with lead and tin which can be used as dyes. When boiled with dilute acids it is resolved into sugar and *datiscetin*, which crystallizes readily. This is soluble in alcohol and in ether, almost insoluble in water. It also gives a fine yellow color when combined with lead.

DATIVE, in grammar, one of the cases of nouns and pronouns, the usual function of which is to mark the location of something given. In English there is no distinctive form for this case; yet when we say, for instance, "give me or him that," "I gave the man a crown," "me, him and man" are really in the dative. In Latin, Greek, Sanskrit, German, etc., there are distinct forms for this case.

DATOLITE, dāt'o-lit, or DATHOLITE, a basic silicate of boron and calcium, having the formula $\text{H}_2\text{O}_2\text{CaO}_3\text{B}_2\text{O}_5\text{Si}_3\text{O}_9$, and crystallizing in the monoclinic system. Its crystals are glassy in appearance, white in color (often with a greenish tinge), and transparent or translucent. Before the blow-pipe it melts with intumescence, and gives a green color to the flame. Its hardness is from 5 to 5.5, and its specific gravity is about three. In the United States it occurs in Connecticut, New Jersey and the Lake Superior district. It is also found in the Salisbury Crags near Edinburgh, as well as in Norway, Sweden and other parts of the European continent. The name is from two Greek words that refer to the tendency that one of its massive varieties exhibits, to divide into granular portions. The crystals when polished are used as ornaments.

DATS E IRADIER, Edurro, Spanish statesman: b. Coruña, 12 Aug. 1856. He studied law at Madrid and became doctor in jurisprudence in 1875. He was elected deputy to the Cortes in 1884, and re-elected in 1891 and 1893. He was early allied with the Conservative Party under Cánovas, but withdrew for a time. In 1887 he became a member of the board of the Madrid Law College, and in 1890-94 served as vice-president of the Royal Academy of Jurisprudence and Legislation. He became Minister of the Interior in 1896, and made an exhaustive study of labor conditions during a visit to Catalonia in 1900. In 1902 he was Minister of Justice in the new Conservative cabinet of that year, and in 1905 he was made a member of the Royal Academy of Moral and Political Science. He was mayor of Madrid from 1907, and upon the organization of the new Cortes, he became president of the chamber. In 1913 on the fall of the Liberal ministry of Romanones he became Prime Minister, but was soon after displaced by a Liberal ministry under Canelejas.

DATURA, a genus of plants of the potato family (*Solanaceae*). It contains about 15 species, widely distributed. The genus is represented in the United States chiefly by coarse weeds naturalized from tropical America. Jamestown or Jimson weed (*D. stramonium*) is said to have received its name from a poisoning that occurred from its use by the settlers of Jamestown, Va. It is also called thorn-apple, It is found in waste places from the eastern seaboard west to Minnesota and Texas. The purple thorn-apple or purple stramonium (*D. toto*) is also found there and in some other regions. An extract from these plants is used in medicine. When taken internally it is a powerful narcotic; medically it is used in mania, convulsions, epilepsy, tic-douloureux, etc. When smoked it palliates the symptoms in asthma. The seeds of some species were used by the aboriginal Americans as narcotics. Some plants of the genus are cultivated for their showy flowers. The seeds of certain species are said to have been used to produce the frenzied ravings of the priests of Baphomet and some other temples. The Peruvians use for the same purpose *D. sanguinea*, manufacturing from it also an intoxicating beverage.

DAUTURINE, a poisonous alkaloid found in the thorn-apple (*Datura stramonium*), and now known to be identical with tropin.

DAUB, dap, Karl, German Protestant theologian: b. Cassel, Germany, 20 March 1765; d. Heidelberg, Baden, 22 Nov. 1836. He became professor of theology at Heidelberg from 1795. His works include 'Lercbuch der Katechetik' (1801); 'Theologumena' (1806); 'Die Dogmatische Theologie jetziger Zeit' (1833). He attempted to reconcile philosophy with theology.

DAUBAN, dō-băn, Jules Joseph, French painter: b. Paris, 31 May 1822; d. 1908. He was a pupil of Auguste Debay. His taste led him to historical and religious subjects, and his compositions, severe in design and of great simplicity in the accessories, are somewhat cold and sober in color. He became director of the museum and the School of Fine Arts in Angers in 1849, received a medal in 1864 and the decoration of the Legion of Honor in 1888. Among his works are 'Louis XI, presenting Guillaume de Cerisy as Mayor of Anjou' (1861); 'Reception of a Stranger by the Trappists' (1864), Luxembourg Museum; 'Trappists Exchanging the Kiss of Peace before Communion' (1865), Museum of Angers; 'Madame d'Anjou Going to the Revolutionary Tribunal' (1869); 'Fra Angelico da Fiesole' (1873); and several portraits and decorative paintings. His last important work was six decorative compositions for the church of Quintin (Côtes-du-Nord).

DAUBENTON, du-bē-ton, Louis Jean Marie, French naturalist and physician: b. Montbard, Côte-d'Or, France, 29 May 1716; d. Paris, 31 Dec. 1799. He became celebrated for his participation in the 'Histoire naturelle' by his friend Buffon; the anatomical part of which was prepared by Madre, was characterized by its accuracy, clearness and sagacity. In 1744 he was chosen member of the Academy of Sciences, and enriched its publications by a number of anatomical discoveries, and also by researches concerning the species of animals and their varieties, the improvement of wool, and the
treatment of the diseases of animals. He threw much light upon mineralogy, botany and agriculture, and proposed a new method for the classification of minerals. He was the author of numerous works of general utility, such as 'Instruction pour les bergers' (1782); 'Mémoire sur les intoxications,' and many others. He became a professor of natural history in the College of Medicine in 1778 and about seven years after professor of mineralogy in the Museum of Natural History. During the Reign of Terror, when the government and many people were in danger of patriotic spirit, he was represented to his section as employed in introducing the Spanish sheep into France.

DAUBENY, dâ-bë-nil or dob-nil, Charles Giles Bridle, English scientist: b. Stratton, Gloucestershire, 11 Feb. 1795; d. Oxford, 13 Dec. 1867. He was educated at Winchester School and Magdalen College, Oxford, and practised for some years as a physician in Oxford. In 1819 he visited Auvergne, and in 1837 made a scientific visit to the United States. From 1822 to 1835 he was professor of chemistry in the University of Oxford. In 1834 he became professor of botany, and in 1840 of rural economy in the same university. He held the last appointment till his death. His principal works are 'A Description of Active and Extinct Volcanoes' (1826); 'An Introduction to the Atomic Theory' (1831); with a supplement, 1840); 'Mineral and Thermal Waters' (1836); 'Lectures on Agriculture' (1841); 'Sexuality of Plants' (1860); 'Lectures on Climate' (1853).

D'AUBIGNÉ, dâ-bèn-yâ, Jean Henri Merle, Swiss ecclesiastical historian: b. Eaux-Vives, near Geneva, Switzerland, 16 Aug. 1794; d. Geneva, 21 Oct. 1872. In 1818 he became pastor of the French Protestant church in Hambourg. In 1823 he was appointed court-preacher at Brussels; but after the revolution of 1830 returned to Geneva, and filled the chair of church history in its theological seminary until his death. The work which has given him a widespread reputation is his 'Histoire de la Réformation au Seizième Siècle' (1835-53), which has been translated into most European tongues. In his biography of John Calvin, ferocious pathy that is often eloquent, although the narrative is too graphic to be everywhere exact. Among his other writings are 'Germany, England and Scotland' (1848); a vindication of Cromwell (1848); 'Trois Siècles de Lutte en Écosse' (1849); and 'Histoire de la Réformation en Europe au Temps de Calvin' (1862-78).

D'AUBIGNÉ, Merle. See D'AUBIGNÉ, JEAN-HENRI MERLE.

D'AUBIGNÉ, Théodore Agrippa. See D'AUBIGNÉ, D'.

DAUBIGNÉ, dô-bë-nil, Charles François, French landscape painter and etcher: b. Paris, 15 Feb. 1817; d. there 19 Feb. 1878. He studied under his father, who was a miniature painter; and afterwards went to Paris, where he was exhibited in the Salon, though his full recognition came only after the artist had reached his 50th year. He devoted himself to close and sympathetic study from nature, working much on the Seine in a houseboat, and developed a style of landscape art marked by singularity unaffected fidelity and originality. In 1853 he gained a first-class medal with his 'Pool of Gylien.' In 1857 he produced his 'Springtime'; in 1861 'The Banks of the Oise'; in 1872 'Windmills at Dordrecht'; and in 1877 his large and very impressive 'Rising Moon.' His 'Sluice in the Valley of Optevoz' (1835) and his 'Vintage' (1853) are in the Luxembourg Gallery. The public galleries of America contain numerous paintings by Daubigny, and small sketches were sold to private collections. He is also known as a book-illustrator and as a vigorous etcher, having produced over 100 plates. Some reproductions, others direct from nature, metal by great frankness of method and free painter-like quality. Consult Henriet, 'Daubigny et son œuvre' (1878); Van Dyke, 'Modern French Masters' (1896); Strahan, 'History of French Art' (1900).

D'AUBUSSON, PIERRE. See AUBUS-ON, PIERRE D'.

DAUCUS, dâ-kûs, the typical genus of the Umbellifera or carrot family. The genus has about 25 species, two of them growing wild in America. Wild carrot, crow's-nest, or Queen Anne's lace (D. carota), is generally a pernicious and abundant weed that grows in clumps. It is a native of Asia, naturalized from Europe. It is the original of the cultivated carrot. See CARROT.

DAUDET, dô-dê, Alphonse, French novelist: b. Nimes, 13 May 1840; d. Paris, 16 Dec. 1897. He was educated at the Lyons Lycée and for two years after leaving it supported himself as an usher at Alais. Going to Paris in 1857 he took to writing verse, his first volume being 'Les Amoureuses' (1858), which met with some success. This was followed by other poems, including 'La Double Conversion' (1859), and at this time he also contributed to the Figaro and other journals. About 1862 he began writing for the stage, and during the succeeding 10 years or so several dramas by him were represented but only with moderate success. These included 'La Dernière Idole' (1862); 'L'Eillet Blanc' (1865), and 'Le Frère Ainé' (1868). Greater public favor was accorded to his 'Lettres de mon moulin,' which appeared in 1866 in a Parisian journal. In 1872 he produced his novel 'Les Avantures Prodigieuses de Tartarin de Tarascon,' an amusing satire on the boastfulness so characteristic of the south of France. From this time he published numerous works, some of the best being 'Fromont Jeune et Risler Ainé' (1874); 'Jack' (1876); 'Le Nâhâb' (1877); 'Les Rois en Exil' (1879); 'Numa Roumes-tan' (1881); 'L'Evangéliste' (1883); 'Sapho' (1884); 'Tartarin sur les Alpes' (1885), a sequel to 'Les Avantures Prodigieuses' 'Trente Ans à Paris' (autobiography) (1887); 'Souvenirs d'un Homme de Lettres' (1889); 'Port Tarascon, dernières Avantures d'Illustre Tartarin' (1890); 'Rose et Ninette' (1892); 'La Menteuse' (1893); 'Entre les Frises et la Rampe' (1894); 'La Petite Paroisse' (1895); 'Colères d'Illen' (1896) and 'Entretien d'une Etoile' (1896); 'Les Mères' (1896); 'Le Trésor d'Arlatan' (1897); 'La Fédor' (1897); and 'Soutien de Famille' (1897). M. Daudet has often been compared with Dickens in his mastery of pathos and humor. Some of his principal works rely mainly on his great powers of caricature for their success.
DAUDET — DAUGHTERS OF THE REVOLUTION

Literary critics appreciate Daudet for his polished style, his originality and his insight into the foibles of humanity. His unaffected sympathy, somewhat tinged with a certain melodramatic sentimentality, and his loving sense of humor constitute his greatest appeal to the average reader. His works have been translated into English and in this dress have been very popular. A complete edition appeared in Boston in 1900. (See SAPPHO, Thomas Brunetière, 'Le Roman naturaliste' (1895); Ratti, G. A., 'Les Idées morales et littéraires d’Alphonse Daudet d’après ses Œuvres' (1911); Daudet, L., 'Alphonse Daudet' (1896).

DAUDET, Ernest Louis Marie, French novelist and historian; b. Nîmes, 31 May 1837. He is a brother of Alphonse Daudet (q.v.). His most notable novels are 'The Venus of Gordes'; 'The Bloom of Sin'; 'Martha.' He is author of an autobiographical sketch, 'My Brother and Myself' (1882). Completely eclipsed in fiction by his brother he devoted his energies to the field of historical research, in which he became known as a prolific and reliable contributor. His noteworthy works are 'History of the Royalist Conspiracies in the South during the Revolution' (1881); 'History of the Emigration' (1886); 'Les Bourbons et la Russie pendant la Révolution française' (1888); 'Les Récits des Temps révolutionnaires' (1908); 'Tragédies et Comédies de l’Histoire' (1912). Consult Ernest-Charles 'Les Samedis littéraires' (Paris 1900).

DAUGHTER OF THE CONFEDERACY. See DAVIS, VARINA ANNE JEFFERSON.

DAUGHTER OF THE REGIMENT. The opera comique in two acts by Gaetano Donizetti (libretto by Bayard and St. Georges), first produced at Paris, 11 Feb. 1840. While in most of his operas Donizetti is pure Italian, in this he comes close to the French type of opera. With 'Don Pasquale' and 'L’Elisir d’Amore,' both of which are buffa operas, it forms the group out of the long list of works accredited to the composer which seems to possess the greatest vitality. The music is vivacious and sparkling, with a raciness born of the combination of French and Italian manner. The deeper note is heard just enough to give the needed contrast, as in Marie’s touching farewell song at the end of the first act, one of the finest melodies in Italian opera. The "Rataplan" duet between Marie and the Sergeant, recurring through the latter scenes, the Song of the Regiment, the romance in the second act with the amusing interruptions into the military spirit and the rousing choruses are household favorites. It is one of those strange instances of erroneous first impression that the opera was not successful in Paris after it had gone the rounds of the other European capitals. The rôle of Marie, the vivandière for whom the courting officer of several parts is a great success, one and has always been popular with the great artists, such as Jenny Lind, Patti, Sontag and Sembrich. Donizetti has always been famed as a writer of prima donna operas—a reputation not altogether undeserved. In 'The Daughter of the Regiment' this claim, in its better sense, is well supported.

LEWIS M. ISAACS.

DAUGHTERS OF THE AMERICAN REVOLUTION, a society composed of women who are descendants of ancestors, any of whom with unfailing loyalty rendered material aid to the cause of independence as a recognized patriot, as soldier or sailor, or as a civil officer in any of the departments of government or States. It was organized in Washington, D. C., 11 Oct. 1890. Its objects are to perpetuate the memory of the spirit of the men and women who achieved American independence; to promote institutions of general and general knowledge; to cherish, maintain and extend the institutions of American freedom; to foster true patriotism and love of country; and to aid in securing for mankind all the blessings of liberty. The society has a membership of 115,865 women, organized into 1,435 local chapters. Delegates from all chapters meet in annual congress in Washington in the third week of April. The society has collected many historical relics, and it has also a valuable historical and genealogical library at its headquarters in the National Society was incorporated by Act of Congress in 1896 and, in accordance with that act, reports annually to Congress. The society publishes The American Monthly Magazine and also a series of lineage books containing the record of the ancestry of each member of the organization.

DAUGHTERS OF THE CONFEDERACY, United, an association of the widows, wives, mothers, sisters and lineal female descendants of men who served honorably in the army and navy of the Southern States or who gave personal services to the Confederate cause. It was organized at Nashville, Tenn., 10 Sept. 1894, and to date has 1,575 chapters in the United States and one chapter in Mexico City. The organization has about 90,000 members.

DAUGHTERS OF THE HOLLAND DAMES, a colonial society of women, the official title being 'The Daughters of Holland Dames, Descendants of the Ancient and Honorable Families of New York,' was incorporated for the purpose of erecting a memorial to commemorate the early Dutch period of our colonial history and to preserve and collect historical documents relating to the same. The headquarters are in New York. This society is not connected with the Holland Dames.

DAUGHTERS OF THE KING, The Order of, a Protestant Episcopal order of women (not to be confounded with the King’s Daughters), organized in 1885. The aim of the society is to bring young women within the influence of the Church and to co-operate with the rectors of parishes to that end. The office of the council is in New York. Its constitution is framed as far as it is possible on the terms of the Brotherhood of Saint Andrew, the men’s organization of the Protestant Episcopal Church to whose purposes and work it closely corresponds. The membership is about 4,500, with about 415 societies, and 900 chapter chapters. It holds a triennial convention. Its official organ is The Royal Cross.

DAUGHTERS OF THE REVOLUTION, a patriotic society of women in the United States, organized in 1891. Eligibility to membership is restricted to women who are lineal descendants of an ancestor, a military or naval or marine officer, soldier, sailor or marine, in actual service under the authority of any of the 13 Colonies or States,
or of the Continental Congress, and remained always loyal to such authority, or descendants of one who signed the Declaration of Independence, or of one who as a member of the Continental Congress or of the Congress of any of the Colonies or States, or as an official appointed by or under the authority of any such representative bodies, actually assisted in the establishment of American independence by service rendered during the War of the Revolution, becoming thereby liable to conviction of treason against the government of Great Britain, but remaining always loyal to the authority of the Colonies or States.* There were numerous subordinate State organizations. The total membership is about 4,000.

DAUGHTERS OF 1812. See United States Daughters of 1812, National Society of.

DAULATABAD, dow-lät-ä-bäd' ("fortunate city"), India, a town and fort in the Deccan, within the Nizam's dominions, 28 miles northwest of Hyderabad. The fortress consists of a conical rock, 600 feet high, with a wide ditch and an outer wall nearly three miles in circumference. The place surrendered to the Mohammedans in 1294, and Shah Murhammad Tughlak (1324-51) thrice attempted to remove the seat of government hither from Delhi. The fortress has not been garrisoned now for many years and the town has greatly decayed. Pop. about 1,000.

D’AUTNOY, döwlée, Marie Catharine Julie de Berneville, Countess, French writer: b. about 1650; d. 1703. She wrote many romances, but the names of the majority are lost to safe oblivion, but her fame rests securely on her "Fairy Tales," written in a simple, bright and charming style, not altogether unworthy of Perrault. "The White Cat," the "Yellow Dwarf," "Finette Cendron," and "Le Mouton" have for two centuries been naturalized in the nurseries of Europe and are still familiar figures in pantomime. Her altogether delightful "Travels in Spain" was reissued in New York in 1898.

DAUMER, döw'mér, Georg Friedrich, German poet and philosopher, often referred to under his pen name Eusebius Emmeran: b. Nuremberg, 5 March 1800; d. Würzburg, 14 Dec. 1875. He was educated at the Universities of Erlangen and Leipzig and in 1822-30 was a professor in the Nuremberg Gymnasium. He underwent some remarkable revolutions of thought concerning religion; in his student days leaned strongly to Feticism; next was the declared foe of the Catholic religion and about 1859 embraced Catholicism and became one of its foremost champions. He wrote among many other philosophical tracts "Hints Toward a System of Speculative Philosophy" (1831); to his second period belongs: "The Fire and Moloch Worship of the Hebrews" (1842); to his third: "My Conversion" (1859). Of his poetical works, the "Flowers of Song from Hafiz" may be named—a very beautiful transcription of the Oriental poet, with free variations in the very spirit of Hafiz himself. He wrote also "Beautiful Souls: a Little Wreath of Legends and Poems" (1862); "Legends and Poems of Saint Mary." For a time he was instructor of the celebrated foundling Kaspar Hauser, in regard to whom he published "Mittheilungen über Kaspar Hauser" (1832); "Enthülungen über Kaspar Hauser" (1859); and "Kaspar Hauser, sein Wesen, seine Urschuld" (1873).

DAUMIER, dômər, Honoré, French caricaturist and painter: b. Marseilles, 26 Feb. 1808; d. Valmondois, 10 Feb. 1879. His father tried to dissuade him from entering the artistic profession by apprenticing him to a hussier and later with a bookseller. He managed, however, to master the technique of etching and entered on his career by making plates for music publishers and illustrations for advertisements. He joined the staff of La Caricature under Philon and started upon his pictorial campaign of satire. Fashion, little-tattle, scandal, politics, blemishes of figure and oddities of character in turn inspired his inexhaustible genius for mockery. Few among his illustrious contemporaries escaped his pencil, and his caricatures had always some strikingly truthful feature about them. His caricature of Louis Philippe as "Gargantua" led to his imprisonment for six months in 1832. La Caricature was discontinued soon after, but was replaced by Charivari, where Daumier continued his famous social caricatures in a series of sketches known as the "Robert Macaire" series. The Revolution of 1848 turned him toward the political field and suggested two of his most remarkable series, "Parliamentary Idylls" and "The Representatives Represented." Despite his prodigious activity in the field of caricature—he has left about 3,958 lithographs—he found time for painting. He produced several remarkable works in this field, such as "Christ and Apostles," at the Ryks Museum in Amsterdam; "The Good Samaritan," "Don Quixote and Sancho Panza," "Christ Mocked," etc. He is represented in the Louvre, "The Thieves and the Ass," and the "Republic," also in the museums of Berlin, Bucharest, The Hague, Montreal, Rheims and by two pictures in the Metropolitan Museum, New York. As a painter he was one of the pioneers of naturalism, and died without much success until shortly before his death, when an exhibition of his works demonstrated the full range of his genius. His ability as a painter has only become generally known since the exhibition of his work in 1900. He was appreciated and loved by his great contemporaries, Victor Hugo, Balzac, Corot, Daubigny, Courbet, Rousseau and Diaz. He became blind in 1877 and in his last days was befriended by Corot, in whose house he died at Valmondois, Seine-et-Oise. Consult the complete catalogue of his lithographs by Hazard and Delflé (Paris 1904); the biographies by Alexandre (Paris 1890) and Kloosowski (Munich 1914) and Geoffroy and Frantz and Uzanne Daumier and Gavarni (London, the Studio, 1904). Consult also brief works on his lithographs by Marcel (Paris 1906) and Cory (London 1907) and Champetillery "Histoire de la caricature moderne" (Paris 1872).

DAUN, L. J. C. See DHAUN, LEOPOLD JOSPEH MARIA, COUNT VON.

DAOUNOU, dô'noo', Pierre Claude François, French statesman: b. Boulogne-sur-Mer, 1761; d. Paris, 1840. He joined the Congregation of the Oratory in 1777. On the outbreak of the Revolution he became a member of the
National Convention. He opposed the execution of Louis XVI and advocated his deportation pending a settlement. He was opposed almost on principle to the death penalty. He was imprisoned and escaped the guillotine only by the downfall of Robespierre. He was first president of the Council of Five Hundred and prepared a program of study for the central schools which was adopted in 1795. He was librarian of the Panthéon in 1801 and added to it the valuable collection of Pius VI. He was archivist of the Empire in 1807 and founded the Bibliothèque des Archives Nationales. He edited the *Journal des Savants* after 1816. He wrote *Histoire littéraire de la France* and *Essai historique sur la puissance temporelle des papes* (1810). Consult Taillandier, *Documents biographiques sur Daunou* (Paris 1841).

**DAUPHIN, dăťn.** Fr. *dô-făn*, the title of the eldest son of the King of France. Dauphin was originally a title held by several of the feudal lords of France and is believed to have originated from the dolphins (*Fr. dauphin*) worn on their helmets or used as a family crest. In 1349 Humbert II, dauphin of Viennois, was childless, transferred his estate, called the Dauphiny (*le Dauphiné*), in the south of France, to Philip of Valois, on condition that the eldest son of the King of France should in future be styled the dauphin and govern this territory. The dauphin, however, retained only the title, the estates having been united with the crown lands. On the death of the dauphin his eldest son inherited the duchy, and no sooner was his eldest brother succeeded him. If the king had no son, as was the case in the reign of Louis XVIII, the title of dauphin was not bestowed on any one: for it was never given to the next prince of the blood and presumptive heir, even if he were the king's brother. The wife of the dauphin was called dauphiness (*dauphine*). The *Delphín classics* (*q.v.*), were editions made for the use of the dauphin (*in usum delphin*).

**DAUPHINÉ, dăťn-n.** One of the ancient provinces of France. It was divided into Upper and Lower Dauphiné. It comprised the departments of the Isère, the Hautes-Alpes and part of the Drôme. The capital of the whole was Grenoble. The province constituted a sort of triange, bounded north by Bresse and Savoie, east by Piedmont, south by Provence and west by the Rhone. After the fall of the Roman Empire, it passed into the control of the Franks and eventually became part of the new Burgundian kingdom of Arles. From 1032 until the middle of the 14th century it was in the possession of Germany. It was bequeathed to France by the lords of the kingdom and for the next century was governed as a separate province by the eldest son of the King of France, when it was finally made part of the kingdom of France. The Huguenots made this place their stronghold during the civil wars.

**DAURAT, dă-râ', Jean.** French scholar: b. about 1510; d. 1588. He became president of the Collège Coqueret, where he superintended the studies of Ronsard, Du Bellay, Baif, and Beline. These poets he carefully trained for the Church, and WINNING the vernacular, and ennobling French literature by the imitation of Greek and Latin models. He wrote nothing of importance in French, but devoted himself to guiding and stimulating the other members of the Pléiade, or seven great poets of the age, in whose works his learning and enthusiasm were reflected. The younger poets, like Jean Labeaux, in *Pléiade française* (Paris 1875).

**DAUTHENDREY, Max.** German poet: b. Würzburg, 1867. He is descended from an old family of nobility, which came to Germany from France and England in the 16th century. His father achieved some distinction as a pupil of Daguerrée in Paris and subsequently as court photographer in Saint Petersburg. From that city he migrated to Würzburg where in 1867 his son was born. Of a highly imaginative disposition from his earliest childhood, young Dauthendrey exhibited no little aptitude for painting, although his strongest inclination lay in the direction of poetry, to which he soon decided to devote himself. He never attended the university, but pursued his studies at the Gymnasium of his native city far enough to qualify for the shorter, one-year term of military service. As a traveling artist, he visited Paris, England and Sicily in 1896, Mexico the following year, Greece in 1898, and in 1906 made a trip around the world. The poetic chronicle of his impressions from these journeys is his *Die ge- ringelte Erde* (Munich 1910), which bears the subtitle *A Song of Love and the Wonders of the Seven Seas* and ranges from the fish-market of Cairo to the sky-scrappers of New York. Dauthendrey is a lyricist of some originality and power. Although it must be said that his earlier poems (*'Ultra Violett,* 1893), novels and plays (*'Kind,* 'Glück,* 'Sehnsucht,* 1895) are marred by excessive striving after a bizarre and fantastic virtuosity. Since 1907 he has produced a considerable bulk of poetry, of which the best is probably contained in his *Insichversunkene Lieder im Laub* (1908). Perhaps the most agreeable quality in his verse is his delicate nature-sense. His drama *Ein Schatten fiel über den* Tisch (1911) is a sortid exposition of marital infidelity. Among other collections of his lyrics and longer works are *Reliquien* (1889); *'Liebeslieder* (1905); *Singsangbuch* (1907); *Lachen und Sterben,* two one-act plays (1911); and *'Der Geist meines Vaters* (1912), which purports to be a history of his family.

**WILLIAM A. BRAUN.**

**DAUW, dà, or PEECHI (Equus bur- chelli),** an animal closely resembling the zebra, which inhabits the plains of southern Africa, particularly to the north of the Orange River. It is about the size of an ass, but more delicately formed. Its general color is a pale brown, with grayish-white on the abdomen and inner parts of the limbs. Its head, neck, and body, and the upper parts of its limbs are striped like the zebra, but the stripes are not so dark in color. It migrates periodically for food, and in times of scarcity visits the cultivated lands and makes havoc of the crops. It has been tamed to some extent, but its temper cannot be relied on. The Dutch colonists call it Bonte-quagga. It is known also as Burchell's zebra. See ZEBRA.

**DAVAO, dâ-vâ'ô, Philippines,** a province in the southeastern part of the island of Mindanao; area 8,976 square miles; with dependent islands 9,171 square miles. Most of the com-
munication between towns and villages is by sea, as almost all are on the coast; there are a few large inland towns, and the United Szerb troops have done much to improve them. Hemp, coffee, tobacco, rice, and corn are cultivated; the cinnamon tree, the betel nut, cloves, and nutmeg grow without cultivation; large numbers of horses, cattle and hogs are raised. There are indications of deposits of coal and some gold, and there are many valuable forests, well watered by numerous streams. Davao, the chief town, is situated on a bay of the west coast of the gulf of Davao. Davao was occupied by United States troops in December 1899, and was given civil government in 1903.

DAVENANT, John, English clergyman and author; b. London about 1570; d. 1641. He was educated at Queen's College, Cambridge, and in 1597 accepted a fellowship in the college. In 1609 he became Lady Margaret Professor of Divinity. The same year also he was advanced to the degree of D.D. In 1614 he became Master of his college. The greatest honor of his life came to him in 1618 when he was appointed as one of the four clergymen who were sent from England to attend the meeting of the Synod of Dort. In 1631 he became bishop of the See of Salisbury. He incurred the displeasure of King James I by preaching before him on the subject of predestination, a subject which was not allowed to be discussed according to royal order. Charges were preferred against him and he had to humble himself before the king. He was one of the great scholars of the time. According to the custom then in vogue he wrote his works in Latin. His 'Treatise on Justification' has been translated into English (2 vols., 1844-46). His most noted work was a commentary on the Epistle to the Colossians.

DAVENANT, Sir William, English poet and dramatist; b. Oxford, February 1606; d. London, 7 April 1668. He was employed in preparing several masques for the entertainment of the court; and on the death of Ben Jonson in 1637, he succeeded to the vacant laurel. With hostilities breaking out between Charles I and the Parliament, Davenant displayed his attachment to the royal cause. At the siege of Gloucester in 1643, he was knighted by the king; and on the decline of the royal cause retired to France, where he became a Roman Catholic, and began the composition of his principal work, a heroic poem, entitled 'Gondibert.' An attempt which he afterward made to lead a French colony to Virginia had nearly proved fatal to him. The ship in which he had sailed from Normandy was captured by a cruiser in the service of the English Parliament, and carried into the Isle of Wight, where Davenant was imprisoned in Cowes Castle. In this forlorn captivity, from which he had but little hope of escaping alive, he composed the third book of 'Gondibert.' In October 1650 he was removed to London for trial before the high commission court. His life is said to have been preserved by the interposition of Milton. There is a corresponding tradition, that Davenant received a visit from Milton by protecting the republican poet after the Restoration. On the return of Charles II to England the stage was re-established with renewed splendor, and Davenant became patentee of a theatre in Lincoln's Inn Fields. He continued to employ his pen and his talents as a theatrical writer and manager till his death in 1673; he was one of the principal authors of opera on the English stage, and women in female rôles has been ascribed to him. He was buried in Westminster Abbey. His works consist of dramas, masques, addresses, and the epic 'Gondibert,' which was never finished; but he is remembered chiefly by the composition of Shakespeare's 'Tempest,' in which he was engaged along with Dryden, a work which long held the stage in place of the original, although unequivocally condemned by modern criticism as a vulgar and degraded version of a drama which stood in need of no such emendation. His plays were edited by Laing and Maidment (5 vols., Edinburgh, 1872-74).

DAVENPORT, Charles Benedict, American biologist; b. Stamforn, Conn., 1 June 1866. He was graduated at the Brooklyn Polytechnic Institute in 1886, at Harvard in 1889, and took the degree of Ph.D. at the latter place in 1892. In 1888 he began to teach at Harvard, where he was instructor in zoology until 1899. In 1904 he became director of the station for experimental evolution at Cold Spring Harbor, L. I. In 1899-1904 was assistant professor of zoology at the University of Chicago. In 1906 he was president of the American Society of Naturalists. His works include 'Observations on Budding in Paludicella and Some Other Bryozoa' (1891); 'On the Life History of Utratella Gracilis' (1893); 'Experimental Morphology' (1897-99); 'Statistical Methods, with Special References to Biological Variation' (1899); 'Introduction to Zoology,' with Gertrude Crotty Davenport (1900); 'Inheritance in Poecilia' (1906); 'Inheritance of Characters in Domestic Fowl' (1909); 'Heredit of Skin-Color in Negro-White Crosses' (1913); 'Heredity in Relation to Eugenics' (1913); 'Eugenics' (1910); 'The Feebly Inhibited' (1915).

DAVENPORT, Cyril James, English authority on bookbinding; b. Stirling, Scotland, 5 June 1848. He became an official of the British Museum 1868, and became superintendent of bookbinding there: 'The English Regalia' (1897); 'Royal English Bookbindings' (1892); 'Cantor Lectures on Decorative Bookbindings' (1888); 'English Embroidered Bookbindings' (1899); 'Cantor Lectures on Cameos' (1900); 'Life of T. Berthelet' (1900); 'Personal Jewelry' (1902); 'Mezzotints' (1903); Bargford's Notes on Bookbindings' (1904); 'History of the Book' (1908); 'English Heraldic Book-stamps' (1909); 'Cameo Book-stamps' (1911); 'Caster Lectures on Miniatures' (1913); 'English Heraldry' (1914).

DAVENPORT, Edward Loomis, American actor; b. Boston, 15 Nov. 1814; d. Canton, Pa., 1 Sept. 1877. His first appearance was made in 1836 at Providence, R. I., as Parson Will in 'Sir Giles Overreach,' with Junius Brutus Booth as Sir Giles. In 1838 he played in Philadelphia. He soon became a leading performer in comedy, melodrama and tragedy. Up to 1847 he appeared chiefly in Boston. In that year he went to England with Mrs. Mowatt, there playing Claude Melnotte in 'The Lady of Lyons,' with Mrs. Mowatt as the Pauline. For two seasons he supported W. C. Macready. In 1854 he returned to the United States, where he traveled extensively, playing
especially Shakespearean parts and those in dramatizations of Dickens. As Brutus in 'Julius Caesar' and Bill Sykes in 'Oliver Twist' he was equally successful. Among his other characters were Sir Giles Overreach and Hamlet. In 1859 he became manager of the Howard Athenæum, Boston, and in 1889 of the Chestnut Street Theatre, Philadelphia. His versatility and finish were notable. Consult Edgett, 'E L Davenport' (1901; Dunlap Society Publ., new series, No. 14) Moses, M., 'Famous Actor-Families in America' (New York 1906).

DAVENPORT, Eugene, American agriculturist and educator: b. Woodland, Mich., 20 June 1856. He was graduated from Michigan Agricultural College in 1878; engaged in farming 1878-89; was professor of agriculture in the Michigan Agricultural College, 1889-91; president of Agricultural College, Sao Paulo, Brazil, 1891-92; dean of College of Agriculture of the University of Illinois, since 1895, and director of Agricultural Experiment Station, since 1896; professor of agricultural chemistry, 1891; professor of physiological botany, 1896; professor of plant physiology, 1901. In Illinois he did particularly important work in investigations of soil fertility. Member of the Authors' Club, London; fellow of the American Association for the Advancement of Science. Author: 'Principles of Breeding'; 'Domesticated Animals and Plants'; 'Education for Efficiency.'

DAVENPORT, Fanny Lily Gypsy, American actress: b. London, 10 April 1859; d. Duxbury, Mass., 26 Sept. 1898. Her first appearance on the stage was in 1857 at the Howard Athenæum in Boston, then under the management of her father, E L Davenport (q.v.). Her real début was at Niblo's Garden in 1862, as King of Spain in 'Paint Heart Never Won Fair Lady.' Later she came under the notice of Augustin Daly, and joined his Fifth Avenue Theatre in 1869. She played during her career in the theatres of all the large cities in the United States. Her most noted rôles were in 'La Tosca,' 'Giaconda,' 'Fedora,' and 'Cleo-Patra.' She was married in 1879 to Edwin H. Parry, but was divorced and subsequently married Melbourn McDowell, an actor of leading rôles in her company. In 1897 she produced 'A Soldier of France,' a play with Joan of Arc as the heroine. It was a failure and this is believed to have hastened her last illness.

Her last appearance was on the stage of the Chicago Grand Opera House, 25 March 1898. Consult McKay and Wingate 'Famous American Actors of To-Day' (New York 1896), and Moses, Montrose, J., 'Famous Actor-Families in America' (ib. 1906).

DAVENPORT, Henry Kallock, American naval officer: b. Savannah, Ga, 10 Dec. 1820; d. Franzenbad, Bohemia, 18 Aug. 1872. He entered the navy in 1838, and in 1844, as passed midshipman, became connected with the coast survey. In 1849-53 he was in the mail-steamship service, subsequently was on sea duty with various squadrons, and in 1856 participated in the capture of the Barrier forts, Canton River, China. In 1856 he was made master with the steamer Hetzel in 1861-64, being in 1862-64 senior officer in command of the sounds of North Carolina. Promoted captain in 1868, he was assigned to the command of the Congress of the European squadron in 1870.

DAVENPORT, Herbert Joseph, American educator and publicist: b. Wilmington, Vt., 10 Aug. 1861. He was educated at the University of South Dakota, and the Harvard Law School, and from 1899 to 1902 was principal of the high school at Lincoln, Neb. He was instrumental in political economy at the University of Chicago 1902-08 and in the latter year was made head of the department of political economy at the University of Missouri. He has published 'Outlines of Economic Theory' (1896); 'Elementary Economic Theory' (1898); 'Principles of Grammar' (with Emerson, 1898); 'Value and Distribution' (1908); 'Economics of Enterprise' (1913), and contributions to economic journals.

DAVENPORT, John, American Puritan clergyman: b. Coventry, England, 1597; d. Boston, Mass., 15 March 1670. Educated at Oxford, he became chaplain of Hilton Castle, near Durham, later was minister of Saint Stephen's Church, London, but there attained a considerable reputation as a preacher. His Puritanical principles and views ere long brought him into conflict with Archbishop Laud, and in 1633 he withdrew from the English Church, and removed to Holland, where he became colleague of the Rev. John Paget, pastor of the Puritan church at Amsterdam. In 1636, however, he returned to England, where he was very active in obtaining the charter of the Massachusetts colony. He arrived in Boston in June 1637 with the synod of Cambridge in August, and in March 1638 sailed with the band of colonists that founded New Haven (Quinipiack). Here he was extremely influential in civil as well as ecclesiastical affairs. He was minister there for 30 years, and aided in establishing the system of civil polity, which began by the declaration that 'all of them would be ordered by the rules which the Scriptures held forth to them.' On 4 June 1649, holding their constituent assembly in a barn, the 'free planters' resolved that church members only should be burressees, and Davenport was chosen one of the seven pillars to support the ordinance of civil government. He exhorted the governor to judge justly, and the cause that is too hard for you to bring it to me. Annual elections were ordained, and God's word established as the only rule in public affairs. In his carefulness in regard to the admission of members to the Church, he held in reality also the keys of all political power. When the messengers of the king, who had come to New England in pursuit of Goffe and Whalley, the regicide judges of Charles I, approached New Haven, he hid the fugitives in his house, and preached to his congregation from Isaiah xvi, 3 and 4; 'Hide the outcasts: betray not him that wandereth.' Let mine outcast dwell with Moab: be thou a covert to them from the face of the spoiler. After the death of Wilson, the pastor in Boston, in 1667, he removed there to succeed him. He was installed in December 1668. His election caused a division in the congregation. Those who were opposed to his views on the 'half-way covenant' withdrew and organized the Old South Church. The controversy went on for many years. Among his
publications are 'Discourse About Civil Government in a New Plantation Whose Design is Religion' (1663); 'The Knowledge of Christ Indispensably Required of All Men Who Would be Saved' (1663); 'A Catechism, containing the chief Christian Duties and Duties as a Friend of the Churches' (1663); 'Christian Religion: with Hooke 1659'; 'The Saints' Anchor-Hold' (1661); 'The Power of Congregational Churches Asserted and Vindicated' (1672).

He was also an editor of the works of Dr. John Preston, for some time leader of the English Puritans. Consult Mather, 'Magnalia Christi Americana' (1702), and Dexter, 'Sketch of the Life and Writings of Davenport' ('Papers' of the New Haven Colony Hist. Soc., Vol. II, New Haven, 1877).

DAVENPORT, Richard Graham, American naval officer: b. Washington, D. C., 11 Jan. 1849. In 1869 he was graduated at the United States Naval Academy, was commissioned ensign in the navy, 12 July 1870; promoted through the various grades, retiring after more than 42 years' active service, 30 June 1907, as commodore, while in command of the Georgia. His various assignments included those of aid to the rear-admiral representing the Navy Department at the Centennial Exposition, Philadelphia in 1876, temporary duty at the Chicago Navy Yard in 1893, member of the Board of Civil Service Examiners for nautical experts, president of the permanent general court martial, also navigation and equipment officer and senior member of the board of inspection at the navy yard, Washington, member of the naval retiring board, assistant to the chief of the Bureau of Navigation, and at various times chief of divisions of the Hydrographic Office. During the war with Spain he was second in command of the fleet blockading the coast of Cuba, and later was commander-in-chief of the Eastern Squadron. In 1898-1899 he made a biological survey of the waters around Porto Rico and vicinity. He assisted in revising and editing many sailing directions and nautical books, published by the United States Hydrographic Office.

DAVENPORT, Robert, English poet and dramatist: flourished about 1623; d. after 1640. He is known only through his 'A Crowne for a Conqueror; and Too Late to Call Backe Yesterday. Two Poems, the One Divine, the Other Morall' (1623); 'King John and Matilda' (1655), a tragedy; and two comedies: 'A New Trick to Cheat the Divill' (1639), and 'The City Night Cap' (printed 1661). That he was associated with Shakespeare in producing parts 1 and 2 of 'Henry VI' seems established; and it is almost certain that he is the author of a play called 'The Pirate.'

DAVENPORT, William Edwarus, American social worker: b. North Stamford, Conn., 31 Aug. 1862. He was educated at the Brooklyn Polytechnic Institute 1875-81; and was a special student at the Union Theological Seminary, 1887-99. In 1901 he founded the Brooklyn Italian Settlement, which with other organizations was consolidated in 1910 as the United Neighborhood Guild. In 1902, 1904, and again in 1909 he was foreign correspondent for the Brooklyn Eagle and the New York Evening Post. He is well known as a lecturer on subjects relating to Italian immigration. He has published 'The New Dispensation' (1884); 'Visions of the City' (1884); 'The Perpetual Fire' (1886); 'The Praise of Plymouth' (1892); 'The Poet and His Friends' (1893); 'Beecher-An Ode' (1891); 'Poetical Sonnets' (1896); 'The Beggar Man of Brooklyn Heights' (1894) 'A Month of Solitude in a Nook in the Old World' (1905); 'Moral Effects of the Messina Earthquake' (1910), and contributions to various periodicals.

DAVENPORT BROTHERS, Iras E. (b. 1839) and William H. (b. 1841). So-called "mediums," who professed to be adepts in spiritual arts, and who, by their skill in performing various feats and their clever deceptions, gained many followers. They flourished in 1845-65, but were finally exposed as impostors. Consult Abbot, 'The Davenport Brothers' (1864) and Barkas, 'Lecture on the Davenport Brothers' (1864).

DAVENPORT, Iowa, city of Scott County, of which it is the county-seat, on the western bank of the Mississippi, opposite Rock Island, III., 330 miles above St. Louis, and 184 miles west by south of Chicago, on the Burlington, Cedar Rapids and Northern, the Chicago, Milwaukee and St. Paul, the Illinois Central, and the Illinois, a division of the Union Pacific and other railways. It is pleasantly situated at the foot of the Upper Rapids of the Mississippi, on the slope of a steep bluff which extends for three miles along the river and commands an extensive view. It is connected with the Illinois shore by an iron railroad and carriage bridge, built in part by the Federal government, and costing $1,200,000, and an iron railroad bridge costing $800,000. On Rock Island, which is crossed by the former structure, are the central United States arsenal and armory, military headquarters and other government buildings. The surrounding region is important both agriculturally and for its coal mines. Davenport ships large quantities of farm produce, river-packets from St. Paul to Saint Louis furnishing means of transportation in addition to that of the railways. The flour and grain business is an important one. Among the numerous manufactured products are lumber and planing-mill products, brick and stone, bread and bakery products, carriages and wagons, agricultural implements, woolen goods, and its products, foundry and machine-shop products, cordage, pottery, furniture, cigars and cooperative products. Wholesale slaughtering and meat-packing is also carried on here. The United States census of manufactures for 1914 showed for Davenport 231 industrial establishments of factory grade; employing 5,292 persons, of whom 3,938 were wage earners, receiving annually $2,412,000 in wages. The capital invested totaled $13,413,052, and the year's output was valued at $17,173,000; of this, $7,057,000 was the value added by manufacture.

Davenport has an Academy of Natural Sciences, the organization having been begun 14 Dec. 1867; Saint Luke's, Mercy and other hospitals a public library, a Masonic temple and other important buildings. It is the seat of Saint Ambrose College and other educational institutions, and of the State Orphanage; and it is an episcopal see of the Roman Catholic Church and the Protestant Episcopal Church. The Academy of Natural Sciences regularly publishes 'Proceedings,' and
DAVID

has a large scientific library and a fine collection of mound-builder relics.

Davenport was founded in 1835, in the autumn of which year a company, led by Col. George Davenport, long a resident on Rock Island, was formed for the purchase of a site. In 1838 it was incorporated as a town, and in 1851 a city charter was obtained from the legislature and adopted. The Chicago and Rock Island Railroad was chartered in 1851 and completed in February 1854. The government is by a mayor, biennially elected, and a city council, comprising the mayor and aldermen elected by wards and at large. The annual income is about $540,000; the expenditure is $500,000. Pop. 47,000.

DAVID, 2d king of Israel, shepherd and harpist, royal armor bearer and warrior, exile and monarch, psalmist and conqueror. Biblical sources present a strictly historical picture of one of the leading characters in Scripture, embellished in later legends, rabbinical and Mohammedan. According to 1 Chron. xii, 15, he was the youngest of the seven sons of Jesse of Bethlehem, or as stated in 1 Sam. xvi, 10, and following verse 12, the youngest of the eight sons. Less esteemed than his brothers, he kept his father's sheep, but showed daring courage in their defense. His fame as singer and player was widespread, and was to occasion his summons to the court to cure Saul's chronic melanchoia. His playing on the harp relieved the despondent king, who grew fond of the youth and made him armor-bearer. David's prowess in the constant struggles with the Philistines gained him increasing popular favor, Saul's daughter Michal as wife and his son Jonathan as close friend. But with a king's proverbial fickleness, Saul's fondness changed to envy and hatred, and David fled for safety to the priests of Nob, all of whom, except one, were put to death as traitors by the king. The fugitive now headed a band of resolute men who secured Keilah when threatened by the Philistines but could not make stand against Saul. Varied adventures followed, in one of which he spared the king's life, when he sought refuge among the Philistines and became a vassal of Achish of Gath, receiving Ziklag as residence, where he ruled four months. Then came the luckless battle of Gilboa, with Saul and his three sons slain, and Israel once again under Philistine sway, although Abner, Saul's general, succeeded in founding a small kingdom east of the Jordan in Mahanaim for Saul's son Ishba'l or IshboRESH, as the name appears in Samuel.

At this crisis, David resolved to return to Israel, and was anointed at Hebron as tribal king of Judea, after having begun communications with its tribes and families. He did not abandon Ziklag, however, his relations as vassal of the Philistines. For seven years and a half he continued this arrangement when events rapidly brought about the logical result. Abner's defeat at Gideon, while attempting to conquer for Saul's son David's small kingdom; that general's deposition; David's flight; and the murder of Ishba'l—all this induced Jonathan's young lame son Mephibosheth to offer David the vacant throne, and his anointing followed. The next step was to free Israel from the yoke of the Philistines, which was accomplished after a long series of sanguinary battles. Then he planned to secure another centre for his kingdom, instead of at Hebron, which was too far south; and without much delay he conquered from the Canaanite tribe of the Jebu- nites the city and stronghold of Jerusalem. With solemn services the Ark of the Covenant was transferred, and in memory of its journeys in the wilderness it was at first placed in a tent. It was the prophet Nathan who dissuaded David at that time from building for it a temple at Jerusalem. Despite his triumphs on the battlefield, David retained his sense of humility and yielded to the prophet in a memorable episode (2 Sam. vii, 1–17).

While details are scanty of David's political and military activity as ruler, Ammon, Edom and Moab and their Aramean neighbors on the north were conquered and made tributary, his kingdom thus becoming the most powerful between the Nile and the Euphrates. But now at the height of his fame, David revealed his moral weakness in the incident of Uriah the Hittite, whose husband he indirectly caused to be slain. There followed quickly the episode of his eldest son Amnon and stepsister Tamar, which led to Amnon's death by Absalom, her full brother. Absalom's rebellion next ensued, in which he was slain at the hand of Joab with David's express command. Much bitterness arose with the Judeans, due to internal jealousy among the tribes not yet wholly unified, which David was unable to counteract. Sudden revolt spread which might have proved more serious, had it not been promptly quelled by Joab. The only further cloud on David's remaining years was occasioned by the question of his successor. Adonijah, now the eldest of his sons, had been allowed by David to appear officially in that rôle; but Bathsheba strove to secure the honor for her son Solomon, the youngest. David, who had now grown weak and credulous, believed the rumor that Adonijah had already proclaimed himself king. Hence he was induced to present Solomon to the people as his successor and, after some discussion, had him anointed as king. He died soon after in his 70th year, having reigned 33 years at Jerusalem.

The outline of David's life and work as here presented is based on 1 Sam. xvi to 1 Kings xi, but a somewhat different history is given in 1 Chronicles, which, omitting features that might be regarded as doubtful and offensive, stresses his activity in the organization of the Temple service, the gathering of material for that structure, the planning of every detail, the arrangement of the priests and ritual, subordinate functionaries as well as judges and officials, together with ordinances referring to military matters and the royal lands. Hence arose the tradition of David as the founder of Israel's religious poetry. Although the psalms have special headings assigning their authorship to him, the entire Psalms are credited as Davidic, which modern criticism disputes. His literary skill and dramatic power attained their highest mark in the dirge on the deaths of Saul and Jonathan (2 Sam. i, 19-27). Apart from his genius as poet, he gave Israel its national unity and character, developing a nation out of a collection of tribes and families. In all its subsequent history, with every change in condition and environment, the national idea was never wholly lost. It is not surprising then,
such was the glory of his reign and the strength of his personality, with its human weaknesses which were never extinguated but frankly stated and bore their full penalty in countless sorrows and struggles, that his name belongs to the immortals of Israel and has become interwoven with visions of the future, rising into roseate clouds of saga in many a rabbinical story and later Mohammedan legend.

Bibliography—Cited portions of the Old Testament tell the record of his life. For Davidic legends consult Ginzberg, L., ‘The Legends of the Jews’ (Vol. IV, pp. 81–121); Weil, ‘Biblische Legenden der Muselmänner’; Grünbaum, Max, ‘Sprach und Sagenkunde’ (pp. 311 ff.).

ABRAM S. ISAACS.

DAVID, Saint (Welsh, Dewi), patron saint of Wales: d. 601. He was archbishop of Caerleon and afterward of Menevia, now Saint David’s. He was celebrated for his piety, and many legends of the miracles which he performed are ascribed to him. He was canonized in 1120. Consult Rice Rees, ‘An Essay on the Welsh Saints’ (London 1836).

DAVID I (often called Saint David), king of Scotland: b. about 1080; d. Carlisle, England, 24 May 1153. He was the youngest son of Malcolm Canmore and Saint Margaret. He succeeded his brother, Alexander the Fierce, in 1124. He married Matilda, grandniece of William the Conqueror; and was Earl of Northumberland and Huntingdon when called to the Scottish throne. On the death of Henry I, king of England, he maintained the claim of his niece Matilda against King Stephen, and seized Carlisle, but was defeated at the battle of Northallerton in 1138. He devoted the rest of his reign to the introduction of English civilization into Scotland. He built many castles and founded five bishoprics and many monasteries. He forwarded the process of feudalization which had been begun by his predecessors. He introduced legislation whereby commerce and manufactories were greatly benefited. Much of this is contained in ‘The Acts of the Parliament of Scotland’ (Vol. I, Edinburgh 1844). Consult Robertson, ‘Scotland under her Early Kings’ (2 vols., Edinburgh 1862) and Skene, ‘Celtic Scotland’ (3 vols., ib. 1876–80).

DAVID II, king of Scotland: b. Dunfermline, Scotland, 5 March 1324; d. Edinburgh, 22 Feb. 1371. He was the son of Robert Bruce (q.v.), and succeeded to the throne in 1329. On the death of his father he was acknowledged by the great part of the nation. Edward Baliol, however, the son of John Baliol, formed a party for the purpose of supporting his pretensions to the crown; he was backed by Edward III of England. Battles were frequent, and at first Baliol was successful; but eventually David’s supporters succeeded in driving him from Scotland. David and his queen, who had taken refuge in France, now returned to Scotland and took the reins of government into his own hands. Still, however, the war was carried on with England with increasing rancor, till at length David was made prisoner at the battle of Neville’s Cross—1346—and held prisoner in captivity for 11 years he was ransomed for 100,000 marks. David returned to Scotland but the kingdom was so poor that it was found impossible to raise the ransom. A few instalments were paid and David sought to be rid of further liability in the matter by offering to make Edward III, or one of his sons, his successor in Scotland. The Scottish Parliament indignantly rejected all proposals of this nature, but David treated secretly with Edward III over the matter. He left no children and was succeeded by his nephew, Robert II. As a ruler he was weak and incapable, being the very spirit which animated his father. Consult ‘Chronica gentis Scotorum’, ed. by W. F. Skene (Edinburgh 1872); Burton, ‘History of Scotland’ (ib. 1905); Lang, A., ‘History of Scotland’ (ib. 1900).

DAVID, dà-vèd, Armand, French abbé, naturalist and missionary: b. Espelette, Basses-Pyrénées, 7 Sept. 1826. He entered the congregation of the Lazarists in 1848, teaching the natural sciences for some time at Savoy, and going, in 1862, to China, where he made an enormous collection of plants, minerals and animals, which he sent to the Museum in Paris. In 1866 he undertook a new exploration, chiefly through Mongolia and eastern Tibet, discovering many new genera and species of flora and fauna. In 1872 he made a third voyage to China, lasting two years. Besides the accounts of his journeys, appearing in the archives of the Museum under the title of ‘Journal of My Third Voyage of Exploration in the Chinese Empire’ (2 vols., maps, 1875), he left many works on natural history, among which are ‘Les Oiseaux de China’ (with 24 plates 1877) and ‘Plantes Davidiennes ex Sinorum Imperio’ (1890).

DAVID, Christian, Moravian missionary: b. Sinflieben, Moravia, 31 Dec. 1690; d. Herrnhut, 3 Feb. 1751. At first a Roman Catholic, he was converted to Lutheran doctrines and in 1717 became a Moravian. In 1722 he was the leader of the Moravians who took refuge from persecution with Count Zinzendorf and founded their settlement at Herrnhut. In 1733 he went to Greenland, establishing the first mission there; he later made several visits to Greenland, as well as missionary journeys to Denmark, Holland, Livonia and England. Consult Thompson, ‘Moravian Missions’ (New York 1882). See Moravians.

DAVID, Félicien Cesar, French musician and composer: b. Cadet, Vaucluse, 13 April 1810; d. Saint Germain, near Paris, 29 Aug. 1876. After some vicissitudes he entered the Paris Conservatoire in 1830, and became an ardent disciple of Saint Simon, Fantin and other social speculators. In 1832, with a few companions, he went to the East in order to realize his dreams of a perfect life, but returned disappointed. In 1841 he published his ‘Méodies Orientales’, and soon after his most successful work, the ode-symphony ‘Le Désert’ (1844). His other works include many compositions for strings and for the pianoforte, and ‘Moise sur le Sinaï’ (1840), ‘Chant du Ciel’ (1842), ‘L’Echo de la Montagne’ (1846), ‘L’Eden’ (1848), ‘La Perle du Brésil’ (1851), ‘Herculanum’ (1859) and ‘Lalla Rookh’ (1863). In 1862 he was made an officer of the Legion of Honor, and succeeded Berlioz at the Institute in 1869 and became librarian on being deprived of his post. His work abounds in felicitous and melodious expression, and is pre-eminently marked by the qualities characteristic of French music. Con-
sult Azevedo, A. 'Félicien David' (Paris 1863) and Brancour, R., 'Félicien David' (ib. 1908).

DAVID, Ferdinand, German violinist: b. Hamburg, 19 June 1810; d. near Klostros, Swiss Alps, 18 July 1873. He was a pupil of Spohr; made his debut in 1825; and became leader of Gewandhaus Concerts, Leipzig 1836. He was a friend of Mendelssohn and the teacher of Joachim and Wilhelmj. Among his compositions the five violin concertos, a number of variations and other concert pieces for the violin hold the first rank. It has been truly said that the publication of his 'Hohre Schule des Violinspiels' marked an epoch in the development of modern violin-playing. In 1843 he became first instructor of violin at the new Leipzig Conservatory. Consult Baillege, C., 'Études musicales et nouvelles silhouette des musiciens' (Paris 1889) and Eckard, J., 'Ferdinand David und die Familie Mendelssohn' (Leipzig 1889).

DAVID, d'aurev, Gerard (Gheerardart Davit), Dutch painter: b. Oudewater about 1460; d. Bruges, 13 Aug. 1523. He studied with Dutch masters, perhaps with Aelbert Ouwater at Haarlem. In 1484 he entered the Painters' Guild of Bruges. He was made dean in 1501. Here he studied the works of the Van Eycks, Van der Weyden, Vander Goes and Hans Memling. He was soon recognized as the great master of Bruges, was awarded several important commissions by the city and became closely identified with the religious life of the city. Until recently he was a forgotten master, his importance being but little recognized until the comparative exhibition of Early Flemish masters at Bruges in 1902. In America he is represented in the Metropolitan Museum, New York, by 'Christ's Farewell to the Holy Women' and in the New York Historical Society by 'The Marriage of Saint Catharine' and in private collections. The National Gallery, London, contains an admirable example of his work in 'A Canon and His Patron Saints', a wing from an altar-piece; and among his other pictures are a 'Madonna,' in the museum at Rome; a 'Crucifixion,' in Berlin; and a 'Baptism of Christ,' and a 'Descent from the Cross,' both at Bruges. Consult Bouwmans, T. 'Gerard David, De L'artiste Schule' (Maastricht 1905). For his paintings in America see Bodenhuser and Valentiner, 'Zeitschrift für bildende Kunst' (Vol. XXII, Leipzig 1911).

DAVID, Jacques Louis, French painter: b. Paris, 30 Aug. 1748; d. Brussels, 29 Dec. 1825. He studied under Vien and entered the schools of the Academy. After obtaining the grand prize in Paris he studied in Rome from 1775 to 1780, devoting himself particularly to historical painting. He visited Rome a second time in 1784 and finished his masterpiece, the 'Oath of the Horatii,' which Louis XVI had commissioned him to design from a scene in the Horaces of Corneille. In the same year he painted his 'Belisarius'; in 1787, the 'Death of Socrates'; and in 1788, 'Paris and Helen.' He finished, in 1789, a large painting representing the departure of the brothers of the Jacobins, and also furnished the designs of the numerous monuments and republican festivals of that time. In 1792 he was chosen an elector in Paris; afterward a deputy in the National Convention; and during the reign of Terror was one of the most zealous Jacobins and wholly devoted to Robespierre. He proposed to erect a colossal monument of the nation on the Pont-Neuf, from the materials of the king's statue. At the trial of Louis XVI he voted for his death. In 1793 he executed the 'Rejoicing of the Saints, Women,' from the exhibition of which he received, as it is said, 100,000 francs. In 1804 the emperor directed him to execute four pieces, among which the coronation of Napoleon was particularly distinguished. Among his finest works of this period were many representations of the emperor, particularly that in which Napoleon was presented on horseback, on Mount Saint Bernard, pointing out to his troops the path to glory. This is often engraved. While court painter to Napoleon he produced the colossal canvas, 'The Coronation of Napoleon I' (now at Versailles); which has been regarded as the greatest historical painting of the 19th century. In 1814 David painted 'Leonidas,' his last painting in Paris. After the second restoration of Louis XVIII he was included in the decree which banished all regicides from France. He then established himself at Brussels, where he died in exile. While at Brussels he painted some exceptional portraits, notably those of 'Three Ladies of Ghent,' and of the daughter of Joseph Bonaparte. The opinions of the merits of this artist are various, but the praise of correct delineation and happy coloring is universally conceded to him. He found in the history of his time a wealth of subjects which he took an active part, the materials of his representations. Consult the monographs by Coupin (Paris 1827); Chesneau (ib. 1862); Delclosse (ib. 1855); Blanc (ib. 1860); De Villars (ib. 1850); Jules David (ib. 1880); Rosenthal (ib. 1905) and Saumur (ib. 1904). Consult also Muthier, 'Histoire de Modern Painting' (Vol. II, London 1907) and Strahan, 'History of French Painting' (1899).

DAVID, Laurent Olivier, Canadian author: b. Sault au Recollet, Quebec, 24 March 1840. He was educated at the College of Sainte Thérèse, and was admitted to the bar in 1864. He assisted in founding the papers Le Colonisateur, L'Opinion Publique and Le Bien Publique. In the latter he attacked the Roman Catholic clergy in Canada and became involved in political matters. In 1886 he was elected to the provincial legislature from East Montreal, but declined renomination in 1890. He became city clerk of Montreal in 1892, and was called to the senate in 1903. He has written 'Biographies et Portraits' (1876); 'Les Héroes de Chateauguay' (1883); 'Les Patriotes de 1837-38' (1884); 'Les Deux Papineaux' (1896) and 'Le Clergé Canadien: sa mission et son œuvre' (1896); 'Laurier et son Temps' (1905); 'Vingt Biographies' (1905); 'Souvenirs et Biographies' (1910).

DAVID, Pierre Jean, French sculptor: b. Angers, 12 March 1779; d. Paris, 5 Jan. 1856. He is commonly called David d'Angers. Against his father's wishes he came to Paris in 1808, and for a time had a hard struggle with poverty. In 1810 he entered the studio of David and was at the same time the pupil of J. L. David (q.v.). His bas-relief of Epaminondas having gained the first prize for sculpture in 1811, he was enabled to go to Rome to perfect himself in his art. In Rome he came under the influence of Canova. On his return to Paris he laid the
foundation of his fame by a colossal statue of the great Condé in marble. In August 1826 he was nominated a member of the Academy of Fine Arts, and in December of the same year professor in the School of Painting and Sculpture. He executed busts of Goethe for Weimar, of the king of Sardinia, of Thack, of Tuck, of Humbold and Humboldt. In 1830 he fought in the ranks of the Republicans and soon after received the commission for his master-piece—the sculptures of the Panthéon. In 1831 he began the magnificent sculptures of the Panthéon, his budget time and labor, and in 1837 he finished it. He took part also in the revolution of 1848 and became a Member of the Constituent Assembly. He went into exile after the coup d'état of Napoleon III and spent some time in Greece, whence he returned, broken in health, soon after. He executed a great number of medallions, busts and statues of celebrated persons of all countries, among whom may be named Walter Scott, Canning, Washington, Lafayette, Guttenberg, Cuvier, Victor Hugo, Béranger, and Madame de Staël.

David worked with great rapidity and ease, and his chief strength consisted in his facility of invention and execution, especially in large works. In works of smaller size his drawing and modeling are seen to be deficient in fineness and accuracy. He was a great master of French Art (New York 1892) and Gosse, 'La Sculpture française depuis le XIVe Siècle' (Paris 1895).

DAVID, dâ-vêth, Colombia, town on the Isthmus of Panama near the west end, 200 miles southwest of Panama city in a fertile plain on the Río David which enters the Pacific eight miles to the south. Stock-raising and the cultivation of tobacco are extensively engaged in; there is a considerable trade and some gold mining. Pop. 9,000.

DAVID AP GWILYM, dâ’vîlîm, Welsh poet of the 14th century. There is a doubt about his dates, some authorities giving 1340-1400; others 1300-68. He had a good education and considerable knowledge of Italian and Latin. His tendency to keen satire was very unpleasant to his kinsmen and neighbors, and he was at one time forced to leave home on this account. He married a girl whom he loved; he addressed nearly 150 poems; though she returned the poet's love she was forced into an uncongenial marriage with a wealthy man. David eloped with her, and, the fine imposed on him by the husband was so heavy that he could not have paid it but for the assistance of the men of Glamorganshire. He is undoubtedly the greatest of mediæval Welsh poets, and has been compared to Shakespeare, Burns, Ovid, and Petrarch. Most of his poems were written in the metre called cynoun, of seven-syllable iambic and couplets. Over 250 of his poems were collected and published by Owen Jones (1789); and a translation published by Arthur James Johnes (1834). Others of his poems have been discovered in manuscript in the Mostly, Library and British Museum, Consult Stern, L. C. "David Ab Gwilym" (in 'Zeitschrift für celtische Philologie,' Vol. VII, pp. 1-265, Halle 1910). See Welsh Literature.

DAVID BALFOUR; Being Memoirs of His Adventures at Home and Abroad, a novel by Robert Louis Stevenson, published in 1893.

A sequel to 'Kidnapped,' this novel opens with the attempt of David Balfour to effect the escape of his friend, Alan Stewart, from Scotland; and to aid Stewart's brother, unjustly imprisoned on a charge of murder. He falls in love with Catriona Drummond, is imprisoned, and after his release he again finds himself to live with Catriona without marriage. Her father interfering, the two are separated; but by the intervention of Alan Stewart they meet again and are married. The novel is in the romantic vein, written with Stevenson's simplicity and directness is artistic in construction. See Kidnapped.

DAVID CITY, Neb., the county-seat of Butler County, situated on the Union Pacific, the Burlington and Missouri, the Chicago and Northwestern railroads, and about 45 miles northwest of Lincoln and 90 miles west of Omaha. It is a trade centre for the populous agricultural region surrounding the city. The city contains a public library, park and Chautauqua grounds. The waterworks and electric-light plant are owned by the city. Pop. 3,000.

DAVID COPPERFIELD. This novel appeared in 20 monthly numbers, beginning in May 1849 and ending in November 1850. After finishing the novel, Dickens remarked that he liked it the best of all his books, his fondness for this child of his fancy, as he called it, was partly due to the fact that the novel was reminiscent of his own early life. Not autobiography exactly, the novel rather runs on correspondencies between the careers of Charles Dickens and David Copperfield. D. C. is C. D. reversed. 'David Copperfield' is the story of a young man, who, by his industry and talents, rises out of the lower middle class—the proletarian almost—into literary fame. He passes through a cruel and degraded childhood, being compelled at one time to earn his living by pasting labels on bottles in a wine-shop withurchins like Mick Walker and Mealy Potatoes, and in the occupation he nearly starves to death. He is befriended by his great-uncle, Charley Wegg, who puts him to school, where he displays unusual abilities; he studies law, learns stenography and becomes an expert reporter in the House of Commons; he writes books and thereby gains a name. Throughout his career he associates with all sorts and conditions of men, from gentlemen down to rascals, some of whom, like Uriah Heep, find their way into jails. He marries twice; the child wife Dora dies, and he becomes supremely happy in the union with the mature Agnes. Everywhere David Copperfield is a skilful mixture of fact and fiction. Dickens drew upon himself and a score of others for personal traits out of which his imagination created characters, rare and new.

Quite apart from autobiography, many readers have regarded 'David Copperfield' as Dickens's best novel. 'Dickens never stood, says his biographer, so high in reputation as at the completion of 'Copperfield.' The popularity it obtained at the outset increased to a degree that approached by any previous novel. 'Pickwick.' The novel was admired by Bulwer-Lytton and Thackeray, and praised by Matthew Arnold, who rarely condescended to notice fiction. 'What treasures of gaiety, invention, life, are in that book! What alertness and re-
souls! What a soul of good-nature and kind-ness governing the whole! These were Arnold's words. In my opinion, 'David Copper-field' contains not a character quite equal to Mr. Pickwick, Mr. Weeble or Mr. Swiveller, but it does it display the grotesque fancy of 'Great Expectations,' or the wonderful intellectual grasp of 'Bleak House.' To know Dickens it is necessary to read all that he ever wrote. But as a work of art 'David Copperfield' is Dickens's masterpiece. It contains little or no melodrama, little or no exaggerated pathos; farce and caricature are held in restraint to the point where they become comedy; incident naturally rises out of character, and character naturally rises out of incident. The most remarkable creation, said to be a remote likeness of Dickens's own father, is Mr. Micawber, the happy impecunious gentleman, whose debts do not trouble him so long as he can keep out of jail; drinks, orates and sighs in perfect contentment, certain that something will turn up. He is not dazzled by the prospect of emigrating to Australia, where something does actually turn up, and he finds ample scope for his rhetoric in a colonial newspaper.

It is a drop from Micawber to Copperfield. The story of his boyhood is excellent, but Copperfield really develops into a cad without the author's knowing it. Nor are Dora and Agnes girls who now greatly interest readers. But there is the eccentric Betsey Trotwood who treats Mr. Dick the lunatic as if he were sane and protects David against Mr. Murdstone. She is admirably conceived and developed. And there are Peggotty, nurse and servant, with cheeks and arms so red that the birds might peck them in preference to apples, and her brother the fisherman and Barkis who 'was willin,' and finally won her. In depicting the Peggotty group of characters Dickens rendered the mingled humor and pathos and heroism of humble life in a surprising manner. And was there ever elsewhere an undertaker like Mr. Omer? Streaks of pain and crime run through the book, but scoundrels like Steerforth and Uriah Heep are somehow forgotten for the full. David Copperfield's fate has been observed, 'Is the perfection of English mirth.'

Milburn L. Cross,
Professor of English, Yale University.

DAVIDGE, William Pleater, American actor: b. London, England, 17 April 1814; d. Cheyenne, Wyo., 7 Aug. 1888. He made his first appearance on the stage at the Drury Lane Theatre in London; after acting in various places in England, came to the United States in 1853, played the part of Sir Peter Teazle at the old Broadway Theatre in New York, supported Forrest, Fanny Davenport and other leading actors and took part in the Shakespearean revivals at the Winter Garden Theatre in 1867. In 1869–77 he was at Daly's Fifth Avenue Theatre; in 1879 he appeared as the original Dick Deady in 'Pinafore,'; and in 1885 he became a member of the Madison Square Theatre Company. He played over 1,000 parts, among them Hardcastle in 'She Stoops to Conquer,' Cackler in 'Good Natured Man,' Caleb in 'The Tempest,' Nick Bottom in 'Midsummer Night's Dream,' and Old Golgo in 'The Merchant of Venice.' He published a volume of reminiscences, 'Footlight Flashes' (New York 1866); 'The Drama Defended' (ib. 1859), etc.

DAVIDISTS, the name given to two distinct religious sects, namely, the followers of David of Dinant in the 13th century, and those of David George or Joris in the 15th century. David of Dinant was a teacher in the University of Paris and contemporary of Almaricus of Bena (Amaury de Bene). At the death of Amaury (1204) he continued to teach Amaury's pantheistic doctrine, founded on Neoplatonism, that the 'All is God.' David George, who lived in the 15th century, is simply the consciousness of the presence of God, the thought that God is the 'One and All': that he who attains the perfect view of the God-All cannot sin, no matter what enormities he commits; he is the Christ, he is the Holy Ghost. The other sect of Davidists, called also David-Georgians, after the name of their founder, who was born at Delft in 1501, had its rise in 1534. Its founder published in 1542 his 'Book of Wonders,' recounting his marvelous visions and divine revelations. But he retired from the leadership in 1544, and during the remainder of his life was a prosperous merchant at Basel, under an assumed name. By order of the senate of Basel, his body, as that of a heretic, was exhumed and burned at the stake with Henry Nicolas as its head, made progress in Holland and got a footing in England, being now known as Familists. The Familists taught as their chief tenet the gospel of love, divine love. Love, they held, is above all laws, whether ceremonial, moral or civil, and the practice of the sectaries was so consonant with this doctrine that early in the 17th century the societies of Familists had to be suppressed in both countries, by the civil power.

DAVIES, Thomas William Rhys, English oriental scholar: b. Colchester, 12 May 1843. He was educated at the University of Breslau; from 1866 on filled judicial places in Ceylon and acted as archæological commissioner. In 1877 he was called to the English bar; was professor of Pali and Buddhist literature in University College, London (1882–1912); and professor of comparative religion, Manchester (1912–15). Among his works are 'Buddhism' (1877); translations of 'Buddhist Birth Stories' (1880); 'Buddhist Suttas' and 'Vinaya Texts' (1891); 'American Lectures' (1896); 'Sacred Books of the Buddhists; Dialogues of the Buddha' (1899); 'Buddhist India' (1902); 'Early Buddhism' (1910).

DAVID'S DEER ('Cervus davidianus'), a deer found in northern China and in Manchuria. It derives its name from Père David, a French Catholic missionary, who first saw it in the imperial park at Pekin. It resembles the Indian swamp-deer, but has long, shaggy hair and a long tail. It has no brown-tine. Little is known of its wild habits, for all of the representatives are found in parks in Europe, and it is likely soon to become extinct.

DAVIDS ISLAND, an island in Long Island Sound, near New Rochelle, N. Y., owned by the United States government and used for military purposes, especially as a training station for infantry recruits. It has an area of about 100 acres, and is fortified as Fort Slocum.

DAVIDSON, Andrew Bruce, Scottish biblical scholar: b. Aberdeenshire 1831; d. 1902.
DAVIDSON

He studied at Aberdeen, was ordained in 1863 and appointed professor of Oriental languages in New College, Edinburgh. He was generally regarded as the foremost British biblical critic of his day, and was a member of the Old Testament Revision Committee. Among his more famous pupils were George Adam Smith and W. Robertson Smith. Among his publications are 'Commentary on Job' (1852); 'An Introduction to Hebrew Grammar' (1858 ed., 1888); monographs on 'Job,' 'Ezekiel,' 'Hebrews' (1877), 'The Called of God' (1903); and 'Waiting upon God' (1904), with biography by Taylor Innes.

DAVIDSON, Charles, American educator: b. Stroethofo, Ohio, 29 July 1852. He was graduated at Iowa College in 1875 and studied subsequently at Yale. After several years of teaching in seminaries and academies he became assistant in English at Indiana University in 1893, and in the following year was associate professor of English at Western Reserve University, and from 1906 to 1911 was professor of education at the University of Maine. He is author of 'English Mystery Plays' (1892); 'Necessary Equipment for Teachers of English'; 'English, a Factor in the Training of a Business Man'; 'A Guess to English Syntax'; 'English in the Secondary School'; 'Motor Work and Formal Studies in Primary Grades' (1911), and various monographs and numerous papers and articles on education and the teaching of English.

DAVIDSON, Sir Charles Peers, Canadian jurist: b. Huntingdon, P. Q., January 1841. He is a graduate of McGill University; was called to the bar in 1864; was returned for the Quebec provincial legislature, 1881, and sat in the Dominion House of Commons, 1882-87, when he was appointed a judge of the Supreme Court of Quebec. He was one of the commissioners appointed in 1891 to inquire into the Baie des Chaleurs Railway scandal, and in 1915 was charged with the investigation of alleged war contract irregularities. He was knighted in 1913.

DAVIDSON, George, American astronomer: b. Nottingham, England, 9 May 1825; d. 1911. He came to the United States in 1832; was graduated at the Central High School, Philadelphia, in 1845; and joined the United States Coast Survey. While in this service he was chief engineer of a party which surveyed a ship canal route across the Isthmus of Darien. He also made a geographical survey of the coast of Alaska in 1867. He traveled extensively in Egypt, China, India and Europe, for purposes of scientific study and also took charge of the telegraph-longitude work, and of the main triangulation and astronomical party carrying the geodetic work across the continent. From 1877-84 he was regent of the University of California, and for many years was president of the California Academy of Sciences. He retired from the coast survey after 50 years of distinguished service, in 1895, and became professor of geography in the University of California. He published 'The Alaska Boundary' (1903); 'The Coast of Alaska from San Diego Bay to San Francisco Bay' (1907); 'Francis Drake on the Northwest Coast of America' (1908); 'Origin and Meaning of the Name California' (1910).

DAVIDSON, James Wheeler, American capitalist: b. Austin, Minn., 14 June 1872. He was graduated from the Northwestern Military Academy, Highland Park, Ill., in 1891. He was a member of the Peary Arctic Expedition to the North Polar regions, 1893-94; war correspondent with Chinese army, 1895; and with the Japanese army, 1895-96. In June 1897, he was appointed by President Cleveland consul agent for the islands of the North Pacific; he remained nine years, during which time he wrote numerous monographs on Formosan affairs, as well as a large volume entitled 'Formosa Past and Present' (1890), which is considered as a standard book of reference on this subject. In 1903 he obtained leave of absence, and under the auspices of the Russian Communication Department made a careful survey of the territory adjacent to the Asian section of the Trans-Siberian Railway, collecting material for a complete report of this territory, extracts from which appeared in the Century Magazine (April-June 1903). In 1904 he was appointed to Dalny, Manchuria, one of the political consulates, where he was expected to promote Secretary Hay's "open door" policy. Later he became consul general at Shanghai. He was decorated by the Emperor of Japan in 1895 with Order of Rising Sun for services rendered Japanese army in capturing the capital of Formosa. He is a fellow of the Royal Geographical Society and member of the Asiatic Society, the Explorers' Club and the Authors Club. He has large lumbering interests and in 1915 was president of eight banks in North Dakota. His publications include 'Formosa Camphor and Its Future' (1895); 'A Review of the History of Formosa' (1896); 'Formosa Under Japanese Rule' (1903), and contributions to the publications of scientific societies and magazines.

DAVIDSON, James Wood, American author: b. Newberry County, S. C., 9 March 1829; d. 1905. He was graduated from South Carolina College (now the State University) and taught Greek at the Mount Zion Collegiate Institute. During the Civil War he fought in the Confederate army as adjuvant in Stonewall Jackson's army corps under Lee in Virginia. After the war he took up journalism, was literary editor of the New York Evening Post, 1873, and American correspondent of the London Standard from 1873 to 1878. After 1887 he was employed in the Treasury Department at Washington. He wrote 'The Living Writers of the South' (1869); 'A School History of South Carolina' (1869); 'The Correspondent' (1886); 'The Poets of the South' (1888); and 'The Florida of To-day' (1889).

DAVIDSON, John, Scottish poet, novelist and miscellaneous writer: b. Barrhead, Renfrewshire, 11 April 1857; d. 3 Aug. 1905. He was at first a teacher, but in 1890 adopted a literary career, writing for the Speaker and other journals. He has published 'Scaramouth in Naxos' (1884); 'The Diff'rent Sort of Music' (1885); and the 2nd series (1896); 'A Random Itinerary' (1894); 'Ballads and Songs' (1894); 'Plays' (1894); 'Ear Lavender' (1895); 'New Ballads' (1896); 'The Last Ballad and Other
Poems\(^1\) (1899); 'The Testament of a Man Forbidden'\(^2\) (1901); 'The Testament of an Empire Builder'\(^3\) (1902); and the novels 'Perifervid'\(^4\) (1903), 'Seeds of Oak, Roots of Acacia'\(^5\) (1904); and 'The Hunter's Dream'\(^\) (1906). Davidson, from depression he was committed suicide by drowning near Penzance, and, in accordance with his directions, his body, on being recovered, was buried at sea.

DAVIDSON, John Wynn, American soldier: b. Fairfax County, Va., 18 Aug. 1824; d. Saint Paul, Minn., 26 June 1881. He was a graduate from West Point in 1845; served during the Mexican War in the Army of the West, was then placed on frontier and garrison duty, and fought a battle against the Apache and Utah Indians at Cienguilla, N. Mex., in 1854, in which he lost three-fourths of his command. He served in the Federal army during the entire Civil War, and in 1866 became lieutenant-colonel and in 1879 colonel, in the United States cavalry. He was professor of military science at the Kansas Agricultural College, and commanded various posts in Idaho, Texas, Indian Territory and Montana.

DAVIDSON, Randall Thomas, archbishop of Canterbury: b, Edinburgh, 7 April 1848. He was graduated at Trinity College, Oxford; after holding important livings was appointed bishop of Rochester in 1891; bishop of Winchester, 1896; and succeeded Temple as primate of England in January 1903. He visited America in 1904. Published 'Life of Archbishop Tait'\(^1\) (1891); 'The Christian Opportunity'\(^2\) (1904); 'Captains and Comrades of the Faith'\(^3\) (1911).

DAVIDSON, Samuel, Irish biblical scholar: b. near Ballymena, Ireland, 1806; d. 1 April 1898. After entering the ministry of the Presbyterian Church, he became in 1835 professor of biblical criticism and literature in the Presbyterian Theological College in Belfast. He afterward joined the Congregationalists, and was appointed, in 1842, a professor in their college in Manchester, but resigned in 1857, owing to his advanced opinions. His works include 'A Table of Key-Numbers' (1833); 'A Translation of Gieseler's Ecclesiastical History'\(^4\) (1846); 'The Ecclesiastical Polity of the New Testament'\(^5\) (1848); 'An Introduction to the New Testament'\(^6\) (1848-51); 'Biblical Criticism'\(^7\) (1852); 'Introduction to the Old Testament'\(^8\) (1862); 'On a Fresh Revision of the English Old Testament'\(^9\) (1873); 'The New Testament Translated from the Critical Text of Von Tischendorf'\(^10\) (1875); 'Canon of the Bible'\(^11\) (1877); 'Doctrine of Last Things Contained in the New Testament'\(^12\) (1882). His autobiography was published in 1889.

DAVIDSON, Thomas, Scottish philosopher and writer: b. Aberdeen, 25 Oct. 1840; d. Montreal, 14 Sept. 1900. He came to the United States in 1867, and was subsequently professor of classics in the Saint Louis High School. In 1875 he settled in Cambridge, Mass. Later he traveled in Greece and Italy. Included in his publications are 'A Short Account of the Niobe Group'\(^1\) (1874); 'The Place of Art in Education'\(^2\) (1886); 'Giordano Bruno'\(^3\) (1886); a 'Hand-Book to Dante'\(^4\) (1887); 'Prolegomena'\(^5\) (1888); 'An Aristotelian and Ancient and Modern Educational Ideals'\(^6\); 'The Education of the Greek People and Its Influence on Civilization'\(^7\).

DAVIDSON, William, American general: b. Lancaster County, Pa., 1746; d. Cowan's Ford, N. C., 1 Feb. 1781. He took up arms at the outset of the Revolution. He formed, at one of the first regiments raised in Carolina, was appointed brigadier after the battle of Camden, and in 1781 was dispatched by Greene to prevent Cornwallis from passing the Catawba at Cowan's Ford. With his death in the battle which ensued, and with the dispersion of his troops, began the pursuit of Greene by Cornwallis.

DAVIDSON COLLEGE, an educational institution at Davidson, N. C.; founded in 1837, under the auspices of the Presbyterian Church, and is at present governed by a board of trustees appointed by the presbyteries of North Carolina, South Carolina, Georgia and Florida. No theological department, however, is maintained, and the degrees conferred are the academic ones in art and science. Its professors and instructors are about 15 in number; students, 353; volumes in the library, 25,000; value of property, about $360,000, and the endowment $250,000.

DAVIE, William Richardson, American soldier: b. England, 21 June 1756; d. Camden, S. C., 8 Nov. 1820. He was brought to North Carolina when a child, and was graduated at Princeton, N. J., in 1776. He entered the American army, and obtained a captaincy in Pulaski's Legion. He rose to be colonel and commissary, served throughout the war, and was a favorite officer under Sumter and Greene. He was a member of the convention to form the United States Constitution in 1787, and advocated its acceptance in the convention of North Carolina. Through his influence the University of North Carolina was established. He was elected governor of that State in 1799, but served only a few months, resigning to accept the position of member of the embassy to the French government which resulted in the convention of 30 Sept. 1800. A good biographical sketch is to be found in 'The Library of American Biography'\(^1\) (1877).

DAVIES, Arthur B., American landscape and figure painter: b. Utica, N. Y., 1862. He studied under Dwight Williams, and in the Chicago Art Institute and in New York. He began as an illustrator for 'Saint Nicholas Magazine'. He is a representative of the Romantic school in painting. He is represented in the permanent collections of the Art Institute of Chicago and the Metropolitan Museum, New York. Among his important works are 'Spring's Renewal'\(^1\) (1901); 'The Breath of Light'\(^2\) (1901); 'The Girdle of Ares'\(^3\) (1898; now in the Metropolitan Museum, New York); 'Visions of the Sea'\(^4\) (1911); 'The Hunter of the Starlands'\(^5\); 'Maya, Mirror of Illusions'\(^6\) (Chicago Art Institute); 'Children of Yesterday'\(^7\); and three other paintings in the Brooklyn Museum. He has of late shown pronounced Cubist tendencies in a series of paintings, of which the most important is 'The Great Mother'\(^8\) (1914).

DAVIES, Charles, American mathematician: b. Washington, Litchfield County, Conn., 22 Jan. 1798; d. Fishkill Landing, N. Y., 18 Sept. 1876. He was educated at the United States Military Academy and was appointed professor of mathematics there in 1828. He
held the same post subsequently at Columbia College and in the University of New York. He published 'Surveying' (1832); an edition of Legendre's 'Geometry' (1828); 'Trigonometry' (1840); 'Elements of Algebra' (1844; latest ed., 1901); 'Logic of Mathematics' (1850); 'Mathematical Dictionary and Cyclopaedia of Mathematical Science,' with W. G. Peck (1855), and other works and textbooks on arithmetic, mathematics, etc.

DAVIES, tar The Virginian, American soldier; b. New York 1836; d. 1894. He was educated at Harvard, Williams and Columbia. He was admitted to the bar of New York in 1857, and entering the United States volunteers as captain when the Civil War broke out, he became brigadier-general in 1863. Serving with Sheridan he was made major-general of volunteers 1865. He resigned in 1866, afterward practising law in New York. He published 'General Sheridan' in the 'Great Commanders Series' (1885).

DAVIES, John, English poet: b. Hereford about 1565; d. London 1618. He was famous as a writing master at Oxford, and writer of curious philosophical poems, epigrams, etc. He was the author of 'Microcosmos' (1603); 'The Witty's Pilgrimage'; 'The Scourge of Folly'; 'Witty's Bedlam' (1617), etc. Consult Grosart (ed.), 'Complete Works' (2 vols., Blackburn 1873).

DAVIES, Sir John, English poet and lawyer: b. Tilsbury, Wiltsire, 1569; d. 8 Dec. 1626. He was educated at Westminster and Oxford. Called to the bar in 1595, he became solicitor-general for Ireland in 1603, and attorney-general in 1606, being knighted the next year. He was elected to the Irish Parliament in 1613, and became speaker of the Lower House. He was returned to the English Parliament in 1621, and appointed lord chief justice in 1626. He published two works connected with his Irish career, 'A Discovery of the True Causes why Ireland was Never Subdued' (1612), and 'Reports of Cases Adjudged in the King's Courts in Ireland' (1615). As a poet he was a reaction from the England of 1590. Out of the earlier or rabbinical period, turning to moral themes. He wrote 'Orchestra,' a poem on dancing, in which he maintained that all motion is music; 'Hymns to Astraea' (1599), a series of acrostics; 'Nosce Teipsum' (1599), a poem on the immortality of the soul. Consult 'Complete Works,' with memoir by Grosart (3 vols., Blackburn 1869-76).

DAVIES, Sir Louis Henry, Canadian jurist: b. Charlottetown, Prince Edward Island, 4 May 1845. He was educated at Prince of Wales College in his native town, and was called to the bar of the Inner Temple, London, in 1866. Beginning practice in Charlottetown he rose rapidly, being solicitor-general 1869 and 1871-72, and premier and attorney-general of the Island 1876-79. He entered the Dominion House of Commons in 1882, remaining a member till his appointment as a judge of the Supreme Court of Canada. He was created K. C. M. G. in 1897, and was Minister of Marine and Fisheries 1896-1901. In 1897 he was a member of the joint high commission appointed for the settlement of outstanding differences with the United States.

DAVIES, Samuel, American clergyman: b. New Castle County, Del., 3 Nov. 1724; d. Princeton, N. J., 4 Feb. 1761. He was educated at the seminary of the Rev. Samuel Blair, Fogg's Manor, Pa., was ordained in 1747, and was at his request appointed to officiate at different points in western Va., where the Episcopal Church being then the established church of Virginia, dissenters were obnoxious to the civil authorities. His labors were highly successful, and led to a controversy between him and Peyton Randolph, the king's attorney-general, as to whether the act of toleration which had been passed in England for the relief of Protestant dissenters extended also to Virginia. The ultimate decision of the question was in the affirmative. With Gilbert Tennent he visited England in 1753 to obtain funds for the College of New Jersey (now Princeton University). In a footnote to a sermon, preached in 1755, and dealing with the spirit aroused by the French and Indian War, he wrote: 'As a remarkable instance, I may point out to the public that heroic youth, Colonel Washington, whom I cannot but hope Providence has hitherto preserved in so signal a manner for some important service to his country.' The first presbytery in Virginia was established through his exertions, and in 1758 he was chosen to succeed Jonathan Edwards as president of the College of New Jersey. A collection of his sermons was published after his death, in three volumes, and passed through several editions in Great Britain and America. Consult memoir by Barnes in the 'Complete Works' (New York 1851).

DAVIES, Thomas Frederick, American Protestant Episcopal bishop: b. Fairfield, Conn., 31 Aug. 1831; d. Detroit, Mich., 9 Nov. 1906. He was a graduate of Yale in 1853, and subsequently studied at the Berkeley Divinity School, where he was for a time professor of Hebrew. He was ordained in 1857, and after being successively rector of Saint John's Church, Portsmouth, N. H., and Saint Peter's, Philadelphia, was consecrated bishop of Michigan in 1889.

DAVIES, Thomas Frederick, American Protestant Episcopal bishop: b. Philadelphia, 20 July 1872; d. Detroit, Mich., 20 Sept. 1908. He was of the family of the Rev. Richard Davies, bishop of Michigan. He was graduated at Yale in 1894 and at the General Theological Seminary of New York in 1897. He was ordained a deacon in 1897; and priest in 1898 by the Protestant Episcopal Church. He was assistant minister at the Church of the Incarnation, New York 1897-1900; rector of Christ Church, Norwich, Conn., 1901-03; rector of All Saints', Worcester, Mass., 1903-11, and became bishop of western Massachusetts in 1911.

DAVIES, T. Witton, English Baptist theologian and Orientalist: b. Nantyglo, Monmouthshire, 1851. He was educated at University College, London, and studied also in Berlin, Leipzig and Strassburg. He was pastor of a church in Merthyr Tydfil in 1878-80, professor of classics, Hebrew and mathematics at Haverfordwest Baptist College in Haverfordwest, and was later principal of Midland Baptist College, Nottingham 1892-99, lecturer in Arabic and Syriac, University College, Nottingham 1897-99, and professor of Hebrew and Old Testament Literature in Bangor Baptist College 1899-1906, and since the latter year professor of Semitic languages. His publications include 'Oriental Studies in Great
DAVISS — DAVIS

DAVISS, dà'vis. Joseph Hamilton, American lawyer: b. Belford County, Va., 4 March 1774; d. Tippecanoe, Ind., 7 Nov. 1811. He was famed for his eccentricities and was commonly known as "Jo" Daviess. He was appointed United States district attorney in Kentucky and in that capacity prosecuted Aaron Burr for treason. J. J. Daviess County, Ill., was named in his honor. He was killed at the battle of Tippecanoe.

DÁVILA, dà've-là, the name of several persons well known in the history of Spanish America: 1. Gil Gonzales. (See CENTRAL AMERICA: FIRST SPANISH COLONIES). 2. Juan, Spanish soldier; b. Granada, Nicaragua, 1530; served in Peru, and later under Coronado in Costa Rica, and wrote (1566) "Relación de la Provincia de Costa Rica," a document of historical value. 3. Coello y Pacheco, governor and captain-general of Chile, 1667—70.

DÁVILA, dà've-là, Alonso, Spanish soldier: b. City of Mexico; d. there, 1566. He was supposed to be implicated in a plot to make Martín Cortes ruler of New Spain, and was executed on this account.

DÁVILA, Enrico Caterino, Italian statesman and historian: b. near Padua, Italy, 30 Oct. 1576; d. near Verona, 8 Aug. 1631. His father, a Cypriote, who fled to Venice after the conquest of Cyprus by the Turks in 1561, introduced him to the French court, where he was made page; after this he entered the French service, in which he highly distinguished himself. He subsequently entered the Venetian service, gradually rose to the post of governor of Dalmatia, Friuli and the island of Candia, and was esteemed at Venice the first man in the republic after the doge. While governor of Crema he was murdered. He is principally celebrated for his "History of the Civil Wars of France, from 1559 to 1598" (Storia delle Guerre Civili di Francia, Venice 1630). This has been translated into several languages, and deserves a place near the works of Guicciardini and Machiavelli. His "Life" has been written by A. Zeno (Venice 1733); Ciscaro (Vicenza 1885). Consult also President J. Adams, "Discourse on Davila" (1805).

DÁVILA, Pedrarias, Spanish governor of the Darien Colony, Castilla del Oro and Nicaragua: b. Segovia, Spain, about 1440; d. Leon, Nicaragua, July 1530. His name was originally Pedro Arias, but the form given above is better known in his name. He was the brother of the Conde de Puñonrostro, and married the daughter of the Condesa de Moya, the friend of Isabella the Catholic; won distinction in the wars of Granada, and enjoyed the protection of Fonseca, bishop of Burgos, master of the affairs of the Spanish-American colonies during the reigns of Ferdinand and Isabella. Fonseca made Dávila governor of Darien in 1514, and the governor promptly employed the adventurers who accompanied him in a number of expeditions, including that of Hernan Ponce and Bartolomé Hurtado (1516) to the coasts of the present republics of Nicaragua and Costa Rica. He established himself at Panama, and had his command the famous soldiers Balboa, Hernandez de Córdoba, De Soto, Ojeda, Olid, Ponce and Francisco Pizarro. In 1526—27 he asserted that, as governor of Castilla del Oro, he ought to administer Nicaragua and Honduras as well. His claim to the former was recognized. Balboa suffered death in consequence of incurring his enmity. Pedrarias is cited most frequently as the type of the vigorous, but wholly unscrupulous official of the first period of Spanish colonization on the American mainland.

DÁVILA Y PADILLA, páf-thël'yâ, Augustín, Mexican historian: b. Mexico 1562; d. Santo Domingo 1604. He entered the order of Dominicans in 1578, taught philosophy and theology at the College of La Puebla and Mexico, becoming prior of his convent La Puebla, and procurer of his order at the courts of Madrid and Rome 1596. He became preacher for Philippe II 1588, and was consecrated as archbishop of Santo Domingo 1601. He burned several hundred copies of the Bible translated into Spanish and annotated by Protestants. He wrote "Historia de la provincia de Santiago de Mejico" (1596—1634); and "Varia historia de la Nueva España y Florida" (Valladolid 1634).

DA VINCI, Leonardo. See VINCI, LEONARDO DA.

DAVIS, Arthur Hoey, Australian literary man: b. Drayton, Queensland, 14 Nov. 1861. After spending six years in a somewhat venturesome life for a boy, from 1882 to 1888, on sheep and stock farms, he entered the office of the curator of Intestate Estates at Brisbane, and the following year he became clerk in the sheriff's office, and in 1892, a position which he held the following year to found Steel Rudd's Magazine, a journal which was destined to exert a very considerable influence on contemporary Australian thought and literature. Davis, or "Steel Rudd," the name by which he is universally known, may be said to have created an Australian literary school of his own and to have done more than any other modern Australian writer to bring his country before the eye of the public. He has encouraged the younger generation of Australian writers to renewed literary efforts, through the columns of his magazine which have been always invitingly open to them. As the chronicler of the lives of the people of the "back country" he became famous in Australia in 1906, and soon thereafter in an international reputation, to such an extent, in fact that, as a critic complains, there seems to be only one name in modern Australian literature worth chronicling. His language is terse, vivid, picturesque, and his power of depicting the life he presents is noticeable in all he does. Among his works which have attracted attention at
DAVIS, Arthur Powell, American civil engineer: b. Decatur, Ill., 9 Feb. 1881. He was graduated at the Emporia State Normal School and at Columbia University in 1898. He was topographer of the United States Geological Survey 1884-94, when he conducted surveys and explorations in Arizona, New Mexico and California. In 1895-97 he was hydrographer in charge of all government stream measurements, and in 1898-1901 was in charge of the hydrographic examination of the Nicaraguan and Panama Canal routes. He is a chief engineer of the United States Reclamation Service since 1906 and in 1909 was consulting engineer of the Panama Canal. He has published 'Elevation and Stadia Tables' (1893); 'Progress of Stream Measurements' (1897); 'Irrigation near Phoenix, Arizona' (1897); 'Irrigation Investigation in Arizona' (1898); 'Hydrography of the American Isthmus' (1902); 'Water Storage on Salt River, Arizona' (1903), also articles in magazines on irrigation, the Isthmian canals and other hydrographic subjects.

DAVIS, Bradley Moore, American botanist: b. Chicago, 19 Nov. 1871. He was graduated at Leland Stanford Junior University in 1892, and studied also at Harvard, Bonn and Naples. From 1895 to 1900 he was connected with the department of botany at Chicago University. He was assistant in botany in 1911-14 and professor of botany since 1914 at the University of Pennsylvania. He is joint author of 'The Principles of Botany' (1906); 'Laboratory and Field Manual of Botany' (1907), and many papers on plant cytology and plant genetics.

DAVIS, Charles Belmont, American author: b. Philadelphia, Pa., 24 Jan. 1866. He is a son of Rebecca Harding Davis and a brother of Richard Harding Davis (qq.v.); was educated at Lehigh University, and was United States consul at Florence, Italy, for some time. He has written 'The Borderland of Society' (1896); 'The Stage Door' (1908); 'The Lodger Overhead' (1909); 'Tales of the Town' (1911); 'In Another Moment' (1913); 'Nothing a Year' (1915).

DAVIS, Charles Harold, American artist: b. Amesbury, Mass., 7 Jan. 1856. He studied three years at the Art Music School of Boston and received a grant to study at the Académie Julian, Paris. He lived in France from 1880 to 1890, and exhibited annually at the Salon. In 1906 he was elected to the National Academy of Design. He was awarded prizes and medals at every exposition since 1857. He paints chiefly evening effects and is remarkable for simplicity of execution. His more notable works are 'The Brook' (Philadelphia Academy); 'Late Afternoon' (Union League Club, New York); 'Evening' and 'August' (Metropolitan Museum, New York); 'Deepening Shadows' (Corcoran Gallery, Washington); 'Summer' (National Gallery, Washington); 'Close of Day' and 'Twilight' (Chicago Art Institute); 'Moonrise at Twilight' (Carnegie Institute, Pittsburgh); 'Landscape' (Boston Museum). He is also represented in the City Museum, St. Louis; the Art Museum, Syracuse; the Wordsworth Athenæum, Hartford; the Art Museum, Worcester, Mass.; the Providence School of Design and the Art Museum, Minneapolis.

DAVIS, Charles Henry Stanley, American physician and Egyptologist: b. Goshen, Conn., 2 March 1861. He graduated at New York and European hospitals and subsequently settled in Meriden, Conn., of which he was mayor 1877-88 and city treasurer 1887-99. He published 'History of Wallingford and Meriden' (1870); 'The Voice as a Musical Instrument' (1873); 'Classics in an Educational and Training of Feeble Minded, Imbecile and Idiotic Children' (1880); 'The Egyptian Book of the Dead' (edited 1887); 'History of Egypt in the Light of Modern Discoveries' (1896); 'Grammar of the Old Persian Language' (1878); 'How to Be Successful as a Physician' (1905); 'Grammar of the Modern Irish Language' (1909); 'Some of Life's Problems' (1914). He was editor of Biblia, a journal of Oriental studies. He was physician to many learned societies.

DAVIS, Cushman Kellogg, American legislator: b. Henderson, N. Y., 16 June 1838; d. Saint Paul, Minn., 27 Nov. 1900. He was graduated at the University of Michigan in 1857; was admitted to the bar, but enlisted in the Union army in 1861. He began the practice of law in Saint Paul in 1865; was chosen to the Minnesota legislature in 1867; became United States district attorney in 1868; governor of Minnesota in 1874; and United States senator in 1887, 1893 and 1899. He was a Republican and a member of the peace commission which negotiated the treaty between Spain and the United States in 1898. He was for several years chairman of the Senate Committee on Foreign Relations, and reported the resolution which practically declared war against Spain.

DAVIS, David, American jurist: b. Cecil County, Md., 9 March 1815; d. Bloomington, Ill., 26 June 1886. He was graduated at Kenyon College in 1832, and settled in Illinois as a lawyer in 1835. He was elected to the legislature in 1844 and served as a State circuit judge from 1848 to 1862. In the latter year he was appointed an associate justice of the Supreme Court of the United States. He voted in favor of the Legal Tender Act. He resigned in 1877 to enter the United States Senate, of which he became president pro tem. in 1891, and retired in 1883.

DAVIS, Edwin Hamilton, American archaeologist: b. Ross County, Ohio, 22 Jan. 1811; d. New York, 15 May 1888. He was the author of 'Ancient Monuments of the Mississippi Valley' (1848), which was described by A. Morlot, the distinguished Swiss archaeologist, as being "as glorious a monument of American science as Bunker Hill is of American bravery."

DAVIS, George Whitefield, American army officer: b. Thompson, Conn., 26 July 1839. He was educated at the New Britain State Normal School, and on the outbreak of the Civil War enlisted in the 13th Infantry and by 1865 had attained the rank of major of volunteers. He was commissioned
captain of the 14th United States Infantry in 1867 and retired as major-general in 1903. He was military governor of Porto Rico in 1899, and provost-marshal of the Philippines in 1901. He was on the war board in 1904 and was governor of the Canal Zone in 1904–05. He was special agent of the State Department to the government of Guatemala in 1913. He wrote the military history of the Panama Canal Commission in 1917. He was president of the board of publication of the official records of the Civil War.

DAVIS, Henry Gassaway, American capitalist and legislator: b. Baltimore, Md., 16 Nov. 1823; d. Washington, D. C., 11 March 1916. He became superintendent of the plantation of ex-Gov. George Howard of Maryland, near Woodstock, Md., and subsequently was brakeman and conductor on the Baltimore and Ohio Railway, and agent at Piedmont, W. Va. Then he was active as a merchant and collier at Piedmont, and later carried to success the West Virginia and Pittsburgh Railway, by means of which he gave access to timber and coal lands of great value. The president of this road, he also became president of the Piedmont and Cumberland line. Sold these roads to the West Maryland Railroad in 1902; at once built coal and coke railway from Elkton to Charleston, W. Va., of which he became president; was also president of the Davis Colliery Company, Elkton National Bank and chairman of board, Davis Trust Company of W. Va.; and personally managed investments at the age of 92 (1916). He was elected as a Democrat to the West Virginia house of delegates in 1865, was State senator in 1867–69, and having served two terms (1871–83) as United States senator, declined re-election. In July 1904 he was nominated by the Democratic party for the vice-presidency of the United States. He was a delegate to the Pan-American Congress, and became also a member of the Intercontinental Railway Commission. He was a power in the Democratic party in the State (as was his son-in-law, S. B. Elkins, in the Republican party). He gave from his great wealth to local charities and educational institutions.

DAVIS, Jefferson, American statesman: b. Annapolis, Md., 16 Aug. 1817; d. Baltimore, Md., 30 Dec. 1865. He was a member of Congress for three terms (1856–65), and took a leading part in advocating emancipation and loyalty to the Union. His published works are 'The War of Ormuzd and Ahriman in the 19th century' (1853); 'Speeches and Addresses in Congress' (1867). DAVIS, Zachary Taylor, American statesman: b. in Christian County, Ky., 3 June 1808; d. New Orleans, La., 6 Dec. 1859. A year or two after the birth of Davis the family removed to Wilkinson County, Miss., a new and prosperous cotton region. Young Davis was sent to various private schools in Mississippi and Kentucky before he became a student at Transylvania University in 1822. From Transylvania he went as a cadet to West Point in 1824, where Robert E. Lee, Albert Sidney Johnston and Joseph E. Johnston were his friends or classmates. From 1828–41 he served seven years as an officer in the United States army along the Northwestern frontier, that is, in Iowa, Wisconsin and Minnesota. Col.

Zachary Taylor was for a part of this period his commander. In 1835 he was married to Miss Taylor and the same year he resigned from the army and settled as a cotton planter in Warren County, Miss. He held the position of a wealthy and influential citizen and owner of slaves. An older brother, a leading public man of the State, contributed much to this easy success and was in considerable measure responsible for the entry of Jefferson Davis into politics, 1843, as a candidate for a seat in the House of Representatives. Meanwhile the first Mrs. Davis had died and he married Miss Varina Howell, a daughter of a well-to-do planter of the State. Hence the connections and social ties of the young political aspirant were such as to advance him rapidly.

The issue which drew him into public affairs was the proposed repudiation of a great debt which the State of Mississippi had contracted with Nicholas Biddle, the Philadelphia capitalist. The older cotton rivers and the Mississippi River were prevailingly Whig and opposed to repudiation on both moral and political grounds. Davis was a Democrat who broke with his party on the issue and offered himself as candidate for the legislature with the object of preventing the Democrats from carrying out their plans. Although he was defeated, he became an elector on the Polk ticket in 1844. As such he canvassed the State and became widely known as an effective speaker and ardent expansionist. The next year he was elected a member of Congress, but he resigned to take command of a regiment of Mississippi volunteers in 1846. He played a conspicuous part under Gen. Zachary Taylor at Monterrey and Buena Vista, for which his name became familiar to the whole country. On his return from Mexico in 1847 he was appointed by the governor of Mississippi to a vacancy in the United States Senate. When the legislature met he was unanimously chosen for a full term. When he appeared in Congress he was promptly made chairman of the Senate Committee on Military Affairs and as such he labored constantly for a larger army and for the conquest and retention of that part of Mexico which borders on the Gulf of Mexico. To the disgust of Gen. C. Calhoun lent his influence to the party of opposition and the extreme expansionists were defeated. Nevertheless Davis was an avowed follower of Calhoun and upon the death of the latter he became the adopted yoder of the South in national affairs. In the critical struggle of 1850, when there was imminent danger of a disruption of the Union, Davis was an extremist who urged secession on the part of the South rather than submission to the compromise measure which allowed California to enter the Union as a free State. He demanded the extension of the Missouri Compromise line to the Pacific which would have made southern California a slave State and left New Mexico, Arizona and Utah open to slave colonization. Failing to secure the adoption of his plan, he signed, with most of the other Southern delegates in Congress, a protest against the compromise, resigned his seat in the Senate and went home to lead a party of protest there. As candidate for the governorship he waged a vigorous campaign, but was defeated by the Unionists on a margin of less than 1,000 votes. Davis was
now a discredited politician, for not only Mississippi but every other Southern State, save South Carolina, had accepted the idea of secession. He retired to his plantation, but he soon began to take an active part in public discussions and when his friend, Franklin Pierce, was nominated for the presidency by the Democrats in 1852, he made an active canvass in his behalf both in Mississippi and Louisiana. After the election of Pierce, Davis was asked to become a member of the Cabinet. The offer was declined, but the President-elect prevailed on him finally to enter the Administration as Secretary of War. Although the avowed purpose of the Democrats was never to disturb the Compromise of 1850, Davis the bitterest opponent of that measure two years before was now one of the first advisers of the Administration. There was uneasiness in the country, but Davis had changed his mind. He never again urged the South to secede but insisted on fighting for the South and slavery within the Union. As Secretary of War Davis was a vigorous and resolute reorganizer. He undertook to reform and reequip the Military Academy at West Point; he enlarged the armories and abolished the rule of seniority which he considered a handicap to any military organization; and he brought camels from Arabia to be used as carriers on the dusty plains of the Far West. But his greatest work was the survey of the Rocky Mountain region with a view to building a Pacific railroad. Five routes were surveyed and an elaborate report in 12 octavo volumes was laid before Congress at the end of his term. Engineers, geologists and botanists had contributed their work and the value of the great West was made plain to the country. He recommended the building of a road by the southernmost route, that is, from Memphis to southern California. The government should give public lands and bonds and aid in financing the scheme, the war powers of the President being called into use in support of these nationalist recommendations. Although nothing was done at that time, these surveys were the beginning of a new agitation for a railway to the Pacific Coast. When Pierce was out of power, Davis returned to the Senate where he continued to represent and press Southern interests upon Congress and the country. The repeal of the Missouri Compromise in 1854, which he had favored, had set the sections to fighting each other as fiercely as before 1850. He now took the view that Kansas should be kept open to slavery and he saw in the Dred Scott decision of the Supreme Court full justification for his contention. The new President, Buchanan, was not in the beginning in sympathy with the extreme pro-slavery demand and he sent Robert J. Walker, whom Davis and most other leading Southerners distrusted, as governor to Kansas. When the Lecompton constitution was defeated in Kansas, Davis denounced Walker as a traitor to the South. Buchanan removed Walker in obedience to the entreaties of Davis and others. Stephen A. Douglas, the Northern leader of the Democratic party, denounced the President for his treatment of Walker and for his acceptance of the Lecompton constitution. Davis immediately regained the popularity he had lost in 1854. The issue was joined and Davis became the irreconcilable opponent of Douglas and of his candidacy. The Senate was made the scene of their maneuvers. Douglas was "read out of the party by Davis which only added to the follower of Lincoln formed at the North. Davis procured the adoption of a series of resolutions in April which was made the platform of the reactionary or Southern element in the convention which was about to meet in Charleston. Davis gave instructions to the national committee while the convention was in session. Douglas directed the conduct of the majority of the delegates. The unyielding attitude of the two leaders caused the break-up of the convention and the nomination of two Democratic candidates, Breckenridge and Douglas. But when it became increasingly clear that Abraham Lincoln, the candidate of the Republicans, would be elected, Davis, who had remained in Washington all summer, endeavored, in September 1860, to bring about a reconciliation between the angry sections of the party. Unable to find a leader who could unite the followers of Douglas and Breckenridge, he gave up and let events take their own course. He was in Mississippi when the election of Lincoln was announced and his opinion was at once sought by secessionists. The arrival of Davis in Charleston was announced in The Charleston Mercury on 10 November that he was opposed to breaking up the Union and advised that Mississippi would probably not follow South Carolina. Later the governor of Mississippi called a conference of the State's delegation in Congress in which Davis again advised against secession. This led to a reaction against him and he was charged with being simply an ambitious candidate for the presidency of the United States. But the shaping of events had already passed beyond the control of the leaders. South Carolina was almost a unit in favor of immediate secession. The cause had long been a popular one in that State. And if South Carolina left the Union and should then be coerced by the Federal government nothing could prevent the secession of the other Southern States. South Carolina seceded. Davis, again in Washington, urged Buchanan to recognize the act as the right of any State. Buchanan refused to follow this advice and when the Senate closed, Davis returned to his place in the Senate with the greatest reluctance. He returned to Mississippi warning the people along the way that there would be a long and bitter struggle. In so far as he had any plans for the new régime, he wished to become the commander of an army in the field. But his election to the presidency of the Confederacy on 9 Feb. 1861 placed him at the head of the movement which he had, to be sure, favored in the beginning but which he had certainly not urged in recent years. He now endeavored to reconcile all elements of the South. The radicals he thought would be satisfied to remain in private stations or fight in the ranks. Conservatives who had opposed secession were placed in Cabinet positions. Charles G. Memminger of the Treasury, L. Pope Walker of the War Department and Robert E. Lee of the army were all of this group; and Alexander H. Stephens, the Vice-President, had always been opposed to secession and he was a personal opponent of Davis. This conciliatory policy of Davis was adopted by the States when they chose opponents of the secession movement to seats in the Confederate Senate. Radicals like William L. Yancey and Robert Barnwell Rhett,
who had fought for a Southern Confederacy for 20 years, scarcely obtained recognition—a policy which brought Davis many of his greatest problems as the bloodshed at Charleston where a Southern army was gathering to compel the surrender of Fort Sumter. William H. Seward, the most influential man of the North before the inauguration of Lincoln, likewise endeavored to prevent an outbreak. The policy of conciliation was so publicly and openly cultivated that Southern leaders of the radical type insisted that there would be no war, that Davis and Seward had an understanding between them whereby the Union was to be restored. When, therefore, General Beauregard telegraphed from Charleston that Fort Sumter would be reoccupied by order of the Federal government, Davis still hesitated and advised against attack if by delay any sort of assurance were given that it could be done peaceably. When the order to begin firing was finally given it was done hurriedly by subalterns of General Beauregard who feared that otherwise there would be no war and a reconstruction of the Union would follow. But the firing on Major Anderson on the night of 12 April 1861 stirred the martial spirit of the whole South, as well as of the North, and the border States of Virginia, North Carolina, Tennessee and Arkansas joined the Confederacy. Davis became the President of all the seceded States and the capital was removed from Montgomery to Richmond. The constitution of the new group of commonwealths was in many respects the work of Davis and the moderate attitude of the Confederacy toward the foreign slave trade and the tariff was due to his influence. Although presidents of republics are not held rigidly to the strict letters of constitutions, Davis was most careful not to overstep the bounds set him save in the gravest emergencies. He set aside the habeas corpus only in rare instances and then for limited districts and for limited periods. He allowed the greatest freedom of the press, even when most of the leading papers insisted upon denouncing him every day. I believe no newspaper office was closed by his order during the whole period of the war. One of the weaknesses of his administration was due to the fact that he was definitely elected in 1861 for a term of six years after the expiration of which he could not be a candidate for re-election. This gave the Confederate Congress a freer hand than any other American Congress has ever had. But an equally difficult problem for Davis consisted in choosing the commanders of the armies. The high officers who resigned from the Union army all expected higher commands from the Confederate government. Davis appointed men according to what he prematurely called a merit system; but they insisted each, save Lee, upon the old seniority rule of the Federal government. Dissatisfaction began when the first list of generals was sent in; it grew steadily to the end. Davis believed in an effective system for the management of the struggle; but in the winter of 1861-62 he became convinced that conscription alone would keep the army units full. Congress opposed him constantly on this issue. He believed the lines of State sovereignty should be partially obliterated in the interest of the South on his side, he also sought to conciliate the conservatives of the North and thus isolate the radical Republicans who urged the prompt coercion of the seceded States. To this end Davis labored consistently to please Richmond where a Southern army was gathering to compel the surrender of Fort Sumter. William H. Seward, the most influential man of the North before the inauguration of Lincoln, likewise endeavored to prevent an outbreak. The policy of conciliation was so publicly and openly cultivated that Southern leaders of the radical type insisted that there would be no war, that Davis and Seward had an understanding between them whereby the Union was to be restored. When, therefore, General Beauregard telegraphed from Charleston that Fort Sumter would be reoccupied by order of the Federal government, Davis still hesitated and advised against attack if by delay any sort of assurance were given that it could be done peaceably. When the order to begin firing was finally given it was done hurriedly by subalterns of General Beauregard who feared that otherwise there would be no war and a reconstruction of the Union would follow. But the firing on Major Anderson on the night of 12 April 1861 stirred the martial spirit of the whole South, as well as of the North, and the border States of Virginia, North Carolina, Tennessee and Arkansas joined the Confederacy. Davis became the President of all the seceded States and the capital was removed from Montgomery to Richmond. The policy of conciliation was so publicly and openly cultivated that Southern leaders of the radical type insisted that there would be no war, that Davis and Seward had an understanding between them whereby the Union was to be restored. When, therefore, General Beauregard telegraphed from Charleston that Fort Sumter would be reoccupied by order of the Federal government, Davis still hesitated and advised against attack if by delay any sort of assurance were given that it could be done peaceably. When the order to begin firing was finally given it was done hurriedly by subalterns of General Beauregard who feared that otherwise there would be no war and a reconstruction of the Union would follow. But the firing on Major Anderson on the night of 12 April 1861 stirred the martial spirit of the whole South, as well as of the North, and the border States of Virginia, North Carolina, Tennessee and Arkansas joined the Confederacy. Davis became the President of all the seceded States and the capital was removed from Montgomery to Richmond. The constitution of the new group of commonwealths was in many respects the work of Davis and the moderate attitude of the Confederacy toward the foreign slave trade and the tariff was due to his influence. Although presidents of republics are not held rigidly to the strict letters of constitutions, Davis was most careful not to overstep the bounds set him save in the gravest emergencies. He set aside the habeas corpus only in rare instances and then for limited districts and for limited periods. He allowed the greatest freedom of the press, even when most of the leading papers insisted upon denouncing him every day. I believe no newspaper office was closed by his order during the whole period of the war. One of the weaknesses of his administration was due to the fact that he was definitely elected in 1861 for a term of six years after the expiration of which he could not be a candidate for re-election. This gave the Confederate Congress a freer hand than any other American Congress has ever had. But an equally difficult problem for Davis consisted in choosing the commanders of the armies. The high officers who resigned from the Union army all expected higher commands from the Confederate government. Davis appointed men according to what he prematurely called a merit system; but they insisted each, save Lee, upon the old seniority rule of the Federal government. Dissatisfaction began when the first list of generals was sent in; it grew steadily to the end. Davis believed in an effective system for the management of the struggle; but in the winter of 1861-62 he became convinced that conscription alone
commission for gallantry. He was with the garrison at Fort Sumter, S. C., as first lieutenant when its bombardment began the Civil War. He received the brevet of major-general of volunteers and the full rank of colonel in the regular army for distinguished service on the Union side during the war. For some years after the war, he was stationed on the Pacific coast, where he suppressed the Modoc revolt in northern California; and was afterward the first United States army officer to hold command in Alaska, a few post, Fort Davis, being named after him in 1900.

DAVIS, John, English navigator: b. Sandridge, near Dartmouth, Devonshire, about 1550; d. 30 Dec. 1605. In 1585 he was sent out with two vessels to find a northwest passage, when he discovered the strait which still bears his name. He afterward explored the coasts of Greenland and Iceland, proceeding as far as lat. 73° N. He made five voyages to the East Indies, on the last of which he was killed in an engagement with some Japanese pirates off the coast of Malacca, and of one of these voyages he wrote an account of his voyages and invented a quadrant.

DAVIS, John Chandler Bancroft, American lawyer and diplomatist: b. Worcester, Mass., 29 Dec. 1822; d. 1907. In 1849 he went to London as secretary of the United States legation; in 1854 became American correspondent of the London Times, and in 1869, 1871 and 1873-74 was Assistant Secretary of State. He represented the United States in the Alabama controversy, zealously pushing the indirect claims; was minister to Germany in 1874-77; and judge of the United States Circuit Court in 1881-82; and became reporter of the United States Supreme Court in 1883. He is the author of 'The Massachusetts Justice' (1847); 'Mr. Sumner, the Alabama Claims, and their Settlement' (1879), a work published in French entitled 'Process Tribunals of the United States' (1878); and many volumes of United States Supreme Court reports.

DAVIS, Katherine Bement, American sociologist: b. Buffalo, N. Y., 15 Jan. 1860. She was graduated at Vassar College in 1882 and studied at the State University of Chicago, the Sorbonne, and Oxford. She was awarded a doctor's degree in political economy in 1900. Mt. Holyoke College conferred the degree of LL.D. on her in 1912 and Yale awarded her an M.A. in 1915. From 1892-97, she was head-worker at the College Settlement in Philadelphia. From 1901-14 she was superintendent of the New York State Reformatory for Girls at Bedford, and by her careful scientific methods of handling the inmates, made that institution a noteworthy experiment in penology. In 1914 she was appointed commissioner of correction for the city of New York by Mayor Mitchell. She was the first woman to hold such an office. In addition Miss Davis has been active in various philanthropic and civic organizations and is a well-known lecturer.

DAVIS, Noah Knowles, American philosophical writer: b. Philadelphia, Pa., 15 May 1832; d. New York, 11 March 1910. He was educated at Mercers University, Ga., was professor of philosophy at the University of Virginia from 1873. Among his published writings are 'The Theory of Thought' (1880); 'Elements of Deductive Logic' (1890); 'Elements of Psychology' (1892); 'Judah's Jewels; a study in the Hebrew Lyrics' (1895); 'Elements of Ethics' (1900); 'Synopsis of Events in Life of Jesus of Nazareth' (1900); 'The Nazarene' (1901).

DAVIS, Oscar King, American journalist: b. Baldwinsville, N. Y., 14 Jan. 1865. He was graduated at Colgate University in 1888, from which he received the honorary degree of Litt.D. in 1914. During the Spanish-American War and the Philippine insurrection, and in China during the Boxer Campaign he was special correspondent of the New York Sun and Harper's Weekly at Manila. He was special correspondent of the New York Herald with the First Japanese Army 1904. He was Washington correspondent of the New York Times and the Philadelphia Public Ledger 1907-12, and became secretary of the Progressive National Committee in 1912. He was special correspondent of the Chicago Tribune in the Far East 1915-16. He has published 'Our Conquests in the Pacific'; 'At the Emperor's Wishes'; 'Dewey's Capture of Manila'; 'Sheffield's Last Stand'; and 'The Storm Birds' (with Reginald Schroeder).

DAVIS, Rebecca Blaine Harding, American writer and novelist: b. Washington, Pa., 24 June 1831; d. 29 Sept. 1910. She contributed many short stories and sketches to periodicals, and also wrote several novels, including 'Life in the Iron Mills' (1861), 'A Story of To-day' (1861), published later under the title 'Margaret Hoth'; and 'A Law Unto Herself' (1878). She was the first writer in this country to introduce the labor question into fiction. Her other works include 'Waiting for a Vindicator'; 'Dallas Galbraith'; 'Natasca'; 'Frances Waldeaux'; 'Doctor Warrick's Daughters'; 'Silhouettes of American Life.'

DAVIS, Reuben, American lawyer: b. Tullahoma, Tenn., 18 Jan. 1913; d. Huntsville, Tenn., 14 Oct. 1890. He was educated in his native place, studied medicine and after a few years' practice abandoned that profession for the study of law. He removed to Aberdeen, Miss., and was prosecuting attorney for the sixth judicial district from 1835 to 1839. He was, where he received the doctor's degree in political economy in 1900. He served in the war with Mexico as colonel of the second regiment of Mississippi volunteers. He was a member of the State house of representatives from 1855 to 1857 and was elected to Congress from Mississippi, serving from 1857 to 1861, when he retired and entered the Confederate army as brigadier-general commanding a brigade of Mississippi militia in Kentucky. After the close of the Civil War he resumed his law practice. He published 'Recollections of Mississippi' (Boston 1889).

DAVIS, Richard Harding, American journalist and popular novelist: b. Philadelphia, Pa., 1864; d. Mount Risco, N. Y., 11 April 1916. His mother was Rebecca Harding Davis. He was educated at Lehigh and Johns Hopkins; b. 3 May 1864 reporter on the Philadelphia Record in 1887; and in 1888 went to New York where his striking stories of local life, first printed in the New York Evening Sun, brought him into prominence. For a short period he was managing editor of Harper's Weekly (1891). From that time on he roved wherever he
pleased or where editors sent him. His first war correspondence came out of the conflict between Greece and Turkey. Later he "covered" all the important wars for various newspapers and magazines — the Spanish-American, South African and Russo-Japanese wars. In 1914, he was correspondent for the New York Tribune in Mexico during the seizure of Vera Cruz. In August 1914 Mr. Davis was captured by the Germans and narrowly escaped being shot for a spy. His last assignment was with the French and British armies in the retreat from Serbia, and the hardships of his correspondent's life is believed to have brought on the attack of angina pectoris which caused his death. A high type of fearless American journalism is exhibited in his travel sketches and war correspondence. While not deeply analytical, his stories and novels are full of action and the characters impress by independence and unerbating vitality. Among his books are: "Gallicager and Other Stories" (1891); "Stories for Boys" (1891); "Van Bibber and Others" (1892); "Coral Caves in Corsica" (1893); "About Paris" (1895); "The Rulers of the Mediterranean" (1894); "The Exiles" (1895); "Three Gringos in Venezuela and Central America" (1896); "Cuba in War Time" (1898); "The Cuban and Porto Rican Campaign" (1898); "With Both Armies in South America" (1900); "The Princess Aline" (1896); "The King's Jackal" (1899); "Soldiers of Fortune" (1897), dramatized with great success in 1902; "Captain Macklin: His Memoirs" (1902); "The Bar Sinister" (1904); "Kite's Farewell" (1904); "Soldiers of Fortune" (1907); "The Man Who Could Not Lose" (1911); "The Lost Road" (1913); "The Taming of Helen" (1903); "Ramson's Folly" (1904); "The Dictator" (1904); and the following plays 1903-13: "The Galloper"; "Yankee Tourist"; "Vera the Medium"; and "Blackmail."

DAVIS, THOMAS EDWARD, American editor: b. Bedford, Va., 25 Sept. 1835; d. 20 Feb. 1917. He was graduated (1858) at the University of Virginia, studied medicine and law but did not practice. In May 1861 he joined the Confederate Army, became adjutant of the 21st Virginia Cavalry and was promoted major and assistant adjutant-general. He fought in numerous engagements and at the close of the war removed to Montana and engaged in mining. He removed to Galveston, Tex., in 1871, where he was engaged in business for several years. He entered journalism in 1876 at Houston, founding the Houston Telegram. In 1879 he joined the staff of the New Orleans Picayune, of which journal he became editor with 1884, remaining in this relation till the sale and consolidation with the Times-Democrat in 1914.

DAVIS, VARINA ANNE JEFFERSON, American novelist: b. Richmond, Va., 27 June 1864; d. Narragansett Pier, R. I., 18 Sept. 1898. She was called "the Daughter of the Confederacy," her father being Jefferson Davis, the President of the Confederate States. Her education was obtained partly in the United States and partly in Germany and France, and she wrote "The Veiled Doctor," a novel, and "A Romance of Summer Seas."
DAVITT, Michael, Irish Nationalist politician and journalist: b. Straid, County Mayo, 25 March 1846; d. Dublin, 31 May 1906. His parents, peasant farmers, were evicted from their farm in 1851 and migrated to Lancashire, where at the age of 10 Michael began work in a cotton mill at Haslington. Here in 1857 he lost his right arm by a machinery accident and secured employment in a printing office where he also managed to educate himself. He joined the Fenian brotherhood in 1867 and in 1870 was sentenced to 15 years' penal servitude for treason-felony in arranging for sending firearms into Ireland. He was released on a ticket of leave in 1877 and went on a lecture tour in the United States. Returning to Ireland he founded at his birthplace, 21 Oct. 1879, the Land League, which spread all over Ireland. He was again in America in 1880, organizing an American branch of the Land League, and on his return to Ireland was imprisoned under the Coercion Act. He was released in 1882. While in prison he had been chosen parliamentary representative for Meath, but being a convict was disqualified. He was one of the respondents before the Parnell Commission 1888–90, and conducted his own defense in a five-day speech. He became an Anti-Parnellite in 1890 and in 1892 was elected member of Parliament for North Meath, but was unseated on petition. He was next returned for Northeast Cork but had to vacate his seat through bankruptcy, caused by the costs in the North Meath petition. He was elected for West Mayo in 1895 but resigned in 1899.

He moved to Boston in 1898 and on his return published the volume Impressions of Australasian Democracy. He visited South Africa as war correspondent during the Boer War, investigated the Khineev massacre and also traveled as correspondent of London journals in the Balkans and the Near East. In politics he was a sincere Nationalist, bitter in his attitude toward English methods and anti-clerical. In his later years his radicalism brought him into association with the Labor party. He contributed hundreds of articles to journals in Ireland, England and America and published 'Leaves from a Prison Diary' (1884); 'Defense of the Land League' (1891); 'The Boer Fight for Freedom' (1902); 'Within the Pale' (1904); 'The Fall of Fenianism in Ireland' (1904); 'Pageant of London' (1905). Consult Cashman, 'Life of Michael Davitt' (Boston 1881).

DAVOS, dä'vo: a valley and district of Switzerland in the canton of Grisons, lying at a considerable elevation among the Alps and now a favorite place of residence both in summer and winter for people troubled with asth-{

osis. The valley is about 10 miles long, shut in by mountains from 6,000 to 10,000 feet high and exhibiting many picturesque features. The chief centre of population is Davos-Platz, a place of 5,000 inhabitants, containing numerous hotels, boarding-houses and other establishments for visitors and having a handsome town-house and an English church. It is well sheltered on the north and east and the air is remarkably pure and dry. The Davos Landwasser traverses the district. This stream takes its rise in Davos, of which is one-sixth of a square mile in area and 175 miles deep. Con-

DAVOUT, dä'voo, Louis Nicholas, Duke of Auerstädt, Prince of Eckmühl and Marshal of France: b. Annoux, Yonne, 10 May 1770; d. Paris, 1 June 1823. He was educated at Brienne and entered the army as sub-lieutenant of cavalry in 1788. On the outbreak of the Revolu-

tion he embraced its principles. He was chief de bataillons in the campaign of 1792, was promoted general of brigade, but was removed because of his being of noble birth. He served on the Rhine in 1794–97, and accompanied Desaix to Egypt in 1798. His skilful handling of his troops at Aboukir gained the attention of Napoleon, and in 1800 he was made general of division and commanded the cavalry in the Marengo campaign. He was next appointed commander of the consular guard and marshal of France in 1804, soon after Napoleon became emperor. He distinguished himself in all of the succeeding campaigns as commander of the Third Army Corps. At Austerlitz his corps bore the brunt of the fighting, in the Jena campaign with a single corps Davout won the great victory against the main Prussian army. His fame was enhanced at Eylau and Friedland. He was appointed governor-general of the grand-duchy of Warsaw after the Treaty of Tilsit in 1807, and in 1808 Napoleon made him Duke of Auerstädt. He again distinguished himself in the actions leading to the brilliant victory of Eckmühl, and also in the battle of Wagram. He was made Prince of Eckmühl in 1810. He helped organize the gigantic army which invaded Russia in 1812. In this campaign he won the victory of Mobiler and was wounded at Borodino. He was placed in command of the Hamburg military district in 1813, defended that city for several months, only surrendering on the direct order of Louis XVIII after the fall of Napoleon in 1814. His character and methods were often regarded as cruel and rapacious, but he doubtless acted on the instructions of Napoleon; being a rigid disciplinarian he gave the same precise obedience to superior orders which he exacted from his sub-

ordinates. His military talents were of the highest, and later judgment has regarded him as perhaps the ablest of all Napoleon's marshals. Although at the first restoration he made his submission, he maintained his hostility to the Bourbonts and during the Hundred Days acted as Minister of War, showing extraordinary ability in organizing troops and procuring army supplies. After Waterloo he directed the hopeless defense of Paris, and was deprived of his estates and titles after the restoration. He pro-

tested against with great bitterness of 1815 and when some of his subordinate generals were in-
cluded, Davout demanded to be held responsible for their acts, as executed under his orders. He made every effort to prevent the condemnation and execution of the gallant Marshal Ney. His rank was restored to him in 1817 and he became a member of the Chamber of Peers in 1819. Consult Blocquel, (Le maréchal Davout) (Paris 1879–80); Correspondance du maréchal Davout (ed. Mazade, 4 vols., Paris 1885); Chenu, (Davout ou la Guerre) (ib. 1866); Montégut, (Le Maréchal Davout) (ib. 1882); Holzhauzen, (Davout in Hamburg)
DAVY, Sir Humphry, English chemist: b. Penzance, Cornwall, 17 Dec. 1778; d. Geneva, Switzerland, May 25, 1829. A taste for chemistry, which he displayed in some experiments on the air contained in sea-weed, the attention of Mr. Gilbert, president of the Royal Society, and Dr. Beddoes, and the latter offered him the place of assistant in his laboratory. Here Davy discovered the respirability and exhalating effect of nitrous oxide. He published his results of his experiments, under the title of 'Researches, Chemical and Philosophical' (1799). This work immediately secured for him the place of professor of chemistry in the Royal Institution, at the age of 22. His lectures were attended by crowded and brilliant audiences, who were attracted by the novelty and variety of his experiments, the eloquence of his discourses and the clearness of his exposition. His discoveries with the galvanic battery, his decomposition of the earth and alkaline metals, his application of alkaline earth and amphoteric bases, his demonstration of the true nature of oxyymuriatic acid, his discovery of chlorine as an element, etc., obtained him a European reputation; and in 1808 he received the Napoleon prize of the French Institute. In 1812 he was knighted. In 1813 appeared his valuable and illustrious 'Elements of Agricultural Chemistry.' The numerous accidents arising from fire damp in mines led him to enter upon a series of experiments on the nature of this explosive gas, the result of which was the invention with which we now will always be associated, the safety-lamp (1815). In 1818 he was created a baronet. In 1820 he succeeded Sir J. Banks as president of the Royal Society. Cuvier said of him that, 'in the opinion of all who could judge of such labours he held first rank among the chemists of this or any other age.' Near the close of his life he wrote his 'Salmonia, or Days of Fly-fishing;' and his 'Conslations in Travel, or the Last Days of a Philosopher.' Besides what is already mentioned, he also wrote 'Elements of Chemical Philosophy' (1802); 'Bakerian Lectures' (1807-11); 'On the Safety-lamp' (1818), etc. A statue was erected to him at Penzance in 1872. Consult his 'Memoirs,' edited by his brother, John Davy (2 vols., London 1830); his 'Life' by Dr. Paris (1831); and 'Fragmentary Remains' (London 1858).

DAWES, Anna Laurens, American writer: b. North Adams, Mass., 14 May 1851. She is the daughter of H. L. Dawes (q.v.) and has been Washington correspondent of English newspapers besides being prominent in various philanthropic and other organizations. She is the author of 'How We are Governed' (1885); 'The Modern Jew: His Present and Future' (1886); 'Explanations of the Constitution and Government of the United States' (1889); 'Charles Sumner' (1892).

DAWES, Henry Laurens, American legislator: b. Cummington, Mass., 30 Oct. 1816; d. Pittsfield, Mass., 5 Feb. 1903. He was graduated at Yale in 1839. Becoming a lawyer, he entered the State senate as a Republican and in 1857 was elected to Congress, serving in the House until 1873. He was elected to the United States Senate in 1875, and served until 1893. The condition of the Indian tribes especially claimed his attention, and after his retirement from Congress he was at the head of the Commission to the Five Civilized Tribes.

DAWES' HOLE, the astronomical name for the minute circular spots on the nucleus of a sun-spot, darker than the rest of the nucleus, and supposed to be the mouths of tubular orifices penetrating to unknown depths. They were first observed by the astronomer whose name they bear.

DAWK, or DAK, a term in India for postal traveling arrangements, by palanquins or other carriages, on the principal of the posting-house station plans of pre-railway days in Europe and America.

DAWKINS, John. See Artful Dodger, THE.

eryshire, 26 Dec. 1838. In 1861 he joined the Geological Survey, became curator of Manchester Museum in 1870, and professor of geology in Owens College there in 1872. The Channel Tunnel Committee employed him in 1882 to map the special surveys of both coasts, and next year he laid down the line for a tunnel under the Humber. He delivered the Lowell Lectures in Boston in 1880. His chief works are ‘Cave-hunting: Researches on the Evidences of Caves Respecting the Early Inhabitants of Europe’ (1874); ‘Early Man in Britain, and His Place in the Tertiary Period’ (1820), the latter a work of great interest; ‘British Pleistocene Mammalia’ (1866–87).

DAWLEY, Thomas Robinson, Jr., American journalist: b. New York, April 1862. He was educated in the Brooklyn schools, left home at 17, went to Liverpool on a cattle ship, tramped from London; later engaged in the printing business in New York. He traveled in Central America, the West Indies, Spain and France; studied law at Providence, R.I.; went to Cuba for Harper’s Weekly in 1896; visited insurgent camps and wrote books with Spanish troops. He was arrested several times, was confined two weeks in Morro Castle and expelled from the island by General Weyler. He returned to Cuba in the following year; visited the army of General Gomez; became a volunteer aide on staff of General Miles in the Spanish-American War. After the taking of Santiago, he published the first American daily newspaper in Cuba, The Times of Cuba. The plant was seized by the Cuban authorities and he was obliged to return to the United States. He next went to Spain for the Century and was special commissioner for the Outlook at the Pan-American Congress in Mexico in 1901. He traveled through the Dominican Republic in 1904 and reported on political and sociological conditions there to President Roosevelt. He was special agent of the Bureau of Labor in 1907–09, and was assigned to investigate the effect of factory employment on the women and children drawn from the farms to the cotton mills of the South. He published several articles on Spain and the Latin-American countries in periodicals and the book ‘The Child that Toileth Not’ (1912).

DAWN, The. ‘The Dawn,’ or more correctly ‘The Dawns’ (‘Les Aubes’), is generally regarded as the greatest symbolistic drama of Emile Verhaeren. It differs from the plays of his Belgian countryman, Maeterlinck, in content, in that it concerns itself directly with social problems and the social revolution of the future, rather than with the psychic readjustments of the individual. ‘The Dawns’ here prophetically foreshadowed are the beginnings of justice between class and class, the triumph of great cities and the coming of peace through renunciation of victory by a people that has conquered its past and its traditional leaders. It announces that the time has come to found new religions and proclaim new doctrines. It differs from Maeterlinck also in construction and style; for whereas Maeterlinck allures with feminine charm and an insinuating grace, Verhaeren attacks his theme with abrupt vigor and irresistible drive that bursts into passages of magnificent poetry. He would compel rather than win his audience. Indeed, it is in these longer impassioned and flaring outbursts that the meaning of the play as well as its poetic value is to be sought. The drama proper is not well articulated, and into it are wound so many strands of meaning that at points it breaks down. Although published in 1898 it has been produced but once, and then privately, and in all probability will never prove successful on the stage. In the person of its tragic hero, the people’s liberator, Herrien, the suppressed impulses and hopes of the early 20th century came to triumphant expression, and his outbursts of eloquent aspiration contain many foreshadowings of the social and socialist movements toward fraternization and an end of national conflicts which were to mark the progress of the World War of 1914. The play has been admirably translated into English by Arthur Symons.

CHRISTIAN GAUSS.

DAWSON, Coningham (William), English author: b. High Wycombe, Buckinghamshire, England, 26 Feb. 1887. He was graduated at Merton College, Oxford, in 1905 and came to America in the same year. He did special work for English newspapers on Canadian affairs and in 1910 became literary advisor to the George H. Doran Publishing Company. He is joint editor, with his father, of ‘The Reader’s Library,’ and has published ‘The Worker and Other Poems’ (1906); ‘The House of the Weeping Woman’ (1908); ‘Murder Point’ (1910); ‘The Road to Avalon’ (1911); ‘The Garden Without Walls’ (1913); ‘Florence on a Certain Night’ (1914); ‘The Raft’ (1914); ‘Slaves of Freedom’ (1916); ‘Out to Win’ (1918).

DAWSON, George Mercer, Canadian geologist: b. Pictou, Nova Scotia, 1 Aug. 1849; d. 1901. He was a son of Sir J. W. Dawson (q.v.) and was educated at McGill University and at the Royal School of Mines in London. In 1874 he was appointed assistant director and from 1895–1901 director of the Geological Survey of Canada. He was the author of ‘Geology and Resources of the Forty-ninth Parallel,’ and similar works.

DAWSON, Henry, English landscape painter; b. Hull, 3 April 1811; d. Chiswick, 13 Dec. 1878. In early life he was a worker in a Nottingham lace-factory, but this occupation he gave up for art in 1835. After struggling some time at Nottingham he went to Liverpool in 1844, and thence to Croydon in 1859, and subsequently he resided at Chiswick. It was long before his abilities were fully recognized, and his pictures began to bring high prices only a little before his death. Among the best of them are ‘Wooden Walls of Old England;’ ‘London from Greenwich Hill;’ ‘Houses of Parliament;’ ‘The Rainbow;’ ‘Rainbow at Sea;’ ‘The Pool Below London Bridge.’

was in 1855 appointed principal and professor of natural history in McGill College, Montreal. He became a member of the Royal Society of Canada (London) in 1862, was knighted in 1885, and was president of the British Association in 1886 and president of the Geological Society of America (1893). His published works include: 'Academic Geology' (1855); 'Handbook of Coral Reefs' (1871); 'The Story of the Earth and Man' (1872); 'The Origin of the World' (1878); 'The Chain of Life in Geological Time' (1881); 'The Geological History of Plants' (1888); 'Modern Science in Bible Lands' (1888); 'Handbook of Canadian Geology' (1889); 'Modern Ideas of Evolution' (1890); 'The Ice Age in Canada' (1894).

DAWSON, Miles Menander, American actuary, insurance lawyer and author: b. Viroqua, Wis., 13 May 1863. He was educated at Kentucky (now Transylvania) University and the New York University Law School. He took up general practice as an insurance lawyer and consulting actuary. He was actuary of New York Legislative Life Insurance Investigating Committee, known as the Armstrong Committee, in 1905, of the Royal Commission on Life Insurance of Canada and the Wisconsin Legislative Insurance Investigating Committee 1906, and actuarial expert adviser of the New York Workmen's Compensation Commission in 1914; has made two study tours in Europe on a member of the Royal and Social Insurance, for Russell Sage Foundation in 1908 and for the United States Bureau of Labor in 1910; American secretary International Committee on Social Insurance; and treasurer of the Poetry Society of America. He has published 'Elements of Life Insurance' (1892; 3d ed., 1911); 'Assessment Life Insurance' (1895); 'Principles of Insurance Legislation' (1895); 'Practical Lessons in Actuarial Science' (1897, 2d ed., 1905); 'Things Agents Should Know' (1900); 'Various Derived Tables' (1900; 3d ed., 1915); 'Business of Life Insurance' (1905); 'Comparative Reserve Tables' (1905, 3d ed., 1915); 'Survivourship Annuity Tables' (1910–15); 'Working Men's Insurance in Europe' (joint author Lee K. Frank); a novel from 'Elise', a novel from Norwegian of Alexander Kjeld (1892); 'Poems of the New Time' (1901); 'Etics of Confucius' (1915).

DAWSON, Samuel Edward: b. Halifax, 1 June 1833. He was educated at Montreal and engaged in business as a bookseller and publisher. He was king's printer of Canada, 1891–1909, and president of the Royal Society of Canada, 1907. He is the author of 'The Saint Lawrence Basin and its Border Lands'; 'A Plea for Literature' (1908).

DAWSON, William, English clergyman: b. Garforth, Yorkshire, 30 March 1773; d. Colne, 5 June 1841. He became a local preacher of the Wesleyan Methodist Church. He went all over England preaching with great power, often to immense audiences in the open air. By many he was considered the most eminent preacher produced by the Wesleyan movement. His life was written and his letters edited by James Everett. His sermons were posthumously published.

DAWSON, William Harbutt, English publicist b. Skipton, 27 July 1860. He was educated at Skipton School and Berlin University. He married a German lady. He has been actively engaged in Social and Political work in Germany for many years. Much of his work has been written for the purpose of interpreting German thought, life and character to English people, and particularly of expounding German practice in the treatment of social, economic and industrial questions. His publications include: 'A Handbook of Modern Germany' (1908); 'German Socialism and Ferdinand Lassalle' (1888); 'Prince Bismarck and State Socialism' (1890); 'Germany and the Germans' (1894); 'Social Switzerland' (1897); 'German Life in Town and Country' (1901); 'Matthew Arnold and his Relation to the Thought of his Time' (1903); 'Protection in Germany: a History' (1904); 'The German Workman: A Study in National Efficiency' (1906); 'School Doctors in Germany' (1906); 'The Vagrancy Problem' (1910); 'Social Insurance in Germany' (1883, 1911–12); 'Industrial Germany' (1913); 'Municipal Life and Government in Germany' (1914); 'What is Wrong with Germany?' the causes of the War' (1915); 'Introduction to German History' (1915), and contributions to the Fortnightly Review, the Nineteenth Century and the Economic Journal.

DAWSON, William James, English poet, novelist and clergyman: b. Towcester, Northamptonshire, 21 Nov. 1854. He entered the Wesleyan ministry in 1875 and is at present pastor of the old First Presbyterian Church, Newark, N. J. His works include 'A Vision of Souls' (1884); 'Quest and Vision: Essays on Life and Literature' (1886); 'The Makers of Modern Poetry' (1890); 'Poems and Lyrics' (1893); 'London Idyls' (1895); 'The House of Dreams' (1897); 'Through Lattice Windows' (1897); 'Table Talk With Young Men' (1898); 'Makers of Modern Prose' (1899); 'The Man Christ Jesus' (1901); 'The Quest of the Simple Life' (1902); 'The Book of Courage' (1911); 'Robert Sheenstone' (1917).

DAWSON, Canada, city and capital of Yukon Territory, Northwest Territories. It is situated at an elevation of 1,400 feet on the right bank of the Yukon River, 1,500 miles from its mouth, at the confluence of the Klondike River, about 30 miles east of the Alaskan boundary; in lat. 64° 5' N., long. 139° 39' W. The city, which is near the site of old Fort Reliance, has grown up since the discovery of gold on Bonanza Creek, 16 Aug. 1896, and is the receiving and distributing centre for the Klondike mining district. It is mostly well built, the two great fires of 1899 having destroyed much of the rude, temporary structures. Forty below zero is the average temperature for days at a time, but blizzards are not common. Thawing the ground by steam, the use of automatic lifts and buckets, and the machinery in general, have largely increased the gold output of the region. Coal deposits have been found nearby. Steamers ply upon both the upper and lower Yukon in the season of navigation from 1 June until October. Dawson has a United States consulate. Pop. 3,013.

DAWSON, Ga., city and county-seat of Terrell County, on the Central of Georgia and the Seaboard Air Line railroads, 95 miles southwest of Macon. It has oil, lumber and grist mills and is the centre of a cotton and fruit-
growing district. It contains a Carnegie library. It was settled in 1855 and incorporated the following year. It is governed by a mayor, elected biennially, and a board of aldermen under a charter of 1891. It owns the water plant and electric-lighting system. Pop. 3,827.

DAY, dàk, a town in department of Landes, southwestern France, on the left bank of the Adour 32 miles northeast of Bayonne by rail. It consists of the town proper, surrounded by old ramparts partly Roman, and of a suburb called Sahlar, on the opposite side of the river and communicating with it by a bridge. The principal edifices are the high church, once a cathedral, the bishop's palace, now occupied as public offices, the communal college, and a handsome thermal establishment. There are various ancient Roman remains. Its chief attraction is its warm sulphur springs, which have temperatures varying from 86° to 166° F., were much frequented by the Romans, and are still in great repute. Its old name was Aquae Tarbellicae. Pop. 11,387.

DAY, Arthur Louis, American physicist: b. New York, Mass., 30 Oct. 1869. He was graduated at Yale in 1892, and was instructor in physics there in 1894-97. He was a member of the scientific staff of the Physikalisch-Technische Reichsanstalt at Charlottenburg, Germany, 1897-1900, and physical geologist of the United States Geological Survey 1900-06, and in the latter year was appointed director of the geophysical laboratory of the Carnegie Institution at Washington. He is member of several learned societies, and has written many papers upon physical and geophysical investigations at high temperatures in German and American scientific journals.

DAY, Benjamin Franklin, American naval officer: b. Plymouth, Ohio, 16 Jan. 1841. He was graduated at the United States Naval Academy in 1862. During the Civil War he served with the West Gulf (1862-64) and North Atlantic (1864-65) blockading squadrons, and attained the rank of lieutenant-commander in 1866. In 1876 he became commander, in 1891 captain, in 1899 rear-admiral, and was retired from the service in 1898. From 1897 to 1900 he was a member of the Naval Examining and Retiring boards.

DAY, George Edward, American theologian: b. Pittsfield, Mass., 1816; d. New Haven, Conn., 2 July 1905. He was graduated at Yale in 1833 and in 1838 at the Yale Divinity School, where he became assistant instructor in sacred literature. From 1840 to 1851 he was pastor of churches in Marlboro and Northampton, Mass.; from 1851 to 1866 he occupied the chair of biblical literature in Lane Theological Seminary; and then that of Hebrew and biblical theology in Yale Divinity School, where he founded in 1891 the Historical Library of Foreign Missions. From 1863 to 1871 he was editor of the Theological Eclectic (afterward merged in the Bibliotheca Sacra) and, beginning in 1869, he published a translation of the 'Theology of the New Testament' of Van Oosterzee (1871); an American edition (1883) of Oehler's 'Theology of the Old Testament'; and other works.

DAY, Holman Francis, American journalist and author: b. Vassalboro, Me., 6 Nov. 1865. He was graduated at Colby College in 1887 and entering journalism the year after, has since been editorially connected with various Maine journals. He has contributed extensively to periodicals and is the author of three volumes of popular verse, 'Up in Maine' (1900); 'Pine Tree Ballads' (1902); 'Kim O'Keehn' (1904); also of novels, 'Squire Phin' (1905), dramatized as 'The Circus Man,' produced Chicago (1909); 'The Rainy Day Railroad War' (1906); 'The Eagle Badge' (1907); 'King Spruce' (1908); 'The Ramrodders' (1909); 'The Skipper' and the 'Skipped' (1911); 'The Red Lane' (1912); 'The Landlister' (1915); 'Blow the Man Down' (1916); 'Along Came Ruth,' a play, produced (1914) by Henry W. Savage.

DAY, James Roscoe, American educator: b. Whitneyville, Me., 1845. He studied at Bowdoin and was ordained a minister of the Methodist Episcopal Church in 1872. He was pastor at Bath, Me., 1872-74; Portland, Me., 1876-78; Boston, 1881-82, New York, 1883-85 and 1889-93. In 1893 he became chancellor of Syracuse University. He was elected bishop in 1894, but in 1898 resigned his episcopal position. He has written many magazine articles and sermons and has published in book form 'The Raid on Prosperity' (1907).

DAY, Jeremiah, American educator: b. New Preston, Conn., 3 Aug. 1773; d. New Haven, Conn., 22 Aug. 1867. He was graduated at Yale 1795. Having early chosen the profession of the theology of while acting as tutor he began to preach as a candidate for the ministry; but before taking charge of any parish was in 1801 elected to the professorship of mathematics in Yale College. In 1817 he became president of the college, continuing in that position till his resignation in 1846. He published 'An Introduction to Algebra' (1814); 'Navigation and Surveying' (1817); and other works.

DAY, John, English dramatist: fl. about 1600. Of his life hardly anything is known. He is mentioned in Henslowe's 'Diary' in 1598 as an active playwright. But few of his earlier works have come down to us save 'The Blind Beggar of Bethnal Green.' Day collaborated freely with contemporaries. Chettle and Dekker. Ben Jonson in his conversations with Drummond of Hawthorned grouped him with some other admirable gentlemen and authors as a rogue and a base fellow. His best works that have reached us are a graceful comedy, 'Humor out of Breath,' and 'The Parliament of Bees,' a kind of allegorical masque in which all the characters are bees, "The very air," says Charles Lamb, "seems replete with humming and buzzing melodies. Surely bees were never so be-hymned before." An edition of Day's works was privately printed by A. H. Bullen in 1881. Consult Svinburne's essay in Nineteenth Century (October 1897); and 'Cambridge History of English Literature' (Cambridge and New York, 1903), 13.

DAY, Richard Edwin, American author and editor: b. West Granby, Osage County, N. Y., 27 April 1852. He was graduated at Syracuse University 1877, engaged in teaching, then journalism, being associate editor of the Syracuse Standard for 18 years. Since 1889 he has edited State publications at Albany,
DAY

N. Y., since 1904, in the State historian's office. He has published 'Lines in the Sand' (1878); 'Thor: a Drama' (1880); 'Lyrics and Satires' (1883); 'Poems' (1888); 'New Poems' (1890); Catalogue of Sir William Johnson Manuscripts in New York State Library' (1909).

DAY, or DAYE, Stephen, American colonial printer: b. London about 1610; d. Cambridge, Mass., 22 Dec. 1668. He was employed by the Rev. Joseph Glover to accompany him to America in 1638, to operate a printing press with which to set up in Massachusetts. Mr. Glover died on the voyage and the press was placed in the house of Rev. Henry Dunster, first president of Harvard College. The first book printed in the colonies was issued from it in 1640, and was entitled 'The Whole Booke of Psalms, faithfully translated into English metre,' commonly styled 'The Bay Psalm Book.' The printing house was taken from him about 1648, and put into the hands of Samuel Green and Constand Thomas, 'History of Printing in America' (1815).

DAY, Thomas, English writer: b. London, 22 June 1748; d. 28 Sept. 1789. He was educated at Oxford, and was called to the bar but never practised. He published several works in favor of the American Revolution and against slavery. His principles led him to recognize most of the indulgences of a man of fortune that he might bestow his superfluities upon those who wanted necessities. He wrote, in prose and verse, on various subjects, but his name is kept alive chiefly by the well-known book which he wrote for the young, entitled 'History of Sanford and Merton.' His 'Poems' were published in 'British Poets' (Vol. LVIII). His 'Life' was written by Keir (London 1791) and by Blackman (ib. 1862).

DAY, William Rufus, American jurist: b. Ravenna, Ohio, 17 April 1849. He was graduated from the University of Michigan in 1870, and from the law school of the same institution in 1872. In the latter year he was admitted to the Ohio bar, and began the practice of law at Canton where he soon gained local and State distinction; in 1886 he was elected judge of the Common Pleas Court of the ninth judicial district, being the candidate of both political parties. In 1889, President Harrison appointed him United States district judge for the northern district of Ohio, but he was obliged to decline the appointment on account of ill health. In 1897 he was made Assistant Secretary of State by his friend, President McKinley, and in April 1898 he succeeded Sherman as Secretary of State, as such conducting all the negotiations of the Spanish War. Later in 1898 he resigned the secretarieship, and was appointed chairman of the United States Peace Commission to frame a treaty of peace with Spain, in which capacity he had a conspicuous and responsible part in all peace negotiations. He then returned to his private practice, but in 1899 was appointed to succeed Judge Taft as United States circuit judge, and on 26 Jan. 1903 was appointed to the Supreme Court by President Roosevelt.

DAY, a word used with several different senses. Its most ancient meaning is the period of light ('natural day') as opposed to the period of darkness, and in this sense it is quite commonly used. Its most common application, however, is to the period of light and that of darkness together, but even in this sense there are different days. The sidereal day is the time that elapses between two successive eclipses of the particular fixed star, or, in other words, is the time occupied by a revolution of the earth round its axis. The solar, astronomical or apparent day is the time that elapses between two successive returns of the same terrestrial meridian to the centre of the sun. This period is not always of the same length, and its mean length gives us the mean solar or civil day. The 24 hours of the sidereal day are numbered in succession from 1 to 24, while the civil day in most countries is divided into two portions of 12 hours each. The abbreviations p.m. and a.m. (the first signifying post meridiem, Latin for afternoon; the latter ante meridiem, forenoon) are requisite, in consequence of our division of the day into two periods of 12 hours each. In this respect the mode of numbering from 1 to 24 consecutively has an advantage, and in some countries is being introduced; in parts of Italy it has long prevailed. The Babylonians began the day at sunrise; the Jews and Greeks at sunset; the Egyptians and Romans at midnight, as do most modern peoples. Astronomers use a day of the same length as the civil, but commonly make it begin at noon and number the hours up to 24, though latterly midnight has been partly adopted as the starting point.

If we take a day according to the second definition given above (that is, a sidereal day), its length, of course, is the same throughout the year (see SIDEREAL TIME). The solar day, in consequence of the varying rapidity of the earth in its orbit, and the obliquity of the ecliptic, is different at different times (see SOLAR TIME), and this difference is uniform throughout the world; but the time of the natural day (or period of light) is different at the different points of the earth, according to their distance from the equator. To get a fixed measure of the time which the sun moving uniformly in the celestial equator and completing its circuit in the same time as the real sun. The time marked by this imaginary sun is called mean solar time; while the time which the sun is on the meridian it is mean noon; when the real sun is on the meridian it is apparent noon. Four times a year these two kinds of solar time coincide. In the intervals the sun is always either too fast or too slow, and the difference is called the equation of time. The daily apparent revolution of the sun takes place in circles parallel to the equator. If the equator and the ecliptic coincided the circle bounding light and darkness would always divide, not merely the equator, but all its parallels, into two equal parts, and the days and nights would be equal in all the parallels through the year; but at the poles there would be no night. Owing to the inclination of the earth's axis to the plane of its orbit (the ecliptic), the parallel of latitude which the sun appears to move is continually changing; and therefore the equator alone (being a great circle) always remains bisected by the circle dividing light from darkness; so that the days and nights here are always equal; while the parallels of latitude, not being great circles, are not;
equally divided by the circle separating light from darkness, except at the time of the equinox, when the sun is moving in the equator; and, of course, at this time only are days and nights equal in those parallels. As you approach the poles the inequality between the days and nights becomes continually greater, till, at the poles themselves, a day of six months alternates with a night of equal duration. The most distant parallels which the sun describes north and south from the equator are, as is well known, only 21½ degrees from it. The distance between the polar circles and the poles is the same. Therefore, as a little reflection will show, when the sun is in one of the tropics, all the polar circle in the same hemisphere will be within the illuminated region (because it will be within 90 degrees of the sun) during the whole of a diurnal revolution, while the other polar circle will be in the region of darkness. These circles, therefore, have one day of 24 hours and one night of the same length in each year. From the polar circles to the poles the time of the longest day increases fast, and in the same measure the length of the longest night. Notwithstanding the inequality of the periods of light and darkness in the different parts of the earth, a part of the earth's surface has the sun above its horizon every year precisely six months, and below it the same length of time.

A day, in law, includes the whole 24 hours from midnight to midnight. In reckoning periods of time from a certain event the day on which the event occurred is excluded. On the other hand, if it be required to prove survival for a certain number of days, it will suffice if the person be alive for any portion, however small, of the last day. While an obligation to pay on a certain day would therefore be theoretically discharged by payment before midnight, the law requires that reasonable hours be observed—for example, if the payment (as a bill) is at a bank or place of business, it must be within business hours.

A lawful day is a day in which there is no legal impediment to the execution of a writ—that is, a day may be unlawful, dies non jurisdis, either by common law or specific statute. By common law a Sunday is a day on which the service of a writ cannot legally be made. Other days have been made holidays by both State and Federal statute in this country, and no such legal holiday is a lawful day.

Days of Grace.—The time at which a note is at maturity is in general three days after the time expressed on the face of it; the additional days are called days of grace. These days must be lawful days.

DAY OF ATONEMENT. See Atonement.

DAY-BLINDNESS, or HEMERALOPIA. See Vision, Defects Of.

DAY OF THE DEAD. See Mythology, Growth of Myths.

DAY LILY, the popular name for a genus of lilies (Hemerocallis), natives of temperate Asia and chiefly of eastern Europe, grown in gardens. They have long radical leaves, and a branched few-flowered scape, with handsome large blossoms, the segments of which are united into a tube. The flowers are found in meadows and along streams throughout the Atlantic seacoast from New Brunswick to Virginia, and west to Ontario and Tennessee. A species with bright yellow flowers (H. flavus) is sometimes found near old gardens. The name of the genus is from Greek signifying "beautiful" in Europe the plants are sometimes cultivated as fodder for cattle. A Japanese plant, Funhici subcordata, is also known as the day lily.

DAY OF THE LORD. Sometimes called the Day of Jehovah, or Day of Jahweh. A term originating in the Oriental Semitology of the 8th century B.C. The Day of the Lord was to come when Jehovah would interfere in the affairs of Israel and deliver them from their misery and their foes. Hence the Day of the Lord is always spoken of as a day of judgment, not as an end, but in order that salvation may come. The judgment may be administered by some distant nation and would be accompanied by the terrors of the Lord. The prophets regarded the day as near at hand. While the day was primarily a day of judgment on Israel, yet it was to include all nations.

DAY NURSERIES, institutions for the care of those infants whose mothers' occupations oblige them to work away from home during the day. The movement originated in France under the leadership of Marbeau in 1844. A society was formed for the propagation and support of these nurseries, which was so successful in its efforts as to induce the municipal boards of charities to include these institutions in their programs. Some of the "crèches," as they are called in France, are still supported by private contribution. The movement was carried to Austria, Germany, Spain, Russia and other countries. In the first-mentioned countries, they became public institutions. In the United States, the first day nursery was founded in New York city in 1854. From insignificant beginnings, it grew to include a hospital, and changed its name to Nursery and Child's Hospital. Now nearly all of the larger cities of the country have such establishments, supported by private philanthropy. The Association of Day Nurseries of New York City was founded in 1897; and in 1898, the National Federation of Day Nurseries held its first meeting at Chicago. In England, the British National Society of Day Nurseries was established in 1901.

The need for these foundations is increasingly great with the more extensive occupation of women in industries. Children are generally admitted between the ages of two months and six years. They are left there in the morning before the mother goes to work, and are called for on her return home in the evening. It is desirable that the nurseries be adequate in size for the neighborhood and well scattered throughout those portions of the city where social conditions demand them, so as to render them readily accessible to the mothers. Plenty of air and light, spacious rooms and out-of-door playgrounds are necessary requisites. The work of the nursery is primarily concerned with medical attention for the children entrusted to it; and with provision for food and occupation of those children during the day. The mothers also receive advice as to the care of the children. Ramifications of the work have carried the efforts of the day nursery
DAY OF SECTIONS — DAYLIGHT SAVING

into close touch with other social agencies. Kindergartens, lunchrooms for school children of working mothers, and playgrounds to keep these older children busy after school until the mothers return, have been added. A small fee is paid for the daily care of the child.

DAY OF SECTIONS, in French history, 4 Oct. 1795, when the National Guard attacked the Convention in the Tuileries. The forces of the government, under command of Napoleon, disarmed the regiments in the different sections, the first clash occurring in the Rue Saint Honoré.

DAYFLY, a name sometimes used for the well-known Mayfly. A neuroptera insect of the family of Ephemeridae. The aquatic instan- tant stages of larva and pupa are unusually long, often extending to 10 months; but the adult period is short, and is passed without taking food, and covers only a few hours, never more than a day. The mouth is shriv- elled in the adult, which passes through an immature winged stage known as the subimagos. The body ends in two or three long thin tails. The membranous front wings are much bigger than the hind wings. In the early summer, Mayflies abound in great numbers about northern lakes and rivers, furnishing food for other insects, and for crustaceans and fish. See NEUROPTERA.

DAYLIGHT SAVING. A movement originated in England by William Willett (1857–1915) in 1907 by the publication of a booklet entitled 'The Waste of Daylight.' Briefly stated, his scheme aimed at securing more daylight leisure for recreation and lessening the work performed by artificial light during the summer months. This was to be brought about in the following manner: The hour between two and three o'clock in the morning of each of the first four Sundays in April should be a short hour consisting of only 40 minutes, while the same hour in four Sundays throughout the rest of the month would be 80 minutes. Greenwich and Dublin mean time were to be retained for purposes of astronomy and navigation, as well as for legal and parliamentary documents unless otherwise signified. Four new telegraphic standard time signals were to be sent out by radio and wireless that during the summer months people should rise an hour earlier than usual in the morning, begin work an hour earlier and finish an hour earlier in the afternoon or evening. The value of early rising has been extolled by wise men of all ages. "Daylight saving" has been practised in the oldest of all industries — agriculture — probably since the creation of man; from the earliest times down to the present day it has been, and still is, in active, daily operations among the bulk of mankind — in Asia, Africa, Australia and the agrarian communities of America and Europe. To the so-called "working classes" — it would be superfluous to preach the "early to bed and early to rise" doctrine: upon them the rising part at least is a life-long obligation. Early rising has become almost a lost art among the "higher ranks" of city dwellers; gas, electric light and the multiplication of amusements have added at least half of the night on to the end of the normal day, and produced the natural result of later rising in the morning. Benjamin Franklin was perhaps the first to draw attention to the anomaly of burning expensive artificial light in the evening whilst an abundance of free daylight was wasted in the morning by late rising. In March 1784 (while United States Minister to France) he published in the Paris Journal a long, humorous letter headed, "An Economical Observation," in which he related that he was in "grand company" one evening where a newly-invented lamp was introduced. "I went home, and to bed, three or four hours after midnight, with my head full of the subject, my sudden awakening at six in the morning, he was "astonished," not only to find that the sun was shining, but "that he gives light as soon as he rises." But for the accidental waking, he says, "I should have slept six hours longer by the light of the sun, and in exchange have lived six hours the following night by candle-light."

The movement started by Willett produced a heated controversy in the British Empire that spread over six years. Numerous societies and corporations welcomed the proposal and several private firms adopted it, though not by altering the clock, but by commencing daily operations an hour earlier. The fiercest opposition to the scheme came from prominent scientists and learned societies. Early in 1908 a "Daylight Saving Bill" was introduced in the House of Commons and, after passing a second reading, was referred to a Select Parliamentary Committee, which reported favorably on it, stating that the proposal would not only be beneficial to the general health of the community at large, but would curtail expenditure on artificial light. The bill, however, did not reach the final stages in the House; a similar bill was introduced in the following year and also referred to a select committee, which reported against it. One of the main objections was advanced in behalf of meteorological instruments designed to record continuously day and night, and the system of daily international telegraphic reports of synoptic observations upon which weather reports are based. It was pointed out that acts of Parliament could produce no effect upon daylight; that gas or electric light could be saved by making more use of daylight without altering time, and that it would be just as reasonable to change the readings of the thermometer at a particular season. The late Sir John Milne, the astronomer, wrote, "The only people that have a shiftless time are Mahometans and savages, and it is now suggested that we should join their ranks." Other prominent men asserted that the proposal was based upon self-deception; "rising at five and making yourself believe it is six o'clock." M. Charles Lallemand, scientist and administrator, was appointed by the French government to investigate and report upon the scheme. He condemned it in toto, maintaining that the position of the sun in the sky afforded the proper determination of time, and that an arbitrary displacement of noon, combined with differences of longitude, would operate very unequally in districts east and west of Paris, and that Brest would be as much as one and a half hours' away from true time. Up to the outbreak of the European War repeated efforts were made by Great Britain to promote legislation on the subject, but without success. Willett died 4 March.
1915. Though he did not live to see his cherished plan adopted except in isolated cases, he knew that it was supported by over 700 city corporations and town and district councils, as well as by hundreds of societies and associations. The year 1916, however, was destined to witness a remarkable translation of theory into practice in the way of "daylight saving." In April its adoption was contemplated in Austria. On 8 May the question was raised in the House of Commons and advocated as a war measure of economy. Sir Henry Norman estimated that altogether $12,500,000 would be saved in lighting. A bill was introduced on 10 May, passed through both houses, received the royal assent on the 17th, and came into operation three days later. Farmers and munition workers expressed disapproval, the former deciding to adhere to the real as against the "sham time" shown by the public clocks. Although the bill referred explicitly to the year 1916 it gave power to extend the operation of the act in any year, so long as the war continued. Instead, however, of adopting the complicated Willett plan, it was decided to advance the clocks by a full hour on 21 May and return to normal time on 1 October. The same month (April 1916) a system was introduced in Denmark, Germany and Holland; Italy, France and Portugal followed in June. In Germany, permanent adoption of the scheme was proposed in July; New Zealand rejected (after passing) it in August; Tasmania adopted it in September; and in November, and the Australian Dominion Parliament passed the measure to take effect in January 1917. The city corporation of London proposed permanent adoption, and in October it was actively urged in the United States. Norway decided in favor of daylight saving in May 1916, but rejected it in April 1917, as also did Denmark and Sweden in the same month, while Spain adopted it in May, at the same time that the Australian Cabinet decided to repeal the act. Turkey, Switzerland, Russia, also adopted "daylight saving." Nova Scotia as Newfoundland were the pioneers of the scheme in the New World. The French bureau in February 1917 suggested an international daylight saving conference to be held after the war. On 17 April 1917 a bill drafted by the National Daylight Saving Association was introduced in the United States Senate by Senator Calder of New York. It was pointed out that New York city could save $1,500,000 annually in gas alone. The American Federation of Labor welcomed the plan; the American Astronomical Society was divided as to its value, voting 18 in favor, 22 against, 6 neutral. The measure was passed 27 June 1917 without a roll call, to take effect on the last Sunday in April 1918. Actually, it came into force at 2 o'clock in the morning of Easter Sunday, 1918. Consult "The Independent," 19 Feb. and 5 May 1917; Current Opinion, 17 Feb. 1917; Nature (London), 9 July 1908; 11 March 1909; 22 April 1909; 6 April 1911; 27 April 1911; 11 May 1911; 27 April 1916; 4 May 1916; 11 May 1916; New York Herald, 17 March 1918; New York Times, 24 March 1918; 13 Jan. 1918; Smyth, A. H., "The Life and Writings of Benjamin Franklin (Vol. IX, New York 1906)."

HENRI F. KLEIN, Editorial Staff of The American.
entering the city daily. The union station was opened to the public in July 1903, and cost including tracks $900,000. The city has an area of 17 square miles.

Manufacturing Interests.—While Dayton's manufacturing industries are widely diversified and include the manufacture of cash registers, railroad signaling plants, building materials, sewing machines, foundry work, etc., these are conducted on so large a scale that many establishments employ from 500 to 2,500 hands. According to the United States census of 1900, the average number of wage-earners in the city was 16,889; the total wages paid Jan. 7, 1909, and the value of the production was $35,679,792. Great progress was made since 1900 and careful estimates show that in 1918 the average of wage-earners had increased to 38,500 with a total wages paid of $20,000,000 and the value of the products of $180,000,000.

In 1918 there were 130 factories engaged in making supplies and ammunition for the United States government. The city's industrial prestige lies largely in the manufacture of airplanes, aviation motors, and gasoline engines. The corporation system, cash registers, recording devises, electric lighting systems for homes and farms, cigars, toys and paper box goods.

Street Railways.—Seven interurban electric roads radiate from Dayton forming an important network in the traffic of the Central States. There are ten local car lines with total mileage of 85.

Government.—Dayton is the largest city in the United States operating under the commission-manager form of government, the new city charter having been adopted Jan. 1914. Five commissioners are elected by the people and the commissioners choose a city manager. The manager and commissioners are subject to recall and the initiative and referendum is in operation in the charter. The municipal government is divided into several divisions, as follows: Service, which oversees all matters pertaining to streets and alleys; street repairs, city asphalt plant, garbage and ash removal, the operation of the municipal garage and police, and streets and roadways, etc. The Safety Department supervises management of the fire and police department. The Finance Department is concerned with the receiving and disbursing of public moneys, city purchasing agent and all license fees. The Law Department protects the city's legal interests, drafts ordinances, etc. The Welfare Department oversees all municipal recreational facilities, parks and playgrounds, public health and sanitation, public nursing, etc. Since the operation of the commission-manager form of government, the city has centralized all public health nursing, erected a leprosarium, garbage reduction plant, which sells grease, established numerous medical clinics and baby feeding stations and a crime prevention bureau. The city has a garden country club, municipally owned, in the world, a tract of 294 acres donated by John H. Patterson. A policeman's bureau is also maintained. In safeguarding health and social conditions, the municipality works in intimate relations with all local social service agencies as well as with the legal aid and administered to the poor. Each department is presided over by a director commanding a salary of $4,000 a year and each department is subdivided into divisions and bureaus for specific service. The city manager receives $7,500, the commissioners $1,200 each and the mayor, who is the commission receiving the highest vote cast in the election, $1,500. The municipal revenues for 1917 were $1,310,510.21 and the expenses were $1,354,610.67, making an excess expenditure of $44,100.46, due to increase of cost of material on account of the war. The tax rate for 1918 was $1.56 on the hundred dollars. Total value of municipal property was $13,675,000, including lands, buildings, stock, automobiles, mechanical equipment, etc.

Banks and Banking.—Dayton has 15 national and State banks, including two savings and trust companies with deposits aggregating $36,000,000. Bank clearings in 1917 were $177,134,067.66. During the year 129 corporations were chartered under Ohio laws adding to Dayton's capital $15,881,750 net. The city has 18 building and loan associations with total deposits of $38,000,000. This is one of the strongest features of Dayton life. Through these agencies approximately 30 per cent of the residents of Dayton are members.

Education.—There are 32 public schools, with total enrolment of 21,300, including adult night classes. There are three high schools, a normal training school and special schools, largely in the nature of classes for defective, crippled and sub-normal children. One high school, Parker, is for freshmen only. Stivers Manual Training High School is said to be one of the most complete in the country. Manual training centres are maintained in eight schools; home economic centres in nine schools while sewing is taught in all high schools and in the seventh and eighth grades in all elementary schools. There are three night school centres. Catholic churches have 15 parochial schools with enrolment in excess of 7,000. There is also one Lutheran parochial school, Saint Mary's College, maintained by the Brothers of Mary, has an enrolment of 600 students and fine laboratory equipment. The United Brethren Church has a theological seminary here, Bongbrake, and the Reformed Church, Ohio synod, maintains its theological school in this city, Central Seminary.

Dayton has 130 churches, a magnificent Y. M. C. A. and Young Women's Christian Association and Young Women's League. Its charity and social welfare agencies are co-ordinated through the federation for charity and philanthropy.

There is considerable civic, philanthropic and social welfare activity in Dayton and 40 organizations at this time are engaged exclusively in war work. Co-relating war, social welfare, commercial and civic efforts, is the Greater Dayton Association, made up of 2,000 Dayton men and women and engaged in a multiplicity of community services.

Public Library.—Dayton had the first library incorporated in the State, having been established in 1805. The public library was opened in 1855 and is supported by public taxation, having an income of $18,000 per annum. The total number of volumes recorded 1 Jan. 1918, was 100,000. There are four daily newspapers, besides 25 church and other publications. There are also two large church publication houses.

Hospitals.—The city hospitals include the
DAYTON — DEACONESSES

Saint Elizabeth Hospital, the Miami Valley Hospital, and the District Tuberculosis Hospital. The Dayton State Hospital for the insane is maintained by the State. The Hospital of the National Military Home which adjoins the city is the largest military hospital in the world and has an average of 600 patients, all of whom are veteran volunteer soldiers of the Civil and Cuban wars. There are several private hospitals.

History.—The town was laid out in November 1795 by Gen. Israel Ludlow and was named after Gen. Jonathan Dayton. The first settlers arrived in the spring of 1796. Situated in the Miami Valley, one of the most fertile valleys in the United States, producing for many years great crops of corn, wheat, tobacco and numerous cattle, sheep and horses and with abundant water power to develop its industries, Dayton has grown to be the third largest manufacturing city in the State. From Dayton (c. 1800-06) the Wright brothers (q.v.) developed aviation. It is the center of one of the most diversified small towns in the United States. With its immense factories, banks and building associations so strong and uniformly successful and with its people so well educated, it is one of the richest and most prosperous communities in the Union. Pop. (1900) 85,333; (1910) 116,577; (1918, estimated) 151,000.

JESSE B. GILBERT,
Associate Secretary of the Greater Dayton Association.

DAYTON, Tenn., city and county-seat of Rhea County, on the Cincinnati, New Orleans and St. Louis Pacific Railroad, 75 miles southwest of Knoxville. It is in the center of a coal-mining and agricultural district; and iron, machinery, lumber, bricks and flour are the chief manufactures. Pop. 1,991.

DAYTON, Wash., city and county-seat of Columbia County, on the Touchet River, and the Washington and Columbia River, and the Oregon railroads. It is about 28 miles, in direct line, northeast of Walla Walla and 50 miles southwest of Colfax. It is situated in one of the best agricultural regions of the State, and its trade is largely in agricultural products, wheat, barley, fruit, hogs and cattle. It contains stores, banks, large flouring-mills and well-built courthouse, city hall, churches and schools. Pop. 2,500.

DAZA, dá'zá, Hilario, Bolivian general and ex-President: b. Sucre 1840; d. 28 Feb. 1894. In 1857 he enlisted as a soldier in the famous battalion of Colonel Balsa, and was rapidly promoted. On 24 Nov. 1870, by an act of treachery he deprived President Melgarejo of office, and defeated him in an engagement 15 Jan. 1871. After that he was practically the arbiter of the destinies of the country for several years. By the coup d'état of 4 May 1876, he became President in place of Frias. The army deposed him 27 Dec. 1879. He went to France, but after a few years returned to Bolivia, and in that country was assassinated.

D’AZEGLO. See AZEGLO, MASSIMO TADEO, MARQUIS D’.

DEACON (from the Greek diakonos, a servant), a person who belongs to an inferior order of ministers in the Christian Church. Seven were apparently first instituted by the apostles (Acts, chap. vi), which number was retained a long time in several churches.

In the Roman Catholic Church, a sacred minister whose functions are to assist the priest in the liturgical service and in the administration of the sacraments; also in emergencies to baptize, to preach and to administer the Eucharist. These three functions it is usually advantageous for the deacon to discharge without express authority from the bishop save in case of necessity. But in the first ages of the Church it was the deacon that gave the communion, in both species, to the faithful in the public liturgical service and at their houses in case of sickness. In the present usage of the Church the diaconate is, save in exceptional cases, simply a step toward the priestly state and office and for the deacon as such there is no recognized place in the economy of the Church.

In the English Church, also, the diaconate is merely a step toward the priesthood, and the deacon’s duties are all in the way of assisting the priest. He preaches only by episcopal permission, and he cannot consecrate the elements of the Lord’s Supper, or pronounce absolution. No person can be ordained deacon before he is 23 years old, except by dispensation from the archbishop of Canterbury. The office of deacon in other churches varies considerably, and, some, of course, have no functionaries bearing this name.

In the Methodist Episcopal churches, the junior order of priesthood, the novitiate being first ordained a deacon, and then after a time, if satisfactory conditions have been fulfilled — such as progress in grace and gifts, and the probation of character — elevated to the full priesthood or eldership — the latter the highest order in the Church — the bishops occupying not a superior ecclesiastical order, but holding a merely supervisory office.

In the Presbyterian churches, the orders here are teaching elders, or ministers, ruling elders, generally called simply elders (these two orders looking over the spiritual affairs of the congregation); and deacons (now gradually being displaced in many places by managers), to attend to the more secular matters.

In the Congregational, Baptist and other churches, deacons are spiritual officers ranking immediately after the minister, and looking after both the spiritual and the temporal needs of the congregations. In the Eastern churches the office of deacon as it existed in the early Church has been preserved with slight modifications. Consult Hirt, ‘The Christian Ecclesia’ (London 1897); Lindsay, ‘The Church and the Ministry in the Early Centuries’ (ib. 1902); McGiffert, ‘The Apostolic Age’ (New York 1897); Seidt, ‘Der Diaconat in der katholischen Kirche’ (Regensburg 1884).

DEACONESSES, in the time of the apostles, were usually widows who assisted in the solemn baptism of women (by immersion), instructed female catechumens in the doctrine and usages of the Church, visited those of their sex who were sick or were in prison for the faith’s sake, dispensed the alms of the faithful, and kept order in the women’s part of the assembly room during the liturgical service. That the deaconesses were in the earliest times widows, and not maids or married women, appears from the curious fact that Saint Ignatius, disciple of Saint John the evangelist, speaks of ‘virgins who are called widows’ as a clear proof of the original custom of choosing widows.
only to be deaconesses, as would be the formal declaration that such custom existed. For a long time it was required that the deaconesses should be not less than 60 years old; by the councils of Chalcedon and in Trullo the age of 45 years was made the minimum; by the Council of Chalcedon deaconesses were forbidden to mRN and it was determined that a second time was ever admitted to the rank of deaconess. The institution of deaconesses was extinct in the Western Church in the 16th century and in the Greek Church in the 12th; but it survives in churches of the Syrian rites.

The work done by the deaconesses in the early centuries is performed now, in the Roman Catholic, and in many of the Protestant Episcopal, churches by the nuns. (See Sisters). In the 19th century the order of deaconesses was revived in several of the Protestant churches. Theodore Fleider (1836), of the United Evangelical Church of Prussia, founded a home for deaconesses, in Kaiserswirth, Prussia. Germany has several homes, and in 1855 the order was established in Baltimore, Md. The General Convention of 1889 adopted a canon regulating the order and providing that members should have adequate preparation both technical and religious, extending over a two-year period. Training schools are maintained in New York and Philadelphia. The Methodist Episcopal Conference in 1888 provided for the establishment of an order of deaconesses, and this church now has many homes in the United States. The Lutheran Church also maintains several homes, the first being established in New York in 1852. In 1891 the Presbyterians instituted the order. Consult Golder, 'History of the Deaconess Movement' (Cincinnati 1903); Nutting and Dock, 'History of Nursing' (New York 1907); Potter, 'Sisterhoods and Deaconesses' (London 1898); 'Year Book' of the New York Training School for Deaconesses (New York 1892-1915).

DEAD, in nautical language, a word frequently employed as part of a designation or phrase having, in general, a meaning somewhat opposite to that of active, effective or real. The three classes are the following: Deadeyes: circular, flattened wooden blocks, without sheaves, and having eyes for lanyards, which form a purchase or tackle whereby the shrouds or other parts of fixed rigging are extended or set-up taut; dead-flat: the name for one of the midship-timbers; dead-lights: strong wooden shutters used to close cabin windows, on the approach of a storm, to protect the glass; dead-ropes: such as do not run in blocks; deadwood: the term applied to the solid blocks of timber erected upon the keel throughout the sharp portions of a ship's hull at stem and stern, the chief object being to give solidity and strength to the ends of the ship.

DEAD, Book of the. See BOOK OF THE DEAD.

DEAD, Disposal of the. In every age and in all countries, the living have shown their respect for the dead by various modes of burial ceremony, and the religion and laws of all countries have a large measure this feeling of reverence for the memory of those who have gone before. The methods of disposal of the dead are many, and historic romance has preserved for us many interesting and pretty customs. In the main, however, three methods are largely employed by modern peoples—burial, embalming or its modifications or cremation with its modifications. It is impossible to tell which method has the greatest antiquity, but probably simple burial antedated the other, since cremation and embalming usually imply a complex religious development. The Hebrews, the Greeks and the Romans in the main buried their dead, their burying-grounds having been located outside of town walls; but cremation also was largely practised by the Greeks, and it has been thought that Hebrews at one time likewise burned their dead. As is well known, embalming was widely customary among most of the nations of antiquity, although the Egyptians may be said to have been the foremost of those employing it.

The argument in favor of cremation is based principally on sanitary grounds, and despite the general sentiment against it, cremation has made considerable progress in the United States and other countries. There are crematories in many of the leading cities of the world, and a great deal of the feeling against cremation has undoubtedly passed away, there is still great general dislike to burning of the dead.

Apart from methods of antiquity, the problem of disposing of the dead with least danger to the living is, from the medical point of view, one of great interest. Its discussion is by no means of recent origin, however, for the early Italians, French and English contributed learned treatises on the subject. It would seem that from the scientific point of view most of the modern writers and those of the Middle Ages strongly favor cremation as one of the cleanest and most efficient modes of disposal of the dead, and it is a matter of history how the ancient Etruscans and others had their burial urns in which to keep the ashes of their forbears.

The method of burial beneath the ground is condemned by practically all sanitarians, but it will probably be many generations before the custom is abandoned, if indeed it is ever to be given up. As to actual dangers that may arise from dead bodies buried beneath the earth, it cannot be claimed that these are imminent. Disease is mainly transmitted from the living person, and now that we have more definite knowledge of factors involved in the transmission of disease, the bogey of disease from burial has little terror for us. It can hardly be claimed with much show of justification that such a water-borne disease as typhoid can originate from the water that may percolate through the ground in cemeteries and ultimately reach a potable supply. This danger is theoretical rather than practical, and the amount of time spent in devising methods to prevent such contamination would be much more rationally employed in taking care of the excreta of the living. The contamination of the earth, the air, and the water is, therefore, really of secondary importance; yet it cannot be denied that, excepting some exclusive cemeteries, the present methods of burial are disgusting; and in times of war or pestilence not only is burial disagreeable, but it is in doubt that the air will not arise from it, and hence special portable crematories have an undeniable place. See CREMATION OF THE DEAD.

DEAD-LETTER OFFICE. The department of the General Post Office at Wash-
DEAD LINE. A phrase which probably originated during the Civil War. In some of the prison camps a line was drawn through or around the camp. If a prisoner attempted to cross that line he was shot at once. To the men it became the dead-line. In a figurative sense it applies to the age-limit of efficiency.

DEAD-MEN’S-FINGERS, an English fishermen's name for the Alcyonium, a genus of polyps, the typical one of the family Alcyonidae, characterized by the polyps of the colony having eight hollow arms and eight mesenteries, and a skeletal composed of separate calcareous spicules. It contains many well-known species, such as A. digitatum, or sea-finger (dead-men's-fingers, known also to fishermen as dead-men's-toes, and cow's-paps), and A. glomeratum. A common species on the United States Atlantic coast is A. cornuform. The name is also applied to certain species of branching sponges.

DEAD-NETTLE, a common name applied to the genus Lamium of the natural order Labiatae, mint family. It is an annual or perennial herb, of which there are about 40 species, all natives of the Old World. It has been naturalized in America, and several species are found in waste places and cultivated ground from New Brunswick to Florida and west to Ontario, Minnesota, and Arkansas. The best-known species are L. purpureum and L. album, which are used in the northern parts of Europe as pot-herbs. A species of the genus Galeopsis (G. tetrahit) is called dead-nettle, as is one of the species of Stackys (S. palustris). It was an old belief that the hairs of the dead-nettle, when dry, caused irritation to the exposed parts of persons coming in contact with the plant, and that this, extending through the system, sometimes caused death; hence the name.

DEAD RECKONING, computation of a ship's position without recourse to astronomical observations. This reckoning is computed from the following data—the longitude and latitude sailed from or last determined; the course or direction sailed (determined from the compass); the rate of sailing; and the time elapsed. These data are liable to many inaccuracies, due to currents, change in declination of the compass. The results arrived at by this method of reckoning are corrected as soon after as is possible by sun or stellar observation. See NAVIGATION.

DEAD SEA, the usual name given to a most remarkable lake in the southeast border of Palestine, called in the Old Testament "The Salt Sea," "Sea of the Plain" or "East Sea"; by the Arabs now, Bahr-Lut, "Sea of Lot." It lies along the line of a great fault from the Gulf of Akaba at the head of the Red Sea to Hermon. It is 47 miles long, with a breadth of from 5 to 10 miles and occupies an area of 340 square miles. Its depth is greater than that of any known, is 1,202 feet below the level of the Mediterranean. There is evidence that its level was nearly 1,200 feet higher than now. The depth of the greater part of the northern section is about 1,300 feet; but at the south end the water is only from 3 to 12 feet deep. The shape is that of an elongated oval, terminated by a promontory which projects into it from the southeast. The Dead Sea is fed by the Jordan from the north and by many other streams, but has no apparent outlet. It is estimated that 6,000,000 tons of water flow into it daily, almost all of it being carried off by evaporation. Along the eastern and western borders of the Dead Sea there are fines of bold, and in some cases perpendicular, cliffs rising in general to an elevation of 1,900 feet on the west and 2,500 feet on the east. It is a striking fact that these cliffs are all composed of limestone on the west, and on the east of sandstone of enormous sizes, and are destitute of vegetation except in the ravines traversed by fresh water streamlets. The northern shores of the lake form an extensive and desolate muddy flat, marked by the blackened trunks and branches of trees, strewed about and encrusted with salt. The southern shore is low, level and marshy, desolate and dreary. On this shore is the remarkable ridge of rock-salt, 7 miles long, and called K mashq Usdom (Ridge of Soda). Lava-beds, pumice-stone, warm springs, sulphur and volcanic slag suggest the presence here of volcanic agencies at some period; but some modern geologists declare that no active volcanoes have ever existed in this vicinity: and that the subsidence of the Jordan Valley occurred in the Tertiary Period. On the other hand it is claimed by modern travelers that the neighborhood of the Dead Sea is frequently visited by earthquakes, and the lake will occasionally casts up to its surface large masses of asphalt. The long-entertained belief that the exhalations from this lake were fatal is not founded upon fact. The absence of bird life is most impressive. The salinity of the waters is adverse to life, though some lower organizations are found in them. The region of the Dead Sea is rich in all kinds of minerals; copper mines were worked in the Byzantine period near the southern end; bitumen and sulphur are abundant, and its basin is rich in marble, porphyry, and other fine stones.

The water of the Dead Sea is characterized by the presence of a large quantity of magnesium and soda salts. Its specific gravity ranges from 1172 to 1227 (pure water being 1000). The proportion of saline matter is so great that, while to every ton of water in the Atlantic there are 31 pounds of salt, in the Dead Sea there are 187 pounds. Its water contains 23 per cent solid matter, and is, bulk for bulk, heavier than the human body. In all large accumulations of water without any outflow, the water acquires an infusion of salt, its feeders constantly bringing in this material, while none can go off by evaporation, even when the shores do not as here abound in salt and nitre. The evaporation is great as the heat is intense, and the sea but slightly increases its area. Rain hardly ever falls; the water is nearly as blue and clear as that of the Mediterranean; and though its taste is horribly salt and fetid, a bath in it is refreshing. Owing to the great specific gravity of the water it is almost impossible for the bather to sink in it, strive as he may. Several of those who have navigated and explored the sea have fallen victims to a fatal fever. For the story of the 'Cities of the
Plain, see Gen. xix; but according to Captain Conder, it is now generally agreed that the Dead Sea was Jordan, and that the River Jordan was formed by a great fault or crack in the earth's surface long before the creation of man, and that the district presents in our own days much the same aspect as in the days of Abraham. It is vain, therefore, to suppose that the 'Cities of the Plain' were once the present sea, though this view was held as early as the time of Josephus.  

The Dead Sea was first navigated by Costigan, an Irish traveler, in 1835, and he was followed by Molyneau, a British officer, in 1847, neither of whom survived their experiences. Lynch, an American traveler, was the first (1848) to explore its coasts and to take soundings of its depths. Consult Abel, 'Une Croisière autour de la Mer Morte' (1911); Blanken-thorn, Naturwissenschaftliche Studien am Toten Meer und im Jordantal (1912); Schmidt, in 'The Fifth Annual Report of the Director of the American School for Study and Research' (1905); Tristram, 'The Land of Moab' (1874).

DEAD SOULS. Gogol was indebted to the great Russian poet, Pushkin, for the subject of his 'epoch-making' satire, 'Pokhozhdieinya Chichij a Dushi' (Chichikov's Adventures or Dead Souls')—perhaps better translated 'Dead Serfs'—and to 'Don Quixote' for its plan. Under the old régime in Russia the serfs, 'fastened to the soil' by the economic regulations of the usurper Tsar, Boris Godunof, were compelled to stop by draught measures the emigration of farmhands, were regarded as personal property and the pomyeshchik, or landed-proprietors, were allowed to mortgage them to the State bank. The census was taken only once in ten years; and it naturally happened that in those intervals many of them died. It was argued that the birth-rate would offset the death-rate, so that taxation on the basis of the previous enumeration would be fairly equitable. In Gogol's tale, which he called a Foem, a wily rascal, the Collegiate Councillor, Pavel Ivanovich Chichikof, conceives the scheme of going about from place to place and getting by hook or by crook, by purchase or by gift, the title to such serfs as had died since the previous census. With the long list thus acquired he plans to borrow enough ready money to purchase a genuine estate with living souls. His journeys bring him into contact with all sorts and conditions of men and women. Gogol describes them without mercy, showing the deleterious influence of slave-holding on owner and serf alike. As in 'Uncle Tom's Cabin,' to which 'Dead Souls' has been compared, there is no attempt to preach; the implication is permitted to carry its own weight. The emancipation of the muzhiks had been advocated by the most enlightened Russian writers; it was especially during the reign of the Emperor Alexander I (1801–25); during the reign of Nicholas I (1825–55), who was occupied with other affairs, the reform shivered or at least was put aside, and not until Alexander II had come to the throne in 1855 was the emancipation effected. It had been made necessary by the demand of popular sentiment stimulated by 'Dead Souls' and by Turgénieff's 'Recollections of a Sportsman.' 'Dead Souls' was to have consisted of three parts. The first part appeared in 1842 and created a sensation. A second edition followed in 1844. It naturally aroused bitter enmity among the Russian middle-class who felt that they had been traduced. The author, who was a sick man, tried to make explanations; he begged his readers to wait for the conclusion before they formed their final judgments, but he grew more and more hypochondriacal; and in a fit of melancholy he burned the manuscript of the second part which was only partially finished; after his death in 1852, an earlier draft was discovered and incorporated with the first. Later a Dr. Zaharchenko of Kief took it upon himself to continue and finish Gogol's masterpiece, but it was a dead failure. The chief interest of 'Dead Souls' is historical: it depicts a condition forever passed away, but its gallery of portraits and of landscapes shows vividly what Russia was in the first half of the 19th century. Chichikof shrewd, plausible, tactful, ambitious; his lackey, Petrushka, taciturn, stupid, ugly; his coachman Sefilan, talkative, with his head in the clouds and always getting lost; his tenika of horses (a three-fold donkey) with its own individuality; his 'brigka' with leather flaps and staring bull's-eyes; all are as familiar to the Russian reader as Don Quixote and Sancho Panza. In Russian literature the names and varied characters of Chichikof's dupes frequently appear without an explanation: they are household words; and many of the sayings so wittily and often sardonically introduced by Gogol have become proverbs. The work is only a torso, but in its details it became the model for many successive Russian writers who affected his style of realism. 'Myervyuiya Dushi' fills the third volume of the collected works of Gogol published in a beautiful edition by T. I. Hagen, Moscow 1884. It was translated by Isabel F. Harpood and published, New York 1888, London 1888. It is analyzed by the Vicomte de Vogüé in 'Le Roman russe' (The Russian Novelist, Boston 1887), and in Ernest Dupuy's 'Great Masters of Russian Literature.' A more detailed life of Gogol, with analyses of his works and his correspondence, may be found in Louis Paul Marie Léger's 'Nicolae Gogol' (Paris 1914). 'Dead Souls' was translated into French under the title, 'Les Ames mortes,' by Ernest Charlière (Paris 1885); the first part was translated into German, as 'Die todten Seelen' in satirisch-komisches Zeitgemälde' by Philipp Löbstein in 1872.

NATHAN HASKELL DOLE.

DEADLY NIGHTSHADE. See Bella-donna.

DEADWOOD, S. D., city, county-seat of Lawrence County; on the Chicago and Northwestern, and the Chicago, Burlington and Quincy railroads. It is one of the principal trade centres for the mining camps of the Black Hills. A considerable amount of the gold, silver, lead and other valuable minerals found in the Black Hills is brought to Deadwood for smelting, refining or reshipment. Besides the large smelter and reduction works, there are manufactories for mining implements and machinery, brick and planing-mills. The Masonic Temple is a large building. The first permanent settlement was made in 1876. Pop. 3,453.
DEAF.
The ("Deaf and Dumb," "Deaf-Mutes"). The term "the deaf" is used in this article to designate persons who are unable on account of deafness to be taught in ordinary schools and consequently must receive their education in special schools or through special teachers at home.

Such persons are sometimes called "deaf and dumb," "deaf-mutes," or simply "mutes." The first schools established in Great Britain and America were named "asylums for the deaf and dumb;" then, as the character of their work became better understood, they were called "institutions for the education of deaf-mutes;" one or the other of these terms still persists in the corporate titles of a few of the older schools. But all that have been established within recent years have been entitled "schools for the deaf" and nearly all the older ones have changed their names to this title. There are excellent reasons for preferring the term "the deaf" to "deaf and dumb," "deaf-mutes," or "mutes." "Deaf and dumb" is objectionable for three reasons: (1) It tends to perpetuate the popular error that deafness and dumbness are two distinct physical defects, whereas there is only one, namely deafness. There is usually no imperfection in the vocal organs of the deaf, except such imperfection of development as may be the result of the lack of exercise; dumbness, where it exists, is simply the consequence of the deafness. (2) The word "dumb" in some parts of the United States carries with it an implication of stupidity and brutishness. The deaf child, even before it receives any education, is not "dumb" in this sense. (3) "Dumb" is even when it is properly used to indicate persons unable to speak on account of their deafness, is inaccurate if applied to the whole class of the deaf, for many of them, having lost their hearing by accident or disease after they had learned articulate language through the ear in the usual way, still retain their speech notwithstanding their deafness; and others, originally dumb from having been born deaf or having lost their hearing in infancy or early childhood, have acquired the art of speaking through instruction and are no longer to be classed as dumb. The confusion of mind caused by the use of the term "deaf and dumb" in taking the thirteenth census of the United States in 1910 led to so many errors on the part of the enumerators that, as stated in the bulletin of the census bureau published in 1915, "it was finally considered inadvisable to make any tabulation covering the total population returned as deaf and dumb." The term "deaf-mutes" is preferable to "deaf and dumb," but when applied to the whole class of the deaf it is equally inaccurate, and for the same reason; a large proportion of the deaf are not mute.

"Deaf-mutes," however, is a correct designation for persons deaf from birth or early childhood who have not acquired the power of speech through instruction. Happily, owing to the progress made in oral teaching within recent years, the number of persons belonging to this class is now much less than formerly. The abbreviated form "mutes" without the qualifying term "deaf" is objectionable for the same reason as "deaf-mutes," and is open to the further objection that it suggests to readers of English literature the assistants of an undertaker at a funeral. The only proper designation for the whole class of persons under consideration in this article is "the deaf." This is the term used in the annual reports of the United States Bureau of Education and the special report of the twelfth census, and is beginning to come into general use. There are several distinct classes of the deaf. These are, first, the two great classes of the congenitally deaf (those deaf from birth) and the adventitiously deaf (those who have become deaf at some time after birth). According to the thirteenth census of the United States the congenitally deaf constitute 39.3 per cent of the whole number and this percentage agrees pretty nearly with that of the statistics of schools for the deaf. But it is often impossible to be sure whether a child is congenitally or adventitiously deaf. Deafness is not usually discovered until he arrives at the age when children ordinarily begin to speak. He may have been born deaf or he may have lost his hearing at some time during the first two or three years of life—sometimes even later—and, in consequence of the loss of hearing, also apparently lose the limited knowledge of language and speech they have acquired through the ear before deafness occurred. Like the congenitally deaf, these children are, and without instruction remain, true deaf-mutes. To them the spoken and written language of their fellow men is entirely unknown, and, even with the best education that special schools can give, they rarely attain to such a mastery of its idioms that they can use it with the accuracy and freedom that a hearing person does. There is, however, a subtle difference in the mental condition of congenitally deaf and quasi-congenitally deaf children. Up to the time they enter school, indeed, this difference is not apparent; the quasi-congenitally deaf child speaks and understands speech no more than the deaf-born child and he possesses no conscious memory whatever of the words he once heard or even used. But it must be that there still remains in his mind a dim, subconscious memory of those words and of language; for it is observed by his teachers that he acquires words, language, and speech more readily and quickly than the child who was born deaf or who lost hearing within a few months after birth. Persons who lose their hearing in later childhood, after they have learned to understand a great deal of language and to speak readily and fluently themselves, are known in schools for the deaf as "semi-mutes"; an awkward and objectionable term, since it does not accurately describe their condition and is not generally understood, but one for which no satisfactory substitute has been proposed. Even these may cease to speak if isolated from their family and friends and persist in the use of the voice; but their memory of words remains, especially if they have learned to write, and, if they receive proper encouragement, it is easy for them to retain the power of
speech. When they are too deaf to hear their own utterance their voices are always peculiar and often disagreeable; but great improvement in this respect may be effected by the careful training of skilful teachers of articulation. This is not altogether different from that of the congenitally and quasi-congenitally deaf; not that their native capacity and learning ability is superior, but that their knowledge of language obtained before hearing was lost gives them an incontestable advantage over the deaf-born and the deaf from early childhood. The pupils who arouse admiration at public exhibitions by their fluent speech and good command of written language, and the deaf who distinguish themselves in later life as writers and poets, generally belong to the class of semi-mutes. Persons who become deaf in adult life retain their speech but, unless they receive special instruction in speech-reading, generally cannot understand much of the speech of others and so are more or less cut off from society and sometimes from their former business or profession. They usually feel their deprivation more keenly than those deaf from birth or childhood, but by persistent study of the art of speech-reading under competent teaching what before was offered to them in many places, they may often be to a large extent restored to the society of their families and friends and enabled to carry on their business or profession more successfully than at first seemed possible.

Another important classification of the deaf from an educational point of view is based upon the degree of deafness. There are all degrees of deafness, extending from a slight impairment of the hearing to a total inability to perceive through the ear the loudest sounds. Those who are only slightly deaf, who can hear well enough to be taught in ordinary schools, do not come within the scope of this article; but among those who are so deaf that they must be taught by special methods there are great differences in the degree of deafness. They are thus divided into two classes: the totally deaf, who have no hearing or scarcely any, and the semi-deaf, who can hear more or less. In a few cases if the semi-deaf the hearing is even then before instruction it was so slight as to have remained unnoticed, may be so developed, or rather educated, by suitable acoustic training, with or without the aid of mechanical appliances, that those who entered school as deaf-mutes may be gradually classed as hard-of-hearing persons. Even where this result is unattainable, any hearing that exists (especially if it is sufficient for the pupil to hear his own voice) is a great aid in acquiring natural and agreeable speech—an acquisition that is almost impossible to obtain with complete deafness. The semi-deaf, like the semi-mute, are sometimes exhibited to the public as deaf-mutes, and the speech of the semi-deaf and the language of the semi-mute are shown as the result of instruction given in the school. Much credit is due to the schools with which credit. But far more credit for the excellence of the speech is due to the partial hearing that the child possesses, and for the excellence of the language to the fact that it was acquired by fore hearing was lost. In justice to the real deaf-mutes, who are less favored by nature, and in the interest of truth, the existence of partial hearing and of speech naturally acquired ought always to be explained to visitors. The semi-deaf pupil may also be semi-mute; in that case he has a twofold advantage over his congenitally or quasi-congenitally and totally deaf classmate.

Causes of Deafness.—The division of the deaf into the congenitally and adventitiously deaf is an important one with respect to the causes of deafness. Congenital deafness is not always hereditary but heredity is probably its most frequent cause. For this cause to be effective it is not necessary that one or both of the parents should be deaf; though both parents may hear, the existence of deafness in other relatives, as grandparents and more remote ancestors, uncles and aunts, brothers and sisters and cousins, is an indication that the deafness is hereditary. Consanguineous marriages often result in deaf children and a large proportion of these children are congenitally deaf. In these cases the deafness is probably hereditary. It is not necessary to believe that consanguineous marriage in itself is a true cause of deafness, but a tendency to deafness exists in many families; when two members of such a family marry each other, that tendency is transmitted to their offspring with increased intensity, for deafness is the result. Another frequent cause of congenital deafness, though one rarely found in the statistics of "assigned" causes, is constitutional syphilis. While this cause is prenatal, and the responsibility for its results rests directly upon one or both of the parents, the deafness is not to be classed as hereditary. Other non-hereditary causes of congenital deafness are probably alcoholism, tuberculosis, scrofula and other diseases in one or both of the parents, but it has not yet been determined how far these causes are effective. The causes of adventitious deafness are many and various. Even the pre-natal influences above mentioned that cause congenital deafness sometimes produce, or combine with other causes to produce, adventitious deafness. Accidents, such as concussion, falls, blows on the ear, etc., are responsible for some cases; but a large majority of the adventitiously deaf have lost their hearing from some disease. The diseases of childhood that most frequently cause deafness are scarlet fever, meningitis, brain fever, catarath, measles and typhoid fever, in the order named.

History and Statistics.—The enumerators of the thirteenth census reported 44,519 "deaf and dumb," and 189 were subsequently added for good reasons in the office, making a total of 44,708 in the United States in 1910; but, as is stated in the preliminary bulletin of the Bureau published in 1915, it was impossible to say just what this total represented; on the one hand it fell short in all probability of including all deaf-mutes, and on the other it included many who were not deaf-mutes at all. Probably the actual number of the deaf in the United States exceeds the returns of the thirteenth census reports. The number of the deaf bears a certain relation to the population, being far greater in countries wherein squalor, privation, medical ignorance or unhygienic conditions prevail. The ratio of deaf-mutes to population is as follows, for the different countries named: Sardinia, 1 to 760; Northern Italy, 1 to 886; Southern Italy and Norway, 1 to 970; France, 1 to 1,200; Prussia, 1 to 1,675; England, 1 to 1,970; Holland, 1 to
2,000; United States, 1 to 2,400. Whether deafness in the United States is increasing or diminishing it is impossible to say positively, for unhappily the decennial censuses of the deaf have not been taken upon a uniform plan and therefore do not afford an exact basis for comparison. According to the returns it appears to be diminishing, and the progress that has been made within recent years in the prevention and treatment of the diseases that cause adventitious deafness gives us reason to hope that this apparent diminution is real and that in the future such deafness will become more and more infrequent. Congenital deafness is more difficult to deal with; but this also appears to be diminishing, as it certainly ought to be. Syphilis is both preventable and curable; alcoholism is at least preventable; and now that the laws of heredity are becoming better understood there should be fewer marriages liable to result in deaf offspring. In antiquity and through the Middle Ages the condition of the deaf was deplorable. Belonging generally to the lower classes, ignorant, unable to understand the speech of others or to make themselves understood except by rude gestures, classed under the law with the idiotic and insane, popularly supposed to be possessed of a devil and so shunned as objects of contempt or superstitious dread, their lot, save in rare cases, must have been one of degradation and wretchedness and always of isolation and unhappiness. Girolamo Cardano, of Milan (1501-76), was the first to express the belief that the deaf could be educated. In "De Surditate" and "Paralipomenon" he not only declared that it was possible, though difficult, for deaf-mutes to learn to read and write, but also stated clearly the principle upon which their education depends; namely, that ideas can be associated with written words without the intervention of sound and so "the deaf-mute can hear by reading and speak by writing." The seed sown by Cardano was slow in springing up and bearing fruit. In the great intellectual progress of the 16th and 17th centuries the deaf had but a scanty share. A few fortunate individuals among them were taught by Ponce, Bonet and Carrion in Spain; Wallis, Holder and Baker in England; Amman in Holland; Pasche, Kerger, Raphael and Lasius in Germany; Fay, Pereire and Vanin in France. Some of these teachers, especially Bonet, Wallis and Amman, and one who was not a teacher, Dalgarino in Scotland, published expositions of their methods. But it was not until the middle of the 18th century that the human conscience was aroused to the duty of educating the deaf generally. The first great impulse in this direction was given by the benevolent Abbé de l'Epee, whose school for the deaf, established at Paris about 1760, speedily became famous throughout Europe. At nearly the same time, independently of De l'Epee and of each other, schools were begun by Samuel Heinze in Dresden and Thomas Braundwood in Edinburgh. Similar schools soon followed in other countries and they have continued to increase to the present time. There are now about 670 schools for the deaf in the world. Gallaudet College at Washington, D. C., was established in 1864 through the efforts of Edward Miner Gallaudet, who was its president from that date until 1910. It was named in honor of Thomas Hopkins Gallaudet, the founder of deaf-mute education in America. Congress has made liberal appropriations for
its grounds, buildings and support, and provides 100 free scholarships. It is the only institution in the United States adapted to the higher education of the deaf. While it is possible for the deaf, with special help, to pursue courses of study in ordinary colleges, they can do so with much greater facility in Gallaudet College. Among its graduates are clergymen ministering to the deaf, editors, publishers, teachers, architects, artists, chemists and other specialists in science, successful business men, farmers, etc.

Among the Americans who have been especially associated with the education of the deaf, and have been so to the deaf, are F. A. F. Bayley, of New York, William W. Turner of Hartford, Abraham B. Hutton of Philadelphia, John A. Jacobs of Kentucky, Harvey P. and Isaac L. Peet of New York, Edward and Thomas Gallaudet.

Notable cases of great proficiency among the deaf are those of Laura Bridgman, a celebrated blind deaf-mute and pupil of Dr. S. G. Howe, and Helen Keller of Boston, a lady of wide information and great intelligence.

Besides papers published at many of the residence schools, there are two American periodicals devoted to the education of the deaf, both published at Washington, D. C.: The American Annals of the Deaf, established in 1848, issued bi-monthly during the school year by the conference of superintendents and principals of American schools for the deaf, and the Volta Review, issued monthly by the Volta Bureau for the increase and diffusion of knowledge relating to the deaf, which was founded and endowed by Dr. Alexander Graham Bell in 1887. The work of this bureau is carried on by the American Association to promote the teaching of speech to the deaf, which was also endowed by Dr. Bell. Other important organizations working in the interests of the deaf are the convention of American instructors of the deaf, which meets triennially; the conference of superintendents and principals above mentioned; and the American Association of the Deaf, whose membership is composed of the educated deaf. One of the leading aims of this association is to promote the combined system of instruction; another is to suppress the vagrant impostors who beg from the public on the pretext that they are deaf. As a matter of fact the really deaf are scarcely ever beggars.

Most of the larger cities in the United States have churches or missions for the deaf in which religious services are conducted in the sign language and much is done in various ways to promote the social enjoyment and material welfare of the adult deaf as well as their moral and religious culture. The Episcopal Church under the leadership of the Rev. Dr. Thomas Gallaudet, a son of Thomas Hopkins Gallaudet, was the pioneer in this work and still has the largest number of workers; but within recent years churches or missions, besides those established by Methodists, Baptists, Presbyterians, Lutherans, Roman Catholics and Jews, have come into existence.

EDWARD ALLEN FAY,
Editor 'American Annals of the Deaf.'

DEAF, Education of the. The education of the deaf presents two fundamental problems. First, the problem of giving them an understanding of their native language. Second, the problem of teaching them to speak the language and to understand it when spoken by others. A deaf child may be taught to read and write the English language and may be given a good education without ever learning to speak or to understand people when they speak. This result can be accomplished by the sole use of writing. It can be further facilitated by the employment of gestural signs and finger spelling. The child so taught gets mental development, knowledge and education.

For a long time that was all that was attempted by educators of the deaf. But to-day in every civilized country in the world some attention is being given to the best method of teaching the congenitally deaf to speak and to read the lips of speakers by sight. In many countries, including the United States, this improvement has gone so far that now a considerable part of all deaf pupils are taught exclusively by means of the speech method without any use whatever being made of the sign language or finger spelling.

The public education of the deaf in the United States began in 1817 in a small institution established in Hartford with the interest and generosity of a few men, one of whom, Dr. Cogswell, had a deaf daughter, Alice. A young divinity student, Thomas Hopkins Gallaudet, became interested in this little girl, and in 1815 consented to go to England for the purpose of learning the best method of educating deaf children in order to use it in the institution it was proposed to establish in Hartford. The method was what is known as the speech or oral method, as distinguished from the silent, or manual, method. But the young Mr. Gallaudet found a curious situation in England. The education of the deaf there was at that time a monopoly in the hands of the Braidwood family, and the terms under which those in charge of the schools in London and Edinburgh were willing to permit Mr. Gallaudet to familiarize himself with their methods were such that he did not feel it possible to accept. When the young American emissary arrived in England, it chanced that the Abbé Sicard, a kindly French priest, who was continuing in Paris the work of educating deaf children by the silent or manual method begun by the Abbé de l'Épée, was in London, and met Mr. Gallaudet with much friendly interest, extending to him a cordial invitation to come to Paris and learn his method of instruction. After prevailing in vain for eight months, teacher and pupil, with the knowledge he wished of the speech method of teaching the deaf, Mr. Gallaudet decided to accept the Abbé Sicard's invitation and went to Paris, where he was received with the greatest kindness. After a stay of three months, the Abbé consented to allow his brother-in-law, Jean-Baptiste Landuyt, to accompany Mr. Gallaudet to the United States. Therefore, it seemed wiser to return at once rather than to take the time to himself learn more
fully the French silent method, since it could be efficiently inaugurated in collaboration with the deaf Clerc. The little school that was opened in Hartford in 1817 was, therefore, conducted by the silent method of signs and finger spelling then in vogue in France, instead of by the speech method as employed in England. Schools were from time to time established in other States, the first being in New York in 1818, until to-day each State has one or more. For 50 years all schools were modeled after the little institution in Hartford, and employed the silent method.

The schools for the deaf in the United States to the teaching of their pupils to speak or to the preservation of the existing speech of those who had the misfortune to become deaf after speech had been acquired. The result was that not only did the congenitally deaf leave the schools truly deaf and dumb, but even those who had possessed speech up to 8 or 10 years of age lost it entirely, and went out into life dumb as well as deaf. With the establishment of the first oral schools in the United States, and the publicity that was given to their success in teaching even the congenitally deaf to speak, the older schools began to pay more attention to the matter of speech for their pupils.

The history of the progress of this speech branch of education in the United States has been that of increasing attention to the more normal treatment of the deaf during the educational period. The exclusion of the deaf from general intercourse with those about them, and the resultant segregation, are largely due to their dependence upon gestural signs and finger spelling with which very few hearing people are familiar. When they possess any ability to speak and to read the lips of those speaking to them, this isolation is greatly reduced. Fifty years ago the terms "deaf-mute" and "deaf and dumb" were correctly applied to almost all deaf persons whose deafness occurred before the 10th year of age. To-day, this name would be a misnomer in the cases of thousands of such persons because they have either been taught to speak or have had their early speech retained or restored.

The efficiency of the educational processes employed with the deaf has enormously increased during the past 100 years in every civilized country, but nowhere has there been greater progress than in the United States. The schools here are now the best equipped and the most lavishly maintained in the world. Not only do they provide the ordinary education of the public schools, but many of them give a thorough training in from 1 to 10 trades; each pupil being taught that means of livelihood to which he or she seems best adapted.

The last statistics (20 Oct. 1917) report the number of schools for the deaf in the United States as 157. Of these, 64 are public boarding schools, 73 public day schools and 20 private and denominational schools. The total number of pupils in attendance was 8,792. Total number of teachers 1,888. Total value of equipment of the public boarding schools $18,215,685. Thirteen of the public boarding schools were conducted on the pure oral plan, by which no teacher or other employee of the schools ever uses either finger spelling or the sign language in communicating with the pupils. Sixty-eight of the public day schools used this method, and 13 of the private and denominational schools, making a total of 94 schools conducted exclusively by the speech method. Forty-eight of the public boarding schools were conducted on what is known as the Combined system, which is a compromise between the silent method brought from France by Mr. Gallaudet and the almost speech method that reached this country half a century later. In the best of the Combined schools very little use is supposed to be made of either finger spelling or the sign language in the school rooms, but the pupils are instructed in these means of communication for use outside of
The American Manual Alphabet for the Deaf.
class rooms, in their intercourse with the teachers of industries, supervisors, servants and each other. The result of this is that the pupils spend by far the greater part of their school lives in an atmosphere of finger spelling and the sign language, and these become their thought vernacular. They think in these methods of expression, and when they speak it is usually with a somewhat laborious process of translation from one means of communication to another. Naturally these pupils do not attain the maximum amount of mental and physical development. Five of the public day schools and seven of the private and denominational schools are conducted by this system, making a total of 60 combined schools.

The age of admission to the schools for the deaf has been steadily decreasing from 10 years of age at the beginning to five and even four years of age in certain schools now. There are also three schools in which children of two are received. The age of dismissal varies greatly, and is modified by circumstances. The course of study extends from kindergarten through the high school.

Gallaudet College, in the city of Washington, founded 1864, is an endowed and government subsidized institution for the deaf in which a deaf student may receive a course of higher education and obtain the degrees of bachelor of science and bachelor of arts. A knowledge of the sign language and of finger spelling is necessary in order to pursue the courses at Gallaudet College. Most of those who have been over educated who wish to take a college course enter the regular colleges and universities and, with the help of their classmates and special tutors, take the same courses that are offered to all students. In this way deaf students have obtained degrees from Harvard, Columbia, Georgia School of Technology, Johns Hopkins and other institutions.

The American Association to Promote the Teaching of Speech to the Deaf is a philanthropic society, incorporated in 1890, to aid schools for the deaf in their efforts to teach speech and speech reading. In addition to this special work the Association carries on the work of the Volta Bureau (q.v.) in Washington, D.C., an institution dealing more generally with the education of the deaf.

The State of New York provides for the payment of $300 a year to any deaf man who is a matriculated student in the recognized universities of the State. This money is to defray the expense of special readers and tutors to enable the deaf pupil to overcome to some extent his handicap. Recent investigations seem to show that something over 97 per cent of the graduates of schools for the deaf in the United States are self-supporting; also, that the earning power of those possessing some ability to talk and read is greater than of those who must depend exclusively upon finger spelling and the sign language, or pencil and paper. The deaf are found in every conceivable occupation, but the majority of them earn a living in some one of the trades, especially printing, brick laying, painting and carpentry.

For educational purposes, the deaf fall naturally into three classes: (1) Those totally deaf from early infancy or birth; (2) Those partially deaf from birth or early infancy; (3) Those adventitiously deaf after speech has been acquired.

All three of these groups need to be given the ordinary common school education as a minimum educational equipment. In addition to this, in the case of each group, special attention must be given to certain other problems not met with in ordinary educational institutions. The first group must be taught to speak and to understand when spoken to by means of sight and in spite of the absence of hearing. The partial deaf and those who are partly deaf must be developed and trained in order to make it of the utmost possible service in the acquisition of speech and language and in the understanding of what is said. The already acquired speech of the third group must be preserved and improved; and lip-reading by sight must be taught to supply the place of the lost power to comprehend by sound. These additional tasks superimposed upon the ordinary educational burdens of the school makes necessary in the schools for the deaf a higher standard of efficiency and effort than is found in the schools for the hearing. Otherwise these schools would not be able to accomplish in approximately the same length of time the same educational advancement that is attained in the ordinary school where the pupils are not handicapped by deafness.

DEAF-BLIND. The. ‘Obstacles to be overcome’ is the motto given by Dr. Howe to his efforts to teach speech to the deaf. When this remarkable man learned in 1837 that up in the mountains of New Hampshire there was a little girl not only blind but also deaf and dumb, he eagerly sought out the child and obtained the parents' consent to take her to South Boston to be educated. He had already formed a theory as to how he would reach a mind thus doubly shut in, and with the finding of Laura Bridgman came the wished-for opportunity to test this theory. It should be noted that Laura Bridgman saw and heard until she was two years old. She had been rather a delicate child, however, having enjoyed only about four months of robust health, when she sickened, her disease raging with great violence during five weeks, when her eyes and ears were inflamed, and speech was greater than that of those who must depend exclusively upon finger spelling and the sign language, or pencil and paper. The deaf are found in every conceivable occupation, but the majority of them earn a living in some one of the trades, especially printing, brick laying, painting and carpentering.

For educational purposes, the deaf fall naturally into three classes: (1) Those totally deaf from early infancy or birth; (2) Those partially deaf from birth or early infancy; (3) Those adventitiously deaf after speech has been acquired.

All three of these groups need to be given the ordinary common school education as a minimum educational equipment. In addition to this, in the case of each group, special attention must be given to certain other problems not met with in ordinary educational institutions. The first group must be taught to speak and to understand when spoken to by means of sight and in spite of the absence of hearing. The partial deaf and those who are partly deaf must be developed and trained in order to make it of the utmost possible service in the acquisition of speech and language and in the understanding of what is said. The already acquired speech of the third group must be preserved and improved; and lip-reading by sight must be taught to supply the place of the lost power to comprehend by sound. These additional tasks superimposed upon the ordinary educational burdens of the school makes necessary in the schools for the deaf a higher standard of efficiency and effort than is found in the schools for the hearing. Otherwise these schools would not be able to accomplish in approximately the same length of time the same educational advancement that is attained in the ordinary school where the pupils are not handicapped by deafness.

Author of ‘Educational Needs of the Deaf.’
to go on and build up a language of signs on the basis of the natural language, which she had already herself commenced, or to teach her the process of speaking. The latter was of course easier, but very inefficient; the former, is, to give her a sign for every individual thing, or to give her a knowledge of letters, by the combination of which she might express her idea of the existence, and the mode and condition of existence, of anything. The former would have worked easily, but very inefficiently; the latter seemed very difficult, but, if accomplished, very effectual; I determined, therefore, to try the latter. After the child had become adjusted to the change of homes, Dr. Howe began teaching her by means of common articles with which she was familiar—spoons, forks, keys, etc.—on which labels with their names printed in raised letters had been pasted. Similar detached labels were given her to feel. Her touch was acute enough, hence she was able to match labels, placing that for book on the book, etc. She did this easily and willingly because she received approbation for so doing; but the idea that the printed word stood for the name of the object had not entered her brain. Then other detached labels were cut up into its component letters. These memory soon enabled her to build into wholes or the words she had felt. Such exercises continued for many weeks to be only a meaningless play to the poor child. The success had been about as great as teaching a very knowing dog, when suddenly the idea flashed upon her that here was a way by which she herself could make up a sign for anything that was in her own mind, and show it to another mind, and at once her countenance lighted up with a human expression; it was no longer a dog or parrot—it was an immortal spirit, eagerly seizing upon a new link of union with other spirits! I could almost fix upon the moment when this truth dawned upon her mind, and spread its light to her countenance; I saw that the great obstacle was overcome, and that henceforward nothing but patient and persevering, plain and straightforward efforts were to be used.

Next, she was given metal type each bearing some emblazoned letter, and a frame with which to set them. With this appliance Laura readily wrote the name of any object she knew and by writing them fixed in mind an extensive vocabulary of common names. Then the less cumbrous manual alphabet was taught her. Here was a means by which she could both write and read; she could spell to her teacher and read what her teacher spelled into her hand. Dr. Howe’s reports teem with interesting psychologic material. At the end of the year he writes: “She is nine years of age, and yet her knowledge of language is not greater than a common child of three years. There has been no difficulty in communicating knowledge of facts, positive qualities of bodies, numbers, etc.; but the words expressive of them, which other children learn by hearing, as they learn to talk, must all be communicated to Laura by a circuitous and tedious method. In all the knowledge which is acquired by the perceptive faculties, she is of course backward; because, previous to her coming here, her perceptive faculties were probably less exercised in one week than those of common children are in one hour.” And so her instruction went on. Through it all the child showed an eagerness to learn and to put herself in touch with the world that was a powerful aid to the teacher. In a few years, when Oliver Caswell, also deaf, dumb and blind, came to the institution, Laura naturally took him up; the result was that she acquired a new ally, and thereby profited much herself. As she approached womanhood her education was already good. She had learned to sew, to knit, and to do fancy work. She often visited her home, but her true home was the institution; there she died in her 20th year, the first case of any one so afflicted made capable of leading an industrious and happy life, and as the first case, historically the most remarkable. Popular interest in Laura Bridgman, both in this country and abroad, was naturally very great. The printed reports of her progress which were eagerly awaited were as eagerly absorbed. Distinguished foreigners coming to Boston visited her. Charles Dickens wrote in his American notes a sympathetic account of his impressions of her. The way to give liberty to the imprisoned mind had been made plain.

In the year 1887 something like the old interest was aroused by accounts of the brilliant deaf, dumb and blind child in Alabama, Helen Keller. This child had lost sight and hearing at 19 months as a result of a serious illness. Like Laura she kept active and tried to do all that surrounded her, and like Laura she developed her own little language of signs. When she was six years old, her friends, who knew of Laura Bridgman’s case, applied to Boston for a teacher. In the following year Miss Anne M. Sullivan was sent. This lady was able to put herself in touch with Helen in a very short time and in a marvelous way. In fact, she has proved herself to be a most remarkable teacher. Following in general the methods adopted in teaching Laura, Miss Sullivan began her work by putting Helen in possession of the manual alphabet. A doll was happily chosen to begin with; and with the doll on the child’s lap, the teacher formed in Helen’s hand the finger letters a-o-l-I. Other familiar objects were similarly introduced, and strange as it may seem, that which had taken three months to reach in Laura’s case in Helen’s took but a few days; or, in Miss Sullivan’s words, it was not more than a week before she understood that all things were thus identified. Her teacher writes: “Never did a child apply herself more joyfully to any task than did Helen to the acquisition of new words. In a few days she had mastered the manual alphabet and learned upward of 100 names.” After teaching verbs and prepositions through action and position Miss Sullivan made a departure. She began to use new words in connection with old words, letting Helen understand them if possible from the context. The child adopted these words “often without inquiry.” In this way she became familiar with the use of many words whose meaning never had to be explained to her.

As to the letters of the raised alphabet, Miss Sullivan writes: “Incredible as it may seem, she learned all the letters both capital and small in one day.” Then came the primer; then pencil writing, though which her mind never did any work for the blind to learn; and yet Helen “wrote an aright and distance a correctly spelled and legible letter to one of her cousins; and this was only a little more than a month after her first lesson in clicheography.”
or tangible point writing, became a constant delight to her.

Words like "perhaps" and "suppose" and that immeasurable abstract idea she learned more through association and repetition than through any explanation of her teacher. The child had the language sense largely developed. Much of the time when no one was talking with her she was reading in books printed in raised letters. Dr. Bell in trying to account for Helen's wonderful familiarity with idiomatic English, considers of great significance the statement of Miss Sullivan, that "long before she could read them (the books) ... she would amuse herself for hours each day in carefully passing her fingers over the words, searching for such words as she knew." In 1888, when Helen was eight years old her teacher took her to South Boston, where she could have the advantage of all the appliances and embodied books that a school for the blind affords. Thenceforth an account of her progress reads like a romance. It was no more difficult for her to learn a new word in German or in Greek than in English; and she took great delight in picking up and using French or Greek phrases. After she came to study these languages, she seemed to advance without effort in the knowledge of them. The educators of the deaf, who have good reason to comprehend the exceeding difficulty of teaching their pupils to articulate intelligibly, feel that Helen Keller's rapid mastery of speech is by all odds her most wonderful achievement. After she had been in South Boston some little time she heard of a Swedish girl afflicted like herself, who had learned to speak, and she said, "I must learn to speak." Miss Sullivan took her to Miss Sarah Fuller, principal of the Horace Mann School for the Deaf, and though Helen's only means of learning the position of the vocal organs in speech was to put her fingers on the lips, tongue, teeth and throat of the speaker, she learned in 10 lessons to articulate so well that she could carry on an intelligible and audible conversation, having communication addressed to her spelled into her hand by the manual alphabet. She has learned since that time to read from the lips and hand of a speaker by placing her fingers lightly on them; so that any one sitting near her can converse with her just as though she could both hear and see. She spent a winter at the Wright-Humason Private School for the Deaf, where she improved her articulation. When Helen was 16 years old she entered the Cambridge School for Girls, Miss Sullivan accompanying her. There, under the guidance of Mr. Arthur Gilman, the director of the school, she took the course preparatory to entering Radcliffe College. At the end of a year she took the regular required examinations in the history of Greece and Rome, in English, in Latin, in elementary French, in elementary German and in advanced German. As the questions and other matter were read into her hand by Mr. Gilman himself, Helen wrote her answers in translation on an ordinary typewriter. She passed the tests in every subject, taking "honors" in English and German. Mr. Gilman writes: "I think that I may say that no candidate in Harvard or Radcliffe College was graded higher than Helen in English." She entered Radcliffe in 1900 and was graduated from it in due course in 1904, receiving her A.B. "cum laude" or with distinction. Miss Sullivan remained with her throughout, acting everywhere as interpreter. Miss Keller still lives with this faithful friend who is now Mrs. Macy. She spends much time reading and studying; in fact she is essentially a student and a thinker and is not, as is often hinted, dependent for ideas upon those about her. Neither is she merely intellectual, being unusually capable in the practical affairs of the household. She has a very normal interest in her personal appearance and has cultivated a charming social personality.

Miss Keller has been able to be personally serviceable to those shut in like herself, especially to the blind. Her great heart throbs in behalf of all suffering humanity; hence, her interest in socialism, the red flag of which means to her only warmth and universal fair play. Desiring to add to her earnings through lecturing, she has now had her speaking voice strengthened and improved in quality under the devoted instruction of Mr. Harry V. Gerard of the New England Conservatory of Music. Since 1912 she has often appeared on the public platform, speaking with evident effect to many thousands of people in different States of the Union. Her autobiography, "The Story of My Life," and other of her writings have been translated into several languages. People who have visited Miss Keller in her home, sometimes doubting the truth of the unique accomplishments of this deaf-blind woman,—and indeed impossible and ridiculous things have been attributed to her,—these visitors invariably go away convinced that Helen Keller represents, as indeed she does, one of the greatest achievements of objective love and subjective will known to education. Her career has exerted a profound influence upon the aspirations of humanity. The literature of the subject, which is very large, has been collected in two special libraries where it may be consulted, namely, at the Perkins Institution, Watertown, Mass., and at the Volta Bureau, Washington, D.C.

The other deaf-blind children who have come under instruction have been or are some at schools for the blind, some at schools for the deaf. They must always have a special teacher and use embossed books and adapted appliances. All have been or are being taught on principles employed in teaching Laura Bridgman and Helen Keller. At the Perkins Institution they attend classes with other pupils, the special teacher acting simply as interpreter and companion.

Howe, "Laura Bridgman, Dr. Howe's Famous Pupil" (Boston 1903); Howe, Samuel G., "Laura Bridgman" (Reprint from Perkins Institution Reports, 1899); Keller, Helen, "Out of the Dark" (New York 1913); Keller, Helen, "Story of My Life" (New York 1903); Keller, Helen, "The World I Live In" (New York 1908); Lamson, Mrs. M. S., "Laura Bridgman: Life and Education" (Boston 1873); Kellon, Robert M., "Miss Keller: the Girl Who Found the Blue-Bird" (New York 1914); Stone, W. M., "Education
DEAFNESS, a condition in which there is loss of hearing, partial or complete, due to disintegration or destruction of some part of the hearing apparatus, either external or internal. See DEAF, THE; EAR.

DEÁK, dák-iék, Ferencz, Hungarian statesman: b. Sétisér, Zala, Hungary, 17 Oct. 1803; d. Budapest, 29 Jan. 1876. Having studied law at Raab, he practised for some time as a barrister, but his political career began with his election to the National Diet in 1832. He soon became, in spite of his loyalist and conservative tendencies, a prominent member of the liberal opposition. He was particularly desirous of preserving Hungarian nationality intact and of improving internal conditions. At the revolution of 1848 he became Minister of Justice under Count Batthyányi and advanced a scheme for the reorganization of the administration of justice which did not materialize owing to the pressure of events. His attempt to avoid the break with Austria, and retired when the Committee of Defense was formed and Kossuth obtained power. He tried to negotiate peace with the Austrian commander in 1848, but terms could not be agreed upon. On the defeat of the patriots in 1849 he retired from public office and did not return till 1860. He led the Diet of 1861, where he formulated the address to the emperor stating the Hungarian demands for constitutional rights. The Diet was immediately dissolved by the emperor, but Deák did not give up the project. It was not until after the war between Austria and Prussia that these demands were granted and Deák's hopes for a dualistic constitutional monarchy were realized. Deák refused to accept any honors, but remained in the Diet until his death, working patiently and consistently for the unity of Hungary and jealously guarding its rights and liberties. Great praise has been given him for his generosity, simplicity and sincere patriotism. His statesmanlike words in the Diet show the clarity of vision and lofty unselfish devotion to his country. Consult Forster, 'Francis Deák, Hungarian Statesman' (London 1880); Ferenczi, Z., 'Life of Deák' (Budapest 1894, in Hungarian); Cseherry, 'Franc Deák' (translated into German by Heinrich, Leipzig 1877-78).

DEAKIN, Alfred, Australian statesman: b. near Melbourne, Victoria, 3 Aug. 1856. He was educated at Melbourne University; was Minister of Public Works and Water Supply 1886-89; Attorney-General 1886-89; Chief Secretary 1886-90; Member of Federal Council 1889-95, 1897-99; Attorney-General of the Commonwealth of Australia 1901-03; and Prime Minister 1903-04 and 1905-08. He has published 'Irrigation in Western America' (1885); 'Irrigation in Italy' (1887); 'Irrigation in India' (1892); 'Irrigation in Australia' (1893); 'Temple and Tomb' (1894).

DEAL, in the United States, a plank 12 feet long, 11 inches wide, and 2½ inches thick. Deals are sawed of various sizes, but are reduced to that cubic dimension in computing them. The name deal is applied in Europe to boards of fir above seven inches in width and of various lengths exceeding six feet. If seven inches or less wide are called battens, and when under six feet long they are called deal-ends. The usual thickness is three inches and width nine inches. The standard size, to which other sizes may be reduced, is one and one-half inch thick, 11 inches broad and 12 feet long. Whole deal is deal which is one and one-half inch thick; slit deal, half that thickness. Deals are exported from many parts of Europe and the American continent. In the timber trade, 50 cubic feet of deals are a load, and 100 feet superficial are a square.

DEALFISH, deep-sea bony fishes of the family Trachypetyidae, allied to the oar-fish and the ribbon-fish (q.v.). As the name suggests, the elongated body is laterally compressed, and with the exception of a small separate elevated anterior portion, the dorsal fin is continuous along the back. The anal fin is absent. The tail-fin is peculiar in being sharply turned upward. The skeleton is very fragile. Some eight species are known from specimens accidentally thrown ashore on European coasts and from the west of South America.

DE AMICIS, Edmondo. See AMICIS, EDMONDO DE.

DEAN, Amos, American jurist: b. Barnard, Vt., 16 Jan. 1803; d. Albany, N.Y., 26 Jan. 1868. He early acquired eminence in his profession and after being professor of medical jurisprudence in the Albany Medical School and of law in the Albany Law School, became chancellor of the University of Iowa in 1855. Among his published works are 'Lectures on Phrenology'; 'Manual of Law' (1838); 'Medical Jurisprudence' (1854); 'Bryant and Stratton's Commercial Law' (1861); 'History of Civilization' (1869-70); 'The British Constitution' (1883).

DEAN, Bashford, American zoologist: b. New York, 28 Oct. 1867. He was educated at the College of the City of New York and at Columbia University. He was instructor in biology at Columbia after 1891 and has been professor of vertebrate zoology there since 1904. He also served as biologist and special investigator of the United States Fish Commission in 1900-01. He became member of the advisory board of the New York aquarium in 1902 and in 1903 curator of herpetology and ichthyology at the American Museum of Natural History, and curator of arms and armor at the Metropolitan Museum of Art in the same year. He is author of 'Fishes, Living and Fossil' (1895) and of numerous papers in paleontology and embryology of fishes, besides a number of articles on arms and armor.

DEAN, John Ward, American author and genealogist: b. Wiscasset, Me., 13 March 1815; d. Medford, Mass., 22 Jan. 1902. He was educated in the public schools of Portland, Me., learned the bookbinding trade and conducted a bookbinding business in Boston for many years, till his appointment in 1872 as librarian of the New England Historic Genealogical Society. Except from 1889 to 1893 he filled this position until his death. He was editor of the New England Historical and Genealogical Register, and of nine volumes of the 'New England Bibliopolist' (1880-98). Among his writings are
numerous biographical memoirs, including the ‘Memoir of Nathaniel Ward’ (1868); ‘Memoir of Michael Wigglesworth’ (1871) and the ‘Story of the Embarkation of Cromwell and his Friends for New England.’

DEAN, in ecclesiastical language, a church dignitary standing over the chapter of a cathedral. The word is from the French doyen and from the Latin decanus, one set over 10 (Gr. deka, Lat. decem, 10). Originally decanus was the designation of a petty civil functionary: its ecclesiastical use had its rise in monachism, where a decanus was named to be chief and monitor of 10 monks or 10 hermits; and the senior decanus of a canobium served as head of the monastic community in the absence of the abbot.

From the institution of canons regular, serving in the chapters of cathedral churches, came the usage of naming the chief among the canons of a chapter as its dean. Rural deans are parish priests who, appointed by the bishop, exercise a certain jurisdiction and supervision over the churches or congregations and their rector within a definite district. In the Curia Romana, the dignitary styled Cardinal Dean of the Sacred College is the chief among the cardinals and is usually the oldest of the seven cardinal bishops: he succeeds his predecessor in the see of Ostia. From ecclesiastical usage the term dean was adopted as designation of the leading member of various secular bodies, for example, the head of a university faculty, or a college, or of a guild. The deans in German cathedrals are subordinate to the provosts; they are episcopal bishops, but sometimes by a sovereign or chapter. In the Church of England some of the deanseries are valuable benefices. A dean may hold one other living along with his deanship. He is bound to reside eight months of the year at his cathedral. The bishop of London holds the honorary office of dean of the chapel royal, and there is also a sub-dean and chaplains. Rural deans are beneficed clergymen appointed by the bishop or archdeacon to exercise jurisdiction in certain matters in some part of the diocese. This office has fallen into disuse, being superseded by the appointment of archdeacons, but has latterly been revived. The rural deans hold office during the life of those by whom they are appointed. There are also a few deans called deans of peculiar, who exercise an independent jurisdiction, and are not under a bishop. In Scotland the honorary title of dean of the chapel royal is bestowed on a clergyman of the established church, and six chaplains are also appointed to a similar honorary office. Deans of colleges are, in English universities, officers appointed to superintend the behavior of the members, and to enforce discipline. In the universities of Scotland and elsewhere the head of each of the faculties of law, theology, medicine, science, etc., is called dean of the faculty. In the United States the dean of the department is the registrar or secretary, and in some institutions he has considerable to do with the discipline. The dean of guild in Scotland is a burgh official whose duty it is to see that buildings are erected in accordance with the municipal regulations.

DEANE, Charles, American antiquarian: b. Biddeford, Me., 10 Nov. 1813; d. Cambridge, Mass., 13 Nov. 1889. He was for many years a merchant in Boston but retired from business in 1864 and devoted himself to the collection of works relating to American history. He edited ‘Bradford’s History of Plymouth Plantation’ (1850); ‘Wingfield’s Discoveries in Virginia’ (1860) and John Smith’s ‘True Relation.’

DEANE, Silas, American diplomatist: b. Groton, Conn., 24 Dec. 1737; d. Deal, England, 23 Aug. 1789. He was graduated at Yale College in 1758, and was a member of the first Continental Congress in 1774. He was sent by Congress to France as a political and financial agent, with instructions to ascertain the temper of the French government concerning the rupture with Great Britain, and to obtain supplies of military stores. But he did not confine himself to his instructions, and made promises and engagements on all sides, which afterward brought the Congress into considerable embarrassment. When it was determined to send ministers to negotiate treaties, Dr. Franklin and Arthur Lee were commissioned to join him at Paris, and he assisted in the negotiation of the treaty with France. In a diocese. In the Curia Romana, the dignitary styled Cardinal Dean of the Sacred College is the chief among the cardinals and is usually the oldest of the seven cardinal bishops: he succeeds his predecessor in the see of Ostia. From ecclesiastical usage the term dean was adopted as designation of the leading member of various secular bodies, for example, the head of a university faculty, or a college, or of a guild. The deans in German cathedrals are subordinate to the provosts; they are episcopal bishops, but sometimes by a sovereign or chapter. In the Church of England some of the deanseries are valuable benefices. A dean may hold one other living along with his deanship. He is bound to reside eight months of the year at his cathedral. The bishop of London holds the honorary office of dean of the chapel royal, and there is also a sub-dean and chaplains. Rural deans are beneficed clergymen appointed by the bishop or archdeacon to exercise jurisdiction in certain matters in some part of the diocese. This office has fallen into disuse, being superseded by the appointment of archdeacons, but has latterly been revived. The rural deans hold office during the life of those by whom they are appointed. There are also a few deans called deans of peculiar, who exercise an independent jurisdiction, and are not under a bishop. In Scotland the honorary title of dean of the chapel royal is bestowed on a clergyman of the established church, and six chaplains are also appointed to a similar honorary office. Deans of colleges are, in English universities, officers appointed to superintend the behavior of the members, and to enforce discipline. In the universities of Scotland and elsewhere the head of each of the faculties of law, theology, medicine, science, etc., is called dean of the faculty. In the United States the dean of the department is the registrar or secretary, and in some institutions he has considerable to do with the discipline. The dean of guild in Scotland is a burgh official whose duty it is to see that buildings are erected in accordance with the municipal regulations.

DEAN, Jeannie, the heroine of Sir Walter Scott’s tale, The Heart of Midlothian. When her sister Effie was sentenced to death for the murder of her own child, Jeannie went on foot to London and obtained from the queen a pardon for her sister. Her devotion forms a contrast to the attitude of the father, David Deans, whose rigid sense of justice leads him, in spite of the dictates of his heart, to drive Effie from his door. Effie is married to her lover and becomes a lady of the court.

DEARBORN, Henry, American soldier: b. Hampton, N. H., March 1751; d. Roxbury, Mass., 6 June 1829. He was practising medicine at Portsmouth when, hearing the news of the battle of Lexington, 19 April 1775, he immediately marched with 60 volunteers, and was at Cambridge early the next day, a distance of 65 miles. He was made a captain, was at the battle of Bunker Hill 17 June, and accompanied Arnold on the expedition through the woods of Maine to Quebec. He served as major under Gates at the capture of Burgoyne, and distin-
guished himself and his regiment by a gallant charge at the battle of Monmouth in 1778. In 1779 he served in Sullivan's expedition against the Indians, in 1780 with the army of New Jersey, in 1781 at Yorktown, and in 1782 was on garrison duty at Saratoga. He was twice member of Congress, and for eight years, during the presidency of Mr. Jefferson, Secretary of War. In 1809 he was made collector of Boston, and on 27 Jan. 1812, became senior major-general in the United States army. Resigning his commission in the army in 1815, he was appointed, 7 May 1822, Minister to Portugal, where he remained two years, and was recalled at his own request.

DEATH, in common language, a state opposed to life, and considered as the cessation of it. Strictly speaking, we can trace only the cessation of organic life. The matter of which the body is composed does not perish on the death of an organized being; it undergoes various changes, which are known by the names of decay and putrefaction, and which are the preparation for its becoming subservient to new forms of life. What becomes of the mind, or thinking principle, whether in man or animal, after death, is a matter of philosophical conjecture or religious faith. The investigations of science do not throw the least light upon it. The change here adverted to, which is called death, does not take place so quickly as is generally believed. It is usually preceded and caused by disease or the natural decay of the age. The state called death takes place suddenly only when the heart or the brain is injured in certain parts. Probably the brain and the heart are the parts from which, properly speaking, death proceeds; but as the cessation of their function is not so obvious as the cessation of the breath, which depends on them, the latter event is generally considered as indicating the moment when death takes place. In the organs of sense and motion the consequences of death first become apparent; the muscles become stiff; coldness and paleness spread over the whole body; the eye loses its brightness, the flesh its elasticity; yet it is not perfectly safe to conclude, from these circumstances, that death has taken place in any given case, because experience shows that there may be from certain causes a state of apparent death, in which all these circumstances may concur without the extinction of the vital spark. The beginning of putrefaction, in ordinary cases, affords the first certain evidence of death. Putrefaction begins in the bowels and genitals, which swell, become soft and loose, and change color; the skin also begins to change, and becomes red in various places; blisters show themselves; the blood becomes more fluid, and discharges itself from the mouth, nose, ears, eyes and anus. By degrees, also, the other parts are decomposed, and, last of all the teeth and bones. In the beginning of decomposition nitrogen and ammonia are produced; in the progress of it; hydrogen, compounded with carbon, sulphur and phosphorus, is the prevailing product, which causes an offensive smell, and the sight which sometimes observed about putrefying bodies. At last, only carbonic acid gas is produced, and the putrefying body then smells like earth newly dug. A fat, greasy earth remains, and a slimy soap-like substance, which mixes with the ground, and contributes with the preceding decompositions to the fertility of it. Even in these remains of organized existence organic life is not entirely extinct; and they contribute to produce new vegetable and animal structures. Putrefaction is much influenced by external circumstances, particularly air, heat and water. When the body is protected from the action of such agencies, it changes into adipocere; but this process requires a much longer time than common putrefaction. In very dry situations the body is converted into a mummy, in which stage bodies are found in the arid deserts of Africa, and on the mountains in Peru. Some vaults are remarkable for preserving corpses from putrefaction. It is well known to every reader that particular substances counteract putrefaction; for instance, those used in tanning and in embalming mummies.

The death-agony is the state which immediately precedes death, and in which life and death are considered as struggling with each other. This state differs according to the cause producing it. Sometimes it is the result of complete exhaustion; sometimes a violent struggle, and very irregular activity, which at last, after a short pause, terminates in death. In some cases consciousness is extinguished long before death arrives; in other cases it continues during the whole period and terminates only with life. The person in this condition has already somewhat the appearance of a corpse: the face is pale and sallow, the eyes are sunken, the skin of the forehead is tense, the nose pointed and white, the ears are relaxed and the temples fallen in; a clammy sweat covers the forehead and the extremities, the alvine discharges and that of the urine take place involuntarily, the respiration becomes rattling, interrupted and at length ceases entirely. At this moment death is considered to take place. This state is of very variable length; sometimes continuing for minutes only, sometimes for days. When the patient is in this condition nothing should be attempted but to comfort and soothe him. As long as the dying person is able to swallow, water or other cordials may be given from time to time.

Signs of Death.—During death the chief physical processes, such as respiration and circulation, may first cease, but molecular activity may persist for some time, as is evidenced in the common observation of the growth of hair after death. The desirability of knowing the absolute signs of death is due not so much to the danger of burying the living, as to the possibility that efforts at resuscitation may not be adequately performed in cases of apparent death. The idea that at the present time people can be buried alive is more or less absurd; but it is very true that many cases of apparent asphyxia, notably following drowning or electrical shock, are recoverable if proper means are taken.

There are a number of conditions that simulate death. The commonest of these are catalepsy and trance states, partial asphyxia and syncope or fainting. In catalepsy there is usually a loss of consciousness, the muscles of the body generally become very rigid, but the limbs may be readily moved and placed in various positions. The temperature is lower, the respiration and the heart-action, while reduced, are apparent. In the trance of appearance of death is much more striking, consciousness is usually abolished, the face is pale, the limbs may be
DEATH

flaccid, and sometimes are rigid, the reflexes may be lost, and the pupils may be dilated and immobile. The absence of the signs of decomposition, the normal ophthalmoscopic appearance of the fundus of the eye, and the persistence of electrical excitability are sufficient, however, for determining that asphyxia by drowning is one of the most frequent causes of apparent death. Resuscitation has resulted even after a body has been under water for an hour. This fact emphasizes the desirability of continued treatment in all cases of asphyxia by drowning. The circulation being readily distinguished from normal death.

The special signs of death are those that involve the circulation, respiration, conditions of the muscular system and certain changes in the eye. Circulatory changes are those of stoppage of the heart, with consequent loss of heat and coagulation of the blood. Careful listening to the heart-sounds by means of specially devised instruments may be necessary to determine whether the heart has stopped beating or not, and special methods a special method of applying ligatures or clamping a lobe of the ear or the finger, cutting off the venous return and permitting the ordinary inflow to continue, may be used. The respiratory changes consist of cessation of respiration, with consequent change in the color of the patient, there being marked palilus in distinction usually to marked cyanosis of asphyxia. A mirror placed before the nose or over the mouth will sometimes detect breathing when it cannot be seen or heard; and if a vessel of water be placed over the chest, movements of that organ may be detected. Muscular changes are very characteristic. There is usually complete muscular relaxation, followed by great stiffness (rigor mortis) after a certain number of hours. There is commonly loss of excitability of the muscles. Changes in the eye are correlative rather than unique. The iris is usually flaccid; the pupil is ordinarily moderately dilated and unresponsive to light, and is not reacted upon by atropine or eserine half an hour after death. The movements of the body of the eye when viewed with the ophthalmoscope.

Finally there are a series of cadaveric changes that result and which are indubitable evidence of death. There is gradual loss of heat, although in certain cases of cholera temperatures as low as 76 ° F. have been observed, and the patient has still lived. Rigor mortis develops, probably, by the action of a ferment resulting in the formation of myosin. This condition may come on very rapidly, sometimes in a few hours, but complete rigor mortis rarely takes place within this time. Occasionally there is an instantaneous rigor mortis, when death occurs suddenly during violent muscular exertion. This happens in times of war, when weapons are sometimes firmly grasped in the dead hand; and in some cases of drowning the pannus may be with weeds and mud clutched in the fingers. The disappearance of rigor mortis usually takes place in from 16 to 36 hours, although there is no absolute rule. Coagulation of the blood, post-mortem postures, post-mortem lividities and putrefactive decomposition, with formation of gases, are usually characteristic and unequivocal.

Death in Mythology, etc.—The representation of death among nations in their earlier stages depends upon the ideas which they form of the state of man after this life, and of the disposition of their gods toward mankind. In this respect the study of these representations is very interesting. Of later ages the same cannot be said, because imitations of representations previously adopted are very often the objects of papularistic art, suggested by ancient gods. However, these representations do not altogether depend on the causes above mentioned, as the general disposition of a nation (for instance, that of the Greeks, who beautified every object) has also a great influence upon them. The Greeks more particularly presented a gentle, beautiful youth. They personified death under the name Thanatos, while the Ærēs were rather the goddesses of fate and violent deaths, like the Valkyrie in the northern mythology. According to Homer, Sleep and Death are twins, and Hesiod calls them the sons of Night. They are often portrayed together on cameos, etc. During the most flourishing period of the arts Death was represented on tombs as a friendly genius with an inverted torch, and holding not a phial of poison, but a sleeping child, winged, with an inverted torch resting on his wreath. Sleep was represented in the same manner, except that the torch and wreath were omitted. According to an idea originating in the East, life in the bloom of youth was attributed to the appearance of some particular deity, who snatched his favorite to a better world. It was ascribed, for instance, to Jupiter, or to his eagle, if the death was occasioned by lightning; to the water-nymphs if the individual was drowned, as in the case of Hylas; to Eos or Aurora if the death happened in the morning; to Selene, if at night, etc. These representations were more adapted to relieve the minds of surviving friends than the pictures of horror drawn by later poets and artists. (Curt. Herder, 'Wie die Alten den Tod gebildet.' Euripides, in his 'Alcestis,' even introduced Death on the stage, in a black robe, with a steel instrument in his hand, to cut off the hair of his victims, and thus devote them to the infernal gods. The later suicide period represent Death under more horrible forms, gnashing his teeth and marking his victims with bloody nails, a monster overshadowing whole fields of battle. The Hebrews, likewise, had a fearful angel of death, called Samæl, and prince of the world, and capable of shaking the devil; but he removes with a kiss those who die in early youth. The disgusting representations of Death common among Christians originated in the 14th century; for the representation of Death as a skeleton merely covered with skin, on the monument at Cumaus, was only an exception to the figure commonly ascribed to him among the ancients. In recent times Death has again been represented as a beautiful youth—certainly a more Christian image than the skeleton with the scythe. The monumental made by Carpey, and the cenotaph erected by George IV in honor of the Stuarts in Saint Peter's Church at Rome, represents Death as a beautiful youth. He is sometimes portrayed under the figure of a dying lion.

Causes of Death.—There are 15 principal causes of death, with the rate per 100,000, as given by the census bureau. They are as follows: Pneumonia, 191.9; consumption, 191.5; heart disease, 134; diarrhoeal diseases, 85.1; kidney diseases, 88.7; apoplexy, 66.6; cancer, 68;
old age, 54; bronchitis, 48.3; cholera infantum, 47.8; debility, 45.5; inflammation of brain and mening, 41.8; diphtheria, 34.4; typhoid, 33.8; and premature birth, 33.7. Death from all principal causes shows a decrease during the last two decades, the most notable instance being that of consumption, which shows a decrease of over 50 per cent per 100,000. The world's death rate is estimated at 68 a minute, 97,920 a day, and 35,740,800 a year.

DEATH, Civil, in English law, formerly the entire loss or forfeiture of civil rights, which followed on attainder for treason or felony. A man was considered civilly dead who retired into a monastery or abjured the realm. By Act 33 and 34 Vict. cap. xxiii a conviction for treason or felony no longer causes attaint of ancient or forfeit of civil rights. In a strict sense, the term has never been used in the United States.

DEATH, Dance of. See DANCE OF DEATH.

DEATH-ADDER (Acanthophis antarcticus), a very venomous and justly feared snake of Australia, which also occurs throughout the Indo-Malayan Islands to the Moluccas. It belongs to the Elapidae, of which the cobra is also a member, but the death-adder lacks the spreading hood. The end of the tail is flattened laterally, and is terminated by a horny spine, anterior to which are several rows of enlarged scales.

DEATH-SONG. It was the pride of the ancient man to depart from life exulting in his victories and defying his enemies. There are traces of death-songs in many languages and among many peoples. The custom has been in vogue especially among some of the tribes of American Indians. The dying chief chanted all the warlike deeds of his life, gloating in his victories over his foes. It is sometimes called the swan-song because of the legend that the dying swan after a long life approaches its end and at the last moment is given the power of sweet song. The Christian believes in a happy deathbed. John Wesley proudly said on one occasion "Our people die well."

DEATH-TICK (Clothila pulsatoria), a neotropical insect of the family Pscocidae, of the size and appearance of the common plant-louse, one species of which is a visitor of gardens. Another species is the little book-louse found running over books and feeding on the paper. In England it is called "death watch," because there it is said to make a ticking sound like that of the beetle (Anobium), thus exciting many superstitious notions. See Death-watch.

DEATH VALLEY, Cal., a low desert in Inyo County, near the Nevada border. The name of this region was given by a survivor of a mining party, who lost their way here and, of whom, after enduring indescribable sufferings, 18 perished in the sands. No other such spot is known. Like all the great valleys of California, it lies oblong from north to south. Its length is about 150 miles; width varies from 10 to 35; surface about 210 feet lower than that of the ocean, the lowest point of dry land in the United States. It is interesting to note that Mount Whitney, the highest point in the United States (14,501 feet), lies at a distance of less than 80 miles from the point of lowest depression. The Panamint Mountains shut out from it the moist winds of the Pacific. In the August atmosphere there is less than one-half of 1 per cent of moisture. The surrounding country is made up of volcanic ranges of black, red, green, yellow and brown—which is all that remains of the valley with the borax now found there.

On the north of the valley is Ralston Desert, on the west Panamint Desert, on the south Mojave Desert and Amargosa Desert is on the east. Death Valley has the lowest depression. Summer heat here rises to 137° F. or more, far higher than anywhere else in the Western world. Death Valley, as seen from the summit of the Panamint Range, presents in November a long gray waste desert, in which there are narrow bands of white made by the rhombo of borax; and to the south is seen a thin line like a blade of steel—the Amargosa River, as it dies away upon entering Death Valley sink. It is a sluggish, dead stream, and evaporation and absorption at last take it all 190 lakes once the centre of a system of lakes. Toward their summit, the Panamint Mountains are of carboniferous limestone formation, rifted and worn, with a very slight growth of píón, pine, mahogany and juniper, near the crests; and below the vegetation becomes more scant with the gorges and narrow caños are seen numerous vines and creepers, on which grow wild gourds resembling oranges, also similar to the bitter desert applies that grow near the site of ancient Sodom. Here also are the most distorted forms of the cactus, and an inferior growth of greasewood or palaverde. The wealth of this desert is wholly mineral.

A sand-storm playing in Death Valley is a wonderful sight. Sand-augers rise like slender stems, reaching up into the delicious atmosphere for thousands of feet and terminating in a bushy cloud. They travel hither and thither and gradually fade from sight. Here mirage raises up spectral cities, groves, fields and tree-marginled rivers. A low rain will seem to be hundreds of feet high; arrow-weeds are magnified into stately palms; and crows walking on the ground appear as men on horseback. Besides crows, here are seen a few poor jack-rabbits, many coyotes, buzzards, horned toads, red-eyed rattlesnakes, mice and mountain rats; and in the Panamint Range there are still a few bighorn or Rocky Mountain sheep.

At the summit of the Panamint and Funeral mountains, the thermometer at times, it is said, falls to 30 degrees below zero. The mineral wealth of this region is great. In the Panamint Range are many mines of antimonial silver ore; and copper, gold, iron, travertine, onyx and marble are also found. In the Funeral Range, gold, silver, lead, copper and antimony have been found in paying quantities, while the thick strata of the west and southern hills show almost inexhaustible quantities of colemanite, a borate of lime named for W. T. Coleman, who was one of the first to discover this deposit and find out its richness in borax. Very rich gold quartz has been taken from mines along the
route traveled by the ill-fated old emigrant party. Human society in Death Valley is confined to a few miners in the Funeral, Calico and Panamint mountains, some few roving bands of Piute Indians and a few squaw-men owning cattle and horses. Visitors to Death Valley should not go earlier than 15 October, nor later than 15 April; no one should attempt to cross it while a sand-storm is blowing; a gallon of water is needed for each person in a party, and three gallons for each horse. At present one can enter the valley by the Atlantic and Pacific Railroad, but the route is little better than from Panamint to Furnace Creek and up through Nevada via Pioche, Nev.

DEATH'S-HEAD MOTH, a species (atropos) of Acherontia, genus of the Sphinx or hawk-moth family, one of the largest of the group, widely distributed over the world, being found in parts of Africa, Asia and Europe. It is crepuscular in its flight. Its fore wings are blackish-brown, with transverse lines of black and a white spot near the middle. The hind wings are yellow, with black stripes crossing the middle and tracing the margin. Upon the dark thorax is described in pale yellow a mask resembling a man's skull. Hence the common name. The moth is about five inches in extent of wings. The caterpillar is of the same length, of bright yellow color, with violet stripes and a row of blue spots along the back. It is injurious to potato and tomato plants, and in some localities is said to rob bee-hives of their honey withstanding the attacks of the bees. When frightened or seized, the moth gives forth a squeaking noise. This, with the death's head, suggests an evil omen to the superstitious, making appropriate the generic name Acherontia. Similar superstitions attach to other members of the genus.

DEATH'S JEST BOOK ('The Fool's Tragedy') is the most extensive and important work of Thomas Lovell Beddoes, begun by him at Oxford in 1825 and touched up and altered till near the close of his life. It was finally published in 1850. The play is a tragedy of revenge, written under the inspiration of such later Elizabethan dramatists as Webster and Tourneur, but embodying also a spirit of fantastic horror, a love of grim and spectral imagery, derived from early 19th century romance. Beddoes' special contribution is a species of weird merriment in death, sufficiently suggested by the strange title, 'Death's Jest Book.' On one occasion the figures representing the medieval dance of death descend from their places on the walls of a cathedral to partake of a banquet with living men. The prime mover of the tragedy is a court fool, Isbrand, who causes the body of his murdered brother to be interchanged in the grave with that of the wife of his murderer, Duke Mainieri. Melverie, by the incantation of an Egyptian sorcerer, summons up the spirit, thinking it his wife's and at the close of the drama is obliged to accompany the ghost to Hell. In plot construction, characterization, and all the specifically dramatic qualities of Beddoes is very wise, but the songs with which the piece abounds are rich in poetry of a highly individual kind. Consult 'The Poetical Works of Thomas Lovell Beddoes,' (edited with a memoir by Edmund Gosse, 1890).

JAMES H. HANFORD.
April 1804; d. Paris, 14 March 1866. He was a son of J. B. J. Debay the elder (q.v.), and was a pupil of his father and of Gros. He took a medal of the third class 1819 at the age of 15, the second prize of Rome in 1822 with his painting ‘Orestes and Pylades’; the first grand prize of Rome with his painting ‘Egerius Discovering the Body of Cythereia,’ and a first-class medal in 1831. From 1830 onward he exhibited in all the expositions at Paris, either as painter or sculptor. His principal pictures are ‘The Old Man and His Children’; ‘Enlisting at the Place du Palais Royal’; ‘The Meeting at the Field of the Cloth of Gold’; ‘Attila’; ‘Promenade of Sixtus Fifth’; and ‘The Battle of Dreux.’ As a sculptor he received honorable mention for his ‘Napoleon I.’ (1841); the first prize in open competition for the monument of Monsignor Affre, now at the church of Notre Dame, Paris; and a first-class medal at the Exposition 1855 for his best-known work, ‘Primitive Cradle’; first shown in 1845. Among other works are statues of Perrault and Claude Lorrain, at the new Louvre; and the marble mausoleum of the Comte and Comtesse de Dumas.

DEBAY, Jean Baptiste Joseph, THE ELDER, French sculptor: b. Malines, Belgium, 16 Oct. 1779; d. Paris, 14 June 1863. He was first a pupil of the painter Van Biscom, then went to Paris and studied under Chardet. Summoned to Nantes, he made 30 busts for the library, 10 statues for the Exchange, the fronton of the Hotel de Ville, and the statues of Saints Peter, Paul and John. Returning to Paris 1817, he made two colossal statues of Neptune and Apollo for Havana; and took a second-class medal with a bust of Talma. Among his works are a bronze equestrian statue of Louis XIV at Montpellier; statue of the ‘Chancellor of the Hospital’ at Aiguesperse; marble statue of ‘Mercury putting Argus to Sleep’ and ‘Mercury Preparing to Slay Argus’ at Havana; group of the ‘Three Fates’; marble statue of Charles Martel in the museum at Versailles; marble statue of Colbert; ‘Young Woman and Shells,’ considered his best work; and the figures of ‘Ocean’ and ‘The Mediterranean’ for one of the Arcades of the Luxembourg fountain. During his later years he held the position of restorer of sculptures at the Louvre. He received the decoration of the Legion of Honor 1825. He executed numerous portrait-busts in excellent style.

DEBAY, Jean Baptiste Joseph, THE YOUNGER, French sculptor: b. Nantes, 31 Aug. 1802; d. Paris, 7 Jan. 1892. He was the eldest son of the preceding. He was a pupil of his father and of Bosio, and went to Havana at 17 years of age to deliver his father’s statues. He took the second prize of Rome 1823, with a bas-relief, ‘The Grief of Evander’ and in 1829 the first grand prize of Rome with the ‘Death of Hyacinth.’ He received the decoration of the Legion of Honor in 1851. Among his works are ‘Theseuses’; ‘Genius of the Sea’; ‘Genius of the Hunt’; ‘Young Slave’ (first-class medal 1841); ‘One of the Pretenders’ (1843); ‘The Barque of the God’; a bronze statue of ‘Cambronnes’ (Nantes); ‘Marshall Oudinot’ (Bar-le-Duc); ‘Modesty and Love,’ marble group; equestrian statue of Napoleon III (Bordeaux); ‘Six Apostles’ (Church of Saint Eustache, Paris); and 10 statues for the Pommereau Gallery at Nantes.

DE BECKER, Jules Alphonse Marie, Belgian ecclesiastic and educator: b. Louvain, 7 Dec. 1857. He was educated at the Josephite College and Catholic University of Louvain, and the Gregorian University, Rome. He was ordained to the priesthood in 1881, was appointed professor of canon law and liturgy at the American College, Louvain, in 1885, and after 1889 served as professor of canon law at the Catholic University there. He was made a canon of Mechlin Cathedral in 1887, and in 1898 became rector of the American College, Louvain. At the latter institution he founded a chair of philosophy and secured the admission of its students to the theological courses of Louvain University. In 1904 Pius X appointed him a member of the commission for the codification of the canon law. He has published ‘L’Eglise aux Etats-Unis’ (1903); ‘De Sponsibus et Matrimonio’ (1903); ‘Legislatio nova de forma substantiá quod sponsalit et matrimonium’ (1908), and contributions to the American Ecclesiastical Review, the Grove Generale, The Catholic Encyclopedia, etc.

DEBENTURE, in finance, a certificate or document signed by a legally authorized officer, as an acknowledgment of a debt due to some person; a deed or bond of mortgage on certain property for the repayment to a certain person of a certain sum of money advanced by such person, together with interest thereon at a certain stated rate. Debentures are frequently issued by public companies, especially railroad companies, for the purpose of raising money for the completion or carrying on of their undertakings. They differ from certificates of stock in that they contain some form of covenant to repay the principal sum with regular interest at some date specified in the future. They are also issued in series and for the purposes of borrowing money. They may or may not be negotiable.

In customs, a certificate entitling the person to whom it is granted to a drawback on certain goods exported, the duties on which had been paid.

In public offices, in some government departments, a term used to denote a bond or bill by which the government is charged to pay a creditor or his assigns the money due on auditing his account. The issuing of debentures is regulated by general statutes in the laws governing corporations. Consult Palmer, ‘Company Precedents’ (London 1902).

DEBIT AND CREDIT (‘Soll und Haben’). Out of the hunger for a national life, for a character that should be nationally German, for traditions upon which to build them and hopes wherewith to feed them, grew such novels as Gustav Freytag’s ‘Debit and Credit’ (1855), called by the Germans a Zeittroman, or novel of the times, to distinguish it from the historical romance or novel of other days. The book was a direct product of the revolution of 1848. ‘Debit and Credit’ is the apostrophe of the great merchant class, to which Germany owes so much of her growth, her success and her constructive national spirit. As such it has made a unique place for itself in German literature, and was in its day as widely translated and read as any
book in the language. In spite of Freytag's consciousness, however, that in painting such an imaginative picture of the people he loves an author must use exceeding care to avoid "distortion in the outline of his picture, because not only the picture, too, flows freely and readily from the pen," the book has, in a marked degree, the defects of its qualities. The glorified pictures of Anton, Schröter, Sabine and the other middle class men and women, the likenesses of the slowly decaying landed and of the rapacious Jews to whom they become a prey, of the Poles—a romantic and incapable nobility, a debased peasantry—who give way before the intelligent, eager, idealistic German colonists—all bear the stamp of that untruth which comes not of a purpose to be false but of prejudice. The book has been well translated into English, with an enlightening preface by the Chevalier Bunsen.

EDITH J. R. ISAACS.

DEBORAH, Hebrew seer or prophetess. She lived in the time of the judges, and by the aid of Barak delivered the northern tribes from the oppression of Jabin and secured a peace of 40 years' duration. The triumphal ode attributed to her is a remarkable specimen of Hebrew poetry. The story is told in 'Judges' IV and V.

DE BOW, James Dunwoody Brownson, American journalist and statistician: b. Charleston, S. C., 10 July 1820; d. Elizabeth, N. J., 27 Feb. 1867. He studied law, was admitted to the Charleston bar in 1844, became a contributor to the 'Southern Quarterly Review,' published at Charleston, and in 1844 took charge of that periodical as chief editor. Among other papers prepared by him for its pages was an elaborate article, published in 1845, upon 'Oregon and the Oregon Question,' which attracted much attention both in this country and Europe. It was translated into French and was the occasion of a debate in the French Chamber of Deputies. In 1845 he removed to New Orleans and established *De Bow's Commercial Review*. This enterprise proved successful and the work attained a circulation greater than has ever been realized by any similar publication in the South. In March 1853 he was appointed superintendent of the United States census. In that position he collected and prepared for the press a large part of the material for the quarto edition of the census of 1850. He afterward compiled the volume entitled 'Statistical View of the United States,' a compendium of the 7th census. In 1853 he compiled from his review a work published under the title of 'Industrial Resources of the Southwest.'

DEBRAUX, de-brô', Paul Émile, French balladier: b. Ancerville, department of Meuse, 30 Aug. 1796; d. Paris, 12 Feb. 1831. He was an ardent Republican and wrote for the common people lively songs of wine and love, sung everywhere in tavern and workshop. He was called 'the Béranger of the rabble.' His best-known songs are 'Mt. Saint John,' 'Belisarius,' 'Say, Do You Remember?,' 'The Soldier's Widow,' 'Marengo.' Béranger published a complete collection of his 'Songs.'

DE BRAY, Guido, one of the most famous of the Walloon writers and reformers, and author of the Belgic Confession of Faith, one of the great creeds of the Reformation and noblest monuments in the Walloon language: b. Mons, in Hainault 1520; d. Valenciennes, May 1567. The Belgic confession was adopted by the nobles as well as by the Reformed clergy. Translated into Dutch, German and Latin, this Confession was printed and presented in 1562 to Philip II of Spain, lord of the Belgic Netherlands, in the vain hope of securing toleration. The invasion and desolation of the Walloon and Flemish provinces followed five years later. De Bray was active as a scholar and a champion among his refugee countrymen in France, Germany and England, being at home in both the Flemish and Walloon tongues. He wrote an important work in Latin, condemning the tenets and excesses of the Anabaptists. Cast into prison by the Spaniards in 1567, he wrote letters to his wife and mother, which are classics. The Belgic Confession is the standard of belief in the Reformed Churches of Belgium, in the Netherlands, in the Dutch colonies and in the Reformed Church in America. Consult Lamerie, 'Guido de Bray;' 'Zyn Leven en Werken,' Zerikzee (1884); 'Schaff's 'Creeds of Christendom' (1877); Griffiths, 'Belgium, the Land of Art' (1912).

DEBRECZIN, dé-bré'tsin, Hungary, a free imperial city on the edge of the great central plain of Hungary, about 137 miles east of Budapest by rail. Its houses are mostly of a single story; and in wet weather the wide but unpaved streets become almost impassable from mud. The chief edifices are the principal Protestant church (from the pulpit of which Kossuth moved the resolutions), and the House of Hapsburg that had forfeited the Hungarian crown, 14 April 1849); and the principal Protestant college, with an attendance of about 2,000 students and a library containing nearly 160,000 volumes; Roman Catholic church, town-house, Patrist college, gymnasium, etc. Both the manufactures and trade are important; the former consisting chiefly of coarse woollens, leather, soap, tobacco-pipes, casks, etc., and the latter being in tobacco, wine, fish, hides, hemp, hemp-wool, potash, cattle, clerical vestments; four large fairs annually and the swine market is the largest in the kingdom. Debreczin is the headquarters of Hungarian Protestantism. The Protestant college, founded in 1531, is considered the best educational establishment in Hungary. This town suffered much in the wars between the Hungarians and the Turks, and afterward in the religious wars. Pop. 92,729.

DE BRY, dé-bré' Theodor, Flemish goldsmith and copperplate engraver: b. Lübeck 1528; d. Frankfort-on-the-Main, Germany, 1598. He settled in Frankfort-on-the-Main about 1570 and established a printing-house there. On a visit to England he engraved the 'Procession of the Knights of the Garter under Queen Elizabeth' (12 plates after Geerarts) and 'The Funeral of Sir Philip Sidney' (34 plates after Thomas Lent). The most important of the works issued from his press is the collection of 'Voyages to the East and West Indies,' published in Latin (25 parts, 1590-1634) and German (27 parts 1590-1630). The New York Public Library possesses an excellent collection of his prints.

DEBS, Eugene Victor, American socialist: b. Terre Haute, Ind., 5 Nov. 1855. He received
DEBT

a common school education and became a locomotive fireman. He was elected to the Indiana legislature in 1884 and was later an official of the Brotherhood of Locomotive Firemen, and, from 1893 to 1897, president of the American Railway Union. He conducted the strike of 1894 in Chicago and was later sent to jail for contempt, because of his management of the same, though he pleaded innocence of any crime and requested to be tried by a jury and be allowed to summon witnesses in his defense. Since 1907 he has been the Socialist movement, and in 1900, 1904, 1908 and 1912 was the candidate of the Socialist party for President of the United States. In 1907 he joined the editorial staff of the Appeal to Reason, remaining in its service six years, during which time he made a nation-wide speaking and organizing campaign in the interest of the Socialist party. Since 1914 he has been the editor-in-chief of the National Rip-Saw published at Saint Louis and while serving in this capacity he has continued his speaking tours in the interest of the Socialist movement. In 1915 he was elected chancellor of the People's College, a working-class educational institution organized upon a co-operative basis for the education of working people. Through correspondences arranged between the school and the parent school, located at Fort Scott, Kans. In 1916 he declined the nomination of the Socialist party for President of the United States.

DEBT (Lat. debitum, owed) in legal acceptance is a stipulated amount of money that one person owes to another under contract or agreement. In popular usage it implies the idea of a certain and definite sum due by book note or bond, whether money, goods or services, that can be verified by data arising out of the transaction. While denoting any kind of just demand—in its broadest sense meaning duty, or what one owes to another—an obligation of a debtor—debt has different shadings of definition, owing to the subject matter of the various statutes in which it is used; but legally and generally its significance is embodied in the above definitions. It denotes not only the obligation of the debtor to pay, but also the right of the creditor to receive and enforce payment. In its common significance it implies the money obligation of a person incurred in his private capacity, or from his individual acts, and not such obligations as are imposed upon him by law in his public relations, or in common with all other citizens. It is the correlative of Credit (q.v.). As generally defined by statute the word includes any claim or demand upon which a judgment for a sum of money or directing the payment of money could be recovered by an action. As used in the statutes relating to the estates of deceased persons, the term is not limited to such debts. With legal debts, but included every claim and demand by a creditor, whether recoverable at law or in equity. Debt is a common-law word and also a technical term. The legal definition of the word is opposed to unliquidated damages or a liability in the sense of an undetermined or contingent debt not enforceable by ordinary process. A debt exists when a certain sum of money is owing from one person (the debtor) to another (the creditor). A debt is not the less owing because it is not yet due. Everything is a debt which is of absolute obligation, but, in its more limited sense, it implies only a particular kind of duty, and in this sense is substantially synonymous with contract. The word debt, however, is of large import, including not only debts of record or judgment, and debts by specialty, but also obligations arising under simple contract, to a very wide extent, and in its popular sense includes all that is due to a person under any form of obligation, or promise. Even in its broadest significance it is considered that the consideration of the obligation of the debtor has been executed on the part of the creditor and the payment of the debt discharges the obligation. In common law, the words debt and demand are of allied meaning, but the latter word is a term of much more comprehensive significance than the former. The term debt imposes a 'sum of money owing upon a contract, express or implied, while the term demand comprises all rightful claims, whether founded upon a contract, or upon a superior right of property. (See DEMAND). The words *debts* and *indebtedness* are not always used in the same sense; that is they do not always impose a legal obligation on the part of one to pay another something due to him. They often imply a mere moral obligation, as, for example, to the parent school, at Fort Scott, Kans. In 1916 he declined the nomination of the Socialist party for President of the United States.
DEBTOR — DEBTOR AND CREDITOR

DEBTOR, a person who owes a debt, or is under obligation, arising from express agreement, implication of law, or from the principles of natural justice, to render and pay a sum of money to another. A person who by reason of an existing obligation is or many become liable to pay money to another whether such liability is certain or contingent is classed as a debtor. So are persons who have engaged to perform, or who owe to others the performance of an obligation; or who owe anything to others as money, goods or services. The term "any debtor" includes anyone who is capable of contracting a debt and has done so. The relation of debtor and creditor may arise by direct agreement or through breach of duty between the parties; the relation of debtor and creditor implies, naturally, that the one has given credit to the other in a contract. The word debtor in its broad sense implies liability and includes corporations and partnerships as well as individuals. It likewise includes the indorser of a promissory note before maturity and all those who at the appointment of a receiver for the winding-up of a bank are liable to the bank for the payment of money, whether their liability had matured or not, and without any regard to the exact nature of the liability, whether as principal or surety. If a person depart from his usual residence or remain absent therefrom, but any fraudulent design he has not absconded nor absented himself within the intention of the law. Where a man stays away with intent to delay his creditors, he thereby absents himself within the meaning of a statute providing that traders absenting themselves to delay creditors shall be adjudged bankrupts. See DEBT; DEBT, ACTION OF; DEBTOR AND CREDITOR, LAWS OF.

DEBTOR AND CREDITOR, Laws of.

One of the earliest institutions among men is the right of holding individual property. Upon this right depends the power of making bargains and effecting exchanges. In various ways bargain-making gives rise to deferred engagements, and obligations are incurred which are called debts. These obligations rest upon a double foundation. The right of holding individual property implies the right of recovering any property which has been entrusted to others, or of retaining possession of any property which others have, for a valuable consideration, agreed to make over to us. The primary foundation of debts, therefore, is the right of holding property. A debt is a contract freely entered into. Whether the right of property is valid or not, it is commonly recognized by the person who incurs debt; no abstract doctrine of the rights of property, therefore, can properly come between him and his creditor to justify the violation of an engagement for which he has accepted an equivo or in the recovery of a sum certain, or readily reducible to a certainty from fixed data or agreement, as distinguished from unliquidated or unascertained damages. See DEBT; DEBTOR AND CREDITOR, LAWS OF.

In early and rude states of society the natural tendency is to regard all obligations as sacred and inviolable, and all who from any cause fail to fulfil them are regarded with contempt or intention, either by omission or commission, and liable to the most severe and exhausting punitive treatment. In such a state of society both the primary and secondary foundations of the obligation are likely to be held in extreme estimation. Hence in the earlier stages of society the laws against debtors are universally found to be of the most stringent kind, and as civilization advances and the relations of society become more complicated, the necessity of repeated modifications of these severe laws becomes apparent. Any modification in favor of the debtor of the consequences of incurring debt, however equitable in itself, necessarily tends to increase the facility with which debt will be incurred, and if these consequences are overrelaxed society will be deprived of a needed protection; debt will be incurred carelessly, and as carelessness borders upon recklessness and recklessness upon fraud, the lines of distinction between right and wrong dealing will become fainter, the protection due in the condonation necessary to be extended to miscalculation and errors of judgment will become a cover for deliberate conspiracy, and society will become a prey to an organized predatory system or modernized form of highway-robbery, thinly disguised under the forms of commerce. Such are the practical difficulties which the modern theory of the law of debtor and creditor has to encounter.

Among the Jews, under the Mosaic law debt was treated with great stringency, but there were regulations adapted to discourage the incurring of it, and also some humane restrictions on the power of the creditor after it had been incurred. Lending on usury was forbidden, and the taking of pledges put under severe restriction. The alienation of the estate of an Israelite was also forbidden. The creditor, on the other hand, had power over the person of his debtor, and even over those of his wife and family, and could cause them to be sold in satisfaction of his claim. If the debtor was an alien he might be sold to perpetual bondage, but on the occasion of a jubilee, which was appointed to be proclaimed every 50th year, every Israelite debtor was set free and his property, if pledged or sold, returned to him.

Nothing is more common in rude states of
DEBTS

society, and under arbitrary and despotic governments, than the liability of the person of the debtor for his debt. This is one of the original sources of slavery. Even in the comparatively enlightened states of Greece and Rome the power of the creditor over the person of his debtor was recognized by law. This power was abolished in Athens by Solon, who is said to have taken his reform from Egypt, where the same unjust law had already run its course. The early Roman law was even more excessive in its undiscriminating severity. By the laws of the Twelve Tables the creditors might cut the body of the debtor in pieces and share it among them, they might also sell him and his wife and family to perpetual slavery. In the Middle Ages, notwithstanding the influence of Christianity, the debtor was treated with hardly less severity. Even the Church took the side of the creditor, and the debtor who died without discharge was excommunicated and deprived of Christian burial. As society became more refined, the laws against debt were again gradually ameliorated, but the process was a slow one. Imprisonment for debt in England, except as an instrument for compelling the surrender of the debtors' effects, was only put an end to in the reign of Victoria.

In the United States originally imprisonment of debtors was adopted as a part of the common law, but at the present time imprisonment for debt, except in case of fraud, or of an absconding debtor, does not legally exist in any of the States. Congress, empowered by the United States Constitution to make a uniform bankruptcy law, exercised this power, and subsequently repealed the law of imprisonment; and now, by Revised Statutes 990 and 991, no person can be imprisoned for debt by any process issuing out of the courts of the United States, in any State where by the laws of the State imprisonment for debt has been abolished. Most of the States, by constitutional provision, have prohibited arrest or imprisonment for debt, while the other States, either by direct statutes prohibiting the laws against debt, or by poor debtors laws, or by insolvent laws, secure the same result; it being held to be against public policy to deprive a man, by imprisonment, of the power to pay his debts and make him a direct charge upon the State. See Dist; Debt, Action of; Debtor.

DEBTs, National. See National Debts of the World; Debts, Public.

DEBTs, Public. Public debts are essentially a modern phenomenon, for before they could appear, private credit with its accompanying mechanism of banks, brokers and credit instruments had to be developed. Certain pre-conditions had to be met before states could resort to public borrowing on any considerable scale, and the machinery for carrying on these transactions, and lastly the willingness on the part of capitalists to lend their money must all exist. This last necessity points to the second of the pre-conditions mentioned above, namely the existence of some adequate security by which the lender may be induced to make the desired loan. At first the promise of a needy monarch was backed up by the pledge of some tangible security, as the crown jewels, or land, or the revenues from some impost. But with the development of constitutional government and a more adequate guaranty has been given the lender, and with the development of public credit has gone on the expansion of public debts. The greater security afforded the lender under constitutional government consists, as Prof. H. C. Adams has pointed out, in the power of the legislative bodies to prevent them from repudiating public obligations. The public creditors in effect lend to a corporation—the government—which they themselves control.

Public debts were first created on any considerable scale in the 18th century, but the 19th century saw an enormous increase in the number of countries making use of public loans and in the sum total of these loans. It has remained for the opening decades of the 20th century, however, to demonstrate the extent to which states can make use of their credit in times of national emergency. The following brief table shows the growth of the public indebtedness of the civilized nations of the world for the last two centuries:

*The figures for the years 1714-1882 are from Adams' "Public Debt," p. 4; those for 1890-1912 are from the U. S. Census volumes on Wealth, Debt, and Taxation; while those for 1918 were compiled by the author, but represent the indebtedness only of the seven leading nations engaged in the European War. Consult 'Direct Costs of the Present War' (Carnegie Endowment for International Peace, Washington 1918).

Purposes, Temporary Necessity.—The purposes for which governments may properly incur debts are in the main reducible to three: temporary necessity, special emergency and the construction of public works. The first of these arises when the actual revenues fall below the estimated revenues and a deficit ensues. It is, of course, impossible that the budget should exactly balance every year, and either a surplus or a deficit is likely to result. Constant surpluses are dangerous as tempting the legislative body to extravagance, and should be avoided. We have only to point to congressional extravagance in the United States between 1888 and 1892 for illustration. Occasional deficits may, therefore, be regarded as a normal incident, and provision should be made for meeting them by the issue of short term treasury notes, payable, as in the case of the Federal government, in three years, or an even shorter period. These should be met out of taxes, and deficits may be increased for this purpose, or the necessary funds be met by greater economy on the part of the legislative body for the next two or three years. It is only when these temporary deficits become recurrent and when accumulated deficits are
converted into permanent obligations, as in Austria from 1904 to 1914, that this practice becomes dangerous. This method of treating temporary deficits must be condemned, as they should never be allowed to become a part of the permanent debt.

Special Emergencies.—By far the greatest part of existing national debts has been incurred to meet special emergencies, of which war has been the chief. An emergency arises when the nation finds that it cannot finance itself on its own money and must press on the money of the people, so that it cannot wait for the tardy returns of new taxes. There are several conceivable ways in which such a situation might be dealt with which may be briefly described. In the first place a nation might accumulate in prosperous times a reserve fund or “war-chest” for use in emergencies. Such a method has been followed by Prussia since the time of Frederick the Great; since 1871 this war chest had consisted of $25,000,000 in specie, which in July 1913 was increased to $60,000,000, in addition to which there were various securities. It may be conceded that such a reserve fund renders the first mobilization of the troops somewhat easier, but as a substitute for borrowing the enormous sums necessary in a modern war is ludicrously insufficient. Moreover, there are various serious financial weaknesses in this method.

In the first place a reserve sufficient to meet such an emergency as war could not be accumulated; the people would not submit to the present real sacrifices involved in the sake of warding off a future imaginary danger. Moreover, in a democratically governed country such a fund would be exposed to constant assaults for diversion to other uses which could probably not always be successfully resisted. But if the fund were kept intact it would result in continuous loss, for it would subtract just that much from the nation’s money supply if it existed in the form of specie. While if it took the form of securities the situation is still more absurd, for to readjust these when the emergency arose would compel their sale in a falling market, and would after all differ in no essential respect from the sale of the government’s own securities. The policy of a reserve fund as an alternative to public borrowing must, therefore, be dismissed as ineffectual and unwise. In practice it is so little used to-day that we need give it no further consideration.

Another method by which a state might raise considerable sums in order to meet a sudden emergency, which is closely analogous to that just described, is by the sale of public property or government owned enterprises. In states like Prussia, which owns its railways, or New Zealand, which owns much of the land, considerable sums might be realized in this way. These states have accumulated a fund of wealth not especially as a war chest, but it is suggested that this capital might be used rather than go into debt; utilize past accumulations rather than mortgage the future. But aside from the fact that most nations do not have large amounts of disposable wealth this method is objection to the same objection as in the previous case, that such sales would be effected in a falling market. In times of sudden emergency, like war, it would involve a tremendous loss and might bring in returns quite incommensurate with the sacrifices made.

Another method of meeting the urgent demands of a sudden fiscal emergency is to raise the rate of some existing tax or taxes so as to bring in the needed additional revenue; as an illustration the English procedure with the income tax may be cited. The machinery for collecting this tax is always kept in good working order, but the rate of the tax is kept purposely low; then when a sudden emergency occurs additional revenue may be quickly secured by the simple expedient of raising the rate. That is to say, writes Prof. F. A. Maitland, this policy establishes a war-chest whose funds are deposited with the people, and assigns a particular tax to serve as its key. Exceptation may possibly be taken to the use of the income tax solely as an emergency tax, for the income tax should form an integral part of any scientifically constructed scheme of taxation, and its full use should not be reserved for special needs. But the principle is unimpeachable and was invoked in this country when the sudden need of greater revenue in 1914 was created, on the model of all other countries. This method, however, is not always feasible at the beginning of a fiscal emergency when funds must be had at once; it takes time for new taxes to become remunerative, and a sudden or large increase in the rate of existing taxes introduces a temptation to the Government to evade these and injustices in a well-adjusted tax system than would be involved by a resort to borrowing.

A fourth method by which a nation, in case of a fiscal emergency, could avert recourse to borrowing might be the issue of paper money. But so serious and tax-reaching are the effects of this that the use of its credit in this fashion is generally resorted to by a modern nation only in the last extremity. Perhaps the best example of a war financed by the issue of paper money rather than by taxes or loan was the American Revolution against England. As the Continental Congress was not clothed with power to levy taxes and did not have the financial standing and prestige to enable it to borrow money at the beginning of the revolution it was forced to resort to the only alternative open to it, namely the issue of bills of credit. The necessity of issuing large amounts with consequent overissue, depreciation in value, derangement of prices with accompanying injustices as between debtors and creditors, and the final practical repudiation of its obligations by the government itself, constitute a story which has been repeated in essentials in almost every case where the government has resorted to this method. In the present European War practically every bellicose nation since 1914 has issued paper money, though it is so far been kept within manageable limits, but the fall of foreign exchange with neutral nations marks the extent, in part at least, of the overissue and consequent inflation which has occurred in each country. The use of paper money may indeed be regarded as involving the creation of the issuing country so that it is only another and less defensible method of borrowing, and in fact is often called a “forced loan.” We are, therefore, thrown back upon the final alternative, that of public debts, as the only feasible
method of meeting a sudden fiscal emergency, at least at the beginning.

Never has this method of financing been illustrated on so stupendous a scale as during the European War, which began in 1914. Taxation was resorted to sparingly during the struggle itself, England being the only country which made vigorous use of this source of revenue. General resort was had to the issue of paper money, either directly by the government or indirectly through the increased circulation of bank notes issued by government-controlled institutions and the sole financial resource of some nations, was loans. By the middle of 1918 the new war loans created since July 1914 by the seven leading powers amounted to about $150,000,000,000. As the debts of these same nations, namely, the United States, France, Great Britain, Italy, Russia, Austria-Hungary and the German Empire, amounted to about $23,000,000,000 before the war, their aggregate debt on 1 Aug. 1918 was not far from $175,000,000,000. This represented a per capita charge on the populations of these seven nations of about $44, against $47 in 1914. It has been estimated that this indebtedness is equal to about 15 per cent of their national wealth. The burden involved in such a charge is perhaps made clearest by comparing it with the per capita debt of the United States, which amounted to $10.59 in 1913, representing one-half of 1 per cent of our national wealth.

Public Works—There is one other purpose for which the employment of public credit is justified and that is the construction of public works. If a canal or an electric light plant is to be constructed it is essential both from an engineering and a fiscal point of view that the money for this purpose must be instantly available so that the work can be carried through to completion without any unnecessary delay. From the engineering standpoint any interruption means waste, for an idle plant, half constructed, would rapidly deteriorate and much of the work would have to be done over again. While from a fiscal standpoint it is essential that the work be completed as speedily as possible in order that it may become productive; a half finished canal or electric light plant involves expense but brings in no return. To raise the large sums necessary to carry out modern public work it is necessary to resort to public loans, as it would be both impracticable and unjust to attempt to secure them by taxation. Moreover, in the case of an improvement whose use extends over a long period of time, it is not unreasonable to ask future generations to share in the burden.

Advantages of Borrowing.—We may at this point endeavor to summarize briefly some of the alleged advantages and disadvantages of public debts. It is necessary to emphasize the fact that the question is not as to whether the money asked for shall be spent. We must assume that the need exists and that the proper authority has decided upon the expenditure. Then the only question is as to the relative merits of public borrowing as contrasted with other methods of raising funds. Numerous advantages have been cited in favor of the policy of public debts, such as that it affords a safe and convenient form of investment; this may have been true in the 18th century, but could hardly have much force in this age of corporate and public utility securities. It has also been urged, as by Alexander Hamilton in this country, that the issue of government bonds is equivalent to the creation of so much new capital in the country. Some writers have even carried this doctrine so far as to suggest that the cause of England's wealth was the existence of her large national debt.

A more solid advantage lies in the fact that by a policy of borrowing a government can secure that part of the national capital which is easily disposable, while a system of extremely heavy taxation, an attempt to cover the deficit financial consequences and result in practical confiscation of some incomes. The purchaser of a government bond gives his property voluntarily for public uses in exchange for an equivalent; it is not, therefore, in ordinary circumstances withdrawn from production, but only the free capital, the surplus from current income, is placed at the disposal of the government. Private industry is, therefore, interfered with as little as possible under this system. Of course this argument assumes that the rates offered by the government is not so high as to cause the withdrawal of capital from existing industries. In case this is done this argument loses much of its force.

But the most convincing argument in favor of a policy of public borrowing lies in the fact that the financial burden of the present generation is thereby lessened and future generations are made to contribute to expenditures as a part at least of whose benefits they will share. This is particularly true when very large sums are needed for undertakings that will last for a long time, as any great engineering work, like a state-owned railroad or a canal or a road system, or municipal improvements such as sewers, street pavements or a lighting plant. In all such cases the expenditure is an investment of capital, the returns from which will be enjoyed by possibly several generations of taxpayers, and it is consequently argued that they should be expected to bear a part of the cost. The same argument would apply to expenditures for public defense, at least for a war of defence, which should protect the country and possibly preserve its very integrity and independence. Here is an immeasurable benefit, the costs of which may fairly be distributed among successive generations through the medium of a public debt.

Disadvantages of Public Debts.—On the other hand, there are undeniable disadvantages and dangers connected with the constantly increasing tendency to resort to public credit to meet all unusual or large expenditures. Perhaps the greatest danger is connected with the last argument cited in favor of public debts. It is so easy to impose the burden of an unusual cost upon the next generation by borrowing the money instead of levying heavier taxation that there is danger that this may be done when there is no real justification for it. Many a local community in the United States to-day is paying the interest on bonds issued to pay for improvements that either never were constructed or were out before the debt was paid.

Another danger lies in the effect which the raising and spending of large sums obtained by the sale of government bonds may have upon private industry. This will be keenly felt if the need of the government is great and it raises the rate of interest in order to attract the
needed supply of capital. Then the capital which would normally have replaced losses that come, or have provided for ordinary growth of the business, may be diverted from private industry into the public purse. But before describing even such a diversion as an evil we shall have to know the use to which the money will be put. It may be that the government expects it will bring advantages so great as to outweigh any losses that may be inflicted upon private industry; unhappily the reverse has generally proven to be the case in the past.

Classification of Public Debts.—In the creation of a public debt various technical questions arise which it is necessary to describe if we are to have a clear idea of its character. The classification of public debts may first be considered, and here there are several lines of distinction. A usual distinction is that between forced loans, or legal tender paper money, and voluntary loans or bond issues. As the former may more properly be discussed under the title paper money, we shall pass on to the further classification of bonds. With reference to the character of the security the bond, the former consist of unpaid accounts charged against the state, while the latter are debts which have been formally acknowledged by the government and have a legal pretense provided by law.

Funded debts again may be classified with reference to the time they have to run, into terminable and perpetual debts. By the former is meant debts which run for a certain specified term upon the expiration of which they are redeemable or convertible at the option of the government. By a perpetual debt is meant one whose contract mentions no time at which payment can be demanded by the creditor; while the government theoretically may pay off such a debt at will, it seldom exercises the privilege, and the debt becomes practically a perpetual one. Such is the form in which most of the French debt has been thrown, while the favorite form for debts incurred by federal, state or local governments in the United States has been the term bond.

One great advantage which the latter has is the fact that the government is thereby given the power, when the bond matures, of converting it into another one bearing a lower rate of interest. Inasmuch as most loans are created in times of crisis or of urgent necessity, the rates of interest have probably been higher than they will be subsequently. Moreover the tendency of the whole 19th century was toward lower interest rates. Short term bonds with frequent conversions would, therefore, lower the national interest charge and set free income which could be used to pay the principal of the debt. Sometimes the debt is thrown into a form intermediate between the terminable and perpetual, namely the annuity. This is really paid in the form of a salary or pension but the term is terminated upon the expiration of the term agreed upon, whether a certain definite time or the life of an individual.

Rate of Interest.—Another technical question to be decided when the debt is created is whether specie, or gold, or other money, or paper money, or both shall be paid the interest. The general verdict is that the government should fix the rate of interest at a point that will approximate the market rate as closely as possible, for if it is fixed any lower the bonds will sell for less than par and the government will have paid a larger sum when it extinguishes the debt than it receives at the time of sale. Usually only those nations which have a practically perpetual debt have preferred to sell their bonds at a discount in order to secure the lower interest rate.

Should the Debt be Paid?—The final problem, but probably the most important of all after the debt has been incurred, is that of debt payment. Should a nation endeavor to pay off its debts? The policy adopted by the United States from the very beginning of its national existence has been one of debt payment, but this policy has not been generally adopted by other nations. England was practically the only European nation which reduced its national debt during the 19th century. This difference in practice reflects two very different theories as to the desirability of debt payment. The one school holds that the only way to get rid of or reduce the burden of a debt is to pay off the principal; the other wishes to accomplish the same purpose by so developing the resources of the country that the burden of the debt becomes negligible.

The arguments against debt payment or rather in defense of a perpetual debt may be briefly stated. It is claimed that the burden of a public debt is gradually lessened by the depreciation of gold; but this is both too uncertain and too tardy in effect to be assigned much weight. Another argument which is entitled to more serious consideration holds that the burden of debt will be diminished by the natural growth of the country in population, industries and wealth. Thus while the French debt, for instance, trebled between 1840 and 1870, the national wealth grew as rapidly and the burden of the larger sum was not felt any more heavily than was the smaller amount a generation before. A third argument urges that surplus revenue should be applied to other reforms before that of debt payment. Thus, John Stuart Mill, writing of English conditions in the forties, said, "the increase of revenue should rather be disposed of by the promotion of foreign trade by liquidating debt, as long as any very objectionable imposts remain." Eventually, he admitted, the remission of taxes should stop and the proceeds be applied to debt payment, but other writers have been unwilling to grant this and have insisted that "taxes fructify in the pockets of the taxpayers," that these could promote the national welfare more if they were not taxed than if taxes were collected and applied to the payment of a national debt.

The arguments advanced in favor of a policy of debt payment rest upon firmer economic ground and justify the action of this country. These are partly economic and partly political. In the first place it has been argued that the payment of a debt will convert the bondholder, who has a certain protection of the government terminated upon the expiration of the term agreed upon, whether a certain definite time or the life of an individual.
DEBTS — DEBUSSY

Another method of debt payment, which has been followed by England largely since the breakdown of the sinking fund policy, is that of annuities. If the public debt is thrown into this form—either as terminable or life annuities, the principal of the debt is automatically reduced as these fall in or mature. The objection to them is similar to the objection to the old sinking fund, that it commits the government to fixed annual payments whether these are convenient or not.

This criticism leads to the statement of the correct policy of debt payment, which consists in the establishment of a permanent appropriation beyond the annual interest charge. But such an appropriation must be out of surplus revenue and therefore cannot be "inviolable." No automatic machinery can compel the extinction of a public debt unless there exists a clear net revenue to devote to that purpose. Considerable discretion must therefore be granted in the administration of a system of debt payment, for it must necessarily be a matter of property to purchase which it was incurred. This would apply in the United States primarily to municipal and local improvement bonds.

For the payment of our national debt the argument is political rather than purely economic one. The debt is almost entirely a legacy of war, and this is even more true of the debts of other nations. Nothing is of greater value to a nation in time of war than unimpaired credit, and nothing impairs the national credit more than a heavy and permanent debt charge. If the adage, "in time of peace prepare for war," be true, it applies with especial force to the payment of a national debt at a rate as rapid as is consistent with sound economic development. It is a truism of modern war that success is determined largely by economic and financial strength. Here we have perhaps the most potent influence making for debt payment, though it must be admitted that hitherto it has not been very effective.

Methods of Debt Payment. — If it is decided that public debts ought to be paid, the further question arises as to the best manner of doing so. The oldest method is probably that of the sinking fund, which still finds expression in our national legislation on this subject. Probably the first application of the principle of the sinking fund was made by Pitt in England in 1726, embodying a proposal put forward by a clergyman named Price. This scheme consisted in the inviolable appropriation of a fixed annual sum to the purchase of public obligations, which should be placed in a fund into which should be paid each year the interest accruing on these bonds. Each year additional bonds would be purchased and placed in the fund and the interest would thus be compounded until in time the debt was annulled. Indeed the calculations of Dr. Price on this point seemed magical. The payments into the sinking fund were continued during the Napoleonic wars even though money had to be borrowed to do it. But the absurdity of this piece of fiscal machinery was exposed in 1813 by Dr. Robert Hamilton, and it was later estimated that between 1785 and 1829 the government had borrowed over £300,000,000 at 5 per cent in order to pay a debt bearing 4½ per cent interest. The scheme was thereupon abandoned and has never been resumed.

Another method of debt payment, which has been followed by England largely since the breakdown of the sinking fund policy, is that of annuities. If the public debt is thrown into this form—either as terminable or life annuities, the principal of the debt is automatically reduced as these fall in or mature. The objection to them is similar to the objection to the old sinking fund, that it commits the government to fixed annual payments whether these are convenient or not.

This criticism leads to the statement of the correct policy of debt payment, which consists in the establishment of a permanent appropriation beyond the annual interest charge. But such an appropriation must be out of surplus revenue and therefore cannot be "inviolable." No automatic machinery can compel the extinction of a public debt unless there exists a clear net revenue to devote to that purpose. Considerable discretion must therefore be granted in the administration of a system of debt payment, for it must necessarily be a matter of property to purchase which it was incurred. This would apply in the United States primarily to municipal and local improvement bonds.

For the payment of our national debt the argument is political rather than purely economic one. The debt is almost entirely a legacy of war, and this is even more true of the debts of other nations. Nothing is of greater value to a nation in time of war than unimpaired credit, and nothing impairs the national credit more than a heavy and permanent debt charge. If the adage, "in time of peace prepare for war," be true, it applies with especial force to the payment of a national debt at a rate as rapid as is consistent with sound economic development. It is a truism of modern war that success is determined largely by economic and financial strength. Here we have perhaps the most potent influence making for debt payment, though it must be admitted that hitherto it has not been very effective.

Methods of Debt Payment. — If it is decided that public debts ought to be paid, the further question arises as to the best manner of doing so. The oldest method is probably that of the sinking fund, which still finds expression in our national legislation on this subject. Probably the first application of the principle of the sinking fund was made by Pitt in England in 1726, embodying a proposal put forward by a clergyman named Price. This scheme consisted in the inviolable appropriation of a fixed annual sum to the purchase of public obligations, which should be placed in a fund into which should be paid each year the interest accruing on these bonds. DEBTS, Right of a Wife to Contract. See HUSBAND AND WIFE.

DEBUSSY, Claude Achille, distinguished French composer: b. Saint-Germain-en-Laye, 22 Aug., 1852; d. 26 March 1918. He was educated at the Paris Conservatoire. From the time he was 12 years old he attracted attention as possessing remarkable musical ability. In 1884 he won the Grand Prix de Rome for his cantata "L'Enfant Prodigue." Later compositions brought rebuke instead of commendation, for their departure from established forms. After a sojourn in London, where he assimilated the modes of the native music, Debussy returned to Paris and gave himself up to composition; but it was not until 1893 that he began to receive public recognition. In 1900 his opera "Pelleas et Melisande" was produced in Paris, and from this time his fame and position were assured. Debussy has written profusely, not only dramatic music, but also a multitude of songs and pieces for piano and orchestra. While his work is refined, graceful and elegant to the
DEBUT — DECALOGUE

highest degree, and his mastery of technique adequate to be perfect; it is claimed that his music is of the intellect rather than of the soul. It is also criticized as being too dependent for full interpretation upon the non-musical aid of the "programme." Among his principal works are 'La Mer', 'Printemps', 'Prélude à l'apres-midi d'un faune', 'Petite Suite', 'Images', 'Ariettes oubliées', 'Trois Nocturnes', 'Cinq Poèmes de Baudelaire', and 'Proses Lyriques'.

Début, dû-bû, a French word which has been adopted into the English language, signifying generally a beginning or entrance, but specially applied to the first appearance of an actor or actress on the stage, or to a first appearance in a particular theatre. In these circumstances, the actor is called débutant; the actress, a débutante. The expression is very frequently used with reference to a young lady's first entrance into society.

Deca (Gr. signifying "ten"), a prefix of frequent occurrence; as in Decapolis, a group of 10 cities; decalogue, the 10 commandments; decametre, a measure of 10 metres, etc. From deca is formed decade, a collection or group of 10. The calendar of the French Republic the term decade was used to designate the week of 10 days, which were severely named primi, duode, tridi, quarti, quinti, sexti, septi, octi, noni, and decadi. See Calendar.

Decachord, dék'a-körd (Gr. dekachords, ten-stringed), an ancient Greek instrument of 10 strings, triangular in shape, also a kind of large guitar with 10 strings.

Decade. See Deca.

Decadents, The, a school of artists and writers, the followers of which delight in the more or less morbid refinements of feeling and style, and pride themselves upon this perversion of taste. The decadent is fond of the products of declining civilization corrupted by many centuries of culture, of works too highly seasoned and vitiated, which preage the beginning of a social order fallen into decrepitude, and shuns the simple, the natural, the healthful, clinging only to the artificial and the complicated in life and character. The name of decadents may rightly be given to those who make a subtle virtuosity out of art. Among French writers Baudelaire was the first theorist of this school, and his influence was felt by many writers of the end of the century, such as the Goncourts and Maurice Barres. The decadents' school of poetry is best represented by Stéphane Mallarmé and Verlaine, and its disciples are numerous, including many men of undoubted talent who have combated the stiffness and dryness of the Parnassians, not without success. They are often termed deliquescents and synthetic; the latter term is well chosen as indicating their aims and manner.

Decalogue. A term, from the Greek, corresponding to the Hebrew 'Ten Words' (Ex. xxxiv. 28; Deut. x. 4); in the Septuagint ol Ḳe'n a Ḳubon. In the Pentateuch it appears in two versions (Ex. xx. 17-20; Deut. v. 17-21); with some variants that have given rise to much discussion and criticism. The sources in the Bible describe it as embodying the statements of God on Mount Sinai; revealed to Moses and the people of Israel on the third month after the divergence from Egypt amid thunder, lightning and heavy smoke. The Ten Words were written by Him on two tablets of stone ('tables of testimonies' or 'tables of the covenant'), and given to Moses. In his anger at the people's apostasy, Moses broke the tables (Ex. xxxii. 19), and later God commanded him to make two other tablets like the first (Ex. xxxiv, 1), upon which to rewrite the Ten Words. In another passage, however (Ex. xxxiv, 27-28), Moses was ordered to rewrite and did rewrite the commandments himself; but in Deut. iv. 13, and other passages, God is the writer. Moses placed in the book (Ex. xxv, 16, 21, xl, 20) this second set brought down from Mount Sinai. The Ark was called, therefore, 'Ark of the Testimony' (Ex. xxv, 22; Num. iv. 5).

The Decalogue begins with the declaration in the first person that the speaker is Israel's God who led him out of Egypt and bondage. Hence no other gods shall be for Israel, and as a necessary corollary, no graven image or representation of anything shall be made to be an idol to bow down to and serve. The sin of idolatry is further enlarged upon as contrasting with the nature of the Deity, who while punishing the children for the sins of their fathers unto the third and fourth generation; of those who hate God is merciful to the thousandth generation of those who love Him and keep His commandments. Next comes the prohibition against taking His name in vain, which is followed by the injunction to keep the Sabbath holy as a rest day from all work for man as well as beast, the stranger as well as the household. Honoring father and mother is the substance of the next commandment, and a reward is added—long life. In quick succession murder, adultery, theft, and false testimony are forbidden. The Decalogue concludes with a commandment against covetousness of anything that is one's neighbor's.

The differences in the two versions of the Decalogue form an interesting chapter in the critical study of the Pentateuch. While there is no essential variation so far as the substantive-literal decisions are concerned, verbal changes occur and in one instance, that of the Sabbath, an entirely different reason is adduced for its observance. The slight variants in the Masoretic text, occasional differences in words, as for instance 'cove' for 'desire,' 'remember the Sabbath' in one case and 'keep' in the other, and 'false witness' in one and 'a witness of deceit' in the other; some additions and amplifications, all this has been explained as due to carelessness on the part of transcribers, who trusted to their memory. But the variation in the reason alleged for the Sabbath cannot be so readily explained. The Exodus version connects it with creation; that of Deuteronomy associates it with Israel's release from Egyptian slavery. In the one case, the universal, in the other a national historical element. One can understand how the critics of the different schools analyze these variants to discover which text is the earlier. The difficulty is felt by the early rabbis who claim both versions to be alike of divine origin and spoken at the same time. The division of the Decalogue is another subject of inquiry. As it was written on two tablets of stone and
on both sides, its arrangement would have been naturally the group of five "words" each on one stone. So, in fact, is the statement as to the original division made by Josephus ('Antiquitates' Vol. III, 5, 4) and by Philo ('De Decalogo' 12) the first group of five including the commandments referring to our relation to God and the second referring to our conduct toward our neighbors. Another variation is to be noted. The sequence of certain of the "words" differs in various versions. The Masoretic text, Josephus, the Syriac Hexapla agree as to the order of the prohibitions against murder, adultery, and theft, but the Septuagint, Codex Alexandrinus and Ambrosianus have the sequence of "murder, theft, and adultery," while Philo has the order "adultery, murder, theft," and the Codex Vaticanus "adultery, theft, murder"—slight variations, it is true; but in so fundamental a code as the Decalogue one would expect in every version uniformity throughout. No less peculiar is the diversity in the numbering of the different commandments. According to the Jewish tradition, verse 2, "You shall not kill," consists of two "words," while verses 3-6 constitute the second. The Codex Vaticanus of the Septuagint and the Deuteronomy of Ambrosianus have a similar arrangement. Josephus and Philo regard verse 3 as first, verses 4-6 as second, verse 7 as third, verses 8-11 as fourth, verse 12 as fifth, verse 13 as sixth, verse 14 as seventh, verse 15 as eighth, verse 16 as ninth and verse 17 as tenth commandment. The Roman Catholic and Lutheran rule combines verses 3-6 into the first, and every commandment is advanced by one to the last, the traditional Jewish ten "being divided into ninth and tenth, to maintain the traditional number. In the exegetical and philosophical writings of the early and medieval rabbinical authorities, the Decalogue plays an important part—piety, mysticism and ingenuity alike enter into their interpretations. A point that aroused much dispute was the relation of revelation to the Ten Words. Was the Decalogue exclusively essential compared to the rest of the Torah? In early Talmudic times the recital of the Ten Words was a special feature, but later withdrawn to silence the inference that the Decalogue alone had been revealed by God on Mount Sinai (Bab. Berak. 1. 11a).

ABRAM S. ISAACS.

DECAMERON, The. In the year 1348 the plague, which had been for some time devastating the East, appeared in the notable city of Florence. A hundred thousand persons perished in a single day. As the first part of his work, after his immortal description of the ravages of the pestilence, exclaims: "Alas, how many great palaces, how many goodly houses, how many noble mansions, once full of families, of lords and ladies abode empty even of the meanest servants! How many memorable families, how many ample heritages, how many famous fortunes were seen to remain without lawful heir! How many valiant men, how many fair ladies, how many sprightly youths whom not others only but Galen, Hippocrates or Aesculapius themselves would have provided with the means of a life and of a happy after-life—have died in the morning with their kinsfolk, comrades and friends and that same night supped with their ancestors in the other world! Boccaccio tells us how at seven o'clock of a Tuesday morning it chanced that seven young ladies, all knit to one another by friendship, neighborhood or kinship met in the venerable church of Santa Maria Novella for divine service: "Each was discreet and of noble blood and well-mannered and full of honest sprightliness. He does not give their actual names but applies to them fictitious designations corresponding to their qualities. The eldest is called Paminia, "the all-admonishing"; there is Fiammetta, known to be the Princess Maria, illegitimate daughter of King Robert of Naples, for whom Boccaccio has placed a "comely and noble passion." The others are Filomena, the "Nightingale," Emilia, Lauretta, the "laurel-crowned," Nefile, the "novelty-loving," and Elisa. They propose to flee from the death-striken city and go to the country. There, they say, "we may hear the small birds sing; there we may see the hills clad all in green and the fields and plains full of corn wave even as doth the sea; there we may see trees, a thousand sorts, and there is the face of heaven more open to view, with the sun against us though it be, nevertheless demihet not unto us its eternal beauties, far goodlier to look upon than the empty walls of our city. Moreover, there is the air far cooler."

While they are discussing how best to go, three young men enter—Tambuscio ("Per nat in Love"), Filostanito ("Unhappy in Love") and Dioneo ("The Amorous"), "all very agreeable and well-bred, of worth and discretion." The ladies invite the young men to accompany them, and the next day with a train of servitors of every kind they repair to a place two miles from the city, on a little hill back from the road where stands a palace with courtyard and loggie and saloons and bedrooms, abounding in costly paintings, with wells of cool water and cellars full of rare wines. They organize their sessions in the most formal manner with the design of "living merrily. Each member of the party must take turns in being "King or Queen of the day." Paminia is chosen to be first and is crowned with "a goodly and honorable wreath" of laurel-leaves. Each servant has an appropriate name and a set task: Parmeno is seneschal and has charge of the chief saloon; Sirisco is purveyor and treasurer; Misia and Lirisca take charge of the kitchen; there are others in charge of the bed-chambers. They stay away till dinner; then they find the tables laid with snowy cloths and glittering with silver; the viands are delicious, they have the choicest wines. Dinner is followed by music and dancing: Dioneo plays the lute, Fiammetta the violin.

At three in the afternoon, after their siesta, they go to a little meadow of green grass and the daily session of story-telling begins. The "Queen" calls upon each in turn and one story
DE CAMP

suggests another, but each is "free to tell of such matters as are most to his liking." On the Second Day Filomena assigns a general task of chores which offer her divers chances to have at last to a joyful issue beyond their hope. Friday and Saturday they have no general gathering, but begin again on Sunday, which is devoted to tales of "such as have by dint of diligence acquired some much desired." On these occasions the stories are more vividly depicted and virtually contrasted. Their behavior is in deliberate contrast to the freedom of their speech, and when there is some talk about a scandal arising from their sojourn together Filomena replies to Neifile: "That amounts to nothing, where I live virtuously and my conscience in no wise reproaches me; let those who will speak against me: I take God and the Truth for my defence." Some of the stories have been retold in modern times; others have been elaborated into full-length novels in the style of Chaucer, who died only a quarter of a century later than Boccaccio, imitated him and used his material. In spite of the delicacy of many of the stories the work, as a whole, is one of the classics of world literature. It has been frequently translated into expurgated form; complete it is to be found in three volumes translated into rather stilted and affected English by James Payne and published in 1886 by the Villon Society for Bartoli, Adolfo, "I Precursori del Boccaccio e alcune delle sue Fonti" (Florence 1874); Lee, A. Collingwood, "The Decameron, its Sources and Analogues" (London 1909); Symonds, J. A., "Giovanni Boccaccio" (London 1895); Morey, Henry, "II Decameron tratte dai migliori commentari" (Paris 1849); Morey, Henry, "II Decameron, Forty of the 100 Novels with Introduction" (1902 and 1969); also the edition by Dr. Guglielmo Pollarolo with notes from the best editions (Florence 1841).

NATHAN HASKELL DOLE.

DE CAMP, John C., American naval officer: b. New Jersey, 5 Oct. 1812; d. Burlington, N. J., 24 June 1875. He entered the navy in 1827; served in the frigate Constitution off the coast of Africa in 1854, and received the rank of commander the next year. During the Civil War he had command of the steap Iroquois in the attack on Fort Jackson and Fort Philip, and served on the Mississippi under Farragut, distinguishing himself especially at Vicksburg. In 1868-69 he commanded the receiving ship Potomac, and was retired in 1870 with the rank of rear-admiral.

DE CAMP, Joseph Rodenb, American figure and landscape painter: b. Cincinnati, Ohio, 5 Nov. 1888. He studied there under Juvence and at the Royal Academy of Munich. He established himself in Boston in 1893, and became an instructor in the school of the Boston Museum of Fine Arts, and in 1898 was elected to the Society of American Artists in 1888. He received the Temple gold medal from the
1 An East Indian edible crab (Fodophthalmus vigil)
2 East Indian sping crab (Parthenope horrida)
3 A Mediterranean crab (Pisa armata)
4 Three-angled Mediterranean crab (Gonogloss rhomboideus)
5 Three-angled Atlantic crab (Pisolaemus nitidus)
6 East Indian shrimp (Stenopus hispidus)
7 Northern shrimp (Palaemon serratus)
8 A Mediterranean porcelain crab (Albunea syrinca)
9 Cocosnut crab (Birgus latro)
10 Mediterranean purple crab (Lissa chiragra)
Pennsylvania Academy of Fine Arts in 1909; honorable mention at the Paris Exposition of 1900 for a 'Woman Drying Her Hair,' and a gold medal at the Saint Louis Exposition in 1904. He created great enthusiasm in Berlin in 1910 with 'An Interior' and 'A Lady Playing a Lute.' Has painted a great many prominent Americans and was award Beck portrait medal at Philadelphia in 1911. Notable works are in the Metropolitan and Worcester museums.

DECAMPS, de-kän', Alexandre Gabriel, French painter; b. Paris, March 1803; d. Fontainebleau, 23 Aug. 1860. He was educated in the studio of Abel de Pujol. When a young man he made a journey to the East, and returned thence with a collection of sketches, from which he afterward produced some of his finest pictures. Among the more celebrated of these are 'The Grand Bazaar'; 'Relieving Guard at Smyrna'; 'A Turkish Café'; 'Turkish Children Going Out of School'; and 'Arab Horsemen Passing a Ford.' Of pictures of animals were 'The Shepherd and His Flock Overtaken by a Storm'; 'An Italian Village'; 'The Hawking Party'; 'Spaniars Playing at Cards'; 'Don Quixote and Sancho Panza.' Decamps also produced some historical and sacred pictures of a high order of art, including the 'Defeat of the Cimbri'; 'The Miraculous Draught of Fishes'; 'Joseph Sold by His Brethren'; 'The Finding of Moses,' and others. The leading merits of this painter are great originality of conception and vigor of expression, with a wonderful skill in the treatment of light and shade. He was made chevalier of the Legion of Honor in 1839. He was extremely sensitive and conscious of his departure from classic tradition, and he abandoned art for many years. Consult the monograph by Moreau; Chesneau, 'Movement moderne en peinture: Decamps' (Paris 1861);Strahan, 'Modern French Painters' (New York 1888).

DE CANDOLLE, Augustin Pyrame, Swiss botanist; b. Geneva, 4 Feb. 1778; d. there, 9 Sept. 1841. He studied chemistry, physics and medicine at Heidelberg, and while on a visit to lichens, was published. Other works quickly followed, including his 'Astragalogia' (1802) and his valuable 'Historia Plantarum Succulentarum.' In 1802 he was elected to an honorary professorship in the Academy of Geneva, but remained in Paris, and delivered his first botanical lectures in the Collège de France in 1804. His 'Flore Française' appeared in four volumes in 1805. Employed by the government, he visited all parts of France and Italy in 1806-12, investigating their flora and agriculture. The results of his journeys are partly embodied in a supplement to the 'Flore.' He was appointed in 1807 to a chair at Montpellier, where he lived from 1810 to 1816; he then retired to Geneva, where a professorship of botany was given him, and there he spent the remainder of his life. De Candolle was an industrious writer, and the fruits of his studies in systematic botany and the properties and natural affinities of plants are embodied in a considerable number of works. The greatest of these is his 'Resumé de la Botanique Naturelle.' (Vols. I and II, 1781-21), was commenced on too grand a scale, and was continued within more reasonable limits in the 'Prodromus Systematis Regni Vegetabilis' (17 vols., 1824-73), the last 10 by his son and others.

DECAPODA, an order of malacostracous Crustacea (q.v.), in which the fourth to the eighth pairs inclusive of the thoracic appendages form uniramous walking limbs; the head and thorax are united to form a cephalothorax and the eyes are stalked. Three sub-orders are usually recognized: (1) The Macrura, in which the abdomen is not permanently flexed beneath the thorax, but forms a long, powerful swimming organ terminated by a so-called caudal fin; (2) the Brachyura, having the abdomen much reduced in size and permanently flexed beneath the thorax, which is usually shorter than its width, while the antennae and antennules are much reduced in size. The crab is typical of this group. (3) The Anomura, or hermit crabs and their allies, with soft, usually asymmetrical abdominal segments. See CRAB; LOBSTERS; HERMIT CRAB.

A sub-order of cephalopods (q.v.), containing those forms with five pairs of tentacles, is also known as Decapoda. It comprises the squid, cuttlefish, the fossil belemnites, the giant cephalopods of the ocean and other related forms. See CEPHALOPODS.

DECALPSIS, The. The name of a Greek confederation of cities east of the river Jordan. After the conquests of Alexander the Great many Greeks settled in Palestine, many going to the country east of the Jordan. The confederation was formed after the death of Herod in 4 B.C. Some of the cities had been free but had been deprived of their freedom by the Jewish Maccabean princes. Later Pompey restored their freedom to them. Their civic eras dated from the year 64-63 B.C., the year of Pompey's campaign in the country. As the Latin name signifies the confederation included 10 cities at first. Later other cities joined the league, until there were 18 members of the league from first to last. It was formed for protection against Semitic influences hostile to them. Scythopolis was the only city west of the Jordan. It was included in the league because of its strategic position, while the others were confined to the Greek cities on the seacoast and to the sea. The rest were east of the Jordan and southeast of the Sea of Galilee. The other nine original cities were Gadara, Hippos, Pella, Dion, Gerasa, Philadelphias, Raphana, Kanatha and Damascas. Those added later were Abila, Kanata, Kapitolas, Edrei, Boasra and three of their neighbors not named. Each city controlled the territory in the surrounding country. Jesus Christ entered the land of the Gadarenes and performed a miracle there (Mark v., 1-20). His demon-possessed patient published the news of his cure in all Decapolis. The cities were usually built for defense and were located on a hill or mound and near some stream or body of water. Many of the streets were so arranged that the dead would not pass through them. In the ruins of Gerasa, one of the richest of the cities, nearly 200 of these columns are still standing, and at Philadelphia about a dozen still remain. Some of the cities had two amphitheatres each. The largest was at Philadelphia, which would possibly seat 7,000, but others would accommodate from 2,000 to 4,000 spectators. Some of the cities also had artificial lakes on which sham sea-fights were staged.
Each city had its own annual festival for athletic games. The temples were beautiful. In each was a central hall ranging in size from 50 to 70 feet in length and from 30 to 50 feet in width. The religion of the homeland prevailed. Gadara was an important town before the time of the fall of Jerusalem. Vespasian captured it and destroyed most of the inhabitants. Josephus was the Jewish general in command and was made a prisoner and taken to Rome. The site of Pella has been explored and a volume published by the Palestine Exploration Fund containing the results. Kanatha occupied the site of the city of Kenannath mentioned in the Old Testament. The sites of some of the other cities remain undiscovered by modern archæologists. These cities were centres of literary activity. From Gadara came *Philodemus the Epicurean, a contemporary of Cicero, Meleager, the epigrammatist, Menippus the satirist, Theodorus the rhetorician, the tutor of Tiberius, and others. Gerasa also was the mother of teachers. Stephanus Byzantinus mentions three, Ariston, Kerykos and Plato. The city was so prosperous that its flourishing period of 1500 years equaled the Antipatrides. It then was that Gerasa reached the height of her glory. For fuller details the reader is referred to 'The Historical Geography of the Holy Land' by George Adam Smith, to which we acknowledge indebtedness for many of the facts of this article.

DECATOR, Stephen, American commodore: b. Newport, R. I., 1751; d. Philadelphia, 14 Nov. 1808. During the war of the American Revolution he commanded several privateers and acquired some reputation by the capture of English ships. At the commencement of hostilities with France in 1798 he was appointed to the command of the Delaware, of 20 guns, in which ship he cruised during the years 1798-99 on the American coast and in the West Indies, capturing at different times the French privateers Le Crovable of 14, and Marsvin of 10 guns. In 1800 he commanded a squadron of 13 sail on the Guadeloupe station, the Philadelphia, a frigate of 38 guns, being his flagship.

DECATOR, Stephen, American commodore: b. Sinepuxent, Md., 5 Jan. 1779; d. Washington, D. C., 22 March 1820. He was the most conspicuous figure in the naval history of the United States for the 100 years between Paul Jones and Farragut. He was well educated at the Episcopal Academy and at the University of Pennsylvania. Retaining a clerical life, in 1796 he entered the counting house of a firm of ship owners. In 1797 he got out the keel pieces of the frigate United States and was on her when she was launched, the first ship of the United States Navy. Through the instrumentality of Commodore John Barry he was appointed a midshipman in the navy by President Adams, 30 April 1798. He cruised in the West Indies during the French War in the United States, taking part in various minor naval actions. Such was his aptitude and ability that he was commissioned lieutenant, 3 Aug. 1802. At the close of the war, in command of the schooner Enterprise, he captured the bomb ketch Mastro, 23 Dec. 1803. In this ketch, renamed the Intrepid, he destroyed the frigate Philadelphia in the harbor of Tripoli by a singularly bold stroke.

On 3 Aug. 1804 Decatur commanded the American gunboats in their attack on the Tripolitan fleet. The war commenced with two simultaneous attacks by the most desperate hand-to-hand fighting in a battle which has been called the "biggest little fight in history," and well merits the name. He took part in four other attacks on Tripoli with his usual distinction. For the burning of the Philadelphia he was commissioned a captain, and at the age of 25 was placed in command of the frigate Constitution. At the close of the war he returned home, having divided with Commodore Preble the honors of the campaign. On 8 March 1806 he married Miss Susan Wheeler of Norfolk, Va. He had no children, and his wife survived him many years. At the outbreak of the War of 1812 he was in command of the United States, in whose building he had assisted, on which he had been launched, and in which he had made his first cruise. On 25 Oct. 1812 the United States captured the British frigate Macedonian, which was dismantled and almost cut to pieces. She lost 35 per cent of her complement, or 89 killed or mortally wounded in the period of 15 hours. Besides the Macedonian, the United States captured three other British ships. The American ship seven were killed or mortally wounded, and five severely wounded. The United States was practically intact. The weather remained favorable and by strenuous work for two weeks the Macedonian was patched up and brought back to New York, the only trophy of the great frigate actions of the war that remained afloat. The disparity in force in favor of the United States was about 7 to 3, in damage inflicted about 9 to 1.

After being blockaded in New London for a year Decatur took command of the frigate President. On the night of 14 Jan. 1815, in the midst of a howling gale, he put to sea from New York. On the morning of the 15th, off the eastern end of Long Island, he fell in with a British squadron of five heavy ships. Every effort was made to escape, but in the afternoon the President was brought to by the frigate Endymion. A running fight ensued until 6 o'clock, when Decatur attempted to lay Endymion aboard, hoping to capture her, scuttle the President and escape on the British ship, but the Endymion had the heels of the President and avoided the manœuvre. For two hours the vessels continued to battle it out, the President was entirely silenced. She had been fought to a standstill. Decatur could not take possession for fear of the other ships. He tried running again, but the President had been severely injured in the battle, and about 11 o'clock she was overhauled by two British frigates, which ran alongside and opened fire. The British flagship was also in range and the last ship was coming up rapidly. The President had lost 24 killed and 35 wounded, including most of her deck officers. Decatur himself had been twice wounded. Further conflict with two fresh ships was hopeless. Decatur reluctantly struck his flag and surrendered to the commodore of the squadron. He was court-martialed for the loss of his ship, but the adversaries were more disposed to censure than to censure in words of the highest commendation.

After the close of the war he was placed in command of a squadron and sent to the Barbary States to exact reparation for injuries and to enforce treaties of peace. His squadron cap-
tured the Algerine frigate Mesouda and the brig Estedio on 17 and 19 June. On 30 June 1815 he exacted submission and peace from the Dey of Algiers; on 26 July the same from the Dey of Tunis; and on 7 August the same from the Bashaw of Tripoli. The treaties were made at the mouth of the cannon and indemnities demanded were paid immediately.

In 1816 he was appointed naval commissioner. On 22 March 1830 he was killed in a duel with Commodore James Barron. The cause of this duel arose from certain strictures which Decatur passed on Barron. Barron had been suspended for his conduct on the Chesapeake when she was attacked by the Leopard in 1807. He had not returned to the United States during the War of 1812 but had remained in England, where he claimed to have been imprisoned for debt. When he applied for reinstatement after the close of the war Decatur opposed his request. He need not have entertained Barron's challenge save for a too masculine sense of honor. He is buried in Saint Peter's church-yard, Philadelphia.

Loneliness to his country was the very breath of life to Decatur. Our judgment does not entitle him to the title of a statesman, for in his famous sentiment, "My country—may she ever be right, but, right or wrong, my country"; but our affections tend to make the sentiment our own. There is a ring of sincerity in the words and in him which wins us in spite of all. His nephew, Stephen, b. 1815; d. 1876, was also a commodore in the United States Navy.

CYRUS TOWNSEND BRADY.

DECATUR, Ala., city, county-seat of Morgan county, on the Tennessee River and the Louisville and Nashville, and Southern railroads, 75 miles north of Birmingham. It has eight factories, a cotton mill, business establishments, engines, foundry products, lumber, sash and blinds, furniture, iron, flour, cotton, cottonseed oil, fertilizer and leather. Its chief buildings are the new post office, city hall, Carnegie library, schoolhouses, hospital and infirmaries. Pop. 5,500.

DECATUR, Ga., town, county-seat of De Kalb County, on the Georgia Railroad, six miles east of Atlanta. Decatur was settled about 1822 and is governed by a mayor and a council of six members elected by popular vote. It is connected with Atlanta by two electric street railways, and is the seat of the Agnes Scott Institute for young ladies and the Donald Fraser School for boys. A battle was fought here 20 July 1864 between a portion of Sherman's army, under General Thomas, and the Confederates under General Hood, the latter retreating at nightfall. Pop. 3,000.

DECATUR, Ill., city and county-seat of McLean County, near the Sangamon River, and on the Wabash, the Illinois Central, the Cincinnati, Hamilton and Dayton and the Vandalia railroads, 17 miles southwest of Chicago and 36 miles northwest of Portage. It was settled in 1830 and in 1830 was incorporated. Decatur is in the midst of the famous Illinois corn belt and is the trade centre of several counties. The chief manufacturing establishments are corn mills, railroad shops, iron works, flour mills, planing mills, agricultural implement works, engine and boiler works, paper and box factories, bridge works, and a large furniture factory, furniture, waterworks equipment, starch factories, soda fountain works and mantle factories. The United States census of manufactures for 1914 recorded for Decatur 126 industrial establishments of factory grade, employing 4,988 persons, of whom 4,003 were male, the men receiving $2,326,000 annually in wages. The capital invested totaled $12,550,000, and the year's output was valued at $11,957,000; of this $2,291,000 was the value added by manufacture. The city has a large trade in grain, coal, livestock and manufactured products.

The principal public buildings are the government building, the courthouse, the municipal buildings, a Carnegie library, home for aged and orphans, Saint Mary's Hospital, the churches (about 25 buildings) and the schools. There is a good system of public schools, including a well-equipped high school. There are two parish schools. The principal departments of the James Milliken University are located here. The city has 11 banks. The government is by commission since 1911. The city owns and operates the electric-light and the waterworks. Lincoln received his first endorsement as presidential candidate at the Illinois Republican Convention held here on 6 May 1860. Decatur is also the birthplace of the Grand Army of the Republic, Post 1 having been organized here on 6 April 1866. Pop. 37,525.

DECATUR, Ind., city, county-seat of Adams County, on the Saint Mary's River, and the Grand Rapids and I. R. Toledo, S. L. and K. C. and Erie railroads, 20 miles southeast of Fort Wayne, and near the eastern boundary of the State. Its principal industries are the manufacturing of lumber, brick and machinery, and stone quarrying. It has municipal water and lighting plants, a Carnegie library, a Knights of Pythias home. Decatur was settled in 1840 and incorporated in 1882. Pop. 5,000.

DECATUR, Mich., town of Van Buren County, on the Michigan Central Railroad, 24 miles southwest of Kalamazoo. It is in a rich farming section and has an important trade in grain, fruit, celery and peppermint. The industries are a large measure works, novelty factory, foundries, and manufactures of flour, stoves, etc., and two grain elevators. Pop. 1,500.

DECATUR, Tex., city, county-seat of Wise County, on the Fort Worth and Denver Railroad, 45 miles northwest of Fort Worth. The town, which has municipal waterworks and electric-lighting plant, is the trade centre of an agricultural region and its industries are chiefly those of a cotton-growing country, with the quarrying of limestone. The Northwest Texas Baptist College is located here. Pop. 2,000.

DECAZES, dé-kāz' Elie, Duc French statesman: b. Saint Martin du Laye, Gironde, 28 Sept. 1780; d. Decazeville, France, 25 Oct. 1860. He gained the confidence of Louis Bonaparte, king of Holland, whom he served even after his abdication in 1810. He supported the Bourbons in 1814 and under the second restoration discharged the duties of Prefect of Police at Paris with marked ability. In 1818 he
became Home Minister, and in November 1819 he resigned. After the assassination of the Duke de Berry in 1820 he resigned, and Louis XVIII made him a duke and his Ambassador to England, where he remained till December 1821. Under the reign of Charles X he opposed the extreme measures of the government, and after 1830 adhered to Louis Philippe. From 1834 to 1837 he was grand referendar of the peers. Consult Daudet, E., "Louis XVIII et le duc Deazes" (Paris 1899).

DECEASED WIFE'S SISTER MARRIAGE BILL, a bill to legalize marriage between a man and the sister of his deceased wife that was brought up in almost every session of the British Parliament after 1835, when Lord Lyndhurst secured the passing of a bill which declared all such marriages null and void. The bill legalizing marriage with a deceased wife's sister passed the House of Commons several times, but till 1896 was invariably rejected in the House of Lords, with, however, decreasing majorities. In 1896 the bill was passed by the Lords, but went no farther. The Colonial Bill, passed in the House of Commons more than 20 years ago and in the House of Lords during the session of 1898, to make marriages of this class legally contracted in the colonies legal also in England, and the Scotch Bill, having a similar object, also was never carried, though there were not wanting high authorities who pronounced such marriages legal in Scotland even without any special permissive legislation. It may be added that marriage with a deceased wife's sister was specially legalized under the sanction of the Crown in all the Australian colonies, in Canada, Barbados, Ceylon, Mauritius, New Zealand, South Africa and Jersey. Bills to legalize the English bill were also passed in Natal. These were, however, refused ratification (by the Crown) for special or technical reasons. Throughout India marriages of this kind were universally legal among all classes and creeds, except British subjects whose domicile was in Great Britain. In every Christian country, except Great Britain, such marriages were legal; and at last, despite the opposition and subsequent refusals of the High Church party to recognize the fact, marriage with a deceased wife's sister was rendered legal by the Act of 1907. The marriage of a woman with her deceased husband's brother, however, is still illegal, and the Act forbids the marriage of a man with the sister of his divorced wife during the wife's lifetime.

DECEIT, in law, the misleading of a person as to material facts, with the intention of fraud and to his damage. It has been held by the courts that erroneous and misleading statements without the intent to defraud, but as a consequence of neglect of the duty of knowing the truth as to such statements, has amounted to deceit. Deceit is recognized as a sufficient ground for the voiding of contracts, and as foundation for suit for damages.

DECEMBER, the 12th month of our year, from the Latin decem, 10, because of the Roman year instituted by Romulus it constituted the 10th month, the year beginning with March. In December the sun enters the tropic of Capricorn and passes our winter solstice. This month was under the protection of Vesta.

DECEMBRISTS (in Russian "Dekabristy"), name given in Russian history to the members of various secret societies which were formed in Russia during the reign of Alexander I, beginning in 1816, and rising in open insurrection on 14 Dec. 1825. The failure of Alexander I to put into effect his humanitarian ideals which he had promised to the people before his accession to the throne, and the utter inability of Count Arakcheev, into whose hands passed the administrative power, to understand the needs and wishes of the people, caused a great dissatisfaction amongst the people and a secret society was formed under the name "Goyuy spasenyes" ("Union for Salvation") Among the founders of this union were several grand dukes, high officers of the army and the civil service. The main objects of that society, as expressed in its constitution, were to endeavor by all means and available forces and by the general good to maintain the mild and honorable measures of the government to prevent all evils and crooked actions on the part of the officials, etc. But its most secret and sacred ideal was to introduce in Russia a parliamentary system of government. In 1822 the society adopted another name, "Brothers of Glory" ("Union of Prosperity"). During the coronation of Emperor Nicholas Pavlovich the Decembrists, profiting by the interregnum that preceded and the military disorder, proclaimed Prince Trubetskoy dictator of the country, with the aim of effecting a revolution and establishing a republican form of government. But Trubetskoy declined autocratic power; the revolution broke out, however, on 14 Dec. 1825, and was immediately suppressed and the ringleaders were summarily dealt with.

DECEMVIRS, (1) the 10 men appointed to codify the laws of ancient Rome. Commissioned to go to Greece to study Greek statute law and on their return (451 B.C.) all the magistrates were suspended and a commission of 10 patriots (decemviri leges scribendi) appointed, with consular powers, to reduce the laws to writing and to govern the state during their term of office. The finished code, after being ratified by the comitia of the centuries, was erected in the Forum inscribed on 10 tables of brass; when this was rendered legal by the Act of 1907. The marriage of a woman with her deceased husband's brother, however, is still illegal, and the Act forbids the marriage of a man with the sister of his divorced wife during the wife's lifetime.

DECEIT, in law, the misleading of a person as to material facts, with the intention of fraud and to his damage. It has been held by the courts that erroneous and misleading statements without the intent to defraud, but as a consequence of neglect of the duty of knowing the truth as to such statements, has amounted to deceit. Deceit is recognized as a sufficient ground for the voiding of contracts, and as foundation for suit for damages.

DECEMBER, the 12th month of our year, from the Latin decem, 10, because of the Roman year instituted by Romulus it constituted the 10th month, the year beginning with March. In December the sun enters the tropic of Capricorn and passes our winter solstice. This month was under the protection of Vesta.
DECIUS.—DE CIVITATE DEI

MAGNUS (1865); ‘Le Prince de Bismarck et l’entrevue des trois empereurs’ (1873).

DECIUS (Lat. deciduus, that falls down, from decidere, fall down, from de, away, + cadere, to fall). In botany, a term applied to various organs of plants, particularly leaves, to indicate their annual or periodic fall. When the calyx of a flower falls with the corolla it is called deciduous; when it falls on the expansion of the flower it is called caducous. Deciduous trees are those which for the most part annually lose and renew their leaves. See Duration.

DECIUS TEETH. See Teeth.

DECIMAL ARITHMETIC, the common system of arithmetic, in which the figures or digits ranged in a row increase in value by being multiplied by 10 as they are read from right to left, and decrease at a similar ratio from left to right. Also that part of the science of numerical calculation which treats of decimal fractions. See Fractions.

DECIMAL FRACTION, a fraction whose denominator is a decimal or power of 10. Thus 12.34 is a decimal fraction. It may be decomposed into the sum

\[
\frac{1000}{100} + \frac{200}{100} + \frac{30}{100} + \frac{4}{100} = 10 + 2 + \frac{3}{10} + \frac{4}{100}
\]

By an obvious extension of the method of local values, where each digit has 10 times the value of the like digit, which immediately succeeds it, the above decimal fraction may clearly be written more concisely in the form 12.34, where the decimal point after the 2 merely serves to indicate which digit represents units.

In this abbreviated form a decimal fraction is termed a decimal. The operations of addition, subtraction, multiplication and division may be applied to decimals in exactly the same manner as to integers; hence their great utility. They present, nevertheless, this disadvantage, that comparatively few fractional quantities or remainders can be exactly expressed by them; in other words, the greater number of common fractions cannot be reduced, as it is called, to decimal fractions, without leaving a remainder.

Common fractions, such as $\frac{1}{4}$, $\frac{2}{3}$, $\frac{4}{7}$ and $\frac{10}{13}$, for instance, can be reduced to decimal fractions only by multiplying the numerator and denominator of each by such a number as will convert the denominator into 10, or 100, 1,000, etc. (The common process is merely an abridgment to this). But that is possible only when the denominator divides 10 or 100 without remainder. Thus, of the above denominators, 2 is contained in 10, 5 times; 4 in 100, 25 times; and 25 in 100, 4 times; therefore.

\[
\begin{align*}
1 & \times 5 & \frac{5}{5} & \frac{1}{5} & \times 25 \\
2 & \times 5 & \frac{10}{10} & \frac{4}{4} & \times 25 \\
25 & 9 & \times 4 & 36 & \\
100 & 25 & \times 4 & 100 & \frac{36}{36}
\end{align*}
\]

But neither 3 nor 7 will divide 10 or any power of 10; and therefore these numbers cannot produce powers of 10 by multiplication. In such cases we can only approximate the value of the fraction, though this approximation may be made as close as we wish by taking a sufficient number of places after the 0 point. Thus $\frac{9}{11} = 3.33333$ is less than .0001; $\frac{1}{12} = 0.083333$ is less than .00001, and so on. Analogues of decimal fractions can be made by taking some other number than 10 as the base of our system of notation: if 6 is our base, for instance, we may write $\frac{5}{6}$ as 3.24, meaning $(3 \times 6) + 2 + (\frac{4}{10}) + (\frac{2}{6})$. 

DECIUS MUS, MVS, Publius, Roman consul. In a war against the Latinis 340 B.C., he devoted himself to death for his country, that is, after certain rites, rushed into the midst of the foes to certain death. His example was followed by his son, and, according to some historians, by his grandson. Such acts of self-devotion (devotiones) were not unusual at that time, when patriotism and piety exerted a powerful influence.

DE CIVITATE DEI, ‘The City of God.’ Augustine’s characteristic theological system is to be looked for elsewhere in his writings against Pelagius and the Donatists: the depths
of his individual religious experiences are revealed with keen powers of self-analysis in 'The Confessions.' The title of the present work of treatises that Augustine had in mind the kind of composition of which Plato's 'Republic' is the supreme example. Such a detailed ideal construction of a newly-organized polity was, however, far from the author's mind. For this reason it is difficult to give a preliminary outline of mediaeval politics is to misunderstand the point of view from which it was written. Neither Plato nor More nor Campanella nor Harrington, nor the various recent constructions of a new order of society along socialistic lines, can be used to render intelligible the purpose Augustine had in view. There are political and sociological elements in Augustine's work as there are theological and philosophical presuppositions, but there is no systematic development of any of these factors; not because Augustine had an unscientific mind like Clement of Alexandria, but because he prepared 'The City of God' as a complete armory of Christian apologetic adapted for the questions debated between Christians and Polytheists in the Gallic Wars. And just because the book was written to meet peculiar contemporary conditions, it is full of what appears to the modern reader as extraneous and tedious material. 'The City of God' is primarily an attack on paganism in the form in which paganism was still supported in the age after Christianity had become, under Constantine, the recognized religion of the Roman state. Augustine planned on a large scale an argument in rebuttal against the claim made by the adherents of old-fashioned polytheism that the adoption of Christianity by the Roman Empire had brought about political ruin and ethical demoralization. To make the anti-pagan case complete, copious quotations are made from the historic records of the Roman people to show that they had always been debarred and that their political schemes had failed. Augustine uses extensive literary sources, but as he is dealing with what was to him a practical every-day issue, he often draws examples and illustrations from everyday life. He describes the manufacture of silverware, he tells of miraculous cases of healing, relates wonders he has witnessed himself, notes in detail examples of heathen astrology and thaumaturgy, mentions the invasion of the Goths under Alaric and refers to the civil wars due to the dynastic quarrels in the family of Constantine. All this varied material is treated from a special point of view which it itself is closely related with the generally misunderstood title of the book. According to Augustine the summum bonum is man's supernatural union with God. All rational beings enjoy the privilege of this union either under normal or transcendent conditions. 'The City of God' then is the community of all spiritual beings, angels as well as men, who are within the sphere of divine grace. In such a community, such a condition, of a visible, social organization are altogether unimportant. All the emphasis is laid upon the contrast between the city of earthly beings, whose end is destruction, and the city of God, in which the souls of the elect realize the true laws of their being inherent in mind in the book which leads one to infer that Augustine looked for a reorganization of society under the influence of the Church as a result of the downfall of the Roman Empire. Incidentally in the course of his argument Augustine introduces judgment on the actual social condition as he knew it which are of permanent interest. He touches on aesthetic questions, discusses family and state relationships, examines the foundation of the right of private property and the concept of the social class in general. To this extent 'The City of God' has a permanent place in sociological thought, because it gives expression to the reflections of a keen and original mind on the last stage of ancient civilization.

Among the many translations of 'The City of God' the most satisfactory is that of Marcus Dods in T. and T. Clark's 'Patristic Library.' A reprint of the 17th century revision by John Healey will be found in Dent's 'Temple Classics.' The Latin text appears in a convenient form in Teubner's series of classical texts. The best critical edition is that published in the 'Latin Ecclesiastical Writers' (Vienna Academy Collection). Among modern works the following are especially useful: Carlyle, R. R. W., and Just the City of God, especially Political Theory;' Bertrand, L., 'Saint Augustin'; Troeltsch, E., 'Augustin die christliche Antike im Mittelalter'; Mausbach, J., 'Die Ethik des Hl. Augustin'; Schilling, O., 'Die Staats und Soziallehre des Augustins'; Hardy, Georges, 'Le Dieu Gouverneur'; August, G., 'Sources of the First Ten Books of Augustine's City of God'; Eucken, R., 'Die Lebens auschauungen der grossen Denker.'

WILSON LLOYD BEWAN.

DECK, See SHIP.

DECKEN, Karl Klaus von der, German African traveler: b. Kolzen, Brandenburg, 8 Aug. 1833; d. Africa, 25 Sept. 1865. He entered the Hanoverian army, which he left after 10 years' service (1860) to follow his bent toward travel. On Barth's advice he went to Zanzibar and started thence on a journey to Lake Nyassa, which failed through the treachery of his Arab guide. Next year he started on a second and successful journey to the mountain regions of Kilimanjaro. In the following year, with Kersten, he climbed that mountain to the height of 13,780 feet. In 1863 he made an extensive voyage along the east coast of Africa, after which he returned to Europe to plan a great expedition for the exploration of East African rivers. This journey ended in disaster and Decken was murdered by a Somali. A description of his journeys was published by Kersten and other survivors in 'Karl Klaus von der Deckens Reisen in Ostafrika 1859-65' (4 vols., 1869-79).

DECKER, Thomas. See DEKKER, THOMAS.

DECLARATION, (1) a formal or positive explanation of any circumstance. (2) That part of law process or pleadings in which a statement of the plaintiff's complaint against the defendant is set forth, with the additional circumstances of time and place when and where the injury was committed, where these are requisite. (3) A simple affirmation allowed in certain cases to be taken instead of an oath or solemn affirmation (See AFFIRMATION; OATH). The use of the new form of an oath is immaterial, provided it be such as the witness believes is binding upon his conscience.
but it is essential that the oath, declaration or affirmation be administered in a manner prescribed by law. Mere technical variations do not affect the validity of an oath, and verbal deviations are immaterial. Perjury may be committed although the person was improperly sworn. No person is permitted to make a declaration or affirmation unless he has conscientious scruples against swearing. The declaration in lieu of an oath or affirmation has become general throughout the United States. (4) The statement made by a prisoner, on being arrested on suspicion of a crime, which is taken down in writing.

DECLARATION, Dying, a declaration made by a person near death. The rule that secondary or hearsay evidence is inadmissible suffers an exception, in law, in the case of a declaration made by a person convinced of impending death and who may not survive the trial of the accused. In Scotland, the dying declaration of a witness is admissible even though not conscious of the danger of death, and in the United States a declaration is frequently admitted, both in civil and in criminal cases, as primary evidence, without regard to the manner in which the declaration was put in evidence. A dying declaration may be adduced for as well as against a person accused of a crime; and there are cases on record in which persons charged with murder have been successfully exculpated on this kind of evidence.

DECLARATION OF INDEPENDENCE, United States. The steps by which the extra-legal de facto governments of the colonies during the early Revolution—the Committees of Correspondence and Safety—were turned into formal legislative bodies, are detailed under Constitutions, State; and Congress, Continental.

The Congress of 1774, assumed neither executive nor legislative authority. The second, early in its existence (6 July 1775), formally disclaimed any purpose of separation. The first half-unconscious step was the appointment, November 1775, of five commissioners to maintain communications with friends of the colonies in "Great Britain, Ireland, or elsewhere": only independent countries send ministers. Thomas Paine's "Common Sense," urges independence as inevitable, and the sooner the better. The states considered their delegates to vote against any such measure; the other two, New York and Delaware, were bitterly divided and their delegates took no part in forwarding the independent movement; South Carolina was also hostile, contrary to its usual habit of earlier initiative; and stirring up the great Indian confederations against the South, as was afterward done. But events pushed them on. British naval captures led Congress, 23 March, to declare all British vessels lawful prize; and Congress, 10 April, ordered all United States ports to all vessels other than British. This was an act of absolute sovereignty, acknowledged or not. The colonies, under instructions from Congress, were steadily forming State governments (see Constructions, State); and Congress, 10 May recommended all the remaining ones to take the same step, which of course involved making their common Union independent also. John Adams was the foremost agent in all this work. The North Carolina convention 22 April resolved to "concur with those in the other colonies in declaring independence." On 17 May Virginia instructed her delegates in Congress to move a "Declaration of Independence:" and on 7 June Richard Henry Lee made a motion to that effect in Congress, which was seconded by John Adams On the 8th and 10th this was debated in Committee of the Whole; but action was postponed to 1 July, as some delegations were averse and others were waiting instructions.

On the 10th a committee of five was appointed to draw up the Declaration: Thomas Jefferson of Virginia, John Adams of Massachusetts, Benjamin Franklin of Pennsylvania, Roger Sherman of Connecticut and Robert R. Livingston of New York. Its composition was assigned to Jefferson by the committee. The latter and Congress made many changes, but mostly by omission rather than alteration of wording, so that the language is practically all Jefferson's. The chief cancellations were five; (1) and (2) The last two counts of his indictment of the king. (1) That he had "...excited reasonable insurrections of our fellow-citizens" by promising them confiscated property. The charge was probably felt to be too weak to maintain, as well as likely to weaken the general case. (2) That he had carried on the slave-trade, and refused to call on legislatures to suppress it. South Carolina and Georgia, which were actively carrying it on themselves, would not permit this; and too much Northern wealth had been earned by it not to make the North very angry at the passage, which would impress foreign nations unpleasantly as to their sincerity. (3) Superfluous rhetoric about the incredulity of future ages as to the daring tyranny of the king. (4) Review of American history, denying that Great Britain had assisted in our establishment, and alleging that "submission to their parliament was no part of our constitution." It was thought best to go as little into the remote origins as possible, fixing the attention upon recent oppressions and natural rights; and above all, to ignore the existence of Parliament altogether. That body is not alluded to, except inferentially as the "others" with whom the king has "...combined" to subject the colonies to an alien and illegal jurisdiction. This was in pursuance of the steady contention of the colonies, (5) Attacks on the English people for re-electing "the disturbers of our harmony," and allowing their chief magistrate to persecute these enormities. This was struck out to avoid giving offense to the friends of the colonies in England, who, in fact, by upholding liberal leaders and even generals, saved us at last. The Declaration was reported 28 June. On
DECLARATION OF INDEPENDENCE

1 July as fixed, debate was begun afresh on Lee’s resolution. In New Jersey and Maryland, the delegates had reversed their instructions meaningly. In Committee of the Whole that evening, nine States voted for it; Pennsylvania and South Carolina voted against it (but the latter delegates, possibly after hearing from the South, offered no instructions to vote yes if it would make a unanimous vote). Delaware was divided, and New York refused to vote. The "yea" Delaware delegate, McKean, sent an urgent message to the third, Caesar Rodney, then on a political trip in southern Delaware, to come on at once; Rodney traveled 80 miles the next day, arrived in the evening, and reversed his State’s vote. Pennsylvania reversed hers also; and this leaving only the abstaining New York delegates out of the voting, the South Carolina members voted yes. This carried the motion that "these United colonies are and of right ought to be free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the state of Great Britain should be totally dissolved by 12 years and no negative vote. On the 3d the Declaration was taken up, and as amended was passed on the evening of the 4th. The anniversary of the fact of independence is therefore the 2d; that of the adoption of the specific document in which it was proclaimed to the world is the 4th, as celebrated. The usual statement that it was "signed" by the members at this time, however, is incorrect; it was signed by the president and secretary, whose signatures only were borne by the printed copy as it came out. The journals of Congress do not enter the Declaration, but left a blank for signatures taken from the engrossed copy. On the 9th the New York convention ratified it, and the delegates gave in their formal adheren in the 5th; it was then, as entitled, "The Unanimous Declaration of the Thirteen United States of America." Six additional Pennsylvania members also recorded a formal vote on the 20th. On 19 July Congress passed a resolution that it should be enrolled on parchment, and on 2 August it was signed by 53 members present; Gerry of Massachusetts, McKean of Delaware and Thornton of New Hampshire were empowered by their legislatures to sign later, Thornton not signing till 4 November. For an analysis of the Declaration and bibliography see United States—The Declaration of Independence.

The parchment with the original signatures was deposited with the Department of State when the government was organized in 1789. In 1823 John Quincy Adams had a copper-plate facsimile made, to give copies to the signers and their heirs; but unfortunately it ruined the original. The wet sheet pressed on the face drew out the ink so that the signatures have become illegible and almost invisible, and the text itself is not so and after a long show for many years only on special occasions, in 1894 it was definitely scaled up in a steel case to keep it from light and air. From 1841 to 1877 it was in the Patent Office.

The signers represented the States as follows:

Massachusetts: John Hancock, Samuel Adams, Robert Treat Paine, Ebenezer Gerry.

Rhode Island: Stephen Hopkins, William Ellery.

Connecticut: Roger Sherman, Samuel Huntington, William Williams, Oliver Wolcott.

Pennsylvania: Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, George Ross.

Delaware: Caesar Rodney, George Reed, Thomas McKean.

Maryland: Samuel Chase, William Paca, Thomas Stone, Charles Carroll of Carrollton.

North Carolina: William Hooper, Joseph Hewes, John Penn.

Georgia: Button Gwinnett, Lyman Hall, George Whitehead.

It may be noted that several of these were not members of Congress when the Declaration was passed.

The Declaration, as agreed to, follows:

A DECLARATION

BY THE REPRESENTATIVES OF THE UNITED STATES OF AMERICA IN CONGRESS ASSEMBLED

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and nature’s God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness.

Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is the right of the people to alter or abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness.

He has refused to submit to the laws most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would consent to abdicate the right of representation in the legislature; a right inseparable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual.
SIGNING THE DECLARATION OF INDEPENDENCE
uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing and weakening their resistance, compliance with his measures.

He has dissolved representative houses repeatedly, for opposing, with manly firmness, his innovation on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining in the meantime, exposed to all the dangers of invasion from without, and consolations within.

He has endeavored to prevent the population of these States; for that purpose, obstructing the laws for naturalization of foreigners; refusing to pass laws for encouraging their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judicocractic powers.

He has made judges depend on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, standing armies without the consent of our legislatures.

He has affected to render the military independent of, and superior to, the civil power.

He has combined with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us;

For protecting them, that, under the pretense of executing the laws of our kingdom in America, they may execute publick justice in a Manner contrary to our common right;

For cutting off our trade with all parts of the world;

For imposing taxes on us without our consent;

For depriving us, in many cases, of the benefit of trial by jury;

For transporting us beyond seas to be tried for pretended offenses;

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies;

For taking away our charters, abolishing our most valuable laws, altering fundamentally the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the work of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections amongst us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which detain our separation, and hold them, as we hold the rest of mankind, enemies in war — in peace friends.

We, therefore, the representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the World for the rectitude of our intentions, do, in the name and by the authority of the good people of these colonies solemnly publish and declare, That these United Colonies are, and of right ought to be, Free and Independent States; that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that as free and independent States, they have full power to levy war, conclude peace, contract alliances, establish commerce and to do all other acts and things which independent States may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our lives, our fortunes, and our sacred honor.
DECLARATION OF INDULGENCE—DECLARATION OF PARIS

DECLARATION OF INDULGENCE, a name applied to the declaration or proclamation issued by Charles II (15 March 1672), and also to a proclamation of James II (4 April 1687), which were ostensibly acts granting liberty of conscience to all adherents to the Protestant religion, but in fact were intended to cajole and seduce the Roman Catholics and Nonconformists, and removed the test of qualification for the holding of office in the corporations, army and civil service. James II ordered the declaration to be read in the churches 25 April 1688. The prime motive was the benefit of Roman Catholicism; that it was aimed against the existing church and was unconstitutional. The king declared their act sedition, and gave them the Tower, and sent the offenders to the Tower. Later they were tried and acquitted, 30 June 1688. On the day of their release an invitation was sent to William of Orange to come and save England from the Roman Catholics. The signers of this invitation were the Earls of Danby, Devonshire and Shrewsbury, the bishop of London, Admiral Russell and Henry Sydney. (See Test Acts). Consult: Howell, 'State Trials'; Burnet, 'History of England'; Adam, 'James II'; and Hals, 'Cromwell'...

DECLARATION OF LONDON. A diplomatic instrument framed at an international conference held in London in 1909 for the purpose of settling and defining certain rules of maritime law in times of war. The famous Declaration of Paris (q.v.) in 1856 is an act or a provision of 1907 and the Declaration of London two years later further efforts were made to codify maritime laws in war, especially those referring to the capture of enemy property. But ever since 1856, and more especially after 1907 and 1909, there was a steady growth of opposition in Great Britain against these rules governing capture at sea, on the ground that they deprived the British navy of its most effective weapon against an enemy. Public opinion in the United Kingdom was so powerful that the British government refused to ratify the 1909 declaration, for it had been signed without the knowledge either of the people or the Parliament. The ministry endeavored to carry the measure by the Naval Prize Bill in 1911; the parliamentary debates in 1911 on the bill for the Imperial Conference realized the inherent danger of the declaration to the empire in case of war and demurred against its ratification. Sir Edward Grey, however, won them over by stating that the Declaration "might be made better than it is if we could get other powers to agree," but that it had either to be taken as it stood or left altogether. The House of Lords, however, came to the rescue and rejected the bill. Speaking from knowledge gained under actual war conditions, it is now easy to realize that the Declaration of London would, if acted upon, have been more acceptable to a nation like Germany than to a people situated like the British. How it would have impaired British naval power may be gathered from the facts. But it was not easy to break a blockade, for the right of a blockading force to capture a blockade-runner did not cover the whole period of her voyage and was confined to ships of the blockading force; stereotyped lists of contraband and non-contraband were drawn up, instead of the old custom of leaving the question to the discretion of the Prize Court; a ship carrying contraband could only be condemned if the contraband formed more than half its cargo; a belligerent warship entering a port of the enemy and taking it to a port for judgment; the transfer of an enemy vessel to a neutral flag was presumed to be valid if effected more than 30 days before the outbreak of war; the question of the test of contraband in his own nation, if accompanied by any sort of warship of her own flag, was exempt from search; belligerents in neutral vessels on the high seas were exempt from capture, a provision by which enemy reservists could return from foreign lands and rejoin their army, and the captain of a German raider could justify his sinking of British ships instead of taking them to a port for adjudication. Directly after outbreak of the war a British Order in Council announced on behalf of the Allies that the principles of the Declaration of London, though not binding upon them, would be adhered to. Successive Orders in Council, instigated by sheer necessity, altered the Declaration beyond recognition. Owing mainly to the existence of the British navy, the German merchant marine of 3,000,000 or more net tons disappeared from the seas. The provisions of the Declaration of London, however, left Germany free to use the shipping of her neutral neighbors, Norway, with a tonnage of 1,716,000; Sweden with 805,000; Holland with 617,000; and Denmark with 548,000, a total of 3,688,000 tons. Finally, an Order in Council, dated 7 July 1916, announced the withdrawal of Great Britain and her allies from the Declaration of London. The note stated that "these rules, while not in all respects improving the safeguards afforded to neutrals, do not provide belligerents with the most effective means of exercising their admitted rights," and "that they could not stand the strain imposed by the test of rapidly changing conditions and tendencies which could not have been foreseen." consultar: Adam, 'James II'; consult: Howell, 'State Trials'; Burnet, 'History of England'; consult: Hals, 'Cromwell'...

DECLARATION OF PARIS. A formal statement of rules as to the procedure of belligerent ships in time of war, proposed by the representative of France, and recommended by the plenipotentiaries of the several nations who drew up the Treaty of Paris in 1856. These rules were adopted by France, Great Britain, Austria, Prussia, Russia, Turkey and Sardinia. The United States declined to adopt the Declaration on the ground that they had no navy, and
in case of war would have to depend upon arming merchant vessels as privateers. Other nations similar to these were Spain, Mexico and Venezuela. The code as adopted was as follows:

(1) Privateering is and remains abolished.
(2) The neutral flag covers enemy's goods with the exception of contraband of war.
(3) Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy flag.
(4) Blockades to be binding must be effective, that is to say, maintained by a force sufficient to prevent access to the coast of the enemy.

DECLARATION OF RIGHTS. The Stamp Act Congress (see CONGRESS, CONTINENTAL) of 1765 published a "Declaration of Rights and Grievances of the Colonists of America," protesting against the Stamp Act, and any other efforts to tax the colonists while denying them representation in the Parliament which imposed the taxes. They sent a petition to the king, and another to Parliament, claiming the same rights as were enjoyed by Englishmen born within the British Isles. The right of representation was included in these; but instead of petitioning for that right, they declared its obvious impossibility a reason why they should not be subject to taxation. The Continental Congress of 1774 (see CONGRESS, CONTINENTAL) asserted a similar claim in its declaration, as a preliminary to calling a final congress, and the Declaration of Independence begins with a like assertion. The assertion of such claims was considered so vital in written constitutions by men of that age that the strongest objection to our national one was its omission in this particular, and the storm of amendments pushed forward (see CONSTITUTIONAL AMENDMENTS) consisted mainly of bills of rights. For a statement of the Bill of Rights of the English nation prepared for the convention that called William and Mary to the throne, see Bill, Bill of Rights.

DECLARATION OF WAR. A public proclamation in which one government declares itself to be at war with another. In the United States, Congress alone has the power to declare war, and when that body votes for war with a foreign power, such a measure is considered tantamount to a declaration of war. Prior to the ratification of The Hague Convention (q.v.) which provided for procedure in regard to the opening of hostilities, the doctrine that notice must be given an enemy before commencing hostilities had not been regarded as an obligation, and practice respecting it had shown no uniformity. Owing to the world-wide use of the telegraph, submarine cable and wireless telegraphy and the wide diffusion of news by which every incident in the events leading to war are instantly published, a formal declaration was scarcely deemed necessary or required by morality or international law, and each belligerent was usually satisfied with announcing its warlike intentions to the constitutional or ruling power. On the outbreak of war belligerents have usually followed the custom of issuing a manifesto describing the events leading to the necessity for such a declaration and justifying their attitude, but such a document is not obligatory, though oftentimes useful. The Hague Convention, to which the United States subscribed, provides as follows:

ARTICLE I. - The contesting powers recognize that hostilities between themselves must not commence without previous and explicit warning, in the form either of a reasoned declaration of war or of an ultimatum with conditions precedent to declaration of war.

ARTICLE II. - The existence of a state of war must be notified to the neutral powers without delay, and shall not take effect in regard to them until after the receipt of a notification, which may, however, be given by telegraph. The neutral powers, nevertheless, cannot rely on the absence of notification, if it is clearly established that they were in fact aware of the existence of a state of war.

The first step after an endeavor to adjust the difficulties by diplomacy is an ultimatum, the non-compliance with which on or before the time limit set usually means the outbreak of hostilities, though often no absolute time limit is set. This happened in President Wilson's demand on 25 June 1916 that Carranza, constitutionalist President of Mexico, immediately release the American soldiers captured in the encounter at Carrizal and make an early Declaration as to his intentions regarding the American punitive expedition then in Mexico. Several days elapsed before Carranza replied and even then failed to answer fully, but this was overlooked since he evinced a desire to adjust the dispute diplomatically, thus removing the immediate pressing necessity for commencing hostilities. For legal purposes the date of the official opening of a war is usually stated in the declaration. In April 1898 the United States sent an ultimatum to Spain demanding her instant withdrawal from Cuba on pain of war. On her refusal, Congress, 25 April 1898, declared that a state of war between the two countries had existed since 21 April. The same condition obtained in the Russo-Japanese War, the Japanese Minister on 13 Jan. 1904 having presented a note to the Russian government requesting a prompt reply, implying that if there were an unreasonable delay, hostilities would be commenced by Japan. On 5 February telegraphic instructions were issued to the Japanese Minister to announce to the Russian government that Japan had terminated negotiations relative to the proposed Russian convention, which communication was made the following day. On the 8th hostilities began at Port Arthur but the formal declaration of war were not issued until 10 February. When no direct notice is given war is held to date from the time when either party commits the first hostile act. In 1854, before the British Ambassador had withdrawn, a British fleet steamed into the Black Sea to compel the retirement of the Russian fleet to Sebastopol. On the other hand in 1870 Bismarck received a formal notice from the French chargé, and in 1877 Russia sent a formal dispatch to Turkey. For the various declarations of the outbreak of the European War in 1914 see WAR, EUROPEAN. Consult Wilson, George G., 'International Law' (New York 1910).

DECLARATORY ACT, an act passed by the English Parliament, 7 March 1766, accompanying the repeal of the Stamp Act, assuring the constitutional right of the king, with the advice of Parliament, to bind the colonies by its laws and action "in all cases whatsoever." This is English colonial law still; but no attempt is made to enforce it against the wishes of the colonies, except where the rights of British subjects are infringed.
DECLÉ, dák, Léonel, English explorer and author; b. Rocourt, Saint Quentin, France, 10 Aug. 1859; d. 1 March 1907. He was of French parentage but a naturalized Englishman. He traveled extensively in Asia, Africa and America, was on the staff of the Pall Mall Gazette for several years and commanded the Daily Telegraph expedition from the Cape to Cairo (1899–1900). He published 'Three Years in Savage Africa'; 'Trooper 3809,' an account of his personal experience in the French army; 'The New Russia' (1906).

DECLENSION, the change of termination in certain classes of words, in various languages, to indicate the relation in which those words stand toward other words in a sentence. The condition of change to which the words are brought by the several terminations are styled cases (Lat. casus) or fallings, for some reason imperfectly understood. The words subject to declension are of the classes, noun, adjective, pronoun. In the Latin language grammarians generally recognize five declensions, five different modes of forming cases, and to each declinable word they assign six cases, namely, the nominative, genitive (or possessive), dative, accusative (or objective), vocative (or imperative), and ablative. There is also the locative case, used in the names of cities, and in such forms as humi, domi. In the plural the nominative and vocative are always of the same form; so, too, are the dative and ablative. The Greek declensions are variously classified, but most generally are made three in number and the cases five, as well as two locative cases found in the dialects. The ancient Sanskrit language has eight cases of nouns and the present language of the Finns has 15; but the languages of Europe derived from Latin—Italian, Spanish, Portuguese, French, etc.—have dropped the declensional terminations of the Latin, and hence the Latin for *man,* which is declined homo, hominis, homini, hominem, homini, homine, has in those modern languages the one form *homo* in French, *hombre* in Spanish. The ancient Germanic language, from which English is descended, had declensions; but in our language the only remnants of the ancient forms are, the possessive cases of nouns and the objective case of pronouns, I: me, he, him; she, her; they, them. While in the Indo-European languages above cited, as well as in the Semitic tongues, the unity of the word is not destroyed by inflection, in languages like the Turkish, which are styled agglutinative, elements are added in declension which supersede or obscure the individuality of the original word. See CASE; INFLECTION.

DECLINATION, in astronomy, the distance of a heavenly body from the celestial equator (equinoctial), measured on a great circle passing through the pole and also through the body. It is said to be north or south according as the body is north or south of the equator. Great circles passing through the poles, and cutting the equator at right angles, are called circles of declination. Twenty-four circles of declination, dividing the equator into 24 arcs of 15 degrees each, are called hour circles or horary circles.

DECLINATION, Magnetic. See MAGNETISM — TERRESTRIAL.

DECLINATION NEEDLE, or DECLINOMETER. The magnetic meridian passing through any place on the earth's surface is a vertical plane whose direction is that in which a magnetic needle, free to move about a vertical axis, comes to rest under the influence of the earth's magnetic force. In general, the magnetic and geographical (or astronomical) meridians are not coincident; the angle between is termed the magnetic declination, or (in nautical phraseology) the variation. It is east or west, according as the magnetic is east or west of the geographical meridian. Any apparatus for the measurement of this angle is termed a declinometer, and consists essentially of a means of ascertaining the two necessary elements—namely, the directions, at the place of observation, of the two meridians. Permanently fixed instruments of this nature are set up in all magnetic observatories. They are generally self-registering, and record the slightest hourly, diurnal and annual variations in the declination of the magnetic needle, as well as the more violent changes due to magnetic storms. See MAGNETISM.

DECLINE AND FALL OF THE ROMAN EMPIRE, The, a monumental work by Edward Gibbon, the first volume of which appeared in 1776, and the last in 1788. 'The Decline and Fall' has been pronounced by many the greatest achievement of human thought and erudition in the department of history. It is a history of the civilized world for 13 centuries, during which paganism was breaking down, and Christianity was superseding it; and so bridges over the chasm between the Old World and the New. It is marked by eloquence and a picturesqueness of narration. The great criticism of the work has always been upon the point of Gibbon's estimate of the nature and influence of Christianity.

DECOCTION, in pharmacy, a solution of a vegetable principle largely obtained by boiling in water the substance containing the principle. Inasmuch as plant drugs usually yield their constituents more readily to hot water than they do to cold water, decoctions are preferred to infusions for obtaining the active principles of plants. Decoctions are not so much used in modern times, because of their great complexity, the active principles of plants being obtained by other means. DECOIC ACID, or CAPRIC ACID, an organic acid having the formula $\text{C}_9\text{H}_{18}\text{O}_2$, and occurring in the form of various compounds in butter, coconut oil, fusel oil (from certain sources), Limburg cheese and the fatty matters extracted from the wool of sheep. It is soluble in alcohol and ether, but almost insoluble in cold water. It crystallizes in needles that have a faint odor suggestive of rancid butter, and is prepared by the distillation of oleic acid, or by the oxidation of that acid by nitric acid. The name *capric* has reference to the fancied resemblance of the odor to that of a goat; while *decoic* refers to the 10-carbon atoms that the acid contains.

DECOMPOSITION, Chemical, is the separation of the constituents of a body from one another, these constituents being obtained either free or in a new state of combination. Limestone, for example, is decomposed into lime and carbonic acid, oxide of mercury into
mercury and oxygen, by heat. This is called simple decomposition. Definite organic bodies resemble inorganic in being influenced by similar forces, but the result in their case is somewhat different, arising from their different composition. In the case of an organic body it is possible to convert its constituents at once into their simplest states of combination, but it is also possible to obtain a large number of intermediate compounds by regulating the decomposing agents. But when this is done, the mixture thus decomposed is styled by chemists compound decomposition. A double decomposition is a reaction in which the elements of two substances rearrange themselves to form two new substances, each of which contains elements from each of the old substances. Thus salt and sulphuric acid react to give hydrochloric acid and sodium sulphate. See Reaction.

DECORAH, Iowa, city and county-seat of Winneshiek County, situated near the north-eastern corner of the State on the upper Iowa River, about 30 miles from its mouth, and on the Chicago, Milwaukee and Saint Paul and the Chicago, Rock Island and Pacific railroads. It is a centre of farming, milling and stock-raising industries, and has manufactures of wagons, metal boats, valves, patent medicines, etc.; Luther College, Valder College and a hospital are the chief institutions. Decorah was settled in 1849; was incorporated as a town in 1857 and was chartered as a city in 1871. Its government is administered under a general law by a mayor elected biennially and a city council. Pop. 3,592.

DECORATED STYLE, the second style of pointed (Gothic) architecture, in use in Great Britain from the end of the 13th to the beginning of the 15th century, when it passed into the Perpendicular. It is distinguished from the Early English, from which it was developed, by the more flowing or wavy lines of its tracery, especially of its windows, by the more graceful combinations of its foliage, by the greater richness of the decorations of the capitals and of the moldings of its doorways and niches, finials, etc., and generally by a style of ornamentation more profuse and naturalistic, though perhaps somewhat florid. The most distinctive ornament of the style is the ball-flower, which is usually inserted in a hollow molding. The Decorated style has been divided into two periods, namely, Early or Geometrical Decorated period, in which geometrical figures are largely introduced in the ornamentation; and the Curvilinear, in which the peculiar characteristics of the style are exhibited. To this latter period belong some of the finest monuments of British architecture. See Architecture.

DECORATION, Interior. See Interior Decoration.

DECORATION DAY, a holiday observed in many States as an occasion for decorating the graves of soldiers killed in the Civil War, whether in national or private cemeteries. The custom of a *Memorial Day* (as it is otherwise called) originated with the Southern States, and was copied scatteringly and on different days in some Northern States,—all in the year 1868. Gen. John A. Logan, then commander-in-chief of the Grand Army of the Republic, issued an order appointing 30 May of that year for Grand Army services in so decorating graves — choosing that day possibly as being the date of discharge of the last Union veteran of the War. The States which observe the day have adopted it singly, there being no national law on the subject. It is a legal holiday in all States including Porto Rico, Hawaii, Alaska and the District of Columbia, with the exception of Arkansas, Florida, Louisiana, Mississippi, North Carolina, South Carolina, South Dakota, Texas and Virginia it is called Confederate Memorial Day.

DECORATIONS. See Orders and Decorations.

DECORATIVE ART. The generic name for all the arts which have for their purpose the embellishment or beautifying of buildings or other objects. Since the decorative arts, as such, make their appeal to the aesthetic sense in serving primarily the end of beauty rather than of utility, even though applied to objects of use, they are properly classed among the fine arts. (See Fine Arts.) Yet inasmuch as their operations do not produce independent creations but are applied to, or executed upon, buildings and objects of utility, the decorative arts are a class by themselves, midway between the useful arts and the independent or pure fine arts, whose works are produced for their own sake, or rather for the sake of the aesthetic enjoyment which they in themselves afford — such as painting, sculpture, architecture or music. The higher forms of decorative art do, however, approach closely to the rank of independent art. Since architectural decoration employs both painting and sculpture for the embellishment of buildings, the sculptor or mural painter may produce for this purpose works of such beauty in themselves, apart from their function of decorating the building, as to rank with the finest works of independent sculpture or painting. The pediment sculptures of the Parthenon are superb as statues, though deposed from the pediments for which they were designed. The world's museums are full of paintings originally designed as decorations of altars, ceilings or even furniture, but which, separated from their original settings, are admired as works of art, that is, as pure fine art. No absolute line can therefore be drawn between decorative art on the one hand, and pure fine art on the other. Architecture, which ranks as one of the major fine arts, is itself the greatest of the decorative arts, its function being to make beautiful the utilitarian structures it designs for the shelter of man and of his varied activities. But by reason of its superior importance and its recognized place among the major fine arts, as well as its employment of many of the decorative arts in subordination to itself, it is rarely ranked with the latter.

Classification.—The decorative arts are divided into two main classes: those which serve architecture, that is, which are employed for the adornment of buildings or related structures; and those which are applied to movable objects. The first are the major decorative arts, or the arts allied to architecture; the second are commonly called the industrial decorative arts, or the minor arts. The major decorative arts include monumental sculpture and carving, mosaic, inlay, stained glass and architectural woodwork, metalwork
and plasterwork. The industrial decorative arts include furniture, textile art (tapestries, rugs, carpets, embroidery, needlework, laces, brocades and printed fabrics), wall-papers, decorative ceramics and pottery, jewelry, goldsmith's and silversmith's work, bookbinding, typographical ornament, manuscript illumination and many other arts and industries. Some of the minor arts in their highest phases approach the pure fine arts in the case of Oriental rugs, calligraphy, textiles and jewelry; others trench upon the domain of architectural decoration, as in the more monumental forms of church furniture. Here, again, absolute lines of demarcation cannot always be drawn.

For the discussion of sculpture applied to decoration see the article SCULPTURE; for that of decorative painting see INTERIOR DECORATION; MURAL PAINTING AND PAINTING. See also DECORATIVE ARTS, MINOR, OF WHICH A NUMBER AND TREATED UNDER SEPARATE TITLES, E.G., BOOKBINDING, EMBROIDERY, FURNITURE, JEWELRY, LACE, POTTERY, TAPESTRY, ETC.

Methods and Technique.—A volume would be required even to summarize the immense amount and variety of the processes and manipulations of the decorative arts, and the books and manuals treating of them would fill a large library. In a brief article it is only possible to notice a few of the more general considerations involved. Decoration is effected by modifications of the form and surface of an object, or by the use of color, or by both combined. All the arts which manipulate form alone are called the plastic arts; these include all kinds of modeling, carving, embossing, forging, casting and all relief and incised work. The arts of decoration by color are the chromatic arts, such as painting, mosaic, inlay, stained glass, enamel, all textile work in color, damascening and niello-work in or on metal, and manuscript illumination. There are also many arts which combine plastic and chromatic manipulations.

On the side of design, the decorative arts make use of pictorial representation, not only in mural painting and decorative sculpture, but also in the minor arts, as in painted vases, mosaics and stained glass. Both the human figure and the forms of animals are prolific elements in the decorative arts of almost all ages and peoples, with the exception of the majority of the Mohammedan arts, which exclude all realistic portrayals of living beings, even of plants. Flowers and foliage are conspicuous in certain styles of decorative art (see PLANTS, ORNAMENTAL), but these are usually conventionalized, not represented in a purely realistic way. The original purpose of decorative representation in every form has usually been symbolic or allegorical, or even, in the more primitive arts, animistic. But as each art has developed, such forms have come to be used more and more for their purely decorative value, their original symbolic significance being gradually lost. Along with these, all styles of decoration have developed other forms, purely ornamental, as motives which they have combined into patterns (conventional ornament), having little or no symbolic significance, but serving purely as embellishments, enriching the form of an object by a pleasing play of line, light-and-shade and color, through the rhythmic repetitions, alternations, variations and contrasts of the pattern. The Mohammedan races, deprived of the resource of naturalistic representation, have developed the art of surface patterning with purely geometric motives to an extent of unison and splendor. See MOHAMMEDAN ART.

History.—Decoration is the earliest form of expression of man's aesthetic instinct. The fine arts had their birth in primitive efforts to embellish the person or to beautify objects of personal or ceremonial use. See ABORIGINAL ART. With the advance of civilization, to the primitive arts of weaving, pottery and wood carving was added architecture, in the effort to adorn the cave, hut or kraal of the tribe or of its fetich or gods. Later the art of smelted metals enabled men to make tools of copper or bronze, later of iron and steel, superior to the primitive flint knives and axes. Decorative metal-work, jewelry and architectural sculpture and carving now began to advance to higher achievements. Before these processes were added, and painting was applied to walls and ceilings with great effect. These developments took place first, some thousands of years B.C., in the Nile Valley, while in the valley of the Tigris-Euphrates a parallel development took place with brick and tile as the chief building materials, in place of stone. In both regions textile art was carried to a very high pitch of decorative beauty, and gold, silver, bronze and glass as well as pottery were employed for dishes and vases of great elegance of form and richness of decoration.

These various arts were disseminated through the Mediterranean basin by Phoenician commerce, and contributed to the formation of Greek decorative art, which, developing after the middle of the 7th century B.C., excelled in two fields especially—architectural carving and sculpture, and pottery; although, indeed, the Greeks touched nothing that they did not adorn. The Roman civilization, developing later and borrowing freely from the Greek, carried the art of architectural carving to even higher perfection, at least in variety and splendor, especially during the Imperial Age, from 27 B.C. to 313 A.D. The Romans made the first systematic applications of decorative mural decoration. This art was taken up by the Byzantines in the 5th century A.D. and employed by them in wall and vault decorations of unsurpassed splendor, for at least eight centuries, in Italy as well as in their own empire. They also excelled in ecclesiastical goldsmith's work, in enameling on metal, in needlework and in manuscript illumination. See BYZANTINE ART.

The Middle Ages witnessed the growth of two distinct systems of decorative art: that of the Christian world in Europe generally, culminating in the superb triumphs of Gothic architecture, carving, stained glass and manuscript illumination, besides enamel and metal-work in France and inlay and mosaic in Italy; and that of the Mohammedan peoples in western Asia and northern Africa, Spain and India. This Oriental art was especially rich in surface decoration (as in the stucco wall-paneling of the Moors), and in various forms of textile art—carpets, rugs, and needlework. To this day the great peoples of Asia, the Chinese, Japanese, and Hindus, as well as the Mohammedans of Persia, Turkey and parts of Arabia, are consummate masters of the minor arts. The decorative arts of the non-Moslems of
India and of the Chinese and Japanese form a
group by themselves apart from the European
developments, which they surpass in variety
and richness of minute patterning, and in harmonies
of brilliant colors, if not in intellectual quality.

The Renaissance, from 1400 on, revived
many of the antique Roman forms, but de-
voured the vast and glorious development
that passed out of general use, mural painting, from
as far back as 1300 under Giotto (q.v.), took
its place in Italy and spread thence into all
countries. (See PAINTING). All the arts of
wood, stone, metal and textiles were marvel-
ously expanded, enriched and developed and
took the lead in all these arts except that of
decorative sculpture, in which France has led
ever since the early Middle Ages.

The first half of the 19th century was in
Europe a period of artistic stagnation. Since
then the decorative arts have been revived in
all branches, but the development of machine
production has greatly modified this develop-
ment, generally for the worse. Hand-crafts-
manship has greatly declined; in certain indus-
tries it has wholly disappeared. On the
other hand, the multiplying of factory products
has made possible a wider distribution of artis-
tic manufactures than when only handwork pre-
vailed. One effort, then, of modern artists is
to perfect the design of machine-made products.
But another, quite as important, is represented
by the Arts and Crafts movements of our
time, which seek to revive forgotten and
neglected handicrafts, to increase the number of
individual craftsmen and craftsmen, and to
stimulate the public appreciation of the indi-
vidual qualities of hand-wrought objects of
decorative art—textiles, pottery, china, metal-work, bookbindings, jewelry—as
well as of the major arts of mural painting and
decorative carving and sculpture. See Morris,
William.

DECORATIVE ARTS, Minor. Called in
former days, frequently, 'minor arts.' As the
term implies, the decorative arts are those which
are called into play in giving an ornamental ap-
pearance to articles of utility. In the practice
of the decorative arts the essential feature al-
tways to be borne in mind is that the decoration
is subsidiary to utility. The article itself must
not, in its decoration, become less fitted for its
purpose, else the article becomes an ornament.
The basic form of the article decorated must not
be modified sufficiently as to hide its purpose.
The decorative arts have the function of beautify-
ing; they hide the nakedness of a plain surface,
or break the cold regularity of a plain outline.
But such embellishments are not brought about
by covering (overloading) the available space,
crowding of ornamentation being a vulgarity not
art. If we take, as an illustration, the structure
of a chair, the appearance of cumbrousness may
be eliminated for artistic effect by reducing
the woodwork to smaller proportions, or round-
ing off the square edges, thereby creating a
decorative effect of lightness. Or the back
and legs of a chair may be given decorative curves
to avoid angularity. But the tapering or re-
duced proportions must be so calculated as in
no wise to encroach on the necessary strength
of the joints or other parts of the structure
where the lateral or vertical strain is imposed.

In jewelry, as another example, a brooch that
is to be worn on delicate or flimsy textiles must
have no sharp projecting points which will tear
or tangle the textile. Another canon in the
DJ
         DECORATIVE ARTS 509
 teachings of the arts of decoration is that of
the adaptability of the decorative theme to
the medium operated on. Thus, with the pass-
ing of the Gothic period in the tapestry
weaves, wonderful imitations of 'painting' ef-
fects were aimed at by the use of thousands of
color tones of yarn. The painted picture was
'simulated,' but the lovely woven effect of tape-
stry was sacrificed, much to the detriment of the
decorative art value. The greatest masters in
the decorative arts were, incomparably, the
ancient Greeks. Their utensils had marvelous
beauty of form, but the form was ever con-
trolled to bring out perfection of the practical
usefulness of the object for the purpose de-
sired. The surface decoration never was
allowed to interfere with its usage; and the
decorative 'values' were always subjected to
the size and shape of the spaces embelished.
The asymmetric disposition of their ornament
alike with that of the Japanese kakiemon style
(see JAPANESE CERAMICS) are admirable ex-
positions of decorative art treatment in perfection.
Some of the spheres in which the decorative arts
find application are ceramics, enamels,
lacquers, arms and armor, woodwork, embroi-
dery, bronzes, engravings, textiles, ironwork, jade
and other stone carving, furniture, bookbinding,
glass, silversmithing, goldsmithing, rugs, ivories,
clocks, locksmithing, mosaics, manuscripts, laces,
numismatics, etc. When the Italian Renaissance
(16th century) brought its influence to bear
on furniture and household utensils the vogue
became so forceful that the existing pieces of
decorative art work were not only discarded but
largely destroyed. With the more grandiose
ideas of the French under Louis XIV much of
the refined furnishings of royalty and nobility
was destroyed or set aside to decay. When
the great changes in style of the Regency and
Louis XV came about we get the same discarding
and destruction of the former art pieces. But
soon the Revolution arrived with destructive
tendencies entirely void of reconstruction. And
the danger of entire loss of the art examples
of the past became apparent to a group of connois-
seurs. David, in supreme power in all art mat-
ters early in the 19th century, had no respect
for anything but misrepresentations of the
antique then being produced and offered no pro-
tection for true art works. These connoisseurs,
in order to aid the survival of some of the beautiful work of the past, began collecting the remnants of the styles of which there were rapidly disappearing. Of such were Alexandre Lenoir, Vivant-Denon (Director of Museums under the Empire); Charles Sauvageot and du Sommerard, who made great collections for the propaganda; Villémin, about 1805, began publishing the great works of art and Inédits, recalling by illustrations the art beauties of other styles. Revoil assisted in the work. Other art publications helped to place the "pseudo-classic" style of the Empire back in its inferior rank. The hunt for examples of the past art styles became quite popular and such pieces were disclosed in sacristies, garrets, or put to most vulgar uses by the lower classes, given to children to play with, etc. The work of the amateur collector of period furniture and engravings in the Kings and the Wealthy, in the days of the "Restauration." Noted among these were such connoisseurs as Carand, de Pourtalés, de Monville, d'Ivry, Brunet-Denon, Durand, Fierard, Debruge, Durnenil, Rebuilder, etc. In 1832 Duree Sommerard's great collection was taken to the old Cluny Hotel (Paris) to become the decorative arts museum visited by the world's artisans for study. The French government, in 1843, purchased the collection and the old Cluny building. The antique treasures of reality were always dispersed through the different palaces, but after the Revolution of 1848 these different collections were taken over by the state and the Louvre Museum became a rendezvous for art lovers with its old Gallery of Apollo restored and others added and filled with art examples of the Middle Ages and Renaissance. France became the supreme decorative arts producer of Europe when the École Nationale des Arts Décoratifs (founded 1765) was advanced as the centre of art culture for artisans.

The Electors of Saxony from 1553 to 1733 collected large quantities of art works in their Dresden palace, and by 1724 there were separate salons for statuary, ivories, wood-carving, stone and metal-work, gold and silver-smithing. The term Grüne Gewölbe (Green Vaults) was applied to the collection. Dresden also acquired, in the 19th century, its Historisches Museum for arms and armor. Ludwig I of Bavaria near the middle of the 19th century brought into being great collections of ivories, wood-carving, Limoges enamels, etc., in his palace at Munich. Friedrich Wilhelm III of Prussia gathered together his art collections and placed them in his Berlin palace which received the title "Königliche Künstlerakademie" (Royal Chamber of Arts). Its immense popularity and usefulness and its rapid growth caused it to be removed to the Berlin Museum. Vienna got together its fine armor collection from the Ambras castle and its great quantities of art and industrial art treasure in the Imperial Palace. Darmstadt, Hanover, Nuremberg, got their museums. In Italy the Uffizi Palace Museum of Florence contained many decorative art collections, such as the "Cabinet of Gems"; also the Pitti Palace of Florence became a museum for great gold, silver, and bronze art works besides its famous picture collections. Rome had long since her galleries of antiques and art collections. England remained oblivious to the fact of the growing decorative arts movement until the Universal Exhibition held in London in 1851, when she opened her eyes to the poverty of her art production and saw the marvels of the great foreign schools, used them as examples as models. Many purchases were made for the British Museum (Arundel Collection, Bernay Collection, etc.). At Burlington House a new museum of decorative arts was accumulated in 1851, but in 1857 Kensington Museum was built and filled with fine works of art. The government of students of the arts. In 1857 the South Kensington Department of Science and Art was started with branches elsewhere for art instruction. In the Paris Exposition of 1857 was shown the great advance in France in its potteries, its glass work, also in the furniture industry. Vienna then (1864) started her Museum for Art and Industry with fine examples of the arts and crafts. South Kensington Museum (1872) opened its Bethnal Green Museum branch in the midst of the largest factory district. Berlin in 1867 started its Kunstgewerbe Museum (Museum of Arts and Crafts) after the Vienna model to soon become one of the richest collections in the world. Its instruction schools quickly grew to include the whole country, elevating the chief industries. The Vienna Universal Exposition of 1873 developed into her "Fachschulen" (schools for special branches of study), now so numerous. In Bavaria the Munich National Museum (founded 1877) became powerful in its art work; the ancient treasures of Nuremberg assisted her to greatly increased industrial activity, and it later received its Gewerbe Museum with its permanent exhibition for manufacturers and merchants of art and crafts which became specialized with separate establishments such as for metal-founding, bookbinding, locksmithing, etc. Now started Kunstgewerbe museums at Hamburg, Leipzig, Dresden, Kaiserslautern, Frankfurt, Stuttgart, to be followed later by those of Düsseldorf, Köningsberg, Danzig, Karlshuhe, Cologne, Kiel, Krefeld, Halie, Hanover, Flensburg, etc. Crafts exhibitions helped the industrial art progress, such as at Munich (1876), Berlin (1872), Dresden (1875), Cologne (1876), Lille (1879), Düsseldorf (1883), Nuremberg (1885), Augsburg (1886), Strasbourg (1895), Düsseldorf (1901). The great progressive outcome of all these activities became apparent in the Paris Exposition (1900) and the Turin Exposition (1902).

France, in order to maintain her hold, and seeing her supremacy in the decorative arts severely threatened, formed the "Union des Beaux-Arts Appliqués à l'Industrie" and founded a "Retrospective Museum for annual exhibitions. This became the "Musée Nationale des Arts Décoratifs" located in the Louvre, and, with the State factories at Sèvres for porcelains and other enamel techniques, the Gobelins doing decorative art work, the Garde-Meuble (furniture, etc.), France was enabled to at least hold her own with the sharp competition. In England William Morris carried on his decorative arts propaganda backed by such artists as Burne-Jones, Rosetti, Ford Madox Brown, etc., and his workshops (started in 1874) showed fine work in quality and capacity. In 1883 they started the "Crafts Exhibition" to be continued as the "Arts and Crafts Exhibition Society" (1880-90). In 1885 started the Birmingham Guild of Handicrafts. Walter Crane, Professor Lethaby, J. Hungerford Pol-
DECORATIVE DESIGN—DE COSTER

len, etc., continued working enthusiastically to further the British decorative arts movements. In recent years the magnificent Victoria and Albert Museum (London) emerged from the less promising South Kensington Museum. Summing up the above historic facts we arrive at the following analysis of conditions. The movement brought about by Germany transformed the method of displaying the contents of the museums for archaeological, cultural and esthetic purposes into a systematic arrangement for industrial, practical study propaganda. The scheme was so successful in industrial results that the other advanced European nations had to fall into line.

Until quite recent times nothing of this artist-artisan propaganda was practised in the United States. European art students and artisan specialists have found here a free noncompetitive and highly profitable field for their talents. What little has been done to promote native training of the decorative arts has been of a sporadic nature, unsupported by the government. Its chief platform has been that of extension study in the schools. But a national awakening has taken place. Museums are being opened in the industrial centres, and all are hastening in their activities in a systematic teaching of Art in a vocational sense; the art museums of New York, Brooklyn, Boston, Philadelphia, Chicago, Pittsburgh, Saint Louis, Buffalo, Worcester, Minneapolis, Cleveland, Toledo, San Francisco, etc., are vying with one another to excel in conveying methods of teaching art for practical purposes to the neighboring schools with lectures and class visits to the exhibited examples of the Gothic, Renaissance and other periods. Art schools for vocational teaching are multiplying; in New York we have as centres, the Art Students' League, the National Academy of Design, Pratt Institute, the Independent School of Art, the New York School of Fine and Applied Arts, the Beaux Arts, Cooper-Union, Teachers College, the New York School of Applied Design for Women, etc.; a worthy beginning imbued with an enthusiastic impulse. See also INTERIOR DECORATION.

DE COSTA, Benjamin Franklin, American clergyman and writer: b. Charlestown, Mass., 10 July 1831; d. New York, 4 Nov. 1904. He entered the ministry of the Episcopal Church and was rector North Adams, Mass. (1858-59); Newton Lower Falls (1858-60); chaplain in the Federal army (1861-63) and rector of the church of Saint John the Evangelist in New York (1863-99). In the year last named he became a Roman Catholic. Included in his many publications are 'The Pre-Columbia Discovery of America by the Northmen' (1869); 'The Moabite Stone' (1870); 'The Rector of Roxbury,' a novel under the pen-name of William Hickling (1873); 'Verrazano the Explorer' (1880); and 'What the Gofit Thou?' (1902). He became president (1884) of the first branch of the White Cross Society, of which he was the organizer. He was editor also of the Christian Times, The Episcopalian, The Magazine of American History and White's Memoirs of the Protestant Episcopal Church (1881).

DE COSTER, Charles Théodore Henri, Belgian poet: b. Munich, 20 Aug. 1827; d. 7 May 1879. He was professor of French literature at the military academy in Brussels. His principal work is the prose epic, 'La légende de Tiel Tyylenspiegel' (1867). Others are 'Les légendes flamandes' (1857); 'Contes belges' (1861); 'Voyage de noce' (1872). Consult Potvin, 'Histoire de lettres en Belgique' (1882).
DECOY, a place into which wild fowl are decoyed in order to be caught. A decoy pond is kept only in an secluded situation. Several channels or pipes of a curved form, covered with light hooped net-work, lead from the pond in various directions. The wild fowl are enticed to enter the wide mouth of the channel by tamed ducks, also called decoys, trained for the purpose, or by grain scattered on the water. When they are well into the covered channel they are surprised by the decoy-man and his dog, and driven up into the funnel net at the far end, where they are easily caught. There are differences of detail, but the general features of decoys are the same. Consult Grinnell, 'American Duck Shooting' (New York 1901).

DECREE, in general, an order, edict or law made by a superior as a rule to govern inferiors. In law it is a judicial decision or determination of a litigated cause. The decree of a court of equity or admiralty answers to the judgment of a court of common law. It differs from a judgment in that the decree decides the justice of the case on the principles involved rather than the right or wrong of the bare questions. In it signified a determination or judgment of the Roman emperor on a suit between parties. In the former German empire the resolutions of the emperor, declared to the estates of the empire, were called decrees. The old name of royal orders in France was ordres or lettres. The national convention, while it possessed sovereign power, used the expression, La convention nationale décréte; but the imperial government used the words imperial decree, for instance, in the famous decrees of Berlin and of Milan. In ecclesiastical history the term is especially used with reference to the authoritative decisions of councils; or to a decision of the Pope arrived at by consultation with the cardinals. See BERLIN DECREE; MILAN DECREE; DECRETALS.

DECREES OF GOD. This expression is of divine origin and is found in the Westminster Confession. The term includes the doctrines of predestinateness, foreordination and election. It has, however, a much wider application and includes the whole plan of God. By implication, also, it includes the doctrine of the sovereignty of God. The entire subject was much debated by Calvinists and Arminians.

DECREPITATION, the cracking noise made by several salts and minerals when suddenly heated. It is accompanied by a violent exfoliation of their particles, and is due to the sudden conversion into steam of the water which is mechanically enclosed between the solid particles of the body; or to the unequal expansion of the laminae of which the mineral is composed in consequence of their being imperfect conductors of heat. The true cleavage of minerals may be often detected in this way, as they fly as particles from natural fissures.

DECRETAL, The (Decretales), signifying pontifical disciplinary decisions, (1) the second part of the Canon Law or Corpus Juris Canonici which contains in five books the papal constitutions, laws, and decisions from the time of Gratian's Decretum, 1151 to 1234, when this second part was compiled by Saint Raymond of Pennafort at the order of Gregory IX. The subject matter of each of the five books is expressed in the mnemonic hexameter verse:

Judicium, iudex, clericus, consilia, crimina;
meaning that the decrees of the first book relate to the constitution of tribunals, those of the second to the duties of judges, those of the third to the rights, privileges, and the dignity of each of the fourth to marriage, and those of the fifth to offenses against the Church's laws.

(2) The False Decretals, or the Pseudo-Isidorian Decretals, a collection of decreals, gathered ostensively by Isidorus Mercator, in the middle of the 9th century. The modern authorship of the document are not known; but as a copy of the Council of Paris (829) is quoted, the collection must have been made later than the year in which the council was held. Some modern historians claim that the collection was well known before the year 845; the period has been narrowed down to 847-850. Rheims and Mayence are each given as the place where the work of collating and writing was done. The writer called himself Isidore Mercator (the "Merchant") and in some MSS "Pecceator" (the "Sinner"). The writer may have had in mind the great Saint Isidore, who had previously made a compilation of decrees and canons). Historians claim that the name was, like the decreals, false, and that evidence points to Benedict Levita of Germany as the compiler. The collection was received at first as authentic. To have at hand and in convenient form all the decrees of councils and the decreal letters of deceased popes, was indeed a boon to be highly appreciated. It was known that letters and documents existed other than those to be found in any collection, so when this collection made its appearance, it was regarded as worthy of praise and thanks.

The collection opened with the 50 apostolic canons received and collected by Dionysius Exiguus; and these were followed by a number of decreal letters said to have been written by early popes, from Clement of Rome, one of the apostolic fathers, to Melchizedek, at the end of the 3d century. None of the letters claimed to have been written by popes; decrees purporting to have been promulgated at the councils of Nicea and Seville, came next. Some of these are true. Then came other letters said to have been written by popes, beginning with Sylvester (who succeeded Melchizedek) and ending with Gregory the Great. All of the decreals in this collection credited to Pope Siricus (384-399) is genuine. The last part of the compilation is a copy of the canons passed by Gregory II (731) at the council held in Rome. Möhler, the German theologian, in commenting
upon the fact that these decretales were at first to well received, almost without a dissenting voice, says: "Pseudo-Isidore seized exactly that in his own age which corresponded to the wishes of all the higher and better order of men. Thence it was that this legislation was so joyously received. Not only was it expected anything false, because it contained so much that was weighty and true. If we examine carefully these invented decretales, and try to characterize their composer in accordance with their general import and spirit, we must confess that he was a very learned man, perhaps the most learned man of his time, and at the same time an extremely intelligent and wise man, who knew his age and its wants as few did. Rightly he perceived that he must exalt the power of the centre—that is, of the Pope—because by that way only was deliverance possible. Nay, if we would pass an unconstrained judgment, we may venture even to call him a great man."

At the time of the appearance of the collection and for centuries afterward, its contents were so held. It was by no means astonishing to hear that of Europe the whole was accepted without thorough examination or criticism. Nicholas of Cusa, an able theologian of the 15th century, was the first one to express a doubt of the genuineness of the collection, and to advance proofs of the truth of his assertion. The Magdeburg Centuriators began investigations, and then many Protestant critics followed the same line of study, arriving at the same conclusion as that of Nicholas of Cusa. Finally, when the Isidonean decretales were critically examined by theologians and historians, it was ascertained that nearly all were forgeries, and that anarchisms and blunders existed in large numbers. Phillips, Hefele, Mohler and others show that in the whole collection there was nothing against the supremacy of the Pope, as had been advanced by some writers; that the letters said to have been written by popes were nearly all false, also that several of the spurious documents existed prior to the 9th century and may have been used in good faith by the compilers. See Canon Law; Christian Doctrine, Development of.

Bibliography.—Paulus Hinschius, 'Decretales Pseudo-Isidorianae' (Leipzig 1863); Laurin, 'Introduzione in corpus juris canonici' (Freiburg 1889); Schulte, 'Geschichte der Quellen und der Literatur des Kanonischen Rechts' (Stuttgart 1875-80); Taunton, 'The Law of the Church' (London 1906).

DECUARIONES, magistrates in the provincial municipia of the Roman state, corresponding to the senate at Rome. Originally the popular assemblies had the sovereign power in the municipia, and conferred the executive authority upon the decuriones. They consisted at first of 10 men, but in later times they frequently numbered more, and sometimes even as many as 100. The magistrates were presided over by two members who were called duumviri, and whose powers within their municipium resembled those of the Roman consuls during peace. Under the republic the whole administration of the internal affairs of their respective cities was in the hands of the decuriones, but after the establishment of the empire they exercised nearly all the circumscribed rights of the communities, though finally they were little more than receivers of taxes. The decuriones were created by election, and each decurio was required to be at least 25 years old, and to possess a certain annual income. Their election took place on the kalends of March. Consult Reid, 'The Municipalities of the Roman Empire' (Cambridge 1913).

DEDEKIND, di'de-kîn, Friedrich, German poet: b. Neustadt on the Leine 1525; d. 27 Feb. 1598. His principal work is 'Grobianus' (1549), a satire in Latin distichs against drunkenness and obscenity; it had wide circulation, and was translated into German, Dutch and English. He wrote two dramas having a religious polemic end in view: 'The Christian Knight'; and 'The Converted Papist.'

DEDHAM, Mass., town, county-seat of Norfolk County; on the Charles River about 25 miles from its mouth, and on the New York, New Haven and Hartford Railroad, 10 miles southwest of Boston. The town is one of the oldest in the State, the first settlement within the town's limits, having been made in 1635. The town is noted as having established the first public school in America supported by a general tax (1644). It has considerable manufacturing interests in cotton, wool, carpets, handkerchiefs and clay, but its chief interests are connected with Boston, of which it is practically a suburb. The prominent buildings of the town are the Historical Society building, the county buildings, including the courthouse, jail, and house of correction, and a public library. Water power is obtained from Mother Brook, a canal connecting the Charles and Neponset rivers, built in 1641. The government of the town is administered by means of town meetings. Pop. 10,063. Consult the town records (8 vols., 1635-1880); Mann, 'Historical Annals of Dedham' (Dedham 1847).

DEDICATION, Feast of the (Heb. Chanukkka) an annual Jewish festival in commemoration of the purification of the Jehovah Temple in Jerusalem after it had been desecrated for pagan worship by the Syrians and later recovered by Judas Maccabeus. The temple had been dedicated in B.C. 168 to the worship of Zeus Olympus by the then ruler of the land Antiochus IV, Epiphanes, and an altar to the god set up on the altar of burnt offerings. When Judas Maccabeus in B.C. 164-65 drove the Syrians out of Jerusalem, he removed the pagan altar, rebuilt the altar of burnt offerings and purified the temple. It was then rededicated to Jehovah with a series of festivals, including a period of eight days. There is some doubt as to the exact date when the dedication took place; in 1 Macc. iv, 52-54, the date is given as the 25th of Chislev (December); the same day the heathen had profaned it, but the day when the pagan altar was set up is given in 1 Macc. i, 54, as the 15th of Chislev. It is most probable, however, that it took place on the 25th in the manner in which the feast is now celebrated, and from the fact that both nations consulted with one another on that date. The use of lights is one of the characteristics of the feast, it is called the Feast of Lights by Josephus ('Antiq.' xii, 7, § 7), and the custom is also mentioned in Talmudic literature. The feast is mentioned
DEDLOCK, Lady, the wife of Sir Le- icy DEDLOCK, a Dickens' novel called 'Bleak House.' Outwardly cold and haughty, she is inwardly wretched in consequence of being haunted by recollections of her past life, and by fear that the existence of her illegitimate child, Esther Summerson, will be revealed. Lady Dedlock dies at the cemetery where her former lover is buried.

DEDUCTION. Deduction is reasoning from a general principle to other less general truths which are dependent upon this principle. It consists in showing that the general law or principle assumed as the starting point is applicable to a particular subject matter, and in drawing the necessary consequences of its application. The form of this mode of inference is therefore given by the syllogism (q.v.), where the major premise (all M is P) states the general law, the minor premise (S is M) the application to a particular case, from which the conclusion (S is P) follows as a necessary consequence. The principle of this method of reasoning is commonly described as subsumption: the conclusion is shown to fall under or be included in the more fundamental propositions which are assumed as the starting point. These latter propositions can similarly be derived from others of still greater generality, until at last we reach the ultimate principles which form the foundation of all science. As to the foundation on which the ultimate principles themselves rest, various theories have been held. Until comparatively recent times the prevailing view (though by no means universally adopted) has maintained that these propositions neither require nor admit of any demonstration. They are necessary intuitions of the mind whose certainty is direct and immediate, and of a higher type than demonstrations can yield. They thus constitute the basis of all science, since they are the fundamental first truths to which all science appeals as its unquestioned authority. In the 17th and 18th centuries particularly, mathematics was regarded as the ideal science, and the position of the demonstrable first principles of all science was often paralleled with that of the axioms of mathematics. It was assumed before the time of Kant that mathematics was wholly a deductive science which derived its results through an analysis of its initial concepts. In like manner it was hoped to put all knowledge on a demonstrative basis by discovering the whole system of necessary truths and by showing how all particular facts in the various fields could be derived from them; for this would afford the absolute certainty which science was supposed to demand, i.e., every fact would be deduced as a necessary consequence of some general principle. As regards the empirical conclusions reached by inductive reasoning, they were not regarded as worthy of the name of science, for they are not universal and necessary truths, but only particular and more or less probable.

The development of thought in recent times has, however, entirely revolutionized our ideal of knowledge, and at the same time broken down the sharp distinctions between necessary, or a priori principles, and empirical truth, as well as between induction and deduction as contrasted methods of reasoning. It is now widely recognized that there are no a priori truths in the old sense; no propositions that are certain in themselves apart from their connection with the rest of experience. It is true, the principles of logic itself and of mathematics, which is a branch of empirical science, may be to partake of a priority to such an extent that we are justified, for most purposes, in treating them as quite a priori. No matter how ultimate any truth may appear, or how necessary in itself, its certainty and necessity are mediated in and through its relation to other experienced facts with which it is connected in the organic unity of a system. It is only through this systematic connection of the parts of knowledge that any inference is possible. For it is only in a whole, where the parts are systematically connected, that the nature of one part enables us to say what the other parts must be. And when it is seen that reasoning consists in making explicit the systematic connections of facts, the contrast between deduction and induction begins to fade away. The structure of every inference is essentially the same; every inference is constituted by the relating of facts through a general principle. In deduction, as we have seen, the general truth is the starting point and we go on to explicate it in its application to some particular group of facts. On the other hand, the problem may be to find some relating principle for a given group of facts; and here we have to work in the reverse direction, beginning with the particulars and by the use of inductive methods seeking to bring to light some universal principles of connection. There are no sciences which use exclusively either one of these methods. Even mathematics, which is supposed to employ only deductive reasoning, depends for a very essential class of demonstrations, known as existence proofs, on a more or less direct reference to concrete experience; and, on the other hand, the so-called observational sciences reason deductively in tracing out the law of the laws which have already been discovered and the consequences of the hypotheses which are employed. In every field thought uses all the means and methods which it can command to aid in solving its problems. Induction and deduction, observation and reasoning, are not separate and isolated processes, but functions of the knowledge-process which are supplementary and go hand in hand. See Induction, Mathematical; Logic.

JAMES E. CREIGHTON, Professor of Logic and Metaphysics, Cornell University.

DEE, John, English astrologer: b. London, 13 July 1527; d. Mortlake, England 1608. In early life he had devoted much of his time to mathematical, astronomical and chemical study; and in 1548 rumors began to prevail that he was addicted to the black art. They were probably well founded; and to avoid the consequences he went abroad. In 1551 he returned to England and through the instrumentality of Cecil, who presented him to Edward VI, obtained a pension of 100 crowns. The suspicion
of the black art appears still to have clung to him, and shortly after Queen Mary's accession he was charged with practising against the queen's life. He was imprisoned. He obtained his liberty in 1555 and after Queen Elizabeth's accession was consulted by Lord Dudley as to a "propiitious day" for the coronation. Lilly's account of him is that he was the queen's intelligence, with a fixed salary; a great bookworm, a mathematician, a hermetic learning, a perfect astronomer, a curious astrologer, a serious mathematician and excellent in all kinds of learning. The nature of his employments excited strong suspicion and in 1576 he was furiously attacked by a mob, from which he had difficulty in escaping with his life. In 1578 during an illness of the queen, he was sent to consult with the German physicians and philosophers as to her recovery and after his return was employed to draw up a sketch of the country sea which, from having been discovered by English subjects, belonged to the crown. He accordingly prepared two rolls, giving both a geographical description and a historical account of the countries. These curious documents are still extant in the British Museum. He returned home, obtained from the queen in 1594 the chancellorship of Saint Paul's Cathedral and in 1595, the wardenship of Manchester College, which he held nine years. It has been supposed, with some plausibility, that Dee's character as an alchemist was merely assumed to enable him to act more securely and effectually as a spy in the employment of the English government. His writings on the occult sciences were published in 1659.

DEE, the name of several British rivers. 1. A river in Scotland, partly in Kincardineshire, but chiefly in Aberdeenshire, one of the best salmon rivers in Great Britain. It rises on the southwest border of Aberdeenshire in the Cairngorm Mountains and flows generally east, 87 miles to the North Sea. Its total course is 90 miles. The city of Aberdeen is at its mouth. 2. A river of North Wales and Cheshire; rises in Lake Bala, Merionethshire; flows north-northeast and northwest to the Irish Sea, 20 miles below Chester; length, about 70 miles. 3. A river of Scotland, county of Kirkcudbright, rises in Loch Dee. It flows southeast and south into Kirkcudbright Bay; length, 50 miles.

DEED, a written instrument under seal, containing a contract or agreement which has been delivered by the party to be bound and accepted by the obligee or covenantee. It has also been defined as follows: "A writing containing a contract, sealed and delivered by the party thereto." (2 Wash. Real Prop. 553.) The law requires greater form and solemnity in the conveyance of land than in that of chattels. This arises from the greater dignity of the freehold in the eye of the ancient law, and from the light and transitory nature of personal property, which enters much more deeply into commerce, and requires the utmost facility in its incessant circulation.

In the early period of English history the conveyance of land was ordinarily without writing, the act being equivalent, in point of formality and certainty, to deeds. As knowledge increased, conveyance by writing became more prevalent and ultimately by the statute of frauds and perjuries, of 29 Charles II, ch. 3, secs. 1, 2, all estates and interests in lands (except leases not exceeding three years) creating a grant, must be in deliver of seisin only, or by parol, and not in writing, and signed by the party, were declared to have no greater force or effect than estates at will only. And by the fourth section no person could be charged upon any "contract or sale of lands, or of any interest or estate in lands of the same," unless the agreement, or some memorandum or note thereof, was in writing, and signed by the party to be charged therewith, or some other person by him lawfully authorized.

With some trivial changes this statute provision has been adopted or assumed as law throughout the United States. Deeds must be upon paper or parchment, must be completely written before delivery, must be between competent parties, and certain classes are excluded from holding lands and, consequently, from being grantees in a deed; must be made without restraint; must relate to suitable property, and should be signed, sealed and delivered. The consideration of a deed must be good or valuable and not partaking of anything immoral, illegal or fraudulent.

A deed to be effective must be delivered and accepted. A delivery is the transfer of a deed from the grantor or his agent to the grantee, or some other person acting in his behalf, in such a manner as to deprive the grantor of the right to recall it at his option. An absolute delivery is one which is complete upon the actual transfer of the instrument from the possession of the grantor. A conditional delivery is one which passes the deed from the possession of the grantor, but is not to be completed by possession in the grantee, or a third person as his agent, until the happening of a specified event. A deed delivered in this manner is an escrow, and such delivery should be always made to a third person. No special form of procedure is required to effect a delivery. It may be by acts merely, by words merely, or by both combined, but in all cases an intention that it shall be a delivery must exist. It may be made by an agent or other person as the grantee himself. To complete a delivery, an acceptance must take place, which may be presumed from the grantee's possession.

In a deed the premises embrace the statement of the parties, the consideration, recitals inserted for explanation, description of the property granted, with the intended exceptions. The habendum begins at the words "to have and to hold," and limits and defines the estate which the grantee is to have. The reddendum, which is used to reserve something new to the grantor; the conditions; the covenants; and the conclusion, which mentions the execution, date, etc., constitute the formal parts of a deed and properly follow in the order observed here.

The construction of deeds is favorable to their validity; the principal rule is that punctuation is not regarded; a false description does not harm; the construction is least favorable to the party making the conveyance or reservation; the habendum is rejected if repugnant to the rest of the deed. The lex rei sitae governs in the conveyance of lands, both as to the requisites and the forms of conveyances.
DEEG—DEEP BOTTOM

Chancellor Kent, after observing that in the United States generally the form of conveyance is very simple, says: "If apprehend that a deed would be perfectly competent, in any part of the United States, to convey the fee if it were the following: A consideration of one dollar to me paid by C. D. do grant, bargain and sell to C. D. and his heirs, the lot of land (describe it), witness my hand and seal, etc."

DEEG, dẹ́g, India, town and dismantled fortress in Rajputana, state of Bhorpur, 24 miles west of Murta. It is a walled town, is situated in the midst of marshes, and almost surrounded by water during a great part of the year. At the southwest corner is the lofty rock of the Shah Boorj, on which the citadel stands. Deeg is a place of great antiquity, and contains remarkably fine palaces, only surpassed in beauty by the Taj Mahal of Agra. Holkar was defeated here by the British under General Fraser in November 1804, and the following month the town and fortress were taken.

DEEMS, Charles Forse, American clergyman and writer: b. Baltimore, Md., 4 Dec. 1820; d. New York, 18 Nov. 1893. He was graduated at Dickinson College in 1839, became professor of logic and rhetoric in the University of North Carolina (1842-47); of natural sciences at Randolph Macon College 1847-48. Becoming a Methodist minister at Newbern, N. C., he was from 1850-54 principal of the Greensboro Female College, N. C. From 1856 to his death he was pastor of the Church of the Strangers of New York, and was widely known as editor and author. He founded the American Institute of Christian Philosophy in 1881, and edited its journal "Christian Thought." A lectureship in philosophy was founded at New York University in his name in 1905. Included in his publications are "Triumph of Peace and Other Poems" (1840); "The Light of the Nations" (1845); "Observe Yings" (1872); "Chicks and Chunks for Every Fireside"; and "My Septuagint" (1892); "Life of Jesus" (1872); the Gospel of Common Sense as Contained in the Canonical Epistle of James (1889); "The Gospel of Spiritual Insight and Studies in the Gospel of Saint John" (1891). His autobiography with a memoir was edited by his sons (New York 1897).

DEEMSTER, an officer once attached to the high court of justiciary in Scotland, who formally pronounced the doom or sentence of death on condemned criminals. The office was conjoined with that of executioner. The name is now given in the Isle of Man to two judges who act as the chief justices of the island, the one presiding over the northern, the other over the southern division.

DEEMSTER, The, a novel by Hall Caine, called by the author the story of the Prodigal Son. It was published in the Isle of Man, and opens in the latter part of the 17th century. The Deemster is Thorkell Myria, whose nephew Dan, the prodigal, deeply loves his cousin Myra; but her brother Ewan interposes, resulting in the death of Ewan. Dan is tried and is declared cut off forever from his people, and banished to a remote corner of the island. During a visitation of the plague, Dan takes the place of Father Dalby, the Irish priest, effecting many cures and at last dying of the pestilence. A dramatization of "The Deemster" was produced by Wilson Barrett under the title "Ben-Ma-Chree."
DEEP RIVER—DEEP-SEA EXPLORATION

577

at Chaffin's Bluff. At the first intimation of Hancock's movement Wilcox moved up and joined Field, and from the south side of the James, General Lee sent Mahone's division of infantry and the two cavalry divisions of Wade Hampton and W. H. F. Lee. Johnson's and Gary's brigades followed, and there were three regiments from Pickett's division. Mott advanced on the New Market road, but was checked at the creek. It was 4 o'clock before Barlow, on his right, could get up one brigade, and with this he assaulted the position near Fussell's Mill, held for the night. On the right Gregg had advanced well up the Charles City road, and on the left Birney seized a part of the Confederate line and captured three guns. On the morning of the 15th Birney's corps, supported by division endeavored to turn the Confederate left. Birney moved toward the Charles City road, on which Gregg was advancing, but he made so wide a detour and found so many obstructions, that it was night when he found his proper position, and attack was deferred until morning. As a diversion to his attack Gregg's cavalry, supported by Miles' brigade of infantry, were to move up the Charles City road. Gregg was off at an early hour of the 16th, driving the Confederate cavalry beyond Deep Creek, as far as White's Tavern, only seven miles from Richmond. At 10 A.M. Terry's division of Birney's corps, supported by Craig's brigade of Mott's division, and Birney's brigade of colored troops, advanced against the Confederate line near Fussell's Mill, and, after a severe fight, carried it, taking three colors and between 200 and 300 prisoners from Mahone's and Wilcox's divisions; but the Confederates soon rallied, retook their works and drove Terry back. Soon after noon the Confederate cavalry, supported by infantry, advanced on Gregg and Miles, slowly driving them back to Deep Creek, and later in the day across it. There was a cessation of hostilities on the 17th. On the 18th the Confederates advanced from their works above Fussell's Mill and attacked Birney, who, with the assistance of Miles, repulsed them. On the night of the 20th the Union troops were withdrawn and returned to their positions in front of Petersburg and at Bermuda Hundred. In this battle the Union troops numbered about 25,000, the Confederates about 20,000. The Union loss was 2,161 killed and wounded, and 625 missing. There are no returns of Confederate losses. Consult 'Official Records' (Vol. XLII); Humphreys, 'Virginia Campaign of 1864-65'; Grant, 'Personal Memoirs' (Vol. II); Sheridan, 'Personal Memoirs' (Vol. I); Walker, 'History of the Second Army Corps.'

E. A. CARMAN.

DEEP RIVER rises in Guilford County, N. C. Its general direction is southeast to Chatham County, where it unites with the Haw River and forms the Cape Fear River. Its length is about 125 miles; it has good water power, some of which is utilized at Lockville. It is navigable to Carbornton.

DEEP-SEA EXPLORATION. While the beginnings of our knowledge of the surface of the sea date back to the earliest recorded voyages of discovery, the physical conditions obtaining in the depths of the great oceans have been ascertained chiefly during the past half century.

The modern science of oceanography (q.v.) is based largely upon the voyages of a score or more of vessels sent out by various governments for the special purpose of making physical and biological investigations of the oceanic basins.

As late as Captain Cook's time the ocean had been sounded no deeper than a few hundred fathoms. For scientific attempts to ascertain depths far from land, it is scarcely necessary to go back farther than a century and a half; and it was not until the day of submarine cables that systematic soundings were taken.

The dredge has been employed by naturalists in obtaining marine forms in shallow water for a century and a half, but its use in ocean depths has been limited to about half that period.

The governments that have participated largely in modern deep-sea exploration are the English, French, German, Austrian, Dutch, Russian, Norwegian, Swedish, and by no means the least, that of the United States. The foundations of oceanography as a science were laid by the British in the publication of the results of the famous Challenger Expedition. The investigations of this vessel were followed by those of American vessels, one of which, the Albatross, is perhaps better equipped for such work than any other vessel afloat, and has been in commission for more than thirty years.

Deep-sea explorations have now been carried into all seas and the general conditions of temperature, depths, and animal life in the great oceanic areas are no longer unknown, while the literature of oceanography occupies an important place in science.

The deep-sea exploring vessel of the present time might properly be described as a floating laboratory, equipped for hydrographical, meteorological, geological and biological investigations. The equipment would include not
merely that of a general scientific laboratory, but also the heavy apparatus necessary for sounding and dredging. The ship machinery for deep-sea work has been gradually brought to a state of high efficiency. Soundings formerly made with rope are now made with a single strand of wire, and instead of the stout rope cable for dredging, light wire rope of great strength is employed. Various self-recording instruments have gradually been perfected for quick and accurate work in taking deep sea temperatures and in the collecting of small forms of life at intermediate depths.

**Sounding.**—During the course of deep-sea exploration, many soundings have been made in depths exceeding 3,000 fathoms. More than 50 great depressions, or "deeps" as they have been called, are now known, varying from 3,000 to 5,000 fathoms. Ten of these exceed 4,000 fathoms. It is only in the western Pacific that depths exceeding 5,000 fathoms have been found. The greatest depth known was discovered in July 1913 by the German survey ship *Friedrich*, about 40 miles east of northern Mindanao, where a sounding was made of 5,348 fathoms, or 406 feet more than six miles. This depth exceeds by 3,000 feet the height of the loftiest mountain peak. The deeps now known are distributed over the Atlantic, Pacific and Indian oceans. While many of them are far out in great ocean basins, some of them are close to the continental slopes. One exceeding 3,000 fathoms (Bartlett Deep) lies in the Caribbean Sea between Honduras and Cuba. Some of the deeps are now known to extend over thousands of square miles while others are apparently mere holes. Enough sounding has already been done to indicate that the greatest depths have probably been discovered.

Deep-sea sounding has shown that the floor of the ocean has not only its depressions, but its elevations. Many islands are merely the projecting summits of submarine peaks, their bases often resting on an ocean floor lying 3,000 fathoms deep. Submarine ridges of great extent have been discovered in the north and south Atlantic. The average depth of the ocean is probably not less than 2,200 fathoms.

Several types of sounding machines are in use, but whatever the pattern, each contains a reel wound with thousands of fathoms of piano wire. In the operation of sounding, a detachable shot weighing from 30 to 60 pounds is employed to draw the wire rapidly and steadily from its reel. It is secured to the sounding rod at the end of the line in such a manner as to become detached when the bottom is reached. Several instruments are sent down at each operation. The sounding rod is provided with a device for bringing up a specimen of the bottom mud. A few feet above it are attached the deep-sea thermometer and water bottle. The latter secures its sample of water at the bottom only. All deep-sea instruments are necessarily self-acting at the bottom and thermometers are so constructed that they will not be damaged by higher temperatures on being brought toward the surface. While the sounding instruments are carried down by the heavy shot, the wire is reel'd in by steam power. It takes about one hour to make a sounding three miles deep and reel in the line with its attached instruments.

**Dredging.**—For the collecting of animal life from the bottom, the dredge is employed. This may be described as a bag-shaped net about 20 feet long, fitted with an iron-framed mouth from 8 to 12 feet wide and 3 or 4 feet high. It is towed by a wire cable about one-third of an inch in diameter, its length depending upon the region to be investigated. The cable is operated by a powerful engine on the main deck, and the cable itself is coiled upon a
rope is passed over the side of the ship from the sound of a bottom, the top of which is guyed to the mast with a spring to relieve strain. The spring or accumulator is graduated and often shows the dredge to be pulling thousands of pounds. The net is sometimes too heavily loaded to be lifted, and may be torn from its frame. Much of the deep-sea mud or ooze washes away during the progress of the dredge toward the surface and under ordinary conditions its load is no greater than can be lifted from the water and swung on board with safety.

Dredges are of several forms, the commonest being that of the beam trawl employed by fishing vessels in shoal water, but with a shorter beam. For convenience we shall refer to all appliances used for collecting at the bottom as dredges. For the exploration of intermediate depths, several types of nets are employed which can be opened and closed by devices operated by metal messengers sent down the dredge line. Various devices are used for collecting forms of life in deep water, such as the harpoon and other appliances well known to fishermen. The surface and intermediate depths of the sea bear forms of life for the capture of which fine-meshed tow nets are used.

Before using the dredge or beam trawl, the depth is ascertained by sounding. In dragging the dredge upon the bottom it is necessary to let out considerably more line than the actual depth, and the dragging of the dredge along the bottom can often be felt by merely placing the hand upon the dragging cable. The deepest dredge haul ever made (that taken by the Albatross off the Tonga Islands in the South Pacific) was 4,173 fathoms, and the time required from the moment the dredge was put overboard until brought to the surface was about 10 hours. On very rough bottom, where dredging nets may be torn from their frames, the "tangle" is often used. This apparatus consists of bunches of shredded rope attached to iron bars, and is effective in obtaining small fishes, sea urchins, crinoids and other creatures which have their surfaces sufficiently rough to become entangled in the loose strands of rope. Fish traps of special design have been used successfully at great depths, and the Albatross has succeeded in taking fishes at a depth of a thousand fathoms with ordinary gill nets.

Deep-Sea Life.—As plant life does not exist in the sea at depths below the influence of sunlight, we find at the bottom and at intermediate depths, forms of animal life only. These consist of fishes, mollusks, crustaceans, medusae, echinoderms and representatives of practically all of the classes of marine life to be found living in shallow waters under the influence of sunlight, but of very different genera and species. When deep-sea investigations began, it was hoped that archaic forms would be discovered; but this hope has not been realized except in slight degree. Animal forms are sometimes brought up by the dredge in great numbers. These animals are common enough to obtain several barrels of crustaceans, starfishes, mollusks or echinoderms, at a single haul. The dredge of the Albatross once brought up 800 fishes from a depth of 1,770 fathoms. The fact that the Albatross obtained living sponges at 4,178 fathoms indicates that there is probably no depth too great for the existence of animal life.

Surface Life.—The surface life of the sea consists of both plant and animal forms, the latter in great variety. It is usually minute, and much of it phosphorescent. It is the small life at or near the surface and now collectively called plankton, which makes the phosphorescence with which travelers at sea are familiar. It is more abundant in some regions than in others, and constitutes the food not only of many of the larger animals living at the surface, but is the basis of the food supply of all creatures living at the bottom and intermediate depths. These small forms are constantly dying and falling to the bottom. Indeed, their dead shells and skeletons cover great tracts of the ocean floor in the regions where they abound. The crustaceans are doubtless the most abundant of these pelagic forms, but almost all classes are represented, including mollusks, worms, ctenophores, tunicates, protozoans, fishes and even reptiles. In the colder waters of the ocean the tow nets used in taking plankton fill very rapidly with certain forms which swarm in cold waters; but in tropical waters a variety of forms is greater, although usually less abundant. Several forms of nets are used in taking the plankton, but all are lined with fine gauze or silk bolting cloth. Under the most favorable conditions the dragging of such nets at or near the surface often yields enormous quantities of surface forms. When the ship is at rest in favorable weather, surface life is readily attracted to insulated electric lights lowered a few inches below the surface of the water where it can be gathered from the deck with long-handled gauze-lined dip nets.

Great currents like the Gulf Stream, drift the surface life of warm regions into colder waters where it is killed by the lower temperature and deposited in great quantities upon the bottom. In such places the deep-sea life consists of bottom forms in greatest abundance. There are, however, wide areas such as those of mid-Pacific regions, which are almost devoid of surface forms, and where the bottom is correspondingly lacking in animal life.

Marine Deposits.—Geologists, like zoologists, is also dependent upon the deep-sea dredge for what is known of the floor of the ocean. The deposits may be referred to three groups: Those derived from the land through the action of rivers and currents and called terrigenous deposits. They consist of muds of various kinds which are characteristic of the adjacent lands from which they have been derived. Farther off, and beyond the influence of rivers, are the pelagic deposits which are made up of dead organisms originating at the surface. These are usually found in the form of diatoms, radiolarian, or globigerina oozes, depending upon the character of the surface life prevailing above them. Still farther from land, in the deeper parts of the ocean, are the red clay deposits, which are believed to cover about half of the floor of the ocean and receive the minimum of dead matter from the surface, and are far beyond the influence of matter washed from the continents. The red clay deposits are believed to have formed very slowly, and to have been subjected to little change during long periods of time.
Light.—The most recent investigations have shown that light does not penetrate deeper than five or six hundred fathoms, and even there is very dim. Experiments with the photometer have shown that light penetration is greater in tropical than in northern waters. A photographic plate exposed at a depth of 900 fathoms for two hours, was in no way affected. Below the levels reached by sunlight, the sea is in total darkness, and plant forms, with the exception of diatoms, are unknown. There is, however, some phosphorescent light, as the deep-sea plants, diatoms, and invertebrates with phosphorescent organs. Such light must, however, be very faint and unevenly distributed.

Notwithstanding the absence of light, a considerable number of deep-sea forms are brilliantly colored, brilliant reds being often found. Most of the deep-sea fishes are, however, black or grayish. Starfishes and crustaceans are frequently red or pink, while holothurians are often violet. There is a great variation in the size of the eye among deep-sea fishes, which is doubtless dependent to some extent upon the penetration of sunlight or the existence of phosphorescence, their eyes ranging from very minute to abnormally large. A number of the deep-sea species are totally blind.

Temperature.—The influence of the warmth to be found in the surface waters does not extend below a few hundred feet, even at the equator where such warmth is greatest. Below 900 fathoms the temperature is always within three or four degrees of the freezing point of fresh water. The low temperature at the bottom is caused by the settling of cold surface water in polar regions. The cold water thus slowly distributed over the floor of the ocean carries with it the oxygen necessary for the maintenance of life in the depths. The bottom of the Black Sea, receiving no such supply of polar water, is devoid of animal life. All deep-sea life would doubtless perish were it not for the mayflower brought down.

Salinity.—Studies of the salinity of the ocean, based on samples of water secured by special ships of apparatus from all depths, have shown various degrees of salinity in different seas. Sea salinity in the Atlantic is higher than in other great open oceans, and highest of all in the Red Sea and in the Mediterranean. It is remarkably low in the Black Sea and in the Baltic, where there are many rivers but no great evaporation.

Pressure.—Sea pressure amounts to about a ton to the square inch with each 1,000 fathoms of depth. At 1,000 fathoms it amounts to 180 atmospheres, while at the greatest depth known (over 5,000 fathoms), the pressure would be about six tons to the square inch. It is evident that animal forms of the surface regions could not endure such conditions, but the tissues of deep-sea animals are so permeated by fluids, that a balance is maintained. Most of the deep-sea forms are so soft that when brought to the surface they are partly or wholly watered in laboratory hardening processes for their preservation as specimens. Both fishes and invertebrates, when brought up from the greater depths, are always dead, and probably die before being dragged far from the bottom. It is interesting to note, however, that the Albatross has taken alive fishes from 500 fathoms, and large lithodes crabs from 735 fathoms.

Size of Deep-Sea Forms.—The dredges hitherto used in deep-sea exploration have secured no fishes or invertebrates of large size. The largest fishes taken seldom exceed four or five feet in length. It is not unlikely that by using larger dredges, with fine meshed nets, less liable to become overloaded with mud, larger animals could be captured.

Charles Haskins Townsend,

DEEP-SEA LIFE. In this account of midoceanic, or pelagic, life the writer purposes to restrict himself to the open ocean, that is the spaces of deep water covering the real oceanic basins. The great land-masses are bordered by a submerged rim of varying width, where the water does not exceed an average depth of 100 fathoms, beyond which the bottom falls or slopes to the plain of the original ocean-basin. The sum of these continental borders and similar shallow seas elsewhere, as in the archipelagic region of the western Pacific, forms only about 15 per cent of the 140,000,000 square miles of salt water, leaving more than four-fifths of it deeper than 100 fathoms, while nearly 10,000,000 square miles exceeds 3,000 fathoms in depth.

We speak of oceans, but in reality it is all one body of water, which by a constant interchange through currents both horizontal and vertical, maintains a virtual unity. The ocean is not a complete one, since distinct variations are observable in temperature, density (salinity), pressure and other physical characteristics that influence animal being. Therefore some parts of the ocean are more populous than others; some are more populous in summer and less so in winter, and there is a definite (although as yet undetermined) geographical distribution of marine life, both horizontal and vertical.

Ocean Floors.—The character of the bottom must be considered. The rivers discharge into the ocean daily an enormous amount of land-material, which is sorted out by weight, readiness to dissolve, etc., and by the action of waves and currents, and is spread out on the bottom to a greater or less distance according to circumstances. The outermost reaches of the coast. This outer border of deposits from rivers shows a bottom of bluish mud, or, in places, of coral sand or of volcanic dust. It is rich in food-material, and supports in the water above it a far larger assemblage of plants and animals than does the sea outside of
it. We have no further concern with this littoral rim further than to point out that, by means of currents, it contributes considerable food to pelagic animals. The floor of the vast spaces of ocean-bottom shows none of this land mud, but is covered with deposits of three kinds. The most extensive of these is a red clay, which covers the bottom in the great bights of the Atlantic between North and South America west of the 50th meridian, a large part of the mid-Atlantic, and most of the floor of the Pacific and Indian Oceans; it is believed to have been derived from the decomposition of submarine rocks, and of pumice and other volcanic débris showered into the sea, mainly in past ages.

Scarce enough widespread is a loose deposit called ooze, composed almost exclusively of the remains of minute animals and plants that have sunk down from the surface. All over the bed of the Atlantic, except where the red clay appears, the ooze shows more tests of the protozoan Globigerina than of anything else, and we therefore know it as Globigerina ooze. Pteropod ooze, patches of which occur here and there, has a predominance of pteropod shells; and so on. Bottom of this kind is far more thickly inhabited by bentonic (deep-sea) animals than the clay bottom, and it is the paths of the great oceanic currents, whereas the red clay underlies chiefly the areas of comparatively stationary water — the great eddies in the oceans.

These oozes imply an abundant life in the open sea. What is its character and how does it exist in a world of only sea-water?

Factors of Deep-Sea Life.—First we must glance at certain conditions. The pressure exerted by water on anything lowered into it increases at a rapid rate as you go down, so that at a depth of only 500 fathoms it equals about 100 times that at the surface. This contributes to the density of the underlying water. The saltiness of the sea also contributes to its density, but varies somewhat according to local conditions. Temperature decreases slightly from the surface downward.

More important than either in its effect on life is temperature, the factor determining to a great extent both the amount and the distribution of marine life. In the middle of the Atlantic, near the equator (Sargasso Sea), the water at the surface in summer will be about 22.30° C., and at 100 fathoms of depth about 16.70° C., below which it diminishes more slowly to about 2.20° C. at 2,000 fathoms, and to below the zero of centigrade (freezing-point of Fahrenheit) in the deeps. The temperature, density, etc., below a few hundred fathoms are probably fairly constant for each measure of descent, so that the water may be regarded as consisting of a series of layers bounded by isothermic or isodichotic strata, each isothermic or isodichotic layer being permanent, and are biological strata as well. At the surface, however, temperature varies with latitude, with seasons, and with circumstances, especially under the influence of winds and currents. In general, the surface of the deep, here warm, there cold, each one fostering and carrying far the kinds of life agreeable to it.

A fourth factor conditioning deep-sea life is that of light, which penetrates to a distance only recently understood; but the rays at the blue end of the spectrum go much farther than do the red rays—a fact of considerable biological significance. The result of late trials with the best photographic plates show that the blue rays at least penetrate to a depth of about 800 fathoms. Below that is absolute darkness, illumined only by the phosphorescent glow of the lanterns carried by animals living in those Stygian depths.

Such in broad outline are the physical conditions of plant and animal life in midocean; and there is good reason to believe that they have changed little since the beginning of earthly time.

Oceanic Plants the Basis of Subsistence:—Now how do organic beings maintain life in the world of sea water? What do they get to eat? Well, here, as elsewhere, the larger and more advanced feed on the weaker; and at the base of the list, as on land, are plants. Leaving aside the vexed question of origin, investigation has shown that not only near shore, but all over the ocean, plants exist in myriads. Most of them are lowly algae, imitating in the unaided eye, yet of vast variety in form, degree of organization and nutritive value. They find their nourishment dissolved in the sea-water and distributed uniformly around them, hence they abound everywhere within the photic zone, or surface-layer penetrated by sunlight; and at certain times and places they may be so plentiful as to give the water a tinge of color.

The majority are single-celled, silicious-framed diatoms. As they are heavier than the water all would sink were it not that some have means of propulsion, others parachute-like suspension-organs. They may have bladder-like attachments, or be flattened into twisted ribs, drawn out like a hair, or be furnished with long projections (flagella). Still more remarkable suspension-organs and varieties of form belong to the Peridinea, which are more complicated, mobile algae often highly phosphorescent. A third series of pelagic algae are the brown flagellates, possess calcareous frames forming globules concealed, or, other shapes. Microscopic "brown algae" occupy the most important place in the economy of the sea, and their shields of lime may be met with in geological deposits as far back as the Cambrian, practically identical with those of the present day.

Masses of seaweed are found floating in various parts of the ocean. These have been uprooted from their fastenings on shore, and collect in quiet, eddy-like places. The greatest and most permanent collection is that of the Sargasso Sea, in the Atlantic just north of the equator, where the plant Sargassum predominates. These continue to live and grow, but do not propagate. Such floating rafts of seaweed are the home and hiding place of a great variety of marine animals.

These algae and seaweeds form the basis of food-supply for the whole of the marine animal-life, since those creatures that feed upon them directly are themselves the prey of all the rest, from shore to shore to the depths and from animals to whales.

Character of Plankton.—Associated with the almost invisible plants swimming in the surface-layers of the ocean, is an assemblage of animals, varying from single-celled globules of
protoplasm (Protozoa) to all the higher classes of invertebrates. These together constitute the "plankton," the swimming or floating sea-life, and its zone is regarded as about 100 fathoms thick. It is often a clear one, thinner than in mid-sea, and in warm than in colder waters, and varies in density of life according to season, temperature, and other regional conditions, yet is everywhere present. Efforts have been made to estimate the amount of plankton, and it is found to be continually decreasing as the amount of fish-food present, but with little success.

In this plankton are multitudes of minute protozoans (q.v.), principally foraminifers and radiolarians in a profusion of species. They have shells consisting either of lime or of silica, and it is these shells, raining down upon the bottom, that constitute the globigerina and other ooze. Here, too, float a great variety of salps, jellyfish and other coelenterates and their larvae, and many swimming worms, notably the widespread sagittas. Outnumbering all these, except the foraminiferous ones, are the copepods, which, in countless forms and multitudes, play there, as Haeckel remarks, a part corresponding to the insects on land. Most numerous of these are the copepods, all very small; and they are the chief grazers of the minute plants, and, in turn, are among the most important food-supplies for larger creatures. Almost equally numerous are the ostracods and other crustaceans, including some big crabs.

Mollusks are fewer, for these as a rule are bottom-dwellers; but one group, the delicate, winged pteropods, are so extraordinarily numerous, that their glossy shells characterize large patches of ooze in the tropics. One species is called "whale's food," and actually is the principal subsistence of the northern whalebone whales. A large variety of small squids is also to be found at or near the surface of the open ocean.

The pelagic plankton, which is very largely different from that of coastal regions, is augmented in summer by an extensive variety and amount of larvae and young animals born both there and in the deeper layers; and at night many animals rise to the surface that are never caught there in daytime. Finally, it is the abode of innumerable fishes that seek their prey at or near the surface. Among these the fain Scopelidae, although represented also in the abyssal fauna, play a more important part at the surface than all other fishes combined; yet most of them are only a fraction of an inch long. Transparency and colorlessness (or a blue tint) are characteristic (for safety) of all the lesser creatures in this surface-fauna.

Intermediate Depth- zones.—It has been said already that between the surface and the bottom the sea seems to be divided into layers of different inhabitants, certain kinds of animals when adult dwelling only within certain limits of depth. These intermediate zones, and their occupants are called "bathypelagic,"—a term including the facts of both their undersea and deep-water existence. Practically, however, these intermediate zones can hardly be defined, and seem to be determined by limits of temperature or of osmotic pressure, and thus vary in their distance below the surface according to the general warmth and density of various regions. Animals taken only by deep hauls of the nets within the tropics, for instance, may be found near the surface in cooler latitudes; furthermore the vertical distribution of fishes, as a class, may differ from that of crustaceans or other groups as a class. Nevertheless, it is generally true that many kinds of pelagic animals dwell at intermediate depths, from which, when adult, they cannot either rise or descend to any great distance. Space cannot be given to much evidence of this, but the following extract from the report of the "Michael Sars Enterprise" (1910) showing general results of its dredgings and net-haulings, as bearing on this point, as follows:

"These catches may be classified into three main regions: (1) A region extending downward from about 500 metres, characterized by the recurrence of Cyclolites and various black or dark-colored fishes, and of many peculiar invertebrates, red prawns being prominent; (2) a region ranging between 150 and 500 metres, characterized by a peculiar community of silvery or grayish fishes belonging to the families Sternoptychidae and Monoceridae, having a smooth outer surface region, comprising the upper 150 metres.

The layer from 800 to 1,000 metres downward may require to be still further subdivided, for certain forms, like the larger Aconichthys, with red eggs, and several fish and several fishes and squids have been taken only in the deepest hauls at 1,500 or 2,000 metres."

Abyssal Life.—Let us now consider the creatures of the abyssal depths, where eternal cold, stillness, darkness and equability unite to make an environment so forbidding that the imagination would refuse to people it with living beings, yet where life and strife do actually abound. This bottom fauna, however, is not equally distributed. It is far more scanty on the areas of red clay than on the ooze; and the fauna of the various ocean-beds differ, because barrier ridges separate them. What is said here relates to that of the bed of the deep Atlantic, which is better known than any other.

The real bottom-animals are mainly fixed, and consist of sponges, hydroids, actinians, bryozoa, ophiurans, crinoids, brachiopods, holothurians, worms and mollusks. These are nowhere numerous, and below 2,500 fathoms are very scarce, to judge by the results of dredging. Their subsistence is wholly derived, apparently, from the fishes; these in turn feed on the smaller organisms that fall from the surface of the ocean. Moving about there also is a limited population of snails, crabs, squids and fishes, making their living upon or close to the bottom; and a larger and more varied company of their relatives swim in the water above them, up to, say, the 2,000-fathom line. All are of forms different in many respects from related species at or near the surface, and some brought up by the dredge can hardly be distinguished from fossils encrusted in the oldest fossiliferous rocks, so unchangeable is the environment in which their race has been propagated for perhaps 50,000,000 years.

Through these black abysses swim fishes with extraordinary adaptations. No attempt at even brief descriptions would be worth making. All are small, often less than an inch, rarely as much as six inches long, yet they are armed to the teeth. This is especially true of the families Stomiidae and Sternoptychidae, in which fishes are given some shape, and in whose heads with a savage array of long sharp teeth.
DEER (Cervidae)

1. The Sambur (Cervus Aristotelis)
2. The Virginia Deer (Cariacus virginianus)
3. The Elk (Alces alces)
4. The Azia (Cervus azia)
5. The Muntjac (Cervus muntjac)
6. The Reindeer (Rangifer tarandus)
DEER — DEER FORESTS

All are voracious, and some, as *Chiasmodus*, have mouths so capacious and stomachs so insensible that they can often swallow fishes as large as themselves, when their stretched stomach with its load hangs beneath them like the yolk-sac of a newly-born trout. All are dark in color; brown, blue or violet marking the abyssal species. Some of them have light-giving organs; and this was formerly regarded as a peculiar possession of deep-sea fishes, enabling them to see their prey in the Stygian gloom of the sunless abyss; but it is now known that light-organs are especially characteristic of pelagic fishes of the region between the surface and 250 fathoms of depth; and ichthyologists are uncertain what service they are to the fishes that carry them.

The eyes of most fishes, such as *Macrurus ornatus*, that inhabit the deepest bottom-layers are very large and have the quality of nocturnal eyes generally — are "day-blind"; yet many fishes, squids, etc., hauled from great depths, have no visible eyes at all, or small and nearly useless ones; and this is also true of other fishes living at intermediate depths. Some of the blind abyssal fishes are provided with whiplike fin-rays or very long head-filaments that probably act as "feelers," and serve the purpose of eyes in seeking food or taking warning of danger.

The general deductions to be made from this outline are that the waters of the ocean are everywhere inhabited, even to their uttermost depths, by living beings; and these are adapted to various circumstances and so form faunas of local extent and character.

**Ernest Ingersoll.**

DEER, animals of the family Cervidae (q.v.), which are noted for their grace of structure and their fleetness of motion. Since the earliest times they have been known as objects of the chase, and their meat, "venison," is considered a delicacy. The male deer is usually called "buck," but the male red deer of Europe is a "stag," or when mature a "hart." The female is called a "hind," or " doe." In the language of mediæval venery each kind of deer, and each age of growing buck, has a distinctive name.

All deer have a coat of short fur, dull in tone, ranging from reddish-brown to gray on the upper surfaces, and usually white below. Those that are marked bear such markings on the face and throat and on the tail. Only a few genera are spotted. In most genera only the young (the fawns) are spotted, and lose their spots when they are about one year old. Deer breed annually, the young, one or two at a birth, being produced in late spring. The fawns remain with their mothers until they are about a year old, when they are sufficiently mature to become independent. The grass-land deer, especially the greater ones, often gather in large herds at the approach of winter. These feed on the meadow herbage, whereas the forest deer eat the leaves, twigs, and buds of bushes.

The deer is valued not only as food, (it is the main subsistence of some northern tribes), but for commercial purposes. The skins make a peculiarly strong, soft leather, known as buckskin; skins with the fur on are not of much account, as the hair is brittle and soon disappears. The hoofs and horns are prized for ornamental purposes, especially the antlers of the roe-deer, which are utilized for making umbrella-handles, and for similar purposes; and the elk-horn, often employed in making knife-handles. The Chinese also make a medicine from stag-horn and they eat the antlers of certain species when "in the velvet." The reindeer is as valuable to the people of the frozen North as the cattle are to the men of temperate regions. Indians of the region north of Hudson Bay and Great Slave Lake are almost wholly dependent on the caribou.

Deer have long been bred in captivity as ornaments for parks, but only in the case of the reindeer has thorough domestication succeeded. Considerable attention is being paid in those parts of the United States where large tracts of wild land are available to breeding the American deer for market and this will doubtless become in the future an important source of meat supply.

The deer family is older than other families of ruminants, dating back to the Lower Miocene Period, when they were very small and without antlers. With a gradual structural change in other directions, such as variations in dentition and increased size, the antlers have been produced and amplified, so that the deer of the present is a far larger and finer-looking animal than his fossil ancestor. In the matter of antlers the young stag typifies the evolution of the race; as a yearling, his antlers are merely one-pronged spikes; but each successive year they become more branched and forked until at maturity they may have seven or more branches. See articles under various English names of deer, as *Elk*, *Fallow Deer*, *Moose*, etc. Consult Lydekker, "Deer of All Lands" (London 1890); Roosevelt (and others), "The Deer Family" (New York 1902); Ingersoll, "Life of Mammals" (New York 1907).

DEER FORESTS, large tracts of waste or uncultivated and mostly uncultivable land, chiefly situated in the Highlands of Scotland, set apart as grounds in which the stag or roe-deer is hunted for sport, but is otherwise protected and allowed to roam in its natural wild state. The name forest does not in this case imply the existence of trees. As a matter of fact most deer forests are mountains or high-lying stretches of ground, exhibiting large areas covered with heath, in many places peat-bogs, marshes, lochs or bare rock, elsewhere patches of grass or other herbage, while plantations of trees of greater or less extent may also occur. Some of the deer forests are of very great extent, the larger of them covering, say, from 30,000 to 70,000 acres. The counties in which they are chiefly situated are Sutherland, Ross, Cromarty, Inverness, and Argyle, while they also exist in Aberdeen, Banff, Forfar, Perth and Caithness. A number of them are reserved in the hands of their proprietors, while many others are let, either for the shooting season or
for a period of years, and in this case may bring a large rental to their owners. The annual rental value of the larger deer forests ranges from $5,000 to $20,000 or even more, and the total rental of the deer forests of Scotland has been set down at over $1,000,000 per annum. Every stag killed costs the person who rents the ground about 50 guineas. A deer forest is always an expensive affair, not only for the rent that has to be paid, but also for the number of keepers, gillies, watchers, beaters, etc., that have to be employed in connection with it.

DEER-GRASS (Rhexia virginica), one of the American representatives of the large family of plants called Melastomataceae, meadow-beauty family, of which only about 20 species are found in the United States. The deer-grass extends from Maine to Florida and west to Illinois, Missouri and Louisiana. Other species extend the habitat of the genus to Texas. The flowers are conspicuous and showy, with bright rosy purple petals, and render the meadows unusually gay when adorned with patches of this lovely plant, entitling it to the common name of the meadow-beauty.

DEER-MOUSE (Peromyscus leucopus), the common white-footed mouse of North America, a rodent of the family Muridae. The main color of its body is buff or fawn, growing dark along the back, the feet and under parts being snowy white. It has full, bright eyes, big, rounded ears, long whiskers and tail, graceful and sprightly movement, it is a very attractive little animal. It has been found to have small cheekpouches. Its length rarely exceeds four inches, its tail being nearly as long. In different sections of the country its markings and habits are varied, and in some it seeks a home in the human dwelling, as do other mice. Also the jumping mouse, Zapus hudsonius.

DEER-STALKING, an exciting but laborious mode of hunting the red-deer, in which, on account of the extreme shyness of the game, their far-sightedness and keen sense of smell, they have to be approached by cautious maneuvering before a chance of obtaining a shot occurs. Great patience and tact and a thorough knowledge of the ground are essential to a good stalker, who has to undergo many discomforts in crouching, creeping and wading through bogs, etc. Advance from higher to lower ground is usually made, since the deer are always apt to look to the low ground as the source of danger. "Deer-driving" toward a point where the shooters are concealed is often practised, but is regarded as poor sport by the true deer-stalker.

DEERFIELD, Mass., town of Franklin County, on the Connecticut River and the Boston and Maine and the New York, New Haven and Hartford railroads, 33 miles north of Springfield. It is an agricultural region, and its industries are chiefly related to agricultural products. It has also manufactures of pocket books and art novelties. It has a high school, Deerfield Academy, and a public library. The town contains the village of South Deerfield, and in colonial times was the scene of several contests with the Indians. Among them were the "Bloody Brook Massacre" (1675) and the burning of the village by the French and Indians under De Marchi (1675). Old Deerfield has a beautiful soldiers' monument, and there is at South Deerfield a marble monument commemorative of the bloody Brook disaster. Eliza Allen Starr, author and art teacher, was born in Deerfield. The waterworks are owned by the municipality. The government is administered by annual town meetings, Pop. 2,209. Consult Sheldon, 'A History of Deerfield, Mass.' (1895), and Powell, 'Historic Towns of New England' (New York 1888).

DEERFIELD RIVER, a river in Massachusetts, rising in southern Vermont and flowing generally southeast for 60 miles, when it enters the Connecticut River. The great fall of the river of nearly 1,100 feet in 50 miles furnishes water power at many places, of which the chief are at the Hoosac Tunnel and Shelburne Falls. Several streams nearly as large as the main river enter it from the north.

DEERFOOT, famous runner: b. Cataraugs reservation, Buffalo, 1828; d. there, 18 Jan. 1897. A half-breed Seneca Indian, he was taken to England in 1861 and matched against the best long-distance runners, defeating nearly all of them. He lost a six-mile race against Mills in September 1861, but defeated White in a four-mile contest a few days later, and directly after outran both of those experts in a 10-mile championship. He beat Levett and Mills (12 miles) at Dublin for $500 in 65 minutes, and Howitt—the "American Deer," in London (four miles). He made a record of 11 miles 720 yards in one hour (London, October 1862), and 11½ miles in one hour six seconds February 1863; another record was 11 miles and 12 miles in 57 minutes and 62 minutes respectively.

DEERHOUND, the Scottish greyhound used for deer-hunting. See Dog.

DEERSLAYER, The. 'The Deerslayer,' last of the Leather-Stocking tales, which Fenimore Cooper published in 1841, is first in the order of events narrated in that famous series. The actions take place on and about Otsego Lake between 1740 and 1745. According to Cooper's own words, the "first and original fiction, no authority existing for any of its facts, characters, or other peculiarities," but "the descriptions of scenery in the tale are reasonably accurate. Essentially a romance, full of a dewy freshness, with large landscapes, and full of the forest philosophy which underlies the whole of Cooper's conception of Leather-Stocking, the book is at the same time, like all his later novels, considerably realistic. The dialect is careful, the woodcraft generally sound. The reality of the piece, however, comes chiefly from the reasoned presentation of the central issue: the conflict in Leather-Stocking between the forces which draw him to the woods and those which seek to attach him to his human kind. The same conflict had figured in earlier volumes of the series, but here it is more appealing than ever before because the hero is in the warm morning of his youth and must choose his career even against the enticements of love. It is hard to tell whether it is at the prescription or the suggestion of the demand of realism that he chooses his native forests; he is enough of a romantic personage to prefer the wilderness, and yet his victory is not a romantic victory but a victory realistically in keeping with his true character. What helps him to this choice is that Judith,
who loves him, one of the few convincing young women in Cooper’s works, has been corrupted by the settlements, and to turn from her is an act forced by his simple principles of virtuous citizen. Leatherstocking scenes are for a life in nature. ‘The Deerslayer’ is thus the tale of his coming age. Already a hunter, as his name implies, he kills his first man. His distress at the realization seems immeasurably eloquent to readers who, knowing his future fates, criticize Leatherstocking stories. Remember the many deaths Natty has yet to deal with. In other matters he is near his later self, for he starts life with a steady philosophy which, through all the many experiences of the volume, keeps him to the end as simple and honorable as at the outset. Of the minor characters only the ardent young Chingachgook and the silly Hetty Hutter call for mention. The movement is rapid, the incidents varied, and the piece as a whole absorbing.

CARL VAN DOREN.

DE FACTO. The word de facto means actual, in fact, based on fact, in contradistinction to de jure which means based on law, by right, by lawful title. A de facto government is always a usurpation and may be said to exist when the usurping government has expelled the regularly constituted authorities from their customary seats and functions and has established itself as a new and independent government. Such was the government of England under the Commonwealth. Such government continues to be a usurpation as long as it is in power or until legalized by the recognition of the department entrusted with the authority to recognize the existence of a state; but the authority claimed for a de facto government must be effective and actually in operation before it may assume the de facto character. The United States Supreme Court has said: ‘Who is the sovereign de jure or de facto of a territory is not a judicial but a political question the determination of which by the legislative and executive departments of any government conclusively binds the judges, as well as other officers, in the execution of the subjects of that government. This principle has always been upheld by this court and has been affirmed under a great variety of circumstances. It is equally well settled in England.’ The Confederacy of 1861–65 in the United States was a de facto government and its actual exercise of authority, over a given territory gained for it a certain amount of foreign recognition (see SECESSION; CONFEDERATE STATES OF AMERICA; UNITED STATES—Secesssion, etc.), but in point of law, since the Confederates did not gain independence and could not establish a government de jure, the usurpation remained illegal to the end. On the other hand, the Continental Congress exercised de facto authority which became de jure when Great Britain recognized the independence of the continent. Thus their success gained for the colonies legal sanction of their usurping acts. A government may be de facto also when by paramount force it maintains itself by military power despite the regularly constituted authorities and is able to compel the obedience of private citizens. A de facto authority may usurp and exercise the authority of any public office, legislative, executive or judicial, but the mere usurpation of the office does not constitute the usurper a de facto officer unless he actually exercises the functions of the office. Thus when President Johnson removed Secretary of War Stanton (q.v.) on 21 Feb. 1868 and appointed Lorenzo Thomas Secretary ad interim, Stanton’s refusal either to resign, to relinquish the office, or to allow another to exercise the functions of Secretary really constituted him a usurper in spite of the Tenure-of-Office Act (partially repealed in 1869 and wholly in 1887), and his actual exercise of authority, backed by Congress, made him the de facto Secretary. The failure of Congress to sustain Stanton by removing Johnson prevented Stanton again becoming Secretary de jure which he had been prior to his removal by Johnson. (Consult Dunlop, William A., ‘Reconstruction, Political and Economic,’ pp. 90–92, 99–108, New York 1907). Acts performed under the authority of a de facto government are valid if such government by legal process subsequently become the government de jure, and certain acts of a de facto government which does not become de jure may be valid, e.g., if the regular taxes for administrative purposes be paid by a private citizen to the de facto authority, he may not be forced to pay such taxes a second time. As far as other nations are concerned such a government is treated as in most respects possessing rightful authority; its contracts and treaties are usually enforced; its acquisitions are retained; its legislation is in general recognized; and the rights acquired under it are, with few exceptions, respected after the restoration of the authorities which were expelled (96 U. S. 176, 185–861). For decisions consult Thorington v. Smith, 8 Wallace 1; Williams v. Brufty, 96 U. S. Sup. Ct. 176; Jones v. U. S., 137 U. S. 202. See GOVERNMENT; STATE; INTERNATIONAL LAW.

DE FACTO CORPORATIONS. See CORPORATIONS, LEGAL.

DEFAMATION. The speaking or writing words of a person so as to hurt his good fame. Written defamation is termed libel, and oral defamation slander. See LIE; SLANDER.

DEFAULT, a failure to appear in any court on the day assigned; especially applied to a defendant when he fails or neglects to plead or put in his answer on an appointed day. In such cases the plaintiff is entitled to sign judgment against him, which is called judgment by default, and the defendant is said to suffer judgment by default. Failure to perform an obligation is termed a default.

DEFAUX, dë-fœ’, Alexandre, French landscape painter: b. Berey, near Paris, 27 Sept. 1826. He was a pupil of Corot and his paintings are distinguished by a remarkable understanding of perspective. He began to exhibit in the Paris Salon in 1859 and among his numerous landscapes are ‘View at Caen’; ‘Abandoned Race Course at Ivry’; ”View of Saint Maur, Coast of Gravelot’ (1863); ‘Eve inking in Spring’ (1869); ‘Fine Winter Day in Bas Meuden’ (1873); ‘The Loire after a Flood’ (1873); ‘Birches at Fontainebleau’ (1874); ‘Gravel Pit at Fontainebleau’ (1877); ‘Forest of Fontainebleau’ (1878); ‘Harbor of Pont-Aven’ (1880); ‘Old Birch-trees at Pigeon Pond in Fontainebleau’; ‘Low Tide in Nor-
mandy" (1884); 'Pastime of a Flock of Geese'; 'After the Storm' (1885).

DEFEASANCE, in law, an instrument which defeats the force or operation of some other deed. That which is in the same deed is called a condition; and that which is in a separate deed is called a defeasance. The defeasance may be subsequent to the deed in case of things executory, but must be part of the same transaction in case of an executed contract. Yet where an instrument of defeasance is executed subsequently in pursuance of an agreement made at the time of making the original deed, it is sufficient; as well as where a deed and a defeasance bear different dates but are delivered at the same time. The instrument of defeasance must at law be of as high a nature as the principal deed. It must recite the deed it relates to, or at least the most material part thereof; and it is to be made between the same persons that were parties to the first deed. Defeasances of deeds conveying real estate are generally subject to the same rules as deeds, as to record and notice to purchasers, but in some cases, notice is not sufficient without recording.

DEFECTIVES. See Feeble Minded.

DEFENDANT, in law, the party against whom a complaint, demand or charge is brought, in order to sustain or to sustain a claim; one who is summoned into court and defends, denies or opposes the demand or charge and maintains his own right. The term is applied even if the party admits the claim.

DEFENDER OF THE FAITH (defensor fidei), the title bestowed on Henry VIII of England by Pope Leo X (1521) in recognition of the monarch's great service to the Roman Catholic Church in writing his Assertio Septem Sacramentorum adversus Martinum Lutherum (vindication of the seven sacraments against Martin Luther). Pallavicini, in his history of the Council of Trent, describes the great satisfaction given to the papal court by King Henry's book and the modes suggested by various cardinals of acknowledging the obligation to the monarch. The Pope, with the aid of Luis de Henery Sadoc, had a form of bull drawn up conferring on Henry the title "Defender of the Faith," so that he might be on a par in the matter of titles relating to religion with the king of Spain's "Catholic majesty" and the king of France as "most Christian majesty." At the suppression of the religious houses at the Reformation the Pope recalled the title. In 1544 it was reconfirmed by Parliament and has remained ever since.

DEFENDER OF THE MARRIAGE TIE, Defensor Matrimonii, or Defensor Vin-culti Matrimonialis, an official in every episcopal jurisdiction of the Roman Catholic Church, whose duty it is in all cases of petitions or suits for judicial separation of married couples or for annulment on whatever ground of marriage contracts or of the marriage relation, to decide and decide all his cases (as well as the validity) of the contract and resist its abrogation. The Defender is required to be in person present at every stage of the trial of a matrimonial cause, and he must have access to all the records and all the testimony. Not only may he, in case the court decide for the nullity of the marriage, appeal to a court of second instance; he is under obligation to appeal every single case; and if he demands it, he must be allowed a further appeal to the highest court. Nor is that all; he has the right, and it is his duty, to open the case anew if he finds there was any serious flaw in the judgment of nullity. In short, a matrimonial cause involving nullity of a consummated marriage contract is in the Catholic Church never finally determined so long as either of the two parties to the suit is living. Consult Taunton, 'The Law of the Church' (London 1906).

DEFENDERS, a Roman Catholic association in Ireland (1784-98), the opponents of the Peep o' Day Boys.

DEFENSE, (1) the answer, denial, or plea of the defendant to the plaintiff's or prosecutor's case. By common law, the defense was merely an answer to the plaintiff's cause of action, being thus the second step in the proceeding. It did not include the demurrer, but in England and in the United States generally the defense includes the demurrer. When a common-law pleading is followed in many States in this country, the term defense has been extended generally to include the plea as well as the demurrer. Under the reformed procedure the term defense may be properly applied to the answer of the respondent to a bill in equity of the complainant, although formerly this was not the case, the term being applied exclusively to common-law actions. It is used both in civil and in criminal suits. The defense must contain every material fact relied upon by the defendant at the trial to defeat the plaintiff's cause of action, and every statement of claim made by the plaintiff must be admitted or denied, although other facts may be pleaded. A statement of defense must generally be delivered to the plaintiff or his attorney within a limited time, varying often with the jurisdiction.

DEFENSE OF POESIE, The. The title given to Sir Philip Sidney's 'Apologie for Poesie' when printed for the second time in the third edition of the 'Apocrypha' in 1598.

DEFENSE OF THE HABIT, An emergency measure passed by the British Parliament 7 August on the outbreak of the European War in 1914, authorizing the trial during the war by court-martial of persons contravening regulations designed (a) to prevent communication of information to the enemy which might be useful, and (b) to secure the safety of railways, docks and harbors. A second act of similar title somewhat strengthened its provisions. Power was also given to detain actual or suspected spies; by the Restriction of Aliens Bill all alien enemies were required to register themselves with the police and were prohibited from traveling more than five miles from their registered address without permission.

DEFFAND, déf-fâd, Marie de Vichy-Chamrond, MARQUISE DU, French letter writer: b. Château de Chamrond, France, 1687; d. Paris 24 Sept. 1765. She married the Marquis du Deffand, from whom she separated after 10 years. During the latter part of her long life she became the centre of a literary coterie, which included some of the greatest geniuses of the age. Among writings remarkable for their wit and talents in the 18th century Madame du Deffand claims a distinguished
DEFIANCE — DEFOE 587

place, though she left no monument of her abilities except her epistolary correspondence, highly praised by D'Alembert as affording a model not to admit any composition. During the last 30 years of her life she was blind. In 1810 was published Correspondence inédite de Madame du Deffand, avec D'Alembert, Montesquieu, le Président Hénault, la Damesse du Maître, d'Alembert, de Choiseul, de Staël; le Marquis d'Argens, le Chevalier d'Aydie, etc. Her letters to the celebrated Horace Walpole, for whom she conceived a violent passion, have likewise been printed. Consult Sainte-Beuve, Causeries du Lundi (Vols. I, XIV).

DEFIANCE, Ohio, city, county-seat of Defiance County; on the Maumee River near the tributary mouth of the Tiffin and Auglaize rivers, and on the Cincinnati and Toledo Canal, 50 miles southwest of Toledo. The Baltimore and Ohio, the Wabash railroads and the Ohio Electric railroad, Lima, 42 miles distant, afford transit facilities for the farming products and live stock of the surrounding agricultural region. Defiance is a busy trading centre and its manufacturing industries include flour mills, iron foundries, machine shops, steel factories, farm implements, waggon, carriage and bicycle works, and woolen mills. It is the seat of Defiance College (q.v.), and has a national bank, daily and weekly newspapers. On the site of an Indian village where General Anthony Wayne built Fort Defiance in 1794, the city dominates a fine view of river and county scenery. Defiance was platted as a town in 1822; in 1845 became the county-seat; and was incorporated as a city in 1881. Pop. 7,500.

DEFIANCE COLLEGE, a coeducational (non-sectarian) institution in Defiance, Ohio; founded in 1902. It was originally the Defiance Female Academy founded in 1850 and opened in 1855. In 1918 it reports professors and instructors, 26; students, 601; volumes in the library, 7,000. Courses are given in the general academic, music, normal and commercial departments. It is owned by the Christians, and is connected with the Christian Biblical Institute, which has a separate board of trustees under the same president.

DEFILEMENT. In many ancient religions the doctrine of ceremonial defilement was taught as is so clearly proven by J. G. Frazer in his 'Golden Bough.' Contact with a dead body, or anything tabooed was defilement. In the Hebrew religion the same idea was taught in the Levitical Code, and rules for purification stated. The Rabbinical teaching carried the observance of defilement and purification to an extreme. Elaborate and lengthy ceremonies were instituted. In the Christian religion as taught in the New Testament, the idea of defilement is purely symbolic, and relates to the defilement of the heart by sin or evil motives. In the early church the old sacrificial idea of defilement was sometimes prevalent, as in the teaching of Saint Simon Stylites and his followers. The fundamental principle of the asceticism is the escape from defilement in a worldly environment. The present teaching is a return to the New Testament idea.

DEFINITION (from the Latin definitio) of a thing signifies, in lexicography, a concise account of its essential and characteristic points. A definition should embrace all the essential properties of the object intended to be defined, and not admit any exceptions; which is often extremely difficult, on account of the shades and gradations by which different things are blended. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined. According to the old scholastic logic, a definition must give the mark of the genus (nota generalis seu genus) and of the species (nota specialis seu differentia specifica); for instance, a barn is a building (nota generalis) for the purpose of preserving corn, etc. (nota specialis). According to Aristotle every strict definition could be divided into two distinct parts; one dealing with the genus, and the other declaring the specific difference by which the given subject varies from others of the same order. Kant and his followers on the contrary make definition merely a list of essential marks summed up without any distinction between genus and difference.

In optics definition means the defining power of a lens — the giving of a clear and distinct image of an object together with all details of importance.

DEFIATION, that geologic activity of the atmosphere that is manifested in the removal of rock material by wind work, entirely aside from any mechanical wear or abrasion. It is characteristic of desert regions.

DEFLECTION OF THE PLUMB LINE. The, or the deflection of the vertical is the angular variation between the line vertical to the actual curve of the earth's surface at any given point, as determined by the varying nature of its constituents beneath, and the line normal to the theoretical curve of the earth considered as a homogeneous ellipsoid of revolution. (See ISOstasy). Consult United States Coast and Geodetic Survey, 'Special Publications' 10 and 12 (Washington 1912).

DEFOE, Daniel, English journalist and novelist, author of 'Robinson Crusoe.' b. London 1659 or 1660; d. London, 26 April 1731. He was the son of James Foe, a butcher, and was born in the parish of Saint Giles, Cripplegate. The date of his birth used to be given as 1651 from a statement in the preface of his 'Protestant Monastery' (1727), that he was then in his 67th year; but the late G. A. Aitken showed (Atheismus, 23 Aug. 1890) that he was born late in 1659 or early in 1660. Little is known of his early years save that he was bright and active and well grounded by his parents in the Bible and in the Presbyterian faith. At about 14 he was sent to a Dissenters' school kept at Newington Green by the Rev. Charles Morton, afterward vice-president of Harvard. Here he studied theology, the classics, Latin and the modern languages, mathematics, and history and geography, becoming later extraordinarily proficient in the two subjects last named. In after years Defoe, defending the school, laid special emphasis on the instruction in English composition. His school course was intended to fit him for the Presbyterian ministry, Dissenters being not then allowed at the universities; but somewhere about 1678 he came to the conclusion that the position of a Dissenting clergyman was not
an enviable one and that he would do better to go into business.

Scarcely anything is known of his life for the next five years, save that he was interested in public affairs during the "Popish Plot" and that he wrote — whether he published is doubtful — in favor of Austria against the Turks. In 1683 he was established in Cornhill, probably as a "hose dealer," but wholesale dry-goods merchants. On 1 Jan. 1683-84 he married Mary Tuffley, by whom he soon had several children. It appears from his writings that he made voyages to Spain and Portugal and resided in Spain for a time, but no dates are given. Probably this was before his marriage, and at this same period he may have done the traveling in Italy and elsewhere of which he makes mention. Equally obscure is his share in the Monmouth uprising, yet it seems likely that he took part in that visionary enterprise and, unlike some of his older contemporaries, escaped unpunished; it might be a Nov. 3rd. During the short reign of James II he appears to have used his pen against the Declaration of Indulgence, but his tract or tracts cannot be identified, the "Letter" believed by some to be from Defoe, was probably written for Burnet's. In January 1687-88 he was enrolled in the Butcher's Company, thus becoming a liverman of the city of London. There is also some evidence that he was a resident of suburban places and that his standing in Presbyterian and commercial circles was good.

At the close of 1688 Defoe joined the army of William III at Hanley, and ever after he made that monarch his special hero, praising him in his writings whenever he could. In 1691 he published his first definitely identified work, a satire on a recent Jacobite plot against William, "A New Discovery of an Old Intreague." For many years he continued to essay poetry, but only on one or two occasions did he rise above mediocrity, his genius being essentially that of a prose writer. In 1692 his affairs, which had probably been going wrong for some time, partly through the multiplicity of his interests, forced him into bankruptcy with a deficit of £17,000. He may have gone into hiding from his creditors, or he may have gone to France. The latter is more probable, and according to the testimony of a journalistic rival, Tutchin, he later discharged in full some of the obligations that had been scaled. Rejecting an offer to take charge of some business in Spain, he became secretary of a tile factory at Tilbury and was also for four years (1695-99) accountant to the commissioners of the glass duty. He seems to have had some reputation as a financier and he may have pleased the government by urging in a pamphlet the necessity of the war against France ("The Englishman's Choice," 1694). His writings between 1691 and 1697 are, however, practically unrecovable and may not have been notable in quantity. By 1697 he had re-established himself, in comfortable circumstances, and before the close of 1700 the had issued a considerable number of tracts dealing with the question of a standing army, with reformation of manners, with foreign affairs and with the vexed problem of the occasional conformity of Dissenters. One of extended compass and interesting to the general reader is the "Essay upon Projects" (1697, but in part written earlier), in which he made numerous and often highly valuable suggestions about such matters of public interest as banks, insurance, good roads, asylum for idiots, and academies, especially for women, in whose welfare he was more interested than in that of any other man of his time. The tracts on occasional conformity were vigorous performances that gave anxiety to easy-going Dissenters, and his strong defense of William's policy with regard to the army and in foreign affairs may have helped him to obtain the confidence of that monarch when a little later he was introduced at court.

Defense of William was also the occasion of his publishing in January 1701 the best of his poems and the most popular of all his early works, his satire "The True-born Englishman." Much prejudice had been stirred up against the foreign-born king, and in rough but energetic verses Defoe turned the tables by dwelling upon the mixture of stocks that made up the English people. Over 80,000 pirated copies were sold, and Defoe, in the tedious but terminable reasons added the prefix to his name, for some years delighted to style himself on his numerous titlepages "The Author of "The True-born Englishman.""

The 'Between the 10th of January and March 1702 on the 8th of which month King William died, Defoe continued to be a fairly prolific pamphleteer. He still dealt with occasional conformity and foreign affairs, but he began more specifically to attack political abuses at home, corrupt elections to Parliament, the misdeeds of stock jobbers, Jacobite intrigues and the like. His powers as an acute arguer sure of making the average reader see his point and as a writer of homely, racy, fluent prose were now fully revealed. He also showed himself to be remarkably well informed on economic, constitutional and diplomatic questions, and full of a sturdy patriotism of the Whig variety. The most noteworthy of his pamphlets of this period are his weighty assertion of "The Original Power of the Collective Body of the People of England" (December 1701) — a rebuke of the independence displayed by the high Tory members of Parliament which would have been worthy of Somers himself; and "Reasons against a War with France" (May 1701) — a little later for some unmentionable reasons added to his name, which he did not scruple to use. It was the first of the tracts in which Defoe sought to attain his ends by irony and indirection—a war with Spain for the sake of colonial aggrandizement being his object despite the inevitably resulting struggle with France. "Legion's Memorial" (May 1701) represents, however, the zenith of his short-lived popularity. The Tories had imprisoned five presenters of the Kentish Petition (of which Defoe wrote a "Letter," which "100,000 men" signed to protest in the names of the many — Legion. He presented the "Memorial" to Harley, the speaker (in what manner is not clear), and the House dared not resent the bold action. On the release of the petitioners Defoe sat by their side at a complimentary banquet.

Several poems on various subjects and prose manifestoes against the High Church party followed; then, at the end of 1702, Defoe returned to the attack on occasional conformity, which was as distasteful to him as it was in itself distasteful. The Churchmen in power had carried through the Commons a bill to prevent the practice, which was, indeed, as Defoe held, a scandal from the point of view of consistency in ecclesiastical
matters, but which, so long as occasional communion according to the rites of the Established Church continues, is likely to lose some of its attractions and would certainly be pursued by ambitious Dissenters. Defoe's arguments were sincere and forcible, but unfortunately left him in an exposed position between the two firing lines. Perhaps it was to satisfy this fear, whether with the Dissenters, who thought him a deserter, or with the Whig leaders, that he published in December 1702 his famous 'Shortest Way with the Dissenters,' in which, assuming the character of a High-Flyer, i.e., of an uncompromising churchman, he argued for the suppression of dissent by any means, no matter how cruel. It is hard to believe that he could have been taken seriously, but there is proof that he was. The Dissenters were alarmed by any hint of proposed persecution at such a time of partisanship; and, when the High Churchmen discovered that they had been applauding a Dissenter who was really aiming to secure toleration, they were furious at being hoaxcd. The result was that Defoe, accused of libelling the Church, went into hiding for fear of his life and whether a second volume of his work is not clear. He was arrested in Spitalfields near the end of May 1703, committed to Newgate, examined in vain as to his political backers, who, if he had any, deserted him, condemned after unfair proceedings, and sentenced to pass in fine, stand in the pillory and be imprisoned. He stood in the pillory on July 29, 30, 31, 1703, but the people draped it with flowers and read his clever 'Hymn' to the instrument of shame.

It used to be thought that Defoe remained in Newgate until August 1704; but it now seems clear from his correspondence with Harley (published by the Historical Manuscripts Commission, 1897, 1899) that through the good offices of the latter he was released about the first of November 1703. This not only disposes of the notion that he began his famous 'Review' in prison, but also makes it clear that he was not, as has been charged, drawing on his imagination when he described his personal experiences during and after the great storm of the end of November 1703 in his volume 'The Storm,' published the next year. He was in prison long enough, however, for his business to go to ruin and his family to come to want, from which they were partially relieved by Harley. He was, he said, to be grateful to that leader, and, although while serving him during the next 10 years, Defoe did and wrote much that it is impossible to regard as honorable, his offences are mitigated by his position of dependence and by the loose examples in political morality set by the leading men of the time.

During and immediately after his imprisonment Defoe continued industriously to publish poems and pamphlets, adding as new topics, not only the 'Storm,' but the theological vagaries of John Asgill, regulation of the press and the state of manners. His main achievement, however, was the establishment (17 Feb. 1704) of his newspaper, A Review of the Affairs of France, etc., which, after several minor changes of title, became A Review of the State of the British Nation. As a weekly this speedily became a bi-weekly and then a tri-weekly sheet. A literary department, supposed to be furnished by a 'Scandal Club,' appeared in early volumes. Defoe wrote practically the whole of the paper, which steered between the extreme Whig Observer of Tutchin and the extreme Tory Rehearsal of Leslie. Even during the period of absence in Scotland the numbers appeared regularly, spreading Defoe's fame and influencing later journalists like Steele. After some changes in title and manner of issue the Review came to an end with its ninth volume (of which the British Museum copy is the only one known and even that is incomplete) on 11 June 1713. Its success entitles Defoe to be called the first great English journalist, whether or not his affectation of independence must give him a high place among caustics. It should be added that in the main he supported the constitutional and religious principles in which he believed and was constant in his endeavors to promote peace with honor and commercial prosperity.

In the spring of 1704 Defoe was in frequent correspondence with Harley, and in the summer he took a trip through several counties to electioneer and gather information. Whether at home or on his journeys, he was continually writing. Between July 1703, when he issued the first of two volumes of his collection of a pirated volume had appeared some months earlier—and the same month of 1705, when the second volume probably appeared, he was responsible for at least 35 publications. The most important of these, as may be gathered, is the celebrated and able 'Goring Arms no Charity' (November 1704) in answer to a bill for employing the poor—an attack upon pauper legislation in a tone strikingly modern. His letters of 1705 show that he was receiving pay but did not know whether it came from Harley's pocket or the Treasury. He submitted his writings to his employer, communicated political intelligence, and in the summer and fall undertook another electioneering tour under an assumed name. Of the numerous publications of the year besides the Review the most important is 'The Consolidator, or Memoirs of Sunday Transactions from the World in the Moon,' a rather heavy prose satire on English politics. He showed his knowledge of American affairs in 'Party Tyranny,' written in defense of the Non-Conformists of South Carolina, a subject to which he returned a few months later. Early in 1706 he had a rough pamphlet duel with Lord Haversham in defense of the ministry, and he discussed the new bankrupt law, a matter in which he was interested, as his creditors, stirred up by his numerous political enemies, were pressing him hard. Of the publications of the year the most important are the huge satire in verse 'Jure Divino,' creditable to his learning and his political principles but impossible as poetry, and his famous 'True Relation of the Apparition of one Mrs. Veal,' which has no superior as a realistic presentation of a supernatural event. The notion spread by Sir Walter Scott and others that this was composed to help the Whigs against the 'Fear of Death' was long since shown to be false; some 20 years ago the late G. A. Atkinson proved that Defoe merely reported with wonderful realism an apparition story current in Canterbury at the time.

The chief political events of 1706 were connected with the proposed union between England and Scotland. In May Defoe began publishing a series of acute, well-informed and conciliatory essays 'at Removing National
Prejudices, which by January 1707 amounted to six in number. Meanwhile in September 1706 at Harley's orders he had set out for Scotland to help on the negotiations at the meeting of the Scotch Parliament. From October 1706 to December 1707 he continued at his post sending letters, much of his time, to Harley, inter-viewing leaders of every faction, encountering the violence of mobs, publishing pamphlets—in short, making himself valuable in every way. Except for an occasional visit to a disturbed centre like Glasgow, he remained in Edinburgh, and at the same time remaining his parliamentary committees, serving them by his knowledge of English commerce and finance, and picking up information about Scotland of which he afterward made much use. The pity of it all is that he passed part of the time at least, as "Alexander Goldsmith," declared that he was in Scotland on his own business and in nobody's pay, and yet was continually writing begging letters to Harley, who was not prompt in forwarding funds. During the 15 months, being the time remaining his lifetime, he published a poem, 'Caledonia,' and several pamphlets.

On his return to England Defoe found Harley in political difficulties and in February 1708 learned of his fall. He immediately offered to share his superior's fortunes, but Harley dis-countenanced, and in a letter to him turned his useful agent over to Godolphin, whom Defoe served with apparent fidelity until Harley came into power in 1710. This meant that Defoe was regarded as a permanent secret service man and not as an official dignified and regular status. He visited Scotland again in 1708 and in 1709, and supported warmly the Whig measures of Godolphin and Marlborough both in his Review and in his pamphlets, which during these years apparently decreased in number. For his reasons for his not appearing more often in his favorite rôle is probably to be found in the fact that he was at work upon his voluminous 'History of the Union of Great Britain' (1709) which, while scarcely interesting, is valuable and interesting for his clear exposition of the Whig measures of Godolphin and Marlborough.

In 1710 he naturally took his part in the Sacheverell controversy and on the dismissal of Godolphin he was glad to be employed once more by Harley. In the fall he visited Edinburgh as "Mr. Claude Guilot," for the purpose of undermining the Jacobites. By February 1711-12 he was back in London having frequent interviews with his chief and writing him letters full of suggestions and also of requests for money. Another visit to Scotland was made in the fall of 1712, but his travels in Harley's interest are not so important as the changed tone of the Review and of the pamphlets of the period. Defoe had the hard or, rather, impossible task of maintaining outwardly his journalistic independence and at the same time of abandoning his support of the war and his general Whig attitude. On the whole, he was fairly consistent, opposing vigorously as he did the passage of the Occasional Conformity Bill, but, of course, his path was a perilous one. The extreme Tories, who were powerful in the next Parliament, would not trust him, and the Whigs, whom he had deserted, detested him as a renegade. The modern reader, making allowance for the facts that it was a factious period, that regular party government was in its infancy, and that Defoe, both by his disposition and by his circumstances, was practically forced into his equivocal position between the Whigs and the Tories, finds it possible to admire the dexterity of his casuistry and the versatility and range of his activity. Between March 1710 and June 1713 when the Review came to an end, he published more than 60 pamphlets, besides at least two books. He dealt with Sacheverell, public credit and loans (essays erroneously attributed to Harley), the extravagant partisanship of the "October Club," the advantages of the South Sea trade, the reasons for advocating the attendance of parliamentary committees, the policy of the Occasional Conformity Bill, the political reputation of Harley and the efforts of the Jacobites in favor of the Pretender. On the last topic he was specially effective. His five or more pamphlets (1712-13) are still readable, and one is amused in endeavoring to understand how the ironical 'Reasons against the Succession of the House of Hanover' should have misled the stupid as much as his 'Shortest Way with the Dissenters.' He had done it; he published it, and got him into just as much trouble, certain Whigs who had themselves been prosecuted for their writings bringing an action against him for treason based upon his having written a pamphlet. Defoe injured his cause by discussing the case in the Review, but Harley secured bail for him, and, after much manœuvreing, since it was to the interest of both to keep their relations from being definitely known, however much they were suspected, he was finally pardoned under the great seal. The statement of some biographers that Defoe was a prisoner between April and November 1713 is shown by his correspondence with Harley and by contemporary newspapers to be an error. He was confined in the Queen's Bench Prison only for a few days.

Between June 1713 and August 1714 when the fall of Harley and the death of Queen Anne brought a change to his fortunes, Defoe wrote about 20 pamphlets (four of them forming an interesting 'General History of England') and abored upon two newspapers 'Mercator's Commerce Retrieved,' and a sham Flying Post. He warmly welcomed the new king and, feeling that he must as far as possible clear himself from the charges of being a turncoat and a mercenary writer, he published in February 1715 his eloquent if not wholly ingenuous 'Appeal to Honor and Justice.' He was also the author of the three parts of the much criticized 'Secret History of the White Staff' (1714-15), a defense of Harley, which that unpopular person felt obliged to declare the work of an opponent. Whether he was nearly so ill from apoplexy as he wished readers of his 'Appeal' to believe is very doubtful, but there can be no doubt that he was in an equivocal position, distrusted by all parties and dependent upon his wits for the support of an expensive family.

Defoe's bibliography now becomes exceedingly complicated. In the four years that elapsed before the appearance of the first part of 'Robinson Crusoe,' he published anonymously over 90 pamphlets, at least six books—including his popular 'Family Instructor,' the exemplary 'Memoirs of the Church of Scotland' and the forged 'Minutes'—worked on a series of political 'Annals
of King George,' edited the monthly Mercurius Politicus and Mercurius Britannicus and contributed to at least three newspapers. He was one of the most conspicuous figures of the time, but was at no period admitted to the brilliant literary circles of Swift and Pope and of Addison and Steele. Meanwhile he had been convicted (July 1715) of libeling Lord Annesley by the declaration that his lordship had tampered with the Irish troops in the interest of the Pretender, and it would have gone hard with him if he had not thrown himself on the mercy of Chief Justice Parker. The latter commended him to the Secretary of State, Lord Townshend, who found him ready to serve the new government in a hazardous employment, to wit, as a spy in the offices of Jacobite newspapers. His chief connection of this sort was with Mist's Journal from 1717 to 1724, with intermissions. He took the sting out of articles and kept the government informed of what the disaffected Tories were doing and writing. Doubtless justifying himself by the thought that he was serving the best interests of Great Britain and the Protestant religion. There is simply no defense for Defoe's conduct; but it should be remembered that his conduct was not his own, but that of persons more inured to intrigue, and it is at least to his credit that his skill made Mist's Journal popular. He continued to labor as an anonymous and outwardly renegade journalist, now editing his own weekly, The Weekly Journal—now contributing leading articles to Applebee's Journal, until 1726, long after his fiction had obtained popularity. Our knowledge of this portion of his career is largely due to the researches of Mr. William Lee, who in the second and third volumes of his great work published the choicest of Defoe's articles in which will be found some of the best of all his writings. Under the protection of Harley he had made himself the ablest political journalist of his time; left to his own devices, he became the ablest journalist commenting on the general news of the day and on morals that England had yet known, with the exception, in certain particulars, of Addison. The later phase of his activity naturally fitted in with his writing of another sort, which was more and more his combined functions he has probably exerted an almost unrivaled influence on English literature.

Defoe had shown in 'Mrs. Veal' and in his description of the supposed destruction of the island of Saint Vincent (Mist's Journal, 1718) his ability to write realistic narratives; but it was 'Robinson Crusoe,' founded mainly on the adventures of Alexander Selkirk on Juan Fernandez, as told by Captain Woodes Rogers, that gave the great journalist a high standing among world authors. The book, concerning the origin of which we know almost nothing, became popular at once, was pirated, printed as a serial and translated into French and German, and subsequent editions, translated through the device that have been composed numberless. A second part, 'The Farther Adventures of Robinson Crusoe,' was added in August 1719, and a third part, the 'Serious Reflections,' a group of essays now little read, appeared a year later. Neither the story that the first and best part was by Harley, nor the notion that Defoe used Selkirk's manuscripts, nor the theory that he gave in 'Robinson Crusoe' an elaborate allegory of his own life (partly supported by his language) will bear close investigation. That in his most famous-book he made admirable use of a theme of universal character and that he embodied in writing it all his resources as a realistic reporter and an imaginative projector, is proved by the position it has attained as a classic.

From the date of this success until 1727, that is, from his 60th to his 68th year, Defoe's work is simply astounding both in quantity and in quality. Of about 70 items some 30 are volumes and several of the remainder almost too large to be called pamphlets. To this period belong the peripatetic stories of Moll Flanders (1722), Colonel Jacque (1722) and 'The Fortunate Mistress' or 'Roxana' (1724)—unrivaled as studies in low life and showing growth on Defoe's part in character-drawing and plot-construction; the adventure stories of 'Captain Singleton' (1720)—remarkable for the knowledge displayed of African geography—and 'A New Voyage 'round the World' (1725)—interesting for its descriptions of the lower part of South America; the 'History' of a famous teller of fortunes, Duncan Campbell (1720); those behind historical epochs and episodes, 'Memoirs of a Cavalier' (1720), 'A Journal of the Plague Year' (1722)—probably Defoe's best work after 'Robinson Crusoe'— and 'Due Preparations for the Plague' (1722) and those popular manuals of conduct, the curious 'Religious Courtship' (1722), and the two parts of 'The Complete English Tradesman' (1725, 1727). These books, some of them masterpieces in their kind, must be added a 'History' of Peter the Great (1723), a book on the servant question ('The Great Law of Subordination Considered,' 1724), three volumes of an early guide-book ('A Tour thro' the Whole Island of Great Britain,' 1724, 1725, 1726), 'The Political History of the Devil' (1726) and 'A System of Magic' (1726), at least 10 pamphlets on famous criminals, such as Jack Sheppard, and several tracts on commercial, economic and social topics—some of them published under the assumed name of Andrew Moreton. There is scarcely another such record of another such record in the annals of the press in the part of an aging man, and these multifarious productions illustrate his times better than is the case with the writings of almost any other author. These were nearly always anonymous save in such a case as 'The Four Years' Voyages of Capt. George Roberts' (1726), which describe the adventures among the Cape Verde Islands of a possible real seaman.

Between 1727 and his death Defoe published at least 30 books and tracts, among them 'Conjugal Lewdness' (1727), a well-mean but hazardous volume; 'An Essay on the History and Reality of Apparitions' (1728), 'A New Family Instructor' (1727), 'A Plan of the English Commerce' (1723) and a number of pamphlets many of which were specially designed to promote the government of London. He also seems to have compiled for a veteran, Capt. George Carleton, a volume of 'Memoirs' (1728) describing experiences as a soldier and prisoner in Spain, which has been too implicitly trusted by historians, and for a certain Robert Fryer a work that entitled 'Madagascar' (1729), giving an account of the young man's captivity on that island. These
books are frequently ascribed to their putative authors, and the first has been attributed to Dean Swift, but there is good reason to hold that Defoe was mainly responsible for them. It is pleasant to believe that his incessant labors enabled Defoe to spend some of his last years in comfort at Stoke Newington; certainly, from the account of him given by his son-in-law, Henry Baker, the naturalist, he must have had a fair income. About 1730, however, at a time when he was working on a periodical, The Pollak State of Great Britain, founded by an old rival, Abel Boyer, he seems to have deeded his property in trust for his wife and daughters to one of his sons, who apparently was false to his trust. Defoe, probably to escape some of his old persecutors, went into hiding, and in April 1731 died in London lodgings. Mystery surrounds his last days, and there are numerous passages in his more active period that need to be cleared up. The man's character, too, remains enigmatic, though we may be sure that he was neither the hero of the early biographers nor the unprincipled mercenary and liar of many contemporaries and some latter-day critics. Fortunately there is little doubt that in his combined achievements as journalist, pamphleteer, realistic novelist and miscellaneous purveyor of information and instruction he is unsurpassed among prose-writers. See Robinson Crusoe.

Bibliography.—No edition of Defoe's works contains more than a small fraction of his writings. The best is that printed at Oxford in 20 volumes (1840–41). A good edition begun in 1890 by the younger William Hazlitt did not get beyond three volumes. 'The Compleat English Gentleman' and 'Of Royal Education' were first printed from a manuscript in the British Museum by Dr. Bühl in 1890 and 1895. There are two recent editions of the fiction—the excellent one in 16 volumes, edited by the late G. A. Allen (1895), and that of equal scope, by Dr. G. H. Maynadier (1904). The most important biographies are those by Walter Wilson (1830, 3 vols.—very valuable for its account of Defoe's times), by William Chadwick (1859)—rather eccentric, by William Lee (1869), 3 vols.—the second and third containing Defoe's newspaper articles—and by Thomas Wright (1894), useful, but disfigured by the curious theory that Defoe kept a vow of silence for a period equal to that spent by Crusoe upon his island). Consult also John Forster's 'Historical and Biographical Essays' (1858), Minto's 'Daniel De Foe' ('English Men of Letters', 1879) and D. W. Rannie's 'Daniel De Foe' (The Stanhope Essay, 1890). Lee's bibliography of 254 items (slightly amended by Wright) was long standard, but is now antiquated. His selections from Defoe's newspapers, although unsupported by much external evidence, seem to have been made with great skill. Consult for further information the present writer's chapter in the ninth volume of The Cambridge History of English Literature and its volume, How to Know the Authors' Series (1916).

William P. Trent,
Professor of English Literature, Columbia University.

DE FONTAINE, Felix. American journalist: b. Boston, Mass., 1832; d. Columbus, S. C., 11 Dec. 1896. The first statement given to the North of the attack on Fort Sumter was written by him; and he was correspondent of the Charleston Courier from the principal battlefields during the Civil War. Subsequently he went to New York, and was connected with the Herald much of the time until his death. He was the author of 'Cyclopedia of the Best Thoughts of Charles Dickens'; 'Gleanings from a Confederate Army Note-Book'; and 'Birds of a Feather Flock Together.'

DE FOREST, Jesse, the reputed founder of New York city and Wallon ancestor of many thousands of Americans: b. about 1575 at Avesnes, Hainault; d. 1624. He was married to Marie du Cloux, 23 Sept. 1601. In Sedan, also, on 22 July 1604, Henry De Forest, founder of Harlem, N. Y., and David de Forest, resident of New Amsterdam in 1659, were born. Jesse was a merchant dyer. His name appears next in the Walloon records of Leyden, where his daughter, ancestress of many New York families, was born in 1609, marrying in 1626 Jean Mousnier le Montagne. Many other members of the De Forest family were in Leyden, the majority of them receiving land grants at Avesnes. Isaac, the future ancestor of the American De Forests, b. 10 July 1616, was one of Jesse's four children born in Leyden. In all, it is probable that Jesse De Forest had at least 10 children—his large family thus furnishing a noble motive for emigration. During the Great Truce, from 1659 to 1626, there were many thousand Wallon soldiers and others in the Dutch Republic. In July 1621, Jesse applied to King James of England, through Sir Dudley Carleton, in the name of 60 families of Wallons, for transportation to Virginia. The "round robin" was signed by 56 men, heads of families representing 227 persons, but the response of the Virginia Company was unsatisfactory. In April 1622, Jesse petitioned the States of Holland and again, on 26 Aug. 1623, the States-General, for aid, and the very next day received his authorization to enroll colonists. Twenty-six ships were sent by the Dutch West India Company to Brazil and Guiana, laden with thousands of fighting men and colonists, one of the latter being Jesse De Forest. They sailed out of the Maas River at Rotterdam on 23 December. He wrote an account of this voyage. On the ship New Netherland, 260 tons, commanded by Cornelis Jacob Mey, of Hoorn, the company of Wallon settlers, with Jesse De Forest's children, sailed for America in March, via the Canary Islands, and touching at Oya-puck in Guiana, sailed northward into the Mauritus (Hudson) River. There being yet no military occupation of New Netherland by the Dutch, this ship, with the armed yacht Mackerie, arrived in time to save the region from French occupation. These Wallon settlers (see WALLONS) began immediately to cultivate the soil and became the ancestors of many thousands of Americans, many of them eminent in the annals of war and peace, literature, education, finance and philanthropy. It is not known where or when Jesse De Forest died. Consult his journal in R. W. De Forest's book; De Forest, J. W., 'The De Forests of Avesnes' (1900); and De Forest, R. W., 'A Wallon Family in America' (2 vols., p. 705, 1914).
DE FOREST, John William, American novelist: b. Humphreysville, Conn., 31 March 1826; d. New Haven, Conn., 17 July 1906. He passed many years in independent study and foreign travel, becoming proficient in several languages, and the army as captain at the outbreak of the Civil War and rose to major. Among his works are 'History of the Indians of Connecticut' (1853); 'Ordeal Acquaintance' (1856); 'Witching Times' (1856); 'European and American Confederate' (1858); 'Seafarer' (1859); 'Miss Ravenel's Conversion' (1867); 'Overland' (1871); 'Kate Beaumont' (1872); 'The Wetherell Affair' (1873); 'Honest John Vane' (1875); 'Justine Vane' (1875); 'Playing the Mischief' (1876); 'Irene Vane' (1877); 'Irene, the Missionary' (1879); 'The Oddest of Courtships; or, The Bloody Chasm' (1881); 'A Lover's Revolt' (1888); 'Overland' (1889); 'The De Forests of Avesnes and New Netherland' (1900).

DE FOREST, Lee, American inventor: b. Council Bluffs, Iowa, 26 Aug. 1873. He was graduated from Sheffield Scientific School of Yale University in 1896. He is one of the pioneers in the development of wireless telegraphy in America. He was vice-president of the American De Forest Wireless Telegraph Company in 1902-06, which was succeeded by the United Wireless Telegraph Company. He is vice-president of the Radio Telephone Company and the De Forest Radio Telephone Company since 1907. He was awarded a gold medal at the Saint Louis Exposition of 1904 for his work in wireless telegraphy. He has taken out over 100 United States and foreign patents on radio telegraphy and telephony; his most important contribution in this field is the 'Audion'—detector and amplifier, which made possible the transcontinental telephone service, both by wire and wireless.

DE FOREST, Robert Weeks, American lawyer: b. New York, 25 April 1848. He was graduated at Yale in 1870, studied law at Columbia, and studied also at Bonn. He was admitted to the bar in 1871 and joined his father's and uncle's law firm, later with his brothers. In 1874 he became general counsel and in 1902 vice-president of the Central Railroad of New Jersey, and holds offices and directorships in several railroad and other corporations. He has taken an active part in several public movements and in 1898 became president of the Charity Organization Society, which office he still holds. In 1913 after 25 years of service as trustee he became president of the Metropolitan Museum of Art. He was chairman of the New York State Tenement House Commission in 1900 and was the first tenement house commissioner of New York city. In 1903 he was president of the National Conference of Charities and Correction and is a vice-president of the American Red Cross and vice-president of the Russell Sage Foundation. Since 1912 he is president of the American Federation of Arts.

DE FOREST WIRELESS TELEGRAPH SYSTEM. The. The inception of this system, invented by Dr. Lee De Forest, dates back to 1899. Dr. De Forest's original idea was to develop a receiver, working on an electro-magnetic principle, which would be entirely automatic in its actions, requiring no tapping back or decohering arrangement like the coherer, but allowing the use of a telephone receiver for rapid and accurate work. During the years 1901 to 1905 Dr. De Forest developed the radio telegraph system bearing his name. He was the first in the world to describe the alternating current generator and transformer at the transmitter as distinguished from the spark coil and direct current and the telephone receiver, with a 'self-restoring' detector as distinguished from the filings core of the Audion. The Audion receiver station. These radical improvements put the radio art upon an engineering basis. In 1904 all then existing records for overland wireless transmission were broken in the service established between the World's Fair at Saint Louis and Chicago, 300 miles. Five months later the American De Forest Wireless Telegraph Company installed five high-power 35 k.w. stations for the United States navy, operating over distances of 1,500 miles. The electrolytic receiver was in 1906 supplanted by the De Forest Audion or ionized current detector. The Audion and Ultradion are more sensitive than any other types of detectors, absolutely reliable in action and enable operation over distances quite impossible with other types.

In an exhausted glass bulb are a hot filament, a cold plate and a grid wire electrode located midway between these two. In circuit between the plate and filament are connected a B battery and telephone receiver. The incoming high frequency impulses to be detected are led to the grid and the filament. The normal negative current passing by means of ions or electrons from filament to plate is more or less interrupted by the slightest negative change impressed on the grid electrode of the Audion. The action is self-restoring instantly upon cessation of the train of waves from the transmitter. In this way an operator listening in the telephone receiver hears an exact reproduction of the transmitted signals. The Audion permits radio telegraphy over immense distances.

In 1906 Dr. De Forest discovered that the Audion could be made to amplify weak telephonic currents and this without any distortion of the voice. The Audion developed as a telephone repeater or relay to such a degree that in 1912 the American Telephone and Telegraph Company purchased a license under all the De Forest Audion patents for wire telephone purposes. Within a short time thereafter transcontinental wire telephony was an accomplished fact, an impossibility before the advent of the Audion relay. The Audion amplifier has been pronounced by eminent telephone engineers as the one radical innovation in the telephone art since the discovery of the microphone.

De Forest devoted most of his efforts from 1906 to 1910 to the development of radio telephony. Sixteen United States battleships were equipped with this system just prior to their historic round-the-world cruise. From 1913 to 1916 De Forest developed the Ultradion receiver for undamped wave reception, and also the Oscillion, or oscillating Audion, as a source of high-frequency undamped waves, as a transmitter, especially for radio telephony. The United States navy has adopted the Ultradion exclusively for all long
DE FREGGER — DEGENERACY

distance reception, utilizing thousands of these bulbs each year. In 1915 there was installed at the large United States navy station at Arlington, Va., a high power radio-telephone transmitter employing over 500 Oscillion bulbs. These sets of apparatus generated by these lamps were controlled by a small "master" microphone. In receiving-stations at Mare Island, San Francisco and Honolulu, Audion amplifiers and directors were installed, and the spoken voice was heard distinctly over 6,000 miles. This was the first demonstration of the correctness of the prophecy made by De Forest in 1908 that transoceanic telephony would be achieved within 10 years. In 1917 attention was drawn to the discovery of De Forest that the Audion in connection with telephone receivers could be used as a source of musical sound. An elaborate musical instrument on this novel principle was developed. A large number of bulbs are controlled by keys corresponding to the keys of a piano. The pitch quantity of the notes can be closely regulated through variable wide ranges by simple changes in the inductance and capacity connected with the various oscillating apparatus.

LEE DE FOREST.

DE FREGGER, Franz von, dä-frëg/ér, Austrian genre painter: b. Stronach, Tyrol, 30 April 1835. The son of a peasant, he early showed a talent for drawing and wood carving, which he practised untutored while tending his father's cattle. His career began late, for he lacked instruction till, in 1860, he went to Innsbruck to study sculpture under Michael Stolz, who, discovering his greater talent for painting, sent him to Munich, where he studied at the Academy under Anschutz. He later became a pupil of Piloty, to whose influence he is indebted for his technique. He soon found the sphere in which he was to score success — the delineation of Tyrolean everyday life and of many stirring episodes in the history of his native land. His 'Joseph Speckbacher and his Son' (1869, Ferdinan deum, Innsbruck), a patriotic scene of soulful conception, and 'Wrestling Match in Tyrol' (1870), a spirited representation of this popular sport of his countrymen, were received with great favor, and most of his subsequent efforts quickly found their way into the principal galleries of Germany and Austria. Among these may be noted 'The Last Summers' (1874, Vienna Museum), an episode of the rising of the Tyrolese in 1859; 'Return of the Tyrolese Riflemen in 1809' (1876, National Gallery, Berlin); 'Andreas Hofer on his Way to Execution' (1878, Königsberg Museum); 'Storming of the Red Tower at Munich in 1705' (1881, Pinakothek Munich).

His work appears to even greater advantage in his village genre scenes, such as 'The Prize Horse' (1872); 'The Zither Player' (1876, Vienna Museum); the ironical 'Fashionable Tyrolese' (1882, National Gallery, Berlin); 'The Fortune Teller' (1891). Before the De Fregger picture is understood the ironical character and quaint humor are the main features of his compositions. He passed most of his life in Munich, where he became professor at the Academy in 1878, and was ennobled in 1883. A 'De Fregger Album,' with text by Rosengart, was published in Vienna (2d ed., 1889-92). Consult Meissner, 'Franz von De Fregger' (Berlin 1900).

DE PUNIKA SPRINGS, Fl., town, county-seat of Walton County, situated on the Louisville and Nashville Railroad, 80 miles northeast of Pensacola and about 25 miles north of the Gulf of Mexico. The industries of the place are farming and dairying. Its two mills are doing a growing business. There are cotton, tobacco, sugar, rice, sugar, and cotton plantations. The town is growing and is an important harbor. The climate is warm, and the soil is fertile.

DE GARMU, Charles, American educator: b. Mukwango, Wis., 7 Jan. 1849. He was graduated from the State Normal University of Illinois in 1873; was principal of public schools, Naples, Ill., 1873-76; professor of modern languages at the State Normal University 1888-90, and president of Swarthmore College 1891-98. Since 1896 he has been professor of the science and art of education at Cornell University. He was elected president of the National Herbart Society in 1892 and is considered the leader of the Herbartian school in the United States. He has published 'Essentials of Method'; 'Herbart and Herbartians' (1896); 'Language Lessons' (1897); a translation of Lindner's 'Manual of Empirical Psychology' (1889); 'Essentials of Method' (1889-1907); 'Interest and Education' (1902); 'Principles of Secondary Education' (1907-1909); 'Laboratory Exercises in the Art of Appreciation' (1907); 'Aesthetic Education' (1913).

DEGA, dé-ga', Edgar Hilaire Germain, French painter and engraver: b. Paris, 19 July 1834, d. September 1917. He was a pupil of La Mothe and studied at the Beaux Arts in Paris. He was one of the most interesting members of the impressionism school, having worked in pastel, etching, dry point and stone-engraving, producing numerous interiors of theatres and café-concerts, foyers of the opera, views of the circus and of laundries, studies of Paris and all with a masterly touch. He expresses a modern ideal of energy and uses a modern language for its expression. In order to say what he wanted he was obliged to master the human figure, this he did with the thoroughness of the ancients. In pure draftsmanship he was unequalled. He also produced several portraits of Manet.

DEGENERACY. In every community there are individuals who fail to measure up to the physical norm and more especially to the mental and moral norm of the race. In a large number of cases this is due to the action of an unfavorable environment which upon a normal constitution, but in another extensive group the condition, be it physical, mental or moral, is itself at fault. The three types of defects are inextricably fused with one another, but in certain individuals the mental and more especially the moral degeneracy is predominant. On the other hand, the fundamental defects may be
obscure and inaccessible to the pathological anatomist of the present day. The neuro-sensory degeneration is frequent, but not always, accompanied by malformation of a more conspicuous character, known as stigmata. These include various distortions of the external ear, facial asymmetry, very early or very late closure of the cranial sutures, polydactylysm and other digital anomalies and various signs of imperfection in the pelvis. An individual stigmata may be present in a person of normal mental and moral make-up, but the concurrence of a considerable number of stigmata is a fairly good sign of degeneracy.

The forms assumed by degeneracy are very various. The mental defect varies from utter idiocy, where the patient is unable to protect himself from immediate physical danger, through imbecility, where he is still incapable of carrying out the daily processes of dressing and undressing, washing, etc., to the various grades of feeble-mindedness, in which he is able to satisfy all his immediate personal needs, but cannot earn an independent livelihood nor associate with his fellows on equal terms. These grades of deficiency naturally show in the brain by insensible gradations. Even the lowest of them is compatible with the high development of some one power of the mind, such as the mathematical or musical faculty.

Mental degeneracy brings of necessity in its train a greater or less degree of inability to perform the customary moral duties and to discern and avoid the temptations of evil conduct. There are also certain malformations of the moral character which are less directly dependent on an atrophied mental development, and which indeed are consistent with a mentality normal or even supernormal in most respects. These may take the form of a general indifference to the claims of good and evil, with a consequent cold-blooded selfishness and brutality or of certain morbid and unnatural impulses. In the latter case, phenomena such as kleptomania (an unreasoning impulse to steal), pyromania (an unreasoning impulse to set fires), and the sexual perversions. These anomalies belong to that group of functional mental disorders known as psychasthenias, which are more or less intimately related with hysteria.

The causes of degeneracy are manifold. The racial poisons of alcohol, drugs and venereal diseases are responsible for a large proportion of the cases, though in many cases alcoholism and drug habits may be symptoms rather than causes of degeneracy. Any factor which enfeebles the mother—poverty, illness or the like—may injure the mental and moral constitution of the child as well as its physical constitution. Together with the fact that degeneracy is in all probability the inherent inferiority of the stock. That certain forms of degeneracy exhibit a pedigree conforming to the Mendelian law is now an established fact. This hereditary quality of degeneracy, together with the fact that degenerates are often likely to have many children owing to their immorality, makes the problem of degeneracy a most serious one. The so-called Jukes family cost the taxpayers of New York State millions of dollars in the course of the 19th century. For this reason many States have enacted laws making it legal in certain cases to perform on degenerates operations designed to prevent the propagation of their kind. There has been a large amount of controversial literature, associated with the names of Nordau and Lombroso, designed to prove a connection between degeneracy and genius. This is for the most part too biased to be convincing. There is no doubt that the existence of a degenerate taint is not inconsistent with genius. See Alcoholicism; Criminology; Degeneration; Eugenics; Feebleminded; Idiocy; Insanity; Pauperism.

DEGENERATION. See Man, Christian Anthropology.

DEGENERATION. In medical pathalogy degeneration is one of the processes that occur in the cells of an organ whereby different grades of disintegraion and shrinking take place. It is one of the retrograde or breaking-down processes in contrast to those of abnormal growth and increase, although in many of the degenerative processes both processes are going on side by side. When abnormal intracellular metabolism slowly converts the cell plasma into useless and abnormal substances the process is known as degeneration, and then the cell is said to be degenerated. This is frequently found in several organs at the same time, and results in large part from the infections diseases accompanied by nutritional disturbances. Thus, in connection with chronic tuberculosis and syphilis amyloid degeneration is apt to occur. Hyaline degeneration is another form, which takes place in the connective tissue by which that part of the cell is rendered homogeneous. Hyaline degeneration commonly affects the arteries and heart-valves, and is frequently associated with chalky infiltrations in these structures. Colloid degeneration occurs in certain forms of cancer in which the substance in the cells resembles
DEGENERATION — DEGENERATION AS A FACTOR IN EVOLUTION

softened glue. Mucoi& degeneration consists in the transformation of the leading tissues into a transparent, viscid, homogeneous mass consisting of mucins and pseudo-mucins. Mucoi& degeneration takes place largely in the connective tissue in the epithelial cells, and sometimes as a result of the disturbance of the functions of the thyroid gland as in myxœdema. Fatty degeneration is a degeneration in which fat globules are deposited in the cells. Albuminous degeneration, or cloudy swelling, as it is sometimes called, consists in a fine granulation of a number of cells in the body, particularly in the kidneys, liver and brain. This acute degeneration is very frequently associated with fatty degeneration, and is due in great part to anomalies of nutrition largely produced by bacteriological agencies, as in the infectious diseases, and also at times to auto-intoxic products having their origin within the body itself as a result of perverted oxidation. Pigmentary degeneration is another form, in which are deposited in the cells small or large quantities of iron compounds derived largely from the blood and known as pigments. The abnormal deposition of lime on the same tissues is known as calcareous degeneration. It occurs in the walls of the arteries in arteriosclerosis.

DEGENERATION, a work of Max Nordau (1895), which aimed at a scientific criticism of those degenerates not upon the acknowledged lists of the criminal classes. "Degenerates," asserted Nordau, "are not always criminals, profligates, anarchists, and pronounced lunatics; they are often authors and artists. These, however, manifest the same mental characteristics, and for the most part the same somatic features, as the members of the above-mentioned anthropological family, who satisfy their unhealthy impulses with the knife of the assassin or the bomb of the dynamiter, instead of with pen and pencil... Now I have undertaken the work of investigating the tendencies of the fashions in art and literature; of proving that they have their source in the degeneracy of their authors, and that the enthusiasm of their admirers is for manifestations of more or less pronounced moral insanity and dementia."

DEGENERATION AS A FACTOR IN EVOLUTION. Degeneration is a term used in biology to describe those not infrequent cases where an entire organism falls below the structural level of its young stages (ontogenetic degeneration) or its ancestors (phylogenetic degeneration); or where an organ in the same way loses its fullness of function and becomes more or less atrophied, abortive and simplified. Thus many parasitic worms, crustaceans, etc., are emphatically simpler than their free-swimming larve, and the sessile adult ascidian shows only traces of the vertebrate characters of the embryo. Examples of the degeneration of individual organs are the tail of a frog; the digestive system of the mature mayfly; the pinene gland of man (primarily a medium eye); the human wisdom-tooth; the spine-bones of the horse (metacarps and metatarsals of lost digits); the limb of certain salamanders, etc. As in the case of the feet of the horse the perfection of the entire structure is often dependent on the atrophy or loss of certain of their parts. The loss of the hind legs in the whale unquestionably permits it to offer less resistance to its motions in the water. On the other hand, the degeneration of an organ may be accompanied by no very great advantage to its owner. Thus a crustacean which starts with a well-developed eye may exhibit the gradual loss of this on assuming a dark habitat. Degeneration must be distinguished (1) from occasional abortion; (2) from reversion to an ancestral type; and (3) from the occurrence of rudimentary and undeveloped organs where a character possessed by ancestral types remains more or less undeveloped, or shows itself only in embryonic life. Degeneration may be due to the environment. Absence of food, heat, light, etc., may mean the absence of the necessary stimulus for the growth and maintenance of the organs; or superfluity of food may cause one system to preponderate over others. Nor can it be doubted that cessation of function checks the food-supply to a given organ, and in other ways helps to bring about its degeneration. Again, the mere pressure of a hypertrophied organ on its neighbors, particularly in the embryonic stages of growth, is capable of causing their atrophy. But on the other hand, there is degeneration — the fatigue of early life, a constitutional sluggishness, etc. — may share in conditioning degeneration, as in the case of the Tunicata. Weismann and others, however, would explain degeneration by what they call the non-operation of natural selection. On this view, organs are not only developed but maintained by natural selection; and if it happens that an organ is no longer an advantage in this struggle for existence (for example eyes in dark caves), then natural selection no longer maintains that organ and it disappears in the course of generation. In other words retrogressive variations have an equal chance of survival to that of progressive variations, and as the ways in which a complicated organ like the eye can deteriorate are vastly greater in number than those in which it can improve, the interbreeding of the surviving cave animals is sure to create sooner or later a race with defective eyes. Weismann applies this ultra-Darwinian conception especially to cases of purely phylogenetic degeneration—for example, to the slightly developed wings of the Apteryz. Many cases of degeneration may be argued to appear hardly to require his subtle explanation, but find a sufficient one in the nature of the environment, in the effects of stopped function and in the constitution of the organism. The problem of ontogenetic degeneration is immersed in the obscurity that shrouds all the phenomena grouped under the law of recapitulation (q.v.). Degeneration is curiously distributed in the animal kingdom. There are groups, such as the vertebrates, in which with all the degeneration that may occur, a certain high level of structure is everywhere maintained. There are groups, such as the ascidians, which are distinguished by the universality of a degeneration at once phylogenetic and ontogenetic. Again, there are groups like the arthropods, where progressive and retrogressive lines of evolution are found in the closest proximity and interconnectedness. The Crustacea, for example, developed free-swimming forms, like the lobster or crab; hopeless vegetative parasites, like Sco-culina, which nevertheless has a free-swimming larva; slightly modified ectoparasites, degener-
ate non-parasitic forms, such as the barnacles; free-swimming forms which pass through a vegetative parasitic stage in their existence; and forms in even more involved degrees of abdication. These forms are related to one another in a manner but distantly suggesting the extent of their degeneracy; neighboring genera may be at very different levels of organization. The insects are also characterized by a mingling of degenerate and non-degenerate forms. (See Degeneracy; Environment; Evolution, etc.). Consult Demoor, Massart and Vandeville, 'Evolution by Atrophy' (New York 1899); Lankester, E. R. 'Degeneration' (London 1880); Morel, 'Traité des dégénérescences' (Paris 1857).

DEGER, dàr-gér, Ernst, German painter: b. Bockenheim, Hanover, 15 April 1809; d. Düsseldorf, 27 Jan. 1885. He was a pupil of Wach and Schadow, in Berlin and Düsseldorf, becoming a painter in oil and of frescoes and giving much attention to the latter form of work. He decorated the chateau at Castell, Szczecin, for Frederick William IV of Prussia, becoming in 1869 professor at the Düsseldorf Academy and member of the Berlin and Munich academies. Among his works are 'Pieta' (1830); 'Bearing the Cross' (1832); 'Annunciation' (1834); 'Virgin Adoring Christ' (1836); 'Madonnas and Seven Scenes from the Life of Christ' (1841-51, in Saint Apollinaris' Chapel, Remagen); 'Adam and Eve' (1853, Raczyński Gallery, Berlin). His works are noted for vigor and finish. He was a leader in the so-called 'Nazarene School.' See Nazarenes.

DEGÉRANDE, zhà-ran-dô, Joseph Marie, Baron, French philosopher and statesman: b. Lyons, 29 Feb. 1772; d. Paris, November 1842. On the siege of Lyons in 1793 he took up arms in its defense, and greatly distinguished himself by his bravery, but he was subsequently obliged to return to France on the proclamation of an amnesty, and joined a cavalry regiment. While in garrison at Colmar he composed an essay on the theme proposed by the French Institute. 'Quelle est l'influence sur l'art de penser, de la génération des connaissances humaines?' (1802); 'Histoire comparée des systèmes de philosophie' (1804), completed after his death; 'Du perfectionnement moral et de l'éducation de soi-même,' a treatise which gained the prize of the French Academy in 1825; 'De l'éducation des sourds-muetts de naissance' (1827); 'Institutes du droit administratif français, ou éléments du code administratif réunis et mis en ordre' (1829-45); 'De la bienfaisance publique' (1839).

DEGENDORF, dàg'èn-dôr, Germany, a town of Lower Bavaria, near the Danube, 39 miles northwest of Passau. It has manufactories of paper, linen, woolens, stoneware and matches. Its church of the Holy Sepulchre is visited annually by a large number of pilgrims. Pop. about 7,500.

DEGLUTITION, the physiological act of swallowing, or the process by which food is conveyed to the stomach. See Digestion.

DEGRADATION, a penalty inflicted on criminous clergymen in the Catholic Church. It consists of two degrees, being either verbal or actual. The canon law specifies minutely the crimes for which the punishment of degradation may be legally inflicted. No jurisdiction is vested in bishops for degrading, except the causes determined by the law and the Pope. By actual degradation the offender, besides being deprived of his faculties, is deprived of his order and of the canonical privileges attached to his order, and in particular is delivered over to the secular arm for punishment; nor does any one who commits a violent assault on him incur the excommunication decreed against whoever violently attacks a cleric or a monk. By verbal degradation the cleric is deprived of all his clerical functions and stripped of his Church benefice if he holds any; but he retains the privileges of his order, and is not handed over to the secular power: he has right of appeal to ecclesiastical courts. If his offense merits imprisonment he must be shut up in some monastery or other ecclesiastical establishment; and though he is degraded, still were one to make an assault on him the assailant would, ipso facto, incur excommunication. Nevertheless, since the sacrament or order imprints an indelible character, the degraded cleric, whether by actual or verbal degradation, is still priest or deacon or whatever he was before in the ministry; and his purely sacerdotal and sacramental acts, even his priestly absolution, if given in articulo mortis or in grave peril of death when no priest in full church communion is at hand, is valid. So, too, his celebration of the mass is valid though sacrilegious.

The process of actual degradation, which was formulated by Boniface VIII (1235-1303), is as follows: The culprit, in the attire of his order and bearing in his hands some instrument of his clerical function, in place of a missal, is brought before the bishop. That emblem of his priestly state is taken away from him; then he is stripped of his ecclesiastical attire, and his head is shaven to obliterate the mark of the clerical tonsure. Finally the bishop addresses him in these words: 'By the authority of God Almighty... we take away from thee the clerical habit and depose, degrade, and deprive thee of all order, benefice, and clerical privilege.'

DEGRADATION. See Erosion.

DE GRASSE, Comte. See GRASSE, COMTE DE.

DEGREE. A title given by a university or college to those who have completed a more or less definitely prescribed course of
study. While educational institutions corresponding to our universities existed in ancient times, and while these undoubtedly gave to their students the opportunity to master theorems or to build up a sound foundation in various sciences, the present academic degrees do not go back continuously further than the Middle Ages. As the titles of doctor and master show, they were originally nothing more nor less than licenses to teach. They were also perfect synonyms; and it was only after some centuries of varying usage that the English universities came to appropriate the title of doctor to the higher faculties of theology, canon law and medicine, and the title master to the lower faculties of grammar and arts. The title of doctor was often applied to distinguished scholars, together with some laudatory epithet: thus Duns Scotus was known as the "Subtile Doctor," and Thomas Aquinas as the "Angelico Doctor." The degree was also sometimes conferred honorarily by the Pope or the Emperor, and those who received it in this manner were known as doctores bullati. Those who received their degree in course, the doctores rite promovi, had to pass public and public or private an examination in public and defend it against a doctor of their faculty, other selected adversaries, and in general against all comers. This custom survived in its original form in England until the middle of the last century. In Germany and America, though the doctoral dissertation is not read in public, the examination to which each candidate must submit consists in a large measure of a defense of his thesis against the members of his faculty or department.

The title of bachelor was not a degree at the time of its first appearance in the 13th century but merely indicated that its possessor had fulfilled certain preliminary requirements for the degree of doctor or master. As the medieval courses varied from 4 years in arts to 14 in theology, the importance of the preliminary title varied much between the different faculties. In the higher faculties, and eventually in arts, it took on the significance of a degree, except in France, where to the present day it signifies merely the completion of secondary education. Another preliminary degree which gave the right to teach was the Licensiate, so called from the licentia docendi. The licentiate stood between the baccalaureate and the doctorate.

In England the bachelor's degree is usually the first to be conferred, after a course of three years. The courses for the ordinary or pass degree and the honors degree, which is subdivided into three or four classes or levels of merit, are different, and each may be taken in several different subjects (schools at Oxford, triposes at Cambridge). There are special bachelor's degree for those from other institutions, and in law and some other faculties. The master's degree in arts is generally conferred without further examination upon the passage of a certain term of years and the payment of certain fees. The various doctor's degrees are generally either honorary, or are only given upon the production of mature works of real value. The German and American schemes, however, have been adopted by some of the newer universities. The University of London and some other institutions confer degrees by examination upon those not in residence. The British universities outside of England follow in general the English scheme, except in Canada, where the American course of study is followed, and in Ireland, where the influence, and in Scotland, where there is a different established tradition. In Scotland the master's degree in arts is not proceeded by a baccalaureate. The German universities give no other degrees than that of doctor except in the faculty of theology, where there is also the degree of licentiate.

The vast majority of the students at a German university take the degree under the faculty of philosophy, and indeed this is a necessary preliminary to the degree under certain other faculties. The doctor's degree is given after the presentation of a thesis and examination, and is divided into four grades of excellence: rite, cum laude, magna cum laude, and summa cum laude. The title of privatozenst may almost be regarded as a degree: it gives its possessor the venia legens, the right of lecturing—collecting his own fees—at any German university. To acquire this right, a so-called Habilitationsschrift must be prepared and accepted. The German system of degree prevails to a greater or less extent throughout the Continent, though in most countries the degree of licentiate or master are also given.

The French degrees are divided into those given by the state and those given by the university. The former consist of the several licentiates and doctorates, for the latter of which one or more dissertations are necessary. The latter consists of the doctorates of the university, which in general resemble the state doctorates.

In America, the older British system has been overlaid by the German system, so that both master of arts and doctor of philosophy are now given. The collegecourse of four years, prescribed in a greater or less extent according to the university or college at which it is given, leads up to a bachelor's degree, usually in arts, science or philosophy, according to the amount of attention devoted to the classics and the natural sciences. These are given in most colleges and universities in four grades, of which the three higher are cum laude, magna cum laude, and summa cum laude. The various technical and professional schools, which may or may not require a college degree or a certain amount of college work for admission, give a bachelor's degree, except in the case of medicine and dental medicine, where the first degree is usually that of doctor. The master's degree is given upon the completion with credit of a year or two of post-graduate work, with or without the writing of a thesis. The doctorate in philosophy and science, and occasionally in theology and law, is given much after the German fashion, upon from two to five years of post-graduate work, the writing of a thesis and the satisfactory passing of written and oral examinations. For the most part the degree of doctor of letters (Litt.D.), doctor of laws (L.L.D.) and doctor of divinity (D.D.) are conferred as honorary degrees. This practice has in many cases been grossly abused, and even the ordinary degrees given in course have been put to the entirely unnatural use of compliments or gifts.
The more familiar degrees are usually known by the following abbreviations:

A.A. or B.A. Bachelor of Arts.  Bachelor of Science.
A.B. or B.Sc. Associate in Art.  Bachelor of Engineering.
B.C.L. Bachelor of Laws.  Bachelor of Science.
B.S. or L.B. (Legum Baccae- Bachelor of Divinity.  Bachelor of Letters.

DEGREES, Measurement of. After Newton had taught that the earth, on account of its motion round its axis, must be highest near the equator, and that the diameter of the equator must be longer, by one 230th part, than the diameter of the pole. French wished to investigate the subject further by actual measurement. The measurement was begun with the result that the axis of the poles was found to be longer than a diameter of the equator, and that the earth was, in form, more like a lemon than an orange. For 40 years disputes were maintained on this point without settling the question; and at last the Academy of Sciences resolved, on the proposition of Condamine, to have a degree measured at the equator (the expedition went to South America in 1733), and one in Lapland (Kittis and Tornea being the extreme stations to which the expedition was sent in 1736). It was found that the northern degree was greater than that under the equator, and that Newton's conjecture was right. But the question still remained, How great is the flattening of our planet? The theory said one 230th part, if the earth had been in a perfectly liquid state when it began its rotation. The calculations, however, always gave different results, according to the different measurements adopted as the basis of them; for measurements had been made, not only in America and Lapland, but also in France, England, Hungary and Italy. When the French established their new and admirable system of measures and weights upon the basis of the metre, which was to be the ten millionth part of the distance from the equator to the pole (3,208,092 English feet, or 39.37 inches), it was necessary to know with accuracy the circumference and the flattening of the earth. A measurement, therefore, took place in France, not of one degree, but of 10 degrees, at Dunkirk to Formentera, one of the Balearic Islands. In Sweden in 1802 the degree, which 80 years before had been measured by Maupertuis, was now measured again with better instruments, and thus the circumference and flattening of the earth were pretty well ascertained. After the Peace of Amiens the measurements of degrees just made in England, under General Roy, by Lieutenant-Colonel Mudge, were connected with those in France; and thus an arc of 20 degrees, from the Balearic Islands over France and England, to the Orkneys, was measured, and the flattening of the earth calculated to be 1-304th (the most recent estimate being 1-292d). In India the measurement of a degree, begun by Lambton, was continued by Everest and completed by Walker. The measurement of an arc of 25 degrees 20 minutes from Hammerfest to Ismaillia was completed in 1855. Similar measurements have been continued to the present time, and at the Geodetic Congress in London in 1900, it was announced that English experts were engaged in measuring an arc of the meridian of 104 degrees from Cape Colony to Alexandria, and had made considerable progress.

The annexed table shows the lengths of a degree of longitude for places at every degree of latitude from 0 degrees to 90 degrees. It is computed on the supposition that the earth is a sphere.

Measurement of a Degree of Longitude.— The degrees of longitude are largest under the equator, and diminish continually toward the
DEGREES OF LATITUDE AND LONGITUDE — DEHMEL

pole. Under the equator a degree of longitude contains 60 geographical, 69.16 statute miles. If the form of the earth is not entirely regular, the degrees of longitude on the same parallel of latitude are of different lengths; but it has been proposed to investigate this by actual measurement. This task is in the trigonometric part, as easy as the measurement of a degree of latitude; but in the astronomical part it is 15 times more difficult. The degree of longitude of two places is determined by the difference of the hour of the day at the same point of time in the two; as a place situated 15 degrees to the east of another has noon a whole hour earlier. One hour, therefore, corresponds to 15 degrees, or 1,042.5 statute miles, under the equator, or 5,504,400 feet; a minute of time to 91,740 feet, and a second of time to 1,529 feet. A mistake of a second of time, therefore, in calculating the longitude of two places, makes a considerable error in space. To determine time within two or three seconds, by means of rockets, at a distance of 1,042.5 miles is impossible; and while the measurement of an arc corresponding to this distance trigonometrically, may be attended with an error to the amount of 200 miles, an astronomical measurement would leave an uncertainty of 2,000 feet. The earlier measurements of the French were directed, in the north, by Maupertuis; in the south by Bouguer. Since that time measurements have been made in all the great continents of the globe — in Pennsylvania, in the time of Maske- lynan, by Mason and Dixon; at the Cape of Good Hope by Lacaill, completed by Maclear; in Prussia by Bessel; in Russia by Struve; in Denmark by Schumacher; and in England by Roy Kater and Colby. The French are from Formentara to Dunkirk was measured by Me- chain and Delamore. The results of the measurements, as given by Airy, make the equatorial diameter 7925.648, and the polar diameter 7899.170 miles; Bessel’s results are almost identical nearly, equatorial diameter 7925.604 and polar diameter 7899.114 miles. There is an international association, having as its main object the correlation of all degree measurements and connected data with the view of accurately ascertaining the figure of the earth.

DEGREES OF LATITUDE AND LONGITUDE. Degree of latitude is the space or distance on the meridian through which an observer must move to vary his latitude by one degree, or to increase or diminish the distance of a star from the zenith by one degree; and which, on the supposition of the perfect sphericity of the earth, is the 360th part of the meridian.

Degree of longitude is the space between the two meridians that make an angle of one degree with each other at the poles, the quantity or length of which is variable according to the latitude. See LATITUDE AND LONGITUDE.

DE HAAS, de häs, Maurice Frederick Hendrick. Dutch-American marine painter; b. Rotterdam, 12 Dec. 1832; d. 23 Nov. 1895. He studied in England and at The Hague under Louis Meyer, and in 1857 was appointed painter to the Dutch navy. In 1859 he came to the United States and on one voyage to New York which remained his home henceforth. Among his paintings are ‘Admiral Farragut’s Fleet passing New Orleans’; ‘Coast of France’; ‘Sunset at Sea’; ‘Moonlight at Sea’; ‘Sunset at Pigeon Cove’; ‘Sunrise in a Fog at Newport’; ‘Shipwreck’; ‘Menhaden Boats off Long Island’; and ‘Off Marblehead.’ His brother Theo is a well-known marine painter. B: 1830; d. 1880. He settled in New York in 1854. Among his pictures are ‘Evening at Halfax’; ‘Narragansett Pier’; ‘Sunrise on the Susquehanna.’

DEHMEL, däm’el, Richard, German lyric poet; b. at Wendisch-Hermisdorf in the Spreewald, of Slavic-German descent, 18 Nov. 1863. He was the son of a forester, and his first impressions of nature wandering in the oak forests tended by his father. After finishing the schools of his native city, he became a stu- dent at the Sophiengymnasium at Berlin, but later went to Danzig and was graduated from the Gymnasium in that city. At the university — chiefly at Berlin — he devoted himself to philosophy and the sociological and natural sciences. He finished at Leipzig with a thesis on the insurance business. Up to the year 1895 he was then secretary of the Association of German Fire Insurance Companies. This difficult work he learned, as he himself states, self-control. While in this position he published his first book of poems, ‘Erlöisungen’ (1891), ‘Aber die Liebe’ (1893) and ‘Lebens-blätter’ (1898). After serving the insurance company for seven years, he resigned and moved to Pankow near Berlin. There he wrote ‘Web und Welt’ (poems and fairy tales 1896); ‘Der Mitmenschen’ (tragi-comedy, 1899); ‘Lu- cifer’ (pantomime drama, 1899) and the children’s book ‘Pitzebuth’ (1901), which he wrote in connection with his first wife, Paula Dehmel, from whom he separated in 1899. After remarrying and traveling for several years in Italy, Greece, Switzerland, Hol- land and England, he settled down at Blankenese near Hamburg. In 1903 he published a lyrical novel ‘Zwei Menschen.’ In 1906 he published his complete works up to that date after having subjected them to a thorough revision. Later works are ‘Michel Michael’ (a comedy, 1911) and ‘Schöne Wilde Welt’ (new poems and proverbs, 1913).

In his earlier writings Dehmel was influenced by Heine and Schiller and later by Lili- encron, Strindberg and Nietzsche. He claimed to stand as an artist between the pure em- piricists like Lilenecron and the pure music-physicians like Mombert. His relation to Nietzsche he defined by saying: ‘Nietzsche is a doubting disserter of the ordinary emotions of the soul and I as a faithful believer give a synthesis of the unusual emotions.’ By some critics Dehmel is considered the greatest lyrical genius since Goethe. Others are willing to admit his genius but object to the extreme real- ism of some of his poems. To be just to him it is necessary to remember that he is constantly struggling toward higher levels. He stresses the importance of the feeling, but connects them with our intelligence. There is always with him an interaction of intellect and emo- tions. The result is a constant emphasis of the need of self-control and self-development. All about us, to pursue, are mysteries, but we must fathom them to the best of our ability. He has always been a hard worker and a champion of the rights of the workingman. His poems are
DEHORNING—DEIOTARUS

DEHORNING, the act or practice of depriving animals, specifically cattle, of their horns. Clippers or shears have been invented for the operation wherewith it is performed quickly and with comparatively little pain and scarcely any disturbance of the animal’s normal functions or condition. The most favorable conditions of weather, etc., should be chosen for it, and the aid of a skilful operator is desirable. When all features of cruelty or unnecessary pain are avoided, there is believed to be much to justify the practice of dehorning, inasmuch as it tends, among other benefits, to convenience, safety and comfort in the handling of cattle, especially during their transportation from place to place.

DEHRA DUN, dē′h-rā doon. (1) A district in the United Provinces, British India. It lies at the base of the Himalayas. Good roads, cultivated fields, hedges, streams flowing through meadows—all, in parts of this district, look like some of the old country districts of the well-cultivated parts of Europe. The area is 1,209 square miles. (2) Dehra is the name of the chief town or capital of the district. It has an English garrison and contains a number of European inhabitants. Pop. 38,610.

DEI GRATIA, dē′l grā′shī-a (Lat. “by the grace of God”), a formula which many European sovereigns add to their title, and which is taken from an expression of the apostle Paul in the New Testament. It was first used by the clergy in the time of Constantine the Great, as an expression of dependence upon the grace of God; afterward the higher clergy came to use along with it the addition et apostolice sedis (by the grace of God and the apostolic see). In the time of the Carlovingian race the secular princes also assumed it; and in course of time it came to be regarded as asserting something like the divine right of kings and their independence of any earthly power. The expression has been made use of on the coins of many nations.

DEIAMBA, dā′yam′ba, an African plant commercially known as Kongo tobacco. It grows wild in the marshy districts of Kongo. The flowers produce a narcotic effect when smoked.

DEIANIRA, in Greek mythology, a daughter of Oineus, king of Thessaly. Her father promised to give her in marriage to him only who proved to be the strongest of all his competitors. Hercules obtained the prize and married Deianira, by whom he had three children. When Nessus, a centaur, who had offered violence to Deianira, was dying by a poisoned arrow shot from the bow of Hercules, she accepted from him the present of his tunic, which Nessus said had the power of reclaiming a husband from unlawful loves. Accordingly, when Hercules became enamored of Iola, daughter of the king of Thebals, she sent him the centaur’s tunic which caused his death. Deianira was so disconsolate at this event that she destroyed herself.

DEIDAMIA (Deidameia), daughter of Lycomedes: she bore Pyrrhus and Oeneus to Achilles, during his abode at Scyrus.

DEILER, John Hanno, American educator: b. Altoetting, Upper Bavaria, Germany, 8 Aug. 1849; d. 20 July 1909. He was graduated at the Royal Normal College, Freiburg, and studied at the Royal Polytechnic Institute, Munich. He taught in the public schools of Munich until 1871, and was principal of a German school in New Orleans 1872-79. He has been professor of German in the University of Louisiana and Tulane University since 1879. He has been connected with various German societies in New Orleans and has published ‘Das Redemptions-System im Staat Louisiana’; ‘Geschichte der Kirchenfreunde im Staat Louisiana’; ‘Geschichte der Einwanderung von 1820-1890’; ‘Deutsche Gesellschaften von New Orleans,’ etc.

DEIMOS, dī-mōs, and PHOBOS, the names respectively of the outer and inner satellites of Mars, discovered by Prof. Asaph Hall in the summer of 1877, with the 26-inch equatorial of the Washington Observatory. Deimos revolves about its primary in 30 hours and 18 minutes, while Phobos, a most extraordinary body, accomplishes its revolution in 7 hours, 39 minutes and 14 seconds, being at a distance of only about 3,700 miles from the surface of Mars.

DEIOCES, dē′kō-sēz, Median king: fl. about seven centuries B.C. He rose from a private station to be the founder of the Median empire. By acting as arbitrator in the disputes which took place in his own vicinity, he had acquired a high reputation for wisdom and justice; and when the Medes, in consequence of their revolt from the Assyrians, stood in need of a sovereign, they found none whose claims to the honor seemed stronger than those of Deioces. Immediately after his election he assumed great state, surrounded himself with body-guards and built the city of Ecbatana, in the centre of which he resided, almost wholly hidden from public view, transacting all business by deputies. His administration was vigorous, and after a peaceful reign of 35 years he was able to transmit the throne, without a contest, to his son Phraortes.

DEIOTARUS, dě′l-o’tar-ə-rus, Galatian te-trach: d. 30 B.C. He received from the Roman Senate the title of king of that province and Armenia Minor, on account of services rendered to the Romans in the Asiatic wars. In the civil war he joined the party of Pompey. Cæsar took from him Armenia, obliged him to march with him against Pharnaces, and left him nothing but the title of royalty. He was accused of having plotted against the life of Cæsar, from which charge Cicero defended him in an oration yet extant. After the murder of Cæsar he returned to his dominions, joined Brutus, and afterward fought with Octavius against Antony.
DEIPHOBUS, dé-If'-ó-bús, in Greek legend the son of Priam and Hecuba, who married Helen, the beauty of Paris, but was betrayed by her to the Greeks.

DEIPNOSOPHIST, dé-ip-nos'-ó-flat (from the Greek Deipnosophistes, learned men at dinner), one of an ancient sect of philosophers famed for their learned conversation at meals. The work or rather compiliation, 'Deipnosophis,' of the celebrated Greek grammarians and rhetoricians, Athenaeus, who flourished about two centuries before Christ, has preserved to posterity thousands of quotations and names of authors to the number of 700, that otherwise would have been lost. The 'learned guests' in his voluminous work numbered 29, who meet and banquet for days, entertaining one another with excerpts which Athenaeus must have gathered at great pains and labor from the library of Alexandria, afterward destroyed. The titles of books he puts into the mouths of his characters alone number 2,500.

DEIR EL-BABERI, dár-él-bah'-ré, or DEIR EL-BAHRI, is a temple site in the district of Thebes, on the west bank of the Nile, opposite Karnak, which is about five kilometers distant from it. At Deir el-Baberi are some remarkable ruins of a temple built on terraces up the hillside which leads up to the aluvial plain. This is known as the temple of Queen Hatsa. The building is probably contemporary with those of Luxor and Karnak, being erected in the same style of magnificence. The first exploration of the site is due to the efforts of Mariette and later of Naville under the auspices of the Egyptian Exploration Fund. Further excavations in 1906 unearthed the temple of Mentuhotep, and under the auspices of the Metropolitan Museum of Art the causeway of this temple was revealed. Consult Mariette. 'Deir-el-Bahri' (Leipzig 1877); and 'Egypt Exploration Fund Memoirs' (London 1894-1913).

DEIR-EL-KAMAR, ká'-mahr ("convent of the moon"), a town of Syria, formerly the capital of the Druses, 13 miles south-southeast of Beyrout. It is situated on the side of a hill of a deep and picturesque glen of Mount Lebanon, on the opposite side of which stands the palace Bteidin, the summer residence of the Christian governor of Lebanon. The town's chief industry is the making of embroideries and rich stuffs. Wine and grain are the principal agricultural products. Pop. 8,000, mostly Maronites.

DEIRA, dé'-râ, an ancient Anglian kingdom stretching from the Tees to the Humber, and extending inland to the borders of the British realm of Strathclyde. With Bernicia it formed the kingdom of Northumbria. The union between Bernicia and Deira seems to have been a recent one, for it was only under Edwin, Oswine and other strong kings, either of Deiran or Bernician blood, that a real united Northumbria existed; and when the struggle for supremacy among the English kingdoms resulted in the triumph of Wessex, the two northern kings were forced to submit. Finally Deira became a kingdom under the Danes. The story seems to be authentic that the slaves who attracted Gregory I in the slave market of Rome were from Deira.

DEISM, the belief in the being of a God, with the denial of the existence or even necessity of divine revelation, believing that the light of nature and reason are sufficient guides in doctrine and practice; a believer in natural religion only. Etymologically the words deist and theist are the same in meaning, only deist is from Latin and theist from Greek. Conventionally, however, they are widely different in import; the term theist being applied to any believer in God, and revealed religion, whether that believer be a Christian, a Jew, a Mohammedan, etc., or a deist properly so called. A deist is, as the definition states, one who believes in God, but disbelieves in Christianity, or more generally in revelation.

The term Deists, or Freethinkers, is usually employed to designate a series of writers who appeared in England in the 17th and 18th centuries and sought to establish Natural Religion upon the basis of reason and free inquiry, in opposition to all positive religions and without reference to supernatural revelation. They were critical, if not hostile, in their attitude toward Scripture. The first, in point of time, of the celebrated English deists was Lord Herbert of Cherbury, the publication of whose work, 'De Veritate,' which appeared in Paris in 1624, began the controversy. There followed, on the same side, Hobbes, Tindal, Morgan, Toland, Bolingbroke, Moore, and Hervey, and a standard work on the subject is the Rev. Dr. John Leland's 'Deistical Writers,' first published in 1754.

DEISSMAN, dis'mán, Gustav Adolf, German theologian. b. Langenscheid, Nassau, 7 Nov. 1866. He was educated at Tubingen and Berlin and the Herborn Theological Seminary. He entered the ministry in 1889, became a teacher at Marburg in 1892 and at Herborn in 1893, and was made professor at Heidelberg in 1897 and at Berlin in 1908. He lectured at Cambridge (England) in 1907 and in 1910, and received the honorary degree of D.D. from Aberdeen (1906). Saint Andrews 1911 and Manchester in 1912. He has published 'Johann Kepler und die Bibel' (1894); 'Bibelstudien' (1895); 'Die Propheten und Kupferdrucke der neutestamentliche Formel in Christo Jesu' (1892); 'The Epistle of Pseudoisiris' (1902); 'Die Hellenisierung des semitischen Monotheismus' (1903); 'Evangelium und Urchristentum' (1905); 'New Light on the New Testament' (1909); 'Philoology of the Greek Bible' (1908); 'Light from the Ancient East' (1910); 'Urgeschichte des Christentums in Lichte der Sprachforschung' (1910); 'Saint Paul' (1912, in English; also in German and Swedish).

DEIST. See Deism.

DEISTIC, or DEISTICAL, pertaining to deism or the deists, containing the doctrines of deism or Natural Religion. See Deism.

DE KALB, Johann, French soldier: b. Huttendorf, Bavaria, 29 June 1721; d. Camden, S. C., 19 Aug. 1780. He was educated in the art of war in the French army. In 1762 he visited the Anglo-American colonies as a secret agent of the Post Office to separate the colonists from the French service, as a brigadier in the French service, when, 7 Nov. 1776, he made with Franklin and Silas Deane an engagement to serve in the forces of the revolted colonies: and in 1777 he accompanied
DE KALB—DE KOVEN

Lafayette to America. Congress appointed him a major-general 15 Sept. 1777, after which he joined Gen. Washington at Long Island and was active in the events near Philadelphia, which preceded the encampment at Valley Forge. He served in New Jersey and Maryland till, in April 1780, he was sent to re-enforce General Lincoln, then besieged in Charleston. He was second in command under General Gates; and in the disastrous battle of Camden, 16 Aug. 1780, was at the head of the Maryland and Delaware troops, who maintained their ground until Cornwallis concentrated his whole force upon them. He fell in the charge upon his regiments before they gave way. He died at Camden three days afterward, and a monument was erected there to his memory in 1825, Lafayette placing the cornerstone.

DE KALB, Ill., city in De Kalb County, on the Chicago and Northwestern and other railroads, 60 miles west of Chicago. The industries of the city are the manufacture of wire and other iron products, agricultural implements, piano, nail and creamery-package goods, shoe and mechanical establishments.

De Kalb has three banks with a combined capital of over $5,000,000, governed by a city council of 12 members, elected for two years, and owns its own water-plant. The Northern Illinois State Normal School is located here. Settled about 1838, De Kalb was incorporated in 1877. It was the scene of an engagement in the Black Hawk War. Here after the battle Lincoln, Davis and Zachary Taylor held a conference. Pop. 9,036.

DE KAY, Charles, American poet, grandson of Joseph Rodman Drake: b. Washington, D. C., 25 July 1848. He was educated at Yale and was the literary and art editor of the New York Times during 30 years, 1876-1906, and art-editor of the New York Evening Post in 1907. From 1894-97 he was consul-general of the United States at Berlin, where, among his activities, he organized the Berliner Fechtklub on the lines of the New York Fencers Club which he had founded in 1852. Always interested in art, he was one of the original founders of the Authors' Club (1882), the National Arts Club of New York (1889) and of the Circle of Friends of the Medallion (1907). He was managing governor of the National Arts Club. His poems are mostly founded on themes from Oriental, classical and literary history. Among his works are 'The Bohemian' (1878); 'Hesperus and Other Poems' (1880); 'The Vision of Nimrod' (1881); 'The Vision of Ester' (1882); 'The Love Poems of Louis Barnavard Kay' (1883); 'Life and Works of Barye, Sculptor' (1889); 'Bird Gods' (1898); and translation of Heinrich Heine's 'Letters' and of several works from the French.

DEKEN, dākèn Agathe, Dutch author: b. Amsterdam, near Amsterdam, 14 Nov. 1741; d. 14 Nov. 1804. She wrote a number of novels with her friend Elizabeth Bekker (q.v.) and poems, among them 'Liederden von den Boerenstand' and 'Liederden voor Kinderen.' They give charming and truthful pictures of the life of the natives of Holland.

DEKKER, Eduard Douwes, Dutch novelist, pseudonym 'Multatuli': b. Amsterdam, 2 March 1820; d. Nieder-Engelheim, 19 Feb. 1887. He spent several years in government service in the Dutch East Indies, but resigned because of his disagreement with the Dutch government there. His story, 'Max Havelaar' (1860), is a forceful accusation of wrongs and scandals of the Dutch administration of Java. He later published many satirical works on social, political and philosophical subjects, among them a volume of admirable 'Parables'; a novel, 'La Sainte Vierge'; a drama, 'Vorstenschool' ('The School of Princes'). After his death there appeared 'Geschiedenis van Wouterje Pieterse' (1888); and 'Letters and Works,' published by his widow. His biography was written by Busken (in Ten Brink's 'Heden-daagsche Letterkundigen,' 1885).

DEKKER, or DECKER, Jeremiah de, Dutch poet: b. Dort 1609 or 1610; d. Amsterdam 1666. His first published poetical work was 'The Lamentations of Jeremiah'; and several others which soon followed it were also translations. His 'Love of Gold,' a powerful satire, and his 'Goede Vrijdag,' or the 'Passion of Christ,' as well as his lyric poems, were still in high estimation; and his 'Epigrams' (Pundichtere) are, beyond doubt, the best of the kind which the literature of that period produced. The best edition of his poems, accompanied with a biography, was published by Bruyeres van Nideck (1726).

DEKKER, or DECKER, Thomas, English dramatist: b. London about 1570; d. 1637. He is first mentioned as a theatrical writer in 1597. He was one of the literary antagonists of Ben Jonson, who satirized Dekker in his 'Poetaster,' and the latter took his revenge in his 'Satironomia.' He appears to have lived from hand to mouth, and been often in difficulties, imprisonments for debt being almost the only record, besides his works, that is left of him. Among his writings may be mentioned the 'Seven Deadly Sins of London,' a moral tract; the 'Double P.,' a violent tract against the Catholics; 'A Knight's Conjuring,' in which he introduces Chaucer, Spenser and many other dead poets; 'The Hornbook,' valuable as a picture of the time. Besides his own plays he co-operated with Massinger in the 'Virgin Martyr,' and with Ford in the 'Sun's Darling,' a moral morality; the 'Pleasant Comedie of Old Fornaturas' (1600); and 'The Honest Whore' (1604); are among the most esteemed of his dramas. The number of Dekker's plays which have survived is about 28, of his tracts about 25. His works have been edited by Shepherd (4 vols., London 1873); selected edition by Rhys (1857) and his non-dramatic works by Grosart (5 vols., 1884-86). Consult Hunt, 'Thomas Dekker' (New York 1911); and the 'Life' by Bullen (in 'Dictionary of National Biography'.

DE KOVEN, Anna Parwell, American novelist: b. Chicago, 19 Nov. 1862. She was graduated at Lake Forest University in 1880 and married to Louis Reginald De Koven (q.v.) May 1884. She is the author of 'A Sawdust Doll' (1894); 'An Iceland Fisherman,' a translation from Pierre Loti; 'Waters of Babylon' (1901); 'Life and Letters of John Paul Jones' (1913); 'Les Comtes de Gruyère' (1914); also contributions in prose and verse to various periodicals.
DE KOVEN (Henry Louis), Reginald, American composer: b. Middletown, Conn., 3 April 1832; d. Oxford, England, 1879 and studied music in the leading cities of Europe. On his return from Europe in 1882 he took up his residence in Chicago, but subsequently moved to New York. From 1902 to 1894 he lived in Washington as conductor of the Washington Symphony Orchestra. He then returned to New York as musical critic of the World. His scores show refinement of instrumental coloring and harmony. His operettas have had great success, notably 'The Begum'; 'Don Quixote'; 'Robin Hood'; his greatest success, 'The Green Master'; 'The Three Dragoons' (1899); 'Maid Marian' (1901); 'Foxy Quiller' (1900); 'The Student King' (1906). He also composed many songs, including 'Oh, Promise Me'; and 'A Recessional,' and various music for piano and orchestra.

DE KOVEN, James, American Episcopal clergyman and educator: b. Middletown, Conn., 19 Sept. 1831; d. Racine, Wis., 19 March 1879. He was educated at Columbia College and at the General Theological Seminary in New York. After his ordination to the priesthood in 1855 he held a pastoral charge at Delafield, Wis., and at the same time became principal of the preparatory school for Nashotah Seminary, founded two years earlier. In 1859 this became Racine College and De Koven its first warden. He soon acquired a marked influence throughout the West, both in educational and ecclesiastical matters, in the latter taking up and carrying forward the teachings of the Oxford Movement. His most prominent appearance in this connection was in the General Convention of 1871, at a time when the ritual controversy ran very high. In bold and outspoken terms, which have become historical, he proclaimed and defended his position, with a marked effect on the legislation under discussion. When, however, in 1854, he was elected bishop of Illinois, a considerable majority of the standing committees of the other dioceses refused to confirm his election, regarding his views as dangerous. He labored diligently for the upbuilding of Racine College, where he remained until his death. The pulpit lectures and his sermons (1880) contain a preface by Mr. Dix, which gives some idea of his commanding position in the church life of his time.

DE KROYFT, dé kroft', Susan Helen Aldrich, American author: b. Rochester, N. Y., 29 Oct. 1818; d. Dansville, N. Y., 25 Oct. 1918. She was graduated at Lima College, New York, 1843, and married Dr. William De Kroyft, of Rochester, who was killed on his wedding day by a fall from a carriage. Mrs. De Kroyft shortly afterward became blind. Her works include: 'Little Jakey' (1871); 'Darwin and Moses,' a lecture; 'A Place in Thy Memory' (1849; revised 1905); 'Mortara' (1888); 'The Foreshadowed Way' (1901); and 'The Soul of Eve' (1904).

DE LA BLACHE, dé-lah-blah', Vitaldi, French geographer: b. Pezenas, Herault, 1845; d. Paris, 5 April 1918. He was educated at the University College of St. Omer, and graduated in 1863. He directed the issue of a series of maps which is known by his name and which was published in the Historical and Geographical Atlas of 1890. In 1912 M. de la Blache was a member of the French delegation which arrived in New York on 7 April of that year with a bronze bust which was to be erected at Crown Point, Lake Champlain, N. Y., on 3 May following, in memory of Samuel de Champlain.

DELABARRE, Edmund Burke, American psychologist: b. Dover, Me., 25 Sept. 1863. He was graduated at Amherst College in 1886, and later studied at Harvard and Freiburg. In 1891-96 he was associate professor and after 1896 professor of psychology at Harvard. During the absence of Dr. Münsterberg in 1896-97 he was director of the Psychological Laboratory at Harvard. He is a member of the American Psychological Association and Fellow of the American Association for the Advancement of Science. He wrote 'Über Bewegungsempfindungen' (1891); 'Report of Brown-Harvard Expedition to Natchoab, Labrador, in 1900' (1902).

DELABORDE, de là-bôrd', Henri François, Couvr., French general: b. Dijon, 21 Dec. 1764; d. 3 Feb. 1833. He distinguished himself in the revolution and was ennobled in 1807. He was twice minister of the interior. He was sent to the Lycée Napoleon and then to the atelier of Baron Guérin to study painting. His first painting, 'Dante and Virgil in the Infernal Regions,' attracted much notice in the exhibition of 1822. This picture displayed a wide departure from the coloring and manner of the school of David, and accordingly it gave rise to enthusiastic praise on the one hand, and contemptuous depreciation on the other. He was employed by the pope to fresco the Sistine Chapel at Rome. In 1824 he was a member of the painting of war against the school of the classicists, who named it a 'Massacre of Painting.' These were followed by the 'Execution of the Doge Marino Falier' (1826); the 'Death of Sardanapalus' (1827); and the 'Murder of the Bishop of Lige' (1830)—pictures painted with fire and vigor. His sympathy with the revolutionary party was shown by his celebrated picture of the 'God of Liberty at the Barricades.' In 1831 he joined the embassy sent by Louis Philippe to the empire of Morocco. To this journey we are indebted for several pictures remarkable for their vivid realization of Oriental life as well as their masterly coloring. They are the 'Jewish Marriage,' 'Muley Abderrahman with His Body-guard,' 'Arabs and Ladies in Their Chamber'; 'Moorish Soldiers at Exercise'; and the several scenes of common life. In spite of his undoubted genius Delacroix failed in gaining popularity with the general public. He was commissioned not only with the decoration of all which he was allowed to touch, such as the Luxembourg Palace, the town-hall and the Louvre, but large paintings were executed by him for the Parisian churches, and the historical museum of Versailles contains two of his master-
DE LACY—DE LAET

pieces—the 'Battle of Taillebourg' (1838) and the 'Taking of Constantinople by the Crusaders' (1841). In 1857 the Academy elected him a member, and all the best of his works was opened in 1864, containing 174 pictures and 303 drawings. Delacroix was an artist of great versatility; mythology, legend, history and poetry by turns furnished him with subjects, and in addition he painted portraits, allegorical and genre pictures, hunting scenes, etc.; but all exhibit at once his strength and his weakness—brilliant coloring and incorrect drawing. He is dramatic, passionate and intensely virile in his concepts. Consult Dargeny, 'Eugène Delacroix par lui-même' (Paris 1885); Robaut and Chesneau, 'L’Œuvre complet d’Eugène Delacroix' (Paris 1885).

DE LACY, William Henry, American jurist: b. Washington, D. C., 8 Feb. 1863. He was educated at Georgetown University and the Catholic University, Washington. He practised law from 1883 to 1906, was admitted to the bar of the Supreme Court of the United States in 1902, and from 1906 to 1913 served as judge of the Juvenile Court of the District of Columbia. He is also associate professor of common law at the Catholic University. He was one of the vice-presidents of the International Peace Congress, Washington 1910; was delegate to the American Prison Congress, the National Conference of Charities and Correction, the National Conference of Catholic Charities, etc. He is the author of 'The Treatment of United States Prisoners' (1906); co-author of 'Administration of Justice in the United States' (1910), and was a contributor to 'The Catholic Encyclopedia' (1914).

DE LAET, dê-lât', Johan, Dutch scholar: geographer and historian: b. Antwerp about 1582; d. Leyden (?) near the end of 1649. Little is known of his life except what he himself has occasionally set down in his own works. In 1624 he was established at Leyden and for 25 years thereafter he was busy publishing and editing books for the Elzevirs. As a director of the Dutch West India Company he had, of course, access to its records while as co-patron of Rensselaerswyck he had an especial interest in the country where his daughter, Johanna, and his son-in-law had made their home. Therefore, to popularize the knowledge of foreign lands connected with that company, he wrote his 'Nieuwe Wereld,' which is an excellent compilation made from the works of a great number of foreign geographers and navigators (Leyden 1625). Five years later there appeared a second revised and enlarged edition, which contained several new maps. De Laet's intention to give to his fellow-citizens as perfect a description of the New World as circumstances would allow was carefully carried out, so that a Latin translation, apparently with some additions, and a French version, was published by Coninx 1670 years. This was followed later by a 'History or Yearly Account of the Proceedings of the Dutch West India Company from its beginning to 1635,' written in Dutch. Meanwhile, the Elzevirs were also engaged in publishing a series of historical monographs on the countries of Europe and Asia, which, because of their appearance in extremely small form, were called the 'Little Elzevrian Commonwealths.' In the publication of these volumes De Laet played no small part, so that Struve, writing about a century later, says that De Laet's must be considered among the best of all that have been published. The first of these was that on England (1625), almost half of which was taken up by a Latin translation, not De Laet's, of the 'De Republica Anglicorum' of Sir Thomas Smith. There followed in rapid succession the works on Italy (1628), Spain (1629), France (1629), the Belgian Confederation (1630), the Empire of the Grand Mogul or True India (1631), Persia (1633 and 1637), Portugal (1641), Poland, Lithuania, Frussia and Livonia (1642), and perhaps Turkey. It was in 1643-44 that De Laet had his famous literary controversy with his compatriot, Hugo Grotius (q.v.), on the origin of the American aborigines, in which he completely vanquished the great Dutch statesman and the father of international law. De Laet also published notable works along other lines. He edited the 'Natural History' of Pliny the Elder (1635), published a book 'On Gems and Precious Stones' (1647), gathered together and put in order the notes of the celebrated naturalist, Marggraf, on the natural history of alum (1648), and finally published an edition of Vitruvius (q.v.), 'On Architecture,' together with the works of several minor writers on the same subject. In all of these works, which were written in Latin with the exception of those concerning the Dutch West India Company, De Laet proves his vast and profound knowledge, but he seems to have been confessedly a popularizer rather than a savant. Consult Wright, H. F., 'Origin of American Aborigines: A Famous Controversy' (Washington 1917); Foppens, J. F., 'Bibliotheca Belgica' (Brussels 1739); Nicéron, J. P., 'Mémoires pour servir à l'histoire des hommes illustres dans la république des lettres' (Paris 1737); Winsor, Justin, 'Narrative and Critical History of America' (Boston 1884-89).

Division of International Law, Carnegie Endowment for International Peace.

DE LAFIELD, Richard, American military engineer: b. New York, Dec. 9, 1798; d. Washington, D. C., 5 Nov. 1873. He was graduated from West Point in 1818 and was draughtsman to the American Boundary Commission appointed under the Treaty of Ghent. In 1819-38 he was assistant engineer in the construction of forts Monroe and Calhoun, had charge of the improvements on the Mississippi and of the building of the Cumberland road and the construction of Fort Delaware. In 1838 he was appointed superintendent of the Military Academy at West Point and held the position seven years at that time, and again from 1856 to 1861, when he was relieved at his own request. In 1855 he was senior member of a commission sent to the Crimea to report on modern methods of warfare; he prepared the report which was published by Coninx 1860. During the Civil War he assisted in organizing and equipping the New York troops and had charge of the construction of fortifications in New York harbor. In 1864 he was made chief of engineers, and retired in 1866 with the rank of major-general. He was a member of the commission for the improvement of Boston harbor and a regent of Smithsonian Institute (1865-67).
DELAGOA BAY—DELAND

DELAGOA BAY, a bay on the southeast coast of Africa, in the Portuguese colony of Mozambique, partly enclosed by Inyack peninsula. It is about 70 miles long and 20 miles wide. Though crossed at its entrance by a shifting bar it is accessible to vessels of the largest class and is the finest harbor on the east coasts of Africa. The port later became the chief of which is the Komati. The Delagoa Bay Railway projected 57 miles from the port of Lourenço Marques to the Transvaal border extends 290 miles further to Pretoria and is the commercial highway regulated by the agreement of 1 April 1909 between Portugal and Great Britain for the transit of export and import goods with the Transvaal gold fields. Another railroad of which (1918) 44 miles were open for traffic is projected to the Swaziland border. Delagoa Bay was discovered in 1502 by Portuguese navigators and has had a varied history of international dispute. It was blockaded by the British during the South African War (1899–1902) to enforce neutrality. In 1899, the Portuguese seized the railway and in 1900 were compelled by arbitration to pay $5,000,000 compensation. Consult Tesset, 'The Key to South Africa, Delagoa Bay' (London 1899). See PORTUGUESE POSSESSIONS IN AFRICA.

DELAGRANGE, dé-là-grán]], Léon, French aviator and sculptor: b. Orléans 1872; d. Pau 1910. He studied at the Ecole des Beaux-Arts, Paris. He produced several works well deserving of notice, including 'Love and Youth'; 'Girl Dancers'; 'A Huguenot'; 'The Templar'; 'A Florentine Page.' In 1907 he was president of the Aero Club of France, and in this year also made his first flight in an aeroplane. In 1908 and 1909 he made several sensational flights and established new speed records, notably at Doncaster, England, during a storm on 17 Oct. 1909 he established a world record — 6 miles in 7 minutes, 36 seconds. He received the decoration of the order of the Legion of Honour in 1909, and the following year a medal from the Paris Academy of Sciences. He was killed in an accident to his monoplane at Pau.

DE LA Hire, dé-là-ér]], Philippe, French mathematician: b. Paris, 18 March 1640; d. there, 21 April 1718. He was a member of the Academy of Sciences and professor at the College of France. His chief work was in pure mathematics, but he was also an astronomer. Many of his papers are in the Memoirs of the Academy of Sciences. Among his writings are 'Nouvelle méthode de géométrie'; 'Sectiones Conice'; 'Mémoire sur la spicyschild' (1694); and 'Mémoire sur les conchois' (1708).

DELABRE, dé-là-br]], Jean Baptiste Joseph, French astronomer: b. Aniens, France, 19 Sept. 1749; d. Paris, 19 Aug. 1799. Eight years after the discovery of Uranus, Delambre published the tables of that planet, although in that period it had but performed a small part of its 80 years' course. He also constructed tables of Jupiter and Saturn and of the satellites, with which he procured him a reception into the National Institute. In 1792 he was appointed to measure the arc of the meridian between Dunkirk and Barcelona for the French government. With his associate, Meehain, he completed this work in 1799. In 1802 Napoleon appointed him Inspecteur-Général des Études, which post he resigned when chosen perpetual secretary of the class of mathematical sciences (1803). His first tables of the sun were published in 1792; in 1806 appeared his new ones. In 1807 he succeeded Lalande in the Collège de France and wrote his 'Traité d'astronomie théorique et pratique' (1814); 'Histoire de l'astronomie du moyen age' (1819); 'Histoire de l'astronomie moderne' (1821); 'Histoire de l'astronomie du 18e siècle.'

DELAMINATION, the division of the blastoderm into two layers, epiblast and hypoblast. See EMBRYOLOGY.

DE LANCY, William Heathcote, American Protestant Episcopal bishop: b. Westchester County, N. Y., 8 Oct. 1797; d. 1865. He graduated at Yale College in 1817; studied theology and entered the Episcopal ministry in 1822. He was secretary of the House of Bishops in the General Convention of the Episcopal Church of the United States, and after the reorganization of the University of Pennsylvania in 1828, he was chosen provost of that institution, which office he retained for five years. In 1839 he became bishop of the diocese of western New York. In 1852 he was sent as a representative of the Episcopal bishops of the United States to England.

DELAND, Ellen Douglas, American writer for girls: b. Lake Mahopac, N. Y., 3 Sept. 1860. She was educated in New York, but lived in Philadelphia until 1901. She has since lived in Boston and in Dedham, Mass., where her home now is. She is a suffragist and active in that cause, in the work of the Episcopal Church, and in various civic affairs, and a trustee of the Dedham Public Library. She is a member of the Boston Author's Club. Her published books include 'Oakleigh' (1896); 'Malvern' (1896); 'In the Old Herrick House' (1897); 'A Successful Venture' (1897); 'Alan Ransford' (1898); 'Kattrina' (1898); 'Three Girls of Hazemere' (1903); 'Josephine' (1904); 'A Little Son of Sunshine' (1906); 'The Friend of the Poor' (1907); 'Miss Betty of New York' (1908); 'The Girls of Dudley School' (1911); 'The Fortunes of Phoebe' (1912); 'Country Cousins' (1913); 'Cynthia' (1915).

DELAND, Margaret Wade (Campbell), American novelist: b. Allegheny, Pa., 23 Feb. 1857. She was educated at the Cooper Union, New York, and for a time taught drawing. In 1880 she married L. F. Deland and has since lived in Boston. 'John Ward, Preacher' (1888), her first novel, attracted wide notice. Other works are 'The Old Garden and Other Verses' (1887); 'Sydney' (1890); 'Florida Days,' a collection of sketches of travel; 'The Story of a Child' (1892); 'Mr. Tommy Dove and Other Stories' (1893); 'Philip and His Wife' (1894); 'The Wisdom of Fools' (1897); 'Old Chester Tales' (1901); 'Good for the Soul' (1902); 'Dr. Lavendor's People' (1903); 'The Common Way' (1904); 'The Awakening of Helena Ritchie' (1906); 'An Encore' (1907); 'The Way to Peace' (1910); 'The Iron Woman' (1911); 'The Voice' (1912); 'Partners' (1913); 'The Hand of Esau' (1914); 'Around Old Chester' (1915).
DE LAND, Fla., town, county-seat of Volusia County, on the Atlantic Coast Line Railroad, about 60 miles southwest of Saint Augustine. It is a favorite health and winter resort, noted for its sulphur springs and its fine shell-paved and shaded streets. It contains Carnegie and Sampson libraries. The John B. Stetson University, a Baptist institution, was established here in 1887. The town owns its water plant. Pop. 2,412.

DELANO, Columbus, American lawyer and politician; b. Shoreham, Vt., 5 June 1809; d. Mount Vernon, Ohio, 23 Oct. 1896. He studied law at Mount Vernon, was admitted to the bar in 1831, and shortly after elected prosecuting attorney of the county. He was elected member of Congress in 1844 and voted against the declaration of war in Mexico; he was again elected to Congress in 1864 and 1866. He was delegate to the Republican conventions of 1860 and 1864, and member of the State legislature in 1863. In President Grant's first administration he was appointed Commissioner of Internal Revenue, and reorganized the department, putting it on an excellent financial footing. In 1870 he became Secretary of the Interior, resigning in 1875 and retiring from public life. He was one of the trustees of Kenyon College and served as its president.

DE LA RAMÉE, de-là-ram-é, Louise. See OUIDA.

DE LA RIVE, Auguste Arthur, Swiss physicist: b. Geneva, 9 Oct. 1801; d. Marseilles, 28 Nov. 1873. He received the appointment to the chair of natural philosophy in the Academy at Geneva at the age of 22. First devoting himself to the study of the specific heat of gases, and of the observation of the temperature of the earth's crust, he soon turned his complete attention to electricity, making original discoveries in connection with magnetism, electrodynamics, the relation between magnetism and electricity, and the properties of the voltaic arc, and presenting new theories on the subject of the aurora borealis. He discovered the process of electro-gilding, for which he received the grand prize of 3,000 francs from the Academy of Sciences 1842, becoming one of the eight foreign associates of the Academy in 1864. His chief work was a complete treatise on electricity in three volumes, which was translated into several languages, and was considered of the highest authority upon the subject.

DELRARCHE, dé-là-rosh', Paul (his real name was Hippolyte), French painter; b. Paris, 17 July 1797; d. there, 4 Nov. 1856. He entered the studio of Baron Gros, and rapidly rose to eminence as one of the greatest of modern painters in France. He visited Italy in 1838 and 1843. His subjects are taken principally from French and English history. Among others may be mentioned, Saint Vincent de Paul Preaching before Louis XIII on Behalf of Deserted Children; 'Joan of Arc Interrogated in Prison by Cardinal Beaufort' (Wallace collection, London); 'Flora Macdougal Ministering to the Pretender after the Battle of Culloden'; 'Death of Queen Elizabeth,' a work greatly admired by French and generally reproached by English critics; 'A Scene of the Saint Bartholomew Massacre': 'The Children of Edward IV in the Tower'; 'Cardinal Richelieu conducting Cinq Mars and De Thou up the Rhone to Execution'; 'Cromwell Contemplating the Dead Body of Charles I,' 1831, 'Nimes Museum,' one of Delaroche's most exacting efforts; 'The Death of Jane Grey,' and the 'Death of the Duke of Guise,' 1835, Chantilly Museum. What he considered his chef-d'œuvre, was the pictorial decoration of the hemicycle of the Palais des Beaux-Arts, on which he was engaged from 1837 to 1841. In this composition Delaroche has sought to illustrate the history of art from the remotest period to the present day, by representing, in one compartment, the great artists of all ages, painters, sculptors and architects. Notwithstanding the number of persons depicted (upward of 80), and the diversities of figure and costume, the whole presents a group in perfect harmony, with a coloring at the same time quiet and rich, and a correctness of drawing which leaves nothing to be desired. It has often been objected to Delaroche that the accessories of his pictures are finished with such minuteness as to divert the attention from the main subject. His signal merits consist in correct drawing, brilliant and harmonious color, and great distinctness and perspicuity in treatment, rendering the story of history at once intelligible. Consult monographs by Mirécourt (Paris 1856); Halévy, 'Notice sur la vie et les ouvrages de Paul Delaroche' (b.
DE LA RUE, də-la-roo', Warren, English inventor and physicist. b. Island of Guernsey, 18 Jan. 1815; d. London, 22 April 1889. He was educated in Paris and followed his father's business, that of manufacturing paper vases. For this he invented many new processes and machines. He is best known for his application of photography to astronomy. In 1850 he constructed a large reflecting telescope at Canterbury, which was transferred later to Cranford, Middlesex. He was a member of the International Electrical Congress at Paris in 1861, president of the Royal Astronomical Society, and held other posts of honor. His reports of original observations in chemistry, astronomy and physics are of the greatest value.

DELAUNAY, de-loh-nay', Charles Eugène, French astronomer. b. Lusigny, Aube, 9 April 1816; d. Cherbourg, 5 Aug. 1872. He studied at the l' cole Polytechnique, becoming a mining engineer. He taught mechanical engineering at the Polytechnique and in the Faculty of Sciences of Paris, and was made a member of the Institute in 1855. In 1870 he became director of the Paris Observatory. Among his works are 'Sur une nouvelle théorie analytique du mouvement de la lune' (1846); 'Rapport sur les progrès de l'astronomie' (1867); 'Cours élémentaire d'astronomie' (1876); 'Traité de mécanique.' He left an unfinished work on 'Théorie de la lune' (in 2 vols.). His 'Life' was written by Thevenot (Paris 1878).

DELAUNAY, Jules Élie, French figure and portrait painter. b. Nantes, 12 June 1828; d. Paris, 5 Sept. 1891. He studied under Lavidier and at the Ecole des Beaux-Arts. He received the Grand Prix de Rome in 1856 and then went to Italy where he perfected his drawing to such a marked degree that his assurance and strength in this branch of his art became his distinguishing characteristic. He won the first-class medal at the Paris Exposition of 1878; and at that of 1889 was awarded the medal of honor. He was made a member of the Legion of Honor and a member of the Institute. His portraits are considered masterpieces. He executed the frescoes in the church of Saint Nicholas at Nantes, several panels at the Paris opera house and 12 paintings for the Palais Royal, which are hung in the hall of the Council of State. His 'Diana' is in the Luxembourg Gallery, Paris, and the 'Death of the Centaur Nessus,' and the 'Lesson on the Flute' are in the Museums at Nantes. Consult Clare, J., L'Art et les artistes français.

DELAUNAY, Louis Arsène, French actor. b. Paris, 21 March 1826; d. Versailles, 22 Sept. 1903. He made his début in October 1846, at the Odéon. In 1848 he acted at the Théâtre Français in the rôle of Durante, becoming secretary to the theatre in 1850. In 1877 he was appointed professor of dramatic declaration at the Conservatoire, and in 1883 became a member of the Legion of Honor. Till he retired (1887), he was one of the most accomplished actors on the French stage. He has found some of his greatest parts in the plays of Hugo, Paulineron, De Musset and Augier.

DELAUNAY-BELLEVILLE, Louis, French engineer. b. 1843; d. 10 Feb. 1914. He was educated at the Ecole Polytechnique and served in the Franco-Prussian War. Entering the Naval Engineering School in 1864, he joined the Belleville works at Saint Denis, near Paris, in 1867, rising to head of the firm. He invented the Belleville boilers used in various navies and the automobile known by his name. He was a grand officer of the Legion of Honor and one time president of the Paris Chamber of Commerce.

DELAVAN, Wis., city of Walworth County near Delavan Lake, on Rock River, 62 miles southwest of Milwaukee, and is in the counties of Kenosha, Milwaukee and Saint Paul Railroad. It has some manufacturing interests, including knit goods and dairies. It is the seat of the State institution for the education of the deaf; and on account of mineral springs in the vicinity and the lake is a place of summer resort and the site of a summer school. The waterworks are owned by the city. Pop. 2,450.

DELAUVIGNE, dé-lă-vēny, Jean François Casimir, French poet and dramatist. b. Havre, 4 April 1793; d. Montmorency, 11 Dec. 1843. He was educated at the Jesuit College, Paris, and in 1811 composed a dithyrambic on the birth of the king of Rome, which attracted considerable attention and procured him, from Comte François de Nantes, a situation in the revenue office. He competed unsuccessfully for the Academy prize. At the Restoration he published a set of elegies, 'Messeniiennes,' which deplored the faded glories of France. The patriotic fervor of these pieces won immediate and widespread popularity for their author. He produced in 1819 his tragedy of 'Les vengeances Siciliennes;' 'Comédiens' appeared in 1820, and the tragedy of 'Pari' in 1821. The liberal political opinions expressed in this play alienated the patronage of the king. Louis-Philippe, duke of Orleans, secured a position for him as librarian of the Palais Royal, where he remained for the rest of his life. In 1823 appeared his 'Ecole des vieillards,' his best comedy. This won for him membership in the Academy (1825). 'La Princesse Aurélée' followed in 1828 and 'Monsieur de Malicéro' (1829). Two patriotic hymns, 'La Parisienne' and 'La Varsityenne,' became very popular. Other works are 'Louis XI' (1832); 'Les Enfants d'Edouard' (1833); 'Don Juan d'Autriche' (1835); 'Une famille au temps de Luther' (1836); 'La Popularité' (1838); 'La fille du Gîte' (1839); 'Le conseiller rapporteur' (1840); and 'Charles VI,' an opera (1843). He left Paris for a vacation in Italy but died before he reached his destination. His popularity in his day was well merited both on account of the simple reality of his works and his private virtues. Because he was so essentially expressive of his time his works are devoid of that imaginative universal quality which ensures posthumous fame. His collected works were published by his brother (1845 and later). His poems and dramatic productions were published separately (1863). Consult Sainte-Beuve, 'Portraits contemporains, Vol. V.;' Favrot, A., 'Etude sur Casimir Delavigne, (1894).

</table>
States; 96 miles long by 9 to 35 broad; 2,120 square miles in area; 1,960 square miles of land. It is bounded on the east by the Atlantic, Delaware Bay, and the breaking waves of the breakers, and on the west by the Delaware River, separating it from New Jersey; north by Pennsylvania, Vermont, and New Hampshire; and south by Maryland, Delaware, and New Jersey. It is about 30 miles wide at the mouth of the river and about 40 miles long.

Topography.—The whole peninsula between the Chesapeake Bay and the Delaware River estuary and bay, divided between Maryland and Delaware, is part of the Atlantic Coastal plain; flat, sandy and with frequent swamps, of which there is one of about 70 square miles in extreme southern Delaware. North of New Castle, where the Pennsylvania uplands sink down to it, there is a handsome rolling country; and behind Wilmington, the divide between Brandywine and Christiana creeks becomes a ridge rising as high as 438 feet, being the most elevated ground in the State. South of this, a loamy ridge, nowhere over 50 feet high, runs through the State northward, the dividing line between the bays, but following the line of Delaware Bay about a dozen miles inland. In the southwest, the part of the State west of the ridge is extensive enough to form a few fair-sized creeks, all feeding the Wicomico in Maryland. On the east flowing into the Delaware, are six or eight good-sized creeks navigable for vessels and steamers of small draft a distance of 6 to 11 miles, to four or five of the larger towns; while in the extreme north, the Brandywine and Christina rivers, although navigable, have but a small claim on the river. The Delaware River itself. The only other good harbors on this marshy coast are at New Castle and Lewes, the latter protected by the Delaware Breakwater at Cape Henlopen, constructed of heavy granite masonry, 2,000 feet in length.

Climate and Rainfall.—Delaware has naturally a range of temperature between the severe cold of New England and the heat of the South, still further tempered by the sea breezes which alternate with the southwest winds in winter. The northwest winds, which blow from the north, not more severe than of old, but the delicate crops, like peas, have furnished more costly thermometer, and the precaution of the spring warmth is felt. On an average he spring begins about April, and the autumn frosts toward the middle of October; the average temperatures run from about 85° in August to 25° in January. The rainfall is from 40 to 46 inches annually, the heaviest on the coast; and droughts are rarely serious. In the swampy districts and southern lowlands, there is still some malaria, though much less than formerly, and for a whole, the State has a very good sanitary record.

Soils and Agriculture.—The soil of the State is light sand, with a rich loam underlaid with yellow clay, in the north, and for some miles inland along the Delaware River, to a lighter loam with the clay, in Kent County, becoming in Sussex a very sandy loam without clay below. The north is the region of cereals and hay; the south and south of fruits, berries, grapes and vegetables, and the south especially of peaches and strawberries. The State is one immense market garden and orchard for the North, especially the great cities of New York, Philadelphia and Baltimore. New Jersey, Maryland and Delaware raise three-fourths of all the peaches, strawberries and
other small fruits sold in those markets. Delaware in the popular mind is identified with the peach crop, but there is a growing tendency to replace this now uncertain crop with cereals, market gardening and especially apples. The other orchard fruits together exceed the peaches, the very large Expert pronounce the flavor of the Delaware apple very superior. The year’s crop of 1918, though shorter than in former years, was 350,000 barrels.

As in market gardening, the tomato is by far the principal crop, and it is exceeded only by that of Maryland. A surprising increase, however, in which it is alone among the Eastern States, has been in the wheat crop for the past two decades; its acreage in 1900 was 116,740, or nearly one-sixth of all the improved land, against 87,530 in 1880 and 125,000 acres in 1915. The first place in acreage, however, belongs to corn, with over 210,000 acres, and with a yield of 6,615,000 bushels. Third is hay, 77,000 acres, yielding 110,000 tons. There is also 11,000 acres of potatoes, yielding 1,095,000 bushels, or 100 bushels to the acre. The State raises 275,000 carriers of cantaloupes, 373 carloads of watermelons and 20,000,000 quarts of strawberries annually.

The Delaware is six miles south of Wilmington, has the finest harbor in the State, and, since the location there of many large manufacturing concerns, among others a branch of the Bethlehem Steel Works and the largest shipbuilding plant in the country, has become the second largest and most prosperous city in Delaware. The Vulcanised fibre industry has its origin in the State and about seven-eighths of the world’s output is made there. It is said that the waters of Delaware, like those of Ireland for linen, are peculiarly adapted to the manufacture of this product. The canning industry throughout the State is very large and embraces corn, peas, tomatoes, string and lima beans, sweet potatoes, strawberries, blackberries, pears, apples, potato-chips fish, oysters, soup and plum pudding. The tomato canning alone annually averages over 30,000,000 No. 3 cans, of three pounds each. The 1917 crop was 33,153,520 No. 3 cans.

For herring, sturgeon and menhaden fisheries of the State are of considerable magnitude and value.

Commerce and Transportation.—Wilmington, Lewes and New Castle are ports of entry and the first is a customs district. It has some direct foreign commerce, a steamer line to New York and coal and a line to Philadelphia and down the bay, besides communication with Baltimore by the Delaware and Chesapeake Canal (see CANALS), 13½ miles long, 66 feet wide and 10 feet deep, completed in 1829. The great Delaware Breakwater opposite Lewes was begun in 1828 and finished in 1889 and forms an artificial harbor some 300 acres in extent, with 24 feet of water. (See DELAWARE Bay.)

Railroad facilities are excellent; there are about 400 miles of main line in the State. The one great line, which serves nearly all the State, is the Philadelphia, Baltimore and Washington, whose main line, double-tracked, runs through it lengthwise from Wilmington to Delaware and another to Cape Charles and Norfolk, Va.; its Delaware, Maryland and Virginia branch in the southeast serves that section. Eight other
branches run from it. In the north, the Baltimore and Ohio and the Philadelphia, Baltimore and Washington division of the Pennsylvania system pass the state, and the line to Philadelphia and Baltimore, the Maryland, Delaware and Virginia Railroad, runs across the State centre to Chesapeake Bay.

Banks, etc.—The State, national and savings banks of Delaware had (1918) a total paid capital of $6,321,073; a surplus of $2,650,040; deposits, $75,154,040 — total resources of all banking institutions, $91,370,055. There are a number of local fire and mutual life insurance societies.

Churches.—The strongest religious denomination is the Methodist Episcopal; next in order of size are the Presbyterian, Protestant Episcopal, Baptist, Roman Catholic, Quaker and Lutheran. There are several smaller bodies. Wilmington is the seat of the Roman Catholic diocese of the same name, embracing Delaware and part of the southern Peninsula, and of the Protestant Episcopal diocese of Delaware.

Charities and Penal Institutions.—There is a State Almshouse and Insane Hospital. There being no State institution for the feebleminded, deaf-mutes or the blind, the state penitentiary holds five of each county, and 14 imbecile children from the State to be maintained at institutions of other States; and they are so kept at Philadelphia and Washington. Wilmington has the Ferris Industrial School for Boys, founded by Dr. Caleb Harlan; two industrial colored institutions and one for colored boys; also the Gause Home for Friendless and Destitute Children. There is a public workhouse in New Castle County. There is a State prison at Greenbank, capable of holding 500 inmates. The whipping post is a punishment for many offenses such as burglary, arson, larceny, wife-beating, etc.

Good Roads, etc.—A new spirit of progress pervades the entire State, shown in better, modern roads, improved farming, finer homes, etc. General T. Coleman Du Pont spent $500,000 building in Sussex County a model public road from Selbyville on the extreme southern edge to Georgetown, and with characteristic liberality signed (Aug. 19, 1914) an agreement commission this road with a fine boulevard system north and south throughout the entire State. A joint county and municipal building, costing $1,500,000, was completed in 1916 in the city of Wilmington. It is a commodious and handsome structure. The capitol building at Dover has been enlarged and beautified and a large mural painting by Stanley M. Arthurs commemorating "The Departure from Dover Green, July 1776, of the First Delaware Regiment" placed upon the wall of the dome.

Various State Boards, etc.—There are the following State boards: Health; Medical Examiners; Dental Examiners; Education; Pardons; Trustees of Delaware College; Trustees of Delaware College for Colored Students; Agriculture; Trustees of State Hospitals; also a State Library Commission; State Revenue and Taxation Commission; and seven hospitals with capacity for about 700 and a tuberculosis sanatorium.

Education.—The public schools are supported by local taxes; by a State distribution of the income of a fund now about $944,407 and of the proceeds of certain taxes, both yielding about $180,875 a year, devoted entirely to paying teachers' salaries and for furnishing free textbooks; and by an annual appropriation beyond this, fixed by the constitution at a minimum of $108,000. Wilmington school year is 9 or 10 months in many schools throughout the State, though shorter in others. Attendance for all children between the ages of 7 and 14 for five months in the year is made compulsory by law, though any district may by vote reduce this period to three months. The schools benefit from the enthusiastic labors of Chas. A. Wagner, Ph.D., Commissioner of Education, an increased interest is being aroused throughout the State in the subject of education. One hundred and fifty "Parents' Teachers Associations," with a membership of 3,600 have been formed, whose meetings have been attended by 20,000 persons — one-fifth of the State's population attending school at night. Wilmington has a fine school system which is excepted from the provisions of the general law by its own charter, and is funded by a short debt of $1,000,000. The Wilmington Conference Academy of the Methodist Episcopal Church is at Dover. Wilmington has two business colleges, while throughout the State are many excellent academies and high schools. Its one college proper, Delaware College, at Newark, was founded in 1833. The State supports an experiment station with courses in agronomy, animal husbandry and horticulture. The facilities of its agricultural department are placed at the disposal of the farmers of the State during the first week in January of each year, styled "Farmers' Week." The college has greatly prospered in recent years. From 1870 to 1913 it was entirely supported by Federal and State appropriations. In 1914 the Alumni Association raised $67,000 and in 1915 $1,000,000 was donated for the purchase of land and the endowment fund. In 1914 the Woman's College of Delaware was established by the State and is sharing in the large growth and prosperity of the older institution. There is a State board of education and in each county a school commission and a superintendent of public instruction, Teachers' institutes are yearly held in each county.

Government.—The present constitution is of 1897; following its own practice — as is also the custom of a number of Southern States — it was framed by a convention elected by the people, but was not submitted to the people. The registration and educational provisions in part exclude unfit electors. The legislature has a senate elected for four years and a house for two. Seven members from New Castle County and five each from Kent and Sussex compose the senate, and 15 members from New Castle and 10 each from Kent and Sussex the house. Sessions are biennial. Provisions for revenue and impeachment are the same as in the national Constitution. The members are paid $5 a day for 60 days, after which they sit at their own expense; special sessions are thus limited to 30 days. All State and county officers are chosen for four years, save the State treas-
urer and auditor, and county sheriff and coroner, chosen for two. The governor's veto includes that of a bill of pardons; his pardoning power is on recommendation of a board of pardons. The judicial power is vested in a supreme court, a superior court, a court of chancery, an orphan's court, a court of oyer and terminer, a court of general sessions, a regis's court and justice of the peace; there are six judges—a chancellor and five "law judges," of whom one is chief justice—all appointed by the governor for 12 years with the concurrence of the senate. The State has one representative in Congress and three members in the Electoral College, chosen by popular election.

From 1889 to 1895 the Hon. Anthony Higgins, a Republican, represented Delaware in the United States Senate and throughout his distinguished career therein maintained the former prestige of the State. In 1895 he was defeated for re-election and, owing to political entanglements, no senatorial choice was made.

Thereafter, for a period of 10 years, John E. Addicks vainly endeavored to have himself chosen the leader of the Unionist Republican party being the result. The "Regulars" were opposed to Addicks and the Union Republicans were in favor of him. Four times senatorial vacancies occurred that left the State but one senator for five years and with none for two years.

Finance.—A State capitation tax of 25 cents is imposed, but the receipts are chiefly from fees, licenses, inheritance taxes, special taxes on banks, railroads, etc. The assessed valuation of the State (1893) was $3,185,263,517. This valuation includes only real estate and five-stock—no other personal property.

Divisions and Population.—The State has three counties: New Castle, Kent, and Sussex. The first, including Wilmington, has about one-half of the entire population of the State. The counties are divided into "hundreds" instead of townships. There are incorporated cities and towns, of which Wilmington is the only large one, with a population (1918) of 110,000; (1900) 76,508, showing 43.7 per cent increase.

Of the others the chief are Dover, the capital, slightly growing; New Castle, Milford, Lewes, and Smyrna. In Indian River hundred, Sussex County, there is a settlement of "white Indians" or "Moors," descended, tradition says, from a band of Moors. A body of Moors is found in Kent County, near Moortown, who came there direct from Spain in 1710, Scharf says in his History. The two settlements, which are decreasing, are probably identical. They do not associate with the colored race, intermarry, and maintain separate schools and churches with the help of the State.

History.—Delaware represents the sole attempt of Sweden to seize its share of America. It does not take its name from the Indians who inhabited it, but from the river and bay, named by the English after Lord de la Warr (Sir Thomas West), who, tradition says, anchored in the bay in 1610; the Dutch called the river "South River" as distinguished from the "North River," the Hudson. The first settlement actually made in Delaware was by the Dutch trader Peter Heyes in April 1631, on the creek near the present Lewes; he called it Hoornkill, or Hoorn Creek ("Kill" Dutch for creek), in honor of Hoorn, the home of De Vries who visited the Delaware in 1632. The story that seeks to explain the corruption of the name Hoornkill for raising revenue, is purely fallacious. Giles Hosset, whom Heyes left in command of this "Zwaanendael" (=Valley of Swans) colony—so called from the number of swans there—fell out with the Indians, who slaughtered the whole settlement of about 30 persons and burned all their little fort, Grond. This brief little settlement defeated Lord Baltimore's claim to the western half of this peninsula. Out of its ashes arose the present State of Delaware. In 1637 Axel Oxenstiern, the great Swedish Minister of Gustavus Adolphus, revived his dead master's pious plan of founding a Swedish West India Company and sent Peter Minuit, the ex-director-general of New Netherland, with a mixed Swedish and Dutch expedition to seize and settle a point on the coast. Minuit landed April 1638, choosing the peninsula where Wilmington now stands, about two miles back from the river; he called the creek "the Elbe," and built a fort which he named Christina, after the girl-queen of Sweden. Gustavus, when named New Gottenburg at Tintonic Island and Upland near by, driving a New Haven English colony off Salem Creek in New Jersey and keeping the place themselves, with a fort called Eilsenburg. In 1646 the Dutch built a block-house on the site of Philadelphia, opposite Fort Nassau built by them in 1623; the Swedish governor, Prinz, marched there and pulled it down. But when Stuyvesant came to New Netherland in 1647 he was under orders to fight, and in 1651 built Fort Casimir on the site of New Casimir, blocking New Netherland to the Swedes. Rising, Prinz's successor, attacked and captured it in 1654 and changed the name to Trinity. Stuyvesant came down in 1655 with a large force, captured not only Trinity but Christina, deported the officers to New Amsterdam and forced the rest to swear allegiance to New Netherland or leave the country. Trinity was renamed New Amstel. The Swedish rule was now ended, but the Swedish blood remained, as many family names still attest, and many a worthy part of that mixed strain of blood, English with a very little Dutch, which composes the population of the State. Between 1631 and 1656 10 expeditions were sent out by the Swedish government and, according to a census taken by Rising in 1654, were 168 persons, Swedes and Dutch, on the Delaware.

When the Duke of York took New Amsterdam from the Dutch in 1664 the Delaware settlements went with it, and New Amstel was renamed New Castle. When New York in 1673 there was a renewed Dutch rule on the Delaware, which, however, lasted but one year. Delaware and New York being restored to England by the Treaty of Westminster, 1674. On 24 Aug. 1682, by a supplemental
DELAWARE 613
deed from the Duke of York, William Penn acquired the whole country comprising the present State of Delaware. There were at that time about 3,500 people in the province of Pennsylvania, and territories and on the eastern bank of the Delaware from Trenton to Salem, and 7,000 in 1684 in the province alone. The people from the earliest settlements were successively governed by Swedish, Dutch and English rulers, with few or no legislative powers until Penn's time, when a pretense of granting such was made by him. It is, indeed, a strange anomaly that a good man who from his Newgate cell penned works on liberty of conscience worthy to rank with Milton's "Areopagitica," or other like classics of human liberty, could have originated so autocratic a system of government as his Upland Code of 1682, which was, in fact, an utter denial of all self-government! But, despite this, the people gradually won the right of self-government, till, upon their separation in 1776 from Pennsylvania, the three counties upon the Delaware were styled as having assumed the full power of autonomy under the name of the "State of Delaware." The century-long title dispute with the Baltimores was settled in 1768. The lower river settlements were first governed as part of Pennsylvania, sending six representatives each to its legislature; but there was no community of interests or feelings between the two sections; quarrels were frequent and in 1691 the three counties seceded and for two years there was a dual government. In 1703 they were granted a separate legislature, which met at New Castle and the two sections continued more peaceably together, having one council and governor, till the Revolution. In the Continental Congress the colony was separately represented as the "Three Lower Counties on the Delaware." These counties were originally known as New Castle, Jones and Whatrekill or Deal, but Penn changed them — Deal to Sussex and Jones to Kent. On 21 September a convention at New Castle adopted a State constitution, in which the three counties were called "The Delaware State." John McKinley was elected its first president or governor in 1777. It was the first (7 December) to ratify the national Constitution. In 1792 it adopted the new constitution; in 1831 a third and in 1897 the present one.

Delaware was a slave-holding State during the Civil War, and a large number of its people, especially in Kent and Sussex counties, warmly sympathized with the South, but even there a deep reverence for the Constitution and a devotion to the Union was felt. But the large preponderance of population and wealth in New Castle, together with the courageous loyalty of its war governor, William Cannon, kept the State in the Union. Still, had the buffer State of Maryland seceded, it is possible Delaware would also have done so. On 2 Jan. 1861, the house unanimously, and the senate by a majority, voted "unqualified disapproval" of a solicitation to secede, made in person by Henry Dixon, who came from Mississippi. The call for Union troops was answered so quickly and fully that Lincoln said in his message of 3 Dec. 1861, "Noble little Delaware led off right from the first." The records of the War Department show that of its entire male population of 59,689 — of which nearly one-sixth were blacks — it furnished 13,651 troops — a proportion probably not equaled by any other State. If to this be added the hundreds who entered the Southern army, it would amount to about one-fourth of all the males! In this it kept good its unequalled record of 1776, when out of a population of 37,260 it gave 4,728 to the cause of the Revolution, besides several hundred militia. During the Reconstruction period, however, the legislative majority sympathized with the South, and by large majorities in both branches voted against the Fourteenth and Fifteenth amendments. Delaware and Kentucky never ratified the Thirteenth Amendment. The leading element in State politics since 1850 has been the "Peace Democrats," devoted to the Union but opposed to coercion of the States, as exemplified in the Bayard family (see BAYARD, JAMES A. 2d, and THOMAS F.). The Democratic majority was always small, except in 1878 when the Republican party was temporarily ruined by joining the Greenback-Labor party.

The American Flag first unfurled on land in the fight at Coch's Bridge, Del. 3 Sept. 1777; a handsome monument marks the spot. George Read, "The Signer," as he is styled in Delaware annals, shares with one other the unique distinction of having signed all the three great charters of the Nation's freedom, viz., the first petition of the Congress of 1774 to the king, the Declaration of Independence and the Constitution of the United States. The nickname, "The Blue Hen's Chickens," for the people of Delaware, was first given to the Revolutionary soldiers of Captain Caldwell, famous for their dash and grit, either because of the prize fighting cocks (chickens of a certain "blue hen") he carried with him, or from their blue uniforms. Tradition says their flag also bore the inscription.

The early colonizers or governors of New Castle, Kent and Sussex counties, prior to Delaware statehood, were as follows:

DUTCH RULE
Cornelius Jacobsen Mey. 1624-1628
William Verholst. 1625-1626
Peter Minuit. 1626-1631
Wouter Van Twiller. 1631-1638

SWEDISH RULE
Peter Minuit. 1638-1640
Peter Hollandar. 1640-1641
John Prints. 1643-1653

DUTCH RULE
Peter Stuyvesant. 1647-1653

SWEDISH RULE
John Pappengoya. 1653-1654

Under William Penn, proprietor, 1681-1718, twenty-six representatives of Penn ruled up to 1704 when the three counties, New Castle, Kent and Sussex seceded and set up their own local government, merely acknowledging the authority of the proprietors and the Provincial governor of Pennsylvania. Thereafter, 13 such Provincial governors represented William Penn till his death in 1718, and his three sons as Proprieters up to 1776, when the three counties separated from Pennsylvania and became the autonomous State of Delaware.

**Presidents Under the Constitution of 1776**

- John McKinley, 21 Feb. 1777, captured by the British 11 Sept. 1777.
- Thomas McKean, acting... 12 Sept. 1777 to 20 Oct. 1777.
- George Read, acting... 20 Oct. 1777 to 20 March 1778.
- Caesar Rodney, Pres... 20 March 1778 to 13 Nov. 1781.
- John Dickinson, 13 Nov. 1781 to 4 Nov. 1782.
- John Cook, acting... 4 Nov. 1782 to 8 Feb. 1783.
- Nicholas Van Dyke, acting... 8 Feb. 1783 to 27 Oct. 1786.
- Thomas Collins, acting... 27 Oct. 1786 to 29 March 1789.
- John Davis, acting... 29 March 1789 to 30 May 1789.
- Joshua Clayton, 30 May 1789 to 13 Jan. 1793.

**Governors Under the Constitution of 1792**

- Joshua Clayton, Federalist... 1793 to Jan. 1796.
- Gunning Bedford, Federalist... Jan. 1796 to 18 Sept. 1797.
- Daniel Rogers, acting, Federalist... 18 Sept. 1797 to Jan. 1799.
- Richard W. Delancy, Jr., Pres... 1799 to 17 March 1800.
- James Symes, act., Federalist... March 1800 to Jan. 1802.
- David Hall, Federalist... Jan. 1802 to Jan. 1805.
- Nathan Mitchell, Federalist... Jan. 1805 to Jan. 1806.
- George Truitt, Federalist... Jan. 1806 to Jan. 1811.
- Joseph Hazlet, Federalist... Jan. 1811 to Jan. 1815.
- Daniel Rodney, Federalist... Jan. 1815 to Jan. 1817.
- John Clark, Federalist... Jan. 1817 to Jan. 1820.
- Jacob Broom, Federalist... Jan. 1820 to Jan. 1822.
- Thomas Cameron, acting Dem.-Rep., 20 June 1825 to Jan. 1826.
- Samuel Sumner, then Rep., 1826 to Jan. 1827.
- Charles Polly, Federalist... Jan. 1827 to Jan. 1830.
- David Hazard, Federalist... Jan. 1830 to Jan. 1833.

**Governors Under the Constitution of 1832**

- Cornelia P. Conway, Whig... Jan. 1837 to Jan. 1841.
- Thomas Stockton, Whig... Jan. 1845 to 2 March 1846.
- Joseph Maull, acting, Whig... 2 March 1846 to 1 May 1846.
- William Temple, acting, Whig... 1 May 1846 to Jan. 1847.
- William Thrapp, Dem... Jan. 1847 to Jan. 1851.
- William H. Ross, Dem... Jan. 1851 to Jan. 1854.
- Peter F. Casy, Whig... Jan. 1855 to Jan. 1859.
- William Cam, 1863 to 1 March 1865.
- Howe Saulsbury, act., Dem... 1 March 1865 to Jan. 1866.
- George Saulsbury, Dem... Jan. 1866 to Jan. 1875.
- James Pender, act., Dem... Jan. 1875 to Jan. 1875.
- John P. Cochran, Dem... Jan. 1875 to Jan. 1879.
- John W. H. Dill, Dem... Jan. 1879 to Jan. 1883.
- Charles C. Stockley, Dem... Jan. 1883 to Jan. 1887.
- Benjamin T. Biggs, Dem... Jan. 1887 to Jan. 1889.
- Robert J. Reynolds, Dem... Jan. 1889 to Jan. 1893.
- Joshua H. Marvel, Rep... Jan. 1885 to 8 April 1895.
- William J. Watson, act., Dem... 8 April 1895 to Jan. 1897.
- Eise W. Tunnell, Dem... Jan. 1897 to Jan. 1901.

**Governors Under the Constitution of 1897**

- John Hunn, Rep... Jan. 1901 to Jan. 1905.
- Preston Lee, Rep... Jan. 1905 to Jan. 1909.
- Simon A. Biddle, Rep... Jan. 1909 to Jan. 1913.
- Charles R. Miller, Rep... Jan. 1913 to Jan. 1917.
- John G. Townsend, Jr., Rep... Jan. 1917 to.

**William E. Wright, Editor, Middletown, Del., Transcript.**

**DELWARE, Ohio, city and county seat of Delaware County; on the Whetstone (Olen-tangy) River, and on branches of the Cleveland, Cincinnati, Chicago and Saint Louis, the Pennsylvania and several other railroads, 24 miles north of Columbus. It is the trade centre of Delaware and surrounding counties, and has manufactures of iron flour, woollens, lumber, furniture, agricultural implements, chairs, carriages, cigars, gasoline engines, etc. It is the seat of Ohio Wesleyan University and the Ohio Wesleyan Female College. The former is a coeducational college which was organized in 1842. Part of its work is the preparation of students for the ministerial office. It contains a Carnegie library and was the birthplace of Rutherford B. Hayes. There are sulphur, magnesia and other mineral springs nearby, and the city has large railroad repair shops, hotels, daily and weekly newspapers, and two national banks. Delaware, Colburnia, also 1827, is governed by a mayor elected every two years, and a municipal council. Pop. 9,076.**

**DELAWARE BAY, a large bay or arm of the sea, between the States of Delaware and New Jersey. The Delaware River and several small streams flow into this bay. It is 65 miles long, and in the centre about 30 miles across, and about 15 miles at its mouth, from Cape Henlopen to Cape May. At the entrance to the bay, near Cape Henlopen, is situated the Delaware Breakwater, the object of which is to afford vessels a shelter within the cape. The breakwater proper is 1,200 feet long, and runs in a straight line from east-southeast to west-northwest, leaving an entrance 650 yards wide between its end and the north point of the cape. It serves also as an ice-break against the floating ice which sometimes comes down the bay. At the distance of 350 yards from the upper or western end of the breakwater a similar dike, of 500 yards in length, is projected so as to form an angle of 146 degrees 15 minutes with the breakwater. Government light-houses are stationed at the entrance, to indicate shoal places in the channel and breakers along the shore. The dividing line between Delaware and New Jersey runs northwest and southwest through the centre of Delaware Bay and up the Delaware River. The bay is a broad open watercourse to Wilmington, the most populous city of Delaware, and beyond Wilmington, to the north, on the Delaware River, to Philadelphia and Camden, two of the largest shipping ports on the Delaware.**

**DELAWARE COLLEGE, an institution founded at Newark, Del., 1833, closed in 1859. In 1870 it was reopened as a "Land Grant College," the State of Delaware appropriating funds received under the Land Grant Act of 1862. Further aid received from the State funds obtained under the congressional act called the "Hatch Bill" enabled the college to open an agricultural experiment station in 1887. A still further grant was received under the act of 1890. The college began to receive an annual appropriation of $40,000 in 1897, under the terms of the Nelson bill which was enacted in that year. Until 1913 the charter was renewable every 20 years but in that year by act of the legislature it was made permanent. In 1913-18 the college received a State appropriation of $15,000, paid in five instalments for the erection of buildings and plant to house a woman's college, which in the main is a distinct institution from Delaware College, but for certain purposes of State administration they are coordinated. The library contains about 20,500 volumes; there are 232 students and 31 instructors. The college is non-sectarian, and its property is valued at $400,000 and its total income, including tuition or incidental charges, is $97,-
DELAWARE & HUDSON RAILROAD

The Delaware and Hudson Railroad system is the outcome of a series of amalgamations of many small lines leased and constructed from time to time by the Delaware and Hudson Canal Company, which was chartered under the laws of the State of New York in 1823 as a coal mining and transportation corporation. The State also loaned its credit of $50,000 to aid in the construction of a canal from Honesdale, Pa., across the Delaware River to Rondout, N. Y. (now a part of the city of Kingston) on the Hudson River, hence the name, "Delaware and Hudson." The canal was completed in 1828 with capacity for boats carrying 25 tons. It was enlarged in 1844 for 40-ton boats and again in 1862 for boats of 125 to 150 tons capacity. It was finally abandoned in 1899, with the completion of the rail lines of the Delaware and Hudson Company. Extending from Wilkesbarre, Pa., to Roose's Point on the Canadian boundary, with branches to Binghamton and Troy, N. Y., Rutland, Vt., Lake George, and some lesser points. The number and variety of its summer resorts this railroad occupies a unique position, touching Cooperstown, Sharon Springs, Round Lake, Saratoga Springs, the Lake George and Lake Champlain resorts, and the eastern gateways into the Adirondack Mountains.

The total mileage operated on 30 June 1916 was 885.63 miles, of which 352.26 miles were owned by the company, and the remainder leased or controlled under trackage rights.

The operating revenues for the fiscal year ended 30 June 1916 were $25,938,675, earned by the transportation of 7,459,533 passengers and 22,623,328 tons of freight. The individual passenger travel averaged 17.4 miles at a charge of 2.2 cents per mile, aggregating 443,297,189 miles and $2,860,283. The freight traffic averaged 145.31 miles per ton, at a charge of 0.688 cents per ton per mile, aggregating 1,414,674,323 ton-miles and $21,631,350. The operating expenses were $16,381,589. After deducting taxes, etc., the total operating income was $8,912,866. Renters for leased roads amounted to $2,006,142 and interest on the funded debt was $2,771,833. The net income, which was transferred to profit and loss, was $4,769,972. The dividend appropriation from surplus was $3,825,234.

The equipment of the road on 30 June 1916 consisted of 490 locomotives with an aggregate tractive capacity of 18,274,250 tons, 246 passenger cars, and 18,818 freight cars, of which 11,431 are coal cars with an aggregate capacity of 463,401 tons. By far the largest freight tonnage of the railroad is coal, amounting in the year quoted to 12,567,166 tons, or 56 per cent of all the freight handled.

The entire investment in road and equipment on 30 June 1916 totaled $68,642,658. Other investments, including $6,465,026 in coal lands, amounted to $63,103,936. The total long term debt amounted to $62,798,000, and the credit balance of the profit and loss account was $18,489,610.

In 1915 the company mined 8,100,767 tons of anthracite coal, which was sold under contract at the pit mouth to the Hudson Coal Company for $15,860,697.

The Delaware and Hudson system includes 333.79 miles of electric lines, embracing the United Traction Company, operating in the cities of Albany, Rensselaer, Troy, Watervliet, Cohoes, Waterford, etc.; the Hudson Valley Railway Company, operating from Cuyahoga Falls to Mechanicsville; the Schenectady Railway Company, operating in the counties of Schenectady, Albany and Saratoga; and other lines in Troy and Plattsburgh, N. Y. The company also owns (in connection with the Rensselaer and Saratoga Railroad) and operates two fleets of passenger steamers, one on Lake Champlain and the other on Lake George. The regular routes of the Champlain steamers total 159 miles and their excursion routes 112 miles, the route of the Lake George steamers being 33 miles. An interesting event in the history of the company is the fact that the first steam locomotive ever placed on a railroad in the western hemisphere, the "Stowbridge Lion," made its trial trip on the Delaware and Hudson Railroad, between Carbondale and Seelyville, on 8 Aug. 1829. The locomotive was built by the Foster Roswick & Company, of Stourbridge, England. It arrived in New York in May 1829. It was of the grasshopper type with walking beams and vertical cylinders. The locomotive and the tender were each four-wheeled, with spokes and feltoes of wood, iron tires and wheel centres. The track on which it ran was of strap iron spiked next the inner edge to large hemlock sleepers laid on crossties. The Delaware and Hudson Railroad system in 1916 included the Albany and Susquehanna Railroad; the Chautaugay and Lake Placid Railroad; the Cooperstown and Charlotte Valley Railroad; the Cooperstown and Susquehanna Valley Railroad; the Rensselaer and Saratoga Railroad; the Albany and Virginia Railroad; the Rutland and Whitehall Railroad; the Saratoga and Schenectady Railroad; the Ticonderoga Railroad; the Greenwich and Johnsonsville Railway; the Napierville Junction Railway; the Northern Coal and Iron Company; the Quebec, Montreal, and Ottawa Railway; and the Schoharie Valley Railroad.

DELAWARE INDIANS (their own name, Renno Renappi, or Lemno Lenape, "true men;" cf. Illinois, Inuit, Lokono, Muysca, Alemanni, etc.), an important Algonquin tribe which lay in the path of white settlement on both sides of the Delaware River, and therefore fills a large place in colonial history. Previously they had been subjugated by the Iroquois, who, instead of exterminating or absorbing them, exacted tribute, called them "women," and dictated their action. The early Dutch settlers were massacred as usual; but the Swedes on the Delaware upheld Indian titles to land to secure their own possession against the Dutch, compelling the latter in turn to buy instead of seizing, so there was peace with the Delawares in this period. The Swedes tried to Christianize them with Luther's catechism, without much success. In October 1682, Penn, in his famous letter, wrote them, as well as and as ill kept by his successors as others of the kind, that the Delawares did not revenge the white encroachments by massacre was due to Penn's sagacity in buying up
DELAWARE, LACKAWANNA AND WESTERN RAILROAD CO.

their overlords, the Iroquois, who threatened to destroy them if they molested "Onas" people. The infamous massacre of the Walking Purchase (q.v.) of 1737 (denounced by the Quakers) ousted them from half a million acres in the forks of the Delaware above Easton, and the Iroquois with furious menaces compelled them to retire to the Susquehanna. Here settlement was resumed, and not daring to resist it, a large part of them by 1750 had removed to the Alleghany and Muskingum, where they recovered Indian courage and ferocity. The Mon- ravian missionaries converted part of the re- mainder, and these always remained peaceful. The others, maddened by aggression, joined the French and Iroquois in the French and Indian war, and helped in Braddock's defeat; sullenly yielding in 1758, after the Senecas had turned against them, they broke out again in Pontiac's Conspiracy (q.v.) of 1762, and were among the besiegers of Detroit, Fort Pitt, Duquesne, etc. Defeated by Bouquet at Bushy Run, 1763, they made peace in 1764–65. In 1768 all the remnants east of the Alleghenies migrated west; and the Cherokees and Delawares founded the village of Gnadenhütten. The Muskingum and the Muskingum plains of the others kept the field till the crushing defeat of Point Pleasant (q.v.), 1774. In the Revolution they were divided; part went with the English, part made a treaty with Congress in 1778. The Christians remained quiet till Gnadenhütten, till in 1781 the English broke it up and removed them to Sandusky. Part of them returned thither to save their crops, and were attacked by the Americans and 90 of them murdered; the rest fled mostly to Canada. Land was given them on the Thames, and they founded Fairfield, with others, who came in 1787 from the Muskingum, where Congress had settled them. The wild tribesmen remained hostile, and contributed to St. Clair's defeat in 1791; but Wayne's victory forced them to make peace in 1795. Successive treaties removed them from Ohio, and by 1800 the main body were on White River, Indiana. They did not join Tecumseh in the War of 1812, and in 1818 they ceded all their land east of the Mississippi and moved to White River, Missouri. There were then 1,800 in all, a few remaining in Ohio. Later, some went south to Red River, on the Texan border, by Spanish permission. By treaty of 24 Oct. 1859 the main body, about 1,000, settled on the Kansas and Missouri. They had schoold and missions. In 1853 they sold all but a reservation in Kansas, invested the moneys sagaciously, and built fair houses, improved their farms, etc. During the Civil War, out of 201 warriors they sent 170 to the Union side, who proved good soldiers and guides, and gained a high reputation. The road was taken up by the Union Pacific Railroad, and they sold the whole in 1867–68, and took up lands on the Verdigris and Caney, bought from the Cherokees. A special treaty of 1866 permitted them to take lands in severalty and become citizens; they took some from the main road, in three divisions, 71 on the Thames in Canada, about 200 at Green Bay, Wis., with the Stockbridges, and some with the Chippewa in Kansas. There are also some on Grand River reserve in Ontario, and about 350 Moravians on the Thames. Consult Harrison in "American Anthropologist" (1913) and Skinner, 'Report of the Archaeologi- cal Survey of New Jersey' (1913).

DELAWARE, LACKAWANNA AND WESTERN RAILROAD COMPANY, The, is a consolidation of a number of short rail- roads originally separate corporations. It was chartered under the laws of Pennsylvania in 1849 as the Liggetts Gap Railroad. This name was changed in 1851 to the Lackawanna and Western Railroad. In 1853 a consolidation was effected with the Delaware and Cobbs Gap Railroad chartered but not yet built, and the present name was then adopted. The system as now operated extends from the seaboard at New York to the Great Lakes at Buffalo, traversing New Jersey, Pennsylvania and southern and western New York, with branches into the slate and cement fields of Pennsylvania and New Jersey, the anthracite fields of Pennsylvania, and the agricultural, dairy and industrial area of central New York. The total mileage operated on 30 June 1916 was 955.5 miles, of which 256.12 miles were owned by the company, and the rest leased under leases and trackage rights. The operating revenues for the fiscal year ended 30 June 1916 were $49,335,739, earned by the transporta- tion of 24,756,657 passengers and 26,458,931 tons of freight. The individual passenger travel averaged 21.83 miles at a charge of 1.566 cents per mile—aggregating in the year 540,372,771 miles, and $8,462,493. The freight traffic aver- aged 189.35 miles per ton, at a charge of 0.719 cents per ton-mile—aggregating in the year 5,010,072,493 ton-miles, and $36,034,113. The operating expenses for the year were $29,511,- 905. After deducting taxes, etc., the total operating income was $17,607,604. Rentals for leased roads amounted to $5,900,196. The net income from all sources was $14,259,516, of which $8,444,080 was appropriated for dividends; $2,056,742 for physical betterments; and a balance of $3,788,694 transferred to profit and loss.

The equipment of the road on 30 June 1916 consisted of 733 locomotives with an aggregate tractive capacity of 23,438,100 tons, 553 passenger cars; and 27,812 freight cars, of which 11,452 were coal cars with an aggregate capacity of 451,110 tons. By far the largest freight ton- age of the road is coal, amounting in the year cited to 12,200,415 tons, or 46 per cent of all the freight handled.

The entire investment in the road and its equipment on 30 June 1916 was $85,656,640. Other investments of the company amounted to $71,314,561. The total stock outstanding on the date mentioned was $42,291,120, and the total long term debt was $102,600. The credit balance of the profit and loss account was $43,444,436.

The company owns extensive anthracite coal lands in Lackawanna and Luzerne counties, Pa. Under the decision of the United States Supreme Court the railroad discontinued its coal business in 1909, and this was taken over by the Delaware and Western Coal Company. The latter sold in 1915 9,113,- 144 tons of coal, valued at the mines at $22,- 726,155.

The railroad owns and operates the New
York and Hoboken Ferry, connecting the city
of New York with Hoboken, N. J.

The present "Lackawanna Railway" as it
is popularly called includes as its oldest com-
ponent the Ithaca and Otsego Railroad, char-
tered in 1828, completed in 1834. For six years
this road was operated by horse power and
stationary engines, the company having no
locomotives until 1840. Other railroads now a
part of the New York, Susquehanna and New
Orleans; the New York, Lackawanna and New
England; the Lackawanna and Wyoming; the
Susquehanna and Chesapeake; the Delaware
and Ohio; the Cleveland, Cincinnati, and
Indiana; the New York Central and Hudson
River; the Lehigh Valley; the Delaware, Lack-
awanna and Western; the New York, Susque-
heanna and Western railroads, near Stroudsburg, Pa., 65 miles north-
east of New York. The Delaware River, where
it passes through the Kittatinny Range of
the Appalachian Mountains, is 60 miles long
three miles in length and above the water the
sides rise to the height of 1,400 feet. Its great
scenic beauty attracts annually a considerable
number of tourists and vacationists.

DELAWARE, or DELAWARE, Thomas
West. See West, Thomas, Lord Delaware,
or Delaware.

DELBRÜCK, dèl'brük, Hans, German his-
torian of military science: b. Bergen, Rügen,
1848. He was educated in Heidelberg, Bonn
and Greifswald. He was an officer in the
Franco-Prussian War and in 1874 became tutor
for Prince Waldemar. He was a member of the
Reichstag in 1882-83 and 1884-90 and after
1883 was on the editorial staff of the Preussische
Jahrbiicher. He was appointed professor of
modern history at the University of Berlin in
1885. He has written several important works
on the art of war as practised within historic
times. The more important of his works are
'Die Perserkriege und die Burgunderkriege' (1887); 'Die Strategie des Perikles erlautert
durch die Strategie Friedrichs des Grossen' (1890); 'Friedrich, Napoleon, Wellington
und Neure Strategie' (1892); 'Geschichte der
Kriegskunst im Rahmen der politischen Geschich-
te' (3 vols., 1900-07); 'Erinnerungen,
Aufsätze und Reden' (1902).

DELBRÜCK, Martin Friedrich Rudolf
von, German statesman: b. Berlin, 16 April
1817; d. there 1903. He was educated at Halle,
Bonn and Berlin. Entering public life in 1849
he was finally made director of the Department
of Commerce and Industry (1859); and his
part in detaching Prussia from the Austrian
commercial policy was considerable. After
1862 Bismarck, then president of the Cabinet,
supported von Delbrück's commercial ideas and
on the same principles he negotiated treaties
with foreign powers. In 1869 Delbrück was
made president of the Imperial Chancellery of
the North German Federation. In 1870 he
negotiated the treaties which made Germany a
unit. For five years after the founding of the
Empire, Delbrück retained his office as presi-
dent of the General Chancellery, now become
the Imperial Chancellery. In 1876 he was dis-
missed in spite of his reputation and service.
Later, as a member of the Reichstag, he dared
oppose Bismarck. He retired from the Reich-
tag in 1881. In 1896 he received the order
of the Black Eagle at the hands of the emperor.
He published 'Der Zollverein und das Tabaks-
monopol' (1857); 'Der Artikel 46 der Reichs-
verfassung.'

DELCASSE, dél′ka-sä, Théophile, French
editor and statesman: b. Pamiers, Ariège,
France, 1 March 1832. For some time on the
staff of La République, in 1863 he was
elected deputy from Foix 1889 and re-elected
1893 and 1898. He was under-Secretary of State
for the colonies and became Minister for the
Colonies in 1894. He was Minister of Foreign
Affairs in Brisson’s Cabinet, holding the same
office under Dupuy, Waldeck-Rousseau and
Combes. He settled the "Fashoda Affair" with
England and gave an eastern frontier to the
possessions of France in Africa. He also con-
cluded a commercial convention with the United States. Owing to disagreement of his Moroccan policy, on 6 June 1905 he resigned his post as Minister of Foreign Affairs. In the following May he again became a member of the Chamber of Deputies and in 1909 was appointed chairman of a committee of deputies appointed to investigate various matters in connection with Morocco. The report of this committee, when presented to the Chamber, drew an attack on Delcassé from Georges Clemenceau, the Premier. Delcassé saw his naval plans adopted in 1910, and held the portfolio of Minister of Marine under Monis, March-June 1911, and in the cabinets of Caillaux and Poincaré in 1911-12. In January of the latter year he became Minister of Foreign Affairs. In 1913 he was sent to Saint Petersburg on a temporary mission. He was again Minister of Foreign Affairs in 1914, retaining his portfolio until October 1915.

**DELCREDERE**, dé kréd-ér, an Italian mercantile phrase expressing a guarantee or warranty, given by factors, brokers or mercantile agents, who, for an additional commission, become bound not only to transact business for their employers, but also to guarantee the solvency of the persons to whom the goods are sold, or with whom business is done. This additional commission is known as a del credere commission. The term has come into general use in international commerce, and is recognized in the common-law system of England and America.

**DELEP PALM**, the *Borassus æthiopum*, a native of the interior and west of Africa, allied to and somewhat resembling the Palmyra palm (q.v.). Its leaves and fruits are used by the Africans for the same purposes as those of the Palmyra by the Asians, and the tender roots produced by the young plant are extensively used as an article of food. The trunk is swollen about halfway up.

**DELECLUSE**, dé-lás-kléz, Étienne Jean, French painter and critic: b. Paris, 20 Feb. 1781; d. Versailles, 12 July 1863. He was a pupil of David, and although achieving a fair success during the first years of his career, he failed to rise above mediocrity. In 1816. He was connected with several reviews and papers, including the *Moniteur* and the *Journal des Débats*, and the *Revue des Deux Mondes*, being allied with the young literary circle of the Restoration. He also wrote several novels. Among his many works are *'Precis d'un traité de peinture'* (1828); *Mademoiselle Justine de Liron'* (1832); *'Notice sur la vie et les ouvrages de Leopold Robert'* (1838); *'Donna Olympia, the Sister-in-law of Pope Innocent X'* (1842); *'Gregory VII, Saint François d'Assise et Saint Thomas d'Aquin'* (1844); *'Louis David, son école et son temps'* (1855); and *'Souvenirs de soixante années'* (1862). In the museum at Versailles there are some curious pen and ink sketches by him of scenes of the invasion of Paris in 1814. Among his paintings are *'Port de l'Asyntaxí'*; *'Entree d'Europe'*(1808); *'Entree de l'Asiatique par Paris'*(1810); *'Un sacriste à Cérès, Hermine et Tancrede'* (1812); *'Auguste et Cinna'* (1814).

**DELEDDA, Grazia** (Mrs. M. P. Lombard), Italian poetess and novelist: b. Nuoro, Sardinia, 1872. She owes her wide popularity to an impulsive originality in her portrayal of Sardinian life. Her first essays were accepted by Angelo De Gubernatis for his *Annali Italiano* and *Natura ed Arte*. Her first novel, *'Anime oneste,'* received the honor of a graceful preface by Ruggiero Bonghi. Among her works, many of which have been translated into other languages, are *'Fior di Sardegna,'* *'Racconti Sarde,'* *'Amore regale,'* *'Nostro Signora del Buon Consiglio,'* *'Le tenzazioni,'* *'Il Vecchio della Montagna,'* *'Dopo il Divorzio,*' *'Il Tesoro,*' *'Elia Portu'*,—which is perhaps her best—and *'Nostalgia.* The main charm of her romances is described as "une certaine sauverie."

**DELEGATE.** See DELEGATION; DELEGATES, COURT OF.

**DELEGATES, Court of,** the old English court final of appeal, and was so-called because the judges thereof were delegates, by the king's commission under the great seal, to hear and determine appeals in the three following cases: (1) Where a sentence was given in any ecclesiastical cause, by the archbishop, bishop, or abbot; (2) when any sentence was given in any ecclesiastical cause in the places exempt; (3) when a sentence was given in the admirals' court, in suits civil and marine, by order of the civil law. This court has been abolished, and the privy council is now the great court of appeal in all ecclesiastical causes.

**DELEGATION,** a person or body of persons deputed to act for another. Before the present Constitution of the United States of America was adopted, the persons constituting the Congress at Philadephia were called delegates, and the body of representatives of a State in Congress is still called the delegation of a State. In Maryland and Virginia the branch of the State legislatures which, in most of the other States, is called house of representatives, has the name of house of delegates. The name of delegate is also given to the representatives sent to the Congress of the United States from Territories not yet formed into States. In Italy branches of government are often called delegazioni, and the members of the Senate in Lombardey, Venice and the states of the Church the term delegazione was applied both to the governor and governing court of a province and to the province itself. The delegate was always a prelate, and directly appointed by the Pope. In the civil law, delegation is that act by which a debtor transfers to another person the duty to pay, or a creditor transfers to another person the right to receive payment.

**DELENDA, de-lén'da, things to be erased or expunged. *Delennda est Carthago* is the celebrated sentence with which Cato the elder was accustomed to conclude all his speeches in the Roman senate. His hatred of Carthage arose from a jealousy of its flourishing state, and the consequent danger to Rome.

**DE LEON, Thomas Cooper,** American author and playwright: b. Columbia, S. C., 21 May 1839; d. 19 March 1916. He was auditor Topographical Engineering at the University of Pennsylvania 1856-61, served in Confederate army 1861-65, and at the close of the war was connected with magazine and newspaper work in Baltimore, New York and Mobile. He organized the Mobile Mardi Gras Carnival and was its manager.
for 25 years, and has designed carnivals for many other cities for their various celebrations. Among his works are 'The Rock or the Rye'; 'Cottagers in the Coast India Company'; 'A Confederate Blockade Breaker'; 'The Puritan's Daughter'; 'Four Years in Rebel Capitals'; 'Out of the Sulphur'; 'A Bachelor's Box'; 'An Innocent Cheat'; 'Crag Nest'; 'Life of Joseph Wheeler'; and 'Confederate Memories'.

DELESLUZE, de-lis-lu, Louis Charles, French communist: b. Dreux, 20 Oct. 1809; d. Paris, 28 May 1871. The February revolution opened to him a career in Paris, where his clever and facile pen quickly made him popular with the rabble, but earned him from the authorities imprisonment and a fine of 10,000 francs. Again at Paris in 1853, he was sentenced to two years' imprisonment, and was next transported to Cayenne, where he remained till 1859. He described his sufferings in 'De Paris à Cayenne: journal d'un transporté' (1867). After his return he was quiet for some years, until his journal, Révol, started in 1868 to advocate the doctrines of the International, brought him into new trouble. In the history of the Paris Commune he played a prominent part, and upon his head rests in great part the guilt of the murder of the hostages, and the burning of the public buildings of the city. He died on the last barricade.

DELESSERT, dé-lés-sar, Benjamin, French naturalist and philanthropist: b. Lyons, 14 Feb. 1773; d. Paris, 1 March 1847. In 1803 he started cotton-spinning in France, but is particularly distinguished by his efforts to produce beet-root sugar. As early as 1801 he was engaged in refining, but in 1806 he began the experiments which were successfully terminated and announced to Chaptal on 2 Jan. 1812. When he heard of it Napoleon was in ecstasy: 'We must see it: let us go,' he said. Delessert, says Flourens, who narrates this incident, had just time to go to Passy, where his work was. On his arrival he found the gates surrounded by the imperial chasseurs, who refused him admission. He then entered the Emperor had seen and admired everything; excitement was at its height. Approaching Delessert, the emperor took the cross of the Legion of Honor from his own breast and gave it to him. It was announced next day in the Moniteur that a revolution in French commerce had been accomplished. Delessert lived through the collapse which the manufacture suffered after Napoleon's fall, and long enough to see it revive and become of the greatest importance.

DELFTSHAVEN, or DELFTSHAVEN, the former being the modern form, once the haven or port of Delft, but now part of the city of Rotterdam, on the river Maas, and the starting point of the voyage of the Pilgrim Fathers to America, in 1620, and the birth place of Piet Hein, the Dutch admiral who in 1628 captured the West India Spanish fleet, with its cargo of $12,000,000 in silver. His statue is in the little park behind the historic edifice of the Reformed Church. The large island, which formed in the river Maas in front of the town, has been recently reclaimed to the gain of the city, by filling the space occupied by the inner channel. In front, facing the river, is the Pilgrims' Avenue, or quay, named July 1892 in honor of the Separatists sailing for America. They spent the night before embarkation on the Speedwell, in the now greatly altered warehouse of the East India Company, the Alte Zeeuw, Blockade Breaker, The Puritan's Daughter, Four Years in Rebel Capitals, Out of the Sulphur, A Bachelor's Box, An Innocent Cheat, Crag Nest, Life of Joseph Wheeler, and Confederate Memories.

DELESLUZE — DELFT

After the revival of interest in Pilgrim history, a stone from this edifice was, with one from Scrooby, England, and another from Plymouth, Mass., set in the facade of the New England Congregational Church in Chicago. After the great fire, in which this handsome edifice was gutted, the three stones remained intact. Three large dykes defend Delfshaven from the water, and here, in 1574, these were cut to flood the country and relieve Leyden. Two hundred Cannon boats, loaded with herrings and bread, moved up the flood and raised the siege. The arms of Delfshaven contain representatives of green fields and white waters, in alternate strips, with herrings and wheat. In the river Schie which from Leyden and Delft has for centuries been made into a canal and flowing through D., the Pilgrim boats were moored. On 28 Sept. 1906, in celebration of the 300th anniversary of the sailing of the first Pilgrim company — others follow a bronze tablet, presented by the Boston Congregational Club and set in the south wall, was unveiled in the Reformed Church, before an international audience. In the Consistory Room of this church, formerly a cloister chapel built in 1416, is kept a register book for the Americans and others who visit the place. On the north wall, is a stone from Chicago with a Greek inscription. In 1915, a storm destroyed several of the larger windows and the Dutch congregation replaced them in stained glass, with two splendid memorial designs in celebration of the rocking the cradle of a great nation. Other companies of Pilgrims from Leyden sailed later from this port. A picture, painted by one of the Cuyp, father or son, discovered in 1893, by George H. Boughton, probably depicts the actual scene of embarkation. The rotunda picture in the capitol at Washington, by Weir, showing luxurious costumes and imaginary hills in the background, was painted before the recovery of the Pilgrim story. Consult Griffis, 'The Pilgrims in Their Three Homes,' (1914).

WILLIAM ELLIOT GRIFFIS.

DELF, or DELF, Holland, town in the province South Holland, six miles southeast of The Hague and eight miles northwest of Rotterdam. It stands on a dead flat, and is intersected in all directions by canals, which are crossed by 69 bridges, mostly of stone. These canals make the great market-place with its public buildings an island, approached by nine bridges. The counterscarps of the old ramparts are now planted with trees, and form public walks. The town-hall (Stadhuis), in the market-place, is a large, solid-looking building, with a heavy square tower rising from its roof. The Prinsenhof, once the occasional residence of William of Orange, and the residence of William (10 July 1584), is now a military barracks. The old Reformed church contains the monuments of Admirals Tromp and Hein, the famous naturalist Leeuwenhoek, and other worthies. The magnificent mausoleum of William, and the burial-place of the Reformers, is the New Church (1412–76); and from its huge square tower the town and neighborhood are from time to time regaled with the richest
music from a chime of three octaves; the New Church contains also the tomb of Hugo Grotius. Delft has long been the seat of an arsenal, and was formerly the centre of the manufacture of the kind of pottery called delftware or del, an industry now revived under the name of "New Delft." The chief manufactures now carried on comprise firearms, carpets, leather, soap, oil and gin. Delft was founded in 1075 and received its charter in 1246. It was almost wholly consumed by fire in 1536; and in 1654 the powder magazine of the arsenal exploded accidentally, when not a single house entirely escaped, and many persons were killed or maimed. Pop. 34,485.

DELFTHAIVE.—To the Dutch town of Delft the world is indebted for a style in faience that has claimed the admiration of the world. When, at the beginning of the 17th century, the Dutch East India Company brought such large quantities of Chinese and Japanese porcelain ware they created a great rage for this beautiful "china." The cost of this imported ware was, however, too high for most of the citizens. The rich Italian faience (majolica) had shown what fine effects were obtainable with opaque tin enamels. Already the Dutch potter had been producing tin enameled tiles for decorating wall surfaces and for covering the surface of househeating apparatus (ovens). These tiles, with their quaint painted decoration consisting of biblical subjects, landscapes, ships, coats-of-arms, etc., had become popular all over Europe. By coating his darker clay body with white opaque tin enamel the Delft potter had found a method of creating an appearance of porcelain very pleasing to the eye. With the Chinese and Japanese porcelain pieces in such abundance before him he had forms and decoration in plenty to carry out a close imitation of equal variety and beauty. Starting at the very beginning of the 17th century, by 1690 this Delft faience was in such favor throughout the Continent and England that about 30 busy factories were in existence. Careful workmanship in both painting and decoration produced a ware which is greatly admired by connoisseurs to the present day. The industry was continued till the end of the 18th century, when the cheap, handsome English "standard" formula "china" (see Ceramics) flooded the European markets. Leading Delft makers and painters were Herman Pietersen, Van Frytom, A. Pynacker, L. Fictor, L. and S. Eenhor, J. Van Brower, A. de Kooqhe, Th. Wittenburgh, etc. Among the best known factories were The Metal Pot; the Double Jug; the Claw; the Peacock; the Porcelain Bottle; the Three Tuns; the New Moor's Head; the Two Little Ships; the Jug; the Two Savages.

Characteristics.—The thick, warm yet brilliant glaze of Delft faience contrasts favorably with the steely glitter of most Chinese porcelain. The white enamel background had a pure, though subdued, mellow tone.

Product.—Handsome "garnitures" for the chimneys, consisting of a central gourd-shaped bottle, a beaker on either side, and at either end a jug with cover (all of Chinese form and decorative motifs), were favorites. Small vessels and beakers and small plates and brushbacks with bright-colored decoration and gold, on black or dark brown ground, are a much sought-for style. Other ornaments were cruets, candlesticks, scent bottles, bird cages, lanterns, sundials, flower holders, human and animal figures, etc. Peculiar forms were naturalistic violins, shoes and slippers for holding flowers, boxes of all sizes. Useful house services were made on a large scale.

Decoration.—Imitations of the Chinese blue-and-white decoration were made in largest profusion — A. de Keyser excelled in this. Gay colors alongside the blue followed. Japanese styles called "Imari" and "Japanese taste" were closely imitated from 1662. Many Oriental motifs were treated in a semi-European way (china-iserie).

Glaze.—Delft ware is coated with a very thick, soft glaze.

Paste.—The body runs from a dark brown to yellow.

Marks.—The name of the factory or maker is quite commonly used.

English Delftware.—The beautiful Dutch Delft pieces quickly attracted foreign imitation, and England, aided at first, no doubt, by Dutch potters, soon (the date is somewhat obscure) began making the white opaque-coated ware. This is generally termed an imitation to true Delft. Lambeth (London) is supposed to have first started this ware, which was then taken up by Bristol and Liverpool. Whereas the Dutch very closely imitated the Chinese styles at first, the English copied the Dutch almost slavishly for a time, but the early product was inferior to the Dutch, its body being coarser and glaze thinner and more uneven. The glaze is not well fused to the body, decoration is inferior and colors cruder. While the Dutch did but one firing for body, glaze and decoration, the English baked the body first, then the decoration and glaze afterward. Much of the ware shows crazing. The product was more for use than ornament and consisted of pill-slabs, drug pots, "Merry Men" plates. The latter are both round and octagonal. They are in sets, each with its motto. Thus we find one set with the lines "What is a Merry Man?"; the next plate reads "Let him do all what he kan;" then others to "entertain his Gestis," "With wyne and Malson his wyfe doth frowne," "All meryment goos done." Other articles are mugs, dishes, candlesticks, posset pots, three-handle mugs, "puzzle jugs," etc. Five colors were used — blue, green, yellow, orange, brownish purple. The so-called "blue dash chargers," with their crude daub, are much prized; they have kings, queens, statesmen, etc., as decoration. Richard Chaffers of Liverpool, shipped so much of his ware to America that this country is now the best source for obtaining specimens.

P., "Dutch Pottery and Porcelain" (London 1907); Moore, Mrs. N. Hudson, "Delftware: Dutch and English" (New York 1908).

CLEMENT W. COUMBE.

DELFTHAVEN. See DELFTHAVEN.

DELHI, India, city, proclaimed the capital of India in 1911, also capital since 1 Oct. 1912.
of a province, formerly a division of the same name, and ancienly of the Patao and Mogul empires. The city lies between Bombay and about 790 miles northwest of Calcutta. It was at one time the largest city in India, covering a space of 20 square miles, and having a population of 2,000,000. It is now reduced to a circumference of seven miles. A vast tract covered with forest lies within the walls of the ancient metropolis of the Mogul empire. The present city, built on two rocky eminences, is surrounded by walls of red sandstone 30 feet high, and from three to five feet thick, with a moat 20 feet broad. There are seven colossal arched gates, defended by round bulwarks, and all built of freestone. The streets of the old part of the city are narrow, but in the modern portion they are broad. The houses here are of sandstone and brick, and are of two and three stories in height. The palace or residence of the Great Mogul, built by Shah Jehan, commenced in 1631, and finished in 10 years, is by far the most interesting building in Delhi, and the most magnificent structure of the kind in India. The Great Mogul, with other structures in the Byzantine-Arabic style, is considered by the Mohammedans the wonder of the world. It is built of white marble and red sandstone, inlaid like mosaic, in lines and arabesques; at the two extreme corners rise minarets 150 feet high, and between them two lofty domes. This imposing edifice was built by the Emperor Shah Jehan, in 17th century, and took several thousand men for six successive years (1631 to 1637) to complete it. There are no fewer than 40 other mosques in different parts of the city, many of them having lofty minarets and gilded domes. The fine structure which stands near the Ajmeer gate was formerly the Delhi College. The famous observatory of Jye Singh, rajah of Jyepeor, at the southwest extremity of the city, has been much dilapidated, and its astronomical instruments nearly all destroyed or carried off. A monument was erected in 1888 by the government to Willoughby, one of the heroes of the siege in 1857. The principal manufactures of the town are cotton cloths, indigo, finely embroidered shawls and jewelry, for which, as well as for delicately carved ivory, Delhi is somewhat noted. The chief imports are by the northern caravans, which bring from Cashmere and Cabul shawls, fruit, and horses. Precious stones of good quality are to be had at Delhi, particularly the large red and black carnelians. The agricultural products of the district consist chiefly of wheat, rice, millet, and indigo. The food is centred in Delhi, and the Rajputana State Railroad traverses the district.

Delhi, or as anciently called, Indraprastha, is one of the oldest cities of India. The modern name Delhí or Delhi is first met with in the 1st century B.C. It has been taken frequently by hostile powers. In the beginning of the 19th century the prosperity of the city and country around was threatened with destruction, and the Mogul emperor and royal family were reduced to great distress by the Maharratians, who took possession of his capital, and his garden houses and gardens, and used his name to oppress and impoverish the people by fraud and extortion. From this miserable state of desolation and ruin the city was rescued by the British in 1803, when it was entered and taken possession of by Lord Lake. On the breaking out of the Indian mutiny in May 1857, Delhi became the centre of the operations of the rebels, who flocked to it from all quarters. The nominal representative of the Great Mogul, who held the sovereignty of the place under British protection, joined cause with the rebels; and in addition to assuming the character of an independent potentate, gave his sanction to the massacres and atrocities perpetrated on the European residents. By the middle of June a British army assembled in front of the city, and a siege commenced, which, from the smallness of the besieging force, was necessarily slow and protracted. It was brought to a successful termination on 20 September, when Delhi was entered by the British troops, and the nominal sovereignty heretofore possessed by the king was declared ended; and he himself, after being tried for the murders committed under his authority, was found guilty, and sentenced as a convict to perpetual banishment. A large part of the place was reduced to ruins in the mutiny and siege, but it has since recovered much of its former appearance, and has also been much improved in its sanitary condition by good drainage, an ample water supply, and lighting system. Delhi on 1 Jan. 1877 was the scene selected for the coronation of Queen Victoria 'Empress of India' and also in 1903 and again in 1911 of the brilliant durbars proclaiming Edward VII and George V emperors of India. In 1911 Delhi was proclaimed capital of India and the supreme government was transferred there from Calcutta. Pop. 230,000.

DELHI, N. Y., village and county-seat of Delaware County; on the Delaware River, and a branch of the New York, Ontario and Western Railroad, about 55 miles east of Binghamton. It is in one of the bee raising regions in the country, and the trade is largely in butter, cheese, eggs and agricultural products. Pop. 1,736.

DELIBES, dé-lèb, Clément Philibert Léon, French composer: b. Saint Germain du Val, 21 Feb. 1836; d. 16 Jan. 1891. He entered the Paris Conservatoire in 1849, and in 1855 produced an opetta, 'Deux sacs de charbon,' at the Grand Opera, where he became second director in 1865, his music for the ballet 'La Fontaine' (1865), met with great success, and his ballet-music for 'Coppélia' (1870), his finest work, secured his position as a composer. He wrote music for a third ballet and for three comic operas, one of which, 'Le roï l'a dit' (1873), became very popular. In 1880 he was appointed professor in the Conservatoire. Consult Pougin, 'Musiciens du XIXe siècle' (Paris 1911).

DELILAH, dé-lélah, the Philistine mistress of Samson. She persuaded him to reveal to her the secret of his great strength, and learning that it lay in his long and thick hair, cut off his locks while he was asleep and then treacherously delivered the helpless man into the hands of his enemies.

DELILLE, dé-léj, Jacques, French didactic poet: b. Aiqueperse, Auvergne, 22 June 1738; d. Paris, 1 May 1813. His translation of Virgil's 'Georgics,' published in 1770, with a 'Discours préliminaire' and numerous annota-
tions, established his fame and obtained him admission to the French Academy. He became professor of Latin belles-lettres in the College of France, and of belles-lettres at the University of Paris. Though an adherent of the old system, Robespierre spared him on every occasion. At his request Delille wrote the 'Dithyrambe sur l’immortalité de l’âme,' to be sung on the occasion at the public academical ceremony of a Deity. His reputation mainly rests on the 'Georgics' and 'Les jardins,' a didactic poem. Other works are 'L’Homme des champs,' 'La pitié,' 'Les trois règnes de la nature,' 'La conversazione.' 'L’Enéide' and Virgile. Cézanne, Sainte-Beuve, 'Portraits littéraires' (Vol. II, Paris 1864).

DELIQUESCENCE (Lat. 'to melt away'), in chemistry the property manifested by many salts, of absorbing moisture from the atmosphere until they become distinctly damp. The name is usually applied to the more pronounced cases, in which the moisture absorbed is so great that the salt becomes visibly wet or even dissolves entirely; salts in which the action is less pronounced being called hygroscopic. Carbonate of potash, caustic potash and chlorides of calcium are familiar examples of deliquescent substances.

DELIRIFACIENT, any drug that induces an irritability of the brain leading to forms of delirium. Thus alcohol for some susceptible minds invariably leads to delirium in the early stages, and also induces delirium in chronic poisoning. Belladonna is a drug that causes a certain amount of delirium, as do also cannabinae, coca and its allies. Opium in small doses brings about an exhilaration and for some delirium. Mescal, a drug widely used among the Indians of South America and of the southwestern United States, also induces a form of delirium. Delirifacents are rarely used in medicine for the effect on delirium.

DELIRIUM is a general disturbance of consciousness, a perversion of the intellectual and perceptive faculties, characterized by a greater or less degree of mental confusion, by more or less transitory delusions and fleeting hallucinations, often accompanied by disordered, senseless speech and muttering; and motor unruliness. It varies in degree from the ordinary wandering or flightiness of mild types, such as fever deliria, to the higher, excited or more violent form, which are termed maniacal delirium, as seen in delirium tremens, general paresis, katatonia, epileptic or manic-depressive patients. It is a frequent symptom of many brain disorders. Present day psychiatry does not recognize — or designate — any one mental disorder by the term delirium. It is a symptom of many mental disorders. The delirium grave which still persists as a term in psychiatry is an exhaustion or toxic delirium — not a disease per se.

There are innumerable causes of delirium, the more prominent ones being infectious fevers, in the young and able-bodied, diseases dependent upon some specific micro-organism, such as seen in typhoid fever, pneumonia, scarlet fever, yellow fever, puerperal fever, pyemia and malaria; although delirium occurs also in analogous diseases not proven directly due to any specific micro-organism, also in trauma. Surgical operations are frequently followed by delirium.

In the delirium of intoxication the causes may be divided into endogenous and exogenous, the former arising from within the body proper, such as septic intoxication, pyemic or uremic absorption, cholema, diabetes, auto-intoxication and insolation, that is, sunstroke. The latter (exogenous) causes are alcohol, drugs, mydriatics, for example, belladonna, dубoisin, atropin; also cocaine, morphine, mineral poisons, for example, iodoform.

Delirium due to exhaustion and inanition is seen in acute anaemia, resulting from hemorrhage of any cause, or the presence in the blood of powerful haemolic poisons, for example, plasmoidium of malaria. It is also due to wasting diseases and lactation.

Delirium may originate in central or peripheral lesions of the brain, for example, blood clot from accidental injury, trauma, surgical operations, meningitis or encephalitis. Delirium may also be due to, or associated with, central depression, notably that occasioned by epilepsy, hysteria major, etc.

Delirium of senility is due to inanition and pathologic changes in the cerebral vascular supply.

The delirium of disease, or acute delirium, resembles that arising during febrile diseases; it is ordinarily accompanied by rise of temperature, which pursues no definite course, and by rapid and progressive body weakness (asthenia), and the typhoid state. The treatment consists of utilizing remedial agents that rapidly produce sleep, and fighting the progressive weakness, by stimulating drugs and nutrition, quieting the motor unrest and reducing fever by hydrotherapy, etc.

The treatment of delirium in general is:

1. Induce sleep, and quiet motor unrest;
2. Stimulate the agents that rapidly produce sleep, and fighting the progressive weakness, by stimulating drugs and nutrition, quieting the motor unrest and reducing fever by hydrotherapy, etc.

DELIRIUM TREMENS, a form of acute insanity due to alcoholic poisoning marked by sweating, tremor, atonic dyspnea, restless-ness, anxiety, precordial distress, mental confusion and hallucinations. See Delirium.

DE LISLE, Charles. See LECIONTE DE LISLE, C.M.R.

DELISLE, de-163, Guillaume, French geographer: b. Paris, 28 Feb. 1675; d. there, 25 Jan. 1726. He was instructed by Cassini, and soon conceived the idea of reforming the whole system of geography. He published, in his 25th year, a map of the world, maps of Europe, Asia and Africa, and a celestial and terrestrial globe of a foot in diameter. By rejecting Ptolemy's statements of longitude, or rather by comparing them with the astronomical observations and the statements of modern travelers, he founded the modern system of geography.
DELILLE, Joseph Nicolas. French astronomer: b. Paris, 4 April 1688; d. there, 11 Sept. 1768. He was a brother of Guillaume Delille. For his 'Mémoires pour servir à l'histoire et au progrès de l'astronomie' (1738); 'Mémoire sur les nouvelles découvertes au nord de la Mer du Sud' (1752).

DELLITZSCH, däl'lich, Franz, German Hebraist and theologian. b. Leipzig, 23 Feb. 1813; d. there, 15 March 1883. He was educated in the university of his native city, became professor of theology at Rostock in 1846, at Erlangen in 1850, and in 1867 at Leipzig. His earlier works dealt with post-biblical Jewish literature, and he afterward wrote commentaries on various books of the Old Testament. He was also the author of numerous theological and devotional works, among which were 'Biblicoprophetische Theologie' (1845); 'The House of God' (1848); 'Biblical Psychology' (1855); 'Jesus and Hillel' (1857); 'Christian Apologetics' (1869); 'Ein Tag in Kapernaum' (1871); 'Durch Krankheit zur Genesung' (1873). He was chiefly eminent as a commentator on the Old Testament, and his honesty as a theologian was shown in the concessions he was willing to make in the last edition of his commentaries on Genesis and Isaiah, 1887, to the latest critical views of the Pentateuch. He interested himself in the conversion of the Jews—he was of Hebrew descent—and for this purpose used his great knowledge of Hebrew and the Talmud and founded a training school in 1888, now called the Institutum Delitzschianum. His translation of the New Testament into Hebrew (1877) was widely circulated in Galatia and Russia. Consult Curtiss, 'F. Delitzsch' (London 1891).

DELLITZSCH, Friedrich, German Assyriologist: b. Erlangen, Bavaria, 5 Sept. 1850. He is a son of Franz Delitzsch (q.v.). He has published among other works 'Assyrian Studies' (1874); 'Where is Paradise?' (1881); 'Prolegomena to the Hebrew and Aramaic Vocabulary to the Old Testament' (1886); 'Assyrian Vocabulary' (1887) onwards; 'Assyrian Grammar' (1889); 'Assyrian Grammar. Second edition' (1894–96); 'Das Babyloniens Weltgeschepcsos' (1896); 'Babel und Bibel' (1902; Eng. trans. 1903); 'Asemampal und die assyrische Kultur seiner Zeit' (1909); 'Handel und Wandel in Altbabylonien' (1910); 'Kleine sumerische Sprachlehre' (1914); 'Sumerisches Glossar' (1914), and numerous articles in 'Mitteilungen der Deutschen Orient-Gesellschaft' (1899–1913), and a translation of George Smith's 'Chaldean Account of Genesis.' In 1877 he became extraordinary professor in Leipzig, ordinary professor at Breslau in 1893, and in 1899 professor of Assyriology in the University of Berlin. His lectures attained a wide popularity, and one of them, entitled 'Der babylonische Ursprung hebräischer Ideen,' delivered in 1901, was attended by Emperor William II who also gave a large sum toward the researches to be made in the territory of ancient Babylonia. In 1906 he lectured in the United States.

DELLITZSCH, Germany, town of Prussian Saxony, on the Löber, 15 miles north of Leipzig. The town is well built and portions of its ancient walls are still to be seen. It contains a castle, first erected in the 14th century and renovated late in the 17th, which is now converted into a penitentiary for female delinquents. The town's industries include brewing, consign-making, preparation of cereals, sugar refining, shoe-making and also woolens and hosiery. Christian Gottfried Ehrenberg, the naturalist, and Schulze-Delitzsch claim Delitzsch as their birthplace. Several important fairs are held each year. Pop. 13,031. Consul-telegram, 'Chromik der Stadt Delitzsch' (Delitzsch 1852).

DELIVERY, in law, the transfer of a deed from the grantor to the grantee or to some person acting in his behalf, in the manner as to deprive the grantor of his right to recall it at option. A delivery may be either absolute, i.e., to the grantee himself; or conditional, i.e., to a third person to hold till some specified conditions be performed on the part of the grantee. In certain cases such as in wills, bonds made by a parent in favor of his children, or deeds in which the grantee himself has an interest, or where there is a mutual obligation between the parties, delivery is not required.

In contracts, delivery refers to the transfer of the possession of a thing from one party to another. Often the actual transfer of goods does not take place. Delivery sometimes denotes transfer of property in shares, and sometimes transfer of the right of possession of the chattel. In the latter sense it may refer either to the formation of the contract or to the performance of it.

DELLA CRUCANS, krus'kanz, a coterie of English poetasters resident about 1785 in Florence (and so named from the 'Della Crusca of that city), who took to penning verses, which they published under the name of the 'Florence Miscellany.' Notwithstanding the inconceivable silliness and affectation of these productions they found numerous admirers. The newspapers of the day began to give publicity to their lucubrations. Genuine poetry seemed for a time at a discount, and nonsense and Della Crusca prevailed. The frenzy was, however, of short duration. The 'Baviad' (1794) and the 'Meviad' (1796) of William Gifford swept the butterfly Orlandoș, Carlos, Lauras, Marias and a thousand other nameless into merited oblivion.

DELLA MARIA, Dominique, French musician: b. Marseilles 1768; d. Paris, 9 March 1800. He was very precocious, but his fame rests upon the score he wrote for 'The Prisoner' by Duval.

DELLA ROBBIA, Luca. See ROBBIA, LUCABELLA.

DELLA ROBBIA WARE, brown terracotta bas-reliefs thickly enameled with tin-glaze; made at Florence (chiefly in 1450–1530; in France 1530–67); so called from the name
DELLENBAUGH — DE LONG

of the artist and its attributed inventor, Luca Della Robbia. The most important and largest work of this type, perhaps, is the trièze on the hospital at Pistoia made after the artist's death. At Tamworth, England, there is a plant, founded in 1847, that turns out this style of pottery, especially for architectural decorations, with great success.

DELLENBAUGH, Frederick Samuel, American artist and author: b. McConnelsville, Ohio, 13 Sept. 1853. He was educated in Buffalo, New York city, Munich and Paris. He was assistant topographer and artist of Major Powell's second expedition down the Colorado River in 1871-73, and accompanied the Harriman expedition to Alaska and Siberia in 1889, and made several personal expeditions to the Southwest. From 1909 to 1911 he was librarian of the American Geographical Society, and is a member of the American Ethnological Society.

He has written 'The North Americans of Yesterday' (1900); 'The Romance of the Colorado River' (1903); 'Breaking the Wilderness' (1905); 'A Canyon Voyage' (1908); 'Frémont and 49' (1913). He contributed to Sturgis' Dictionary of Architecture on American aboriginal buildings.

DELLYS, dél-lez', Algeria, a seaport in the department of Algiers, 49 miles east of the city of Algiers. The inhabitants are mostly French and Arabs. It contains the mosque of the Mohammedans and the mission school of the Christians. The trade is principally in grain, oil and salt. The city is now under French control. Pop. 3,987.

DEL MAR, Alexander, American political economist: b. New York, 9 Aug. 1836. He was educated at New York University and in Europe. He edited the Daily American Times in 1854; Hunt's Merchants' Magazine 1860; the Social Science Review in 1864; and the Financial Chronicle in 1865. In the latter year he organized and was director of the United States Bureau of Statistics, Navigation, Emigration and Commerce (now the Department of Commerce and Labor). He was appointed United States delegate to the International Congress at Turin 1866; The Hague 1868; St. Petersburg 1872. In 1876, he became mining commissioner of the United States Monetary Commission. He is president of the Latin-American Chamber of Commerce; member of the Société de Statistique de Paris, of the Société Astronomique de France, of the Ligue de l'Enseignement de Bruxelles, and numerous political-economic societies. He has written 'Gold Money and Paper Money' (1862); 'Resources, Productions and Social Conditions of Egypt, Spain, France, Germany, Russia, etc.'; 'History of the Precious Metals' (1879); 'History of Money in Ancient States' (1881); 'History of Money in Modern States' (3d ed. 1901); 'Fluctuations of Gold'; 'The Law of Payment'; 'Essay on Corporations'; 'Money and Civilization' (1885); 'The Science of Money' (1889); 'History of Monetary Crimes' (1899); 'History of Money in Modern States'; 'History of Money in Ancient States' (1893); 'History of Money in Greece, Rome, Great Britain, France, Germany, Russia, Spain, etc.'; 'The Middle Ages Revisited'; 'Barbara Villiers and the Mint Act'; 'The Aryans and the Conquest of India' (1911); 'History of the Precious Metals'; also numerous other works, including over 100 brochures on national and socialistic subjects.

DELMONTE Y TEJADA, däl-món'tā ê tē-hā-dā', Antonio, Dominican historian: b. Santiago de los Caballeros, Santo Domingo, 29 Sept. 1783; d. Havana, 19 Nov. 1861. He studied law at the University of Santo Domingo. His share in the campaign against Toussaint l'Ouverture, caused him to seek refuge at Havana, where he became an official of the government. He is the author of 'Historia de Santo Domingo' (1853), a history of the island from its discovery.

DE LOACH, Robert John Henderson, American botanist: b. Statesboro, Ga., 21 Dec. 1873. He was graduated at the University of Georgia in 1898. In 1900 he was superintendent of city schools at Swainsboro, Ga., 1900; taught in the United States Indian School at Fort Sill, Okla., 1900-02. In 1903-05 he was principal of the Statesboro High School and in 1906-08 botanist of the Georgia Experiment Station; professor of cotton culture, Georgia State College of Agriculture since 1908, and director of the Experiment Station since 1913. During the summer of 1911 he was collaborator in the Bureau of Plant Industry at Washington. He has written 'Rambles with John Burroughs' (1912); 'Agriculture in Common Schools,' and bulletins on plant breeding and diseases, and contributions to periodicals. He is editor of the agricultural depart-ent of the Atlanta Constitution.

DELOME, dél-lom'; Jean Louis, Swiss writer: b. Geneva in 1740; d. Switzerland, 16 July 1806. He at first practised as a lawyer in his native city, but the part which he took in its internal commotions obliged him to go to England, where he passed some years in great poverty. He became known by his once celebrated 'Constitution de l'Angleterre,' translated by the author himself into English in 1772. Delome also published in English his 'History of the Flagellants or Mem-morials of Human Superstition' (1783); an 'Essay on the Union with Scotland' (1796). He returned to Switzerland about 1779.

DE LOME, dé-lom'; Enriched Dupuy, Spanish diplomatist: b. Valencia, Spain, Aug. 1851; d. Paris, France, July 1904. He became first secretary of the Spanish legation in Washington in 1882, and minister to the United States in 1892 and 1895. In February 1898 it was discovered that he had written a letter to Señor Canalejas, a Spaniard of high rank who had been in United States a short time previous supposably to make observations for the Spanish government. The letter, which followed Canalejas to Havana, and was probably abducted from him by burglars, contained disparaging phrases regarding the President of the United States, and otherwise plainly showed that neither the writer nor the recipient of it believed that Spain was acting in good faith in the United States government. De Lome at first denied the genuineness of the letter, but it was proved beyond a doubt that he was the author, and he telegraphed his resignation to Madrid on 9 February.

DE LONG, George Washington, American naval officer and Arctic explorer: b. New
DELOO — DELOS

York, 22 Aug. 1844; d. Siberia, 30 Oct. 1881. He was graduated from the Naval Academy in 1865; he reached the grade of lieutenant-commander, and perished of cold and exposure while in command of the Jeannette Expedition in 1879–81. His body was finally recovered by George W. Melville and Lieutenant Daniel Hooper and brought to New York for burial. His journals have been published, entitled 'The Voyage of the Jeannette' (1883); and the story of the search for the survivors is told in Melville's 'In the Lena Delta' (1884).

DELOO, an African antelope, one of the duiker-bok (q.v.).

DELORME, dé-lúrm, Marion, French courtesan: b. Blois, 3 Oct. 1613; d. Paris, 2 July 1650. Her beauty and wit soon made her house the rendezvous of all that was gallant and brilliant in Paris. The king, the princes of Condé and Conti, Buckingham, Cinq-Mars, Saint Evremont, were among her admirers. The leading spirits of the Fronde regularly assembled in her house and she is said to have assisted them in their enterprises. Mazarin was about to have her arrested when she died suddenly. The legend arose in France that the death and funeral were a mere pretense, got up to permit her to make her escape. She is said to have crossed over to England and married a rich lord, who shortly afterward died. She then returned to France, married a chief of brigands, who was captivated by the charms of his victim. After his death she married a procurator of finance in Franche-Comté, with whom she spent 22 years of her life. Upon his death prosperity forsook her. Plundered by adventurers and her own servants, she died in extreme poverty in 1706, or according to another story in 1741, at the age of 129 years. Victor Hugo has taken her as the subject of one of his dramas; Alfred De Vigny makes her the leading character in his novel 'Cinq-Mars.' The story of her life and the legends concerning her were written by Peladou ('Paris 1882).

DE L’ORME, Phillibert, French architect: b. Lyons 1515; d. Paris, 8 Jan. 1570. He studied under Cardinal de Ste. Croix, and became the favorite architect of Henry II and Diane de Poitiers. On the death of Henry II he was in disfavor for some time. He began the Tuileries for Catharine de Medici. The Château d’Anet, at the commission of Diane de Poitiers was begun in 1532, and was one of his chief works; another is the tomb of Francis I, at Saint Denis. Numerous châteaux of France are attributed to him. He wrote a book which was long a high authority on architecture: 'Nouvelles inventions pour bien bastir et à petits frais' (Paris 1561). Critics ascribe a high place to De L’Orme, as one of the chief figures in the French renaissance of architecture. He was strongly nationalistic in his tendencies and strove to create a distinctive style. He succeeded in making new adaptations of the Greek forms and paved the way for further innovations. Consult Vachon, 'Philibert de l’Orme' (Paris 1887).

DELORE, Pierre Claude François, French genre painter: b. Paris, 28 July 1783; d. there, 8 Nov. 1859. He was a pupil and imitator of Girodet. Among his works are 'Death of Abel' (1810); 'Hero and Leander' (1814); 'Raising of Jarius’ Daughter' (1817), in church of Saint Roch, Paris; 'Christ Resurrecting' (1819), in Notre Dame, Paris; 'Cephalus Carried Off by Aurora' (1822), in the Luxembourg; 'Hector Reproaching Paris' (1824); 'Sappho Reciting an Ode to Phoan' (1833); 'Eve Plucking the Forbidden Fruit' (1847); 'Magdalen at the Sepulcher' (1835); 'Adam and Eve after the Fall' (1839); 'Holy Family in Egypt' (1850).

DELORT, dé-lorz, Charles Edouard, French painter: b. Nimes, 4 Feb. 1841; d. 10 March 1895. He was a pupil of Gleyre and of Gérôme. Among his works are: 'Daphnis and Chloe'; 'The Stolen Cattle' (1866), Museum of Nimes; 'Confidence'; 'Starting for the Chase' (1873); 'Marauders' (1874); 'Embarking of Manon Lescaut' (1875); 'After Breakfast' (1876); 'A Poacher'; 'Admonition' (1880); 'Capture of the Dutch Fleet by the Hussars of the French Republic' (1882); 'Return from the Review' (1884); and 'Return from Exile' (1889).

DELOS, dé-løs (ancient ASTERIA; CYNTHUS; ORTYGIA), the central and smallest island of the Cyclades, in the Aegean Sea, a rugged mass of granite about two square miles in extent. Near the centre of the island is a rocky hill, Mount Cynthias, 360 feet high. Delos, according to old legends, was raised from the sea-bottom by Poseidon. It was then a naked rock floating about in the ocean, and was accidentally driven by the waves into the centre of the Cyclades. The island is surrounded by Hera (Juno), with an oath, not to grant a resting place to the fugitive Latona where she might be delivered. The unhappy goddess wandered restlessly over the earth until she perceived the floating island. As this was not stationary, it was not comprehended in the oath of the earth, and offered her an asylum. Here Latona bore the infant gods Apollo (who was hence called Delios) and Artemis (who was called Delke). Both were worshipped on this island. Delos was therefore no longer the sport of the winds; it was moored to the bottom of the Aegean with adamantine chains by Zeus, and the fame of the isle spread over the world. Thus far mythological tradition.

At an early period the island was occupied by the Ionians, had kings of its own, who also held the sacerdotal office. In the course of time it came under the dominion of Athens. In 477 B.C. Delos became the common treasury of the league against Persia, but the money was afterward transferred to Athens. In 426 the Athenians purified Delos by removing all the tombs, and thenceforth they prohibited births and deaths from taking place on the island. In 422 they removed all the Delians from the island in order to complete its purification, but soon afterward these were allowed to return. After the destruction of Corinth the rich Corinthians fled thither and made Delos the seat of a flourishing commerce. Delos had a famous temple of Apollo, built of Parian marble, and containing, before its destruction, the beautiful statue of the god, a remarkable altar, from which the Delian problem (Doubling the Cube), as it is called, had its name. The inhabitants, having consulted the oracle concerning the remedy for a plague which raged in Delos, were ordered to double the altar of Apollo, which...

VOL. 8 — 40
was a cube. A solution of this problem of the duplication of the cube was attempted in different ways by several of the ancient mathematicians. The Grecians celebrated the Delian festival here every five years; and the Athenians performed annually the pilgrimage called the *theia*, with processions and dances.

Delos was celebrated in ancient times for the number and the excellence of its artists, and workers in silver and bronze. Cicero, in his *oration for Roscias*, has many eulogiums upon the fine vases of Delos and Corinth. Delos, called Dili or Sdili, is now without permanent inhabitants; a few shepherds from the neighboring islands of Mycenos and Rhenea pay it summer visits with their flocks. Some ruins of its former magnificence yet exist. Among these are remains of the temple of Apollo above referred to, of one to Latona, of an amphitheatre, etc., besides a curious primitive temple of Apollo, called the Cave of the Dragon, which is not a real cave.

In 1829 the work of exploration of the ruins began under Blouet; in 1837 Lébègue explored the site of Mount Cynthus. Since 1877 the work of excavation, still under French auspices, has proceeded largely under the direction of Théophile Holmölle. The procedure has been slow and economical, but the results excellent. Delos is the only ancient Greek city that remains approximately intact. It may almost be termed the Greek Pompeii in view of the scientific results which it has yielded. The complete plan of the sacred precinct of Apollo has been recovered; together with the theatre, the temple on Mount Cynthus, the temples of foreign gods, and an extensive part of the commercial section of Hellenistic and Roman days. Sculpture of all periods has been found in abundance, as well as inscriptions throwing light on various points of discussion. Not the least interesting of the finds has been a series of accounts, presenting what may be called a balance sheet, which throws light on mundane or financial side of the religious life of the time. Practically there is an approach to the precinct of Apollo through an avenue flanked by porticos. The temple of Apollo is the centre of the precinct. It is a Doric work, with 13 columns at either side, and six in front and rear; and having comparatively few sculptural decorations. It dates from the early 4th century B.C. The decorative groups on the two gables have been in part recovered, and are now in the National Museum, Athens. To the north of the precinct of Apollo are large remains of the commercial Delos. In the 2d and 1st centuries B.C., Delos was the chief commercial town of the eastern Mediterranean. The most extensive building in this region is a kind of exchange, with a very large court encircled by apartments. The shore, facing Rhenea, was lined with docks and warehouses. A well of six metres in depth was found filled with tablets of marble and bronze, having upon them 20 ancient inscriptions regarded as of great value. The sanctuaries contain exvotos, stele, and inscriptions on marble and bronze giving in full detail accounts of the high priests and catalogues of the offerings brought by pilgrims. Streets, gardens, and sewage canalization may be distinctly traced. Interesting private houses have also been discovered. Mention should also be made of the long and narrow hall, extending north and south and entered through a portico at its southern end, having at its northern end the famous "altar of horns," composed of the horns of the victims and accounted one of the seven wonders of the world. The entire building is often called "The Sanctuary of the Bulls," from the design of the capitals of the two columns separating the altar from the remainder of the hall. Consult Diehl, "Excursions in Greece" (Eng. trans. by Perkins, 1883); A. E. Haigh, "The Attic Theatre" (3d ed., Oxford 1907); Holmölle, "De Apollo Deliacus Simulacris" (Paris 1885); "Les archives de l’intendance sacrée de Delos" (Paris 1886); and "Exploration archéologique de Delos (parts 1-3, Paris 1910-11); Sir R. C. Jebb, "Journal of Hellenic Studies" (Vol. I, London 1881); Lébègue, "Recherches sur Delos" (Paris 1870) and Baedeker’s "Greece."

**DELPHI**, the seat of the most famous oracle of ancient Greece, was situated in Phocis, on the southern side of Parnassus. Apollo, according to Fabius, having killed the serpent Python, went into Mount Cynthus, and was here, perceived a merchant vessel from Crete sailing by. He immediately leaped into the sea in the form of an immense dolphin (Greek, *delphis*), took possession of the vessel, and forced it to pass by Pylos, and to enter the harbor of Cissa, not far from Delphi. After the Cretans had landed he assumed the figure of a beautiful youth, and told them that they must not return to their country, but should serve as priests in his temple. Inspired, and singing hymns, the Cretans followed the god to his sanctuary on the rocky declivity of Parnassus; but, discouraged by the sterility of the country, they implored Apollo to save them from famine and poverty. The god, smiling, declared to them the advantage which they would derive from serving as his priests. They then built Delphi, calling the city at first Pytho, from the serpent which Apollo had killed at this place. The oracles were delivered from a cave called Pythium. Tradition ascribes its discovery to the shepherd who first found it at the foot of Parnassus, and was filled with prophetic inspiration by the intoxicating vapor which arose from it. Over the cave, which was contained in a temple, was placed the holy tripod, upon which the priestess called Pythia by whose mouth Apollo was to speak, received the vapors ascending from beneath, and with them the inspiration of the Delphian god, and proclaimed the oracles (hence the proverb, to speak *ex tripode*, used of obscure sentences, dogmatically pronounced). After having first bathed herself, and particularly her hair, in the neighboring fountain of Castalia, and crowned her head with laurel, she seated herself on the tripod, which was also crowned with a wreath of the same, then, shaking the laurel tree and eating perhaps some leaves of it, she was seized with a fit of enthusiasm. Her face changed color, a shudder ran through her limbs, and cries and long protracted groans issued from her mouth. This excitement soon increased to fury. Her eyes sparkled, her mouth foamed, her hair stood on end, and almost suffocated by the ascending vapor, the priests were obliged to retain the struggling priestess on her seat by force; then she began, with dreadful howlings, to pour forth detached words, which the priest...
collected with care, arranged them, and delivered them in writing to the inquirer. At first the answers were given in verse, or were put in small tablets by a priest at the temple. The answers, who were poets, but in later times, the authority of the oracle being diminished, they contented themselves with delivering them in prose. This oracle was always obscure and equivocal; yet it served, in earlier times, in the hands of the priests, to regulate and uphold the political, civil and religious relations of Greece. It enjoyed the reputation of infallibility for a long time; for the Dorian, the first inhabitants of the place, who soon settled in all parts of Greece, spread an unbounded reverence for it. At first only one month in the year was assigned for the delivery of oracles; afterward, one day in each month; but none who asked the god for counsel dared approach him without gifts. Hence, the splendid temple possessed immense treasures, and the city was adorned with numerous statues and other works of art, the offerings of gratitude. Delphi was at the same time the bank in which the rich deposited their treasures, and the treasury of the temple of Apollo, though this did not prevent it from being repeatedly plundered by the Greeks and barbarians. Although the sanctuary and its treasures had been almost miraculously preserved from the Persians and Gauls, they were forced by Sulla to contribute to the payment of his soldiers, and Nero removed 500 brazen images from the sacred precincts. Constantine the Great enriched his new city by the sacred tripod, the statues of the Heliconian Muses, the Apollo, and the celebrated Pan dedicated by the Greek cities after the conclusion of the war with the Medes.

The ancients believed Delphi to be the centre of the earth; this, they said, was determined by Jupiter, who let loose, from the east and from the west, two eagles, which met here. The tomb of Neoptolemus (or Pyrrhus), son of Achilles, was at Delphi, and near it the famous Lesche, adorned by Polygnotus with the history of the Trojan War. In the plain between Delphi and Chirha the Pythian games were celebrated. These national games, and the protection of the Amphictyons, gave Delphi a lasting splendor. It is now a village called Castri, near which the Castalian spring may still be seen.

In 1892 the site of Delphi, until that time occupied by the village of Castri, was purchased by the French government, a new village was established farther westward, and the French School at Athens, under the direction of Théophile Brès, undertook important excavations. The entire precinct has been revealed, and, with the assistance of Pausanias' Johann Scheid, many structures have been identified, including the altar, temple, stadium, theatre, treasuries and other buildings. More than 3,000 inscriptions have been found; many of great value for Greek history. The sculpture discovered contributes much to the history of art in the late 6th and early 5th century B.C. The ancient wall (the Hellenico), extending east and west, has been traced, and the two boundary walls, climbing the hill at either end of the Hellenico, have been traced. The main entrance was in the eastern of these two walls, and from this the Sacred Way proceeds by a zigzag course to the temple. Just within the precinct wall, on the northern side of the Sacred Way, stood the large building dedicated as an offering by the Lacedaemonians after the battle at Ægospotamos (q.v.). To the west, on the southern side of the way, was the Sicylean treasury, in the form of a Doric temple, distyle in antae. Still further westward, on the same side of the way, is the Cnidian treasury, originally a small temple with a sub-structure of tufa. The sculpture from the pediment and frieze of this building, and the fragments of mouldings, are of very considerable interest. The structure has been described as perhaps the most nearly perfect extant example of the transitional style of the early 5th century B.C. Here the Sacred Way makes a decided turn; and further north, but still on the same side of the way, is the Athenian treasury—a Doric temple in antae, of small size, with a basis bearing the remains of a dedicatory inscription which announces that it was built with the spoils from the battle of Marathon (q.v.). It was on stones in this treasury that the hymns to Apollo with ancient musical notation were found. This building was the many-fluted "Column of the Naxians," which supported the colossal marble sphinx, now in the museum.

The site of the temple shows the remains of various successive buildings. Many remains have been recovered of that built by the Alcmeneid (6th century), which was destroyed by an earthquake. Some archaic sculptures discovered have been assigned to the gables of this structure. The foundations now extant are those of the temple built in the 4th century. No detail of information can be gained as to the oracle. The theatre, in the northwest corner of the precinct, dates from the early 2d century and is one of the best preserved in all Greece. The walls and seats of the auditorium remain; there are 33 tiers of seats arranged in seven sets, with a paved longitudinally intersecting passage, or diazoma. Consult the "Bulleten de correspondance hellénique" (Vols. XVII et seq.; Vols. XVI, XVII, Paris 1893 et seq.) and the "Comptes rendus des séances des inscriptions" (Paris 1893 et seq.); Mommsen, 'Delphica' (Leipzig 1878).

DELPHI, Ind., city of Carroll County, of which it is the county-seat, about 20 miles southwest of Logansport, and 60 miles north by west of Indianapolis; on the Wabash River and the Louisville, New Albany and Chicago, the Wabash and other railways. The waterpower is excellent. There are lime-works, the lime interests being extensive; besides paper mills, wagon and carriage manufactories, flour and planing-mills and a bent-wood factory. There are municipal waterworks and a public library. Pop. 2,161.

DELPHIC CLASSICS (Auctores Classici in seum Serenissimi Delphi), a collection of the works of the Latin classic authors, prepared by order of Louis XIV, at the suggestion of the Duke of Montausent for the use of the dauphin of France. The Duke of Montausent was the dauphin's governor, and in making a selection of authors, texts and translators, employed the services of Bossuet, "the Eagle of Meaux," and Huet, bishop of Avranches, both preceptors to the young prince. This collection of the Latin classics does not comprise all the
works of Latin writers that are extant, and it contains a few authors to whom the title doxian can be given only by a very generous interpretation of the word. A notable omission of a genuine classic is the 'Pharsalia' of Lucan, which seems to have been dropped, as having no possible connection with the heir of an absolute monarch. The series was completed in 64 volumes, 4to, including a Dictionary of Antiquities in one volume. The text is accompanied by copious explanatory notes (in Latin), and, in a few cases, by all possible and of difficult prose writers (Tacitus, for instance), by an interpretation in easier Latin. The same is done in the case of all difficult phrases occurring anywhere in the prose authors. The complete works of the several classics, as far as extant, are given as well as the spurious works commonly attributed to them. A valuable feature of this collection is the very complete verbal index to the works of each author. In the years 1819-30 Vatly, of London, republished the Delphine Classics, with an introduction and notes and interpretations, but usually with the texts as amended by later critical research. To the notes of the Delphine edition Vatly added very voluminous Nota Variorum. These last far exceed in bulk the text and notes of the original Delphine Classics, Consult Sandys, 'A History of Classical Scholarship' (Vol. II, Cambridge 1908).

DELPHINE, a romance by Madame de Staël, published in 1802. Its bold imagery, keenness of observation and power of impassioned description, perhaps justify 'Delphine's' position among the masterpieces of French literature. But neither situations nor characters are true to nature. The romance had a special interest for Madame de Staël's contemporaries, for several of the men and women of the time appeared in it under the thinnest of disguises. As in the case of 'Corinne,' the liberal ideas scattered through the story drew down on the author the anger of Napoleon, who ordered her to leave France.

DELPHINIA, a festival celebrated in honor of Apollo (Delphinius being one of his names) at Athens, on the 7th of the month Munychion (April). On this occasion a procession of girls bearing garlands marched to the temple of the god to seek his favor more especially, perhaps, in the interests of seamen.

DELPHINIDAE, the dolphin family of cetaceans. See Delphin; Narwhal; Porpoise.

DELPHINIUM, a genus of beautiful annual and perennial plants of the crowfoot family (Ranunculaceae), with large irregular flowers, consisting of 60 species, natives for the most part of the north temperate zone; some few species are found in the mountains of Mexico. The name is a reference to the supposed resemblance of the flower to a dolphin. The genus is represented in America by about 25 species, which are known as larkspur, with blue or purple flowers, rarely red or white. The type of central Pennsylvania is found in waste places in southern New Jersey, Pennsylvania and farther southward, naturalized from Europe. The cultivated plants have shorter spurs and longer and denser racemes of flowers. The tall larkspur (Delphinium) is found in the woods of central Pennsylvania, west to Minnesota, south to Nebraska, northern Alabama and North Carolina. Other species extend the range of the genus westward across the continent. From the European D. staphisagria, stavesacre, is extracted an alkaloid known as delphinine. The field larkspur is a simple astringent.

DELPHINUS, del'fin's (the dolphin), one of Ptolemy's original 48 constellations, situated between Vulpecula, Pegasus, Equeulus, Aquarius and Aquila. It has been increased in size than the third magnitude. The names Sulacolun and Rotanev assigned to its stars Alpha and Beta, are merely reversals of the name Nicolaus Venator, an astronomer's assistant, who wished to commemorate himself.

DELPHOS, Ohio, city in Allen and Van Wert counties, situated on the Miami and Erie Canal, and on the Pennsylvania and other railroads; about 70 miles southwest of Toledo. The principal industry of the city is the Fort Wayne railroad repair shops. It has marble and granite works, paper and flour mills, brewery and manufactory of galvanizing iron products, oil cans, printing presses, furniture, pipe, etc. Settled in 1834, Delphos was incorporated in 1851 as a village and became a city in 1913. Its government is administered by a mayor, elected biennially, and a municipal council. It owns the water plant and has a Carnegie library.

DEL RIO, Tex., county-seat of Val Verde County; about five miles from the Rio Grande River; 170 miles west of San Antonio, on the Southern Pacific Railroad. Notable features of the city are the San Felipe Springs, a hospital, two convents and the Federal building. Its industries are those of an agricultural and stock-raising region, and it has several small cotton and wool manufacturing plants. Pecans, wool, hides, livestock, fruit and vegetables constitute important exports. Del Rio has adopted the commission form of government. Pop. 9,000.

DELSARTE, dél'sart, François Alexandre Nicolas Chérie, French educator: b. Solesmes, 19 Dec. 1811; d. Paris, 19 July 1871. He attained distinction as a tenor singer in the Opéra Comique, suddenly lost his voice, and thereafter applied himself to musical and dramatic instruction, having among his pupils many who afterward achieved operatic and dramatic celebrity. He was author of many books on music and romances, and his chief work was the elaboration of a system of dramatic expression, by which the voice and entire action of the body were trained by fixed rules. He aimed to make elocution a science. His system in part has of late been gaining many adherents among elocutionists.

DELSARTE METHOD, a system of physical training for voice and gesture, invented by François Delsarte (q.v.). It is not a method of gymnastics, but a system of exercises to gain poise and breath control.

DELTA, the name of the fourth letter of the Greek alphabet, the capital form of which is an equilateral triangle, the sides of which are in the ratio of 1 to a tract of land triangular in shape, generally formed by the deposit of river sediment, especially at the mouths of rivers which flow into lakes or seas. A mountain stream changing the force and rapidity of its current upon entering a level plateau deposits at the base of the mountain sediment which assumes the triangular form
DELUGE (through the French, from Lat. diluvium, 'a flood'). There is scarcely any considerable race of men among whom there does not exist, in some form, the tradition of a great deluge, which destroyed all the human race except their own progenitors. The classical story of Deucalion and Pyrrha is but a typical example of similar myths found everywhere, and savages and fathers of the Church alike have argued that the shells, corals, and other marine objects often found on the tops of mountains offered distinct proof of the historical reality of a deluge. That the Noachian deluge recorded in Scripture covered the whole earth and destroyed all mankind save one family, was the universal opinion until toward the close of the 18th century. The organic remains, on which the science of palæontology is now founded, were regarded as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geology, it soon became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits; but many of these were, after a few years, found to belong to a period vastly anterior to any historical epoch, and to have been produced by long-continued and persistent agencies, differing totally from a temporary cataclysm. The story of the flood of Noah, recorded in Genesis vi–ix, is composite, being made up of two independent narratives, the Yahwe and the Elohim. The more common modern opinion regards the flood of Noah as partial and local, although the parallelism seems fairly enough to be implied in the biblical description, and although the old theory has been revived by writers of some authority, other noted men have argued and maintained the partial character of the flood from the absence of all record of a deluge among the black races of the world, as the negroes and Papuans, asserting that this opinion is quite consistent with the exegesis of Scripture, with tradition, and the doctrine of the Church, while it is the only theory that avoids all the ethnological and linguistic difficulties presented by the existence of the great negro and yellow races marked off so distinctly from the Noachian type.

The deluge traditions of many primitive races are connected with religious mysteries, and it is scarcely true, as has often been asserted, that it is the Old Testament alone that gives a moral reason for the deluge sent upon the world. The Chaldean account discovered by George Smith presents a striking resemblance to the Genesis story, and agrees with it also in making the flood distinctly a divine retribution for human sin, although it of course differs from the Jewish account in being polytheistic instead of monothestic. The vessel in which Xisuthros,
the Chaldean Noah, sails, is a ship guided by a steersman, and others beside his own family are admitted into it. The flood is seven days at its height, and that is the time when a dove, a swallow and a raven. The ship finally rests on Rowandiz, the highest mountain of eastern Kurdistan, and the peak which supports the heavens, instead of upon Ararat, the north ern or Armenian continuation of the range. Babylonian tradition also confounds Noah with Enoch, for Xisuthros is taken to the skies immediately after coming out of the ark. Two deluge poems were amalgamated together in an Akkadian epic, in 12 books, describing the adventures of Girdhubar.

DELUDE TABLET, or DELUGE TABLETS, the name given to the tablet or tablets (the 11th of the Izdubar Legends) inscribed with cuneiform writing, which being translated is found to contain the Chaldean account of the deluge. Perhaps it may have been originally Acadian. A paper on the subject was read by George Smith, of the British Museum, before the Society of Biblical Archaeology, on 3 Dec. 1872, and a revised translation published in 1874. What Mr. Smith called the Flood-hero was Adra-basis. In Babylonic proper names compounded of two elements, either might at pleasure be placed first. Reversing the relative positions of the two elements, the name becomes Hasis-adra, which being imperfectly heard by the Greeks was by them written Xithurus or Xisuthros.

DELUINATION (native name), the linsang or weasel-cat (Prionodon gracile), a small quadruped inhabiting the vast forests of the eastern extremities of Java and Malacca. It is of pale yellowish-white color, with elegantly marked stripes and bands of a deep brown. It is allied to the civets, but is destitute of a scentpouch.

DELUSIONS. A delusion is a mental state in which the mind, reasoning from definite facts, arrives at erroneous, undeniable, and perhaps foolish conclusions, and is unable to modify these conclusions, whatever proof may be brought to show their falsity. Thus a patient suffering from delusions may read into the actions of others ideas and conclusions relating to himself that have no basis in actual logic. Seeing several people on a corner, a man with persecutory delusions may infer that they are gathering to do him harm, or planning to deprive him of his liberty, etc. See INSANITY.

DELYANIS, Δῆλ-λίνης, Theodoros, Greek statesman: b. Peloponnesus, 1826; d. Athens, 13 June 1905. He entered politics early in life and in his long career held many Cabinet positions. He was Minister of Foreign Affairs in the provisional government of 1862–63, Minister to France (1867); served again in the Cabinets from 1868–78; represented Greece at the Berlin Congress 1878; Prime Minister also from 1885–86 and 1890–92. While Prime Minister for the third time, 1895–97, he brought about the Greco-Turkish war, whose disastrous result obliged him to resign with his whole Cabinet. He was Premier again from 1902–05. He was also for a professional gambler for the stringent measures taken by him against gambling houses.

DEMADES, δήμ-άς, Athenian orator: d. 316 B.C. Originally a fishmonger, he rose to high places in the republic. He was captured by Philip of Macedon in the battle of Cheronaea, but soon set at liberty. He afterward exerted his influence in favor of the Macedonian party at Athens, but betraying Antipater, was put to death by Cassander, the son of the latter. Of his speeches, none have come down to us. A collection of sayings under the title ‘Demades’ have been attributed to him by Conzett Blasi, ‘Attische Beredsamkeit’ (Vol. III, Leipzig 1887–93).

DEMAGOGUE (from Gr. demos, the people, and agogos, leader, from agein, to lead), one who leads or directs the people in political matters. In its original acceptance it was considered an honorable designation, and in this sense Pericles, Demosthenes and Cicero were demagogues. On the other hand, the tanner, Cleon, satirized by Aristophanes in his play of the ‘Knights,’ is a portrait of the personage to whom the epithet in its bad sense is applied. It is a handy nickname to throw at a popular politician with whose views you have no sympathy. Usually it means an orator or political agitator who curries popularity and power with the masses by pandering to their ignorance or prejudice.

DEMAND, a technical term in law, of comprehensive meaning. When referred to contracts it means a claim, a legal obligation. Its correlative is release, and a release of all demands is a release of all covenants real and personal, whether the conditions are broken or not, of all annuities, recognizances, obligations and contracts. Demand, in the practice of law, is a requisition made by one individual to another to do a particular thing, namely, pay some debt, fulfil some contract, release some person or property. Demands are either express or implied. Sometimes an express demand is required before action can be taken, in other cases the law requires no more than the demand implied by bringing an action. Whether an express demand is required before a plaintiff can commence action to enforce fulfilment of a contract depends upon the express or implied stipulations of the parties to the contract. When no date is given in the contract for its fulfilment, whether in the case of a promissory note, or in the contracting of a debt, the payment of the obligation is due on the present day, or immediately on demand. It is requisite, in some cases arising ex delicto, that is, in some criminal cases, to make a demand for the restoration of the right before the commencement of an action, or, for instance, when the wife or other member of the plaintiff’s household has been enticed away, in order
to constitute the party a wilful wrongdoer, a demand for restoration must be made. When property unjustly obtained, unlawfully detained, or converted, a demand for the delivery of its possession to the owner is requisite before an action can be laid. When an order to pay, or to do something has been made, a rule of that order, or payment of the money, or performance of the thing must be made before an attachment will be made for contempt. In like manner, before action can be taken for breach of promise of marriage, a demand for marriage must be made by the plaintiff, unless the defendant has married another person, or has refused to marry at any time. See CONTRACT; RECOGNITION; RELEASE.

DEMAND AND SUPPLY, in political economy, the desire for services or utilities on the one hand, and the production or offer of them on the other, which tend to complete an act of exchange. Demand is therefore the amount of a commodity that will be taken at a given price; supply the amount that will be offered at a given price. Demand is commonly said to be relative to supply, but in reality it is relative to the wants and in the opinion of certain political economists qualify the term demand by the word effectual, but it is scarcely necessary to make such a limitation. A mere desire for objects has no commercial significance, but that desire simply which contemplates a mutual benefit. Thus the wish of a beggar to possess a diamond cannot affect the price of the article, as he can offer no desirable object in return. The intensity of demand, and the consequent effect upon values, will be proportionate to the necessity which exists for satisfying the demand. Different rules, therefore, will apply to the increase of price consequent upon increased demand and reduced supply in articles of voluntary use, and to the same rise in price when affecting articles of necessary use. The demand for the latter class of utilities is constant, and a deficiency in supply cannot be met by abstinence, except to a scarcely appreciable degree, whereas any considerable deficiency in the supply of articles of voluntary use is to some extent met by economy. Power of purchase, therefore, increase in different ratios according to the degree in which the commodities demanded are necessary or convenient. Thus the price of grain may rise, in the case of a bad harvest, from 50 to 100 per cent; cotton or wool, in similar circumstances, would certainly fluctuate, but not to anything like the same extent; wine would vary in price least of all; the deficiency in the last two commodities being artificially restored by the decrease of demand consequent on economy and other contingencies. In recent economic theory the law of demand and supply is accepted as a preliminary step, but chief interest is held to centre in the forces underlying demand and supply, such as cost of production, etc. See POLITICAL ECONOMY.

DEMARATUS, Spartan king. He succeeded his presumed father, Ariston, about 516 B.C. His rule is noted for his interminable quarrels with his colleagues Cleomenes, and partly on account of doubts which had been cast upon his real parentage. He retired into private life; but having afterward become a magistrate, was sitting in that capacity at the Gymnopedian games when Leotychides, who had supplanted him as king, sent tauntingly to ask him how he felt in a secondary place after having occupied the first. The boldness of his reply forced him to take flight, and he passed over into Asia, where he was well received by Darius. He afterward accompanied Xerxes as councillor on his expedition to the west, and assisted in the undertaking.

DEMARCAITON, Line of, the boundary established 4 May 1493 by Pope Alexander VI, who assigned to Spain all the lands she had discovered or might discover west of a line running from the North pole to the South, distant 100 leagues west of any of the Azores and Cape Verde Islands (provided such lands had not been in the actual possession of any other Christian king or prince up to the preceding Christmas), and to Portugal, on the same conditions, all the territory she had discovered or might discover east of the said line. The governments of the peninsula held that the Pope had sole and absolute authority to dispose of all countries inhabited by heathen peoples; moreover the papal bull inter caetera of 4 May 1493, forbade all persons without special permit to go "for the purpose of any other reason" to the islands and mainlands thus granted exclusively to Spain and Portugal. After this territorial concession had been made, Portugal's possessions in the eastern hemisphere were called the East Indies, and those of Spain in the western hemisphere were called the West Indies. An extension of the papal gift of the Indies was made in the bull dated 25 Sept. 1493. A dispute arising in regard to the position of the line of demarcation, the 6 countries concerned sent commissioners to the Spanish city of Tordesillas, and on 7 June 1494 the commissioners agreed that the line should pass north and south, 370 leagues west of the Cape Verde Islands. On the strength of this agreement, Portugal claimed and secured the eastern part of South America (see BRAZIL). After the Victoria returned to Seville (1522) from her voyage to the Moluccas, and so round the world, the Portuguese accused their rivals of having broken the terms of the agreement. The Spaniards in reply said that the Spice Islands (Moluccas) were not within the limits of the Portuguese territory. To settle this important dispute, a congress was convened at Badajoz in 1524. Commissioners of both countries were in attendance—Fernando Columbus, Sebastian Cabot and others. The two main points to be decided were: (1) Whether the line of demarcation should be drawn at the stated distance west of the western or eastern limit of the Cape Verde Islands; and (2) where it would pass on the opposite side of the earth. This Badajoz junta failed to come to an agreement "owing to the Portuguese experts, who could not overcome this dilemma; if the line was pushed more to the west, Portugal would gain a greater part of Brazil; but she might lose all rights over the Moluccas, as the line, of course, had to be carried to the other hemisphere as well." The treaty of Vitoria, signed 19 Feb. 1524, provided that, inasmuch as some doubt existed regarding the possession of Castile and the king of Portugal as to the possession and ownership of the Moluccas, there should be appointed by each one of the parties to the treaty "three astrologers and three pilots, and sailors, for the determination
of the demarcation. A treaty negotiated at Saragossa and signed by representatives of the Spanish and Portuguese monarchs 22 April 1529 fixed the line of demarcation 27°34' leagues east of the Moluccas, Spain selling for a stated sum whatever rights she had formerly claimed to in the Spice Islands, and agreeing for the future practically not to colonize, and expressly not to "trade there in any manner whatsoever." It did not seem necessary at that time to raise the question as to the location of the line in the New World, though it is plain that the claim of Spain to the gold and silver of the New World in the east had been logically completed, Portugal would have been excluded from the South American continent. The bearing of this matter upon Spanish rights in the Philippines is of special interest. The Molucca Islands, the Philippines, and, indeed, the western half of Australia lay within the Portuguese assignment, as a matter of fact. Therefore the principal Spanish settlements and explorations in the Far East appear to have been made in compliance with Portugal's treaty rights. The dispute over the southwestern boundary of Brazil in the 18th century resulted in the abrogation of the line of demarcation and all agreements based thereon by a treaty of 1750. This treaty was also abrogated in 1761 and all disputes were at length settled by a new treaty in 1779. The other nations of Europe paid little regard to the papal bull. Consult Blair and Robertson, "The Philippine Islands," (Vol. I); Harrisse, "The Diplomatic History of America" (New York 1898); Dawson, "The Line of Demarcation of Pope Alexander, etc., with an inquiry concerning the Metrology of Ancient and Mediaeval Times," (in Proceedings of Royal Society of Canada, 1899); Bourne, "Essays in Historical Criticism" (New York 1901).

MARRION WILCOX.

DEMAREST, William Henry Steele, American educator; b. Hudson, N. Y., 12 May 1863. He was graduated at Rutgers College in 1883 and from the New Brunswick Theological Seminary in 1888. He was ordained minister of the Reformed Church in America. He held pastorates at Walden, N. Y., 1888-97, and at Catskill, N. Y., 1897-1901; in the latter year he was appointed professor of church history of New Brunswick Theological Seminary. In 1900 he was made president of Rutgers College.

DEMAS, a fellow-laborer with Paul and mentioned in the New Testament three times. (Col. iv. 14; Philemon xxiv; 2 Tim. iv. 10). In the last passage he is described as having deserted the Apostle in his hour of need, when Paul was waiting for his trial before Nero, because "he loved this world." He went to Thessalonica which may have been his home town, it is thought. He probably never returned to his faith, for by tradition he is classified among the apostates to the faith. John Bunyan uses his name and character as a warning in his "Pilgrim's Progress." The word Demas-like, is a word applied to a traitor who is tempted by his greed to desert his good cause.

DEMAVEND, dém-a-vénd', a volcanic mountain, now extinct, of Persia, and the highest peak of the Elbruz chain, 45 miles south of the Caspian Sea, and about 40 miles northeast of Teheran. Its height, according to the most reliable measurement, is 18,464 feet. At a distance the mountain has the form of a smooth cone, and appears to slope evenly from top to bottom at an angle of 45 degrees. The cone terminates in a crater of 85 yards in diameter, and is nearly surrounded by jagged rocks, composed partly of basalt and partly of limestone and sulphur. This sulphur is an article of commerce. The basin within is almost entirely filled with snow. Around the base are many hot springs. William T. Thompson was the first European to visit it (1857).

DEMEA, dém'-bë-a or dém-bë'-a, a lake of Abyssinia, in the western part of the country. It is about 50 miles long and 6,000 feet above the level of the sea. It contains many islands, one of which is a place of confinement for state prisoners. The Bahrel-Azrek, the Abyssinian Nile, flows through it.

DEMBINSKI, dém-bë'-nsk', Henryk, Polish general; b. Strzalkow, near Cracow, 3 May 1791; d. Paris, 13 June 1864. Entering the Polish army in 1809, he aided in the French invasion of Russia three years later and was made captain by Napoleon. In the year 1825 he became a member of the Polish Diet, where he cast in his lot with the opposition party. On the outbreak of the revolution in that country (1830), he was made brigadier-general, and in the following year was nominated governor of Warsaw and commander-in-chief of the Polish army. On the fall of Warsaw in September into the hands of the Russians, Dembinski made his escape to France. From 1833-35 he was in the service of Mehmet Ali of Egypt. The Hungarian Revolution of 1849 once more offered him a field for his activity, and he was appointed by Kossuth commander of the insurgent troops. He had the misfortune to lose the battle of Kápolna, and resigned his command, but consented to act under Görgei. After the capitulation signed by the latter at Villagoss, and the resignation of Kossuth, Dembinski fled to Turkey. He returned to France in 1859 and began his "Mémoires" of the Hungarian War. Consult Danzer, "Dembinski in Hungary" (Vienna 1873).

DEME, dém, a subdivision of ancient Attica and of modern Greece. The démos were townships or hundreds, subdivisions of the phulai, and were equivalent to the Dorian komai, Latin papi. The word really meant a country district, or a common name for divisions of the country, and in the time of Herodotus they were 100 in number in Attica (10 in each phulê), afterward 170; their origin was commonly referred to Theseus. The government of the deme was by a presiding officer, treasurer, controller, and assembly which carried on the public business of the deme. Membership was hereditary, regardless of the location of the actual residence of the member. The word démos early came to be applied to the common people, and survives significantly in our democracy and démagogue. Consult Leake, "Dèmes of Attica" (London 1820).

DEMENTIA PRECOX, a term used in psychiatry to designate a disorder group characterized by certain types of mental deterioration or disintegration. This term originated with Kraepelin, professor of psychiatry at Munich. Clouston of Scotland termed the dis-
order the "insanity of adolescence," and Bleuler of Zürich has used the term "schizophrenia." Thus from the terms alone a brief description can be formulated—a mental disorder, chiefly occurring in adolescence or young life, characterized by a splitting of the psyche "schizophrenia," and usually leading to a precocious dementia, or mental breakdown. This mental disorder is the most frequent of all the psychoses, constituting fully 30 per cent of the admissions to hospitals for mental diseases. In some individuals it runs a comparatively mild course—recovers, or becomes chronic, this last individual being called "eccentric," "bizarre" or "very peculiar." On the other hand it may run an exceeding violent and furious course—the patient being wildly maniacal, with active delirium accompanied by hallucinations. These patients may die in a delirium from exhaustion or they recover—or the process quieting down leads to a more chronic mild deteriorating process, marked by episodes or outbursts of unruly or disorderly conduct. These types of chronic diseases make up the vast majority of the mentally ill in the State hospitals for the insane of the country. The chief feature that characterizes dementia precox is the tendency for the patient to make use of "wistful thinking"—that is, it draws his interest from the external world [introverts] and constructs a phantasy world into which he tends to withdraw more and more. At first this type of thinking detaches him only partially from the world of reality. He is able to come out of his "day dreaming" as it were—but as the introversion of his phantasy life becomes more and more pronounced the splitting between his phantasy world and the real world becomes too great to be bridged. When this occurs the individual is "sick." The early stages of this process are marked by a lack of interest taken by the potential schizophrenic in his surroundings. He is apt to lie in bed all the morning or all day, uninterested or only mildly interested in the newspapers or books. He does not move about or does so in a listless halfhealed manner. There is a failure of voluntary attention and a lack of sociability. There may be some keenness of interest but it is largely on the inner sense. The patient's senses he seems heedless of what is going on about them. He may lose themselves in their abstractions, may wander about aimlessly. In this stage many take up a tramp or hobo existence and are able to get along in this haphazard, indifferent, lazy sort of manner, without many obligations except living from hand to mouth. In others there is a greater disintegration—the lack of unity of the personality comes to show in the development of certain trends which have been called the [a] hebephrenic, [b] cataleptic and [c] paranoid types of the disease process. [a] The hebephrenic types show a gradual dilapidation of interests. They make up the simpler types of the disease. They show a number of additional somatic or bodily signs. Headaches are frequent, irritability and failure of concentration, with gastro-intestinal disturbances, are prominent. They sleep badly and in this phase are often diagnosed by the unskilled physician as subjects of "nervousness," or "neurasthenia" or "neurasthenia" or "neurasthenia." So they are treated for "nervousness," or "neurasthenia" or "neurasthenia." In the phase they are treated for "nervousness," or "neurasthenia" or "neurasthenia." Or the process of slow deterioration, the hebephrenic type. [b] In the cataleptic types the symptoms just described are also found—but in addition there is an increase in amount of motor activity. The muscles are
more tense. They hold themselves stiffly. They stick out their chests, or hike a shoulder, or constantly show unique or queer mannerisms. Some will stand in one position for hours, days or even weeks. Some patients are known to lie rigid in bed for years, not moving—stomach tube fed, mute and absolutely resistant and with eyes closed, oblivious to everything. Heat or cold, hot irons or ice, no amount of torture can make them move. In the days of the medieval tests for witches or devils some of these patients stood most surprising tortures without flinching. They will say the same thing over and over again—"Locks and keys—keys and locks—locks and keys—keys and locks" one patient will repeat six to seven hours without cessation. Some walk backward and forward a certain invariable number of steps—"Stereotypy." Again the catatonic type of patient will become violently excited, rush aimlessly here and there, into things, through windows, pound on doors, or attempt to strangle people with his or her sticks with enormous violence. This fury may be frightful, occasion a high temperature and a host of physical symptoms, or the patient will go into a stupor and lie comatose for weeks or months—absolutely negativistic to every call of nature, refuse to undress, to bathe, to do anything. Saliva may accumulate in the mouth and even decompose without their regard. In a few cases, after it may be months of stupor, these catatonics will suddenly get up, appear perfectly normal and, surprising as it may appear, may know everything that happened about them for months, during which time they lay apparently oblivious to their surroundings. More often, however, they pass into a chronic stage of dementia or die from an acute meningeal suffusion—"Catatonic brain death." [c] The paranoid forms seem to come off the best in their conflicts. They split the least as it were. They construct a fairly logical system of defense. They find an external cause for their inner wishes and by this mechanism are able to get along fairly well in the social world. Only when they commence to react violently to these external sources of irritation are they made the subjects of detention, of incarceration and sometimes of electroshock. A large number of the cases are of mild types and are to be expected. Many inventors, reformers, religious zealots, quacks, litigious and vindictive individuals approach this group or slide into it in varying degrees. Most frequently the delusional attitudes are sexually colored. The most common is that certain men or women are following or conspiring against them to ruin them, or degrade them. Various secret societies are banded against them. Cliques and political parties are hampering their activities. Certain of these patients are constantly seeking vindication for certain fancied wrongs. Their reputations are being assailed and they must protect them. Others must right all the wrongs of others, especially political wrongs and hence become assassins or regicides, etc. Others are religious fanatics and would make what is symbolic, real. To take the blood of the "Savior," in a symbolic sense, is not sufficient. They must have actual blood and hence kill to satisfy their pathological sadistic wishes. Certain of these patients are constantly seeking the paranoid type of dementia precoex. These are often remarkable for their apparent lucidity of thought and clear logical capacities. In the paranoid type the fragmentation of the personality is the least marked and hence there is a greater coherency of the personality. Thus many of this type of mentally disordered individuals are rarely recognized by the layman to be sick. They are often thought of as difficult people to get along with, especially in the family circle, but to the average outsider they are rarely considered sick. They may even occupy important positions in the community and yet be very seriously and seriously sick. Under the term "monomania" a number of this type were classed by former students of mental disorders.

Nature of Dementia Precox.—From this abbreviated description it may be pointed out that it presents correlations on the one hand to the more distinctly so-called psychogenic types of disorders, such as the psychoneuroses, and on the other hand to many of the more distinctly somatic diseases, (various chronic disorders). It is possible to formulate the mental symptoms in a way that they are very severe then the term neuroses. The mental symptoms are capable of interpretation at a psychological level. On the other hand, it can be seen that recent investigations are tending to show more and more that there are distinct somatic disturbances during life and pathological changes found after death. In any case the acute cases that lead to death must be conceived as having profound bodily changes correlated with psychical symptoms. The formulation of the disease process from either standpoint alone must of necessity be unsatisfactory. For example, the toxic theory of the etiology fails to give a comprehensive idea of why the mental manifestations take the particular form they do, why for example, an hallucinatory voice which a patient heard should be that of a young woman whom the patient had seduced, "telling him to lead a decent life." This is the patient's self-critique appearing in hallucinatory form. It would seem, that when the type of splitting of the personality is euthymic applied to the dementia precoex or schizophrenia applies. It is possible that the somatic processes, whatever they may be, in this deeper regression to the infantile and the archaic in the individual can be identified and there are multiple factors that may be limited and thus permit the older phylogenetic thought symbols to appear in conduct. At any rate, it seems quite evident that the greater difficulty of conception here is due in part to the quite arbitrary separation of the individual into two distinctly and mutually exclusive parts, namely mind and body. The dualistic hypothesis that conceives of the mental and the physical going side by side without mutual interference or interaction is responsible for such a conception. From the cases at hand standpoint such a concept seems entirely unnecessary, for one is met at every turn with the intimate relations constantly maintained between the body and the mind, and therefore comes naturally to consider the human being as a biological unit presenting types of reactions that at one extreme are predominantly psychic, while at the other they are predominantly physical, but which present every grade of intermediary type. The severe mental disturbance of the nature of anxiety that may be in this particular type of dementia precoex is well known, as are also the physical upset, particularly the gastro-in-
testinal, that are associated with certain mental conditions such as worry. The interrelations between the mental and the physical are a matter of daily observation. Occasionally, however, they are very pronouncedly emphasized. The following case, cited by Jelliffe and Wratny, is an instance: A chronic patient who had been for many years in a hospital, working daily at outdoor labor, was suddenly seized with a violent impulse in which he attacked all about him. He seized a heavy iron bar, killed two people and injured another, and ran headlong and wildly without direction into the woods. He was finally cornered, and in the process of securing him he was shot by a farmer with a load of buckshot, none of which, however, penetrated farther than through the skin and produced no serious wounds. He was brought back to the hospital, incoherent, mumbling and trembling, showing all the evidences of a tremendous emotional upset. The shot were picked out of his skin, the dressings were a few inches and the bed. Up to that time he had been a strong, physically healthy negro. He never left his bed again, and approximately a year afterward he died, having developed an acute tuberculosis. Such cases demonstrate the necessity of considering the human being as a unit and not endeavoring to draw hard-and-fast lines of distinction between the mind on the one hand and the body on the other. 9 In the present state of knowledge, however, one is often unable to make any specific correlation between the physical findings and the mental symptoms, while on the other hand it is quite possible to express the symptomatology of the disease, to describe it, to, so to speak, reconstruc the psychoses purely in psychological terms. For the present, therefore, the disease must be described psychologically, and the explanation of the mental symptoms must be sought psychogenetically, without, however, forgetting that there are certain somatic changes which are pretty generally attached to the symptomatology of the disease process and which must ultimately be made to fit into the general rubric before a complete understanding of the entire situation is had. On the psychologic side the disease may be a certain type of reaction to a mental conflict, resulting in a splitting of the psyche and the outcrop of unconscious mental trends to the surface of the mental life. The patient is confronted with a situation to which he cannot quite adjust himself which is absolutely unacceptable and impossible, and he is therefore driven away by his incapacity to assimilate it and cast back upon himself. The battle of the opposing forces produces the disease picture which is the outward evidence of the effort on the part of the individual to reach a solution of the difficulty. The symptoms are the result of the appearance of the unconscious trends distorted and disguised as they are in dream formations. Jung has especially noted this similarity to the dream state and would consider dementia precox as a sort of waking dream or dream from which the patient does not awake, the dream picture being fixed as it were.

The psychological side of the situation, however, as may be seen is not all. There are certain physical changes in the course of the disease and certain pathological findings. So far as the observation goes, however, the etiological factors lie almost, if not quite entirely, in the mental sphere, and one must therefore conceive of the physical changes as superadded. This is a possibility which was well illustrated by the case already quoted of the man who died after a tremendous emotional explosion, during which he killed two people. When the psychic splitting is profound and when it is of considerable duration, it is quite understandable that it should undermine the barriers to a physical mechanism and thus produce the physical changes found. From the descriptions of the mechanisms in the psychoneuroses, taken in connection with what is known of the vegetative nervous system, it may be seen that constantly operative psychic disturbances are capable of producing the physical changes.

Ways of Getting Well.—With the concept of the disease process which has been previously elaborated, what is the significance of the three main types of gastric pain? Primarily, physiologi-cal? Bertschinger has recently made an admirable study of the process of recovery in dementia precox and his discussion of the nature of the conflict and the ways of adjusting is particularly illuminating. The three clinical types of the disease unit and the interplay of the two factors, the conflict and the reaction, the severity of the former and the efficiency of the latter determining the outcome in the individual case. The degree of confusion in the acute onset is an expression of the completeness with which the patient is driven back from reality and the dominance of the unconscious trends. Conditions of moderate confusion with capacity for adequate reaction to reality at times, or under the special stimuli of, for example, questions, show that the patient still has a certain grip upon the real world and is making an effort at least to retain it. Certain other cases of quite clear consciousness with complete orientation show a very adequate grasp upon reality, and these patients, to the casual observer, often seem quite natural. In such patients, however, one will notice interference of thought, hesitations in the course of conversations, stutterings and stammerings over certain points seen, be a certain type of reaction to a mental conflict, resulting in a splitting of the psyche and the outcrop of unconscious mental trends to the surface of the mental life. The patient is confronted with a situation to which he cannot quite adjust himself which is absolutely unacceptable and impossible, and he is therefore driven away by his incapacity to assimilate it and cast back upon himself. The battle of the opposing forces produces the disease picture which is the outward evidence of the effort on the part of the individual to reach a solution of the difficulty. The symptoms are the result of the appearance of the unconscious trends distorted and disguised as they are in dream formations. Jung has especially noted this similarity to the dream state and would consider dementia precox as a sort of waking dream or dream from which the patient does not awake, the dream picture being fixed as it were.
DEMERARA RIVER — DEMETER

the whole situation is actively and definitely shut out. Here there is an active effort on the part of the individual to exclude the offending tendencies, and when this succeeds recovery takes place as the result, so to speak, of the encapsulation of the objectionable material, and its exclusion from consciousness. This form of the disorder is the most acute, and the recovery is equally most apt to be prompt, and it will be seen from this explanation why this is so. In the paranoid form of the disorder the reaction is much more efficient than in the hebephrenic variety, and in some respects less efficient than in the catatonic. Here the individual takes a flight into a psychosis, and the delusions are the expression of a compromise between the opposing psychic trends. Unable to live in the real world, the patient succeeds in inventing a world in which he can live, and having invented it he succeeds in getting along fairly well without noticeable deterioration.

The conflict in these cases tends to become stationary, with the development of the delusional world. Bertschinger has more especially defined the ways of getting well by pointing out that the patient in recovering may, as a result of the conflict which he cannot adjust, find a compromise by changing himself and interpreting reality in terms of his morbid fantasy, or by translating the world of his phantasy into terms of external experience. And so one would find on the one hand delusions of grandeur which are a compromise formation and serve to change the individual so that he may be better satisfied with life, and on the other hand one finds delusions of persecution, the delusions of influence from the outer world, that serve to change the outer world in conformity with the patient’s complexes. These outside influences are but the reflections back upon the patient of his failures to get from the world what he wants, and they are consequently felt as malign and destructive influences. Another method of getting well is that already described of the catatonic, the shutting out and walking off of the conflict in a circumscribed forgetfulness. In many cases conversions into bodily symptoms, such as are found in hysteria, are found. Another method of getting well is by living through a series of imagined scenes either real or imaginary, which brings the complex to a logical conclusion. For example: A young Japanese woman was overwhelmed by the sad news that five members of her family had been killed in battle. She passed instantly into a dreamy state of consciousness, went on with the work of the household just as if all five were members of it, made their beds, set their places at table and acted in every way as if they were alive and present. Finally she, so to speak, let one of them die and then another and another until finally she had come to the death of all five, after which she awoke from her dream-like state and was well. She had succeeded in an efficient reaction to the situation by its attenuation, extending it over a considerable period of time. Finally, a certain world of reality well by the final domination of the reality motive, with a resulting correction of their delusional phantasies. These patients are best helped by psychoanalysis when they are capable of establishing mental contacts with the physician. As a rule they are treated foolishly for bodily diseases too long and the mental disintegration goes too far for possible skilled intervention. They then are left to their own devices. Appendicitis used to be treated in this way for centuries, but now prompt surgical intervention saves thousands of lives. Early psychoanalytic treatment will help the dementia precox patient. Courtray, Jelliffe and White, Diseases of the Nervous System (2d ed., 1917); Bleuler, Die Schizophrenie (1911).

SMITH ELY JELLIFFE

DEMERARA RIVER, British Guiana, rises in the unexplored mountains of the interior, flows northward and empties into the Atlantic at Georgetown. It is navigable for small vessels to a point about 150 miles above its mouth. The estuary of the Demerara forms a moderately good harbor. See GEORGETOWN.

DEMESNE, du-men, or DOMAIN (in French domaine), in its popular sense, denotes, under a feudal aristocracy, the lord’s domain, his manor place, with the lands thereto belonging. In England the demesne of the Crown denotes either the share reserved to the Crown in the distribution of landed property at the time of the Conquest (ancient demesne), or such as came to it afterward, by forfeitures or other means. They are at present contracted within a very narrow compass, having been almost entirely granted to private subjects. The rents and profits of the demesne lands of the British Crown are no longer kept separate, but are incorporated with the ordinary revenue. See CIVIL LIST.

The alienation of the domains in France, rendered necessary to reward powerful supporters, was the main cause of the fall of the Capetian dynasty. The succession of the Capets was likewise due to their great possessions, which rendered them the most powerful nobles in France. The policy of this house, particularly of Louis XI of the Valois branch, in despoiling the great nobles, made them at length absolute masters of the kingdom, although at first their authority, beyond their own domains, was very feeble. The despotic power of the French monarchy reached its climax under Louis XIV, the most powerful of the Bourbon branch of the family. The nobility had now lost nearly all its feudal privileges, and could easily be rewarded by places at court, appointments in the public services, and pensions out of the national revenue. Napoleon, who endeavored as much as possible to revive the traditions and institutions of the monarchy, had also a domaine extraordinaire (law of 30 Jan. 1810), which consisted of his acquisitions by conquests, and were kept entirely at his disposal; these supplied the means of donations to his generals, etc. The domaine extraordinaire was likewise reserved by the Bourbons (law of 22 May 1816). The administration of these donations was conducted with great wisdom; and Napoleon, as Las Casas relates, dwelt with pleasure on this branch of his government.

DEMETER, dem-è’tèr, one of the twelve principal Greek divinities, the great mother-goddess, the nourishing and fertilizing principle of nature. She was the daughter of Cronos and Rhea, and mother of Persephone (often called Cora, the Maiden, the Proserpine of Roman mythology), and according to Hesiod, of Dionysus (Bacchus). By the Romans she was

Identified and worshipped with Ceres. See
CERES.

DEMETER, Dimitrija, dé-mé-ter, dé-mé-
trē-shā, Croatian dramatist and poet: b. Agram, 21 July 1811; d. there 24 June 1872. His principal dramas are: 'Love and Duty'; 'Blood-Revenge'; and the tragedy 'Teuta.' He wrote a lyric epic poem, 'The Battlefield of Grobnik,' and several stories. He translated several foreign dramatic works into Croatian.

DEMETRIUS I, surnamed POLIOR-
 CETES, king of Macedonia: d. Pella, Syria, 284 B.C. He was defeated at Gaza by Ptolemy in 312, and shortly after defeated Cilices in Syria. He appeared before Athens with a fleet, and restored to the people their ancient form of government (307 B.C.). After defeating Ptolemy in a naval battle at Cyprus he attempted to besiege Rhodes, but was unsuccessful. Having lost the battle of Ipsus against Seleucus, Cassander and Lysimachus (301 B.C.), he fled to Egypt. He passing over to Corinth, embarked on an expedition against the Thracian dominions of Lysimachus. He then went to Asia, to bestow his daughter Stratonice in marriage on Seleucus, and on his way took possession of Sidon, which his friendship with Seleucus was broken off. He conquered Macedonia (294 B.C.), and reigned seven years, but lost this country by his arbitrary conduct. He surrendered to Seleucus and remained his prisoner for the rest of his life.

DEMETRIUS II (called "Nicator"), king of Syria: d. 126 B.C. Ptolemy Philomelus, king of Egypt, placed him on the throne of his father, after expelling the usurper, Alexander Balas, 146 B.C. He married Cleopatra, the wife of the same Alexander, and daughter of Ptolemy. About 138 he was defeated and taken prisoner in an expedition against the Parthians. Restored to his throne about 128 he was overthrown by a pretender. He committed suicide at Tyre.

DEMETERUS, or DMITRI, a series of impostors who usurped supreme authority in Russia, and led to some of its remarkable revolutions. Ivan Wasiliewitch, who had put his elder son, Ivan, left the throne in 1584 to another son, Feodor, whom Boris Godunov entirely supplanted in his authority. Ivan had left another son, Dmitri, by a second marriage; and Boris, fearing that he might one day prove a formidable obstacle to his ambitious projects, made way with him, but no one exactly knew how. Shortly after, in 1598, Feodor died, and Boris took possession of the throne. Mystery still hung over the fate of Dmitri, and Grishka or Gregory Otreiieff, a monk belonging to the convent of Tehudov, determined to turn it to account. Several persons had been struck with his resemblance to Dmitri, and he at once explained the fact by declaring that he was Dmitri indeed, and that the design of Boris to murder him had been frustrated. The report quickly spread and Otreiieff fled into Poland, where Sigismund III, king of Poland, who saw in him a useful instrument for introducing Polish influence into Russia, aided him to enter that kingdom at the head of a body of troops. Boris was defeated and slain at Zhidov, and Dmitri proclaimed grand duke of Russia. He was now firmly seated on the throne, and might have transmitted it to his descendants had he governed with prudence. Conspirators, after exciting a tumult, forced their way into the palace and put the false Dmitri to death. His body was exposed to public view, but in such a state that its features could not be recognized; and a rumor of his being still alive having spread, another impostor quickly appeared to personify him. The Poles espoused the cause of the second false Dmitri, and had made it triumphant, when he was assassinated in 1610 by the Tartars whom he had selected as his body guards. A state of anarchy ensued, and continued for nearly half a century, during which a number of other false Dmitri appeared in different quarters. Consult Munro, 'The Rise of the Russian Empire' (London 1900); Kostomaroff, 'Les faux Dmitri' (Petrograd 1864).

DEMETER PHALEREUS, fa-lē-roos, Greek orator and philosopher: b. Phalerum, At-
tica, about 345 B.C.; d. about 283 B.C. He was made Macedonian governor of Athens (317 B.C.) and archon (309 B.C.), and embellished the city by magnificent edifices. He was the advocate of the Athenians, over whom he ruled, erected him as many statues as there are days in the year, but these were afterward scornfully broken, and he himself condemned to death by that fickle people. He fled to Egypt, where he is said to have promoted the establishment of the Alexandrian Library, and of the museum, the superintendence of which Ptolemy Lagus entrusted to him. Under Ptolemy Philadephus, he fell into disgrace, and was banished to a remote fortress, where he died from the bite of an asp. Demetrius was among the most learned of the Peripatetics, and wrote on several subjects of philosophical and political science. But the work on rhetoric, under his name, probably belongs to a later age. Consult Wright, 'A Short History of Greek Literature' (New York 1907).

DEMETZ, dé-mäts', Frédéric Auguste, French philanthropist and prison reformer: b. Paris, 12 May 1796; d. there 22 Nov. 1872. He was judge, vice-president of the chamber of correctional police and court councilor. He founded, in 1840, the penitential and agricultural Colony of Mettray for juvenile delinquents, devoting himself wholly to this establishment, which has served as a model in France and elsewhere. He was elected corresponding member of the Academy of Moral and Political Sciences, Paris, in 1864. He wrote many essays and reports upon penitentiary methods and reforms. Among the latter were 'Rapports à Monsieur le Comte de Montalivet sur les penitenciers des Etats-Unis,' a study of United States penitentiaries which he undertook for the French government in 1836.

DEMI-MONDE, Le ('The Outer Edge of Society'), by Alexandre Dumas the Younger, was written in 1854, and, after troubles with the censorship amusingly recounted in a preface, acted and published in 1855. By 'demi-
monde' Dumas says (Preface, p. 11) he means not courtesans, to whom this phrase of his coin-
ing is often misapplied. His book is not the unclassified women of respectable stock, whose loss of full social recognition had love for its
sole cause, with some recruits whose talents have gained them a semi-respectability and others from among the foreign residents. This society, he says, is not for everybody. *One is banished to the 'demi-monde' for selling herself, as one is from the 'monde' for giving herself away — It begins where the legal consort ends and ends where the venal consort begins,* or, as his Olivier puts it (Act II, Scene 8, p. 108), *'The first woman who was turned out of the dusty path and had not her fault in the darkest retreat she could find; the second went to look for the first and they learned to call fault 'misfortune,' crime 'error,' to console and excuse one another. When they were three they asked one another to dinner. When they were four they had a quadrille. Then there gathered around them girls who had made a false start in life, sham widows, women who take the names of the men with whom they live, some legal couples who have spent supernumerary years in a liaison, in short all women who want to make believe that they have been somebody and do not wish to appear what they are.*

In construction the play is faulty, its denouement is a piece of dramatistic ligeredemain. The heroine, an overreaching and overreaching herself, throws away her hope of rehabilitating herself through marriage with the soldierly Raymond de Nanjac, while Marcelle's straightforwardness wins hand and heart of Olivier le Jalin, the exponent throughout of Dumas' ideas. But this is of less interest than the keen insight shown in the satiric portrayal of a social class more clearly defined in the Paris of its day, than since divorce has gained greater social recognition in France.

**Benjamin W. Wells.**

**DEMI-RELIEF, or DEMI-RILIEVO.** ré-le'vō, a term applied to sculpture projecting moderately from the face of a wall; half raised, as if cut in two, and half only fixed to the plane. Mezzo-rilievo, which is the more correct term used to designate this style of sculpture, is lower than alto-rilievo and higher than basso-rilievo.

**Demidov, dem'ëdôf, or Demidoff,** a noble Russian family, whose head, Nikita Demidoff, was an armory-founder at Toula. This Demidoff was entrusted by Peter the Great with the business of casting the cannon for that prince's numerous warlike expeditions. He actively seconded all the exertions of the tsar, by whom he was ennobled, and in 1725 discovered the mines of Kolyvan, the working of which speedily enriched him. He left a son, Akinfiy, and several grandsons, who distinguished themselves in the same career as their progenitor and amassed colossal fortunes. The best known of these are Prokop Demidov, who worked with great profit the iron, copper and gold mines of the Ural Mountains; Nikolai Nikitich (about 1774-1828), a zealous philanthropist, who introduced into his country several branches of industry, founded establishments of public utility and carried to a great state of perfection the working of mines. He had an annual income of more than $1,000,000. His last years he passed in France and Italy, enjoying the society of the cultured men and ladies and the world's pleasures around him. He left two sons, Paul and Anatoli (1812-70), who, as well as inheriting his fortune, had also the same high taste and benevolence. The latter married Princess Mathilde, daughter of Jerome Bonaparte.

**Demijohn,** a jug in a wickerwork casing or box, used for holding liquor.

**De Mille, Henry Churchill,** American playwright: b. North Carolina about 1853; d. Pompton, N. J., 10 Feb. 1893. He was graduated at Columbia College, and was by turns preacher and teacher till 1882, when he became examiner of plays at the Madison Square Theatre, and later for a short time an actor. His first successful play was the 'Main Line,' in which he collaborated with Charles Barnard. In 1887, having become associated with David Belasco, he wrote the society dramas 'The Wife' (1887); 'Lord Chumley' (1888); 'The Charity Ball' (1889); 'Men and Women' (1890). His last work was a melodrama adapted from the German, entitled 'Lost Paradise,' which was successfully produced in 1892.

**De Mille, James,** Canadian novelist: b Saint John, N. B., Aug. 1837; d. Halifax, N. S., 28 Jan. 1880. He was graduated at Brown College in 1854. He was professor of classics in Acadia College (1860-65), and of history and rhetoric in the Maine Military Academy, from 1865 until his death. Among his publications are 'Andy O'Hara' (1860); 'The Soldier and the Spy' (1865); 'The Dodge Club' (1866); 'Cord and Creese' (1867); 'The American Baron' (1870); 'The Lass of the Lice' (1870); 'A Comedy of Tyrants' (1872); 'The Living Link' (1874); 'A Castle in Spain' (1882-83); 'The Winged Lion' (1877; 2d ed., 1904), and many books for boys, including 'Treasures of the Sea.' A posthumous work, 'A Strange Manuscript Found in a Copper Cylinder,' appeared in 1888. A treatise of his on rhetoric was published in 1878.

**De Mille, William Churchill,** American playwright: b. Washington, N. C., 25 July 1878. He was graduated at Columbia University in 1900, and received his diploma from the American Academy of Dramatic Arts in 1901. His plays include 'Strongheart' (1905); 'The Warrens of Virginia' (1907); 'The Land of the Free' (1912); 'The Woman' (1912); 'The Royal Mounted' (1908); 'Classmates' (1907).

**Deming, Philander,** American lawyer and author: b. Carlisle, N. Y., 6 Feb. 1839; d. 9 Feb. 1913. He was graduated at the University of Vermont 1861, and at the Albany Law School. From 1878-79 he was president of the New York State Law Stenographers' Association. He began to write stories for the magazines in 1875, and his published books include 'Adirondack Stories'; 'Tompkins and Other Folks.'

**Deming,** county-seat of Luna County, New Mexico, 88 miles northwest of El Paso on the Southern Pacific, Silver City branch of Atchison, Topeka and Santa Fé and a branch of El Paso and Southwestern railroads. It is situated in a wide desert flat on bank of Mimbres River which is usually dry. Altitude 4,335 feet. For many years it was a small centre for widely scattered ranches and mining districts in Florida, Tres Hermosas and Victoria mountains and Cooks Range and had considerable cattle and wool business. It was incorporated 1901. The population was 1,864 in 1910, and about 3,500 in 1914, and has grown
greatly since owing to great extension of irrigation, and the establishment of Camp Cody, for the concentration and training of soldiers for the war with Germany. A large amount of water underlies the desert in the Deming region which by pumping is raised for the irrigation of an extensive area yielding abundant crops of beans, tomatoes, alfalfa and other products.

DEMISE, de-miz' (literally, a laying down*), a grant by lease; it is applied to an estate either in fee-simple, or for a term of life or years. The word demise in a lease implies an absolute covenant on the part of the lessor for the lessee's peaceable enjoyment during the term. As applied to the Crown of England, demise signifies its transmission to the next heir on being laid down by the sovereign. *So tender is the law of supposing even a possibility of the sovereign's death, that his natural dissolution is called his demise, an expression which merely signifies a transfer of property* (Blackstone). The principle of immediate demise was laid down by William and Mary, in order to avoid the disturbances and inconveniences consequent to the death of the sovereign.

DEMIURGE, dem'i-urj (Greek, demiuur-gos, a handicraftsman*), (1) designation applied by Plato and other philosophers to the Divine Being, considered as the Architect or Creator of the universe. The Gnostics made a distinction between the Demiurge and the Supreme Being; with them the first is the Jehovah of the Jews, who, though deserving to be honored as the Creator, was only the instrument of the Most High who created physical man. He was also called Archon and Son of Chaos, chief of the lowest order of spirits or demons of the Pleroma. Christ, according to the Gnostics, brought the revelation of the spiritual life which added to the *psyche* or sensuous soul, created by the Demiurge, the *pneuma* or divine rational soul. The origin of evil was sometimes attributed to the Demiurge.

(2) In some of the Peloponnesian states of ancient Greece the name Demiurges seems to have been given to a chief magistrate, probably corresponding to the Roman tribune. Among the Eleians and Mantians they were the chief executive magistrates. In the Achaean league they ranked next to the strategi or generals. They were found also in the Dorian states.

DEMOEDIES, Greek physician: b. Crotona about 550 B.C.; d. 504 B.C. He was for a time physician to Polycrates, tyrant of Samos; was taken prisoner by the Persians and rose to a position of considerable influence in the court of Darius I through his medical skill. He persuaded the king to send him with others on a secret mission to Greece, but escaped from his companions and fled to Crotona. He is mentioned in Herodotus, Bk. 3, pp. 129-138.

DEMOCRACY, History of. Introduction.—Some preliminary notion of what is meant by democracy will be indispensable at the outset, in order to provide some logical basis for the organization of a discussion of its historical development. As a general concept it may be held that democracy is a form of social organization in which the participation of each individual in the various phases of group activities is free from such artificial re-strictions as are not indispensable to the most efficient functioning of the group, and in which group policy is ultimately determined by the will of the whole society. The procedure adopted will be to trace the evolution of democracy in each succeeding period, as: (1) a practical fact in society; (2) a concept in social, political, and economic theory.

Democracy in Primitive Society.—Critical ethnologists have come into essential agreement that the earliest type of social organization among primitive men was that of the local group organized about the institutions of the family and the village, and characterized by the absence of any elaborate kinship organization. It is in these small social groupings that the nearest approach is found to the so-called "primitive democracy." Here one finds small groups on a basis of intimate association, little affected by external influences, and the component individuals participate in the whole culture of the group to a degree unknown in modern society. As Professor Cooley has pointed out, these circumstances provide a psychological situation highly adapted to the development of intimacy and freedom in social relations. But, at the same time, as Professor Durkheim has vigorously insisted, these conditions are conducive to the maximum of the external and socio-psychological influences so familiar to the student of crowd psychology. Consequently, one finds in these primitive local groups a very considerable prevalence of customary regulations and restrictions, some tendencies toward the development of caste, and a particular susceptibility to the domination of the forceful personality—all of which seriously impair the operation of a democratic type of social organization and functioning. Also it must be recognized that these approximations to democracy in primitive society are rather incidents of an undeveloped pre-political condition than the result of conscious planning of social organization on the basis of political liberalism.

When one turns to examine what are generally the more advanced types of primitive society organized on a kinship basis, with either maternal or paternal descent, even less appears of the alleged democratic characteristics of primitive society. Among the Hattians the group is minutely ordered by a veritable maze of customary regulations which are enforced with great rigidity and severity. Within the group the freedom of the individual is further restricted by the general prevalence of social ranks and grades. The much vaunted tribal assemblies have been reduced by modern critical research from the original fountain springs of political liberty, as pictured by such writers as Maurer, Kemble and Freeman, to mere formal gatherings to grant a pre-assured acquiescence in the policies of the leaders of the group—a function strangely similar to that of the American party convention. A distinguished authority has remarked that the defiance of the policies of the chiefs by a tribal assembly is such a rarity as to constitute no less than a political revolution, something which is even less frequent in primitive than in modern society. Finally, an individual in primitive kinship society is not free to transfer his membership from one group to another, but must remain forever in his own group, as an
individual in primitive society has no standing outside of his kinship group, and in such a case occupies the position of an outlaw. Viewed externally, then, primitive society is a "closed shop," and this state is dominated by a mass of customary regulations and is organized more or less according to a hierarchy of social classes. As primitive society approaches most closely the beginnings of real political or civil society the undemocratic features of social organization greatly increase.

It is scarcely necessary to point out the fact that aside from mythology there is no specific theorizing with respect to social and political relations in primitive society. In that period there is only one theory as to the foundations and justification of the existing social order, namely, that it is the only "safe" order. Its perpetuation unaltered and unimpaired is the only guarantee of relative immunity from the dangers lurking in the unknown. In primitive society, as among modern conservatives, there is a veritable sanctity in the existing order which precludes the possibility of any critical examination of its origin and justification.

**Democracy in Early Political Society.**—If this situation be regarded as established it is that political society and the state originated through the amalgamation of tribal groups as a result of the incessant wars waged in what Bagehot has called the "nation-making age." In the highly autocratic and hierarchal caste society which then developed and which characterized early political society there was, of course, not the slightest approximation to anything democratic in any field of social relations. In no other stage has the individual counted for so little and been so circumcised in liberty as in the period of the formation of states and the development of early despotisms. The facts almost justify Hegel's famous dogma that in this period only the despots were free.

Early political society is characterized by as complete an absence of democracy in theory as in practice. The only expenditure of political thought was in justifying the existing régime on the basis of the sanctions of a unique revealed religion or the superior wisdom of existing institutions. Existing institutions then be a part of the divine order as in primitive society they had been regarded as the source of the "luck" of the social group.

**Democracy During Classical Times.**—It is impossible to make any sweeping statement as to the degree of democracy realized in ancient Greece as the situation varied greatly in different periods in both Athens and Sparta. The radical transformations of Greek government from tyranny to aristocracy and from aristocracy to the so-called democracy were so frequent as to give rise to the famous Platonic and Aristotelian theory of the cycles of government changes. True democracy was not prominent in Hellenic society. Even Athens, the most liberally inclined of the Greek city-states, at the period of its most democratic organization could scarcely be regarded as a democracy in the modern application of the term. While, as Mr. Zimmern has pointed out, there has been a tendency to exaggerate the number of Athenian democrats, it is clear that there was never a time in Athenian history when a majority of the population was not excluded from participation in the life of the state. Greek "democracy" meant relative social and political equality only among the citizen class—the class, which in the opinion of Aristotle, was "born to rule." Within this privileged citizen class, however, Athenian democracy made the closest approximation in antiquity to a democratic control of group activities.

In republican Rome the same conception of exclusiveness in the citizenship existed as had prevailed in Greece. The large numbers of slaves and foreigners were excluded from the political life of the state and within the citizen body itself there was less of a democratic control of political activities than had existed in Athens. Despite the gains made by the plebeians in the 4th century B.C. and the later attempts of the Gracchi to break down the domination of the aristocratic governing clique, the government of Rome drifted steadily into the exclusive control of the autocratic "ordo senatorius" and from that into the principate and the empire. The sodalities or industrial associations were the only approximation to social democracy, and they were discouraged and prohibited by the government. During the imperial period a slight movement toward democracy might be detected in the reduction of the number of slaves through manumission and the extinction of many of the sources of supply, but this slight symptom was more than offset by the growth of imperial despotism, the increase of plutocracy and the extinction of the curiate or middle class through the disproportionate burdens of taxation imposed upon it. As a result the middle class, the lower class freemen and the slaves were all assimilated into one semi-free class—the so-called "coloni." Classical antiquity, then, never brought real democracy in the political, social or economic realms. It passed, leaving a more decided condition of inequality than it had received from the primitive tribal society with which it had started.

With the Greeks systematic speculation regarding the foundations of society and politics first appears. In the "Republic" and the "Statesman" Plato discussed the nature of democracy. He defined it as a form of government and held that it inevitably tended to degenerate into anarchy. Plato's "rule of the many," of course, meant only the rule of the citizen minority of the population. Even this shadowy democracy did not attract Plato who preferred an enlightened monarchy. Aristotle devoted a portion of his "Politics" to a discussion and definition of democracy. From the standpoint of the terminology of political science he maintained that democracy was that form of government in which the majority of the citizens, excluding foreigners and slaves, directed the activities of the state for the advancement of their own class interests. It was, then, the corrupt form of "popular" government, the term "polity" being reserved for the virtuous administration of government by the whole body of the citizens. From an economic standpoint Aristotle held that democracy meant the control of public policy by the mass of the poor citizens who possessed little or no property. Aristotle was no more favorable than Plato to the exclusive "democracy" of the Greeks and held that the only valuable func-
tion of the people lay in electing and scrutinizing the officials, and not in the direct and actual control and operation of the government. Here, then, we find the full application of the democratic principle in society as in the state. He laid down his famous dictum that merit should determine social and political position and held that certain individualistic and oriental tendencies in the institution of slave service were born to serve the more intelligent and capable members of society. It is scarcely necessary to add that by the intelligent and capable, Aristotle meant the Attic Greeks, and by those fitted for perpetual servitude, the barbarians. Thus, his seemingly useful conception of social differentiation on the basis of ability resolves itself upon closer examination into a chauvinistic apology for racial egoism. While Plato and Aristotle had looked with delight upon even the limited democracy of Greece, Polybius held that in any stable state some permanent concessions must be made to the democratic principle. Drawing upon the experiences of the early Roman republic he put forth his famous theory of checks and balances which were to be brought about by including in the organization of the government the monarchical element, the aristocratic senate and the democratic assemblies. Only through this arrangement could one hope to prevent the continual changes in government which had been outlined in the famous classical theory of the cycle of governmental transformations. Finally, one finds among the Greeks the first adumbration of the doctrine of a governmental contract as the origin of political society—a theory first stated by the Sophists, Plato and the Epicureans and which was destined in the 17th and 18th centuries to work strongly for the development of democratic tendencies in politics.

Among the Romans the only significant development in democratic theory making for democracy was the doctrine of the Roman lawyers concerning the origin and justification of the political order. The lawyers held that the foundations of political authority lay in the consent of the people. Though the emperor might in fact be chosen by his legions in a remote boundary district the legal theory always held that he owed his authority to the tacit assent of the whole body of the Roman citizenry. In so far as such people, as advanced the doctrine of, the origin of political authority in a governmental compact.

Democracy in the Middle Ages.—The Roman Empire ended with the growth of plutocracy and the crushing out of practically all of the few democratic tendencies which existed. With the barbarian invasions and the establishment of the Teutonic kingdoms the fruits of classical civilization were for the most part lost and western Europe dropped back in a cultural sense into the conditions from which classical civilization had developed a thousand years earlier. Even the feeble advances which classical civilization had made in the direction of democracy had to be regained before further progress could be made toward the securing of personal freedom, political enfranchisement and popular control of public policy.

Feudal society, developing from roots in the Roman villa and in the German mark and comitatus, offered little opportunity for the development of democracy. With its perpetuation to a slight degree of the slavery of classical times and its retention on an extensive scale of the servitude or half-slavery which had been so common in the colonate of the later Roman Empire, the feudal age was in general even less democratic in a political sense than the classical city-states. On the manors there were some democratic tendencies in the individualism of the serfs, and Professor Giddings has insisted that the real origin of modern social democracy is to be looked for in the enforced equality among the members of this servile class in the Middle Ages. Some symptoms of democracy also appeared in the medieval free towns, but they were not extensive. The political, social and economic organization was hierarchical and restrictive, and equality in the medieval town, as in the classical city-state, meant the equality of the favored few. The Magna Charta as a harbinger of modern democracy has withered before modern historical research quite as much as the Teutonic folk-moot. It did not mark a movement looking toward modern political liberalism, but was a reactionary manifesto of the feudal lords who were irritated by the recent extension of royal power and in 1215 made an effort to pull England back into the decentralized lawlessness and local tyranny of the feudal period. The only notable development of democracy in the Middle Ages occurred as an incident of the rise of Christianity. A number of writers have claimed with some degree of justification that the first instances of real democratic society are to be found in the early Christian communities of the Apostolic Age. Certainly, the only extensive development of democracy in social organization in the medieval period occurred in the monastic movement, and in the monasteries essential equality was the general rule. The organization of the secular clergy and the medieval Church, however, with its elaborate hierarchal for ecclesiastical administration and for the control of the sacraments, was scarcely less autocratic than the feudal society of the period. The only concession that the medieval Church made to democracy was that its offices were in theory, at least, open to all classes solely on the basis of merit. On the whole, however, democracy or any strong prophecy of democracy scarcely appeared during the thousand years that followed the collapse of the western Roman Empire.

The advances made toward the development of the theoretical concept of democracy during the medieval period were as scanty as the achievements in the field of democratic practices. The Christian conception of the brotherhood of man was certainly more democratic in its implications than the early Stoic doctrine. The Stoics had meant by this phrase merely the brotherhood of the intellectually élite, but the Christians rejected this limitation and emphasized the reality of brotherhood through the medium of faith and belief. In the field of political theory there were few developments beyond a revival of various doctrines which had appeared in classical antiquity. Manegold of Lautenbach, in the last half of the 11th century, gave the development to the medieval version of a governmental compact as the basis of political society and held that the breaking of this contract by
the prince was sufficient to justify rebellion among his subjects. In the same century the removal of absolutist law and the rise of modern legal institutions in Europe with the lawyers' doctrine of popular sovereignty, a conception later developed with great vigor by Marsiglio of Padua. The Conciliar movement of the 15th century, based largely upon the Roman legal theory of the corporation of men, attempted to work out a theory of representation for ecclesiastical government. While the insistence of the great theorists of the Conciliar movement, such as Gerson and Cusanus, upon the validity of the doctrine of popular sovereignty was an important development in the direction of democratic political theory, the Conciliar doctrine of representative government was rather one which looked back to the system of feudal estates than forward to the modern parliament. Those who look to the Conciliar movement for the origins of modern representative democracy are not less in error than those who try to derive it from the Magna Charta. The concept of democracy scarcely figured in any medieval discussion save in the writings of those mediæval scholastic philosophers who retain Aristocratic terminology and analysis with its contempt for democracy. The concept of the "people," which appeared so frequently in the latter part of the mediæval period, in the discussions of popular sovereignty was scarcely a democratic notion. By the "people" was meant only the first three estates, excluding the peasantry which constituted the vast majority of the population, and it did not usually refer to the people as individuals but as a corporate entity.

Democracy from the Commercial Revolution to the Industrial Revolution.—Beginning with the opening of the 16th century and extending over about two centuries there occurred that great transformation which marks the dawn of modern society—the "Commercial Revolution." The explorations and discoveries and the resulting contact with new cultures broke through the "cake" of mediæval custom and opened the way for the development of mediæval institutions and laws. The increased volume of wealth at the disposal of the monarch, as a result of the "intervention of capital," enabled him to develop a paid officialdom and army and by their assistance to crush feudalism and perfect the national state. But the most important of all of its results was the great increase of the bourgeoisie, or middle class, which, as Professor Hayes has so well explained, was destined for centuries to be the centre from which all liberalizing and democratizing influences spread and which ultimately secured the well-nigh universal destruction of the autocratic and exclusive social and political régime which had characterized the Middle Ages. The Protestant Reformation made few contributions to democracy in politics. In fact, it made the lot of the people harder than before, but it did increase the power of the upper middle class and thus accelerated the movement already begun by the commercial revolution.

In England during this period the new middle class effected the greatest transformation of the social and political régime which was accomplished before the 19th century. By the beginning of the 17th century the power of the feudal nobility had generally vanished, serfdom had disappeared and the restrictive guild system of industrial organization had been practically eliminated. Before the close of the century, through successive concessions from the king and through the revolutions of 1649 and 1689, the bourgeoisie had dethroned two autocratic monarchs, had eliminated the rule of royal arbitrariness in politics and law, and had brought about the close of the absolutist régime in the government and had enacted into a constitutional document those guarantees which have since come to be recognized as the most fundamental of human rights. While oppressive religious disabilities, exclusive property qualifications for participation in political life and the perpetuation of many of the social phases of mediæval feudal aristocracy all operated to prevent England from being classed as a democratic nation in 1700, the fact that the middle class had created a constitutional system and had secured the complete power of the Parliament—the popular branch of the government—constituted an epoch-making step toward the ultimate development of democracy. In France, even more than in Tudor England, the concept of the "people" developed rather for the development of royal absolutism than for the growth of constitutional or democratic government. The Estates-General, summoned in 1614 for the last time in 175 years, made a pathetic failure as compared with the achievements of the English "Long Parliament" and the hope of a gradual evolution of legislative supremacy in France, such as had taken place in England, perished. The political power of the feudal nobility was crushed by Richelieu's centralizing policies and by the suppression of the "Fronde" in 1652, but they retained their oppressive social and economic privileges until the "August days" of 1789. The French Revolution of 1789 to 1795 was the product of the abuses of the "old régime," of the revolutionary political theory of the English Whigs, of the intellectual impulse from the French "philosophes" and of the American example of a successful experiment with revolution and the beginnings of democracy. The "third estate" was not the first to rise in 1789, but it was successful in opposition to the combined strength of the monarch and the first two estates, but the strength had so increased by 1789, as a result of the effects of the commercial revolution, that they were able to coerce the monarch, the weakened nobility and the clergy and they proceeded to clear away not only the vestiges of feudalism but also the oppression of the Church and the tyranny of the monarch. The calling of the Estates-General in 1789 is worthy of passing mention in any historical survey of the development of democracy because the first instance in history of the exercise of universal manhood suffrage occurred in the election of the deputies of the third estate. The most significant achievements of the French Revolution were the abolition of these economic and social aspects of feudalism which still persisted, the establishment of a constitutional monarchy in 1791 and of a republic in 1792. Though many of these reforms proved transitory, their effect was never entirely lost and they constituted the stimulus and precedent for the more gradual development of French democracy in the 19th century.

In all other important European states, with
the exception of the abortive reforms of Joseph II of Austria, the old régime with all of its medieval institutions and practices remained practically undisturbed until the 19th century. It continued to improve. But as a result of the French Revolution was spread throughout Europe by Napoleon, and the "Industrial Revolution" had still further increased the numerical strength of the bourgeoisie, this class was already in the process of liberatizing activities with some degree of success into central, southern and eastern Europe.

The establishment of an aristocratic republic in America in the closing years of the 18th century marked an important advance in the development of democracy. While American society and politics at the beginning of our national history abounded in undemocratic features, the new state had been founded on revolution from established authority; and it was one of the first examples in history of an extensive federal republic and of a government organized on the basis of a written constitution formulated by a national constituent convention. It, therefore, stimulated the growth of constitutionalism and republicanism elsewhere, most notably in France, and it laid the foundation for what became in the 19th century the most ambitious experiment which has yet been conducted in the democratic control of political institutions. In America, as in England and France, the revolutionary movement was organized by the middle class made up of merchants and the professional classes.

In the period between 1500 and 1800 many notable advances were made toward the development of democratic tendencies in political theory. The most significant and influential of these was the doctrine of a social contract as the explanation of the origin and justification of social institutions and political organization. This doctrine, as distinguished from the earlier theory of a governmental contract, was first enunciated by Aeneas Sylvius in the middle of the 15th century, but it did not become an important dogma in political theory until it was expressed by the English churchman, Hooker, and the German jurist, Althusius, at the opening of the 17th century. It received a systematic exposition in a number of classical works, particularly those of Hobbes, Pufendorf, Spinoza, Sydneys, Locke, Rousseau, Kant and Fichte. It was not necessarily a democratic doctrine and it was used by none of its adherents, most notably by Hobbes, to defend royal absolutism. In the hands of Locke and his plagiarist, Rousseau, however, it worked strongly for the destruction of the obscurant and autocratic divine right theory and provided a theoretical justification for altering the existing political order when it had become subservise of the terms of the original contract. In other words, it provided a dogmatic foundation for political revolution and it was used to inspire and justify the great revolutions of the 17th and 18th centuries in England, France and America. This revolutionary version of the social contract theory powerfully stimulated the development of the doctrine of popular sovereignty. Another important contribution was the doctrine that life, liberty and property are the natural and inherent rights of all men. This theory, first stated by Fortescue at the close of the 15th century, was again enunciated by the Levellers in the middle of the 17th century and was given a permanent position in political theory through the influence of John Locke. It was widely at variance with the contemporary social and economic oppression and at the same time it was greatly influential in combating these conditions, especially when these "rights" became a part of the program of the radical party in the various countries. In addition to their early formulation of the doctrine of rights, the Levellers made another significant contribution to the general body of democratic political theory, namely, the doctrine that every citizen should be accorded the right of participating in political activity through the exercise of the suffrage. Another important doctrine making for democracy in politics was that which was most vigorously expounded by Locke, namely, the legal supremacy of the legislative or popular branch of the government.

The importance of this doctrine appears when one reflects that without the predominant power of the elective or popular branch of the government which makes it possible for the representatives of the people to control the policies of the state, the fact that the people have the right of universal suffrage and the election of representatives does not ensure a democratic control of public policy. The impotence of the German Reichstag and the autocratic nature of the German imperial government, in spite of universal suffrage, is the most striking modern demonstration of the fact that without a powerful legislature all the other incidents of democracy may be vain and empty forms. Finally, the Utopian socialist schemes of such writers as More, Bacon, Campanella and the pre-revolutionary socialists in France made provision for the introduction of some degree of social democracy. It is most significant, however, that during this entire period there was no systematic analysis of the meaning and implications of democracy, nor, with the doubtful exception of Mably in France, Tom Paine in England and Jefferson in America, was there any important defense of democracy as the ideal form of government. Most of the radicals regarded a constitutional monarchy or, at the most, an aristocratic republic as the ideal form of government. Montesquieu and Rousseau, for example, both held that a democracy would only be tolerable in a very small state and could never be successful in an extensive country. In short, all of the theories of the period have been briefly summarized above were rather fragmentary contributions which might later be utilized in a systematic analysis and defense of democracy than anything which could be regarded as comprehensive and thorough-going discussions of the nature and validity of democracy itself.

Democracy from the Industrial Revolution to the Present Day.—At the opening of the 19th century democracy did not prevail in any country in the world, and only England, France and the United States had made any notable progress in that direction. Even these modest advances seemed destined to be crushed and the old order restored after 1815 through the sinister influence of Metternich, the able and alert statesman of the old régime, who extended his reactionary system throughout continental Europe by 1823. But in that year he received his initial reverse in Great Britain's
challenge to the intervention of the reactionaries in the South American revolutions. This action of the Great Powers was not so much motivated by an abstract love of liberty and revolution, for these were scarcely more pleasing to her Tory ministry than to Metternich, but was rather led to this course by the fact that her trading interests, so greatly increased by the industrial middle class, were more likely to be advanced by the freedom of the Spanish-American republics than through the return of Spanish control. The industrial revolution thus gave the old régime its first serious rebuff and from that time on it has caused it continually to retreat until to-day it retains only a precarious hold on those mid-European states where Metternich had most thoroughly established his system. This greatest transformation of all phases of life in the history of mankind, which has been known since Arnold Toynbee's time as the "Industrial Revolution," came first in England between 1750 and 1825 and was passed along to the Continent, reaching France between 1825 and 1850, and Germany from 1850 onward, but especially after 1870. Austria about the same time, and scarcely touching Russia until the last decade of the 19th century. In addition to its great series of mechanical inventions, it tremendously accelerated the process begun by the commercial revolution, namely, the increase of the bourgeoisie or middle class, to which the world owes most of the great advances in civilization and liberalism. This class, motivated in part by sentiments of enlightened humanity and in part by selfish class interests, carried the day against the autocracy of the old régime and made it possible for the proletariat, which was also created by the industrial revolution, to consolidate the positions already won for it by the bourgeoisie and to begin the struggle for the final realization of democracy in the true sense of the word. The battle for political and social democracy, then, in the last century has centred about three successive tasks: (1) the elimination of the vestiges of the old régime - the heritages of the Middle Ages; (2) the establishment of the liberal régime of the "benevolent bourgeoisie"; and (3) the attack upon the supremacy of the bourgeoisie by the proletariat, beginning about the middle of the 19th century. A series of measures were created when set in motion by the industrial revolution and attention may be turned to the manner in which they have been realized in the leading countries of the Western world. Most of the achievements in these directions have consisted in the extension of the suffrage, the increase in the importance of the popular or legislative branch of the government as compared with the executive, the extension of representative institutions, a broadening of the conception of the scope and functions of government, and the disfranchising of the commercial and monarchical interests. At the beginning of the 19th century economic democracy was as far from realization as political democracy and the advances made since that time have been most notable. In 1800 most of the extensive re-

strictive economic regulations which had been enacted during the two previous centuries operated in not so much to the material interests of the bourgeoisie. With the growth of the political power of the bourgeoisie after the industrial revolution went the abolition of most of the old restrictions on economic activities and there was instituted the regime of "laissez-faire" which gave the industrial middle class and its merchants unrestricted opportunity for the development of their great industrial enterprises and for the enjoyment of the "blessings" of the freedom of contract. This individualistic movement was most thorough-going in England, where it was chiefly associated with the work of Cobden, Bright, Mill and Gladstone, but no European country entirely escaped its influence. Laissez-faire, however, gave economic liberty only to the upper middle classes and it is to the development of trade-unionism that one must look for the movement which has been, up to the present time, the most effective instrument for advancing economic democracy among the laboring classes. In England the middle class secured their first great triumph over the old order in the Parliamentary Reform Bill of 1832 and in the Municipal Reform Act of 1835. These reforms destroyed the mediaeval system of election and representation which had persisted in England until that time and gave political recognition to the dislocation of economic interests and population caused by the industrial revolution. They were scarcely a direct victory for democracy, as they did not carry with them an enfranchisement of the masses, but they did constitute an indirect triumph in that they brought into power the bourgeoisie who immediately proceeded to clear away many of the most formidable obstacles to the ultimate realization of democracy. The democratic movement of this period — Chartism — proved a pathetic failure, but essentially all of the Chartist demands have since been realized, a significant testimony to the progress of democracy in England. The first important direct step in the actual realization of political democracy in England came in Disraeli's Borough Franchise Bill of 1867 which brought something approaching universal manhood suffrage to the residents of boroughs. A similar extension of the franchise to the working classes was created by Gladstone in 1884, for all practical purposes, made in England a political democracy. The process has been carried to completion by the sweeping Franchise Act of February 1918 which brought universal suffrage to males and introduced on a very liberal scale the principle of woman suffrage, thus making England's electorate the most inclusive and democratic of that of any modern nation. Fortunately, England, two centuries before, had established the supremacy of Parliament and when the people secured the vote they were in a position to insist upon political policies of the government and secure for themselves the substance as well as the form of political and social democracy. The grip of the people upon the legislative power in Great Britain was made ever stronger and more certain by the Parliament Bill of 1911 which finally assured the supremacy of the House of Commons. Beginning with the Elementary Education Act of 1870, the people have been able in part to transform England into a social
as well as a political democracy. Especially rapid has been the progress in this direction under a constitutional monarchy. The attempt, as abundantly testified by the remarkable series of reform measures passed during that time. Among the most conspicuous of these have been the Workmen's Compensation Act of 1906, the Education Act of 1902, the Small Holdings Act of 1907, the Old Age Pensions Act of 1908, the Labor acts of 1909 and 1913, the Lloyd George Budget of 1909-10, the National Insurance Act of 1912 and the Franchise and Education Acts of 1918. These are a convincing demonstration of the fact that the English proletariat has now gained for itself the position held in 1815 by the Tory squarrearchy and in 1848 by the bourgeoisie liberals. Economic democracy in England has been realized through the abolition of the various restrictions upon the freedom of economic activity which existed in 1800. This was accomplished through the efforts of the middle class and the proletariat. Especially significant has been the development of trade-unionism. This was first legalized through the activities of Francis Place and Joseph Hume in 1824-25. It has received further legislative encouragement by the laws of 1871-76, 1906 and 1913, and, in spite of some recent adverse court decisions, the right of trade unions to organize and carry on their work in England. In spite of a titular monarch and aristocracy, England is at the present day, perhaps, the most democratic of the great modern nations.

In France the ultra-conservative squarrearchy, led by the arch-reactionary Charles X, made a most daring and determined effort, between 1815 and 1830, to restore the old régime. The futility of the attempt to revive in France the order of things which had existed before 1789 was demonstrated by the Revolution of 1830 which sent into final oblivion the autocraty and corruption of Bourbon absolutism. The bourgeois liberals, strengthened by the effects of the industrial revolution, came into power with the Orleans monarchy of 1830 to 1848. Louis Philippe, however, refused to square his policies with the growth of liberalism and met, in 1848, the fate which Charles X had encountered in 1830. The new Republican government depicted a fatal split of its polity into a Bonapartist adventurer, by the aid of this division among Republicans and Socialists and the romantic lustre of his name, was able to establish a temporary autocraty. But during its brief period of power the Provisional Government of 1848 secured for France the enactment of a universal male suffrage law, which has been retained almost entirely unchanged down to the present day. This gave France the double honor of being the nation which originated and practiced universal manhood suffrage in 1790 and also the first powerful nation to adopt, as a permanent political institution the practice of universal manhood suffrage. Like his predecessors, Charles X and Louis Philippe, Louis Napoleon was unable to resist the growing forces of democracy and liberalism which were being continually augmented by the effects of the industrial revolution and the growth of the bourgeoisie, and even before he was swept off the throne by the debacle of 1870 he had been compelled to relinquish most of the attributes of autocraty and to establish a liberal constitutional monarchy.
DEMOCRACY

tained practically unchanged and no redistribution of seats in the Prussian Landtag has taken place since 1860, thus giving rise to a situation resembling that of the notorious "rotten boroughs" of England before 1832. Furthermore, the exclusive three-class system of distributing the suffrage and the archaic method of oral voting in Prussia destroy even those slight traces of democracy which might exist in spite of discouraging surroundings. In the German Empire universal manhood suffrage was introduced in 1871 for elections to the Reichstag, but even this change has left the small communities uninfluential and pre-existing municipal structures for the emerald cities of modern Germany from anything like an equitable representation, deprives the bourgeoisie and proletariat of a just expression of their will, even in the foreign department of the German political organization, and perpetuates the dominating influence of the reactionary squirearchy. Moreover, since 1807 that most fundamental of all contradictions of democracy, the subordination of the civil government to the military, has, for all practical purposes, existed in the German Empire. From the standpoint of the realization of political democracy, then, Germany's condition to-day is very similar to that of England in the time of Henry VIII and of France in the days of Charles X. Nor is there any greater degree of social democracy in Germany. The elaborate social legislation program of Bismarck came not from the influence of the people nor as a result of the modern democratic conception of the state as the agent and servant of the people, but proceeded from Bismarck's highly undemocratic desire to crush the Social Democrats, to ensure a healthy nation as the indispensable basis of a strong military system, and to attach the people to the autocratic German state through gratitude for its paternalism. The social legislation of modern Germany is, thus, in no way a symptom of social democracy, but is simply the outgrowth of the same 18th century enlightened despotism that impelled Frederick the Great to undertake his liberal reforms in Prussia. Of the truth of this assertion overwhelming proof is afforded by the fact that the Social Democrats invariably opposed the social legislation of Bismarck, and by Bismarck's acknowledged purposes in undertaking the program of social reform. In Germany, trade unionism, as a movement toward economic democracy, made its first appearance as a significant movement in the decade of the sixties, but was greatly weakened and suppressed during the period of anti-social legislation between 1878 and 1890. After 1890 the reform movement has received legal sanction for extensive economic activities. It is probable that no fact in recent history so clearly indicates the power of the underlying forces now making for democracy as the action of the German governing classes in 1914. In spite of their throttling control over the organs of government, they were unable to check the operation of those great industrial and social forces which have created modern democracy and they deemed it necessary to stake their very existence in the desperate attempt to stifle the growth of liberalism by the consolidation of all classes and the submergence of all opposition through the psychological effect of the great national and patriotic enterprise of an aggressive, vigorous and glorious European war.

In the Austrian Empire, political liberalism, since its defeat in 1850, has met a somewhat kinder fate than in the Prussianized German Empire. No serious attempt was made to restore the feudal system which was abolished in 1848-49, and in the period from 1860 to 1867 the liberal inclined Francis Joseph I, in order to placate his own subjects and the Hungarians for their disappointments in 1848-49, granted reforms which embodied many of the aspirations of the liberals of 1848. An important approximation to representative government was secured by the Constitution of 1861 and the "fundamental laws" of 1867 which gave the Austrian legislature a legal position of much greater power than that possessed by the German imperial legislature, carrying with it the institution of ministerial responsibility. While the suffrage was at first extremely exclusive, the acts of 1896 and 1907 have introduced universal manhood suffrage. The existence of a considerable degree of social democracy in Austria is also assisted by the passage of a number of important social reform acts since 1885 which have not been simply a perpetuation of the benevolent despotism of Joseph II, but have been largely a result of the agitation of Socialists and Liberals. Economic democracy has appeared in Austria as a result of the legalization of trade-unionism in 1869 and its subsequent growth since that time. While many influential vestiges of autocracy still remain in Austria in theory and law, and many more in actual fact, there can be no doubt that Austria has advanced much further along the "democratic path" than her great mid-European ally.

Hungary, however, has been little affected by the progress of either political or social democracy in the other member of the Dual Monarchy. It has made almost no advances in a liberal direction beyond the situation which existed in 1847 except to retain the act of the liberals of 1848 abolishing the political and economic aspect of feudalism. Hungary remains to the present day politically and socially the most illiberal, archaic and mediaval of any great European nation.

In Italy the permanent establishment of parliamentary government was anticipated by Charles Albert of Piedmont in 1847-48 and was assured by the efforts of Cavour, a great admirer of the English system and one of the most vigorous advocates of parliamentary institutions among the liberal statesmen of the 19th century. The necessary complement of parliamentary government, universal suffrage, was secured by the laws of 1882 and 1912. Finally, social democracy has made great strides in the laws of 1886, 1898, 1908 and 1912 which protected the labor of women and children, insured the working classes against accident, sick-
ness and old age and established a national life insurance system. In Italy trade-unionism has had a very recent origin and development. Coming into existence along with the growth of the strength of radical parties recruited from the proletarian, trade-unionists have been little hampered in Italy by restrictive legislation.

In Russia, which retained most aspects of the mediaeval system unimpaired, with the exception of the transitory reforms of Alexander I, down to the middle of the 19th century, every epoch-making step was taken in the formal abolition of serfdom by the decree of Alexander II on 3 March 1861. The adjustment of the conditions of emancipation, however, brought little progress in the direction of social democracy, but resulted essentially in a transformation of the peasantry from serfs of nobles to *serfs of the state.* Not until the manifesto of 16 Nov. 1905, the edicts of November 1906 and the sweeping land reforms of 27 July 1910 and the abolition of the Emancipation Act of 1861 and the real abolition of serfdom actually accomplished. The first important movement in the direction of political democracy in modern Russia came in 1864, when Alexander II issued his noble decree creating the local assemblies or *zemstvos,* thereby introducing some degree of local self-government into Russia, something which had not existed since the period of centralization under Peter the Great at the opening of the 18th century. After the Polish revolt of 1863, Alexander II, like his uncle, Alexander I, abandoned his early reforming tendencies and the night of reaction settled upon Russia which was not to be broken for 40 years, in spite of the policy of revolutionary terrorism and the assassination of tsars, dukes and public officials. But the grip of reaction, which assassinations could not break, was weakened by that deadly and persistent enemy of mediaevalism in politics and society — the industrial revolution — which first began to affect Russia on a considerable scale in the nineties during the ministry of Witte. This greatly strengthened the hitherto insignificant Russian middle class, in which lay the only hope of liberalism. Guided by such able leaders as Professor Miluykov and aided by the disasters of the Russo-Japanese War, the bourgeoisie, in the revolutionary movement of 1905-06, were able to extort from the tsar the grant of approximate universal and the creation of a constitutional parliamentary government. When freed from the strain of war, however, the tsar, encouraged by his reactionary ministers, proceeded to abrogate his liberal measures by lowering the powers of the Duma and by altering the electoral law so as to defeat the principle of universal suffrage. While this reactionary policy proved temporarily successful, in 1917, disasters more serious than those of 1904-05 drove the discredituated autocracy from Russia in complete rout. During the summer of 1917 the Russian revolution passed through those stages, so familiar to students of French history between 1789 and 1793, from the control of constructive bourgeois statemen to that of the leaders of the Bolshevik mob. The ultimate outcome of the revolution cannot be predicted, but it is probable that it will be as impossible to re-establish the conditions of 1900 in Russia, as it was in France to bring about a return to the order of things which existed in 1788.

In the United States democracy was nearer to realization in 1800 than among European countries, and, consequently, the advances made since that time have been more gradual and less spectacular than those in Europe. In the first half of the century the main *achievements* in *democratizing* the nation consisted in the abolition of the aristocratic property qualifications for the exercise of the suffrage and in the vulgarization of the concept and practices of democracy, as a result of the Jacksonian system. To men like Jefferson democracy had a strong Aristotelian flavor, and great emphasis was laid upon special training, high intelligence and expert direction of government. With the advent of the Jacksonians all this was changed. The *dangers* of special preparation for office were emphasized, supreme faith was put in *pure* benefits of office and the *spoils* system were made the indispensable guides for administrative procedure. It was not strange, then, that the rule of statesmen ceased in the United States and the era of politicians, so inseparably connected with the democratic system, which later scandals of the *spoils system* were in some degree curbed by the movement for civil service reform which began in the administrations of Grant, Hayes and Arthur. This salutary tendency was continued and supported by Cleveland, particularly in his second term, and though it was weakened somewhat by McKinley, it was revived with renewed vigor by Roosevelt and Taft. Even firmer and more extensive is the hold of the spoils system on American State and local government. Democracy in America has, thus, failed to produce that efficiency in the public service which has been realized in autocratic Germany or in democratic England and France. The most pressing problem in American politics is to work out a plan for the introduction into the democracy, already won, of the principle of special fitness for public service. The great obstacle to social democracy in America — negro slavery — was removed in part in 1863, but this question of the oncoming democracy has been complicated with the much more difficult problems of race prejudice, and its final solution is not likely to be arrived at for a century. In many ways the show of strength of the Progressive party and the victory of the Democratic party in 1912 may be regarded as a gain for social democracy as they were symptoms of a great popular protest against the domination of American politics and legislation by the conservative wing of the capitalistic class, which had become entrenched in American politics as never before, after the retirement of President Roosevelt. Economic democracy seems legally if not actually achieved in America. The use of *blanket injunctions* against trade unions, so common in the labor disputes of the Republican age, has declined greatly, and the attempt of the conservative capitalists between 1908 and 1912 to bring the trade unions within the reach of the anti-unionism acts was at last defeated by the Clayton bill. Finally, it might be noted that "democracy in America* is no longer restricted,
as it was in the time of De Tocqueville, to the United States alone, but has become an assured fact in the Dominion of Canada and has made notable advances in some of the leading countries of Latin America.

Nor is the United States, as it was in De Tocqueville's day, the most advanced and extensive laboratory in the democratic experiment. That position has passed to the Australian possessions of Great Britain. Building on the bases described in De Tocqueville, Australia and New Zealand have passed far beyond their model in the originality and extent of their experiments in social, economic and political democracy. With their universal male, and practically universal female suffrage, their parliamentary government, their elaborate series of social reform measures, and their original experiments in attempting to solve the perplexing problems of economic democracy they are easily entitled to the front rank in the vanguard of the world's progress toward ultimate democracy.

These notable achievements, which have been too briefly enumerated above, have constituted great strides in the direction of political democracy since 1800, but they have left many great problems unsolved and to meet this will have to be met and conquered before democracy can be regarded as finally achieved. The securing of universal suffrage and representative government has made political democracy possible, rather than assured its existence. As Mr. Bryce and Mr. Bell have so well pointed out, the political boss has proved quite as much of an obstacle to modern democracy as did the feudal lord to democratic tendencies in the mediæval period. Attempts have been made, which are as yet only partially successful, to eliminate his sinister influence through such devices as the direct primary and the civil service laws. Also archaic forms of political institutions have often been found unsuited for a rapid and flexible adjustment to the desires and needs of the people and such machinery as the initiative, referendum and recall has been introduced in the hope of making government more sensitive and responsive to the public will. Again, many of the problems connected with the perfection of representative institutions are yet to be solved and schemes are being proposed and adopted which embrace the principle of minority and proportional representation and the representation of professional and economic groups. Then Mr. Hobhouse and others, from the standpoint of political theory, and President Wilson, from the position of the constructive statesman, have reminded the world that most difficult and perplexing problems are involved in reconciling political democracy at home with the repressive forms of government in other countries. Finally, no one can seriously maintain that social and economic democracy are yet fully achieved when such extremes of social and economic position exist as are revealed, not in the morbid harangue of the soap-box orator, but in the sober and reliable statistics gathered by every great modern nation. While it is neither probable nor desirable that society will permanently adopt any method of graduating social and economic reward other than that of services rendered, it is a patent fact that the prevailing methods of determining the value of services is sadly antiquated and in need of revision, particularly in the direction of preventing rewards from being inherited instead of earned. It is further necessary to take such steps as shall be required to ensure that all members of society may receive adequate equality of opportunity and equipment for rendering services to society and receiving their reward therefor.

There can be no doubt that the present World War will have a far-reaching effect upon the future of democracy, not only in its reaction on the domestic policies of the various States involved, but also in the readjustment of nationality and imperialism in a manner more in accordance with the principles of self-determination and democracy. While there are powerful classes, organizations and individuals in every country opposed to Germany, who are really much more in sympathy with the German system, principles and practices than with true democracy in politics, science and industry, it is certain that as the gigantic conflict has progressed it has assumed more and more the nature and characteristics of a final struggle between arrogant nationalism and mediæval autocracy, on the one hand, and modern democracy and socialism on the other. A profound change in the political and social order, comparable only to that which took place from 1789 to 1815, must be the inevitable outcome.

The development of the importance of democracy as a problem for theoretical analysis by the various branches of social science since 1800 has been fully as remarkable as the phenomenal growth of democracy in social, political and economic life. As was pointed out above, democracy until this period was not of sufficient importance in political philosophy ever to have received a comprehensive and systematic analysis by a political theorist. Since the beginning of the 19th century, however, works on various phases of democracy have appeared in such a volume that only a few leading tendencies can be noticed in the scanty space which remains.

In the first place, it is interesting and significant that the chief trends in the development of democracy in political theory and belief, and, to a large degree, were determined by the actual development of democracy in practice. Just as the first great advances toward democracy in the 19th century were the work of the middle class advocates of laissez-faire, so the first great expositions and defenses of democracy came from individualists in political theory such as Jefferson, Mill, Cobden and Spencer, who defended a semi-Aristotelian variety of democracy, in which the masses should participate but should be directed by the intellectually élite. Again, in the period of imperial dominion and, to the fact that democracy has in fact been made more inclusive to embrace the proletariat as well as the bourgeoisie and has tended to adopt a broad program of social reform and state activity, to-day the chief advanced exponents of modern democracy are men like the great socialist leaders Bebel, Liebknecht and Jaurès, such radicals as H. G. Wells, Bernard Shaw and others of the English Fabian group, and sociological reformers who advocate a policy of extensive state activity and a radical program of social reconstruction in
behalf of the proletariat. The present day adherents of the mid-Victorian individualism of Mill have become the conservatives, who, in political theory, occupy to-day the position once held by the Marxists. The early defenders of liberty, Dugald Stewart and their apologists, Boual, De Maistre, and Von Haller.

An interesting development in the field of the analysis of democracy in social and political theory has been the clarification of the definition of democracy. The early definitions were generally formalistic and concerned chiefly with such problems as distinguishing between "pure" and "representative" democracy and analyzing the political concept of democracy. Especially important has been the "democratization" of the very conception of democracy. The old Aristotelian notion of the "people" as the upper and middle class members of society, which persisted down to the close of the 18th century, has been supplanted by the newer view which regards the people as embracing all the members of society with no exception. Consequently, the phrase "government by the people" meant quite a different thing when used by Lincoln than it did when employed by Aristotle, Cusanus, Locke or Jefferson. Again, more recent students of the subject have come to see that democracy is far more than merely a form of government. Professor Giddings, who may be taken as typical of the recent synthetic interpretation of democracy, finds that democracy is a form of government, a form of the state and a type of social organization and social control. As a form of government a "pure" democracy is held to mean the enfranchisement of the majority of the population and the direct participation of the whole mass of the citizens in the operation of all the affairs of government. The much more common "representative democracy" is defined as one in which the citizens govern indirectly through periodically selected deputies or representatives. As a form of the state democracy implies the existence of popular sovereignty. Lastly, as a form of society democracy means both a democratic organization and control of non-political forms of activity and a determination of public policy by a majority of the citizens. (For a detailed analysis of the latent potentials of every member of the society, and imposes upon society the moral obligation to do everything in its power to hasten the realization of such a condition.

Another phase of the development of the theory of democracy in the last century which can only be touched upon here is the great controversies over the merits of democracy as opposed to monarchy and aristocracy. That anyone should have thought democracy worthy of a lengthy and sustained attack on the part of Montesquieu and the growing importance of the subject, for such a thing rarely or never occurred before this period. The first phases of the controversy, following the French Revolution, were particularly acrimonious and partisan when the reactionaries, such as Burke, Bonald, De Maistre and Von Haller bitterly attacked the new order of things and were answered in kind by its admirers such as Paine, Jefferson, Bancroft and Lamartine. The more recent echoes of the Burke-Paine controversy have been more scholarly and temperate. Maine, Leveson, Le Bon and Tocqueville have questioned the origins of democracy and they have been effectively answered by Giddings, Sumner, Lowell, Eliot and the English Liberals and Fabians. On the whole, English, French and American writers now tend to defend the efficacy of a democratic form of social and political organization, while Teutonic writers, with the exception of the Socialists, have drifted away from their mid-century liberalism and have tended more and more to defend autocracy. Both tendencies have, no doubt, been the logical outgrowth of their social and political environment.

The remaining tendency in the development of democratic theory, and that which is destined to bring the most fruitful results, has been the gradual shift of method from a priori mythology and generalization to what some theorists imagine democracy to be, to a real concrete and inductive study of democracy in operation and an analysis of its fundamental foundations. The first conspicuous case of a concrete study of democracy in action was made by De Tocqueville nearly a century ago and it remained for over a half-century the only analysis of its kind. James Bryce next essayed the task with equal success in his remarkable "American Commonwealth." Still more recently, Hofstadter and Croly have continued this line of approach in a brilliant but less comprehensive manner. These studies, however, though epoch-making, were mainly descriptive rather than analytical. The need of a more profound analysis has been effectively stated by Mr. Graham Wallas and a number of fragmentary attempts have been made to supply this need. The impulse to this more penetrating analysis has come mainly from sociologists and economists, as the political scientists have seen the content to proceed with the further development of the external, and somewhat superficial, formalistic and legalistic line of approach to politics, which received its most effective formulation in the monumental works of Professor Burgess. Professor Beard's brilliant and original torso has for the first time presented in their true perspective the origins of American democracy. Mr. Bentley, in a profound and too little read book, has brought the methodology of Gompowicz, Ratner and Toomer to bear on an analysis of that struggle of economic interests in society and politics which furnishes the only key to the understanding of so many problems in modern political life. The sociologists, particularly in America, have shown that democracy is not something that can be plucked from the clouds, but requires certain indispensable conditions in the social environment for its successful operation, and they have tried to indicate the nature of some of these indispensable prerequisites of successful demo-

Professor Giddings, in a number of thoughtful volumes and essays, has sketched the
environmental background which determines the nature of political life and organization, has pointed out the necessity of homogeneity of mental reactions for the existence of a liberal and democratic society, his non-monologizing of the Aristotle-Harrington conception of the leadership of the intellectual élite with the modern view of the necessity of a democratic control in society, and has outlined the significant reasons for believing that democracy and materialism are not mutually exclusive. Professor Ross has carried out Professor Giddings' conception of the necessity of homogeneity and general intelligence for the successful operation of a democracy and has shown by trenchant writings the grave dangers to American democracy from the carelessness and indifference of the government in allowing the unrestricted immigration of heterogeneous and ignorant elements from the "surplus populations" of Europe. Also, following out Professor Giddings' emphasis on the importance of racial and psychological homogeneity in democracy and upon the determination of political organization by the conditions in the social environment, Professor Tenney has pointed out many of the most important conditions and prerequisites of democracy and has sounded a note of warning against the dangers latent in the admission to the United States of peoples and classes who neither satisfy these conditions nor can be made to satisfy them by assimilation into the population. Professor Cooley, in a brilliantly written work, has analyzed, in a penetrating manner, the psychological problems inherent in the organization of democratic society on a large scale and has made numerous helpful suggestions as to how some of these perplexing problems may be solved.

The students of social psychology, such as Sighele in Italy, Tarde, Durkheim and Le Bon in France, Bagehot, Wallas, MacDougal and Trotter in England, and Giddings, Sumner, Cooley and Ross in America, have analyzed the diverse phases of those socio-psychic phenomena that affect group behavior and are especially prominent in modern democracies with their predominance of urban life and the resulting increase in the volume and variety of psychic stimuli. Professor Ellwood, in several erudite and lucid volumes, has produced a synthesis of the chief results of the work of the social psychologists and has indicated their bearing upon the problems of politics in general and of American democracy in particular. Finally, statisticians, led by Professors Mayo-Smith and Willcox, have begun that quantitative measurement of political and social phenomena which Professors Wallas and Giddings have insisted is the only way in which politics and sociology can be raised to the level of true sciences. These diverse but complementary contributions toward a concrete investigation and a fundamental analysis of the problems of democracy doubtless forecast the most fruitful tendencies in the further advancement of the theory of democracy. The synthesis of these various lines of approach to the analysis of the foundations of democracy—geographical, economical, biological and psychological—studied by the exact methods of statistical measurements, is the most pressing task which awaits execution in the field of political and social theory.

DEMOCRACY

Harry E. Barnes,
Lecturer in History, Columbia University.

DEMOCRACY, The Nature of. The word "democracy" (Greek, demos, the people) means the rule of the people. The meaning of the word "people" has been different from age to age, so that to understand the nature of democracy we must view it as an historical process of development.

Historical Phases of Democracy.—The conclusion of present-day anthropologists is that primitive society and primitive government were everywhere essentially democratic. That is, in primitive society there existed only natural class distinctions such as the distinctions of age, sex and capacity; so that government as existed in primitive groups was usually based upon the customs and the opinions of the adult members of the group—the headmen, leaders or chiefs, usually being selected by the free suffrages of the group. The case of the North American Indians with their clan and tribal assemblies and councils will serve as an illustration of this primitive democracy. Such primitive democracies usually decided what the action of the group should be, whether it concerned the election of a chief, the making of war or a penalty for some offender against tribal usages, only unanimously. A discussion was held until practically unanimous agreement was reached regarding the policy of the group, usually without formal voting.

In primitive democracies the "people" were the whole membership of the primitive group (clan or tribe) of adult age, though among some primitive peoples, such as the Australian aborigines, the women seemed to have had very little voice. The organization and functions of such primitive democracies were of the simplest sort and they were based almost wholly upon custom, we might almost say instinctive, usages. A democratic form of group control was possible because of the similarity of the habits, feelings and ideas of all members of the group.

Primitive democracy was gradually superseded during the period of barbarism, owing to the stresses and strains of the prolonged and constant warfare which characterized that stage of social evolution, especially of warfare for purposes of conquest, by more despotic types of government. The war chief became a king, usually, however, with his authority more or less limited by the tribal council. After the conquest and subjugation of one group by another centralized social control in the hands of definite authorities became even more necessary. However, the tradition that the freemen of the dominant tribe were the source of this authority persisted; and in some groups after the subjugated elements had become recon- ciled to their position as slaves, the freemen of the dominant or conquering group drove out their kings and their authority again among their own male members. Thus arose the "ancient democracies," such as those of early Greece and Rome.
mocracies were of a very limited kind. The "people" in this case consisted of the freemen, the warriors, of the conquering tribe or group, while from one-half to four-fifths of the popu-
lation were slaves. The democracies of classic antiquity were thus of the
authoritative and coercive type. This is a
point not always recognized, but which should
be carefully borne in mind in considering the
nature of democracy. "Primitive democracy,"
as we have seen, was a democracy which
sprang spontaneously from the similarity of
habits, feelings and ideas of the whole group;
while "ancient democracy" was the effort of a
master class, or conquering group, to dominate
a very much larger group with its "mores." It
was democratic only with reference to the
members of this master class, while with refer-
ence to the whole population it was aristoc-
ocratic or oligarchic.

The third stage of the evolution of demo-
cratic society and government, namely, "mod-
ern democracy," is much more complex and
must not be confused with the two preceding.
Like primitive democracy, modern democracy
must be seen in the rule of the people, or public opinion. Unlike ancient democracy, modern
democracies generally recognize no subject or
servile class, and of recent years, the
tendency is for all adult members of the political
group, whether male or female, to participate
in the public opinion.

In other words, modern democracy is that form of social control in which the opinion
will of every adult member of the group enters
into the determination of the group behavior. It
is a phase of social evolution which attempts
to replace individualism and collectivism. Instead of being a mere stage in social and
political development, as manifestly was the
case both with primitive and with ancient de-
mocracy, modern democracy believes itself to
represent the final phase of social control as
of political evolution. It depends not only upon
the freedom of the personality of the indi-
vidual, but also upon the equality of social and
political rights and upon the recognition of the
solidarity, or fraternity, of all members of the
group. Its method as a process of social con-
trol is not through the development of mere
formal likeness but in the population by
cohesive authority or otherwise, but rather
through the development of rational likeness
by means of free discussion, the un-
trammeled formation of public opinion and
the free selection of leaders or agents of au-
thority.

Democracy as a Form of Social Control.

The exact significance and nature of de-
mocracy remains the subject of much specu-
lation and is best brought out if we consider briefly the
historical succession of forms of social con-
trol. The lowest form of group control of
which we know is that which rests chiefly
upon the instincts and upon the correlated se-
lective processes of the natural environment.
Such control is characteristic of animal groups;
but the lowest human groups of which we have
knowledge show a very different type of com-
trol—that of habit, or of custom and tradi-
tion. All existing savage communities of
human kind universally show this type of con-
trol and we have seen it represents the primitive human social condi-
tion. A third form of social control is that
in which the control is exercised by the despotic
power of a small group of individuals over a
larger group. This control, as we have seen,
spurred from the conquest of one
group by another. Such an authoritarian type
of social control characterized the social and
political life not only of barbarous peoples,
but also of peoples in the lower and middle
phases of civilization. Authoritarian or des-
monic control could not arise, of course, until
some machinery of government had become
established. The ruling class in such cases
often maintained, as we have seen, democratic
relations within their group, but they
established and maintained the unity of the
population of the group as a whole through a
fear-inspired obedience which finally estab-
lished habits of solidarity. The present
nation must of necessity be authoritarian and
modern world, until very recent times, have been
authoritarian societies of this sort.

A fourth and higher type of social control,
however, has been gradually emerging among
modern civilized nations, a type of control in
which the unity of the group is secured not so
much by coercive authority as through the indi-
direct means of rational discussion, the for-
mation of a rational public opinion and the
free selection of leaders. This is what we may
call "free society" in contrast with the authori-
tarian and custom-rulled societies of the past;
and this is modern democracy. It recognizes
not merely that certain rights belong to the
individual as a member of the group, but also
that certain functions pertain to the individual
in controlling the behavior of the whole group.
As Hobhouse says, "It founds the common good
upon the common will, in forming which it
bids every grown up, intelligent person to take
a part." Modern democracy is therefore much
more than a form of the state or of govern-
ment. It is rather a new phase of social evolu-
tion, a goal toward which all human history
has been striving. Whether it will succeed or
not obviously depends upon the effectiveness
of indirect means of social control, such as
education, public discussion and the possibili-
ity for mass movements of men to form rational
opinions and execute rational decisions as a
group; since social control and social unity
are necessities of social existence. If dem-
ocracy fails, obviously social control must
revert to control by a master class. It is for
this reason that it is rightly said that democ-
rracy is "the great adventure of modern civil-
ization."

In democratic societies, then, public opin-
on is the force which lies back of the power
of all regulative and corrective action, the
action as public opinion becomes rational and
powerful can a democratic society be efficient
and successful. For this reason democracies
depend upon free thought, free public dis-
cussion, free assemblage and a free press. If
these rights are denied it is obvious that the whole machinery of intercom-
munication in the group will be hampered,
that it will be impossible to compare ideas and to come to a rational judgment regarding group policies. It is only through free discussion and the formation of a public opinion untrammeled by either the prejudices and emotions of the mob or the interests and power of some special class, that democracy can be what Mazzini declared it should be, "the progress of all through all, under the leadership of the best and wisest."

There has been much debate whether the principle of democracy should be liberty or equality. In practice, however, both absolute liberty and absolute equality are destructive of democracy. Too great liberty has been found to lead to the exploitation of the weak by the strong and indeed to the negation of all government and all forms of social control. In brief, it leads to anarchy. On the other hand, nothing has been more destructive of democracy than attempts to realize in social and political life an absolute or dead-level equality. In this case, social efficiency and liberty both are destroyed. The greatest degree of absolute equality in society, indeed, seems more compatible with certain forms of autocracy than with democracy. For this reason, many political writers have usually concluded that democracy rests upon, not absolute, but relative liberty and equality among citizens. The truth seems to be, however, that the liberty and equality of democracy, if not socially destructive, must both rest upon another foundation. Without a sense of the interdependence and oneness of things, we mean such sympathy, understanding and good will among the members of the group that what they do collectively is a spontaneous expression of the inner psychic unity of the whole group, or at least of a large majority of its members. Democracy, in this sense, doubtless remains largely a social and political ideal but such sympathy, likeness, and good will are the necessary sociological bases of successful democracy.

In answering the question, "Upon what basis have free communities risen and flourished?" Professor Giddings very rightly replies: "Always this: the people that have made them and maintained them have been sufficiently likeminded, sufficiently alike in their purposes, in their morals, in their ambitions and ideals, in their views of policy and method, to work together spontaneously. Naturally there has been among them what the old Roman lawyers called "a meeting of minds," that without a whip over them, or a strong hand to hold them together they have collectively carried on the struggle for existence and advantage, freely and effectively. They have all seen the same truth; they have all wanted the same success, they have striven by the same method for the realization of the same great purpose."

**Democracy as a Form of the State and of Government.**—As a form of the state democracy means what is ordinarily called "popular sovereignty." It is the like participation of all adults in creating the actual power that is sovereign in the state at any given time. As a form of government democracy is the actual rule through universal suffrage of the citizens taken as a mass. Unlike primitive democracies, modern democracies have found it necessary to adopt the principle of "majority rule" in reaching political decisions. Unanimity is not possible in the great complex societies of modern civilization. Decisions upon public policies and leaders to carry out these policies are usually reached, therefore, by a majority vote. Unfortunately, in this interdependence of the interests and power of some special class, that democracy can be what Mazzini declared it should be, "the progress of all through all, under the leadership of the best and wisest."

With further discussion a more fully developed social consciousness and a social decision can be reached which are truly representative of the will of the group. The dangers of majority rule in complex modern societies can best be met, therefore, by such means of public education as will arouse fully social consciousness regarding any given situation. This again, of course, shows that modern democracy to be successful depends upon highly developed intelligence and patriotism in the individual citizen.

Much has been made of the distinction between "pure" and "representative" democracies. The pure democracies are those in which questions of public policy are settled by the meeting of men in mass, such as in the assembly of primitive democracies, in the cantonal meetings in Switzerland and in the New England town meeting. Government by assembly, or by mass meetings, however, is quite impossible in complex societies, even though there are certain advantages in the way of securing unanimity and mutual understanding in such a system. If means of intercommunication are sufficiently highly developed and kept untrammeled, moreover, there is no reason why democratic government should not work equally successfully under the system of delegates or representatives. Popular control in representative democracies obviously depends upon some system for the "recall" of officials, when elected, at the will of the electors, if they are not found to be truly representative. For the same reason the initiative and referendum are necessary means of completing representative democracy in the field of legislation. Where these methods work badly, as it must be acknowledged that they often do, it is because democracy itself has failed, not for lack of intelligence and patriotism on the part of the people. In all the democratic nations of the present, the tendency is toward more direct government; and this on the whole is probably to be commended, for the exercise of the responsibilities of government is itself an education. If democracies are to be a success, the whole mass of citizens must be trained in the knowledge and art of self-government.

Whether democracies are "absolute" governments or not has also been a much debated question. Rousseau and perhaps a majority of the popular exponents of democracy have held that democratic rule is "absolute," not less than autocratic rule, since "sovereignty" by its very nature must be absolute. In practice, however, democratic governments have usually refrained from exercising absolute control over many things, such as the opinions, beliefs
and practices of the people in religion and in many other matters. "Limited majority rule," instead of "absolute majority rule," is coming more and more to be recognized as the single principle of democracy, since the belief in the absolute state, whether democratic or autocratic, is seen to be contrary to the practices of the most enlightened democracies and fraught with danger to the democratic principle itself. Freedom of thought, speech and conduct may easily be entirely lost.

Modern democracy is, however, far from giving allegiance to the principle that "that government is best which governs least." On the contrary, modern democratic government is constantly extending its functions and recognizes that government as an agency of social control is coextensive, as Mill said, with human interests. Nevertheless, a too rapid extension of the functions of government may prove impracticable or dangerous under present conditions. This is especially true of democratic governments, because they depend so much upon the development of intelligence and character in the individual citizen. Again, it must be remembered that even democratic governments in their control of social life are limited in their direct action to relatively external conditions and that their success depends not so much upon their power of coercing the individual as upon eliciting his initiative and co-operation.

Democracy as a Form of Industry.—It must be acknowledged that a democratically organized industry would be something very far removed from traditional modern capitalism. It would imply the giving of a large voice in the management of industry to the workers; it would also imply the giving of equal remuneration for equal services; finally, it would imply fraternity in the management of industrial enterprises and in industrial life generally. Whether such a democratization of industry implies complete government ownership or not, we need not here discuss. Obviously, it does imply such a collective control of industry that the opinion and will of every individual in the political group will count in the determination of industrial policies. This implication of democracy is being rapidly perceived by all democratic nations; and democratic governments are now accordingly rapidly increasing control in the interests of democracy. Socialism, in this moderate sense of democratic control and regulation of industry in the interests of public welfare, would seem near realization in the immediate future in all fully democratic nations.

However, the relations between democracy and the modern socialistic movement are very complex. Socialists are wont to claim that socialism is simply democracy carried over into industrial relations. But many socialists, favor, not democracy as we have defined it, but rather working-class domination. Apparently many socialists wish the establishment of socialism whether it comes through the wishes of the majority of citizens or not. This particular class of socialists we may call the revolutionary socialists, as they are not inclined to wait for the coming of socialism through the working of democratic machinery. Quite recently some prominent German socialists have claimed that socialism will depend for its successful development, not upon a democratic, but upon a bureaucratic, social and political organization.

Democracy as a Form of Social Life.—In its essence, as we have seen, democracy is a form of social control; but social control is broader than government, extending even to the intimate relations of individuals in society. Democracy is gradually coming to expression in these relations, also. Thus in the family life, we find the authoritative family to be passing and a more democratic type of the family to be evolving. In the democratic family quite evidently a larger measure of liberty and equality must be introduced; but here as elsewhere in democratic society, fraternity, even more than liberty and equality, is necessary if a democratic type of family life is to succeed. A larger and larger measure of democracy is indeed, being introduced into all of the "free associations" and the institutions of society. Churches are gradually becoming more democratic in their spirit, although older forms of governmental organization may persist. Even schools are trying out the principles of self-government. In the still more intimate personal relations of social life the most advanced democratic peoples are striving to realize a higher degree of liberty and equality among their members. But in these more intimate relations democracy has developed slowly and relatively unevenly, because here perhaps more than anywhere else in the social life, democracy is dependent upon fraternity, that is, upon sympathy, understanding and good will.

Democracy and Social Efficiency.—Critics of democracy, such as Lecky, have always pointed out that democracy is apt to mean the control of ignorance and mediocrity and so is incompatible with social and political efficiency. The Great War has brought this question again to the forefront in democratic nations and some even claim that it will decide the matter. It may be pointed out that whether democracy means the control of the inefficient and mediocre will altogether depend upon circumstances. Doubtless the mass of men can never be trained to be experts in the work of government and of social control generally; and such work, it may be admitted, in order to be efficient, must be done mainly by experts. However, the masses can be taught to select intelligently their leaders, and with patriotic rather than selfish ends in view; and in the long run the mass of the group are more to be trusted in the determination of group policies than any governing class, however wise that class may be. Democracies, then, can be equally efficient, probably more efficient, than autocracies, when all of their members have been trained so that they will take and play intelligently their part in the social life spontaneously, and not through coercion from above.

CHARLES A. ELLWOOD,
Professor of Sociology, University of Missouri.

DEMOCRATIC PARTY, The, one of the chief political organizations in the United States. To Thomas Jefferson belongs the honor of being the founder, and for a third of a century the undisputed leader, of the Democratic party. Scarcely had the present Constitution been adopted before there appeared a line more or less distinct dividing those who, like Jefferson (q.v.), believed in a people fully capable of self-government and trusted them, and those who, like Hamilton (q.v.), thought that the masses needed to be under the control of a strong and centralized government. This fundamental difference of opinion manifested itself in the formation of the Republican party in 1854, and the antecedent and party organizations were soon perfected.

As Jefferson himself has described the birth of parties in the United States, his opinion can be accepted as authoritative. In a letter written in 1823 just after the close of his life, to William Johnson, he said:

At the formation of our government, many had formed their political opinions on European writings and practices, believing the experience of old countries, and especially of England, as it was, to be a safer guide than mere theory. The doctrines of Europe were that men in numerous associations cannot be restrained within the limits of order and justice, but by forces physical and moral, wielded over them by authorities independent of their will. Hence their organization of kings, hereditary nobles, and priests. Still farther to constrict the brute force of the people, they deemed it necessary to keep them down by hard labor, poverty and ignorance, and to tax them from as few, as much of their earnings, as that unmitigated labor shall be necessary to obtain a sufficient surplus barely to maintain a scanty and miserable life. And these earnings they apply to maintain their privileged orders in splendor and idleness, to fascinate the eyes of the people, and excite in them a humble adoration and submission, as to an order of superior beings. Although few among us had gone all these lengths of opinion, yet many had advanced, some more, some less, on the way. And in the convention which formed our government, they endeavored to draw the cords of power as tight as they could obtain them, to lessen the dependence of the general functionaries on their constituents, to subject to them those of the States, and to weaken those plans for maintaining the steady equilibrium which the majorithy of the convention had deemed salutary for both branches, general and local. To recover, therefore, in practice the powers which the nation had refused and to work to their own wishes those actually given, was the steady object of the Federal party. Ours, on the contrary, was to maintain the will of the majority of the convention and of the people themselves. We believed, with them, that man was a rational being by nature with rights and with an innate sense of justice; and that he could be restrained from the powers which he would be accused of, by moderate and enlightened confidents, to persons of his own choice, and held to their duties by dependence on his own will. We believe that the people himself, and the chosen of the people, as kings, priests, was not the wisest nor best to effect the happiness of the nation, nor that wisdom a virtue were inherited; that the trappings of such a machinery, consumed by their expense, those earnings of industry they were necessary to live and by the inequalities they produced, exposed liberty to sufferance. We believe that men enjoying in ease and security the full fruits of their own industry, felt the interest on the side of law and order, habituated to think of themselves and to follow their guide, would be more easily and safely governed, than with minds nourished in error and vitiated and debased, as in Europe, by ignorance, indigence, and oppression. The cherishment of the people they were our principle, and our aim, the freedom of the other party. Composed, as we were, of the landed and laboring interests of the country, we could not be less anxious for a government in which the permanent interests of the inhabitants of the cities, the strongholds of federalism. And whether our efforts to save the principles and form of our Constitution have not been successful; republican freedom, order, and prosperity of our country determined.

Jefferson not only gave a history of the formation of parties, but for future generations, he enumerated the elements which each party contained. In a letter to C. E. Ebeling in 1795 he said:

Two parties exist within the United States. They embrace respectively the following descriptions of persons. The Anti-Republicans consist of: (1) The old Refugees and Tories; (2) British merchants residing among us, and composing the main body of the Bankers; (3) American merchants trading on British capital, another great portion; (4) speculators and holders in the backs and public funds; (5) officers of the Federal government with some exceptions; (6) office hunters willing to give up principles for places,—a numerous and noisy tribe; (7) nervous persons, whose laguind fibres have more analogy with a passive than active state of things. The Republicans comprehends: (1) The entire body of landholders throughout the United States; (2) the body of laborers not being landholders whether in husbanding or the arts. The latter is to the aggregate of the former party probably as 500 to 1; but their wealth is not as disproportionate, though it is also greatly superior and is in truth the foundation of that of their antagonists. Trifling as are the numbers of the Anti-Republican party, their thirst for power and fear of them an appearance of strength and numbers. They all live in cities together, and can act in a body and readily at all times; they give chief employment to the newspapers, and, therefore, have most of them under their command. The agricultural interests are dispersed over all part of country, have little means of intercommunication with each other, and feeling their own strength and will, are conscious that a single exertion from these will at any time crush the machinations against their government.

Jefferson's philosophic mind sought not only the facts, but the reason for the facts, and in 1824, in a letter to Mr. Lee, he thus classified men according to their party tendencies:

Men by their constitutions are naturally divided into two parties: (1) Those who fear and distrust the people and wish to draw all powers from them into the hands of the higher classes; (2) Those who identify themselves with the people, have confidence in them, cherish and consider them as the most wise depository of the public interests. In every country these two parties exist, and in every one where they are free to think, speak, and write, they will declare themselves. Call them, therefore, liberals and serviles, Jacobins and ultras, Whigs and Tories, Republicans and Federalists, aristocrats and Democrats, or by whatever name you please, they are the same parties still, and pursue the same object. The last appellation of aristocrats and Democrats is the true one expressing the essence of all.

Jefferson's purpose was to found a party that would be really democratic in personnel, in purpose and in method. The party, however, was at first called the Republican party, and afterward the Democratic-Republican party. It was not until in Jackson's time that it became universally known by its present name. As there were no national conventions and no national platforms in the early days of the Republic the position of the party on public questions must be gathered from the words and speeches of the leaders and from the votes of the members of the party in Congress. Jefferson's first inaugural address contains the essence of the party creed as generally accepted during the first quarter of the 19th century. In fact, it is still the creed of the party, and no group of men desiring to maintain an influence in the party can ever now admit any essential departure from it. It will be found below:

About to enter, fellow-citizens, on the exercise of duties which comprehend everything dear and valuable to you,
it is proper you should understand what I deem the essential principles of our government, and consequently those which ought to shape its administration. I will compress them within the narrow compass of a few pages; but not at all its limitations. Equal and exact justice to all men, of whatever State or persuasion, religious or political; peace, commerce, and honest friendship with all nations, entangling alliances with none; the support of the State governments in all their rights, as the most competent administrations for our domestic concerns and the surest bulwarks against Anti-republican tendencies; the solicitude for the laws of the constitution in its whole constitutional vigor, as the seal of our peace at home and safety abroad; a jealous care of the right of election by the people—a mild and safe corrective of abuses which are lopped by the sword of revolution where peaceable remedies would have been inadequate; absolute acquiescence in the decisions of the majority, the vital principle of republics, from which is no appeal but to force, the vital principle and immediate parent of despotism; a well-disciplined militia, our best reliance in peace and for the first moments of war, till regulars may relieve them; the supremacy of the civil over the military authority; economy in the public expense that labor may be lightly burthened; the honest payment of our debts and sacred preservation of the public faith; encouragement of agriculture, and of commerce as its handmaid; the diffusion of information and arrangement of all laws at the bar of the public reason; the independence of the press, freedom of the press, and freedom of person under the protection of the habeas corpus; and trial by juries impartially selected. These principles form the bright constellation which has gone before us and guided our steps through an age of revolution and reformation. The wisdom of our sages and blood of our heroes have been devoted to their attainment, and been the vocal creed of our politics; the faith, the tenet of instruction, the touchstone by which to try the services of those we trust; and should we wander from them in moments of error or of alarm, let us hasten to retrace our steps and to regain the road which alone leads to peace, liberty, and safety.

The first and most fundamental difference between the Democratic party (when it was known as the Republican party, afterward as the Democratic-Republican party and to-day as the Democratic party) and the party which has opposed it (first known as the Federal party, then as the Whig party and more recently as the Republican party) was upon the construction of the Constitution. The former party has insisted upon a strict construction, while the latter has leaned toward a liberal construction of the Federal Constitution. This difference is a natural one for the Democratic party, believing in the right of the people to, and in the capacity of the people for, self-government, has insisted upon giving them as large a part as possible in the control of their own affairs.

It follows, therefore, that the Democratic party favors local self-government and opposes the centralization of power in remote centres. It believes that the nearer the people are to their government the more effective will be their control over it. The various parties that have opposed the Democratic party have given more or less emphasis to the Hamiltonian view and have increased the power of the representative at the expense of the constituents.

While this distinction has not at all times been clearly marked, and while these views have not been held by all the individual members, the general tendency has existed.

In the very beginning this tendency was illustrated in the Alien and Sedition laws enacted by the Federalists and in the Kentucky and Virginia resolutions supported by the Democrats. (See Alien and Sedition Acts; also Kentucky Resolutions and Virginia Resolutions.) Parties in this instance went to the extreme, the Federalists attempting to confer dangerous power upon the Federal government, the Democrats asserting views which were afterward so misconstrued as to weaken the Federal Union. The preservation of the balance between the Federal government and the State governments has always been a delicate matter, and as the line cannot be drawn with mathematical accuracy there has always been room for dispute; the public sentiment having gone to the one side or the other as it was necessary to maintain the equilibrium. It is likely that this discussion will continue, but the efficiency of government in an extreme in either direction will be thwarted by the conservative middle class, which rallies to the support of the side that is attacked.

Beginning with Jefferson's administration in 1801, and continuing to the end of Monroe's administration in 1825, the Democratic party held undisputed sway in the nation. Jefferson, like Washington, refused to consider a third term, and his Secretary of State, James Madison (q.v.), succeeded him. Madison, following the example set by his predecessor, retired at the end of his term, and James Monroe (q.v.), who had been his Secretary of State, succeeded him.

The War of 1812 was conducted by the Madison administration, and it was during this period that the War of 1812 was conducted. The bill for the declaration of war was adopted by a convention of Federalists which met at Hartford, Conn., in December 1814. These resolutions went further in the direction of States rights than either the Kentucky resolutions or the Virginia resolutions. They began by recommending "to the legislatures of the several States represented in this convention, to adopt all such measures as may be necessary effectively to protect the citizens of said States from the operation and effects of all acts which have been or may be passed by the Congress of the United States, which shall contain provisions subjecting the militia or other citizens to forcible drafts, conscriptions, or impressments not authorized by the Constitution of the United States."

While the Hartford resolutions announced a political policy, they had their origin in the commercial interests which were affected by the War of 1812, and the embargo act (see Embargo) which was enacted as a war measure.

The Federal party which supported Clinton's candidacy in 1812 laid great stress upon the commercial interests. The platform adopted by the New York Federalists urged the election of Clinton as the surest method of safeguarding the protection of those commercial interests which were flagging "under the weakness and imbecility of the administration." The Federalists attacked what they called the Virginia regency, and the Hartford resolutions recommended a constitutional amendment making the President ineligible for renomination, and another prohibiting the selection of two Presidents in succession from the same State.

It was during the administration of James Monroe that the doctrine, afterward known by his name, and followed ever since, was promulgated. The doctrine was set forth in a message sent to Congress by James Monroe on 2 Dec. 1823. (See Monroe Doctrine.) The following is the text covering this subject:

In the wars of European powers, in matters relating to themselves, we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we have an right to make preparations for our defense. With the movements on this hemisphere we are, of necessity, more
immediately connected, and by causes which must be obvious to all enlightened and impartial observers. The political system of Europe, with its basis in the idea of national independence and sovereignty, is essentially different in this respect from that of America. This difference must necessarily produce differences in the external policy of the governments and to the defense of our own, which has been achieved by the loss of so much blood and treasure, and which has been purchased with the acknowledged rights and honors of free citizens and under which we have enjoyed unexampled felicity, this whole nation is devoted. We owe it, therefore, to carry it forward to its consummation in the national independence, to form the United States into a powerful and independent nation, without let or hindrance, to the system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies and dependencies of Great Britain, we have nothing to fear from foreign interposition. It is possible that the allied powers should extend their political system to any portion of this continent without endangering our peace and happiness, nor can any one believe that our southern brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition, in any form, with indifference.

This message was written after consultation with Jefferson, who was then living in retirement at Monticello. The following extract from a letter written by Jefferson to Monroe in October 1823 not only shows Jefferson's part in the formulation of the doctrine, but also proves his foresight and his comprehension of American interests and his devotion to the welfare of his country:

"This question, presented by the letters you have sent me, is the momentous which has been offered to my contemplation since that of Independence. That made us a nation, this sets our compass and points the course which we are to steer through the ocean of time opening on us. And nothing can upset the anchor on its uncertain foundations more auspicious. Our first and fundamental maxim should be, never to entangle ourselves in the bruisls of Europe. Our second, never to suffer Europe to intermeddle with its-Atlantic affairs. America, North and South, has a set of interests which are distinct from those of Europe and peculiar in her own. She should, therefore, have a system of her own, separate and apart from that of Europe. While the last is becoming the domicile of despotism, our endeavor should surely be to make our hemisphere that of freedom. One nation most of all, could disturb us in this pursuit, she now offers to lead, aid, and accompany us in it. By acceding to her proposition, we detach her from the bands, being her most natural allies. into the scale of free government, and emancipate a continent at one stroke, which might otherwise linger long in doubt and difficulty. Great Britain is the nation which will do us the most harm of any one, or all on earth, and with her on our side we need not fear the rest. With her, we should most seriously cherish a cordial friendship; and nothing would tend more to knit our affections than to be fighting once more side by side, not that I would purchase even her amity at the price of taking part in her wars. But the present proposition might engage should that be its consequence, is not her war, but ours. Its object is to introduce and establish the American system, of democracy, in all the powers of the world, of never permitting those of Europe to intermeddle with the affairs of our nations, it is to maintain our own principle, not to part from it. And if to facilitate this, we can effect a division in the body of the European powers, and draw over to our side all those powerful moguls entirely we should do it. But I am clearly of Mr. Canning's opinion, that it will prevent instead of provoke war. With Great Britain we have nothing to lose and much to gain, and I think that if we two continents, all Europe combined would not undertake such a war, would they propose to our front line of enmity without superior fleets? Nor is the occasion to be slighted which this proposition offers, of declaring our protest against the atrocious violations of the rights of nations by the interference of any one in the internal affairs of another, so flagrantly begun by Bonaparte, and now continued by the equally lawless Alliance calling itself Holy. But we have just to ask ourselves a question. Do we wish to acquire to our own confederacy any one or more of the Spanish provinces? I candidly confess that I have never understood for the adding which could ever be made to our system of States. The control which, with Florida Point, this island would give us over the Gulf of Mexico, an ally between us and the United States and those powers to declare that we should ever be safe and strong as an independent state, is to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies and dependencies of Great Britain, we have nothing to fear from foreign interposition. It is possible that the allied powers should extend their political system to any portion of this continent without endangering our peace and happiness, nor can any one believe that our southern brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition, in any form, with indifference.

Jefferson died on 4 July 1826, just 50 years after the signing of the Declaration of Independence. Two years before his demise the second great Democratic leader had made his entrance into the arena of politics. Andrew Jackson (q.v.) of Tennessee, the hero of the War of 1812, had grown in fame and popularity from the day he landed under the English at New Orleans. In 1824 he became the nominee of his party, and in the election following received 153,872 votes, as against 105,321 cast for John Quincy Adams; 44,282 cast for Crawford; and 40,597 cast for Henry Clay. In the Electoral College Jackson received 99 votes, Adams 84, Crawford 41 and Clay 37. As no one of the candidates had a majority in the Electoral College the election of the President deeply revolted upon the House of Representatives; and by a coalition between the Adams and the friends of Clay, the former received the votes of 13 States, while Jackson received but 7 and Crawford 4.

The defeat of Jackson after he had secured a large plurality of the popular vote, and a considerable plurality in the Electoral College, aroused great partisan feeling, and from that time until 1828 Jackson was the candidate of the party, his campaign growing in strength as the years proceeded until when election day arrived he had a popular majority of nearly 140,000 and a majority of nearly 100 in the Electoral College. Calhoun was chosen Vice-President at the same time.

The chief features of Jackson's administration were his removal of the South Carolina legislature and his veto of the act for the rechartering of the United States bank. He took vigorous steps to enforce the Federal authority and, in an elaborate message, presented the arguments against the right of secession with force and lucidity never since surpassed. His action in this matter resulted in the alienation of John C. Calhoun, who up to that time had been a staunch political friend.

The figure over the bank charter not only occupied a large part of the time of his administration, but resulted in a controversy that permeated other issues. The Senate passed a resolution censuring him for removing the deposits from the bank, and this became an issue. Under
one of deadly hostility to the best interests of the country, dangerous to our Republican institutions, and the liberties of the people, and calculated to place the business of the country within the control of a concentrated money power and above the laws and the will of the people.

7. Resolved, That Congress has no power under the Constitution to interfere with or control the banking institutions of the several States; and that such States are the sole and proper judges of everything pertaining to their own affairs, not prohibited by the Constitution; that all efforts by abolitionists or others, made to induce Congress to interfere with questions of slavery or to take inscient actions in relation thereto, intended to lead to most alarming and dangerous consequences, and that all such efforts have an inevitable tendency to disturb the peace and happiness of the people, and endanger the stability and permanence of the Union, and ought not to be countenanced by any friend to our political institutions.

8. Resolved, That the separation of the moneys of the government from banking institutions is indispensable for the safety of the funds of the government and the rights of the people.

9. Resolved, That the liberal principles embodied by Jefferson in the Declaration of Independence, and sanctioned in the Constitution, which make ours the land of liberty and the asylum of the oppressed of every nation, have ever been cardinal principles in the Democratic faith; and every attempt to subvert the present privilege of becoming citizens, and the owners of soil among us ought to be resisted with the same spirit which swept the Alien and Sedition laws from our statute book.

As the names of several different persons had been presented for Vice-President the convention of 1840 made no nominations for that office, but adopted resolutions leaving the decision to members of the party in the various States, and trusting that before the election took place the opinion would be so concentrated as to enable the Electoral College to secure the choice of a Vice-President.

Upon the death of Harrison, John Tyler became President, and during his term vetoed two bills which had for their object the re-establishing of the United States Bank. Tyler favored the annexation of Texas, which had separated from Mexico and had existed under an independent government since 1836. Jas. K. Polk, the Democratic candidate, also favored annexation, while Henry Clay, for a third time a candidate for the Presidency, opposed annexation.

In the platform of 1844, the first nine resolutions of the platform of 1840 were reaffirmed, and new resolutions added demanding, first, that the proceedings be limited to the direct object of purchasing the Oregon territory; and then to the national object specified in the Constitution, rather than distributed among the States; second, sustaining and defending the veto of the President which had "thrice saved Americans from the corrupt and tyrannical domination of the Bank of the United States," and third, declaring for the annexation of Texas. The campaign resulted in the election of Polk and Dallas, although their majority in the Electoral College was proportionately larger than their popular plurality.

The campaign of 1848 was waged with Lewis Cass of Michigan and William O. Butler of Kentucky as the Democratic candidates for President and Vice-President. The platform of 1848 reaffirmed that of 1840 and 1844, and added new planks covering new questions. Resolution No. 19 of the platform of 1848 is given below because it reiterates the Democratic contention in regard to the value of self-government. It reads:

Resolved, That in view of the recent development of this grand political truth, of the sovereignty of the people and their capacity and power for self-government, which is prostrating thrones and erecting new foundations of despotism in the Old World, we feel that a high and sacred duty is devolved, with increased responsibility, upon

the leadership of Thomas H. Benton, of Missouri, the Democrats began a fight for the reversal of the action of the Senate, and finally secured a majority of that body and expunged the resolution.

While Jackson's military achievements were the foundation for his early popularity, his great political fame was due to championing the cause of the masses, as against the concentrated power of the wealth. In his message vetoing a bank charter he presented with emphasis and accuracy the Democratic view of the sphere of government. He said:

Distinctions in society will always exist under every just government. Equality of talents, of education, or of wealth, cannot be produced by human institutions. In the full enjoyment of the gifts of heaven and the fruits of superior industry, economy, and virtue, every man is equally entitled to protection by law. But when the laws undertake to add to that advantage artificial distinctions— to grant titles, gratuities, and exclusive privileges—to make the rich richer and the potent more powerful, the humble member of Congress from the western cabin sees the farmers, mechanics, and the laborers—who have neither the time nor the means of going to the metropolis, for themselves, have a right to complain of the injustice of their government.

Jackson's position on the bank charter represented the views of his party adherents. His veto was sent to Congress on 10 July 1831, and it was the main issue of the campaign of 1832, when, with Henry Clay as his opponent, he secured a popular plurality of 157,000. In the Electoral College he had 219 votes as against 49 cast for Clay. His Secretary of State, Martin Van Buren, succeeded him as the Democratic candidate and was elected, having both a popular majority and a majority in the Electoral College. Van Buren defeated William Henry Harrison in that year, and was defeated by him in the following campaign. In the earlier campaigns the nominations were made by a Congressional caucus, or by the various States, but Jackson's renomination in 1832 was made by a national convention held at Baltimore, and Van Buren was nominated by a convention held at the same place four years later.

In 1840 the Democratic convention was again held at Baltimore, Van Buren was renominated and a lengthy platform was adopted. As this platform bore the basic doctrines of the party from that time to the breaking out of the Civil War it is worthy of reproduction. It was as follows:

1. Resolved, That the Federal government is one of limited powers, derived solely from the Constitution, and the grants of powers shown therein ought to be strictly construed by all the departments and agents of the government, and that it is inexpedient and dangerous to make any doubtul constitutional powers.

2. Resolved, That the Constitution does not confer upon the general government the power to commence and carry on a general system of internal improvements.

3. Resolved, That the Constitution does not confer authority upon the Federal government directly or indirectly, to do what the States, contracted for local internal improvements or other State purposes; nor would such assumption be just or expedient.

4. Resolved, That justice and sound policy forbid the Federal government to foster any branch of industry to the injury of an other, or to injure the interests of one portion to the injury of another portion of our common country—that every citizen and every section of the country has a right to demand and insist upon an equality of rights and privileges, and to complete and ample protection of persons and property from domestic violence or foreign aggression.

5. Resolved, That it is the duty of every branch of the government and of every citizen in conducting our public affairs, and that no more revenue ought to be raised than is required to defray the necessary expenses of the government.

6. Resolved, That Congress has no power to charter a United States bank; that we believe such an institution
the Democratic party of this country, as the party of the people, to sustain and advance among us constitutional liberty, equality, and fraternity, by continuing to resist all monopolies and exclusive legislation for the benefit of the few at the expense of the many, and by a vigilant and constant adherence to those principles and compromises of the Constitution, which are broad enough and strong enough to contain the American people, and to exclude the Union itself, as it is, and the Union as it shall be, in the full expansion of the energies and capacity of this great and progressive people.

The Whig candidates, however, Zachary Taylor and Millard Fillmore, were successful that year, having both a popular majority and a majority in the Electoral College. In the campaign of 1852 Franklin Pierce of New Hampshire and William R. King of Alabama were the Democratic nominees, and the platform reiterated the leading planks of 1840, 1844 and 1848.

The platform of 1852 also reiterated the principles laid down in the Kentucky and Virginia resolutions and defended the Mexican War as just and necessary. The campaign of 1852 resulted in an overwhelming Democratic victory, the popular plurality being more than 200,000.

The slavery question was constantly growing in prominence, and at last exerted an influence upon every issue that arose. The position taken by the various parties in regard to the Mexican War was largely determined by the slavery views held by the members of the parties.

The Fugitive Slave laws of the various States also created a considerable controversy, and each election showed an increase in the anti-slavery sentiment. In 1856 the Democratic platform again reaffirmed the principles set forth in 1840 and reiterated in subsequent campaigns. It quoted resolution 7 of the platform of 1840, and said:

That the foregoing proposition covers, and was intended to embrace, the whole subject of slavery agitation in Congress; and, therefore, the Democratic party of the Union, standing on this national platform, will abide by, and adhere to, a faithful execution of the acts known as the compromise measures settled by the Congress of 1850, the act by reclaiming fugitives from service labor included; which act, being designed to carry out an express provision of the Constitution, agreed to with fidelity hereunto, be repealed, or so changed as to destroy or impair its efficiency; that the Democratic party will resist all attempts at renewing in Congress, or out of it, the agitation of the slavery question, under whatever shape or color the attempt may be made.

The Republican party took the name by which the Democratic party was originally known, and its first national convention in 1856, John C. Fremont and William L. Dayton being the nominees. James Buchanan and John C. Breckinridge were the Democratic nominees. They received a majority of 60 in the Electoral College and a popular plurality of 390,000, the Fugitive Slave party, led by Millard Fillmore and Andrew J. Donelson, secured only eight electors but polled 874,000 votes. During the Buchanan administration the Dred Scott decision was rendered, and this, while it was a legal victory for the friends of slavery, resulted in an anti-slavery agitation that inured to the advantage of the Republican party.

In 1860 the conflict between the Northern and Southern Democrats became irreconcilable, and the Charleston convention, which met 23 April, 1860, to adjourn without a nominating ticket. The Northern Democrats met at Baltimore 18 June and nominated Stephen A. Douglas of Illinois for President and Herschel V. Johnson of Georgia for Vice-President, while the Southern wing of the party met at the same place 10 days later and nominated John C. Breckinridge of Kentucky for President and Joseph Lane of Oregon for Vice-President. As the Douglas platforms adopted at that time represented the positions taken by the two wings of the party they will be found in the following:

1. Resolved, That we, the Democracy of the Union convention assembled, hereby declare our allegiance to the resolutions unanimously adopted and declared as a platform of principles by the Democratic convention of Cincinnati, in the year 1856, believing that Democratic principles are unchangeable in the fundamental points to the same subject matters; and we recommend, as the only further resolutions, the following:

Inasmuch as differences of opinion exist in the Democratic party as to the nature and extent of the powers of a Territorial legislature, and as to the powers and duties of Congress, under the Constitution of the United States, over the institution of slavery within the Territories.

2. Resolved, That the Democratic party will abide by the decisions of the Supreme Court of the United States on the question of constitutional law.

3. Resolved, That it is the duty of the United States to afford ample and complete protection to all its citizens whether at home or abroad, and whether native or foreign.

4. Resolved, That one of the necessities of the age, in a military, commercial, and postal point of view, is speedy communication between the Atlantic and Pacific States; and the Democratic party pledge such constitutional government aid as will insure the construction of a railroad to the Pacific coast at the earliest practicable period.

5. Resolved, That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves and just to Spain.

6. Resolved, That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave Law are hostile in character, subversive of the Constitution, and revolutionary in their effect.

7. Resolved, That it is in accordance with the true interpretation of the Cincinnati platform, that, during the existence of the Territorial government, the measure of restriction, whatever it may be, imposed by the Federal Constitution on the power of the Territorial legislature over the subject of domestic relations, as the same has been or shall hereafter be finally determined by the Supreme Court of the United States, shall be respected by all good citizens, and enforced with promptness and fidelity by every branch of the general government.

The Breckinridge platform was as follows:

Resolved, That the platform adopted by the Democratic party at Cincinnati be affirmed, with the following explanatory resolutions:

1. That the government of a Territory, organized by an act of Congress is provisional and temporary; and, during its existence, all citizens of the United States have an equal right to settle, with their property in the Territory, without their rights, either of person or property, being destroyed or impaired by congressional or territorial legislation.

2. That it is the duty of the Federal government, in all its departments, to protect when necessary, the rights of persons and property in the Territories, and wherever it can be done it is its constitutional duty.

3. That when the settlers in a Territory having an adequate population, form a State Constitution in pursuance of law, the right of sovereignty being vested in the people, and the State thus organized ought to be admitted into the Federal Union, whether its Constitution prohibits or recognizes the institution of slavery.

4. That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves, and just to Spain, at the earliest practicable moment.

5. That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave Law are hostile in character, subversive of the Constitution and revolutionary in their effect.

6. That the Democracy of the United States recognize its duty to adhere to those principles of the Constitution which are broad enough and strong enough to contain the American people, and to exclude the Union itself, as it is, and the Union as it shall be, in the full expansion of the energies and capacity of this great and progressive people.

Whereas, One of the greatest necessities of the age, in a political, commercial, postal, or fiscal point of view, is a speedy communication between the Pacific and Atlantic coasts; therefore be it

Resolved, That the Democratic party do hereby pledge themselves to use every means in their power to secure the passage of some bill to the extent of the constitutional authority of Congress, for the construction of a Pacific railroad, from the Mississippi River to the Pacific Ocean, at the earliest practicable moment.
It will be seen that both conventions reaffirmed the Cincinnati platform of 1850. It will be noticed that there was no difference between the platforms grew out of the slavery question, the Douglas platform leaving the question to the Supreme Court, promising to abide by its decision; the Breckinridge platform declaring that the people of a Territory had the right to decide the question for themselves, and also declaring that the citizens of the various States had the right to settle in a Territory and carry their property with them (meaning slaves) without being interfered with by congressional action.

The election of 1860 resulted in a victory for the Republican party, whose candidates, Abraham Lincoln and Hannibal Hamlin, ran upon a platform denouncing "threats of disunion," and saying that the new dogma, that the Constitution was a contract, could slavery into any or all of the Territories of the United States, was a "dangerous political heresy." The platform did not call for the abolition of slavery in the States where it existed, but asserted that "the normal condition of all the territory of the United States is that of freedom," and that the Republican fathers, when they had abolished slavery in all our national territory, ordained that "no person shall be deprived of life, liberty or property, without due process of law," it becomes our duty by legislation, whenever such legislation is necessary, to maintain this provision of the Constitution against all attempts to violate it; and we deny the authority of Congress, of a territorial legislature, or any individual, to give legal existence to slavery in any Territory of the United States.

Lincoln received a popular plurality of nearly 500,000 and a plurality of 108 in the Electoral College. Douglas came second in the popular vote, but fell behind both the Breckinridge ticket and Bell and Everett in the Electoral College. It was due to the fact that the Douglas vote was large in the States which Lincoln carried.

In the war between the States the supporters of Douglas enlisted side by side with the supporters of Lincoln, Douglas himself having urged the support of the Union. He was in the war for the maintenance of the Union. During the war, however, many things were done which aroused criticism from the Democratic leaders, and by the Democrats generally. Among the things complained of were arrests and courts-martial in States not in rebellion and where the civil authority was undisturbed.

The Democratic platform of 1864 announced unswerving fidelity to the Union under the Constitution, as the only solid foundation of our strength, security and happiness as a people, and as a framework of government equally conducive to the welfare and prosperity of all the States, both Northern and Southern; and then declared as the sense of the American people, that after four years of failure to restore the Union by the experiment of war, during which, under the pretense of a military necessity of a war power higher than the Constitution, the Constitution itself has been disregarded in every part and public liberty and private right alike trodden down, and the rights of the country essentially impaired, manumity, liberty, and the public welfare demand efforts be made for a cessation of hostilities.

As a convention of all the States, or in the end that, at the earliest possible date, be restored on the basis of Gen. George B. McClellan of New Jersey was nominated by the Democratic party for President, and Governor Hiram Belcher of Ohio for Vice-President. The election resulted in a popular majority of 408,000 for the Republican ticket and in an electoral majority of 191- Kentucky, New Jersey and Delaware being the only three of the 24 States giving their electoral vote to the Democratic ticket. It will be seen that the Republican plurality was less than it was in 1860.

The assassination of Abraham Lincoln and the inauguration of Vice-President Andrew Johnson (q.v.) as President precipitated a struggle in which most of the Republican senators and members of Congress were arrayed against the President. The Democrats took the side of the President, and with the aid of a few Republicans prevented the adoption of the articles of impeachment presented by the House.

During the reconstruction period that followed, the Democrats insisted that the States which were held in the Union should be given the rights and privileges of other States.

The campaign of 1864 was fought under the leadership of Horatio Seymour of New York and Francis P. Blair of Missouri, and the platform demanded:

1. Immediate restoration of all the States to their rights in the Union under the Constitution, and of civil government to the States and to the American people.
2. Amnesty for all past political offenses, and the regulation of the elective franchise in the States by their citizens.
3. Payment of all the public debt of the United States as rapidly as practicable—all money drawn from the people by taxation, except so much as is necessary for the necessities of the government, economically administered, being honestly applied to such payment; and when the obligations of the government do not expressly state upon their face, or the law under which they were issued does not provide that they shall be paid in coin, they ought to be right and justice, to be paid in the lawful money of the United States.
4. Equal taxation of every species of property according to its real value, including government bonds and other public securities.
5. One currency for the government and the people, the laborer and the office-holder, the pensioner, and the soldier, the producer and the bondholder.
6. Economy in the administration of the government; the reduction of the standing army and navy; the abolition of the Freedman's Bureau and all political instrumentalities designed to secure negro supremacy; simplification of the system and duty on the new government, including the war, saving and collecting internal revenue; that the burden of taxation may be equalized and lessened, and the credit of the government and the currency made good; the repeal of all enactments for enrolling the State militia into national forces in time of peace; and a tariff for national defense and protection of the home market, such as an equal taxation under the internal-revenue laws as will afford incidental protection to industries and manufactures, and as well, without impairing the revenue, impose the least burden upon, and best promote and encourage the great industrial interests of the country.
7. Reform of abuses in the administration; the expulsion of corrupt men from office; the abrogation of useless laws and the restoration of rightful authority to, and the independence of, the executive and judicial departments of the government; the subordination of the military to the civil power, to the end that the usurpations of Congress and the despotism of the sword may cease.
8. Equal rights and protection for naturalized and native-born citizens, at home and abroad; the assertion of American nationality which shall command the respect of foreign powers, and furnish an example and encouragement to people struggling for national integrity, constitutional liberty, and individual rights; and the maintenance of the rights of naturalized citizens against the absolute doctrine of immutable allegiance and the claims of foreign powers to punish them for alleged crimes committed beyond their jurisdiction.

Besides this statement of the position of the parties the platform arranged the Republican party for its reconstruction policy, charging that instead of restoring the Union it had "so
far as was in its power dissolved it and subjected 10 States in time of profound peace to more than any negro supremacy, and that it had "nullified the right of trial by jury, abolished the right of habeas corpus and overthrown the freedom of speech and press." The Republicans nominated General Grant and Schuyler Colfax, and secured a popular plurality of about 300,000 (less than the plurality of 1864) and an electoral majority of 134.

In May 1872 a convention known as the Liberal Republican Convention was held at Cincinnati, Ohio, and nominated Horace Greeley of New York for President and B. D. Gratz Brown of Missouri for Vice-President. The platform demanded the recognition of the doctrines of equality of allmen before the law, and pledged the party's support to Articles 13, 14 and 15 of our amended national Constitution. It favored the sacred maintenance of the public credit, opposed repudiation and insisted upon the return to specie payments.

The Democrats met on 9 July at Baltimore and nominated the same ticket and adopted a platform substantially like the one adopted by the Liberal Republicans.

Those members of the Democratic party describing themselves as "straight-out" Democrats met 3 September following and nominated Charles O'Connor of New York for President and John Quincy Adams of Massachusetts for Vice-President; although both declined, nearly 30,000 votes were cast for the head of the ticket. The platform declared that the Baltimore convention had betrayed the party into a false creed and false leadership, and proclaimed that the Democratic party preferred principle to power, and would not surrender those principles in exchange for offices which Presidents confer. The election resulted in an overwhelming victory for the Republican ticket, Grant and Wilson receiving 286 electoral votes in 190 and a popular plurality of more than 750,000.

The nomination of Horace Greeley brought to his party a large number of influential Republicans and alienated many Democrats, yet the party's vote was only about 125,000 more than the Democratic vote of 1868, while the Republican vote of 1872 was nearly 600,000 greater than the vote of four years before.

The Democrats entered the campaign of 1876 with courage and confidence. The discovery of corruption in several of the departments and the conviction of officials high in authority, together with the panic of 1873, had broken the prestige of the Republican party and caused a wide-spread demand for reform. The Democratic party took advantage of the situation and nominated as its candidates Samuel J. Tilden of New York, who had become conspicuous in reform in his State, and Thomas A. Hendricks of Indiana, who represented all that was highest, purest and best in Democratic principle and political rectitude and negro supremacy. The party's platform abounds in power and demanded reform in every department. Among other things it demanded reform in the tariff and condemned the resumption clause of 1875.

The campaign resulted in a popular plurality of about 100,000. The result, however, was disputed and charges of fraud were made in the election of several States. The situation grew so serious that Congress created an electoral commission, to which the whole matter was referred. The commission was composed of five senators selected by that body, five members of Congress selected by that body, and the five senior members of the Supreme Court. See Electoral Commission.

The Senate being Republican selected three Republicans and two Democrats; the House being Democratic selected three Democrats and two Republicans, and of the judges three were Republicans and two Democrats. The Electoral Commission contained eight Republicans and seven Democrats and on every contested question the vote stood eight to seven, each member casting his vote so that it would aid his party.

The Democrats of 1880 endorsed the principles embodied in the platform of 1876, protested against centralization as dangerous to the government and denounced the "great fraud of 1876 and 1877 by which upon a false count of the electoral votes of two States the candidate defeated at the polls was declared to be President, and for the first time in American history the will of the people was set aside under a threat of military violence." The righting of the wrong of 1876 was declared to be the paramount issue. Gen. Winfield Scott Hancock, the Democratic nominee, weakened his campaign by putting the tariff question aside as a "local issue." He was defeated, however, by a popular vote of less than 10,000 and by only 59 votes in the Electoral College.

In 1884 the Democrats met at Chicago and nominated Grover Cleveland of New York for President and Thomas A. Hendricks of Indiana for Vice-President. A platform of great length was adopted, the tariff question being the one discussed at great length. The platform contained the following plank on the money question: "We believe in honest money, the gold and silver coinage of the Constitution, and a circulating medium convertible into such money without loss." This platform also contained a plank reaffirming that portion of the Democratic platform of 1876 which endorsed the liberal principles of Jefferson.

The Republican ticket, headed by James G. Blaine and John A. Logan, received a plurality of a little more than 20,000 in the popular vote, but Mr. Cleveland had 37 majority in the Electoral College.

The Democratic platform of 1888 reaffirmed the platform adopted in 1884 and endorsed the President's views on the tariff question as expressed in the tariff message which he sent to Congress in December 1887. The tariff question was made the paramount issue and the campaign waged on this question, and resulted in the election of the Republican ticket and its candidates, Benjamin Harrison and Levi P. Morton, that ticket having a majority of 65 in the Electoral College, although the Democratic ticket had a popular plurality of about 100,000.

During the Cleveland administration an attempt was made to reduce the tariff and the Mills Bill received the support of the Democratic members of the Senate and House. The Republicans, however, took advantage of the Republican victory of 1888 to propose and enact
a high tariff law, known as the McKinley Act, taking its name from the chairman of the Ways and Means Committee of the House. The passage of this law was followed by an increase in prices of commodities and it became the paramount issue in the following campaign of 1892. The Democratic ticket nominated Grover Cleveland for a third time and named Adlai E. Stevenson of Illinois as his running mate.

There was a fight in the convention over the tariff plank, and as finally adopted it declared that the Federal government had no constitutional power to impose and collect tariff duties except for revenue only. The trusts were denounced and the party pledged to the enactment of laws made to prevent and control them.

The money plank of the platform was as follows:

We denounce the Republican legislation known as the Sherman Act of 1890 as a cowardly makeshift, fraught with possibilities of danger in the future which should make all of us, as its author, anxious for its speedy repeal. We hold to the use of both gold and silver as the standard of value in the country, and to the coinage of both gold and silver without discrimination against either metal or charge for mintage, but the dollar unit of coinage of both metals of equal intrinsic value and exchangeable value or be adjusted through international agreement, or by such adaptations of the present laws as shall maintain the parity of the two metals, and the equal power of every dollar at all times in the markets and in the payments of debts; and we demand that all paper currency shall be kept at par with and redeemable in such coin. We insist upon this policy as especially necessary for the protection of farmers and laboring classes, the first and most defenseless victims of unstable money and a fluctuating currency.

President Harrison was renominated by the Republicans and Whitelaw Reid was placed upon the ticket with him. In the election the Democratic ticket polled a plurality of 132 in the Electoral College and a popular plurality of about 380,000. The People's Party nominated James B. Weaver of Iowa for President and James G. Field of Virginia for Vice-President and polled a little more than 1,000,000 votes.

During President Cleveland's second term two questions occupied public attention—the money question and the tariff question. Congress was called together in extraordinary session in August 1893 and the President recommended the unconditional repeal of the Sherman Law. By reference to the Democratic platform of 1892 it will be seen that the money plank contained a statement of the party's faith in the double standard as well as its desire for the repeal of the Sherman Act, and an effort to repeal the makeshift without restoring the double standard caused a division in the ranks of the party; but the President succeeded in securing the legislation which he desired. Doing this, he had the support of a larger percentage of the Republican senators and members than he had of the Democrats.

Congressman Wilson, chairman of the Ways and Means Committee, reported a measure which the House passed without his signature. The bill contained an income tax, but this clause was declared unconstitutional by the Supreme Court, the vote standing five to four. The decision was rendered at the second hearing. At the first hearing the vote stood four to four, and as the ninth judge who was not present until the second hearing favored the tax it required the change of year from the part of one of the judges to render the income tax inoperative.

After the passage of the tariff law the currency question again occupied the attention of Congress and became the paramount issue in the campaign of 1896. The money issue was fought out in the party and the delegates to the Chicago convention were instructed to carry out the financial policy endorsed by the members of the State convention selecting them, who in turn had been instructed by county conventions. As a result of this inter-party contest the advocates of bimetallism won a decisive victory, having more than two-thirds of the national delegates.

The following platform was adopted:

We, the Democrats of the United States in National Convention assembled, do reaffirm our allegiance to those great essential principles of justice and freedom upon which our institutions are founded, and which the Democratic party has always striven to uphold, and against the infringement of freedom of speech, freedom of press, freedom of conscience, the preservation of personal rights, the equality of all citizens before the law, and the upholding of constitutional limitations.

During all our history the Democratic party has resisted the tendency of selfish interests to the centralisation of governmental power, and steadfastly maintained the integrity of the dual scheme of government designed by the founders of this Republic of peoples. Under its guidings and teachings the great principles of local self-government have found their best expression in the autonomy of the States and in the assertion of the necessity of confining the general government to the powers granted by the Constitution of the United States.

The Constitution of the United States guarantees to every citizen the rights of civil and religious liberty. The Democratic party has always been the exponent of political liberty and religious freedom, and it renues its obligations and reaffirms its devotions to these fundamental principles of the Constitution.

Recognising that the money question is paramount to all others at this time, we invite attention to the fact that the Federal Constitution named silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the Constitution made the silver dollar the monetary unit of gold to free coinage at a ratio based upon the silver-dollar unit.

We declare that the act of 1873 demonetising silver without the knowledge or approval of the American people has resulted in the appreciation of gold and the fall in the prices of commodities produced by the people; a heavy increase in the burden of taxation and of all debts, public and private; the enrichment of the money-lenders at home and abroad; the prostration of industry and impoverishment of the people.

We are unalterably opposed to monometalism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometalism is a British policy, and its adoption has brought other nations back to the old financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the stifling of that spirit and love of liberty which proclaimed our political independence in 1776 and won it in the War of the Revolution.

We demand the free and unlimited coinage of both silver and gold at their present legal rates and without waiting for the aid or consent of any other nation. We demand that the standard silver dollar be a legal tender, equally with gold, for all debts, public and private, and we favor such legislation as will prevent for the future the demonetisation of either metal, which, in exchange for private contract.

We are opposed to the policy and practice of surrendering to the holders of the obligations of the United States the option reserved by law to the government of redeeming such obligations in either silver coins or gold. We are opposed to the issuing of interest-bearing bonds of the United States in time of peace and confines the traffick with bankers in a law by which, in exchange for bonds and at an enormous profit to themselves, supply the Federal treasury with gold to maintain the policy of gold monometalism.
Congress alone has the power to coin and issue money, and that officers appointed to collect it could not be delegated to corporations or individuals. We, therefore, denounce the issuance of notes intended to circulate as money in any district in which the Constitution does not authorize it, and we demand that all paper which makes a legal tender for public and private debts, except where a majority of Congress and a majority of the people of the State, to which the power is delegated, shall be issued by the government of the United States, and shall be redeemable in coin.

For the collection of taxes for purposes of revenue, such duties to be so adjusted as to operate equally throughout the country, and not discriminate between the different districts. We condemn the practice of the Executive and the legislative branches of the Republican government to foreclose the tax liens on property, under the alleged power of Congress to fix the rates of interest.

We demand the right of eminent domain be secured to the United States by a clear and practical declaration of the Constitution and laws of the United States be extended to said Territory.

The Monroe Doctrine, as originally declared, and as interpreted by the United States, is the best guarantee of the foreign policy of the United States and must at all times be maintained.

We extend our sympathy to the people of Cuba in their heroic struggle for liberty and independence.

We are opposed to life tenure in the public service, except as provided in the Constitution. We favor appointments based on merit in the report of the majority to which they cannot give their assent. Some of these are wholly unnecessary. Some are ill considered and ambiguous, as for instance the one which requires a law to be made effective through legislation, for the relief of the people and the restoration of the country's prosperity.

The minority, led by Senator Hill of New York, submitted the following, which was rejected by the convention:

To the Democratic National Convention: 16 delegates, constituting the minority of the Committee on Resolutions, and many declaratory propositions, which were offered as a substitute for the financial plan in the following report:

We declare our belief that the experiment on the part of the United States alone of free silver coinage and a change of the existing standard which would secure the coöperation of other great nations, would not only imperil our finances, but would retard or entirely prevent the establishment of international bimetallism, to which the efforts of the government should be steadily directed. It would place this country as once upon a silver and disturb business, diminish the purchasing power of the wages of labor, and inflict irremediable evils upon our nation's commerce and industry by which they hold to the only just and true expression of Democratic faith upon the important and vital principle of which is offered as a substitute for the financial plan in the majority report:

"Until international co-operation among leading nations for the coinage of silver can be secured we favor the rigid maintenance of the existing gold standard as essential to the preservation of our national credit, the redemption of the notes of the government, and the payment of the public debts, and in the temporary absence of such coöperation, the maintenance of the present standard by the government.

We declare that the present movement is the outcome of the result of the action of other great nations, would not only imperil our finances, but would retard or entirely prevent the establishment of international bimetallism, to which the efforts of the government should be steadily directed. It would place this country as once upon a silver and disturb business, diminish the purchasing power of the wages of labor, and inflict irremediable evils upon our nation's commerce and industry by which they hold to the only just and true expression of Democratic faith upon the important and vital principle of which is offered as a substitute for the financial plan in the majority report:

"Until international co-operation among leading nations for the coinage of silver can be secured we favor the rigid maintenance of the existing gold standard as essential to the preservation of our national credit, the redemption of the notes of the government, and the payment of the public debts, and in the temporary absence of such coöperation, the maintenance of the present standard by the government.

We declare that the present movement is the outcome of the result of the action of other great nations, would not only imperil our finances, but would retard or entirely prevent the establishment of international bimetallism, to which the efforts of the government should be steadily directed. It would place this country as once upon a silver and disturb business, diminish the purchasing power of the wages of labor, and inflict irremediable evils upon our nation's commerce and industry by which they hold to the only just and true expression of Democratic faith upon the important and vital principle of which is offered as a substitute for the financial plan in the majority report:

"Until international co-operation among leading nations for the coinage of silver can be secured we favor the rigid maintenance of the existing gold standard as essential to the preservation of our national credit, the redemption of the notes of the government, and the payment of the public debts, and in the temporary absence of such coöperation, the maintenance of the present standard by the government.
The main resolutions submitted by the minority were rejected by more than a two-thirds vote and the platform as reported by the committee was adopted by the same vote. The resolution endorsing the administration was defeated by a little less than two-thirds. The convention named as its candidates William Jennings Bryan of Nebraska and Arthur Sewall of Maine. The "National" Democrats met at Indianapolis in September following, issued a platform endorsing the gold standard and named John M. Palmer and Simon B. Buckner as their national ticket. William McKinley of Ohio and Garret A. Hobart of New Jersey were the nominees of the Republican convention. The platform contained a plank favoring a protective tariff and a plank opposing free coinage until foreign co-operation could be secured—but pleading the party to promote international bimetallism.

The People's party, generally known as the Populist party, met at Saint Louis and adopted a platform declaring that the Democratic platform and endorsed and nominated the Democratic candidate for President. Instead of endorsing Mr. Sewall for the Vice-Presidency, the convention named Thomas E. Watson of Georgia for that office. The Silver Republicans met at the same time, endorsed the Democratic ticket and adopted a silver plank identical with the Democratic plank.

The campaign aroused deep feeling on both sides and was warmly contested in the Central States. It became apparent early in the campaign that the Democratic ticket would carry the Western and Southern States and that the Republican ticket would sweep the Eastern States. A very large vote was polled, the total that year being nearly 2,000,000,000, excess of the total vote of four years before. The Republican party secured a popular plurality of 601,854. The electoral vote stood: McKinley and Hobart, 271; Bryan and Sewall, 176.

Between 1896 and 1900 there was an improvement in industrial conditions, an increase in the prosperity of the country and a series of wars throughout the world. In 1898 the United States interfered in behalf of the Cubans and became involved in a war with Spain, which war resulted in Cuban independence; but during the war a naval victory in the Philippines put this nation in temporary control of those islands and resulted in our possession of them as an indemnity for the expenses incurred in behalf of the Cubans. The cession of the Philippine Islands to the United States raised a question which has not yet been settled. The sentiment is at present divided, the Democrats favoring the immediate promise that independence will be given as soon as a stable government is established, this independence to be accompanied by protection from outside interference of the Philippines. The Republicans desire that the Philippine Islands be held under a colonial system and others desire that the islands be given a territorial form of government with a view to ultimate statehood.

The Democratic convention which met at Kansas City, 4 July 1900, endorsed the Declaration of Independence and adopted the following platform:

"We, the representatives of the Democratic party of the United States, assembled in national convention on the fortieth anniversary of the adoption of the Declaration of Independence, do reaffirm our faith in that immortal proclamation of the inalienable rights of man and our allegiance to the Constitution framed in honor of the fathers of the Republic. We hold with the United States Supreme Court that the Declaration of Independence is the spirit of our government, of which the Constitution is the form and letter. We declare again that all governments instituted among men derive their just powers from the consent of the governed, that any government not based upon the consent of the governed is oppressive, and that the people a government of force is to substitute the methods of imperially for those of a republic. The Constitution follows the flag, and denounce the doctrine that an Executive or Congress, deriving their existence and their powers from the Constitution, can exercise lawful authority beyond it or in violation of it. We assert that no nation can long endure half republic and half empire, and we warn the immediate declaration of imperialism abroad will lead quickly and inevitably to despotism at home.

Believing in those fundamental principles, we denounce the Porto Rican law, enacted by a Republican Congress against the protest and opposition of the Democratic minority, as a bold and open violation of the nation's organic law and a flagrant breach of the sacred promise that imposed upon the people of Porto Rico a government without their consent and taxation without representation. It goes to corroborate the slander of the formless and unpledged made in their behalf by the commanding general of our army, which the Porto Ricans welcomed to a peaceful and unresisted occupation of their island, and the poverty and distress a people whose helplessness appeals with peculiar force to our justice and humanity. In this, the first act of its imperialistic programme, the Republican party seeks to commit the United States to a colonial policy inconsistent with republican institutions and condemned by the Supreme Court in numerous decisions. We condemn and denounce the Porto Rican policy of the present administration. It has involved the public in unnecessary war, sacrificed the lives of many of our noblest citizens and placed the United States in a position of vast obligations and applauded throughout the world as the champion of freedom, in the false and un-American position of crushing with military force the efforts of our former allies to achieve liberty and self-government. The Filipinos cannot be citizens without our endangering our civilization; they cannot be subjects without impairing our form of government, and as we are not willing to surrender our civilization or to convert the republic into an empire, we favor an immediate declaration of the nation's purpose to give the Filipinos, first, a stable form of government, second, independence; and, third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America.

We are not opposed to territorial expansion when it takes place in desirable territory which has been incorporated into states in the Union and whose people are willing and fit to become American citizens. We favor expansion by peaceful and legitimate means. But we are opposed to forcing or purchasing distant islands to be governed outside the Constitution and whose people can never become citizens.

We are in favor of extending the American flag and influence among the nations, but believe that influence should be extended, not by force and violence, but by the persuasive power of a high and honorable example. The importance of other questions now pending before the American people is no wise diminished, and the Democratic party takes no backward step from its position on them, but the burning issue of imperialism growing out of the Spanish war involves the very existence of the republic and the destruction of our free institutions. We regard it as the paramount issue of the campaign.

The declaration in the Republican platform adopted at the Philadelphia convention, held in June 1900, that the Republican party "steadfastly adheres to the policy announced in the Monroe Doctrine," is manifestly deceptive. This profession is contradicted by the action of the party, in opposition to the spirit of the Monroe Doctrine, to acquire and hold sovereignty over large areas of territory and large numbers of people in the very heart of the hemisphere. We insist on the strict maintenance of the Monroe Doctrine in all its integrity, both in letter and spirit, and on the use of the power of the Constitution to prevent the extension of European authority on this continent and as essential to our supremacy in American affairs. At the same time we declare that the time has come when the people shall ever be held by force in unwilling submission to European authority.

We oppose militarism. It means conquest abroad and intimidation and oppression at home. It means the strong arm which has ever been fatal to those people that millions of our citizens have fied from in Europe. It will impose upon our peace-loving people a large standing army and unnecessary burden of debt which will place an immeasurable constant menace to their liberties. A small standing army
and a well-disciplined State militia are amply sufficient in time of peace. This republic has no place for a vast military service and conscription.

The patriotic ideal of the volunteer soldier is his country's best defender. The National Guard of the United States should ever be cherished in the patriotic hearts of a free people. The military drafts are ever an element of strength and safety. For the first time in our history and coeval with the quest there has been a wholesale departure from our time-honored and approved system of volunteer organization. We denounce it as un-American, un-American, and un-American are the electric words that strike the ancient and fixed principles of a free people.

Private monopolies are indefensible and intolerable. They destroy competition, control the price of all material and of the finished product, thus robbing both producer and consumer. They lessen the employment of labor, and arbitrarily fix the terms and conditions thereof, and deprive individual energy and small capital of their opportunity for betterment. Opposition and protest to prevent or for appropriating the fruits of industry to the benefit of the few at the expense of the many, and unless their sovereignty is checked all wealth will be aggregated in a few hands and the republic destroyed.

The dishonest palling with the trust evil by the Republican party in State and national platforms is conclusive proof of the truth of the charge that trusts are product of Republican policies, that they are fostered by Republican laws, and that they are protected by the Republican administration in return for campaign subscriptions and political support.

We pledge the Democratic party to an unceasing war in nation, State and city against private monopoly in every form. Existing laws against trusts must be enforced, and future laws against trusts must be made as plain in publicity as to the affairs of corporations engaged in interstate commerce, requiring all corporations to show, before doing business in the State of their origin, that they have no water in their stock, and that they have not attempted, and are not attempting, to monopolize any branch of business or the production of any articles of merchandise, and the whole constitutional power of Congress over interstate commerce, the mails and all modes of interstate communication shall be exercised by the enactment of comprehensive legislation against the subject of trusts.

Tariff laws should be amended by putting the products of trusts upon the free list, to prevent monopoly under the plea of protection.

The failure of the present Republican administration, with an absolute control over all the branches of the national government, to enact any legislation designed to prevent or even curtail the absorbing power of trusts and illegal combinations, or to enforce the anti-trust laws already on the statute books, proves the insincerity of the high-sounding phrases of the Republican platform.

Corporations should be protected in all their rights, and their legitimate interests should be respected, but any attempt by corporations to interfere with public affairs of the people or to control the sovereignty which creates them should be forbidden under such penalties as will make such attempts in any case uneconomical.

We condemn the Dingley tariff law as a trust-breeding measure, skillfully devised to give the appearance of which the people do not believe and to place upon the many burdens which they should not bear.

We deplore and will not enlarge the scope of the interstate commerce laws as will enable the commission to protect individuals and communities from discriminations and the public from unjust and unfair transportation rates.

It will be seen that the question of imperialism was made the paramount issue, the trust question coming next in the amount of attention given to it. The convention, however, reaffirmed the principles embodied in the Chicago platform, and reiterated the position taken four years before on the money question and on several other questions.

Mr. Bryan was renominated and Adlai E. Stevenson of Illinois was placed upon the ticket as the candidate for Vice-President. This ticket was endorsed later by the People's Party in the Silver Republican convention, both of which parties adopted platforms in line with the Democratic platform upon the leading issues. The Democratic ticket was also endorsed by the Anti-imperialists.

It was with a desire to focus public attention upon the menace of imperialism, the Republicans said: "Let well enough alone," and credited the improved conditions of the people in part to the gold standard and in part to the high-tariff law enacted in 1897. They protested against any change in the financial laws or the tariff law, and denied that they intended any departure from the principles of free government.

The Republican ticket, headed by President McKinley and Theodore Roosevelt of New York, was again successful, the popular plurality being 849,455. The electoral vote was 291 for McKinley and Roosevelt 292; Bryan and Stevenson 155. The campaign of 1900 did not excite as much interest as the preceding campaign. In 1904 Alton B. Parker of New York was nominated for President, with Henry Davis of West Virginia for Vice-President. In this election the party practically reversed its previous position on the money question. The Republican party, with a ticket headed by President Roosevelt, was again successful, the electoral vote standing 336 to 148.

While Roosevelt's popular vote and popular majority were the largest ever recorded for any President up to that time, it is remarkable, and indicative of the increasing independence of the voters, that five States which gave Roosevelt large majorities elected Democratic Governors; Massachusetts, Minnesota, Missouri, Colorado, and Montana. The same zeal for thorough-going reform and an appreciation of the personal character of candidates has greatly affected State and municipal elections, resulting in the overthrow of bosses and machines and a permanent elevation of popular political standards for parties and for administration.

The principal declarations in the platform of the Democratic party, adopted at Saint Louis, Mo., 8 July 1904, were:

In favor of laws giving labor and capital impartially their just rights; trial by jury in cases of indirect contempts in Federal Courts; liberal appropriations for the improvement of waterways; economy of administration, without impairing efficiency of any branch of the government; and the enforcement of honesty in public service;

Condemning the action of the Republican party in Congress in refusing to prohibit an executive department from entering into contracts with convicted trusts or unlawful combinations in restraint of interstate trade, and in favor of "Jeffersonian simplicity of living" as the part of public officials; against "executive usurpation of legislative and judicial functions," and the exclusion of persons of sound judgment and of an open door for the world's commerce in the Orient without any unnecessary entanglement in Oriental and European affairs, and without any attempt to make responsible and absolute government anywhere within our jurisdiction," against "an indefinite, irresponsible, discretionary and vague absolutism and policy of colonial exploitation"; and against tariff legislation that "seizes the many to enrich the few," and in favor of a tariff limited to the needs of the Government, economically administered, and so levied as not to discriminate against any industry, class or section; a gradual reduction of the tariff; against private monopoly, and in favor of individual equality of opportunity and free competition; against rebates and discrimination by transportation companies; and in favor of an enlargement of the powers of the Interstate Commerce Commission, reclamation of the Intracoastal Waterway, the construction of the Panama Canal, and the 1907 election of U.S. Senators by direct vote of the people.

Condemnation of polygamy within the jurisdiction of the United States, and also of the ship subsidy bill passed by the United States Senate; and in favor of upholding a merchant marine, liberal trade arrangements with Canada, the maintenance of the Monroe Doctrine, a reduction of the army, generous pensions, and civil service reform.

In 1908 the Republican party nominated Secretary of War William Howard Taft, of Ohio, for President and Congressman James S. Sherman, of New York, for Vice-President. The Democratic party for the third time selected William J. Bryan as its Presidential candidate
and John W. Kern, of Indiana, for Vice-President. The Socialists nominated Eugene V. Debs, of Indiana, and Ben Hanford, of New York; the Populists Thomas E. Watson, of Georgia; the Republicans William R. Hearst, of New York; and the Prohibitionists Eugene W. Chafin, of Illinois, and Aaron S. Watkins, of Ohio. This election witnessed the entry of a new party into the political arena—the Independence party, of which William R. Hearst, of New York, was the chief factor, and of which Thomas L. Hisgen, of Massachusetts, and John T. Graves, of New York (formerly of Georgia), were the candidates. The results of this election were as follows: Taft, Republican, 7,637,676; Bryan, Democrat, 6,982,182; Debs, Socialist, 448,453; Chafin, Prohibitionist, 241,252; Hisgen, Independent, 83,183; Watson, Populist, 33,871; Gillhaus, Socialist Labor, 15,421.

This election was remarkable in that nearly 1,350,000 more votes were cast than in the election of 1908—but controlled it. A popular vote in excess of that of Roosevelt by over 14,000; Bryan received over 1,300,000 votes more than his predecessor, Parker; and the Socialist vote increased more than 45,000. On the other hand the Prohibition vote was more than 17,000 less than that of 1908. The Populist vote was behind the vote of 1904; and the Socialist-Labor candidate less than 50 per cent of the vote of his predecessor. In this election the independence of the voters was again manifested. It had been in 1904, several States which gave the majority of the Democratic governors, notably Indiana, Minnesota, and Ohio. Also several States that had previously been Republican in gubernatorial elections changed to the Democratic column, notably Colorado, Idaho, and Ohio, while the usually Democratic Missouri elected a Republican governor. Oklahoma, with seven electoral votes, had been admitted as a State since the election of 1904, thus increasing the electoral vote to 483 and raising the majority necessary to win the choice from 238 to 242. The electoral college gave Taft 321 votes and Bryan 162.

The principal declarations in the platform of the Democratic party, adopted at Denver, Colo., 10 July 1908 were as follows:

The misuse of patronage on the part of the President; in favor of a law preventing any corporation contributing to a campaign fund, and any individual contributing an amount above a reasonable minimum, and providing for the publication before election of all such contributions above a reasonable minimum; against the extension of the powers of the general government by judicial construction; in favor of additions to federal remedies for the regulation of Interstate commerce and for the prevention of private monopoly, as well as State remedies of the same kind.

In favor of tariff reform by immediate revision and reduction of import duties; that articles entering into competition with American manufactures as are sold abroad more cheaply than at home, and that graduated reductions should be made in such other schedules as may be necessary to restore the tariff to a revenue basis; the immediate repeal of the tariff on pulp, print paper, lumber, timber, and logs, and that these articles be placed upon the free list.

Against private monopoly, as in 1904:—By first, the enforcement of a law preventing products should be placed upon the free list, and material reductions made in the tariff upon the necessities of life, especially upon articles competing with such American manufactures as are sold abroad more cheaply than at home, and that graduated reductions be made in such other schedules as may be necessary to restore the tariff to a revenue basis; the immediate repeal of the tariff on pulp, print paper, lumber, timber, and logs, and that these articles be placed upon the free list.

At the Democratic convention held at Baltimore, 25 June–2 July 1912, 46 ballots were taken. The first ballot gave Taft 347, Debs leading candidates resulting: Champ Clark, Missouri, 440½; Woodrow Wilson, New Jersey, 324; Judson Harmon, Ohio, 148; Oscar W. Underwood, Alabama, 117½; the final ballot, Woodrow Wilson, 429, Champ Clark, 84; Judson Harmon, 12; Thomas R. Marshall, Indiana, was nominated for Vice-President. The Republican party renominated as President, William Howard Taft, Ohio, and nominated as Vice-President, Nicholas Murray Butler, New York. The Progressives nominated Theodore Roosevelt, New York, for President and Hiram W. Johnson, California, for Vice-President. Eugene V. Debs, Indiana, as President with Emil Seidl, Wisconsin, as Vice-President were nominated by the Socialist party; Eugene W. Chafin, Ariz., as President and Aaron S. Watkins, as Vice-President by the Prohibitionist party; and Arthur E. Reimer, Massachusetts, President, August Gilhaus, New York, Vice-President, by the Socialist Labor party. The results of the election were as follows: Woodrow Wilson received a plurality vote of 2,173,519; the figures being Woodrow Wilson, 6,193,019; William H. Taft, 3,484,956; Theodore Roosevelt, 4,119,507; Eugene W. Debs, 901,873; Eugene W. Chafin, 207,928; Arthur E. Reimer, 29,259. The chief declarations in the National platform of the Democratic party, adopted at Baltimore, Md., 2 July 1912, were those on tariff reform; currency reform; on the enforcement of the anti-trust law; on income tax and popular election of senators; on Republican extravagance through oppressive taxation; on the establishment of rural credits; a redeclaration of the platform of 1908 on the rights of labor; the conservation of national resources; on law reform; and the prohibition of wines. Attention was also called to the fact that the Democratic party's demand for a return to the rule of the people, expressed in the National platform four years ago, has now become the accepted doctrine of a large majority of the voters. We again remind the country that only by the larger exercise of the reserved power of the people can they preserve themselves from duplication of directors among competing corporations; second, a license system which has enabled the nation to create corporations or its right to regulate as it will foreign corporations doing business within its limits, make it necessary for a manufacturing or trading corporation engaged in Interstate commerce to take out a federal license before it shall be permitted to conduct as much as 25 per cent. of the product in which it deals, a license to protect the public from watered stock and to prohibit the control by such corporations of more than 50 per cent. of the total amount of any product consumed in the United States; and a law compelling such licensed corporations to sell to all purchasers in all parts of the country on the same terms after making due allowance for one of transportation and handling. Control over Interstate commerce by Congress and by each State within its borders, by the chief factor, and of which Thomas L. Hisgen, of Massachusetts, and John T. Graves, of New York (formerly of Georgia), were the candidates. The results of this election were as follows: Taft, Republican, 7,637,676; Bryan, Democrat, 6,982,182; Debs, Socialist, 448,453; Chafin, Prohibitionist, 241,252; Hisgen, Independent, 83,183; Watson, Populist, 33,871; Gillhaus, Socialist Labor, 15,421.
At the Democratic National Convention held at Saint Louis, Mo., June 14-16, 1916, President Wilson and Vice-President Marshall were renominated by acclamation. The Republican party nominated Charles E. Hughes, New York, and Charles W. Fairbanks, Indiana, respectively, for President and Vice-President. The election resulted with a plurality vote of 581,941 for Wilson, the figures being Wookood Wilson, New Jersey Democrat, 9,129,269; Charles E. Hughes, New York, Republican, 8,547,325; Allen J. Benson, New York, Socialist, 590,579; J. Frank Hanly, Indiana, Prohibitionist, 221,329; Arthur E. Reimer, Massachusetts, Socialist Labor, 14,180.

Endorsing the administration of Woodrow Wilson as the best exposition of sound Democratic policy ever displayed at home and abroad, the National Convention at Saint Louis, Mo., 16 June 1916, adopted a declaration which challenged a comparison of the record of the party in keeping pledges and in constructive legislation, with those of any party at any time. The achievements wrought by four years of Democratic administration were summarized, and for the further conduct of national affairs the policies to which the party committed itself included: Economic freedom to remove so far as possible every bar or restraint and uncertainty from the path of the business men of America; an unreserved endorsement of the Underwood tariff law as the best means for providing sufficient revenue for the economical administration and operation of the Government and development of Americanism, sumorning all men of whatever origin or creed who would count themselves American, to join in making clear to all the world the unity and consequent power of America; industrial preparedness as preparedness to maintain peace and to ensure the same respect for its rights as the nation extends to the rights of other powers; to make the honor and ideals of the United States a standard for international relations alike in negotiation and action; to continue the promotion of the Pan-American Concord, the friendly relations between the people of the Western Hemisphere; the development of the merchant marine; of agriculture and betterment of the farmer; the construction of great and development of a national system. The conclusion of the declaration summarized as follows:

This is a critical hour in the history of America, a critical hour in the history of mankind. Upon its record, which shows great constructive achievement in following out a consistent policy for our domestic and internal development, upon the word of the Democratic administration, which maintained the honor, the dignity and the interests of the United States and at the same time retained the respect and friendship of all the nations of the world, and upon the great policies for the future strengthening of the life of our country, the enlargement of our national vision and the ennobling of our international relations, we appeal with confidence to the voters of the country.

In the President's armed neutrality message delivered in a personal address to Congress 26 Feb. 1917 he said in part:

Said was it unhappily possible to safeguard our neutral rights by diplomatic means against the unwarranted infringements they are suffering at the hands of Germany, there may be no recourse but to armed neutrality, which we shall know how to maintain, which is abundant American precedent. It is devoutly to be hoped that it will not be necessary to put armed forces anywhere into action. The American people hate it, and our desire is not different from theirs. I am sure that they will understand the necessity of the acting, the purpose I hold nearest my heart and would wish to exhibit in everything I do. . No course of my choosing or of theirs can come only by the wilful acts and aggressions of others.

In the President's address to Congress, delivered at a joint session of the two Houses 2 April 1917, the reasons for entering the World War were stated as follows:

The present German submarine warfare against commerce is a warfare against mankind. . . It is a war against all nations. And it is a war against all nations. An armed neutrality, an armed neutrality, which has been so-called, takes lives in ways which it has stirred us very deeply to learn of, but the ships and people of other neutral and friendly nations have been sunk and overwhelmed in the waters in the same way. There has been no discrimination. The challenge is to all of us. And, the nation must choose for itself how it will meet it. The choice we make for ourselves must be made with a moderation of counsel and a temper of consciousness of the three conditions that constitute our motives as a nation. We must put excited feeling away. Our motive will not be revenge or the vindication and of the physical might of the nation, but only the vindication of right, of human right, of which we are only a single champion. I must remind you that the twenty-sixth of February last I thought that it would suffice to assert our neutral rights with arms, our right to use the areas against unlawful interference, our right to keep our people safe against unlawful violence. But armed neutrality, it now appears, is impossible. The German submarine is in effect outlawed when used as the German submarines have been used against merchant shipping. It is impossible to defend ships against their attacks as the law and our custom have assumed that merchantmen would defend themselves against privateers or cruisers, visible or invisible, on the open sea. It is common prudence in such circumstances, grim necessity, indeed, to endeavor to destroy them before they have shown their own intention. They must be dealt with upon sight, if dealt with at all. The German Government denies the rights of neutrals to use arms at all within the areas of the sea which it has prescribed, even in the defense of rights which no modern publicist has ever before questioned their right to defend. . . . The submarine is only armed guards which we have placed on our merchant ships will be treated as beyond the pale of law and subject to be dealt with as people would. Armed neutrality is insufficient enough at best; in such circumstances and in the face of such pressure the submarine is not only insufficient; it is likely only to produce what it was meant to prevent; it is practically certain to draw us into the war without either the rights of the all our hearts and our lives. There is one choice we cannot make, we are incapable of making; we will not choose the policy which will suffer the most sacred rights of our nation and our people to be ignored or violated. The wrongs against which we now array ourselves are no common wrongs; they cut to the very roots of human life. . . . Just because we fight without ransom and without choice, without right or wrong for ourselves, but what we shall wish to share with all free peoples, we shall, I feel confident, conduct our operations as belligerents without passion and ourselves observe with proud punctilio the principles of right and of fair play we profess to be fighting for. . . . It is a distressing and oppressive duty, Gentlemen of the Congress, which I have performed in thus addressing you. There are, it may be, many months of fiery trial and ascetic penal system. But there is a fearful thing to lead this great peaceful people into war, into the most terrible and disastrous of all wars, civilization itself seeming to be in the balance. But the right is more precious than peace, and we shall fight for the things which we have always carried nearest our hearts. . . . for the right of those who submit to authority to have a voice in their own governments, for the rights and liberties of small nations, for a universal dominion of right by such a concert of free peoples as shall bring peace and safety to all nations and make the world itself at peace. For this the administration is privileged to spend her blood and her might for the principles that gave her birth and happiness and the peace which she has treasured. God helping her, she can do no other. . . .

The work of the administration is briefly summarized in a survey of the principal acts passed by the 65th Congress making provision
to prosecute the war. On 2 April the German war resolution was introduced in the House, and four days after the assembling of Congress, on 6 April 1918, President Wilson signed an act to that measure. A general deficiency appropriation act was passed amounting to $163,841,400.52, of which $100,000,000 was for national security and defense. The first issue of liberty bonds was authorized to meet expenses for national security and defense, to aid allied governments and for other purpose. The act appropriated $3,007,063,945.46 for establishing credits in the United States for foreign governments by purchase of bonds of our Allies, and expenses incident to preparation and issue of bonds and certificates; it authorized the issue of bonds amounting to $5,063,945,460, of which $3,000,000,000 were to meet the loans authorized to foreign governments; $2,000,000,000 to meet domestic expenditures; and $63,945,460 to redeem the 3 per cent loan of 1908 to 1918, maturing 1 Aug. 1918; it also authorized $2,000,000,000 of one-year certificates of indebtedness temporarily to provide revenue. Other acts appropriated $273,046,322.50 for the support of the army for the fiscal year 1918; $1,344,896.18 for the support of the Military Academy during 1918; $3,281,094,541.60 for the military and naval establishments on account of war expenses, including $405,000,000 for an emergency shipping fund with which to begin construction of the greatest merchant fleet the world has ever known; $640,000,000 to increase temporarily the Signal Corps of his army; to purchase, manufacture, maintain, repair and operate airships; $27,826,150 for the construction, repair and preservation of certain public works on rivers and harbors; $45,150,000 to insure vessels and their cargoes with attendant expenses; $176,250,000 to provide a military and naval family allowance, compensation and insurance fund for the benefit of soldiers and sailors and their families; and $1,250,000 for the construction of a building for the increased work of the Treasury Department in Washington to provide further for national security and defense, $11,345,400 were appropriated to stimulate agriculture and facilitate the distribution of agricultural products, and $162,500,000 to encourage the production, conserve the supply and control the distribution of food products and fuel. The President was also authorized to increase temporarily the military establishment of the United States by selective drafts; to take over for the United States any vessel owned in whole or in part by any corporation, citizen or subject of any nation with which the United States might be at war; to take possession of a site for use for permanent aviation stations of the army and navy for school purposes; to institute condemnation proceedings of lands for military purposes; to punish acts of interference with foreign relations, the neutrality and the foreign commerce of the United States; to punish espionage and better enforce the criminal laws of the United States; and $450,000 were appropriated to enforce the provisions of an act to define, regulate and punish trading with the enemy and for other purposes. The first appropriations for the fiscal year 1918 and prior years on account of war expenses and for other purposes, a further appropriation of $5,356,666,016.93 was authorized and also contract obligations, to be met by future Congresses, amounting to $2,401,458,393.50; the second issue of liberty bonds amounting to $4,000,000,000; and a special issue of one-year certificates of indebtedness amounting to $2,000,000,000, and an issue of five-year war saving certificates amounting to $2,000,000,000. The total appropriations and contract authorizations for 1918 amounted to $21,380,730,946, which, however, $7,000,000 of loans to the Allies is reimbursable by the foreign governments to whom the advances are made. Since this summary was made the third issue of liberty bonds amounting to $5,000,000,000 has been effected, and the fourth issue amounting to $6,000,000,000 has been authorized. In its stupendous task the people have loyally stood by the government and supported the President and Congress in all that they have undertaken.

The two decades preceding this regrettable catastrophe had witnessed remarkable progress in Democratic economic reforms. Among the more important are:

1. The popular election of United States senators— the gateway to other reforms.
2. An income tax amendment to the Federal Constitution, followed by an income tax law that equalizes taxation.
3. A reduction in import duties — the best tariff law in fifty years.
4. Currency reform— the greatest piece of constructive legislation enacted during this generation, removing the penalties from the despotism of high finance and politics from the grip of Wall Street.
5. The initiative, the referendum, and the lottery, a law that gives the farmer his first opportunity to borrow on long time, and at approximately what money is worth in the market.
6. Anti-trust laws: 7. One creating a Trade Commission; and 8. The other, built on the theory that a private monopoly is indefensible and intolerable, lays the axe at the root of the tree.
9. A shipping law, which, by the creation of a government-owned merchant marine, enables the people to lay out new trade routes and to protect themselves from exorbitant freight rates on the sea.
10. 10. A Child Labor law which restrains the money-mad employer from stunting the body and dwarfing the mind of the child of this generation, who is to be the citizen of the next generation.
11. An eight-hour day law, which protects the wage-earner in his right to reasonable time for the enjoyment of home and for preparation for responsibilities of civic enfranchisement.
12. Abolition of Government by Inquisition — or, stated in another way, the recognition of the right of trial by jury when the alleged contempt is not committed in the presence of the court.
13. The Philippine law, which, by giving to the Filipinos the promise of ultimate independence, relieves the United States of the suspicion of having abridged the privileges of the Declaration of Independence, and enables it to resume its proper place among the nations as the foremost champion of the doctrine that governments derive their just powers from the consent of the governed.
14. And, last of the reforms to which attention will be called now, the 30 peace treaties which, by providing for investigation of all international disputes, make war between the contending parties a remote possibility.

In the foregoing review an attempt has been made to present a history of the Democratic party from its organization to the present time, and the party's position on public issues has been shown by quotations from platforms adopted by its national conventions. While platforms are not so specific as laws, and not so elaborate as speeches, they are probably a better index to the true purposes of parties than either laws and speeches — for the reason that laws are often compromises, and speeches may represent the individual opinions of the speakers rather than of the
party, while platforms are written by delegates chosen for that purpose. It will be seen that the party has met with successes and reverses, but it is also noticeable that it has declined in regard to the immediate effect of those principles upon it. For instance, it was defeated in 1840, and yet the platform of 1840 was constantly reaffirmed and reiterated for 20 years afterward. The platform of 1860 was then subsequently reaffirmed and even made stronger the platform of 1888, upon which the party had suffered defeat. Between 1913 and 1916 the party carried out the platform of 1908 as well as the platform of 1912.

It may be said, however, in conclusion, that there is to-day and will continue to be an imperative need for a party thoroughly committed to the defense of the inalienable rights of the individual and to local self-government, and jealous of the encroachments of Federal power. Even when such a party is not in power, it exercises a potent influence in molding public opinion and in restraining excesses, because it is very quick to champion the cause of an individual whose rights have been trampled upon, or the cause of a community whose rights have been ignored. In proportion as the organization is true to the principles promulgated by Jefferson and defended by Jackson, it may hope to appeal to the confidence of those who seek neither favoritism nor privileges, but are content to enjoy the blessings of a government in which the individual is protected in the enjoyment of life and liberty and in the pursuit of happiness. WILLIAM JENNINGS BRYAN.

DEmOCRATIC SOcieties In THE UnITED StAtes, a naval association in 1793 organized on the lines of the French Jacobin (q.v.) clubs. The masses in this country sympathized with the French Revolution, as essentially the same with their own, and clamored for an open stand by the government on that side. Instead, the attempt of Edmond Genet (q.v.) to drag the country into an active alliance with France, forced Washington to proclaim neutrality. This irritated popular feeling, and made it worth while for local politicians to organize a faction on the basis of French sympathies, ignoring American questions wholly. It is curious that this basic element of the Democratic or "people's party," which charged the Federalists with being nationalistic, monarchic, and a "British party," was itself the only purely foreign party ever known in the United States. In all the important towns, clubs were organized in imitation of the Jacobin clubs of France. That of Charleston openly claimed to be a branch of them and was formally recognized as such. As usual in such cases, the mass of Liberty is composed of their prototypes, without regard to American fitness: wore cockades and liberty caps, called each other "citizen" and "citizens," held banquets of fraternity, etc. They were at first looked down upon by the "Republicans" or opponents of the Federalist party, rejected questions, who accepted their votes but scorned their antics and irrelevancy; but common political opposition soon forced them into a common organism, which was called Democratic-Republican, still the official name of the party. Washington platform subsequently societies in 1794, as having fostered the Whiskey Insurrection (q.v.), which in fact they approved, the atrocities of the Reign of Terror, and the final downfall of Robespierre and the Jacobin Club of Paris,—perhaps equally the fact that the craze had become a bore,—caused the general disappearance of the clubs or societies in 1794-95.

DEmOCRITUS, Greek philosopher of the new Eleatic school: b. Aderba between 470 and 460 B.c.; d. 370 B.c. Some Magi and Chaldeans, whom Xerxes left on his return from his Grecian expedition, are said to have existed in Democritus the first inclination for philosophy. After the death of his father he traveled to Egypt, where he studied geometry, and probably visited the Federates, to extend his knowledge of nature. Among the Greek philosophers he enjoyed the instruction of Leucippus. He afterward returned to his native city, where he was placed at the head of public affairs. Indignant at the follies of the Aderbes, he resigned his office and retired to part, devoted himself exclusively to philosophical studies. Of his numerous philosophical works mentioned by Diogenes Laertius (q.v.) only the titles and a few doubtful fragments are preserved.

In his system he developed still further the mechanical or atomic theory of his master Leucippus. Thus he explained the origin of the world by the eternal motion of an infinite number of invisible and indivisible bodies, atoms, which differ from one another in form, position and arrangement and are alternately separated and combined by their motions in infinite space. In this way the universe was formed, fortuitously, without the interposition of a First Cause. Although denying the presence of design in nature, he admitted that of law. He called the common notion of chance a cover of human ignorance, the refuge of those who are too idle to think. The eternal existence of atoms (of matter in general) he inferred from the consideration that time could be conceived only as eternal and without beginning. In the atoms he distinguished figure, size, gravity and impenetrability. Fire consists, according to him, of active globules, and spreads, like a light envelope, round the earth. The soul consists, in as far as it is a moving power, of the finest fire-atoms; but since it is acquainted with the other elements, and anything can be known only by its equal, it must be composed in part also from the other elements. Knowledge by sense is due to contact with atoms emanating from the senses, objects, through the mediation of the organs of sense. Direct contact and mediated by the organs of sense, gives rise to 'trueborn' knowledge. The continuation of the soul after death was denied by Democritus, who divided it into two parts: the rational part, which has its seat in the breast, and the sensual part, which is diffused through the whole body. Both
constitute only one substance. He applied his atomical theory, also, to natural philosophy and astronomy. Even the gods he considered to have arisen from atoms and to be perishable like the rest of things existing. In his ethical philosophy Democritus considered the acquisition of peace of mind as the highest aim of existence. The most perfect happiness and the only fruit of the higher mental activity exerted in the endeavor to understand the nature of things, of the peace of mind arising from good actions and of a clear conscience. (See Epicurus; Lucretius; Consult Bruier, A., ‘Die Urbewegung der Atome und die Weltentstehung bei Leukippus und Demokrit’ (Halle 1884); Dryoff, Adolf, ‘Demokristudien’ (Leipzig 1899); Mullach, ‘Democriti operum fragmenta’ (Berlin 1843).

DEMOGEOT, dé-mō-zhō̄, Jacques Claude, French historian and poet; b. Paris, 5 July 1808; d. there, 9 Jan. 1894. He taught in the colleges at Beauvais, Rennes, Lyons, and in 1843 became professor of rhetoric at the Lycée Saint-Louis, which he left to take a chair in the faculty of letters at the Sorbonne. He wrote Etude sur Platon le jeune (1845-50); ‘Les lettres et les hommes de lettres au XIX siècle’ (1856); ‘Tableau de la littérature française au XVII siècle’ (1859); ‘Histoire de la littérature française depuis ses origines jusqu’aux jours’ (1851). His poetical writings are a drama, ‘Romeo et Juliet’ (1852); ‘Contes et causeries en vers’ (1862); ‘Francesca da Rimini’ (1882).

DEMOGORGE, dé-mō-gōr-gō̄n, (from Gk. δαίμων, demon, and γοργή, horrible), a mysterious divinity in pagan mythology, viewed as an object of terror rather than of worship. He is first mentioned by Lactantius (or Latianus) Placidus in a commentary on Statius, about the 5th century a.d. By some he is regarded as the author of creation, and by others as a famous magician, to whose spell all the inhabitants of Hades were subjected. In Shelley’s ‘Prometheus Unbound’ it is this dread power of the Demogorgon that overthrows Jove. The use of the word in later poets probably originated with Renaissance mythology, rather than with the classical authors.

DEMOISELLE, dā-mwā-zēl’, the Numidaea, or the ‘Numidae virgo’, an African bird which visits the south of Europe. It is about three feet in length and differs from the true cranes in having the head and neck quite feathered and the tertiaries of the wings elongated and hanging over the tail. It has its name from its gracefulness and symmetry of form.

Among insects, a dragon-fly of the family Agrionidae, characterized by more slender build, exact resemblance between fore and hind wings and the wide separation of the eyes.

Among fishes, a small species of pintado (Abudefduf Saratius), common in tide-pools from Florida to Uruguay, especially about Porto Rico.

DEMOIVRE, dé-mwāv’r, Abraham, French mathematician; b. Vitry, 26 May 1667; d. London, 27 Nov. 1754. He settled in London after the revocation of the Edict of Nantes and gained a livelihood by becoming a teacher of mathematics. His chief works are ‘Miscellanea Analytica’; ‘The Doctrine of Chances, or a Method of Calculating the Probabilities of Events at Play’; and a work on ‘Annuities’; besides ‘Papers’ in the ‘Transactions’ of the Royal Society, of which he was a Fellow. He was selected by the Royal Society to judge the dispute between Leibniz and Newton concerning the discovery of the infinitesimal calculus (q.v.). He is best known for his investigations on complex numbers (see Imaginary Quantity), and the theorem that \( \cos(a + i\pi n) = \cos a + i\pi n \) bears his name.

DEMON (Greek daimon), a name given by the ancients to a spirit or genius supposed to hold an intermediate place between men and the celestial deities. In Homer we find the term daimon sometimes applied to one or other of the gods, but it is commonly used by him in a general sense, as when we speak of ‘the Deity’ or ‘The Providence.’ Daimon is probably derived from daimô, to divide or distribute, though some look upon it as equivalent to daémon, intelligent or wise. Resided uses daimon in a different sense from Homer. He admitted four classes of rational beings—gods, demons, heroes and men. A strict classification was not made until the popular belief had been introduced into the schools of the philosophers. In the school of Zeno the immortals into gods and demons: the mortals into heroes and men. In the Greek philosophy these demons early played an important part. Thales and Pythagoras, Socrates and Xenophon, Empedocles and the Stoics, invented many fictions concerning them, each in his own way. The poetic Plato, however, goes further than any of the others. In ‘The Banquet Dialogue’ the character of the demons is thus explained: ‘Demons are intermediate between God and mortals; their function is to interpret and convey to the gods what comes from men, and to men what comes from the gods; the prayers and offerings of the one and the commands of the others. These demons are the source of all prophecy and of the art of the priests, in relation to sacrifices, consecrations, conjurations; for God has no immediate intercourse with men, but all the intercourse and conversation between the gods and mortals is carried on by means of the demons, both in waking and in sleeping. Thus the gods use the aids of such demons or spirits.’ In other places he says of them, they are clothed with air, wander over heaven, hover over the stars and abide on the earth; they beheld unveiled the secrets of the time to come, and regulate events according to their pleasure; every mortal receives at birth a particular demon, who accompanies him until his end, and conducts his soul to the place of purification and punishment. Later writers divided them, in reference to the effects ascribed to them, into good and bad spirits—Aten, demons and Cacodemons. The Romans still further developed the Greek demonology; with less, however, of a poetical character and mixed with Etruscan notions.

A full and systematic development of demonism is found in Buddhism, which recognizes six classes of beings in the universe, two only of which, those of men and angels, are good; the other four—the Asuras, irrational animals, Pretas or goblins and the demonis of hell—are evil. The Asuras are the most powerful of the wicked spirits, and constant war exists between the gods (Devas). They dwell beneath the three-pronged root of the world-mountain, occupying the nadir; while their great enemy, Indra, the highest Buddha of king, sits upon the pinnacle of
the mountain in the zenith. With the Asuras are associated numerous groups, as the Rakshasas, Nāgas, yālas, gandharvas, ogres with bloody tongues and long tusks eager to devour human beings, and lurking in fields and forests; the Nagas, snakes with human faces; the Mahoragas, great dragons; the Piśhachas or Vampires, etc. According to their nature and office, the different species of demons dwell in the air, the water or the earth, in holes, dens or clefts. See Egypt, Religion; and also Hebrews; Zoroaster.

In the New Testament we find demons, *demons* or "unclean spirits" occupying a prominent place. The Greek word used being generally *daemon* (a neuter adjective noun from *daimon*). These spirits are represented as entering into and possessing human beings, injuriously affecting them in some strange manner, and as being "cast out" by Christ and his disciples, and even by some among the Jews themselves (Luke ii, 19). Very different views are held regarding these accounts of demoniacal possession. Some regard them as plain statements. "There is no reason to suppose that as the world has become Christian, the powers of evil have been controlled and rendered unable to gain such possession of men as they did in Judea and neighboring places in the time of our Lord and the apostles, and as they are said to do in some parts of the world now. It is believed, moreover, that when Christ was on earth the Devil put forth his utmost power, knowing that his time was short and that he was then suffered to put forth a stronger hand than before or since in order that the triumph of Christ might be more conspicuous." These statements, from Blunt's *Dictionary of Doctrinal and Historical Theology*, represent what may be called a highly orthodox view of the subject of possession. The same writer admits that the symptoms of possession, as described in the Gospels, are those of some ordinary diseases, and we have one case which might be put down as confirmed epilepsy with suicidal mania. The Roman Catholic Church teaches that there can be no doubt of the reality of demoniacal possession. See Exorcism.

In the opinion of some writers the persons spoken of in the New Testament as possessed of devils were really sufferers from common diseases, being the unhappy victims of madness, monomania, hypochondria, hysteria, epilepsy and kindred ailments, and that Christ in dealing with them merely accommodated his language to the prevalent opinions of the time.

However much the first teachers of Christianity participated in the beliefs of their fellow-creatures, ignoring the facts of the case, there can be no doubt that their successors, the fathers and teachers of the Church, were considerably influenced by the popular ideas on this subject. In the early Church the "energumens" or spirit-possessed were recognized as a distinct class, and the Church originated a regular discipline in regard to them. The lives of the saints and holy men and women contain many a story in which demons figure, and the office of exorcist was long one of importance. It did not readily occur to the Jew or early Christian to deny even the existence of the gods of the heathen nations; they were simply regarded as demons or devils. We thus find in literature up to the Middle Ages, and even on this side of them, the divinities of Oriental, classical, and Scandinavian mythology figuring as princes of hell. Consult such authorities as Scott, *Demonology and Witchcraft*; Conway, *Demonology and Devil-Lore*; and for the demons of Scripture the dictionaries of the Bible, as Smith, Hastings, and the *Encyclopaedia Biblica* (Vol. i, 1859); also Horst, *Demonomagie* (2 vols, 1818); and *Zauberbibliothek* (6 vols, 1821-26); Úbert, "Ueber Dämonen, Heroen, und Genien" (1850); Bastian, "Der Mensch in der Geschichte" (3 vols, 1860); Taylor, "Primitive Culture" (2 vols, 1871); Roskoff's admirably learned "Geschichte des Teufels" (2 vols, 1869); Maspéro, "Dawn of Civilization" (New York 1894); Nevins, "Demon Possession" (Chicago 1895); Alexander, "Demoniac Possession in the New Testament" (Edinburgh 1901); Townsend, "Satan and Demons" (Cincinnati 1892); and above all the works of Bodin, "De Magorum Demonomania" (1581); and the like. See Angels; Animism; Devil; Evil; Exorcism; Hell; Serpent-worship; Werewolf; Witchcraft; Zoroaster.

**DEMONETIZATION.** See Bimetallism.

**DEMONIAC,** a term to designate an old superstitious idea, that of a person whose mental faculties are overpowered, and whose body is possessed and actuated by some created spiritual being; especially a person possessed of or controlled by evil spirits. See Demon.

**DEMONOLOGY,** the scientific study of beliefs in and evidences of the existence and influence of evil spirits. It is founded on the theory that there are beings out of the body and soul, as well as those in the body, and that these disembodied beings have the power to influence, control and obsess to their hurt those now living in the flesh. The belief in demons is prevalent particularly in India, South Africa and China, and in some sections the foundation seems to lie in the recognition of the evil influences constantly at work in human consciousness to distort and deform the good, and the personification of such influences. The bibliography of the subject is very large, but consists almost wholly of tales of incidents which are ascribed to the activities of the assumed evil spirits. All of the investigations that have been made have not as yet resulted in what may be rightly termed a science and the subject remains rather in the status of a religious belief. (See Witchcraft.) Consult Conway, M. D., "Demonology and Devil-Lore" (2 vols, New York 1889); Nevins, Rev. J. L., "Demon Possession and Allied Themes" (Chicago 1895); Scott, Sir Walter, "Demonology and Witchcraft" as a distinct class, and the Church originated a regular discipline in regard to them. The lives of the saints and holy men and women contain many a story in which demons figure, and the office of exorcist was long one of importance. It did not readily occur to the Jew or early Christian to deny even the existence of the gods of the heathen nations; they were simply regarded as demons or devils. We thus find in literature up to the Middle Ages, and even on this side of them, the divinities of Oriental, classical, and Scandinavian mythology figuring as princes of hell. Consult such authorities as Scott, *Demonology and Witchcraft*; Conway, *Demonology and Devil-Lore*; and for the demons of Scripture the dictionaries of the Bible, as Smith, Hastings, and the *Encyclopaedia Biblica* (Vol. i, 1859); also Horst, *Demonomagie* (2 vols, 1818); and *Zauberbibliothek* (6 vols, 1821-26); Úbert, "Ueber Dämonen, Heroen, und Genien" (1850); Bastian, "Der Mensch in der Geschichte" (3 vols, 1860); Taylor, "Primitive Culture" (2 vols, 1871); Roskoff's admirably learned "Geschichte des Teufels" (2 vols, 1869); Maspéro, "Dawn of Civilization" (New York 1894); Nevins, "Demon Possession" (Chicago 1895); Alexander, "Demoniac Possession in the New Testament" (Edinburgh 1901); Townsend, "Satan and Demons" (Cincinnati 1892); and above all the works of Bodin, "De Magorum Demonomania" (1581); and the like. See Angels; Animism; Devil; Evil; Exorcism; Hell; Serpent-worship; Werewolf; Witchcraft; Zoroaster.

**DEMONETIZATION.** See Bimetallism.

**DEMONIAC,** a term to designate an old superstitious idea, that of a person whose mental faculties are overpowered, and whose body is possessed and actuated by some created spiritual being; especially a person possessed of or controlled by evil spirits. See Demon.

**DEMONOLOGY,** the scientific study of beliefs in and evidences of the existence and influence of evil spirits. It is founded on the theory that there are beings out of the body and soul, as well as those in the body, and that these disembodied beings have the power to influence, control and obsess to their hurt those now living in the flesh. See Angels; Animism; Devil; Evil; Exorcism; Hell; Serpent-worship; Werewolf; Witchcraft; Zoroaster.
DEMONSTRATION, a proof in which the conclusion necessarily follows from the premises, and the rejection of the conclusion, therefore, always involves a contradiction. The great domain of demonstration is mathematics, in which all the proofs, however complicated, are drawn from a few simple axioms, founded on intuitive perception of number, time and space. In ordinary language, however, demonstration is often used as synonymous with proof and sometimes even more loosely as synonymous with explanation and exhibition, as when we speak of anatomical demonstration. In military tactics it is an operation which may be performed to the end of deceiving the enemy in regard to the real measures to be taken against it.

DEMOPHON, or DEMOPHON, in mythology, the son of Celesus and Matanira, whose Ceres loved so passionately that she wanted to make him immortal. To attain that purpose she made him pass through fire, but, being disturbed by the cries of his mother, who chanced to see him, the goddess hurriedly mounted her car, leaving Demophon to perish in the flames.

DE MORGAN, Augustus, English mathematician: b. Madura, southern India, 27 June 1806; d. London, 18 March 1871. In 1828 he was appointed professor of mathematics in University College, or as it was then called, London University — a situation which he held until 1856, with the exception of the five years from 1831 to 1836. Previous to this appointment he had turned his mathematical attainments to account in the service of some of the London assurance companies and continued throughout his life the confidential adviser of some of the most important of these associations. He was first president of the London Mathematical Society and was a member of the Royal Astronomical Society and did much to encourage a decimal system of coinage. Among his many works are 'Elements of Arithmetic' (1830); 'Elements of Algebra' (1835); 'Elements of Trigonometry' (1837); 'Essay on Probabilities and on Their Application to Life Contingencies and Insurance Office' (1838); 'Formal Logic' (1847), and contributions to various encyclopedias. A memoir was written by his widow (London 1882).

DE MORGAN, William Frend, English novelist: b. London, 16 Nov. 1839; d. Chelsea, 15 Jan. 1917. He was educated at University College School, was a student at the Royal Academy in 1859 and adopted art as a profession. In the years following 1864 he was chiefly engaged in stained-glass work; in 1870 turned his attention to ceramic work, when his experiments in lustre, at that time not much known in England, attracted some attention among artists. In 1905 he commenced as a writer of fiction with 'Joseph Vance,' which achieved an immediate success. The novels that followed were equally successful, so much so that De Morgan was soon regarded as one of the most popular novelists of his generation. His other publications are 'Alice-for-Short' (1907); 'Somehow Good' (1908); 'It never Can Happen Again' (1909); 'An Affair of Dishonor' (1910); 'A Likely Story' (1912); 'When Ghost Meets Ghost' (1914). Consult Phelps, W. L., 'E.

says on Modern Novelist' (New York 1910), and Cooper, F. T., 'Some English Story-Tellers' (ib. 1912).

DEMOSTHENES, famous Greek orator: b. Athens, 384 or 385 B.C.; d. 322 B.C. His father left him a considerable fortune, of which his guardians attempted to defraud him. Demosthenes, at the age of 17 years, conducted a suit against them himself, and gained his case. He studied rhetoric and benefited in some degree from the teachings of Isocrates and Plato. But nature had placed great obstacles in his way, and his first attempts to speak in public were attended with failure. He not only had a husky voice and a shrill voice, but was unable to pronounce the letter θ. These natural defects he endeavored to remedy by the greatest exertions. He succeeded by the advice of the actor Satyrus, who advised him to recite with pebbles in his mouth, on the roughest and stepest places. To strengthen his voice he exercised himself in speaking aloud on the seashore, amidst the noise of the waves. At other times he shut himself up for months in a subterranean room, with his head half-shaved, that he might not be tempted to go out, and acquire dignity of manner by practising before a mirror. He is also said to have transcribed the history of Thucydides eight times for the purpose of forming his style. After such a laborious preparation he composed and delivered his masterly speeches, of which his enemies said that they smell of the lamp, but to which posterity has assigned the first rank among the models of eloquence — speeches in which he openly opposed the foolish wishes of the multitude, censured their faults and inflamed their courage, their sense of honor and their patriotism. He thundered against Philip of Macedon in his orations known as the Philippics, and instilled into his fellow-citizens the hatred which animated his own bosom. The first Philippic was delivered in 352 B.C., when Philip could no longer conceal his ambitious scheme of subjugating the whole of Greece. In 349 the city of Olynthus, the northern ally of Athens, was captured and destroyed by the Macedonians, and shortly afterward Philip took possession of the Peloponnesus. The orator insisted on the necessity of immediately preparing a fleet and an army; urging the Athenians to begin the war themselves; to make Macedonia the theatre, and to terminate it only by an advantageous treaty or a decisive battle. They admired and approved his plan, but did not execute them. The celebrated Phocion, who knew the weakness of Athens, unceasingly advised peace. Demosthenes went twice to the court of Philip to negotiate, but without success. He recommended war and endeavored to arm not only Athens, but all Greece. When Philip had finally penetrated into Phocis, through the Pass of Thermopylae, and had taken possession of the city of Eleaea (338), to the terror of Athens, Demosthenes obtained a decree of the people for fitting out a fleet of 200 vessels, marching an army to Eleusis and sending embassadours to all the cities of Greece, for the purpose of forming a universal confederacy against Philip. He was himself among the ambassadors, and prevailed on the Thebans to
DEMOTICOS, or DEMOTIKA, Turkey in Europe, a town in the province of Adrianople, on the Maritza, five miles south of Adrianople. The town has some silk, woolen, and earthenware manufactories. The agricultural pursuits consist of raisins, figs, vegetables, tobacco and wine. It is the seat of a Greek archbishop, and is defended by a citadel, containing a palace, in which several of the Turkish sultans resided before they gained possession of Constantinople. Charles XII remained here for some time after the defeat of Pultowa. It was occupied during the Balkan War by the Bulgarians. The Treaty of London, 31 May 1913, confirmed the Bulgarian possession of the town, but by the final Treaty of Constantinople, 29 Sept. 1913, it was restored to Turkey. Pop. 8,700.

DEMPSTER, John, American clergyman and theological educator: b. Florida, N. Y., 2 Jan. 1794; d. 28 Nov. 1863, while on his way to California. His father, the Rev. James Dempster, was a graduate of the University of Edinburgh and became one of the early helpers of John Wesley in England. After he came to America he became a minister of the Presbyterian Church and was pastor of the church at Florida, N. Y., for many years. In 1816 John Dempster entered the ministry of the Methodist Episcopal Church. He served important churches and was 12 years a presiding elder. He also served as a missionary in Buenos Ayres for a short period. He was one of the founders of the first theological school of the Methodist Episcopal Church, which was first located at Newbury, Vt., and then at Concord, N. H., and was called the General Biblical Institute. In 1867 it was moved to Boston and became the Boston University School of Theology. Mr. Dempster was president and professor, 1845-54. He was also one of the founders and the first president of Garrett Biblical Institute, Evanston, Ill., serving from 1855 to 1863. He planned to found a third theological school in California and was on his way to that field when stricken. His 'Lectures and Addresses' were collected and published in 1864.

DEMPSTER, Thomas, Scottish scholar: b. Clifton, Aberdeenshire, Scotland, 23 Aug. 1579; d. near Bologna, Italy, 6 Sept. 1625. His autobiography, which contains a curious mixture of truth and fiction, states that he became heir to the title of Baron of Muresk, but that the property accruing thereto had been fraudulently handled by his father and he was unable to regain it. Dempster's adherence to the Roman Catholic faith was one cause of his estrangement from his father. He studied at Cambridge, Paris, Louvain, Rome and Douay and became successively professor at Tournay, the College of Navarre at Paris, at Poitou, Nimes and again at various colleges of Paris. Quarrels forced him to leave Paris, and after a brief service as historian to James I of England he became professor of civil law at Pisa and later of humanities at Bologna—a period full of quarrels and scandalous duels. Urban VIII made him a knight and gave him a pension. He remained at Bologna until his death. Bayle says that though his business was only to teach a school he was as well his sword as his pen and as quarrelsome as if he had been a duelist by profession. Scarcely a
DEMULCENTS, remedies of a mucilaginous nature that are used in inflammatory conditions of the mucous membrane. They consist largely of mixtures of the oils, gums and albumins. Thus sweet oil, acacia, tragacanth, marshmallow, slippery elm, white of egg, cream, milk and fixessed are all types of this class of remedies.

DEMURRAGE, in maritime law, is used to signify the amount to be paid by the charterer to the owner of a ship for detaining her in port longer than the time specified. The time of delay in port for a cargo, for convoy, etc., is usually stipulated in the charter-party and also the allowance to be made in case of longer delay for those objects, and this time is sometimes specified in working days or lay days, as distinguished from holy days when no cargo can be put on board. All ordinary cases of detention, such as port regulations, the overcrowded state of the harbor, and the like, or even from the unlawful acts of the custom-house officers, are at the freighter’s risk, and demurrage must be paid although it is proved that the delay was not caused by any fault of his. But demurrage cannot be claimed when the ship is detained by a public enemy or by the hostile occupation of the port, nor if the detention is caused by the owner, master or crew. The claim ceases whenever the vessel is cleared and ready for sailing, though she should be detained by adverse winds or other causes.

DEMURRER, a pause or stop put to the proceedings of an action upon a point of difficulty, which must be determined by the court before any further proceedings can be had therein. He that demurs in law confesses the facts to be true as stated by the opposite party, but denies that by the law arising upon those facts any injury is done to the party or that he has made out a lawful excuse. Demurrer upon evidence is a statement by the party making it that he will not proceed because the evidence on the other side is not sufficient to maintain the issue. A general demurrer is one not specifying an objection, but relying on some defect in substance; a special demurrer specifies some particular defect in the form of the adversary’s allegation. A demurrer when allowed puts an end to the suit, unless it is confined to only a part of the bill. If it is not granted as required. Generally there is a provision that the counsel must certify that the demurrer is well-founded in law and an affidavit must be made by the defendant that it is not interposed for delay.

DENARIUS, a Roman silver coin, the principal one under the republic and the empire, originally of the value of 10 asses or pounds of copper; but afterward of 16 asses, when the weight of the ass was reduced to one ounce in 217 B.C. It was first minted when it weighed 72 grains. It was equivalent to about 16 or 17 cents of United States money. The obverse bore the helmeted head of Roma and the mark of its value X—that is, 10 asses; the reverse had Castor and Pollux upon it. Later other mythological and historical types were cast upon it. It continued to be the ordinary silver currency down to the age of the Emperor Septimus Severus and his sons, by whom pieces composed of a base alloy were introduced. The name was also given to gold coin struck during the empire; its full title was denarius aureus, and it was generally called aureus, but by Pliny uniformly denarius. It passed for 25 silver denarii. Diocletian in 296 A.D. gave the name denarius to a coin of copper issued by him. The denarius of Tiberius is the penny mentioned in the New Testament. In the British formula 4 s. d. the d. is representative of the denarius, or silver penny of medival days; when a penny had nearly the purchasing power of the dollar of our day. Hence, as the English translation reads, the master of the vineyard agreed with the laborers, “for a penny a day,” in the parable in Matthew xx. The copper penny was not coined in England until 1665. A strong effort was made to secure, in the Revised Version of the New Testament of 1881, the original word “denarius,” but the word “penny” was retained.

DENATURED ALCOHOL, Alcohol that has been rendered unfit for use as a beverage or as a medicine by the addition of poisonous and offensive substances. It is also called denaturalized and denaturized alcohol, and industrial alcohol. Denature means to change the nature of, and the reason for changing the nature of alcohol is that it may not be subject to the Government tax on alcohol as a beverage, and thus be sold at a low price for industrial purposes. The first official recognition of denatured alcohol as a distillers industry was the action of the British government in 1855, in relieving it from the payment of duty demanded on alcoholic beverages. The denaturing agent then used was, as now, methyl or wood alcohol, added to the ethyl or grain al-
cohol in the proportion of 10 per cent. The mixture was called methylated spirit.

France, in 1872, provided a special tax of about 30 cents per gallon on alcohol denatured for use in the arts. In Germany, denatured alcohol was taxed at 30 pfennigs in 1874. The Netherlands taxed the denatured spirit in the same year; Austria-Hungary followed in 1888; Sweden in 1890; Switzerland in 1893; Norway in 1894; and Belgium in 1896. The United States law went into effect in 1907. At that time the second price of proof alcohol in the United States was about $2.50 a gallon, and the Government tax was $2.08, so that the distiller received about 42 cents a gallon. Being relieved of this tax on the denatured product the distiller could afford to sell it for 42 cents, rendering it available for a variety of uses. As a matter of fact it can be made for much less than 42 cents a gallon, as the price in Germany has been as low as 15 cents, and the figures presented in Congress at the time the proposed law was discussed went to show that it might be made as low as 11 cents a gallon. In 1916, proof alcohol was selling for $2.04 per gallon, the tax was $1.10 per gallon, and denatured alcohol was 60 cents.

A denatured alcohol may be applied, for light, fuel and power purposes, all require a cheap article, as it comes into competition with petroleum products that are sold at a low figure. But because alcohol is better than petroleum for many purposes, often it will be used even at a somewhat higher price. The price of $2.50 a gallon, however, was prohibitive, in most cases, to industrial uses.

Ordinary alcohol, specifically called ethyl alcohol, for the purpose of taxation and storing in bonded warehouses, is made to a uniform standard called proof alcohol, which is 94 per cent pure, the remainder being water. For use as a beverage or medicine this is diluted. (See Alcoholic.) To denatured alcohol there is added to the proof alcohol a small quantity of methyl or wood alcohol, which is distinctly poisonous, and which of course renders it unfit to drink. In order to spoil the taste and render it offensive, a little benzine or pyridine is also added, when the denaturizing is considered complete, and this product is called "completely denatured alcohol." It is the regular commercial grade.

The United States law provides that "to every 100 gallons of ethyl alcohol of 180 degrees of proof methyl (wood) alcohol, and half a gallon of approved benzine, and that this mixture shall be free from taxation as alcohol.

Besides the commercial type, the Government provides also for "specially denatured alcohol" to be used for certain manufactures in which the commercial type would be injurious. The latter can be used in making soaps, liniments, compound camphor, etc., but not for medicines taken internally. For example, the alcohol used in making chloral is denatured by passing through it a current of carbon dioxide. Alcohol used in making chloroform is denatured with chloride of lime. In varnish factories the denaturating agent used is turpentine. In vinegar factories the alcohol is denatured by adding an equal quantity of vinegar. For other similar specific uses several resins are employed; also camphor, acetic or nitric acids, acetic ether, acetone oil, several of the coal-tar dyes, naphthaline, nitrobenzol, castor-oil, caustic soda, phenolphthalein, chloroform, formalin and others. The United States law does not specify the articles and quantities, but simply the condition that it must be rendered unfit for use as a beverage or medicine, and making the revenue officers the judges as to when this has been accomplished. About 50 processes have been published for making denatured alcohol.

Denatured alcohol has to be made in a distillery, and a bond on warehouse must be executed on the premises, and accommodation provided for a revenue officer to watch the process. Dealers in denatured alcohol and manufacturers who use it must secure permits from the collector of internal revenue in that district. Manufacturers using the "special" grade have to give bonds.

To protect denatured alcohol from accidental handling as ordinary alcohol, the Government requires that it be put up in cans of light green color, not smaller than five nor larger than 135 gallons, and that these cans be marked "Denatured Alcohol" in letters of red, at least one and one-half inches long. Dealers in beverages are forbidden to have such cans of denatured alcohol about their premises.

Denatured alcohol may be manufactured more cheaply than ordinary alcohol by using cheaper materials, such as are unfit for use in making a beverage. Ordinary alcohol is made from grain, either Indian corn, wheat or barley. Alcohol for industrial use may be made from any starchy vegetable substance, or a waste by-product, as the poorest grade of molasses, or the waste of a canning-house. In the Louisiana sugar belt and in Hawaii, where molasses is cheap, that is probably the best material; in Maryland, where there are many canneries, fruit waste could be used; in Kansas and Oklahoma in the years when there is an oversupply of corn, it can be made into denatured alcohol; where potatoes are very cheap, these can be employed. In such ways denatured alcohol can be produced at a cost low enough to justify its use in lamps and for fuel, and for operating engines of the gasoline type, as for automobiles. Since wood alcohol is the principal and most important article used in denaturizing, the endeavor of the trade is to cheapen it, but while wood pulp and sawdust (the raw material) are cheap, they do not yield a large quantity of alcohol, hence much material has to be handled in its manufacture. Of any woody fibre or cellulose can be used, however.

Alcohol does not burn with a bright enough flame to make a good illuminant, but by using its heat to render a mantle incandescent it gives a good light, that is safer than kerosene, and presents no nuisance of smell and accumulated carbon.

As a fuel, denatured alcohol is convenient, clean and safer than petroleum. As a motive power fluid, it is cleaner and better in some ways than any of the petroleum products, but is also more costly. It requires an engine and carburetter specially designed for alcohol to render it practicable for automobile and similar engines.

Denatured alcohol is commonly used in the manufacture of aniline dyes, electric apparatus, starch, transparent soaps, tobacco, shellac varnish, celluloid, paints, hats, shoeblacking, insect
DENBIGH.—DENDROBATES.

powders, disinfectants, cements, gas mantles, cartridges, anti-freezing mixtures and in cleaning and polishing preparations.

On 30 June 1915, the Commissioner of Internal Revenue reported the manufacture of 5,386,647 gallons of completely denatured alcohol and 8,599,822 gallons of specially denatured alcohol.

Bibliography.—Brachvogels, Industrial Alcohol, p. 224 (Herrick, Denatured or Industrial Alcohol) (1907); Wiley, 'Manufacture of Denatured Alcohol' (1910).

DENBIGH, dənˈbɪθ, Wales. (1) A maritime county of North Wales; area, 426,084 acres. Oats, barley and rye are the principal crops; sheep are raised in the uplands; and woolens are manufactured. The principal industry is mining, coal, iron, lead and slate being extensively worked. The county is divided into two divisions for parliamentary purposes, each returning one member. Pop. 144,783. (2) A municipal and parliamentary borough, capital of the county of Denbigh. Population of municipal borough, 6,892.

DENBY, Charles, American diplomatist: b. Mount Doy, Va. 1830; d. Evansville, Ind., 13 Jan. 1904. He was educated at Georgetown University and Virginia Military Institute and became a lawyer. Having served through the Civil War and attained the rank of colonel, he resumed the practice of law. He was appointed minister to China in 1885 and served for 13 years in Peking. In 1898 he was made a member of the commission to investigate the conduct of the war with Spain, and in 1899 a member of the Philippine Commission. During the war between China and Japan the Japanese government placed its interests in China in his care. He wrote 'China and Her People' (2 vols., 1896).

DENDERAH, dənˈdərə-ə, Egypt (the Ten-tyra of the Greeks and Romans), a village on the left bank of the Nile; lat. 26° 10' N.; long. 32° 40' E.; celebrated for its temple, one of the most magnificent and best preserved remains of antiquity in Egypt, begun under Ptolemy XI and completed in the reign of the Emperor Tiberius. It was dedicated to the goddess Athor or Aphrodite, and is enclosed within a wall built of sun-dried bricks, in some parts 35 feet high and 15 feet thick. The portico of the temple consists of 24 columns, in three rows four deep on either side, each above 22 feet in circumference, and 50 feet high. The interior consists of a number of apartments, all the walls and ceilings of which are covered with religious and astronomical representations, including the figure of Athor. Some of these appear at one time regarded as of great antiquity. Another remarkable object belonging to the temple, and which excited the greatest interest, was a celestial planisphere or zodiac, forming the ceiling of one of the upper chambers. This was carefully removed from its original place in 1822, and conveyed to Paris. Plinders Petrie in 1898 excavated the tomb of the ancient princes of Denderah. Consult Mariette, 'Denderah' (5 vols., 1869–80); Petrie, 'Denderah' (1900).

DENDERMONDE, dənˈdər-mɔ̃də, or TERMONDE, Belgium, town in the province of East Flanders at the junction of the Dender and the Scheldt rivers, 12 miles northwest from Brussels. It is strongly fortified, defended by a citadel and surrounded by low, marshy ground which can be let under water. It contains manufactories of woollen and linen goods, tobacco and other articles. It is an important railroad centre. It possesses a college, a public library, an academy of design and architecture, a music school, a fine church in which are a number of paintings by Van Dyck and De Crayer and a remarkably decorated townhall of the 14th century. Pop. 10,193.

DENDRERPETUM, dənˈdərˌrəpətəm, a small lizard-like fossil amphibian, discovered by Dawson and Lyell in Nova Scotia; so named from its being found in the interior of a fossil trunk and hence supposed to have been of arboreal habits. It is now regarded as a labyrinthodont and is ranked by some scientists under the suborder Labyrinthodontia Vera. The skull is parabolic in form.

DENDRITE (Gr. *tree-like*), any mineral in which arborescent forms resembling trees or mosses occur. These peculiar markings, which are often of great delicacy and beauty, are commonly due to the presence of certain metallic oxides which have separated from the general mass of the mineral. Moss agate is a familiar example of a dendrite, the markings in this case being due to the presence of oxide of manganese. The name *dendrite* is also applied to the complex, tree-like crystals in some growths often observed in the case of silver, lead, copper and certain other metals. Manganes oxide dendrites on limestone are often, but incorrectly, called fossil ferns.

DENDRITIC DRAINAGE. See TRELLISED DRAINAGE.

DENDROBATES, a genus of South American tree-frogs representing the family Dendrobatidae, which is remarkable in having species in West Africa and Madagascar, as well as seven species in tropical South America. These frogs are small, brightly colored, toothless, and have not webbed feet, but adhesive disks on their toes. Sitting for life in trees: and are noteworthy from the use made of them by man. The Indians eat these frogs before a fire, then scrape off the poison exuded under the pain of the heat, and with it poison their arrowheads. This skin-poison is also employed for dyeing the Amazonian green parrots in a fanciful way. To do so feathers of the part to be dyed are pulled out, and these places are rubbed with the collected poison, or simply with a living frog (Dendrobates tinctorius), and again when the new feathers begin to appear the same is rubbed off. It is yellow instead of green, and since the Brazilians . . . are rather partial to these artificially produced freaks or 'contrafeitos' as
they call them, the industry is kept up. These little frogs are remarkably attentive to their young. They spawn in shallow puddles that quickly dry up. The father frog therefore sits down in the puddle as soon as the eggs hatch, whereupon the tadpoles crawl upon his back (the brood is small), and stick there by suckering-like mouths while he carries them to another water place, and so on until their metamorphosis is finished. Consult Gadon, Amphibia and Reptiles (New York 1901).

DENDROBIUM, an extensive genus of epiphytes belonging to the family Orchidaceae, natives of Asia and Australasia, where they are found in great numbers in the damp tropical forests. About 600 species are known, of which many are cultivated in hothouses. The genus varies greatly in the character of its flowers, some of the species being among the finest of the orchids. Among these are D. noble, D. chrysanthum, D. gibsoni, and D. densiflorum.

DENDROLAGUS, a genus of marsupial animals, popularly known as tree-kangaroos, from their habit of living in trees. Their fore legs are longer and stouter in proportion than those of the kangaroo, and their hind legs shorter. They move on the tree-tops with a jumping motion of the hind legs, clinging to the landing place with the forelegs, which are armed with long sharp claws. Four species are known, one of them (D. tumbolata) being a native of northern Queensland, and the other three (D. urinus, inustus and dorianus) natives of the island of New Guinea.

DENEEN, Charles Samuel, American lawyer and public official: b. Edwardsville, Ill., 4 May 1803. He was graduated at McKendree College in 1825, was admitted to the bar in 1826 and practised law in Chicago until 1840. In 1892 he was a member of the Illinois house of representatives, was attorney for the Sanitary District of Chicago 1895-96, and attorney for Cook County 1896-1904. He was governor of Illinois from 1905 to 1913, and afterward served as attorney for a committee of investigation into the Chicago voting-machine scandal.

DENGUE (den'gè) FEVER (also called dandy, breakbone, and seven-days' fever, scarletina rheumatica, abu rokab), a specific disease usually distinguished by an acute onset with fever, intense muscular and joint pains, and later by a measles-like eruption. In some countries it is endemic and has three times assumed epidemic proportions. It is found in Eastern countries—Arabia, China, India, Africa, especially in Egypt and Zanzibar. It has been found in Spain, Greece and Asia Minor; in Bermuda, the West Indies, the southern United States; in parts of South America; and in Sydney and Brisbane, Australia. It is essentially a disease of the tropics, where it is usually found in hot weather, in the coast and river districts and low levels more than in inland parts; and it would seem to be a communicable disease, depending upon some micro-organism. As a rule the disease lasts from four to eight days, and the prognosis is favorable. Complications or a fatal end are very rare. It is frequently confounded with influenza, yellow fever, rheumatism, measles, scarlet fever. Treatment is by means of quinine, ice, the newer antipyretics and opium.

DENHAM, Dixon, English explorer: b. London 1786; d. Sierra Leone, 9 June 1828. He was educated at Merchant Taylors' School with a view to entering business, but joined the army in 1811, and fought in the Peninsular campaign and in the Netherlands. In 1823-24 he was engaged in company with Captain Clapperton and Dr. Oudinot in the central regions of Africa. The account of the expedition was prepared by Denham, and published under the title Narrative of Travels and Discoveries in Northern and Central Africa (1826). In 1826 he went to Sierra Leone as superintendent of the liberated Africans, and in 1828 was appointed lieutenant-governor of the colony.

DENHAM, Sir John, English poet: b. Dublin, Ireland, 1615; d. London, March 1669. He was the son of Sir John Denham, chief baron of the exchequer in Ireland, and was educated in London and at Oxford. In 1641 he first became known by his tragedy of The Sophy. This piece was so much admired that Waller observed, "Denham had broken out like the Irish rebellion, 60,000 strong, when no person suspected it." In 1643 he published the first edition of his most celebrated poem, called "Cooper's Hill." Among the last and best of his productions is a poem in which he commemorated the death of Cowley. In 1653 a corrected edition of his works was published. He was forced to escape to France in 1648 because of his implication in the secret service of Charles I. Returning to England in 1652, he was appointed after the Restoration as surveyor-general of the royal buildings. His tomb is at Westminster Abbey. He wrote papers on "English Poets" (London 1880-83). His poetry generally is remarkable for its rhythmic flow and smoothness, leading up sometimes to passages of force and dignity.

DENHART, or DENHARDT, Clemens, German explorer: b. Zeitz 1852; d. at 1856, respectively. Then made a tour in 1788, through the Tana River region, East Africa, to establish German trade, and another from the island of Lamu to Viti in March 1888, the sultan of the Swahili desiring a treaty with Germany based upon the protectorate. He was still in the field 18 years previously. Clemens Denhart transferred part of the territory acquired by him to the German Colonist Society, the Deutsche Witgesellschaft. All rights to this territory were ceded by Germany to England in 1890, in exchange for the island of Helgoland, the brothers receiving an indemnity of 150,000 marks from the German government. An important work by Clemens Denhart was published in 1883 in the Mitteilungen des Vereins für Erdkunde at Leipzig under the title 'Anleitung zu geographischen Arbeiten bei Forschungsreisen.'

DENIA, da'nè-a, Spain, seaport on the east coast of Alicante. Roman antiquities abound in the neighborhood. The harbor is small and there is a lighthouse. Raisins and salt are the principal articles of commerce.

DENINA, da-nè-nà, Carlo Giacomo Maria, Italian historian: b. Revello, Piedmont, 28 Feb. 1731; d. Paris, 5 Dec. 1813. He studied at Turin, and in 1758 became a professor in the university there. In 1769 he published the first three volumes of his 'Delle rivoluzioni
DENIO — DENISON

d'Italia,' his most important work, which was finished in 1772. He went to Berlin in 1782, and was appointed a member of the Academy. He published 'La Prusse littéraire sous Frédéric II'; 'Political and Literary History of Greece'; and 'Letters from Brandenburg,' etc. His 'Clé des Langues,' dedicated to Napoleon, brought him the position of librarian to the emperor. His 'Rivoluzioni' was translated into English by Langhorne (London 1773). Consult Surra, 'Vita de Carlo Denina' (2 vols. 1819).

DENIO, Hiram, American jurist: b. Rome, N. Y., 21 May 1799; d. Utica, 5 Nov. 1871. He studied law, was admitted to the bar and practised at Rome and Utica. He was appointed circuit judge of the Fifth New York circuit, and was three times elected judge of the State Court of Appeals, the first time in 1853. He retired from that office in 1866. He edited with William Tracy 'Revised Statutes of New York' (1852), and published 'Reports of Cases Argued and Determined in the Supreme Court and in the Court for the Correction of Errors' (5 vols. 1845-48).

DENIS, Fr. dé-né, or DENYS, Saint, first bishop of Paris, and patron saint of the French nation. Exact information regarding Saint Denis cannot be obtained, but there is no doubt he belongs to the 3d century. In the Middle Ages it was believed by many that Saint Denis, or Dionysius, of Paris was the same as the Dionysius converted at Athens by Saint Paul; but the number of years intervening between the time of Saint Paul and when Denis was bishop of Paris (about 207 years) is proof that the Areopagite of Athens and the apostle of Paris were not the same person. The most reliable authorities say that Saint Denis of Paris was sent by the Pope to Gaul about 250 A.D. His mission was most successful; many pagans were converted to Christianity. The number of his disciples attracted the attention of the Roman governor who caused the arrest of Denis and several of his companions, among whom were Eleutherius, a deacon, and Rusticus, a priest. The Christian women who had to decorate the Christian sacrifice to the gods, were tortured and put to death. The bodies of Denis, the priest and the deacon were thrown into the Seine. Catulla, a Christian woman, recovered the bodies and gave them burial. Later a church was built over the place where the bodies were interred. Dagobert I built (about 636) here the abbey of Saint Denis. His feast, in the calendar of the Roman Catholic Church, is 9 October. Consult Butler, 'Lives of Saints'; Taillat, 'Apostolate of Saint Denis' (Amiens 1869); Vercelly, 'Vie de Saint Denis' (Paris 1854).

DENIS, Saint, sânh dé-né, France, a north ern suburb of Paris and lying within the lines of forts surrounding the capital. It has numerous manufactories of calicoes and other printed cotton goods, gelatine, candles, saltpetre and soda, and a great annual live stock market, ex tenting for some time in the 3d century a chapel was erected on or near the present site to the memory of Saint Dionysius or Denis, who is said to have been martyred here. For this chapel Dagobert I, in the 6th century, caused a large basilica, which he himself was interred, and afterward it was used as the burial place of the kings of France. Changes were made later but under the Abbot Suger the building became most beautiful. The chapel was destroyed during the Revolution and the bodies of the kings put into a cannon pit. Many of the tombs and relics were, however, preserved in the Musée des Petits Augustins. Napoleon's decree of 20 Feb. 1806 made Saint Denis again the burial place of the reigning family of France. Louis XVIII obliterated from Saint Denis all traces of Napoleon's rule; but under the famous architect Viollet-le-Duc effected a magnificent restoration of the ancient building. The present stained-glass windows are all, with one exception, modern. Pop. 71,549.

DENISON, George Taylor, Canadian soldier: b. Toronto, 31 Aug. 1839. He was educated at Upper Canada College and Toronto University, was called to the bar in 1861, and practised law in Toronto, in 1877 being appointed police magistrate of the city. In 1872 and 1873 he was sent to England as commissioner in behalf of immigrants. He held the military service in 1855 and was made lieutenant-colonel in 1866; he was in active service in the Fenian raid of 1866 and in the Riel rebellion in the Northwest Territory in 1885. His 'History of Cavalry' (1877) won the first prize offered by the emperor of Russia for the best book on the subject; he has written also 'The National Defences' (1861); 'Canada, Is She Prepared for War?' (1861); 'The Fenian Raid at Fort Erie' (1866); 'Canada and Her Relations to the Empire' (1895); 'Soldiering in Canada' (1900) and 'The Struggle for Imperial Amity' (1909). He was one of the founders of the 'Canada First' party, and through his contributions to periodical literature and public addresses has been known as an earnest advocate of Canada's rights and of the preservation of the unity of the empire.

DENISON, Iowa, city, county-seat of Crawford County, on the Boyer River, and on the Chicago and Northwestern and the Illinois Central railroads, about 100 miles west by north of Des Moines. A business college and a normal school. The flour and flour- ishing trade carried on in grain, flour and live stock, dairy products and general agricultural produce. The city has a hospital, flour mills, refrigerating and ice plant, creameries, etc. The water-supply system is owned and operated by the city. In 1849, an Indian massacre took place at Fort Purdy, nearby. Pop. 3,133.

DENISON, Tex., city of Grayson County, 70 miles northeast of Dallas, on the Mississippi, Kansas and Texas, the Texas Central and other railroads. It is of importance as a railroad centre, and contains shops of four systems, also cotton, cottonseed-oil, and flouring mills, creosote works, handle factory, mattress and felt factory and grain elevators. In 1914, 1,109 persons were engaged in 30 manufacturing establishments, capitalized at $1,052,000; $743,000 was paid in salaries and wages; $479,000 of materials were used, and the value of the products was $2,069,000. It is the seat of Saint Xavier Academy and Washington School, and has a government building, public library, city hospital and two parks. The union railroad station is also a noteworthy feature. It was settled and incorporated in 1872, owns its water-
works and has the commission form of government. Pop. 14,000.

DENISON UNIVERSITY, an educational institution in Granville, Ohio, founded in 1831, under the auspices of the Baptist Church, and intended at first as a manual training school. The manual training was soon abandoned, and the theological department was dropped in 1870. The Shepardson College for Women, established in 1887, became affiliated with the university in 1900. In 1917 the library contained about 55,000 volumes; the attendance was 710 students; instructors 55.

DENTRIFICATION. See NITRIFICATION.

DENIZEN, in English law, an alien who by letters patent has been constituted a British subject permanently or for a time. A denizen is in a middle state between an alien and a natural-born or naturalized subject. He may take lands by purchase or devise, or derive a title by descent through his parents or his ancestor though they be aliens. No denizen can sit in Parliament or take office, civil or military. The right of conferring denizenship is within the powers of the king and of Parliament, though usually exercised exclusively by the latter. In the United States this civil condition is well known in South Carolina, having been created by statute. In natural history, an animal or plant originally introduced into a country or district by human agency, which now maintains itself there without the direct aid of man, is called a denizen of that country or district.

DENMARK (Danish, Danmark), northern kingdom of Europe, between lat. 54° 40' and 57° 45' N., and long. 8° 4' and 12° 45' E. It is composed of a peninsular portion and an extensive archipelago, lying east of it, with a few scattered islands on its west side; and is bounded north by the Skager Rack, which separates it from Norway; northeast and east by the Cattegat and Sound, which separates it from Sweden; east and south by the Baltic; south by the duchy of Schleswig, and west by the German Ocean or North Sea. The peninsular portion is composed of Jutland and measures, north to south, 185 miles with a breadth varying from 40 to 106 miles — its broadest part being from Fort Un Dot Point, lat. 56° 26' 42" N., on the east coast, to Nissum Fiord on the west coast. The numerous islands lying east of Jutland are mainly comprised in two groups: first, that of Jylland, Seeland and Zealand, including, besides the large island of that name, the small adjoining islands east of the Great Belt, the principal of which are Amager, Langøe, Tarøe, Masnedøe, Agerøe, Lolland or Laaland, Falster and Møen, and second, the Fünen or Fyen group, comprising, besides the large island of that name, the neighboring islands west of the Great Belt, including Langeland, Aeroø, Fanøe, Taasinge and others. Besides these, there are the outlying islands of Læsøe and Anholt, in the Cattegat, and Bornholm in the Baltic.

Besides these territories, Denmark possesses the Færøe Islands and Iceland, in the north Atlantic Ocean; Greenland, in the Arctic regions.

Copenhagen is the capital, and among the towns of importance are Aarhus, Odense and Aalborg.

The following table gives the main divisions of the country, with their area and population, as well as the total area and population of the whole monarchy, according to the latest official enumeration:

Previous to 1864 the duchies of Schleswig-Holstein and Lauenburg belonged to Denmark, so that the area of the kingdom was then greater by about 7,350 square miles, the corresponding population being more than a million.

Geology and General Aspect.—Denmark is a very low-lying country, there being no elevation of any consequence throughout the whole kingdom. The greatest height is attained on the eastern side of the peninsula, though even there it never exceeds 550 feet. In respect of geological structure all the rocks belong to the upper series of the Secondary, and to the Tertiary formation, and have been deposited from water in regular strata. The rock most fully developed is the chalk, of which several distinct species have been recognized. The whole west coast is rendered almost uninhabitable by the drift-sand, which has formed an almost uninterrupted line of sterile downs, called Kitten, extending from Cape Skagen to Blaavand's Hook, a distance of nearly 200 miles. Along parts of the coast of Jutland are extensive flats or plains, which have been wrested from the sea, and which are protected from its encroachments by huge dykes, as in Holland.

Rivers, Lakes, Sea-arms, Ports, etc.—Denmark has no large rivers; the principal is the Guden Aa, which is navigable for part of its course. Less important streams are the Holm Aa, the Lönborg Aa and the Stor Aa. All the others are insignificant streams. There are no rivers in any of the islands, but brooks and streamlets abound. There are a number of lakes, particularly in Jutland, and several in the larger islands; but they are all small. The most remarkable of the physical features of Denmark are its lagoons or fanni, winding inlets of the sea, that penetrate far into the land. The largest of these is the Lympford or Liim Fiord, in Jutland, which entering the land in the Cattegat, winds its way quite through the peninsula and is separated from the North Sea merely by a narrow strip of land which storms have ruptured in one or two places. Most of the streams, lakes and coasts of the kingdom are well stocked with fish. Besides these inland seas, the Great Belt separates the large islands of Seeland and Fünen and the Little Belt flows between the latter and the coast of Jutland and Schleswig. Denmark is well supplied with excellent seaports, the most important being Copenhagen, Aalborg, Aarhus and Randers.

Climate.—The prevailing characteristic of the climate of Denmark is humidity; it is also remarkably temperate for so northerly a re-
gion; both the result of the lowness of the land and of its proximity to the sea on all sides. The highs of summer are great, some times excessive. The mean temperature of the year is 47°. The mean length of the day is 16½ hours, the longest 17½ hours. Heavy rains are frequent in autumn, and mists in summer, especially on the west coast of Jutland. The annual rainfall ranges from 21 to 27 inches.

Animal and Vegetable Products.—Horses and cattle are reared in great numbers, and both are excellent. Large flocks of sheep are kept; but rather for the flesh than the wool, which is coarse and short. Swine are also reared to a great extent. Deer, stags, roes, hares and a variety of other game are met with in the royal and other forests, but do not abound anywhere else. Wild fowl,—including the eider-duck, so famous for its down—are numerous. Poultry of all kinds are raised, particularly geese. Potatoes, barley, oats, rye, beans, peas, tares, flax, hemp, madder and tobacco are raised; and the isle of Fæmø and buckwheat in Fünen. Among the garden fruits are apples, plums, cherries, pears and nuts. Few of the great forests with which the country was once covered now remain. Government, however, has of late years paid some attention to this source of national wealth, and has taken measures for the protection and better management of the forests. The larger forests are now confined to the east side of Jutland and to Seeland.

Agriculture, Cattle-Breeding, etc.—Although not particularly favored by nature, Denmark is yet pre-eminent an agricultural country. Of the total area 80 per cent is productive; about one-sixth of the unproductive area is bog. The land is greatly subdivided, as the law interdicts the union of small farms into larger and encourages the division of landed property. The kinds of grain most largely cultivated are barley, oats, rye and wheat, the greatest area being occupied by oats, the second by barley. Rye is grown throughout the whole peninsula and in the islands of Fünen and Seeland, and some of the islands on the west coast. From this grain the greater part of the bread used in Denmark is made. Wheat, which occupies a very small area, is grown chiefly on the islands of Lolland and Langeland, and on large estates in other quarters of the kingdom. The yearly yield of the cereal crop is said to be larger than that raised by any corresponding European population except that of Mecklenburg. The oats crop of 1917 amounted to 273,270, the barley crop to 194,660, that of rye to 112,659 and that of wheat to 58,465 tons. Buckwheat is cultivated to some extent in Jutland, as also in the island of Fünen and elsewhere. Potatoes, which were introduced into Denmark early in the 19th century, are now very generally cultivated. Herbage plants and grass are carefully cultivated. Beans, peas and tares are also extensively cultivated throughout the whole country and form an important article of food. Flax, hemp, hops, tobacco, madder, lavender and mustard seed are grown, but not in sufficient quantities to supply the home demand. The part of the kingdom best adapted for the production of fruit is the island of Fünen. Cattle-breeding, grazing and the dairy engage the greatest share of the farmer’s attention in Denmark. Large and increasing numbers of cattle are annually exported from the country. A great increase has of late years taken place also in dairy produce, and the export of butter is now the chief export of the country. Denmark.

Fisheries.—The fisheries are an important branch of national industry. Next to the herring the turbot, torsk and salmon are the most abundant sorts of fish. Oyster banks occur on the east coast of Jutland, near its northern extremity. The fish in the southern parts of the island and Fæmø and more especially in the south, are largely exported and the rearing of hogs is much attended to; the greatest number are reared in the vicinity of the woods in East Jutland. The rearing of bees occupies a large share of attention, particularly in the island of Fünen, and wax is largely exported.

Fisheries.—The fisheries are an important branch of national industry. Next to the herring the turbot, torsk and salmon are the most abundant sorts of fish. Oyster banks occur on the east coast of Jutland, near its northern extremity. The fish in the southern parts of the island and Fæmø and more especially in the south, are largely exported and the rearing of hogs is much attended to; the greatest number are reared in the vicinity of the woods in East Jutland. The rearing of bees occupies a large share of attention, particularly in the island of Fünen, and wax is largely exported.

Manufactures. These are comparatively insignificant and do not come within particular or national manufacture. There are, however, one or two articles which have attained a considerable reputation; these are the woolens and earthenware of Jutland, the former a domestic manufacture; the wooden clocks of Bornholm and a superior kind of stove made in Copenhagen. The manufacture of paper is pretty extensive and has of late years been greatly improved and extended. There are also iron foundries, sugar refineries, some extensive tanneries and many distilleries. Randers in Jutland and Odense in the island of Fünen were formerly celebrated for the manufacture of gloves; but the peculiar kind of leather from which they were made, and in which their excellence consisted, is now prepared in other countries. The people of Denmark bake their own bread, brew their own beer and spin the greatest portion of the woolen yarn afterward knitted into stockings or woven into cloth by the village weaver. The women make up their own dresses and frequently the clothes of their husbands; the latter make the wooden shoes and slippers and manufacture the greater part of the house furniture and farming utensils. Several of the manufacturing establishments of Denmark belong to the government. Among these establishments are a royal porcelain manufactory in Copenhagen and a royal cloth manufactory in Irsørrød, which supplies cloth for the army. According to statistics gathered on 26 May 1914, there are 82,442 industrial factories and shops in Denmark, employing altogether 346,000 persons, of whom 259,000 were skilled workers. Of the total, 15,400 used mechanical power. There were 22 distilleries (5 in Copenhagen) whose output of brandy reduced to 100 degrees, amounted to 2,989,646 gallons. In 1916 there were produced 297,000 gallons of excisable beer and 342,250,000 gallons (small) for the home market. In the same year 137,760 tons of beet sugar were produced at 9 sugar factories and 56,480 tons of margarine in 49 factories.
DENMARK

Commerce, Canals and Railways.—The commerce of Denmark is carried chiefly with Great Britain, Germany (especially Schleswig-Holstein and the North German States), Russia, Great Britain and Germany possessing by far the largest share. The chief imports are textile goods (especially cottons), metals and hardware, wood and articles made of it, coal, bricks, salt, manure, oil, oil-cakes, fish, rice, and paper. The principal exports are cotton manufactures, coal and iron. Considerable quantities of cotton are imported by Denmark from Germany. The manufactures of Denmark being, as already mentioned, insignificant, the articles exported consist chiefly of agricultural products. The declared value of the total imports in 1914 amounted to $220,913,330 and that of the exports to $240,957,220. In 1916 the mercantile marine of Denmark consisted of 3,520 vessels, with a total tonnage of 589,252 tons. The coasting trade is extensive and is largely shared in by foreigners. There are several canals in Denmark, but none of them of any great consequence. There are 2,404 miles of railroads, over half owned by the state. The freight and passenger traffic of the railroads of Denmark is about 1 per cent. of the Danish freight and passenger traffic of the railroads of Germany. Denmark, Fünen, Laaland and Falster, which, assisted by ferries, gives direct communication with the capital on the one hand and with Jutland on the other.

Money, Weights, etc.—Since 1 Jan. 1875 the unit of the Danish monetary system has been the krone or crown, equal to about 26¼ cents. The krone is divided into 100 öre. The use of the metric system of weights and measures became obligatory in Denmark in public offices on 1 April 1910, and generally on 1 April 1912.

People, Education, Religion.—The population of Denmark is composed almost exclusively of Danes, with a few thousand Jews and others. The Danes have regular and well-formed features, fair or brown hair and blue eyes, with muscular frames; they are kind-hearted, honest and simple-minded, and continue to maintain their ancient reputation of being bold and hardy seamen. All classes are noted for their industry, which is characteristic of the nation. At the head of the educational institutions stand the University of Copenhagen and the Holberg Academy at Sorø. Elementary education is widely diffused, although in this regard Denmark is no longer so pre-eminent as formerly; it is compulsory for children between the ages of 7 and 14 years, and the public schools, maintained by communal rates, are, with the exception of a few middle-class schools, free. Of elementary schools there are 3,446 with 400,000 pupils. There are training colleges for teachers, and classical and other higher education is afforded by a large number of colleges in the more important towns, with the University of Copenhagen (1,300 students) for the centre of the entire system. Denmark has also the Royal Library, with 800,000 volumes, is especially rich in Oriental and Icelandic MSS. The established religion is Lutheran, to which the king must belong; but complete toleration is enjoyed in every part of the kingdom. The Reformation was introduced in 1536, when the Church revenues were seized by the Crown. Denmark was divided into seven dioceses in which there are 1,360 parishes. According to the census of 1911 there were 27,372,792 Protestants, 9,821 Roman Catholics, 256 Greek Catholics, 5,164 Jews and 9,043 other or of no confession.

Government, Army and Navy, Finance.—The government of Denmark is a constitutional monarchy, the king being assisted by a cabinet of 10 ministers. The Crown was elective until 1660, when the people and clergy, impelled by hatred toward the nobles, invested the sovereign (Frederick III) with absolute power, and declared the succession to the throne hereditary. From that time the Crown exercised absolute rule till 1831, when a constitution was granted. This proving unsatisfactory was superseded in 1848 by the form of a monarchy; with some alterations, Denmark now enjoys. The present Constitution of Denmark is founded on the "Grundlov" (charter) of 5 June 1915, which was put in force 1 Jan. 1916. According to this new charter, the executive power is vested in the king and his responsible ministers, and the right of making and amending laws in the Rigsdag, or Diet, acting in conjunction with the sovereign. The king must be a member of the Evangelical Lutheran Church, which is declared to be the religion of the state. The Rigsdag comprises the Folketing and the Landsting, the former being the popular chamber, the latter a senate. The Folketing consists of 140 members returned in direct elections by universal suffrage for the term of four years. The franchise is enjoyed by all citizens of good reputation, male and female (of an age gradually decreasing from 30 years at present to 25), who are not in receipt of poor-relief. All voters are eligible for election to the house. Of the 140 members the capital has to elect 24 by the list system of proportional representation. Outside the capital 92 members are elected in single-member constituencies by simple majority, and furthermore 23 additional seats are to be allotted to candidates of the working class, who have a head of household, and less than their proportional share. The additional seats are to be had by those non-elected candidates having received the most votes. The Landsting consists of 72 members. The franchise is enjoyed by all electors to the Folketing, of 35 years of age, and residing in the electoral district. All former privileges for the largest taxpayers have been abolished by the Grundlov of 1915. The election is indirect and exclusively proportional. Fifty-four of the 72 members are elected by the Andrep (government) method of proportional representation in large electoral districts, mostly embracing 10 to 12 members. The remaining 18 members are to be elected on the principle of proportional representation by the members of the outgoing house. Fifty-four members of the Landsting are reapportioned in two sections, each including about 27, and sitting 8 years. Both the members of the Landsting and of the Folketing receive payment for their services at the rate of 10 kroner ($2.25) per day. Members must accept payment. The Rigsdag must meet every year on the first Tuesday in October. To the Folketing all money bills must in the first instance be submitted by the government. The Landsting, besides its
DENMARK

legislative functions, has the duty of appointing from its midst every four years judges who, together with the ordinary members of the Hojester, form the Rigester, a tribunal to try parliamentary impeachments. The ministers have free access to both of the legislative assemblies, but can only vote in that chamber of which they are members.

For administrative purposes Denmark is divided into 18 counties (amter), each of which is administered by a government (amtmand). Moreover, the county is a municipal division with a county council superintending the rural municipalities (about 1,200). There are 77 urban municipalities with a mayor and a town council. Rural as well as urban municipal councils are elected directly by universal suffrage. Copenhagen forms a district by itself, and has its own form of administration. The total revenue in the fiscal year from 1916 to 1917 was $13,488,105; and the expenditure $82,633,689. Since the war of 1866, the government has maintained a comparatively large reserve fund to meet any sudden emergency. That fund in 1917 was $3,182,605. The total national debt is $163,634,870, or about $38 per head of the population. The national debt, the national debts of the other Scandinavian countries, and the Danish government's share of the national debt of the United States, amount to over $301,111,110. The deposits in the Danish savings banks increased from $262,827,000 in 1916 to $298,440,000 in 1917.

The Danish army is a national militia, serving in some respects the Swiss army. Every able-bodied Danish subject is liable to serve in the army or navy, except the inhabitants of Iceland, and the Faeroe Islands. Exemptions in Denmark are few, even clergy men having to serve. Service commences at the age of 20 and lasts for 10 years. For the first 8 the men belong to the active army, and for the second 8 years to the extra, or territorial, reserve. At the time of joining, the recruits are continuously trained for 165 days in the infantry, 280 days in the field artillery, 1 year in the garrison artillery and 200 days in the cavalry. The engineers have 7 months', and the train 2 months' continuous training. In the case of about one-fourth of the men their initial training is prolonged by periods ranging from 24 to 180 months. and the period of the service to which they belong. Subsequent training for all arms only takes place once or twice in the remaining 6 or 7 years of army service, and then only for 25 or 30 days on each occasion. The active strength of the active army is about 820 officers and 12,900 men. The navy in 1916 had 3 monitors, 15 torpedo boats, 2 small cruisers, 2 minelayers and 6 submarines. Besides these, there is a nominal fleet of war craft, but this has little or no fighting power. The navy numbers 4,000 officers and men. The military budget for 1916 amounts to $4,902,465, besides allotments for fortifications, etc.

History.—The early history of Denmark is lost in the twilight of the saga-period, out of which loom dimly the figures of its heroes, their braided hair and plumed helmets. When the borders the Celts had first their home, and from its shores the Angles and Saxons sailed in the 5th century to the conquest of England; while in the place the Danes from Zealand settled on the dunes and from there they looked south as far as the Elster. One of their earliest kings, Harald Hildetand, fell in battle against the Swedes in 695; and shortly afterward a branch of the Yngfinger occupied Jutland, where they held a footing for two centuries. One of their kings, Harald Klak, received baptism in 826 from Bishop Eyste. The Danes did not at once place any check on the long accustomed inroads on Frankish territory, or on the piratical expeditions of the Vikings; although the country was soon torn by dissensions between the adherents of the old and new faiths. Form the Old, who drove the Thuringer from the peninsula, and first united the mainland and islands under one rule, was the bitter enemy of Christianity; and although his death in 936 gave fresh vigor to the diffusion of the new faith, yet even its ultimate success was only ensured by the zealous support it received from Gorm's grandson, Canute. On his death in 1035 the three kingdoms of his Anglo-Scandinavian Empire separated, and his sister's son, Svend Estridsen (1047-76), ascended the throne of Denmark, founding a princely line that flourished 400 years. Internal dissensions and external wars weakened the country, and the introduction of a feudal system raised up a powerful nobility, and ground down the once free people to a condition of servitude. Waldemar I (1157-82) added Holstein to the other Wendish provinces of Mecklenburg and Pomern, and extended his sway over Norway also. Under Waldemar II the conquests of Denmark extended so far into German and Wendish lands, that the Baltic was little more than a Danish sea. The valour of the German princes and the treachery of his vassals combined to rob him, however, of these brilliant conquests, and his death in 1241 was followed by a century of anarchy and inglorious decadence of the authority of the Crown, during which the kingdom was brought to the brink of annihilation. Under his grandson, Waldemar IV, Denmark made a transient recovery of the conquests of the older Waldemars, rousing the jealousy of the Hanseatic League, and the national laws were codified. From his death in 1375 to 1412, his daughter, the great Margaret, widow of Haakon VI of Norway, ruled not only that country and Denmark, but in course of time Sweden also, with so light a firm a hand that for once in the course of their history the Danes, Swedes, and Norwegians were content to act in harmony. Margaret's successor, Eric, the son of her niece, for whose sake she had driven to give permanence, by the act known as the Union of Calmar (1397), to the amalgamation of the three sovereignties into one, undid her glorious work with fatal rapidity, lost the allegiance and the crowns of his triple kingdom, and led his disastrous existence in misery and obscurity. After the short reign of his nephew, Christopher of Bavaria (1440-48), the Danes exerted their ancient right of election to the throne, and chose for their king Christian of Oldenburg, a descendant of the old royal family through his maternal ancestress, Rikissa, the great-granddaughter of Waldemar II. Christian I (1441-49), when he elected Duke of Schleswig and Holstein, was the founder of the Oldenburg line, which continued unbroken till the death of Frederick VII in 1863. His reign was followed by half a century of intermittent sway as far south as the Eider. The insane tyranny of Christian II cost that monarch his throne and freedom; the Danes chose his uncle Frederick I to be their king,
while Sweden was forever separated from Denmark and rose under the Vasas to be a powerful state. See GUSTAVUS I.

Under Christian III (1536-59), the Reformation was established in Denmark. Christian IV after his brief share in the Thirty Years' War proved one of the ablest of all the Danish rulers. His liberal and wise policy was, however, cramped in every direction by the arrogant nobles, to whose unreasonable superciliousness Denmark owed the reverse in which she lost (1658) all the possessions she had hitherto retained in Sweden; and with the relinquishment of these, and consequently of the undivided control of the passage of the Sound, the country's former international importance came finally to an end. The national disgraces and abasement which followed led, in 1660, under Christian's son, Frederick III, to the rising of the people against the nobles, and their surrender into the hands of the king of the supreme power. For the next hundred years, the peasantry of the northern powers hostile to England, a fleet was sent into the Baltic and considerable injuries were inflicted by an attack on Copenhagen, in 1801, under Parker and Nelson. From this the country rallied; but in 1807 the British government, suspicious of an intention on the regent's part to violate his neutrality and take sides with Napoleon, demanded the surrender of the entire Danish navy, to be restored at the conclusion of peace. A refusal was followed by the bombardment of Copenhagen in September 1807, and the fleet was given up; but this treatment drove Denmark into Napoleon's arms and with him the kingdom was obliged to co-operate until the close of 1813.

By the Congress of Vienna, Denmark was compelled to evacuate North Germany. From this period a spirit of discontent grew up in the duchies, degenerating into mutual animosity between the Danish and German population, which led to an open rupture with Denmark in 1848, immediately after the accession of Frederick VII. (For the whole question, see SCHLESWIG-HOLSTEIN.) After alternate hostilities and armistices, the war was virtually concluded in 1850, by the victory of the Danes at Liddes; but in 1863 the quarrel was renewed. On the death of Frederick in that year, Prince Christian of Schleswig-Holstein-Glücksborg ascended the throne under the title of Christian IX, in conformity with the act known as the Treaty of London of 1852, by which the succession to the Danish crown had been settled on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII of Denmark. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the Duke of Augustenborg, who was established in the title of Duke of Schleswig-Holstein; but his cause was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating the duchies with the German Confederation. Denmark, unaided by England and France, allies on whose support she had relied, was forced to go single-handed into the unequal contest. After a brave but utterly futil battle the Danes found themselves forced to submit to the terms dictated by their powerful foes, and resign not only Lauenburg and Holstein, but the ancient Crown-appanage of Schleswig. By the peace of Vienna 1864, the Danish king bound himself to abide by the decision which Prussia and Austria should adopt in regard to the destiny of the severed Danish provinces. The dissensions between these two great powers, which led to the Austro-Prussian War of 1866, resulted in the triumph of Prussia, and since then the duchies have remained an integral part of that state. Since the war, Denmark, although reduced to the narrow limits of the islands and Jutland, has recovered from its fall, and has greatly prospered, in spite of the spread of socialistic opinions. The Swedish peasantry were kept in serfdom, and the middle classes depressed; but by the end of the 18th century the peasants had been gradually emancipated, while many improvements had been made in the method of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The miseries of the reign of Frederick VI, who governed as regent from 1784, brought the country to the verge of ruin. Denmark having joined Russia in a compact of the northern powers hostile to England, a fleet was sent into the Baltic and considerable injuries were inflicted by an attack on Copenhagen, in 1801, under Parker and Nelson. From this the country rallied; but in 1807 the British government, suspicious of an intention on the regent's part to violate his neutrality and take sides with Napoleon, demanded the surrender of the entire Danish navy, to be restored at the conclusion of peace. A refusal was followed by the bombardment of Copenhagen in September 1807, and the fleet was given up; but this treatment drove Denmark into Napoleon's arms and with him the kingdom was obliged to co-operate until the close of 1813.

By the Congress of Vienna, Denmark was compelled to evacuate North Germany. From this period a spirit of discontent grew up in the duchies, degenerating into mutual animosity between the Danish and German population, which led to an open rupture with Denmark in 1848, immediately after the accession of Frederick VII. (For the whole question, see SCHLESWIG-HOLSTEIN.) After alternate hostilities and armistices, the war was virtually concluded in 1850, by the victory of the Danes at Liddes; but in 1863 the quarrel was renewed. On the death of Frederick in that year, Prince Christian of Schleswig-Holstein-Glücksborg ascended the throne under the title of Christian IX, in conformity with the act known as the Treaty of London of 1852, by which the succession to the Danish crown had been settled on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII of Denmark. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the Duke of Augustenborg, who was established in the title of Duke of Schleswig-Holstein; but his cause was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating the duchies with the German Confederation. Denmark, unaided by England and France, allies on whose support she had relied, was forced to go single-handed into the unequal contest. After a brave but utterly futil battle the Danes found themselves forced to submit to the terms dictated by their powerful foes, and resign not only Lauenburg and Holstein, but the ancient Crown-appanage of Schleswig. By the peace of Vienna 1864, the Danish king bound himself to abide by the decision which Prussia and Austria should adopt in regard to the destiny of the severed Danish provinces. The dissensions between these two great powers, which led to the Austro-Prussian War of 1866, resulted in the triumph of Prussia, and since then the duchies have remained an integral part of that state. Since the war, Denmark, although reduced to the narrow limits of the islands and Jutland, has recovered from its fall, and has greatly prospered, in spite of the spread of socialistic opinions. The Swedish peasantry were kept in serfdom, and the middle classes depressed; but by the end of the 18th century the peasants had been gradually emancipated, while many improvements had been made in the method of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The miseries of the reign of Frederick VI, who governed as regent from 1784, brought the country to the verge of ruin. Denmark having joined Russia in a compact of the northern powers hostile to England, a fleet was sent into the Baltic and considerable injuries were inflicted by an attack on Copenhagen, in 1801, under Parker and Nelson. From this the country rallied; but in 1807 the British government, suspicious of an intention on the regent's part to violate his neutrality and take sides with Napoleon, demanded the surrender of the entire Danish navy, to be restored at the conclusion of peace. A refusal was followed by the bombardment of Copenhagen in September 1807, and the fleet was given up; but this treatment drove Denmark into Napoleon's arms and with him the kingdom was obliged to co-operate until the close of 1813.

By the Congress of Vienna, Denmark was compelled to evacuate North Germany. From this period a spirit of discontent grew up in the duchies, degenerating into mutual animosity between the Danish and German population, which led to an open rupture with Denmark in 1848, immediately after the accession of Frederick VII. (For the whole question, see SCHLESWIG-HOLSTEIN.) After alternate hostilities and armistices, the war was virtually concluded in 1850, by the victory of the Danes at Liddes; but in 1863 the quarrel was renewed. On the death of Frederick in that year, Prince Christian of Schleswig-Holstein-Glücksborg ascended the throne under the title of Christian IX, in conformity with the act known as the Treaty of London of 1852, by which the succession to the Danish crown had been settled on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII of Denmark. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the Duke of Augustenborg, who was established in the title of Duke of Schleswig-Holstein; but his cause was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating
the land and sea forces and the fortification of Copenhagen. The ruling party in the Folketing strongly advocated an increase in the army and navy, and an improvement in the coast fortifications; this was advisable as a demonstration of power, which would be of effect in the case of war with other nations, but would also secure Denmark against the encroachments of Germany. The representatives of rural constituencies or Agrarians, however, together with the Radicals, were opposed to an active policy on the part of Denmark. The Conservatism of King Christian, were for warlike preparations, by the increased national defenses.

In 1874 the Liberal party, under Fonnesbech, succeeded Holstein-Holsteinborg's Conservative Cabinet, which had been in power since 1870, but even the Liberals failed to overcome the opposition which the Folketing persisted in showing to the proposed expenditure on the military and naval forces. The king therefore called into office a ministry of purely independant character, which he had counseled Estrup to appoint. Jacob Brønnum Estrup was a remarkable man. When he took his seat in the Landsting in 1864, he appeared as leader of the Agrarians, and showed both power and patriotism in his public career and did much for the advancement of Danish constitutionalism. His desire always was to render Denmark's place among the Powers secure and independant, to develop its resources, and especially to secure for his country adequate protection in the carrying trade of the world's commerce. The king had found in him a man ready to carry out his wise designs for the little realm. In 1866 he had been a leading spirit in the revision of the constitutional code of Denmark, and he strongly advocated the view of the Conservatives that the Folketing, or lower house of the Rigsdag, had not, like the English House of Commons, the sole right to make appropriations from the public treasury. The Radicals of the Folketing, however, claimed supremacy in all matters of taxation and finance, and formed the Left in that assembly. On the other hand, the king and Landsting, or upper house, according to the Conservatives, had constitutionally the right of overruling the Folketing. Estrup was on the side of those who would not trust the lower house with the sole control of the exchequer. The government, he maintained, was threefold,—king, Landsting and Folketing; where any two of them were united against the third, the majority ought to be paramount in deciding the issue. From the time Estrup was appointed Minister of Finance and president of the Council, the clash of parties increased day by day; Estrup again and again brought forth his measures of warlike preparation; again and again were they defeated. In the Folketing the opposition majority increased with every division. In 1876 this party had 74 members as against 27 supporters of the government. It threw out the budget at Estrup, and the government was compelled to retreat, although the fortification of Copenhagen went forward. This brought about a crisis in political affairs and also led to a new development in the constitution. Estrup stood his ground and was supported by the press as well as by the public opinion of the capital. He maintained that, according to the parliamentary system of Denmark, he had it in his power to propose a provisional finance measure; that such a measure could be carried by the Landsting, the upper house, which controlled the Folketing. The measure, with the approval of the king, and the fortifications at Copenhagen were on their way to be completed. In 1880 two measures were passed for the increase of the army and navy. The opposition thereupon began what was known as the "Verdomte Blight," i.e., obstruction. Not only did they oppose the finance measures of the government, but every measure, of whatever kind, proposed by Estrup's party and sanctioned by the Landsting, they threw out. But the long and the ministry remained firm, and were supported by a large majority of the population of the country. The fortification of Copenhagen was completed with the assistance of volunteer contributions to the amount of $25,333,333. The financial measure was purely independant. The appropriation made for land defenses amounted to $10,033,333.33; the department of railways had expended $17,733,333.33. There was still a large balance in the treasury. The history of Denmark from that time is a history of parliamentary struggle. The Moderates of the Left could not keep pace with the violence of the Radicals, and in 1891 an actual rupture took place. The Moderates deserted altogether from the "policy of blight," or obstruction, and drew nearer and nearer to the Conservatives. The consequence was that the Radicals lost their supremacy in the Rigsdag, and in the elections of April 1892 forfeited many seats. The opening speech of the Prime Minister in the Folketing (1892) outlined a policy which was not long in being carried out. The Moderate Lefts supported a measure for land defenses; the fortifications projected were quickly finished, and the triumph of the Conservatives was complete. This was shortly before the resignation of Estrup in 1894. But the fluctuations of parliamentary life in Denmark were not yet complete. The dispute indeed seemed interminable. The Landsting and the ministry stood on one side, a majority of the Folketing on the other. This majority in the lower house gradually completed the rupture which had been threatened during the debates on land defenses, and seemed at last rent asunder permanently into Radicals and Moderates. In August 1899 M. Hørning became Premier. The Radicals had been gathering strength since the retirement of Estrup and the absence of his firm hand and clear judgment had imperiled the tranquility of the political voyage in Denmark. In 1900, however, the new Conservatives rallied their strength and a cabinet was formed, one of their number, M. Schøsted, who, after a stormy experience, resigned in 1902, when the Radicals won an overwhelming victory at the polls and a Radical administration, under Professor Dinesen, came into power. After the elections of 1915 was compelled to beat a retreat, and the Free Conservatives, 22 Right (Conservatives), 29 Left, 6 Radicals and 4 Socialists. The Folketing, elected May 1915, contained 42 Left, 27 Radical Left; 32 Socialists, 8 Right (Conservatives), and 5 Independents. On 29 Jan. 1906
the aged Christian IX died. He was succeeded by his son Frederick VIII, whose second son Charles had been elected in the preceding year to the throne of Norway as Haakon VII. On 14 May 1912, Frederick died suddenly in Hamburg, while traveling incognito, and the body remained unidentified for some time in the public morgue. His son succeeded as Christian X. In the year following his accession he was shorn of some of his powers by the Folketing, which in the same session granted suffrage to women.

The prosperity of Denmark has greatly advanced since its dismemberment in 1864, and the increase in its trade has been remarkable. In 1913 the merchant steam fleet included 3,504 vessels of 89,873 registered tons. These form a part of the great tram fleet that plies between Europe and America. The trade between Denmark and the United States has especially shown a healthy growth, the imports from the United States to Denmark in 1914 being $21,073,000, while the United States imported from that country goods to the value of $2,915,250. This growth of trade between the two countries has been rapid, for the route from Copenhagen to Newport News via Norfolk, Va., was only opened up in 1898. The six Danish steamers engaged on this route also run to New Orleans and carry American goods to all the principal Baltic ports. The New York route has several large steamers built since 1898. The Danes emigrate in considerable numbers to the United States and generally settle in the agricultural districts of the West, notably in Illinois. Returns for 1914 give 6,202 as the extent of Danish immigration to the United States. Agriculture has been developed in the peninsula to a remarkable degree during the past few years, and dairy produce manufactured with the aid of steam machinery has shown a proportionate increase. There are about 900 steam dairies in Denmark. The sanitary precautions taken by government in the inspection of cattle are more thorough perhaps than anywhere else in the world.

The Danish West Indian possessions have recently become territories of the United States. The Danes, under their King, and the British, under their Virgin Islands, Saint Thomas, a smaller island further south, and Saint John, to the east of Saint Thomas. Their united area is 118 square miles. The proximity of these islands to Porto Rico and their importance as stations in the trade routes of the Caribbean Sea adds to their desirability as United States possessions. There was expressed for many years a willingness by Denmark to transfer these islands, and the question was brought up afresh in 1902, when a Danish fleet, purchased for the sale of the Danish West Indies to the United States for $5,000,000, was signed at Washington by President Roosevelt, 14 January, and ratified by the Senate, 17 February. This was considered to have settled the question finally, but 23 April of the same year the Danish Landsting passed a resolution postponing a decision as to the sale, until the electorate qualified to send members to the Colonial Council should be consulted. The sale was not to be ratified until these electors should approve the cession. The postponing went further than this, and refused to ratify the sale, unless the inhabitants of the islands, who are mostly free negroes engaged in the cultivation of the sugar cane and number 35,156, declared in favor of the transfer by a plebiscite. The matter was thus naturally referred once more to the Landsting, and when the matter came before that body three days after the decision was regarded as adverse to the bill. As the Premier reminded the Council, it would be necessary to put out more capital in the islands unless they were sold, and accordingly the West Indian Co., with a capital of $1,000,000, was formed at Copenhagen three days after the decision of the Landsting. Trade between Denmark and these three islands had been steadily decreasing for some years, and the Danish government in 1902 appointed a commission to proceed to the islands and report on measures for improving their commercial condition. In Feb. 1917 Congress of the United States appropriated $25,000,000 for the purchase of the islands and fixed the form of government. The formal transfer of the islands took place a few weeks later. See DANISH LANGUAGE; DANISH LITERATURE; VIRGIN ISLANDS.

Editorial Staff of The American.

DENNER, Balthazar, German portrait painter; b. Altona, 15 Nov. 1685; d. Rostock, 14 April 1749. He was painter to several courts, executing portraits of princes and dignitaries, and was noted for his extraordinary minuteness of finish. Among his works are 'Head of an Old Woman'; VI paid 4,700 florins; and 'Head of an Old Man,' both in the Vienna Museum; and many canvases in other famous galleries.

D'ENNERY, Adolphe Phillipe. See Ennery, Adolphe Phillipe de.

DENNEWITZ, d'en'-nyt, Germany, village in the province of Brandenburg, Prussia, famous for the battle between the French and Prussians, 6 Sept. 1813, the former commanded by Ney (under whom were Oudinot, Bertrand, Reynier and Arrighi), the latter by Tavenien
DENNEY — DENNISON

and Bulow. Forty thousand Prussians maintained their ground for several hours against 80,000 French; and on the arrival of the Russian and Swedish battalions victory declared in Prussian blood. Although the Russians and Swedes came up, they were far superior in numbers. The French were defeated, and fled in disorder, leaving behind them on the field of battle 15,000 in killed, wounded and prisoners and 43 pieces of ordnance. The allied, mostly French losses totaled about 9,000. A point of great credit of notice in connection with this victory was the fact that it was due to the valor of the Landwehr (militia) troops, whose fighting qualities Napoleon had disdained.

DENNEY, James, Scotch theologian of the United Free Church: b. at Paisley, 5 Feb. 1856. He received his M.A. at the University of Glasgow in 1879, and his B.D. from the Free Church College of Glasgow in 1883. He was minister of East Free Church, Broughty Ferry, 1886-97. Since 1897 he has been professor of New Testament and language, literature and theology in the United Free Church College of Glasgow. He is the author of 'The Epistle to the Thessalonians' (1892); and 'The Second Epistle to the Corinthians' (1894, both in 'The Expositor's Bible'); 'Studies in Theology' (1895); 'The Epistle to the Romans' (in 'The Expositor's Greek Testament,' 1900); 'The Death of Christ' (1902); 'The Atonement and the Modern Mind' (1903); 'Jesus and the Gospel' (1908); 'The Way Everlasting' (1911); 'War and the Fear of God' (1916).

DENNEY, Joseph Villiers, American educator: b. Aurora, Ill., 9 Jan. 1862. He was graduated at the University of Michigan in 1885, and afterward studied law, taught for a year at the University of Michigan and from 1891 to 1894 was associate professor and from 1894 to 1898 professor of rhetoric at the Ohio State University. In 1908 and in 1911 he lectured at Columbia University. He is author of 'Burke's Conciliation Speech' (1898); 'Macaulay's Warren Hastings' (1907); 'American Public Addresses' (1909); 'Four Kings of the King' (1911); 'Washington, Webster, Lincoln' (1911); 'Argumentation and Debate' (1911); and in collaboration with Fred N. Scott 'Paragraph Writing' (1893); 'Composition-Rhetoric' (1897); 'Elementary English Composition' (1900); 'Composition Literature' (1902); also with Charles H. Johnston 'High School Education' (1912); with S. B. Tobey, 'An English Grammar' (1913), and contributions to the educational press on language training and rhetorical theory.

DENNIS, John, English dramatist and critic: b. London 1657; d. 6 Jan. 1734. In 1697 he produced a comedy entitled 'Plot and No Plot,' which was followed by several dramatic pieces and poems of little value. He also became a political writer for the Whig party. The irritability of his disposition, heightened probably by the unprosperous state of his finances, involved him in perpetual broils, and made him a sort of standing jest with the wits of his time. He wrote some severe strictures on Addison's 'Cato' and Pope's 'Rape of the Lock' in review, gave one in Ortolán, and one in Swift produced a sarcastic tract entitled 'A Narrative of the Deplorable Frenzy of Mr. John

Dennis.' In his old age his necessities were relieved by a benefit at the Haymarket Theatre, to which his former antagonist, Pope, contributed a prologue. The most important of his criticisms is his 'History and Reformation of Modern Poetry' (1701). Consult Paul, H. G., 'John Dennis: His Life and Criticism.'

DENNIS, Louis Munroe, American chemist: b. Chicago, 25 May 1863. In 1885 he was graduated from the University of Michigan, and afterward studied at Munich, Dresden and Wiesbaden. From 1887 to 1889 he was instructor, 1891-93 assistant professor and after 1900 professor of inorganic and analytical chemistry at Cornell University. He is head of the department of chemistry since 1903. He has published 'Chemical Problems in Inorganic Chemistry' (1890); 'Elementary Chemistry' (1902), with Frank W. Clarke; 'Laboratory Manual of Elementary Chemistry' (1902), with same; 'Manual of Qualitative Analysis' (1902), with Theodore Whittlesey; 'Gas Analysis' (1913). He is translator of Walther Hempel's 'Methods of Gas Analysis' (1902), and contributes frequently to American and German chemical journals.

DENNIS, William Cullen, American lawyer: b. Richmond, Ind., 22 Dec. 1878. He graduated at Earlham College in 1896, and from Harvard Law School in 1901. In 1902-04 he was assistant professor of law at the University of Illinois, at Stanford University 1904-05, at Columbia 1905-06, and professor of law at George Washington University 1906-09. From 1906 to 1910 he was assistant solicitor of the Department of State. In 1909-10 he was United States agent before the Hague Tribunal in the United States-Venezuela arbitration case; he was again agent of the United States in the Chumash case with Mexico before the International Boundary Commission 1910-11, and was secretary to Chief Justice White in the Costa Rica-Panama Boundary Arbitration 1911-14, and engaged in private practice at Washington D.C. from 1911.

DENNISON, Walter, American educator: b. Saline, Mich., 9 Aug. 1869. He was graduated at the University of Michigan in 1893. In 1894-95 he studied at Bonn University. He was instructor in Latin in the University of Michigan in 1897-09, professor of Latin and Roman archaeology at Oberlin College 1899-1902, and junior professor of Latin at the University of Michigan 1902-10, and since 1910 professor of Greek and Latin at Swarthmore College. In 1908-09 he was professor of Latin at the American School of Classical Studies at Rome. He wrote 'A Junior Latin Book,' with John C. Rolfe (1896); and he also edited 'Livy, Book I and Selections from Books II-X' (1908). He revised Kelsey's 'Topical Outline of Latin Literature' (1899) and Frienze's 'Virgil's Aeneid' (1902).

DENNISON, William, American statesman: b. Cincinnati, Ohio, 23 Nov. 1815; d. Columbus, Ohio, 15 June 1882. He was graduated at Miami in 1835 and became a lawyer, being elected to the Ohio legislature in 1846. He became involved in national politics, and became a leader in the anti-slavery movement, and was considered invaluable aid to the Union cause throughout the Civil War. President Lincoln appointed him postmaster-general in 1864, an office
he retained under President Johnson, resigning in 1866. Dennison College owes much to his liberality.

DENNISON, Ohio, village in Tuscarawas County, 100 miles northeast of Columbus, on the Pittsburgh, Cincinnati, Chicago and Saint Louis Railroad, and on the Panhandle Ohio Canal. It contains a public library and a hospital and has sewer-pipe works and railroad shops. The government, under the Ohio law of 1902, is administered by a mayor and council. Pop. 4,008.

DENNY, George Hutcherson, American educator: b. Hanover County, Va., 3 Dec. 1870. He was graduated at Hampden-Sidney College in 1890, at Fowles's Boarding School in 1892, at Washington and Lee University as professor of Latin in 1899, and became a member of the University of Alabama. He is chairman of the Rhodes Scholarship Committee for Alabama and president of the Alabama Service Organization since 1912. He received the following honorary degrees: Ph.D. from the University of Virginia 1896, and LL.D. from Furman University 1903, Washington College 1905, Tulane 1912, Washington and Lee 1913 and LL.L from the University of Southern California 1914. He wrote 'The Subjunctive Sequence After Adjective and Substantive Predicates and Phrases' (1896). He contributed to the 'Library of Southern Literature' on the South in the 'Building of the Nation.'

DENON, dé-nōn, Dominique Vivant, Baron de, French artist, diplomatist and author: b. Châlons-sur-Saône, 4 Feb. 1747; d. Paris, 27 April 1825. He studied law and drawing with Hallé. He was attached to embassies at Petrograd, Switzerland and Naples, successively. At Ferney, Switzerland, he painted the portrait of Voltaire. In 1789 he was in London. In 1791 he was in Italy and won the well-known prize for 'Déjeuner de Ferney.' At Naples he took advantage of the opportunity to collect old masters and make portraits; and with the Abbé Saint-Non wrote 'Voyage pittoresque de Naples et de Sicile' (1799). Becoming inspector-general of the fine arts in 1799, he accompanied Bonaparte, he accompanied the general in his campaigns to Italy and Egypt, and in 1801 to Upper Egypt. The work which was the result of his journey, 'Voyage dans la Basse et la Haute Egypte,' was issued in 1802. When he returned to Paris with Bonaparte he was appointed inspector-general of the museums and all the works of art executed in honor of the French successes — monuments, coins, the erection of the triumphal pillar in the Place de Vendôme, etc. He accompanied Napoleon in all his campaigns, and employed himself in drawing and in selecting those masterpieces in the conquered countries, which were taken to Paris as trophies. After the abdication of the emperor he retained his office, but was deprived of it in 1815, in consequence of having joined Napoleon on his return from Elba. He retained, however, his place in the institute. From that time he lived retired, and the preparation of engravings and lithographs of his splendid collection of works of art forming the occupation of his last years. In 1826 appeared at Paris the 'Description des objets d'art composant le cabinet de feu M. le Bar. V. Denon.' In 1827-73 his etchings were published with an introduction by La Frizelère.

DENS, Petrus, author of a manual of Catholic theology: b. Boom, Belgium, 1690; d. Mechlin, 15 Feb. 1775. He is noteworthy only as the reputed author of a manual text-book of Catholic theology, 'Theologia Moralis et Dogmatica' (Moral and Dogmatic Theology). His work was published under his name by the professors of Mechlin and probably contained much of Dens' teaching. It is still used, with modifications, by the professors of Mechlin. He was a professor in the diocesan seminary of Mechlin and during 40 years was president of the institution. He was also honored with several offices of importance in the diocese of Mechlin — pastor of the metropolitan church there, president of the seminary, canon penitentiary, synodal examiner and archpriest of the chapter. He wrote treatises on penance, on the virtue of religion and several tracts.

DENSITY, a term denoting the mass per unit of volume in a body. (See Specific Gravity). The density of the earth has been determined as about 5.27. See Gravitation.

DENT, Frederick Tracy, American soldier: b. White Haven, Mo., 17 Dec. 1820; d. Denver, Col., 24 Dec. 1892. He was graduated from the United States Military Academy at West Point in 1843 and served in the Mexican War, being engaged in the siege of Vera Cruz and the battles of Churubusco and Molino del Rey. He took part in the Yakima expedition in 1865, in the Spokane expedition and in the Snake River expedition (1866). During the Civil War he commanded a regiment in the Army of the Potomac in 1863; was stationed in New York in September 1863, where riots were feared, and was Grant's aide-de-camp throughout the Richmond campaign. He was secretary to President Grant during his first administration. He retired from active service in 1881 with the rank of brigadier-general in the regular army.

DENT, John Charles, Canadian author: b. England 1841; d. 1888. He came to Canada in early life and was called to the bar of Upper Canada. Returning to England, he engaged in journalism; afterward pursued that vocation in Boston, Mass., and in 1870 joined the staff of the Toronto Globe. He was the author of 'Canadian Portraits' (1880); 'Last Forty Years' (1881); 'Upper Canada Rebellion' (1885).

DENTAL CORPS, a branch of the United States Army established by the act of 3 March 1911. It consists of dental surgeons and acting dental surgeons, in all not more than one to each 1,000 enlisted men in the army. The number of dental surgeons is limited to 60. Acting dental surgeons have a status similar to that of contract surgeons (q.v.). They must be graduates of a standard dental school and are appointed by the Surgeon-general after a physical examination of the same standard as that required for a commission in the medical corps of the army and a mental examination involving oral and written questions and clinical work. The dental surgeons, who rank as first lieutenants, are appointed from among those acting dental surgeons who have served for three years with a clear record. The physical examination is given over again, and a new profes-
DENTAL FORMULA — DENTISTRY

sional examination, consisting of a written and a practical part, must be passed. Officers of the Dental Corps rank next below officers of the Medical Reserve Corps, and their right of command is limited to the Dental Corps.

DENTAL FORMULA. See Teeth.

DENTALIUM, a genus of mollusks of the class Scaphopoda, the shell of which, about two inches long and three-quarters of an inch thick, is an excellent tooth. These mollusks, called tooth-shells, bury themselves uprightly in the sand, and capture their food, which mainly consists of foraminifers, by means of their tentacles. Several species are known in various parts of the world, one of which, common on the northwest coast of America, was valued by the Indians as an ornament for clothing, and strings of it served as money among them. This shell, when used as money by the Indians, was called bigus, and the shell is often called bigu-shell.

DENTARIA, copper-root, a genus of plants of the natural order Cruciferae. There are about 15 species, natives of temperate countries, of which 11 are found in America. They are ornamental herbs, with creeping singularly toothed root-stocks, from which they receive the names of pepper-root and toothwort. The stem-leaves are opposite or in whorls of three and the flowers are white or pink. The American species extend from Nova Scotia to Florida and west to Minnesota and Louisiana. The best-known is the pepper-root, crinkle-root or toothwort (D. laciniata). The common names refer to the pungent and tooth-like divisions of the root, which is, in some localities, ground and used like horseradish.

DENTATUS, Manius, or Marcus, Curius, Roman statesman, flourished in the first half of the 3d century B.C. His first office was tribune of the people, in which he distinguished himself by his opposition to Appius Claudius Cæcusc, who, in defiance of law, refused to accept any votes for plebeian candidates. In 290 B.C. he was consul in the Samnites war and in the Samnites terminated a war which had lasted for 49 years. He then marched against the Sabines and was again successful in restoring them to the Roman protectorate. In 283 B.C. he was again consul, and near Beneventum defeated King Pyrrhus. The triumph which followed was one of the most magnificent which had ever been witnessed. In 274 B.C. he was a third time consul, and after terminating the war with the Lucanians, Samnites and Bruttians, retired to his Sabine farm and spent the remainder of his life in cultivating it. In 272 he became censor, and in that year he built an aqueduct, the Anicensis Veto, which carried the water from the party. He was noted for his great simplicity and frugality as well as for his military and executive achievements.

DENTEX, a genus of acaenopterous fishes near the perchers. One species (D. vulgatisi), the Dentex of the ancient Romans, abounds in the Mediterranean, and has occasionally been taken in the American shores of Great Britain. It is voracious, and has large, sharp teeth. It is sometimes seen three feet in length and 20 to 30 pounds in weight. Great numbers are taken in the mouths of rivers in Dalmatia and the Levant, where they are cut in pieces and packed in barrels with vinegar and spices, just as the ancients used to treat them.

DENTIFRICE (Lat. denisificium, a tooth-powder, dens, tooth, fricare, to rub), any preparation, liquid or powder, for the purpose of cleaning the teeth. Chalk, precipitated, is generally the base of most of the dentifrices on the market. For detergents, charcoal, cuttlefish bone, or most of the sometimes incised with the milder principle. Bleaching salts and acids find their way in many market preparations, constituting a grave danger to the tooth structure. Astringency is acquired by using catechu, cinchona and rhatany; myrrh gives odor; peppermint is used to make the taste pleasant; bole armenciac to color the pastes. A few drops of any of the standard antiseptics added to water will often prove an efficient cleanser aided by the friction of the brush.

DENTILS, in architecture, little cubes or small squarish blocks resembling teeth, into which the square member in the bed-molding of an Ionic Corinthian, composite and occasionally a Roman Doric cornice is divided. Their breadth should be half their height and the metoche (interval) between them two-thirds of their breadth.

DENTIN, or DENTINE, dën’tin, the bone-like structure constituting the body of a tooth, which in the crown portion is covered by enamel and in the root portion by the crista petrosa or cementum. See Teeth.

DENTISTRY. Dentistry may be defined as being a special department of the science and art of healing; embracing a knowledge of the structure, physiology and pathology, and the therapeutic, surgical and mechanical treatment of the tissues of the mouth and its contained organs, also a knowledge of the materials used and their manipulation in the restoration of the dental and oral structures. The early history of dentistry is so closely interwoven with that of medical science that it is impossible to distinguish it from its mother science. The Babylonians, Egyptians, Assyrians, Hebrews, Hindus, Greeks and Romans were the early cultured inhabitants of whom historical records exist. The recent excavations in Babylon have brought to light some interesting facts concerning the practice of dentistry under King Hammurabi, at about 2260 B.C. The law states that if a dentist who knocks out a tooth of one of his caste, his own tooth shall be knocked out, while, if it is the tooth of a freeman, he pays one-half mine silver. The Egyptian medical history is principally recorded in the various papyri, especially those deciphered by Ebers and Brugsch, which probably cover the period of 3700 to 1500 B.C. The Egyptian physicians were largely specialists, and it is very probable that some were selected to look after the welfare of the teeth. Most of the dental remedies found in the papyri consist of pastes, powders, plasters, decoctions, etc., in which Saint John's bread, sage seed, honey and some unknown plants play important parts. The treating of abscesses, caries and loose teeth seems to have been known. The Hindus were apparently very proud of their teeth. It is recorded that the use of tooth powders and washes, and especially the use of the tooth cleaner, rimacara, were necessities of their daily toilet. As a toothpick they employed a bitter tasting wood, which,
when chewed, produced a fibrous bundle, which was then used as a brush for the gums and the teeth. The aborigines of the western coast of Africa are still using the wood of the sisal plant for brushes for the same purpose, and a toothbrush of this same nature has been recently introduced in the United States, in Great Britain, etc. In the writings of Hippocrates and Pliny frequent allusion is made to drugs which were especially advocated for diseases of the teeth and the mouth. With the simpler remedies as hyssop, licorice, dog’s milk, goat’s butter, etc., many disagreeable substances, especially of the animal kingdom, were recommended. In Pliny’s writings we find, among other dental suggestions, that “If one wishes to be free from toothache, one should eat a whole mouse twice a month.” 9 The ancient writings on dental therapeutics contain so many conflicting statements relative to the sources of specific medications that it is extremely difficult to reach an unbiased decision regarding their origin. Plagiarism was of common occurrence among the early scribes; it was, however, not looked upon as a breach of literary etiquette in the same sense of the word as we understand the term. The works of Galen, which may be cited Pliny (79 A.D.), who in his famous ‘Naturalis Historia’ prides himself on the fact that he is able to present excerpts of nearly 100 writers and their 2,000 works. He is honest enough, however, to name these authors, while many of his colleagues of this and a later period prefer silence on this point. Even the renowned Galen (131–200 A.D.) owes most of his botanical knowledge as presented in ‘De simplicium medicamentorum’ to the materia medica of Dioscorides, which he duly acknowledges. Again, the seven books of Paulus Aegineta (about 600 A.D.) are primarily compilations culled from Galen and Orbibius (about 360 A.D.). The dental therapeutics as presented by the more important Greek-Roman writers—Galen, Oribibius, Celsus, Aurelian, Paulus Aegineta, etc., the Arabo-Persians—Rhazes, Ali Abbas, Abulcasis, Avicenna and Mesue; the early Germans—Scheneck von Grafenberg, Heinrich von Holzprundt and Ryff; the early Italians—Muro and Mico; the French—Guy de Chauliac, Valescus, Paré and Houiller—all, in their final analysis are culled from Dioscorides. Especially Avicenna (980–1037), “the prince of Arabian Physicians,” as he has been styled, and who treated on general medicine—the ‘Canon’—for many centuries enjoyed equally as high a reputation as did the works of Galen, and to-day is still to be found in many homes of Asiatic Turkey, has been a flagrant plagiarist of Dioscorides dental medicine. And Walther H. Ryff (1500–72), that “jack-of-all-trades” to whom Haser refers as “the roving plagiarist,” compiled his dental medicine from the same source via Aeculianus. The dental remedies referred to by that mixture of charlatanism and necromancy, John Gaddesden (about 1310 A.D.), science professor in Merton College, Oxford, are so thoroughly tainted by medical avarice, superstition and ignorance that it would be an insult to the enumerated writers if we place him in the same category. Moreover, we may add an example of the disgusting therapeutic measures recorded in his bizarre tome, ‘Rosa medicine’ which has been significantly dubbed by the illustrious Guy de Chauliac, “Rosa fatus,” the following mixture composition in the form of a decoction which he recommended to be taken against dental podagra (neuralgia), may be cited: The gall of a crow, one ounce; pepper, nutgalls, cloves, pitch, mustard seed, the heart of a magpie, the fat of mice, crow-dung, plantain and lice. The famous German Arztney Buchlein wider allerlei Krankheit und Gebrechen der Zeeen gerochen aus dem Galeno, Avicenna, Mesue, Cornello Celso, etc. (Leipzig 1530), is an anonymous compilation which, as far as its pharmaco-therapeutics is concerned, merely exhibits the same stimgama as do the works of the above mentioned writers, i.e., it is an epitome from Dioscorides’ dissertations, with slight alterations, as a sequence of having passed through the works of the various authors enumerated on its title-page. In a most interesting collection of Anglo-Saxon manuscripts bearing the quaint title, ‘The Hymds, Wortcunning and Starcraft,’ which in modern English would signify ‘Physicians’ prescriptions, the Knowledge of Plants and Astrology,’ which was published some decades ago in London—numerous references relating to the diseases of the teeth are to be found. Here, again, one meets with many drugs which are readily traced to a dissemination of dental knowledge by the Greco-Roman military surgeons accompanying the conquering cohorts during their occupation of Britain. It is probably not amiss to depict a conception of the practice of medicine, and incidentally of dentistry, as it may be gathered from the study of the medical works written during the early centuries of the Christian era. The freeborn Roman looked upon the practice of medicine as a handicraft, the pursuit of which was not compatible with the dignity of a ‘civis Romanus.’ The practice of medicine in Rome prior to its invasion by the better educated Greek physicians was carried on by slaves; the larger estates depended on their ‘servus medicus,’ a slave who had acquired some routine medical knowledge, or the ills of the subjects of the household were looked after by the patriarchal ‘pater familias.’ Some of these latter representatives of the medical profession together quite an extensive knowledge of the healing art, and their recorded experiences furnish some of the most valuable data to the medical historians. Celsus, Pliny and Cato are elucidative types of Roman lay practitioners incidentally are voluminous and fruitful titterateurs on this subject. To the cultured Romans, who were highly conscious of the blessings of personal hygiene, the demand for the services of some genius who would keep their masticating organs in perfect condition was a matter of necessity. The works of medical writers of this period are filled with innumerable recipes for tooth preparations. The mechanical side of dentistry, which by necessity must have been carried out by specialists, has received its ample share as, for instance, an excerpt from the famous Law of the XII Tables, enacted 450 B.C., which contains the following paragraph: “Neither add any gold (to a corpse); if any one shall have teeth bound with gold, it shall be lawful to him to bury or burn him with it.” Numerous specimens of Roman and Ettruscan dentistry have been found in burial-places. The great satirist, Martial,
DENTISTRY

has preserved the name of at least one dentist, Cancellus, who has grown rich like a senator among the grinds and belles dames, and who cures the tooth diseases; and how he can extract! It is also of interest to note that in the exquisitely beautiful ancient works many allusions are made to the teeth and their care. So we read, for instance:

Easte quid hie disam, quod oent tus basia myrrham?
How do I explain it that your kiss smells of Myrrh?

Artificial teeth seem to have been quite fashionable with the Roman dames, as the following would indicate:

Dentibus atque comis, noe te pudet, uteris emitis;
Quid faciat Laelia? Non scitur.
Without shame you make show with bought teeth and hair; But what about the eye, Laelia; can one buy this also?

Specimens of Etruscan dentistry in form of bridges, crowns, bands, etc., are still preserved in the National Museum of Naples. With the exception of a few monographs the early literature of dentistry is scattered among the various treatises on general medicine. In the large majority of instances these records are published by medical practitioners, although sometimes by laymen who themselves did not practice of the Art of Dentistry. The appearance of the work of Fauchard, 'Le Chirurgien Dentiste' (1728), who has been significantly styled the 'Restaureateur de la chirurgie dentaire,' dentistry is not entitled to the cognomen of a learned profession. In reality it constituted the handicraft of vagabonds who traversed the country from one end to the other practising medicine, dentistry, alchemy, chiroponcy and necromancy as occasion demanded, and again interspersing these with a little pillering. The professional mountebank who presented himself as a tooth-puller, barber, leech and theriac vender was a familiar figure in the market-places of the big cities or at the annual fairs of the smaller towns. The extraction of the aching tooth was incidentally an incentive for the sale of some nostrum, and as a renumeration for the prevention of the occurrence of pain in the remaining teeth. The "dentatores" or "dentsipices" of the Romans, the "cavi denti" of the Italians, the "arracheur des dents" of the French, the "zahnbrecher" of the Germans, and the "kindhart" of the English represented the bulk of our professional ancestors. The patron saint of dentistry, Saint Apollonia, was canonized in Rome about 300 a.d. Being a Christian, Saint Apollonia was tortured by her persecutors by having her teeth, one by one, extracted, and finally suffered death upon the pyre. Her memory is commemorated on 9 February of each year. Remains of her skeleton are preserved in the various churches of Rome, Naples, Cologne, Antwerp, Brussels and Quebec, and excellent pictures of the saint by Guido Reni, Carlo Dolci, and others are found in Milan, Florence and other cities. The name of Saint Apollonia is frequently mentioned in prayers in the various books of prayers composed in the Middle Ages, and is especially intended for the relief of toothache.

Prior to 1840 comparatively few important communications on dental surgery had appeared. The foremost literature of this time was published in France and England, and a few books of importance appeared in Germany. The United States was at this period principally concerned with the practical development of the new branch of the healing art, and, with the exception of the writings of Longbotham, E. Parmly, L. S. Parmly, Trenor, Fitch, Bostwick, Spooner, S. Brown, the Burdells and their followers, little was written on dental surgery. Dental textbooks, if used at all, were imported from England, or translations of French works were published. Leonard Koecker, a practitioner of international reputation, pictured the situation quite correctly when he stated, in 1826, that in the United States "nothing" has been done in the way of publishing on the subject of dental surgery, yet I feel myself authorized to say that in no part of the world has this art obtained a more elevated station. No specific current dental literature was in existence at that time and comparatively few medical journals tried to disseminate the progress of medical and, incidentally, dental knowledge. The few journals were seriously hindered in this laudable cause by the extreme difficulties of accounting for the very limited facilities of the postal service. The first dental periodical of this or any other country appeared in 1839 under the name of American Journal of Dental Science, and Prior to the appearance of the work of Fauchard, 'Le Chirurgien Dentiste' (1728), who has been significantly styled the 'Restaureateur de la chirurgie dentaire,' dentistry is not entitled to the cognomen of a learned profession. In reality it constituted the handicraft of vagabonds who traversed the country from one end to the other}
The discovery of anesthesia is the greatest boon ever bestowed on mankind for the relief of suffering. With the introduction of nitrous oxide as a general anesthetic in 1844 by Horace Wells, the stimulation for further research was initiated and the future development of anesthesia was merely a sequence of this incentive.

The distinguishing factor of dental training and one which is not required to the same degree in any other department of the healing art is the manual skill and mechanical training needed for the successful practice of the prosthetic or restorative operations which the dentist is constantly called upon to perform. It was the lack of facilities in medical schools for obtaining the necessary training in the mechanical procedures of dental art that led to the establishment of the first dental college and placed dental education upon a basis independent of general medical education. The increase in knowledge of the diseases of the mouth and its contained organs and the growing recognition of the vital relationships of the oral tissues to the body as a whole, have gradually compelled the broadening of the dental educational curriculum until at present all of the fundamental medical sciences are included in the curriculum of the best dental colleges. And upon this sound basis is erected the superstructure of technical education and manual training necessary to the art of the dentist. The development of dentistry in America has been phenomenal, and especially in all that pertains to its art side. The incorporation of the systematic teaching of mechanical dentistry in the college course instead of depending upon the uncertain educational results of the apprenticeship system has had greatly to do with creating a body of American practitioners skilled in their art. It is in fact for his skill as an operative dentist that the American practitioner has been mainly distinguished.

The art of replacing lost portions of tooth crowns by gold fillings has had its greatest development in America; indeed as we know the operation to-day it may be said to have originated there. As originally practised the ideal gold filling was one which simply acted as a stopper inserted in a cavity produced by decay, for the purpose of excluding moisture and furnishing a surface sufficiently resistant to withstand the wear and tear of mastication. The filling was finished on a level with the cavity margins and no attempt was made to restore the lost contour of the tooth in imitation of its natural configuration. However, the discovery of the cohesive property of annealed gold foil was made and promulgated by Dr. Robert Arthur, of Baltimore, in 1855, the whole method of filling teeth with gold was revolutionized, and the restoration of the normal configuration of the tooth by building with gold foil became the accepted ideal of practice. In connection with the general use of cohesive gold as a filling material certain ingenious and important devices came into existence as adjuncts to the operation of tooth-filling, having their origin in the necessities of the case. These were the dental engine, the mallet and the rubber coffer-dam. The operation of preparing the cavity for the reception of the gold involves the removal of decayed portions and frail margins, and giving to the cavity a retentive shape, so that the filling when inserted shall be solidly and immovably held in place. The early methods of cavity preparation were laboriously performed by small chisels and cutting instruments manipulated exclusively by the hand. Hand instruments were also exclusively used for the insertion and condensation of the gold foil in building up tooth-filling, and incidentally giving it the required form and surface finish. The introduction of the dental engine run by foot-power or by electric motor has not only greatly facilitated the operation of tooth-filling but has traded mechanism for rate and perfect results. So manifold has been the improvements made in the dental engine and its equipment of accessory appliances that it may, if the operator so desire, be used for every step of the operation from cavity preparation to the finished filling. As the cohesive property of gold, upon which its value in restoring the form of the tooth depends, is at once destroyed by contact with moisture, great difficulty was formerly experienced during large filling operations in excluding the gold from contact with saliva; napkins, lubrious paper and various mechanical devices were used for the purpose, but were often insufficient to prevent the destruction of a filling during the progress of its insertion. The device known as the rubber dam, introduced for the first time by Dr. S. C. Barnum of New York, about 1865, solved the problem of effectually excluding moisture from the teeth undergoing filling operation, and made possible more extensive and thorough restorations than had previously been attempted. The discovery of the usefulness of the cohesive property of gold in filling operations soon brought into requisition other means than simply hand pressure or condensing the gold foil into a solid homogeneous mass. It was soon found that greater solidity could be obtained by the percussive force of a mallet applied to the gold through the plugging instrument, so that the use of the mallet became general for the purpose, largely through the persistent advocacy of Dr. W. H. Atkinson of New York. The earlier forms of condensing mallets were simply hard mallets with heads made of various materials and different weights to attain desired variations in the impact and quality of the blow delivered upon the condensing instrument. Later, automatic mallets, combining a plugging instrument and mallet, were introduced. In these instruments the blow was produced by a hammer propelled by the release of a spring compressed by pressure, the malleting mechanism being contained within a bellows. As a result of this automatic plugging point which was applied to the surface of the filling upon which the impact of the blow was ultimately expended. In 1867 Dr. W. G. A. Bonwill of Philadelphia introduced his electromagnetic mallet, and it is Dr. S. C. Barnum of New York who developed the principle of the Morse telegraphic recorder so modified that the art of the electromagnet was effectively utilized as a mallet actuating upon the free end of the gold-plugging instrument. With the automatic interrumpers of the current afterward added to it the Bonwill instrument contributed greatly to the improvement of gold-filling operations both in the solidity of the gold, its more accurate adaptation to the walls of the cavity and in lessening the fatigue and discomfort of both patient and operator incident to the operation. The blow delivered by the electromagnetic mallet while...
light are extremely rapid, an advantage which its inventor sought to utilize in a later device, to be used in connection with the dental engine, known as the Bonwill engine mallet, an instrument of high efficiency and the parent device of our present high-speed0 drills. To further lessen the stress encountered alike by patient and operator in the malleting of gold fillings the cast gold inlay was introduced by Dr. W. H. Taggart in 1905. This method of restoring lost tooth substance consists in the utilization of a compound gold plug obtained by pouring gold into a mold made from a wax pattern and which is set into the prepared tooth cavity with a thin layer of cement. The extensive use of gold as a filling material as the perfection to which the technique of its use for that purpose has been developed, especially in America, has recently brought about a reactive tendency against the display of elaborate operations of gold, especially in conspicuous positions in the front teeth, aesthetic considerations stimulating the use, also gutta-percha. Certain of these with the texture and color of human teeth. Recently through the invention of an improved technique by Dr. C. H. Land of Detroit, Mich., and the further investigations of Dr. N. S. Jenkins, an American dentist formerly residing in Dresden, Germany, the use of porcelain as a restorative material has become practically possible and bids fair to supplant gold as a filling — at least in conspicuous situations. The dura-
ability of porcelain restorations as compared with gold fillings remains to be tested by time and experience, but the immediate result is in all respects in favor of porcelain, especially in the matter of appearance, which so harmonizes with the teeth structure in color and texture as to be invisible when the operation is correctly performed. The filling of cavities is also extensively done with plastic materials that have the property of becoming hard in the course of time after having been inserted in a soft state. This class of materials includes the amalgams and cements. The amalgams and cements. The amalgams, for example, serve only a temporary purpose, and their usefulness is therefore of limited duration. Silicate cements which at present are extensively employed as substitutes of gold and porcelain in the restoration of teeth are not among the anterior teeth must also be classified as limited in duration. The amalgams, however, while unsightly in appearance, are extremely useful; being quite durable and capable of insertion without great difficulty, they can be used in cases of great loss of tooth structure, thus restoring many cases that could not otherwise be as successfully treated and with less cost than gold filling. Following the researches of Koch in bacterial pathology the rôle played by micro-organisms in the causation of dental diseases is the subject of study by numerous investigators, notably the late Prof. W. D. Miller, an American dentist resident in Berlin, through whose researches the cause of tooth decay was explained. Similarly the causal relation of disease producing micro-organisms to disorder of the dental pulp and the tissues surrounding the roots of teeth has been clearly made out, with the result that operations upon the pulp chambers and root canals of teeth in which the pulp has been devitalized by decay or disease are now among the recognized conservative operations of dentistry. This advance in the treatment of pulless teeth has made possible the permanent saving of multitudes of teeth in a condition of comfort and functional usefulness which were previously inevitably sacrificed or lost. Later investigations have thrown light upon the causes and improving the modes of treatment of those diseases of the retaining tissues of the teeth which when unchecked result in their early loss by destruction of their attachment to the gums and alveolar sockets. The grinding of dental crowns of porcelain upon healthy natural roots is accomplished in a large variety of ways, the attachment being by metallic dowels cemented into the properly enlarged pulp canal of the root, this being in most cases reinforced by means of a gold collar or ferrule connected with the porcelain crown, closely encircling the periphery of the root at and slightly under the gum margin. Perfect adaptation of the crown and root end is obtained by correctly shaping the exposed portion of each. The crown of porcelain is attached to this foundation by gold solder and backing plate of gold connecting with the platinum pins of the crown. In certain cases hollow crowns, made entirely of gold plate, shaped to the contour of the original natural crown, are used upon the roots of the grinding teeth instead of porcelain crowns, as they possess the advantage of superior durability. Aggregations of crown permanently united upon their contiguous surfaces and supporting crowns in spaces where teeth have been extracted constitute so-called bridge work. No restorative operation in dentistry requires more judgment and skill, nor has any dental procedure been more abused in its performance than bridge work. Where the operation is intelli-
genously and skillfully done, it constitutes the most satisfactory result both as to comfort, utility and appearance that prosthetic dentistry has yet attained; otherwise it defeats the very object for which it should be undertaken, namely, the repair of the mouth to full functional usefulness and aesthetic appearance.

The department of dentistry technically known as mechanical or prosthetic dentistry comprises all those operations and the labora-
tory manipulations of the materials used in the construction of artificial organs for lost dental organs and parts of the oral tissues. Where lost teeth are to be replaced by means other than those described as crown and bridge work, it is done by mounting the porcelain crowns upon a base-plate adapted to the surface of the palatal vault as well. An impression of the alveolar arch is taken in an impression tray containing a plastic material which will subsequently harden, usually plaster of paris or a modeling compound consisting of gum kauri, stearin and talc; beeswax or beeswax and spercha have been used, but are now practically abandoned for this purpose. Into the matrix formed by the impression a batter of plaster of Paris is poured, which after it has hardened forms the cast upon which the baseplate is superimposed. Then the arrangement of the teeth to the wax trial plate
has been found to be satisfactory by actual trial in the mouth of the patient, it is returned to the cast and the whole embedded in plaster of Paris contained in a sectional iron founder. The upper and lower sections of the flask are separated after the investing plaster of Paris has fully hardened, and the wax is completely removed by a steam bath. The metal is then poured on the facsimile matrix in the plaster, which is then packed full of vulcanizable caoutchouc; the flask is then closed and after being firmly bolted together is subjected to the action of the heat from superheated steam for about an hour at 320° F. in a vulcanizer. The case is allowed to cool and when removed from the matrix the now thoroughly hardened plate is finished with a fine polish and is ready for insertion in the mouth. Metallic plates serving as the base of support of artificial teeth are constructed by stamping or swaging the flat plate cut approximately to the desired pattern between male and female dies, made from zinc and lead, respectively, which have been obtained by casting the molten zine into a sand matrix made from the plaster of Paris model of the alveolar arches. This furnishes a zinc model or male die upon which a female die or counter-die of lead is cast, and between these the metallic base-plate is struck up to the form of the alveolar arch upon which it is intended to rest. Upon this base-plate porcelain teeth are fitted and attached by a metallic connection between the platinum pins (which for the purpose are baked in the porcelain texture of the artificial teeth) and the base-plate, union being made by soldering. Dentures upon an enamelded platinum base-plate constitutes a form of work known as continuous gum work, in which, after the teeth by means of their pins have been united to the plate by soldering with pure gold, porcelain paste or ebonite, as it is technically called, is packed around the roots and between the teeth; then carved into form until the natural contour is reproduced. The piece is then subjected to high heat in a muffle until vitrified, after the manner of firing or baking china or pottery. It is next given a coating of enamel in imitation of the natural gum color, and after this has been fused in the muffle and the piece finally finished it constitutes the most artistic, hygienic and anatomically perfect denture of which dental art is capable. Besides the restoration of lost teeth, the construction of mechanism for the correction of palatal defects whereby imperfect speech and deglutition are restored to practically normal conditions; it includes also the construction of splints in the treatment of fractures of the jaws and the restoration of parts of the jaws lost by accident or disease; construction of mechanism for the correction of irregular positions of the teeth and for the restoration of facial deformities due to irregular or imperfect development of the jaws and bones of the nasal or facial regions. The correction of irregularities in the position of the teeth has developed such importance and covers such a wide field of study and work as to constitute a distinct specialty of modern dental practice. This branch of dentistry is termed orthodontics; its importance is due not only to the cosmetic value of its results, but because of the direct bearing which irregular positions of the teeth and deformities of the dental arches exert upon the bodily health. The whole field of dental and oral pathology has been so far developed by study and research as to place modern dental practice distinctly among the recognized specialties of the healing art. Most of the bacteria causing general bodily disease find access to the system through the mouth, which is also the habitat of many bacteria harbored and multiplying as well. Hence the hygienic care of the mouth as a protection against disease invasion is of the utmost importance. Late researches have shown that the mouth, its tissues and its secretions, and the teeth themselves, furnish important indications of certain bodily diseases, malnutrition, etc., which are extremely valuable as diagnostic means. The training of the dental practitioner has therefore been enlarged so that in the foundation elements it is now co-extensive with that of the practitioner of general medicine, but specialized with reference to its particular field of inquiry.

In 1918 there were about 46 institutions within the border of the United States and its possessions engaged in the teaching of the science and art of dentistry. These institutions are partially bona-fide departments of universities, partially correlated therewith, or they are conducted as private schools. The present dental curriculum consists of four annual sessions each in consecutive academic years; each academic year consists of a period usually beginning about the first of October and lasting until the middle of June. In most institutions the courses in dentistry are open to women on the same terms as to men. For the session 1919-19, the preliminary educational requirement for matriculation is the completion of a standard four-year high school course or the equivalent, which (in the States of New York and Pennsylvania) must include the satisfactory completion of a one-year course in an approved high school in each of the following sciences: physics, chemistry and biology, or in lieu thereof, the passing of each of these sciences at 75 per cent or above in examinations conducted by the Bureau of Professional Education of the respective State or other state examinations of equivalent grade. These requirements may be satisfied by a certificate from an approved high school or a preparatory school of equal academic grade or by entrance examination including a series of written examinations of the study the student who has fulfilled all the requirements satisfactorily receives his degree. This degree in most institutions is designated as Doctor of Dental Surgery (D.D.S.), while a very few (Harvard, Minter) confer the degree of Doctor of Dental Medicine (D.M.D.). The practice of dentistry is regulated separately by each political division of the United States. Examining or licensing boards look after the enforcement of the laws regulating the practice of dentistry in each individual State. In most instances the pre-requisite for obtaining a state license is the possession of a bona-fide diploma from a reputable dental school recognized by the National Association of Dental Examiners. Interchange of licenses is practised by a few States; even that in 1918 approximately 47,000 registered dentists in the United States, i.e. about one dentist to each 2,000 inhabitants. A lower ratio (about one to three or five thousand) may be recorded for other civilized countries. The dental profession
of the United States, in harmony with other professional callings, has formed numerous associations, of which the National Dental Association, the dental societies of the States, being to some extent like the American Dental Association, and with the dental societies of the cities and towns, are most influential bodies. The dissemination of useful professional knowledge is readily accomplished through annual and semi-annual congresses and for the last twenty years through the publication of scientific journals, of which the best are the American Journal of Dental Science, the Journal of Dental Science, and the Journal of Dental Researches, published by the American Dental Association, the Journal of the American Dental Association, and the Journal of Dental Practice, published by the British Dental Association. The professional journals are read by all dental practitioners and are of great value in the advancement of dental science.

DENTISTRY, PUBLIC. This term may properly be used to denote all phases of dental service except that bought of a dentist by an individual. It includes military and naval dentistry as well as that provided by municipalities and other governmental authorities. It is composed of the most recently realized of the professional duties of the state, embracing the whole organized movement up to 1918, save perhaps in some few advanced communities.

Bibliography.—Bennet, Science and Art of Dental Surgery (1913); Black, Special Dental Pathology (1919); Blair, Oral Surgery (1917); Cuyler, Crystal of Pathological Anatomy of the Face (1916); Fones, Mouth Hygiene (1916); Goodby, The Myology of the Mouth (1903); Harris, Principles and Practice of Dentistry (1896); Hopkins-Smith, Normal and Pathological Histology of the Mouth (1913); King, American Text Book of Operative Dentistry (1911); Litch, American System of Dentistry (in treatises by various authors 1886-87); Miller, Micro-Organisms of the Human Mouth (1890); Peeso, Crown and Bridge Work (1916); Pickrell, Prevention of Dental Caries and Oral Seepage (1914); Prinz, Dental Caries and Oral Seepage (1917); Smale and Colyer, Diseases and Injuries of the Teeth (1903); Turner, American Text Book of Prosthetic Dentistry (1914).

HERMANN PRINZ
Professor of Materia Medica and Therapeutics, School of Dentistry, University of Pennsylvania.

DENTISTRY, PUBLIC. This term may properly be used to denote all phases of dental service except that bought of a dentist by an individual. It includes military and naval dentistry as well as that provided by municipalities and other governmental authorities. It is composed of the most recently realized of the professional duties of the state, embracing the whole organized movement up to 1918, save perhaps in some few advanced communities.

Budapest had a fine public dental clinic in 1892. In England the government began to take a hand in the care of the mouths of the people in 1904. In a report of the Inter-Departmental Committee on Physical Deterioration presented to Parliament a warning was sounded that "the teeth of the people have become much worse in the last ten years and in many parts of the country may be described as very bad." (England was at that time using 90 pounds of sugar per capita per year). It was suggested that dental hygiene be given special prominence and far better practical attention in the schools. In France nearly every hospital long since had a dental department giving free dental care to the poor, besides numerous municipal clinics in Paris and in the larger provincial cities. Italy has not been behind in this work: Florence early had three dental clinics, Naples two, and Rome one attaches to the University School of Dentistry, while Brescia, Turin, Milan, and other places, in like manner carried on this work at a period relatively early. Germany had 33 clinics exclusively for school children, and Switzerland followed closely the German system (Zentler). America, which by its knowledge of the dental hygiene, has always led the world in dentistry, has been a little slow in taking up the work for the children; but it has in some respects surpassed all other nations in public dentistry, thus maintaining its original lead.

Boston a few years ago began the system of school medical service and promptly agitated for and actually established dental services as a part of that system, including dental nursing as a profession legalized and encouraged by the general department of public education. Since 1914 that city has had in the Forsyth Dental Infirmary for Children the most adequate institution for public dentistry in the world. In December 1910, by the appointment of two dental consultants and special lecturers on oral hygiene of the New York State Department of Health, Commissioner E. H. Porter earned the distinction of being the first State commissioner of health in the United States to take an active part in the crusade for clean mouths, the contention of their public lectures, long since and now common knowledge, being that "a clean tooth never decays and a lazy tooth becomes in time a rotten tooth." Haven Emerson of New York city found in the summer of 1907 that 97 per cent of the 'stay parties' of the sea breeze (adults) had decayed teeth, and the American Statistical Association in the same year showed that approximately 9,000,000 children in the United States had bad dental equipment or diseased teeth.

The Boston institution is the pioneer and sole present model for further constructions in the direction of the public care of children's teeth, mouths and throats. The institution developed from the philanthropic idea of Mr. James Bennett Forsyth, a Boston business man, who had been a great sufferer from neglected teeth. The idea acted upon by his two brothers, John Hamilton and Thomas Alexander Forsyth, for the actual creation of the Infirmary, and the heirs of another deceased brother, Mr. George M. Forsyth, resulted in the foundation and erection of a memorial building of utility and beauty, the equipment and administration of which is unrivaled for its objects, which are summarized as follows:

(1) To educate parents, teachers, nurses and children in the hygienic value of healthy mouths and sound teeth, and to furnish instruction as to the best methods of securing the same.

(2) To prevent dental caries by oral prophylaxis and by the care and preservation of the temporary teeth.

(3) To investigate the causes and to study the prevention of oral diseases and caries of the teeth.

(4) To remedy, so far as possible, existing
conditions of dental caries and other oral diseases.

(5) To establish and promulgate a higher standard of dental asepsis.

(6) To furnish for the dental profession an opportunity for charitable work and for the educative experience of a large class. The War work was enthusiastically taken up by the institution, courses were organized to fit dentists for service in the Dental Officers' Reserve Corps, 600 dentists registered for the first course and the director was appointed preliminarily in charge of the corps. The lectures given in the course have been compiled and edited as a textbook under the title, 'War Dentistry.'

In addition to its work more strictly and directly therapeutic, this infirmary conducts two schools, a training school for dental hygienists and a postgraduate school of orthodontia. There are departments of social service and registration; Roentgen rays; extraction; surgery; orthodontia; research; oral hygiene; library and museum; and several assistants and the staff; besides the extensive dental-clinic department suggested in our illustration. In 1917 the total number of cases treated was 31,750; new cases, 16,457; returned cases, 14,293; emergency cases, 2,917; average number of full-time operators, 18; and of half-time operators, 14; average number on visiting staff, 75; and average number of patients daily, 363.

It cannot be doubted that when the world returns again to the pursuits of peace and social progress numerous such institutions will come up to educate and to care for the children of this and of other lands, certain that septic teeth are the cause of much pain and disease heretofore ascribed to other causes.

GEORGE VAN NESS DEARBORN
Medical Corps, United States Army.

DENTISTRY IN THE UNITED STATES. From the earliest times dentistry was practiced as a branch of medicine. Herodotus speaks of means of preserving the teeth, and artificial teeth are alluded to by Greek and Latin poets. In the United States the first historic mention of dental practice is about the year 1785, and for some 40 years thereafter the practice was confined to the country, and they were for the most part peripatetic, only the largest cities giving support to a resident dentist. The Baltimore College of Dental Surgery, established in 1839, was the first institution of the kind in the world. It was the direct result of an agitation to put dentists on a higher professional plane and followed an unsuccessful attempt to found dental chairs in medical schools. It had been argued that pathology of the mouth and dental mechanics should be taught in the medical schools as branches of medicine and that graduates choosing these courses should receive the degree of M.D. as in the case of other branches of medicine. At the beginning no previous preparatory studies were required. To obtain a graduate's degree the student attended two courses of lectures, each of four months, covering dental surgery, dental mechanics and dental pathology. In addition some general instruction was given in anatomy, physiology and therapeutics. A previous experience of five years as a practicing dentist was credited as equal to one term's attendance. In 1839 also the American Journal of Dental Science, the first dental periodical in the world, was established. For five years this was the only publication of the kind, but within a few years a dozen had come into being. In 1845 the Ohio College of Dental Surgery (since 1888 the dental department of the University of Cincinnati), in 1856 the Pennsylvania College of Dental Surgery, in 1863 the Philadelphia Dental College were founded. These separate schools taught at first very little medicine, but paid attention almost entirely to the lectures and to those branches which a dentist must know. All conferred the degree of D.D.S. In 1865 the New York College of Dentistry was founded with the purpose of educating men to practise dental surgery as a specialty of medicine. The curricula included the fundamental departments of medicine with operative dentistry and oral prosthetics. In 1867 Harvard University opened a dental department and began to teach dentistry as a branch of medicine with the special degree of D.D.S. (D.M.D. or medicine doctor). By this time the practice of dentistry had come to include to a large degree the saving of diseased teeth and mouth tissues, requiring medical as well as dental education. In 1875 the University of Michigan and in 1878 the University of Pennsylvania followed the example of Harvard in opening dental departments. Since 1878 there has been a most astonishing increase in dental schools and dental students, due largely to the fact that the dental laws in many States now require graduation from a dental school as a condition for license. In 1878 there were 12 schools and 701 students; in 1910 there were 53 schools and 6,459 students. The number of practitioners of dentistry in the United States in 1917 was 46,223; 115 institutions in the United States (and 7 in Canada) are devoted to the systematic education of dentists; the profession has an extensive literature of standard works and periodical publications, and the furnishing of supplies and material used in dental practice is an enormous industry involving millions of capital, a growth which has all developed within 70 years.

In 1840 the American Society of Dental Surgeons, the pioneers of the associations to which dentistry owes so much of its progress, was organized in New York. This was followed by the organization of the Virginia Society of Surgical Dentists in 1842, and within the next five years several other district and State organizations. The National Association of Dental Faculties, organized in 1884, has done much to strengthen courses of study in dental schools. At the time of its organization only those schools were admitted which had proper facilities for instruction and a corps of competent teachers. From time to time standards have been raised by rules governing attendance, instruction and graduation. The schools in the association, all require three full courses of dental lectures. The main defect of its requirement was the failure to require a sufficient preliminary general education for admission.

The first State to regulate by law the practice of dentistry was Alabama. In 1841 a law was passed requiring the examination of dental practitioners in the State by a medical board.
containing at least one dentist of recognized ability. This was the first legislation as to
dentistry passed in any country. For nearly 30 years no other State passed such a law, but
here and there regulations affecting the practice of dentistry became part of the existing stat-
utes of several States. The next State to pass a dental law was New York, dated 1855, but this action
was not taken till 1868. The English law was
enacted in 1878, and those of other countries
about that time or later.
Supervision.—The practice of dentistry is
now regulated by statute in all political divisions
of the United States. Examining boards are
appointed in Alabama, Kentucky, North Caro-
lin and South Carolina by the State dental
associations; in District of Columbia by dis-
trict commissioners; in Indiana by the gov-
ernor, State Board of Health and dental asso-
ciation; in Nebraska by State Board of Health;
In New York by the Regents; in the Philip-
ippines by the Board of Health; in the remain-
ing divisions by the governor, usually, on rec-
ommendations of the State dental societies.
Licenses.—The interchange of licenses is highly desirable and will doubtless be brought about to
some extent in the near future. An important
step toward interchange of licenses was taken
in 1898 when the New York dental law was
amended so that the Regents may now iss-
their license to any applicant who holds a
license to practise dentistry granted by a State
board of dental examiners, endorsed by the
Dental Society of the State of New York, pro-
vided that his preliminary and professional education meets the New York statutory re-
quirements. The dental examiners of Pennsyl-
vania having been endorsed by the New York
State Dental Society and recommended by the
State dental examiners, the Regents endorse
Pennsylvania licenses granted under the new
regime.
Licentiates of Other States.—Delaware, In-
diana, Montana, Ohio, and Wisconsin admit
licentiates of other States having equal require-
ments on "signification of reciprocal courtesy";
Illinois, approved diploma from reputable
dental or medical college, or on five years' prac-
tice; New Jersey, Pennsylvania, and Wisconsin,
on proof of license from other State boards
having equal requirements; New Mexico and
Utah, on proof of diploma recognized by the
National Association of Dental Facul-
ties; New York, on proof of license from
another State board having equal require-
ments and endorsed by the New York
State Dental Society, or on graduation from a
registered dental school and six years' practice;
District of Columbia, Louisiana, Michigan,
Missouri, Nebraska, Nevada, North Dakota,
Oklahomna, South Dakota, Tennessee, Wiscon-
sin, on approved diploma from other States;
Kansas, Kentucky, Ohio, Texas, on approved
diploma from a dental college in the United
States or any foreign country. In the remain-
ing political divisions no provision is made in
the law for admission of licentiates of other States.

Minimum of Educational Requirements.—
In most divisions dental diplomas do not now
confer the right to practise, an examination
being required. The few exceptions are at the
discretion of the examining boards.
The requirements for admission to the ex-
aminations before the licensing boards of the several States as compiled up to 1 Jan. 1918,
are as follows:
Alabama, a diploma of graduation from some
dental college or collegiate department recog-
ized by the National Association of Dental
Faculties, indicating a grade of at least 75 per
cent in all dental branches.
Alaska, a diploma from a reputable dental
school. Dentists practicing in the Territory
since 1909 who have such diplomas are regis-
tered and licensed without examination.
Arizona, a diploma from some reputable
dental school, or a license issued by another
State requiring equal proficiency.
Arkansas, a diploma of a reputable school
of dentistry; or the certificate of the examin-
ing board of a State in which equal proficiency
is required.
California, diploma of reputable dental
school endorsed by State board of examiners,
or four-year high school course and not less than five years' practice; or certificate
of examining board of another State requiring equal proficiency showing five years' recent
practice.
Colorado, diploma from legally organized
reputable dental school.
Connecticut, diploma of graduation from
recognized dental school, or three years' prac-
tice in the State; or certificate from another
State board of dental examiners with equal
requirements. The license may be issued with-
out examination in the discretion of the board.
Assistants are licensed to practice in the office
of a licensed dentist.
Delaware, no restrictions to applicants; li-
censes also those who have lawfully practiced
dentistry in States which reciprocate such
courtesy to Delaware dentists.
District of Columbia, certificate of the board
of examiners that qualifications for examination
are sufficient.
Florida, diploma of graduation from recog-
nized dental college or collegiate department.
Georgia, diploma from reputable dental col-
lege.
Hawaii, a diploma of graduation from a
recognized dental college or collegiate depart-
ment.
Idaho, a diploma from a legally organized
dental school; a license from the examining
board of another State; or four years' study
with a licensed Idaho dentist.
Illinois, a high school education or its equiva-
ient, previous to the dental course, and a
diploma of graduation from some reputable
dental college; or active legal dental practice in
some other State for the five years next preced-
ing the examination.
Indiana, diploma recognized by National
Association of Dental Faculties.
Iowa, diploma from reputable dental school.
Any dentist having been engaged in lawful
practice for five years under certificate of a
board of dental examiners in another State may
be licensed without examination.
Kansas, a diploma from a reputable dental
school; or previous lawful dental practice in
another State for the five years next preceding
the examination.
Kentucky, diploma from a recognized dental
college or collegiate department.
Louisiana, no stated requirements; examines all applicants.
Maine, a diploma of graduation from a reputable dental college and a preliminary education equivalent to that required for graduation from a Maine high school. The board may license at discretion, without examination, dentists with five years' practice in other States requiring equal proficiency.
Maryland, a diploma of any legally authorized university or collegiate dental school. A licentiate of another State may be licensed without examination at the discretion of the board.
Massachusetts, a diploma from an approved dental school; or at least three years' study without diploma, at the discretion of the board. Dentists with five years' practice in other States, and equal requirements are licensed without examination.
Michigan examines all applicants; and issues licenses without examination to licentiates of other States which demand equal proficiency.
Minnesota, a diploma from a reputable dental school; or five years' lawful dental practice in another State. A licentiate of another State may be licensed without examination, at the discretion of the board.
Mississippi, a diploma of a reputable dental school and a preliminary education equivalent to a high school course.
Missouri, a diploma of any authorized dental school.
Montana, a diploma of a reputable dental school; or five years' dental practice in any State which extends a similar courtesy to Montana dentists.
Nebraska, a diploma of graduation from a reputable dental school, and such preliminary education as shall be approved by the dental secretaries of the State.
New Hampshire, a diploma from a recognized dental school, and a three-year course in high school.
New Jersey, a certificate of good moral character from two licensed dentists of the State, a preliminary academic education of four years in a high school, and a diploma from an approved dental school, attested by an identifying photograph endorsed by an official of the school; or five years' practice immediately preceding application certified by the board of the State in which the practice was carried on.
New Mexico, a diploma of graduation from a reputable school of dentistry.
New York, a four-year high school course, or its equivalent and a degree from registered dental school or medical degree with a special two-year course; or license to practise dentistry in New York State for a practice of 25 years without the State, or in a foreign country.
North Carolina, a diploma of graduation from some reputable school of dentistry.
North Dakota, preliminary education of four years at high school, a diploma from an approved school of dentistry, and at least one year in the State University, or an equivalent institution; or five years of practice in dentistry in another State requiring equal proficiency.
Ohio, a certificate of the State superintendent of public instruction that the applicant is possessed of an education equal to that required for graduation from a high school, and a diploma from a legally chartered dental school; or five years' dental practice under license in another State requiring equal proficiency, providing that such State reciprocates such courtesy. In the latter case a license may be issued without examination at the discretion of the board.
Oklahoma, a diploma of graduation from a dental college approved by the examining board.
Oregon, diploma from dental school in good standing, or dental study and practice in Oregon prior to this act.
Pennsylvania, a competent preliminary education and a three-year dental course; or a diploma of a recognized dental school.
Philippines, diploma from legally incorporated dental school.
Porto Rico, a diploma of a reputable dental school, certified as genuine by two freeholders. Lacking these, the applicant may demand examination on his merits.
Rhode Island, graduation at a recognized dental college; or actual practice of dentistry in another State for the five years next preceding the examination.
South Carolina, no requirements; all applicants examined.
South Dakota, a diploma of graduation at an approved dental school; or practice in dentistry in another State for the five years immediately preceding the examination.
Tennessee, a diploma of a reputable dental school.
Texas, no restrictions; examines all applicants.
Utah, diploma recognized by National Association of Dental Faculties, or two years' practice or three years' study with licensed dentist.
Vermont, a preliminary high school course, and the diploma of a reputable school of dentistry.
Virginia, a diploma of graduation from a recognized dental college; or active practice of dentistry in another State for the five years preceding the examination.
Washington, a diploma from a recognized dental school.
West Virginia, the diploma of a reputable dental school. Any dentist holding a license from another State may be licensed after examination.
Wisconsin, a general education equivalent to a four-year course in the Wisconsin high schools, and a diploma of graduation from a reputable dental college; or license to practise in other States issued previous to 1909, and with at least five years' practice in such State—provided a similar courtesy is extended to Wisconsin dentists removing to such State.
Wyoming, a diploma from a recognized dental college or collegiate department.

DENTITION. See Teeth.

D'ENTRECASTEAUX (dán-tr-kás'tô) ISLANDS, since 1884 part of the British protectorate of New Guinea, lie north of the south-
east extremity of New Guinea; area 1,083 square miles. They comprise three chief islands separated by narrow channels. They are named after the French admiral and explorer, Joseph Antoine Bruni, chevalier d'Entrecasteaux (q.v.), who visited these waters in 1792. His name is also preserved in D'Entrecasteaux Point on the southwest coast of western Australia and in D'Entrecasteaux Channel, separating the south of Tasmania from the Bruny Islands. The islands contain boiling springs and other indications of volcanic action. There are several very high mountains. Administratively, the islands are part of the Territory of Papua, the name given to British New Guinea by a proclamation of the governor-general of Australia 1 Sept. 1906.

DENUDATION. See EROSION.

DENVER, James W., American soldier and frontiersman, b. Winchester, Va., 1817; d. Aug. 18, 1858. He removed to Cincinnati, Ohio, in 1842, where he studied for the bar. Later he removed to Missouri, where he raised a company and served as captain in the Mexican War. In 1850 he went to California where he became prominent in politics, serving as state senator and was appointed secretary of state, and afterward was elected to the 34th Congress. Before the end of his congressional term he was appointed commissioner of Indian affairs, but resigned to accept the office of governor of the Territory of Kansas in 1858. He returned to Washington after 12 months of service leaving the territory well-organized and law-abiding. He returned to California in 1859, but soon after removed to Wilmington, Ohio. He served in the Union army as Brigadier-General of volunteers during the Civil War until 1863. After the war he practised law in Washington, D. C. General Denver, at that time governor of Kansas, suggested the name Colorado for the Territory formed out of Kansas, Utah, New Mexico, and Nebraska, and the capital city of Saint Charles was renamed Denver in his honor.

DENVER, Colo., city, capital and commercial centre of the State, 639 miles west of Kansas City, 538 miles from Omaha, 2,025 miles from New York and 1,457 miles from San Francisco.

Topography.—It is situated on both sides of the South Platte River at its junction with Cherry Creek, usually a dry stream, but at intervals carrying great floods of water; lat. 39° 40' 36" N., long. 104° 56' 55" W.; altitude 5,270 feet. The site of the "Queen City of the Plains," as it has been designated, with an area of 584 square miles, coterminous with the county of Denver, slopes gently back from either bank of the river, and has a commanding view of the main range of the Rocky Mountains, terminating with Pike's Peak on the south and Long's Peak on the north. It lies 15 miles from the foot-hills, the eastern base of the Rocky Mountain Range.

Government, Municipal Conditions.—The municipal government is vested in a mayor elected for three years. His cabinet consists of four members, consisting of the managers of revenue, safety and excise, parks and improvements, and health, all appointed by the mayor, and nine elective councilmen. The manufacture or sale or giving of alcoholic and malt liquors is prohibited by the constitution of the State, and public drinking places do not exist. The streets are laid out regularity, and are built of brick and stone; no wooden structures having been permitted since 1876. In 1915 there were 900 miles of streets, 370 miles of which were graded and paved with asphalt and disintegrated granite; 700 miles of sidewalks are uniformly paved with stone or concrete and 38.59 miles of alleys are likewise paved. There are 141.25 miles of storm and sanitary sewers. The streets are generally bordered by trees, the elm and maple being most abundant; but every shade tree known to the local forester can be found.

Public Utilities.—The public utilities are modern in every particular. Street cars operated by overhead trolley traverse 205 miles of streets, and in 1915 carried 72,983,000 passengers. Overhead trolley lines also connect with Golden, 12 miles west, Boulder, 30 miles north-west, and Littleton, 10 miles south. Gas, electric light and electric power are supplied by the Colorado Power Company. Water used is generated near Glenwood Springs, west of Denver, and transmitted 150 miles, and also near Boulder, whence it is transmitted 50 miles. Telephone communication exists between Denver and all communities in neighboring States, and long distance service extends to the two oceans. The domestic water supply is furnished by The Denver Union Water Company, a private corporation. Water is taken from the South Platte River, Cherry Creek and Bear Creek at distances varying from 6 to 48 miles from the city. The greater portion of the water is handled through two reservoirs known as Cheesman and Marston lakes, having a joint capacity of 33,000,000,000 gallons, furnishing a storage reserve equal to the needs of at least half a million population. The water from these reservoirs, although of remarkable natural purity, is all filtered before reaching the city mains. The daily consumption for domestic and irrigating purposes averages approximately 220 gallons per capita, and at times has reached a maximum of 375 gallons per capita. Sanitary conditions are safeguarded by a health department to which is delegated great power. Inspection of all public and private properties is regularly and carefully made. The mortality record for 1915, based on a population of 250,000, was 1.36.

Public Buildings.—Among the notable public buildings of the city are the State Capitol and Federal building; the four-story constructed of Colorado granite, cost $2,700,000; the second, of Colorado white marble on strictly classic lines, cost $2,400,000; the Federal building houses the Federal courts, post-office and other government offices. The United States Mint cost $1,200,000. During 1915 it received in gold and silver bullion $34,842,618, of which $574,175 was gold. Of the total receipts Colorado smelters and mills furnished $14,303,768. No gold was coined in 1915; $1,987,175 was coined into half-dollars, quarters and nickels; 220,500 pennies were made. The mint, according to the United States Treasurer, contained on 6 July 1916 $485,000,000. Among other public buildings are the union railroad station costing $1,000,000, two museum buildings, public library, public baths, city hall, county court-
house, armories, schools and colleges. A stock-
show stadium has a seating capacity of 7,500
and cost $250,000. An auditorium, erected and
controlled by the city, has a seating capacity of
12,000 and is so arranged that it can be re-
adjusted temporarily for smaller gatherings,
for theatre, concert and other purposes.

The banks and financial institutions are strong. The five
national banks report combined capital and sur-
plus for 1915 as $7,103,380; national bank clear-
ings, $308,421,052; deposits, $57,605,781; loans
and discounts, $34,030,906. Total number of
banks, 36. The assessed valuation of the city
in 1915 was $358,365,823; bonded indebtedness,
$1,564,350, with sinking fund $855,096, leaving
net bonded indebtedness $709,254; indebtedness
per capita, $2.88; annual tax levy, 16.2 mills
on the dollar; property assessed at its full cash
value; number fire alarms, 1,057; number fires,
908; loss by fire, $244,354; number of persons
per policeman, 1,072.

Parks, Public Playgrounds. The city has 30 parks and 10 playgrounds. Those lying
strictly within the municipal limits comprise
1,318 acres. They contain bronze and marble
statuary and all floral adornment known to
the modern scientific landscape artist, lakes and
fountains, pavilions for musician entertainments
where the municipal band of 50 pieces gives
daily concerts during the summer (in winter
the concerts are given Sundays in the municipal
auditorium), floral-bordered walks, wide-surfaced
drives, municipal golf links, tennis courts,
camping grounds for automobile tourists, bath-
ing beaches and playgrounds with modern
equipment and competent supervision and in-
struction. A natural history museum is lo-
cated in City Park, also a zoological garden
well stocked with native animals and birds.

Another feature of this park is the electric
fountain, which plays every summer evening
with varicolored lights. The connecting sys-
tem of parkways about the city includes 12
miles of parking, with gardens, lawns and floral
decorations, altogether embracing 56 acres.

Denver owns in the mountains within 30 miles
from the corporate limits parks comprising
2,530 acres, to which more is being added from
year to year. These mountain parks include
cabin and peak; a reach which a highway has
been constructed by way of Lookout Mountain
to the summit of Genesee Peak, rising to an
altitude of 8,270 feet. The mountain roadways
are at no point less than 20 feet in width and
their grade more than 6 to 100 feet, and
where are guarded by post-and-rail
and cable protection. Rustic shelters and rest sta-
tions where refreshment may be had, fire-
places for cooking, etc., are conveniently locat-
ed for parties who motor over part or all of the
72 miles of highway. A mountain pasture
stocked with buffalo lends to the
attractiveness of the parks, while trout streams
lure the city dweller and the tourist. These
parks are maintained by the city of Denver for
the free use of its citizens and guests, and pro-
vide unique and pleasurable rural excursions
and mountain outings. The round trip from
Denver by automobile over one of the most
popular routes is accomplished in four hours.

From various points on the trip the city is in
full view, and with a glass its streets, buildings
and parks are distinctly recognized. From these
summits at night the view of the distant brilli-
antly lighted city is enchanting. In 1915 the
City spent on the maintenance of its parks
$233,000, and on improvements including moun-
tain parks $160,000.

Schools, Libraries, Etc.—The public schools
provide free education for all from the kind-
garten through the high school. In addition
to the elementary fundamental branches, night schools are provided for adults
of all nationalities; manual training, special
training in cooking and sewing, modern and
ancient languages, music, drawing, trade schools
with special preparation for advanced work in
technical schools and military training. In 1915
$1,463,000 was expended for the maintenance
of public schools. The school property is valued
at $4,260,000. The public library contains
100,000 volumes; five branches of this library
are maintained at various points in the city.
In addition there is a medical library of several
thousand volumes; six law libraries; school
libraries containing 60,000 volumes exclusive of
textbooks; at the State Capitol a library num-
bering approximately 15,000 volumes. Denver
has four daily newspapers, 35 weekly papers
and a number of trade journals. Its church
edifices number over 200.

Climate.—The climate is one of the most
delightful and remarkable in the country.
United States Department of Agriculture data
for the years 1872 to 1915 is given in the following
information: Descending fractions of a degree,
the mean annual temperature at Denver is 50°
as against 49° at Chicago, 49° at Boston, 55°
at Washington, 56° at Saint Louis and 69° at
Jacksonville. During the last 44 years 100° or
higher has been touched 13 times, 7 in July
and 6 in August. While these high tempera-
tures were maintained for only a few minutes,
readings in the 90's are common during every
summer months. For July, the warmest month,
the average temperature is 72°, and the average
daily maximum, or afternoon reading, is 86°.
Here, as elsewhere over the greater part of
the United States, the coldest month is January,
with an average temperature of 31°. The
annual precipitation is 14.5 inches; Chicago, 33.2;
Saint Louis, 40; Washington, 42.7; Boston, 41.8;
and Jacksonville, 54.1. Of sunshine Denver has
0.7 per cent of the possible, as against 65 at
Saint Louis, 57 at Washington, 54 at Boston
and 58 at Chicago. The average relative hu-
midity is 52 per cent. It is highest in February,
57 per cent, and lowest in October, 49 per cent.
Twice during the last 42 years a humidity as
low as one-half of 1 per cent has been re-
corded. The annual relative humidity at Saint
Louis is 70 per cent, Boston 72, Washington 73,
Chicago 74 and Jacksonville 80; and for the
ewer months — June, July, August and Sep-
tember — at Saint Louis 66 per cent, Chicago
and Boston 74, Washington 76 and Jacksonville
82. It will be observed that in the Atlantic
States the humidity during the warm months
is greater than the average annual, just the
reverse of that which characterizes.

In brief, Denver summers are characterized by
warm days and cool nights, the heat of the day
not attended by the usual debilitating effects;
the winters by an abundance of sunshine and
general absence of snow and severe, long-
continued cold.
Railroad Service.—The railroad lines entering the city are the Atchison, Topeka and Santa Fe, the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the Colorado Midland, the Denver and Rio Grande, the Union Pacific, the Colorado and Southern, the Denver and Salt Lake and the Denver, Northwestern and Pacific. Of these, jointly with others, four continue across the continent, and the Denver and Salt Lake, now under construction, will make the fifth. The Union Pacific Railroad takes its passengers through Denver to the line of the Cheyenne and Ogden; the Burlington and Rock Island transfer to the Union Pacific, Rio Grande or Santa Fe; and the Santa Fe, whose main line extends south of Denver across the continent through New Mexico and Arizona, makes southern connection for Denver. The greatest transportation enterprise of recent years, involving a six-mile tunnel through the Rocky Mountains, is the construction of the Denver and Salt Lake Railroad, by which the rail distance between Denver and Salt Lake City will be shortened 100 miles.

Commerce, Industries.—As a commercial centre Denver is increasing in importance each year, and a combination of natural conditions gives it a promise to the city. In 1890 manufactured products totaled $30,000,000 and in 1915 $62,000,000. The wholesalers sold in 1915 $53,000,000 worth of goods. Foundry, railway and mining machinery are manufactured. Five flouring mills have daily capacity of 3,500 barrels. Four paint manufactoryes and one varnish factory have a total annual output of $1,125,000. Window and plate glass is not made in Denver, but mirrors and ornamental art glass made and jobbed in 1915 totaled $750,000. Denver is the distributing point for Colorado, New Mexico, Arizona, Wyoming, Idaho, Montana, Nebraska and Kansas. The paints and varnishes produced are especially adapted to dry climate use. The live stock interests of the West centre in the Denver Union Stock Yards and added packing plants; 425,000 steers of cattle (chiefly Western) were received in 1915. The packing companies are at present (1916) increasing their capacity at a cost of half a million dollars; 768,421 head of sheep were received in 1915 and 341,501 hogs were handled at the packing plants. The live stock industry is growing rapidly and money to finance operations is easily obtainable. Denver's proximity to the mining and agricultural regions of the State has greatly assisted in its building. The gold production of Colorado for 1915 was $23,358,068; silver, $4,137,353; zinc, $13,545,212; lead, $3,629,524; coal, 8,537,775 tons; a total, excluding coal, of $50,489,943. Among the leading agricultural products of the State in 1915 were sugar beets, 1,254,913 tons of which were converted into 195,343 tons of sugar. The executive offices of the beet sugar companies, and of many other substantial industries, are in Denver.

Population.—The population in 1910 was 213,381. In 1916 it was estimated to be 253,000. It is not so greatly disproportionate than is usual in cities of like size. Representative citizens, while more largely from the northern States of the Union, are found from every State as well as from most European countries. Census returns of 1910 gave 25,300 of foreign birth and 4,000 of negro descent. Only the first generation of native Coloradans have arrived at adult life.

History.—Denver was settled by gold seekers in 1858. The following year it was incorporated as a city by the provisional legislature and named in honor of Gen. J. W. Den- ver, the governor of Kansas. In 1851 it was incorporated by the first Territorial legislature and became the capital of the Territory in 1867. In 1870, on the completion of the Denver Pacific and Kansas Pacific railroads, it was first connected with the older settlements of the Missourit Valley. The bibliography of Denver is found complete in the library of the Colorado Historical Society. The Denver Public Library also has a complete list of books and pamphlets relating to the history of the city from its foundation.

THORNDIKE DELAND,
Secretary of the Denver Chamber of Commerce.

DENVER, University of. This institution is the pioneer school of higher learning in Colorado. With the commencement of 1916 the list of graduates numbers more than 3,100, and the institution therefore leads all institutions in the Rocky Mountain country in secular society. Approximately 1,400 students are now in residence as candidates for degrees. There are some hundreds of additional students in Denver who are taking college work without seeking degrees. The departments are as follows: graduate school, extension college, extra-mural college, summer school, Warren Academy, law school, dental school, school of commerce, school of art, lecture department. The properties and endowments of the university now aggregate more than a million dollars in value. The General Education Board has made a conditional grant of a large amount for endowment exclusively on conditions which have been fully met. Within three years the university properties and endowments will aggregate more than a million and a half in value. The university is owned by the Methodist Episcopal Church. No religious test has ever been made for admission to any of the departments. The university is conspicuously the university for Denver, though it attracts students from nearly all the States in the Union.

DENYS, Nicolas: b. Tours 1598; d. Acadia 1668. He accompanied De Razilly to Acadia in 1632 and engaged in sedentary fisheries at Port Rossignol, now Liverpool Bay, Nova Scotia, receiving a grant from the Company of New France. His fort was seized by D'Aulnay CharnIsay, lieutenant-general in Acadia, in 1647. In 1653 he received a grant from the French king of the coasts, estuaries and islands of the Gulf of Saint Lawrence, to which Newfoundland was afterward added. He established the headquarters of his fisheries first at Chedabucto (Guysbro Harbor, N. S.), then at Saint Peters, Cape Breton, where his buildings were destroyed by fire, and finally at Nipisigut (Bathurst, N. B.). His Description and Natural History of Acadia was published in 1672.

DEOBUND, dé'- or dā'o-bund, or DEOBAND, India, city in the Saharanpur district, United Provinces of Agra and Oudh; an ancient place, with manufactures of fine cloth and a grain trade. It has many temples and is much resorted to by pilgrims. Pop. 19,250.
DEODAND, dö-dänd (Deo dandum, a thing to be given or dedicated to God), an obsolete legal term for anything that had directly caused a person's death, all such chattels being, by the old rule of the common law of England, forfeited, partly by the number of persons of the sort who should have been alive. They were frequently increased by the king, and by the cession of Savoy and Nice to France in 1860 the number of the French departments was increased to 89, and by the cession of Alsace-Lorraine to Germany in 1871 the number was reduced to 87. At the head of each is a prefect, appointed by the President of the Republic, and assisted by a conseil de préfecture. Most of the states of South America are also divided into départements (départements), but these resemble the French ones in nothing but the name. Each French department is subdivided into arrondissements, these again into cantons, and these again into communes. The name is also applied to military divisions and to districts of other divisions, as of government and schools.

DEPAW UNIVERSITY ACADEMY, an institution for the secondary education of boys at Chicago. It was founded in 1898 and is conducted by the Vincentian Fathers. Its courses are given for entrance into college, for business training, and general education. The De Paul High School for Girls is under the direction of the Sisters of Charity.

DEPAW, dë-pä', Washington Charles, American manufacturer: b. Salem, Ind., 4 Jan. 1822; d. New Albany, Ind., 5 May 1887. He received a liberal education; worked himself up to the foremost rank among the business men of his State; and was successively a mill-owner, a merchant and a banker. He was noted for his extensive gifts in behalf of education. His aid to the Indiana Asbury University set it upon a sound basis, and its name was changed to De Pauw University in his honor. He also founded De Pauw College for Women and several charitable institutions at New Albany, Ind. See De Pauw University.

DEPAW UNIVERSITY, a coeducational institution in Greencastle, Ind.; founded in 1837, under the auspices of the Methodist Episcopal Church, and known as the Indiana Asbury University until 1884, when its name was changed to DePauw University. In the original charter of the institution there existed provisions for schools of divinity, law, medicine, art, music and pedagogy, and of liberal arts. At some period in the course of its existence the university has instituted and conducted every one of these. Insufficient endow-
ment and income rendered it impossible to keep these professional departments up to the standard which the institution set itself and it suspended all except the school of music, thus leaving only the college of liberal arts and this school in operation at present. In 1915 there were in attendance 883 students with 40 professors and instructors; number of volumes in library, 27,725; grounds and buildings valued at $528,000; productive funds, $1,200,000.

DE PERE, de-për or de-pär', Wis., city in Brown County, on the Fox River at the head of steamer navigation, and on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads, about 100 miles north of Milwaukee. Here was established the first mission in Wisconsin. Saint Norbert's College is situated here. The parts of the city on either side of the river are united by means of a steel bridge over the river. The industrial establishments of the city include brick, pottery and tile works, paper mills, boiler works, internal combustion engines, sash and door factories, paper mills, pipe works, foundries, woolen mills, creameries, limestone quarries, and municipal waterworks. The city exports principally cattle, grain and hay. Pop. 4,447.

DEPEW, Chauncey Mitchell, American lawyer, legislator, politician and orator: b. Peekskill, N. Y., 23 April 1834. He was graduated from Yale College in 1856, studied law in Peekskill and in New York and was admitted to the bar in 1858. He was soon after elected to the New York assembly and served as chairman of the committee on ways and means. For a time he was acting speaker of the house. In 1863 he was nominated upon the Republican ticket for secretary of State and was elected by over 30,000 majority. In 1865 he declined a renomination. President Grant tendered him the Japanese mission about this time, but Dr. DePew declined the offer to enter the service of the New York and Harlem Railroad as attorney. In 1869, when the consolidation occurred of the Hudson River, Harlem and New York Central railroads he was made a director and attorney for the newly organized company. In 1872 he accepted the nomination for lieutenant-governor on the Republican State ticket, but was defeated by a small plurality. In 1873 he became general counsel for the entire Vanderbilt system of railroads, and in 1882 second vice-president of the reorganized New York Central and Hudson River Railroad, and president in 1885. The same year Yale College conferred upon him the title of LL.D. During this period he was acting as a regent of the State University. He remained president of the New York Central until 1898, when he became chairman of the board of directors of the Vanderbilt system, which included the New York Central and Hudson River, Lake Shore and Michigan Southern, Michigan Central and the New York, Chicago and Saint Louis railroads. His political career during these later years was eventful. In 1886 he declined the election to the United States Senate. In 1888 he figured prominently as a candidate for the presidential nomination at the National Republican Convention, withdrawing from the contest in favor of Benjamin Harrison, of Indiana, who, after his election and elevation to the Presidency, tendered to Mr. DePew the portfolio of Secretary of State, which was declined owing to large railroad interests. In 1899, on 17 January, he was elected to the United States Senate as junior member from New York State. He remained in the Senate until 1911. He became involved in the investigation of certain New York life insurance companies in 1912, and, as a result that he repaid to the Equitable Life Assurance Society, of which he was a director, a loan made to a concern in which he was interested, and he resigned from the directorate of the Equitable. Since 1885 Dr. DePew has been regarded as one of the leading Republicans of the country. Dr. DePew was married in 1871 to Ellen Hegeman, who died 1893, leaving one son. He was married again in 1902 to Miss Palmer. Dr. DePew's fame abroad is even greater than in the United States. In London and Paris he is regarded as America's representative citizen. This fame rests largely upon his ability as orator, after-dinner speaker and lecturer. He delivered important addresses at the Washington Centennial at New York in 1889 and the dedication of the World's Columbian Exposition, at Chicago, in 1893, and orations at the funeral services of President Garfield and General Sherman. As a wit and humorist, Dr. DePew has acquired a name second to none in this country, and he has been in great demand for many years at annual dinners and banquets as the after-dinner speaker. He has published collections of his orations and after-dinner speeches in one volume (1890), and his later speeches (1894). Consult Clemens, 'DePew Story Book' (1898).

DEPESTER, de pës'er, Abraham, American merchant: b. New York, 8 July 1658; d. there, 10 Aug. 1728. He was the eldest son of Johannes DePeyster (q.v.); and filled many important public offices after the final cession of the New Netherlands to Great Britain. Between 1691 and 1695, he was mayor of New York, and subsequently became chief justice of the province and president of the king's council, in which latter capacity in 1701 he acted as colonial governor. He was also colonel of the forces of New York and assayer of the provinces of New York and New Jersey. A statue has been erected to him in Bowling Green, New York city.

DEPESTER, Arent Schuyler, British military officer: b. New York, 27 June 1736; d. Dumfries, Scotland, November 1832. He was a grandson of Abraham DePeyster (q.v.). In the American Revolution he was a colonel in the Royal army; was at different times in command of the British posts of Detroit, Mackinac and elsewhere in Canada.

DEPESTER, Johannes, American colonial merchant: b. Haarlem, Holland, 1660; d. New York about 1695. He was one of the early settlers of New York; and became prominent in public affairs during the Dutch possession; was one of the last to swear allegiance to the Crown after the English succeeded to the government; served several times as alderman and deputy mayor, and was frequently urged to become mayor by the English residents, but declined from ignorance of the language.

DEPILATORIES ("I pull out the hair"), applications used to remove the hair from the body, especially the face and scalp, without injuring the texture of the skin. Quicklime, caus-
tic alkalies, arsenic barium sulphide and orpine are the most common ingredients. The most celebrated depilatory is the pumice, used by Oriental nations, which consists of quicklime and sand, mixed with water impregnated with a strong alkaline lye. The parts which are to be deprived of hair are rubbed with this mixture, and after a time washed in warm water. This depilatory acts with great speed, and the utmost care is necessary in using it that it may not irritate and injure the skin. Sometimes a plaster of pitch and resin is used for the same purpose. The best and most effective means of removing the hair to-day is by means of a galvanic current, and needle electrode, which is applied directly to the hair-follicle, thus killing it. This procedure is sometimes called electrolysis. There are few depilatories that are free from all chance of poisoning, and none that are not liable to leave a scar unless used with the utmost care.

DEPONENT. (1) in Latin grammar, a verb which is passive in the conjugation of its tenses, but active in meaning. The old grammatical fiction was that such a verb laid aside (deponent, laying aside) its passive meaning. These verbs were originally reflexive. (2) In law, a person who deposes or makes a deposition; one who gives his testimony in a court of justice; a witness upon oath. See Deposition.

DEPOSIT, in geology, a layer of soft or hard matter formed by the settling down of mud, gravel, stones, detritus, organic remains, etc., which had been held in suspension in water. Marine deposits are those that are formed on sea bottoms; lacustrine, those formed at the bottoms of lakes; fluviatile, those formed on river bottoms; and so on. In contradistinction to bed or layer, which is matter more evenly distributed during formation, a deposit is nearly always irregular in form. See Geology.

DEPOSIT, a term of wide meaning in law, but especially applied to money paid as an earnest or security for the performance of a contract; also to money or goods belonging to one person entrusted to the safe-keeping of another, to be kept without fee, and to be re-delivered on demand. When such a deposit is made to a bank or trading company, interest, according to agreement, is generally paid on it. The person who makes the deposit is called the depositor and the person who receives the deposit is called the depositary. An irregular deposit arises where one deposits money with another for safe-keeping, in cases where the latter is to return, not the specific money deposited, but an equal sum. A quasi deposit occurs where one comes lawfully into possession of the goods of another by finding. By the civil law, deposits are divided into two classes, necessary and voluntary. The first class is where the depositor is compelled by some sudden emergency, such as fire or shipwreck, to confide his property to some one, without having opportunity for choosing his depositary. The second class is where the deposit is made by the mutual consent of the parties. Besides such deposits of money received by banking or commercial companies with a view to employing it in their business, a merchant or commercial company frequently deposits with a bank documents, such as deeds or bonds, as security for the payment of a loan. The civil law again divides deposits into simple deposits and seques-trations: the former is when there is but one party depositor (of whatever number composed) having a common interest; the latter is where there are two or more depositors, having each a different and adverse interest.

DEPOSIT CURRENCY. See Currency.

DEPOSITION, (1) in law, the testimony of a witness reduced to writing in due form of law, by virtue of a commission or other authority of a competent tribunal, or according to the provisions of some statute law, to be used on the trial of some question of fact in a court of justice. In criminal cases, depositions cannot be used without the consent of the defendant, in most of the States; in some provision is made for the taking of depositions by the accused. An act of Congress and various statutes provide for taking depositions in civil cases.

The privilege of deposition is granted to witnesses living more than 100 miles from the scene of the trial; to very old or infirm persons, or by reason of sickness, imprisonment or being bound to a voyage at sea; or undertaking a journey out of the United States. All witnesses granted deposition must be duly sworn before committing evidence to writing.

(2) In ecclesiastical law, the act of depriving a clergyman, by a competent tribunal, of his clerical orders, to punish him for some offense, and to prevent his acting in the future in his clerical character.

DEPOSITION OF METALS. See Electroplating.

DEPÔT, dé'pō, Fr. da-pô, a French word in general use as a term for a place where goods are received and stored; hence in military matters a magazine where arms, horses and mules, ammunition, etc., are kept, or where recruits are sent for assignment and preliminary training. The term is now usually applied to those companies of a regiment which remain at home when the rest are away on foreign service.

In the United States it is the common term for a railway station.

DEPRAVITY. A theological doctrine which has been the subject of much discussion. The Calvinists held that because of the fall of man our depravity was total, involving the bondage of the will and an inability to do any spiritual good. On the other hand, the teaching of Arminianism was that depravity was only a bias, which was entirely nullified by belief in the efficacy of salvation in Christ. The freedom of the human will and the consequent right of choice determines the continuation of depravity.

DEPRÉS, dê-prés, Joaquin, Flemish composer: b. Hainault, about 1450; d. Condé, 27 Aug. 1521. But little is known of his personal history. He studied probably under Ockeghem and was choir-boy and later chapel-master at Saint Quentin. He went to Italy, where he remained for several years at the court of Pope Sixtus IV and visited all of the great courts of the world. His contemporaries regarded him as the foremost composer of his times. His work forms the connecting link between Ockeghem and Lassus and Palestrina. His principal service to music was in the development of counterpoint and in the adaptation of musical themes to the words of the piece. He left 32 masses, which were partly edited by
PETRUCI, and fragments have since been published. The Sistine Chapel possesses a number of manuscript fragments. The Gesellschaft für Musikforschung published selected pieces in modern notation (Berlin 1877). Consult Eiter, 'Bibliographie der musiktheoretischen Werke' (1877); Menil, 'Josquin de Prés' (in Revue Internationale de Musique, No. 21, Paris 1899).

DEPRETIS, dą-prātēs, Agostino, Italian statesman; b. Mezzana-Corte-Bottaroni, near Stradella, 31 Jan. 1813; d. there, 29 July 1887. He studied and practised law in Turin and in 1848 was elected to the Piedmontese Chamber, there supporting the opposition. He was most prominently identified with Italian politics from 1849, when he was made civil governor of Brescia, and in 1861 was sent to Sicily as proctor for Garibaldi. He served in a number of the Italian ministries, beginning in 1862 as Minister of Public Works under Rattazzi. Under Ricasoli in 1866-67 he was Minister of Marine and afterward held the portfolio of Finance. In 1876 he was called to form a ministry himself while acting as President of the Council and Minister of Finance he instituted many reforms in the government. In 1879 he resigned and Cairoli formed a government, but Depretis was again placed at the head of the Council in 1885 and remained there until his death. In 1893 a monument was erected in his honor at Stradella.

DEPREZ, de-prāz, Marcel, French engineer and pioneer electrician; b. 1843. In 1872 he conducted an extensive series of experiments in electric power transmission and 10 years later succeeded in transmitting electric power 35 miles by telegraph wire between Munich and Miesbach. This is considered the first successful experiment in the transmission of electric power through a considerable distance. Later he conducted many other successful experiments on the lines of the Northern Railway of France. He became professor of electricity at the Conservatoire des Arts et Métiers and professor of physics at the Collège de France. He is a member of the Academy.

DEPRIVATION, the removing of a clergyman from his benefice on account of heresy or misconduct. It entails, of course, loss of all emoluments, but not the loss of clerical character, except it be deprivatio ab officio, or deprivation of office, which then becomes deposition (q.v.) or degradation. The lighter punishment, simply taking away a clergyman's living or prebend, is called deprivatio a beneficio.

DE PROFUNDIS, the 130th of the Psalms of David (129th in the Douay version); one of the seven psalms expressive of sorrow for sin and desire for pardon used in the liturgy of the Roman Catholic Church and called the Pentential Psalms. The name De Profundis comes from the Latin version of the first words of the psalm, "Out of the Depths." See Penitential Psalms.

DEPTFORD, dētför'd, England, a metropolitan and parliamentary borough of southeast London. In the reign of Henry VIII a dockyard was established in this place, then known as Deptford Strond. It was in this dockyard that Peter the Great of Russia served as an apprentice and learned shipbuilding, 1691. It was from Deptford that Captain Cook sailed in command of the Resolution and Discovery on his last voyage (1776). The London cattle market occupies the site of the old dockyard. The Royal Victoria Victualling Yard, the largest arsenals and navy supply depot, is located here. Deptford has important engine, chemical and earthenware manufactures. The borough returns one member to Parliament. Pop. 109,496. Consult Dews, 'History of Deptford' (1889).

DEPUTIES, Chamber of, the lower of the two legislative chambers or second house of national parliament in France, Italy and Romania. The first French Chamber of Deputies was established under Louis XVII in 1814. By enactments introduced in 1830 any citizen of 30 years and upward who paid direct contributions to the extent of 500 francs might be elected as a deputy. Originally the Chamber was elected for five years; in 1824 it became septennial and in 1830 it was again limited to five years. In France (1917) the Chamber of Deputies is elected for four years by manhood suffrage, and each citizen 21 years old, not actually in military service or for six months' residence in any one town or commune, and not otherwise disqualified, has the right of vote. Deputies must be citizens and not under 25 years of age. The manner of election of deputies has been modified somewhat since 1871. The scrutin de liste, under which each elector votes for as many deputies as the entire department has to elect, was introduced in 1871. In 1876 it was replaced by the scrutin d'arrondissement, under which each department is divided into a number of arrondissements, each elector voting for one deputy only; in 1885 there was a return to the scrutin de liste, in 1889 the uninominal vote was reintroduced. In 1889 it was enacted that each candidate is bound to make, within the fortnight which precedes the elections, a declaration as to his being a candidate for a given constituency, and for one constituency only—all votes which eventually may be given for him in other constituencies being reckoned as void. In each constituency the votes are cast up and the deputy proclaimed elected by a commission of councillors-general appointed by the prefect of the department. The Chamber in 1917 was composed of 602 deputies; each arrondissement elects one deputy, and if its population is in excess of 100,000 it is divided into two or more constituencies. The Chamber assembles every year on the second Tuesday of January, unless a previous summons is made by the President of the Republic, and must remain in session at least five months out of the 12. Deputies are paid $3,000 a year and the President of the Chamber receives in addition $14,400 for the expense of entertainment. Deputies travel free on all railways by means of a small annual payment.

In Italy the number of deputies is 508, elected for five years, unless the Chamber is dissolved by the king, and chosen by almost universal suffrage. Deputies must be 30 years old and must receive a number of votes greater than one-tenth of the total number of inscribed electors, and deputies in this place, then known as Deptford Strond. It was in this dockyard that Peter the Great of Russia served as an apprentice and learned shipbuilding, 1691. It
no income from any public funds whatsoever. All deputies travel gratis on the railroads.

In Rumania the Chamber of Deputies consists of 183 members, elected for four years. Deputies must be 25 years of age, and receive $4,000 a year. The actual attendance besides free railway passes.

DEPUTY, a lieutenant or substitute who exercises power which properly belongs to another who has placed him in his stead. The appointment of a deputy does not free the principal from responsibility. A deputy must take an oath of office. His salary is paid by the government. If authorized for the time being to act with full power of his principal he is called a general deputy and may act in his own name. Otherwise, when acting in a particular and limited matter, he is only a special deputy. Generally deputies may be appointed only by administrative and executive officers.

DE QUINCEY, Thomas, English miscellaneous writer: b. Manchester, England, 15 Aug. 1785; d. Edinburgh, 8 Dec. 1859. In a striking sense, DeQuincey's life and writings are distinct; for by far the most interesting events in his life took place before 1821, the year in which his first published work appeared. The course of his life is of an interest wholly secondary to his writing. He was the son of Thomas DeQuincey, a well-to-do merchant, of a family that had come to England with the Conqueror. His mother was a Miss stretching, a lady of quality. He was the fifth child and second son among eight children of diverse temperaments. Most of his youth was spent at Greenhay, an estate near Manchester, where, though dominated by the will of an imperious elder brother, his life was that of a shy, sensitive child, of lively imagination, and with a great love for mysterious and fanciful literature. After studying with a private tutor, he was sent to school at Bath, where he distinguished himself in Latin and Greek, and, in 1800, after a visit at Eton and a ramble in Wales with his friend, Lord Westport, to the Manchester Grammar School, to the end that he might prepare for Brasenose College, Oxford. A year and a half, however, was all that he could stand of a régime which deprived him of health, of society, of amusement, of liberty, of congeniality of pursuits and which, to complete the precious picture, [admitted of no variety. Early one morning in July 1802, he ran away from his master's house, and for nearly a year lived a vagrant life. For some months he roamed about North Wales, with the knowledge of his mother and the support of his uncle, but in November he cast away this support and went to London. Here, according to his own account, he endured many hardships, was frequently obliged to sleep in the streets, to share the lot of vagrants like himself, and to resort to money-lenders for support. Through the aid of one of the latter he was finally discovered by his family. In the fall of 1803 he was sent to Worcester College, Oxford, and here he remained off and on till 1809, but never took a degree. Though little in particular is known about his life at the university, he was distinguished as an admirable Greek scholar and read prodigiously in English literature and German metaphysics. His feeling of superiority and his desire for privacy, together with a straitened income, were the reasons for his seclusion. Leaving Oxford in 1809, he went to live at Grasmere in order to be near Wordsworth and Coleridge, and in the Lake region he remained almost continuously till 1821. His life here was a very studious one, in which the most conspicuous determinant was the confirmation of his habit of opium taking. He had first experimented with the drug in 1804, at Oxford, as a relief for an attack of neuralgia, and thereafter, until 1813, took it systematically at intervals of two or three weeks simply for the pleasure that it gave. In the latter year, however, he "was attacked," as he says, by a most appalling irritation of the stomach, in all respects the same as that which has caused me so much suffering in youth, and accompanied by a revival of the old dreams. It was then that he began taking opium regularly and in large quantities. To some extent he broke the habit at the time of his marriage, in 1816, to Margaret Simpson, the daughter of a farmer in his neighborhood, but the general effect was great prostration of his will, and, though in later years, he had the habit under control, he probably never altogether shook it off. It was some time before he could bring himself to do anything. His first work of any importance, after the failure of his attempt to write a philosophical work, 'De Emendatione Humani Intellectus' and an unfinished 'Prolegomena to all Future Systems of Political Economy,' was the editorship of the Westminster Gazette, which office he occupied about a year, 1819-20. The chief result of all this was to stimulate in him a desire to write, and in September 1821 he published in the London Magazine the first part of his most striking and popular work, 'The Confessions of an Opium-eater,' being an Extract from the Life of a Scholar. Then began the prolific course of writing which has made DeQuincey the prince of magazine writers. It is unnecessary, from this point, to trace his career in detail. The main facts up to his death are that from 1821 to 1825 he lived chiefly in London, where he wrote a great deal for the London Magazine. Then he returned to Grasmere, whence he contributed largely to Blackwood's Magazine. In 1830 the editor, his friend, John Wilson ('Christopher North,' q.v.), induced him to settle in Edinburgh, and here and at the suburb, Lasswade, he remained till his death. His articles appeared chiefly in Blackwood's, in Tat's Magazine, and, latterly, in Hogg's Weekly Intelligencer, and his life was a very secluded one. Stories are told of his eccentricities and his absent-mindedness. His quiet was disturbed only by the death of his youngest daughter and his wife. For 20 years at Edinburgh he was obliged to support himself and his large family by his pen, but toward the last decade, legacies enabled him to live in more ease and to give his thought to a complete edition of his collected writings, of which the first volume appeared in 1853. DeQuincey's published work contains about 150 titles, representing articles varying in length from the moderately long novel 'Klosterheim' (1832), and the historical picture 'The Caesars' (1832-33), to short sketches such as 'On the Knocking at the Gate in Macbeth' (1823), and 'English Dictionaries,' an incomplete note. In these articles he entered the fields of personal experience, reminiscence of personal acquaint-

vol. 8—45
ance (chiefly of members of the "Lake" group), biography (principally English), criticism, history, (lastly, chiefly, and, if modern, that of out of the way bits of information), philosophy (chiefly by way of expounding well-known men), theology (by way of argument for orthodox Christian doctrine), economics (exposition and defense of Ricardo), and, more slightly, politics, natural science, linguistics, ethics, aesthetics and fiction. A more compact arrangement of his works, that adopted by Prof. David Masson, is into autobiography, literary reminiscences and confessions; biographies and biographical sketches; historical essays and researches; speculative and theological essays; political economy and politics; literary theory and criticism; and tales, romances and prose treatises; with some miscellaneous chiefly in the form of imaginative prose.

In almost all these classes DeQuincey achieved great, though unequal, success. Popularity, he is best known by the writings in which he exploited his own life and by the dream prose which resulted from his habit of opium eating. The "Confessions" is naturally his best known work, but scarcely less in interest are his autobiographical sketches. In all these he reveals himself with singular intricacy and freedom. His dream prose, which has done probably more than any other of his writings to make great his name as a stylist, is best represented by such remarkable pieces as "Suspria de Profundis" (1845), of which the most famous is "Levana and the Ladies of Sorrow." All of them are illustrations, as it were, of the states of mind which he describes in the "Confessions." Much of the same sort of value attaches itself to the less sensational sketches of his contemporaries, and the instinct of self-revelation is here tempered by the addition of brilliant analyses of the characteristics of his great contemporaries for whom he had an intellectual fondness.

Much of DeQuincey's dream prose is sometimes included under the head of his narrative writing. His best narrative certainly has the character of imaginative work. In this class are to be found his brilliant "Three Memorable Murders" with its introductory extravaganza, "Murder Considered as One of the Fine Arts" (1826–27), "The Spanish Military Nun" (1847), and what is probably, all in all, his masterpiece, "The English Mail-Coach" (1849). Several of these narrative pieces, like the excellent "Flight of a Tartar Tribe" (1837), may more properly, as regards subject, be classed as historical writings. In all these DeQuincey is always brilliant and successful. The same, however, cannot be said of his attempts to write stories and novels. His essays in this field were all comparatively early, took the form of melodramatic, supernatural tales, like "The Fatal Markman" (1823), translations from the German, like "The Dice" (1823), or of long lurid romances, like "Klosterheim" (1832), and "The Avenger" (1838).

Of as great importance as the analytical and narrative papers, though not so popularly known, are the biographical and the critical writings. These are hard to separate into distinct classes. DeQuincey was too much interested in analysis to be a strictly good biographer, and whereas the essay on Shakespeare (1838), for example, is mainly biographical, it rambles into minute questions and contains much matter of a purely critical sort. On the other hand, much of his critical work is in no sense biographical; such are his well-known essays on "Rhetoric" (1828), and "Style" (1840–41), and the numerous paradoxical statements of critical theory with which he frequently enlivened the pages of contemporary reviews. As good examples as any of his idea of biography and criticism may be obtained from his various essays on Pope. That of 1837 is chiefly biographical; those of 1848 and 1851 are critical, and the last, "Lord Carlisle on Pope," characteristically takes the form of dissent from an accepted view. Further, in part at least, his biography and criticism deals with English writers; outside of them, Germany is his favorite field.

DeQuincey's historical writings, in like manner, are hard to divide, and may best be treated together. Many of them, like "The Spanish Military Nun" and "The Flight of a Tartar Tribe," are narrative and deal with extraordinary events. He is, however, more likely to be interested in the philosophical aspect of history, as in "The Philosophy of Roman History" (1839). The best known of his writings of this class, and indeed his most ambitious piece of work, is the unfinished "Caesars" (1832–33), in which he desired "simply to characterize the office of Emperor, and to notice such events and changes as were operated for evil, and for a final effect of decay, upon the Caesars or their empire." It is really an attempt to present a general view of the sublimest incarnation of power, a monument of the mightiest of greatness built by human hands, which upon this planet has been. DeQuincey's more strictly philosophical writings, including his discourses on economics and theology, are also numerous. They are mainly serious, discriminative, analytical and paradoxical in tone and manner. Typical examples are "On Hume's Argument about Liberty" (1839), "Casuistry" (1839), and "Judas Iscariot" (1853).

In general, in all these writings, DeQuincey deals chiefly with intellectual conceptions and is concerned with objects only to a comparatively slight degree and for an ulterior purpose—that of showing the underlying subtlety. The apparent exceptions to this generalization lie in his descriptions of particular people, like Wordsworth, the particular scenes of such an essay as "The English Mail Coach," and the narration of historical events, all of which are, however, subordinated to an underlying idea. Furthermore, the purpose of DeQuincey's writing, so far as one can see, is much more intellectual than moral, though it may have secondary moral effects. Curiosity is his animus—the desire to present some new body of facts or ancient facts in a new and strange light. He enjoys what might be called intellectual sensation and loves to delve and burrow into the recesses of experience. He has frequently been called an "intellectual animal," and that term as well as any sum up the vast range as well as characterizes the attitude of the author toward his subjects. The main fact is that he deals in distinctions, that his interest lies in intellectual phenomena, and that he is appealed to by the logic of situations.
DeQuincey differs strikingly from such writers as Shakespeare, Addison, Johnson and Lamb, in that it is impossible to trace him through any period of apprenticeship before coming to his own. Rather he is like Swift, in that he leapt to publishing rather late, jumped at once into success and continued pouring out work of striking quality. Like Swift, DeQuincey, once embarked, knew no let or hindrance to the course of his expression. Unlike Swift, however, he never took an active interest in affairs and his writing is in no wise concerned with the practical movements of the time. Hence the course of his life after 1821 is, from the point of view of his work, unimportant, and any account to the last 39 years is an account of the interests of his mind. These were so varied that it is impossible to trace the history of his mind with any definiteness, but a few observations may be made. If anything, the decade between 1841 and 1850 is the most prolific, and on the whole represents the climax of his enthusiasm. In that decade, too, the prevailing interest is mainly in philosophy and criticism, whereas the preceding 10 years were particularly rich in history and biography. On the whole, setting aside such a striking performance as the 'Confessions,' there is a tendency toward originality. His criticism and philosophy are less formal and less of the nature of summary, while it is especially to be noted, in narrative, his adaptations of German tales and his own German-bred romances gave place to such original pieces as 'The English Mail Coach,' and 'The Spanish Militia Nun.' There is in the decade between 1841 and 1850 much reversion to the original type of the 'Confessions.' Probably the fact that DeQuincey did a good deal of hack work in the decade beginning with 1830, when he first established himself at Edinburgh, would account for the general inferiority of that decade to the following, and yet many of his best pieces belong there.

DeQuincey is usually regarded as among the English masters of prose style. The application, with regard to him, signifies a marvelous and unfailing command of means of expressing very minute shades of thought and feeling, combined with the power to write, on occasion, sonorously, grandly and very wittily. He is always discursive and intricate, to a degree almost unparalleled among masters of prose. As a critic he has few superiors, and as a thinker few masters in point of delicacy and exactness, but many in profundity. See 'Confessions of an Opium Eater.'

DE QUINCEY'S AUTOBIOGRAPHIC SKETCHES. What is commonly called 'The Autobiography' of Thomas DeQuincey is more accurately entitled 'Autobiographic Sketches.' This latter title suggests the mode of composition. DeQuincey did not deliberately plan and forsward compose his autobiography. Rather he began by contributing reminiscent articles to periodicals, a practice which he continued until he had written and published about 30. In 1853, he collected these articles, revised, enlarged and polished them with his customary diligence, and gave them to the public under the title 'Autobiographic Sketches.' The reader must not suppose that all of DeQuincey's autobiographical work is contained in these collected articles; the Sketches must be supplemented by a large amount of other reminiscent composition, particularly by the 'Confessions of an English Opium Eater,' by 'The English Mail Coach,' and by that noteworthy series of papers included under the general title, 'Suspiria de Profundis.' In truth, all of these compositions might, with entire propriety, be included under the title 'Autobiographic Sketches.' As a matter of fact, the autobiography of DeQuincey, more than that of almost any other literary man, is legimnatory—a succession of sketches loosely connected and widely scattered. DeQuincey lived from early childhood in a dream-world; the record of his successive dreams constitutes the true inner autobiography of the man. He might have written an objective account of his outward events of his life and thus have attained a brevity and a form such as David Hume attained in his autobiography sketch. Fortunately, DeQuincey did not do this, and, in consequence, we may know his spirit as we may know the spirit of only a few men. Apart from their value as a revelation of DeQuincey's soul, the 'Autobiographic Sketches' are remarkable from a purely literary point of view. To be sure, they exhibit both the defects and the virtues of DeQuincey's style. At one time, we are carried rapidly on by the swift flow of the author's "impassioned prose"; at another, we are bcalmed by sluggish, almost uninteresting narrative. In general, however, the style is of high quality and the narrative compelling. Few readers can ever forget DeQuincey's account of his visit "about an hour after high noon" to the chamber where his little sister lay dead; of the Sunday mornings when he went with his family to a church having all things ancient and venerable, and the proportions majestic" of his stay at "Oxford, ancient mother, hoary with ancestral honors." The appeal of the whole series is strong, and it is the experience of most readers that they return to these 'Sketches' frequently to commune with the strange elfin spirit of DeQuincey; to pass under the spell of the "organ music" of his rhetoric; to feel something of that "mighty and essential solitude" which, in the words of the author, "stretches out a sceptre of fascination" for us all.

WALDO H. DUNN.

DER ARME HEINRICH, a courtly epic, written by the Middle High German poet Hartmann von Aue in the decade between 1190 and 1200. Its source is an unknown Latin work,

WILLIAM T. BREWSTER,
Professor of English, Columbia University.
probably the family chronicle of the lords of Aue to whose family Hartmann belonged. Different to most of the coincidences, he proudly boasted that he was able to read books, i.e., Latin books. He tells us, moreover, that he began to interpret a tale he found in writing. The poem relates the touching story of how Prince Henry was cured of the dread disease of leprosy by the devotion and sacrifice of a little girl. In the midst of worldly honors the prince had been suddenly smitten by leprosy, and, forsaken by all his courtiers and friends, took refuge in the house of one of his tenant farmers, whose little 12-year-old daughter cared for him tenderly. Henry in return soon became fond of her, gave her many presents, and called her in jest his little wife. Learning one day that her master could be cured by the blood of an innocent maid she determined to sacrifice herself. After much difficulty she obtained her parent’s consent, and made the journey with the prince to Salerno. Henry, touched by her devotion and by her wondrous beauty, as she lay stricken upon the surgeon’s table awaiting the fatal knife, refused to accept the sacrifice. On their homeward journey, however, his skin was restored to its former purity, and he rewarded the maid’s devotion by making her his wife. The monstrosity of the piece is shown by the fact that this 12-year-old girl is prompted to her sacrifice mainly by the hope of winning heaven, and talks like a learned monk on the wickedness of this world and the raptures of heaven. The subject is a repulsive one, but with delicate tact Hartmann avoided all descriptions of the loathsome disease, and, as the poet Uhland once said, cast over the old legend so soft and subdued a light that it is one of the most charming tales of the Middle Ages. In modern times it has been worked up in English by Longfellow in his ‘Golden Legend’ and by Rosetti in ‘Henry the Leper.’ Many German writers have attempted to modernize the legend, the most important of whom are Gerhard Hauptmann in a verse drama and Ricarda Huch in a prose tale. Consequent Tarbell, H., ‘Der arme Heinrich in der neueren Dichtung.’ The best German editions are those of Wackenroder-Toscher (Basel 1885), of Weitzel (3rd ed. 1891), and of Paul, H. (2nd ed. 1893). A good English edition is that of J. G. Robertson (London 1895).

DANIEL B. SHUMWAY.

DER GRÜNE HEINRICH, “Green Henry” (1854) is a poetic autobiography of G. Keller in the same sense and with the same limitations as ‘Werther’ or ‘Wilhelm Meister’ of Goethe. Truth is freely mingled with fiction, and there is a generalizing purpose to exhibit the psychic disease that affected the whole generation of the transition from romanticism to realism in life and art. Green Henry, so named by his friend, and a member of the civil service. This experience, he determined to be a painter, and to Munich’s artistic Bohemia, whence he finds his way to a count’s mansion and thence home to his dying mother and an all-too-tardy and brief repentance. Abandoning art, he enters the civil service. This reminiscence affords occasion for extended political reflections. The tone of the reminiscences makes it clear that Keller would have the reader understand that Heinrich has lived through and risen out of his instability and irresolution and sees life steadily and cheerfully at last. ‘Der Grüne Heinrich’ was slow in gaining recognition. A second edition was not called for till 1879. It has since won general and often extravagant praise. Keen insight, fresh humor and instinct for realistic narration are its outstanding merits; its faults are lack of proportion, occasional garrulity and obtruded moralizing, but most of all the doubt that it leaves in the reader whether the Heinrich who had shown such persistent lack of character, especially in his relations with his mother, would so quickly be capable of discovering, rather than recovering, a normal balance of mind.

BENJAMIN W. WELLS.

DERA (a word derived from the Arabic ‘der,’ a monastery), the name of several towns in British India, the two principal places so designated being (1) Dera Ghazi Khan, and (2) Dera Ismail Khan (qq.v.).

DERA GHAZI KHAN, d’é-ťa gá-zé́ khan, India, a district and a town in the Punjab, in the division of Multan. The district lies entirely on the right bank of the Indus, and consists of a sandy strip of low land shut in between the Suleiman Hills and the river. The town lies about two miles from the Indus, has many striking mosques, town-hall, courthouse, handsome bazaar, cantonments, etc. Pop. of the town 19,000.

DERA ISMAIL KHAN, é̂s-má-é’Il, India, a district and a town in the northwest frontier province, in the division of Derajat. The district lies north of that of Dera Ghazi Khan on both sides of the Indus, and is in great part barren and sandy. The town is situated four and one-half miles west of the Indus, and is the administrative headquarters of the Dera Ismail Khan district. There are here various government offices, cantonments for troops, and an important station of the railway. An important caravan trade is conducted with Afghanistan. It is a somewhat straggling town on a level plain. Pop. 35,131.

DERAJAT, dér-a-já’t, India, division or commissionership forming a portion of the Punjab, and occupying part of the valley of the Indus. It comprises the districts of Dera Ghazi Kahn, Dera Ismail Khan, Muzaffargarh, and Bannu. Much of it is sandy and uncultivated, but many parts are well cultivated, and irrigation is largely employed. The area under cultivation is increasing rapidly. Area, 22,315 square miles. Pop. 1,643,603.

DERBEND, or DERBENT (’gateway’), Russia, a port and capital of the district of Daghestan, on the western shore of the Caspian, 140 miles northwest of Baku. It is charmingly situated among vineyards and orchards and fields of maize and madder on the declivity of a branch of the Caucasus, which here approaches very close to the water’s edge. It is surrounded by ancient walls. The harbor is inaccessible to all but small vessels; but a con-
siderable trade is done at the four large markets held here yearly. Silk and cotton fabrics, earthenware and weapons are manufactured, and saffron is cultivated. It was long considered the key of Persia on the northern side. It was invaded by the Arabs in 728, by the Mongols in 1220, and frequently changed hands before it was formally incorporated with Russian Caucasia in 1813. Pop. about 15,000.

DERBY, Pierre Auguste Charles Bourigay, American statesman: b. France, about 1765; d. New Orleans, 6 Oct., 1829. During the Revolution of 1789 he was obliged to flee from France to Santo Domingo and thence to the United States, living for a while at Pittsburgh, Pa., and subsequently removing to Missouri, to Florida, finally settling in Louisiana. In 1813 he was made secretary to Mayor Borée of New Orleans, and in the same year was appointed interpreter of languages for Governor Claiborne. In 1815 he was one of three delegates sent to petition the United States government for the admission of Louisiana as a State of the Union. Their efforts, however, were unsuccessful. Subsequently Derbigny held other public offices, such as clerk of the Court of Common Pleas, secretary of the legislature, and member of the lower house of the first State legislature and judge of the Supreme Court. He delivered the first Fourth of July oration made in Louisiana and in 1820, with Livingston and Moreau, was appointed to revise the laws of Louisiana. In that same year he received the first license issued to operate a steam ferry across the Mississippi at New Orleans. As a personal friend of General Lafayette he was his representative in legal and business affairs in Louisiana until his death. In 1828 when Governor Johnson's term of office expired, Derbigny succeeded him, and his administration was marked by the visit to New Orleans of General Jackson, who had been invited by the legislature to take part in the celebration of his victory of 8 Jan., 1815. Governor Derbigny was killed early in the second year of his administration by a fall from his carriage.

DERBY, Earl of, a title conferred in 1485 on Thomas, second Lord Stanley, two months after Bosworth Field, where he and his family had greatly contributed to Richard III's victory. The Stanleys were descended from Adam de Aldithley, who attended William the Conqueror to England, and whose grandson, having married the heiress of Thomas Stanley, of Stafford, entered the service of the king in that county, which he had received as his wife's marriage portion, for that of Stoneley, in the county of Derby, and afterward assumed the surname of Stanley. In 1405 Sir John Stanley, who had married the heiress of Lathom, obtained a grant of the Isle of Man, which he and his descendants ruled till 1733.

DERBY, Edward Geoffrey Smith Stanley, 14th Earl of, English statesman: b. Knowsley Park, Lancashire, 29 March 1799; d. there, 23 Oct. 1869. He was educated at Christ Church, Oxford, and entered Parliament shortly after leaving that university as member for Stockbridge in Hampshire. His very first speech marked him out as a skilled debater, and he rapidly rose to distinction in the House. His views at first inclined him to side with the Whig party. In 1827 he joined Canning's ministry as Under-Secretary for the colonies, and became Chief Secretary for Ireland and Lord Grey. The opposition, led by O'Connell in the House of Commons, was very powerfully supported by the Arabs in 728, by the Mongols in 1220, and frequently changed hands before it was formally incorporated with Russian Caucasia in 1813. Pop. about 15,000.

DERBY, Edward George Villiers Stanley, 17th Earl of: b. London, 4 April 1805; and succeeded his father the 16th Earl, in 1908. He was educated at Wellington College, served in the Grenadier Guards, 1885-95, was chief press censor in South Africa, 1900. He represented the West Houghton division of Lancashire in the Conservative interest, 1892-1905; was financial secretary to the war office, 1900-03; and Postmaster-General, 1903-05. After the outbreak of the great European War he devoted himself to securing voluntary accessions to the army and was appointed director of recruiting under what was called the Derby scheme. He was created a Knight of the Garter in 1914.

DERBY, Edward Henry Smith Stanley, 15th Earl of: b. Knowsley, Lancashire, 21 July 1826; d. there, 21 April 1893. He was educated at Rugby and Trinity College, Cambridge. He was a member of the House of Commons
DERBY—DERBY PORCELAIN

(1848–69); Under-Secretary of Foreign Affairs; afterward Secretary of State for India. Under his superintendence the management of the British India empire was transferred from the East India Company to the government of Great Britain. In 1866 and also in 1874 he was secretary of state for foreign affairs. Lord Derby became a Liberal in 1879, and was secretary of state from 1880 to 1885 and from 1886 to 1886. In 1879, he took a stand against Irish Home Rule in 1886 and afterward ranked among Mr. Gladstone's opponents. He became chancellor of the University of London in 1891, which post he held until his death.

DERBY, George Horatio, pen name JOHN PHOENIX, American humorist: b. Dedham, Mass., 3 April 1823; d. New York, 15 May 1861. He was graduated at West Point (1846) and served in the army during the Mexican War (1846–47). He wrote a series of sketches and burlesques, entitled "Phoenixiana" (1855); and "The Squibob Papers" (1859).

DERBY, Orville Adelbert, American geologist: b. Kelloogsville, N. Y., 23 July 1851. He was graduated from Cornell University in 1870, made trips to Brazil in 1870 and 1871, and was instructor at Cornell in 1873–75. In 1875 he became a member of the Brazilian geological commission, and has since been engaged in geological work in Brazil, being at one time curator of the geological department of the National Museum, and holding the position of chief of the geological and biological survey of São Paulo since 1886. In 1907 he became chief of the geological survey of Brazil. He has published a number of valuable papers on the geology and geography of Brazil, and is considered one of the first authorities on the subject. In 1891 he published the first detailed topographical maps of South America based on actual surveys.

DERBY, Conn., city in New Haven County, at the junction of the Naugatuck and Housatonic rivers and on the New York, New Haven and Hartford Railroad, nine miles west of New Haven. In 1893 the towns of Birmingham and Derby were consolidated and incorporated as the city of Derby. It is a manufacturing city of much importance and has abundant water power from the two rivers. There are extensive manufactures of brass and iron goods, type-writing machines, pianos, organs, piano players, heavy castings, engines, dairies and other machinery, files, woolen underwear, corsets, hosiers, combs, hairpins, curling irons, keys, guns and ammunition, paper, pins and spectacles, and at one time the old town had a large West India trade and noted ship-building yards. A bridge across the Naugatuck River connectes Derby with the thriving manufacturing city of Ansonia. It has several parks, daily and weekly newspapers, a national bank, good public and private schools. The government is administered by a mayor, elected biennially, and a unicameral council. It was the birthplace of Gen. David Humphreys, prominent in the American Revolution. Consult Orcutt and Beardsley, 'The History of the Old Town of Derby' (Springfield 1880), and 'The Town Records of Derby, 1665–1710' (Derby 1901). Pop. (1914) 9,441.

DERBY, England, a municipal, county, and parliamentary borough, capital of Derbyshire, on the Derwent River and the main line of the Midland Railway, 129 miles north-northwest of London by rail. It has some fine public buildings, among which are the churches of All Saints, Saint Alkmund and Saint Werburgh, built before the time of Henry VIII; Saint Mary's (Roman Catholic) designed by Pugin. The Derby grammar school dates from 1160. There is a very handsome free library and museum and a fine technical college. The principal manufactures are silk, cotton, paper, articles in Derbyshire spar, castings and porcelain, etc. Here are situated the offices and principal workshops of the Midland Railway, giving employment to about 12,000 workmen. The principal public utilities are municipally owned. Derby is one of the oldest towns in the kingdom, and is supposed to owe its origin to a Roman station, Derventio, situated at Little Chester, on the opposite side of the river. Under the Danes it took the name of Deoraby. Derby was the most southerly point reached by Prince Charles Edward in 1745 during his march on London. Richardson, the novelist, and Herbert Spencer were natives of the town. The borough returns two members to Parliament. Pop. 109,864.

DERBY DAY, the great annual London holiday, on which "The Derby," one of the most popular of the English horse-races, is run. It always falls on a Wednesday, being the second day of the grand race meeting, which takes place in the week after Trinity Sunday. The race is run on Epsom Downs, an extensive plain in the neighborhood of London. This race was instituted by the Earl of Derby in 1780. The entry-money is now $500, but under the new regulations introduced in 1890 the first prize is definitely fixed at $25,000 with any surplus fees. The course over which the race is run is 1 mile 4 furlongs 29 yards in length. Since the race was instituted the weights have been several times increased, until now the colts have to carry 126 pounds and the fillies 121 pounds. Derby day is now regarded, especially in London, as a great holiday, Parliament is adjourned and vast multitudes flock from all parts to the neighborhood to Epsom Downs. The grand inauguration racing day of the summer season at Washington Park track, Chicago, is now called the American Derby day. See Horse Racing.

DERBY PORCELAIN. A porcelain factory was started in this English town in 1750 by William Duesbury assisted by Andrew Planché, a French refugee potter, and with the financial backing of a Derby banker named Heath. The venture was a success, and, in 1769, Duesbury purchased and ran the Chelsea porcelain works. In 1784 he brought the plant and workers to Derby. In 1776 he acquired the Bow porcelain factory and moved it, together with a number of artisans, to Derby. On Duesbury's death, in 1786, his son (same name) continued the works, but in 1795 he took in Michael Kent as partner, with the firm name Duesbury & Kent. Next year Duesbury died, to be succeeded by a third William Duesbury. In 1809 Robert Bloor, manager, bought the factory. Sickness caused him to engage John Thomas as man-
We find the crown in puce, blue, purple, green, lilac, rose, vermillion, black and (rarely) gold.

Artists.—Duesbury gathered in perhaps the finest artists of any English ceramic factory. Amongst them there were R. Aikew, flower painter; Vincent Billingsley, the noted flower genius; Zachariah Bowman, landscapes and birds; John Haslem, flowers (later portrait painter to the queen); F. Duvivier, flowers; Michael Kean, miniatures; W. Pegg, plants and single flowers; J. Backer, R.A., modeler; W. T. Misdale, hill landscapes; Brewer, figures and landscapes; Keys, gilder; and many equally as noted.

CLEMENT W. COUMBIE.

DERBYSHIRE, a north midland county in England; area, 1,029 square miles. The county is noted more for its coal mining and manufacturing than for agriculture although about 70 per cent of the area is productively occupied. Oats, barley, potatoes and wheat are the principal crops, with dairy farming and pasture in the uplands. Its beautiful scenery and the numerous mineral springs attract tourists and health seekers. The Peak district is one of the most attractive in the kingdom.—Kinder Peak rising to 2,088 feet and the Peak to 1,880 feet. The Trent and the Derwent are the principal rivers. Its chief minerals are coal, iron ore, lead, flour or Derbyshire spar, limestones, marble, zinc and elastic bitumen. Some of the industries of the county are malting and brewing, the manufacture of iron, silk and cotton goods, calico prints, agricultural implements, paper, hats, porcelain, various kinds of cloth, and vases, urns, etc., from the Derbyshire spar. Coal mining is an important industry and to transport the coal several canals and railroads cross the county. The principal towns are Derby, Buxton and Belper. Haddon Hall, the original of Martindale Hall in Scott's 'Peveril of the Peak,' and Chatsworth, the seat of the Devonshire, are noteworthy historically and as architectural types. For parliamentary purposes the county is divided into seven constituencies, each returning one member. Pop. 683,423.

DERBYSHIRE SPAR, the finely crystallized fluorite from Derbyshire. The *Blue John* of the Derbyshire miners is a crystalline fluorite in which are alternate bands of blue and pale yellow spar. It is made into ornament floral and architectural types. For parliamentary purposes the county is divided into seven constituencies, each returning one member. Pop. 683,423.

DERCETO, der-sé'tö, the Greek name of Atargates, a Syrian goddess, the principal female deity of the Philistines, widely worshipped at Ascalon. She was the female counterpart.
of Dagon (q.v.), terminating like him in a fish. She was a nature goddess presiding over the principle of generation and fertility, corresponding to the later Greek goddess Aphrodite and the Roman Venus.

DERECSKE, de-réch-ké, Austria-Hungary, a market town in Hungary, in the county of Bihar. In the neighborhood are four lakes, from which, by evaporation, soda is obtained. Nearby is another lake, called Pingoto, celebrated from the earliest times for its baths. In the same locality pearls are found, which, though small, are equal in beauty to those of the East. Pop. 8,272.

DERELICT, any property abandoned, deserted or cast away in such a manner as to indicate by the owner that he has relinquished claim thereunto. The mere intention of abandonment does not constitute dereliction. A ship abandoned at sea either by consent or compulsion under stress of weather or other unforeseen conditions is not forfeited if any evidence is left thereon of the owner's intention to return when the stress is removed. The owner may recover on payment of salvage within a year and a day; otherwise the property is considered derelict. The same rule applies to goods thrown overboard.

DERENBOURG, dé-réⁿ-boor', Hartwig, French Orientalist: b. Paris, 17 June 1844; d. 1908. He studied at Göttingen and Leipzig, pursuing Arabic later at the Paris École des Hautes Études. Engaged at the Bibliothèque Impériale to continue the preparation of the catalogue of Arabic manuscripts in 1879 he was appointed professor of Arabic and in 1886 professor of Islamism and the religions of Arabia at the École des Hautes Études. In 1880 he examined the Arabic manuscripts in the Escorial and other libraries in Spain (Vol. 1 of his Escurial catalogue appearing in 1884), and on his return was made assistant to the commission upon Semitic inscriptions at the Académie des Inscriptions et Belles-Lettres. He issued a number of valuable editions of Arabic writers and became a member of the institute in 1900.

DERENBOURG, Joseph, French Orientalist: b. Mayence, 21 Aug. 1811; d. Bad-Enns, 29 Aug. 1895. Of a family distinguished for learning, whose original home was Derenberg in Saxony, after rabbinical studies in his early youth, he went first to Giessen and then to Bonn, where Freytag was his Arabic teacher, and from which he gained his doctorate in 1834. A few years were spent as private tutor in Amsterdam, when in 1838 he settled in Paris. In 1852 he became proof-reader of Oriental texts at the Imprimerie Impériale, which position he resigned in 1879, owing to an affliction of the eye. He was an active educational factor in French Judaism, and with wider fields of Oriental learning made noteworthy contributions, his erudite works proving mines of value for later scholars. For example his Essai sur l'histoire et la géographie de la Palestine (Paris 1867) shed much light on the history of the Jews in the time of Christ. He planned a complete edition of Saadia's works in Arabic and French, a large part appearing in his lifetime. He issued a second edition of S. de Sacy's Séances de Hariri, and collaborated with his son Hartwig in his edition of Abu-la Walid, and of Saadia.

DE RERUM NATURA, de rér-oom na-tóor-óo'ra (On the Nature of Things), a philosophical poem of about 7,500 hexameter verses, conceived and written in the grand style that is part of the epic form, and dealing with the physical constitution and environment of human life with a view to the emancipation of that life from the tyranny of superstition and of mean desire. The doctrines set forth are those of Epicurus, whom the author reveres as the savior of mankind. Of this author, Titus Lucretius Carus, we know something of nothing except through the revelation of his personality that is made in the poem itself. Saint Jerome, it is true, in his continuation of the Chronicle of Eusebius, says that Lucretius was born in 95 A.C., became insane through the effects of a love-potion, wrote in his intervals several books which Cicero subsequently edited, and died by his own hand in his forty-fourth year. Every clause of this brief statement has been disputed and there is no general agreement as to the amount of truth that may be contained in it. It would seem, on the other hand, that it is highly improbable that a poem should have been thus composed that exhibits on almost every page extraordinary acuteness of observation and reasoning. On the other hand, the passionate intensity which marks the style from beginning to end has suggested to many readers, as it did to DeQuincey, that the author was laboring under some abnormal strain, and the internal evidence is conclusive that the work did not receive final revision. But interesting as it would be to know something of the details of the poet's life, it is not likely that any such knowledge would materially change the idea that we have been able to form of him from his work. No poet was ever less autobiographical; no poet ever made a more complete revelation of his essential self. The greater part of the poem is concerned with the proof of the existence and character of the laws of the physical universe. Yet Lucretius is interested in physical science primarily because it alone provides the necessary foundation for his doctrine of ethics. Observing everywhere in the history of the Mediterranean world the sufferings of mankind due to belief in the power of anthropomorphic and capricious deities, he set himself the task that modern science has in fact accomplished, to prove that the reign of law is universal, that given causes produce given effects, and that no arbitrary interposition of an external power can modify in the slightest degree the chain of causation. It follows that man is master of his fate, that neither in this world nor in the next (for, the soul being atomic, there is no next) can the gods affect his life in any way for weal or for woe, and that therefore, if only he is willing to achieve knowledge of nature and control of himself, he may order his thought and action according to the dictates of his reason. The greater part of the “that is worthy of the gods.” For though they have no power, the gods do exist. Somewhere in the interstellar spaces is their seat and there in passionless tranquillity they incarnate Epicurean perfection. No aspect of the poem is more striking or more engaging than the enthusiasm with which Lucretius dwells upon this
conception of universal law and supports it by a literally amazing variety of evidence. Everywhere in the poem there is evidence of a life passed in the open air. He draws instances in support of his reasoning from phenomena within the range of everyone's observation, from the sky, from the sea, from forest and stream, from the life of animals and of men. Yet at home in the stretches of infinite space and infinite time and reasons with no less absolute confidence about the world of the infinitesimally small, where the atoms that must forever elude the observation of the senses are laying the foundations of the visible universe. The poem shows, in fact, that he had to an extent that is surprising in a disciple of Epicurus a passion for knowledge for its own sake. But his supreme interest was, after all, in the nobility of feeling, thought and action that this rational understanding of nature's processes brings at last within the reach of men. Intellectually an aristocrat, he is yet essentially a social reformer, and is moved to the depths of his being by the pathos of human life. And the ever-present tragedy is especially poignant because it is quite unnecessary. The way of salvation is simple and obvious; yet it is extremely difficult to persuade men to follow it. Happiness, for which all mankind strives, continues to be sought by means that will prove still, as heretofore, fail to secure it. Simplicity of living, riches gained not by increase of possessions but by diminution of desires, contentment found in fundamental human relationships, a life, in brief, devoid of ambition and largely contemplative, such an ordering of existence even in a world whose laws are, on the whole, austere, will gain for man real happiness, and, at the worst, such happiness as is possible under the circumstances. For a mature mind cannot be content with fairy-tales. The facts of life and equally the fact of death must be faced uncompromisingly if man is to retain his self-respect. Rational beings will seek therefore a possible, not an impossible, happiness. Lucretius preaches this gospel of quietism with the fervor of an evangelist and the imaginative power of a great poet.

DE RESZKE. See RESZKE.

DERG. Lough, lough. (1) An expansion of the Shannon River, between the provinces of Munster and Connaught, Ireland. It is 24 miles long and from two to six miles broad. (2) A lake in the southeast of the county of Donegal, province of Ulster, Ireland. It is three miles long and two and one-half miles wide. Saint's Isle and Station Island are in this lake.

DERMATITIS, a name given to certain inflammations of the skin, characterized not so much according to form and arrangement of the pathological changes taking place in the skin, but rather from their cause. These causes may act from within or without. The characteristic change taking place is some form of erythema or redness, with the characteristic heat, redness and swelling. Thus there are found dermatitis traumatica, or the dermatitis set up by mechanical injuries such as blows, pressure, friction, scratching; dermatitis calorica, such as is due to sunburn or frostbite; X-ray dermatitis, dermatitis venenata, due to animal, vegetable or mineral poisons, such as mustard, turpentine, croton-oil, tartar emetic, poison ivy, nettle, aniline dyes, strong acids, strong alkalis, arnica, etc.; dermatitis medicamentosa or drug eruptions, such as happen following the use of antiseptic, antipyrin, belladonna, arsenic, bromides, iodides, etc. There may be also dermatitis following vaccination or following poisoning in wounds. There are other forms too numerous to mention, but those given are the commonest.

DERMATOLOGY (from Gr. derma, the skin), a science that treats of skin diseases. See Skin.

DERMATOPHYTE, a parasitic plant, a sort of fungus infesting the cuticle and epidermis of men and animals, and giving rise to various forms of skin diseases. The commonly known species are Achiron schoenleini (favus); Trichophyton tonsurans (ringworm), and Microsporon furfur (dandruff, scurf).

DERMESTES, der-més'tes, a genus of coleopterous insects, the type of the family Dermestidae. The larvae of this genus are covered with slippery hairs. They devour dead bodies, skins, leather and other animal substances. One species (D. lardarius) is known by the name of bacon-beetle, and is often found in ill-kept ham or pork chops. Many insects of which have similar habits to those of the true Dermestes, sometimes receive that name, although they really belong to the genera Attagenus, Necrophorus, etc.

DERMOT MAC MURRAGH, Irish king: the last ruler of Leinster before the sovereignty was assumed by Strongbow in the reign of Henry II of England. He became king in 1146 and, having carried off the wife of O'Ruarc, Prince of Leitrim, was attacked by the latter and was driven from Ireland in 1147. He betook himself to Aquitaine, where he did homage to the English king, who granted him permission to enlist adventurers in England to aid him in recovering his kingdom. He received the aid of Richard de Clare, Earl of Pembroke, usually called Strongbow, who married his daughter Eva in 1170. With his aid he proved victorious, but when he died in the same year his kingdom was assumed by his son-in-law.
DERNBERG, derm'boor, Bernhard, German statesman: b. Hesse-Darmstadt 1856. Of Jewish extraction, he received a commercial education and as a young man came to America and engaged in banking business, acquiring a good knowledge of American methods and the English language. In 1906 he was appointed Colonial Secretary, and during his four years' tenure of the office he succeeded in developing the resources of the German colonies, notably Southwest Africa. His bustling business methods and brusque manners brought him into frequent conflict with other officials, and he was obliged to resign. A wealthy man, he occupied himself mainly with economic studies till the European War broke out, when he was sent to the United States to co-operate with Count Bernstorff to win American friendship. The press campaign he conducted in New York was directed toward justifying German policy and placing England with Belgium in the wrong. He published Germany's peace conditions in April 1915, declaring there was nothing in the German program "which would not be beneficial to the rest of the world, especially the United States."

DERNE, dérn, or DERNA, Africa, town of Barca, in the north coast of Africa, in a fertile district. It was captured by the United States fleet in 1805 during the war against Tripoli. Pop. about 7,000. See DERNE EXPEDITION.

DERNE EXPEDITION (Derna or Derne), a military expedition undertaken during 1805 by William Eaton (q.v.), United States consul to Tunis in 1799-1803, to secure recognition of American international rights. Eaton became indignant at the abject submission of Christendom part from fear and part from greed, to the wretched Barbary pirates; he had raged at their insults year after year while he was consul at Tunis; and when Tripoli, in 1801, finally insisted on war despite all payments, eagerly seized the chance of ending its robberies once and for all by a United States protectorate. About 1792 Hamet Caramanli or Caramelli, pasha of Tripoli, had been deposed by his brother Yussuf and fled to Tunis, where he was then living; and Eaton resolved to have Tripoli restore him on condition of peace and no tribute, and thus strike terror into the other piratical states. He borrowed $22,000 for Hamet to equip a force with which our navy was to co-operate; but the naval commanders' hands were tied by their instructions, and in 1803 Eaton's plain-spoken refusal to comply with the bey's extortions caused his peremptory dismissal as consul. He returned to the United States and urged Jefferson to make the country a United States protectorate, but the government did not feel justified in giving carte blanche for so daring a scheme. At length, in March 1804, Eaton was sent to the Mediterranean as "naval agent" with Barron's squadron, but without authority or instructions. He carried on neither squadron nor authority, but he could have help and be left to act untrammled. Meantime Hamet Caramanli had failed and fled to Egypt, where, when Eaton arrived at Cairo on 8 December (having heard at Misr, in September, of Hamet's fiasco), the viceroy was besieging him and a few followers at Minyeh on the Nile. Eaton rescued him at great pains and some peril, and brought him to Alexandria; made a pact with him and a plan of campaign with Barron, and collected an "army" of some 500 floaters—the majority Arabs, some Tripolitan Kabyles, a hundred Alexandrian Christians. His squadron was the most extraordinary rabble for a desperate military venture—and started for a march of 600 miles across the Libyan Desert to Derne, the seaport capital of Barca, the most fertile province of Tripolitania. The march was a trial of what they carried and no water for days together, and more than once the Arabs with Hamet were on the point of deserting in a body or cutting Eaton's throat. His energy and moral force finally pulled the entire body through a six weeks' march to Bomba, just east of Derne, 17 April 1805; but no ships were in sight. The Arabs cursed him afresh as an infidel traitor and resolved to break up next morning; Eaton and the Christians took post on a hill for a last and final farewell; and next morning the waiting fleet saw the smoke and came in. The Arabs rejoined them and after restocking from the fleet and resting a week, on the 25th, in co-operation with three cruisers, they assailed Derne, destroyed all earthworks and 800 men. On the 27th they carried it by storm, Eaton being shot through the wrist. A large force was sent from Tripoli to retake it and on 13 May he repulsed it in a sharp engagement with the aid of the fleet's guns. Another month passed; Eaton showed no enthusiasm over Hamet, one Oriental master being about the same as another; Eaton could not march on Tripoli, some 700 miles farther on, but the pasha's troops could not drive him from Derne. Suddenly the ground was cut from under his feet by the treaty arranged with the pasha by Tobias Lear, United States consul-general for Algiers and commissioner of peace, it is said through jealousy of Eaton's success. Hamet's supporters were left to the pasha's vengeance, Hamet to European exile and a grudging pension, and Hamet's family became possessors of the pasha. (See BARBARY POWERS, UNITED STATES TREATIES AND WARS WITH THE.) Eaton returned to America, and his services, while slightly or ignored by government officials, were recognized "as the virtues and undaunted courage of a single man," in a resolution passed by a large majority in the senate of Massachusetts, 25 Feb. 1806, the committee for the sale of these lands being "authorized and directed to convey to William Eaton, Esq., a citizen of this Commonwealth and to his heirs and assigns, a tract of land, to contain 10,000 acres of any of the unappropriated land of this Commonwealth in the District of Maine, excepting the ships on Penobscot River." His exploit was also perpetuated in verse by Paine, author of "Home, Sweet Home," and by John Pierpont. In 1808 General Eaton was the principal agent in foiling the Aaron Burr conspiracy to invade Mexico. Consult Life of the late Gen. William Eaton (Brookfield 1813).

DEROSNE, dé-rón, Charles, French chemist and inventor: b. Paris 1780; d. there September 1846. He devised a still for the rectification of alcohol so arranged that instead of the weak aqueous spirit which distilled being completely condensed by cold water, it was condensed by water only a little under the boiling
point of the mixture, so that while the alcohol still remained as vapor, a large proportion of the watery vapor was condensed, and thus the distillate was made stronger. This apparatus is called by his name. His most important research was in the composition of opium, in the course of which he isolated a crystaline body, long distinguished as Derosne's salt. He himself did not determine its character, and it was not till some later years that it was distinguished as an alkaloid by Rohonquet, and called him narkotin, the name by which it is now known. He was the first to introduce animal charcoal for decolorizing syrup.

DE ROSNY, rô'nè, Léon Louis Lucien Prunol, French Orientalist: b. Loos, France, 5 Aug. 1837. He studied in Paris at the École des Langues Orientales, became professor of Japanese at the Special School of Languages in 1888 and founder of the International Congress of Orientalists. In 1893 he was interpreter to the Japanese ambassador at Paris, whom he accompanied to Holland, England and Russia. He was decorated with the Legion of Honor in 1884 and in 1886 was nominated assistant director of the École des Hautes-Études. Among his numerous works are 'Asiatic Studies' (1864); 'The Origin of Language' (1889); 'Japanese Anthology' (1871); 'A Grammar of the Chinese Language' (London 1874); 'Japanese Religion' (1881); 'Vocabulaire de l'écriture hiérotique yucatéque' (1883; 2d ed., 1886); 'Le livre sacré et canonique de l'antiquité Japonaise' (1885); 'Les populations danoïbiennes' (1882-85); 'Le Taoïsme' (1892); 'Cours pratique de la langue Japonaise' (1903); 'L'Amérique précolombienne' (1904); 'La Bible du Japon' (1904), and various translations, pamphlets and essays.

DE ROSSET, Armand John, American physician: b. Wilmington, N. C., 17 Nov. d. there, 18 March 1896. He was the son of Moses John De Rosset of London and Mary Ivie, a native of the West Indies. In 1874 he was matriculated at Princeton. At the close of the first session of his collegiate course a fellow-student, Robert G. Harper, observing his rigid observance of absence, and the determination to remain at the college during the vacation for want of funds to defray the expenses of the journey home, offered to be his teacher in the studies of the next year. The offer was gladly accepted and at the opening of the next session De Rosset was promoted to an advanced class, completing his course in three years. While at the medical college he enjoyed the friendship of Dr. Rush, with whom he had a long correspondence. He was appointed by the President of the United States to be post-physician, which office he held for many years. During two or more terms he served in the town government. His writings were confined to contributions to medical publications — a pamphlet on the intermittent fever, by Linné, etc. His son, Moses John: b. Wilmington, N. C., 11 Jan. 1796; d. there, 30 June 1826, also entered the medical profession, in which he was associated with his father from 1818 until his death. ARMAND JOHN, another son of Armand John De Rosset, was born in Wilmington, 6 Oct. 1807; d. 1897. He attended the medical college of Charleston, S. C., in 1826-27, and was graduated at the medical department of the University of Pennsylvania in 1827. From 1828 to 1837 he practiced his profession in Wilmington and then engaged in mercantile affairs, which he relinquished only a few years previous to his demise at the advanced age of 90 years.

DE ROSSET, Moses John, American physician, son of Armand John De Rosset (1807-97): b. Pittsburg, N. C., 4 July 1838; d. Wilmington, N. C., 1 May 1881. In youth he showed remarkable aptitude for languages and mathematics. He spent three years in Geneva at the famous school of Diederich and spent six months in Cologne to perfect himself in German. He was graduated in the medical department of the University of New York in 1859 and was appointed resident physician at Bellevue Hospital, New York, in the same year. At the beginning of the Civil War he entered the Confederate army as assistant surgeon and, after serving through Stonewall Jackson's Valley campaign, was promoted to full surgeon and assigned to duty in Richmond. Subsequently he was detached as inspector of hospitals of the department of Henrico. At the close of the war he settled in Baltimore, where he was appointed adjunct professor of chemistry in the medical department of the University of Maryland. He was also a professor of chemistry in the dental college of that city. He here prepared himself for practice in diseases of the ear and eye, and in 1873 removed to Wilmington, N. C., and devoted himself to this specialty, becoming also a contributor to the North Carolina Medical Journal. To improve his health he removed for a time to Texas but soon returned to Baltimore, where he issued a translation of Bouchardat's 'Annual Abstract of Therapeutics, Materia Medica, Pharmacy and Toxicology for 1857.' His writings were chiefly contributions to medical journals.

DERGULEDE, dâ-roo-lâd', Paul, French poet: b. Paris, 2 Sept. 1846; d. 1914. His 'Soldier Songs' (1872) and 'Military Refraints' (1888) were immensely popular, and won him the presidency of the Patriotic League, an association intensely hostile to Germans, and whose agitation seemed likely to lead to a collision with Germany, wherefore the poet was prevailed on to retire from the presidency. He was the chief advocate of the 'revanche' against Germany, having taken part as a soldier in the disastrous campaign of 1870-71. In 1883 he went to Russia to further the cause of a Franco-Russian alliance; and supported General Boulanger during his temporary rise to power. His anti-Semitism was marked during the Dreyfus case. He was a member of the Chamber of Deputies 1893-95 and 1898-99. He was condemned to banishment in 1900 for 10 years for conspiracy against the republic. The amnesty of 1905 reduced this to five years, and in 1906 he sought but unsuccessfully re-election to the Chamber of Deputies. He wrote a drama on patriotism, 'The Hetman'; and a semi-religious drama, 'The Moabites.' Other works are a patriotic cantata, 'Vive la France' (1880); 'Messe de Guescin' (1895); 'La Mort de hoc' (1897); 'Poésies militaires' (1896); etc.

DERR, Louis, American physicist: b. Pottsville, Pa., 6 Aug. 1868. In 1889 he graduated at Amherst College and studied also at the
DERRICK — DERWENTWATER

Massachusetts Institute of Technology 1892, and at the Harvard Graduate School 1892–93. In 1892 he became assistant in physics at the Massachusetts Institute of Technology and became full professor in 1907. He was also instructor in physics at Boston University 1893–98, and from 1895 to 1908 was in charge of instruction in physics at the Boston Normal School of Gymnastics. He is Fellow of the American Academy of Arts and Sciences and member of the American Association for the Advancement of Science. He has published 'Notes on the Principles of Dynamo and Transformer Design' (1902); 'Photography for Students of Physics and Chemistry' (1906). He edited the 'Cyclopedia of Engineering' (1902; 2d ed., 1912) and since 1907 is assistant editor of the 'Chemical Abstracts'. He has also published numerous papers in scientific journals.

DERRICK, a mechanical device for lifting and shifting heavy weights. The simplest form of derrick is the gin, a tripod of three legs, with a compound pulley at the apex and another at the base, and a windlass to operate the pulley rope. These simple derricks are easily portable and are used very commonly for lifting stones, pulling stumps, lowering iron pipes into trenches and similar work. The builders' derrick has two legs framed together like a broad ladder and set wider apart at the bottom than at the top. The foot piece at the bottom is fitted with wheels which run sideways along a plank parallel to the face of the building. The top of the derrick is inclined toward the building and is held in position by guy ropes. This form of derrick is used by stone masons to lift and set in place stone facing, sills, lintels, columns, etc. It is sometimes footed on a beam of an upper story, hanging outward over the street and used also to hoist lumber, window frames and the like.

For large and heavy work, as in excavations and the erections of steel-frame buildings, the derrick in common use is the guy derrick, comprising a mast held upright by four to seven guys, widely extended and securely anchored, and a boom attached to the mast near the bottom by a hinged joint, so that it may rise and fall in a vertical plane; the whole having the outline of the letter V. The foot of the mast is a pivot pin set in an opening in a heavy base plate, a large derrick, a ball and socket joint. The guys at the top are attached to a thick circular plate which slips down on a gudgeon pin. The mast is thus free to revolve and if the derrick is small, it is swung by means of a horizontal pushing bar; if large, the base of the mast is fitted with a bull wheel, from five to eight feet in diameter, which is operated by cable from a winding engine. Derricks are usually equipped with two separate hoists, one lifting the load and the other drawing in the guy cables which control the sag of the boom away from the mast. The winding drums which do this work are generally detached from the derrick itself, but in some cases the winding machinery is built on a platform attached to the base of the mast and revolves with it upon a coggled circular track. In confined situations, as between buildings in cities, where there lacks room to stretch guys to support the mast, the stiff-legged derrick is used. In this type the mast is held at the top by heavy beams or legs which are set apart at the ground, to the ends of an arc of 90 degrees. The bases of these legs are heavily anchored with stone, bags of sand and gravel or other weighty material.

Small derricks are of wood; the masts being from 20 to 45 feet in height, and respectively from 10 to 16 inches square. The beams or legs are 12 inches thick and 18 inches wide, and the guys run from 8 to 16 inches square. A five-ton derrick will have a mast 25 feet long, and a boom of 30 feet. The guys will be wire cables of one inch diameter, and the hoisting cable from five-eighths to three-quarters inch in diameter. If the legs, they will have the same cross section as the mast, and be as long as the working area will permit. In stiff-legged derricks the mast is usually much shorter than the boom. The masts and booms of timber derricks are sometimes trussed with iron rods to strengthen them, but for extra heavy work the derrick is often all metal, of latticed structural steel. (See Crane.)

DERVISH, René Edward, American military officer: b. Haiti, W. I., 22 Feb. 1789; d. San Francisco, 23 Nov. 1865. He graduated at the U.S. Military Academy in 1812, and served with credit in the war with England. He subsequently supervised the construction of fortifications in New York harbor and the Gulf of Mexico. During the Civil War he was ordered to the Pacific Coast, where he constructed defenses in San Francisco harbor.

DERVISH, the Persian word for the Arabic faqir or fakir. See FAKIR.

DERWENT, dér'wen't, (1) the name of four rivers in England, in Derbyshire, Yorkshire, Durham and Cumberland, respectively. The Yorkshire Derwent is a tributary of the Uose. (2) A river in Tasmania. It rises in Lake Saint Clare in the centre of the island and enters Storm Bay by an estuary. A lighthouse, elevated 70 feet above the sea, has been erected on Iron Pot Island, at the entrance of the Derwent, exhibiting a fixed light, visible at from 12 to 15 miles' distance. On the Derwent estuary is the town of Hobart. Its entire length is about 130 miles and it is navigable as far as Hobart.

DERWENTWATER, James Ratcliffe, Earl of, English nobleman: b. London, 28 June 1689; d. London, 24 Feb. 1716. His grandfather had been created Earl of Derwentwater by James II, and his father, Francis, married a natural daughter of Charles II. He succeeded to the title in 1705 and entertained a personal attachment toward the Stuart family, which induced him to take part in 1715 to restore them to the English throne. The standard of revolt having been raised in Scotland, Lord Derwentwater commenced the movement in England on 6 Oct. 1715. The cause of the Pretender was a losing one from the first, and in July 1716 Derwentwater was displayed by the Earl of Derwentwater and other Jacobite nobles, they were compelled to surrender at discretion at Preston on 13 Nov. 1715. The Earl of Derwentwater, being impeached for high treason, pleaded guilty, and was beheaded on Tower Hill. His estates were confiscated and given to Greenwich Hospital.
DERWENTWATER, or KESWICK
LAKE, a beautiful lake in Cumberland, England, in the vale of Keswick. It is about three miles in length and one and a half in breadth, and stretches from Skiddaw on the north to the hills of Borrowdale. Near the northeast corner is the celebrated cascade of Lodore. Its waters are carried to the sea by the Derwent.

DERZHAVIN, dyér-zhá'yén, Gabriel Romanovitch, Russian lyric poet: b. Kazan, 14 July 1743; d. Novgorod, 6 July 1816. He joined the Preobrazhensky Guard in 1782, becoming lieutenant-captain in 1783. He became successively governor of Olonetz (1784) and of Tambov (1785). In 1793 he was called to the Senate, in 1800 was master of the Imperial treasury, and in 1802 was Minister of Justice. The poet retired in 1814, to write under the French influence of St. Petersburg (9 vols., 1864-83), the eighth volume of which is a biography of the author by the editor, J. Grot. See ODE to God.

DESAIGNE, dâ-sä-gwâ'dâ-rô, a valley in Bolivia and Peru, between two ridges of the Andes in which was perched the town near the city of Potosí. This valley or tableland is about 400 miles in length, and varies from 30 to 80 miles in breadth; area 150,000 square miles, and includes Lake Titicaca, and the salt lake of Aconquijas or Uruca. Desaguadero signifies in Spanish a channel.

DESAIGNE DE VEYGOUX, dë-sâ' dé-vâ-goo, Louis Charles Antoine, French general: b. Saint-Hilaire-d'Ayat, August 17, 1745; d. Marengo, 14 June 1800. Entering the army at 15, he was in 1792 appointed aide to Prince Victor de Broglie, commander of the Army of the Rhine. He was promoted to the command of a brigade in 1793-94, and then of a division. In 1796 he covered himself with glory by his heroic conduct in Moreau's famous retreat through the Black Forest. Behind the ruinous fortress of Kehl, Desaix resisted the Austrian army for more than two months, only capitulating in January 1797, when his ammunition was spent. He served under Bonaparte in Egypt, where he distinguished himself greatly, and was appointed governor of the upper part of the country. He completely subdued Upper Egypt, and received, as a testimonial of admiration from Bonaparte, a sword, with this inscription on its blade, "Conquête de la Haute Egypte." His own soldiers used to compare him to Bayard, while the inhabitants named him "the Just Sultan." He was obliged, however, in 1800, to sign the unfavorable treaty of El Arish with the Turks and English, and in 1801, with the Treaty of France was captured and detained by Lord Keith as a prisoner of war. He afterward obtained his parole, and returned from Egypt just in time to take part in the battle of Marengo, in which he was killed. A monument has been erected to his memory at Paris. Consult Bonval, E., 'Histoire de Desaix' (Paris 1881).

DESAITIR, the name given to a collection of sacred books, purporting to be the work of the 15 old Persian prophets, together with a book of Zoroaster. The collection is written in a language no longer understood, and is equally different from the Zend, the Pehli and modern Persian. The last of the 15 prophets, Hassan, who lived at the time of the downfall of the Sa珊nides, literally translated the Desaitir, and accompanied it with commentaries. This work was until the 17th century the chief source of the ancient Persian religious doctrines, interwoven with astrology and demonology; and, after having been forgotten for about a century and a half, was discovered at Isphahán and published at Bombay in 1818. Erskine added an English translation, but considered the collection as spurious; and Sylvester de Sacy believed it the work of a Parsee in the 4th century of the Hegira, who invented the language. By some, however, it is considered as genuine. No trace of any connection with the Zendavesta and the magic of the Parsees has been found in the Desaitir.

DÉSAUGIERS, dâ-zô'zhâ, Marc Antoine Madeleine, French song writer and dramatist: b. Fréjus, 17 Nov. 1772; d. Paris, 9 Aug. 1827. He was educated for the ministry at the College Mazarin, Paris. When only 17, he became a prisoner of the revolting blacks. His life was in great danger, but he managed to escape to the United States where he taught piano-forte playing at Philadelphia. He returned to Paris in 1805 and began his dramatic career. His parody of the opera 'Danaids' ('The Little Danaids') was acted for 300
consecutive nights. His vaudevilles were remarkably successful. As a light song writer he was second only, if indeed second, to Beranger. Many of his songs will live long; such as 'The Consolations of Old Age,' 'The Picture of New Delights,' 'The Mirror,' 'Sunday Pleasures,' 'The Palais Royal.'

DESAULT, de-sô, Pierre Joseph, French surgeon; b. Magny-Vernais, 6 Feb. 1744; d. Paris, 1 June 1795. He was led by his inclination to the surgical profession; in consequence of which he entered the military hospital at Béfourt, where his situation was favorable for obtaining a knowledge of the treatment of wounds from fire-arms, in which department he afterward rose to great eminence. He went to Paris in 1764, and was one of the numerous scholars of the celebrated Petit. After having been several years principal surgeon of the hospital De la Charité, he was put at the head of the great Hôtel-Dieu in Paris, in 1788. Here he founded a surgical school, in which have been educated many of the most eminent surgeons of Europe. His principal merits were that he brought accuracy and method into the study of surgery; improved the treatment of fractured bones by adopting improved bandages; and first introduced into France the clinical method of instruction in surgery. He was distinguished for the skill and boldness with which he performed operations. Desaulx wrote only two small treatises; but the Journal de Chirurgie, in which his scholars published his lectures delivered in the Hôtel-Dieu, and the Ouvres Chirurgicales (3 vols., 1798-1803. Eng. trans., 1814) edited by Bichat under Desaulx's name, contain his whole system. Consult Labruné, 'Étude sur la vie et les travaux de Desaulx' (Besançon 1867).

DESBARRES, dà-bár', Joseph Frederick Wallet, English military engineer: b. England 1722; d. Halifax, N. S., 24 Oct. 1824. In 1756 he sailed as lieutenant for America, where he was raised, and for a time commanded, a corps of field artillery. In 1757 he gained a victory over the Indians who had captured Fort Schenectady; and at the siege of Quebec was aide-de-camp to Wolfe, who was mortally wounded with several of the rifles was mortally wounded. He conducted the subsequent engineering operations during the conquest of Canada, and was quartermaster-general in the expedition that retook Newfoundland (1762). He made a survey of the coast of Nova Scotia in 1763-73, and afterward prepared charts of the North American coast for Lord Howe. He was lieutenant-governor of Cape Breton (1784-1804), and of Prince Edward Island (1805-13).

DESCARTES, René, re'nà dà-kà-r't, distinguished French philosopher: b. La Haye in Touraine, 31 March 1596; d. Stockholm, 11 Feb. 1650. He was educated at the Jesuit College of Le Fléche. Here he studied physics and philosophy according to the scholastic system and showed especial fondness and aptitude for mathematics, which alone seemed to satisfy his desire for clear and certain knowledge. All else that he had learned seemed to him lacking in the clearness and certainty that would entitle it to be ranked as knowledge. After leaving school he went to Paris where he continued his studies. He then enlisted in the military service of the Netherlands and afterward in that of Bavaria. During these years he was always tormented by doubts, and was constantly seeking a method by which he could attain certainty. At length he made the discovery of his famous principle of certainty which he expressed in the proposition, 'I think, therefore, I am (cogito ergo sum), and which he regarded as 'the foundations of a wonderful science.' In 1629 he withdrew into seclusion in Holland, frequently changing his residence that he might continue his work without interruption. Here he lived for 20 years and produced the works upon which his fame rests. In 1649 he accepted the invitation of Queen Christina of Sweden to come to Stockholm and personally instruct her in his philosophy. The Queen preferred to have her lectures in philosophy at 5 o'clock in the morning and Descartes had to proceed to the palace at that hour. The severity of the climate and the life at court were injurious to his naturally weak constitution, and a year after his arrival he contracted an illness from which he died.

Descartes' fame rests not merely upon his contributions to philosophy, however, but also upon his services to physical science and mathematics. He discarded the old methods of explaining physical phenomena by means of final causes, and insisted that everything takes place mechanically. He is one of the chief pioneers of the mechanical view of the world, and formulates clearly the fundamental laws of this mode of explanation, which he extends to explain all physiological processes. In mathematics he made important contributions to the theory of equations and was the originator of the science of analytical geometry.

Descartes' principal works are 'The Discourse on Method,' which gives a clear account of development of his thought and with which was published his 'Dioptrics,' 'Meteors,' and 'Geometry,' under the common title of 'Essais philosophiques' (1637); 'Meditations on the First Philosophy' (1641); 'The Principles of Philosophy' (1644); 'The Treatise on the Passions' (1650). Modern editions of Descartes are those by Cousin (Paris 1826), and by Adam and Tannery (12 vols., ib., 1897-1910). The most important writings have appeared in the English translations of Desbarres (Edinburgh 1825) and Torrey (New York 1892). Consult Boutroux, 'L'Imagination et les mathématiques selon Descartes' (Paris 1900); Fischer, 'Geschichte der neueren Philosophie' (Heidelberg 1897); Fouillé, Descartes' (Paris 1893); Hoffmann, René Descartes' (Stuttgart 1895); Haldane, Descartes: His Life and Times' (London 1905); Iverach, 'Descartes, Spinoza and the New Philosophy' (New York 1904); Mahaffy, Descartes' (Edinburgh 1881); Smith, 'Studies in Cartesian Philosophy' (1909); Strok, Millet, 'Descartes, sa vie, ses travaux, et ses découvertes' (2 vols., 1871). For Descartes' philosophy see the article CARTESIANISM.

JAMES E. CREIGHTON, Professor of Logic and Metaphysics, Cornell University.

DESCARTES' RULE OF SIGNS is a theorem by which the maximum number of positive or negative roots of an equation can at once be detected on sight. The theorem may be thus explicated: The number of positive roots of an equation cannot exceed the number of variations in the signs of its coefficients, con-
sidered in their proper order. A fair example is the cubic equation: \( F(x) = 3x^3 - 7x^2 + 11x + 4 = 0 \).
Here are but two variations of signs on passing from one extreme term to the other, through the intermediate one; we conclude therefore that the cubic cannot have more than two positive roots. The maximum number of negative roots is seen on applying the same theorem to the equation which is obtained from the original by changing \(-x\) into \(x\). Thus the positive roots of \( F(-x) = 1x^3 + 4 = 0 \) are negative roots of the original cubic, and by Descartes' rule cannot exceed three.

DESCENDANTS, as a term of law, is applied to the issue of a person, or the offspring of such issue, to the farthest generation. Such descendants have a prior claim over collateral relatives or ancestors in the inheritance of property left by a deceased ancestor. See DESCENT.

DESCENT IN LAW is the transmission of the real estate of a person dying intestate to his heir or heirs. The title acquired by the heir, in this manner, is called title by descent.

Prior to the Revolution, the law in England was that real estate could only descend and never ascend; but in the United States the law has been changed by statute, and at the present time real estate may ascend as well as descend; but, as far as the title is concerned, it is called title by descent.

According to the old English law, real estate descended to the eldest son who was living; provided that he had no elder brother who had died leaving a son to survive him; if all the sons had died without leaving issue, all of the daughters inherited together. There were exceptions to this rule, as in one part of England, the youngest child was the heir. Estates tail might also be called an exception, in some cases, as an estate tail female, where the daughter took the property; and if there were no daughters, the estate went to a person outside of that immediate family, the sons being excluded absolutely.

In the United States, some of the States have passed laws by which any words used, in the granting of an estate, which would create an estate tail shall be considered as creating an estate in fee simple, and by this means have abolished estates tail.

The rules of descent are applicable only to real estate, although sometimes they are incorrectly spoken of as applying to personal property also. Distribution is the proper word to use in speaking of personal property.

In the United States there is a wide distinction between the laws of descent and those of distribution. The laws on the subject are regulated by statute of the different States, and are consequently subject to change at any time. These laws differ materially, and it is therefore necessary to examine with care the statutes of any particular State in order to determine its rule on this subject.

The general rule in the United States seems to be that real estate, subject to the rights of the surviving spouse, descends to children, grandchildren, and great-grandchildren in the lineal line; in default of these heirs, then to parents, and, if they are dead, the estate goes to collaterals; and if there are no heirs to the State. In only a few States the husband and wife placed in the line of inheritance. The law of the place where the real estate is situated is the law according to which the estate passes to the heir; and it makes no difference where the decedent was domiciled.

DESCENT OF MAN AND SELECTION IN RELATION TO SEX, The work by Charles Darwin, published in 1871. The evidences of the descent of man from some earlier, less-developed form, collected and marshaled by Darwin, consist of minute inferential proofs of similarity of structure, at certain stages of development, between man and the lower animals. This similarity is especially marked in the embryonic stages; and taken with the existence in man of various rudimentary organs, seems to imply that he and the lower animals come from a common ancestor. Darwin reasons that the early ancestors of man must have been more or less monkey-like animals of the great anthropoid group, and related to the progenitors of the orang-outang, the chimpanzee and the gorilla, and that this much remoter ancestors must have been aquatic. The 'Descent of Man' was received with enthusiasm by scientific men, and its influence was much greater than that of the 'Origin of Species.' It had a lasting effect not merely on physical and biological science, but on ethical and religious conceptions. The volumes containing the 'Descent of Man' Darwin placed his elaborate treatise on sexual selection, which may be regarded as a part of the theory of man's descent. See DARWINIAN THEORY.

DESHAMPS, dà-shǎn', Éustache, called Morel, French poet: b. Vertus, Marne, about 1330; d. after 1415. He composed a multitude of short poems of a political or moral nature. The 'Miroir de mariage' comprises 13,000 lines. He wrote also 'De l'art de dicter' (on the Art of Poetizing). His works were published in Saint Hilaire (11 vols., 1878-1903). Consult Hoeppner, E., 'Éustache Deshamps' (Strassburg 1904).

DESCHANEL, dà-shǎn, Émile Auguste Etienne Martin, French critic: b. Paris 1819; d. 1904. He studied at Paris, becoming professor of rhetoric at the Normal School, and wrote literary and other criticism, the 'Prati des Deux Mondes.' These essays took on a radical quality, especially those on 'Catholicisme et Socialisme,' which offended the government. After the coup d' état (1851), he was arrested and expelled from his country. He fled to Belgium, where he engaged in literary labors and made the acquaintance of Victor Hugo. When it became safe for him to return to France, he at once resumed his literary work by becoming one of the editors of the 'Journal des Débats' (1859). In 1876 he became deputy, and was re-elected in the following year. The Collège de France called him to the chair of modern literature in 1881. A few months later he was elected senator. Of his works the following are the best known: 'Dictionnaire de la conversation' (1857); 'Etudes sur Aristophane' (1867); 'Le roman des classiques' (1882); 'Le théâtre de Voltaire' (1886).

DESHANEL, Paul (Éugène Louis), French statesman and author: b. Brussels
1856. His father had been exiled because of difficulties with the government of Napoleon III. He was educated at the Collège Saint-Barbe and the Lycée Condorcet. In 1878 he became subprefect of Dreux, and was secretary-general of Seine-et-Marne and subprefect of Brest in 1879. He entered the Chamber of Deputies in 1885 as member for Eure-et-Loir, became vice-president of the Chamber in 1896, and president 1898–1902. He was a leader of the Progressive Republicans and a firm advocate of the separation of church and state. He was again president of the Chamber in 1912–16. In 1899 he was made a member of the French Academy, and was a candidate for the office of President of the Republic. His publications include 'La Question du Tonkin' (1883); 'La politique française en Océanie' (1884); 'Les Intérêts français dans l'océan Pacifique' (1888); 'Orateurs et Hommes d'État' (1888); 'Figures de femmes' (1889); 'Figures littéraires' (1890); 'Questions actuelles' (1891); 'La décentralisation' (1895); 'La Question sociale' (1898); 'La République nouvelle' (1898); 'Quatre ans de présidence' (1902); 'L'Idée de patrie' (1905); 'Politique intérieure et étrangère' (1906); 'A l'Institut' (1907); 'L'organisation de la démocratie' (1910); 'Hors des frontières' (1911); 'Paroles françaises' (1911); 'Segrais, Madame de Sévigné' (1911); 'Lamartine' (1913).

**DESHUTES RIVER**—DESERONTO

DESHUTES RIVER, Oregon, a river rising in the Cascade Range in Klamath County. After a northeasterly course through Crook and Wasco counties, it empties into the Columbia River. Its length is 320 miles, and its course for 140 miles runs through the great north-western lava bed, forming a canyon with walls 1,000 to 2,500 feet in depth. More than a hundred layers of stratified lava are thus uncovered.

**DES CLOIZEAUX**—dá klíwa'zó, Alfred Louis Olivier Legrand, French mineralogist b. Beauvais 1817 d. 1897. He devoted himself to the study of minerals and became an instructor in the Ecole Centrale des Arts et Manufactures, and later lectured at the Ecole Normale. In 1876 he was appointed to the chair of mineralogy at the Musée d'Histoire Naturelle. His principal contributions to science were in the study of the optical properties of crystals, on which he based his crystallographic system. His discoveries include microline, a triclinic potash feldspar (\(KAISi_2O_6\)) and the circular polarization of cinnabar. On the subject of crystallography he wrote 'Leçons de crystallographie' (1861); 'Manuel de minéralogie' (2 vols., 1862–93); 'Nouvelles recherches sur les propriétés optiques des cristaux' (1867). He was elected a member of the Academy of Sciences in 1869 and was awarded the Wollaston medal by the Geological Society of London (1886).

**DESCLOT**—dé-sklo', Bernat, a Spanish historian who flourished in the latter half of the 13th century. He is known chiefly as the author of a Catalanian history of great linguistic value. Originally published under the title 'Libre del rey En Pere,' it is the oldest narra-

**DESCROZILLES**—dá-krov-zel', François Antoine Henri, French chemist b. Dieppe, 11 June 1751; d. Paris, 14 April 1825. He studied chemistry at Paris under Rouelle, and later became professor at Rouen. He devoted himself to the technical applications of the science.

**DESERMONA**—the heroine of Shakespeare's tragedy 'Othello.' She is the daughter of a Venetian senator, Brabantio, and is drawn to love the Moor who visits her father, by hearing him relate the vicissitudes of his adventurous career. She marries him against her father's will and proves a devoted wife, but Othello, through the machinations of Iago, is led to doubt her fidelity, and, in a jealous rage, smothers her. Desdemona's character is marked by modesty, sweetness and innocent trustfulness. See OTHELLO.

**DESTADA**—dés-'ě-dā. See DÉSIRADE.

**DESERT**—from *desert*, Book of Mormon, signifying 'land of the honeybee', the name given to the State of Utah, 5 March 1849, at a convention of Mormons in Salt Lake City, when they adopted a constitution establishing *a free and independent government by the name of the State of Deseret.* Congress refusing recognition created the Territorial government (q.v.), the year following. See COMPROMISE OF 1850.

**DESERONTO**—Canada, a town in Hastings County, province of Ontario, on the Bay of Quinte, at the mouth of the Napanee River and on the Canadian Northern Railway. It is about 132 miles east of Toronto. Its principal manufactories are lumber-mills, flour and furniture, car shops, shipyards, chemical works, locomotive works, foundry and iron smelting works. It is an attractive summer resort. Pop. 2,013.
